Experts

Simon Adams has written and contributed to more than 80 books on a wide range of topics: from history to the arts and politics.

Peter Bond has written 12 books and contributed to, or edited, many more. He also writes for the European Space Agency and is consultant editor for IHS Jane's Space Systems & Industry. He was formerly a press officer for the Royal Astronomical Society.

Dr Marina Brozovic is a physicist at NASA's Jet Propulsion Laboratory. She has written many research papers, and works on asteroids, satellites of the giant planets, and was involved in the New Horizons mission to Pluto.

Peter Chrisp is an author of children's history books, with over 80 titles to his name. He specializes in ancient Rome, ancient Greece, and myths and legends.

Emily Dodd is a screenwriter for the CBeebies science television show *Nina and the Neurons*. She is passionate about science, wildlife and storytelling, and is an author of fiction and non-fiction books.

James Floyd Kelly is a writer from Atlanta, Georgia. He has written over 35 books on a range of subjects that include 3D printing, robotics, and coding.

E.T. Fox is an author and historian, with particular expertise in the areas of British and Atlantic maritime history and piracy, among others. He is a lecturer, has published books and articles, and has advised on numerous television productions.

Kirsten Geekie is a film programmer and writer specializing in short films and cinema for young people. She is the Film Programming Manager at Into Film, co-curator of the Into Film Festival, and was the lead writer of the *Children's Book of Cinema*.

Cat Hickey is the learning manager at ZSL Whipsnade Zoo. She has worked in zoos for eight years and spent a year working as a research scientist in Madagascar, collecting data on lemurs.

Dr Emily Hunt is a professor of engineering at West Texas A&M University. She has a background in mechanical engineering, with a particular interest in innovative nanotechnology.

Phil Hunt has written, edited, and acted as consultant on a wide range of travel and transportation illustrated reference books and magazines for adults and children.

Sawako Irie has taught the Japanese language at the University of Sheffield and has run training programmes at SOAS University of London. Currently, she provides Japanese cultural and language services.

Klint Janulis is a former US Army Special Forces operator, medic, and primitive skills survival instructor. He provides expert information to the UK television show *10000 BC* and is currently completing an archaeological Doctoral programme at Oxford University.

Rupert Matthews has written over 170 books about history. He writes for newspapers and magazines, and is a public speaker at events and in schools.

Sean McArdle was a headteacher and primary school educator, specializing in maths. He has written and contributed to many publications and mathematics websites.

Dr Angela McDonald is an Egyptologist based at the Centre for Open Studies at the University of Glasgow. She has a PhD from Oxford University, and is an expert on Egyptian texts. She led tours to Egypt for many years, and has published books and articles on ancient Egypt.

Bill McGuire is an academic, broadcaster, and popular science and fiction writer. He is currently Professor Emeritus of Geophysical and Climate Hazards at University College London.

Marcus Weeks is a musician and author. As well as contributing to numerous reference books, he has written several books on philosophy, psychology, and music.

Contents

How this book works

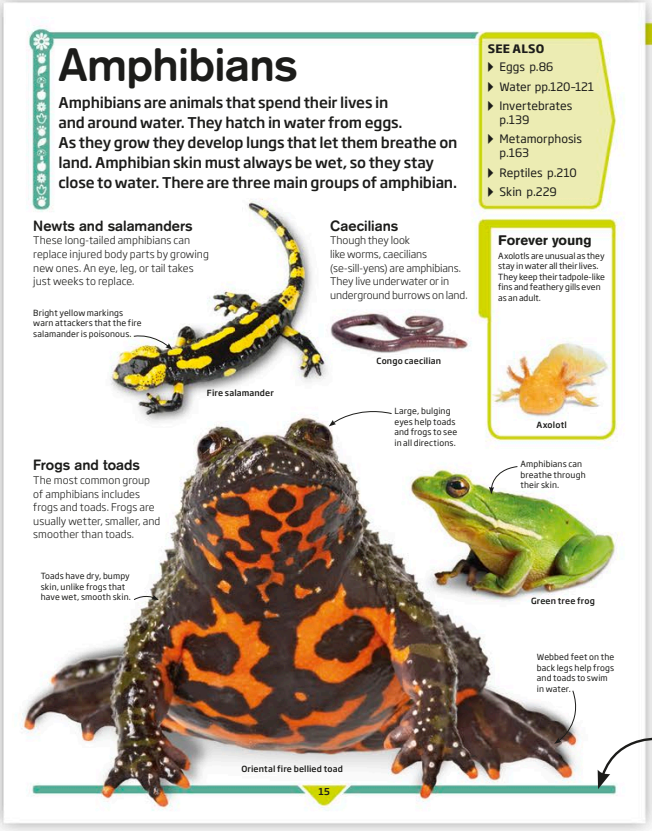
Ever wonder what a planet is? Do you know the difference between frogs and toads? Every page in this encyclopedia is packed with fun facts and amazing photographs. Dive straight in or jump to a page that catches your eye to discover all about our wonderful world. The helpful tips here will guide you through using this book.

Alphabetical pages

The book's pages are arranged alphabetically. You can look up topics using the contents list, which starts on page four, or flip through the pages in whichever order you like.

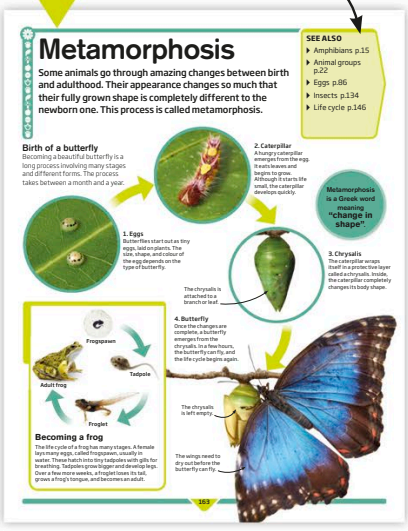
See also

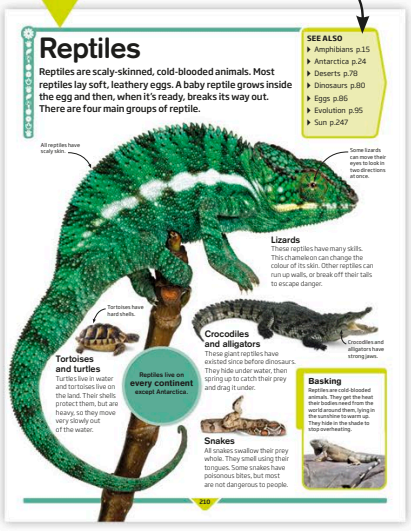
If you enjoy reading a page, you can use the "see also" box to find similar pages in the book and see where they are. This lets you make links across topics and subject areas and create your own journey through the encyclopedia.



In the "see also" box, "p." stands for page and "pp." for pages.

Follow the suggestions in the "see also" box to get to related topics elsewhere in the book.





The colour at the top and bottom of the page shows which type of subject the page is about. This turquoise colour shows that the amphibians page is about nature (see below).

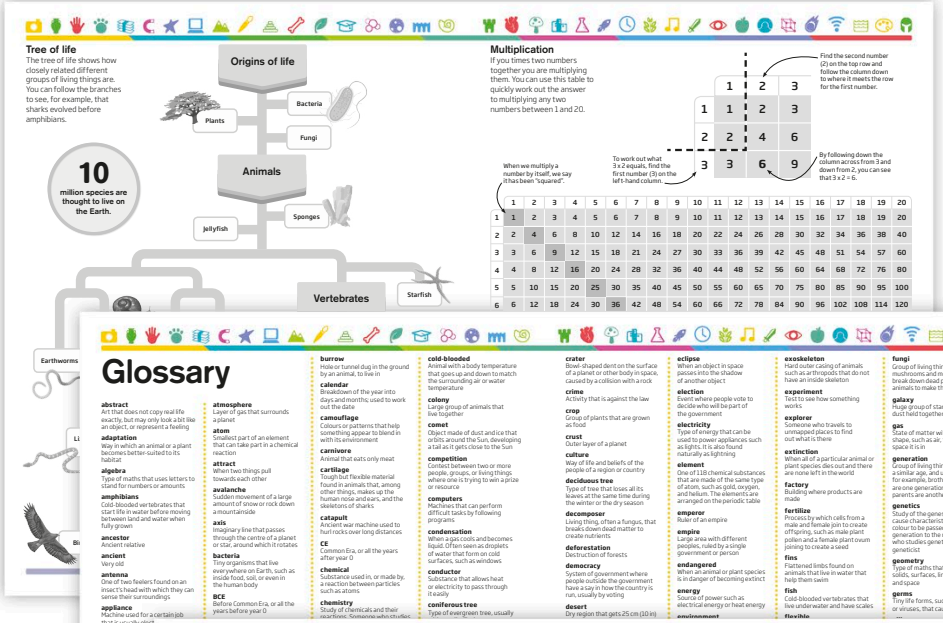
Subject areas

The encyclopedia covers nine different subject areas. Each one has its own colour, which is shown at the top and bottom of the page.

Art | People | History | Earth | Nature | Science | Technology | Space | Human body

The story of...

These pages bring together information from the different subjects, to get you thinking about things from lots of different angles. These pages are not arranged alphabetically.

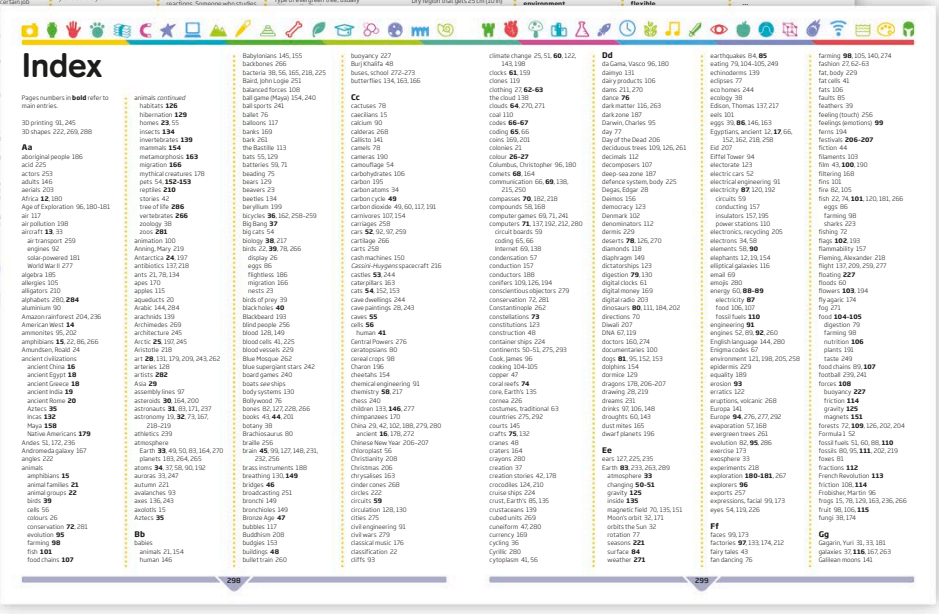


Reference

The reference section contains useful lists, diagrams, and tables. For example, there is a map of the world and there are lists of great artists, scientists, and writers.

Glossary

The glossary is a list of some of the more difficult words used in the book. If you would like an explanation of what a word means, you can look for it in the glossary.



Glossary

The glossary is a list of some of the more difficult words used in the book. If you would like an explanation of what a word means, you can look for it in the glossary.

Index

The index lists alphabetically everything covered in the book, along with its page number. If there is anything you want to know about, you can look it up here.

Africa

Africa is a very hot continent, and a lot of the landscape is made up of deserts and dry plains. Its central region is covered in rainforest. This continent was home to the first people on Earth millions of years ago.

About Africa

Population: 1.216 billion

Highest point: Mount Kilimanjaro

Lowest point: Lake Assal

Biggest desert: Sahara Desert

Longest river: Nile

African animals

Africa is home to many types of animal. Large areas have been set up where they can roam freely and safely. Tourists go to watch them in the wild.

Giraffes are the world's tallest animals, with males reaching 5.5 m (18 ft).

African elephants are the heaviest land animals.

Ancient pyramids

The pyramids in Egypt were built 4,500 years ago. Inside are the tombs of Egyptian rulers called pharaohs.

The pyramids are made of millions of stone blocks that were cut and dragged into place.

Aircraft

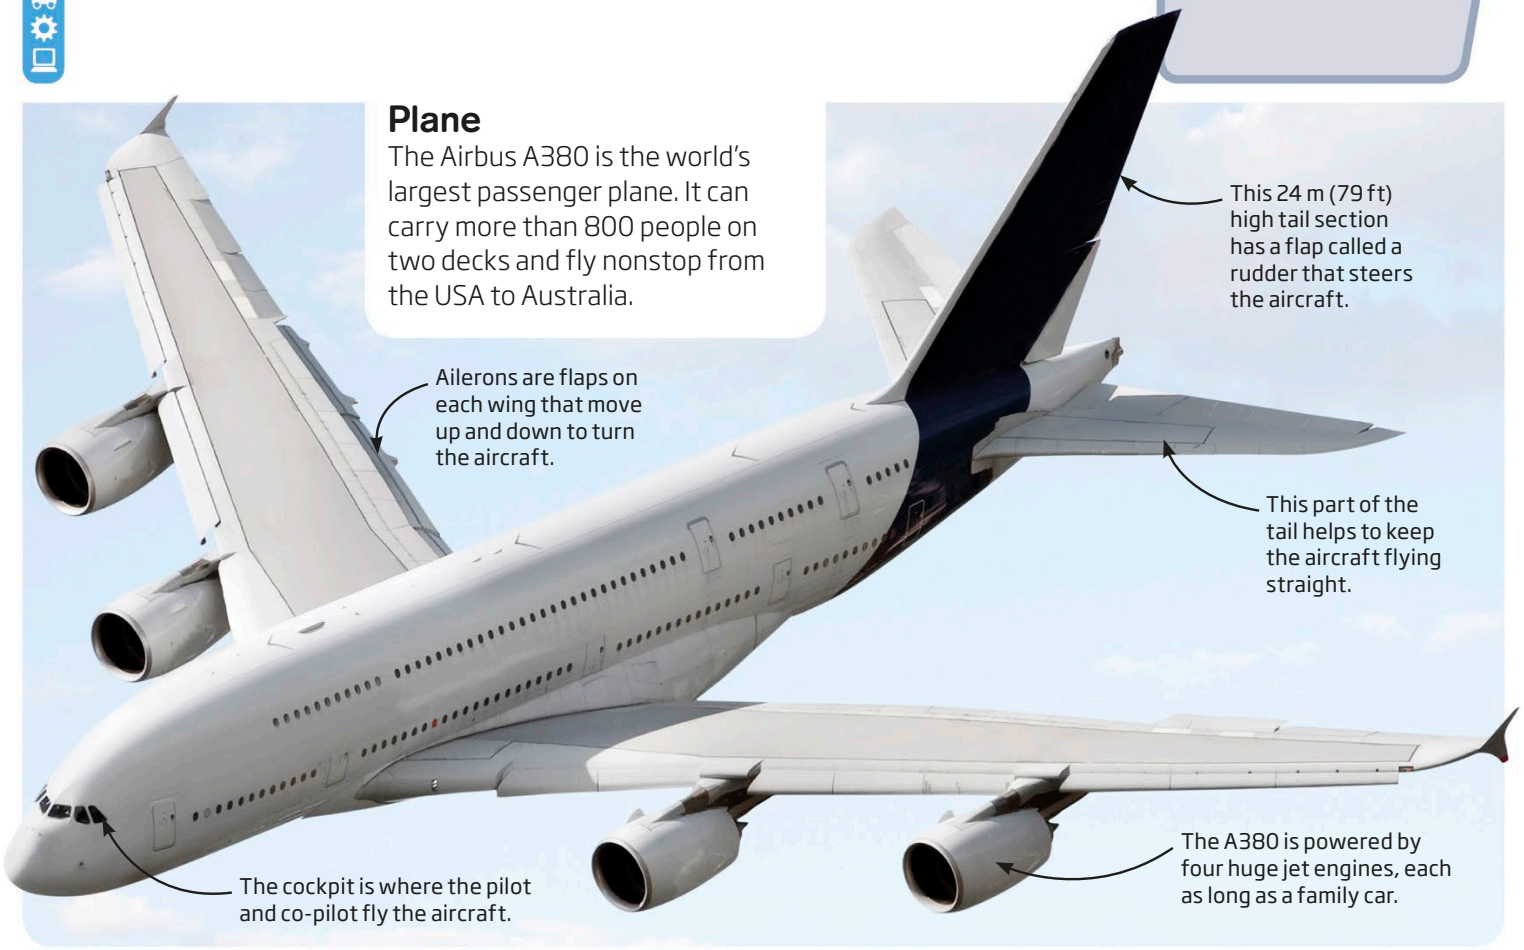
Aircraft are types of transport that let us travel through air. They take people around the world on holidays and are also used by fire crews, doctors, and farmers. Types of aircraft include planes, helicopters, and hot-air balloons.

SEE ALSO

- Atmosphere p.33
- Birds p.39
- Forces p.108
- Gravity p.125
- Transport pp.258–259

Plane

The Airbus A380 is the world's largest passenger plane. It can carry more than 800 people on two decks and fly nonstop from the USA to Australia.

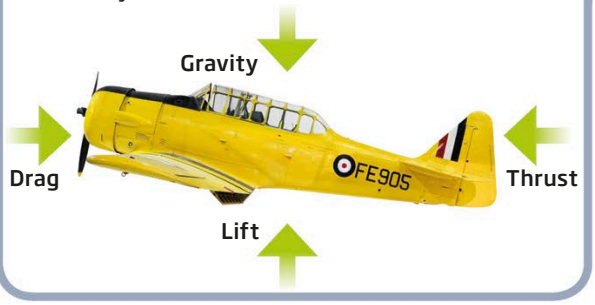


Helicopter

A helicopter uses fast-spinning blades, called rotors, to fly through the air. These rotor blades raise the helicopter and move it forwards. Smaller rotors on the tail keep the craft straight.

How aircraft fly

The green arrows show the four pushes and pulls, or forces, acting on an aircraft during flight. The weight of gravity pulls it down, lift raises it up, thrust moves it forward, and drag pulls it back. The pilot uses the controls to manage these forces to take off, fly, and land safely.



American West

Between the years of 1840 and 1900, many people living in the eastern United States moved west to find adventure and start new lives. Some, called settlers, set up farms and cattle ranches. Others dug mines in search of gold.

SEE ALSO

- Gold pp.200–201
- Native Americans p.179
- North America p.184
- Transport pp.258–259
- Trains p.260

Wagon train

Settlers travelled west in groups of wagons called wagon trains. They took with them everything they needed to make their new homes.

Wagons were pulled by horses or oxen. They carried people, supplies, and farming equipment.

A wagon train could have up to 250 wagons.

Native American wars

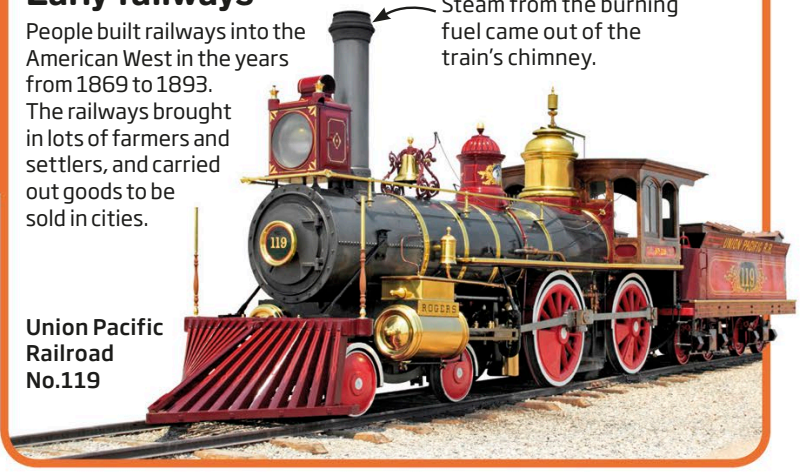
Wars were fought between the settlers and the local Native American tribes. Despite winning some battles, the tribes ultimately lost the wars and their land.

Painting of Custer's Last Stand, a Native American victory

Early railways

People built railways into the American West in the years from 1869 to 1893. The railways brought in lots of farmers and settlers, and carried out goods to be sold in cities.

Steam from the burning fuel came out of the train's chimney.



Union Pacific Railroad No.119

Amphibians

Amphibians are animals that spend their lives in and around water. They hatch in water from eggs. As they grow they develop lungs that let them breathe on land. Amphibian skin must always be wet, so they stay close to water. There are three main groups of amphibian.

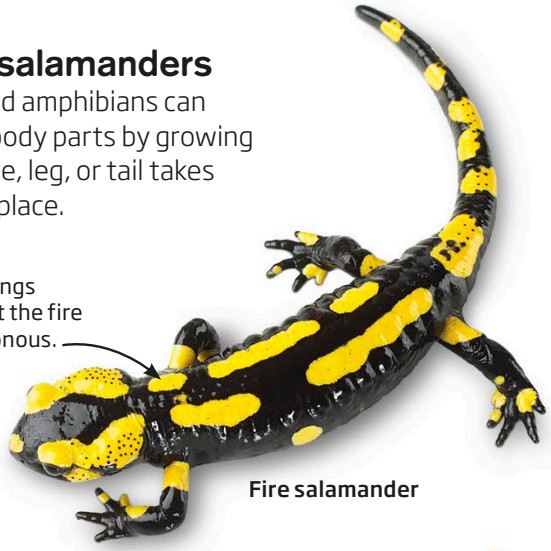
SEE ALSO

- Eggs p.86
- Water pp.120–121
- Invertebrates p.139
- Metamorphosis p.163
- Reptiles p.210
- Skin p.229

Newts and salamanders

These long-tailed amphibians can replace injured body parts by growing new ones. An eye, leg, or tail takes just weeks to replace.

Bright yellow markings warn attackers that the fire salamander is poisonous.



Fire salamander

Caecilians

Though they look like worms, caecilians (se-sill-yens) are amphibians. They live underwater or in underground burrows on land.

Congo caecilian

Forever young

Axolotls are unusual as they stay in water all their lives. They keep their tadpole-like fins and feathery gills even as an adult.

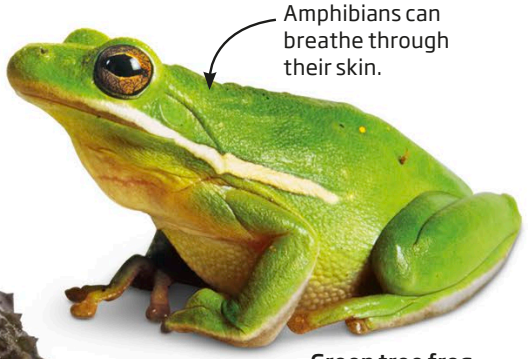
Axolotl

Frogs and toads

The most common group of amphibians includes frogs and toads. Frogs are usually wetter, smaller, and smoother than toads.

Large, bulging eyes help toads and frogs to see in all directions.

Amphibians can breathe through their skin.



Green tree frog

Toads have dry, bumpy skin, unlike frogs that have wet, smooth skin.

Webbed feet on the back legs help frogs and toads to swim in water.

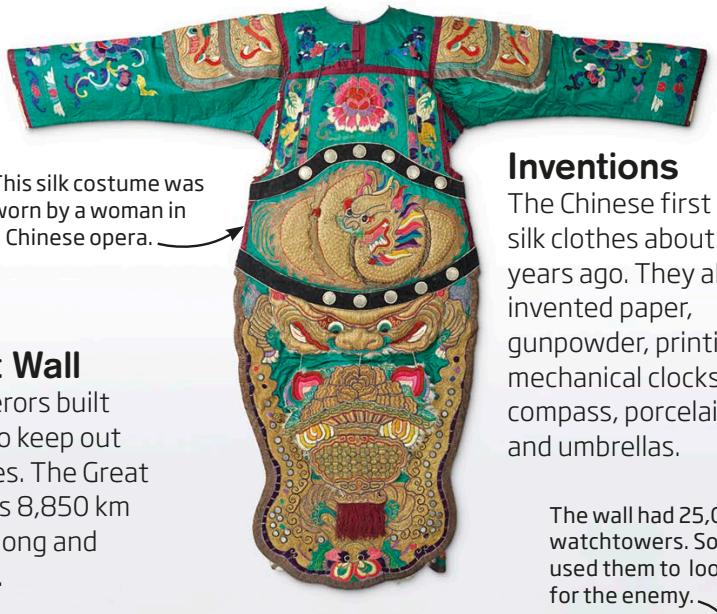
Oriental fire bellied toad

Ancient China

Chinese culture is thousands of years old. By 200 BCE, China was united under a family of emperors called the Han Dynasty from the city of Hanzhong. China produced many new inventions that spread to the rest of the world.

SEE ALSO

- Eating pp.104-105
- Inventions pp.136-137
- Exploration pp.180-181
- Trade p.257
- Writing p.280



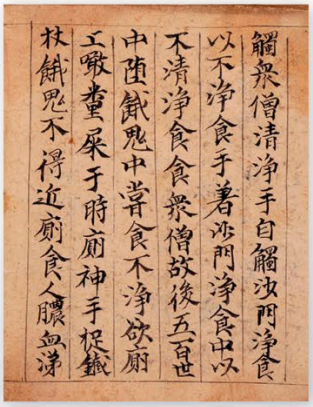
This silk costume was worn by a woman in a Chinese opera.

Inventions

The Chinese first made silk clothes about 5,500 years ago. They also invented paper, gunpowder, printing, mechanical clocks, the compass, porcelain, and umbrellas.

The Great Wall

Chinese emperors built strong walls to keep out northern tribes. The Great Wall of China is 8,850 km (5,500 miles) long and 500 years old.



Writing

Chinese writing dates to about 1400 BCE. Each of the 4,000 symbols represents a word or part of a word. The text is read from top to bottom and right to left.

The wall had 25,000 watchtowers. Soldiers used them to look out for the enemy.

Hilltop walls were easier to defend.

The top of the wall was wide enough for soldiers to march along.

Rice-growing

Rice was first grown in China about 10,000 years ago. It is still farmed today. Rice grows in flooded fields, such as these terraces.

Ancient Egypt

Thousands of years ago, between 7000 BCE and 395 CE, Egypt was led by powerful rulers called pharaohs. The Egyptian people farmed the land next to the River Nile and built amazing monuments for their pharaoh and the gods.

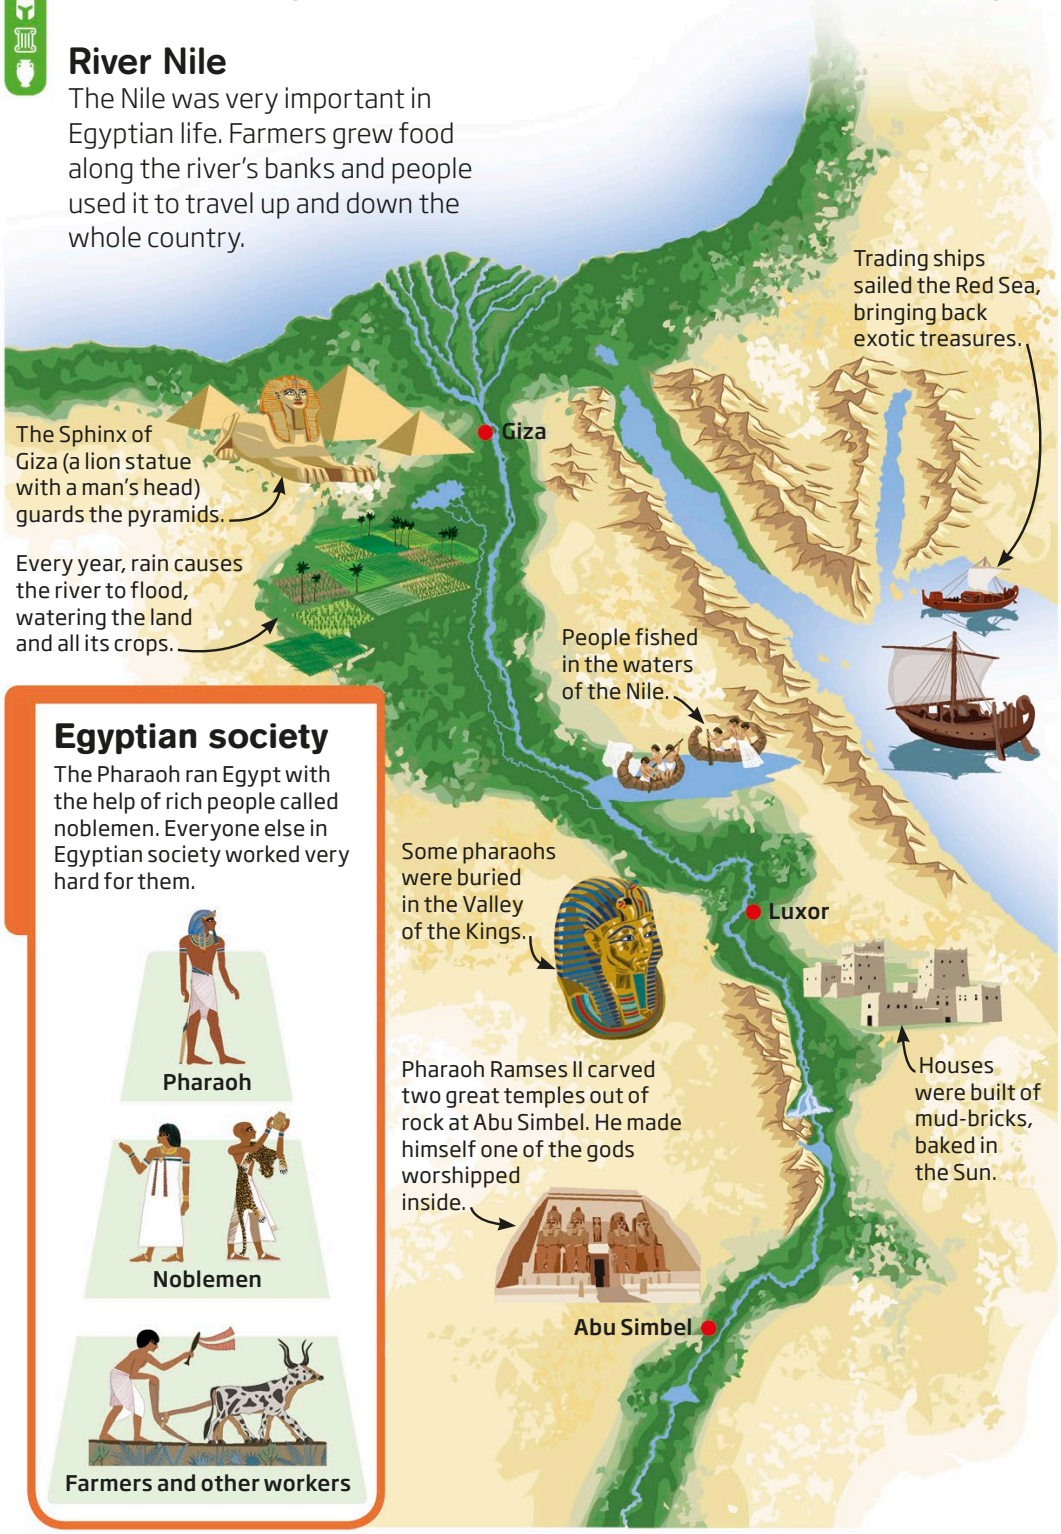
- Buildings p.48
- Governments p.123
- Life cycle p.146
- Rivers p.211
- Ships p.224
- Weather p.271

River Nile

The Nile was very important in Egyptian life. Farmers grew food along the river's banks and people used it to travel up and down the whole country.



Egyptian society

The Pharaoh ran Egypt with the help of rich people called noblemen. Everyone else in Egyptian society worked very hard for them.

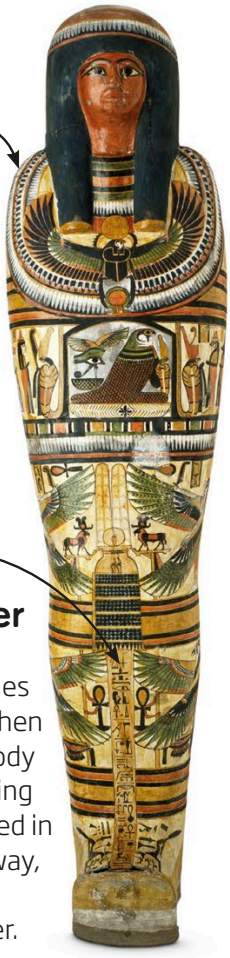
Pharaoh

Noblemen

Farmers and other workers

Pyramids

The pyramids were tombs built to protect the pharaoh when he died. They were filled with treasure for the pharaoh to use in the afterlife. The largest pyramid is nearly 140 m (460 ft) tall.



Living forever

The Egyptians turned their bodies into mummies when they died. The body was dried out using salt, then wrapped in bandages. This way, they hoped they would live forever.

Ancient Greece

The ancient Greeks were among the most creative people in history. They were great builders and artists who invented theatre, politics, history, writing, science, and sport. Some of the words they created are still used today. Greek civilization was at its best between 510 and 323 BCE.

SEE ALSO

- Ancient Rome p.20
- Buildings p.48

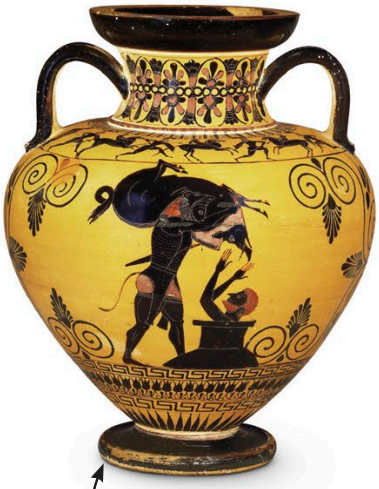
- Religion p.208
- Games pp.240–241
- Sport p.239

Parthenon

The most famous Greek temple is the Parthenon in Athens. It was built for the goddess Athena, protector of the city.

Greek pottery

Greek vases were often painted with scenes from myths. This vase shows one of 12 labours, or tasks, carried out by the mythical hero Hercules.



Vases like this were all-purpose containers, for oil, wine, honey, or other foods.

Gods and goddesses

The Greeks worshipped dozens of gods. Here are six of the most important ones, who are all members of the same family.

Zeus, king of the gods

Aphrodite, goddess of love

Apollo, god of music

Poseidon, god of the sea

Artemis, goddess of hunting

Hades, god of the Underworld

Olympics

The Greeks held the first athletic competitions, such as the Olympic Games. This lifelike statue shows someone throwing a round weight, called a discus.

Ancient India

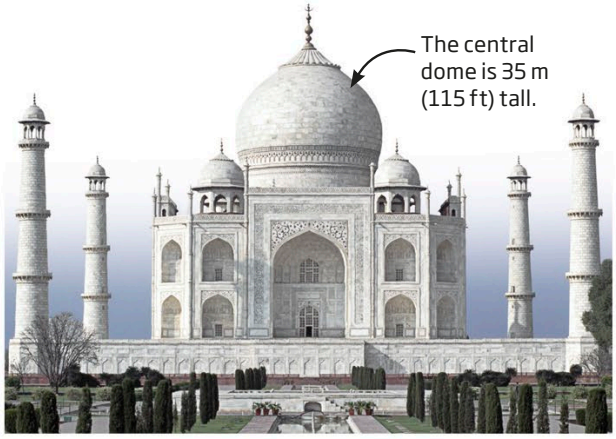
Great cities were built in India 5,000 years ago. This marked the start of a unique civilization. In the years 1526–1857, India was united as the Mughal Empire. The Mughals made scientific breakthroughs and beautiful works of art.

SEE ALSO

- Art p.28
- Asia p.29
- Astronomy p.32
- Buildings p.48
- Religion p.208
- War pp.278–279

Mughal Empire

The Mughal Empire was founded by Babur, a ruler from Central Asia who conquered northern India in 1526. The Empire was ruled by Babur's family for more than 300 years.

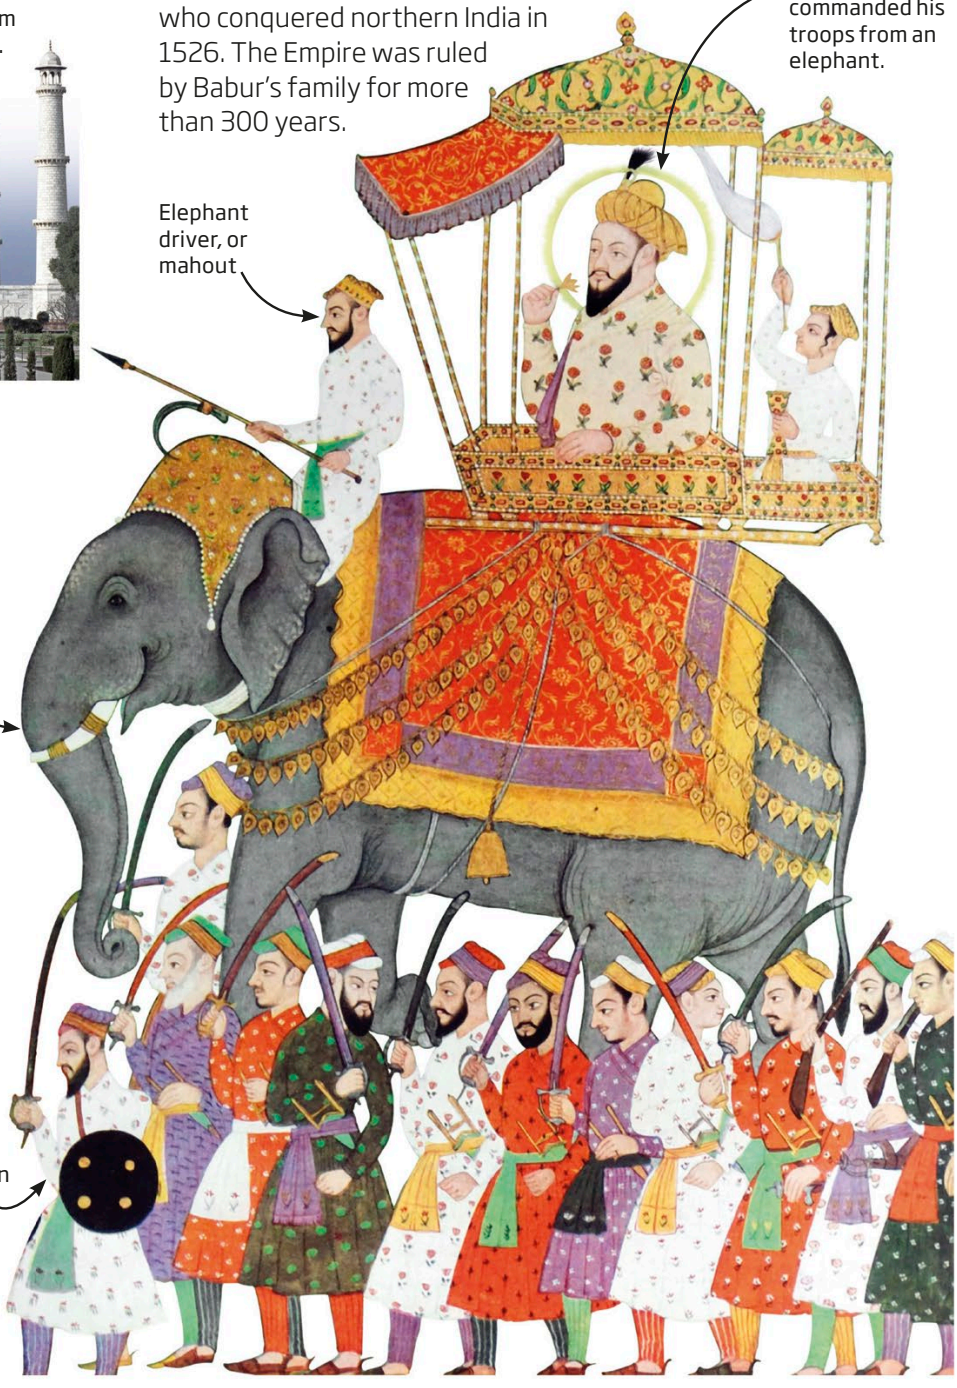


Taj Mahal

Built by the Mughal ruler Shah Jahan in 1632, the Taj Mahal is the tomb of his wife, Mumtaz Mahal. The huge white marble building took 20,000 men more than ten years to finish.

Science

The Mughals studied the stars and made brass globes to map their positions. Scientists invented shampoo and new ways to work with metal.



Ancient Rome

About 2,000 years ago, the ancient Romans ruled a great empire, including all the lands around the Mediterranean Sea. The Roman Empire was well organized, and it lasted for hundreds of years.

SEE ALSO

- Buildings p.48
- Europe p.94
- Governments p.123
- Law p.145
- Maps p.155
- Slavery p.230
- War pp.278–279

Roman society

Within the empire, there were different groups of people, with different rights. Citizens had more rights than non-citizens, and slaves had no rights at all.

Roman Empire

The Roman Empire started as just one city, Rome, in what is now Italy. Over time it grew across Europe.

Roman soldiers

The Romans conquered their empire using well-trained armies, called Legions. This is a centurion, an officer in charge of 80 legionaries (foot soldiers).

Roman buildings

The Romans were expert builders, and many of their buildings still stand. This is the Pont du Gard, an aqueduct that carried water to Nîmes, a Roman city in France.

Animal families

Animals live in many different types of family groups. Some animals live in big groups, called colonies. They work together to bring up their babies. Other animals form male and female pairs. Family groups help animals to survive.

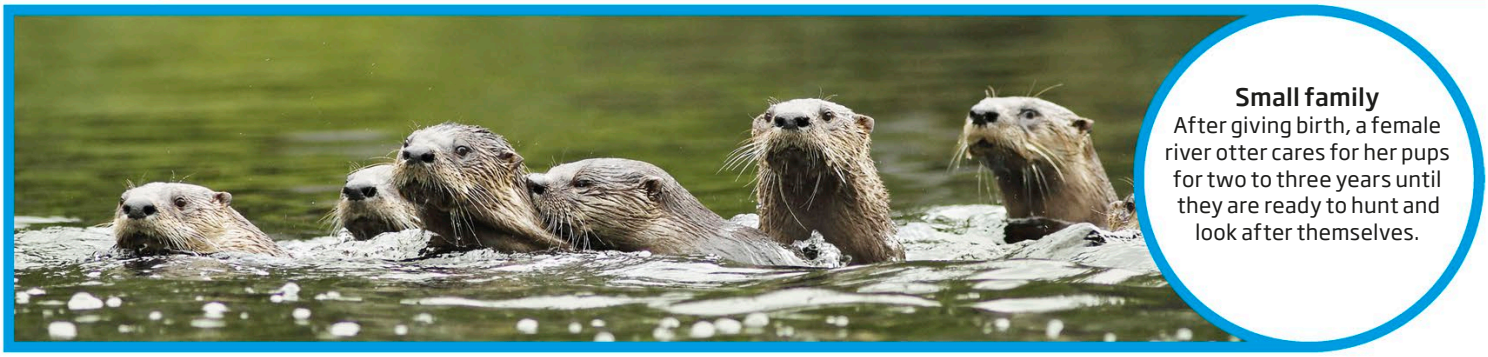
SEE ALSO

- Animal groups p.22
- Animal homes p.23
- Birds p.39
- Insects p.134
- Mammals p.154
- Homes pp.244–245

Pair
After mating, a pair of emperor penguins take turns to look after the egg and then feed the baby. They live with up to 5,000 other penguins.

Herd
Zebras move around in large groups, called herds. When young are born, the large numbers help protect them from other animals' attacks.

Colony
Ant families can be very large. The queen is the leader of the colony and lays the eggs. The other ants work to protect and feed the colony.



Small family
After giving birth, a female river otter cares for her pups for two to three years until they are ready to hunt and look after themselves.

Animal groups

Animals can be divided into groups, depending on their body features. Animals that look and act in similar ways are grouped together. This is called classification.

SEE ALSO

- Animal families p.21
- Fish p.101
- Insects p.134
- Invertebrates p.139
- Spiders p.238
- Vertebrates p.266

The green band shows which animal groups are vertebrates.

Amphibians
These animals have wet skin. They live in or near water. The young hatch from eggs, and change body shape to become adults.

Birds
Birds have feathers, which keep them warm and help most to fly. They have beaks to catch or pick up food.

Fish
Fish live in water. They are covered in bony plates, called scales, and have special organs called gills for breathing.

Mammals
Mammals have fur or hair on their bodies. They feed their babies on milk made by the mothers.

Reptiles
Reptiles have scaly skin. They are cold-blooded, which means they must warm up in the Sun before they can move.

Invertebrates
There are many groups of invertebrates, including insects, slugs, spiders, and shellfish.

Animal groups
Animals are divided into two main groups. Vertebrates have spines, invertebrates don't. There are more groups inside these two main groups.

Animal homes

Animals need homes to shelter in and to keep their young safe. Animal homes are built in many different places and in all shapes and sizes. Some animals work together to build large structures. Others move every night, making new homes as they go.

SEE ALSO

- Animal groups p.22
- Birds p.39
- Insects p.134
- Mammals p.154
- Homes pp.244–245
- Work p.274

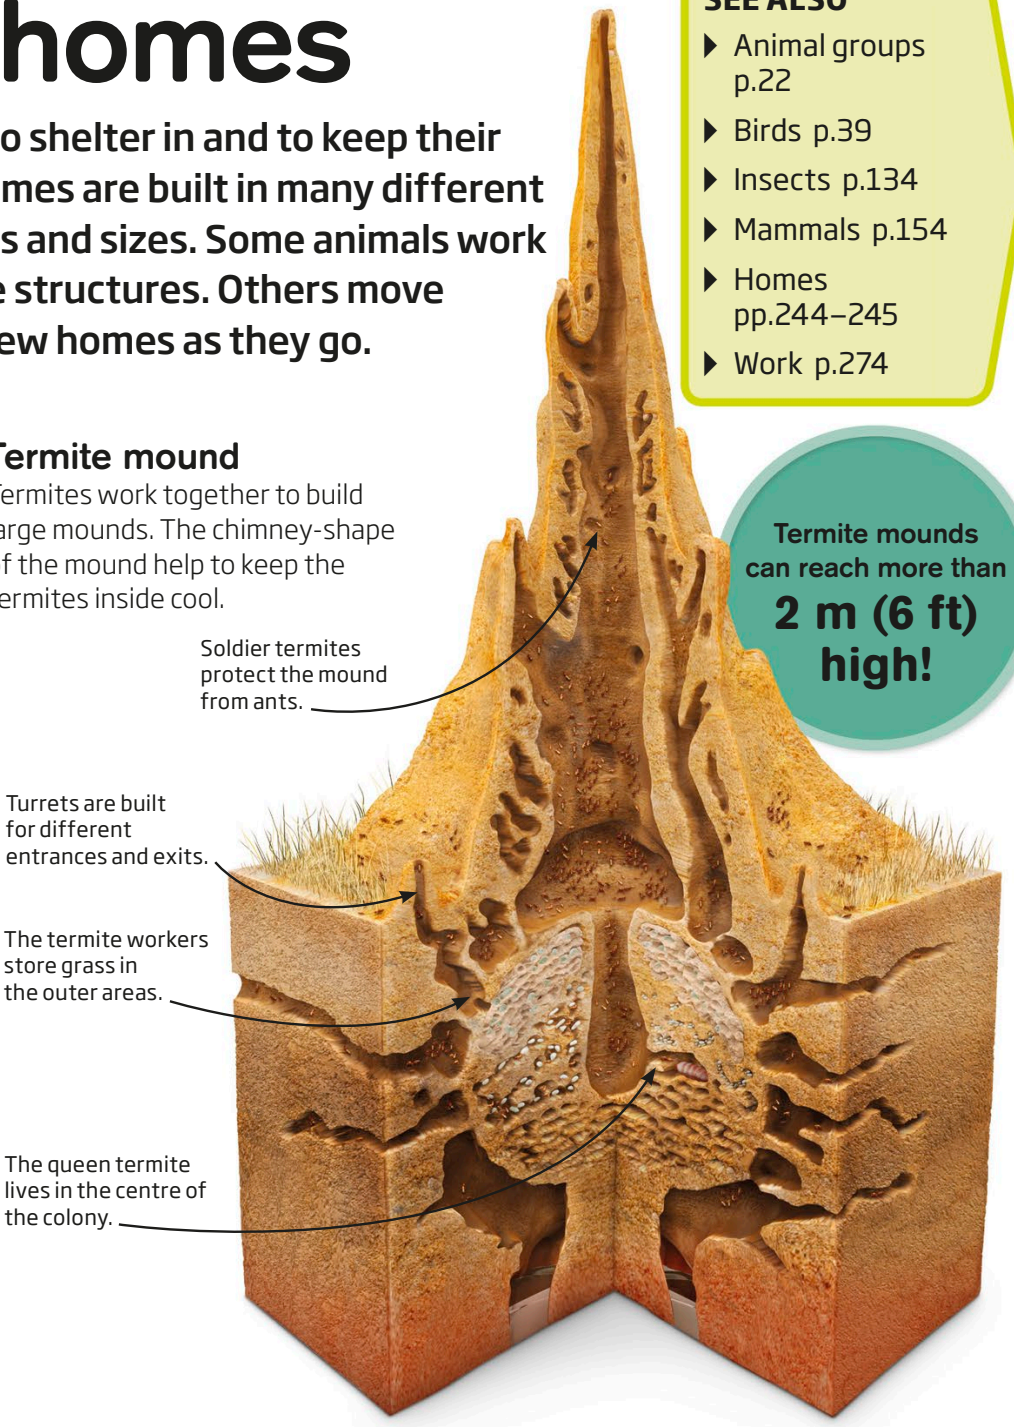
Weaver bird nest

Male weaver birds loop leaves and grass together to build up their nests. The entrance is at the bottom to stop other animals finding the way in.

Termite mound

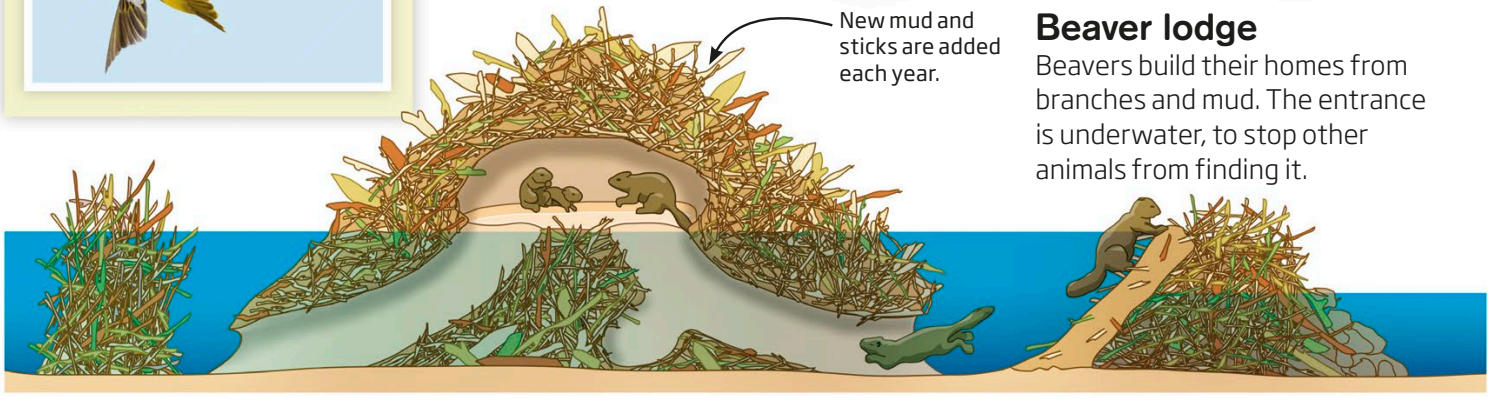
Termites work together to build large mounds. The chimney-shape of the mound help to keep the termites inside cool.

Termite mounds can reach more than 2 m (6 ft) high!



Beaver lodge

Beavers build their homes from branches and mud. The entrance is underwater, to stop other animals from finding it.



Antarctica

Antarctica is the fifth largest and most southern continent. It is very cold and windy. Most of the land is buried under huge ice sheets, which stretch far out into the sea. In winter, it can be as cold as -90°C (-130°F), and windspeeds during storms can reach an incredible 320 kph (200 mph).

SEE ALSO

- Arctic p.25
- Birds p.39
- Changing world pp.50–51
- Climate change p.60

About Antarctica

Population: 4,000

Highest point: Mount Vinson

Lowest point: Bentley Subglacial Trench

Biggest desert: The whole continent

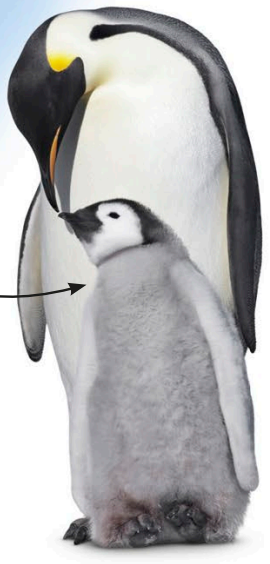
Longest river: Onyx

Race to the pole

In 1911, Norwegian explorer Roald Amundsen beat Britain's Robert Scott in the race to be the first to the South Pole. Sadly, Scott's team died on the return journey.

Amundsen used dog sledges to reach the South Pole.

Emperor penguin chicks are raised on the sea ice.



Big penguins

Emperor penguins are the largest kind of penguin. They eat fish and squid and dive as deep as 500 m (1,640 ft) when hunting for food.

Arctic

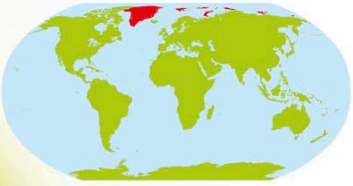
The Arctic is a cold region that surrounds the North Pole. It is mostly sea, which is frozen for much of the year, but it also includes most of Greenland and the northernmost parts of North America, Europe, and Asia.

SEE ALSO

- Antarctica p.24
- Climate change p.60
- Oceans and seas p.187
- Polar habitats p.197
- World p.275

Chilly circle

The Arctic Circle is about twice the size of the USA. The animals that live there need to be able to survive in the cold. Land animals have thick fur or fluffy feathers, and sea animals have a thick layer of fat.



Lemmings are small rodents. They eat plants and live in burrows.

The Nenets people of Arctic Russia are reindeer herders who live in tents made of reindeer skin.

About the Arctic

Population: At least 500,000 in summer, but fewer in winter

Highest point: Gunnbjørn Fjeld, Greenland

Lowest point: Arctic Ocean

Biggest desert: Arctic Polar Desert

55 million years ago, the Arctic was so hot that there was no ice, and alligators lived in the sea.

All change

Our planet is getting warmer, and the Arctic sea ice is melting. This means that ships can now travel across the Arctic between the Atlantic and Pacific oceans.

Polar bears

Polar bears live in the Arctic and roam the sea ice, hunting seals. The bears are at risk from climate change because the sea ice is melting. This makes it harder for the bears to find seals to eat.

Colour

Our world is full of beautiful colours. The colours we see around us are actually different types of light bouncing off objects and into our eyes. Colours also have meanings. For example, a red light means "stop" in traffic, and a white flag means "surrender" in war.

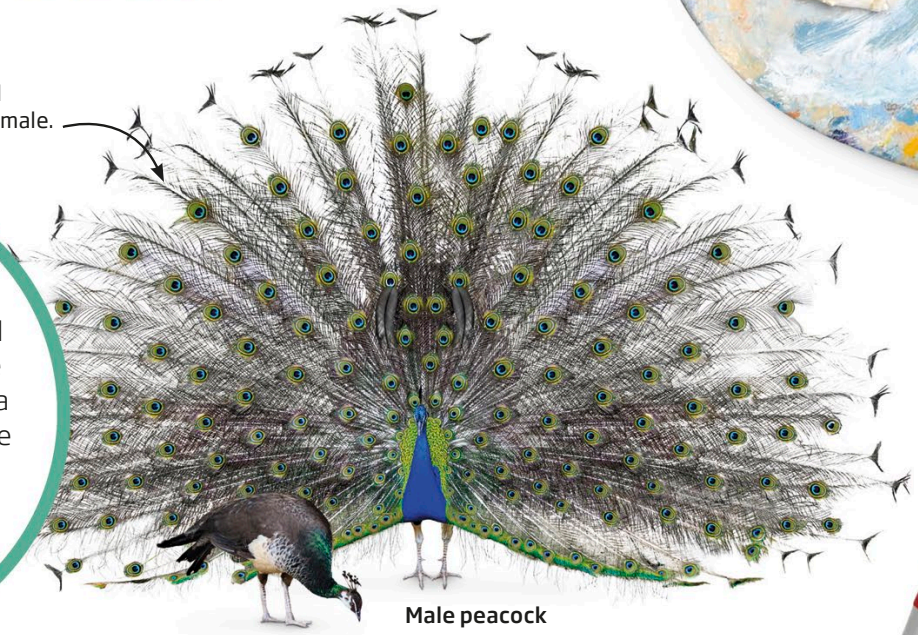
Paint

Artists make paint by mixing something called a pigment with water. A pigment is a material that changes the colour of reflected light by taking in some colours and reflecting back other colours.

Artists mix paint on a palette.

Rainbow colours

White light is made from all the colours of the rainbow – red, orange, yellow, green, blue, indigo, and violet. When white light from the Sun passes through rain, it can refract (split) to make a rainbow.



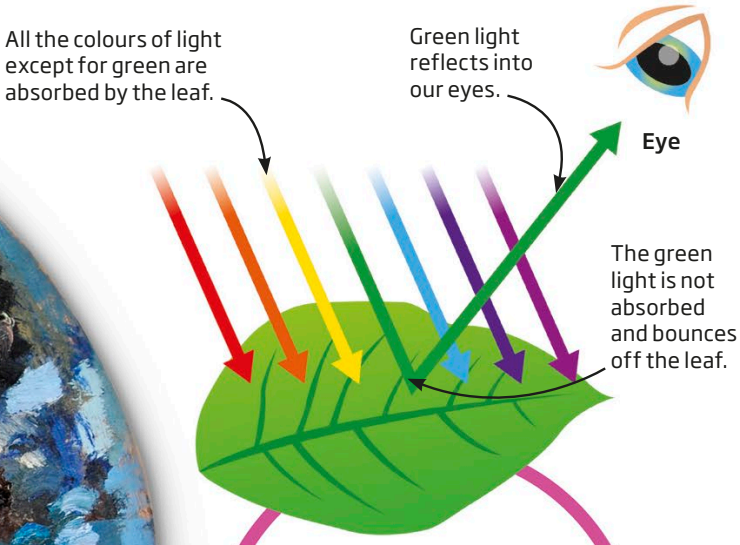
The male peacock is brightly coloured compared to the female.

Male peacock

Female peacock

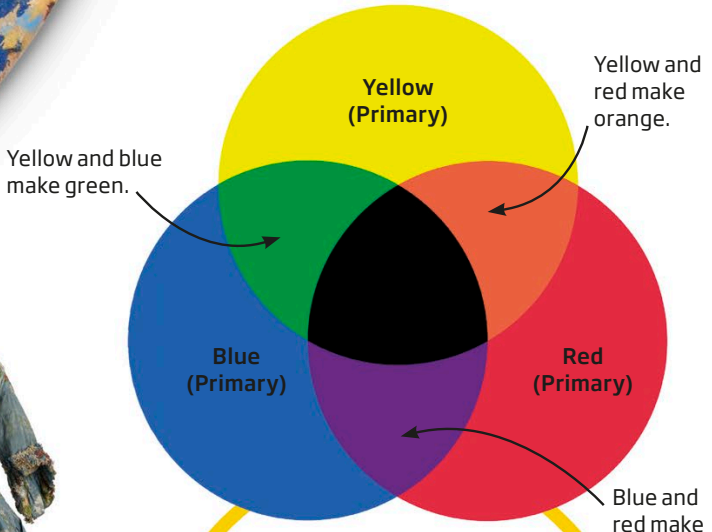
Animal colours

Male birds are often colourful to attract female birds. Some animals use bright colours as a warning, and some can change colour. Others use their colouring to blend in with their surroundings.



Reflecting colours

A plant looks green because green light reflects off it into our eyes. The other colours of light from the Sun are absorbed by the plant's leaves.



Mixing colours

Primary paint colours can be mixed to make secondary colours. The primary colours are red, yellow, and blue. Secondary colours can also be mixed to make new colours – for example, mixing orange and green makes brown.

Silk dress from 1750

Fashion

All around the world, different styles and colours are used in clothing to help people express themselves. Fashion changes over time. Clothes are very different now from those worn 250 years ago.

Art

When you create a picture or sculpture, you are making art. Art can show something from real life or the imagination, and is made of different materials. Throughout history, people have drawn or painted pictures of the world around them. Art helps us show our feelings about the world and creates beautiful objects to look at.

SEE ALSO

- Ancient Rome p.20
- Colour pp.26–27
- Buildings p.48
- Crafts p.75
- Photography p.190
- Stone Age p.243

Painting

Painters use an object such as a brush loaded with coloured paint to create an image on paper, board, or canvas. Paintings can be detailed or simply show lines and shapes.

Stone Age handprints at Cueva de las Manos

Cave painting
The first paintings were made on cave walls around 40,000 years ago. They showed handprints, people, and animals.

***Bedroom in Arles* by Vincent van Gogh, 1888**

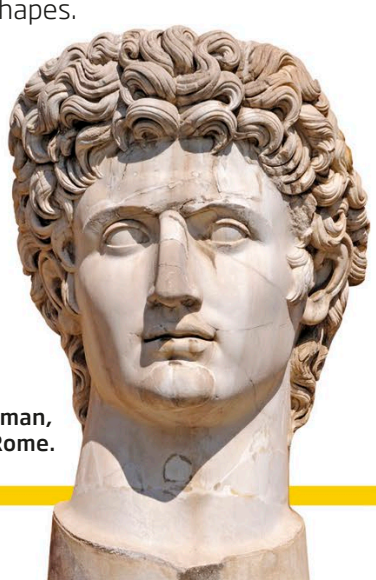
Lifelike painting
Many paintings show lifelike images from the world. This could be an indoor or an outdoor view, a person, or an object.

***Landscape at Ceret* by Juan Gris, 1911**

Abstract painting
Abstract art uses colours and shapes to show amazing pictures that aren't lifelike, but could show something real.

Sculpture

Sculptors work in clay, wood, stone, metal, or other materials to create objects. These might show people or abstract shapes.



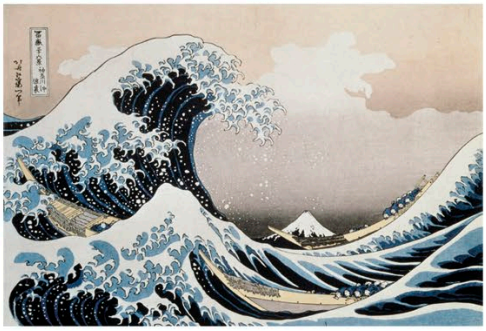
Sculpture of a man, from ancient Rome.

***Dancer Adjusting her Shoe* by Degas, c.1890**

Drawing

Artists use pencils, coloured crayons, chalk, charcoal, and ink to draw beautiful images on paper. Drawing is quicker than painting, so it is a good way of recording real-life scenes.

***The Great Wave* by Hokusai, c.1831**



Printing

Pictures can be cut out of a material such as wood and covered in ink or paint. The ink or paint on the cut-out picture is then transferred onto paper, to create a print.

Asia

The biggest continent on Earth is Asia. More than 60 per cent of the world's population live here. Asia has many landscapes, from snow-capped mountains and sun-scorched deserts to lush rainforests and sandy beaches.

SEE ALSO

- Ancient China p.16
- Ancient India p.19
- Buildings p.48
- Mammals p.154
- Maps p.155
- World p.275

India and **China** are both home to more than **one billion people**.

Much of northern Asia has a rocky landscape, with few people living in it.

About Asia

Population: 4.427 billion

Highest point: Mount Everest

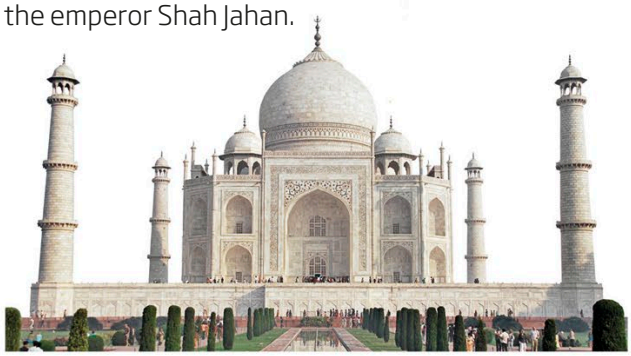
Lowest point: Dead Sea, Israel

Biggest desert: Arabian Desert

Longest river: Yangtze, China

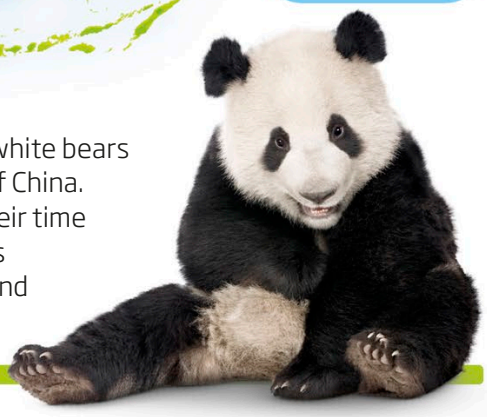
Taj Mahal

India's most famous building is the Taj Mahal. It is made of white marble and was completed in 1648. The Taj Mahal is the burial place of Mumtaz Mahal, wife of the emperor Shah Jahan.



Pandas

These rare black-and-white bears live in the mountains of China. They spend most of their time eating bamboo. Pandas are a symbol of peace and friendship in China.



Asteroids

Asteroids are rocky or metallic objects that travel around the Sun. They formed at the same time as the planets. Most asteroids are covered in craters, or dents, from where they have smashed into each other.

SEE ALSO

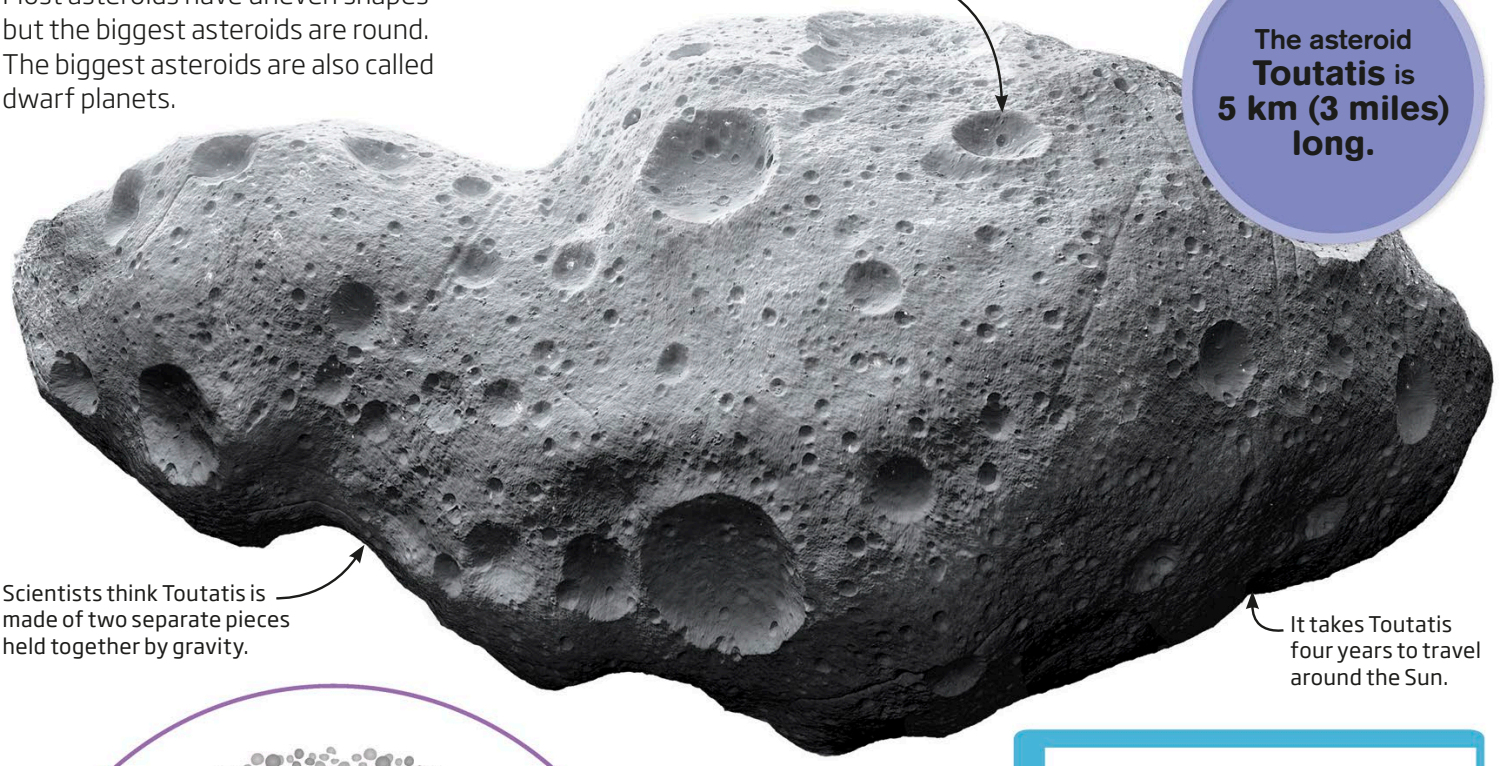
- Gravity p.125
- Metals p.162
- Meteorites p.164
- Rocks and minerals p.214
- Solar System p.233

Asteroid shapes

Most asteroids have uneven shapes but the biggest asteroids are round. The biggest asteroids are also called dwarf planets.

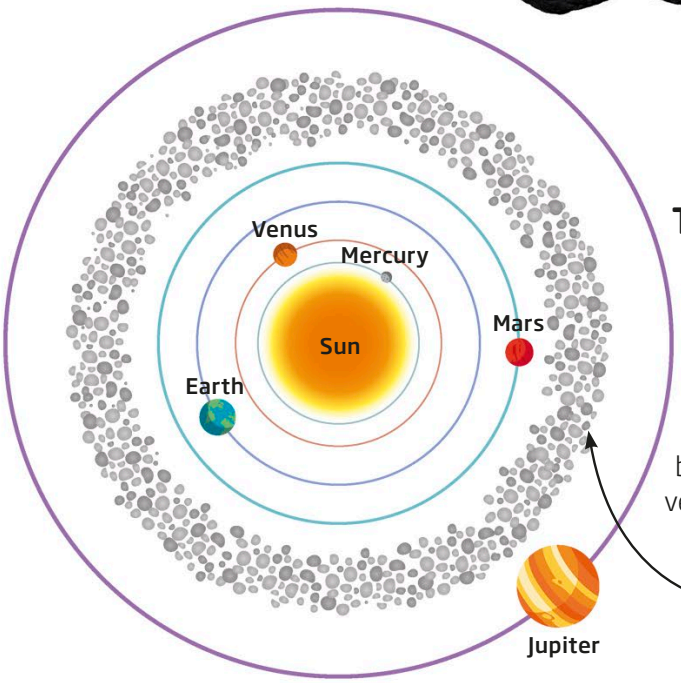
The craters on an asteroid's surface are made by bumping into smaller asteroids.

The asteroid Toutatis is 5 km (3 miles) long.



Scientists think Toutatis is made of two separate pieces held together by gravity.

It takes Toutatis four years to travel around the Sun.



The main belt

Most asteroids travel around the Sun in the "main belt" between Mars and Jupiter. There are millions of asteroids in this belt, but they are very far apart.

Asteroid mining

Scientists think that in the future people will mine asteroids for their metals, minerals, and water. Spaceships may stop off on asteroids as they travel out into the Solar System.

Astronauts

Astronauts are people who are specially trained to take part in missions in space. They help us learn more about the Universe we live in. Fewer than 600 people have been into space, and only 12 have walked on the Moon.

SEE ALSO

- Explorers p.96
- Moon p.171
- Exploration pp.180–181
- Solar System p.233
- Space travel p.237
- Universe p.263

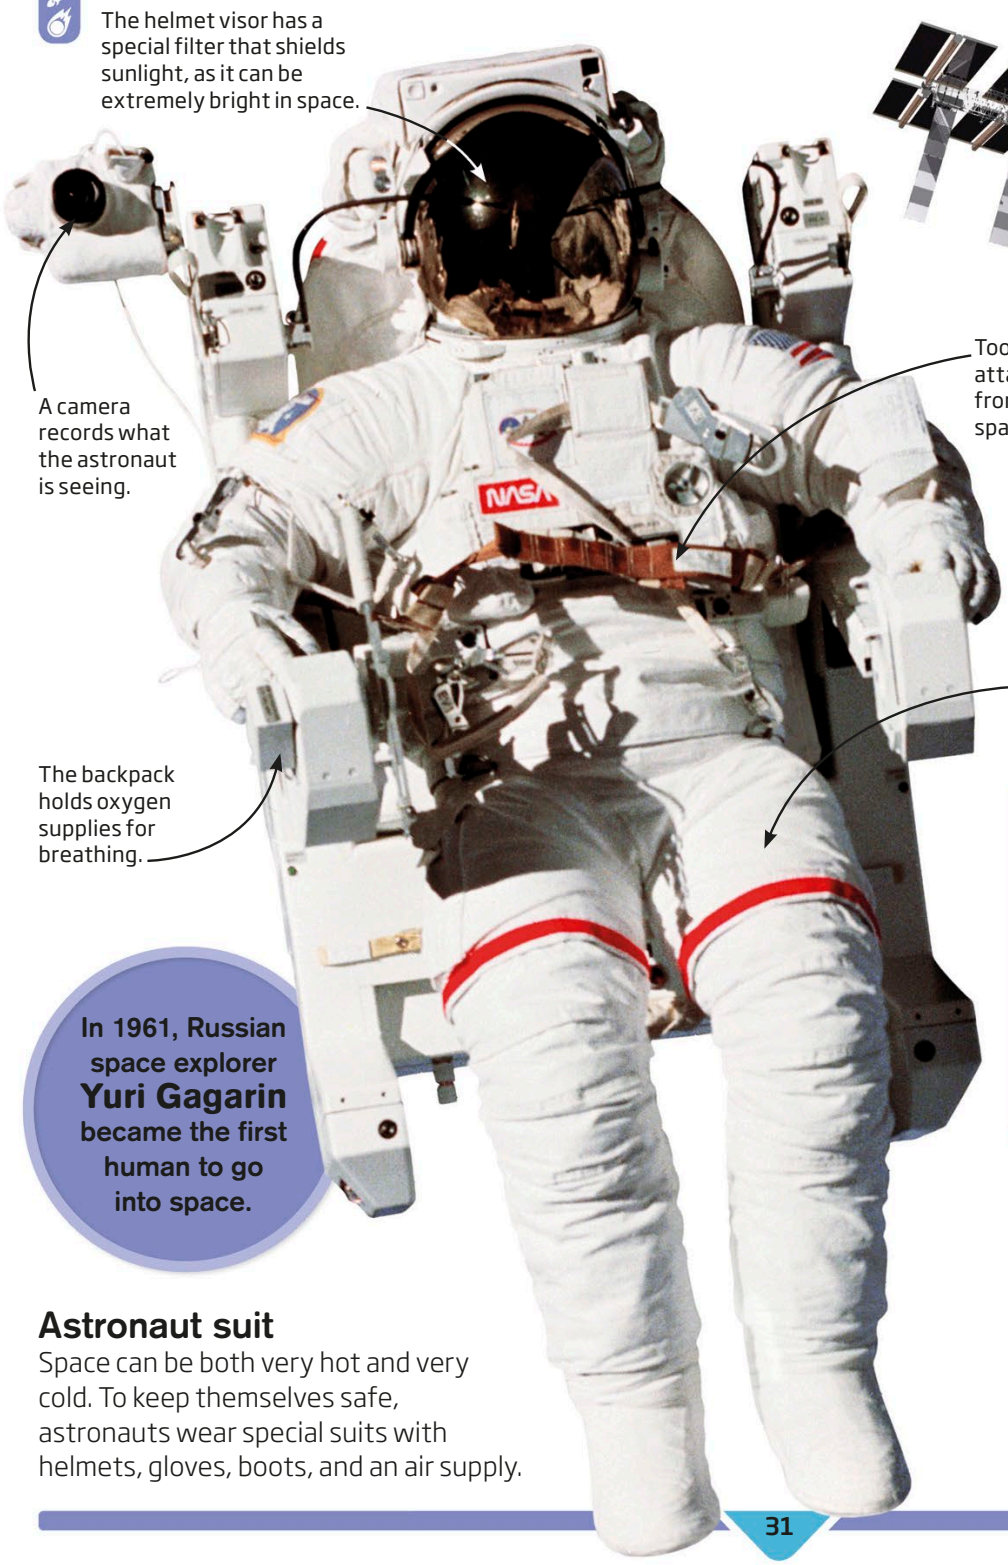
The helmet visor has a special filter that shields sunlight, as it can be extremely bright in space.

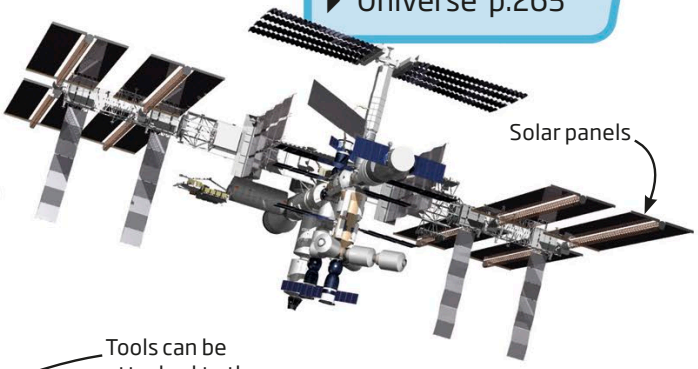
A camera records what the astronaut is seeing.

Tools can be attached to the front of the spacesuit.

The suit is made of many layers of fabric that keep the astronaut safe and warm.

The backpack holds oxygen supplies for breathing.





Solar panels

The International Space Station

The International Space Station is a permanent base for astronauts. The station is 400 km (250 miles) above the Earth. It can house six astronauts at a time.

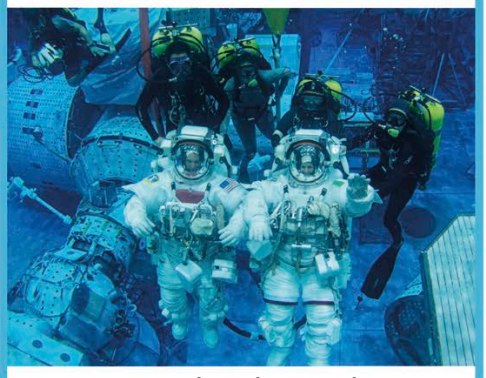
In 1961, Russian space explorer Yuri Gagarin became the first human to go into space.

Astronaut suit

Space can be both very hot and very cold. To keep themselves safe, astronauts wear special suits with helmets, gloves, boots, and an air supply.

Becoming an astronaut

It takes many years of work to become an astronaut. Astronauts have to learn many new skills. They also train hard to make sure they are fit and healthy.



Astronauts train underwater because they float weightlessly, like in space.

Astronomy

Astronomy is the science of studying space. The first astronomers looked at the night sky with just their eyes. Modern astronomers use binoculars and telescopes to look at things too far away to be seen with the naked eye. They look at space to learn about our planet and the Universe around it.

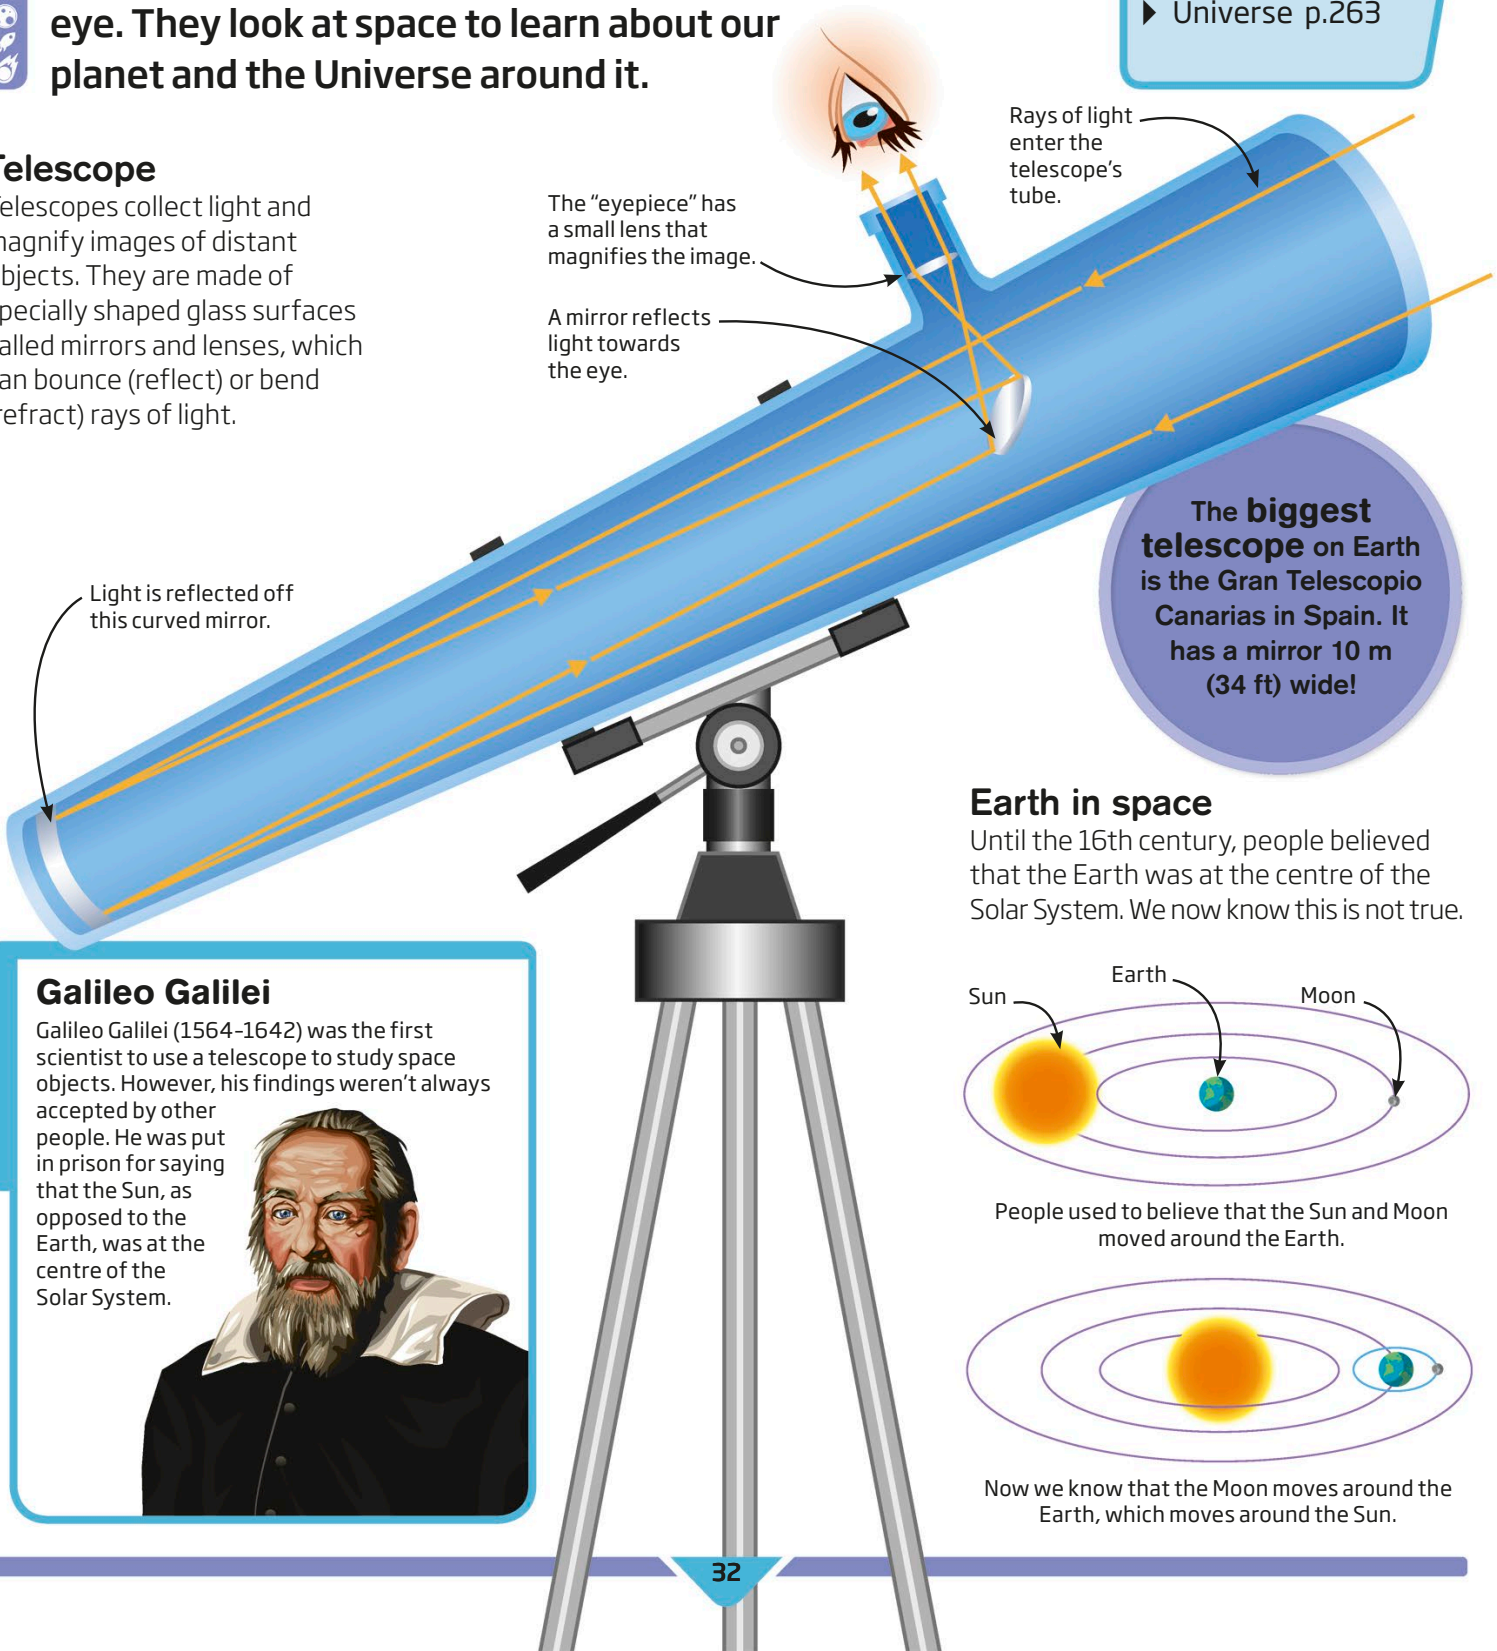
- Sun p.247
- Universe p.263

Telescope

Telescopes collect light and magnify images of distant objects. They are made of specially shaped glass surfaces called mirrors and lenses, which can bounce (reflect) or bend (refract) rays of light.



The biggest telescope on Earth is the Gran Telescopio Canarias in Spain. It has a mirror 10 m (34 ft) wide!

Galileo Galilei

Galileo Galilei (1564–1642) was the first scientist to use a telescope to study space objects. However, his findings weren't always accepted by other people. He was put in prison for saying that the Sun, as opposed to the Earth, was at the centre of the Solar System.

Earth in space

Until the 16th century, people believed that the Earth was at the centre of the Solar System. We now know this is not true.

People used to believe that the Sun and Moon moved around the Earth.

Now we know that the Moon moves around the Earth, which moves around the Sun.

Atmosphere

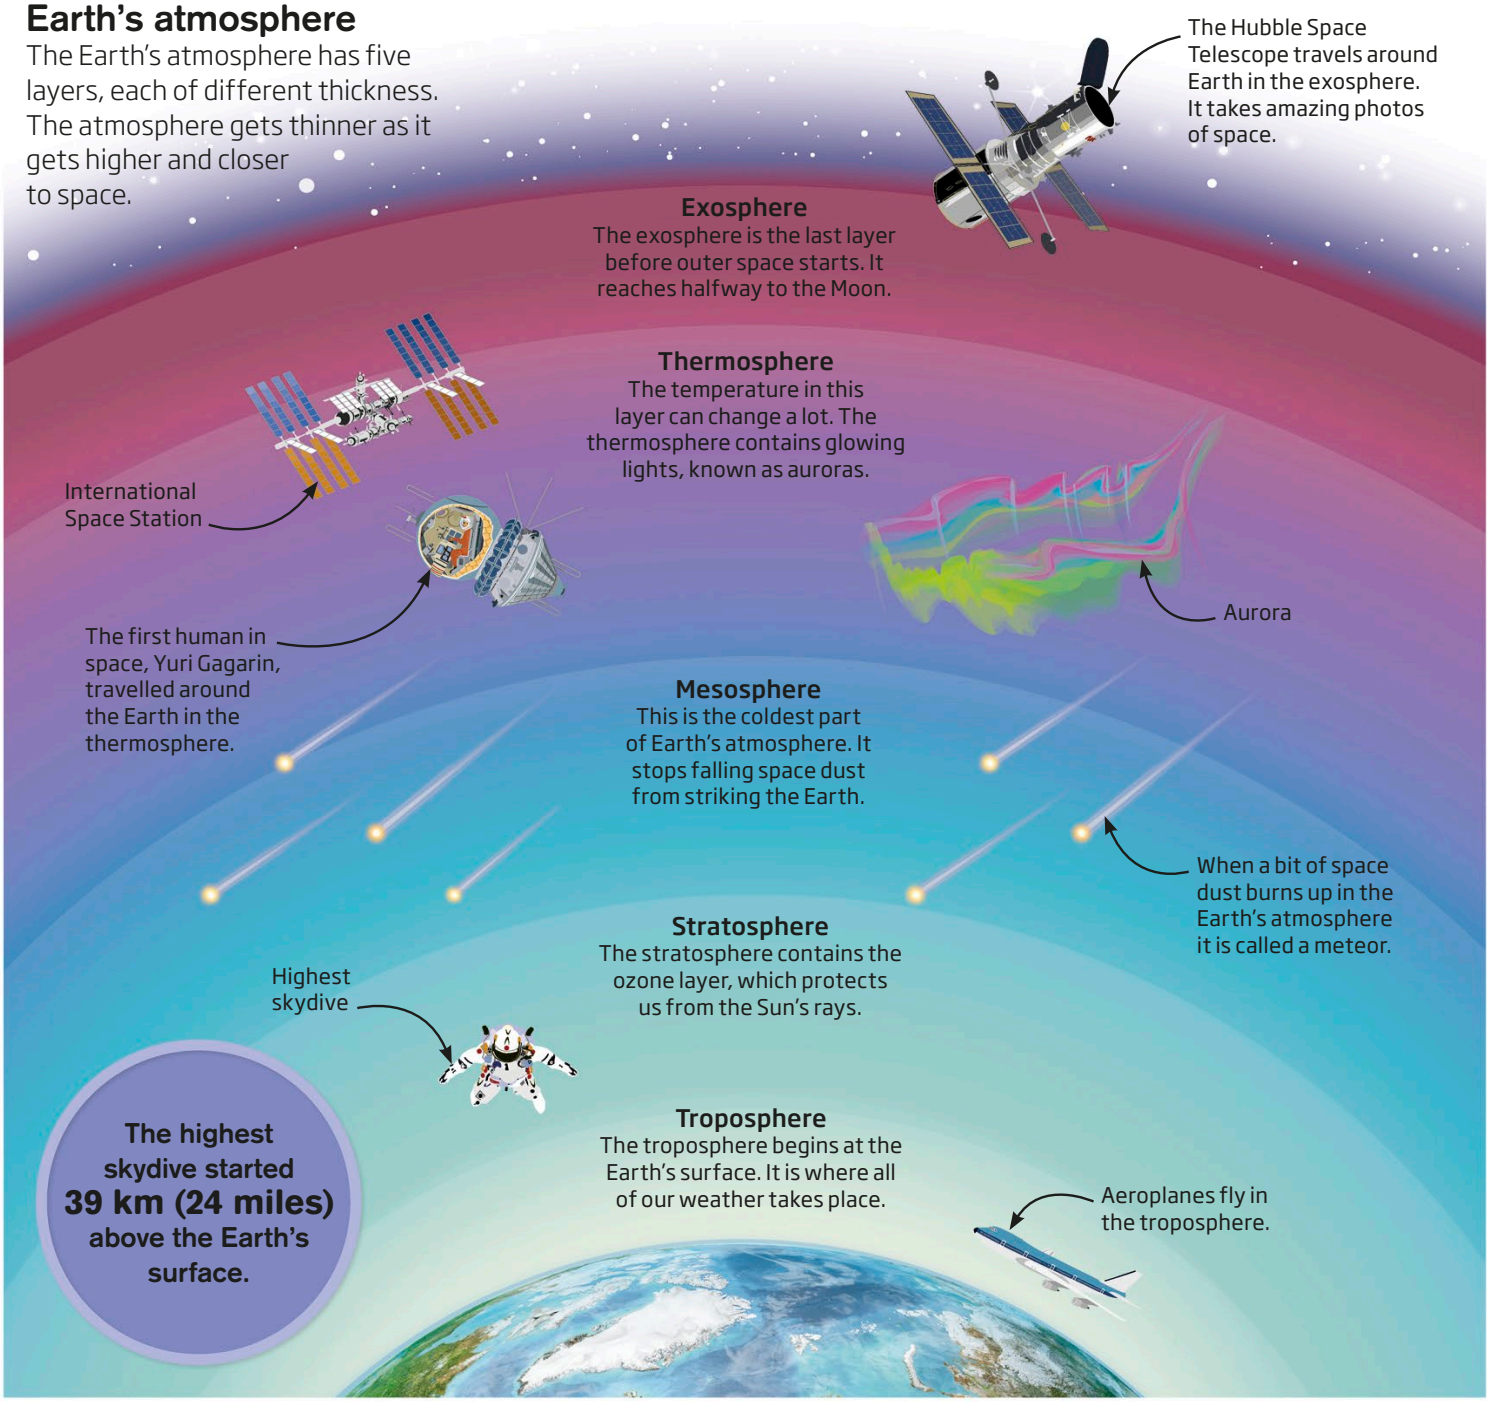
An atmosphere is a blanket layer of gases that surrounds a planet or moon. The Earth's atmosphere gives us the air we breathe. It also keeps our planet warm, blocks harmful rays from the Sun, and stops space rocks from hitting us.

SEE ALSO

- Atoms p.34
- Earth p.83
- Gases p.117
- Meteorites p.164
- Sun p.247
- Temperature p.252
- Weather p.271

Earth's atmosphere

The Earth's atmosphere has five layers, each of different thickness. The atmosphere gets thinner as it gets higher and closer to space.



The highest skydive started 39 km (24 miles) above the Earth's surface.

Atoms

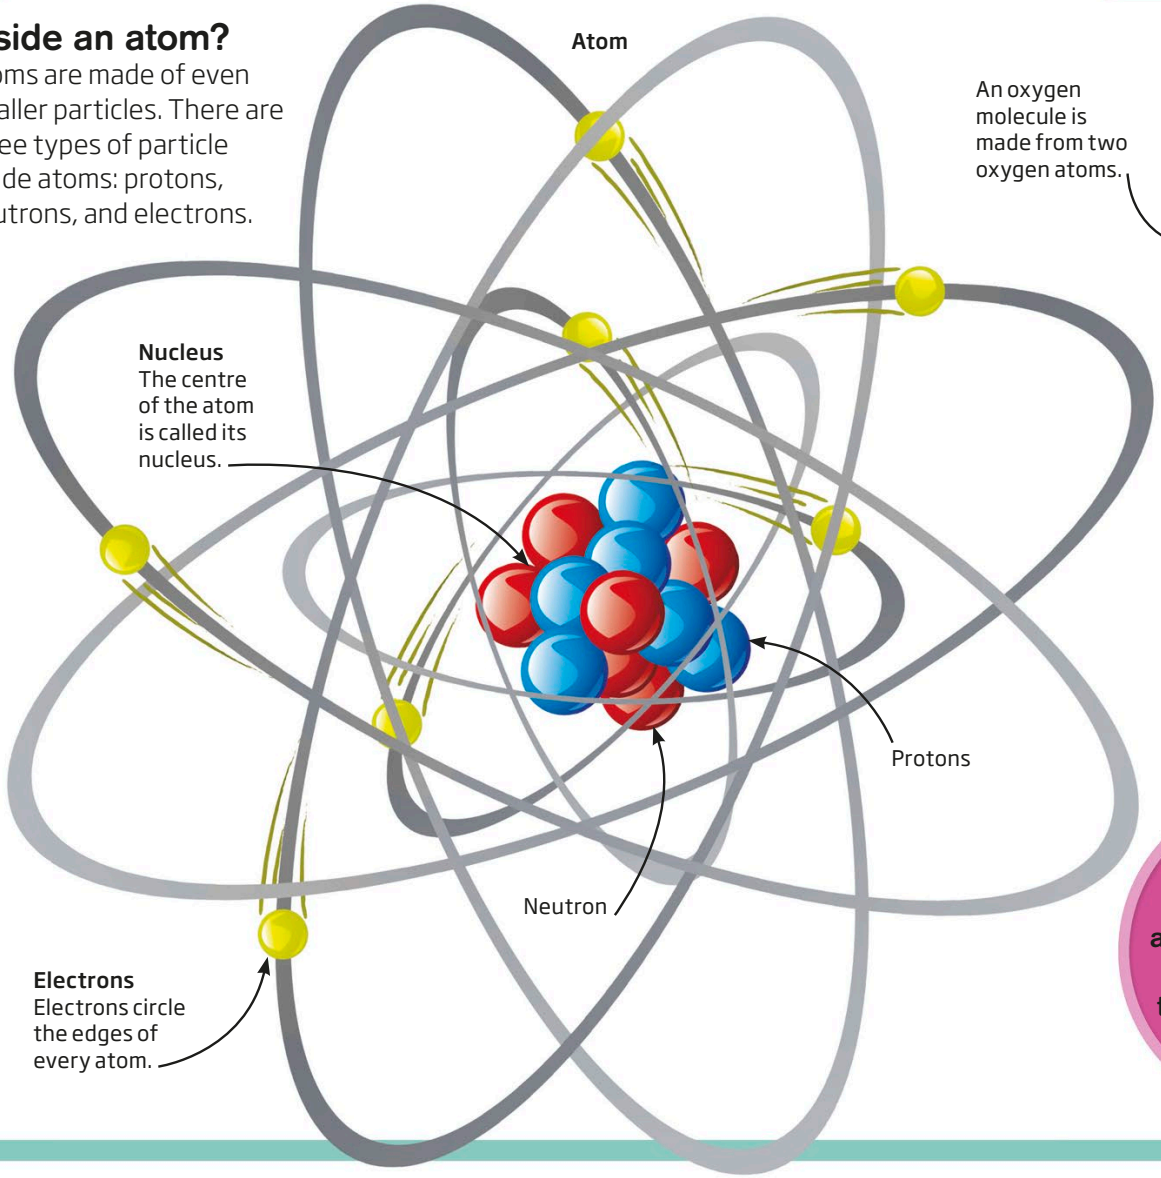
Atoms are tiny, round building blocks that build everything in the Universe. They are so small we can't see them and are mostly made of empty space. Humans, cars, stars, and everything else around us are all made from tiny atoms.

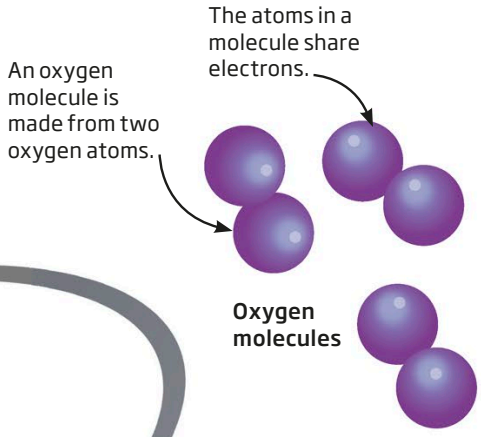
SEE ALSO

- Carbon cycle p.49
- Changing states p.57
- Chemistry p.58
- Elements p.90
- Solar System p.233

Inside an atom?

Atoms are made of even smaller particles. There are three types of particle inside atoms: protons, neutrons, and electrons.





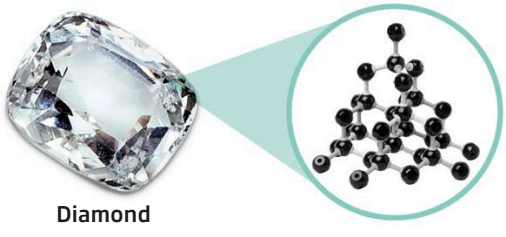
Molecules

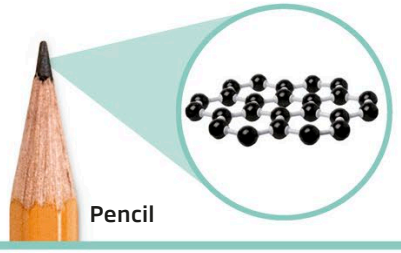
Two or more atoms stuck together are called a molecule. Molecules can be long chains of atoms, or arranged in shapes.

There are 7 billion atoms in a full stop – that's more than there are people on planet Earth.

Carbon atoms

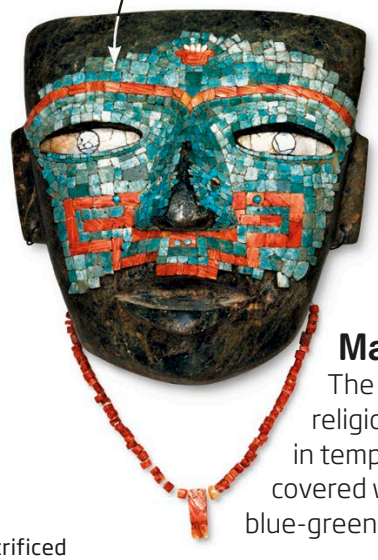
Carbon joins with other atoms in molecules to form all living things. Carbon atoms can be arranged in different ways to make different materials.





Aztecs

The Aztecs were a people who lived in Central America. They had a huge empire between 1400 and 1519 CE, during which time they built great stone cities. Farmers produced maize and avocados, and bred turkeys.



Mask

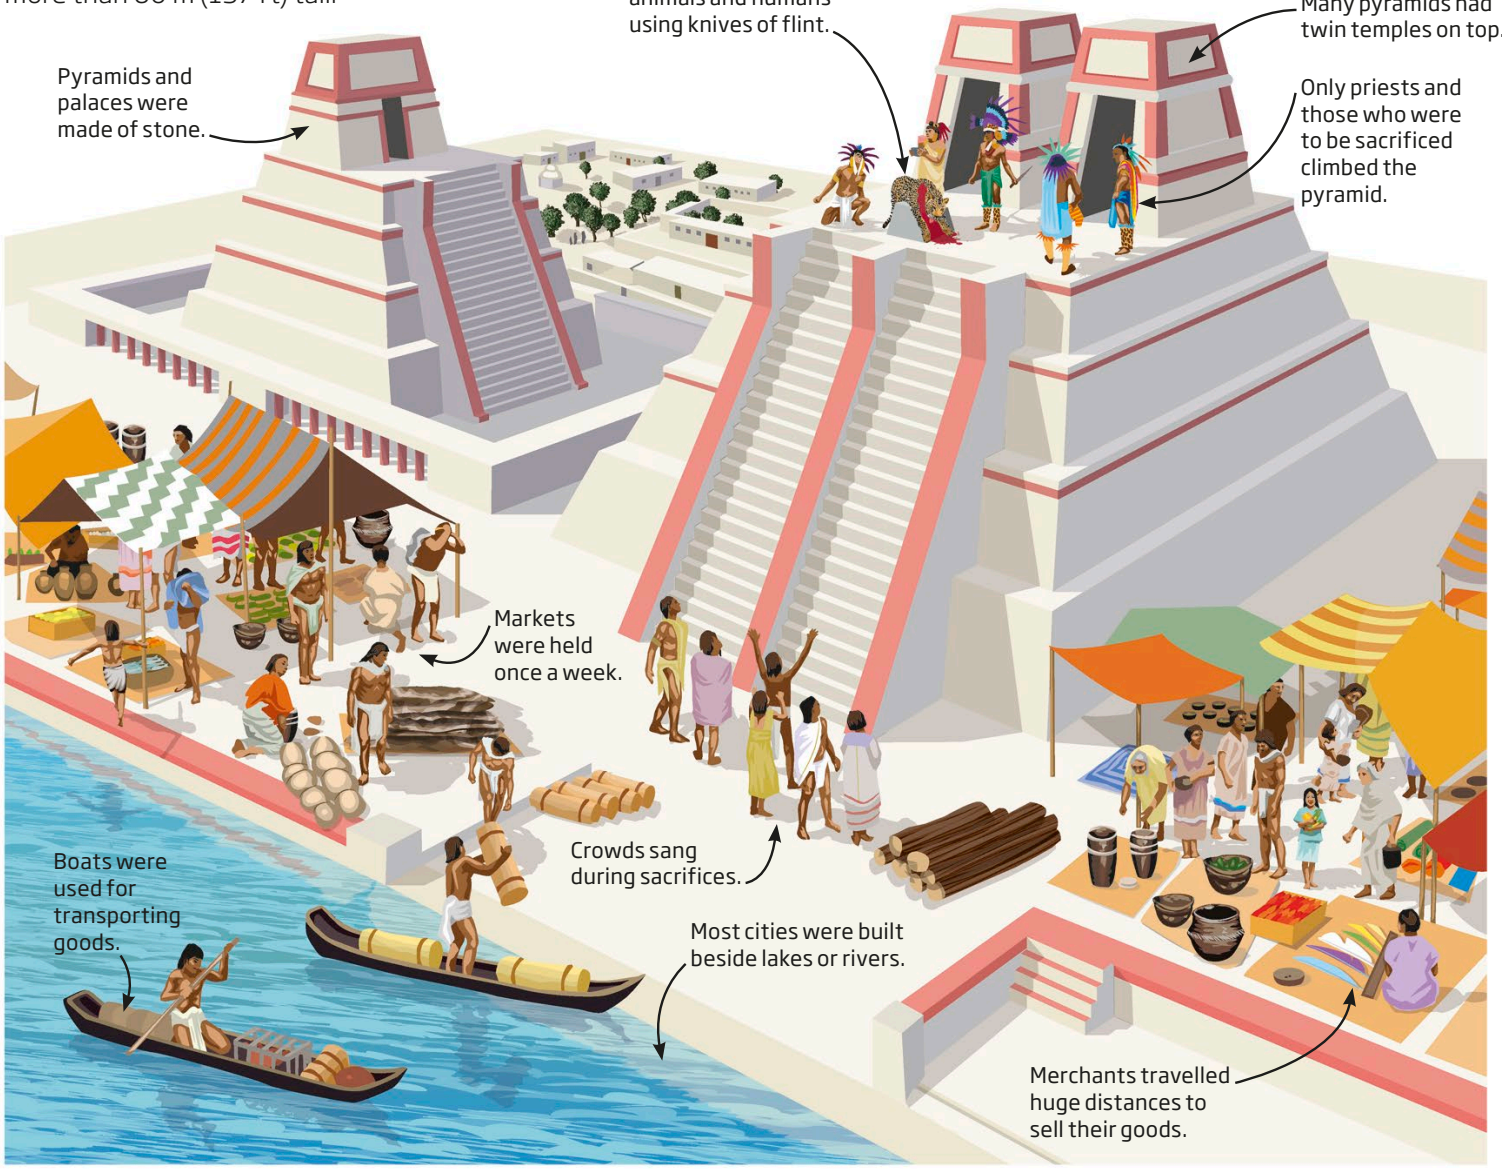
The Aztecs used masks in religious ceremonies or to display in temples. This wooden mask is covered with pieces of a precious blue-green stone called turquoise.

SEE ALSO

- Buildings p.48
- Crafts p.75
- Farming p.98
- Incas p.132
- Maya p.158
- Religion p.208

Aztec city

At the centre of each city stood a group of temples. Most temples were set on top of enormous stepped pyramids that could be more than 60 m (197 ft) tall.



Bicycles

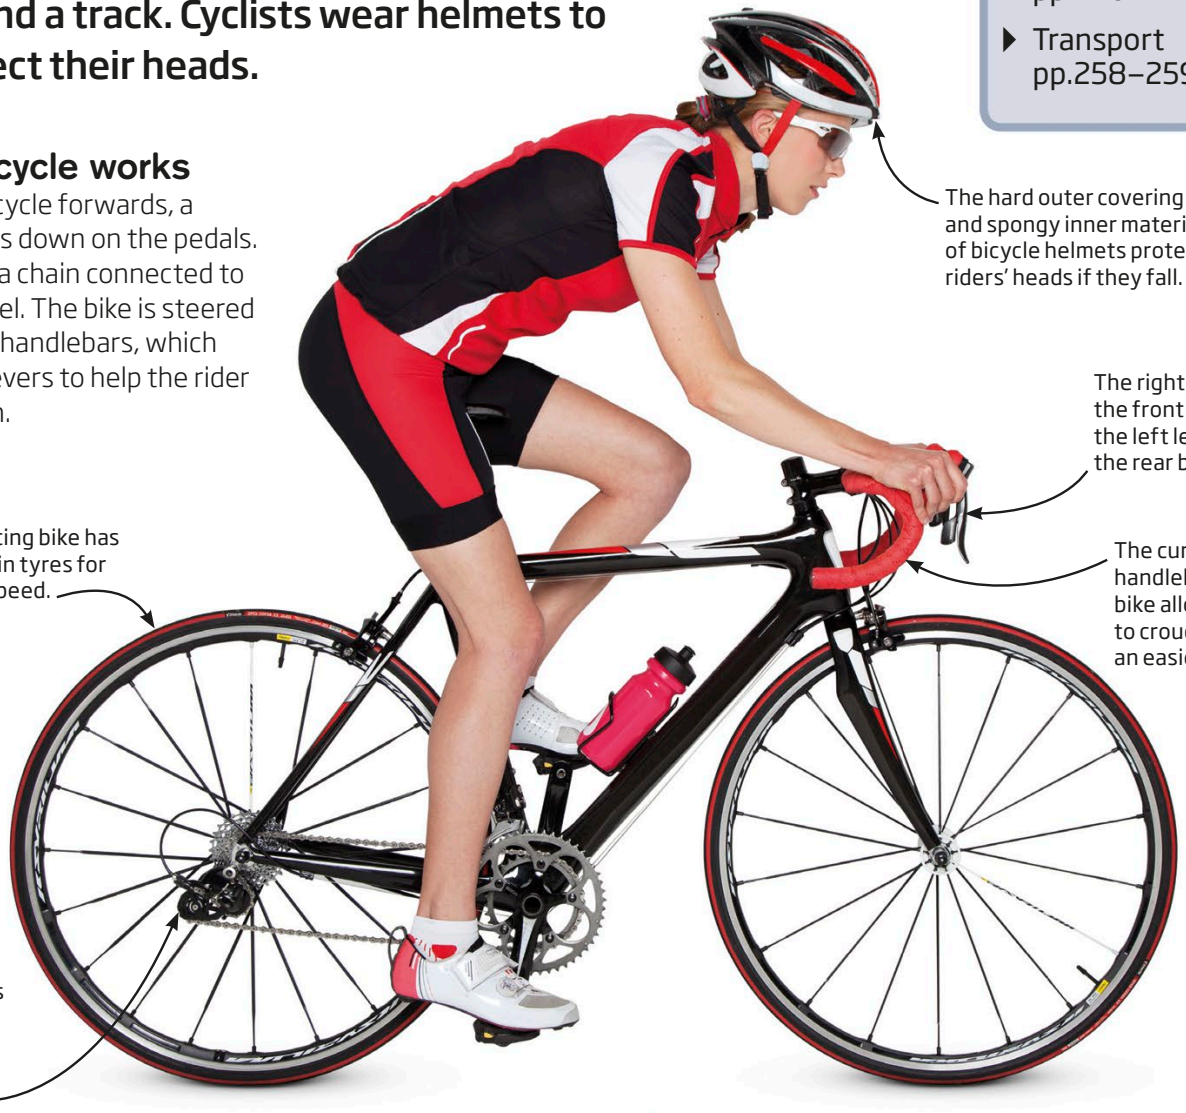
A bicycle is a two-wheeled vehicle. There are many types of bicycle. Some are for cycling on the road, others for riding up and down mountains, and others for racing around a track. Cyclists wear helmets to protect their heads.

SEE ALSO

- Inventions pp.136–137
- Metals p.162
- Sport p.239
- Games pp.240–241
- Transport pp.258–259

How a bicycle works

To move a bicycle forwards, a cyclist pushes down on the pedals. These move a chain connected to the rear wheel. The bike is steered with a set of handlebars, which have brake levers to help the rider to slow down.



The hard outer covering and spongy inner material of bicycle helmets protect riders' heads if they fall.

The right lever applies the front brake, while the left lever applies the rear brake.

This racing bike has very thin tyres for extra speed.

The curved handlebars on this bike allow the rider to crouch down for an easier ride.

The derailleur is a part of the bike that moves the chain to a different cog for going up or down hills.

Traditional spoked wheel

Carbon-fibre racing wheel

Bicycle wheels

Most bicycle wheels have traditional spokes (wire rods) that join the hub at the centre of the wheel to the rim at the edge. Racing wheels have just a few large spokes.

Cycle racing

In the fastest type of bike racing, riders compete on bicycles without brakes or gears. They ride on sloped tracks in arenas called velodromes. Other types of race take place on mountain tracks and on roads. The most famous of these races is the 3,500 km (2,175 mile) Tour de France.

Big Bang

Scientists believe that the Universe began in a dramatic event called the Big Bang, 13.8 billion years ago. The universe was tiny at the start, but it has been expanding ever since.

SEE ALSO

- Atoms p.34
- Elements p.90
- Gases p.117
- Light p.147
- Solar System p.233
- Universe p.263
- Volume p.269

1. The Big Bang
The Universe was tiny and very hot. It started to grow.

2. Atoms
After 380,000 years, tiny particles formed, called atoms.

3. First stars and galaxies
The first stars and clusters of stars, called galaxies, appeared 100 to 200 million years after the Big Bang.

4. Our Solar System
The Sun and the rest of the Solar System formed nine billion years after the Big Bang.

5. Today's Universe
The Universe is still expanding. Scientists study this stretching of space by measuring how fast other galaxies are moving away from us.

Creation

The Universe started as a tiny point of pure energy. It then began to quickly expand and cool down. Over time it got bigger and bigger.

Scientists think the first stars were probably very big and very bright.

Most scientists think our Universe will keep expanding forever.

The space between galaxies keeps expanding.

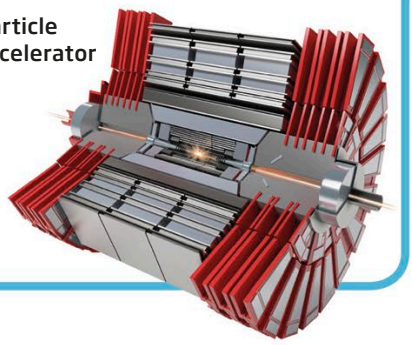
The Universe may keep expanding forever.

Light from distant galaxies travels for billions of years before it reaches Earth.

Re-creating the Big Bang

Scientists try to create the conditions of the Big Bang in huge machines called accelerators, which smash tiny particles together.

Particle accelerator

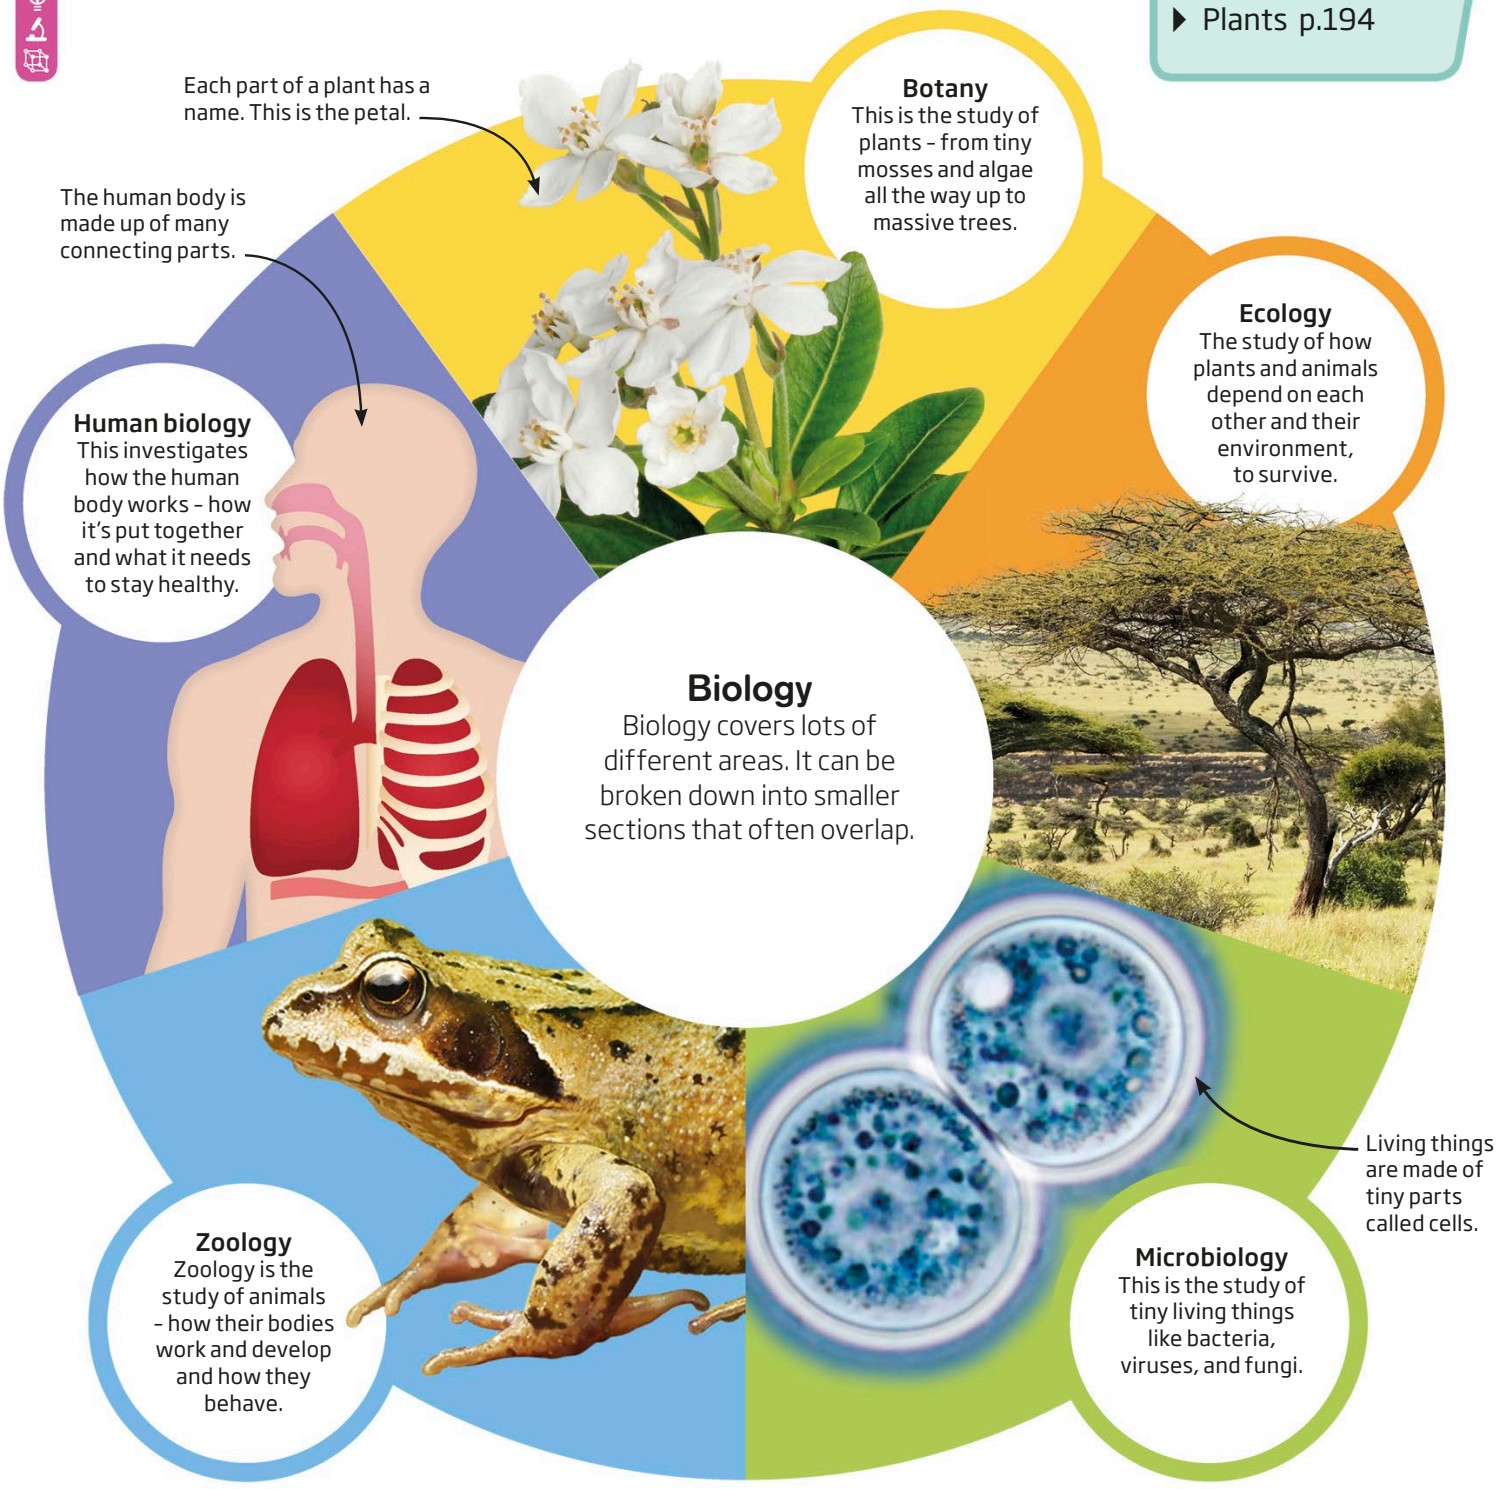


Biology

Biology is the science of living things. It studies how plants and animals interact with each other and their surroundings. It includes grouping and labelling living things and investigating how they live.

SEE ALSO

- Cells p.56
- Evolution p.95
- Food p.106
- Food chains p.107
- Habitats p.126
- Human body p.130
- Plants p.194



Birds

Birds are animals that have feathers and beaks. They lay hard eggs, which their chicks hatch out of. Most birds can fly, and they are found all over the world.

SEE ALSO

- Aircraft p.13
- Animal groups p.22
- Dinosaurs p.80
- Eggs p.86
- Fruit and seeds p.115
- Rainforest p.204

Brightly coloured feathers stand out among the trees.

Hooked beak for picking food.

Macaw

Parrots

These tropical birds are colourful and often very noisy. They are strong fliers and eat fruit, nuts, and seeds.

Strong claws to move along branches.

Long tail feathers help with steering.

Short beak to pick up nuts and seeds.

Yellow warbler

Songbirds

Most birds in the world are part of a huge family called songbirds. Each type of songbird has its own special song.

Curved beak tears food.

Large wings help to fly high.

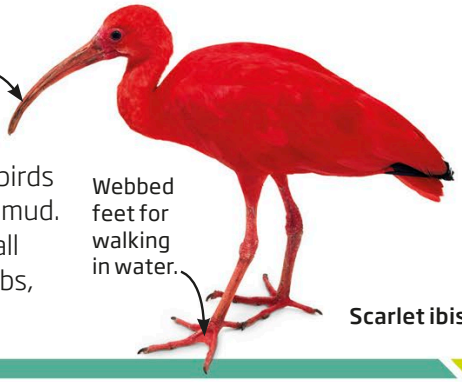
Bald eagle

Birds of prey

Birds of prey hunt for their food. They have sharp beaks, fly fast, and grab food, such as fish, with their feet.

There are almost 10,000 different kinds of birds.

Long, curved bill used to find food.



Webbed feet for walking in water.

Scarlet ibis

Wading birds

These long-legged birds wade around in the mud. They search for small animals, such as crabs, in the water to eat.

Swimming birds

Not all birds can fly. Penguins swim underwater instead. Their feathers are waterproof and they use their wings to steer.

Emperor penguin

Black holes

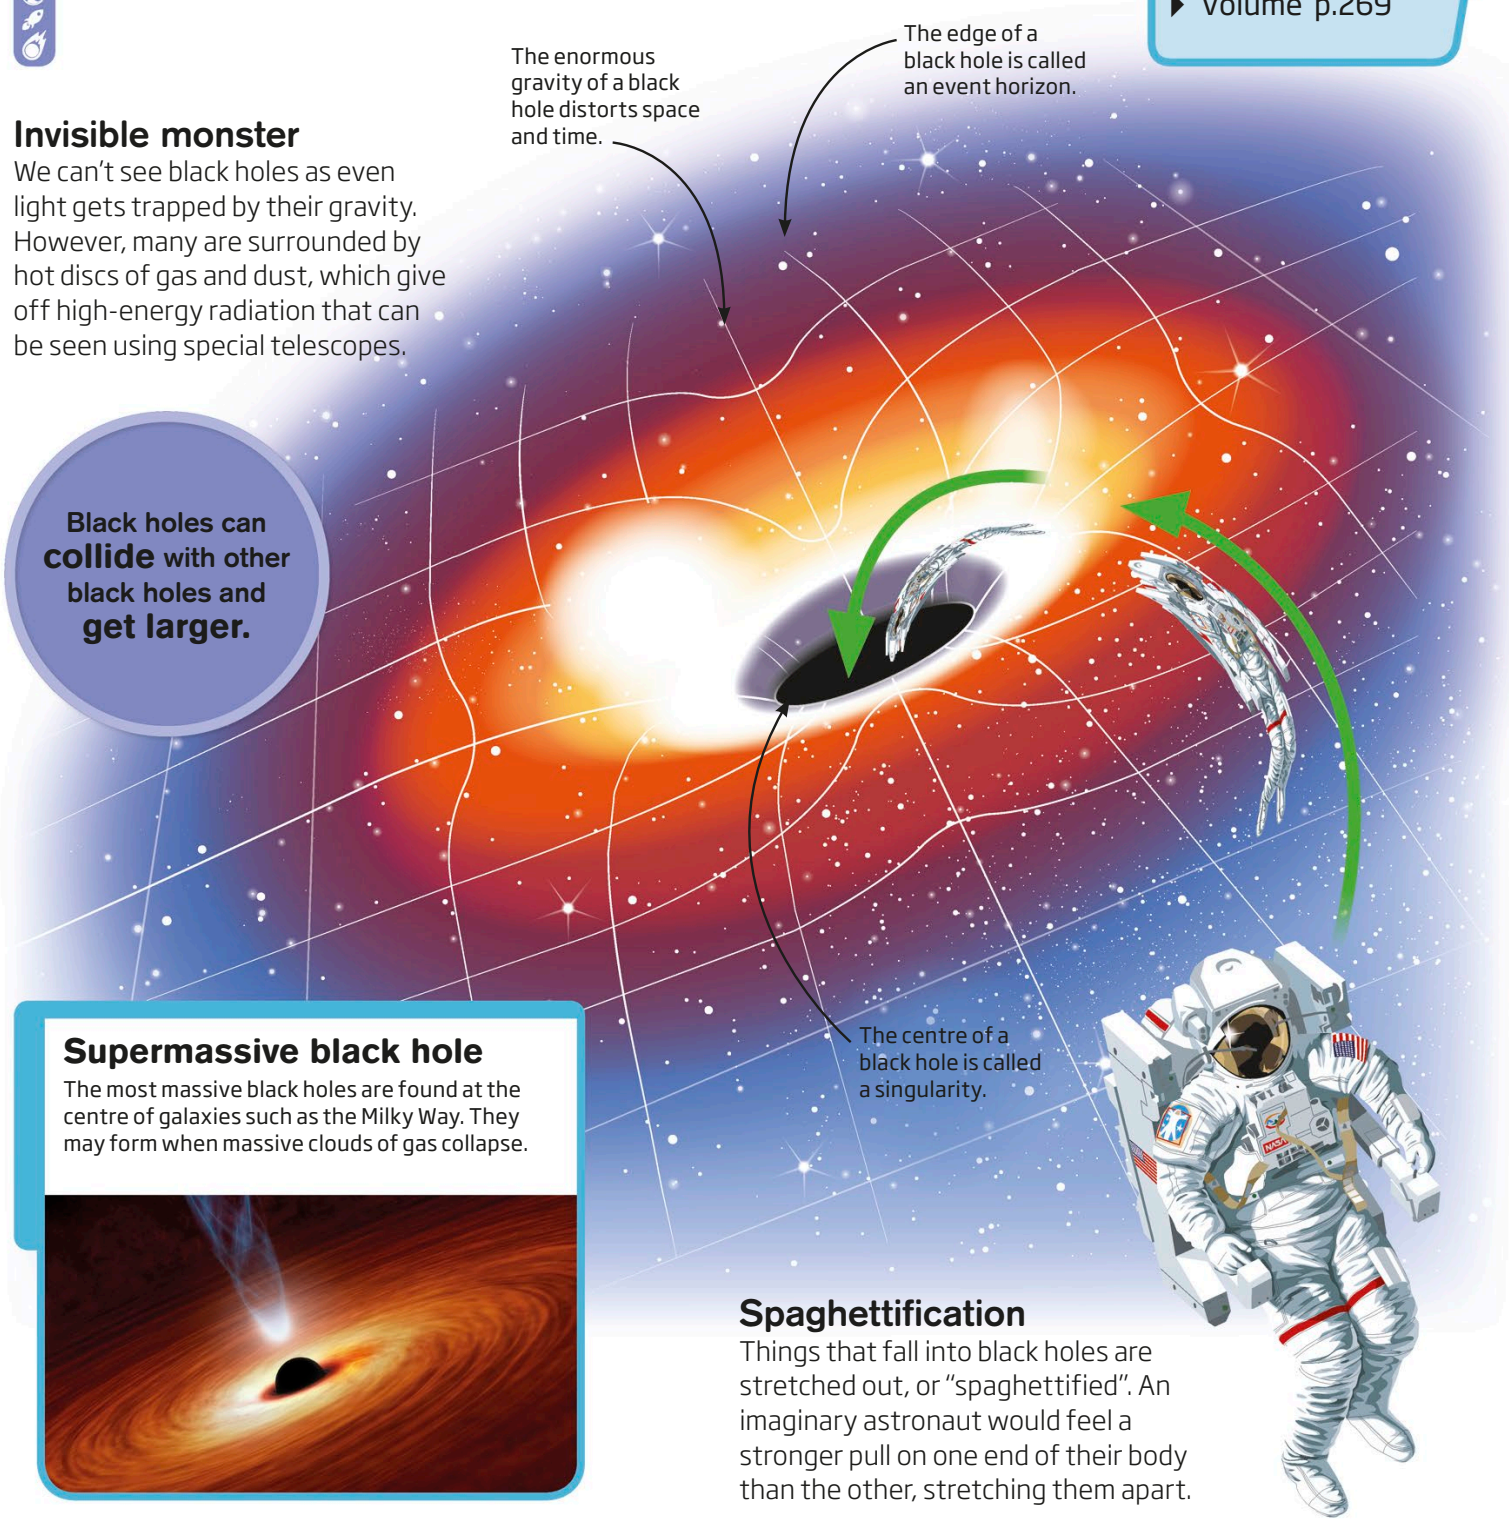
Black holes are the Universe's most mysterious objects. They form when a star much more massive than the Sun runs out of fuel. It explodes as a "supernova", then collapses under its own gravity, creating a black hole.

SEE ALSO

- Galaxies p.116
- Gravity p.125
- Light p.147
- Physics p.192
- Stars p.242
- Sun p.247
- Volume p.269

Invisible monster

We can't see black holes as even light gets trapped by their gravity. However, many are surrounded by hot discs of gas and dust, which give off high-energy radiation that can be seen using special telescopes.



Black holes can collide with other black holes and get larger.

Supermassive black hole

The most massive black holes are found at the centre of galaxies such as the Milky Way. They may form when massive clouds of gas collapse.

Spaghettification

Things that fall into black holes are stretched out, or "spaghettified". An imaginary astronaut would feel a stronger pull on one end of their body than the other, stretching them apart.

Body cells

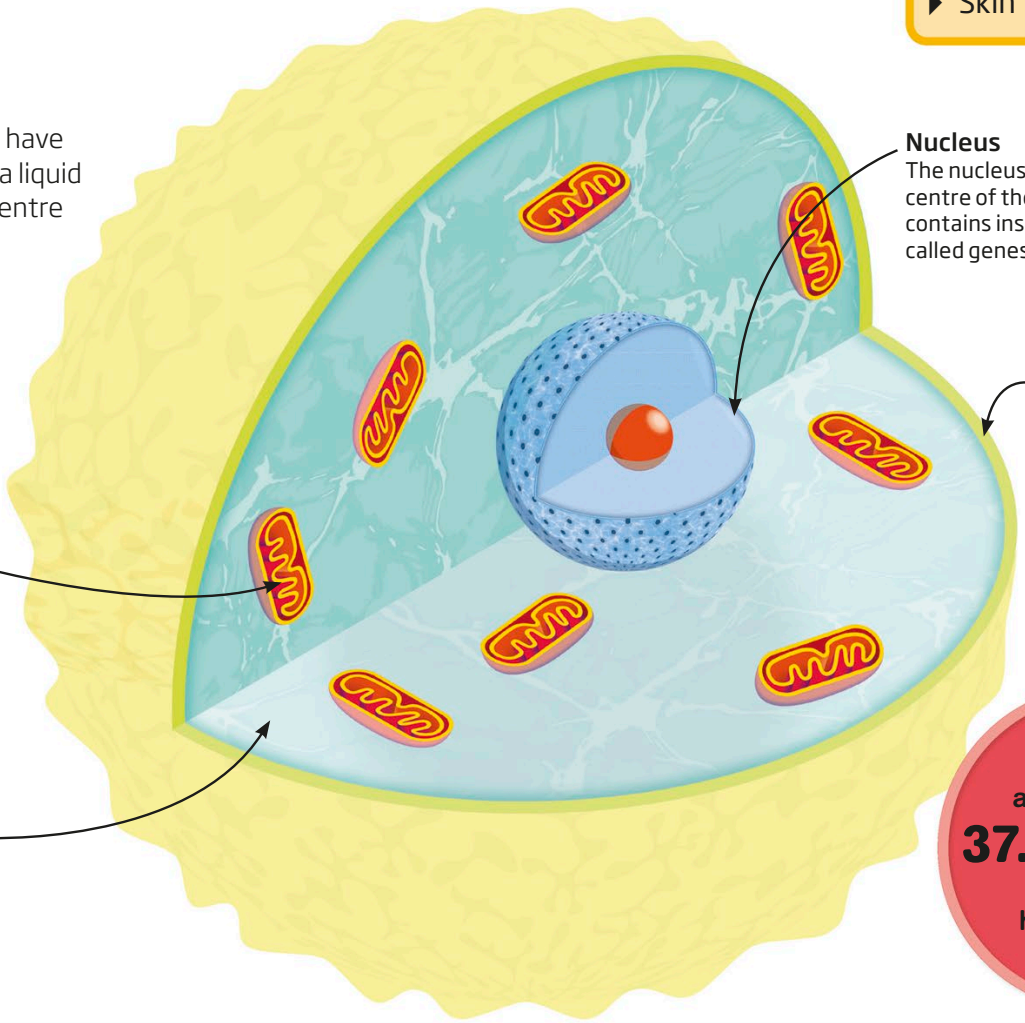
Body parts are made up of tiny things called cells. Cells have important jobs to do, like sending messages, turning food into energy, and fighting off germs. Every cell has a particular job to do to keep the body healthy.

SEE ALSO

- Cells p.56
- Genes p.119
- Human body p.130
- Microscopic life p.165
- Sickness p.225
- Skin p.229

Inside a cell

All of our body cells have an outer shell with a liquid inside. In the very centre of the cell is a core, called the nucleus.



Nucleus
The nucleus is the control centre of the cell. It contains instructions called genes.

Cell membrane
The membrane is the edge of the cell. It allows things to move in and out.

Mitochondria
These tiny structures release energy to power the cell.

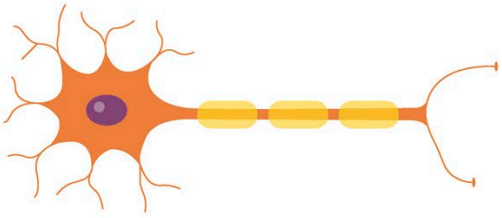
Cytoplasm
Cytoplasm is a liquid inside the cell where chemicals mix together to bring the cell to life.

There are approximately **37.2 trillion** cells in the human body!

Types of cell

Cells come in many different sizes and shapes. Each one is perfectly suited for the job it does in the body. Cells can divide to make more of themselves.

Red blood cells pick up oxygen from the lungs and transport it around the body.



Nerve cells have long stems. They carry electrical messages to the brain.

White blood cells change shape and squeeze in between other cells to kill germs.

Fat cells store and release energy. They protect the body from bumps and knocks.

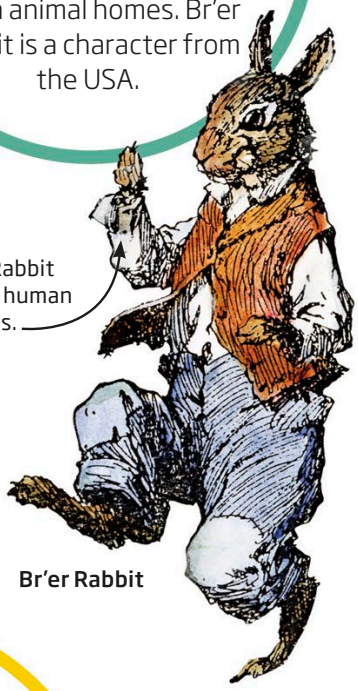
Intestine cells are frilly. The frills absorb useful nutrients from food.

Storytelling

Storytelling is the activity of telling or writing stories. They can be real or made up, can be of any length, and can be about any subject. People have always told stories to entertain each other or to inform people about, and make sense of, their world.

Animal stories

Many stories feature animals as their main characters. These animals speak and dress like real people, although they often live in animal homes. Br'er Rabbit is a character from the USA.



Br'er Rabbit

Oral history

Because early people couldn't read or write, they passed on stories by telling them to each other. The storyteller often acted out bits of the story. People still tell stories in this way today.

Storytelling in a library

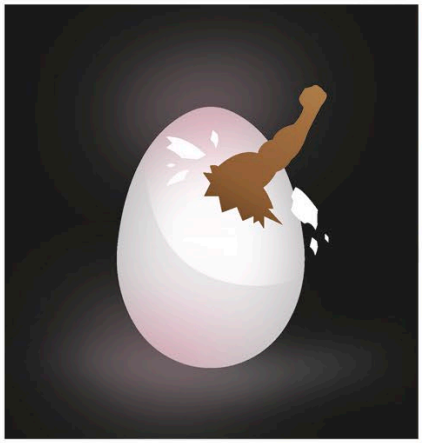
In ancient India, people recited all

10,600

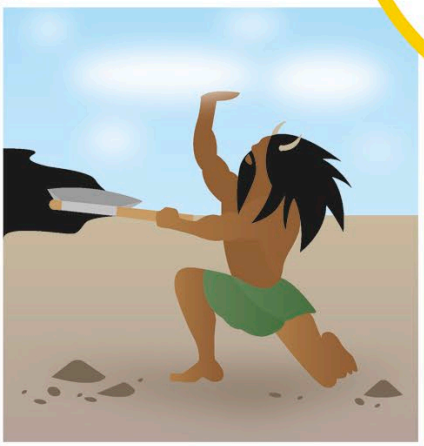
verses of the sacred hymn book, *Rigveda*, from memory.

What is a story?

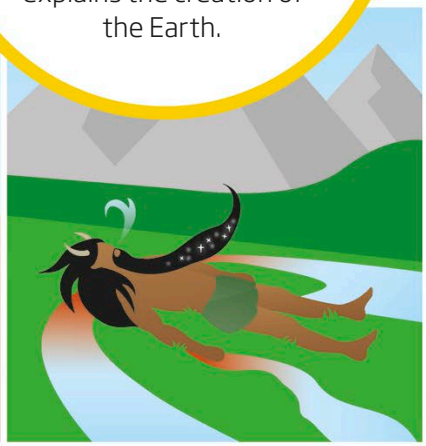
A story is a fictional (made-up) account of imaginary or real events and people. A story has a beginning, middle, and an end. The Chinese story of Pangu explains the creation of the Earth.



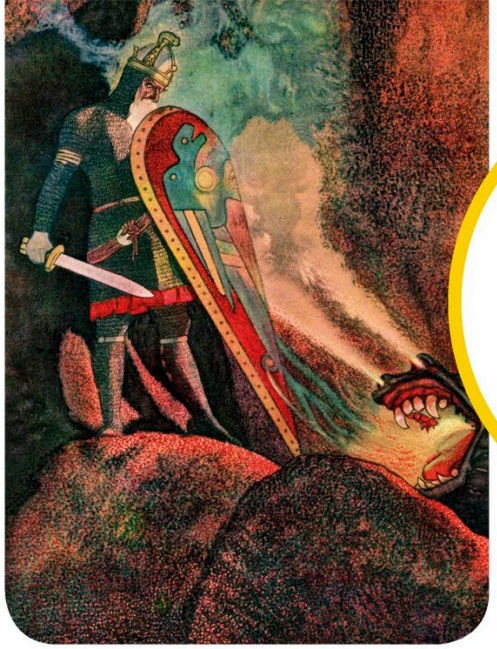
Beginning
In the beginning, there was chaos. Out of chaos came an egg, and out of this egg hatched Pangu, the first creature.



Middle
As Pangu grew up, he created the Earth and the sky, and stood between them to force them slowly apart.



End
When Pangu died, his breath became the wind, his voice became thunder, and his bones became valuable minerals.



***Beowulf* is a very long poem about an ancient hero.**

Poetry

Poetry is a type of literature. It often has short, rhyming lines joined together in verses. A poem uses words very carefully to suggest different meanings or ideas. It can be any length and about any subject.

Fairy tales

A fairy tale is a story that contains magic and characters such as fairies, witches, goblins, or giants. Fairy tales tell the story of good versus evil, and usually have a happy ending. *Sleeping Beauty*, *Aladdin*, and *The Boy Who Cried Wolf* are all examples of fairy tales.

In the fairy tale *Aladdin*, a genie magically appears from a lamp.

Magical lamp

Novels

A novel is a long story about people and their lives. Novels can be set in imaginary or real worlds, and can take place at any point in time. There are many different types of novel. For example, a historical novel would be set in the past and teach about history.

With more than 8,000 pages, the world's longest novel is *Men of Goodwill* by French author Jules Romains.

Children's stories from around the world

Filming *Romeo and Juliet*

Films

Films are a visual form of stories. Actors perform the story in a real-life setting. The actors speak the lines of the story and try to make the film as realistic and lifelike as possible.

Books

Books are collections of written words put together to tell stories or give you information. Before books were invented, people shared stories by remembering and telling them to each other. Millions of books have been created since paper was invented, and many are now read on electronic devices such as tablets.

SEE ALSO

- Storytelling pp.42–43
- Inventions pp.136–137
- Language p.144
- Materials p.157
- Writing p.280

Early books

Books have been written and decorated by hand for thousands of years. Pages were often made from parchment, which is the thinned skin of an animal. These books took a long time to make.

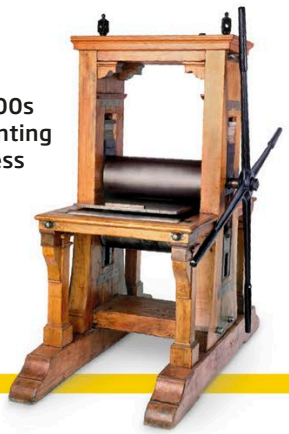
J.K. Rowling's first Harry Potter book has sold more than 100 million copies since 1997.

Medieval prayer book

Golden book
In Europe, monks wrote the first books in Latin. They decorated them with real gold.

Printing

In around 1440 in Germany, Johannes Gutenberg invented the printing press. He carved single letters onto metal blocks, then put them together as words, and printed them onto pages.



1900s printing press

Fiction

A book of fiction is a story in which the author writes about imaginary people and events. Fiction books can also be called novels.

Non-fiction

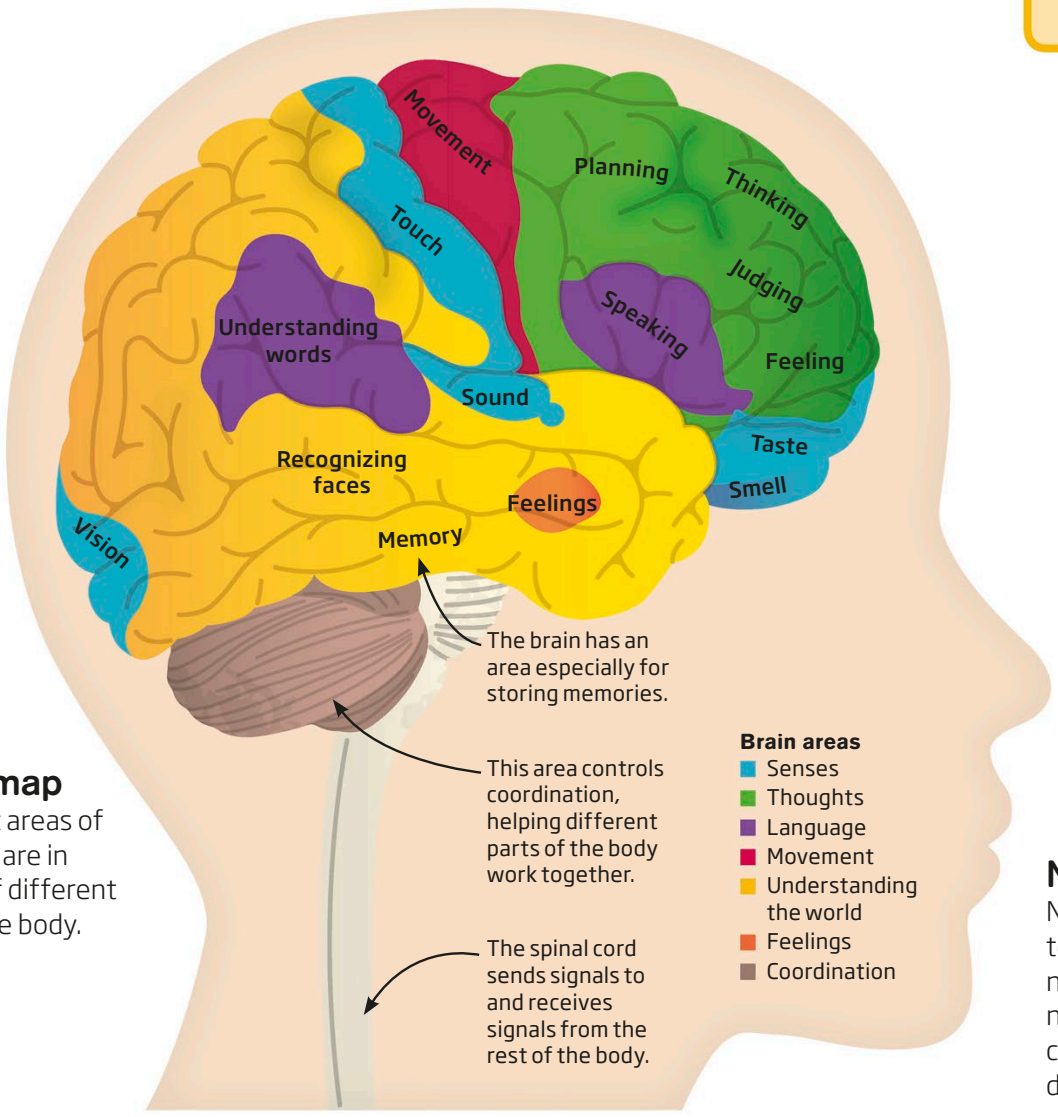
A non-fiction book contains facts about the real world. Dictionaries, atlases, cookery books, and books about history and animals are all examples of non-fiction books.

Brain

The brain controls the whole body. Every time we think, feel, or move, the brain is at work. It even keeps working when we're asleep. The brain is the most complicated organ in the living world.

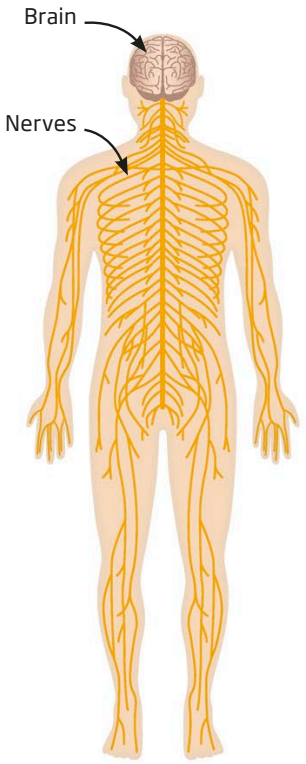
SEE ALSO

- Body cells p.41
- Feelings p.99
- Human body p.130
- Robots p.212
- Sight p.226
- Sleep p.231



Brain map

Different areas of the brain are in charge of different jobs in the body.

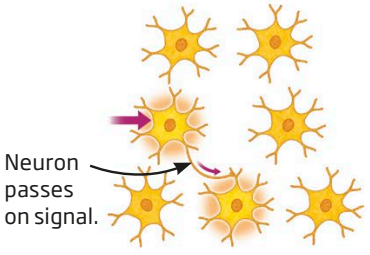


Nervous system

Nerves connect the brain to the rest of the body in a network called the nervous system. Nerves carry information between different body parts.

Thinking

The brain is made up of tiny cells called nerves, or neurons. They look like little trees. When we think, tiny electrical and chemical signals move quickly through the cells.



Acting alone

The brain does some things without us having to think. For example, it keeps our hearts pumping blood around our bodies at the right speed and controls our breathing.

Bridges

Bridges are structures that carry people and vehicles over obstacles. They are usually built over rivers, valleys, and roads. Bridges are designed to hold heavy loads and survive bad weather.

SEE ALSO

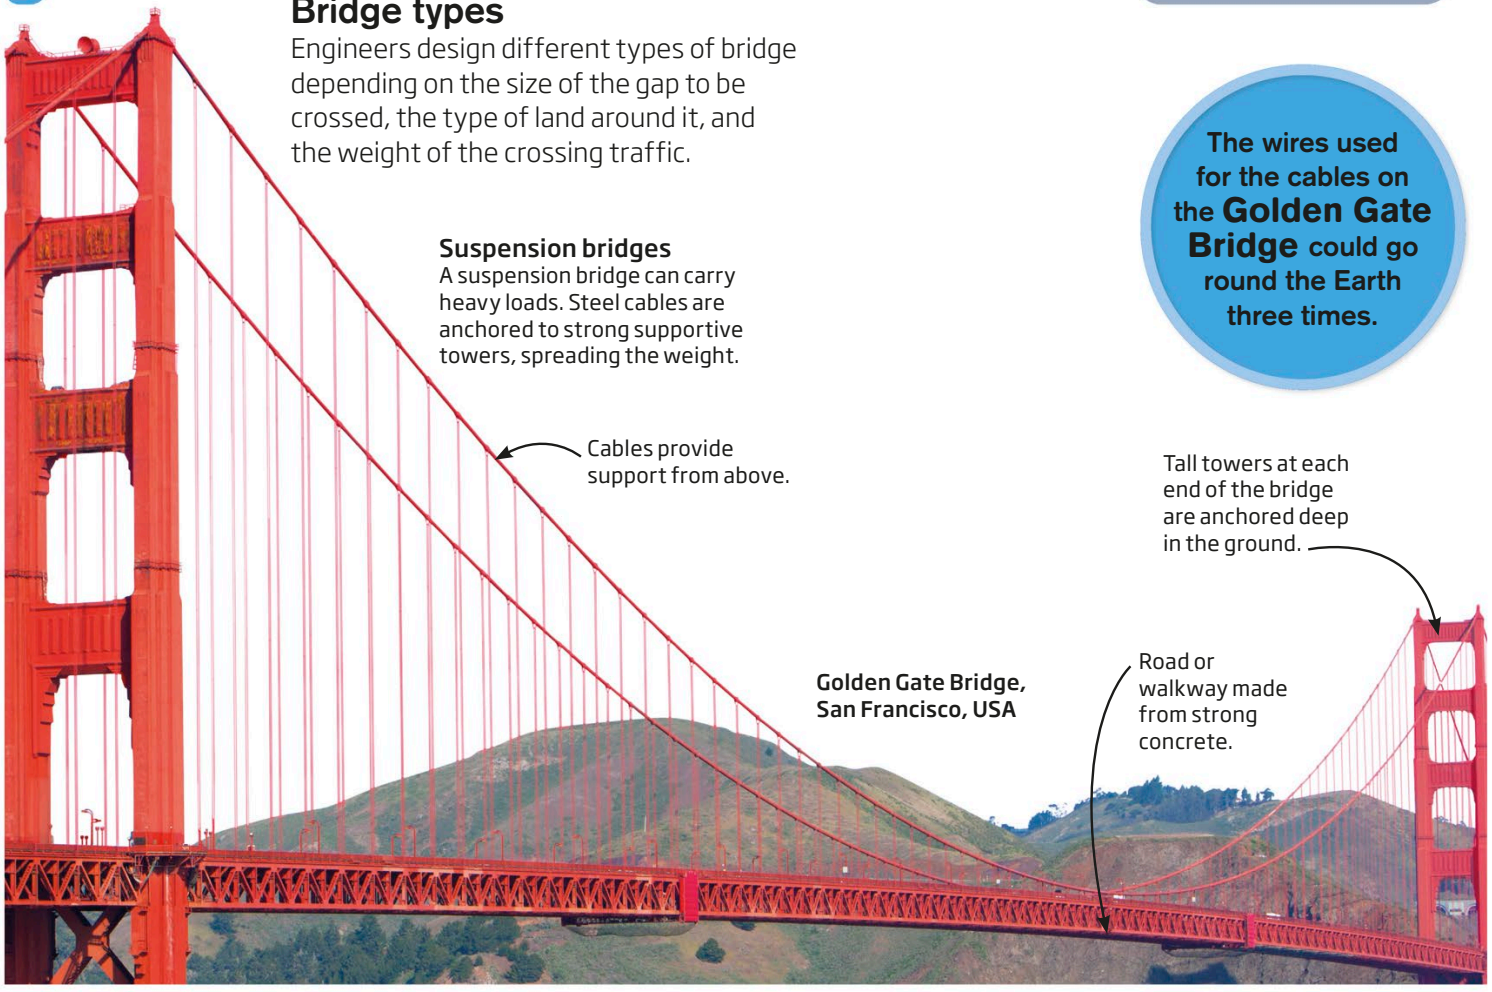
- Cars p.52
- Engineering p.91
- Materials p.157
- Rivers p.211
- Storms p.243
- Transport pp.258–259

Bridge types

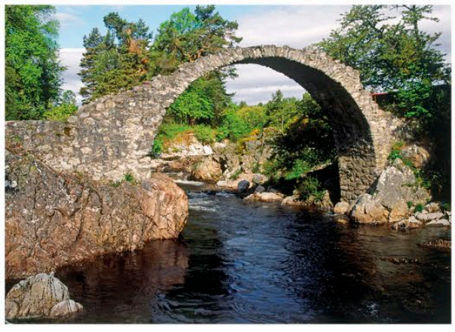
Engineers design different types of bridge depending on the size of the gap to be crossed, the type of land around it, and the weight of the crossing traffic.

The wires used for the cables on the Golden Gate Bridge could go round the Earth three times.

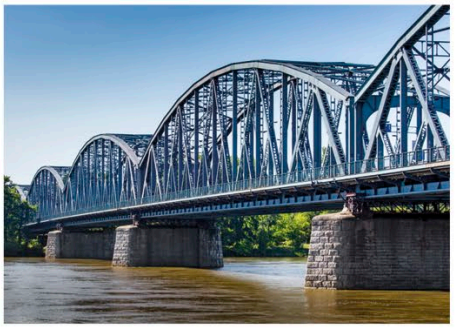
Suspension bridges
A suspension bridge can carry heavy loads. Steel cables are anchored to strong supportive towers, spreading the weight.



Golden Gate Bridge, San Francisco, USA



Arch
Arch bridges are usually made of stones cut into exactly the right wedge shapes to form an arch.



Truss
A truss bridge is built from triangles called trusses. Triangles are the strongest shapes, so this bridge can carry heavy weights.

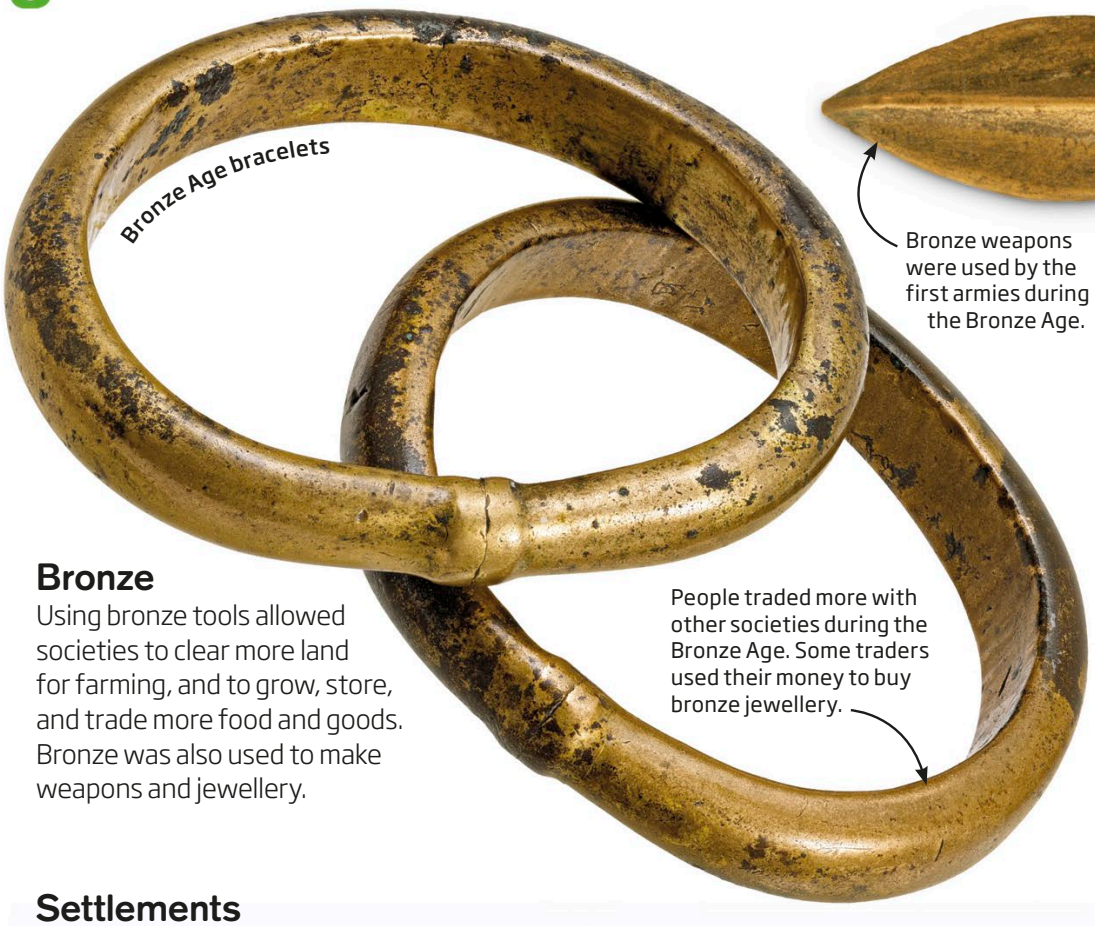
Beam
A beam bridge is the most simple design. All the weight is placed directly on top. It is built to be stiff and not bend.

Bronze Age

The Bronze Age is a period of history after the Stone Age and before the Iron Age. It began about 5,500 years ago when societies first learned to make a metal called bronze. Bronze is a mix of the metals tin and copper. Combined, these metals are stronger than they would be alone.

SEE ALSO

- Buildings p.48
- Crafts p.75
- Iron Age p.140
- Metals p.162
- Stone Age p.243
- Trade p.257
- Writing p.280



Bronze Age spear tip

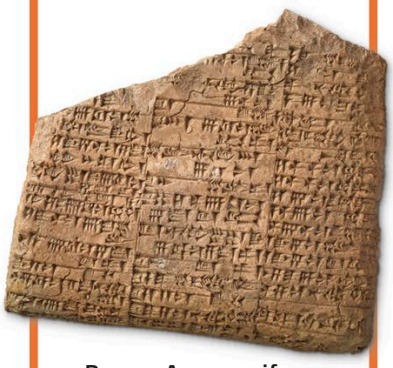
Bronze weapons were used by the first armies during the Bronze Age.

Bronze

Using bronze tools allowed societies to clear more land for farming, and to grow, store, and trade more food and goods. Bronze was also used to make weapons and jewellery.

Early writing

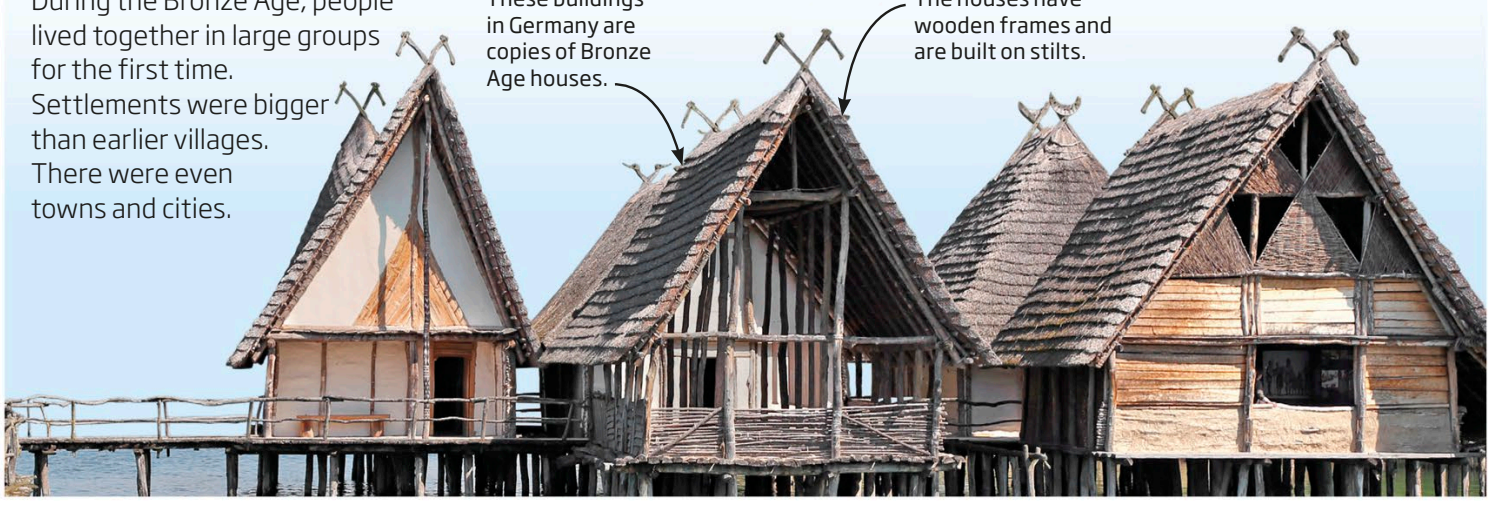
The first written language was invented in the Bronze Age. It was called cuneiform. Writers used pointed reeds called styluses to make marks in soft clay tablets, which then hardened.



Bronze Age cuneiform tablet from Iraq

Settlements

During the Bronze Age, people lived together in large groups for the first time. Settlements were bigger than earlier villages. There were even towns and cities.



Buildings

A building is a solid structure fixed in one place. It has walls and a roof to shelter us from the weather. The shape of the building depends on its purpose. Buildings can be many different things, including hospitals, schools, and houses.

SEE ALSO

- Ancient Greece p.18
- Ancient India p.19
- Bridges p.46
- Castles p.53
- Engineering p.91
- Factories p.97

Types of building

Many towns and cities have a mix of buildings from across history. These buildings have different designs and are made from a variety of materials.

London skyline

The world's tallest building, the Burj Khalifa in Dubai, is 828 m (2,716 ft) tall – which is more than 100 houses tall.

Construction

Machines are used to put up large buildings. Foundations are dug deep into the ground to stop the building from falling down. Cranes lift heavy building materials such as steel beams and panes of glass for windows.

Carbon cycle

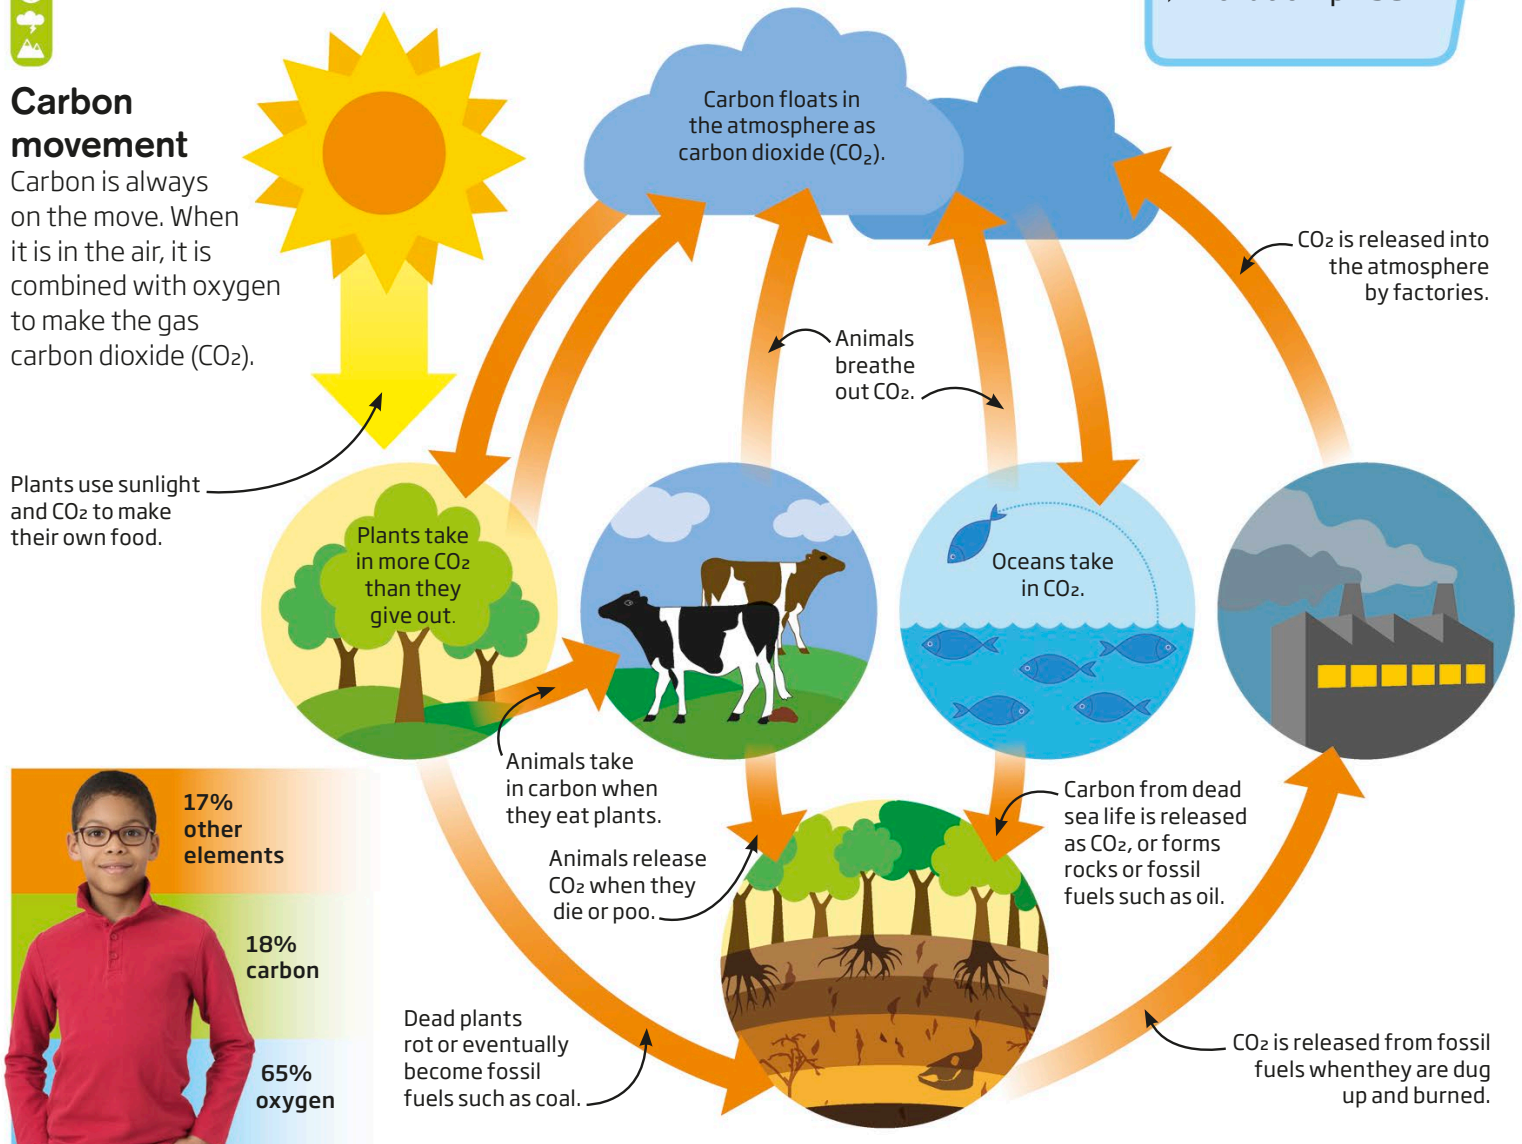
Without the element called carbon, our world would be frozen and lifeless. Carbon constantly moves between living things, the atmosphere, the oceans, and the Earth below us. This movement is known as the carbon cycle.

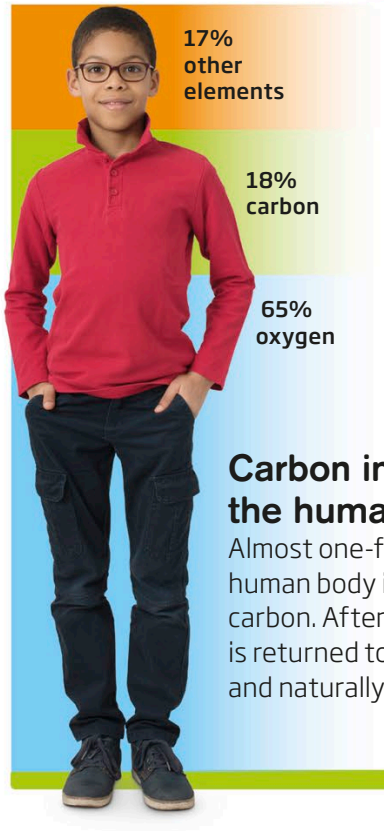
SEE ALSO

- Atmosphere p.33
- Climate change p.60
- Elements p.90
- Fossil fuels p.110
- Gases p.117
- Pollution p.198

Carbon movement

Carbon is always on the move. When it is in the air, it is combined with oxygen to make the gas carbon dioxide (CO_2).



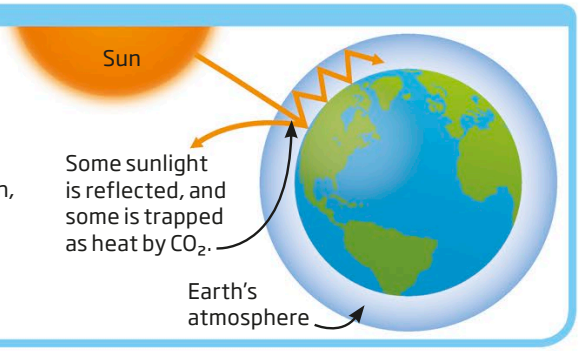


Carbon in the human body

Almost one-fifth of the human body is made of carbon. After we die, this is returned to the Earth and naturally recycled.

Keeping the Earth warm

Carbon dioxide in the atmosphere acts like a blanket around the Earth, trapping the Sun's heat. Without it, the Earth would be very cold.

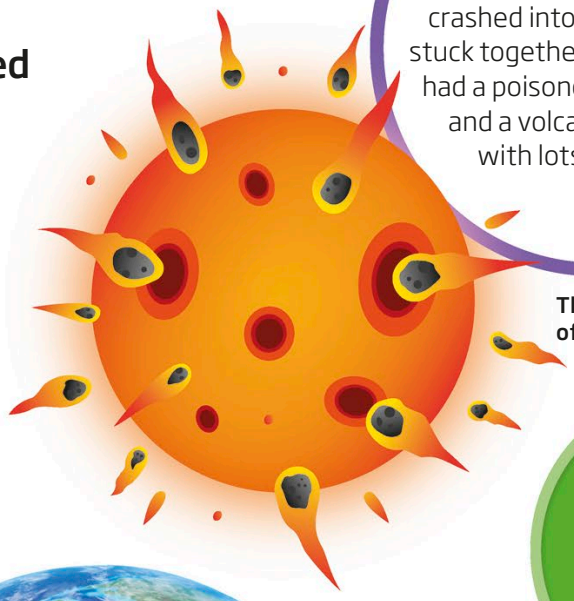


Changing world

Since it formed, the Earth has been covered with molten lava, bombarded by rocks from space, and blanketed in ice. In 4.5 billion years, Earth has changed from a hot, lifeless planet into a watery home, full of life.

Earth is born

Our planet was formed when rocks orbiting the Sun crashed into each other and stuck together. The early Earth had a poisonous atmosphere and a volcanic landscape with lots of craters.



The formation of the Earth

On the move

Earth's land is split up into huge chunks called continents. Throughout Earth's history, the continents have shifted around. Today, there are seven continents, but they have not always looked the way they do today.

Mountains are created when **continents move** and hit each other.

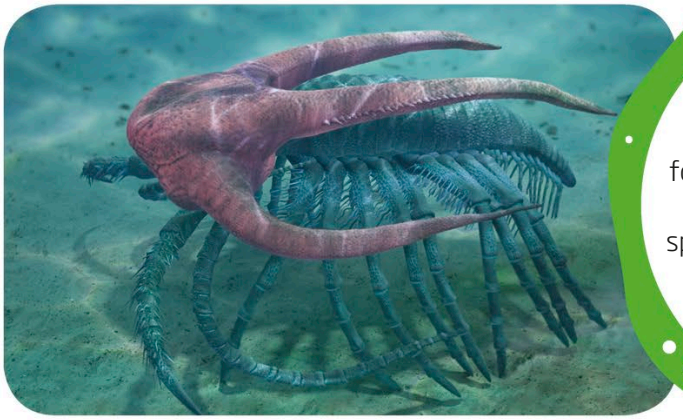
The continents were grouped together in a "super-continent" called Pangaea.

250 million years ago

120 million years ago

Pangaea split in two, forming Laurasia in the north and Gondwana in the south.

Marrella, a life form from 540 million years ago.



Life begins

At first, nothing lived on Earth. The earliest life forms appeared 4,600 million years ago. Over time, more species developed. Now there are millions of different types of life, and over 7.5 billion people.

The Andes mountains formed 45 million years ago.

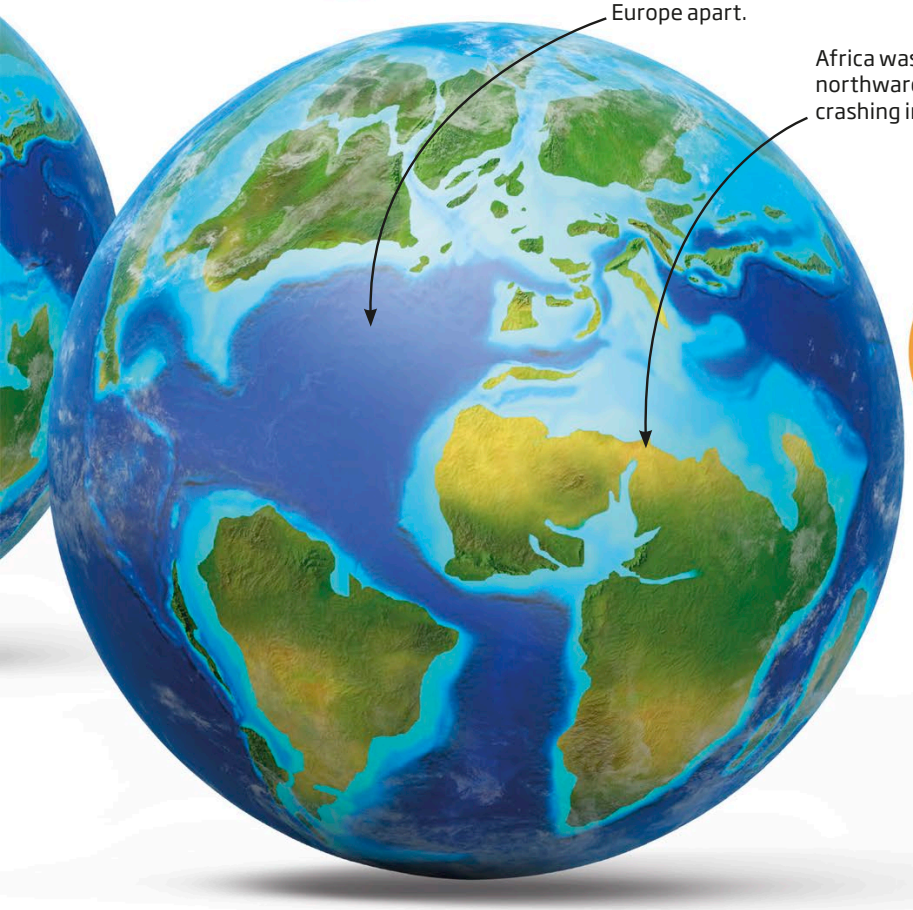
Changing surface

The Earth's surface changes constantly. As continents crash together or move apart, mountain ranges are forced up, then worn down. Rainforests become icy wastes, oceans expand and shrink, and glaciers turn into deserts.

Under ice

For much of the last two million years, huge ice sheets covered large parts of Northern Europe and North America. We are currently living in a warmer period.

Mammoths lived during the last ice age.

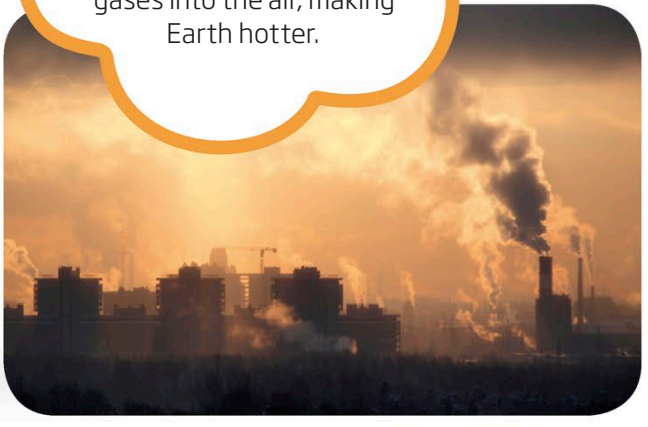


80 million years ago

If the sea level today was as high as it was 500 million years ago, London, New York, and Sydney would all be underwater.

Climate change

Humans have a direct impact on Earth's climate. We burn fossil fuels such as coal, oil, and gas to make power. This releases dangerous gases into the air, making Earth hotter.



Burning fossil fuels

Cars

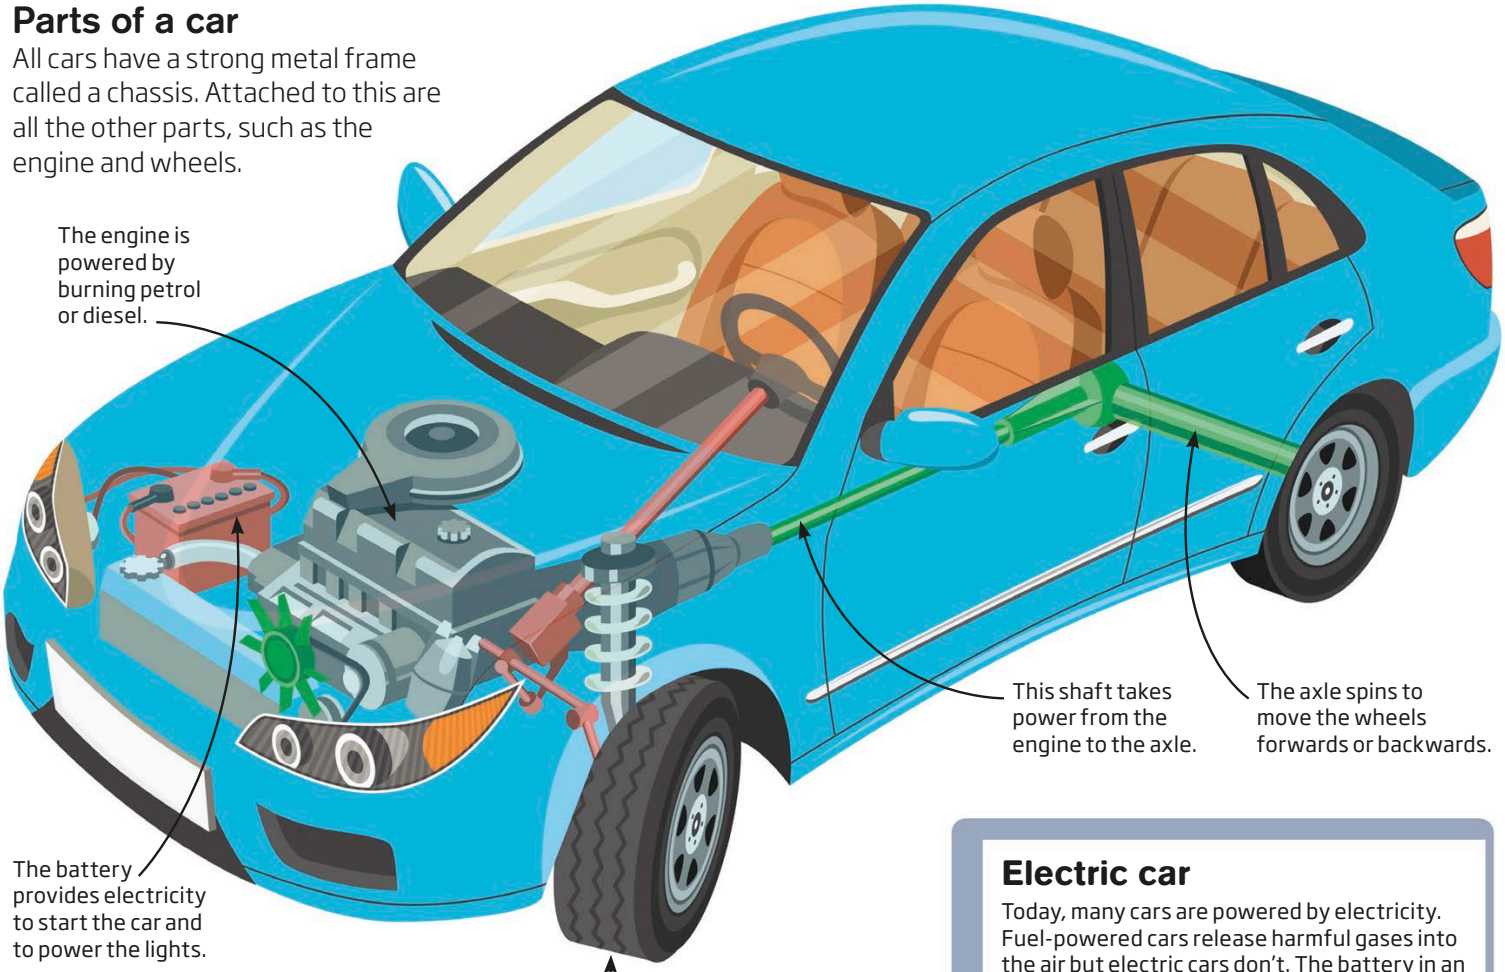
Cars are vehicles that travel on roads. The shape and size of a car depends on its use, such as for a family or for racing. Cars are powered by engines. Engines can be powered by fuel such as petrol or diesel, or by using electricity.

SEE ALSO

- Electricity p.87
- Engines p.92
- Fossil fuels p.110
- Inventions pp.136–137
- Sport p.239
- Transport pp.258–259

Parts of a car

All cars have a strong metal frame called a chassis. Attached to this are all the other parts, such as the engine and wheels.



Formula 1

Some of the world's fastest cars take part in a racing competition called Formula 1. They compete on special tracks and around some city streets. The cars have long, low shapes to help them go super fast.

1998 Ferrari F300 F1

Electric car

Today, many cars are powered by electricity. Fuel-powered cars release harmful gases into the air but electric cars don't. The battery in an electric car is powered up at a charging point.

Castles

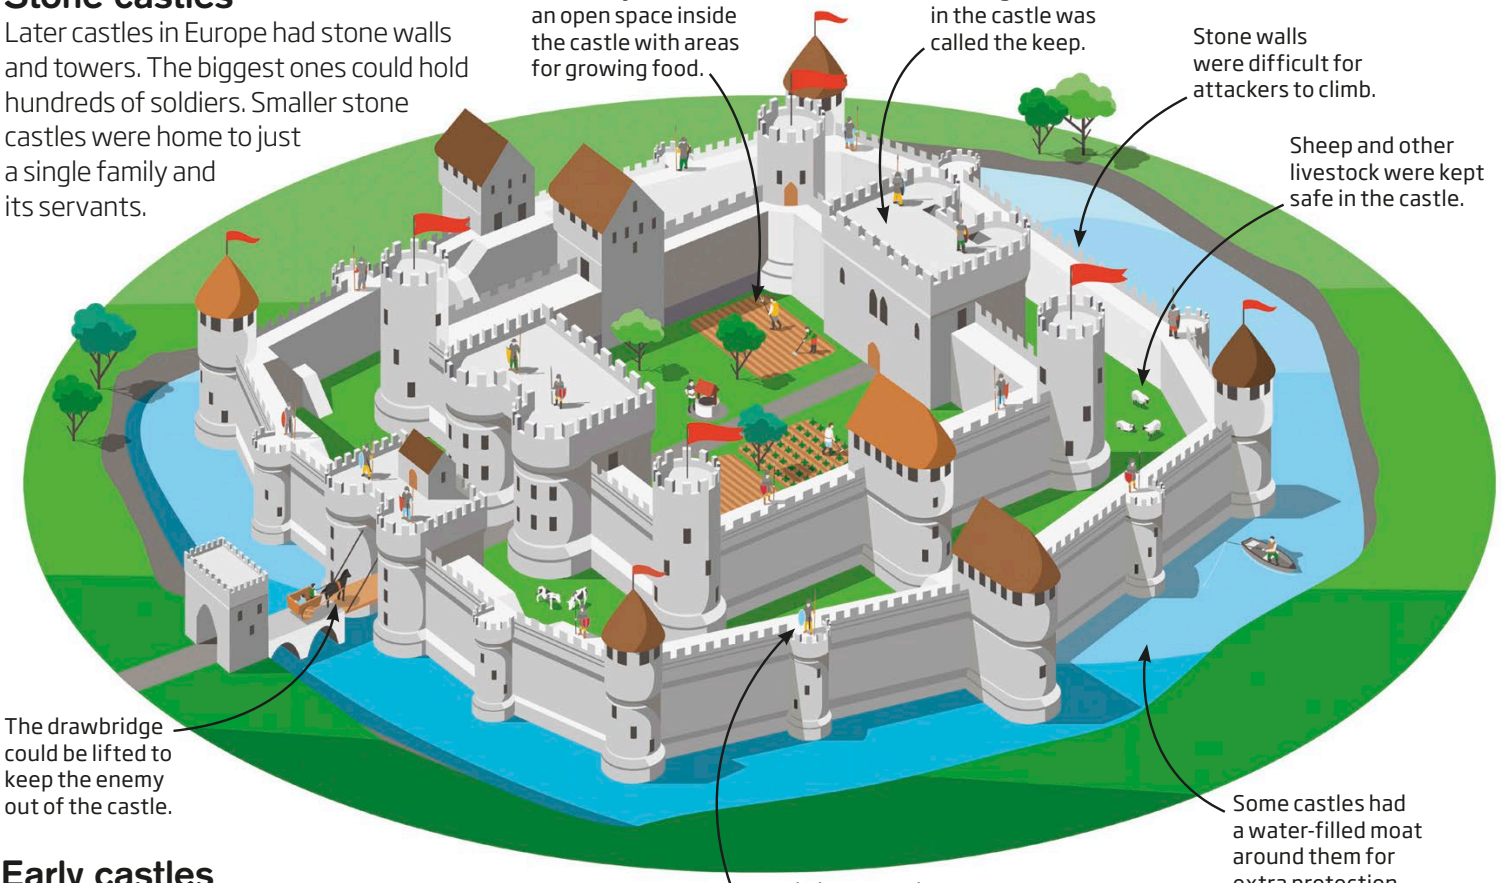
Most castles were built between 1000 and 1500 CE. They had homes and workshops inside their walls. Kings and wealthy people built castles as protection from enemy attack. Once cannons were invented, they were no longer safe. Many fell apart over time, but some are still standing.

SEE ALSO

- Buildings p.48
- Engineering p.91
- Europe p.94
- Imperial Japan p.131
- Knights p.142
- Homes pp.244–245

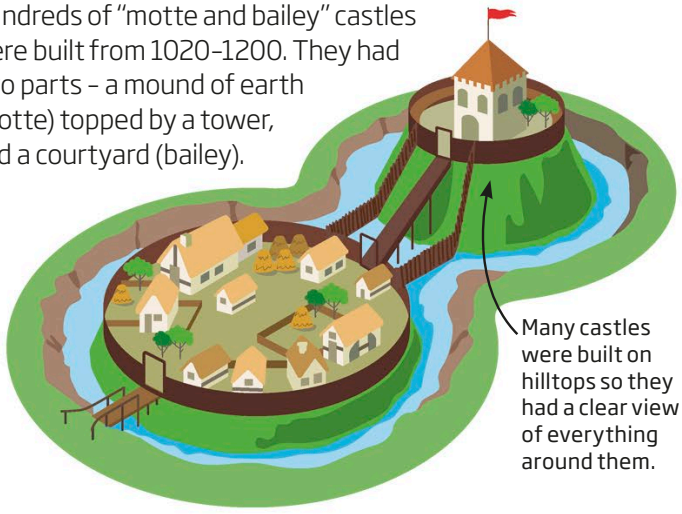
Stone castles

Later castles in Europe had stone walls and towers. The biggest ones could hold hundreds of soldiers. Smaller stone castles were home to just a single family and its servants.



Early castles

Hundreds of "motte and bailey" castles were built from 1020–1200. They had two parts – a mound of earth (motte) topped by a tower, and a courtyard (bailey).



Japanese fortress

Castles in Japan were designed with towers built of both wood and stone. The central tower was used as the main hideout if the castle was attacked.

Cats

The cat family are all meat-eaters. They have sharp teeth that let them slice up their food. Cats are very fast, with strong bodies that let them run, jump, and even swim.

SEE ALSO

- Dogs p.81
- Food chains p.107
- Habitats p.126
- Pets pp.152–153
- Sight p.226
- Vertebrates p.266

Small wild cats

Most wild cats are much smaller than lions. The colours of their fur help them to be camouflaged, or hidden, in their habitat.

Cat tongues are covered in sharp hairs. They are used to clean meat off a bone and to wash their fur.

Lynx

Chartreux

Pet cats

Cats were one of the first animals that humans tamed from the wild to become pets, around 12,000 years ago.

Lion

Big cats

The largest types of cat are known as "big cats". They include lions, tigers, leopards, and jaguars. These are the only cats that are able to roar.

Night vision

Cats hunt at dawn and dusk. Their eyes are good at seeing when there is not much light. Their eyesight is six times better than a human's.

Leopard

Caves

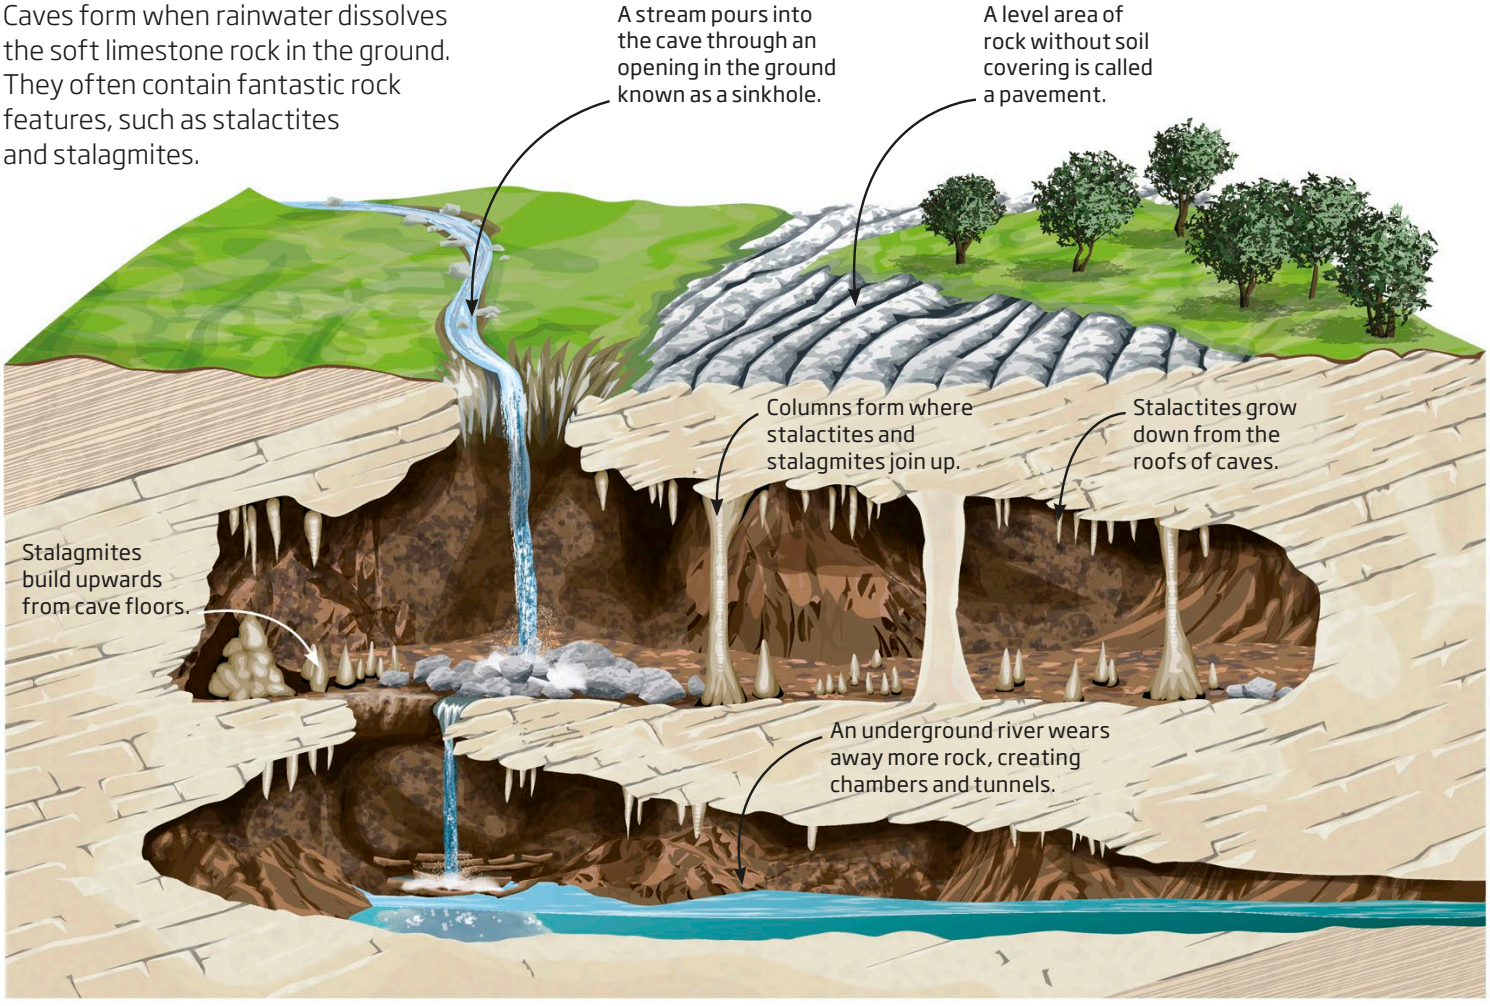
Caves are large natural holes in the ground. They are usually formed when rock is hollowed out by running water over millions of years. Prehistoric humans used caves for shelter, and some people still live in caves today. They are also home to lots of animals, including bats.

SEE ALSO

- Animal homes p.23
- Erosion p.93
- Glaciers p.122
- Rocks and minerals p.214
- Homes pp.244–245

Cave network

Caves form when rainwater dissolves the soft limestone rock in the ground. They often contain fantastic rock features, such as stalactites and stalagmites.



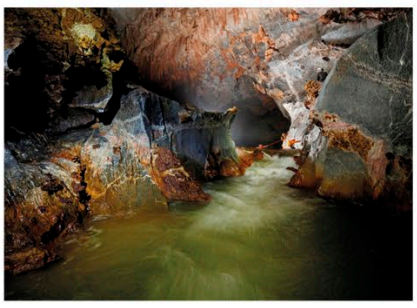
Ice caves

Glaciers are rivers of ice that move very slowly. Some glaciers have caves inside them. They are made by streams of water tunnelling through the glacier.

This ice cave is inside a glacier in Iceland.

Biggest cave

The 40-storey-high Hang Son Doong cave in Vietnam, Asia, is the world's biggest cave. Inside, it has a river, a forest, and even its own clouds!



A river flows through part of the huge cave.

Cells

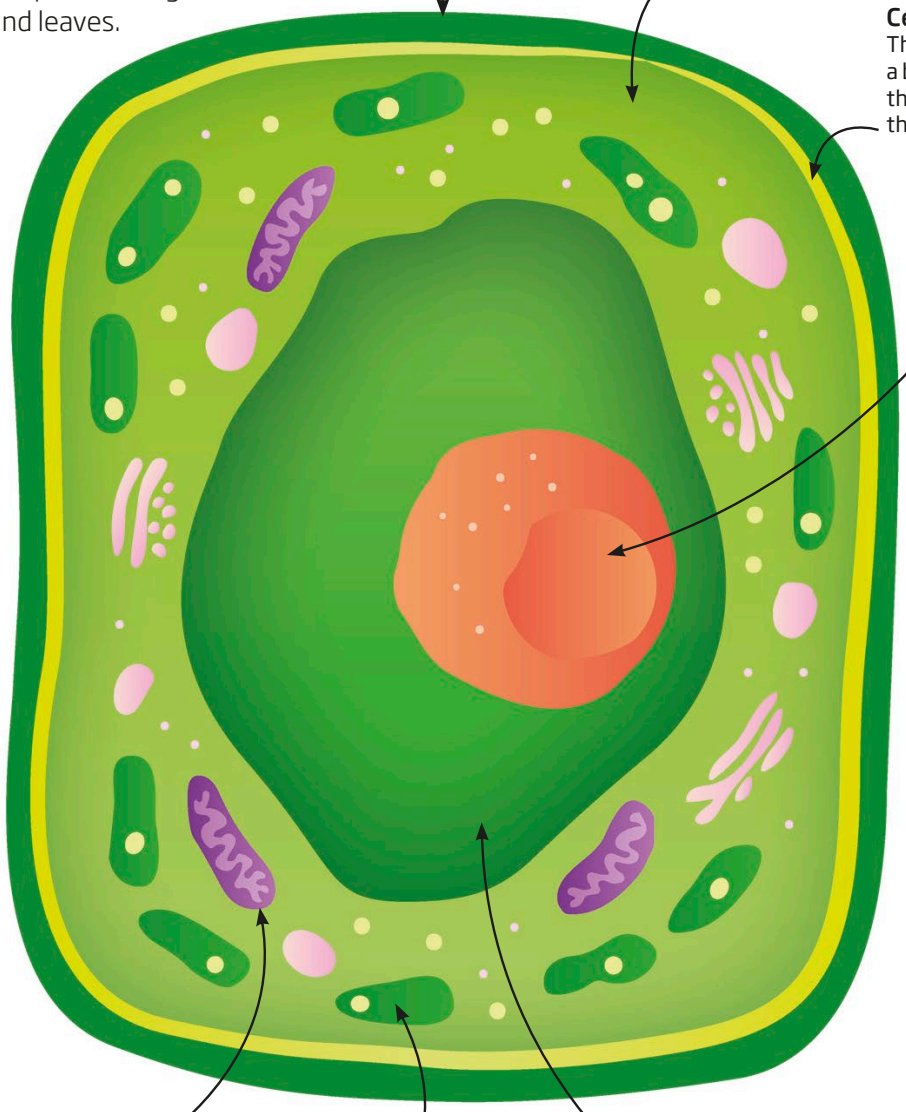
Living things are made from tiny parts that stick together, called cells. Cells come in different shapes and sizes depending on the job they do. They can divide and make copies of themselves.

SEE ALSO

- Body cells p.41
- Genes p.119
- Heart p.128
- Photosynthesis p.191
- Plants p.194
- Sickness p.225

Plant cell

Plant cells can collect air and make their own food from sunlight. They have a strong cell wall, which gives the plant strong stems and leaves.



Cell wall
The strong outer wall gives the cell and plant their shape.

Cytoplasm
This is the liquid that everything else floats in inside the cell. Chemicals mix together here.

Cell membrane
The cell membrane is a barrier that keeps the cytoplasm inside the cell.

Nucleus
The nucleus controls the cell and contains instructions called genes.

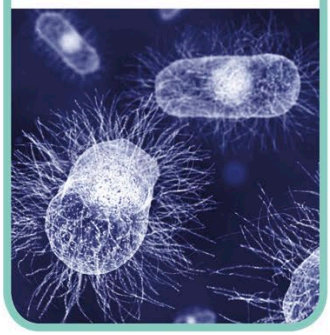
Mitochondrion
This is where energy from sugar is released to power the different parts of the cell.

Chloroplast
Chloroplasts collect sunlight and use air and water to make food.

Vacuole
The vacuole is a storage bubble filled with liquid food, water, or waste.

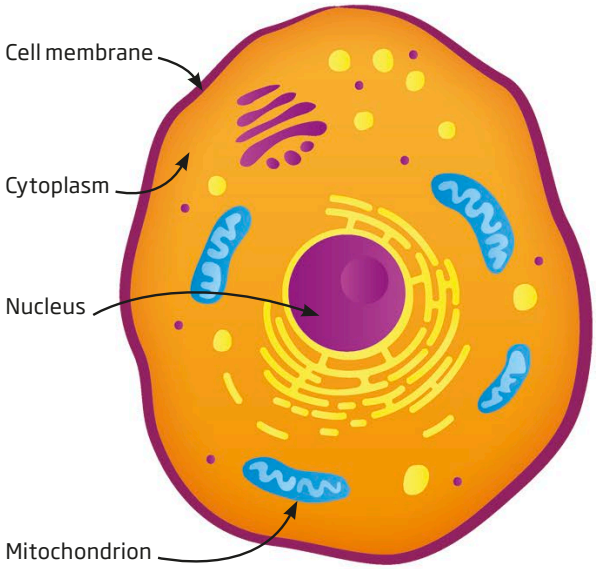
Bacteria

Bacteria are living things made from just one cell. They can divide to make copies of themselves. This is how germs spread and make us ill.



Animal cell

Animal cells use oxygen to break down sugar and make energy. Animals get sugar from the food they eat, while oxygen gets to the cells through the blood.



Changing states

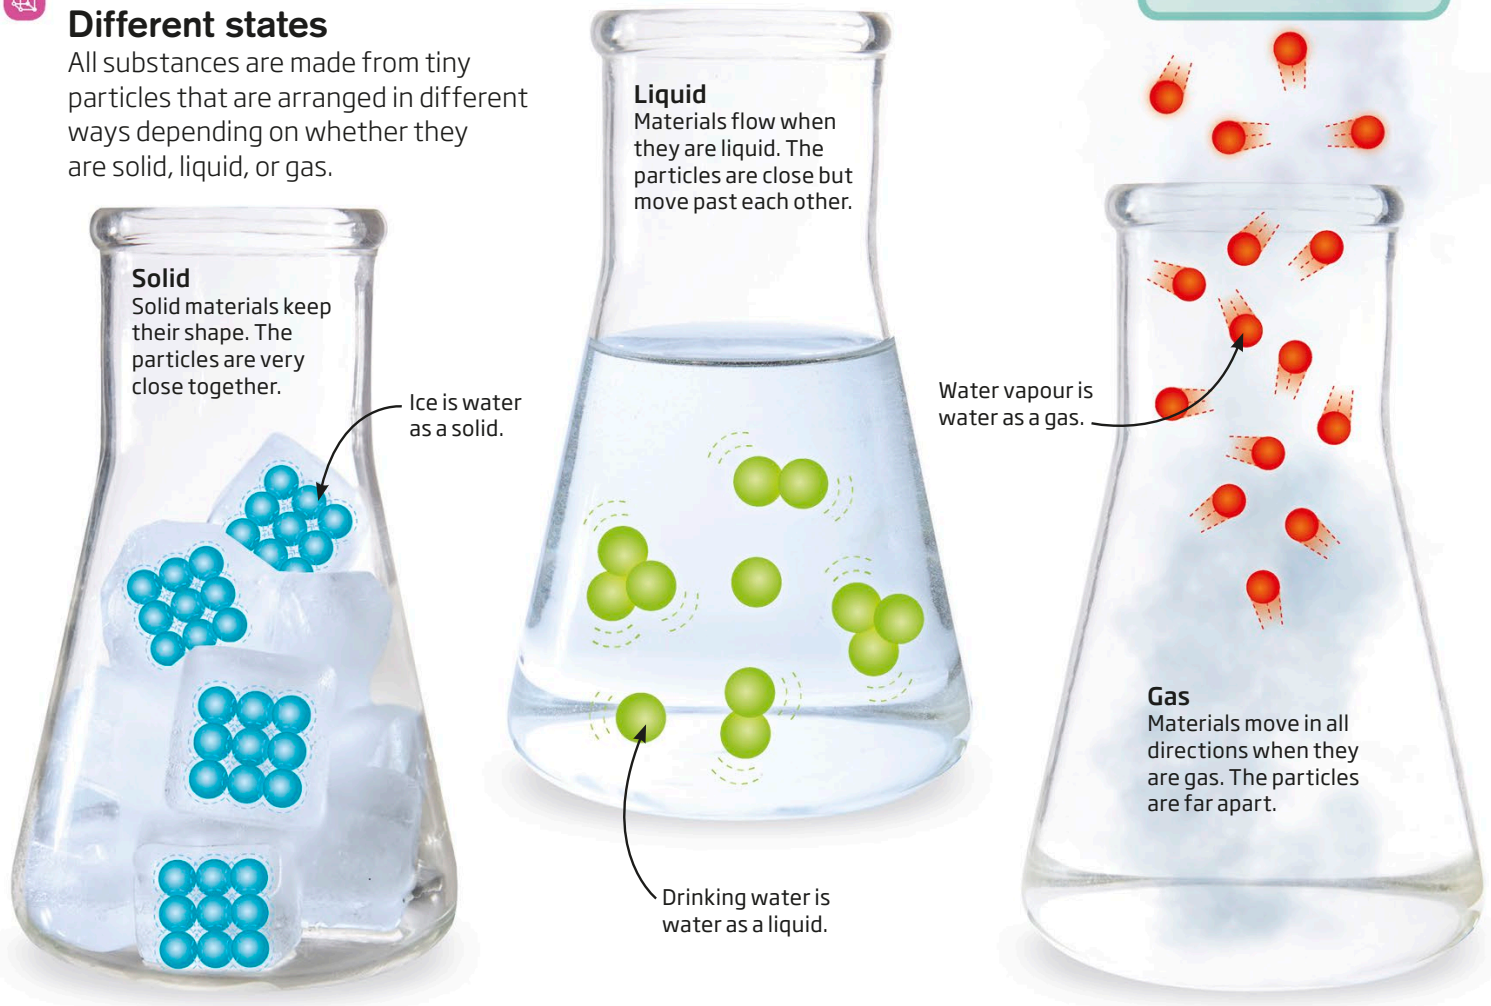
Most materials can change between being solid, liquid, or gas, depending on their temperature and how tightly packed they are. Substances such as water can change from one state to another and then back again.

SEE ALSO

- Atoms p.34
- Gases p.117
- Water p.120-121
- Liquids p.148
- Solids p.234
- Temperature p.252

Different states

All substances are made from tiny particles that are arranged in different ways depending on whether they are solid, liquid, or gas.



Shifting states

The same material can change from being solid to liquid and from liquid to gas when it is heated, and back again as it cools. These changes are called melting, solidifying, evaporating, and condensing.

Melting When we heat a solid it melts and changes to a liquid.

Solidifying When a liquid like this lava cools it becomes solid.

Evaporating When a liquid changes into a gas it evaporates as steam.

Condensing When water turns from a gas back into a liquid form, this is condensing.

Chemistry

Chemistry is a science that looks at the smallest ingredients of everything, called elements. It studies how elements react when we mix them together, and how tiny particles in materials are arranged and can be rearranged.

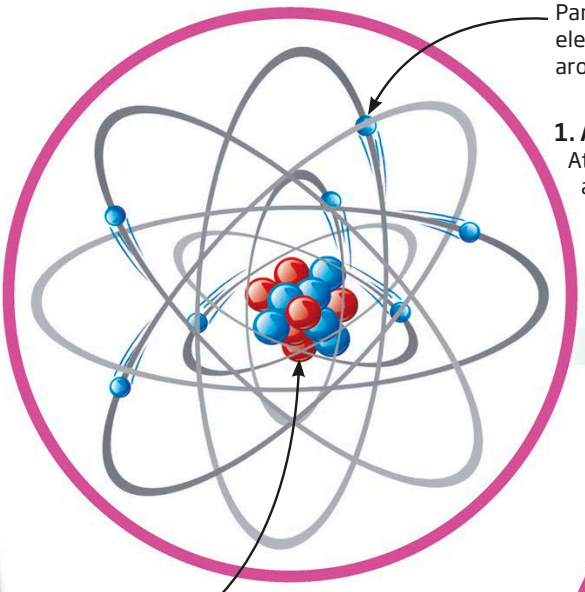
SEE ALSO

- Atoms p.34
- Body cells p.41
- Elements p.90
- Engineering p.91
- Changing states p.57
- Materials p.157

Building blocks

Everything around us is made from tiny parts called atoms. Atoms join to each other and other types of atoms to make arrangements called molecules. These basic building blocks are what chemistry investigates.

An atom is mostly empty space. If an atom was the size of a football stadium, the nucleus would be the size of a marble.



Particles called electrons move around the outside.

The centre is called the nucleus. It contains particles called protons and neutrons.

1. Atoms

Atoms are so small we can't see them and they're mostly empty space. They have even smaller particles inside. The type of atom depends on the number of particles inside it.

Gold

Antimony

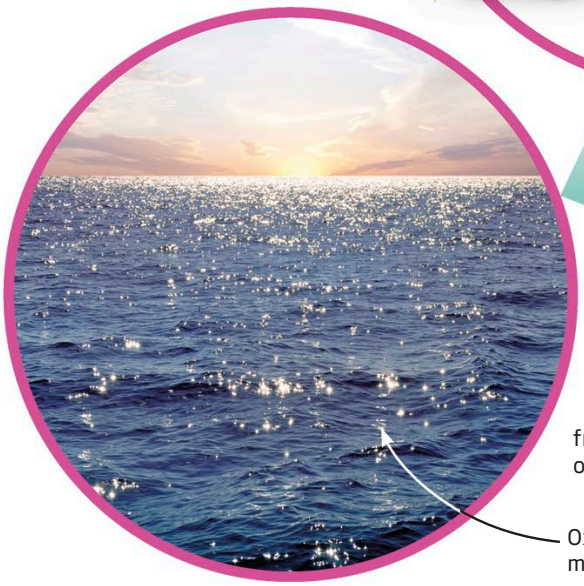
Plutonium

2. Elements

Materials that that have only one type of atom are known as elements. Elements have just one ingredient – themselves. Antimony, plutonium, and gold are all elements.

3. Compounds

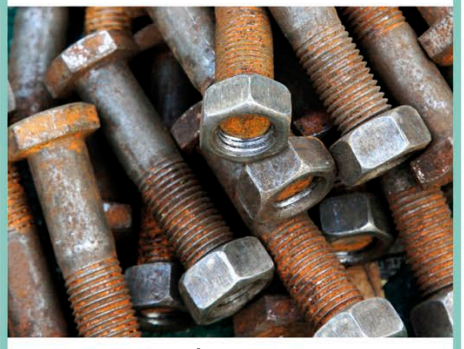
Elements that have joined together are called compounds. For example, water is a compound made from the elements oxygen and hydrogen.



Oxygen and hydrogen combined make the compound water.

Chemical reaction

When two or more elements come together to make a new compound, it is called a chemical reaction. Reactions can fizz, burn, or even explode when new compounds are made.



Iron and oxygen react to form rust.

Circuits

A circuit is when an object that uses electricity is connected with wires to a power source. Circuits in our homes connect lights and appliances, like the fridge or television, to electricity.

SEE ALSO

- Computers p.71
- Electricity p.87
- Light p.147
- Measuring p. 159
- Television p.251

How circuits work

When a circuit is a complete loop with no gaps, electricity can flow around it. We use symbols to represent the different parts of the circuit.

Electricity travels through metal wires.

Wires are covered in plastic to stop electricity escaping.

Battery "cell"
Batteries are power sources that hold electricity. Electricity can flow around the circuit when we connect it to both ends of a battery.

Switch
Electricity only flows around the circuit when the switch closes and is switched on. Once the switch is opened, the circuit breaks.

Light bulbs
Electricity makes the light bulb switch on and light up. Objects in a circuit that need electricity to work are called components.

Crocodile clips connect circuit wires to objects.

The flow of **electricity** around the circuit is called the **current.**

Circuit boards

Computers have tiny boards in them called circuit boards. Circuit boards have lots of wires connected up to tiny components to make the computer work.

Climate change

Climate is the average weather for an area. The way we live is changing the Earth's climate. It is becoming warmer. This change is causing extreme weather conditions, such as long periods of little rainfall, called droughts, and huge storms. Many countries are now trying to stop climate change.

SEE ALSO

- Arctic p.25
- Carbon cycle p.49
- Fossil fuels p.110
- Industrial Revolution p.133
- Pollution p.198
- Storms p.246

More than **35 billion** tonnes (39 billion tons) of **CO_2 is released every year.**

What is the cause?

Power stations, factories, and cars pump gigantic amounts of the gas carbon dioxide (CO_2) into the atmosphere. This gas acts like a blanket, trapping the Sun's heat and warming our planet.

Exhaust fumes from road traffic are one of the biggest causes of climate change.

How is the climate changing?

Climate change is making our summers hotter. Floods, droughts, and powerful storms are becoming more common. The ice in cold parts of the world is melting, which is making sea levels rise.

Flooding in New Orleans, USA

What can we do?

We need to reduce the amount of fuels we burn that release CO_2. We can do this by using sources of energy that do not produce CO_2, such as sunlight, wind, and water.

Solar panels make energy from sunlight and do not release harmful gases.

Clocks

A clock is a device used to keep track of time. Ancient civilizations measured time by falling sand, flowing water, or the position of the Sun. Modern clocks are either digital or have clockwork mechanisms.

SEE ALSO

- Machines p.150
- Measuring p.159
- Numbers p.185
- The sciences pp.218–219
- Sun p.247
- Time zones p.255

How does a clock work?

Clocks make regular movements for measuring time. They do this using machinery known as clockwork. The clock face has moving hands that show the hours, minutes, and seconds.

Clock face
This part of the clock shows the time, in hours, minutes, and seconds.

Minute hand
The long minute hand makes a full turn around the clock every hour.

Hour hand
The short hour hand makes a complete turn around the clock every 12 hours.

Second hand
This long, thin hand makes a complete rotation of the clock every minute.

Gears
Gears are wheels that lock together. In a clock, they make the hands turn at different speeds.

Pendulum
Each swing of the pendulum turns the gears one click, usually once a second.

Counterweight
This weight stores energy so the clock can work without a battery.

The first **pendulum clock** was made by Dutch scientist Christiaan Huygens in 1656.

Then and now

In the past, people had sundials, which showed the time of day using shadows cast by the Sun. Modern digital clocks show time as numbers.

Sundial

Digital clock

Clothing

Over time, the things we wear have changed a lot. The clothes that people wear often reflect where they live, what jobs they do, and how much money they have. Clothes are generally made from woven materials such as cotton, wool, or silk, with special designs. They are often worn for show, but can also be practical or even worn for fun.

First clothes

The first people wore clothes made of animal skins to keep out the cold and wet. They later discovered how to clip the wool off a sheep's back and spin it into a thread that could be woven to make material.

This long, embroidered dress is made of silk.

The **Roman Emperor Nero** wore a **purple toga** and punished anyone else who wore purple with **death**.

A toga wraps around the body and is thrown over the left shoulder.

Roman clothes

The main item of clothing for ancient Romans was a simple tunic. For special occasions, men wore a long piece of cloth called a toga on top of their tunic. Women wore a woollen shawl called a palla.

Court finery

In the royal courts of Europe in the 1500s and 1600s, men and women wore special, expensive clothing. The women wore long, embroidered dresses, while the men wore padded jackets with short trousers and silk stockings.

A sari can be up to **8 m** (27 ft) long.

A long cotton or silk sari is wrapped around the waist.

Kimono

Traditional costume

Around the world, people wear clothes that are unique to their country. For traditional events, Indian women wear saris, while Japanese women wear long, decorated kimonos with wide sleeves. A kimono is tied at the back with an *obi*, or sash.

A padded jacket, called a doublet.

Hats were designed to match the rest of the outfit.

A New Look skirt was full and long, with a small waist.

Weaving

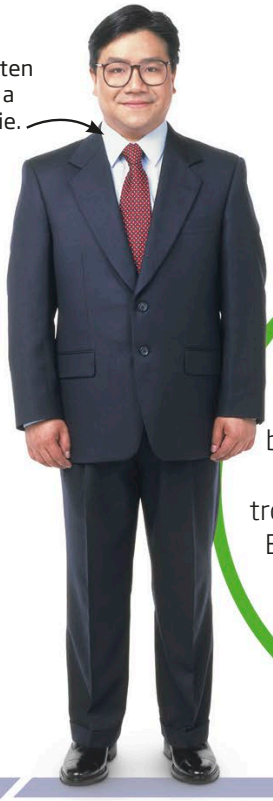
The cotton, silk, wool, or linen material used to make clothes is woven on a loom. Different coloured threads can be used to make different patterns, such as checks or stripes.

Loom

The New Look

During World War II (1939–45), material for new clothes was in short supply. In reaction to this, fashion designer Christian Dior introduced in Paris in 1947 a "New Look" for women. The full skirts were shorter and became fashionable around the world.

A suit is often worn with a shirt and tie.



Traditionally, the **bottom button** of a suit jacket should be **left undone**.

Smart suit

All around the world, businessmen and women wear a suit of a jacket and matching trousers. The suit was developed in Europe during the 1800s and is a practical uniform for work and other formal occasions.

Clouds

Clouds are made of tiny droplets of water or ice. They form when air that contains water rises and cools. As well as making rain, snow, and hail, clouds help control our planet's temperature.

SEE ALSO

- Gases p.117
- Water pp.120–121
- Storms p.246
- Temperature p.252
- Water cycle p.270
- Weather p.271

Types of cloud

There are many different types of cloud. Some float very high up, while others hug the ground. Clouds may look white and fluffy or dark and stormy.

High-level clouds

Cirrus
These wispy clouds form very high up in the air.

Cirrocumulus
Cirrostratus clouds sometimes break up to form these little clouds.

Medium-level clouds

Altostratus
These clouds form a thin sheet across the sky.

Cirrostratus
These thin clouds are made of tiny ice crystals.

Altocumulus
These clouds are broken into segments, or "cloudlets".

Low-level clouds

Stratus
These flat sheets of cloud can be white or grey.

Stratocumulus
These big clouds form a lumpy layer in the sky.

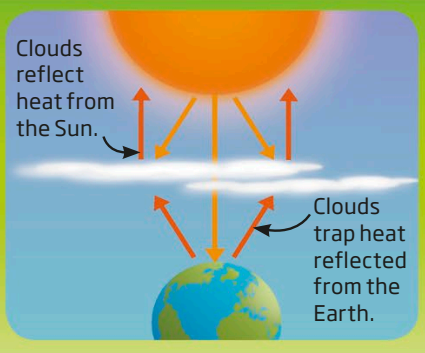
Cumulonimbus
Towering and huge, cumulonimbus clouds are often seen during thunderstorms.

Nimbostratus
Tall and grey, these clouds bring hours of rain or snow.

Cumulus
These fluffy heaps of cloud are often seen on sunny, breezy days.

Temperature control

Clouds reflect the Sun's heat, stopping the Earth from getting too hot. They also trap heat below them, so a cloudy night is warmer than a clear one.



Cloud or UFO?

Clouds that do not move can form in the sheltered air behind areas of high ground, such as mountains. They are shaped like saucers or lenses and have been mistaken for unidentified flying objects (UFOs)!

Coding

Computers follow instructions from special programs. These instructions are known as code, and writing them is called coding. Code can be written in many different coding languages.

SEE ALSO

- Codes p.66-67
- Communication p.69
- Computers p.71
- Internet p.138
- Language p.144
- School pp.272-273

Computer languages

Programming languages tell computers what to do. This example shows a text-based language called Python.

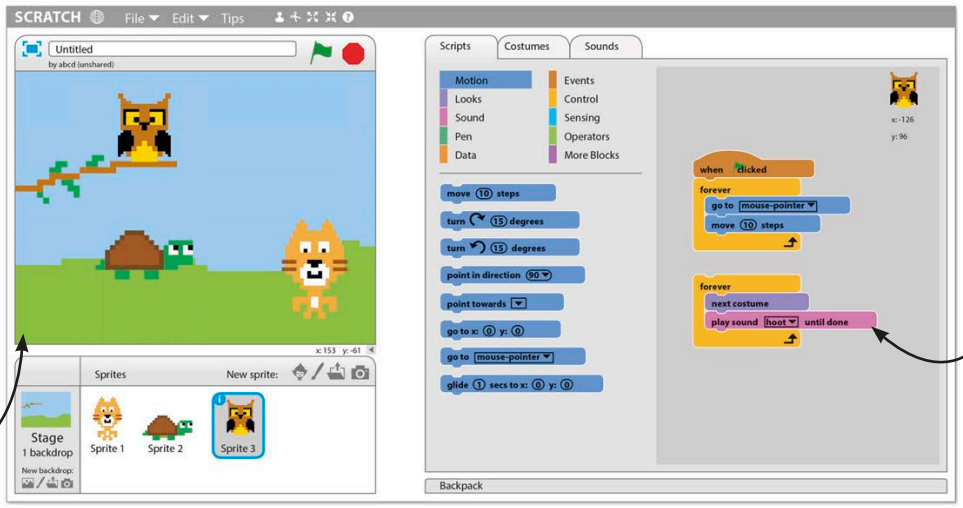
Input
Instructions are typed into a text window. These instructions tell the computer to show, "Hello World!".

Output
When the program is run, it follows the typed instructions. Here, the computer screen shows, "Hello World!".

The first programmer was Lady Ada Lovelace (1815–1852).

Learning to code

Some computer languages are easier to learn than others. Scratch uses colourful blocks of code that you can arrange to make your own games.



Output
The blocks control the actions of the characters here, on the "Stage".

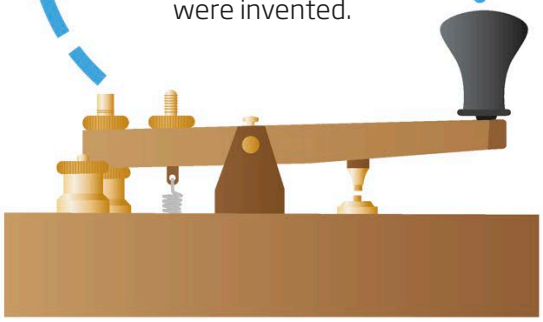
Input
Coding in Scratch is done by putting together instruction blocks.

Codes

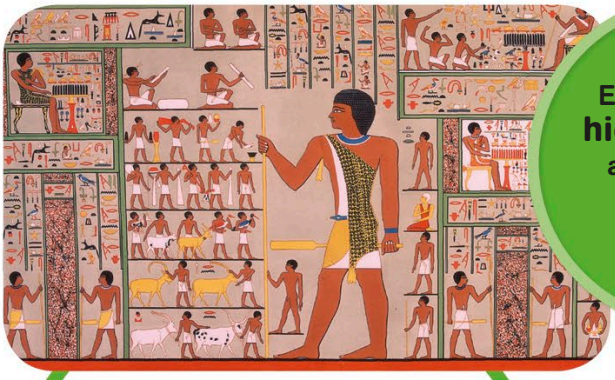
Codes are words, letters, and numbers that are used to represent other words, letters, and numbers. People used codes to communicate with each other, or to keep things secret. Others, such as DNA, are just instructions.

Morse Code

Morse Code represents letters and numbers as dots and dashes. It was used to send messages through wires before telephones were invented.



Morse Code tapping machine



The ancient Egyptians used **hieroglyphics** as a **writing system** to record their history.

Writing with pictures

The ancient Egyptians used drawings to communicate, instead of written words. These symbols are called hieroglyphics. Hieroglyphics were not understood by modern people until a stone was discovered with a translation of hieroglyphics into Greek, allowing the "code" to be worked out.

Languages

The different languages humans speak are types of code. Until you learn a foreign language, hearing someone using it to speak or reading their writing will make little sense to you.

- **您好** Nee-how, Mandarin
- **Bonjour** Boh-zhoo, French
- **Hello** English
- **こんにちは** Konnichiwa, Japanese
- **здравствуйте** Zdrast-wui-tyeh, Russian
- **Merhaba** Mehr-hah-bah, Turkish
- **Holá** Oh-lah, Spanish
- **Jambo** Ja-m-boh, Swahili
- **নমস্কার** Nômoshkar, Bengali

Programming

Computers need instructions to operate. These are created by programmers, who use combinations of symbols and words. Programming is often called coding.

Codes in war

One of the most common uses for codes is to keep secrets, especially during wartime. When commanders give orders to their armies, they need those orders to be kept secret from the enemy. Code breakers try to crack the codes and learn enemy secrets.

This system of writing from ancient Greece is still not understood.

Linear A tablet

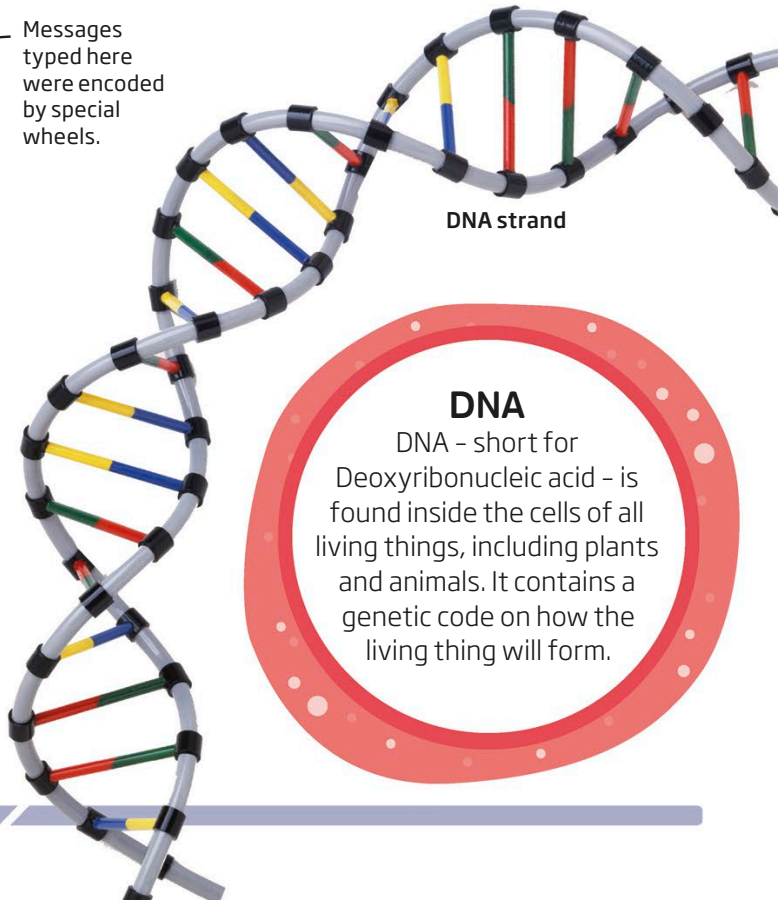
The **Enigma Code** was broken by a machine called a **"bombe"**, created by **Alan Turing**.

Unbroken codes

Some languages remain a mystery – their writings have been discovered but never translated. It is likely that we will never know what they mean.

Messages typed here were encoded by special wheels.

The Enigma machine was used by Germany during World War II.



DNA strand

DNA

DNA – short for Deoxyribonucleic acid – is found inside the cells of all living things, including plants and animals. It contains a genetic code on how the living thing will form.

Comets

Comets are objects in the Solar System made of ice, dust, and rock. They have a hard core and long tails of gas and dust. Every now and again they appear within sight of Earth, before disappearing into deep space.

SEE ALSO

- Asteroids p.30
- Gases p.117
- Gravity p.125
- Meteorites p.164
- Solar System p.233
- Sun p.247

Two tails

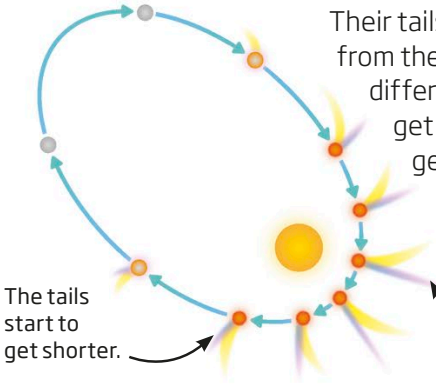
When a comet gets close to the Sun, its ice melts and two tails form: one made of gas and one made of dust.

Halley's Comet

Halley's Comet makes one full circle around the Sun every 75 years, and it has been recorded by historians for more than 2,000 years. The Bayeux Tapestry, which tells the story of the Battle of Hastings, shows it moving across the sky in the year 1066.

Circling the Sun

Comets move around the Sun. Their tails always point away from the Sun, but in slightly different directions. The tails get longer as the comet gets closer to the Sun.



Communication

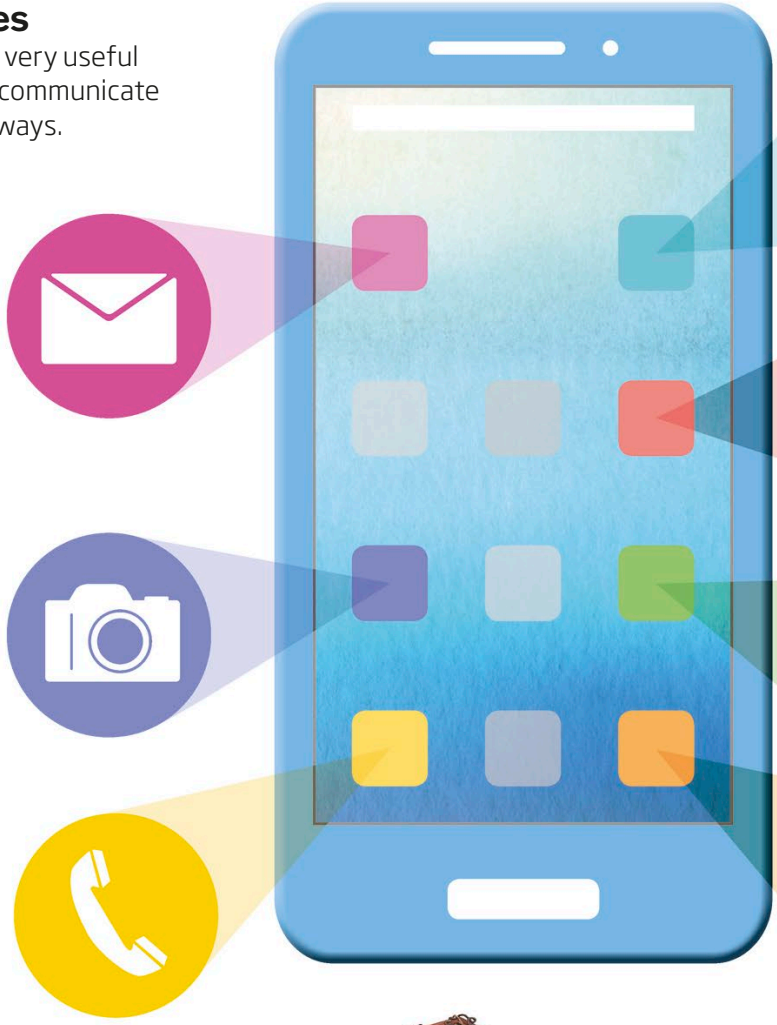
The different ways people keep in touch are all forms of communication. People have many ways of communicating, such as talking to each other or writing letters. Most modern communication other than talking is done using mobile phones.

SEE ALSO

- Codes pp.66-67
- Computers p.71
- Internet p.138
- Satellites p.215
- Games pp.240-241
- Telephones p.250

Mobile phones

Mobile phones are very useful as they let people communicate in many different ways.



Email
Email lets us send written messages. It is much faster than sending a letter through the post.

Photo messaging
Photos can be taken and then shared with other people.

Phone
Using a phone lets you talk to others around the world.

Video calling
This type of call lets you see the person you are speaking to.

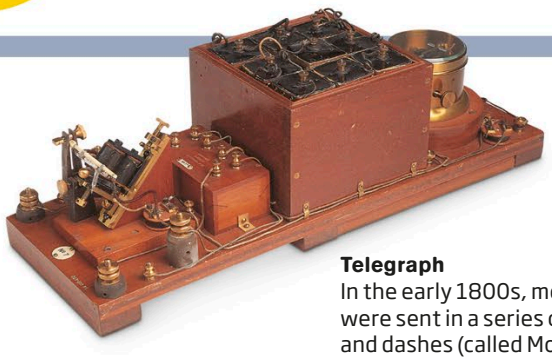
Gaming
People can chat and talk to one another while they play games.

Internet
The internet lets people find out information very quickly.

Texting
Texts are short written messages. Texting is a popular way to communicate.

Past and future

People have always found clever ways to communicate. The first humans drew pictures for each other on cave walls. Modern communication is becoming more high tech.



Telegraph
In the early 1800s, messages were sent in a series of dots and dashes (called Morse Code) over a thin wire.

HoloLens
This is a computer you can wear. It displays 3D objects that the wearer can interact with.

Compass

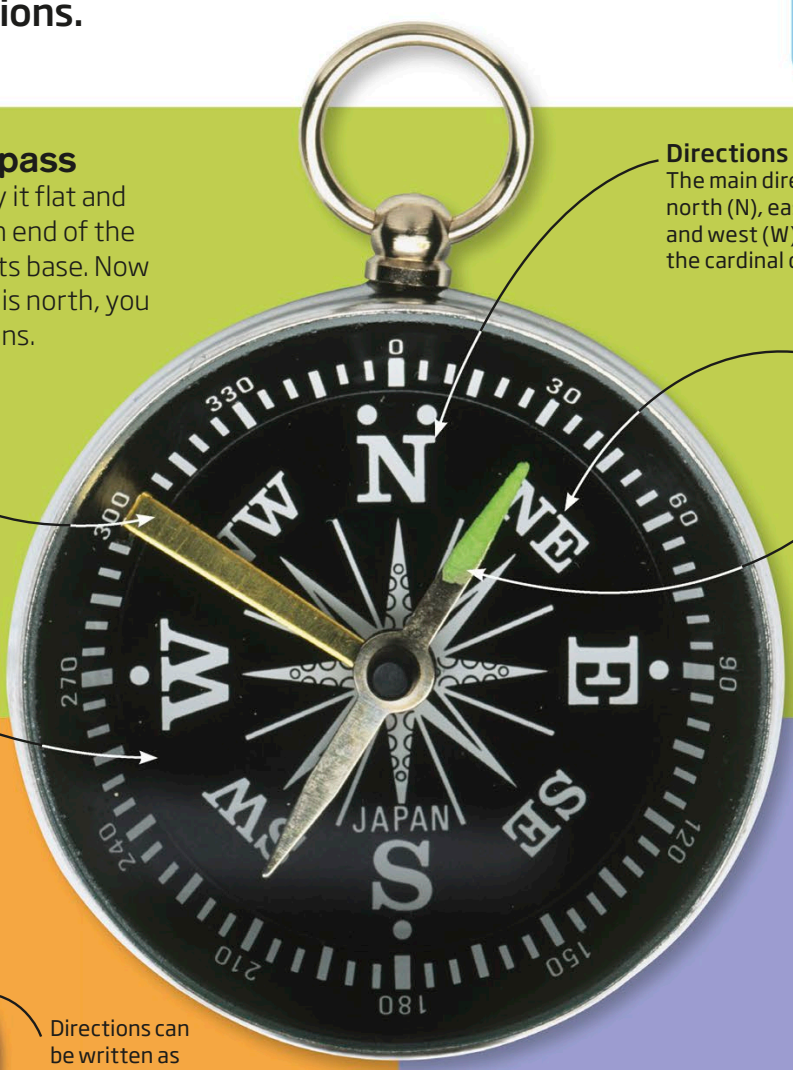
A compass is a simple instrument that helps people find their way around by showing directions. It is usually round and contains a freely rotating, magnetic needle that always points north-south. This lets you work out other directions.

SEE ALSO

- Ancient China p.16
- Inside Earth p.135
- Magnets p.151
- Maps p.155
- Navigation p.182

How to use a compass

When using a compass, lay it flat and then turn it until the north end of the needle is above north on its base. Now you know which direction is north, you can find the other directions.



Directions
The main directions are north (N), east (E), south (S), and west (W). They are called the cardinal directions.

Finer directions
Between the four cardinal directions are more precise ones, such as northeast (NE) and southwest (SW).

Needle
The magnetic needle detects Earth's magnetic field and lines up with north-south. The end of the needle pointing to north is usually coloured or marked.

Direction hand
This hand can be turned to mark the direction that you want to travel towards.

Compass rose
The base of the compass shows all the different directions and is known as the compass rose.

Directions can be written as angles. For example, southwest is 225°.

Walking compass

A walking compass has a see-through back so that it can be used on top of a map. This lets you work out where you are and which direction you want to go in.

21st-century compass

Many of today's phones contain a device called a magnetometer. It detects the Earth's magnetic field and lets you use your phone as a compass.

A compass on a phone shows which direction the phone is pointing in.

Computers

Computers are machines that store information and can be programmed to perform tasks. Many show information on a screen, such as on a mobile phone or a laptop. Others are hidden inside objects to make them work.

SEE ALSO

- Coding p.65
- Codes pp.66–67
- Communication p.69
- Internet p.138
- Machines p.150
- Robots p.212

How computers work

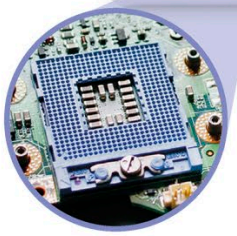
Computers are programmed in code to perform different tasks. This is called software. The programs are stored and run by the parts, or hardware, of the computer.

Screen
Words and images are displayed on the screen.

USB port
Work can be saved and moved between devices on a tiny hard drive, called a USB. It is plugged in here.

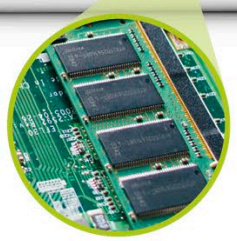
Battery
Computers need electricity to work. The battery provides and stores the electricity.

Keyboard
Words typed on the keyboard appear on the screen.



Processor
This part performs the calculations that make the computer work.

Motherboard
This connects everything, so that different parts of the computer can communicate.



RAM
This part stores information, but only while the computer is switched on.

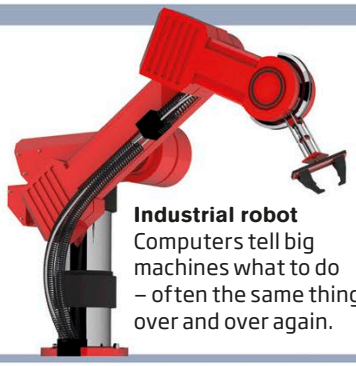
Hard drive
This stores information even when the computer is switched off.

How we use computers

Computers are found inside many everyday objects. Computers let us program these machines to perform specific tasks.

Traffic lights
Computers control when the lights change colour.

Video games
Game consoles are computers that let you play games on a television screen.



Industrial robot
Computers tell big machines what to do – often the same thing over and over again.

Conservation

Conservation is the protection of habitats and the plants and animals that live in them. This is important because human activity, such as cutting down trees and throwing away rubbish, destroys animal homes.

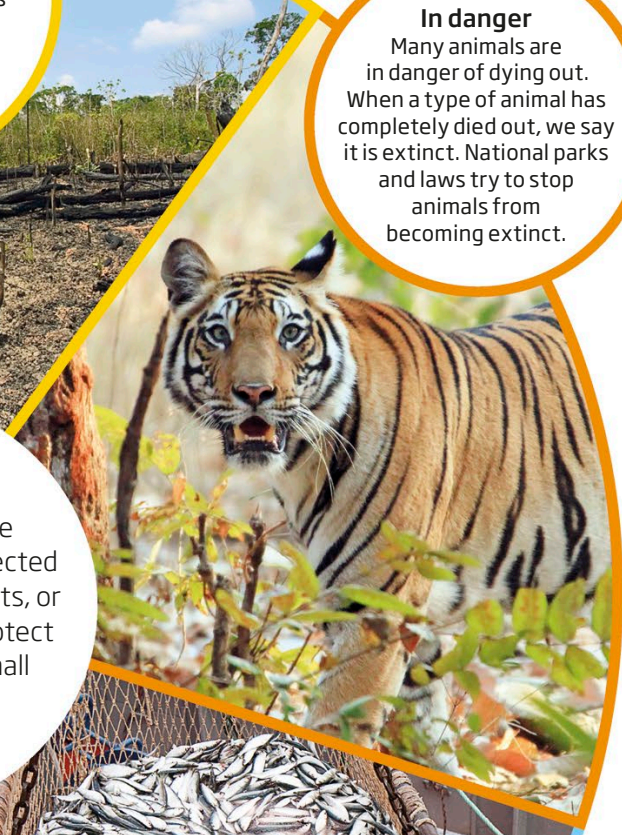
SEE ALSO

- Climate change p.60
- Farming p.98
- Forests p.109
- Habitats p.126
- Pollution p.198
- Zoo p.281

Habitats
Animals live in areas we call habitats. When people damage habitats, they threaten many animals and plants. Wildlife reserves protect habitats and the animals that live in them.

Forests
People cut down trees for wood and to make space for farms. Some wood is used to make paper. Recycling paper helps save trees.

In danger
Many animals are in danger of dying out. When a type of animal has completely died out, we say it is extinct. National parks and laws try to stop animals from becoming extinct.



Under threat
Here are some of the ways humans have affected animals and their habitats, or homes. We can help protect animals by making small changes in our everyday lives.

Pollution
Pollution happens when people release dirty or harmful substances into the world around them. It can kill wildlife. Reusing and recycling things reduces the amount we throw away.

Fishing
People have caught so many fish from the sea that many species are becoming rare. We can now choose to eat farmed fish instead, leaving wild fish alone.

Constellations

Ancient civilizations looked at the night sky and grouped stars into patterns or constellations to represent heroes, creatures, and objects. As the Earth moves, the constellations appear to move across the sky. The stars are all at different distances from the Earth.

SEE ALSO

- Ancient Greece p.18
- Galaxies p.116
- Myths and legends p.178
- Navigation p.182
- Seasons p.221
- Stars p.242

Modern constellations

Astronomers today look at 88 constellations. Some can be seen from both the north and south parts of the world, others from only one or the other.

This star is called Menkent, meaning "shoulder of the Centaur".

This star is called Mizar.

Ursa Major
Also known as the Big Dipper, Ursa Major ("great bear") can only be seen from the northern half of Earth.

Centaurus
This constellation represents a half-man, half-horse creature from Greek myth. It is only visible from the southern half of Earth.

Betelgeuse is a red supergiant star.

Orion's belt

Orion
The hunter, Orion, is one of the most well-known constellations. Three bright stars line up to make Orion's belt.

Navigation

Ancient sailors used the constellations to find where they were. By looking at the pattern of stars they could work out where they were on Earth. One key signpost was Polaris, the North Star.

Over thousands of years, stars shift and constellations change their shape.

Coral reefs

Coral reefs are underwater structures where many plants and animals live. They are made by tiny animals called corals that grow hard shells. When they die, the shells remain and new corals grow on top of them. Some coral reefs can grow very big.

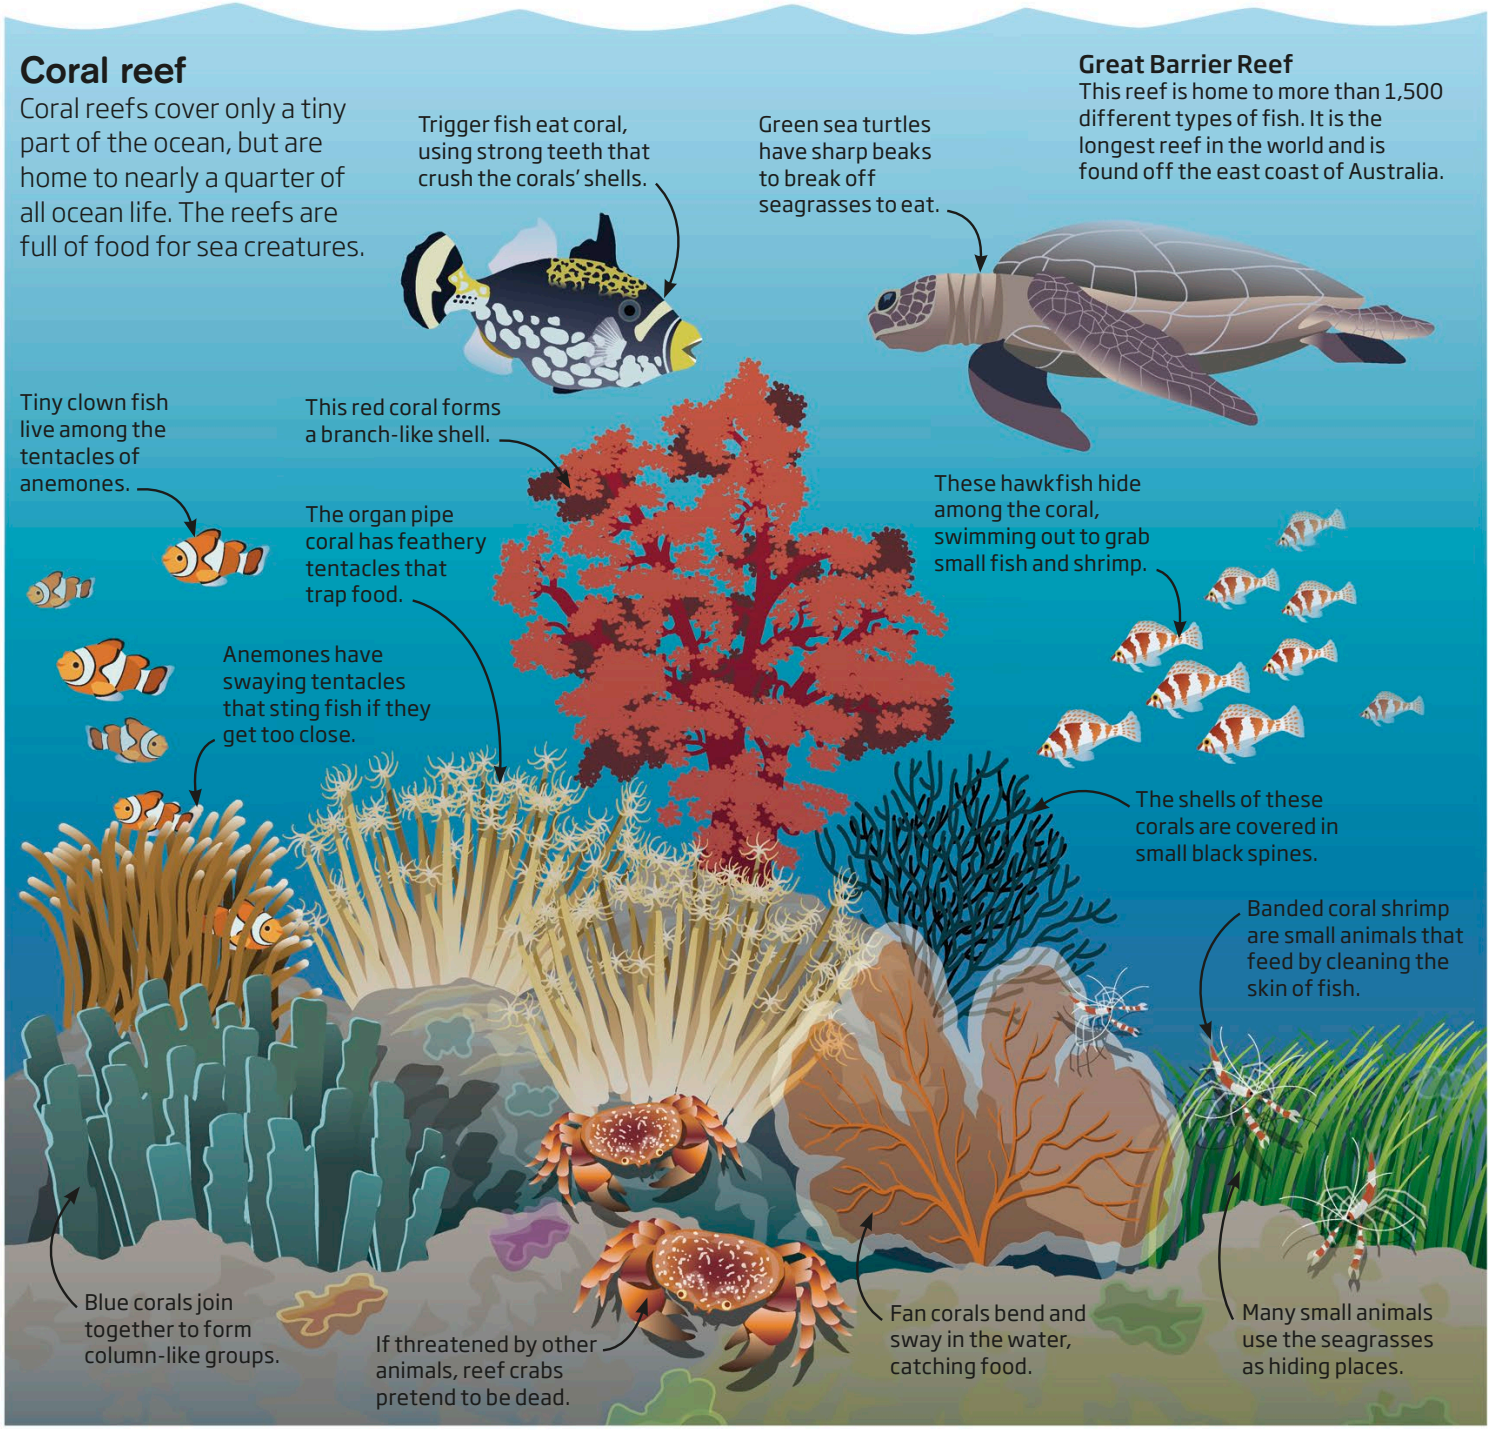
SEE ALSO

- Animal homes p.23
- Fish p.101
- Invertebrates p.139
- Oceans and seas p.187
- Vertebrates p.266

Coral reef

Coral reefs cover only a tiny part of the ocean, but are home to nearly a quarter of all ocean life. The reefs are full of food for sea creatures.

Great Barrier Reef
This reef is home to more than 1,500 different types of fish. It is the longest reef in the world and is found off the east coast of Australia.



Crafts

A craft is something done by hand, often with a lot of skill. People have always used natural and artificial materials, such as clay or glass, to make things. Craft objects can be for everyday use, such as plates to eat off, or for decoration, such as jewellery.

SEE ALSO

- Ancient Rome p.20
- Art p.28
- Books p.44
- Clothing pp.62-63
- Inventions pp.136-137

Pottery

Potters use clay from the ground to make things such as plates, bowls, cups, and vases. They shape the clay, then put it in a special oven called a kiln to heat it up and make it hard.

Red terracotta clay

Ancient Egyptian vase

African wooden figure

Woodcarving

Woodworkers shape wood into different things. They can make furniture, bowls, and other useful or decorative items.

Glass Roman jug

Glasswork

When sand is heated to a very high temperature, it becomes liquid glass. This can be shaped and cooled into solid objects such as jugs.

Native American woven rug

Weaving

Weavers bring together wool, silk, or cotton threads to make material. This can be used for many things, such as clothes, rugs, and wall decorations.

Beads are made in different sizes and shapes.

Ancient Middle-Eastern beads

Beading

Materials such as glass can be made into beads. Beads can be threaded onto string to make jewellery, or sewn onto clothing.

Dance

Moving your body in time to a beat is called dancing. People dance to music to enjoy themselves, to be close to their friends, and to show their skills. Dances can be very formal with set movements to follow, or much more casual and relaxed.

SEE ALSO

- Clothing pp.62-63
- Music pp.176-177
- Festivals pp.206-207
- Religion p.208
- Sport p.239
- Theatre p.253

Traditional dance

Many countries or regions have their own dances, called traditional dances. Korean fan dancing involves making shapes with fans.

Tribal dance

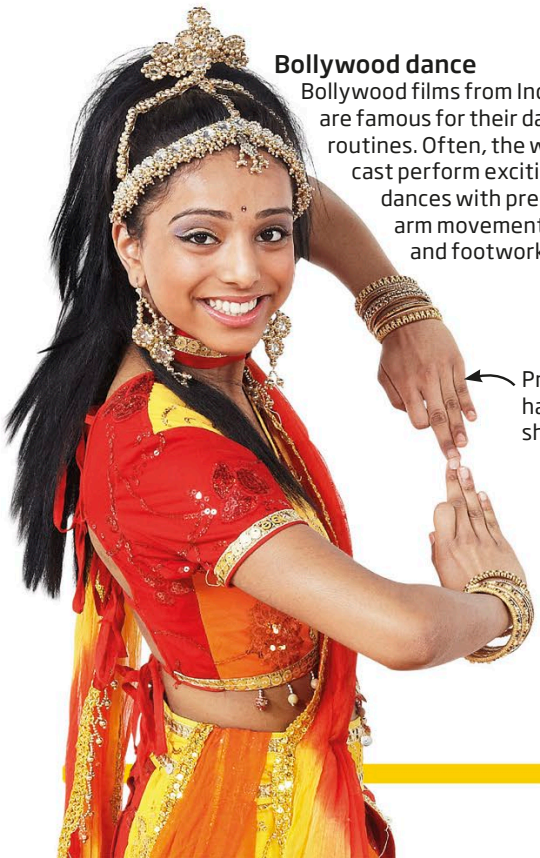
Many African tribal dances follow drum beats and have strong rhythms. The historical dances of tribes can include whole crowds.

Religious dance

Some people in the Islamic religion dance by spinning round in circles. This is called Sufi whirling and helps them feel closer to God.

Ballet

Ballet is a formal dance style with graceful and strong moves. Ballet dancers use a series of precise steps, leaps, and lifts.



Bollywood dance

Bollywood films from India are famous for their dance routines. Often, the whole cast perform exciting dances with precise arm movements and footwork.

Street dance

Street dance often involves dancers making up their own moves to hip-hop music. They usually do flips and spins.

Latin dance

Latin dance began in Latin America. Dances such as the tango involve two people dancing close together, as if they are in love.

Day and night

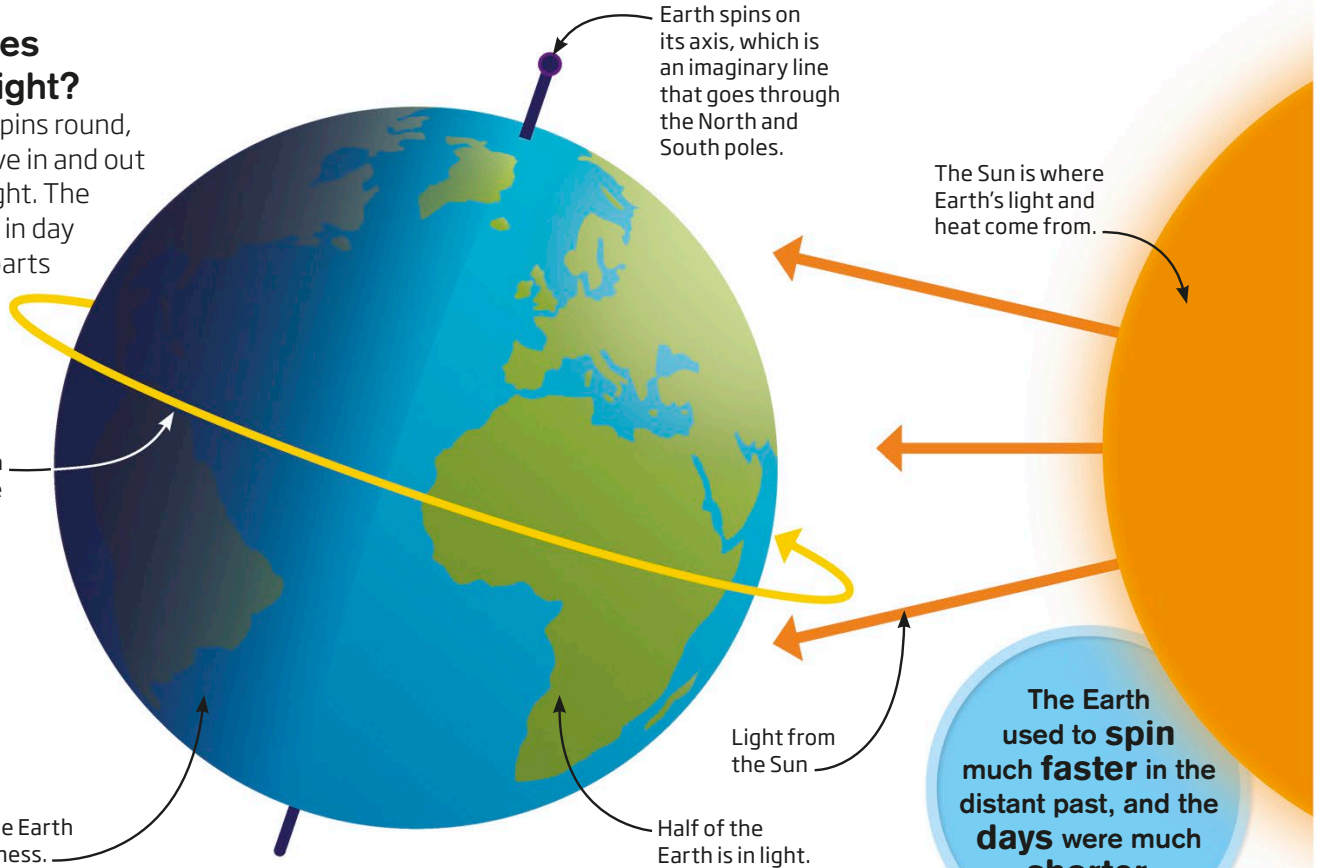
Day and night are times of light and darkness that occur because the Earth spins, or rotates. One full day-and-night cycle is called a "day" for short. The half of the spinning Earth that faces the Sun has daylight, and the half facing away from the Sun is in darkness.

SEE ALSO

- Earth p.83
- Light p.147
- Moon p.171
- Seasons p.221
- Solar System p.233
- Sun p.247
- Tides p.254

What makes day and night?

As the Earth spins round, parts of it move in and out of the Sun's light. The light parts are in day and the dark parts are in night.



The Earth used to spin much faster in the distant past, and the days were much shorter.

Moving Sun

The Sun appears to move across the sky during the day as the Earth spins around it. It rises in the east and sets in the west. In the summer, the Sun is higher in the sky than in the winter.

Eclipses

The Moon circles the Earth. Occasionally, it blocks our view of the Sun during the day, and the sky darkens for a few minutes. This event is called a solar eclipse. If the Moon blocks all of the Sun, it is called a total eclipse, and stars can be seen in the sky.

Total eclipse

Deserts

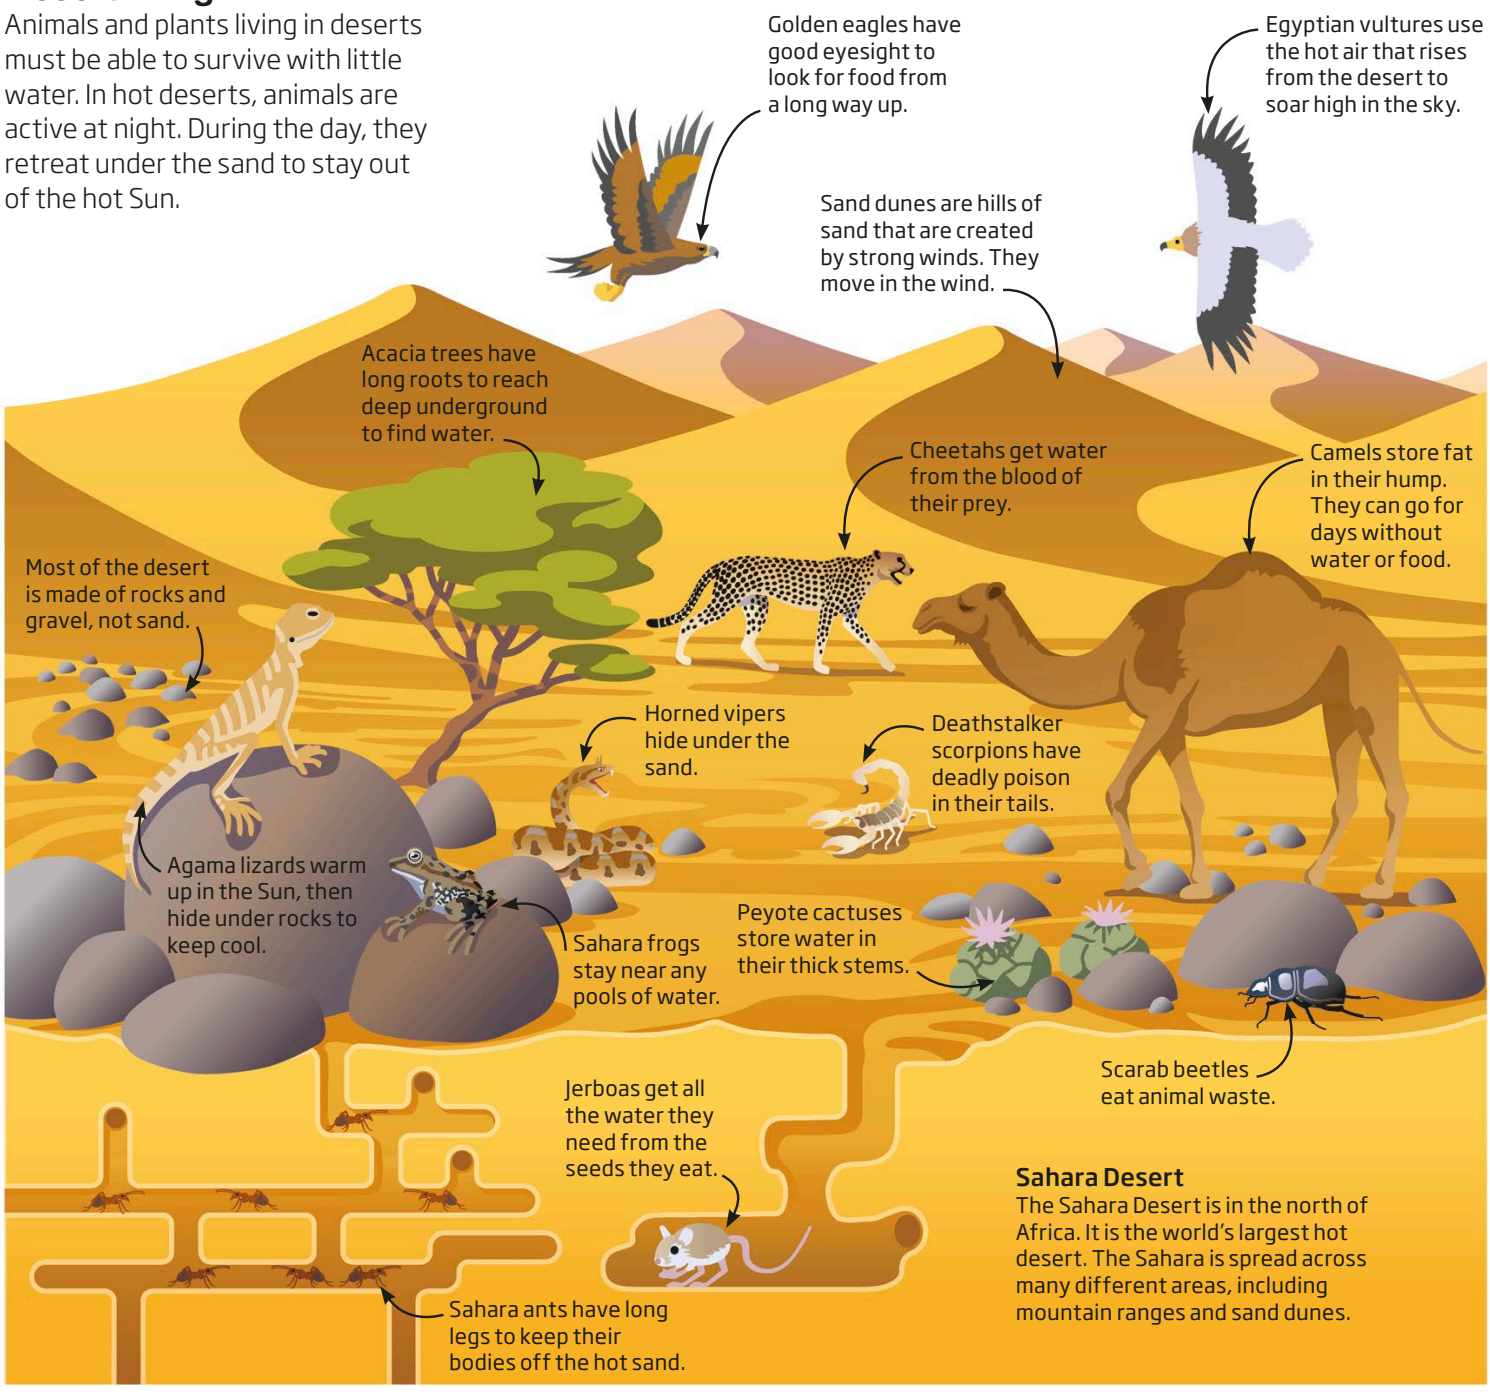
The world's driest areas are deserts. They have less than 25 cm (10 in) of rain a year. Deserts can be sandy, rocky, or even icy. Most deserts have hot days and cold nights. Some animals survive here by getting water from plants or by only moving around after sunset.

SEE ALSO

- Africa p.12
- Antarctica p.24
- Habitats p.126
- Mountains p.172
- Plants p.194
- Reptiles p.210
- Weather p.271

Desert living

Animals and plants living in deserts must be able to survive with little water. In hot deserts, animals are active at night. During the day, they retreat under the sand to stay out of the hot Sun.



Sahara Desert

The Sahara Desert is in the north of Africa. It is the world's largest hot desert. The Sahara is spread across many different areas, including mountain ranges and sand dunes.

Digestion

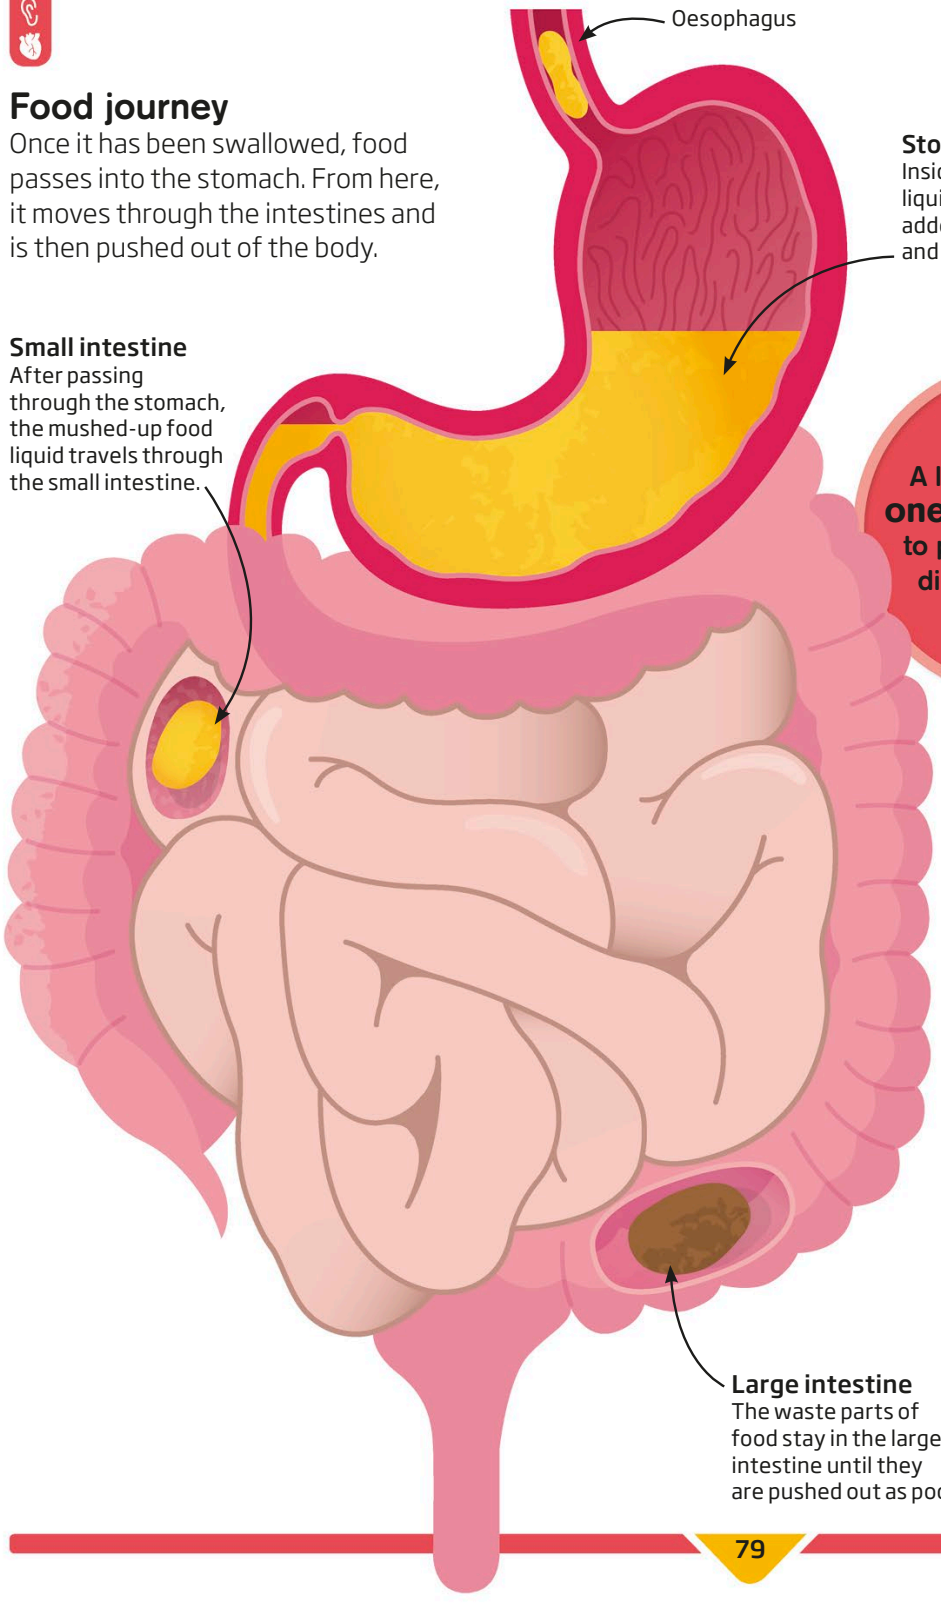
Digestion is when we eat food and it gets broken down and used by our bodies to give us the energy we need to move and stay healthy. Your digestive system starts with your mouth and ends at your bottom.

SEE ALSO

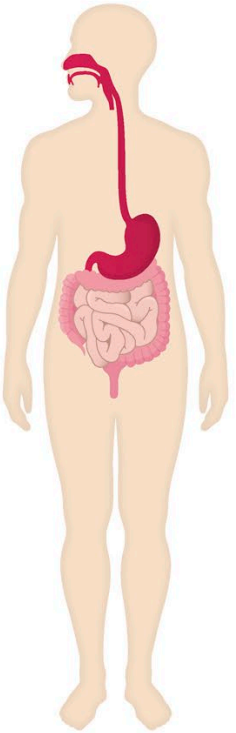
- Food p.106
- Eating pp.104–105
- Human body p.130
- Lungs p.149
- Taste p.249

Food journey

Once it has been swallowed, food passes into the stomach. From here, it moves through the intestines and is then pushed out of the body.



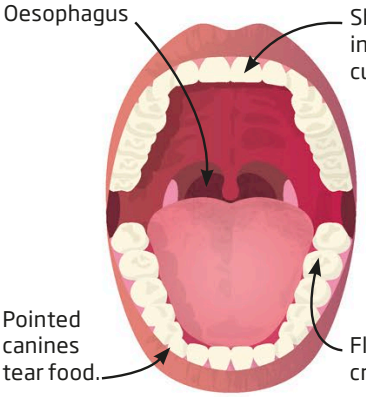
A large meal takes one to three days to pass through the digestive system.



Digestive system

In the mouth

When we chew, food is broken and mixed with saliva. Different teeth do different jobs. When the chewed food is swallowed, it goes down a tube called the oesophagus.



Dinosaurs

Dinosaurs are reptiles that lived on Earth for 160 million years, about 225 million years ago. Some were fierce meat-eaters, others gentle plant-eaters. Scientists have learned about dinosaurs from studying the fossils left behind when the dinosaurs died.

SEE ALSO

- Asteroids p.30
- Birds p.39
- Fossils p.111
- Prehistoric life p.202
- Reptiles p.210
- Rocks and minerals p.214

Ceratopsians

Ceratopsians were plant-eating dinosaurs. They had a protective frill around their head.

Triceratops's frill was used to protect the neck during fights.

The horns were used for defending itself against other dinosaurs.

Dinosaur fossils

The remains of dinosaurs have been preserved in rock. Some even show the dinosaur's last meal still inside them.

Archaeopteryx fossil

Dinosaur remains have been found on every continent, including Antarctica.

The sharp beak was used for tearing pieces off tough plants.

The legs had to be strong, as Triceratops weighed the same as four cars.

A long neck let Brachiosaurus reach leaves at the top of tall trees.

Triceratops (try-SER-uh-tops)

Tyrannosaurus rex (TIE-ran-oh-SORE-us rex)

Sharp teeth let T. rex tear meat off bones.

Theropods

Theropods were fierce meat-eating dinosaurs. They lived in what is now North America.

The long tail was used for balance.

Sauropods

Sauropods were enormous plant-eating dinosaurs. They had to eat all the time to fuel their huge bodies.

Brachiosaurus (brack-ee-oh-SORE-us)

Dogs

Dogs are meat-eaters with sharp teeth and excellent senses. They include wild jackals, foxes, and wolves, as well as the tame dogs we keep as pets in our homes. Wild dogs hunt for food or eat animals that have already died.

SEE ALSO

- Animal families p.21
- Cats p.54
- Deserts p.78
- Hearing p.127
- Pets pp.152–153
- Work p.274

Pet dogs

There are lots of different types of dog. Some are friendly and make good pets. Some are strong and loyal to their owners and are good at guarding things.

There are more than **300** different types of pet dog.

Irish Wolfhound

Beagle

Lhasa Apso

Grey wolf

Wolves

The grey wolf is the most closely related animal to pet dogs. Wolves live and hunt in groups called packs.

Fennec fox

Foxes

These pointy-eared animals can be found in deserts, icy locations, mountains, and even cities. The fennec fox is the smallest fox.

Working dogs

For thousands of years, dogs have been known as man's best friend. This is because they work closely with people. Dogs work in the fields, hunt, and even sniff out people who have been buried in rubble or snow.

Early humans

The first humans were similar to apes, such as gorillas and chimpanzees. Over millions of years, they learned to walk on two legs and got smarter as their brains grew larger. They also lost most of their body hair, slowly becoming more like the humans we are today.

SEE ALSO

- Africa p.12
- Evolution p.95
- Fossils p.111
- Monkeys and apes p.170
- Exploration pp.180–181
- Stone Age p.243

Ancient humans

There were many different types, or species, of human relatives. Some of them lived at the same time and may have met each other regularly.

7 million years ago

Hominins
Early human-like species, called hominins, developed from apes. They spent a lot of their time in trees, and began walking on two legs.

4 million years ago

Pre-humans
Australopithecus is a species of hominin that learned to walk fully upright, like humans do today.

3 to 2.5 million years ago

First tool-makers
Homo habilis was one of the first species to use stone tools to help with work. The tools made it easier for them to get food.

2 million years ago

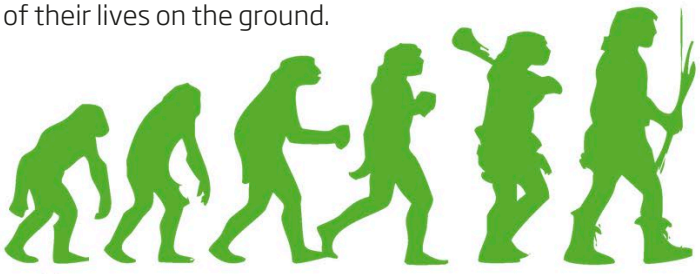
First fire-makers
Human relatives became steadily more clever and ate more meat. Homo erectus may have been using fire to cook food over a million years ago.

200,000 years ago

Modern humans
Modern humans appeared in Africa. The tools they made helped them adapt to other environments. They spread across the world, while other human-like species died out.

Human evolution

The first human-like animals were short, had small brains, and lived mostly in trees. Over many years, they began spending more of their lives on the ground.



How do we know?

Ancient humans left behind bones and tools. Scientists study the bones to learn everything from how ancient humans walked to what they ate and what diseases they had. Their tools can reveal information about daily life.

Ancient skull

Earth

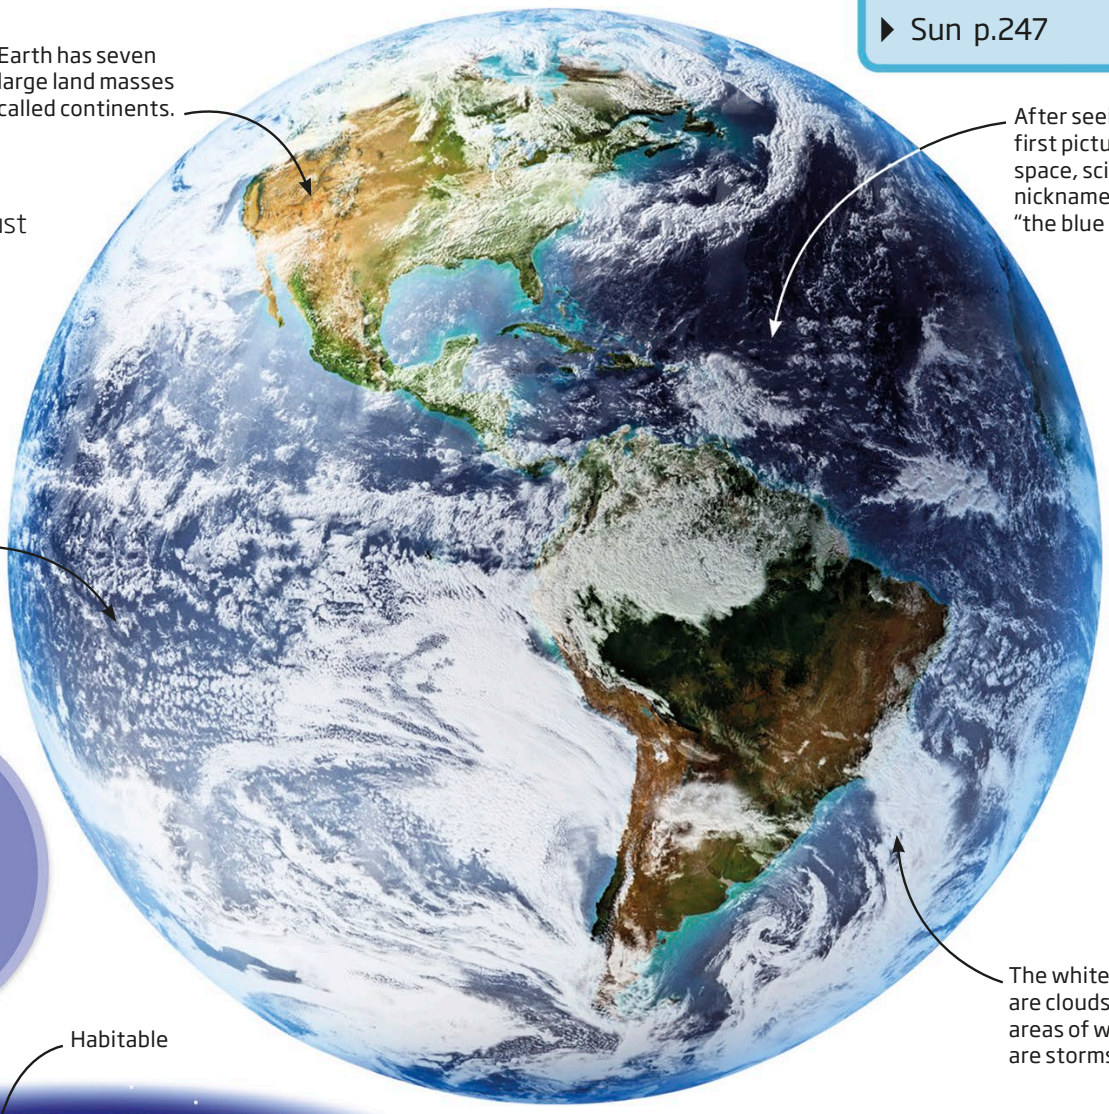
Earth is the planet we live on. It is the third planet away from the Sun and the largest rocky planet in the Solar System. Earth is about 4.5 billion years old. At the moment it is the only planet known to support life.

SEE ALSO

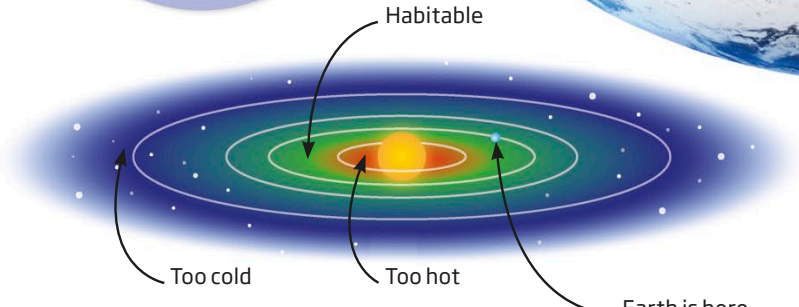
- Atmosphere p.33
- Earth's surface p.84
- Gases p.117
- Water pp.120–121
- Solar System p.233
- Sun p.247

Our home

Earth has all the right conditions for life. It is just the right distance from the Sun, it has oceans of liquid water, and a blanket of gases called an atmosphere that protects it from outer space.



About **70 per cent** of the Earth's surface is **covered in liquid water.**



Safe zone

Earth orbits the Sun in what is known as the habitable zone (in green), where liquid water can exist. Closer to the Sun, it is too hot, and further away it is too cold.

Earthrise

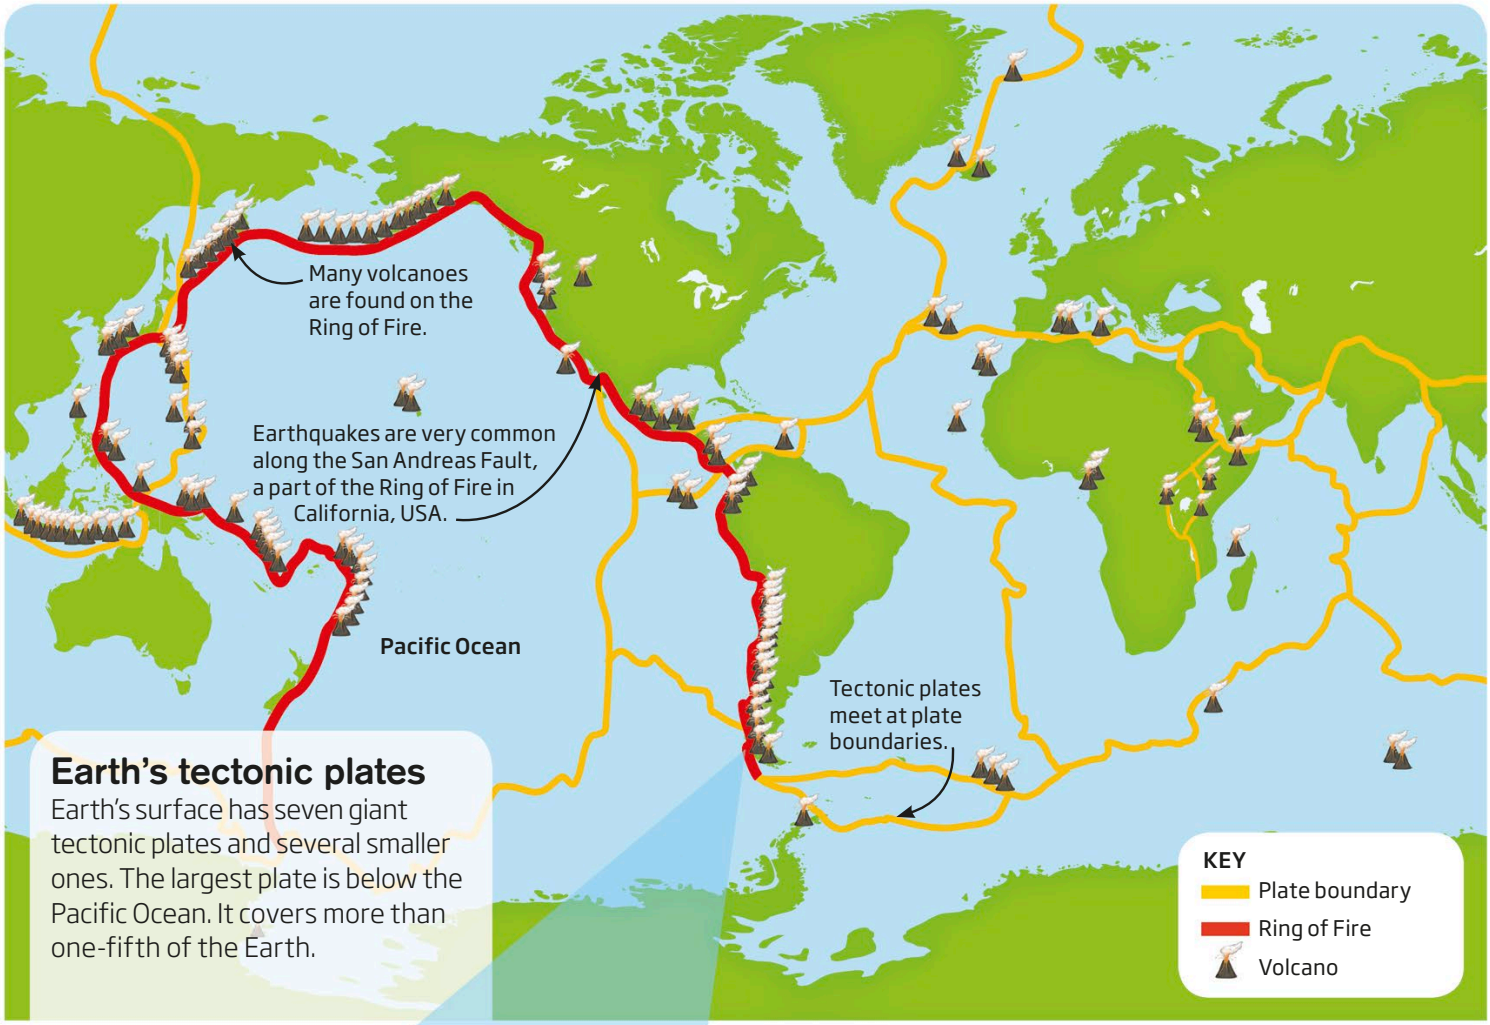
On Earth, we see a sunrise and a moonrise as the Sun and Moon become visible in the sky. When astronauts orbited the Moon in 1968, they saw our own planet rising in the sky.

Earth's surface

The outer layer of the Earth is called the crust. It is made up of many pieces, called tectonic plates, which fit together like a giant, ball-shaped jigsaw. Tectonic plates move very slowly, just a few centimetres each year.

SEE ALSO

- Earthquakes p.85
- Inside Earth p.135
- Mountains p.172
- Oceans and seas p.187
- Volcanoes p.268
- World p.275



Earth's tectonic plates

Earth's surface has seven giant tectonic plates and several smaller ones. The largest plate is below the Pacific Ocean. It covers more than one-fifth of the Earth.

Ring of Fire

Volcanic eruptions and earthquakes are common at the plate boundaries around the Pacific Ocean. This is known as the Ring of Fire.

Mountains

The Himalayas are a mountain range in Asia at the boundary between two tectonic plates. The range formed over millions of years as the plates pushed into each other, forcing the ground up. The mountains are still rising by about 5 mm (1/5 in) every year.

Earthquakes

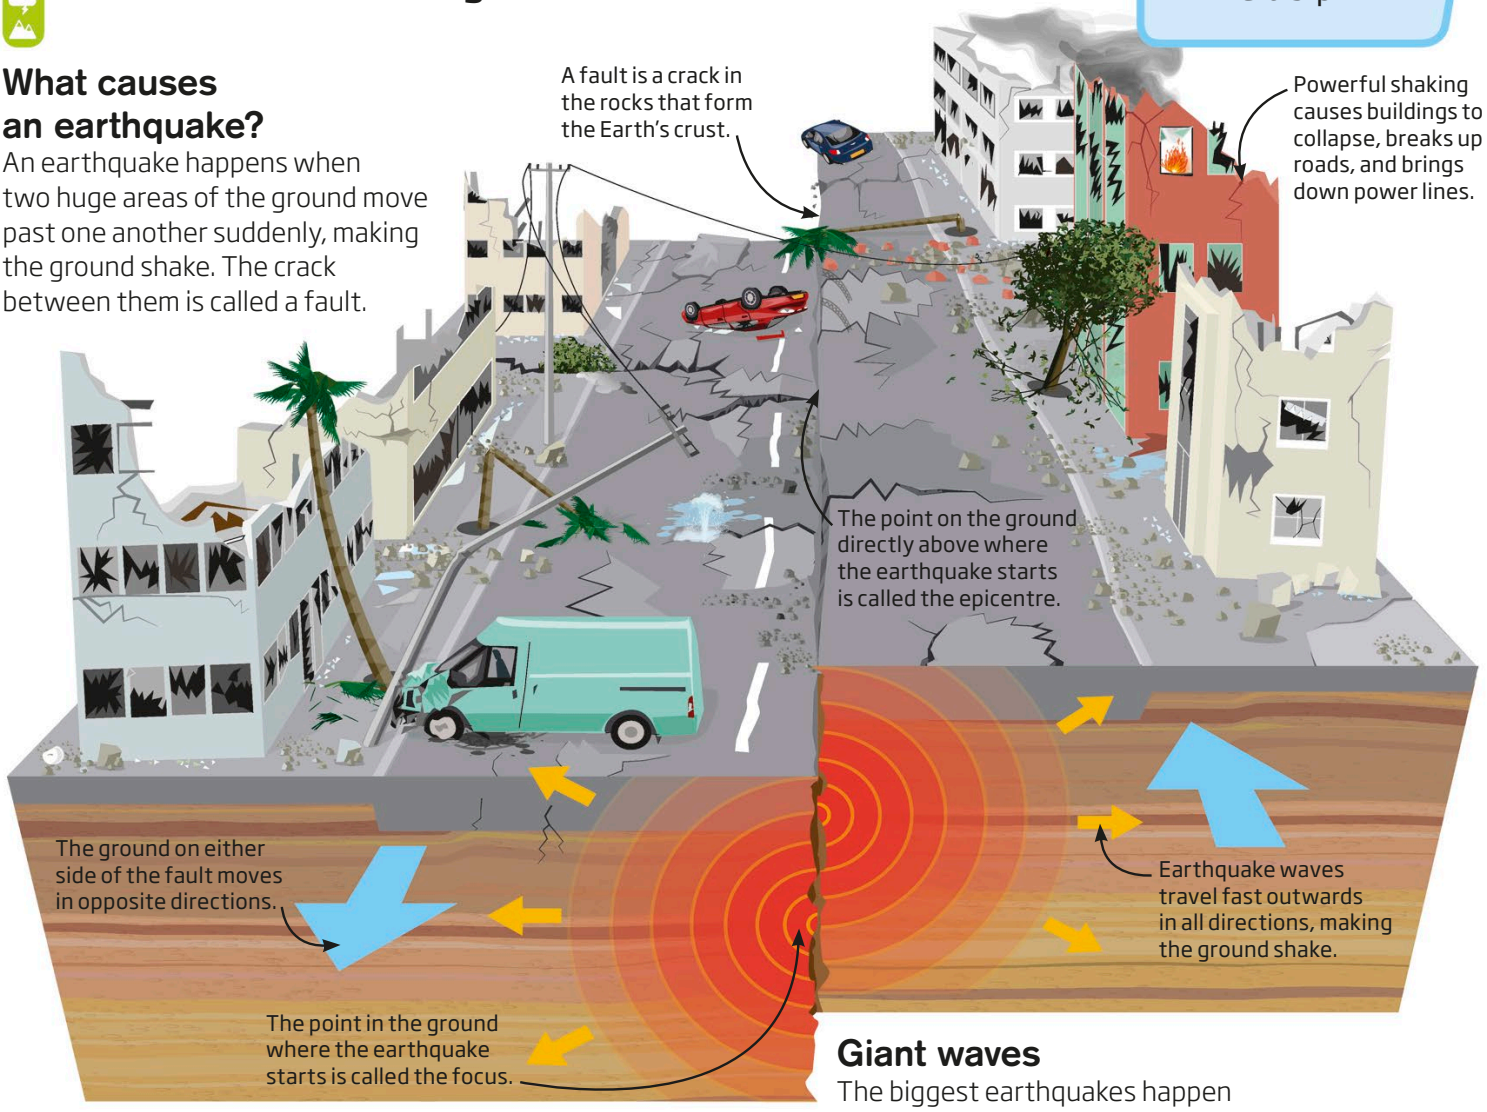
An earthquake is when the ground shakes. Earthquakes happen along cracks in the Earth's crust, known as faults. Small earthquakes can only just be felt by humans, but the biggest can cause enormous damage.

SEE ALSO

- Buildings p.48
- Changing world pp.50–51
- Earth's surface p.84
- Inside Earth p.135
- Rocks and minerals p.214

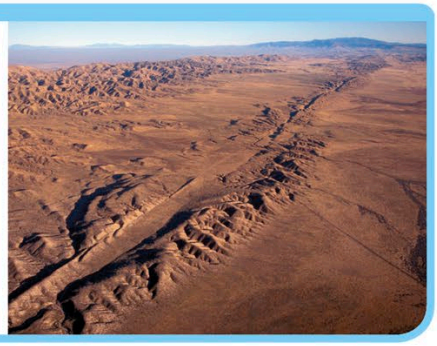
What causes an earthquake?

An earthquake happens when two huge areas of the ground move past one another suddenly, making the ground shake. The crack between them is called a fault.



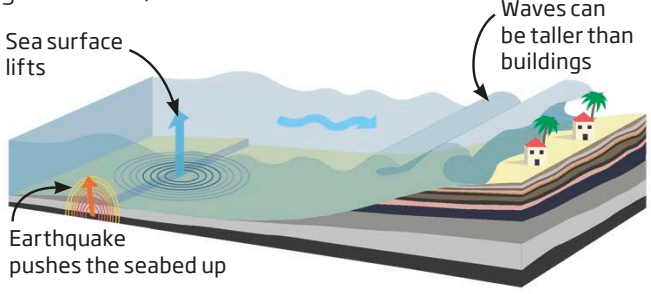
San Andreas Fault

The San Andreas Fault is a large crack in the ground that slices through the US state of California. It marks the join between two huge pieces of the Earth's crust, called plates. Big earthquakes happen on the fault about every 10 years.



Giant waves

The biggest earthquakes happen under the sea. They make the sea bulge upwards, forming dangerous giant waves, known as tsunamis.



Eggs

Some young animals grow and develop inside round objects called eggs. There are different types of egg. The size of the egg and the length of time it takes to hatch depends on the size of the animal that laid it.

SEE ALSO

- Amphibians p.15
- Birds p.39
- Fish p.101
- Life cycle p.146
- Mammals p.154
- Metamorphosis p.163

Bird eggs

Bird eggs are hard and waterproof. They are kept warm, or incubated, by one of the parents. Most bird eggs are kept safe in a nest.

Ostrich eggs are the largest in the world.

It takes 42 days for an ostrich chick to be ready to hatch.

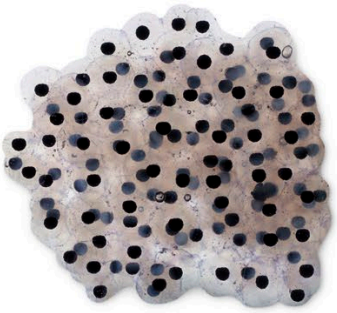
Ostrich chick

Egg-laying mammals

Most mammals give birth to live babies. Only one group, called monotremes, lay eggs. The monotreme shown here is called an echidna.

Tortoise hatchlings are male or female depending on how warm the egg was kept.

Leopard tortoise hatchling



Frogspawn

Dogfish eggs look like leathery bags, which are sometimes called "mermaid's purses".

Fish eggs

Most fish produce lots of eggs and don't look after them. But they do lay the eggs in places like sea grasses to keep them safe.

Reptile eggs

Reptile eggs are soft and leathery. The mother buries them in the ground and leaves them to hatch on their own.

Amphibian eggs

Amphibians such as frogs and toads lay wet eggs in water. When they are ready, the eggs hatch and tadpoles come out.

Electricity

Electricity is the flow of tiny charged particles called electrons. It is used to power lights and electrical appliances, such as kettles and televisions, in our homes, at school, and all around us.

SEE ALSO

- Atoms p.34
- Circuits p.59
- Energy pp.88–89
- Materials p.157
- Metals p.162
- Television p.251

Lightning

Lightning is a type of natural electricity called static electricity. Tiny bits of ice in the clouds rub together, charging up electricity until a big spark of lightning occurs.

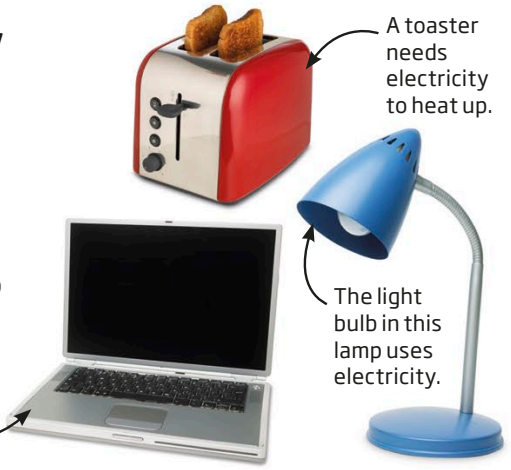
Making electricity

We make electricity from different types of energy. For example, solar panels change the Sun's light energy into electricity, and wind turbines change the wind's movement energy into electrical energy.

Wind turbines

Using electricity

Appliances like kettles and televisions in our homes work when we press a switch to connect them to electricity. Electricity flows through them to make them function.

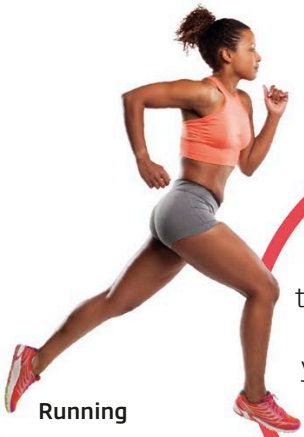


Energy

Energy is power to make things happen. It is everywhere around us. Heat, light, and movement are types of energy. We need energy to make our bodies work and it's what we use to make electricity and power our homes. Energy can be stored and it can change from one form to another.

Fossil fuels

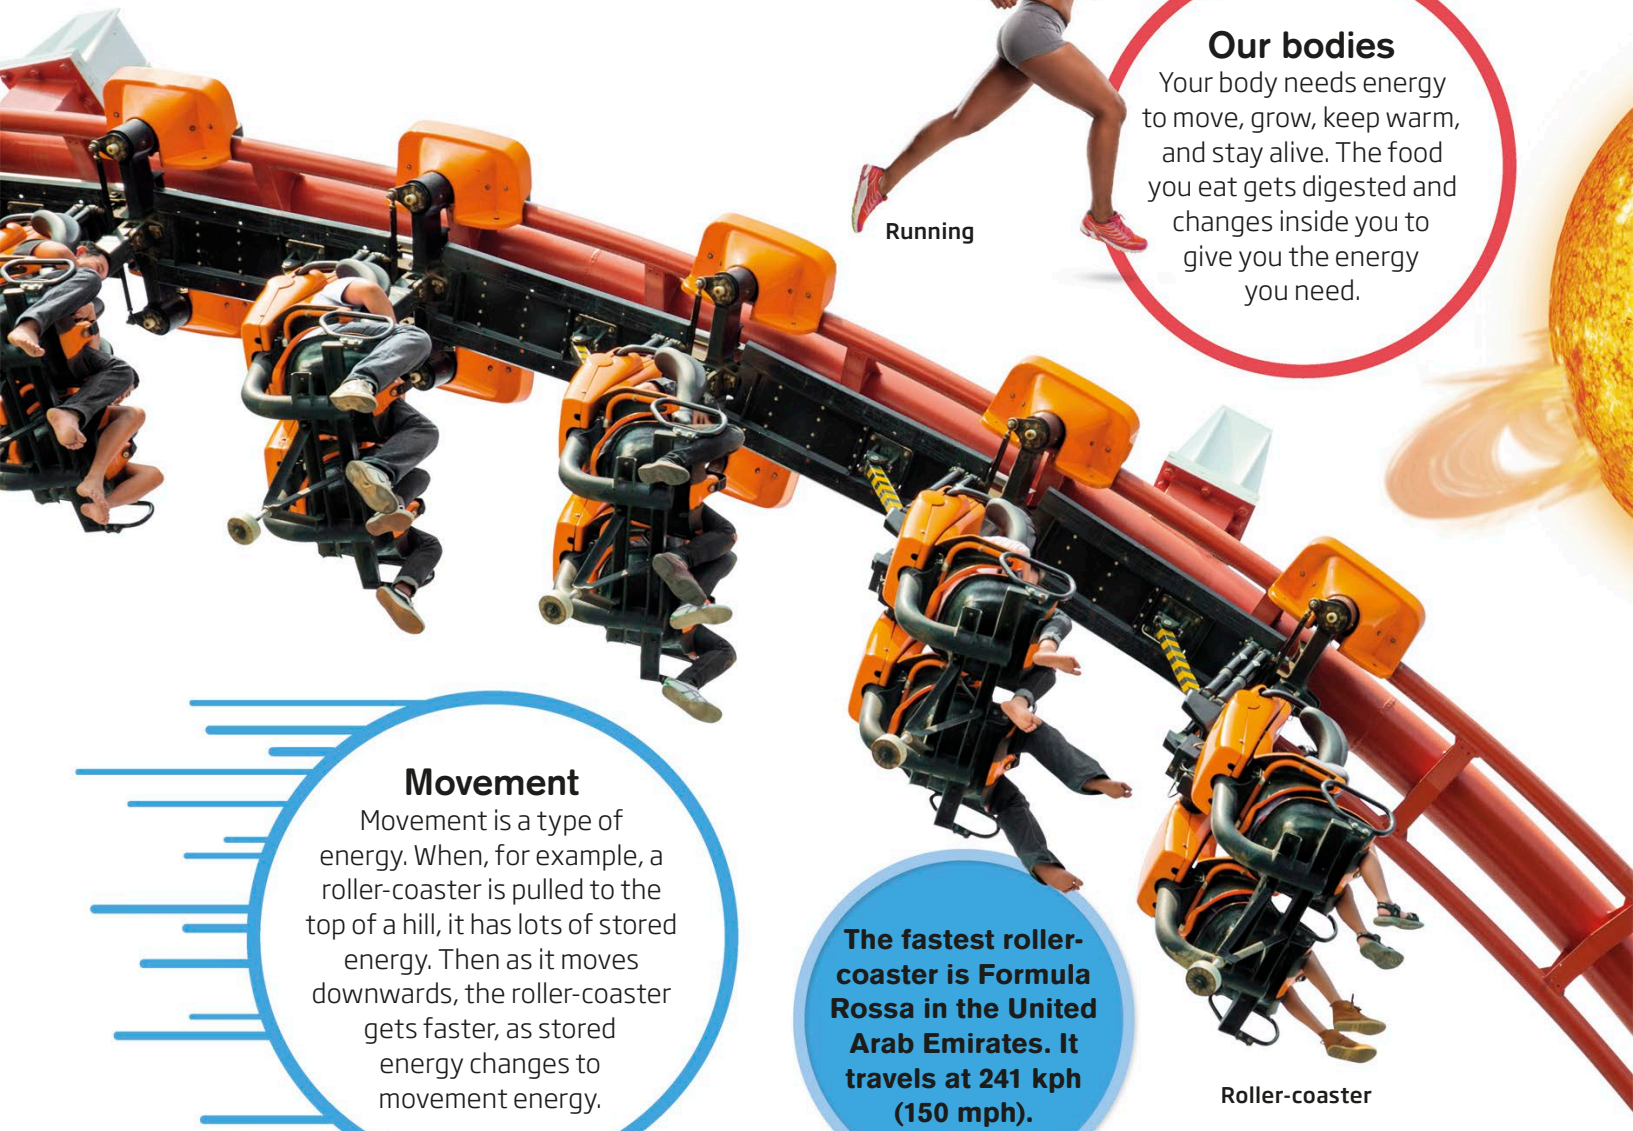
Fossil fuels are made from dead plants and animals squashed underground millions of years ago. Coal, oil, and gas are fossil fuels. We burn these fuels to release heat and this makes electricity in power stations.



Running

Our bodies

Your body needs energy to move, grow, keep warm, and stay alive. The food you eat gets digested and changes inside you to give you the energy you need.



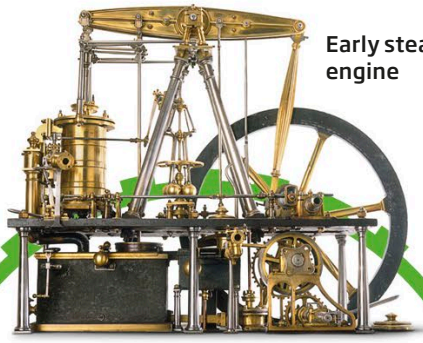
Roller-coaster

Movement

Movement is a type of energy. When, for example, a roller-coaster is pulled to the top of a hill, it has lots of stored energy. Then as it moves downwards, the roller-coaster gets faster, as stored energy changes to movement energy.

The fastest roller-coaster is Formula Rossa in the United Arab Emirates. It travels at 241 kph (150 mph).

Burning coals



Early steam engine

Industrial Revolution

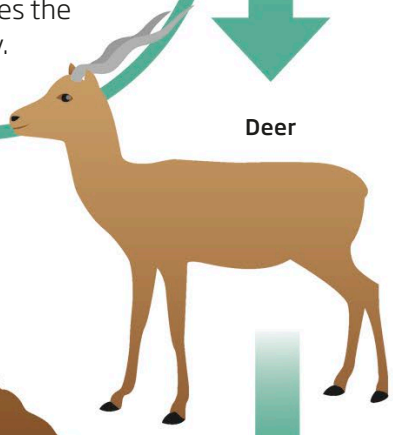
From the late 1700s, people began using energy in new ways, creating huge industrial growth. Movement energy from water turned wheels to drive machines to weave textiles in mills. Heat energy from steam engines drove trains and machines in factories.

The first steam engine was developed in the 1760s by Scotsman James Watt.

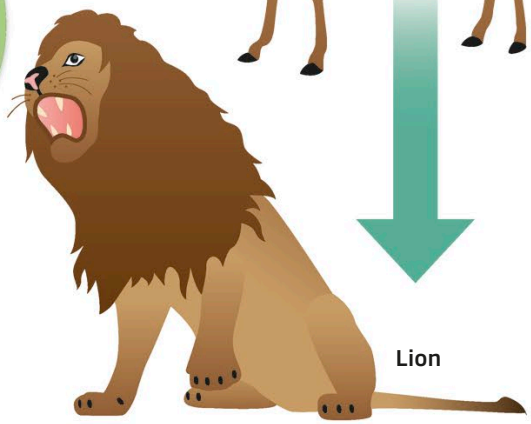
Food chain

Plants take energy from the Sun's light and convert it into sugar, a type of stored energy in plants. In this example, the deer eats the stored energy in the plants, which gives the deer energy. The lion eats the deer, and this food gives the lion energy.

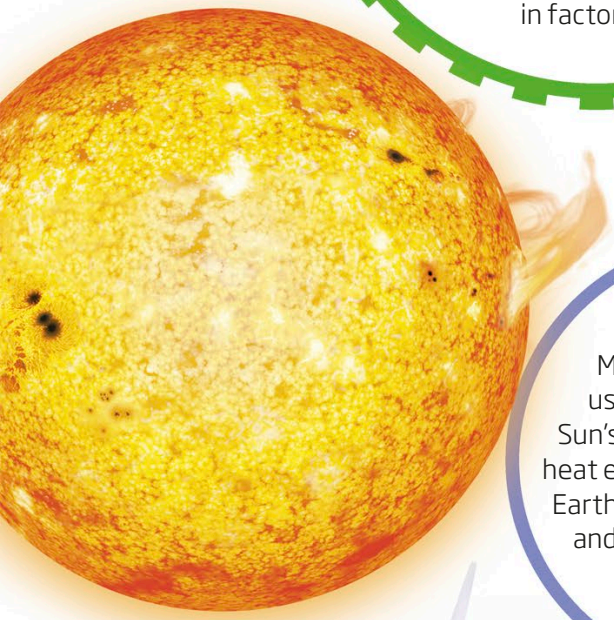
Plants



Deer



Lion



The Sun

The Sun

Most of the energy we use is from the Sun. The Sun's light energy changes to heat energy, warming up planet Earth. Light helps plants grow and plants provide animals with energy.

Renewable

Renewable energy is energy made from sources that won't run out, such as sunlight, wind, and water. For example, we can use a wind turbine or a water wheel to change movement energy into electricity.

The wind turns the blades of the turbine.

Wind turbines

Elements

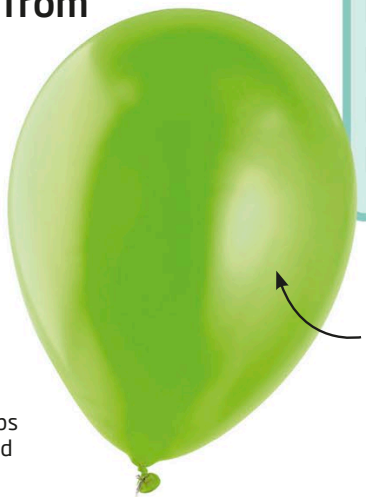
An element is a material that can't be broken down into other materials. All objects are made from tiny particles called atoms, which usually join together in groups. Elements are pure materials, which means they are made from only one type of atom.

SEE ALSO

- Atoms p.34
- Electricity p.87
- Gases p.117
- Liquids p.148
- Metals p.162
- Gold pp.200–201
- Solids p.234

Elements everywhere

Three-quarters of the elements are part of a group called metals. They are usually solids that conduct electricity. Non-metal elements include gases, such as hydrogen and oxygen, and solids, such as carbon and sulphur.



Helium
The gas helium is used in party balloons because it is lighter than air, so it floats. Helium is made inside stars.

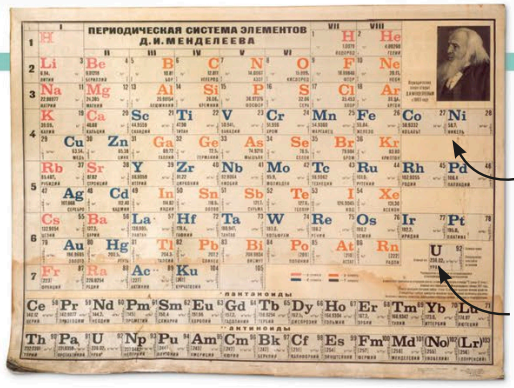
Calcium
The metal calcium is found in rocks, living things, and milk. It helps make bones, teeth, and animal horns.

Aluminium
The soft, light metal aluminium can be made into foil, cans, and aeroplane parts. It doesn't rust like some metals.

Gold
The valuable metal gold is found in its pure form in nature. It can be hammered into shapes without snapping.

The periodic table

The periodic table lists all the known elements in the Universe. There are more than 100 chemical elements and we keep finding more. All the elements have a symbol and are placed in groups according to how they behave and how many particles they have inside them.



The first periodic table, written by Mendeleev

Nitrogen has the symbol Ni.

Uranium has the symbol U.

Mercury is the only metal that is liquid at room temperature.

Engineering

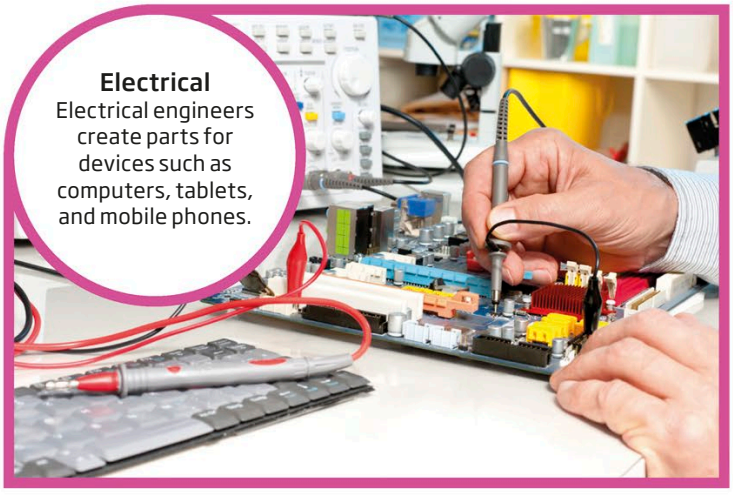
Engineers use maths and science to solve problems. They invent and create machines, buildings, tools, and other useful inventions that make our lives easier. There are different types of engineers that specialise in different areas.

SEE ALSO

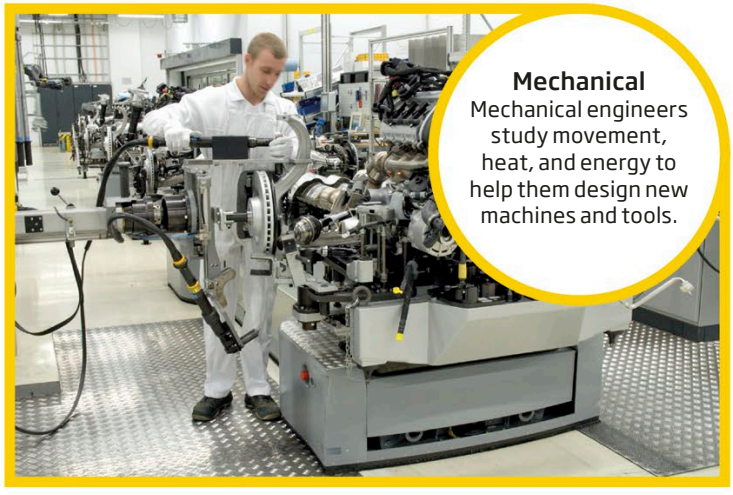
- Bridges p.46
- Buildings p.48
- Factories p.97
- Inventions pp.136–137
- Machines p.150
- Materials p.157

Civil
Civil engineers design and build structures such as buildings, bridges, and roads.

Chemical
Chemical engineers turn materials into useful products, including medicines.



Electrical
Electrical engineers create parts for devices such as computers, tablets, and mobile phones.



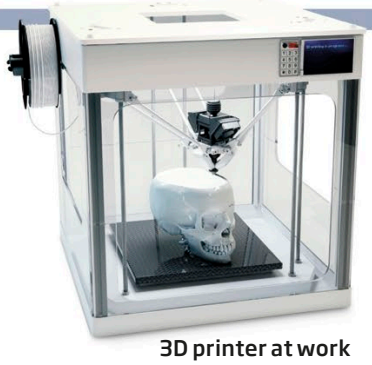
Mechanical
Mechanical engineers study movement, heat, and energy to help them design new machines and tools.

Engineering process

Engineers develop older technology to make new, better designs. An invention like the wheel has changed over time from the earliest version to a hi-tech modern one.

3D printer

Engineers can now use computer-aided design (CAD) programs to make three-dimensional (3D) models of their designs. The 3D printer creates the model using layers of plastic.



3D printer at work

Engines

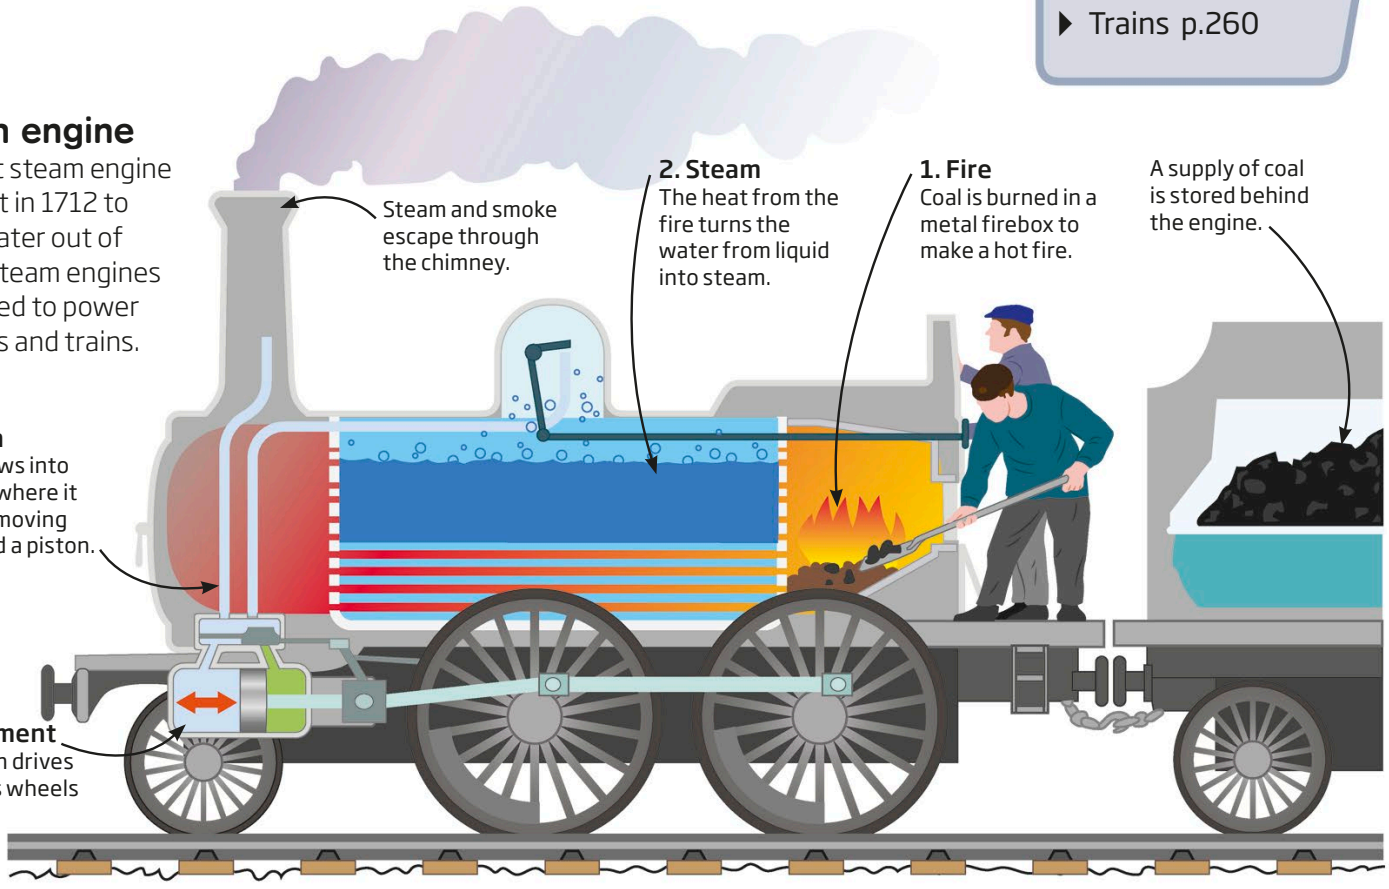
Engines power machines by turning fuel into movement. Coal, oil, or electricity is heated to create energy. The energy is then used to turn wheels or parts that move the machine forwards. There are three main types of engine.

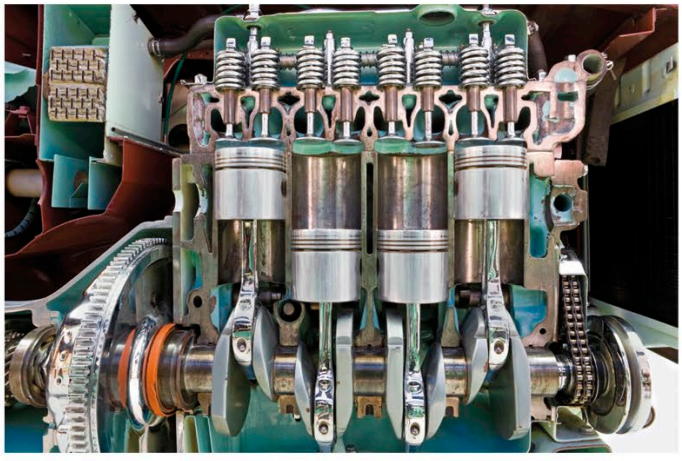
SEE ALSO

- Aircraft p.13
- Cars p.52
- Factories p.97
- Forces p.108
- Machines p.150
- Ships p.224
- Trains p.260

Steam engine

The first steam engine was built in 1712 to pump water out of mines. Steam engines were used to power factories and trains.





Car engine

Car engines burn petrol or diesel. There are four moving parts called pistons, which move up and down, making the car's wheels turn.

Jet engine

Jet engines are used for aircraft. They work by squashing, heating, and speeding up air. This hot air is blasted out backwards, pushing the aircraft forwards.

Erosion

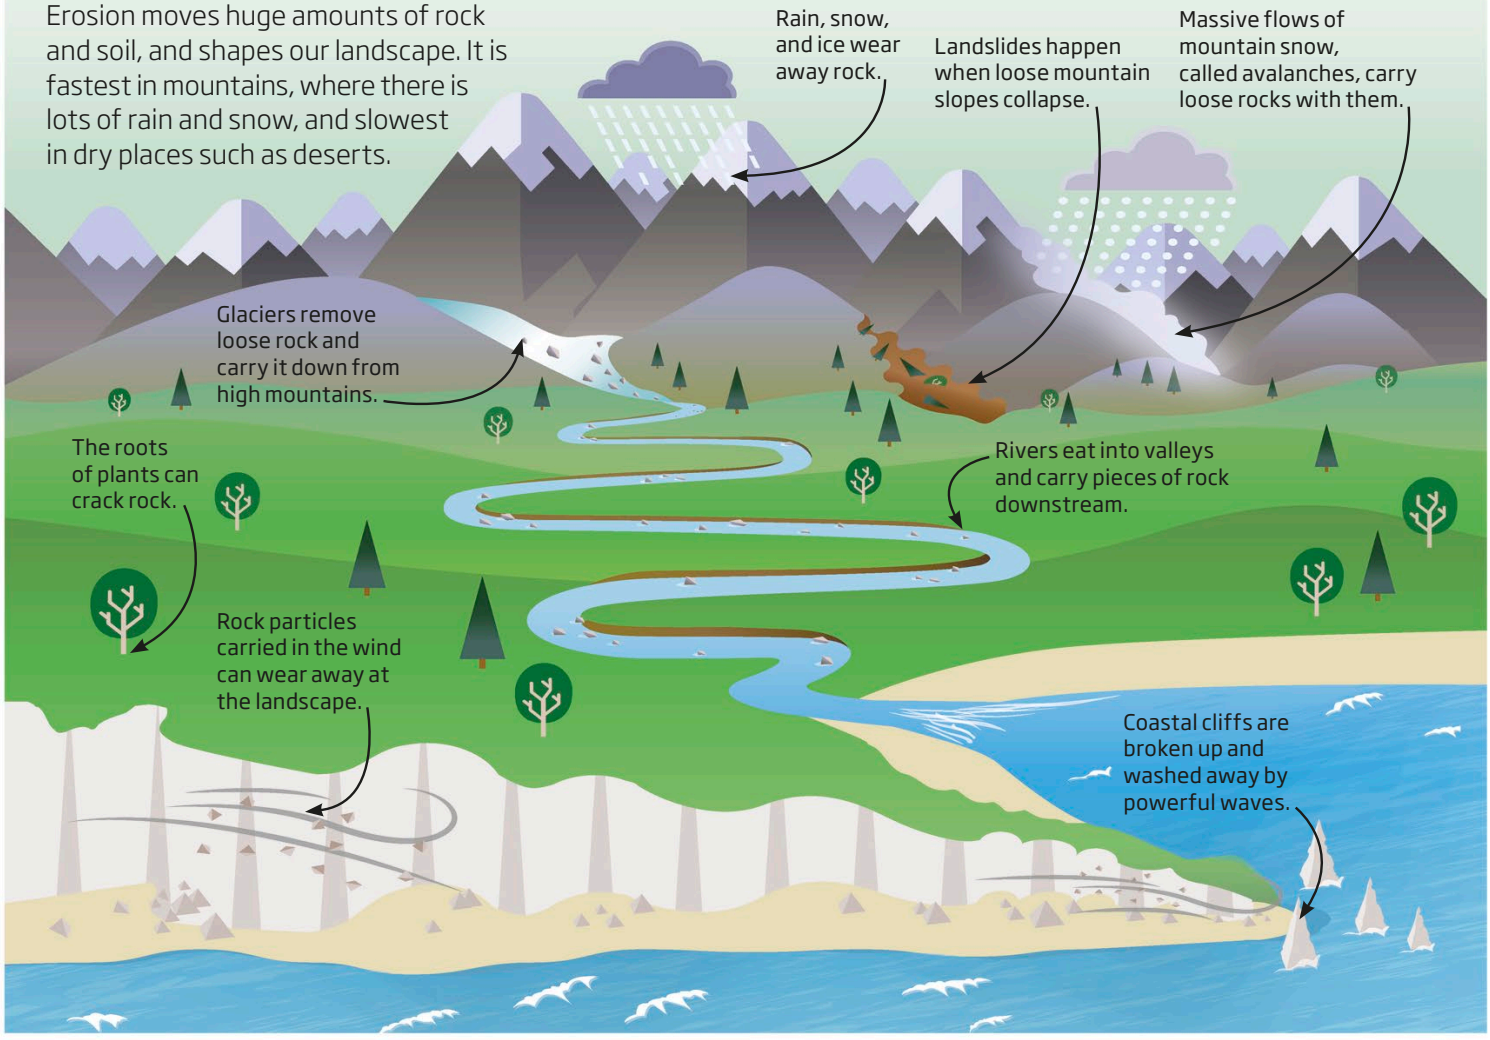
Erosion is the natural movement of rocks, tiny pieces of loose rock, and soil, over long distances. Many different things can cause erosion, including wind, rivers, ice, oceans, and landslides.

SEE ALSO

- Caves p.55
- Deserts p.78
- Glaciers p.122
- Mountains p.172
- Rivers p.211
- Rock cycle p.213
- Weather p.271

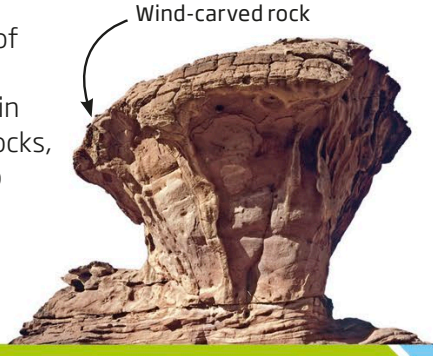
On the move

Erosion moves huge amounts of rock and soil, and shapes our landscape. It is fastest in mountains, where there is lots of rain and snow, and slowest in dry places such as deserts.



Wind sculptures

Over a very long period of time, tiny pieces of rock carried by strong winds in deserts can sandblast rocks, wearing them away into amazing shapes.



Glacier power

Glaciers are rivers of ice that move down from high mountains very slowly. As they move, they pick up rocks that scrape away at the landscape, carving steep-sided valleys and hollows in the ground.

Europe

The continent of Europe is surrounded by sea, except in the east, where it is joined to Asia. Much of Europe is flat, but there are several high mountain ranges, including the Alps, Pyrenees, and the Carpathians.

SEE ALSO

- Ancient Greece p.18
- Ancient Rome p.20
- Asia p.29
- World War I p.276
- World War II p.277

About Europe

Population: 743.1 million

Highest point: Mount Elbrus

Lowest point: Caspian Sea

Biggest desert: Oltenia Sahara

Longest river: Volga

Although it is the **second smallest** continent, Europe contains nearly **50 countries**.

This powerful meat-eater is the biggest member of the weasel family.

Wolverine

Eyjafjallajökull

In 2010, ash from this volcano in Iceland stopped more than 100,000 airline flights.

Ferry

Oil

Gas

Coal

Beneath the domes of this cathedral in Moscow, Russia, are ten separate churches.

Dobšinská Ice Cave

St Sophia's Cathedral

The building of this cathedral began in 1882. It is due to finish in 2026.

Dalmatian pelican

Sagrada Familia cathedral

Flamenco dancing

Leaning Tower of Pisa

Mount Olympus

Mount Etna

Giant's Causeway

The Giant's Causeway is an area of hexagonal columns made of ancient volcanic rock. It is on the coast of County Antrim in Northern Ireland.

Eiffel Tower

This iron tower in Paris, France, is 324 m (1,063 ft) high. It was completed in 1889 and is the most visited monument in the world.

The tower is made up of more than 18,000 pieces of cast iron.

Evolution

In order to survive, an animal needs to change when the weather and food around it changes. This is called adaption. The theory of evolution is that lots of these tiny changes over millions of years create new types of living things.

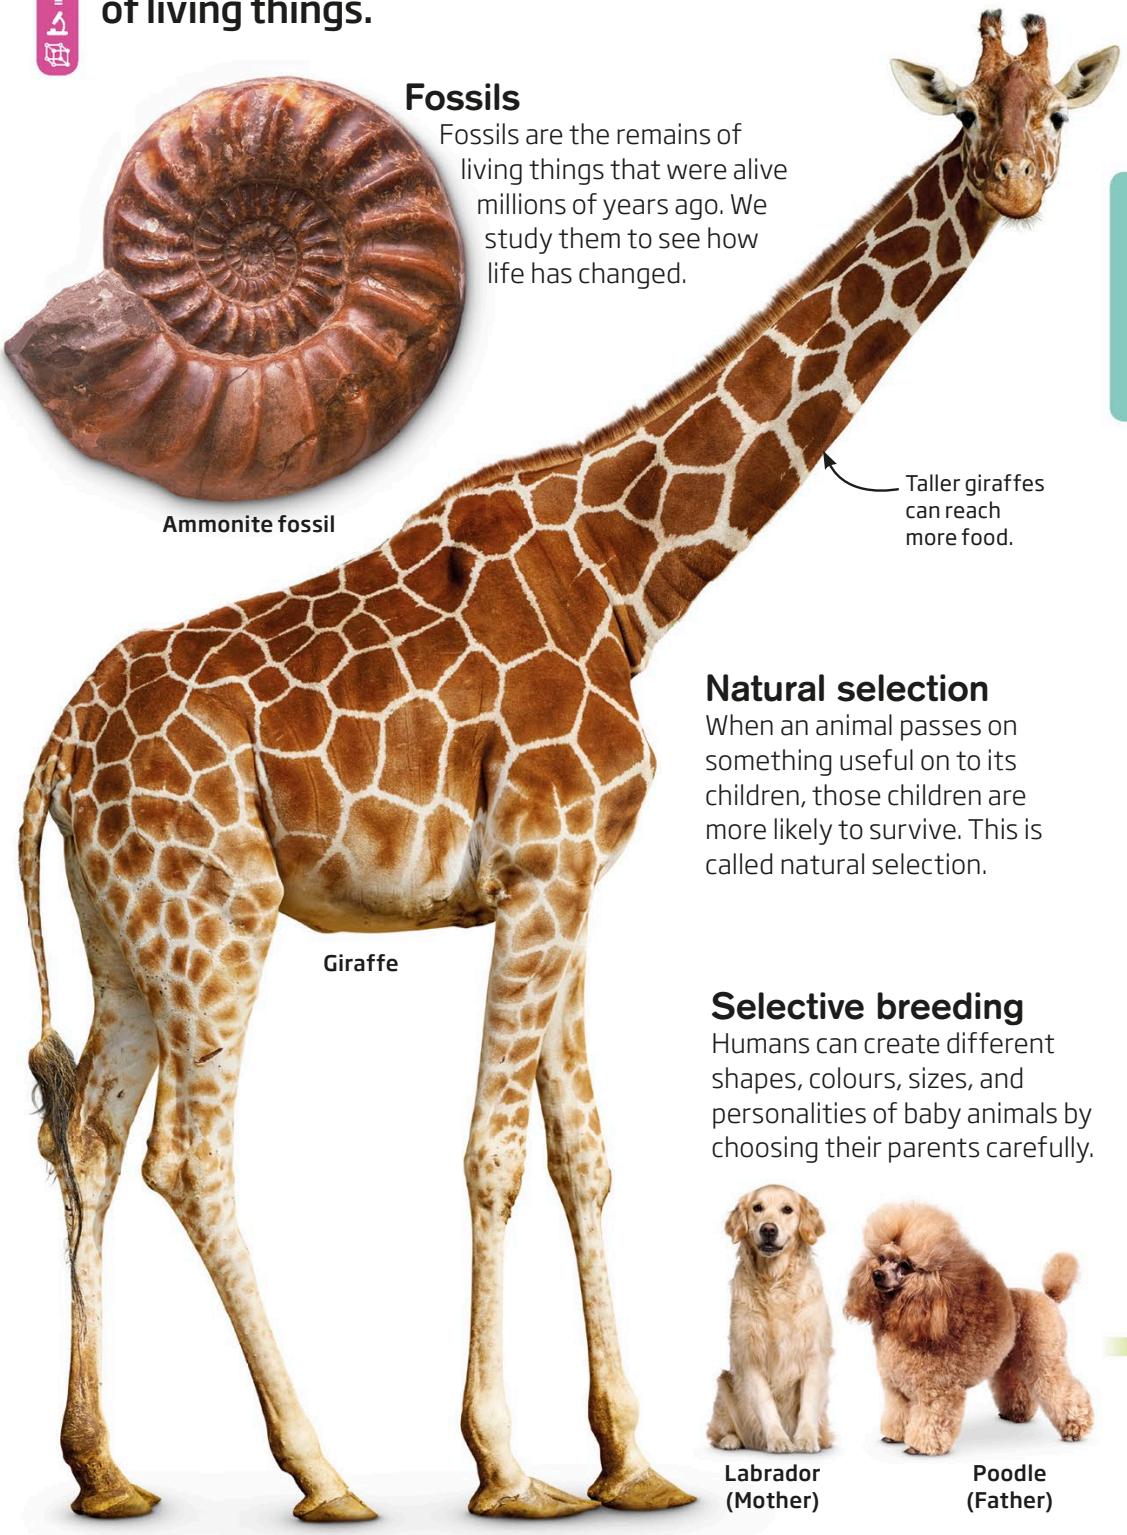
SEE ALSO

- Dinosaurs p.80
- Dogs p.81
- Fossils p.111
- Genes p.119
- Life cycle p.146
- Prehistoric life p.202

Fossils

Fossils are the remains of living things that were alive millions of years ago. We study them to see how life has changed.

Ammonite fossil

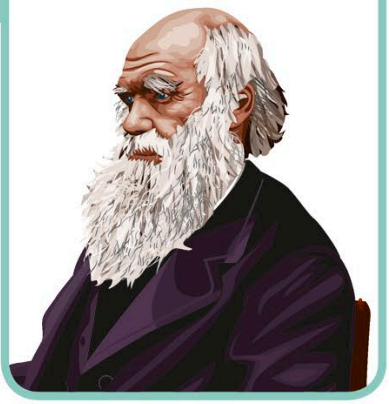


Taller giraffes can reach more food.

Giraffe

Charles Darwin

Scientist Charles Darwin came up with the theory of evolution while travelling around the world investigating living things.



Natural selection

When an animal passes on something useful on to its children, those children are more likely to survive. This is called natural selection.

Mammals first appeared and began evolving 220 million years ago.

Selective breeding

Humans can create different shapes, colours, sizes, and personalities of baby animals by choosing their parents carefully.

Labrador (Mother)

Poodle (Father)

Labradoodle (Child)

Explorers

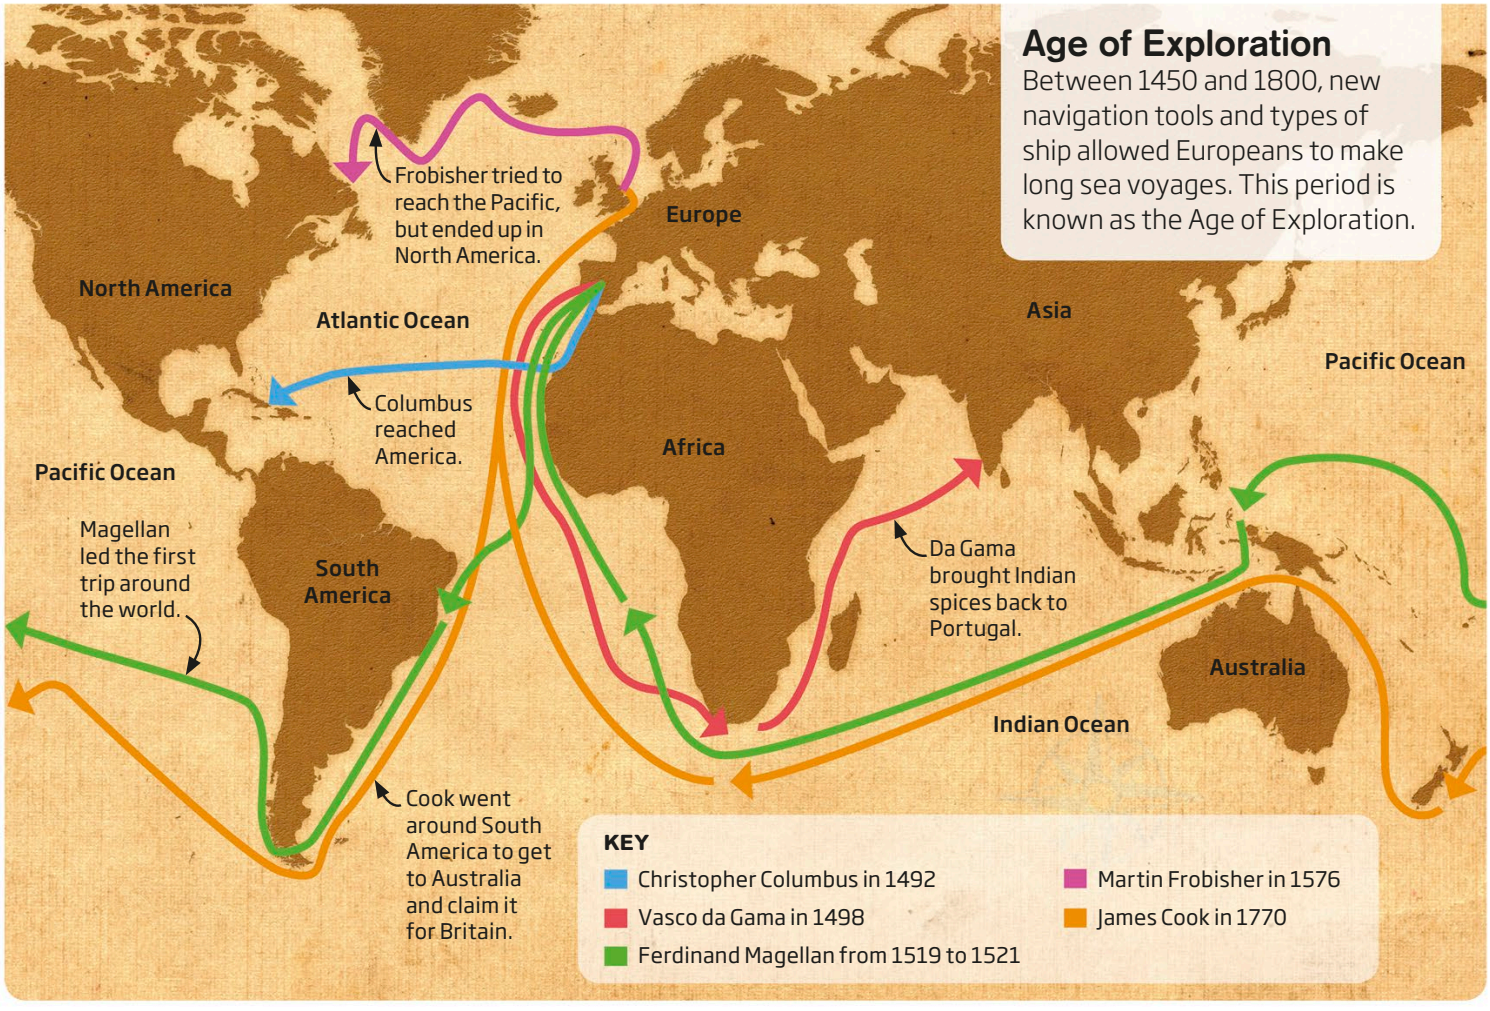
Explorers travelled to new places to meet different people, find goods for trade, or just to see what was there! They came from all over the world and faced big challenges on their journeys. Some were successful, such as Chinese explorer Zheng He, who reached Madagascar in the 1420s. Others did not complete their missions.

SEE ALSO

- Europe p.94
- Maps p.155
- Exploration pp.180–181
- Navigation p.182
- Ships p.224
- Trade p.257

Age of Exploration

Between 1450 and 1800, new navigation tools and types of ship allowed Europeans to make long sea voyages. This period is known as the Age of Exploration.



Trade

Explorers discovered items they had never seen before. Merchants then traded these goods, such as food, spices, and precious metals. Pepper, for example, spread from India around the world.

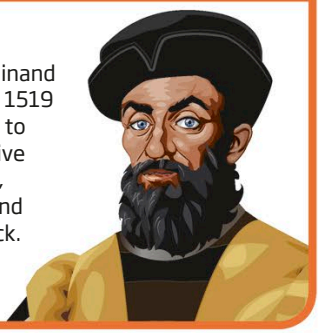
Cinnamon

Black pepper

Gold

Magellan

Spanish sailor Ferdinand Magellan set out in 1519 to find a new route to Asia. He left with five ships and 270 men, but only one ship and 18 men made it back.



Factories

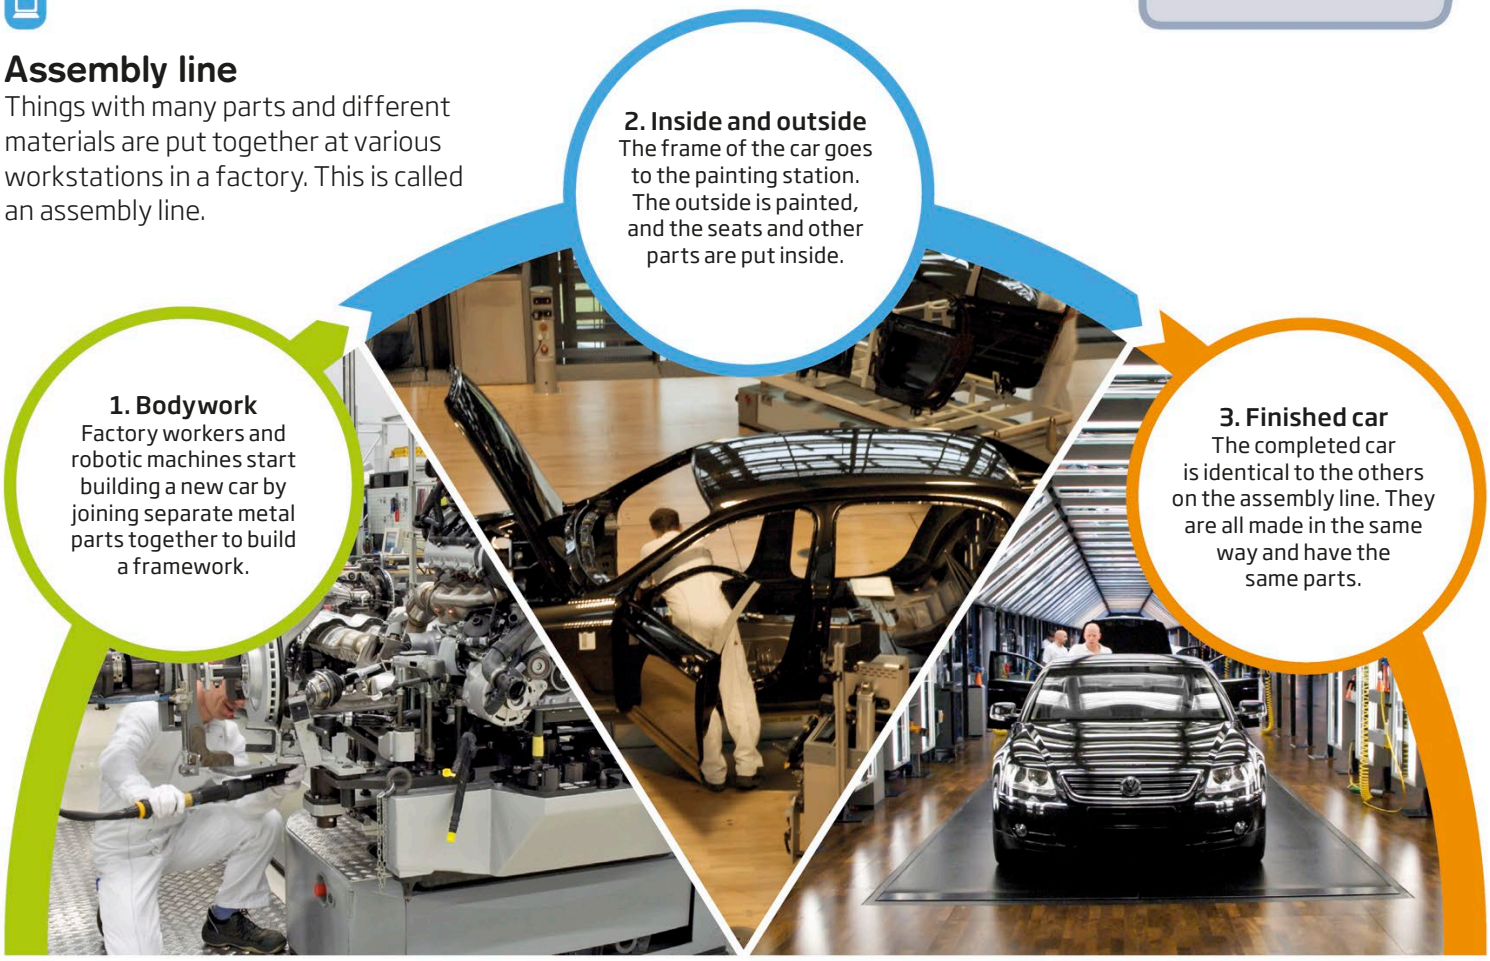
Factories are places where people and machines work to make things. When factories make many identical things at the same time, it is called mass production. Almost everything we have, use, and wear comes from a factory.

SEE ALSO

- Cars p.52
- Engineering p.91
- Machines p.150
- Robots p.212
- Transport pp.258–259
- Work p.274

Assembly line

Things with many parts and different materials are put together at various workstations in a factory. This is called an assembly line.



1. Bodywork
Factory workers and robotic machines start building a new car by joining separate metal parts together to build a framework.

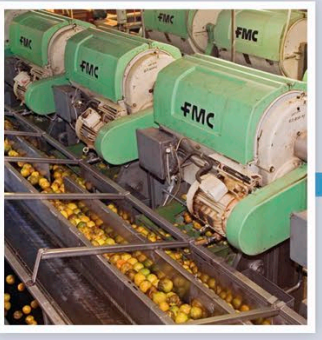
2. Inside and outside
The frame of the car goes to the painting station. The outside is painted, and the seats and other parts are put inside.

3. Finished car
The completed car is identical to the others on the assembly line. They are all made in the same way and have the same parts.

Bottling factories

Drinks are made and bottled in factories. The same ingredients and processes are used to fill thousands of bottles every day.

Oranges enter the factory.



The oranges are squeezed.

The juice is put into bottles.

Farming

Farming is growing plants and raising animals, usually for food. Common crops include cereals, fruit, and vegetables. Farm animals include cows, sheep, pigs, chickens, and even fish. As well as their meat, cows are farmed for their milk and chickens for their eggs.

SEE ALSO

- Fish p.101
- Eating pp.104-105
- Food p.106
- Fruit and seeds p.115
- Incas p.132
- Plants p.194

Cereal farming
Cereal crops such as wheat, corn, and barley are grown in large fields. Rice is also a cereal. It is grown in hot countries in water-covered areas called paddy fields.

Animal farming
Farmers raise pigs, cows, and chickens in large sheds or outdoors in fields. Sheep, goats, and llamas are often kept on rough or higher ground.

Fruit and vegetable farming
Crops such as pineapples and potatoes are grown outside. Others, such as strawberries and peppers, are grown all year round in glasshouses or plastic tunnels.

Fish farming
Much of the fish we eat, such as salmon and cod, is now farmed rather than caught in the wild. The fish are kept in net pens or cages in lakes, rivers, or the sea.

Feelings

Feelings are how we respond to things that happen in and to us. Feelings affect our brains, bodies, and how we behave. Being able to tell other people our feelings is important and helps us to feel connected to each other.

SEE ALSO

- Art p.28
- Brain p.45
- Heart p.128
- Language p.144
- Philosophy p.189
- Taste p.249

Happy
Chemicals are released in the brain when we do things we like. The chemicals make us feel happy!

Sad
If something bad or disappointing happens, we feel sad. Sometimes we cry when we are sad.

Angry
We get angry when we think something is unfair or wrong. Anger makes our heart beat faster and our muscles tense up.

Scared
If we are in danger we feel scared. Our heart beats faster to help us get away from the situation.

Disgusted
Disgust is a strong feeling of dislike for something we see, hear, smell, or taste.

Expressions
The different faces people use for feelings are called expressions.

Film

A film is a series of still images that are quickly played one after the other, so that the pictures seem to move. Films are used to tell stories or show real events. They were first invented in the late 1800s. Live action films are recorded on cameras. Animations are usually drawn by hand or on a computer.

SEE ALSO

- Art p.28
- Storytelling pp.42–43
- Machines p.150
- Photography p.190
- Television p.251
- Theatre p.253

Film types

"Genre" is a French word that means type. Films are grouped into genres when they have similar stories or styles. Common genres include action, science fiction, and documentary.

E.T. the Extra-Terrestrial (1982)

Science fiction
Sci-fi films explore themes of science and technology, such as space. "Fiction" means imaginary, and the science is often made up.

The Eagle Huntress (2016)

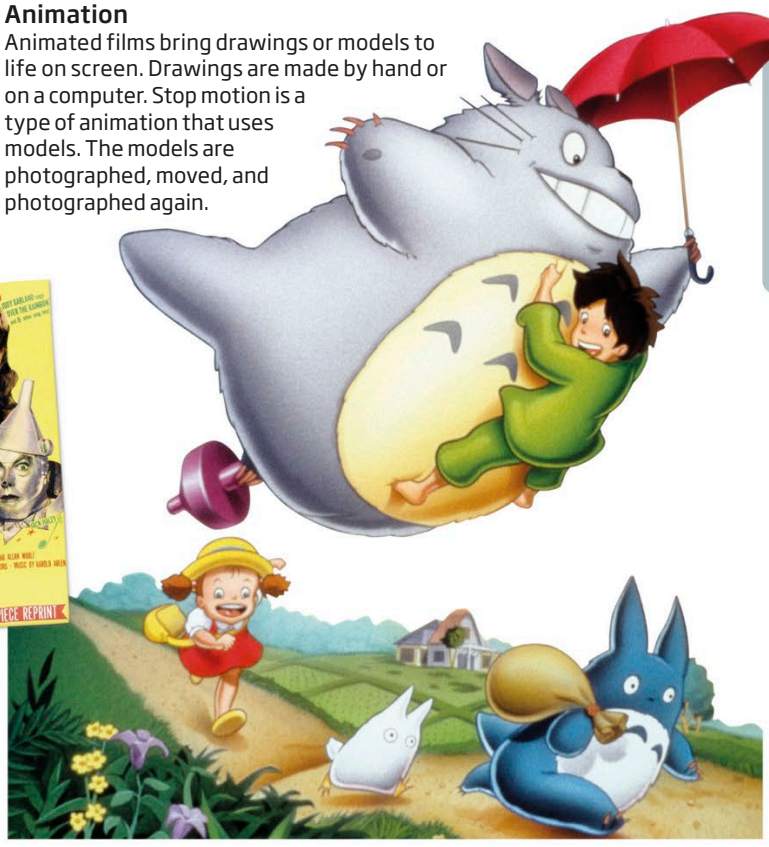
Documentary
Documentaries are a record of real life or actual events. They show the wonders of nature and how people live. This was one of the first film genres.

Spy Kids (2001)

Action
Action films are exciting stories about imaginary heroes or heroines. They use their strength and intelligence to stop people doing bad things.

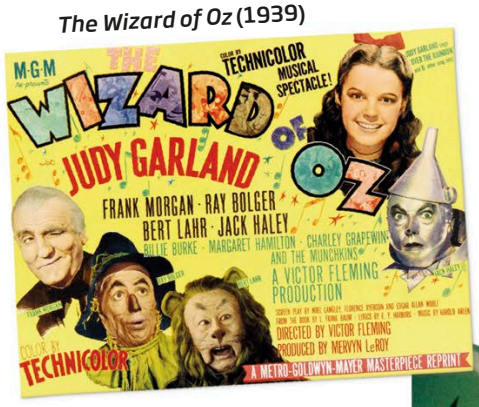
Around **2,000** new films are made in India every year.

Animation
Animated films bring drawings or models to life on screen. Drawings are made by hand or on a computer. Stop motion is a type of animation that uses models. The models are photographed, moved, and photographed again.



My Neighbor Totoro (1988)

The Wizard of Oz (1939)



Musicals
These stories are told through music, song, and dance. They became popular in the 1930s, when films were made with sound and colour for the first time.

Silent films

Technology has come a long way since films were invented. The first films were in black and white, and had no sound. Background music was played live at the cinema, and actors used their faces and body gestures to tell a story.

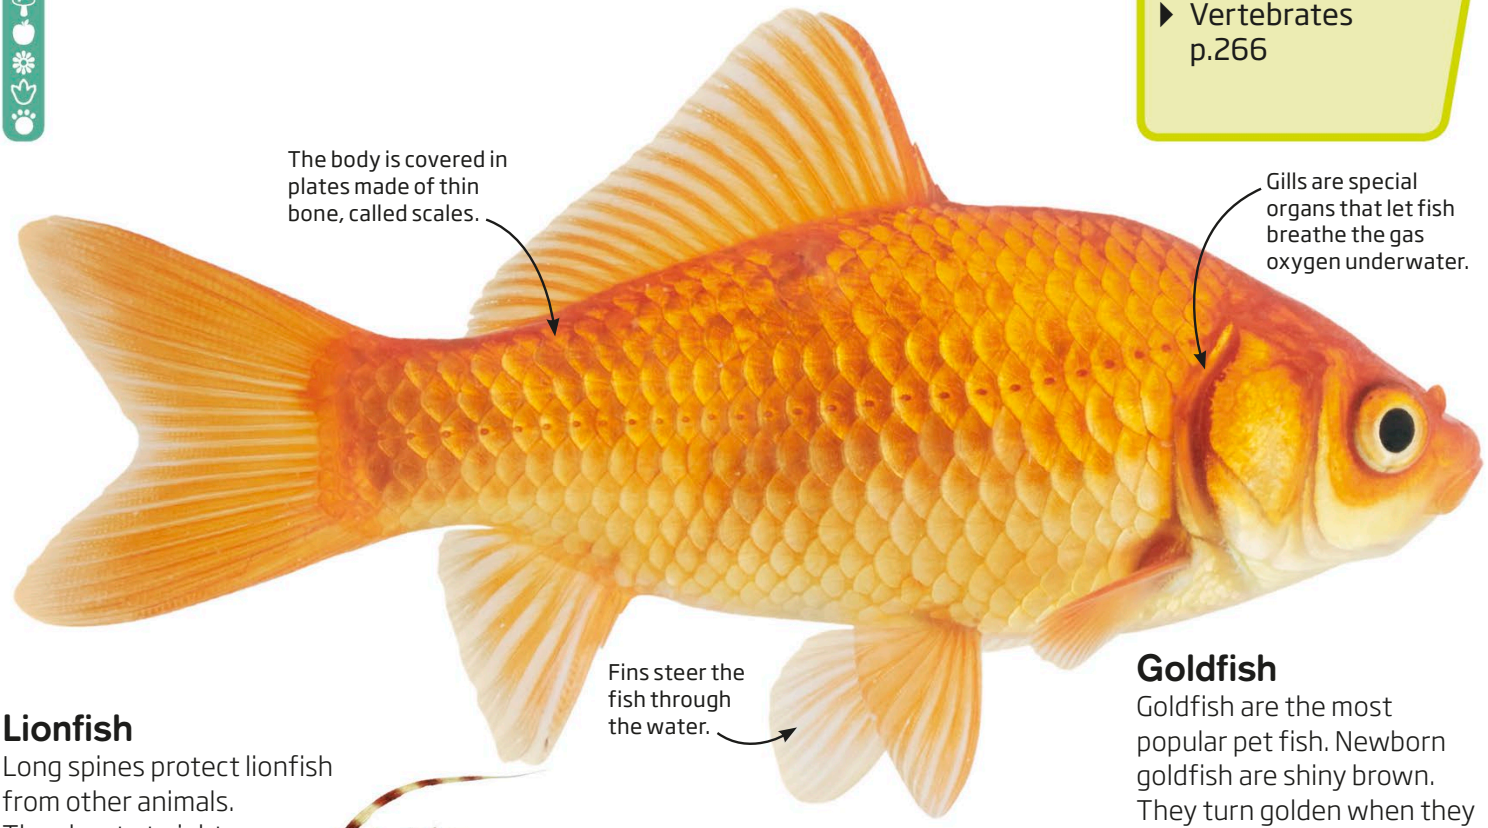
Charlie Chaplin in *A Dog's Life* (1918)

Fish

Fish are animals that live in water. They are able to breathe underwater, and have fins to help them swim around. There are over 3,000 different species of fish in the world.

SEE ALSO

- Life cycle p.146
- Pets pp.152–153
- Oceans and seas p.187
- Seashore p.220
- Vertebrates p.266

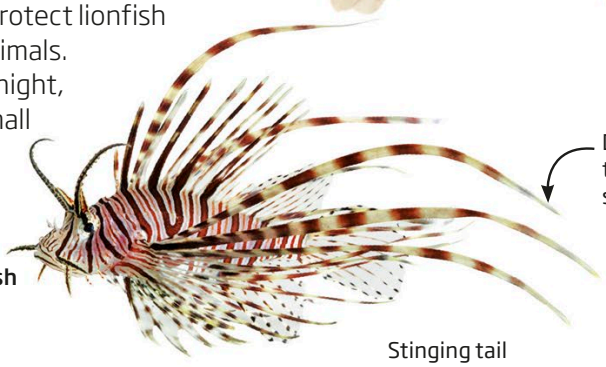


Goldfish

Goldfish are the most popular pet fish. Newborn goldfish are shiny brown. They turn golden when they are a year old.

Lionfish

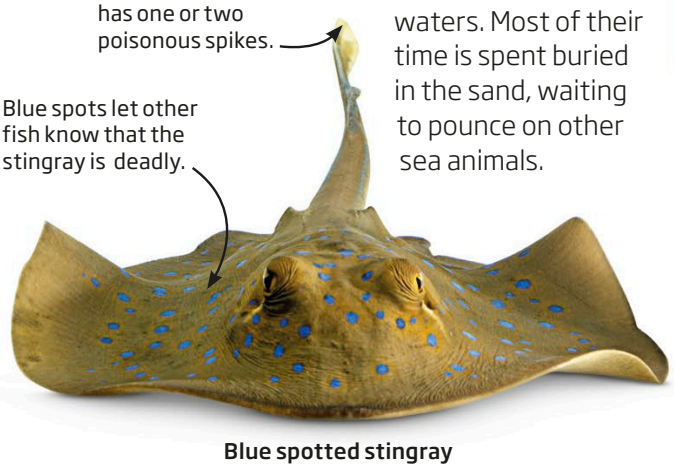
Long spines protect lionfish from other animals. They hunt at night, feeding on small fish, crabs, and shrimp.



Red lionfish

Stingray

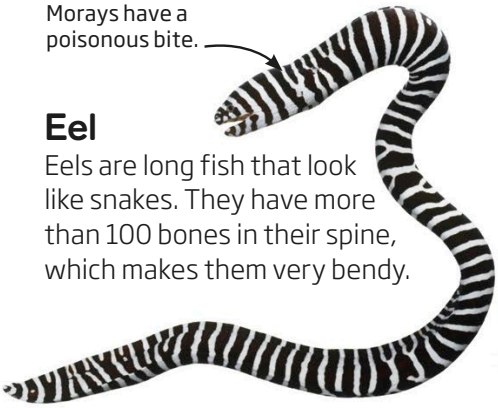
These fish are found in warm, shallow waters. Most of their time is spent buried in the sand, waiting to pounce on other sea animals.



Blue spotted stingray

Eel

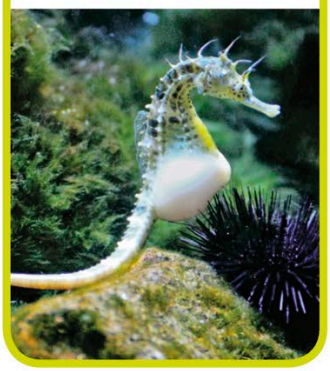
Eels are long fish that look like snakes. They have more than 100 bones in their spine, which makes them very bendy.



Zebra moray eel

Seahorse dad

Most fish don't look after their eggs. Seahorses are different – the male carries the eggs around in a pouch on its belly, until they hatch.



Flags

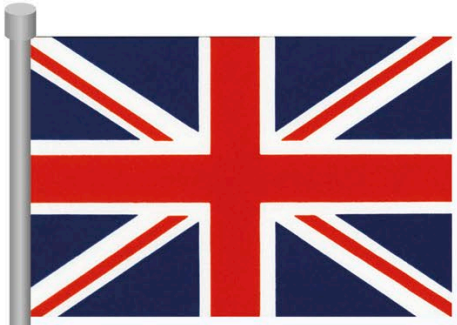
A flag is a piece of material showing a unique set of colours and symbols. Flags represent a country, city, religion, organization, or sport. The symbols and colours can also represent a message, such as a request for help. Flags are often flown from flagpoles outside buildings to show who the building belongs to.

SEE ALSO

- Africa p.12
- Colour pp.26–27
- Asia p.29
- Governments p.123
- North America p.184
- World p.275

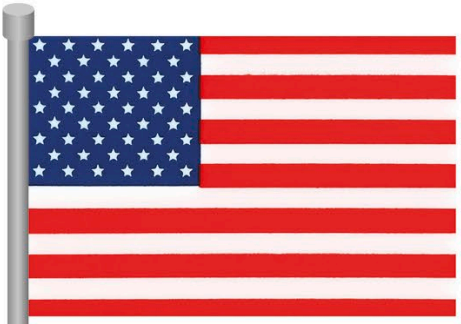
National flags

Each country has its own special flag, called a national flag. Most of these have colours or stripes with stars or other symbols placed on top. Each part says something about the country.



United Kingdom
The upright red cross and the diagonal red and white crosses show the English, Northern Irish, and Scottish flags of the United Kingdom.

China
Red stands for communism, which is the type of government in China. The stars show communism and Chinese unity.

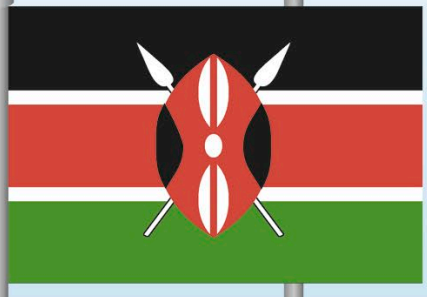


USA
The stars stand for the 50 US states. The stripes are for the original 13 states. The flag is nicknamed "the stars and stripes".

Germany
The black, red, and gold are from the uniforms of German soldiers in the 1800s.

India
The colours stand for ideas such as peace and truth. The central wheel symbol is from the Buddhist religion.

Kenya
The shield is a sign of the Maasai people of Kenya. The colour white represents peace.



The first national flag was flown in Denmark in 1478.

Signal flags

Flags can be used to send messages. Ships use flags to ask for help if they are in trouble, or to tell other ships to keep out of the way.

Flowers

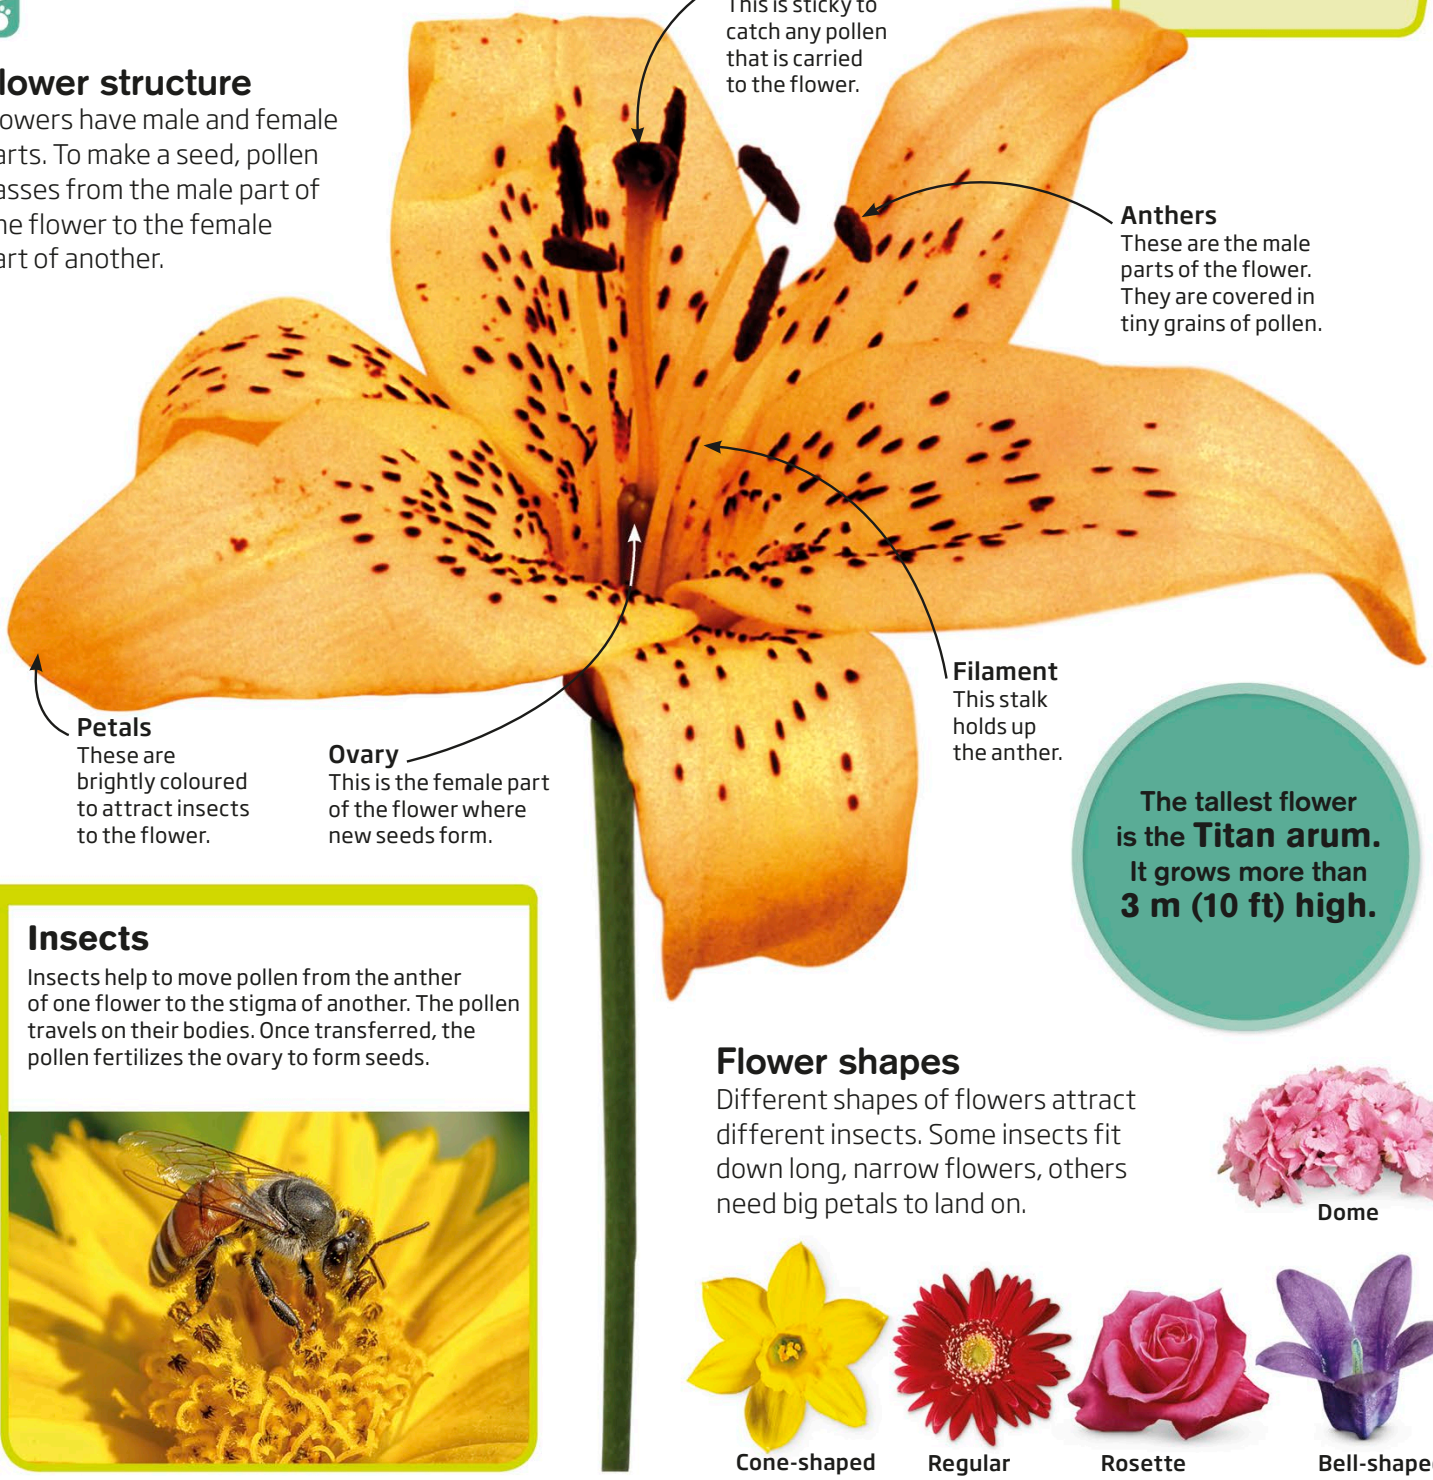
Flowers are a part of a plant. To make new seeds, they swap tiny grains called pollen. Pollen can be spread by wind or insects. Flowers have brightly coloured petals to attract insects.

SEE ALSO

- Fruit and seeds p.115
- Habitats p.126
- Insects p.134
- Plants p.194
- Shapes p.222
- Trees p.261

Flower structure

Flowers have male and female parts. To make a seed, pollen passes from the male part of one flower to the female part of another.



Stigma
This is sticky to catch any pollen that is carried to the flower.

Anthers
These are the male parts of the flower. They are covered in tiny grains of pollen.

Filament
This stalk holds up the anther.

Petals
These are brightly coloured to attract insects to the flower.

Ovary
This is the female part of the flower where new seeds form.

The tallest flower is the Titan arum. It grows more than 3 m (10 ft) high.

Insects

Insects help to move pollen from the anther of one flower to the stigma of another. The pollen travels on their bodies. Once transferred, the pollen fertilizes the ovary to form seeds.

Flower shapes

Different shapes of flowers attract different insects. Some insects fit down long, narrow flowers, others need big petals to land on.

Dome

Cone-shaped | Regular | Rosette | Bell-shaped

Eating

When we eat we take in all the things we need to keep us alive and healthy. Eating food gives us the energy that allows us to think, walk, play, and work. It is also something we love to do.

Ribs with black-eyed peas and collard greens, from the USA

Food around the world

People used to only eat things that were grown near them. Now, we can eat food from all over the world. Different countries have their own special recipes to make their favourite foods.

Paella from Spain

Pizza from Italy

Kebabs from Turkey

Dosa from India

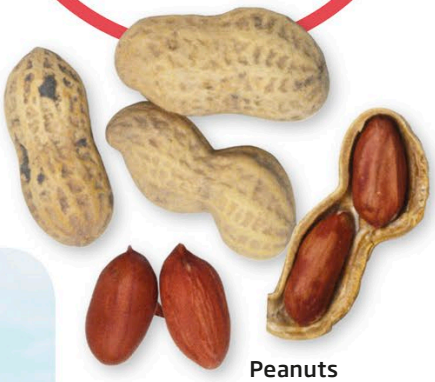
Early eating

Our ancient ancestors hunted for meat and fish, and foraged for fruit, nuts, and roots. They started using fire to cook food around 400,000 years ago.

Fire

Food allergies

Some people are allergic to certain foods, which means they become ill when they eat them. These foods can include shellfish, peanuts, and milk-based foods.



Peanuts

Chow mein from China

More than **1.3** billion people in the world work as farmers.

Bento box from Japan

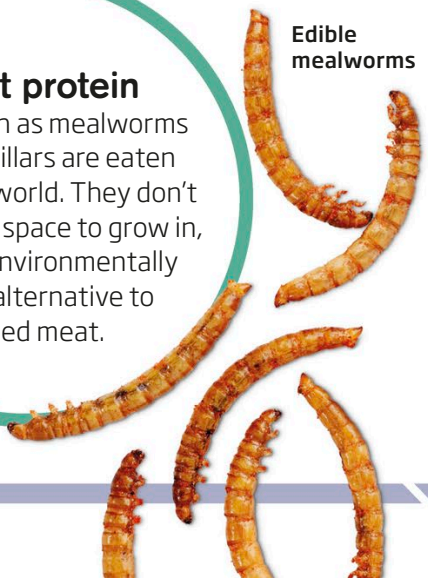
Combine harvester cutting wheat

Farming

People began farming at least 15,000 years ago. Today, almost half of the world's land is farmed for food. Farmers breed animals for their meat, milk, and eggs. They also grow plants called crops, such as wheat and oats.

Insect protein

Insects such as mealworms and caterpillars are eaten all over the world. They don't need a lot of space to grow in, so are an environmentally friendly alternative to farmed meat.



Edible mealworms

Eating in space

Astronaut space food must be easy to eat, light in weight, quick to prepare, and not too messy. Food is often freeze-dried and put in pouches. Water is then added before eating.

Astronaut food

Food

Humans need to eat the right mixture of different food groups to keep all the parts of the body working properly. Food gives us energy to move, grow, and repair our bodies. Types of food give our bodies the different goodness we need.

SEE ALSO

- Digestion p.79
- Energy pp.88–89
- Eating pp.104–105
- Food chains p.107
- Gases p.117
- Plants p.194

Food groups

There are five main food groups that give us the nutrients and vitamins we need to be healthy.

Carbohydrates
Bread, rice, cereal, and pasta contain carbohydrates, which give our bodies energy.

Dairy foods
Milk, yoghurt, cheese, and butter contain calcium to help teeth, nails, and bones grow.

Fruit and vegetables
Fruit and vegetables have fibre, which helps break down our food. They also contain vitamins and minerals that help our bodies work properly.

Protein
Meat, fish, eggs, and beans are high in protein, which is needed to grow and repair our bodies.

Fat and sugar
Sugar and fat give our bodies energy. We can get fat from food like cheese and nuts, and sugars from fruits. Too much fat and sugar is bad for us.

Drinking

Water transports the goodness we get from food into and around our body. It then flushes waste materials out of our bodies.

Energy

When we eat, our body changes energy in food into the energy we need to move and grow. Stored energy is turned into movement energy in our bodies.

Food chains

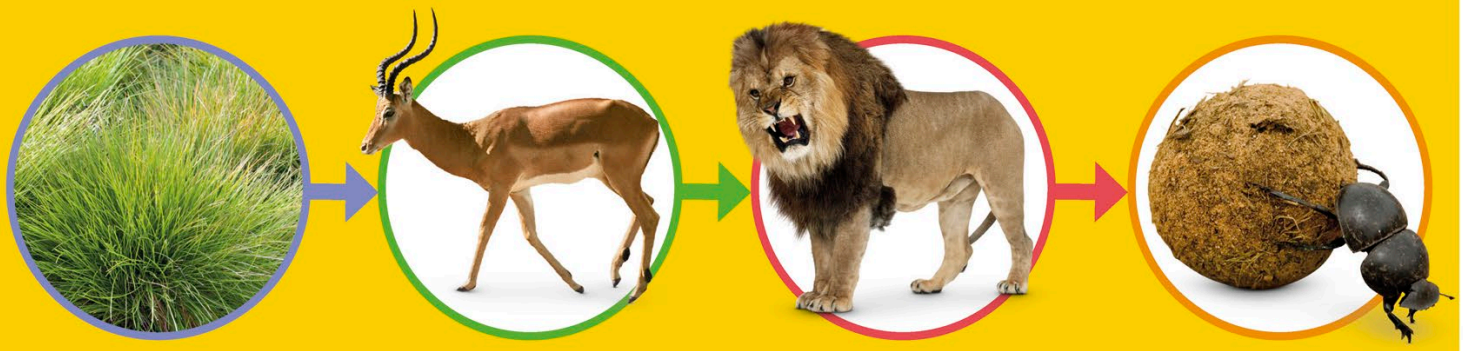
A food chain is the passing along of energy from food. Only plants can make their own food. All animals are part of a food chain, either eating plants or other animals. All animals need energy to grow, survive, and reproduce.

SEE ALSO

- Animal groups p.22
- Conservation p.72
- Eating pp.104–105
- Food p.106
- Habitats p.126
- Photosynthesis p.191

Energy on the move

Energy moves along a food chain. Each animal in the chain gets energy from what it eats. The arrows show how the food energy is passed along.



Producer
Plants produce their own food by a process using light from the Sun. In a food chain, they are called the producers.

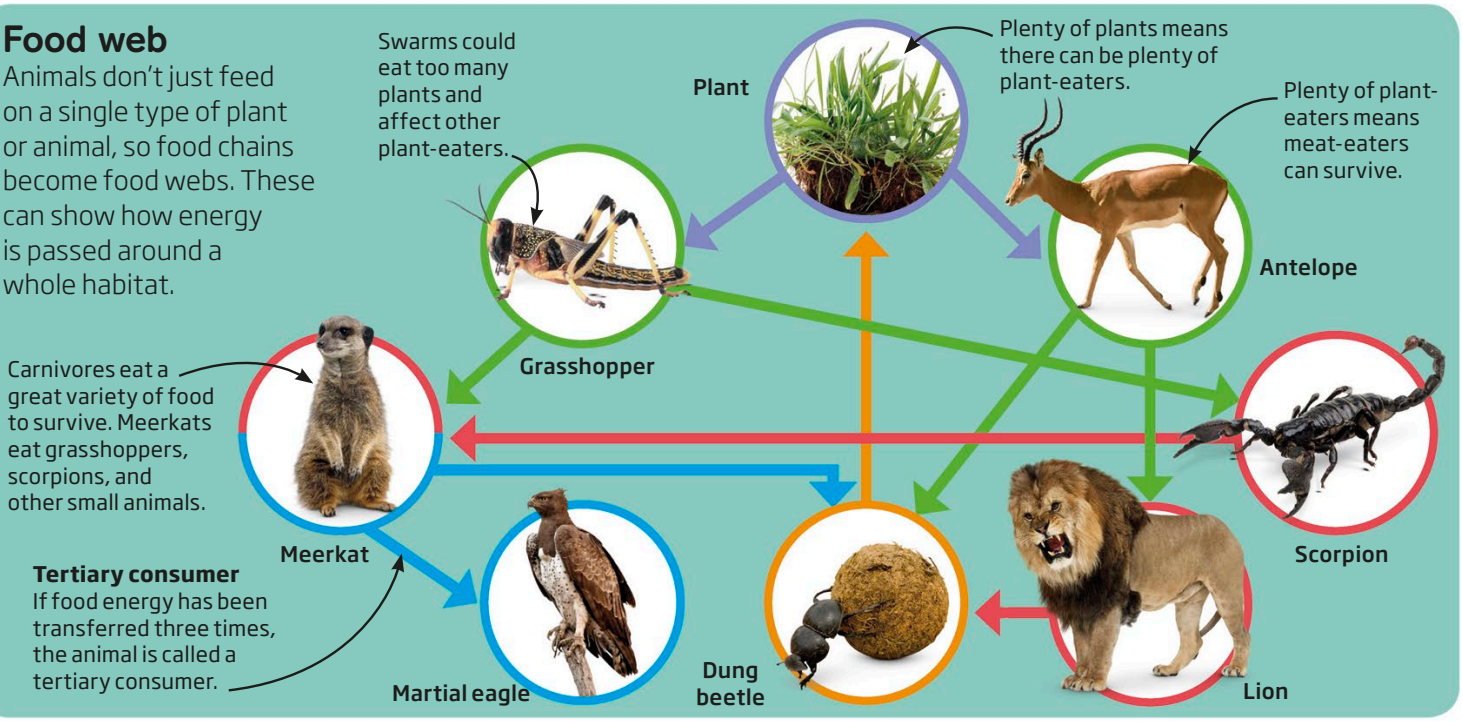
Primary consumer
Animals that eat plants are called primary consumers. They are also called herbivores.

Secondary consumer
Meat-eating animals that eat plant-eaters are called secondary consumers. They are also known as carnivores.

Decomposer
These animals break down decaying material, such as dung, returning the goodness to the soil for plants to use.

Food web

Animals don't just feed on a single type of plant or animal, so food chains become food webs. These can show how energy is passed around a whole habitat.



Forces

A force is a push or a pull. Forces can start things moving, speed them up, or slow them down. Some forces work through touching. Others, such as gravity, work invisibly and can affect objects a long way away.

SEE ALSO

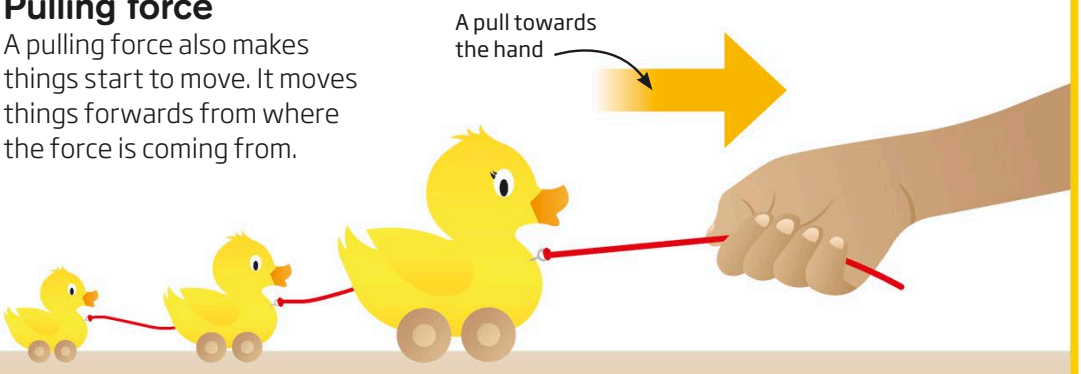
- Friction p.114
- Gravity p.125
- Magnets p.151
- Measuring p.159
- Solar System p.233
- Sun p.247

Pushing force

A pushing force makes things start to move and can also speed them up. Your hand applies a pushing force when it moves a toy car.

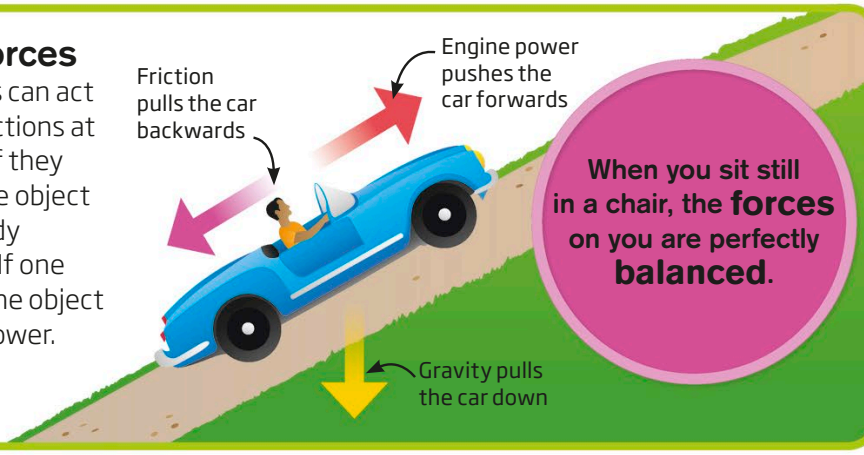
Pulling force

A pulling force also makes things start to move. It moves things forwards from where the force is coming from.



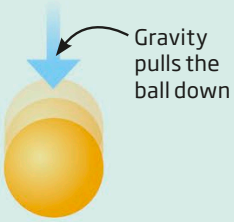
Balanced forces

Pushes and pulls can act in different directions at the same time. If they are balanced, the object moves at a steady speed, or is still. If one force is bigger, the object gets faster or slower.



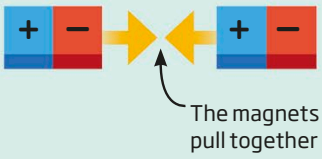
Gravity

Gravity pulls objects down towards the Earth. It's the force that stops us floating off into space.



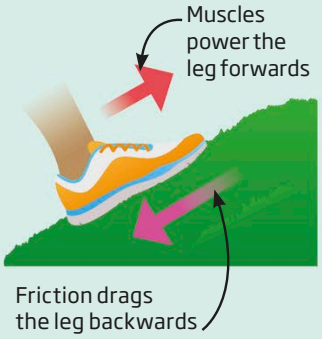
Magnetism

Magnetism is a force that pulls objects towards a magnet, or pushes them away. Opposite magnetic forces attract each other.



Friction

Friction is a force that slows down movement. It is created when two surfaces touch.



Forests

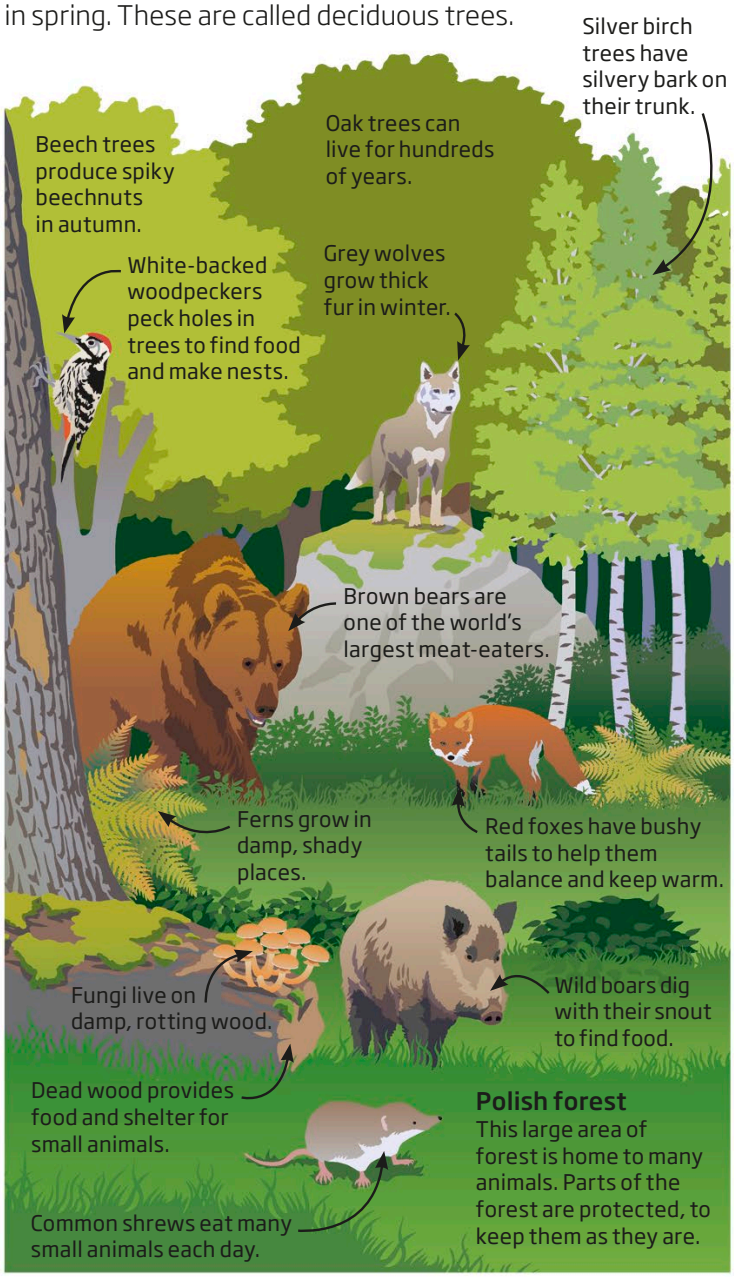
Forests are places where many trees grow. Forests grow in a wide range of places all over the world. There are different types, depending on the temperature and how much rain they get. Different trees, plants, and animals live in each type of forest.

SEE ALSO

- Animal homes p.23
- Fruit and seeds p.115
- North America p.184
- Rainforests p.204
- Seasons p.221
- Trees p.261

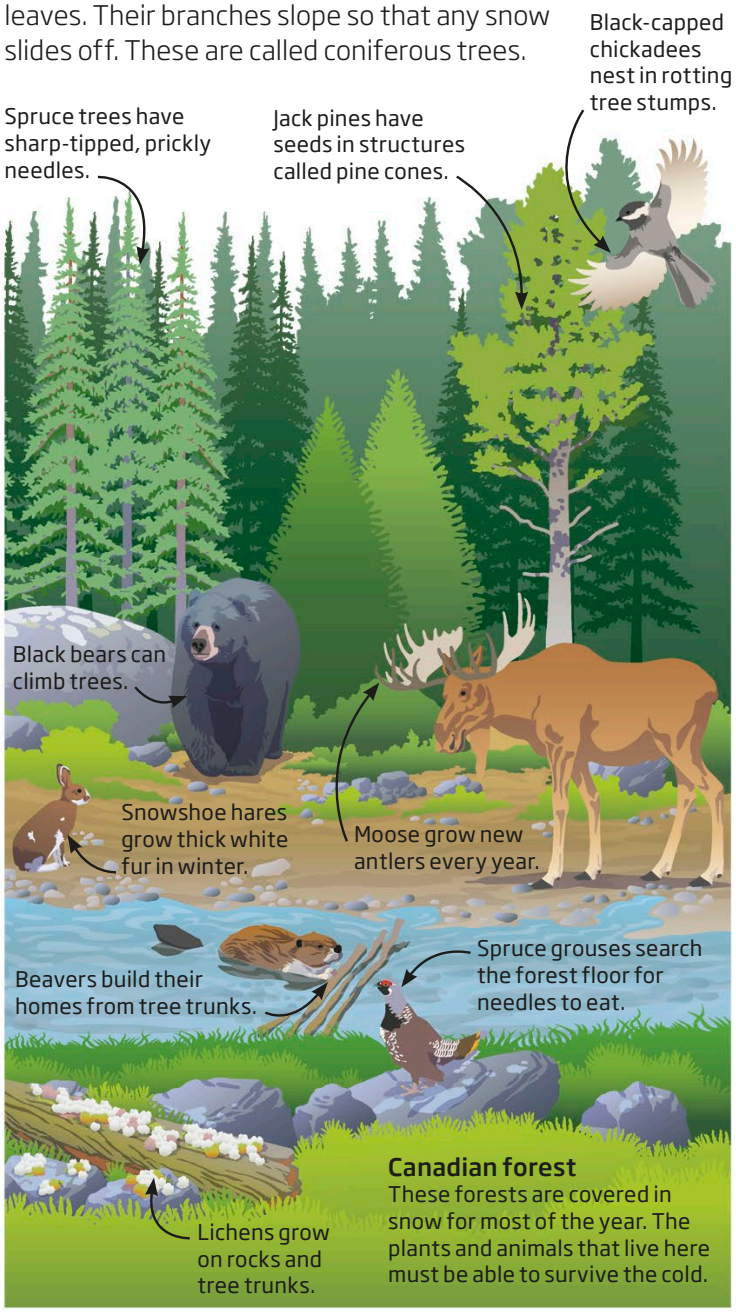
Deciduous forests

These forests have four seasons, with warm summers and cold winters. Many trees drop their leaves in autumn and grow them back in spring. These are called deciduous trees.



Coniferous forests

These forests are found in cold, northern parts of the world. The trees have needle-like leaves. Their branches slope so that any snow slides off. These are called coniferous trees.



Fossil fuels

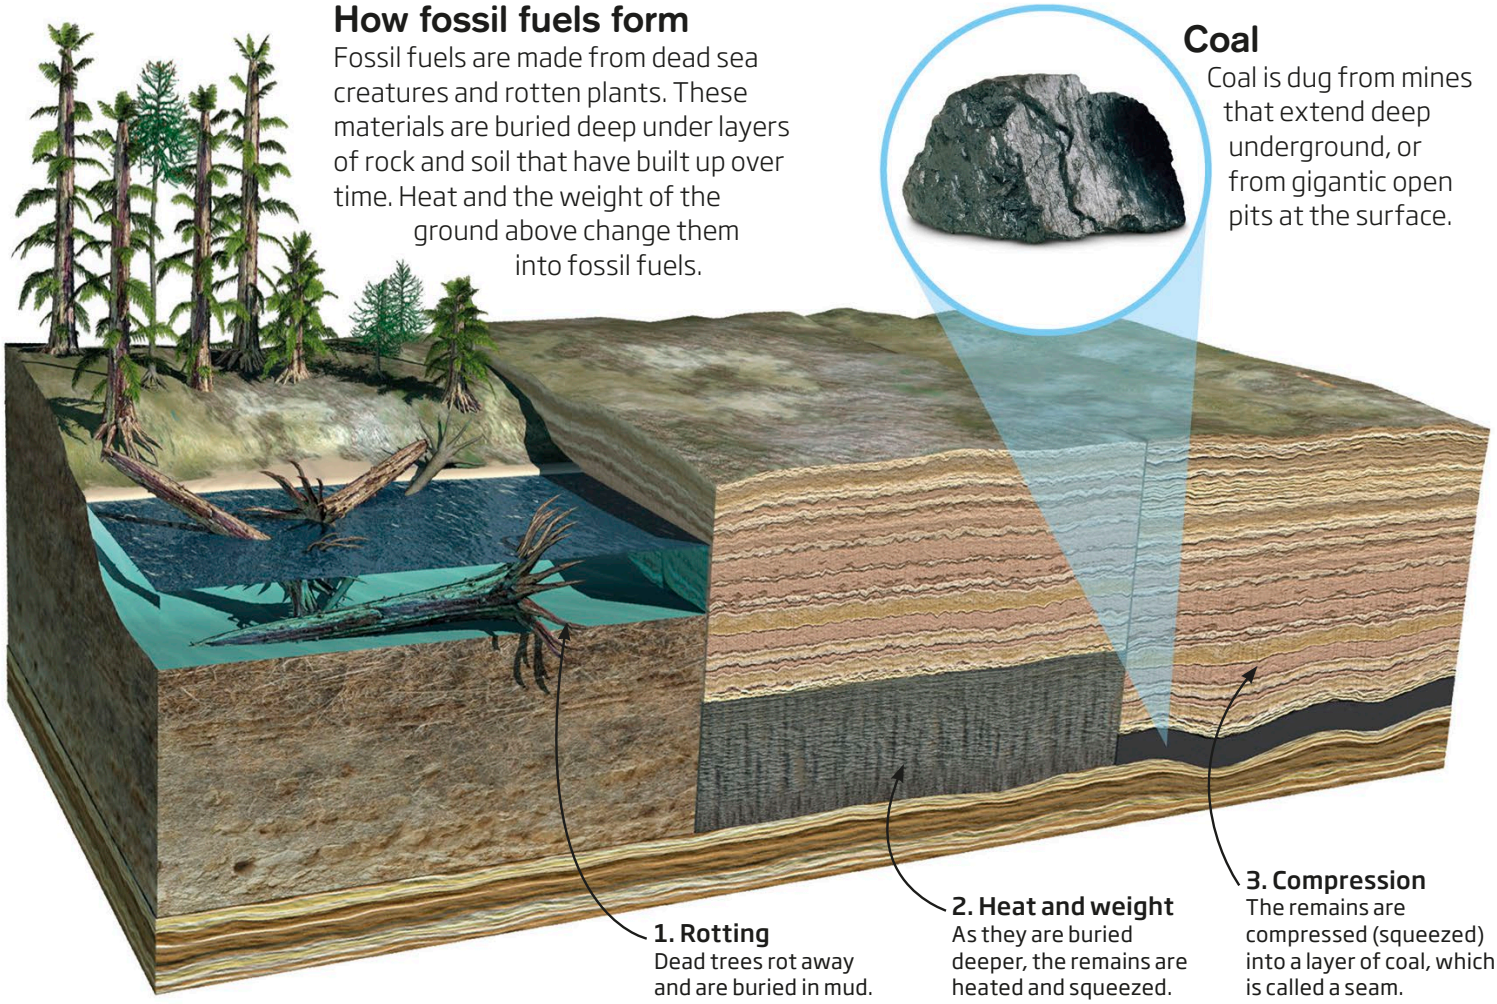
Fossil fuels are natural materials that formed underground millions of years ago. We dig them up or pump them out of the ground so that we can burn them to make energy to power vehicles or to make electricity. There are three types of fossil fuel: coal, crude oil, and natural gas.

SEE ALSO

- Carbon cycle p.49
- Climate change p.60
- Dinosaurs p.80
- Fossils p.111
- Industrial Revolution p.133
- Pollution p.198

How fossil fuels form

Fossil fuels are made from dead sea creatures and rotten plants. These materials are buried deep under layers of rock and soil that have built up over time. Heat and the weight of the ground above change them into fossil fuels.



1. Rotting
Dead trees rot away and are buried in mud.

2. Heat and weight
As they are buried deeper, the remains are heated and squeezed.

3. Compression
The remains are compressed (squeezed) into a layer of coal, which is called a seam.

Coal

Coal is dug from mines that extend deep underground, or from gigantic open pits at the surface.

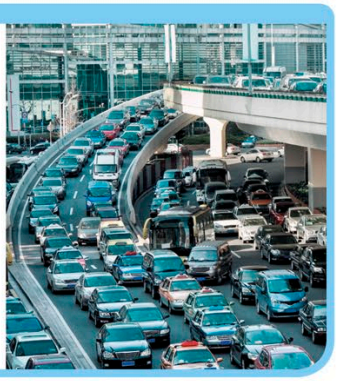
Generating electricity

Fossil fuels are burned in power stations to make electricity. We have used fossil fuels to make electricity for many years, but burning them harms the environment.

Cooling towers at a power station.

Gas and oil

Crude oil is extracted from the earth by drilling. It is used to power vehicles and make plastics. Gas is also released through drilling. It is used for heating buildings. There are limited amounts of fossil fuels – if we keep using them they will eventually run out.

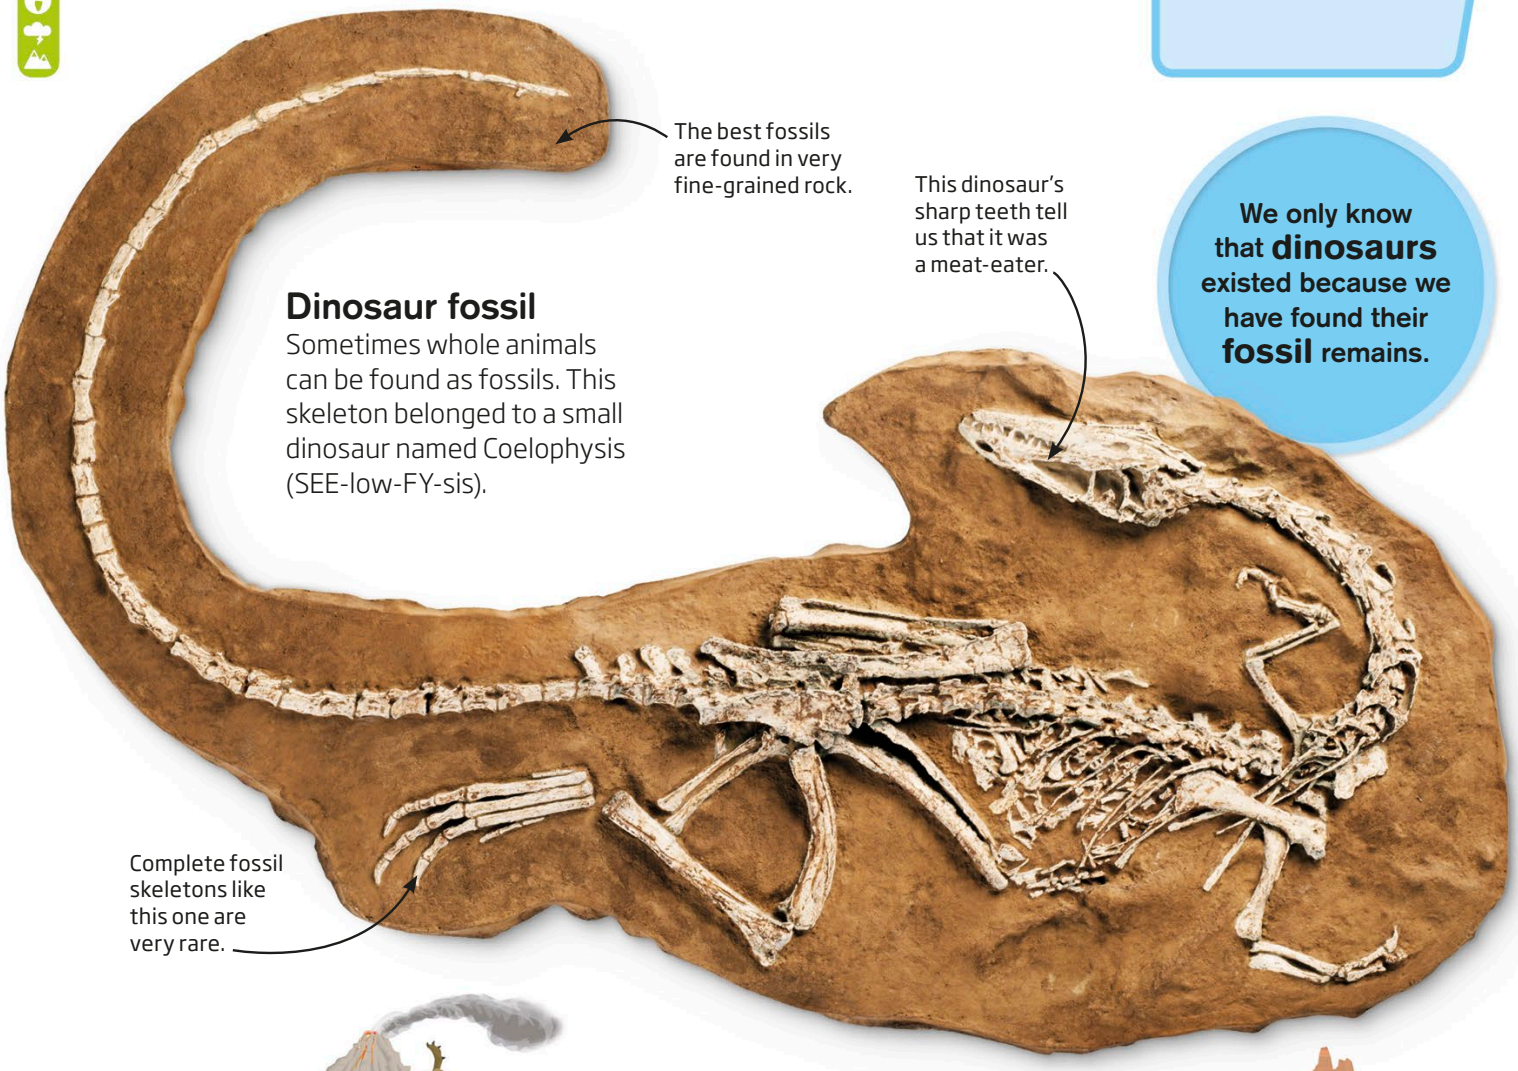


Fossils

Fossils are the remains of plants and animals from long ago. They are usually bones or shells that have turned into stone. Some fossils are so small that we cannot see them without special equipment. Others are as tall as a building.

SEE ALSO

- Dinosaurs p.80
- Fossil fuels p.110
- Prehistoric life p.202
- Rock cycle p.213
- Skeleton p.228



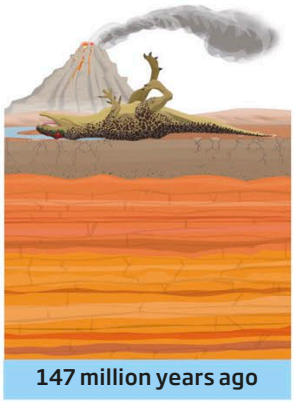
Dinosaur fossil

Sometimes whole animals can be found as fossils. This skeleton belonged to a small dinosaur named Coelophysis (SEE-low-FY-sis).

We only know that dinosaurs existed because we have found their fossil remains.

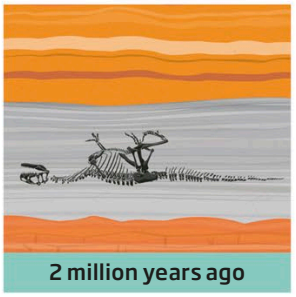
How fossils are made

To become a fossil, an animal or plant needs to be covered up soon after it dies. Turning into a fossil takes millions of years.

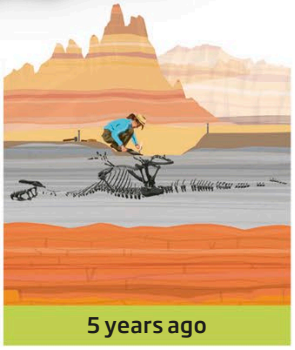


Death
A dinosaur dies and its body sinks into the soft mud by a river.

Burial
Layers of mud, sand, and ash cover the dinosaur, and its flesh rots away.



Turning to stone
The skeleton of the dinosaur slowly turns from bone to stone.



Discovery
Millions of years later, a scientist uncovers the fossil skeleton.

Fractions

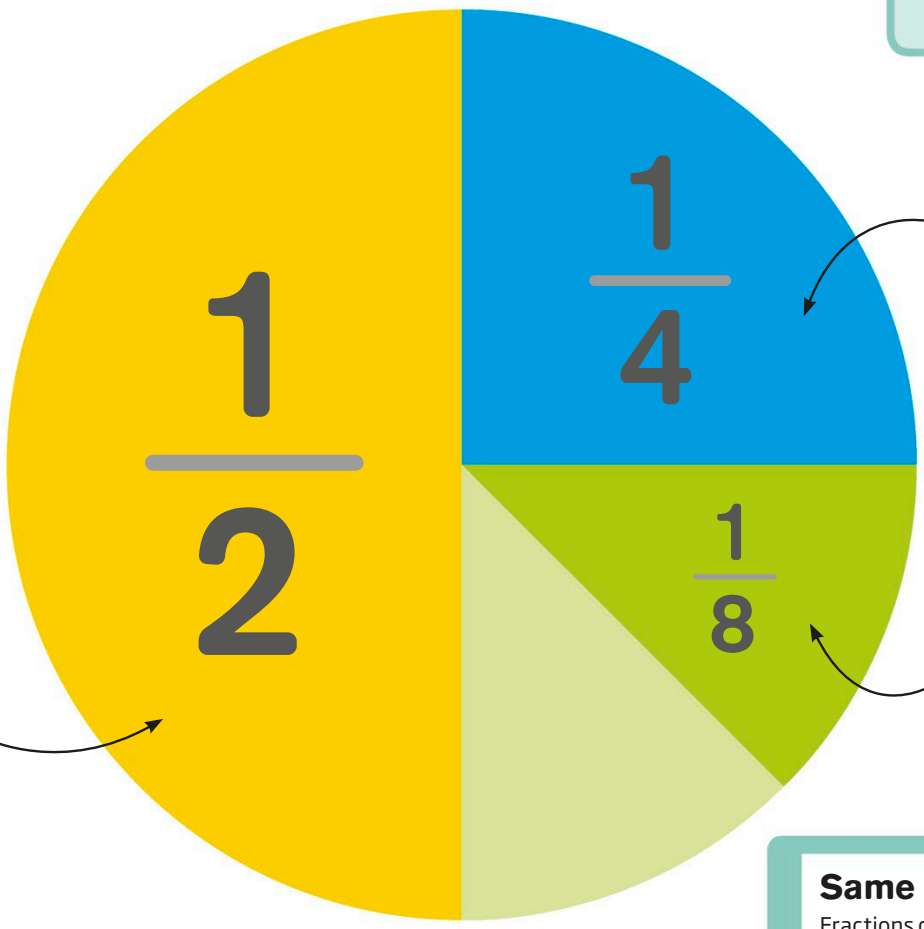
Fractions are parts of whole numbers. They are written as one number over another number. The number on the top is usually smaller than the one on the bottom. Fractions can be used on their own or with whole numbers.

SEE ALSO

- Astronomy p.32
- Clocks p.61
- Measuring p.159
- Numbers p.185
- Shapes p.222
- Symmetry p.248

Common fractions

A whole number can be split into any number of parts to make a fraction. Here are some of the fractions we use most often.



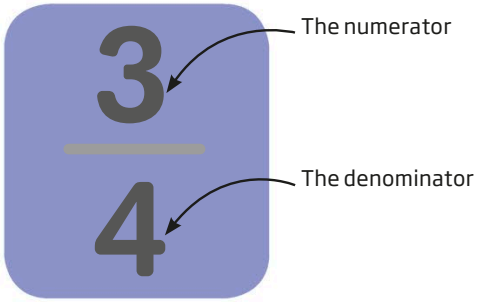
Half
Half of a number is when it is split into two equal parts.

Quarter
A quarter is 1 part out of 4 equal parts.

Eighth
One-eighth is 1 part out of 8 equal parts.

Parts of a fraction

The top number in a fraction is called the numerator. The bottom number is called the denominator. They are divided by a line.



Three-quarters

Decimals

Fractions can also be written as decimals. The number to the left of the decimal point is a whole number. The number to the right is the fraction.

Decimal

Same but different?

Fractions can be written differently but mean the same. A half is the same amount as two quarters.

French Revolution

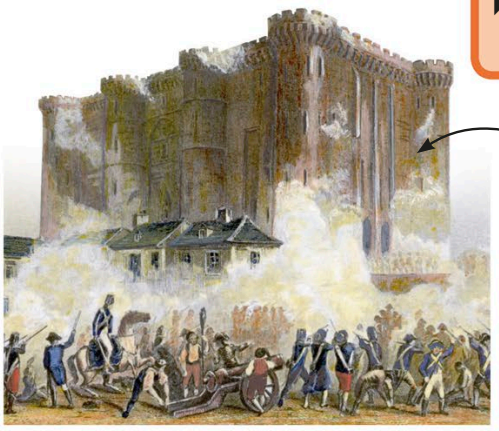
For years, France was ruled by all-powerful kings, who were very rich and could do whatever they wanted. The ordinary people of France were poor. Between 1789 and 1799, the people overthrew the king and changed laws.

SEE ALSO

- Buildings p.48
- Money p.69
- Europe p.94
- Governments p.123
- Law p.145
- War pp.278–279

Marie Antoinette

The luxurious lifestyle of Marie Antoinette, the French queen, made many ordinary people angry. They thought she did not care about their problems.



The Bastille was used to keep prisoners of the king.

The Bastille

The Bastille was a royal prison in Paris. On 14 July 1789, a crowd attacked it and stole weapons that had been stored inside.

Louis was beheaded using a machine called the guillotine.

King Louis XVI was killed in 1793.

General Antoine-Joseph Santerre was a leader in the Revolution.

End of the monarchy

The king and queen tried to run away from France dressed as servants. They were caught and later executed in front of crowds of people.

Friction

Friction is a force that slows down moving things by pulling against the direction of their movement. It is created between two surfaces as they move past each other. Different surfaces produce different amounts of friction.

SEE ALSO

- Forces p.108
- Water pp.120–121
- Gravity p.125
- Materials p.157
- Temperature p.252

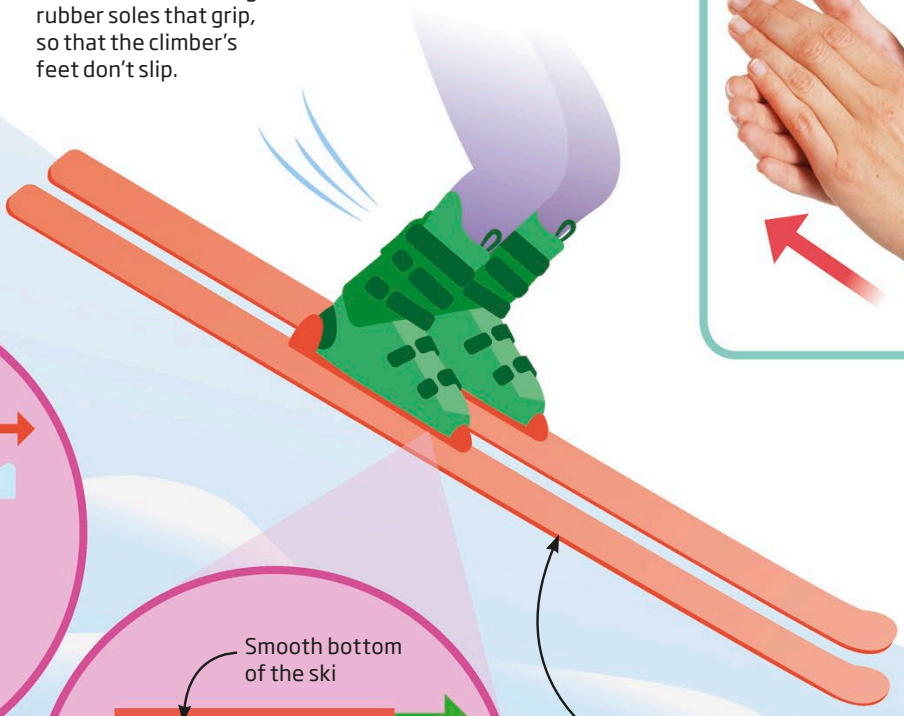
Grip or slip?

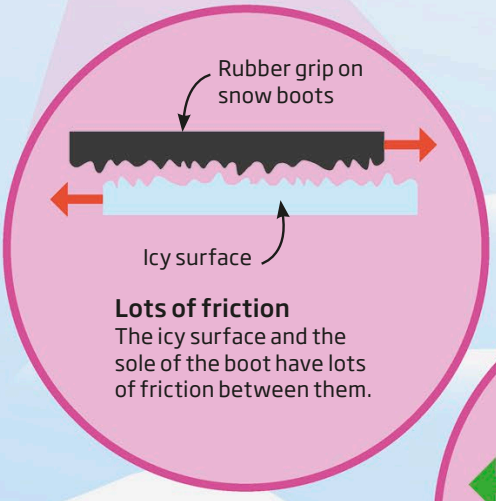
Rough surfaces grip better because they create more friction than smooth surfaces. Smooth surfaces slip past each other because they create less friction than rough surfaces.

Rubber sole
Snow boots have rough rubber soles that grip, so that the climber's feet don't slip.

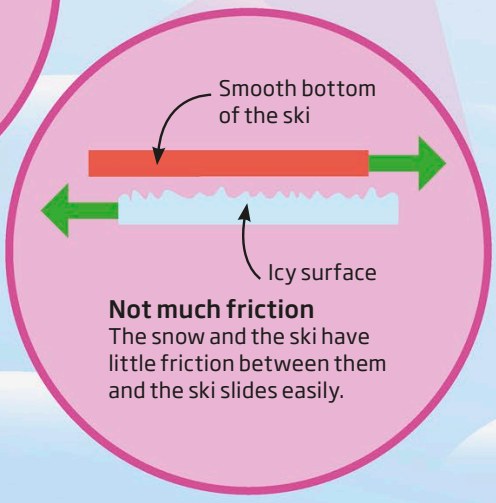
Producing heat

If we rub our hands together there is friction between them. They start to get warm because friction produces heat.





Lots of friction
The icy surface and the sole of the boot have lots of friction between them.



Not much friction
The snow and the ski have little friction between them and the ski slides easily.

Skis
Smooth skis slide over an icy surface very easily. They are made of many different materials, including wood and plastic.

Fruit and seeds

Seeds store everything a new plant needs to start growing, including food. A fruit protects the seeds inside it. It also gives a plant a way to move its seeds away to somewhere they can grow.

SEE ALSO

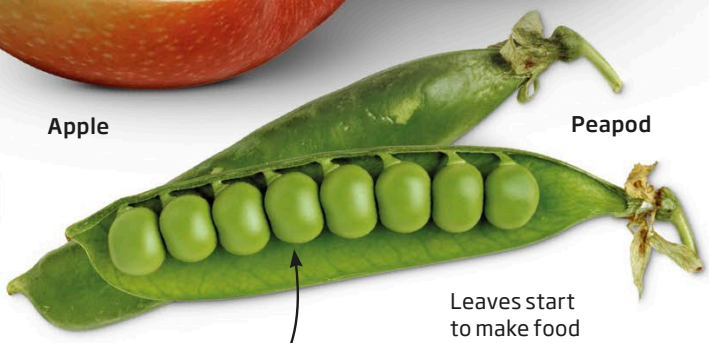
- Animal groups p.22
- Flowers p.103
- Eating pp.104–105
- Plants p.194
- Trees p.261
- Weather p.271

Fruit

Fruit forms from the flowers of some plants. Fruit usually tastes sweet, so people and animals like to eat it.

Apple seeds sit in a core in the middle of the fruit.

Apple seeds can take up to 80 days to begin to grow.

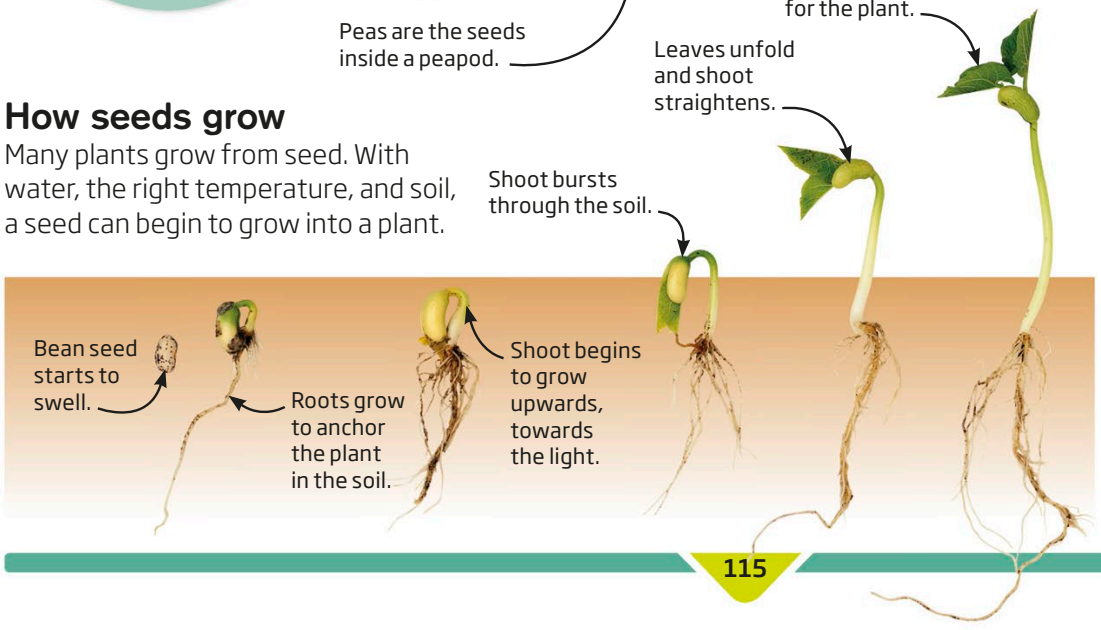


Apple **Peapod**

Peas are the seeds inside a peapod.

How seeds grow

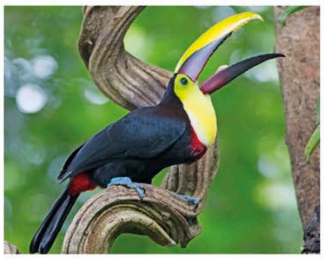
Many plants grow from seed. With water, the right temperature, and soil, a seed can begin to grow into a plant.



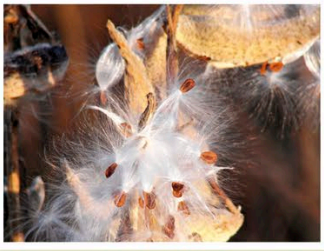
Spreading seeds

Plants spread, or disperse, their seeds in different ways.

By wind
Some plants have "winged" seeds that help their seeds fly away in the wind.



By animal
Animals eat fruit, and then poo out the seeds away from the plant.



Exploding pods
Some plants have seed pods that explode, flinging the seeds into the air.

Galaxies

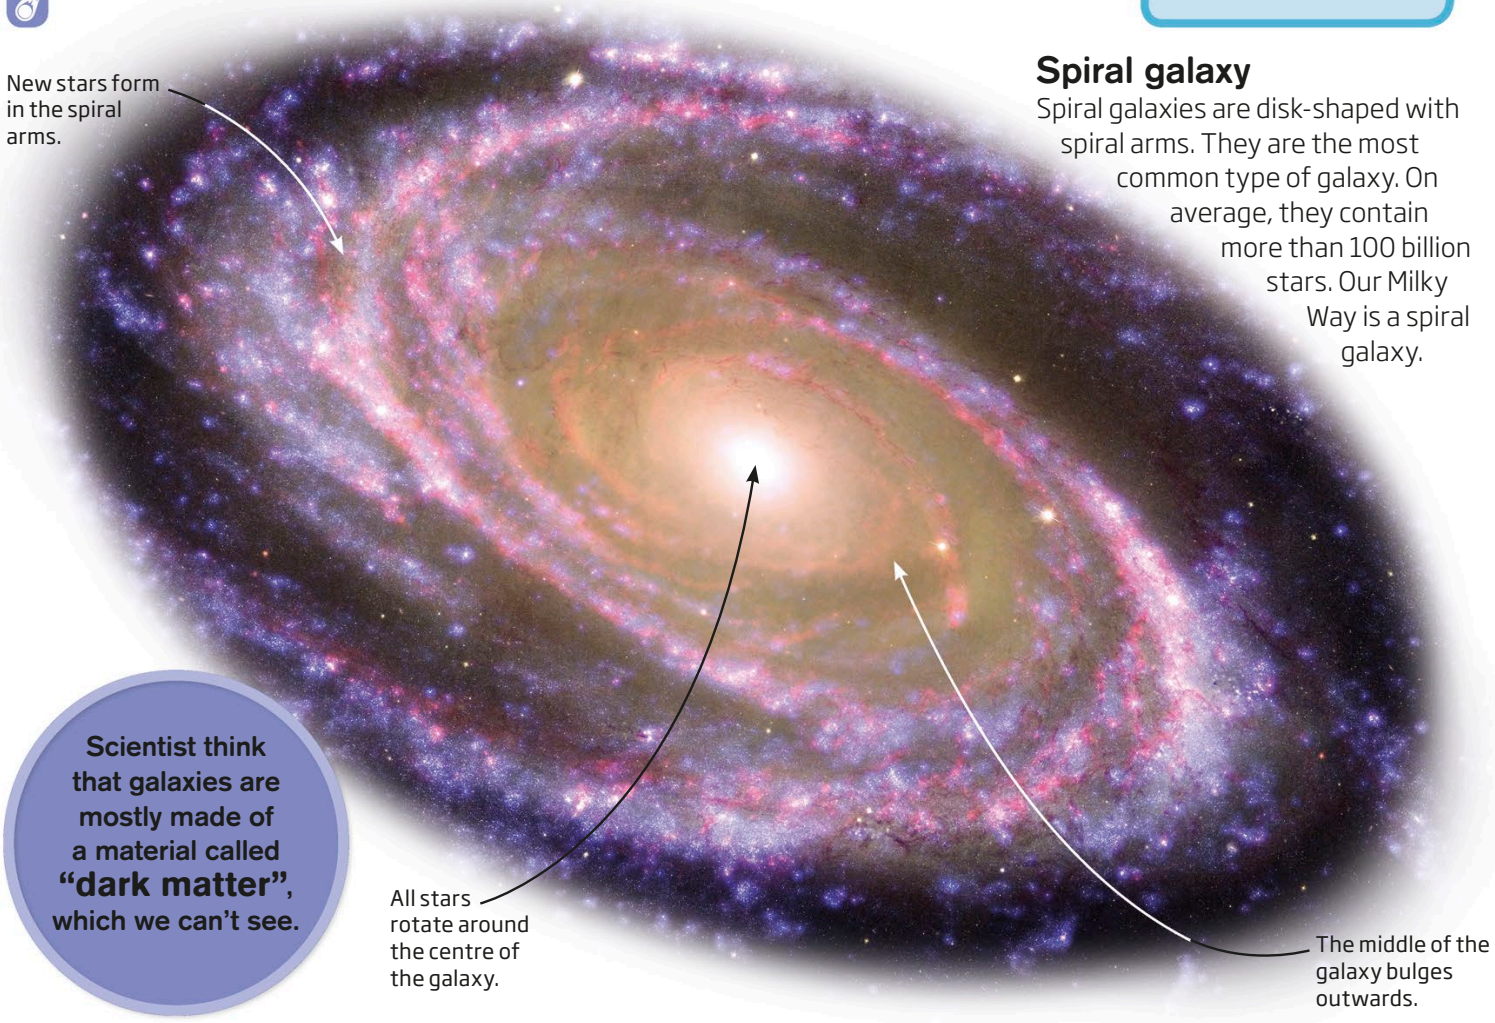
Galaxies are enormous groups of stars, planets, dust, and gas that are held together by the force of gravity. They come in different sizes and shapes, including spiral, elliptical, and irregular.

SEE ALSO

- Gases p.117
- Milky Way p.167
- Physics p.192
- Shapes p.222
- Stars p.242
- Universe p.263

Spiral galaxy

Spiral galaxies are disk-shaped with spiral arms. They are the most common type of galaxy. On average, they contain more than 100 billion stars. Our Milky Way is a spiral galaxy.



Scientist think that galaxies are mostly made of a material called "dark matter", which we can't see.

Elliptical galaxy

Elliptical galaxies are rounded in shape, and are usually made up of older stars. They are generally larger than spiral galaxies. Elliptical galaxies contain lots of stars but little gas or dust.

Irregular galaxy

Small galaxies that do not have a clear structure are known as irregular galaxies. These may be created by two galaxies colliding. They contain lots of young stars, dust, and gas.

Gases

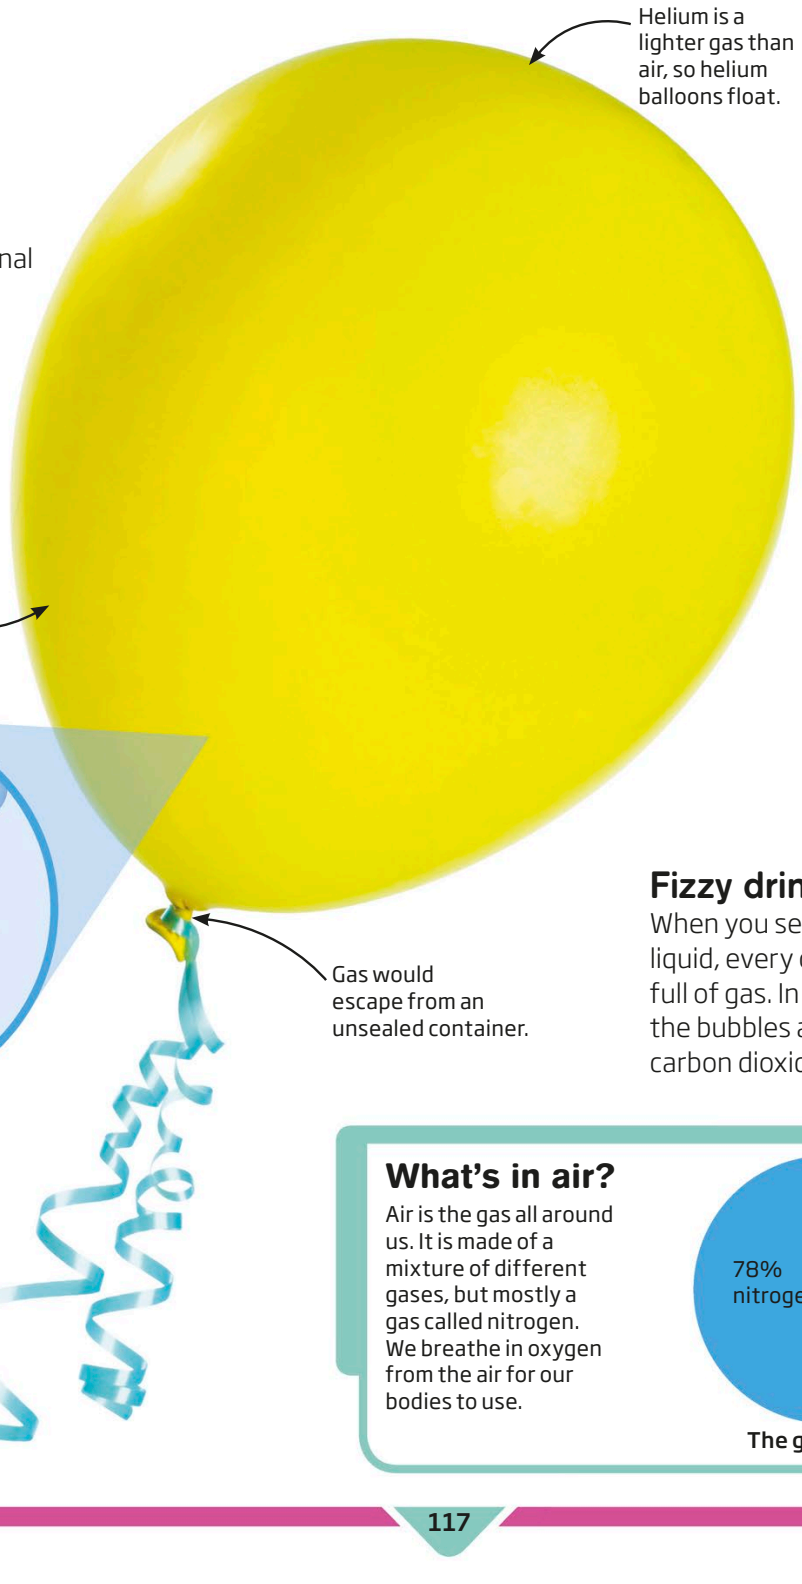
Gases are all around us – we are surrounded by a mixture of gas called air. We can keep them in sealed containers but if we open the container, the gas escapes and spreads out. Most gases are invisible.

SEE ALSO

- Changing states p.57
- Elements p.90
- Liquids p.148
- Lungs p.149
- Mixtures p.168
- Solids p.234

What gases do

Gases have things they do called properties. For example, gases can be squashed and then they push back to fill the original space. This is useful for pumping up bike tyres that cushion bumps in the road as we cycle.



Blowing bubbles

Soap bubbles contain a little bit of air that pushes out towards the bubble. The soap bubble mix is stretched but pushes back, squashing the air into a sphere.

Gas particles

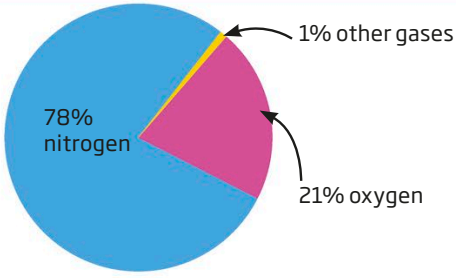
Gases are made from tiny particles that move away from each other in all directions at top speed. They travel long distances unless they bounce off solid barriers.

Fizzy drinks

When you see bubbles in a liquid, every one of them is full of gas. In a fizzy drink, the bubbles are the gas carbon dioxide.

What's in air?

Air is the gas all around us. It is made of a mixture of different gases, but mostly a gas called nitrogen. We breathe in oxygen from the air for our bodies to use.



The gases in air

Gemstones

Gemstones are minerals that can be cut and polished to make jewels. They are often set in pieces of jewellery, such as rings, brooches, and even crowns. Many gemstones, such as rubies, are brightly coloured. Others, such as diamonds, are usually colourless.

SEE ALSO

- Elements p.90
- Metals p.162
- Money p.169
- Precious metals p.199
- Gold pp.200–201
- Rocks and minerals p.214

Cutting gemstones

Gemstones are found as minerals. To become sparkly jewels, they must be cut into shape. Very sharp tools are used to carefully cut the stone into exactly the right shape.

Jewellery

Gems are often set in precious metals, such as gold and silver. They are used to make brooches, earrings, and other pieces of jewellery.

Different colours

The colours of gemstones are often caused by substances in minerals known as impurities. Sapphires and rubies are both types of a mineral called corundum, with impurities that make them blue or red.

Diamond is made entirely from carbon squeezed under enormous pressure deep within the Earth.

Genes

Genes are the instructions that make people the way they are. They include things like skin colour, hair colour, and height. Half our genes come from our mother and half from our father.

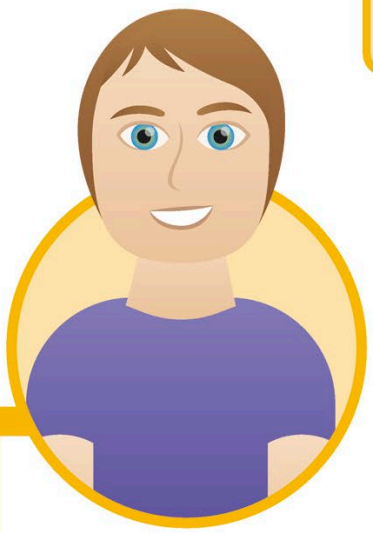
SEE ALSO

- Body cells p.41
- Evolution p.95
- Human body p.130
- Life cycle p.146
- Mammals p.154
- The sciences pp.218–219

Inheritance

Face shape, eye colour, and hair texture are passed down from either the mother or the father's genes. Skin colour works differently – it depends on the amount of a chemical called melanin in the skin.

Mother

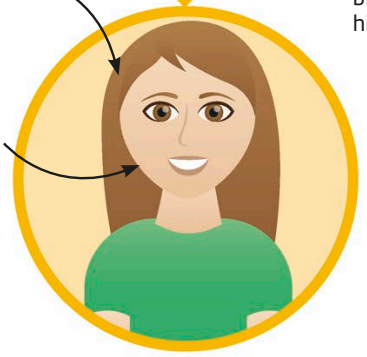


Father

If you unravelled all the DNA in a person, it would reach to the Sun and back 400 times!

Her hair is light brown and straight like her dad's.

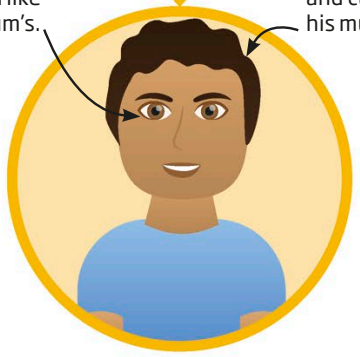
Her face shape was passed on from her mother's genes.



Child 1

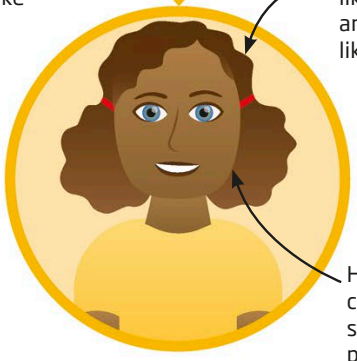
His eyes are brown like his mum's.

His hair is black and curly like his mum's.



Child 2

Her hair is curly like her mum's, and light brown like her dad's.



Child 3

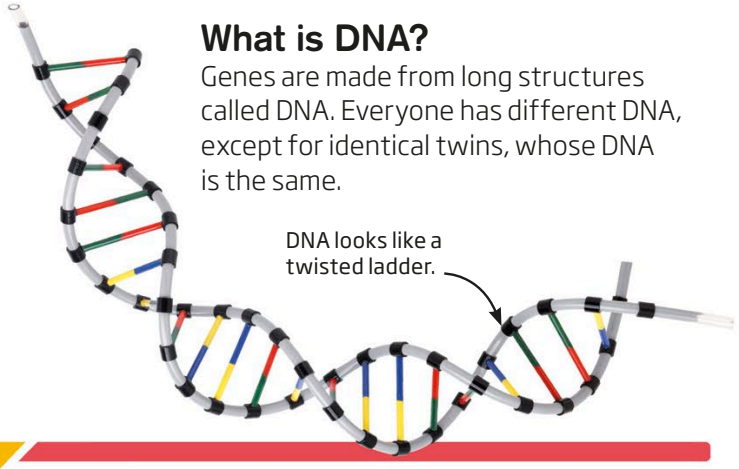
Her skin colour could be the same as either parent or anything in between.

Clones

Most animals get a mix of different genes from their parents. Clones have exactly the same genes as another animal. Dolly the sheep was the first cloned mammal. Her genes were taken from a single cell of a female sheep.

What is DNA?

Genes are made from long structures called DNA. Everyone has different DNA, except for identical twins, whose DNA is the same.



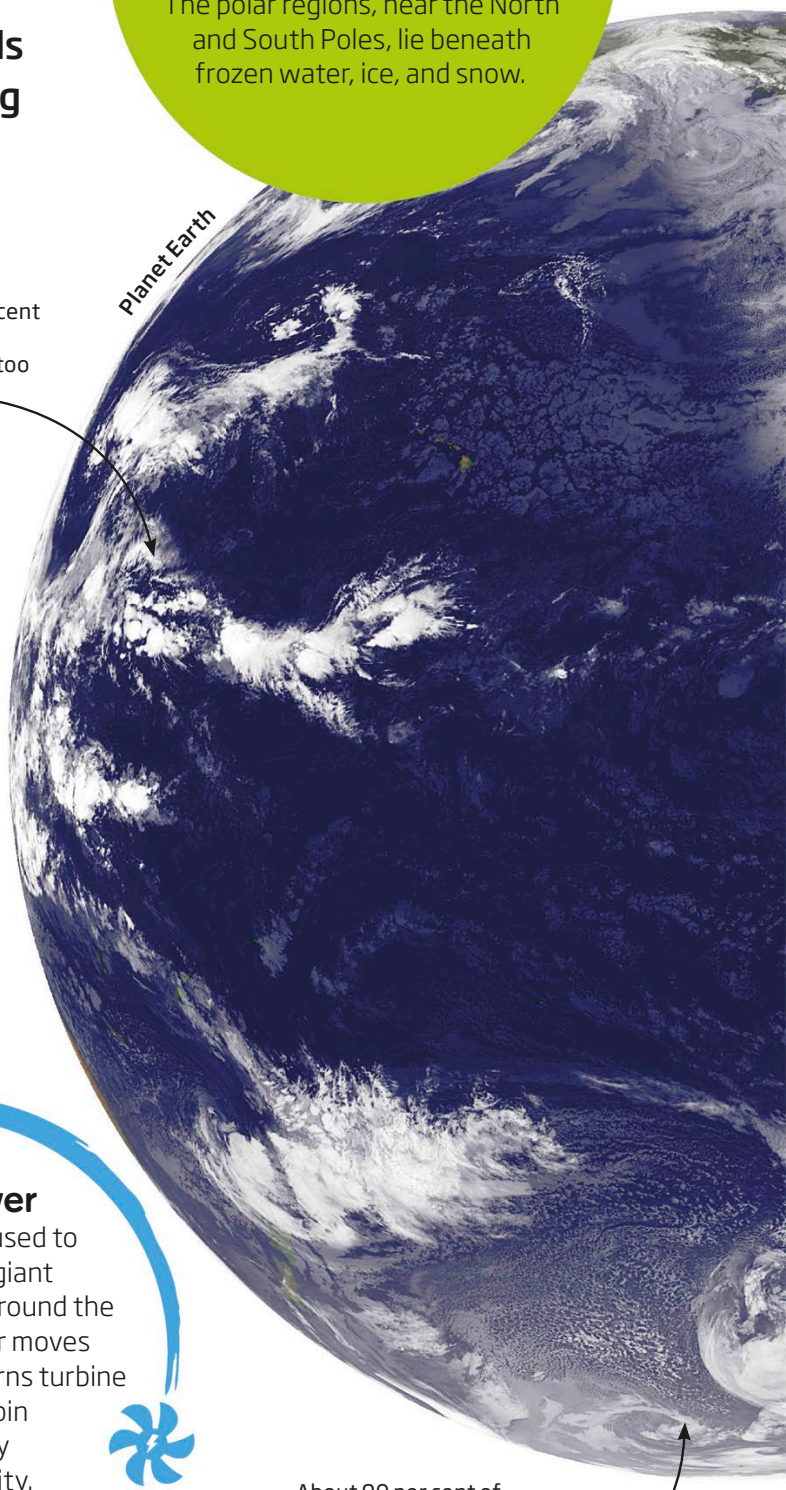
DNA looks like a twisted ladder.

Water

Water is a clear, colourless substance that is found all around us. It forms Earth's oceans, lakes and rivers, snow and ice, and the clouds drifting overhead. All living things – including us – are mostly made of water, so without it our planet would be lifeless.

Blue planet

Nearly three-quarters of the Earth is covered by oceans and seas. Rivers and lakes stretch across the land's surface. The polar regions, near the North and South Poles, lie beneath frozen water, ice, and snow.



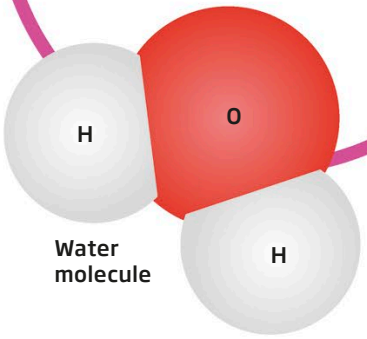
Planet Earth

More than 96 per cent of all the water on Earth's surface is too salty to drink.

About 90 per cent of all frozen water on Earth is in Antarctica, around the South Pole.

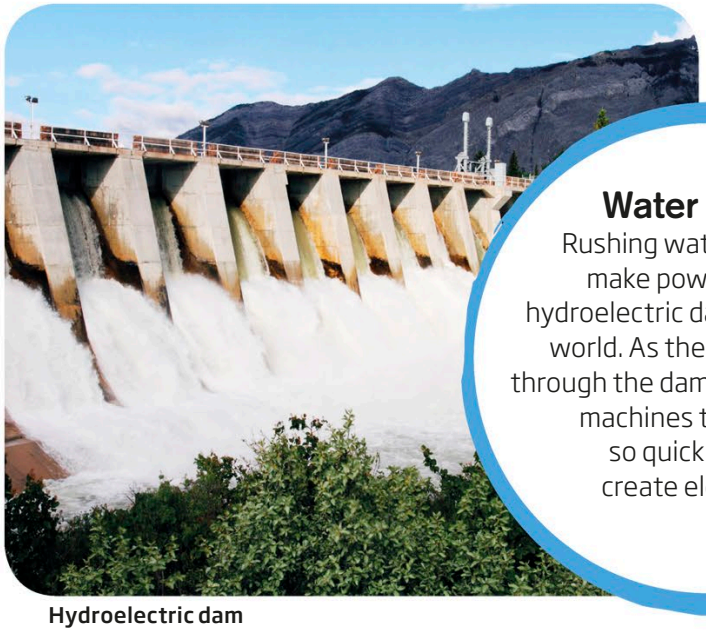
What's in water?

Water is made up of tiny particles called molecules. Each one has an oxygen (O) atom joined to two smaller hydrogen (H) atoms, so water is also known as H_2O.



Water molecule

Fish breathe using special organs called gills to extract oxygen from the water.

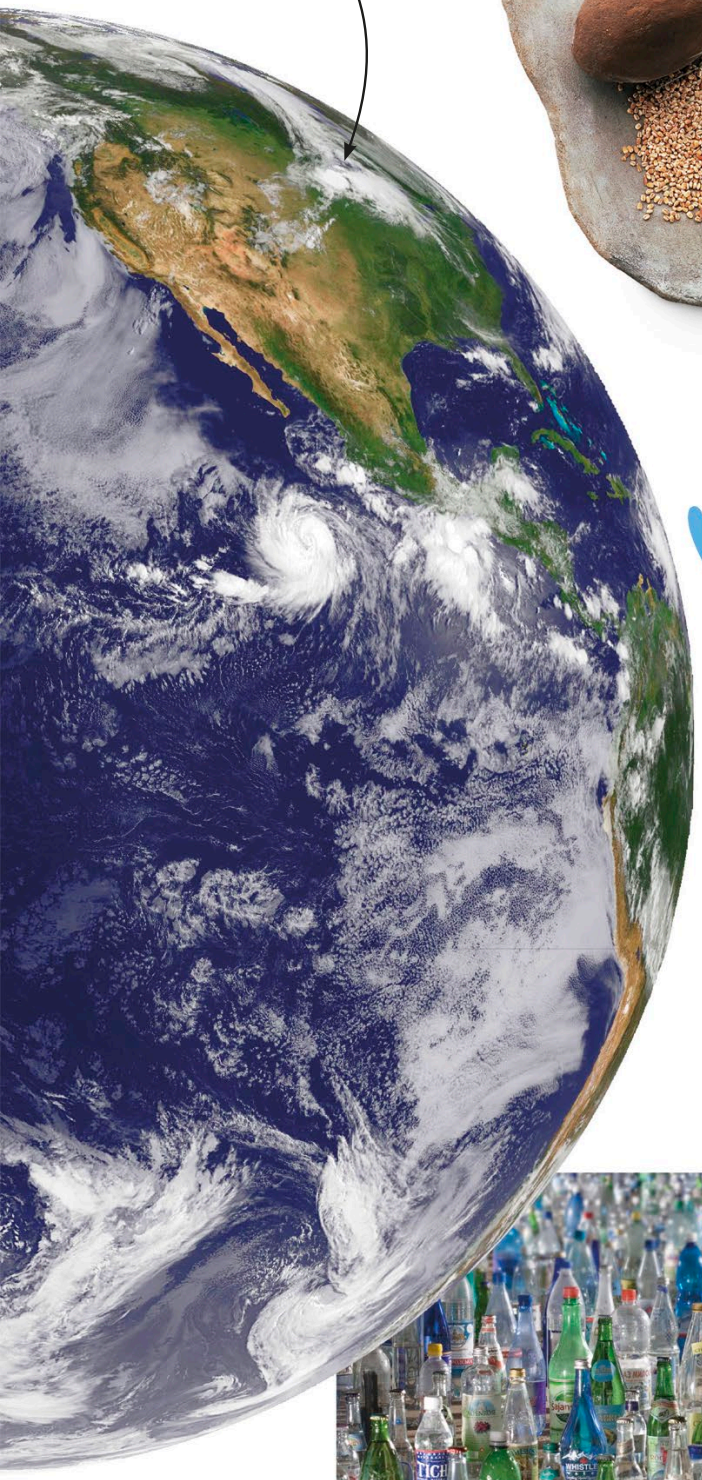


Hydroelectric dam

Water power

Rushing water is used to make power at giant hydroelectric dams around the world. As the water moves through the dam, it turns turbine machines that spin so quickly they create electricity.

Only 2.5 per cent of the Earth's water is fresh. It is found mostly in rivers, lakes, and glaciers.



Grain grown in Mesopotamia

Stone for grinding wheat into flour

Land of the rivers

The first cities were built in Mesopotamia (now mainly Iraq) around the Tigris and Euphrates rivers. The rivers allowed goods and people to move around and provided essential water to drink, cook with, and use to water crops.

Stone sickle for cutting crops

Kayaking

Water sports

Without water there would be fewer ways for us to have fun. There would be nothing to swim in or surf on, and no kayaking or sailing. There would be no snow for skiing or sledging and we could never build a snowman.

We lose **water** from our bodies through **sweating** when we are active and play sports.

Plastic water bottles

Bad for the environment

More than 200 billion plastic water bottles are used around the world each year. Making the bottles releases lots of harmful gases into the air, and only one in five bottles is recycled – the rest are thrown out as rubbish.

Glaciers

Glaciers are slow-moving rivers of ice. They form high up in mountains or regions near Earth's poles and flow downhill. The front of a glacier may melt to make a river or lake. If a glacier reaches the coast, huge blocks of it break off and float away into the sea as icebergs.

SEE ALSO

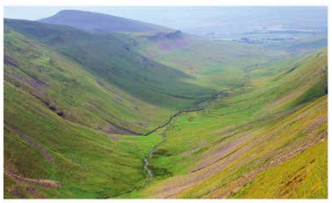
- Antarctica p.24
- Arctic p.25
- Changing world pp.50–51
- Climate change p.60
- Erosion p.93
- Mountains p.172

How are glaciers made?

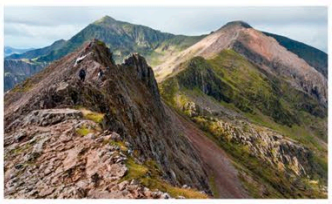
Glaciers are made from snow that builds up and turns into ice. Eventually, there is so much ice that it starts to flow downhill.

Signs of glaciers

Some parts of the world were once colder and covered in glaciers. As the climate warmed, the glaciers melted away. However, they left signs in the landscape that they were once there.



U-shaped valley
Glaciers carve steep-sided valleys into flatter U-shaped ones as ice and rock grind the hillside away.



Sharp ridge
An arête is a sharp ridge of rock that separates two valleys that once had glaciers in them.

Giant rocks
Glaciers can pick up giant rocks and dump them far from where they came. They are called erratics.

Governments

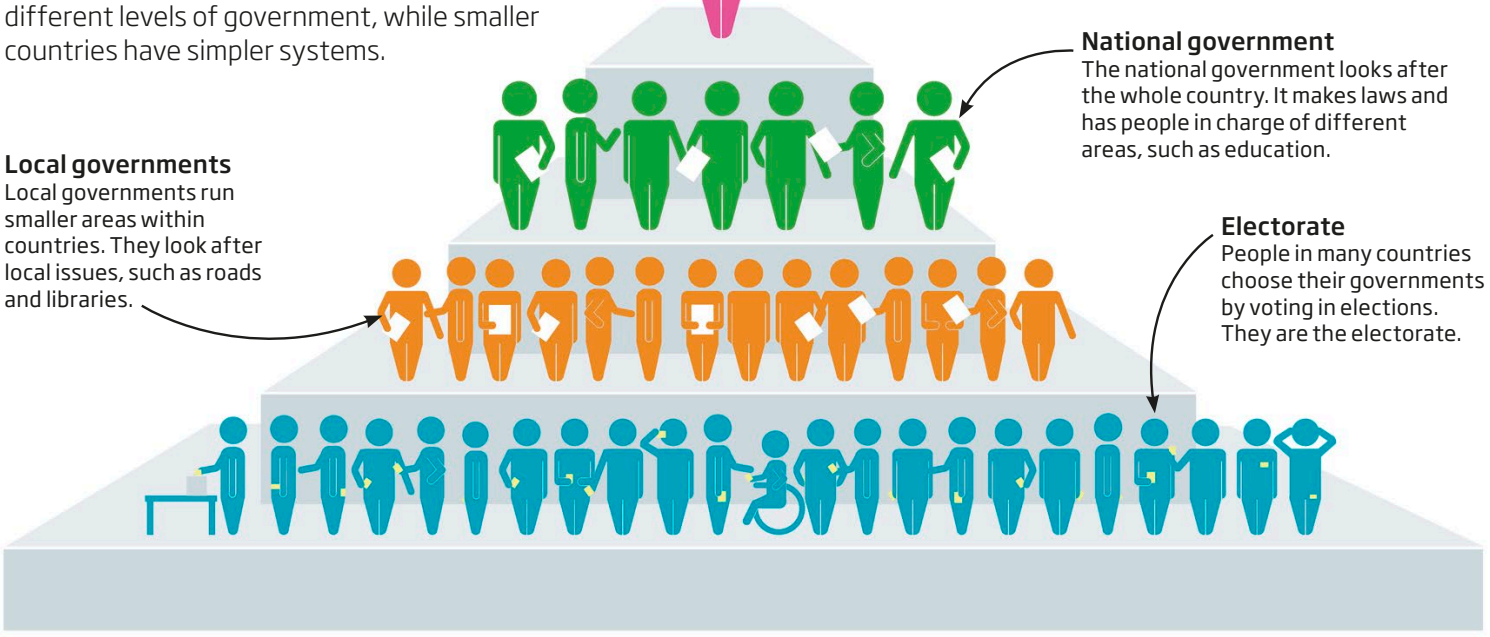
A government is an official group of people that runs a country. Governments keep their people safe through rules called laws. They often try to keep the peace with other countries, and can help provide services such as schools and hospitals. Most governments try to help people lead better lives.

SEE ALSO

- Law p.145
- Medicine p.160
- Trade p.257
- School pp.272-273
- Work p.274
- World p.275

How a government works

Each country has its own system of government that looks after its people. Large countries have different levels of government, while smaller countries have simpler systems.



Head of state
One person is in charge of each country, such as a president or queen. They represent it when meeting with other countries.

National government
The national government looks after the whole country. It makes laws and has people in charge of different areas, such as education.

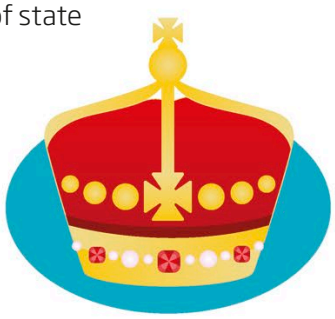
Local governments
Local governments run smaller areas within countries. They look after local issues, such as roads and libraries.

Electorate
People in many countries choose their governments by voting in elections. They are the electorate.

Types of government

Most countries in the world are democracies. They elect (choose) who is in government. Other countries have heads of state who aren't chosen.

Democracy
In a democracy, people vote for a government and a head of state to rule them and take decisions for them.



Monarchy
A monarchy is a family system in which the job of the head of state is passed from the king or queen to their child or relative.

Dictatorship
Dictators often rule by force. They use an army to make people do what they say.

Constitutions

A constitution is a written document that sets out the aims and values of a country and how it should be ruled. The US constitution was written in 1787.

Grasslands

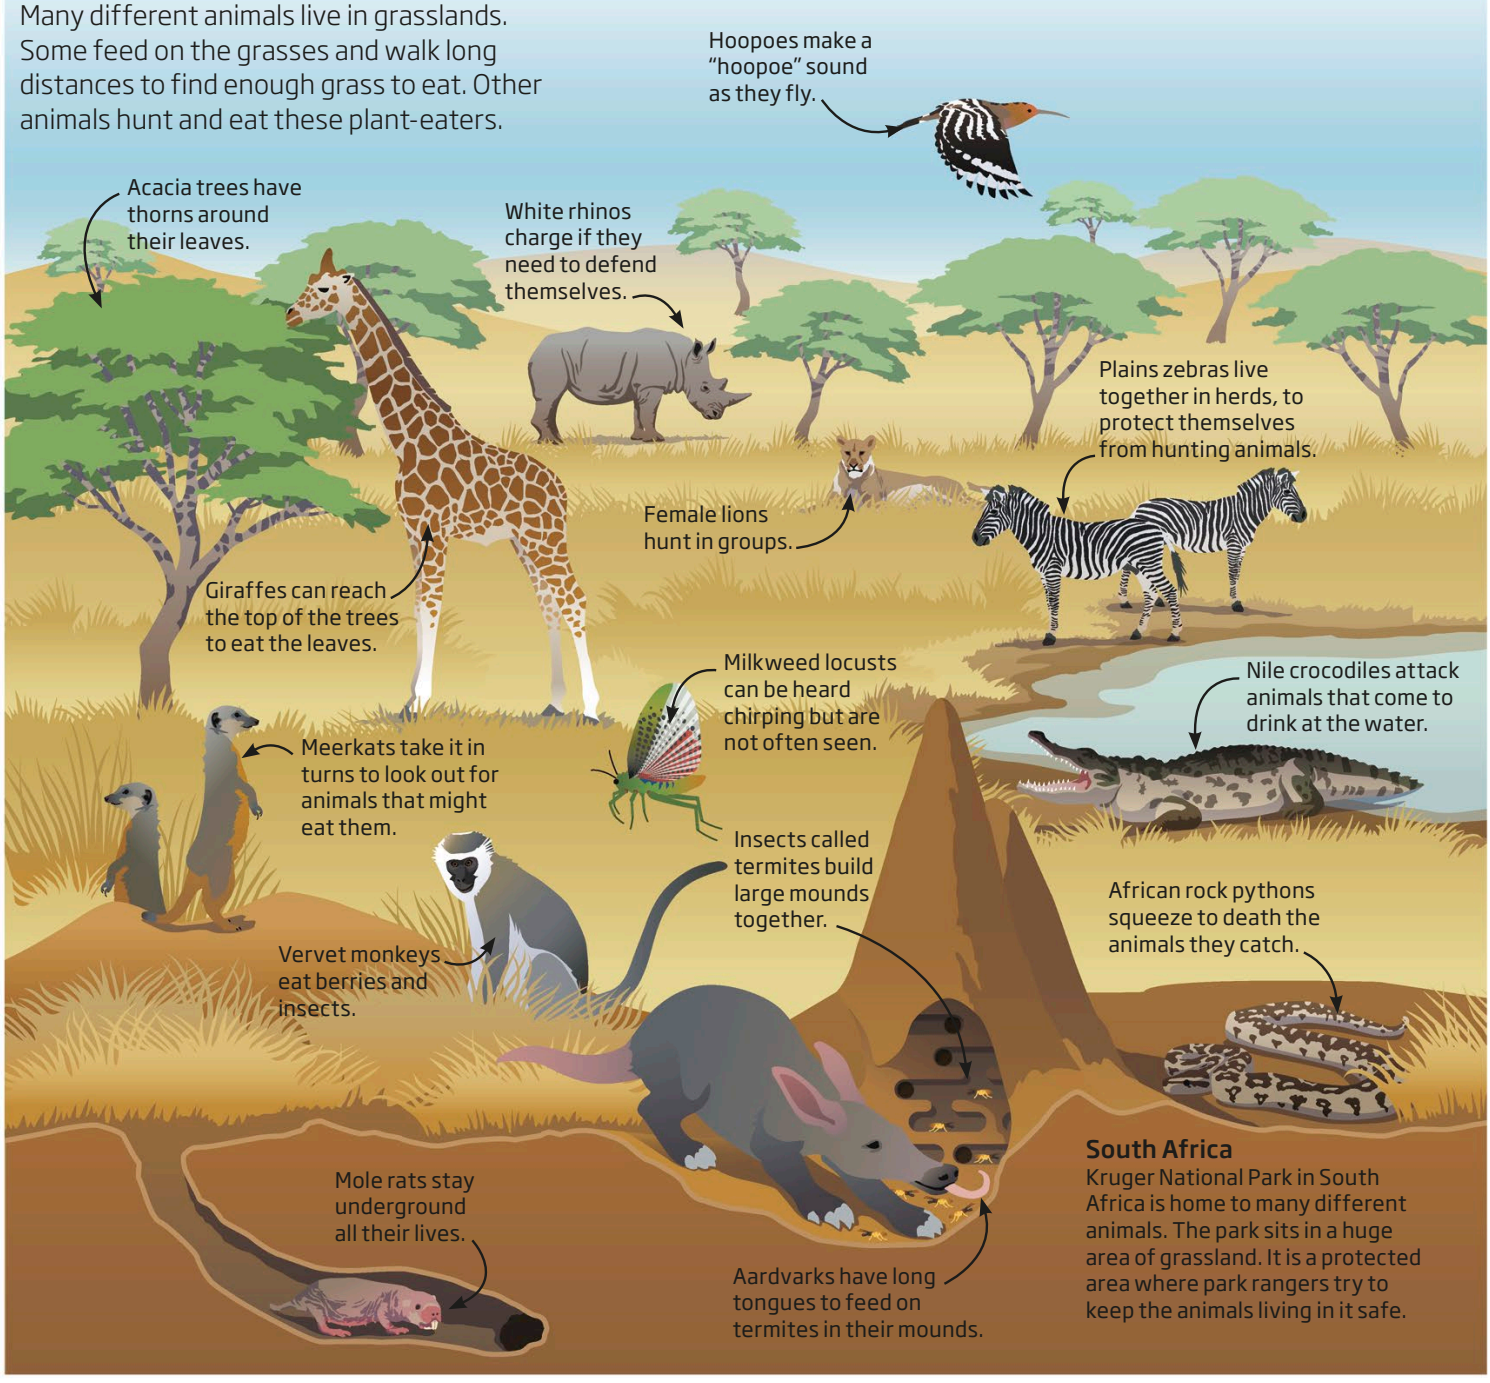
Grasslands are large areas covered in grass with just a few trees. They are dry, but get more rain than deserts do. Grasslands are known as savannas in Africa, steppes in Russia, prairies in North America, and pampas in South America.

SEE ALSO

- Africa p.12
- Animal homes p.23
- Birds p.39
- Deserts p.78
- Migration p.166
- Monkeys and apes p.170

Grassland life

Many different animals live in grasslands. Some feed on the grasses and walk long distances to find enough grass to eat. Other animals hunt and eat these plant-eaters.



South Africa

Kruger National Park in South Africa is home to many different animals. The park sits in a huge area of grassland. It is a protected area where park rangers try to keep the animals living in it safe.

Gravity

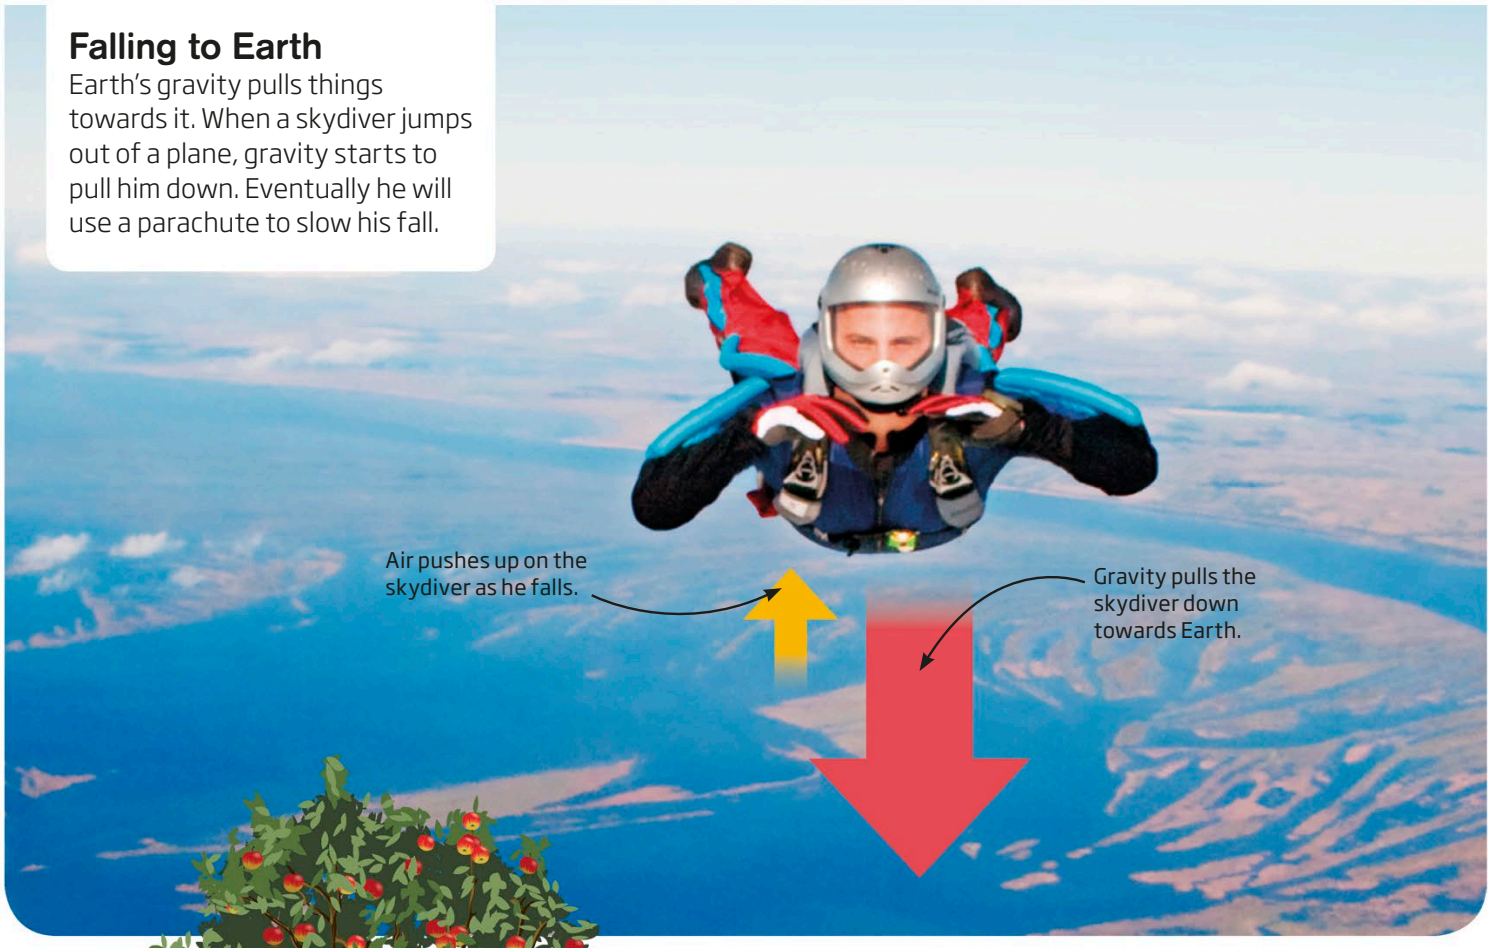
Gravity is an invisible force that pulls us back down towards Earth when we jump in the air. If we throw a ball up it comes down because of gravity. Without it, we would float off into space.

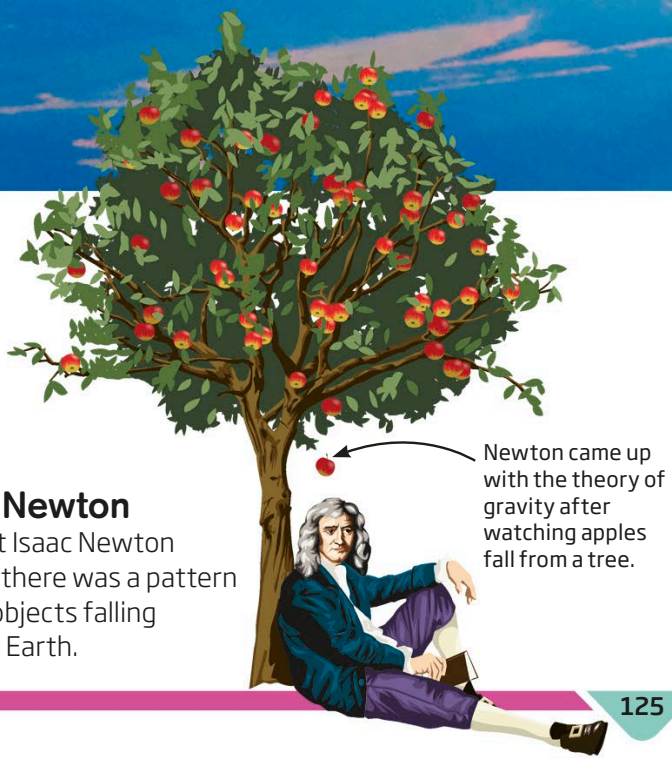
SEE ALSO

- Forces p.108
- Gases p.117
- Measuring p.159
- Moon p.171
- Solar System p.233
- Sun p.247

Falling to Earth

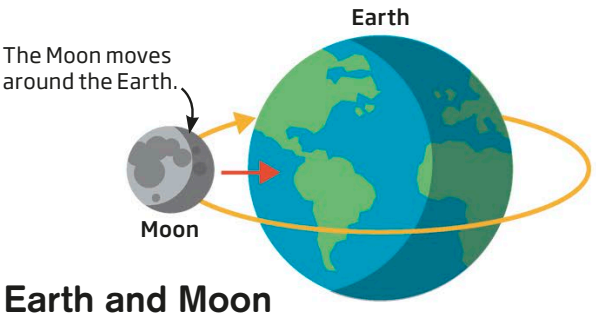
Earth's gravity pulls things towards it. When a skydiver jumps out of a plane, gravity starts to pull him down. Eventually he will use a parachute to slow his fall.





Isaac Newton

Scientist Isaac Newton realized there was a pattern behind objects falling towards Earth.



Earth and Moon

The strong pull of Earth's gravity keeps the Moon moving around it. Without gravity, the Moon would disappear off into space.

Habitats

A habitat is the place a plant or animal lives. Habitats around the world have different temperatures and landscapes. Animals and plants have certain features that allow them to survive in their habitats.

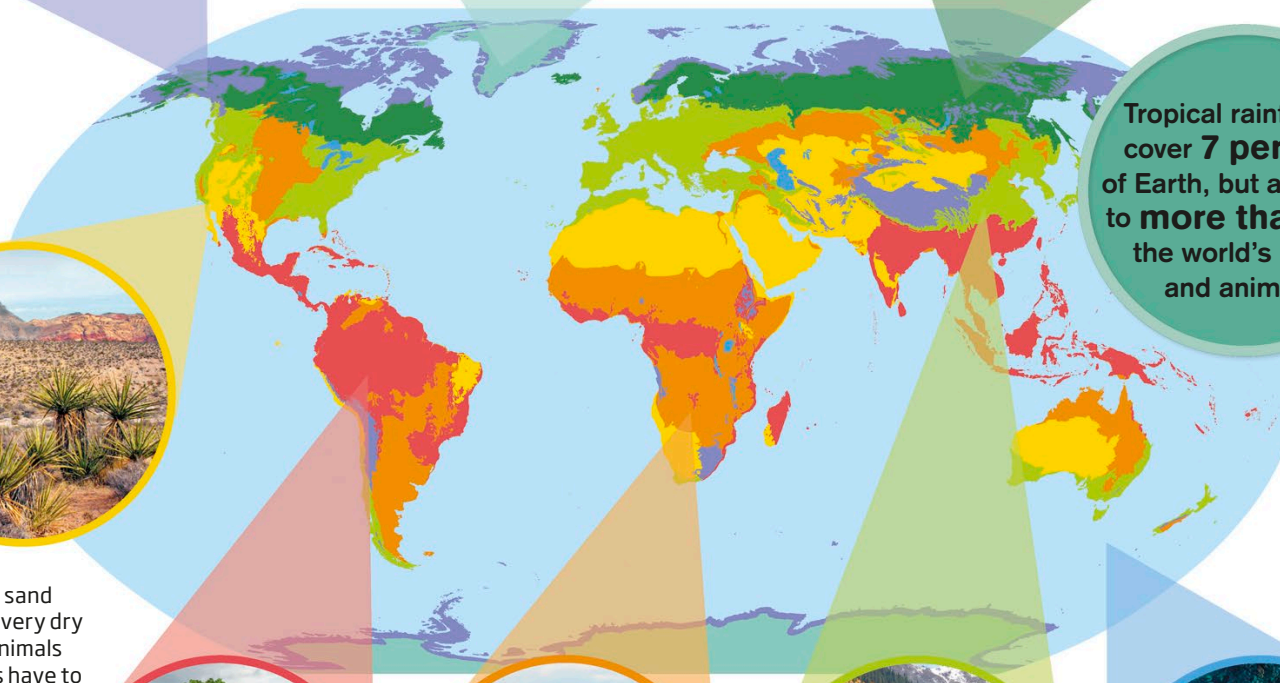
SEE ALSO

- Coral reefs p.74
- Deserts p.78
- Forests p.109
- Grasslands p.124
- Polar habitats p.197
- Seashores p.220

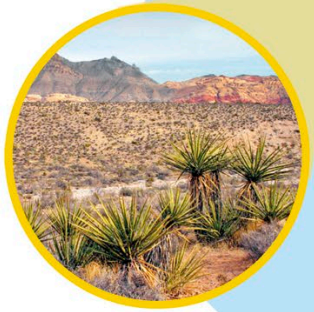
Tundra
This cold habitat has very few trees, plants are small, and animals often move away after the short summer.

Polar regions
Very few plants and animals can survive in the freezing temperatures of this icy habitat.

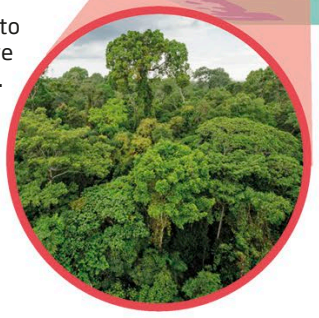
Coniferous forest
This habitat is full of coniferous trees, which keep their needle-like leaves all year round.



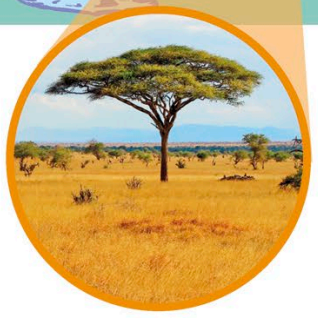
Tropical rainforests cover **7 per cent** of Earth, but are home to **more than half** the world's plants and animals.



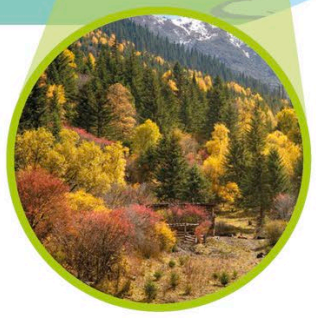
Desert
Rocks and sand cover this very dry habitat. Animals and plants have to be able to survive with little water.



Rainforest
Trees grow quickly in this warm, rainy habitat. They provide food and homes for thousands of different animals.



Grassland
Grasslands have more rain than deserts, but not enough for many trees to grow. Most animals that live here eat grass.



Deciduous forest
This habitat has four seasons. The trees drop their leaves in autumn and grow them back in spring.

Ocean
This saltwater habitat covers 70 per cent of Earth's surface. Some animals live deep down.

Hearing

Hearing happens when our ears receive a sound. Sound is a vibration that travels through the air and into our ears. The sound goes into the hidden parts of the ear and our brain identifies what we hear.

SEE ALSO

- Brain p.45
- Communication p.69
- Human body p.130
- Music pp.176–177
- Radio p.203
- Sound p.235

The ear

The ear is much bigger than it looks from the outside. The inner ear and outer ear are hidden inside our heads.

Inside the ear

The smallest bone in your ear is the size of a grain of rice.

The ears are shaped like cups to catch sound.

Outer ear

1. Ear canal
Sound vibrates through the air and into the ear.

2. Ear drum
The ear drum is a tiny disk with skin stretched over it. It picks up sound vibrations.

3. Bones
Three tiny bones called the ossicles pass the vibrations along.

Middle ear

Inner ear

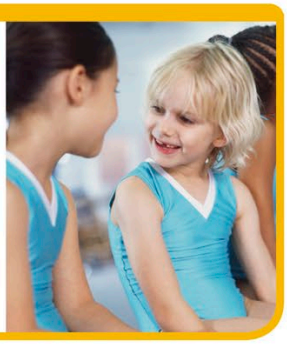
4. Inner ear
The inner ear contains liquid-filled tubes. The vibrations move through the liquid and tiny hair cells in the cochlear detect the sounds.

5. Nerve
This nerve sends sounds to the brain as electrical signals.

The curled part of the inner ear is called the cochlear.

Brilliant brain

The brain makes sense of the signals from the ear. For example, if someone is talking to us, the brain works out what the meaning of the sounds are.



Heart

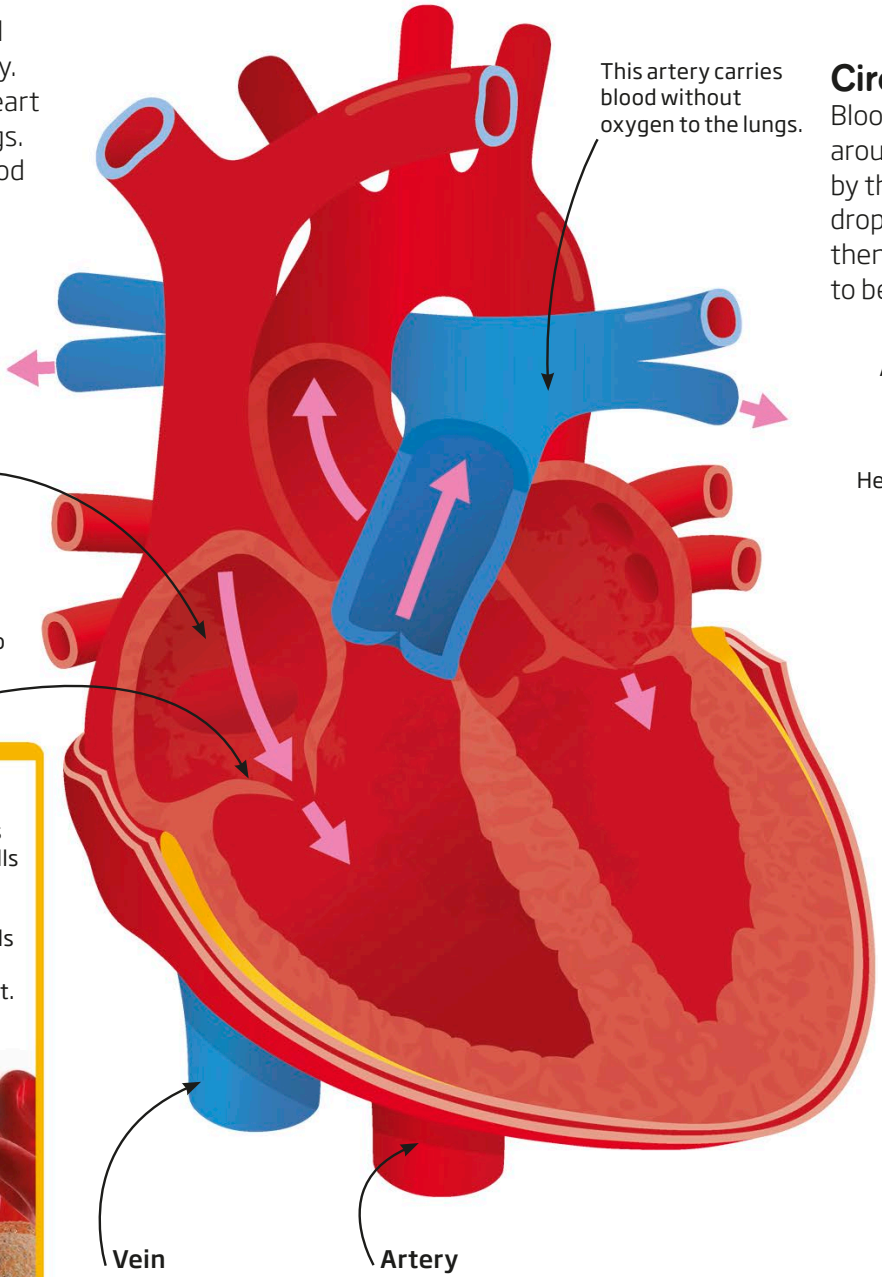
The heart is a pump about the size of a fist. It is mainly made of muscle and it pushes blood around the body by squashing itself in and out around 80 times a minute. Blood is a liquid that carries oxygen and food around the body. If the heart stops beating, the body stops working.

SEE ALSO

- Body cells p.41
- Brain p.45
- Feelings p.99
- Human body p.130
- Lungs p.149
- Medicine p.160

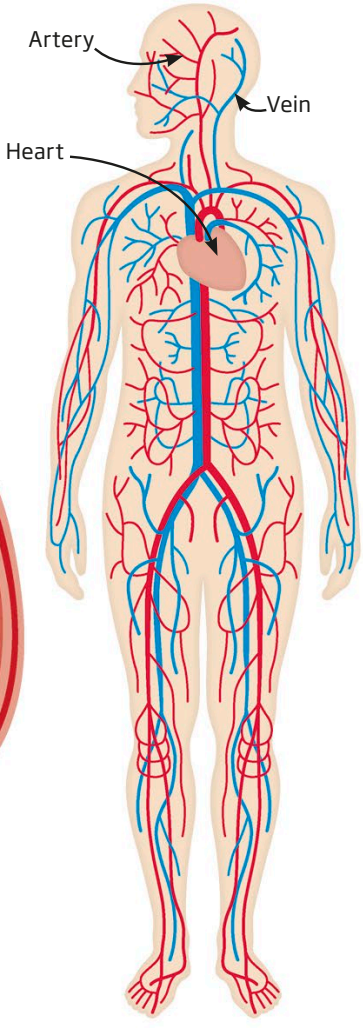
Inside the heart

The heart pumps blood every second of the day. The right side of the heart sends blood to the lungs. The left side sends blood to the rest of the body.



Circulation

Blood with oxygen in it travels around the body, pumped along by the heart. The oxygen is dropped off in different places, then comes back to the heart to be pushed to the lungs.



Blood vessels

Blood

Blood contains tiny parts called cells. Red blood cells carry oxygen and waste gas. White blood cells kill germs. Broken bits of cells stick together to make a scab when the body is cut.

Hibernation

For many animals, finding enough food in winter is hard. Some animals migrate, or move, to warmer areas. Others survive by going into a deep sleep, called hibernation. They wake up again in the springtime when there is more food.

SEE ALSO

- Amphibians p.15
- Animal groups p.22
- Day and night p.77
- Mammals p.154
- Migration p.166
- Seasons p.221

Dormouse

These small mammals make cosy nests under leaves on the forest floor, or at the bottom of hedges.

The furry tail wraps around the mouse's face to keep it warm.

Bats hibernate upside down in caves or trees.

Bat

Bats enter a deep hibernation. Their heart rate drops from 400 to 25 beats per minute.

Dormice can curl up and sleep for up to **seven months** in a year.

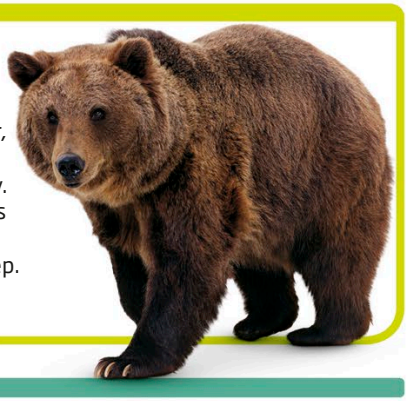
Wood frog

Wood frog

This frog's body freezes in the winter and its heart stops beating. When the weather gets warmer, its heart starts beating again and the frog thaws out.

Do bears hibernate?

Bears sleep in the winter, but not very deeply, so they can be woken easily. This is called a torpor. It is like hibernation, but without such a deep sleep.



Human body

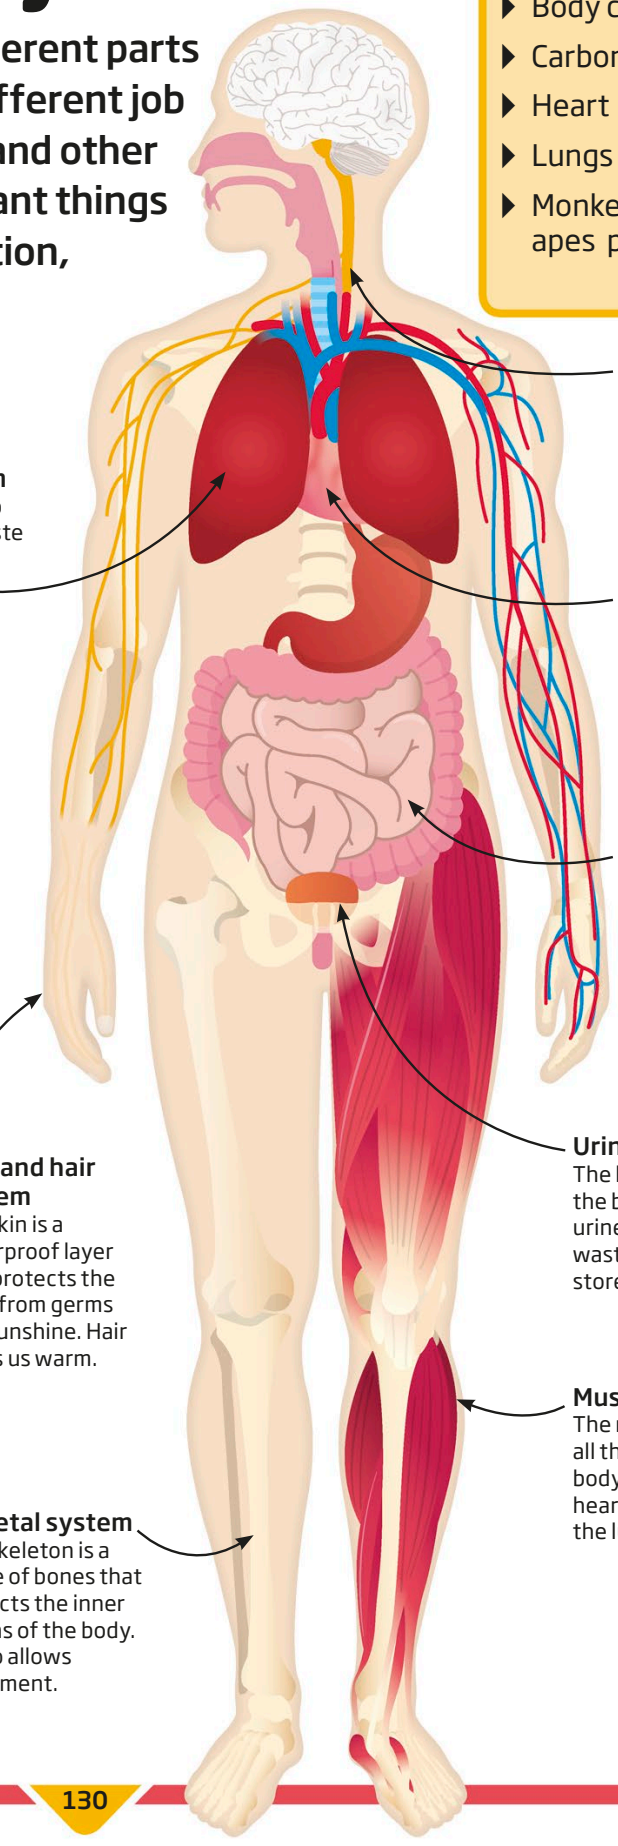
The body is made from lots of different parts called organs. Each organ has a different job to do. Organs work with muscles and other parts of the body to make important things happen, such as breathing, digestion, and movement.

SEE ALSO

- Biology p.38
- Body cells p.41
- Carbon cycle p.49
- Heart p.128
- Lungs p.149
- Monkeys and apes p.170

Body systems

Organs that are linked together are called systems. Each system has its own job, but they work together, too.



Nervous system
The brain thinks and controls body movement. Signals are sent to the brain through nerves.

Respiratory system
The lungs bring air into the body and send waste air out. They supply oxygen to the blood.

Circulatory system
The heart pumps blood around the body in a loop to transport oxygen and food.

Digestive system
The stomach and intestines break down the food so it can be used to power the body.

Skin and hair system
The skin is a waterproof layer that protects the body from germs and sunshine. Hair keeps us warm.

Urinary system
The kidneys clean the blood and make urine from the waste. The bladder stores the urine.

Muscular system
The muscles move all the parts of the body. They make the heart pump and the lungs breathe.

Skeletal system
The skeleton is a frame of bones that protects the inner organs of the body. It also allows movement.

Body ingredients

The human body is made up of tiny parts called cells. The cells of the body contain lots of different ingredients. They all have different uses in the body.

Calcium helps muscles to work and the heart to keep beating.

One-quarter of our body is **carbon**. It is also found in diamonds!

A tiny amount of **iron** is found in the body. It makes your blood red.

Tears contain **sodium chloride**, which is the same as table salt.

Phosphorus helps make bones strong. Matches burn using phosphorus.

Over half of the body is made of **water**. Water is found in our blood and cells.

Imperial Japan

During the Edo period, from 1603 to 1868, Japan was ruled by a series of powerful men called shoguns. Each ruled from the city of Edo, which is now Tokyo.

SEE ALSO

- Art p.28
- Dance p.76
- Knights p.142
- Musical instruments p.175
- Theatre p.253
- War pp.278–279

A horned helmet was part of a samurai's armour.

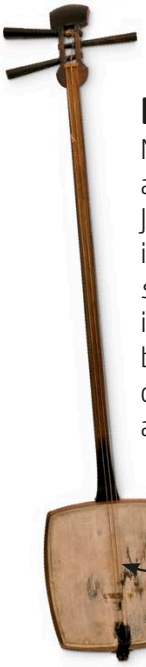
Noble samurai

Samurai were warriors who fought for a powerful lord and followed strict rules. Their way of life was called *Bushido* (bu-shi-do), "the way of the warrior".

The main weapon was a sword called a *katana*.

Art

Poets, painters, writers, and craftspeople made beautiful works of art during this time. This print from 1857 shows a traditional Japanese scene of trees and a river in the snow.



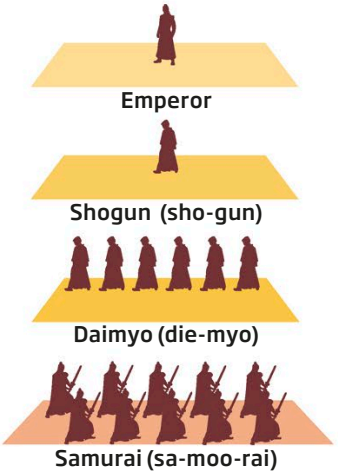
Making music

Music has always played an important part in Japanese culture. This instrument, called a *shamisen* (sha-mee-sen), is like a guitar. It provided background music for dance performances and puppet theatre.

Shamisens have three strings and a square body.

Strict command

Edo society's chain of command was strict. The emperor was the leader, but the shogun was in charge of the lords, who were called daimyo. The daimyo were in charge of the samurai army.



Incas

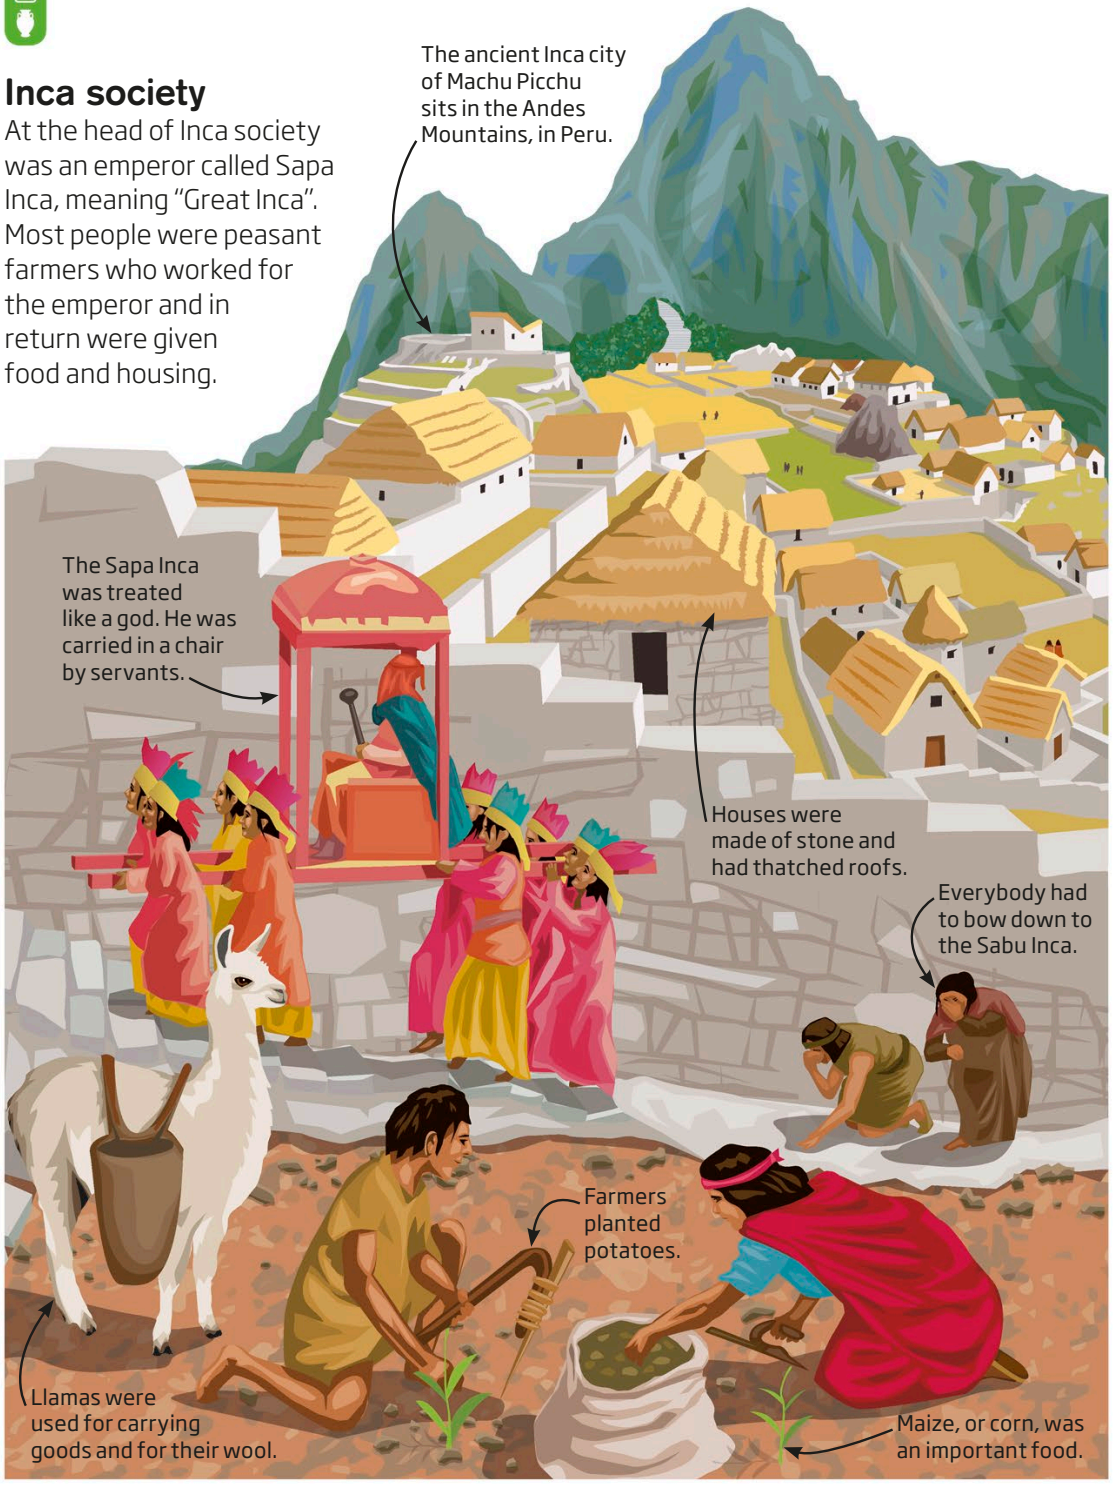
The Inca people lived in the mountains along the west coast of South America. Between 1438 and 1532 CE, their wealthy empire was the largest in the world. Society was well organized and everyone knew their place.

SEE ALSO

- Aztecs p.35
- Crafts p.75
- Farming p.98
- Maya p.158
- Gold pp.200–201
- South America p.236

Inca society

At the head of Inca society was an emperor called Sapa Inca, meaning "Great Inca". Most people were peasant farmers who worked for the emperor and in return were given food and housing.



Sun god

This gold disc shows Inti, the Inca god of the Sun. Every year the Incas held a nine-day festival of eating, drinking, and sacrifice to honour the Sun god.

Inca crafts

The Incas made sacred objects from gold and silver to be used in temples. Craft workers also made fine pieces from clay, leather, and feathers.

Gold llama

Industrial Revolution

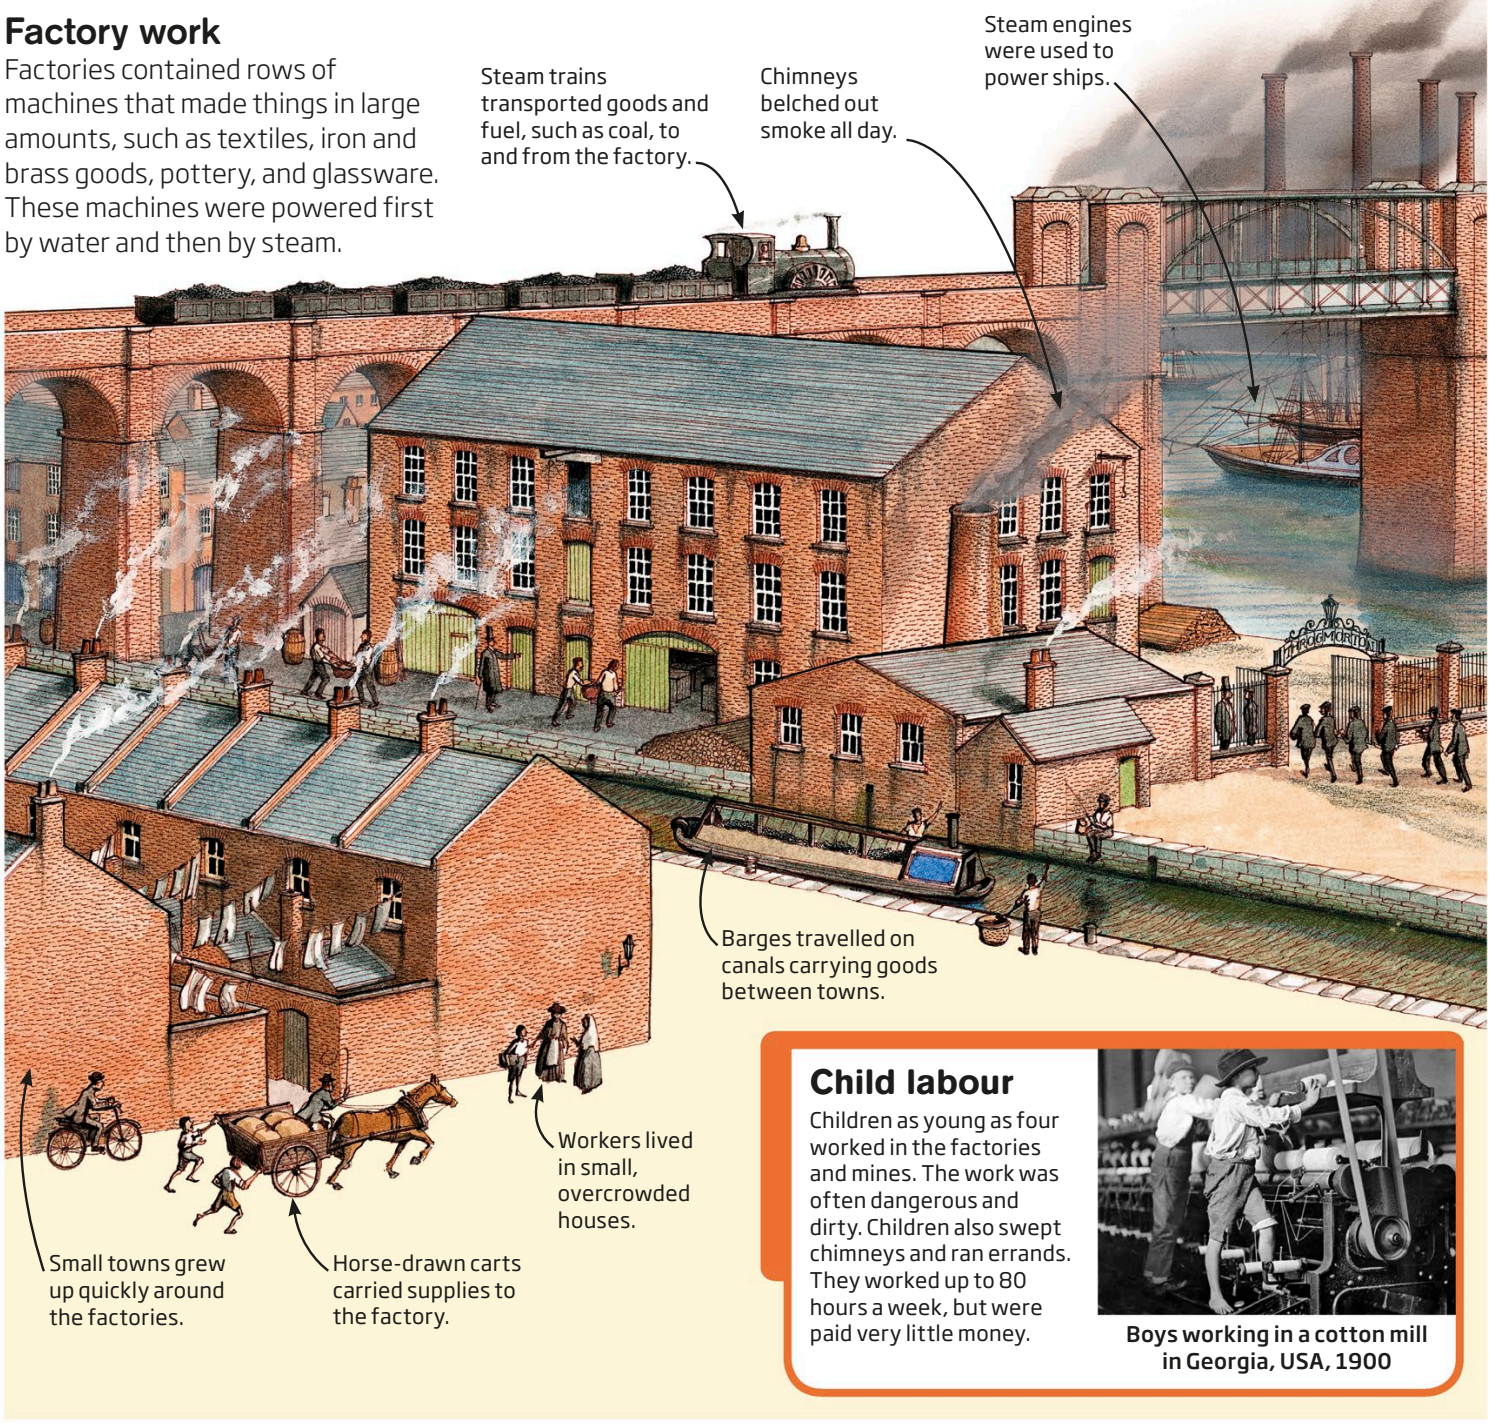
The Industrial Revolution was a time of huge growth in industry brought about by the introduction of new machinery. Factories were built to make products using large numbers of machines. The revolution began in Britain during the 1760s and later spread around the world.

SEE ALSO

- Buildings p.48
- Engines p.92
- Factories p.97
- Inventions pp. 136-137
- Machines p.150
- Pollution p.198

Factory work

Factories contained rows of machines that made things in large amounts, such as textiles, iron and brass goods, pottery, and glassware. These machines were powered first by water and then by steam.



Child labour

Children as young as four worked in the factories and mines. The work was often dangerous and dirty. Children also swept chimneys and ran errands. They worked up to 80 hours a week, but were paid very little money.

Boys working in a cotton mill in Georgia, USA, 1900

Insects

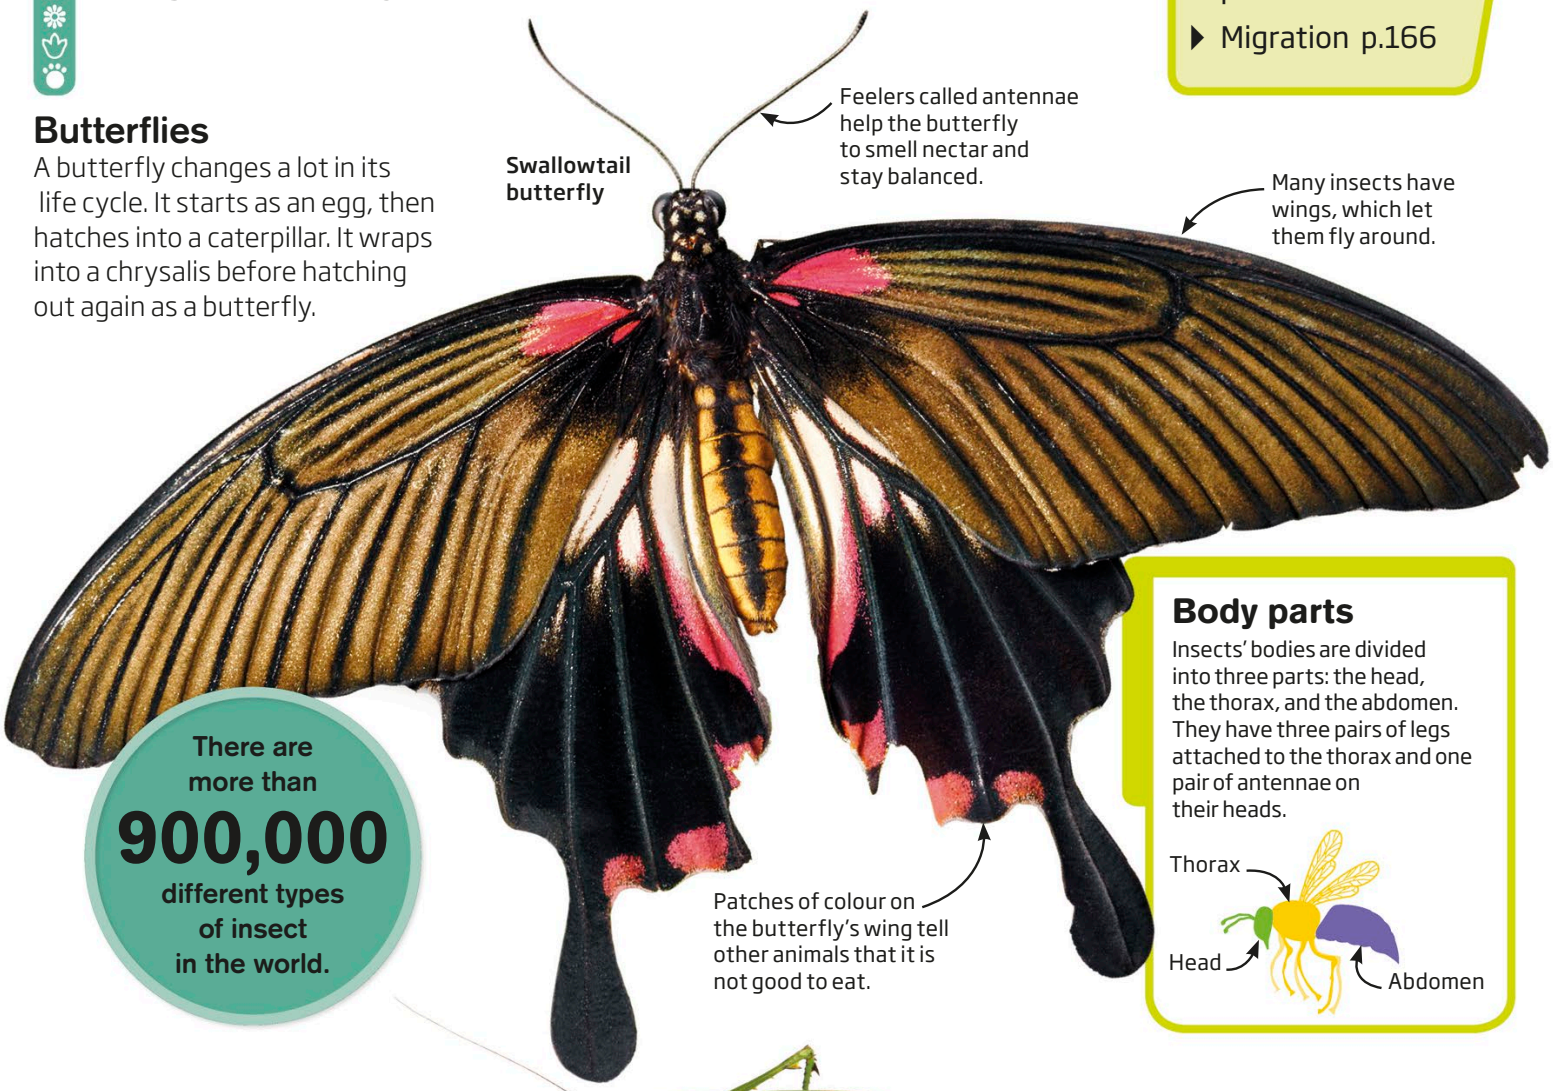
Insects are the largest group of animals, and are found all over the world. They have three pairs of legs and a tough outer covering, called an exoskeleton. Many insects have wings and can fly.

SEE ALSO

- Animal groups p.22
- Eggs p.86
- Invertebrates p.139
- Metamorphosis p.163
- Migration p.166

Butterflies

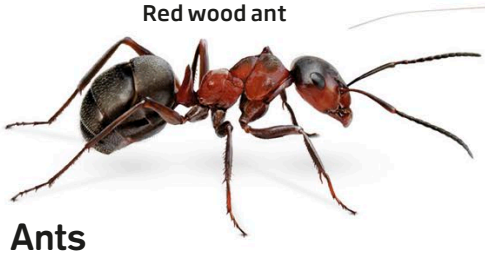
A butterfly changes a lot in its life cycle. It starts as an egg, then hatches into a caterpillar. It wraps into a chrysalis before hatching out again as a butterfly.



There are more than **900,000** different types of insect in the world.

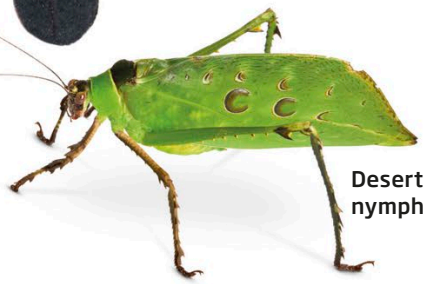
Body parts

Insects' bodies are divided into three parts: the head, the thorax, and the abdomen. They have three pairs of legs attached to the thorax and one pair of antennae on their heads.



Ants

Ants live together in groups called colonies, with thousands of workers and a queen. They are small but strong – ants can lift 20 times their body weight.



Grasshoppers

These insects can leap 20 times their body length. They can also fly fast, reaching speeds of up to 13 kph (8 mph).

Beetles

Beetles are found on land and in water all over the world. They have hard, shiny outer wings that close over a soft inner set of wings, to protect them.

Inside Earth

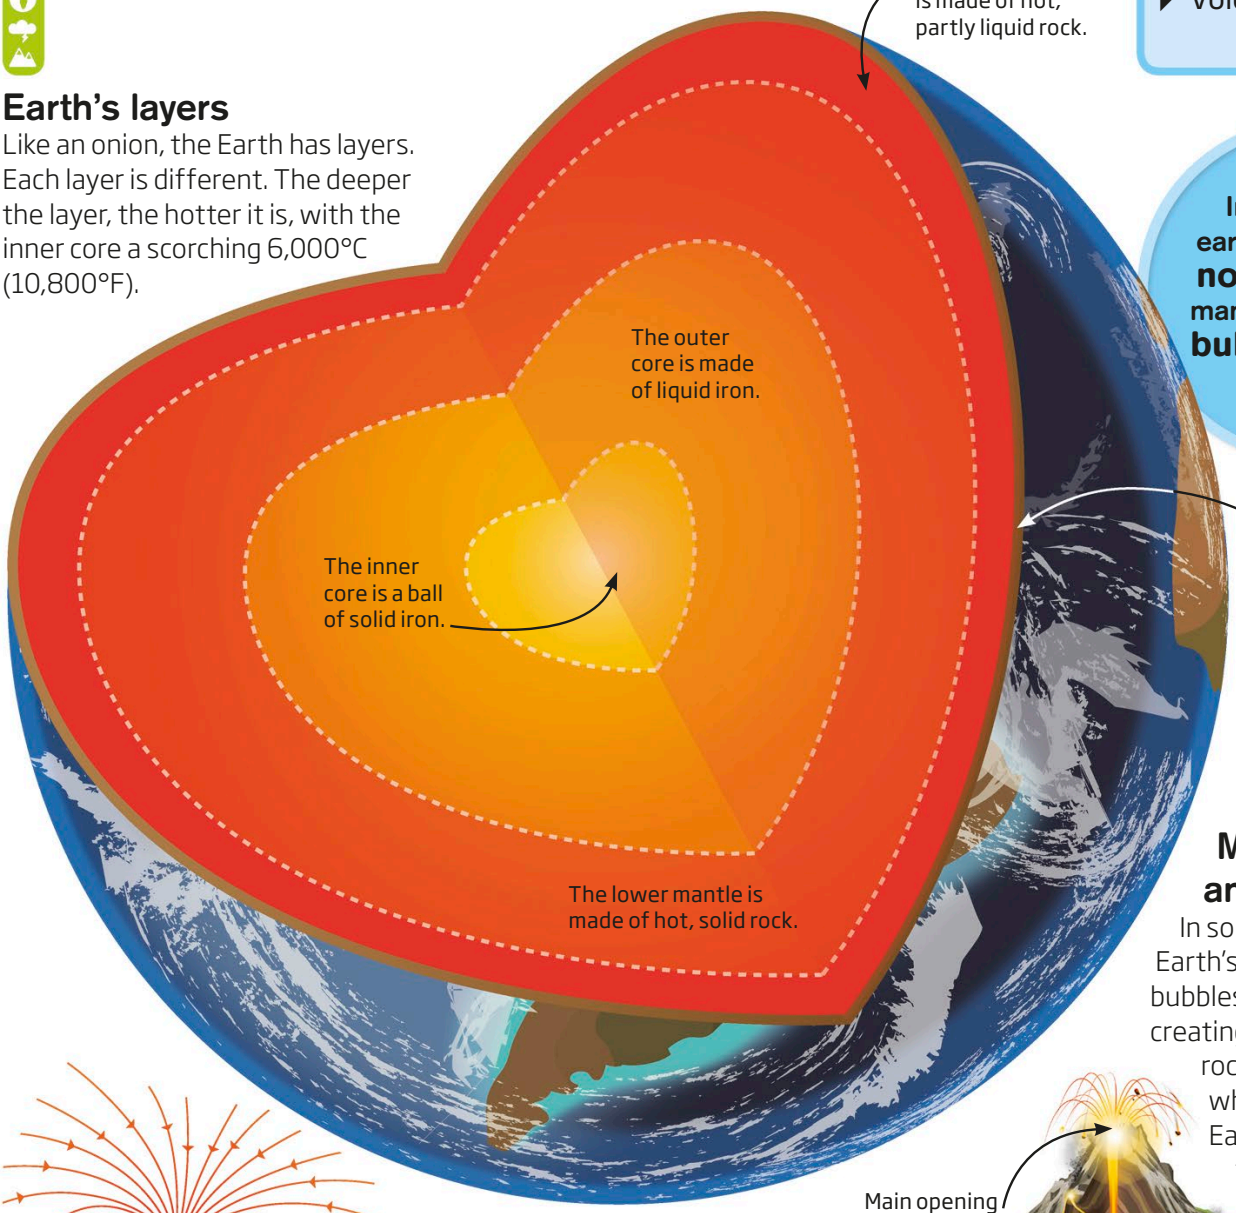
The Earth is made up of four layers. We live on its outer layer, or crust. The crust floats on a layer of extremely hot rock called the mantle. Below this, our planet's centre, or core, is made of the metal iron.

SEE ALSO

- Compass p.70
- Earth p.83
- Earth's surface p.84
- Magnets p.151
- Metals p.162
- Volcanoes p.268

Earth's layers

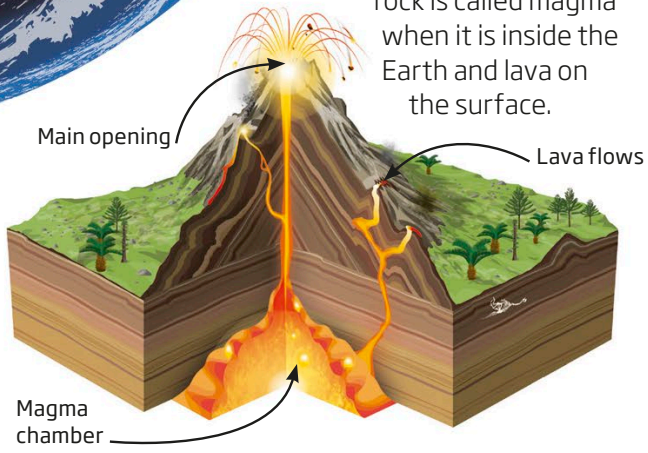
Like an onion, the Earth has layers. Each layer is different. The deeper the layer, the hotter it is, with the inner core a scorching 6,000°C (10,800°F).

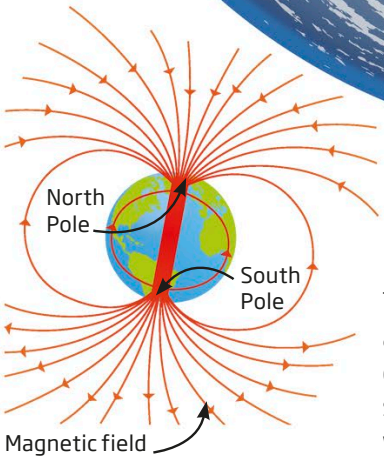


In our planet's early history, it had no crust and the mantle was a sea of bubbling liquid rock.

Magma and lava

In some places on the Earth's surface, liquid rock bubbles up to the surface, creating volcanoes. Liquid rock is called magma when it is inside the Earth and lava on the surface.





Magnetic Earth

Because the Earth's outer core is liquid, it moves as the Earth spins. This creates a magnetic field around the Earth. This field keeps out harmful energy waves from space. It also lets us find directions when we use a compass.

Inventions

Inventions are new ideas that solve problems or prove useful to us. Thousands of years of brilliant brainpower have resulted in things and ideas that have transformed people's lives. Even in the modern world, people keep coming up with new ideas and inventions.

Hard flint was broken down to make sharp tools.

Hand axe

The hand axe was the first stone tool in prehistoric times. People dug for flint, which they shaped into handcrafted axes to cut meat, chop wood, scrape skins, and protect themselves. Hand axes were used for more than a million years.

A rod, or axle, links the wheels together – turning the axle uses much less energy than turning the wheel.

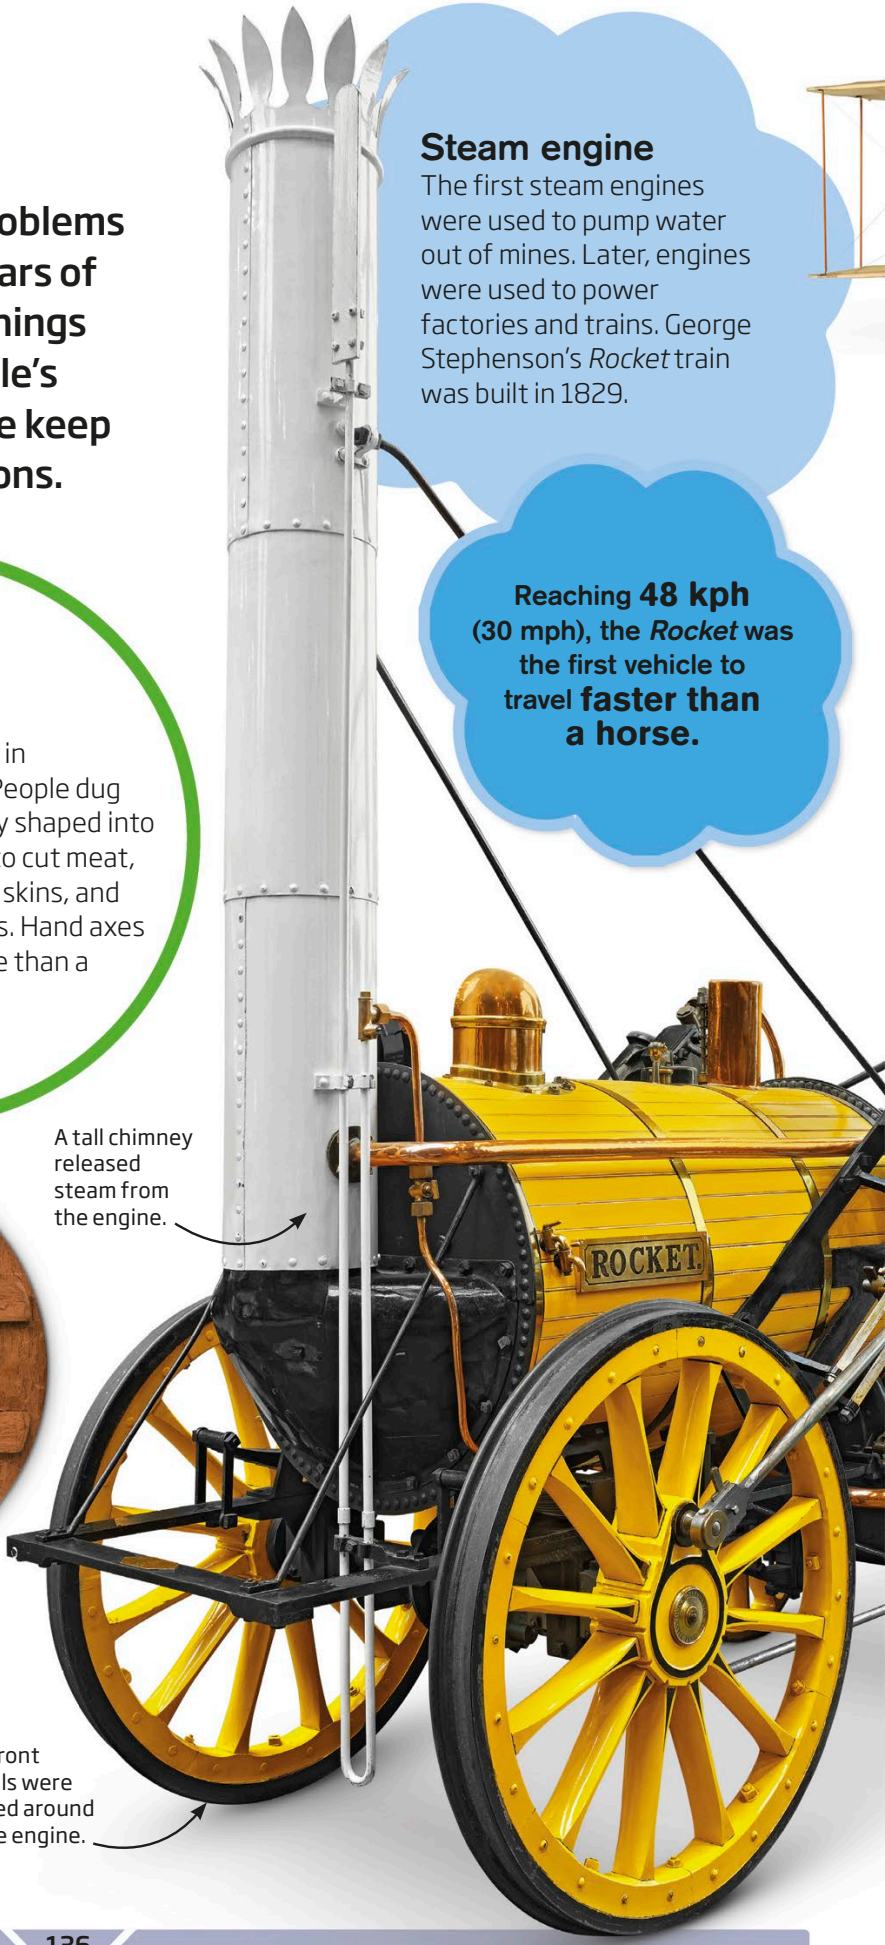
Wheel

The wheel was invented more than 5,000 years ago in Mesopotamia (part of modern-day Iraq). Wooden discs were attached to animal carts to carry heavy loads. Later, wheels became lighter, which made them faster and smoother.

Steam engine

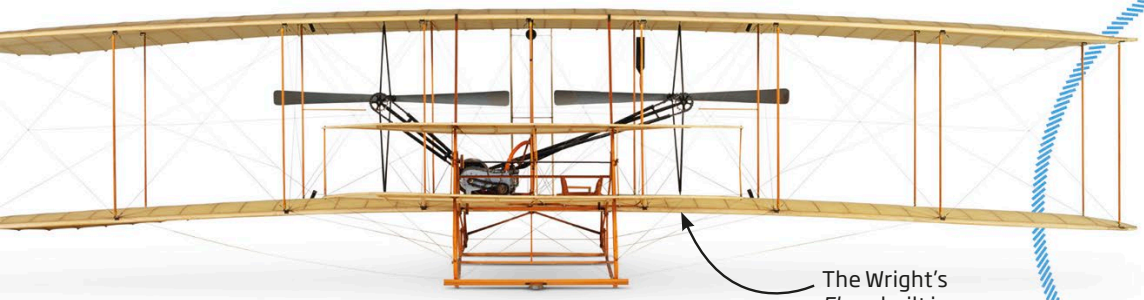
The first steam engines were used to pump water out of mines. Later, engines were used to power factories and trains. George Stephenson's *Rocket* train was built in 1829.

Reaching 48 kph (30 mph), the *Rocket* was the first vehicle to travel faster than a horse.



A tall chimney released steam from the engine.

The front wheels were pushed around by the engine.



The Wright's *Flyer*, built in 1903.

Flight

In 1903, American brothers Wilbur and Orville Wright built a glider with a light engine. Although Flyer took off for only 12 seconds over 37 m (120 ft), it was the first-ever powered flight.

Plastics

Plastics are cheap to make, easy to shape, and last a long time. They can be hard, soft, or bendy. The first human-made plastic was made by Belgium-born chemist Leo Baekeland in 1905. Now plastics are all around us.

Antibiotics

Infection-fighting antibiotics battle bacteria inside the body. They were discovered by accident in 1928, when Scottish scientist Alexander Fleming noticed bacteria dying around mould in his lab. The bacteria-killing chemical penicillin has since saved many lives.

Antibiotic pills

Thomas Edison (1847–1931) was an American master of invention, patenting

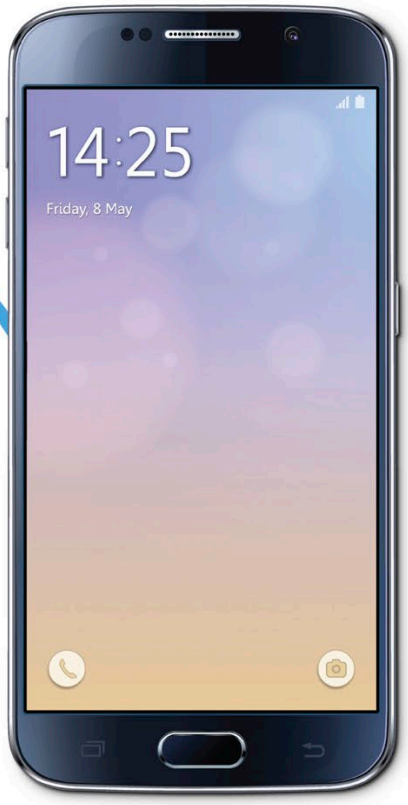
1,093

ideas in his lifetime, including batteries and light bulbs.

The first electronic computer, ENIAC, was huge, filling a room measuring 15 m (50 ft) long.

Computers

Computers are electric machines that follow instructions. Modern computers can do billions of sums every second. We use them to find, store, and share information. The idea of a computer was invented by English engineer Charles Babbage in the 1830s.



Internet

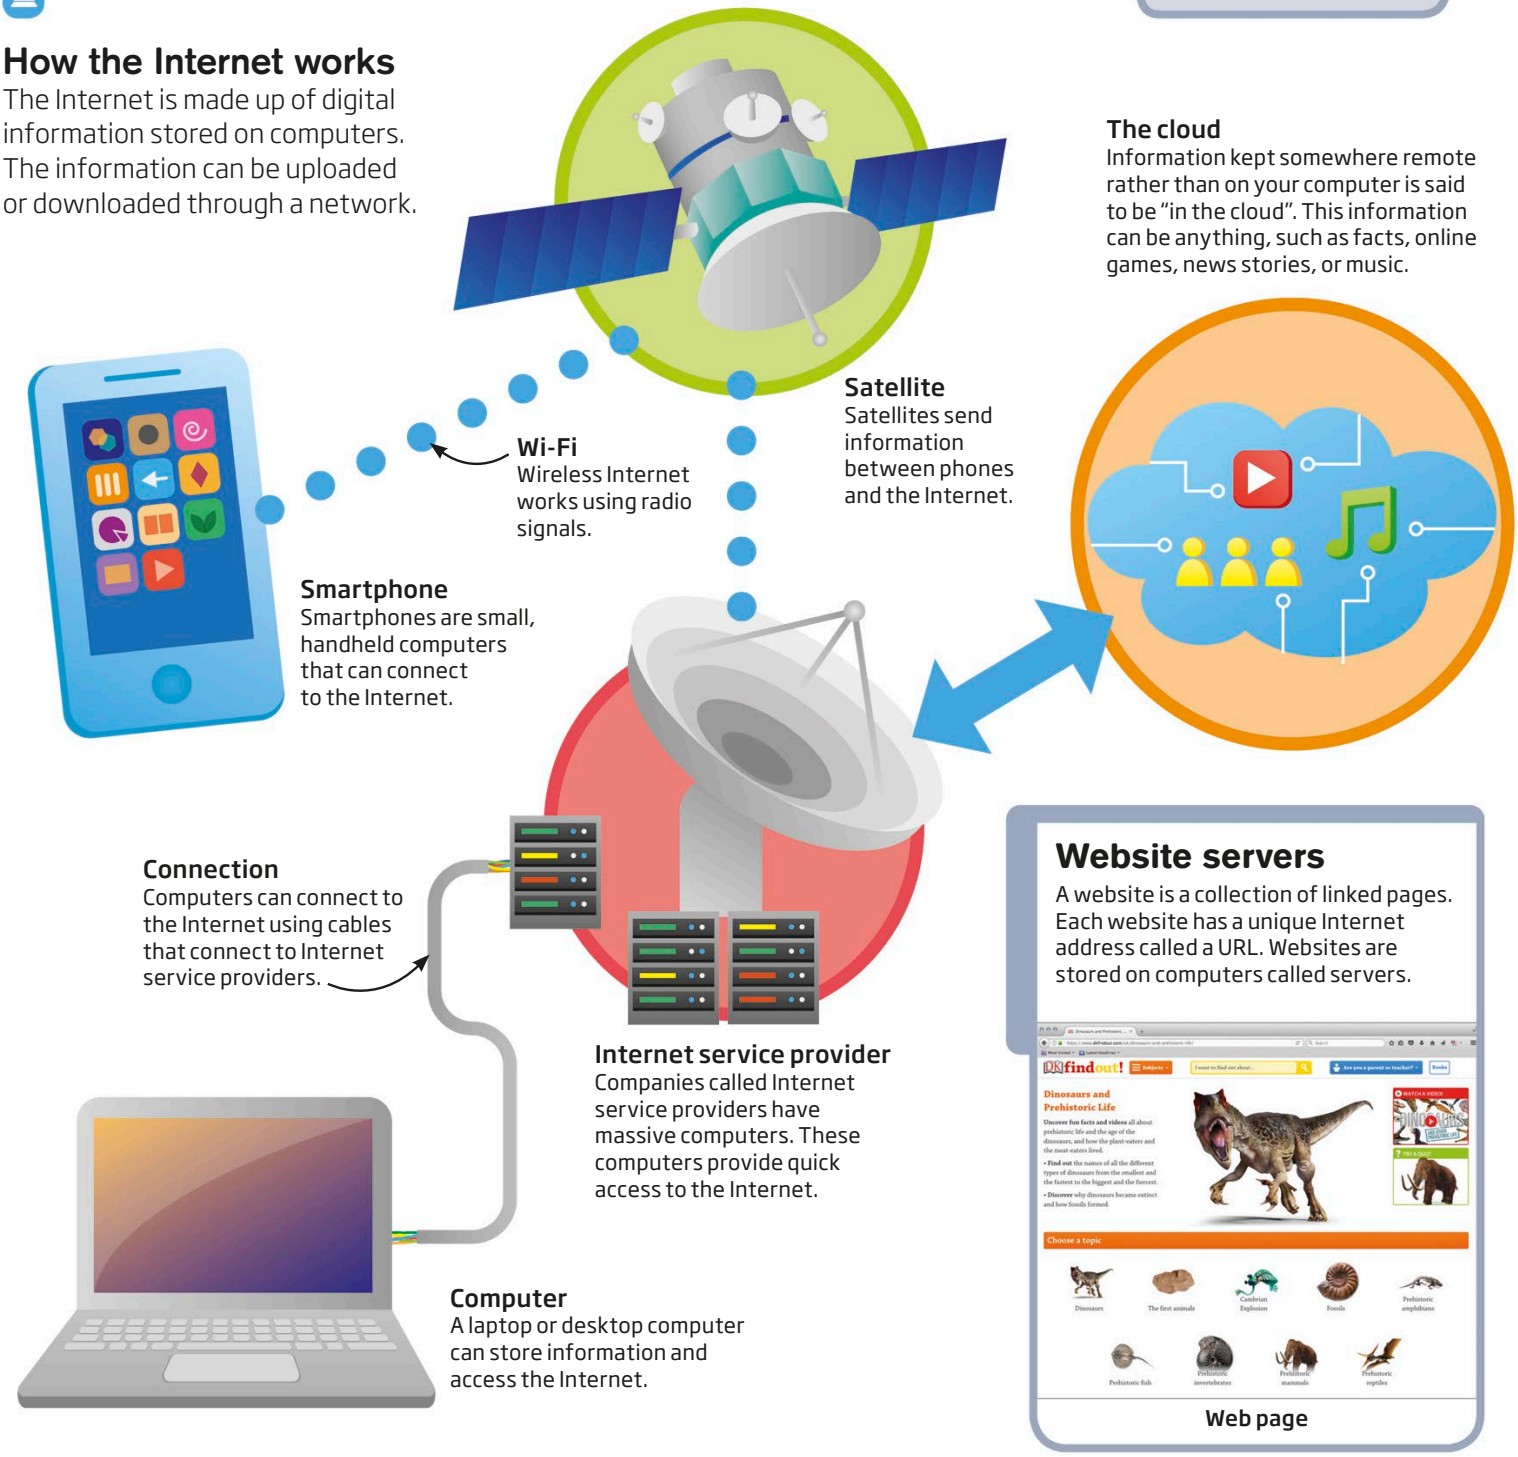
The Internet is a network that links together computers all over the world. We use it to find things out, for entertainment, and to communicate with each other. The Internet was first thought of in 1962. Now, billions of people use it every day.

SEE ALSO

- Codes pp.66–67
- Communication p.69
- Computers p.71
- Satellites p.215
- Telephones p.250

How the Internet works

The Internet is made up of digital information stored on computers. The information can be uploaded or downloaded through a network.



The cloud
Information kept somewhere remote rather than on your computer is said to be "in the cloud". This information can be anything, such as facts, online games, news stories, or music.

Satellite
Satellites send information between phones and the Internet.

Wi-Fi
Wireless Internet works using radio signals.

Smartphone
Smartphones are small, handheld computers that can connect to the Internet.

Connection
Computers can connect to the Internet using cables that connect to Internet service providers.

Internet service provider
Companies called Internet service providers have massive computers. These computers provide quick access to the Internet.

Computer
A laptop or desktop computer can store information and access the Internet.

Website servers

A website is a collection of linked pages. Each website has a unique Internet address called a URL. Websites are stored on computers called servers.

Web page

Invertebrates

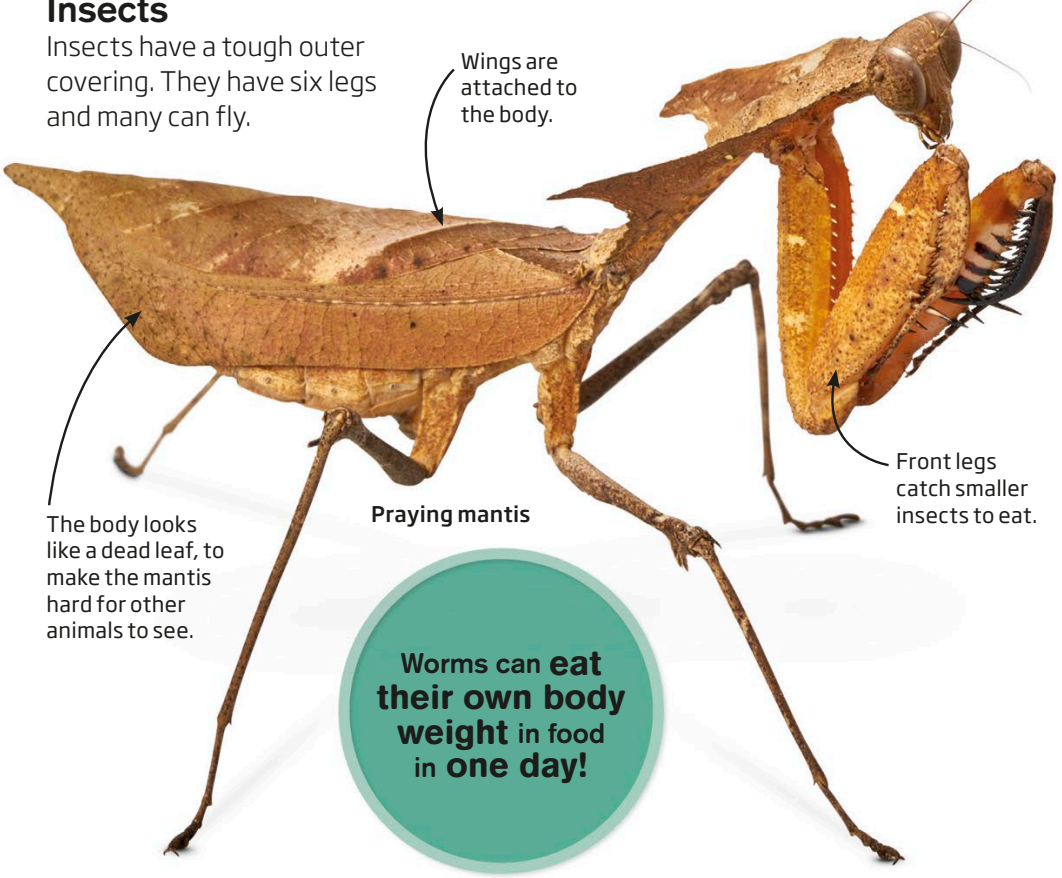
Invertebrates are animals that don't have backbones. They are divided into many smaller groups, such as insects and molluscs. Ninety-eight per cent of all animals are invertebrates.

SEE ALSO

- Animal groups p.22
- Animal homes p.23
- Habitats p.126
- Insects p.134
- Vertebrates p.266

Insects

Insects have a tough outer covering. They have six legs and many can fly.



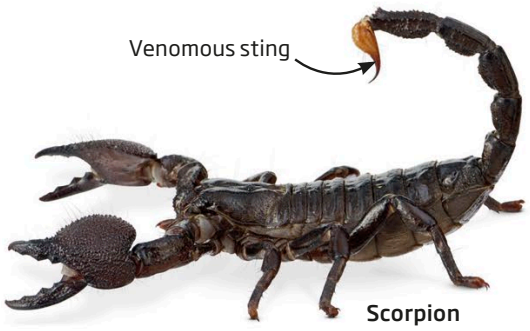
Worms can eat their own body weight in food in one day!

Molluscs

Molluscs have soft bodies with no skeleton and no legs. They live in water or wet soil.

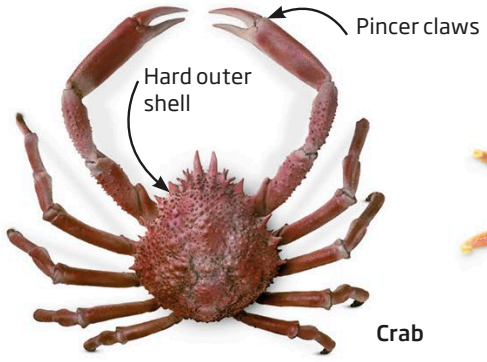
Worms

Worms have long soft bodies with no legs. Their bodies are split into many parts, or segments.



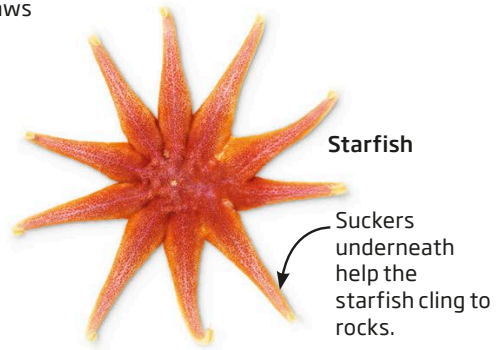
Arachnids

These animals have eight legs, not six like insects. Arachnids include spiders, scorpions, and mites.



Crustaceans

Crustaceans have hard outer shells, and more than eight legs. Most of them live in water.



Echinoderms

These animals have bodies split into equal parts around a disc in their middle. They all live in the sea.

Iron Age

During the Iron Age, people began using iron tools and weapons instead of bronze ones. It started about 3,200 years ago and lasted for around 1,000 years, depending on the area. Iron tools were stronger and more hard-wearing than anything before.

SEE ALSO

- Bronze Age p.47
- Farming p.98
- Metals p.162
- Rocks and minerals p.214
- Trade p.257
- Vikings p.267

Tools

Iron tools allowed farmers and builders to work better. They were able to grow more crops, clear land for farms, and build bigger buildings.

This iron sickle would have been attached to a wooden handle and used to cut wheat.

Iron cutting edge

Weapons

Iron weapons were lighter and cheaper to make than weapons made from bronze. Well-made iron weapons were also stronger and sharper than bronze ones. Having good weapons meant societies could build powerful armies.

Making a sword was very difficult. The best swordmakers were well paid.

Danish iron sword from the Viking period of 800–1100 CE

Hill fort

Hill forts are Iron Age villages built on the top of hills. They had earth or stone walls around them. Hill forts allowed people to see the enemy approaching and prepare themselves for attack.

The walls at the base of the fort acted as a protective barrier.

Iron Age hill fort in Dorchester, UK

Making iron

Making iron items is a process that needs great skill and care. The iron must be made extremely hot before it can be shaped into a weapon or a tool. How we shape iron today is similar to how Iron Age craftsmen performed the task.

1. Dig it out
Iron is dug from the ground in lumps, called iron ore.

2. Heat it up
The iron ore is heated to high temperatures to make it melt.

3. Pour it in
The melted iron is poured into a shaped mould and left to cool.

Jupiter

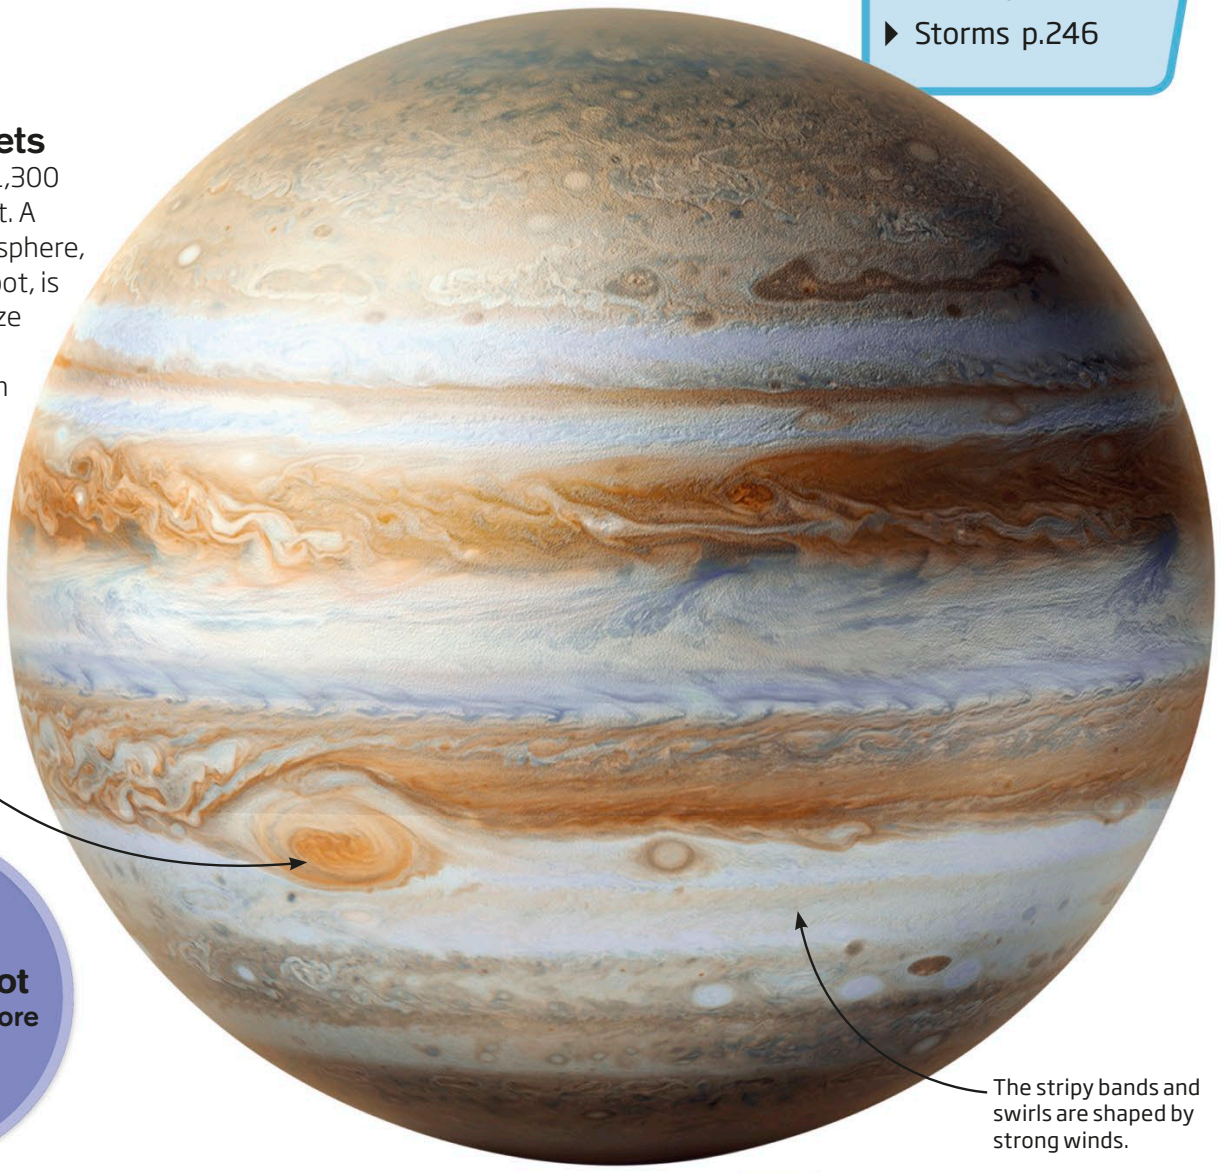
Jupiter is the largest planet in the Solar System, and the fifth planet from the Sun. It is a "gas giant" made of hydrogen and helium. Jupiter does not have a solid surface like Earth.

SEE ALSO

- Astronomy p.32
- Atmosphere p.33
- Elements p.90
- Gases p.117
- Solar System p.233
- Solids p.234
- Storms p.246

King of the planets

Jupiter is so large that 1,300 Earths could fit inside it. A huge storm in its atmosphere, called the Great Red Spot, is more than twice the size of Earth. Jupiter is the third brightest object in our night sky after the Moon and Venus.



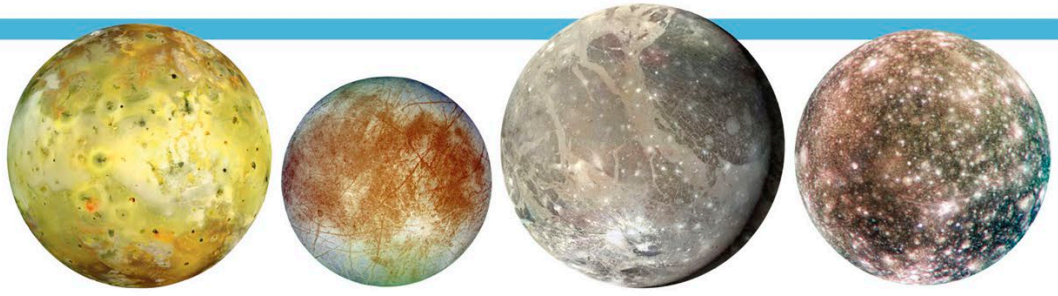
Scientists have been watching the Great Red Spot storm since 1830.

Winds swirling around the Great Red Spot reach speeds of more than 400 kph (250 mph).

The stripy bands and swirls are shaped by strong winds.

The Galilean moons

Jupiter has more than 60 moons of different sizes. Its four largest moons are called Io, Europa, Ganymede, and Callisto. They are known as "the Galilean moons" because they were discovered by the Italian scientist Galileo Galilei in the 17th century.



Io | Europa | Ganymede | Callisto

Knights

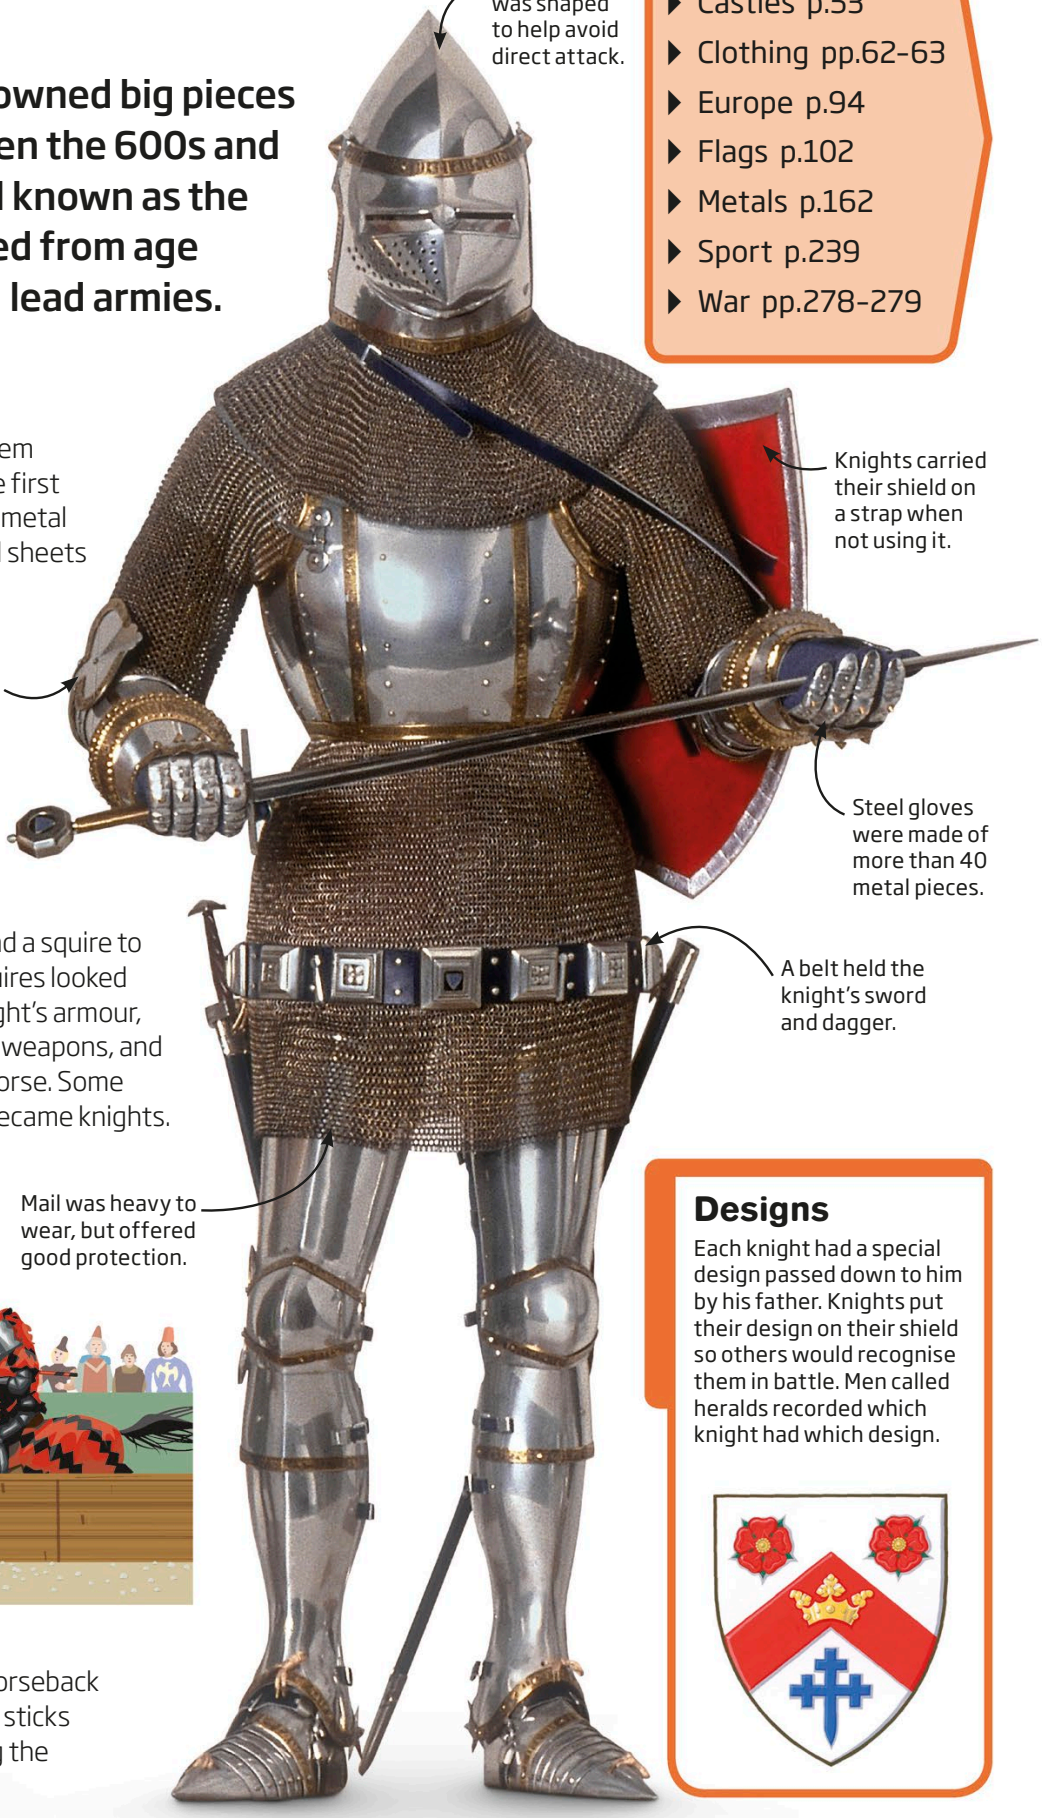
Knights were men who owned big pieces of land in Europe between the 600s and the 1600s, a time period known as the Middle Ages. They trained from age seven to be fighters and lead armies.

SEE ALSO

- Castles p.53
- Clothing pp.62-63
- Europe p.94
- Flags p.102
- Metals p.162
- Sport p.239
- War pp.278-279

Armour

Knights wore suits of armour to protect them from enemy weapons, such as swords. The first armour was made of mail, which is rings of metal linked together. Later armour also included sheets of shaped steel.



Squires

Each knight had a squire to assist him. Squires looked after their knight's armour, sharpened his weapons, and cared for his horse. Some squires later became knights.

Jousting

At jousts, crowds watched as knights on horseback raced at each other holding blunt, wooden sticks called lances. They scored points by hitting the other knight or knocking him off his horse.

Designs

Each knight had a special design passed down to him by his father. Knights put their design on their shield so others would recognise them in battle. Men called heralds recorded which knight had which design.

Lakes

A lake is a large body of water surrounded by land. Most lakes contain fresh water, but some are salty. Lakes are usually found in high areas or near large rivers. The water in lakes comes from streams or rivers around them.

SEE ALSO

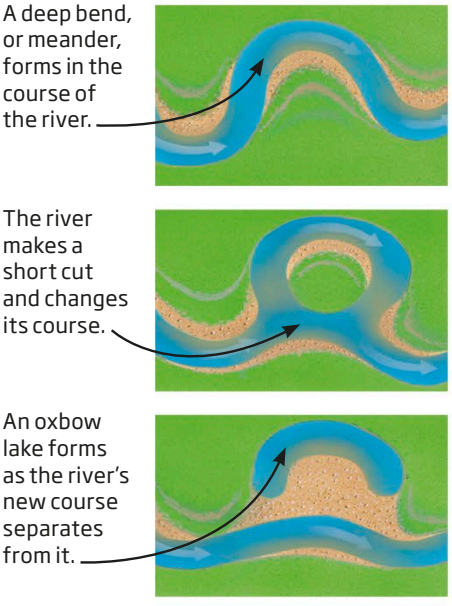
- Climate change p.60
- Factories p.97
- Farming p.98
- Water pp.120–121
- Rivers p.211
- Water cycle p.270

How we use lakes

Lakes provide water for factories, farming, energy, sport, and homes. Nearly all lakes are natural but some, known as reservoirs, are made by people.

Oxbow lakes

Rivers sometimes change their course. When they do, bends in them may become cut off to form U-shaped bodies of water called oxbow lakes.



Wet or dry?

Lakes can dry out if there is a long period without rain, called a drought, or if the climate changes. They may reappear when the rain returns or stay dry forever.

Language

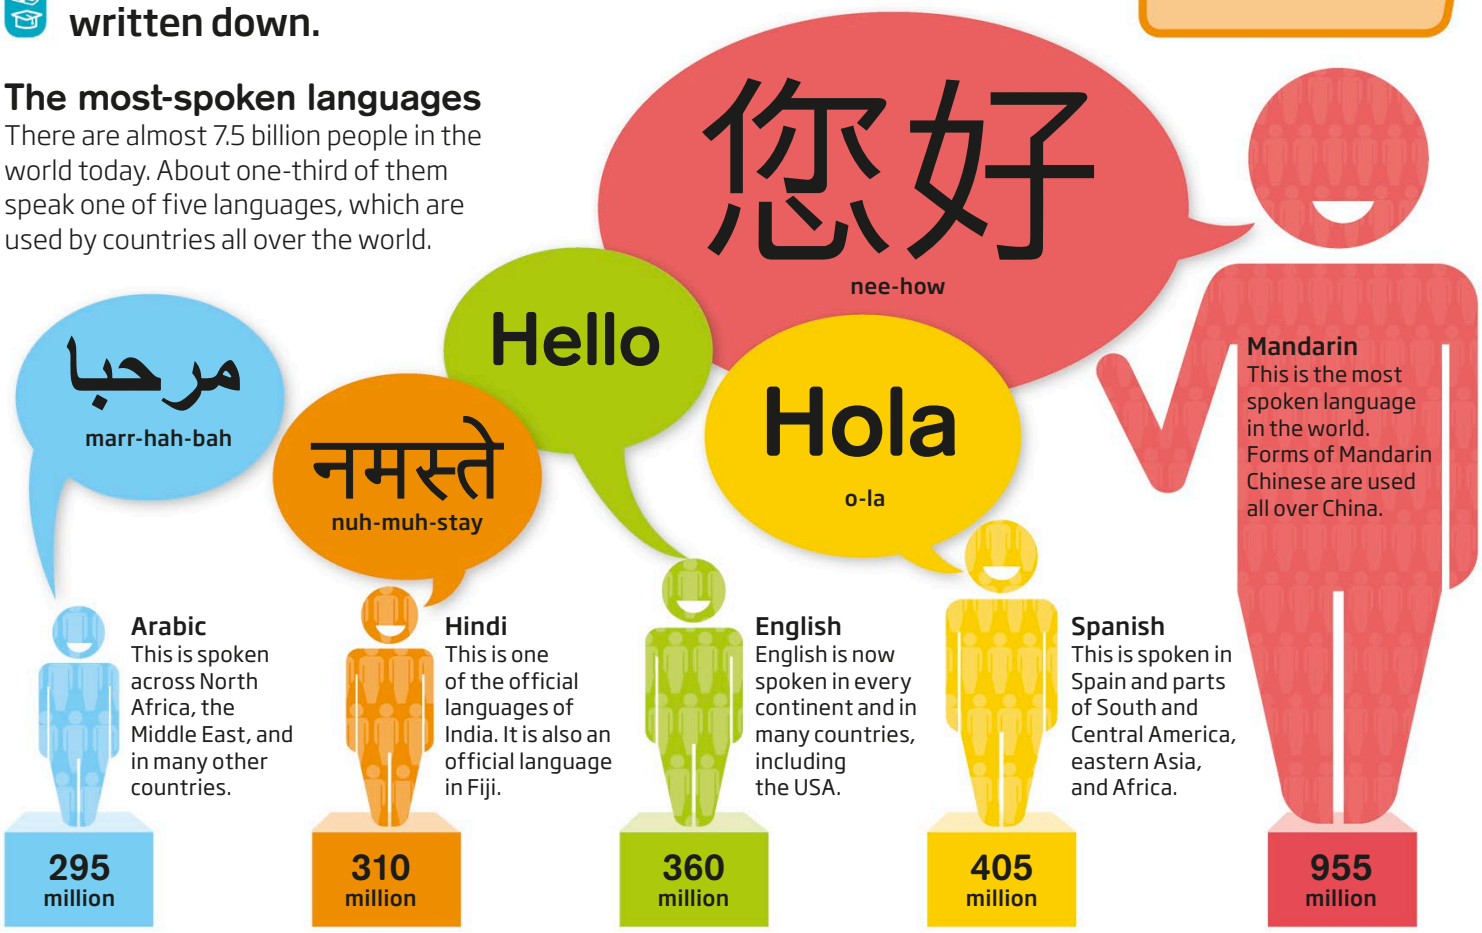
Language is how people communicate. Across the world, people speak many different languages. There are more than 7,100 in total, some spoken by millions of people and others by just 100. These languages often sound very different from one another, and can look different when written down.

SEE ALSO

- Ancient Rome p.20
- Storytelling pp.42–43
- Books p.44
- World p.275
- Writing p.280

The most-spoken languages

There are almost 7.5 billion people in the world today. About one-third of them speak one of five languages, which are used by countries all over the world.



Arabic
This is spoken across North Africa, the Middle East, and in many other countries.
295 million

Hindi
This is one of the official languages of India. It is also an official language in Fiji.
310 million

English
English is now spoken in every continent and in many countries, including the USA.
360 million

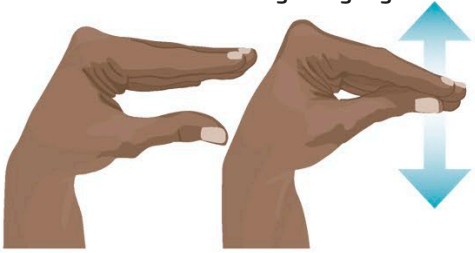
Spanish
This is spoken in Spain and parts of South and Central America, eastern Asia, and Africa.
405 million

Mandarin
This is the most spoken language in the world. Forms of Mandarin Chinese are used all over China.
955 million

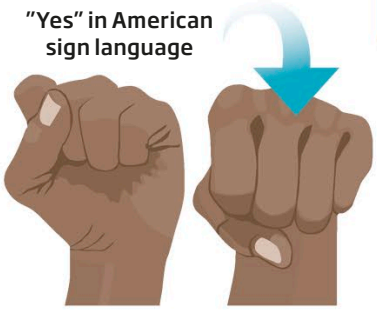
Sign languages

People sometimes use hand shapes, body movements, and facial expressions to talk, rather than spoken language. This is called a sign language. It is useful if someone cannot hear or speak.

"No" in American sign language



"Yes" in American sign language



Dead languages

Some languages die out when their speakers start using another language. Latin was once spoken in the Roman Empire, which included much of Europe. It's now a dead language, but can still be read and written.

Latin words from the Roman Empire.

Law

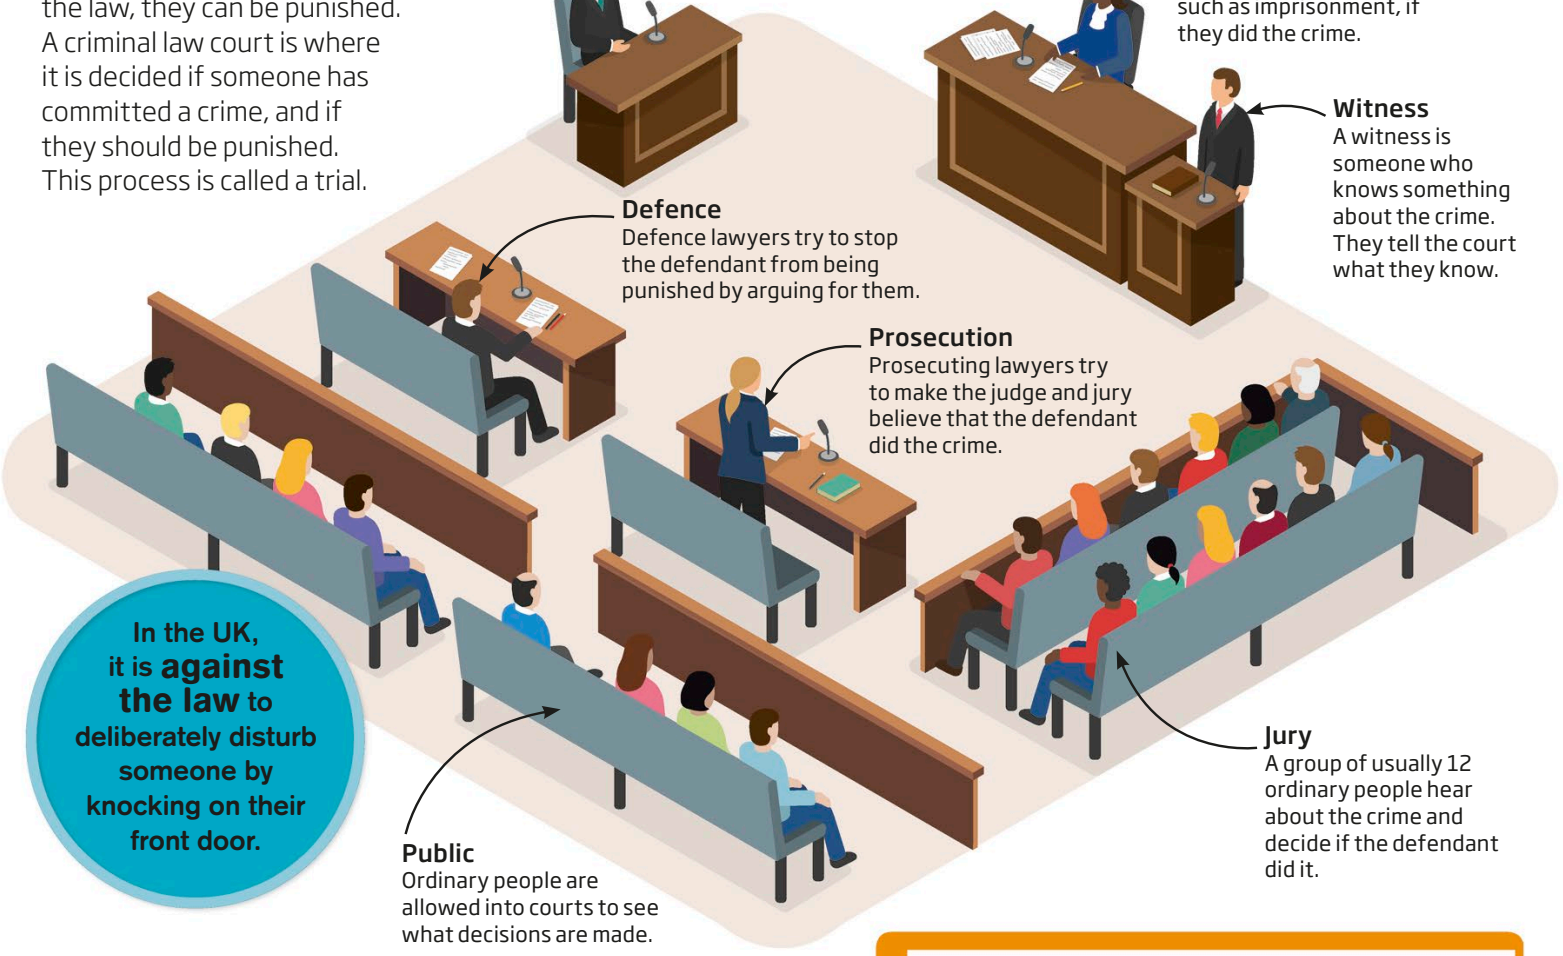
Laws are official rules for people to follow. The government writes laws for the whole country. Some laws stop people from doing bad things (crimes), such as stealing. These are called criminal laws. Other laws try to improve life, such as making sure people are paid a fair amount of money for doing work.

SEE ALSO

- Changing world pp.50–51
- Codes pp.66–67
- Governments p.123
- Trade p.257
- Work p.274
- World p.275

Law court

If someone doesn't follow the law, they can be punished. A criminal law court is where it is decided if someone has committed a crime, and if they should be punished. This process is called a trial.



Defendant
The defendant is the person who is said to have committed the crime.

Judge
The judge controls the court, and may give the defendant a punishment, such as imprisonment, if they did the crime.

Witness
A witness is someone who knows something about the crime. They tell the court what they know.

Defence
Defence lawyers try to stop the defendant from being punished by arguing for them.

Prosecution
Prosecuting lawyers try to make the judge and jury believe that the defendant did the crime.

Jury
A group of usually 12 ordinary people hear about the crime and decide if the defendant did it.

Public
Ordinary people are allowed into courts to see what decisions are made.

In the UK, it is against the law to deliberately disturb someone by knocking on their front door.

Police

The police make sure people follow laws. They capture people who might have broken laws. This is called putting someone under arrest.

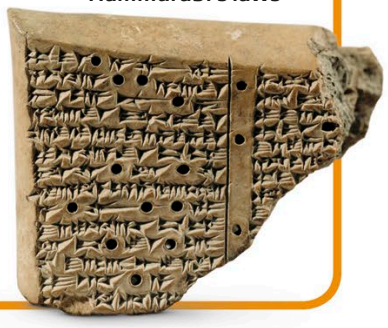
Police cars travel at high speeds to catch criminals.

Police car

First laws

One of the earliest sets of laws was drawn up by King Hammurabi of Babylon, who ruled from 1792 to 1749 BCE. There are 282 laws about the family, trade, and wages.

Hammurabi's laws



Life cycle

Like all animals, humans are born, grow up, and can have children of their own. This is called a life cycle. There are many different stages that a human goes through on their journey from birth to adulthood.

SEE ALSO

- Body cells p.41
- Cells p.56
- Genes p.119
- Human body p.130
- Metamorphosis p.166
- Skeleton p.228

Baby
Babies are very small and can't feed themselves or talk. They need parents or carers to take care of them.

Toddler
Toddlers learn how to walk, talk, and feed themselves. They grow teeth called milk teeth, which fall out and are replaced with adult teeth.

Growing up
Everyone starts life as just two cells. We grow into children and eventually adults.

Child
Children grow and learn quickly. They are smaller than adults and still have a lot of skills to learn.

Sperm and egg
A sperm cell joins an egg cell inside the mother's womb. After nine months, the cells have grown into a baby.

Teenager
Chemical signals called hormones tell the body to start changing from a child into an adult.

Adult
Adults can make their own children. Males produce sperm cells and females produce egg cells.

The **oldest person** recorded died at 122 years and 164 days old.

Unborn baby
Babies grow inside the mother's womb. Doctors look at the growing baby using a process called an ultrasound. At 12 weeks a baby is about the size of a lime.

Light

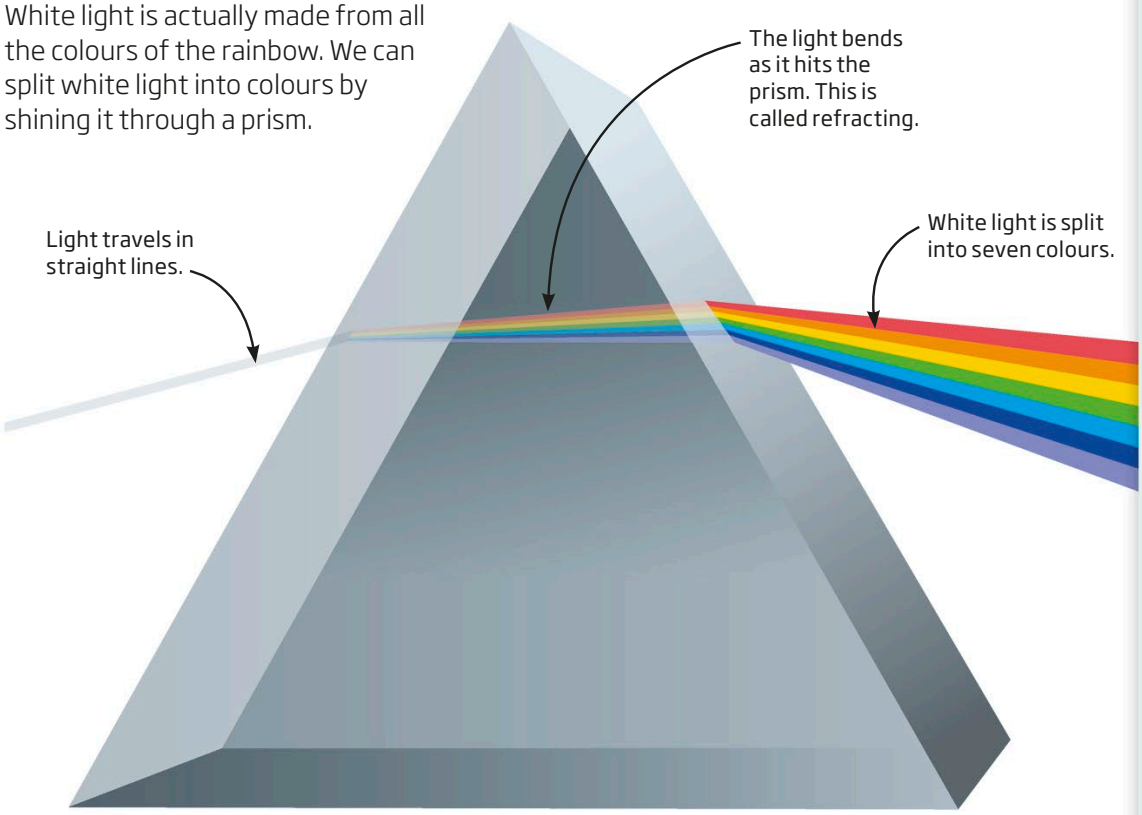
Light is a type of energy that bounces off objects and into our eyes – we need it to see things. Light can change into other types of energy such as heat or electricity. Dark is the absence of light.

SEE ALSO

- Colour pp.26–27
- Energy pp.88–89
- Invertebrates p.139
- Materials p.157
- Sight p.226
- Sun p.247

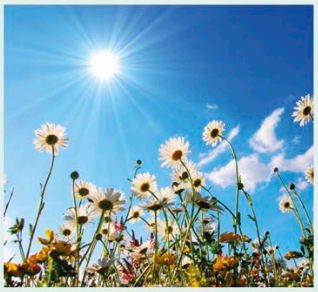
White light

White light is actually made from all the colours of the rainbow. We can split white light into colours by shining it through a prism.



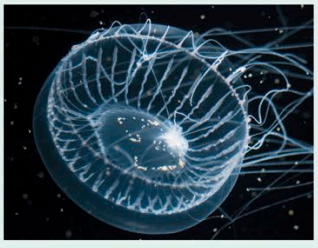
Light sources

The main source of light on Earth is the Sun. Artificial light sources include lightbulbs, candles, and oil lamps. Some animals, such as jellyfish and fireflies, produce their own light.



The Sun is a natural light source.

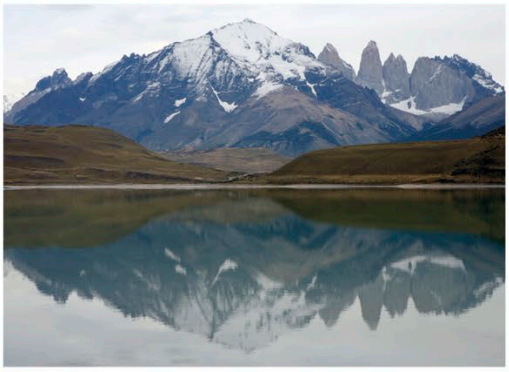
A candle is an artificial light source.



Some jellyfish can glow in the dark.

Shadows

A shadow is a dark area where light is blocked by an object. It takes the shape of the object blocking the light.



Reflection

More light bounces off shiny surfaces like mirrors or still water. This is called reflection.

Liquids

Liquids are runny materials. They can be poured into things, and move to fit the shape of their container. Liquids make a pool not a pile. We drink liquids including water. When a liquid cools, it can become a solid. Heating a liquid up can create a gas.

SEE ALSO

- Atoms p.34
- Changing states p.57
- Gases p.117
- Rivers p.211
- Solids p.234
- Water cycle p.270

What liquids do

The things a liquid can do are called its properties. For example, liquids can be heated up to cook things. Liquids are good at mixing because of the way they flow and move. Some liquids flow more easily than others, but they all change shape to fit their containers.

Around **75 per cent** of your brain is made of **water.**

Liquid particles

Liquids are made from tiny particles that move around quickly and stick together in groups. When they cool, they slow down to eventually become solid.

Dissolving

Some materials dissolve (disappear into) liquids. If we add salt to water, it becomes salty water. We can't see the grains of salt because they have dissolved into the water to make salt water.

Water

Two-thirds of the Earth's surface is covered in water. Water is essential because living things need water to survive. Animals drink water and plants take water in from the ground or air. Most living things are made up of at least half water.

Lungs

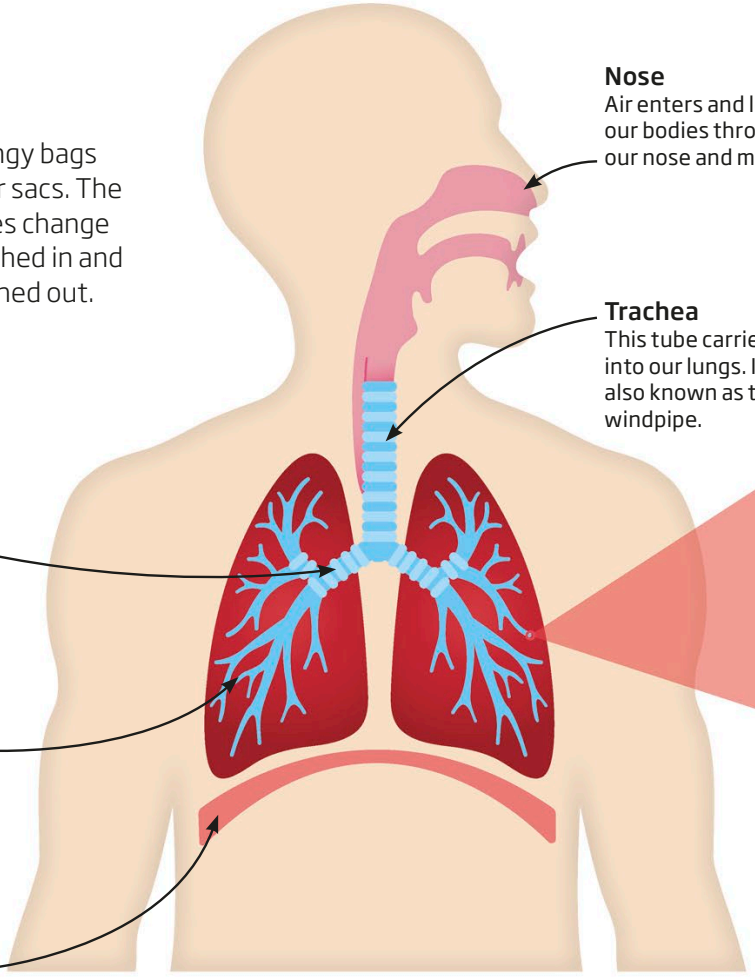
We breathe air in and out of our lungs. The lungs take oxygen from the air and transfer it to the blood. Every part of the body needs oxygen, so the lungs collect it and the blood carries it around the body.

SEE ALSO

- Brain p.45
- Gases p.117
- Heart p.128
- Human body p.130
- Skeleton p.228
- Sound p.235

Lungs

The lungs are two spongy bags filled with tubes and air sacs. The air sacs are where gases change places. Oxygen is breathed in and carbon dioxide is breathed out.



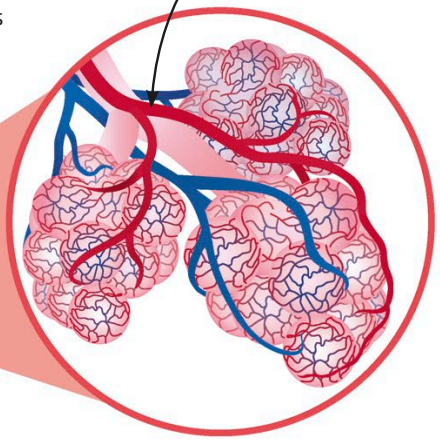
Nose
Air enters and leaves our bodies through our nose and mouth.

Trachea
This tube carries air into our lungs. It is also known as the windpipe.

Bronchi
These two air tubes connect the trachea to the lungs.

Bronchioles
The air goes into these tiny tubes. Each one ends in air sacs called alveoli.

Diaphragm
This muscle changes the shape of the lungs so we can breathe in and out.

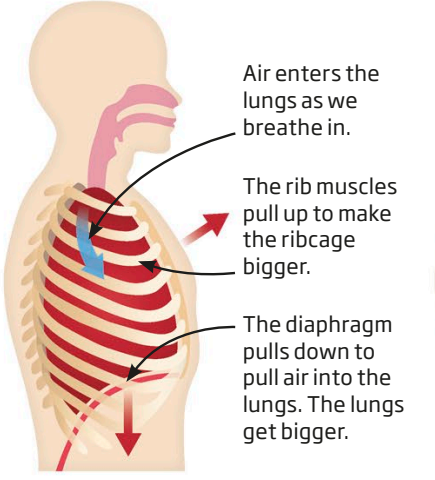


Oxygen is taken into the blood and carbon dioxide is sent out of the blood in the air sacs.

Alveoli, or air sacs

Breathing

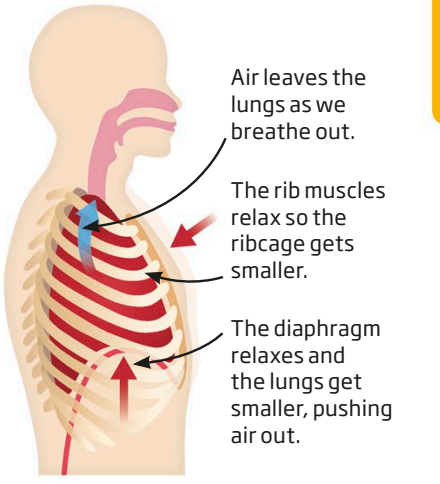
Muscles work together to let us breathe in and out. We have a diaphragm muscle below the lungs and more muscles around the ribcage. They change the size and shape of the lungs.



Air enters the lungs as we breathe in.

The rib muscles pull up to make the ribcage bigger.

The diaphragm pulls down to pull air into the lungs. The lungs get bigger.



Air leaves the lungs as we breathe out.

The rib muscles relax so the ribcage gets smaller.

The diaphragm relaxes and the lungs get smaller, pushing air out.

Voice box

The voice box is in the throat. It stops food from getting into the lungs and makes us cough if any food gets in. The voice box also lets us speak and sing.

Machines

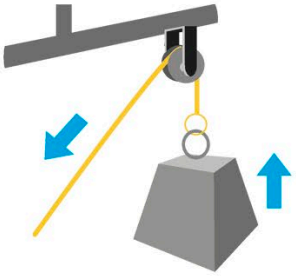
Machines help us do things. They usually perform tasks that are too big, small, boring, long, or dangerous for people to do. Most modern machines are powered by electricity or gas.

SEE ALSO

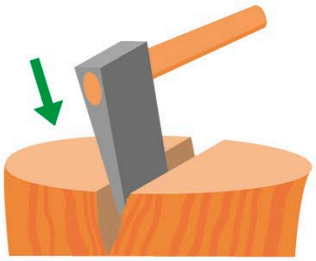
- Aircraft p.13
- Bicycles p.36
- Electricity p.87
- Energy pp.88-89
- Engines p.92
- Robots p.213
- Trains p.260

Simple machines

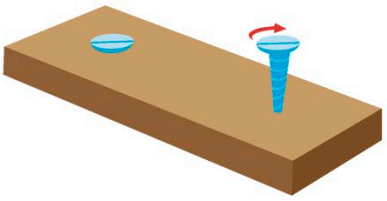
Simple machines reduce the effort needed to do things. A person must operate the machine, but only a small amount of effort is required to move heavy objects.



Pulley
A pulley uses a rope or chain looped over a wheel to lift heavy loads.



Wedge
Made of wood or metal, this triangular tool can be used to push things apart.



Screws
These sharp metal pins are used to attach things. As the screw is turned, it moves down and round.

The operator sits in the driver's cabin.

Lever
Levers move like arms. This one raises a metal scoop to collect building materials.

Wheel
Wheels make it easier to move heavy things around.

Big machines

Diggers are made up of several simple machines. They are powered by engines.

Why we use machines

Machines are usually more efficient and reliable than human workers. This is because they can do things without ever becoming bored, tired, slow, or distracted.

Neat work
A sewing machine can sew more neatly and more quickly than most people can by hand.

Repetitive work
Automatic cash machines don't sleep, so they can give out money 24 hours a day.

Dangerous work
Robots are used to study active volcanoes, so people do not have to put themselves at risk.

Magnets

Magnets are objects that other magnets and some metals stick to. They have two sides or ends called poles. The area all around the magnet where the magnet acts is called the magnetic field.

SEE ALSO

- Compass p.70
- Earth p.83
- Electricity p.87
- Inside Earth p.135
- Forces p.108
- Materials p.157

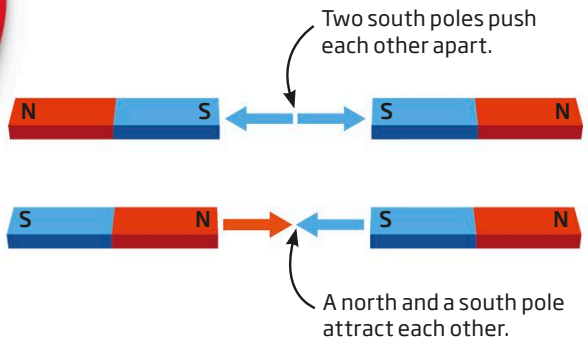
Magnetic materials

Materials that magnets stick to are called magnetic materials. Any metal that contains iron is magnetic, but most metals are not magnetic.

The **largest magnet** on Earth is **Earth** itself. The whole planet is a magnet with **two poles**.

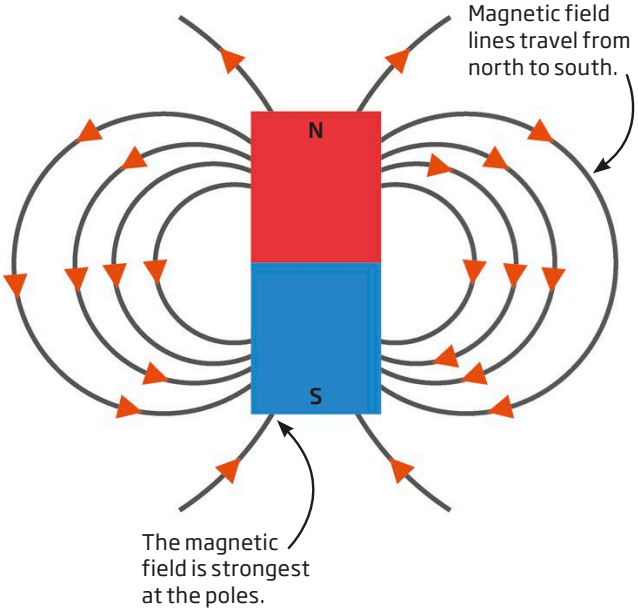
Magnetic force

Two identical poles repel each other, pushing each other away. Two opposite poles attract each other and stick.



Magnetic field

The magnet acts on things that are nearby. The region where the magnet attracts or repels magnetic materials is called the magnetic field.



Pets

Pets have become an important part of humans' lives. Many animals are kept as companions, for work, or to help people go about their daily lives. It is estimated that 44 per cent of homes in the world have a pet.

Canaan dog

Pets big and small

Pets aren't just dogs and cats – we keep all sorts of animals as pets. They vary from big dogs and horses to small snakes and hamsters. Each species needs a special diet and room to exercise.

First pets

Dogs were the first animals to be kept as pets. They were used for hunting – helping early humans to catch food. Ancient art from 12,000 years ago shows humans and dogs together.

Dog

Bronze statue of a cat from ancient Egypt

Bearded dragon

Holy cats

The ancient Egyptians loved cats. They caught mice, rats, and snakes, which kept people's homes clean. Cats were also believed to have special powers for guarding children. The punishment for killing a cat was death.

Goldfish

Hamster

Gerbil

Snake

Helpful pets

Dogs are good at keeping people company. They are also easy to train, and can be used to help people with disabilities. A dog can be a person's eyes or ears, and help them get around.

Guide dogs are specially trained to help people who need help seeing.

Pets in space

For years, animals have helped scientists answer questions about how humans would survive in space. Dogs Belka and Strelka (above) were sent into space on the *Sputnik 5* in 1960. They returned safely to Earth using a parachute.

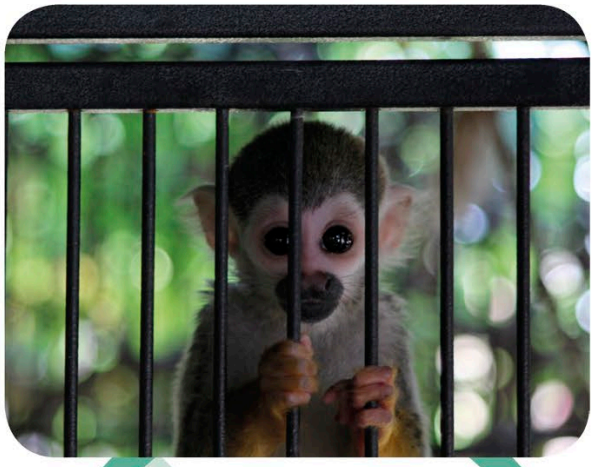
Budgie

Cat

Rabbit

Guinea pig

Tarantula



Not pets

It is illegal to keep some animals. Wild animals, such as monkeys, can even be dangerous. Before getting a pet, make sure you know that the animal has come from a good home and has not been taken from the wild.

Mammals

Mammals are animals that have body hair and feed their babies on milk made by the females. They are warm-blooded, which means their bodies stay the same temperature. There are many different groups of mammals.

SEE ALSO

- Animal families p.21
- Animal groups p.22
- Food chains p.107
- Habitats p.126
- Vertebrates p.266

Mammal babies

Mammals give birth to live babies. Parents feed and care for their young until they can look after themselves.

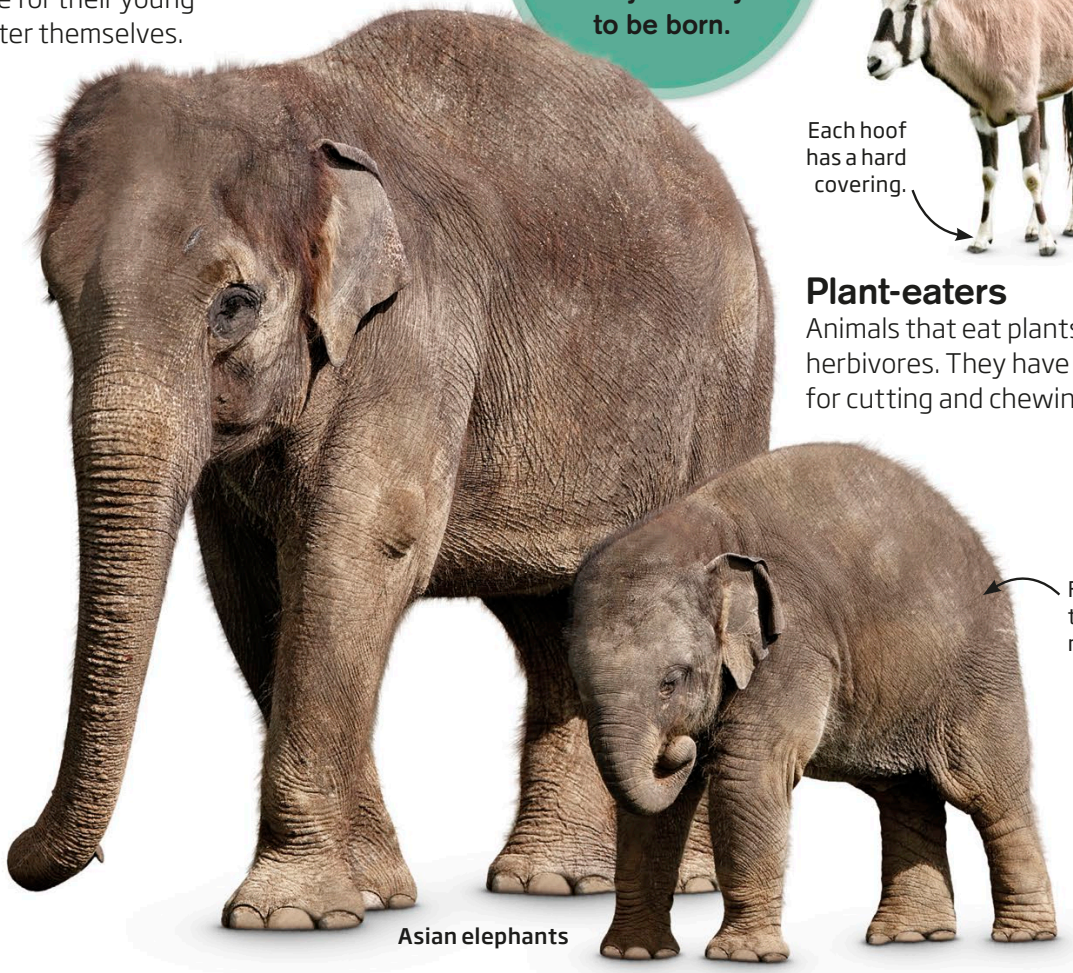
A mother elephant is pregnant for nearly two years before its baby is ready to be born.

Cheetahs have sharp hearing to help them catch animals to eat.

Cheetah

Meat-eaters

Meat-eating animals are called carnivores. They hunt other animals for food.



Fur or hair on the body keeps mammals warm.

Asian elephants

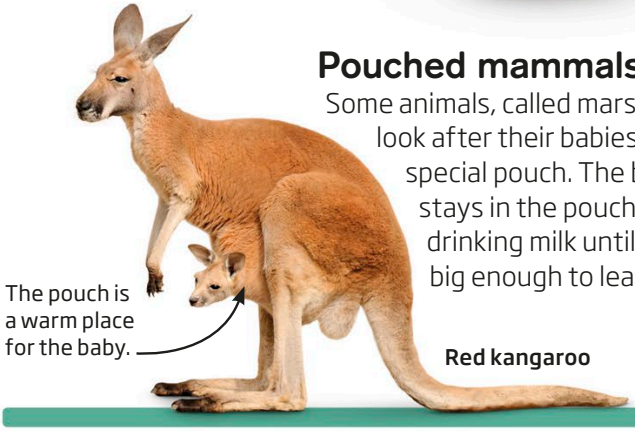
Gemsbok's horns grow longer each year.

Each hoof has a hard covering.

Gemsbok

Plant-eaters

Animals that eat plants are called herbivores. They have special teeth for cutting and chewing leaves.



The pouch is a warm place for the baby.

Red kangaroo

Pouched mammals

Some animals, called marsupials, look after their babies in a special pouch. The baby stays in the pouch, drinking milk until it is big enough to leave.

Dolphins

Not all mammals live on land. Dolphins are mammals that live in water. They come up to the surface to breathe through a blowhole at the top of their head.

Maps

A map is a detailed picture of what the ground looks like from above, as if you were flying over it. Maps tell us how big an area is and what can be found there. Maps can be of anything, from the whole world to the insides of buildings.

SEE ALSO

- Compass p.70
- Explorers p.96
- Measuring p.159
- Exploration pp.180–181
- Navigation p.182
- Transport pp.258–259

Using a map

We can use a map to work out the height of the land, to follow roads and railways, or to find our way to a hospital or school.

This shows which direction the top of the map is pointing towards. This is usually north, or "N".

The map is divided into a grid with squares for different areas.

A key shows which real-life features the map's lines and symbols represent.

The scale bar shows the real-life distance between points on the map.

Symbols are used for different features, such as buildings and campsites.

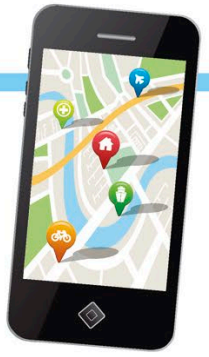
Ancient maps

Maps were less accurate in the past. This 2,500-year-old stone map shows how people in Babylon, in modern-day Iraq, saw the world.

Babylon is shown at the centre of the world.

The end of paper maps?

Paper maps are still around today, but fewer people use them. Most cars now have GPS to guide the driver, and digital maps can be viewed on mobile phones or laptops.



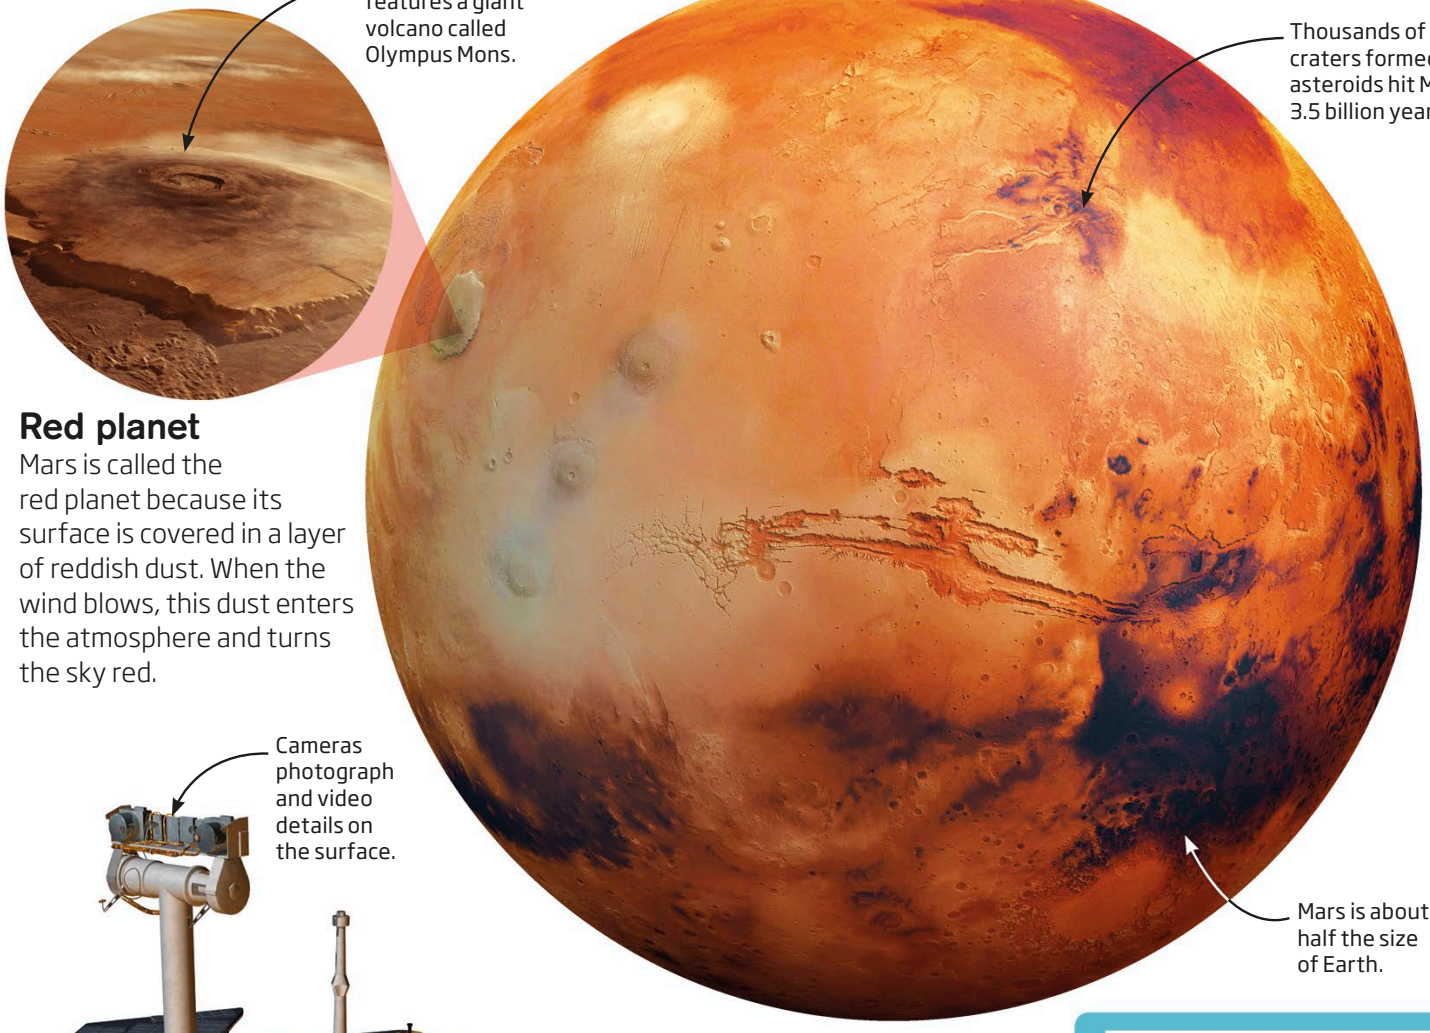
Phone map

Mars

Named after the Roman god of war, this rocky planet has huge volcanoes, ice caps, and deep canyons. It was once a wet, warm world where water flowed. Now, Mars is a cold, dry world covered in craters.

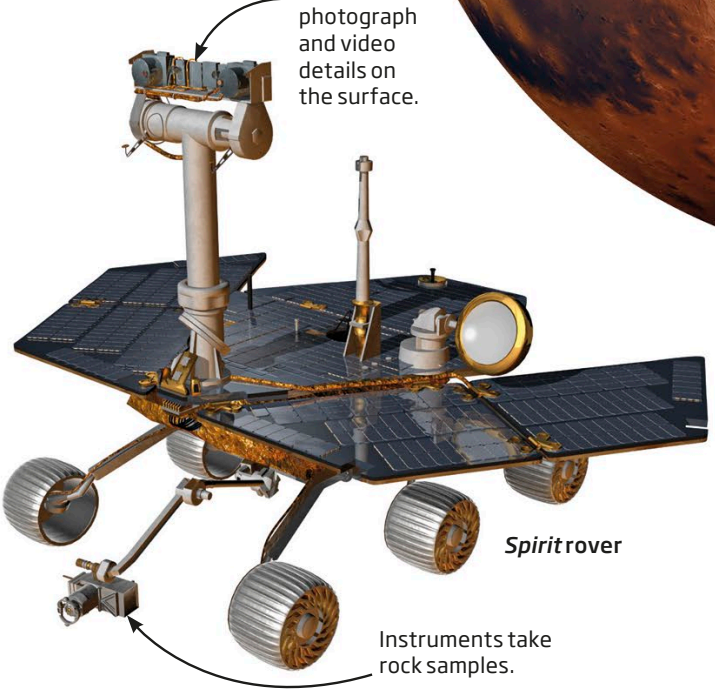
SEE ALSO

- Ancient Rome p.20
- Asteroids p.30
- Elements p.90
- Rocks and minerals p.214
- Space travel p.237
- Volcanoes p.268



Red planet

Mars is called the red planet because its surface is covered in a layer of reddish dust. When the wind blows, this dust enters the atmosphere and turns the sky red.

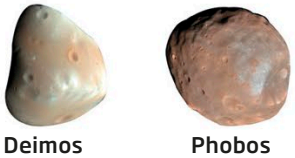


Mission to Mars

Since 1976, spacecraft have visited Mars to study its surface. Two twin rovers called *Spirit* and *Opportunity* arrived on Mars in 2004, and *Opportunity* is still exploring.

Moons of Mars

Mars has two tiny moons called Deimos and Phobos. These rocks may have started as asteroids. Phobos is the largest, measuring 27 km (16 miles) in length.



Deimos **Phobos**

Materials

Materials are what all things in the world are made of. We describe them using their properties, which are how they behave and what they do. They can be hard, bendy, waterproof, or magnetic. Materials will either float or sink, and electricity can pass through some of them.

SEE ALSO

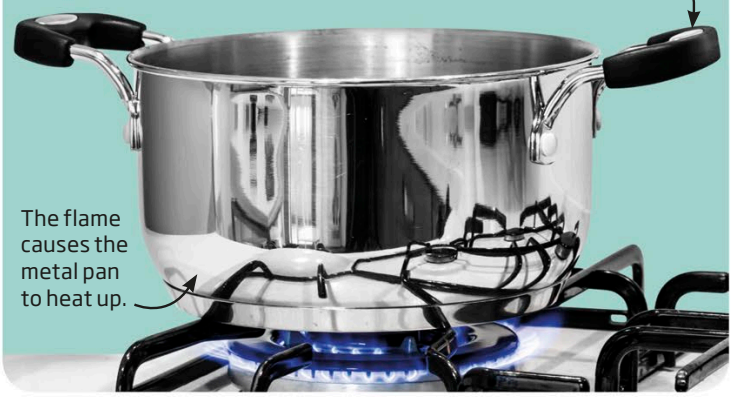
- Atoms p.34
- Buildings p.48
- Electricity p.87
- Gases p.117
- Liquids p.148
- Plastic p.195
- Solids p.234

Solubility

Solubility is how easily something dissolves (mixes into) liquid. If you put salt in water, the salt dissolves into it, so salt is soluble. Soluble materials can be solids, liquids, or gases.

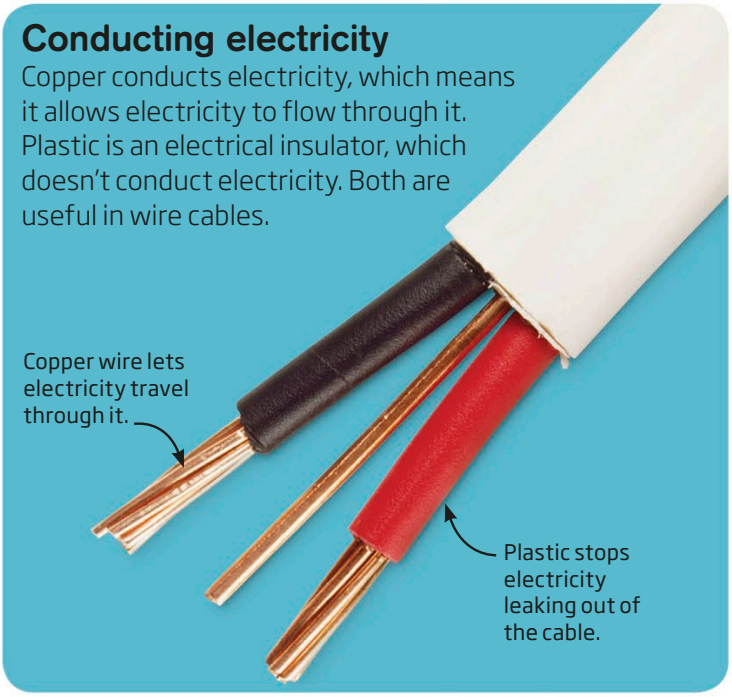
Conducting heat

Metals are good at conducting heat, which means when something hot touches them, the heat transfers into them. Wood, plastic, and rubber are poor conductors of heat. Both properties are useful in saucepans.



Conducting electricity

Copper conducts electricity, which means it allows electricity to flow through it. Plastic is an electrical insulator, which doesn't conduct electricity. Both are useful in wire cables.



Flammability

Flammability is how easily something catches fire and burns. Dry wood is highly flammable, which means it catches fire and burns easily, giving off heat.

Maya

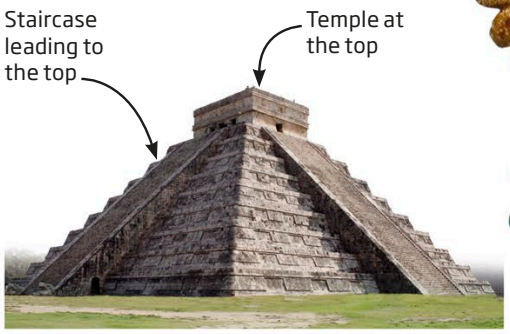
The Maya people lived in Central America from 1000 BCE to 1600 CE. They built great cities from stone and farmed maize, beans, and squash. The Maya had many gods, who they built temples for. They were skilled mathematicians and developed a calendar.

SEE ALSO

- Art p.28
- Aztecs p.35
- Farming p.98
- Incas p.132
- Games pp. 240-241
- Religion p.208

Mayan gods

The Maya worshipped many different gods. They believed the gods controlled the world around them, including animals and the weather.



Mayan pyramid at Chichén Itzá, Mexico

Temples

Many Mayan temples were built on top of stone pyramids. Priests at the temples sacrificed animals, sang, and danced to honour the gods.

Mayan sport

The Mayans played a sacred ball game. Players hit a large rubber ball to different parts of a court to win points. They could only use their forearms and hips.

Chaac, the Mayan rain god

Chaac was the brother of the Sun. When he cried, his tears fell as rain.

Measuring

We measure things to find a number that shows the size or amount of something. Being able to measure things lets us record and compare them. We use many different types of measurements, as well as various tools for measuring.

SEE ALSO

- Ancient Egypt p.17
- Astronomy p.32
- Clocks p.61
- Earth p.83
- Numbers p.185
- Volume p.269

Measuring tools

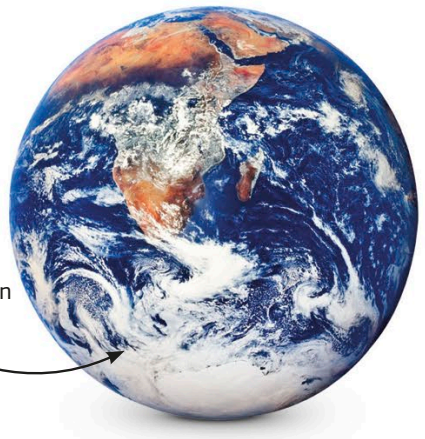
Different tools let us measure time, size, distance, speed, weight, and volume. Volume is the amount of three-dimensional space something takes up.

Weighing through history

People have always wanted to be able to compare amounts of things. The ancient Egyptians invented their own, very accurate system of weights and simple scales to measure the goods they bought and sold.

Big and small

All objects can be measured one way or another. A box of eggs fits easily on weighing scales, but planet Earth is so big it can only be weighed using complicated scientific calculations.

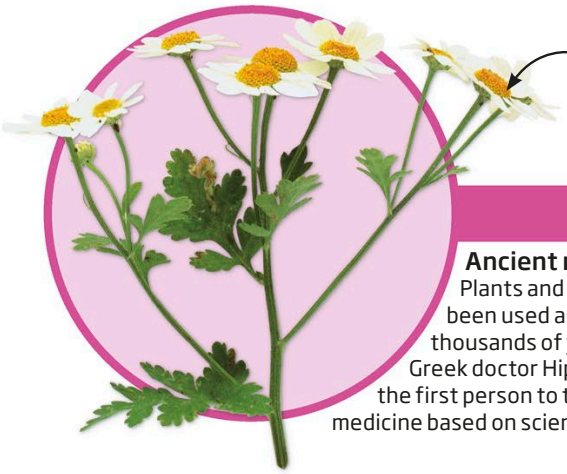


Medicine

Medicine is used to treat and prevent sickness. Medicine can be made from plants or from chemicals in a science lab. Doctors are trained to discover different problems and find the right treatment or medicine to make people better.

SEE ALSO

- Ancient Greece p.18
- Biology p.38
- Chemistry p.58
- Human body p.130
- Science p.217
- Sickness p.225



Chamomile was used to treat fevers in ancient Greece.

Ancient medicine

Plants and herbs have been used as medicine for thousands of years. Ancient Greek doctor Hippocrates was the first person to teach about medicine based on science.

Medieval medicine

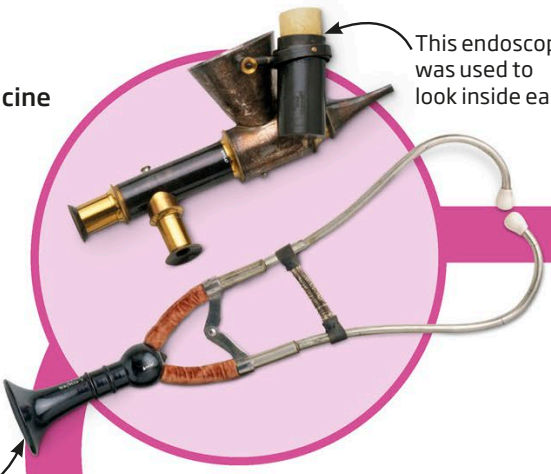
Too much blood was thought to make people sick, so leeches were used to suck out small amounts.

Medicinal leech

This sickly royal patient has been covered in leeches to try to cure him.

Early modern medicine

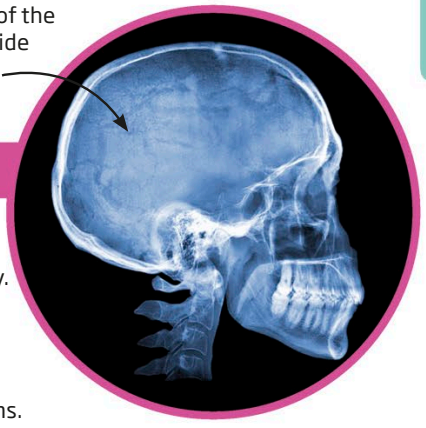
Doctors used new inventions to find out what was wrong with patients. Bad smells were thought to cause sickness, so patients breathed in nice smells like herbs.



This endoscope was used to look inside ears.

A patient's heart could be heard with the newly invented stethoscope.

An X-ray takes a picture of the bones inside the body.



Modern medicine

Doctors use machines like X-rays to look inside the body. We know tiny germs and viruses cause sickness. We can kill germs with antibiotic medicines, and we can stop viruses with vaccine injections.

Smallpox was the first infectious disease to be wiped out by humans, in 1980.

Doctors

Doctors find out what is wrong with patients by looking at their bodies, asking questions, and testing things from the body, such as the blood. They can then treat them.

Mercury

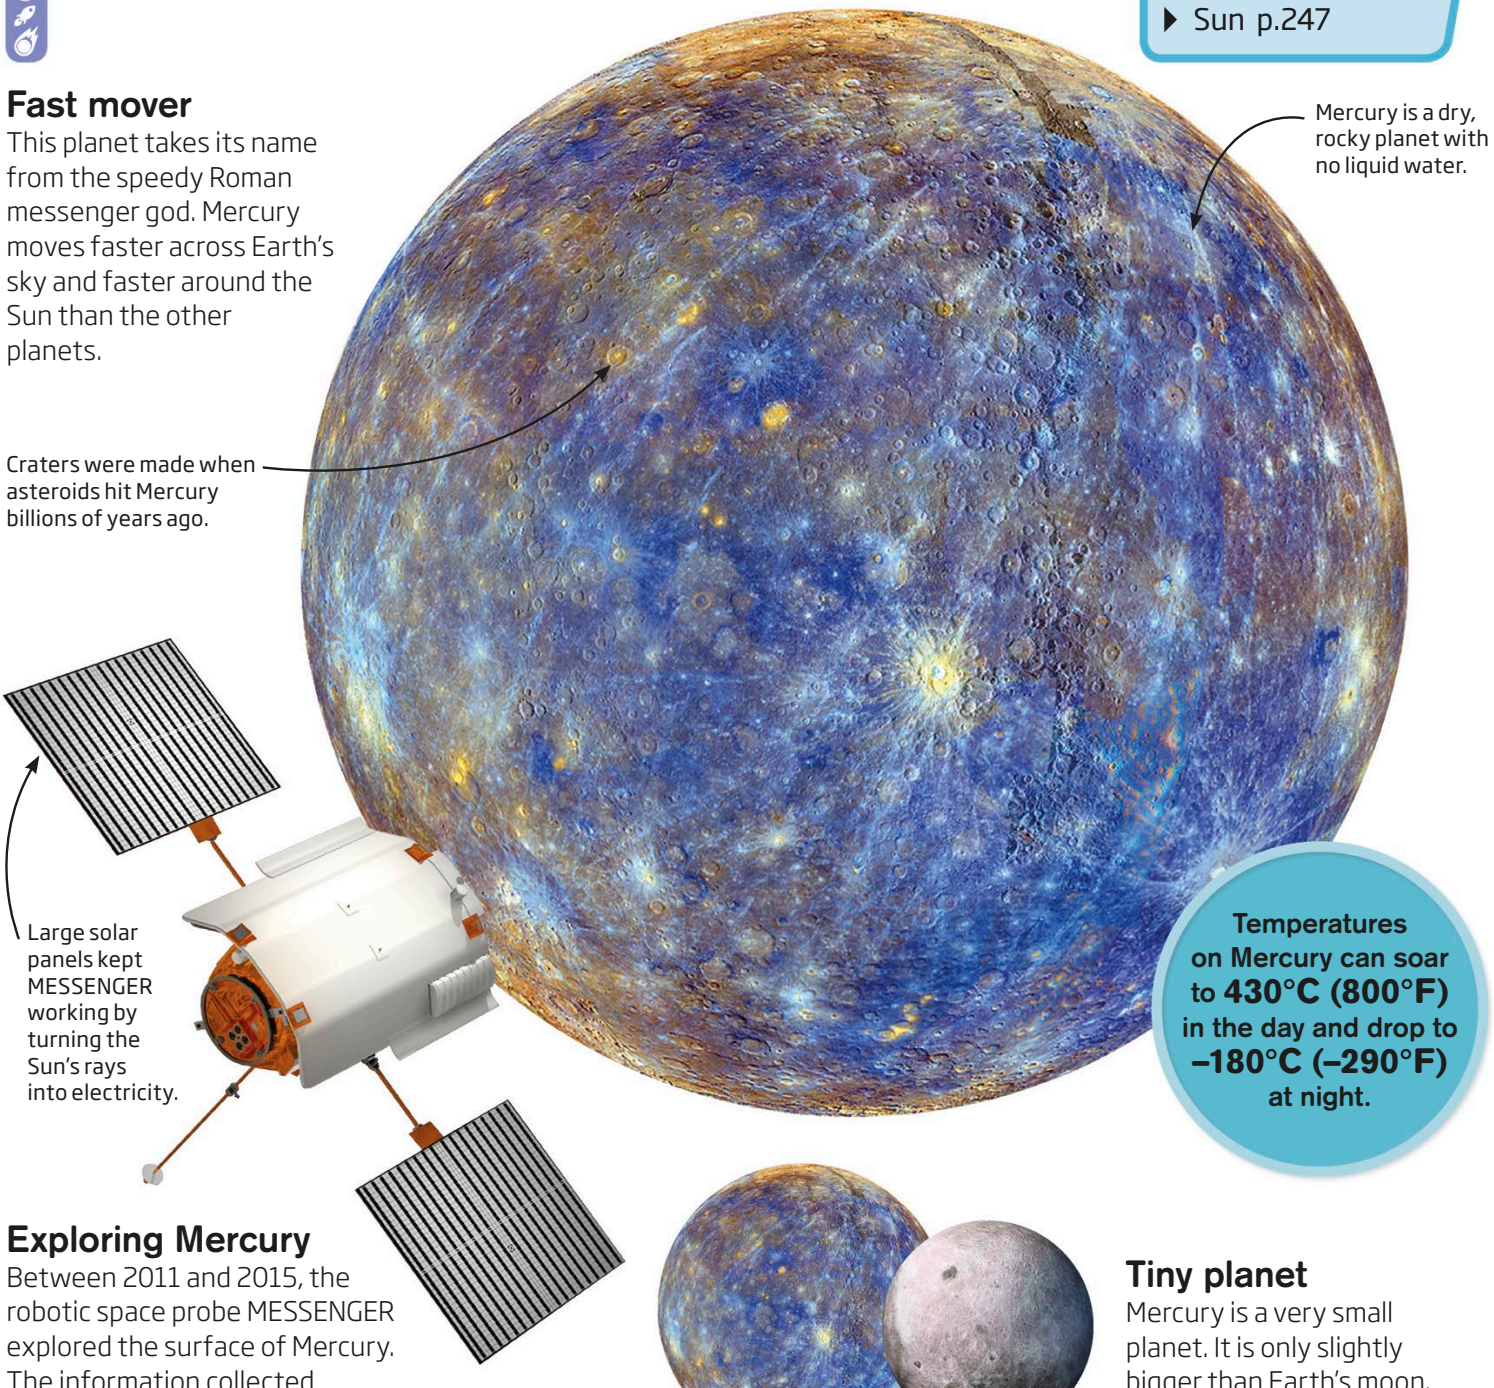
Mercury is the smallest planet in the Solar System. Despite this, it can often be seen from Earth at sunrise and sunset. The average temperature is a scorching 167°C (332°F) because this planet is closest to the Sun.

SEE ALSO

- Ancient Rome p.20
- Asteroids p.30
- Water pp.120-121
- Moon p.171
- Solar System p.233
- Sun p.247

Fast mover

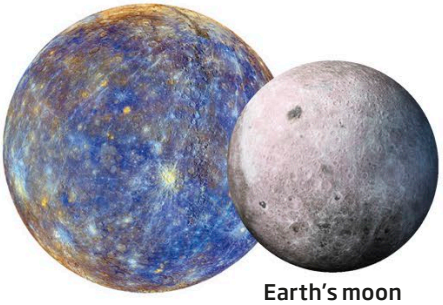
This planet takes its name from the speedy Roman messenger god. Mercury moves faster across Earth's sky and faster around the Sun than the other planets.



Temperatures on Mercury can soar to 430°C (800°F) in the day and drop to –180°C (–290°F) at night.

Exploring Mercury

Between 2011 and 2015, the robotic space probe MESSENGER explored the surface of Mercury. The information collected allowed scientists to make complete maps of Mercury for the first time.



Tiny planet

Mercury is a very small planet. It is only slightly bigger than Earth's moon. The planets Jupiter and Saturn both have moons that are bigger than Mercury.

Metals

We find metals in rocks. Metals can be strong or bendy, and they let electricity pass through them. These features are useful for making many things, from wires to buildings. Metals can be used on their own or mixed together.

SEE ALSO

- Bicycles p.36
- Elements p.90
- Iron Age p.140
- Liquids p.148
- Magnets p.151
- Meteorites p.164

Bicycle basics

A bicycle is made from a combination of strong and bendy metals. The type of metal used for each part depends on what it needs to do.

The **ancient Egyptians** made things out of iron from meteorites, which had **fallen from space.**

Metal from mines

People dig tunnels underground to find metal in places called mines. Usually, the metal found in mines is not pure, which means it has rock and gas mixed in it. These materials need to be separated from the metal before we can use it.

1. Ore
An ore is a rock that contains metal. The ore is discovered and dug out of the mine.

2. Melting
The ore is heated to melt and remove the metal. Chemicals are added to help remove gases.

3. Cooling
The metal cools into a solid. It can be heated up and hammered into useful shapes.

Metamorphosis

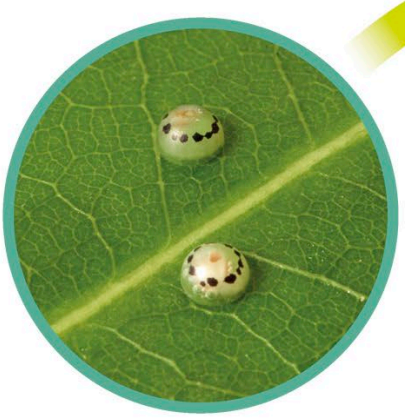
Some animals go through amazing changes between birth and adulthood. Their appearance changes so much that their fully grown shape is completely different to the newborn one. This process is called metamorphosis.

SEE ALSO

- Amphibians p.15
- Animal groups p.22
- Eggs p.86
- Insects p.134
- Life cycle p.146

Birth of a butterfly

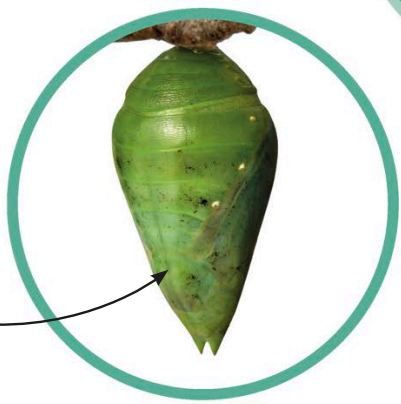
Becoming a beautiful butterfly is a long process involving many stages and different forms. The process takes between a month and a year.



1. Eggs
Butterflies start out as tiny eggs, laid on plants. The size, shape, and colour of the egg depends on the type of butterfly.

2. Caterpillar
A hungry caterpillar emerges from the egg. It eats leaves and begins to grow. Although it starts life small, the caterpillar develops quickly.

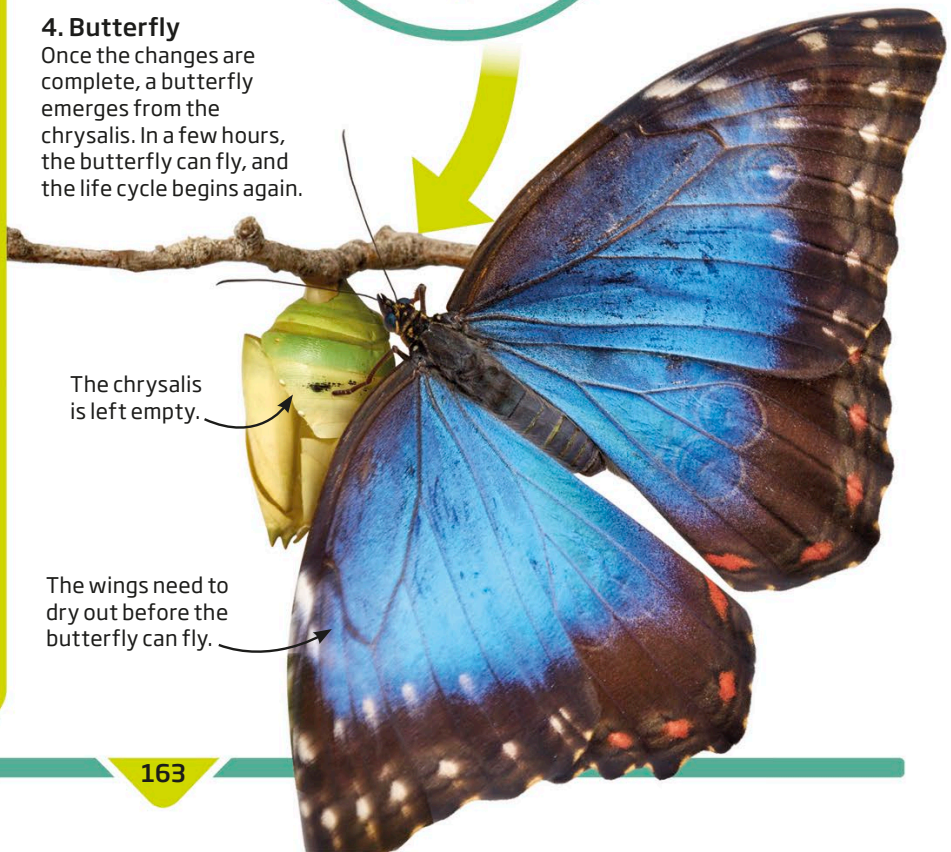
Metamorphosis is a Greek word meaning "change in shape".



The chrysalis is attached to a branch or leaf.

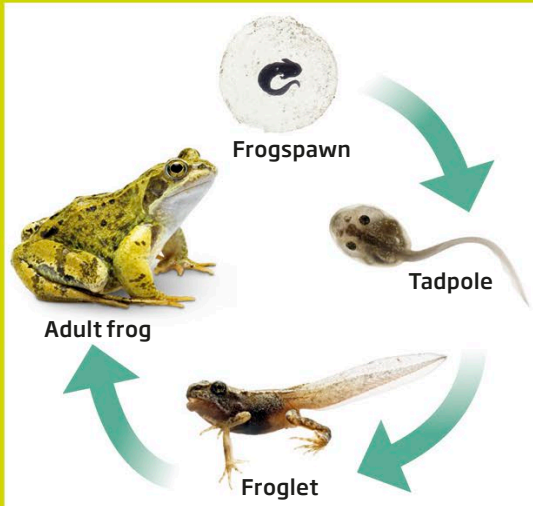
3. Chrysalis
The caterpillar wraps itself in a protective layer called a chrysalis. Inside, the caterpillar completely changes its body shape.

4. Butterfly
Once the changes are complete, a butterfly emerges from the chrysalis. In a few hours, the butterfly can fly, and the life cycle begins again.



The chrysalis is left empty.

The wings need to dry out before the butterfly can fly.



Becoming a frog

The life cycle of a frog has many stages. A female lays many eggs, called frogspawn, usually in water. These hatch into tiny tadpoles with gills for breathing. Tadpoles grow bigger and develop legs. Over a few more weeks, a froglet loses its tail, grows a frog's tongue, and becomes an adult.

Meteorites

Meteorites are pieces of space rock (asteroids and comets) that reach the surface of the Earth. They come in many different sizes, from tiny pebbles to rocks the size of a house. Only big meteorites can create craters when they hit the ground.

SEE ALSO

- Asteroids p.30
- Atmosphere p.33
- Comets p.68
- Metals p.162
- Rocks and minerals p.214
- Solar System p.233

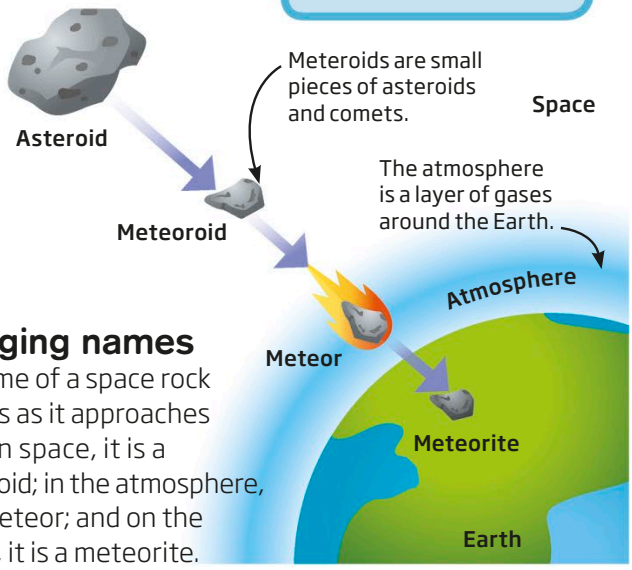
Space rocks

Meteorites are made of materials that are also found on Earth. There are three main types.

Stony-iron
Stony-iron meteorites are a mixture of metal and rock. They are very rare.

Stony
Most meteorites that are found are stony. They come from the crusts of asteroids.

Iron
Iron meteorites are made of iron and nickel metals. They come from the cores of asteroids.



Changing names

The name of a space rock changes as it approaches Earth. In space, it is a meteoroid; in the atmosphere, it is a meteor; and on the ground, it is a meteorite.

Crash site

If a meteorite makes it through Earth's atmosphere, it crashes into the surface. The hole it leaves is called an impact crater. This huge crater is in Arizona, in the USA.

Microscopic life

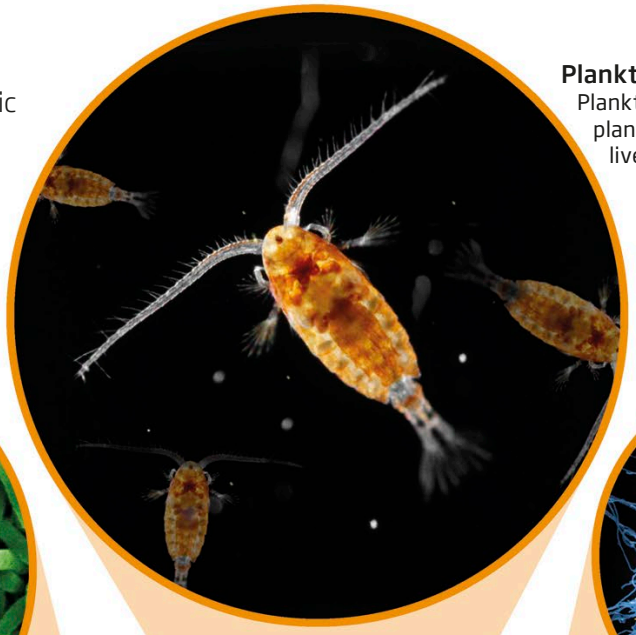
Microorganisms are very tiny living things. They are all around us – in the air, in our bodies, and in water. Most microorganisms are so small that they can only be seen through a magnifying machine called a microscope.

SEE ALSO

- Body cells p.41
- Food chains p.107
- Inventions pp.136–137
- Invertebrates p.139
- Sickness p.225

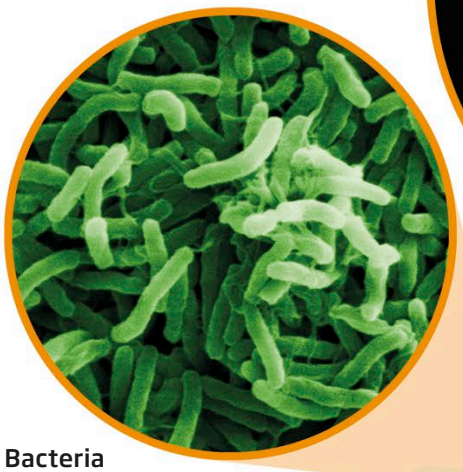
Types of microscopic life

There are many kinds of microscopic life. Some are harmful and spread illness. Others are helpful, such as the bacteria in our stomach, which break down our food.



Plankton
Plankton are microscopic plants and animals that live in water.

Virus
Viruses attack the cells of plants and animals, causing sickness.



Bacteria
Some bacteria help our bodies use food. Others cause illness, such as cholera and tetanus.

Scientists put samples on glass slides to examine in closer detail under a microscope.

Dust mites look like tiny bugs.

Humans have trillions of bacteria in their bodies to help them survive.

Dust mites

These microscopic bugs live all around us. They live in people's homes and eat flakes of dead skin that drop off us.

Microscope

Microscopes use lenses to enlarge, or magnify, things. This lets us look at things much smaller than what we can see with just our eyes.

Migration

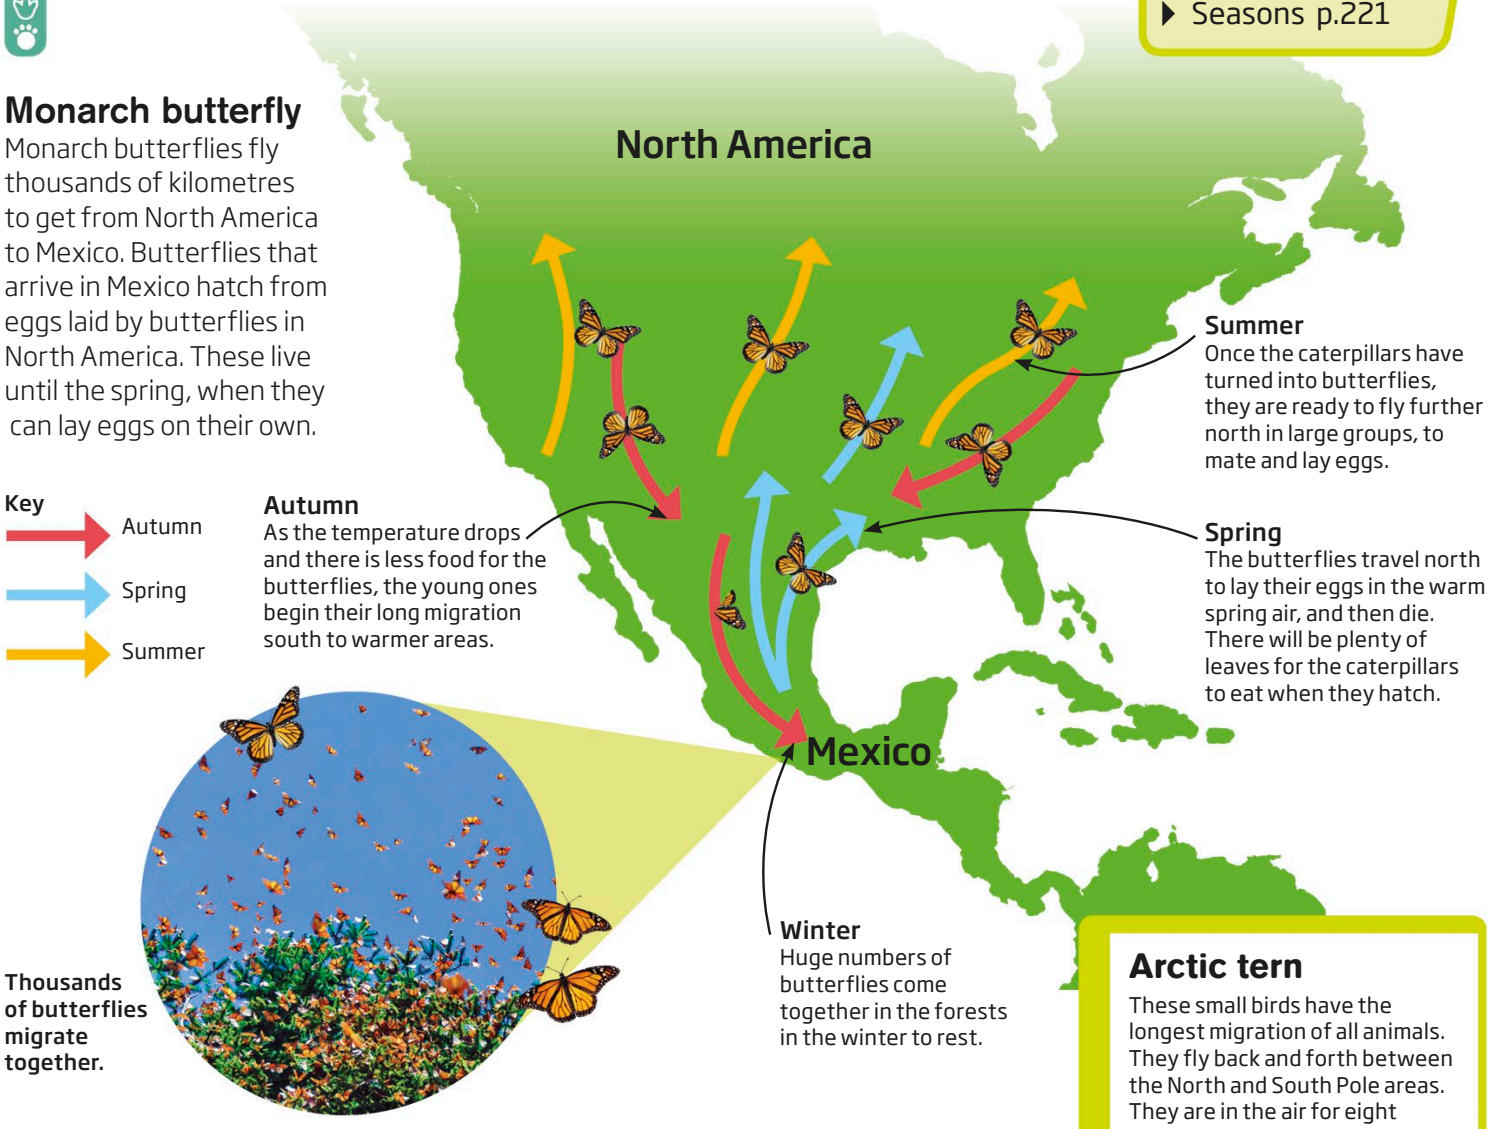
Some animals make long journeys each year. These journeys are called migrations. Animals migrate to find water, to spend winter in warmer places, or to find the best place to mate and have their babies.

SEE ALSO

- Birds p.39
- Insects p.134
- Mammals p.154
- Metamorphosis p.163
- North America p.184
- Seasons p.221

Monarch butterfly

Monarch butterflies fly thousands of kilometres to get from North America to Mexico. Butterflies that arrive in Mexico hatch from eggs laid by butterflies in North America. These live until the spring, when they can lay eggs on their own.



Thousands of butterflies migrate together.

Arctic tern

These small birds have the longest migration of all animals. They fly back and forth between the North and South Pole areas. They are in the air for eight months of every year.

Caribou

These hoofed animals from the Arctic travel in enormous herds. They walk up to 50 km (30 miles) a day for three months to spend their summer in open areas and winter in forests.

Milky Way

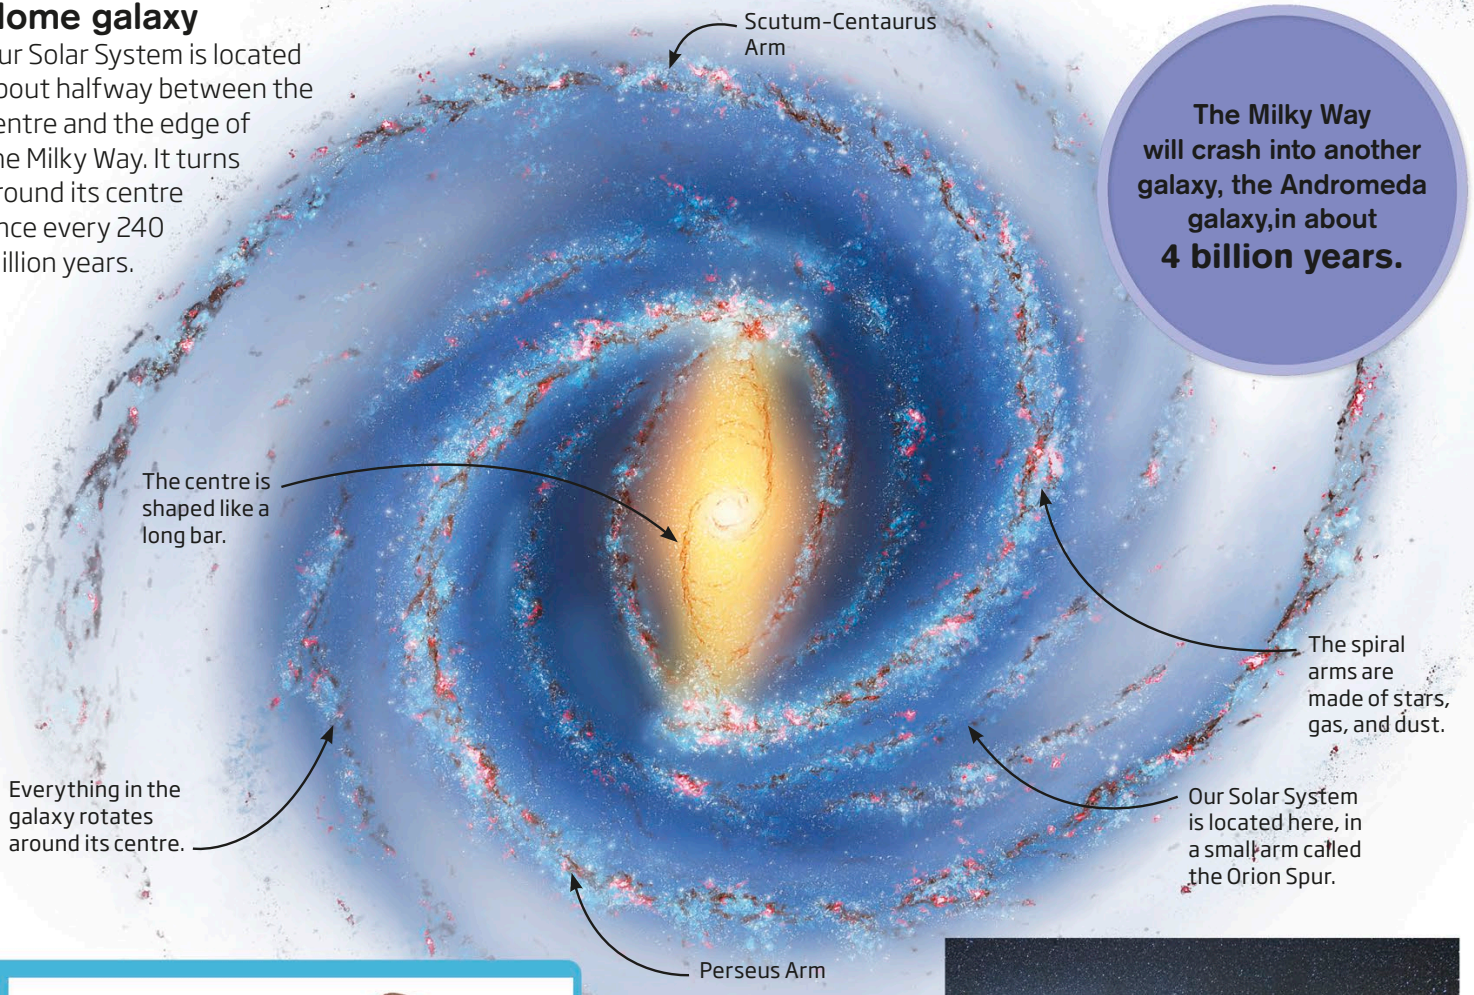
The Milky Way is a galaxy, or group of stars. It contains more than 200 million stars, including our Sun. Astronomers think that the Milky Way is shaped like a spiral, with two main arms.

SEE ALSO

- Astronomy p.32
- Constellations p.73
- Earth p.83
- Galaxies p.116
- Solar System p.233
- Stars p.242
- Universe p.263

Home galaxy

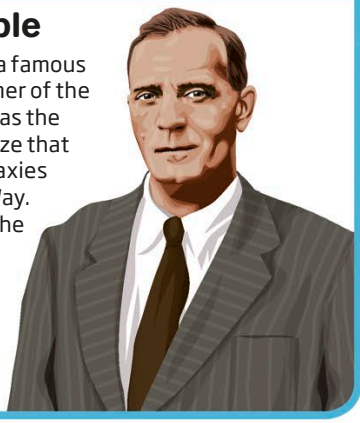
Our Solar System is located about halfway between the centre and the edge of the Milky Way. It turns around its centre once every 240 million years.



The Milky Way will crash into another galaxy, the Andromeda galaxy,in about 4 billion years.

Edwin Hubble

Edwin Hubble was a famous American astronomer of the 20th century. He was the first person to realize that there are other galaxies beyond the Milky Way. He also measured the distances between galaxies.



View from Earth

From Earth, we can see the Milky Way as a faint white band across the night sky. The light we see is created by billions of shining stars.

The Milky Way from Earth

Mixtures

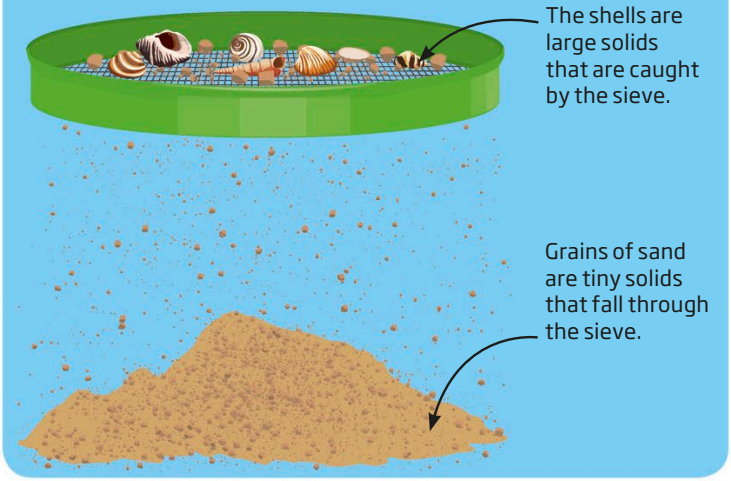
A mixture is made when we mix different materials together and they can be easily separated back out into their original parts. Mixtures can be made from solids, liquids, and gases. There are three main ways of separating mixtures.

SEE ALSO

- Changing states p.57
- Gases p.117
- Liquids p.148
- Rocks and minerals p.214
- Solids p.234

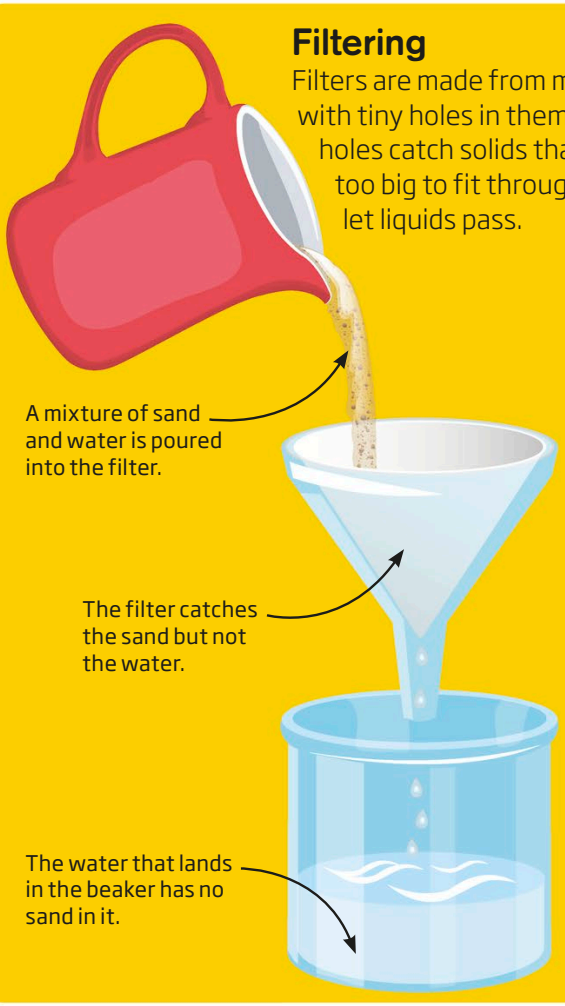
Sieving

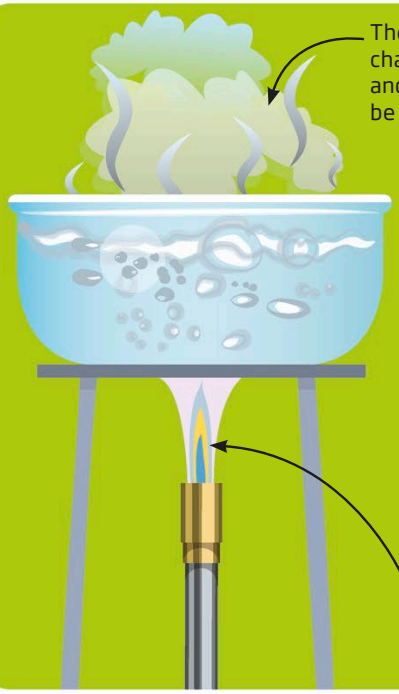
We can use a sieve to separate large solids from small ones, or solids from liquids. A sieve is made from criss-crossed wire with small holes that let some solids through.



Filtering

Filters are made from materials with tiny holes in them. The holes catch solids that are too big to fit through, but let liquids pass.





Evaporation

Some solids such as salt dissolve (disappear) when they are mixed into a liquid. If we heat the liquid, we can separate out the solid in a process called evaporation.

Compounds

Some materials that are joined together can't be easily separated by sieving, filtering, or evaporation. These materials are not mixtures, they are compounds. Iron and sulphur make the compound iron sulphide.

Iron sulphide

Money

We exchange money for things we want to buy, such as food, clothes, and electricity. Money has a number value, and it is made up of coins and notes. Some objects are expensive and worth more money than others.

SEE ALSO

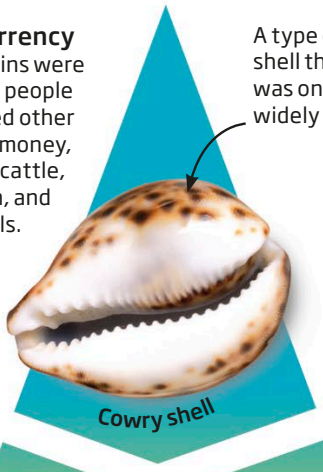
- Measuring p.159
- Metals p.162
- Numbers p.185
- Plastic p.195
- Precious metals p.199
- Work p.274

Currency

The different units of money used around the world are known as currency. In the USA, for example, the currency is the dollar, and in Japan the currency is the yen.

Early currency

Before coins were invented, people exchanged other things as money, including cattle, salt, grain, and even shells.



Digital money

Banks store money for people in bank accounts. People can pay into or take money out of their bank account. They can use a card or phone to spend the money from the bank in a shop.

Ancient coins

The first coins were used nearly 3,000 years ago. They were made from gold and silver. Different coins were made across the ancient world.

Value

An object that takes a lot of time to make or uses expensive materials is said to have a high value. It will cost more money than something that is quick and easy to make and uses cheaper materials.

High-value sports car

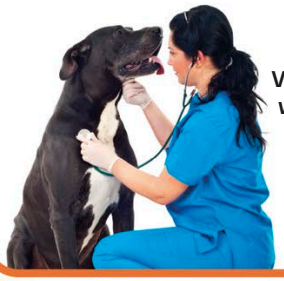
Low-value toy car

Modern money

Coins today are made from a mix of metals called alloys. We also use notes made from cotton-paper or plastic.

Earning money

People exchange their time for money, too. This vet gets paid for the time she spends making animals better. She goes to work and earns money.



Vet at work

Monkeys and apes

Apes, monkeys, and lemurs belong to a group of animals called primates, which also includes humans. Most primates are clever and like to play. Primates are the only animals with hands that can grab things.

SEE ALSO

- Africa p.12
- Early humans p.82
- Habitats p.126
- Rainforest p.204
- South America p.236
- Vertebrates p.266

Apes

Apes do not have tails and can stand more upright than monkeys. They use their huge, strong arms to climb trees and hang from branches.

Chimpanzee

Chimpanzees live in groups of up to 120 animals.

Old World monkeys

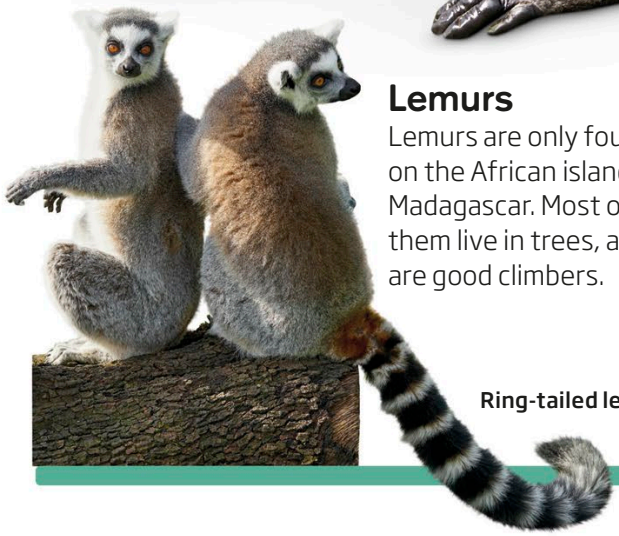
From Africa and Asia, these monkeys live in many different places, such as swamps and mountain forests.

Rhesus macaque

Squirrel monkey

New World monkeys

From South America, these monkeys spend most of their time in the trees. They use their tails to swing from branch to branch.



Lemurs

Lemurs are only found on the African island of Madagascar. Most of them live in trees, and are good climbers.

Ring-tailed lemurs

Tool use

Chimpanzees are some of the cleverest animals in the world. They use tools to open hard nuts or find insects to eat. Young chimpanzees learn how to use tools from the older members of their group.

Moon

The Moon is a round, rocky, airless "body" that circles the Earth. It is the most familiar object in the sky after the Sun. People have visited the Moon, but not since 1972.

SEE ALSO

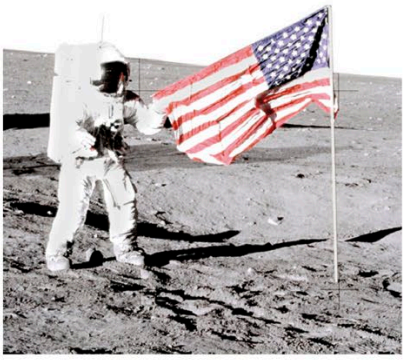
- Asteroids p.30
- Atmosphere p.33
- Comets p.68
- Earth p.83
- Solar System p.233
- Tides p.254

Rocky body

The Moon is large and rocky with a dusty, airless surface. It is about one-quarter the width of the Earth.

The dark areas are where there used to be seas of liquid rock.

The Moon's surface is covered with pits from where space rocks crashed into it.

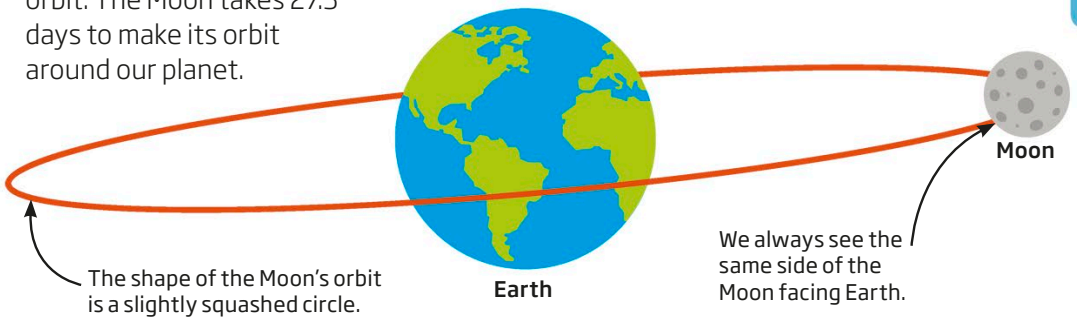


Man on the Moon

The Moon is the only object in the Solar System that has been visited by humans. American Apollo spacecraft landed 12 people on the Moon between 1969 and 1972.

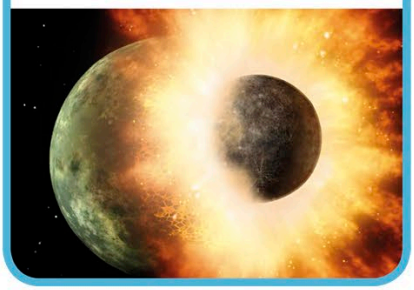
Moon's orbit

The Moon travels around the Earth. This is called an orbit. The Moon takes 27.3 days to make its orbit around our planet.



Moon creation

Scientists think the Moon was created when a small planet, Theia, crashed into the Earth, 4.5 billion years ago. As a result, rocks on the Moon are similar to rocks on Earth.



Mountains

Mountains are tall, rocky features on the Earth's surface. They usually have very steep sides and tower over the surrounding landscape. The tops of mountains are called summits, and they are often covered in snow, even in summer.

SEE ALSO

- Earth's surface p.84
- Evolution p.95
- Glaciers p.122
- Rock cycle p.213
- Rocks and minerals p.214
- Volcanoes p.268

Mountains around the world

Every continent has mountains. Most mountains are in rows, or ranges, that can be thousands of kilometres long.

The Andes mountain range runs the length of South America.

Mountain life

Mountain animals must be able to survive on steep rocks without much oxygen to breathe. Mountain goats are good at climbing and eat small plants.

How are mountains made?

Most mountains are formed over millions of years, as huge pieces of the Earth's crust push into each other. Where they meet, the ground is forced up, making mountain ranges.

The pointed shape of the **Matterhorn** was made by slow-moving **rivers of ice** thousands of years ago.

The summit

This mountain is called the Matterhorn. It is part of a range in Europe called the Alps.

The treeline is the highest point on the mountainside where trees can still grow.

Muscles

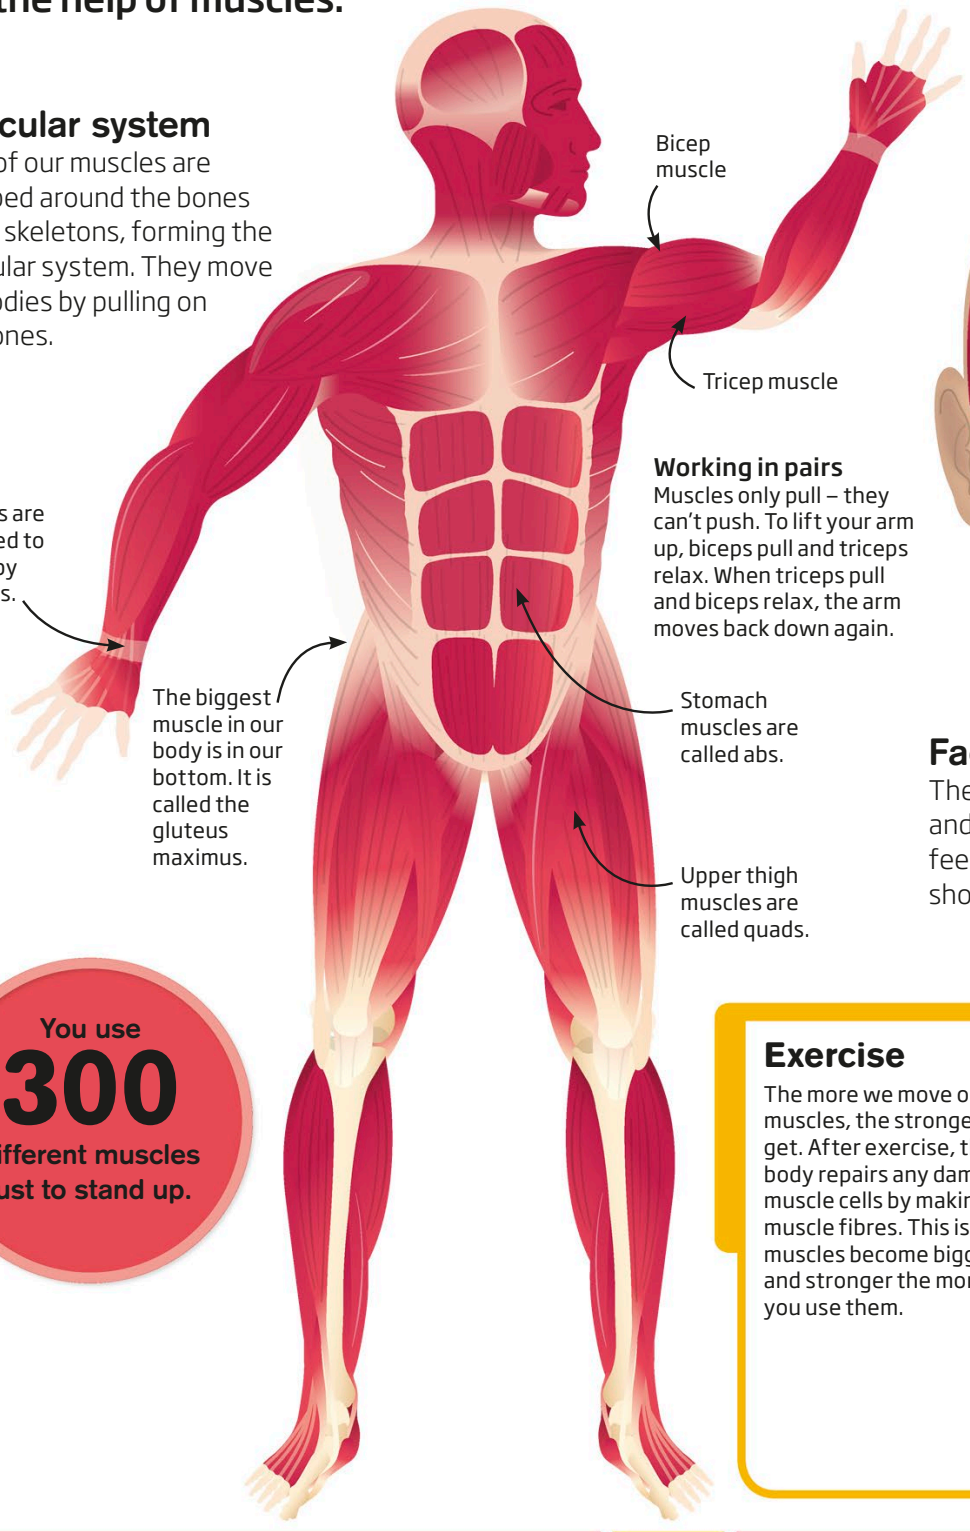
Muscles are stretchy cords that pull parts of the body to make them move. They work in teams. Some muscles work without us thinking, others move when we choose to move them. Every time we blink, smile, or move, it is with the help of muscles.

SEE ALSO

- Body cells p.41
- Feelings p.99
- Human body p.130
- Skeleton p.228
- Sport p.239
- Games pp.240–241

Muscular system

Most of our muscles are wrapped around the bones of our skeletons, forming the muscular system. They move our bodies by pulling on the bones.



Working in pairs

Muscles only pull – they can't push. To lift your arm up, biceps pull and triceps relax. When triceps pull and biceps relax, the arm moves back down again.

Face muscles

The muscles in our face move the eyes and mouth and help us to express our feelings to others. For example, we show we are happy by smiling.

You use 300 different muscles just to stand up.

Exercise

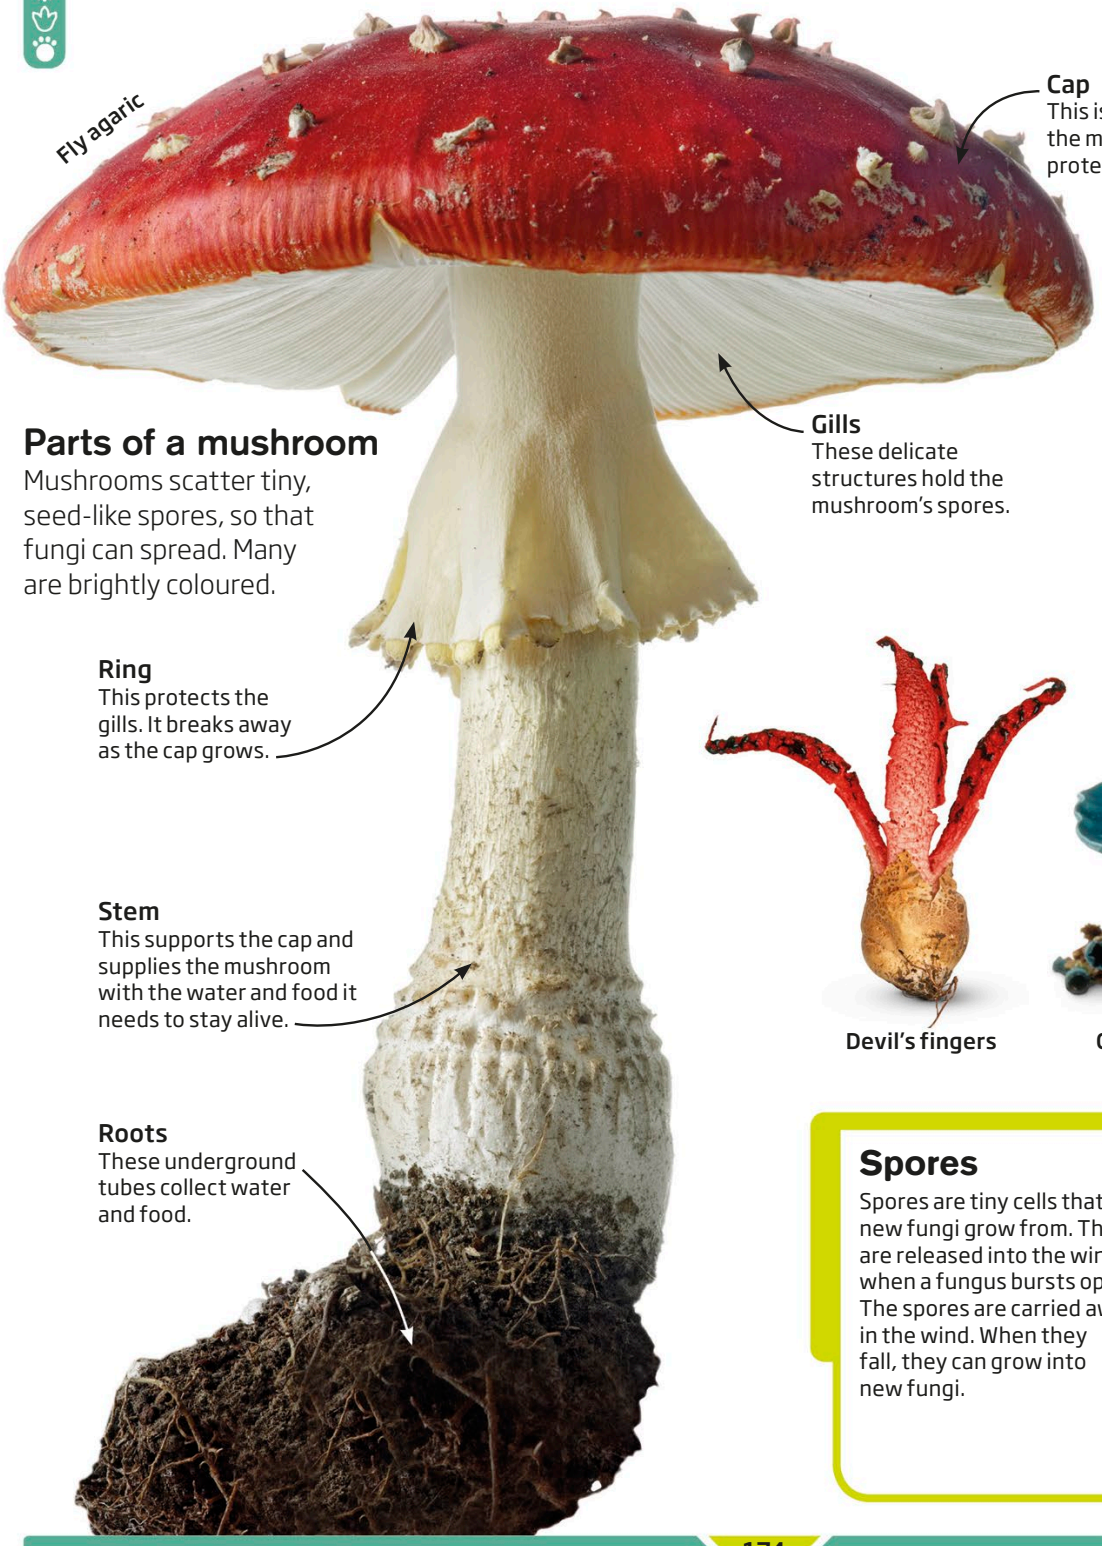
The more we move our muscles, the stronger they get. After exercise, the body repairs any damage to muscle cells by making new muscle fibres. This is why muscles become bigger and stronger the more you use them.

Mushrooms

A mushroom is the fruit of a fungus. Fungi are neither animals nor plants. They feed on living and dead animals and plants. Many fungi are very poisonous – you should not touch or pick them.

SEE ALSO

- Animal groups p.22
- Colour pp.26–27
- Fruit and seeds p.115
- Life cycle p.146
- Plants p.194



Parts of a mushroom

Mushrooms scatter tiny, seed-like spores, so that fungi can spread. Many are brightly coloured.

All parts of the fly agaric mushroom are poisonous. It was used to kill flies in medieval times.

Fungi

There are many different types of fungus. Most of them grow in damp places, such as grassy fields and shady woodlands.

Devil's fingers

Green elfcup

Yellow jelly antler

Spores

Spores are tiny cells that new fungi grow from. They are released into the wind when a fungus bursts open. The spores are carried away in the wind. When they fall, they can grow into new fungi.

Puffball

Musical instruments

An object used to make musical sounds is called a musical instrument. Musical instruments make sounds in different ways – some have strings that vibrate, others a hole to blow into or a surface to beat. We put musical instruments into four groups based on how they make sound.

SEE ALSO

- Dance p.76
- Hearing p.127
- Music pp.176–177
- Orchestra p.188
- Radio p.203
- Sound p.235

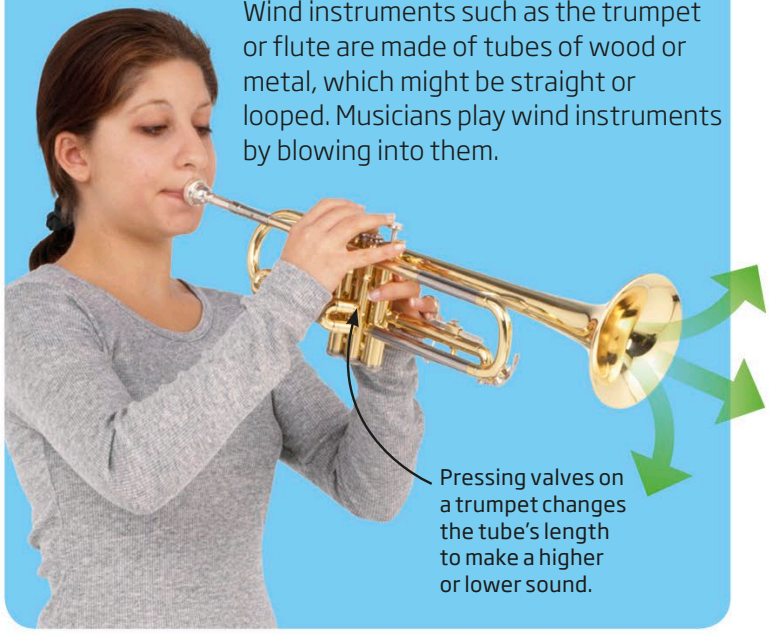
Strings

The sound of stringed instruments comes from their vibrating strings. Players pluck the strings with their fingers or move a bow across them.

Drawing a horsehair bow over the violin's strings makes them vibrate.

Wind

Wind instruments such as the trumpet or flute are made of tubes of wood or metal, which might be straight or looped. Musicians play wind instruments by blowing into them.



Pressing valves on a trumpet changes the tube's length to make a higher or lower sound.

Keyboard

Musicians play instruments such as pianos and synthesizers by pressing keys on a keyboard. Piano keys cause a tiny hammer to hit a string, which produces a particular sound called a note.

A modern grand piano has 88 keys.

Percussion

Percussion instruments such as drums make a sound when they are hit. Some, such as bells and xylophones, can make different notes (sounds). Others, such as rattles, produce a noise when shaken.

Traditional drum heads are made from animal skin.

The **story** of...

Music

Since the earliest times, people have felt the need to make music. We can express our feelings by singing or playing instruments. Musicians organize sound into tunes and regular patterns known as rhythms. A steady rhythm can inspire people to dance.

Musicians rehearsing in Brazil

Playing together

Many people enjoy getting together to make music. Players and singers perform in concerts or just for fun.

The American Symphony Orchestra performs in New York

Classical music

The kind of music performed in concert halls is known as classical music. It is played by orchestras, choirs, or groups of musicians called ensembles. Classical music began hundreds of years ago, but is still written, played, and enjoyed around the world today.

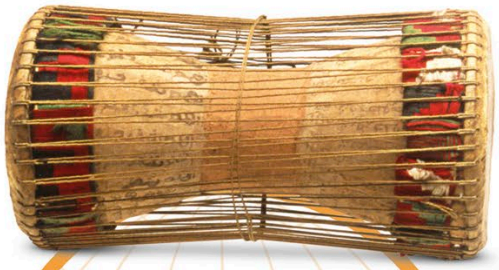
Pop and rock

Most of the music we hear on the radio is rock or pop music. Before pop music, most music was classical or traditional. Pop music introduced electronic instruments, a strong beat, and words that are easy to sing along to. It quickly became popular all over the world.

This part changes the vibrations of the strings into an electrical signal.

Singing

Singing is an important part of music-making all over the world. Singing helps us to express our feelings. A singer can sing alone, or with others as part of a choir.



Kalengo drum from Nigeria

First instruments

The first instruments were probably rattles and drums made of wood or bone. Instruments that make a sound when you blow them appeared over 40,000 years ago.

Bone flute from around 800 BCE

Around the world

There are different types of music and musical instruments all over the world. Singing styles are varied too. African music is often very rhythmic and exciting, while Asian music emphasizes the tune.

Panpipes from South America

Guiro from Central America

The longer the pipe, the lower the sound it makes.

The sound the guitar makes is created by turning these knobs, which tighten or loosen the strings.

Notes can be made by pressing the string on to the fingerboard and plucking the strings further down.

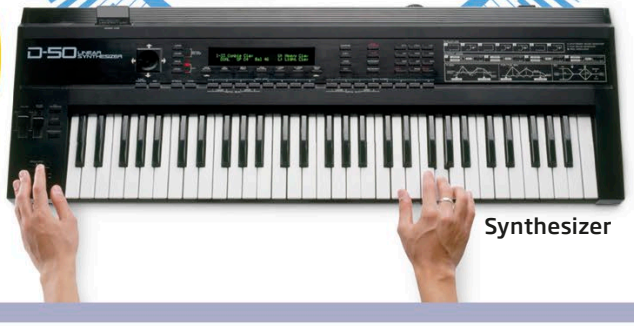
1932

The year the first electric guitar was sold.

Gibson electric guitar

Modern sounds

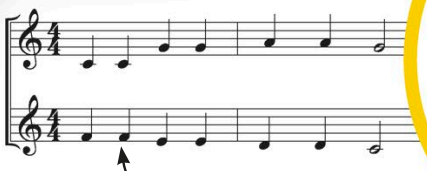
The first musical instruments made sounds when people touched or blew them. Now we also have instruments powered by electricity. Modern synthesizers can copy other instruments and make completely new sounds too.



Synthesizer

Notation

Musicians write music down using a system of symbols called musical notation. The dots on and between the lines tell the performer which notes to play or sing.



This is the music for "Twinkle Twinkle Little Star".

Myths and legends

Myths and legends are stories. In the past, people invented myths to answer big questions, such as where our world came from. Unlike myths, legends are often based on real events, but the details have changed a lot over time, so there is not much truth left!

SEE ALSO

- Ancient Egypt p.17
- Ancient Greece p.18
- Storytelling pp.42-43
- Books p.44
- Writing p.280

Mythical creatures

Myths often include strange creatures, which sometimes have a mix of features from different animals. Mythical creatures can be terrifying monsters, or friendly beasts like the Chinese dragon.

Minotaur
The minotaur is a scary monster with a human body and the head of a bull. He appears in an ancient Greek myth.

Chinese dragon
The Chinese dragon has four legs and a long, snake-like body. In China, dragons are a symbol of good luck.

Griffin
The griffin is part lion and part eagle. In Greek myths, griffins stand guard over treasures.

Legendary heroes

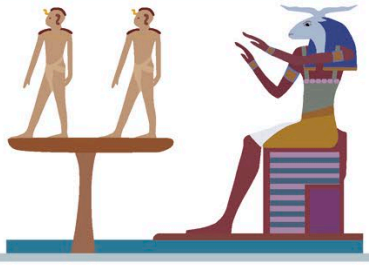
Many myths and legends tell the stories of brave people called heroes. Hua Mulan is the hero of a Chinese legend. She pretends to be a man and takes her elderly father's place as a soldier.

This is a modern statue of Hua Mulan. Her story has been told in many books and films.

"Myth" comes from the Greek word "mythos", which simply means "story".

Creation myth

Many myths are about how the world was created. An Egyptian myth says that the first people in the world were shaped out of clay on a potter's wheel, by a ram-headed god called Khnum.



Native Americans

People first moved from Asia into the Americas more than 25,000 years ago. When Europeans first arrived in the Americas in the late 1400s, there are thought to have been 50 million people already living there in tribes. These people are known as Native Americans.

SEE ALSO

- Art p.28
- Dance p.76
- North America p.184
- Religion p.208
- Homes pp.244–245

The centre of this mask shows the Sun god.

Art and beliefs

Native Americans had many gods and beliefs. Some rituals involved dance, and people often expressed their beliefs through art. For example, the Bella Coola tribe used this carved mask for dance ceremonies.

Cultural areas

There were once hundreds of Native American tribes, each with its own traditions. This map shows the ten Native American cultural areas. The tribes of each area often shared similar customs or ways of life.

KEY

- Plateau
- Northwest
- Arctic
- Subarctic
- Northeast
- Southeast
- Southwest
- Plains
- Great Basin
- California

By the early 16th century, the Native American population had fallen to only 400,000 due to disease brought by the Europeans.

Finding food

Some tribes grew crops such as potatoes, corn, or tomatoes. Other tribes relied on hunting wild animals, such as buffalo, or gathering plants.

Homes

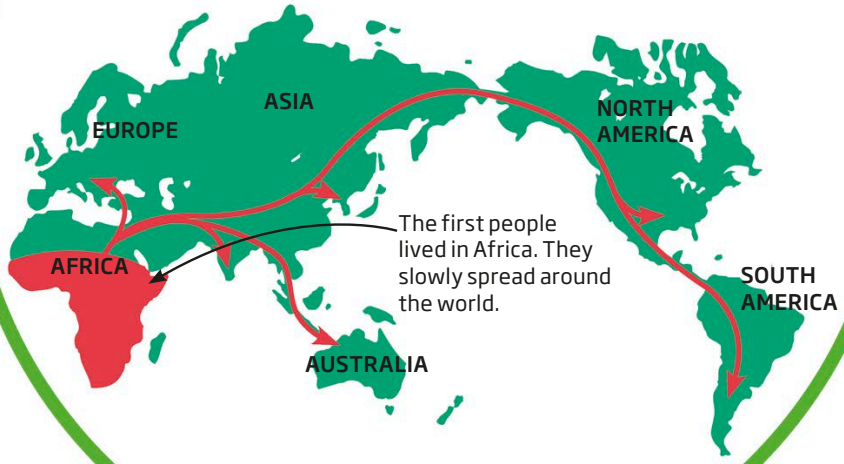
Native Americans lived in different kinds of homes. Northeast farmers had longhouses, which were homes built for several families. Plains hunters used tents called tepees.

Exploration

Humans have explored the land, sea, and sky, and we are starting to explore space. Since our first travels on land, we have made new technology to let us sail and fly. Distant countries can work together because of world exploration. We might even live in space one day!

Leaving Africa

Humans first lived in Africa. They started to leave this continent in large groups between 80,000 and 70,000 years ago. They went by foot to the nearby continent of Asia, and later travelled by boat to Australia.



Trade

In the past, people travelled many kilometres by land and sea to buy things from other countries. Merchants found new routes between distant lands, and bought or traded items such as spices. These goods were then brought home to sell.

Ginger

Cinnamon

Cloves

Vasco da Gama found the first sea route from Europe to India in the 15th century.

This ship carried Christopher Columbus to an island off the coast of America in 1492.

The *Santa Maria*

Reaching the poles

The freezing North and South poles were unexplored until the early 1900s. The first explorers travelled in sleds pulled by dogs and wore fur for warmth.

American explorer Robert Peary, in 1909

Some deep-sea fish live for over **200** years.

A deep-sea hatchet fish

Under the sea

Oceans are many kilometres deep in places. These black depths are largely unexplored. The few crafts that have reached the bottom of ocean trenches have found mysterious new creatures.

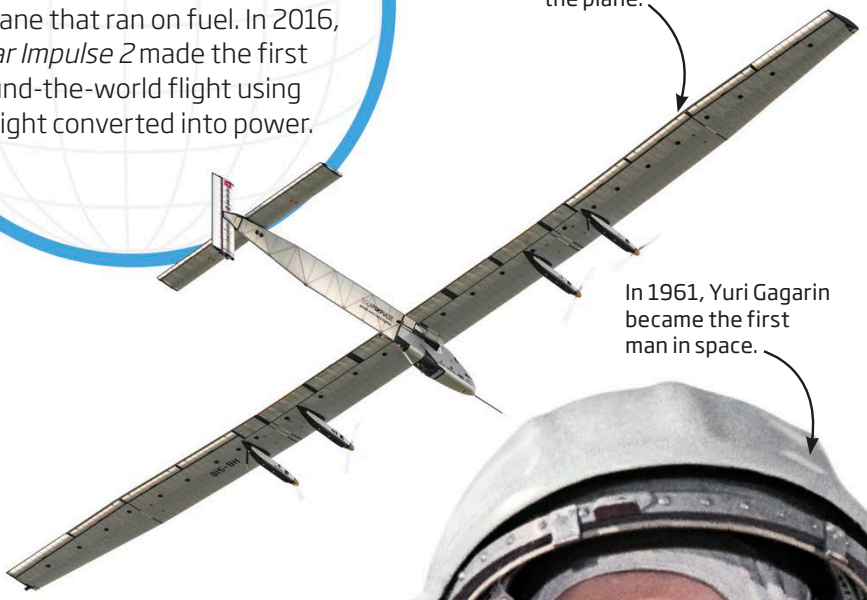
Age of exploration

In the 1400s, Europeans travelled by ship to distant places they had never been to before, including America. These long trips were called expeditions.

Europeans first sailed all the way to Australia in the **17th century**.

Around the world

As technology advances, new opportunities for exploration open up. The first flight around the world was made in 1924 by a plane that ran on fuel. In 2016, *Solar Impulse 2* made the first round-the-world flight using sunlight converted into power.



Space exploration

A Russian spacecraft called *Sputnik 1* first flew around the Earth in 1957. Humans soon made it into space too, and landed on the Moon in 1969. Since then, we've used robots to visit every planet in the Solar System, as well as comets.

Navigation

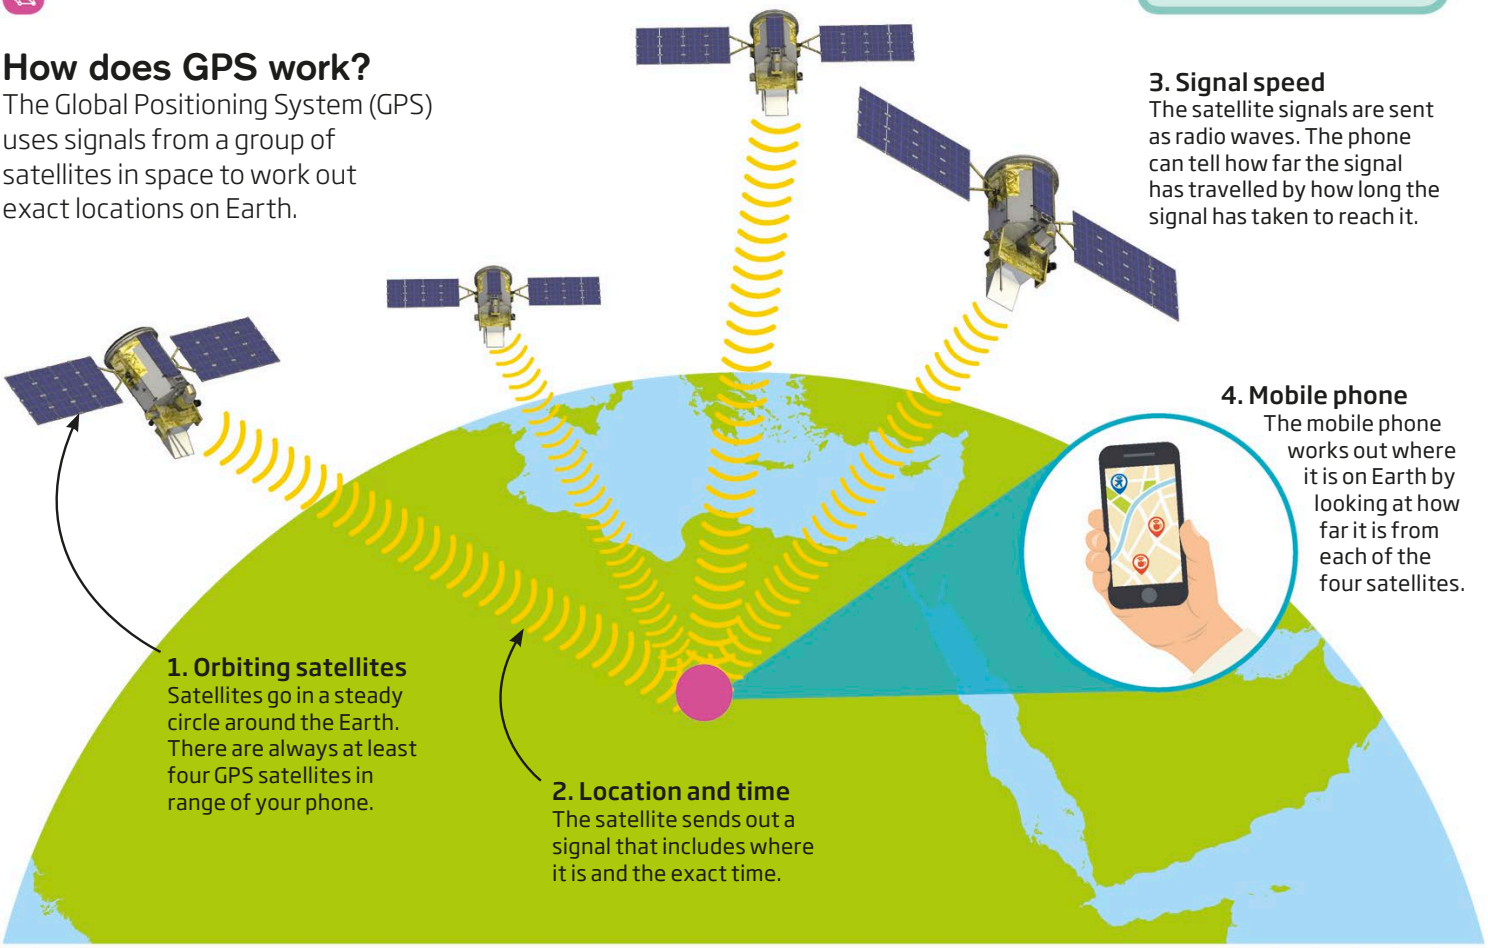
Navigation is finding where you are and where you are going. We can use the Sun, stars, a compass, and paper maps to navigate. Today, most modern transport receives signals from satellites in space to show where it is on Earth. This is called GPS.

SEE ALSO

- Compass p.70
- Constellations p.73
- Light p.147
- Maps p.155
- Radio p.203
- Satellites p.215

How does GPS work?

The Global Positioning System (GPS) uses signals from a group of satellites in space to work out exact locations on Earth.



1. Orbiting satellites
Satellites go in a steady circle around the Earth. There are always at least four GPS satellites in range of your phone.

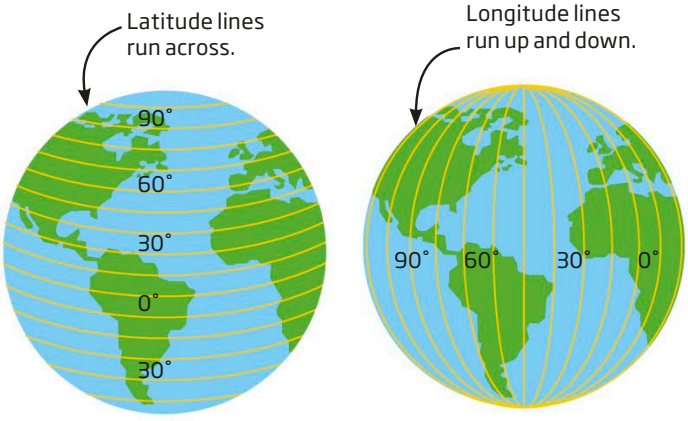
2. Location and time
The satellite sends out a signal that includes where it is and the exact time.

3. Signal speed
The satellite signals are sent as radio waves. The phone can tell how far the signal has travelled by how long the signal has taken to reach it.

4. Mobile phone
The mobile phone works out where it is on Earth by looking at how far it is from each of the four satellites.

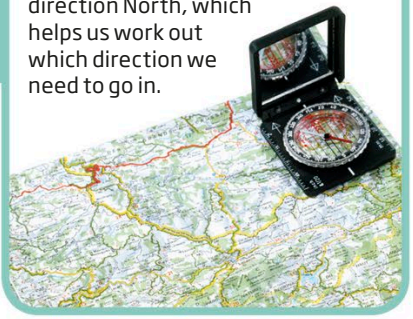
Latitude and longitude

Maps of Earth have grid lines of latitude and longitude to show where places are. Every place has a unique latitude and longitude number in degrees.



Map and compass

Without GPS, we can still navigate using a paper map and a compass. The compass shows the direction North, which helps us work out which direction we need to go in.



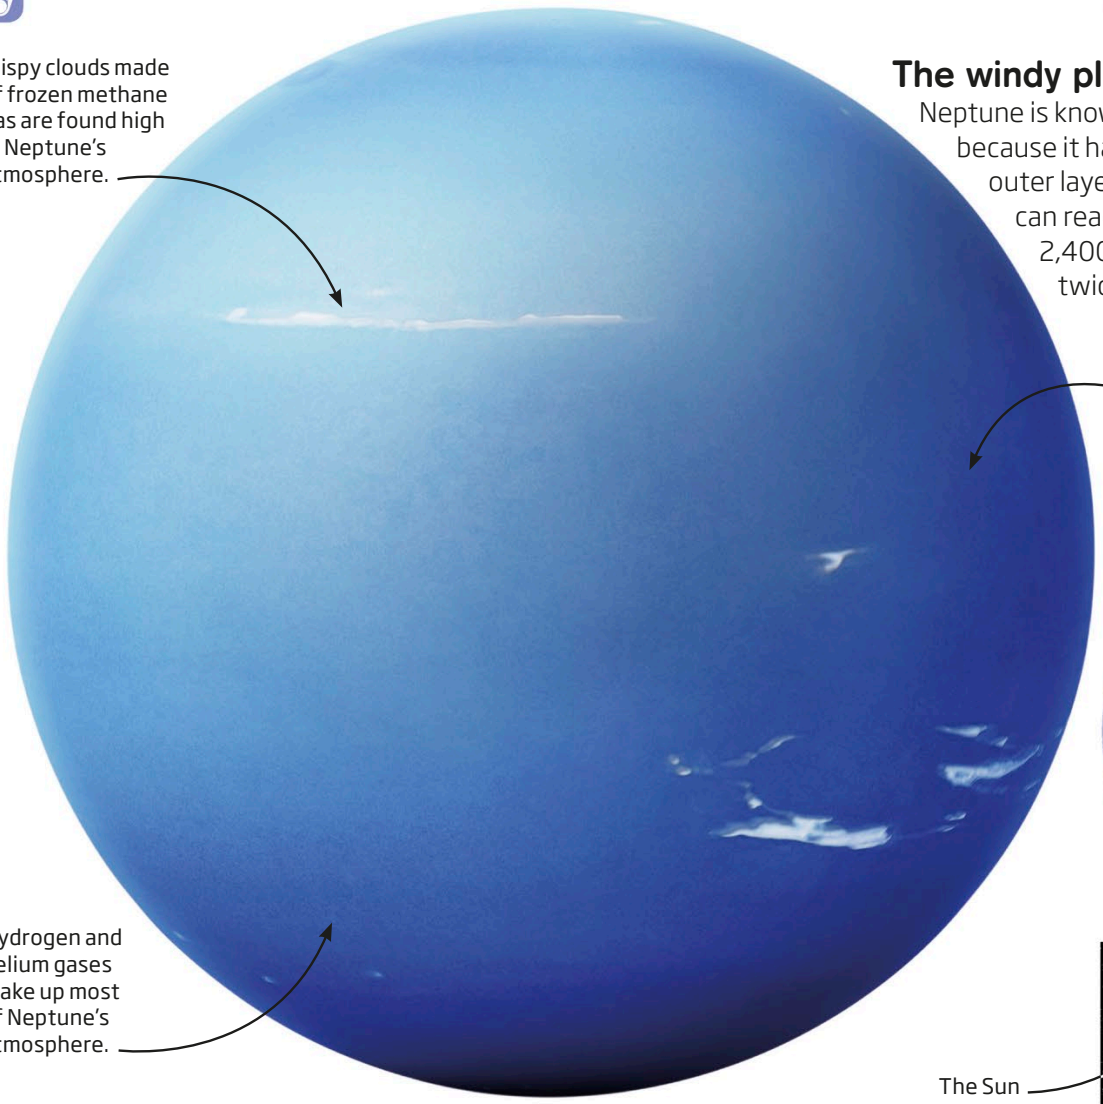
Neptune

Neptune lies in the freezing cold, dark outer parts of the Solar System. It is the eighth planet and the furthest planet from the Sun. Neptune is often called the "twin planet" of Uranus because it is made up of similar ices and gases. It is four times larger than Earth.

SEE ALSO

- Atmosphere p.33
- Gases p.117
- Liquids p.148
- Pluto p.196
- Solar System p.233
- Uranus p.264

Wispy clouds made of frozen methane gas are found high in Neptune's atmosphere.



Neptune gets its blue colour from methane gas in the upper atmosphere.

Hydrogen and helium gases make up most of Neptune's atmosphere.

The windy planet

Neptune is known as "the windy planet" because it has powerful winds in the outer layers of its atmosphere. Winds can reach speeds of more than 2,400 kph (1,500 mph), about twice the speed of sound.

Scientists think that Neptune's largest moon Triton is an icy minor planet that got caught by Neptune's gravity.

The Sun

God of the sea

Neptune was named after the Roman god of the sea, who is usually pictured carrying a three-pronged spear called a trident. The planets Mercury, Venus, Mars, Jupiter, and Saturn are also named after Roman gods.

Beyond Neptune

There are thought to be several thousand icy "minor planets" that orbit the Sun beyond Neptune. The first, and largest, minor planet that was discovered is Pluto.

North America

North America stretches from the icy Arctic in the north to tropical Central America in the south. Huge areas of grassland, called prairies, cover much of North America. There are also mountains, forests, deserts, and some of the world's biggest lakes.

About North America

Population: 579 million

Highest point: Denali

Lowest point: Badwater Basin

Biggest desert: Great Basin Desert

Longest river: Missouri

The United States is home to the remains of more types of dinosaur than any other country.

Statue of Liberty

This statue towers 93 m (305 ft) over New York Harbor. Completed in 1886, it was a gift from the people of France to the people of the USA.

Mississippi River

The Mississippi is a huge river in North America. Ships use it for transporting goods, and tourists ride on its riverboats called paddle steamers.

Numbers

Numbers are symbols that can be used to show amounts, sizes, distances, and times. The ordinary numbers we count with are called "whole numbers" or "natural numbers". All maths requires us to use numbers.

SEE ALSO

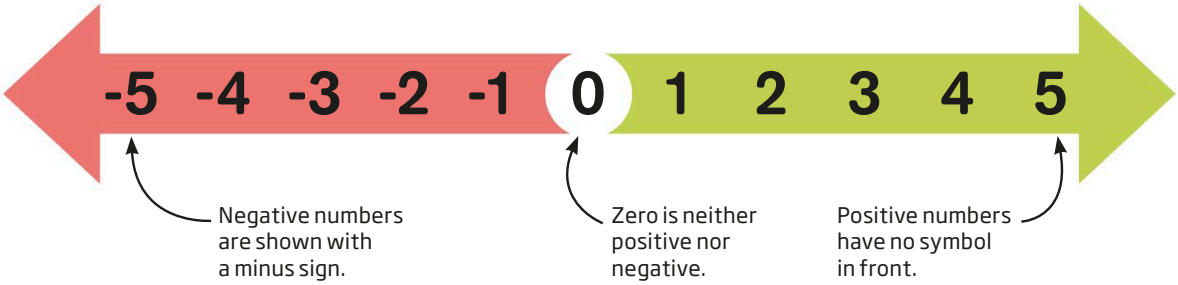
- Clocks p.61
- Coding p.65
- Codes pp.66-67
- Fractions p.112
- Measuring p.159
- Temperature p.252

Whole numbers

The numbers 0 to 9 are used to build all the bigger numbers. They are called whole numbers because they are not split into smaller amounts.

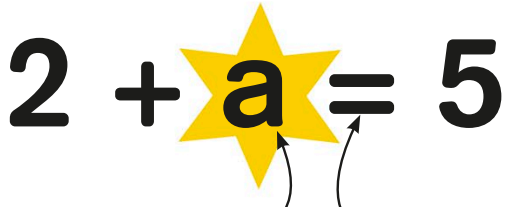
Negative numbers

Numbers less than zero are called "negative" numbers. They are used to show things less than zero, such as cold temperatures.



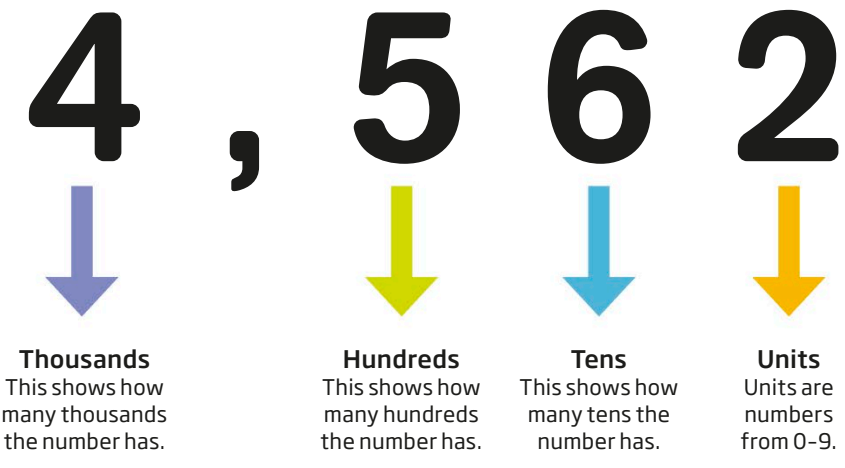
Algebra

Algebra is a type of maths that uses letters to stand for numbers or amounts. We can use algebra to work out the value of unknown amounts.



Place value

The place where a number is written in a longer number shows how much it is worth. The lowest worth, the unit, is on the right.



Oceania

Oceania is a continent made up of Australia, New Zealand, Papua New Guinea, Fiji, and other islands in the tropical Pacific Ocean. It is home to some of the world's most unusual wildlife, including kangaroos, koalas, duck-billed platypuses, and kiwis.

SEE ALSO

About Oceania

Population: 40.3 million

Highest point: Mount Wilhelm

Lowest point: Lake Eyre

Biggest desert: Great Victoria Desert

Longest river: Murray

Uluru

This giant sandstone rock feature towers over the landscape of central Australia. Uluru is a special place for the aboriginal people who have lived in Australia for thousands of years.

The kiwi uses its strong legs for running and fighting.

Kiwis

The kiwi is a flightless bird that lives in New Zealand. It is about the same size as a chicken, but its egg is six times the size of a chicken's egg.

Oceans and seas

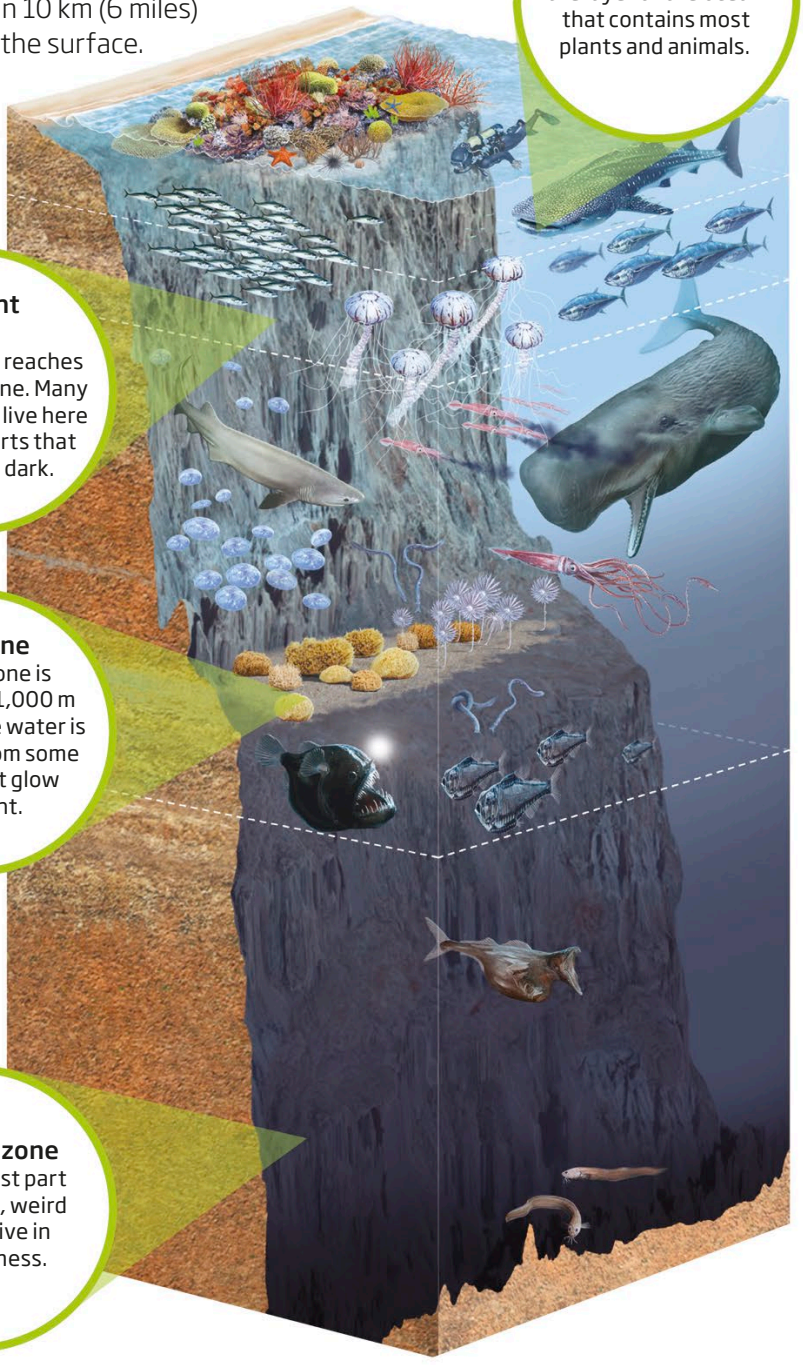
More than two-thirds of our planet is covered by oceans and smaller seas. They contain most of the world's water and are full of life of all shapes and sizes. Some of the deepest parts of the ocean have still not been explored.

SEE ALSO

- Coral reefs p.74
- Water pp.120–121
- Exploration pp.180–181
- Seashore p.220
- Tides p.254

Ocean depths

Oceans are divided into different zones according to depth. The deepest part is more than 10 km (6 miles) beneath the surface.



Sunlit zone
This zone receives lots of sunlight and is the layer of the ocean that contains most plants and animals.

Twilight zone
Little sunlight reaches the twilight zone. Many creatures that live here have body parts that glow in the dark.

Dark zone
The dark zone is deeper than 1,000 m (3,300 ft). The water is dark apart from some animals that glow with light.

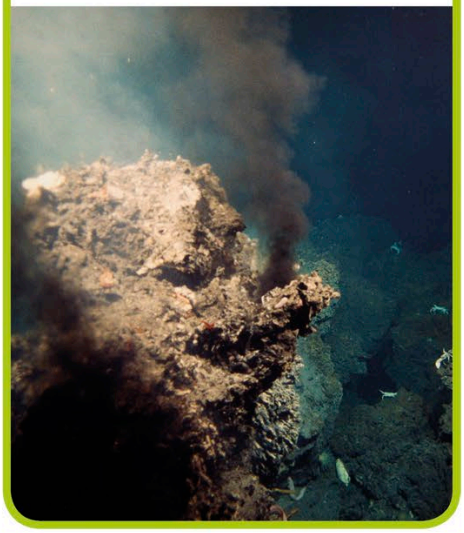
Deep-sea zone
In the deepest part of the ocean, weird creatures live in total darkness.

The world's oceans

The Earth has five oceans. The largest is the Pacific, which holds half of the world's salt water. The smallest is the Arctic Ocean, which is partly frozen.

Ocean smokers

In places, hot water bursts from the seabed, creating chimney-like structures known as smokers. The water that comes out from the smokers can be white or black, depending on what minerals the water around them contains.



Orchestra

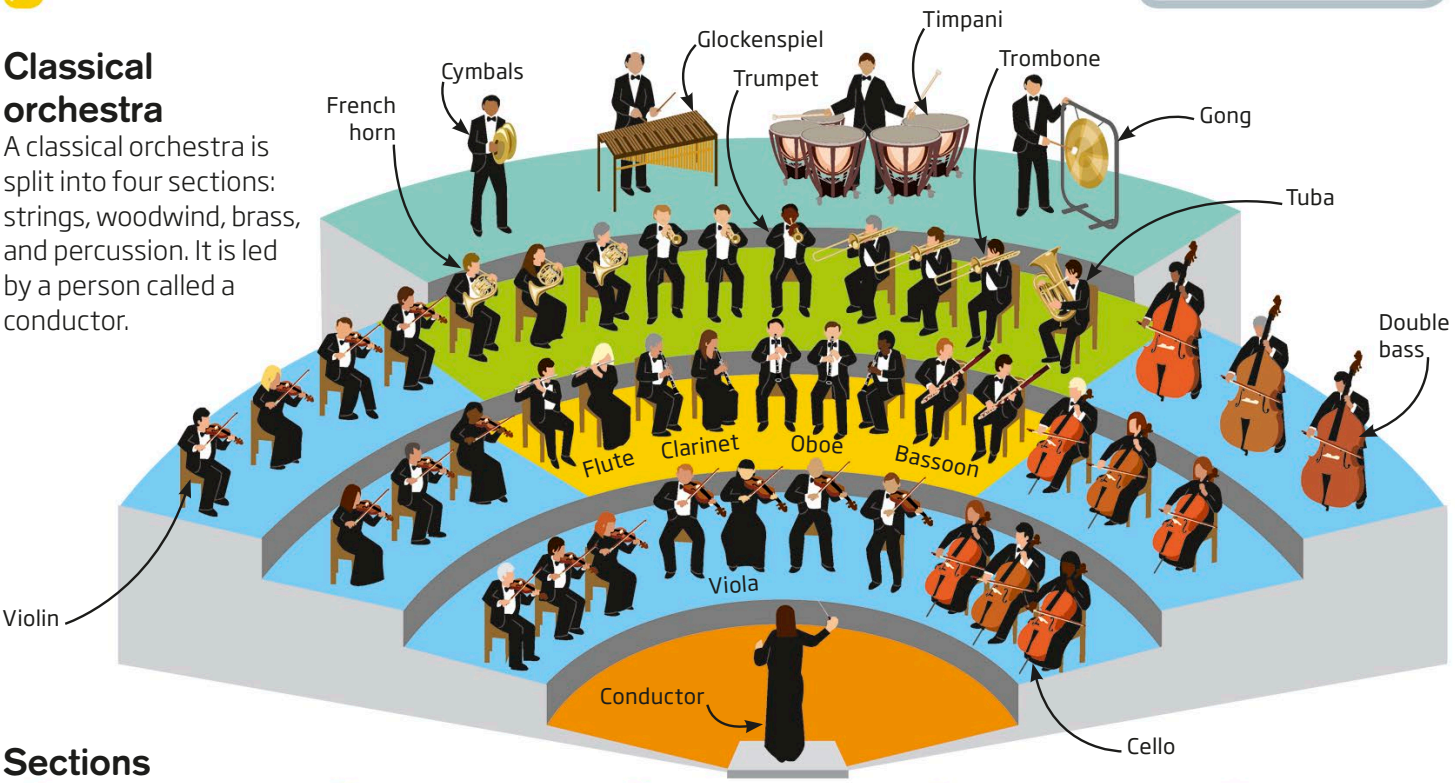
An orchestra is a large group of people playing different musical instruments together. Orchestras were created to play classical music, such as complicated pieces called symphonies. Orchestras often create music for films, and sometimes play non-classical pieces, such as pop music.

SEE ALSO

- Dance p.76
- Film p.100
- Musical instruments p.175
- Music pp.176–177
- Radio p.203
- Sound p.235

Classical orchestra

A classical orchestra is split into four sections: strings, woodwind, brass, and percussion. It is led by a person called a conductor.



Sections

Strings

Every classical orchestra has stringed instruments. These are usually two groups of violins, as well as violas, cellos, and double basses.

Woodwind

Many classical orchestras include instruments of the woodwind family, such as flutes and bassoons. They usually sit behind the strings.

Conductor

Using hand gestures and a stick called a baton, the conductor makes sure the musicians play together at the right time and speed.

Brass

Full orchestras include a brass section, which is usually behind the woodwind. Trumpets, trombones, French horns, and tubas are brass instruments.

Percussion

There are many percussion instruments. Percussion usually seen in a classical orchestra includes the timpani, bass and side drums, and cymbals.

Playing together

There are different types of orchestra around the world. They often use very different instruments to the classical orchestra, and might have fewer people playing.

The gamelan

In Java and Bali, people play percussion instruments, such as xylophones, in an orchestra called a gamelan.

Chinese orchestra

A Chinese orchestra uses traditional Chinese instruments. There are woodwind, percussion, and stringed sections.

Philosophy

Philosophy is a way of trying to understand things by asking questions and thinking of answers. It was first studied thousands of years ago, when people wanted to find out about the world and their own lives. People who try to find answers to these questions are known as philosophers.

SEE ALSO

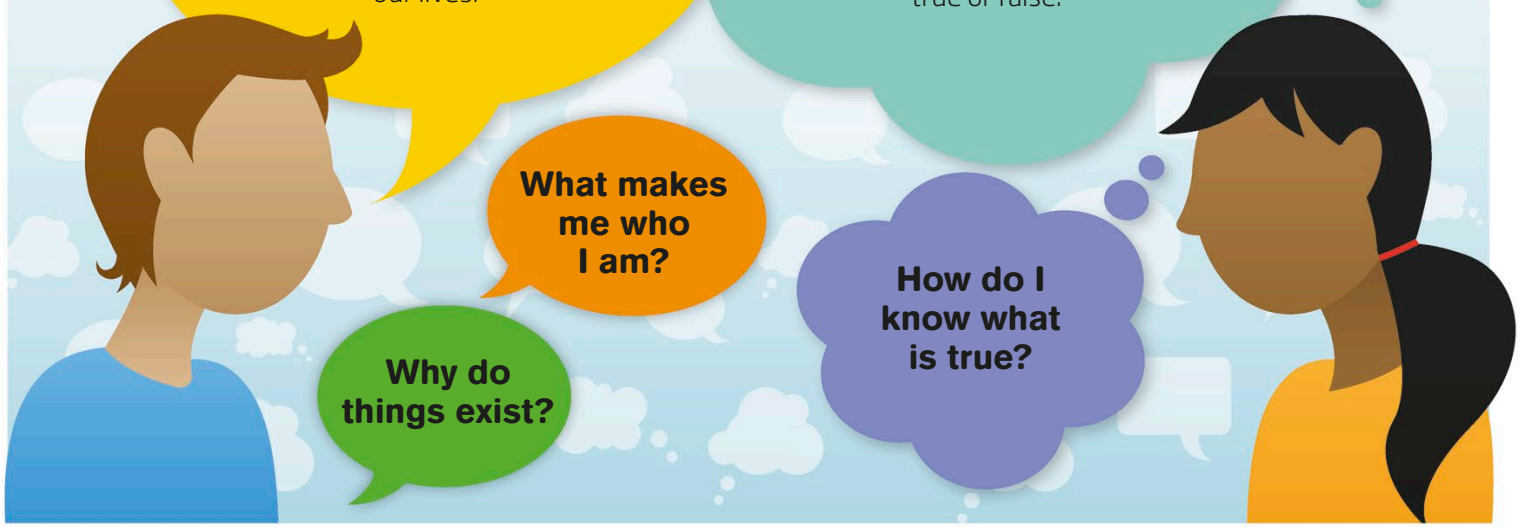
- Ancient China p.16
- Ancient Greece p.18
- Governments p.123
- Religion p.208
- Science p.217

Asking questions

To find out about the world, philosophers ask all sorts of questions. They ask about things such as what is real around us, and what is the best way to live our lives.

Thinking of answers

Philosophers try to come up with answers to these questions. By thinking hard about their answers, they can decide whether they are true or false.



Right and wrong

An important part of philosophy is deciding what makes something right or wrong. For example, we all know that stealing is bad. Philosophers ask why it is bad.

Equality

Men and women are often treated differently. For example, men are generally paid more. Philosophers try to explain how everybody should be treated equally (the same).

First philosophers

Western philosophy began in ancient Greece. The Greek city of Athens was home to many of the most important early philosophers, such as Socrates, Plato, and Aristotle.

Statue of Plato

Photography

A photograph is a still image taken using a machine called a camera. Photographs give us a visual record of who we are and what we have done. These images can capture important people and events in history, or private moments in your own life.

SEE ALSO

- Art p.28
- Computers p.71
- Film p.100
- Inventions pp.136–137
- Telephones p.250
- Television p.251

Cameras

The first photographic cameras were invented in France in the 1800s, but were large and hard to use. Cameras are now small enough to fit inside mobile phones.

Early cameras
The first cameras took pictures on metal sheets that had been made sensitive to light. It took many minutes to take a photo.

Daguerreotype cameras were the first cameras to go on sale to the public in 1839.

These cameras can connect to computers to transfer images.

Digital camera
Modern digital cameras produce images made up of millions of tiny points of colour that are displayed on screens.

The film is rolled up inside the camera.

Film camera
Later cameras use strips of light-sensitive plastic film. When the film is exposed to light, a picture forms.

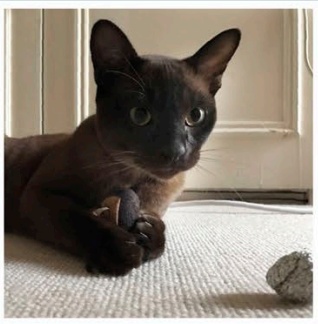
Camera phone
Many people now take photographs using tiny digital cameras built into their mobile phones. These photos can also be transferred to and viewed on computers.

The first photograph was taken in 1816 by French inventor Nicéphore Niépce.

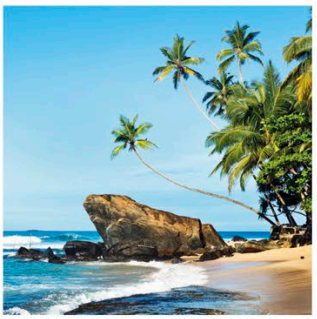
Taking pictures

Photographs fall under different categories called genres. Photos of yourself are called selfies, and other genres include animals and travel.

Selfie



Pet portrait



Holiday snap

Photosynthesis

Plants make their own food. They do this by taking in the Sun's light energy, as well as water from the ground and gas from the air. Producing energy in this way is called photosynthesis.

SEE ALSO

- Carbon cycle p.49
- Cells p.56
- Gases p.117
- Light p.147
- Plants p.194
- Temperature p.252

How do plants make food?

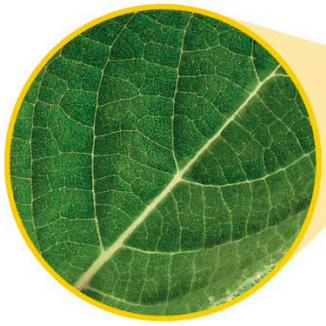
The plant combines carbon dioxide with water to make sugar. The energy it needs to do this is supplied by the Sun's light.

Sunlight
Plants need energy from sunlight to complete photosynthesis. They grow towards the light.

Carbon dioxide
Holes in the plant's leaves take in a gas called carbon dioxide.

Oxygen
Oxygen is given out as waste when carbon dioxide, water, and light react together in the plant.

The **oxygen** that plants give out is the same gas that **humans and animals** need to breathe in.



Leaves
A chemical in the leaves called chlorophyll absorbs light energy from the Sun. Chlorophyll makes plants look green.

The stem is strong to support the plant and move it towards light.

Water
The plant needs water to survive. Water travels up the stem into the plant.

Roots
The plant roots take in water and minerals from the soil.

Conditions

Temperature, light, and water need to be just right for a plant to survive. If these conditions change too much and don't suit the plant it will start to die.

Physics

Everything in the Universe that weighs something is called "matter". Physics is a science that looks at how matter moves and interacts. This includes energy, forces, magnets, light, heat, waves, and sound.

SEE ALSO

- Circuits p.59
- Electricity p.87
- Energy pp.88–89
- Forces p.108
- Magnets p.151
- The sciences pp.218–219

Physics around us

Discoveries from physics are used in everyday life. This is called applied physics.

Understanding weather
Physics lets us predict weather, by studying how patterns of heat and cold create wind.

Weather balloons collect weather information

Medical equipment
Scanners, heart monitors, and X-ray machines were all invented by people using physics.

Heart-rate monitor

Computers
Tiny wires connect parts inside machines and computers so that they can carry out tasks.

Circuit board from inside a computer

Nuclear physics
Atoms are the tiny particles that everything is made from. Splitting them releases energy we can use.

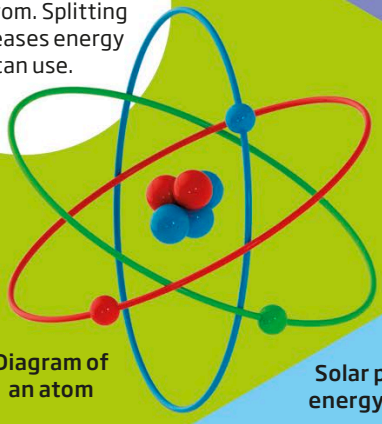


Diagram of an atom

Solar panels collect energy from the Sun

Electricity
We can make electricity by burning fuel or using heat, sunlight, wind, or water.

Fairground ride

Mechanics
Studying pushes, pulls, and movement lets us design machines, including fairground rides.

Pirates

Pirates were criminals who attacked ships to steal goods, using force and violence to get their way. They are often now remembered as jolly villains who buried treasure and relaxed on tropical islands, but the reality was not so pleasant.

SEE ALSO

- Clothing pp. 62-63
- Explorers p.96
- Flags p.102
- Maps p.155
- Oceans and seas p.187
- Ships p.224

Pirate flag

Pirates put symbols of death on their flags to frighten people. These symbols included skulls, bones, and skeletons. This flag was flown by famous pirate Jeremiah Cocklyn.

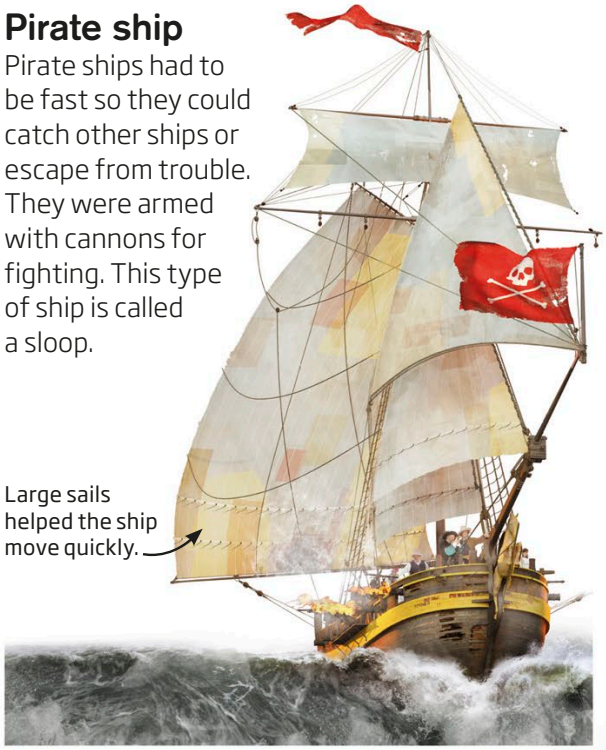
Pirate life

Pirates could be at sea for weeks at a time. To keep from getting irritable, which could lead to fights among crew, they passed the time with music, games, food, and drink.

The years between 1690 and 1725 are known as the golden age of piracy.

Pirate ship

Pirate ships had to be fast so they could catch other ships or escape from trouble. They were armed with cannons for fighting. This type of ship is called a sloop.



Blackbeard

The most famous pirate of all was nicknamed Blackbeard. He attacked ships on the American coast until he was finally killed in a battle with the British Navy in 1718.

Plants

Plants are living things that make their own food using energy from the Sun. Most plants stay in one place, with roots that fix them in the ground.

SEE ALSO

- Flowers p.103
- Food p.106
- Fruit and seeds p.115
- Insects p.134
- Photosynthesis p.191
- Trees p.261

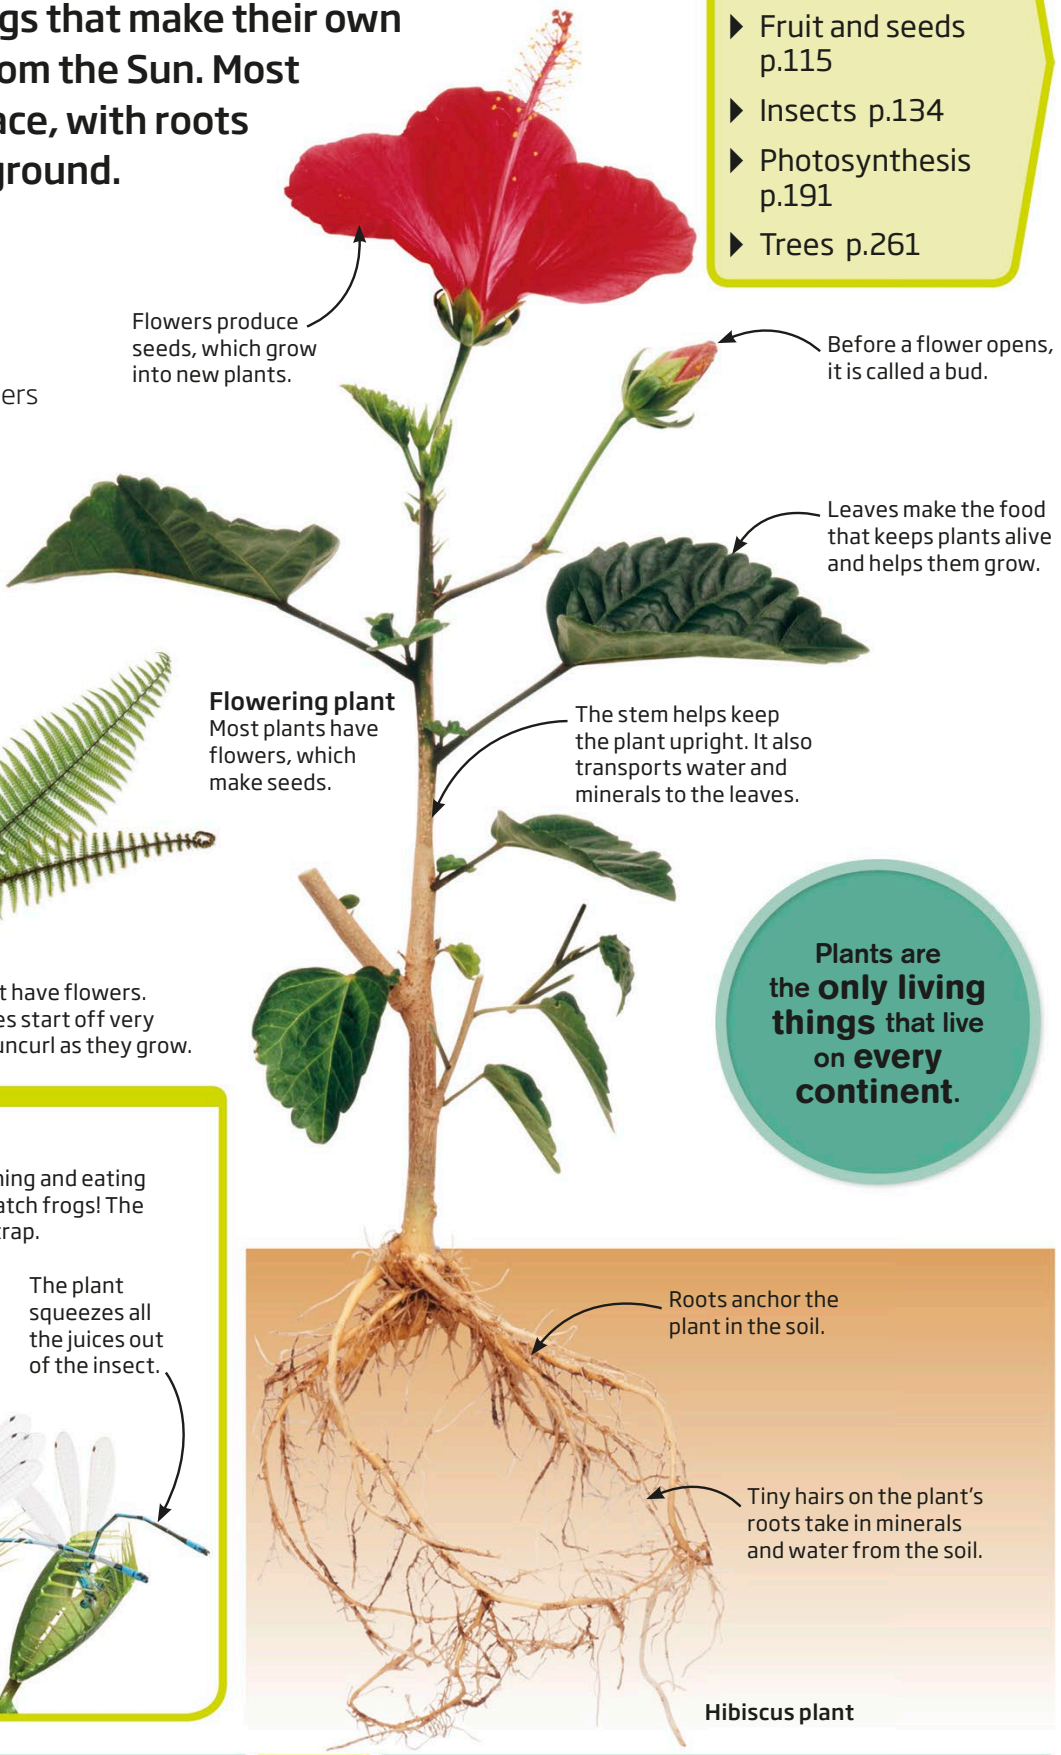
Types of plant

There are four main groups of plant. Some have flowers, like hibiscus. Others don't, such as conifers and mosses.

Conifer
Plants that have seeds in cones are called conifers. They are mainly trees.

Moss
These leafy plants grow where it is damp and dark.

Fern
Ferns don't have flowers. Their leaves start off very small and uncurl as they grow.

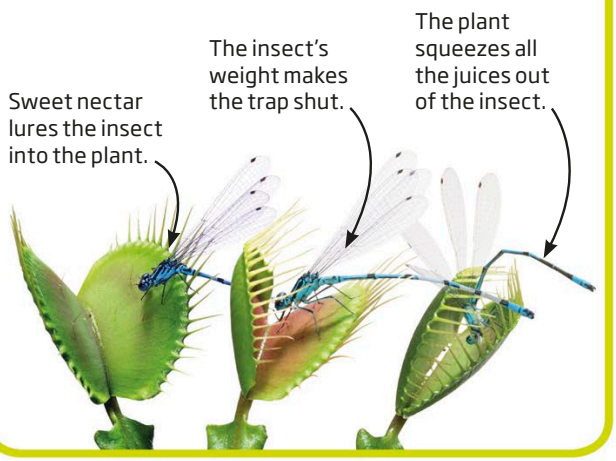


Hibiscus plant

Plants are the only living things that live on every continent.

Meat-eating plants

Some plants get extra energy by catching and eating animals, such as insects. Some even catch frogs! The plant shown here is called a Venus flytrap.



Plastic

Plastic is a useful material that we make, but it can also be found naturally. It can be coloured and moulded into shapes without breaking. It is waterproof, so it can be used for packaging and to carry liquid. It's also strong enough to make rope.

SEE ALSO

- Atoms p.34
- Carbon cycle p.49
- Electricity p.87
- Gases p.117
- Liquids p.148
- Materials p.157
- Recycling p.205

Plastic everywhere

We use plastic to make many everyday objects, including toys, glue, cars, bags, computers, tents, and clothes like fleeces and waterproofs. For most items, the plastic is heated to become liquid, then poured into moulds to set.

25

plastic bottles can be recycled to make one polyester fleece.

Making plastic

Natural plastic is found in plants, trees, insects, animal horns, and milk. Artificial plastic is made from oil, coal, and natural gas found underground. All plastic contains an element called carbon.

Plastic pellets

Useful plastic

Plastic is a useful material because of how it behaves. For example, it doesn't let electricity through, and is strong and long-lasting.

Electric cable

Insulation

Plastic is an insulator, which means electricity and heat can't flow through it. It keeps electricity inside cables.

Laboratory containers

Hard to break

Plastic containers are harder to break than glass or pottery ones. They are also easier to make and safer to use.

Plastic bags

Long-lasting

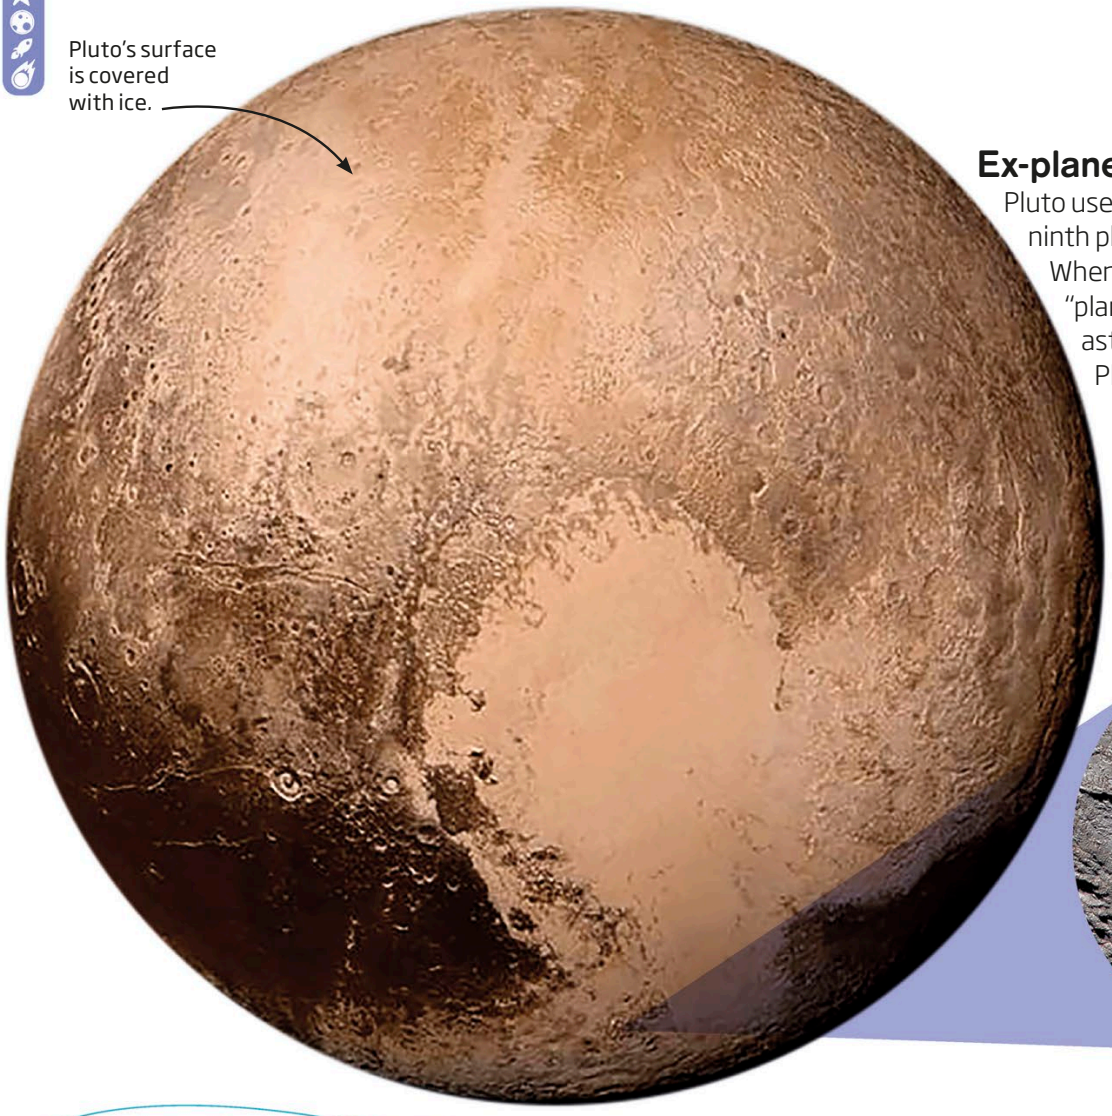
Plastic lasts a long time. It can build up in the environment, so we turn it into new plastic by recycling it.

Pluto

Pluto is a dwarf planet that travels around the Sun at the edge of our Solar System, beyond Neptune. It has one giant moon called Charon, and four small moons.

SEE ALSO

- Earth's surface p.84
- Glaciers p.122
- Moon p.171
- Neptune p.183
- Solar System p.233
- Volcanoes p.268

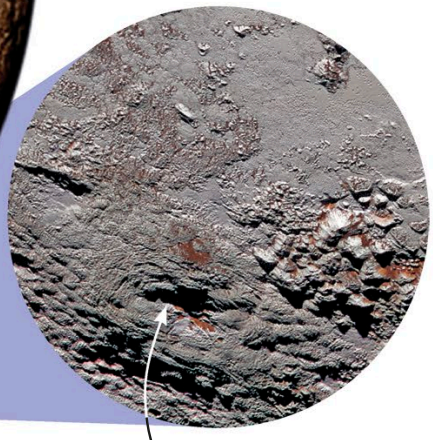


Ex-planet

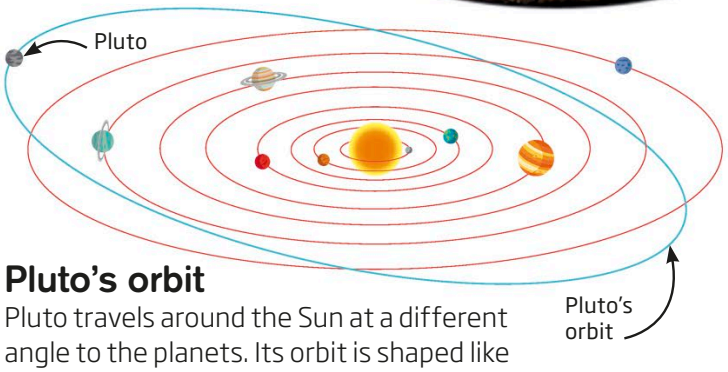
Pluto used to be considered the ninth planet in our Solar System. When other similar small "planets" were discovered, astronomers downgraded Pluto to a dwarf planet.

Ice volcanoes

Pluto may have cryovolcanoes –volcanoes that erupt an icy slush of water and gases.



A feature known as Wright Mons is thought to be a cryovolcano.



Pluto's orbit

Pluto travels around the Sun at a different angle to the planets. Its orbit is shaped like an elongated circle. It takes Pluto 248 Earth years to circle the Sun.

Dwarf planets

Dwarf planets are similar to planets but smaller, which means they share their path around the Sun with other objects, such as asteroids and comets.

Polar habitats

Polar habitats are snow or ice-covered areas found in the coldest places on Earth – the Arctic in the north and Antarctic in the south. There are no trees and only very few plants. Animals have to survive in freezing temperatures.

SEE ALSO

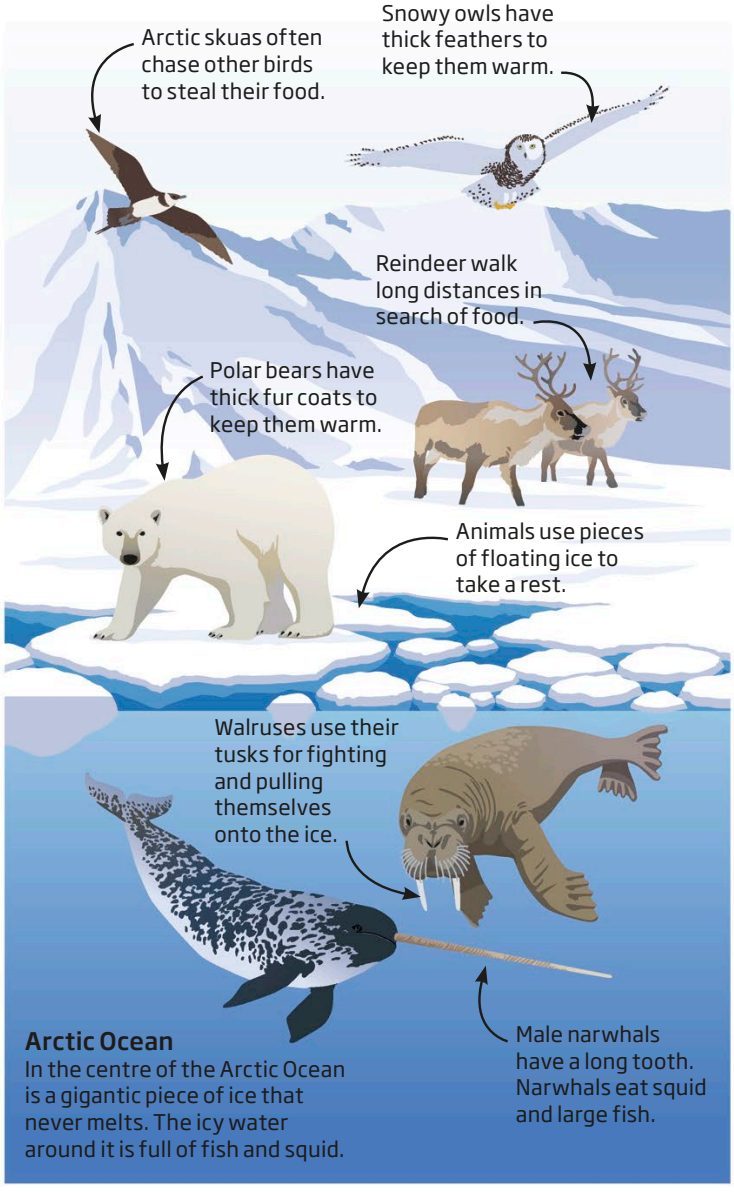
- Animal groups p.22
- Antarctica p.24
- Arctic p.25
- Earth p.83
- Habitats p.126
- Oceans and seas p.187

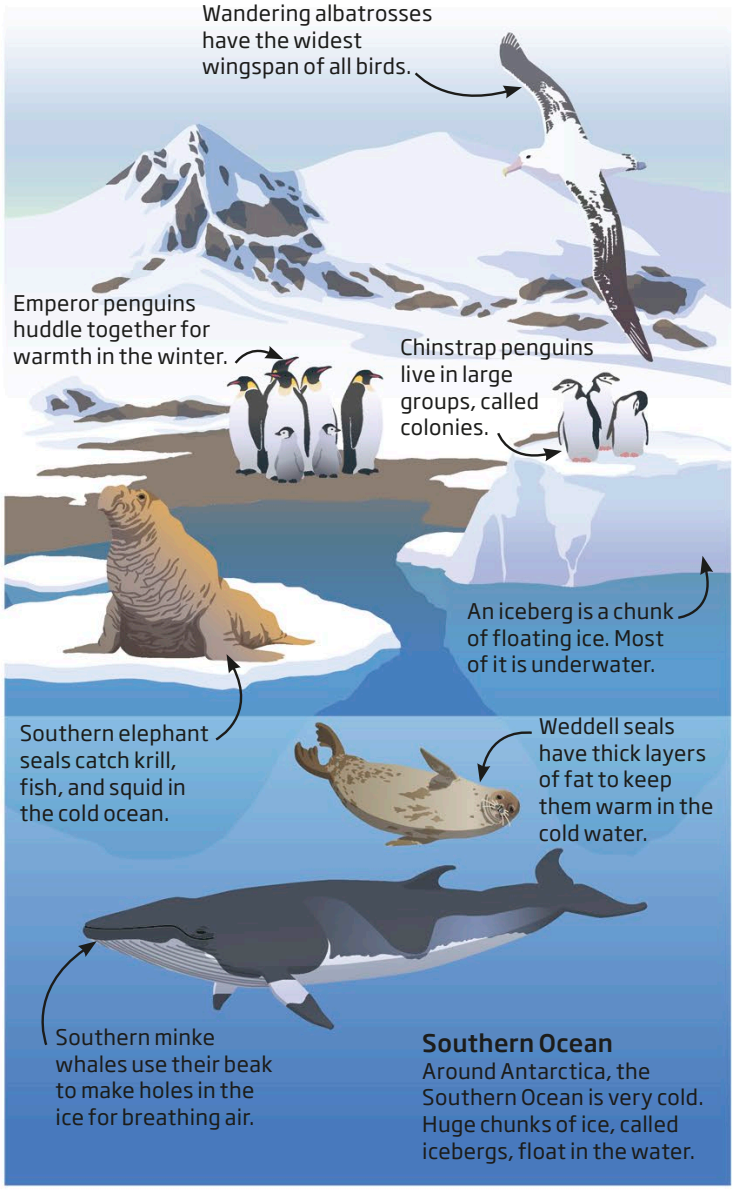
Arctic

Around the North Pole at the top of the world is the frozen Arctic Ocean. The Arctic also includes the northern tips of Canada, Russia, Greenland, and Norway.

Antarctic

Around the South Pole at the bottom of the world is the large landmass, or continent, of Antarctica. The Antarctic is the coldest and windiest place on Earth. It has no large land animals.





Pollution

Pollution happens when dirty or harmful substances are released into the world around us. Pollution kills wildlife, causes health problems for humans, spoils the countryside, and makes the world around us dirty. It is even making our planet warmer.

SEE ALSO

- Cars p.52
- Climate change p.60
- Factories p.97
- Farming p.98
- Industrial Revolution p.133
- Recycling p.205

Air pollution
Cars, lorries, factories, and power stations pump out gases into the air. These can cause illness, poison rivers and oceans, and heat up our world.

Land pollution
Poisons from rubbish dumps seep into the ground and then into rivers. Chemicals used in farming kill insects, such as bees, and can make people ill.

Water pollution
Plastic rubbish is washed into the sea and swallowed by sea life. Harmful waste from factories and sewage from homes pollute rivers and sea water.

Rubbish at sea

When waste plastic is dumped in the sea, it is carried away by currents into gigantic, floating rubbish patches. The biggest patch is in the North Pacific Ocean. It is called the Great Pacific garbage patch and is bigger than the USA.

Precious metals

Precious metals are rare and worth a lot of money. They are found in the ground as pure metal or combined with other elements in rocks. Silver and gold are the best known and have been treasured for thousands of years. Other precious metals include platinum and beryllium.

SEE ALSO

- Aircraft p.13
- Elements p.90
- Metals p.162
- Money p.169
- Gold pp.200–201
- Rocks and minerals p.214

Gold

Pure gold is a very soft metal. To make it harder – so that we can make useful objects out of it – we combine gold with small amounts of other metals.

A mobile phone contains just a tiny amount of gold – about 0.025 g (0.001 oz).

Gold earrings

This ancient Egyptian burial mask is covered in gold foil.

The most valuable coins have always been made of gold.

Catalytic converters in cars contain platinum. It makes exhaust fumes less poisonous.

Platinum

Just a few hundred tonnes of platinum are produced each year. Because it is so rare, it is used in very small amounts.

Platinum is used in pacemakers. These devices can keep a person's heart beating.

Watch

Pieces of jewellery are often made from platinum.

Platinum bar

Mirror

DVD

Silver

This precious metal, along with gold and mercury, has been used by humans since prehistoric times.

The highest quality flutes are made of solid silver.

Cutlery

Silver is used in many of today's batteries.

Beryllium

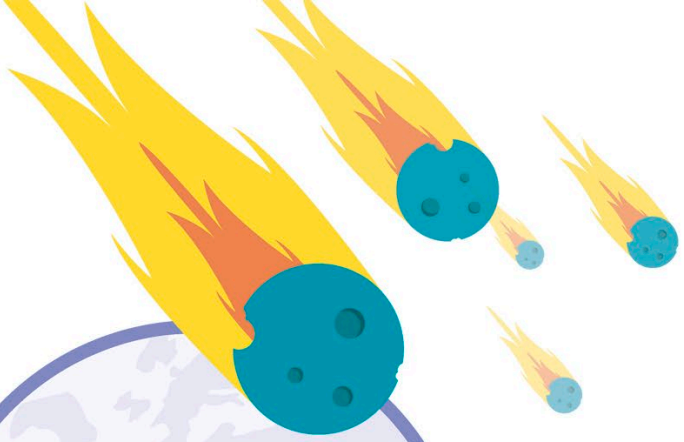
Beryllium is a steel-grey precious metal. It is a vital component of computers, cars, aircraft, phones, medical equipment, and many other hi-tech gadgets.

Fighter aircraft

The **story** of...

Gold

Gold is a precious metal that has been used to make jewellery and decorations since ancient times. It is rare and very expensive. But that's just the start of its story. Gold has a glittering history and is still popular all over the world.



Meteor shower

When Earth first formed, gold and other metals sank deep into the core. Other gold, found near the surface of our planet, arrived later from space. Asteroids rained down in a powerful storm, bringing gold with them.

This gold mask is thought to show the Greek hero Agamemnon.

Digging for gold

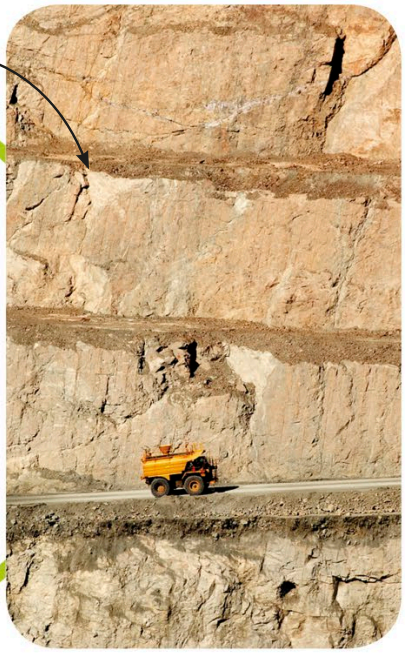
In the past, a single nugget could change the life of a gold-digger. When gold was found in the USA in the 1800s, it started a "gold rush". Thousands of people, known as prospectors, travelled to the USA hoping to find gold and become rich.

Gold nugget

25

per cent of all the world's gold is stored in a New York City vault.

Large gold mines have created huge holes deep into the ground.



Gold mine

Pieces of gold found loose on Earth's surface can be picked up by hand. Bigger quantities deep underground must be dug out in a process called mining. Modern mines use heavy machines to dig away chunks of rock that contain traces of gold.

Centuries of sparkle

Gold was the first metal to be discovered and used by humans. It is beautiful and shiny, as well as soft and bendy. This makes it ideal for shaping into jewellery, including delicate rings, bracelets, and necklaces.

The world's **oldest coins** were made from electrum – a mixture of gold and silver.

Golden money

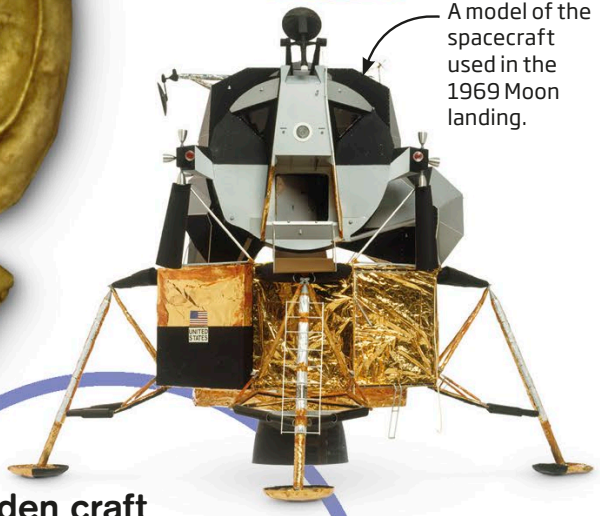
The first gold coins were made by King Croesus in 564 BCE. All coins used to be made of precious metals, including gold and silver. However, modern coins are usually made of cheaper metals, such as copper, nickel, and zinc.

Sacred manuscripts were decorated with gold leaf.

Gold leaf

For centuries, gold has been used to decorate religious buildings, works of art, and objects. As well as using the solid metal, gold can be thinned down into very fine sheets called gold leaf. Gold leaf is used to decorate books and paintings.

The mask was discovered by archaeologists in a burial tomb in 1876.



A model of the spacecraft used in the 1969 Moon landing.

Golden craft

Space scientists use sheets of gold foil to cover parts of some spacecraft and satellites they send into space. The foil protects them by reflecting the Sun's harmful rays during their journey.

The **visors** of **space helmets** are coated in a thin layer of gold to keep astronauts cool and safe.

Prehistoric life

Earth has changed a lot over many millions of years. It has not always been home to plants, animals, and people. Many early living things no longer exist, so we only know about them from their remains. The distant past is known as "prehistory".

SEE ALSO

- Dinosaurs p.80
- Early humans p.82
- Earth p.83
- Fossils p.111
- Habitats p.126
- Oceans and seas p.187

Oceans
The first life was in the oceans. There were underwater plants and early animals.

Ammonites were animals with shells that lived in water.

Dinosaurs were the main land animal in prehistoric forests.

Forests
As Earth warmed up, plants grew on land and forests provided food for different types of animals.

Ice ages
In times when the Earth cooled down, most of it was covered in ice. Animals had to adapt to survive.

Woolly mammoths had thick fur coats to help them keep warm in the ice ages.

Stone Age
After the last ice age, Earth warmed up to how it is today. A great variety of plants and animals live in many different habitats, such as deserts, forests, and polar regions.

Early humans invented ways to hunt and gather food, and survive longer.

Radio

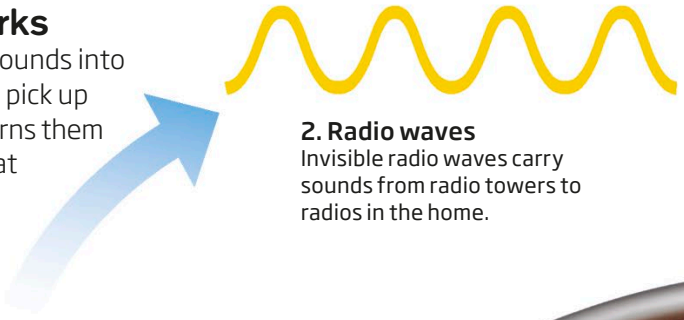
Radios pick up signals and turn them into sounds we can hear. They do this using invisible waves that carry sound information. Thousands of different radio stations play music, news, and drama to listeners all over the world.

SEE ALSO

- Atmosphere p.33
- Books p.44
- Communication p.69
- Hearing p.127
- Navigation p.182
- Television p.251

How radio works

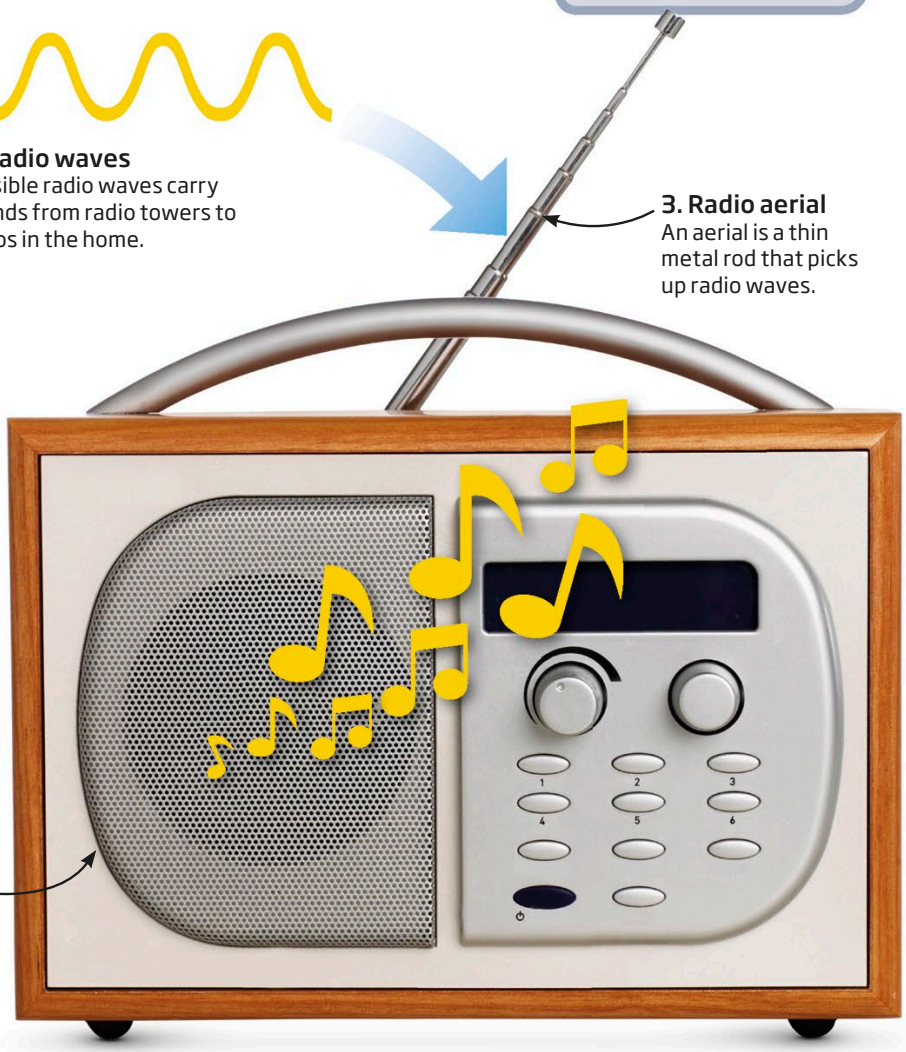
Radio towers turn sounds into radio waves. Radios pick up these waves and turns them back into sounds that you can hear.



1. Radio tower
Radio towers have antennas on the top of them. These antennas send out radio waves.

2. Radio waves
Invisible radio waves carry sounds from radio towers to radios in the home.

3. Radio aerial
An aerial is a thin metal rod that picks up radio waves.



Radio waves travel at the speed of light – about 300,000 km (186,000 miles) a second!

4. Speaker
The radio's speaker plays the waves as sounds.

Radio towers are tall to make sure that radio waves can travel over buildings.

Digital radio

Instead of radio waves, digital radio uses digital signals that don't get broken up like radio waves do. This means they sound better.

Remote control

Wireless gadgets use radio waves to contact each other. For example, a remote control can tell a toy car how to move around.

Remote control toy car

Rainforests

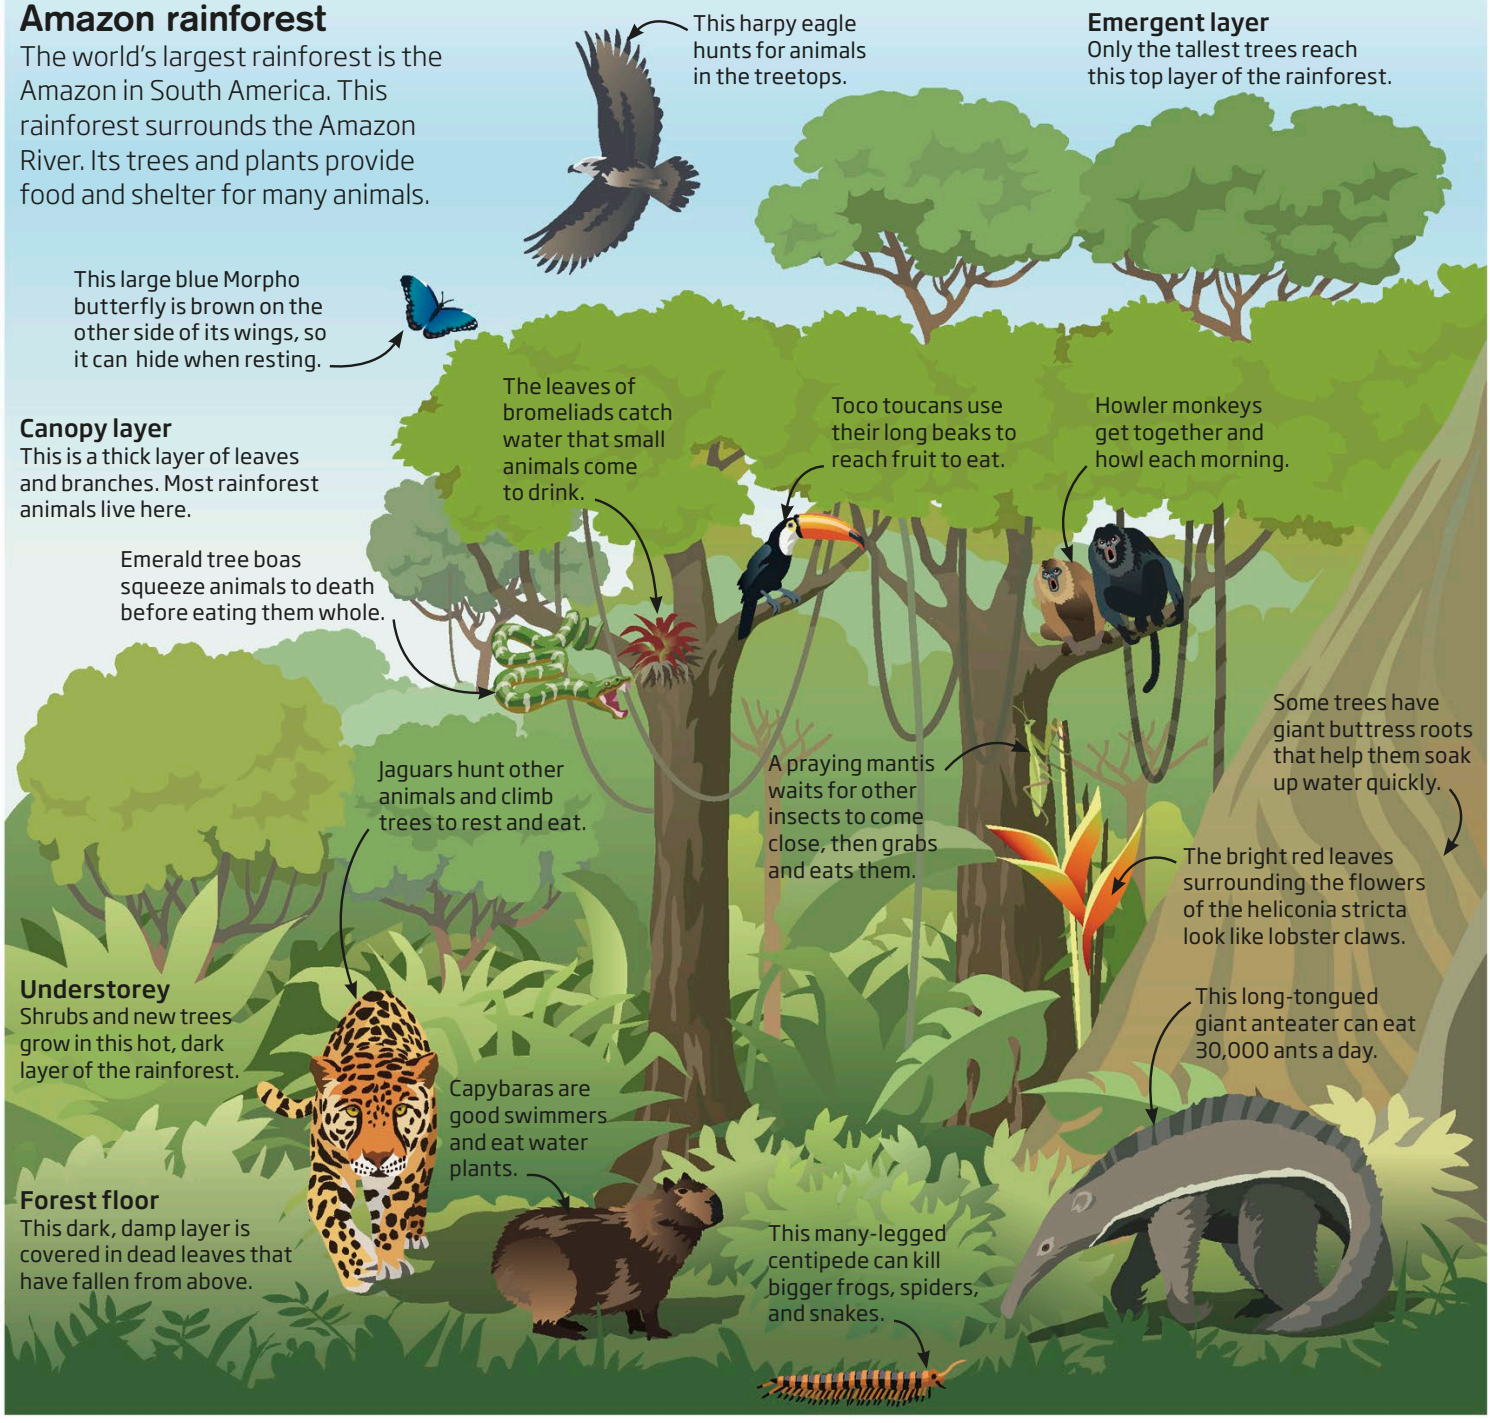
Rainforests are forests with tall trees and lots of rain. Tropical rainforests are hot places. They are home to nearly half of all animals and plants in the world. The trees are so thick with leaves that little sunlight reaches the forest floor.

SEE ALSO

- Birds p.39
- Forests p.109
- Habitats p.126
- Materials p.157
- Plants p.194
- Trees p.261
- Weather p.271

Amazon rainforest

The world's largest rainforest is the Amazon in South America. This rainforest surrounds the Amazon River. Its trees and plants provide food and shelter for many animals.



Recycling

Recycling means reusing rubbish or making it into new things rather than burning it or burying it in the ground. Everything from paper, glass, metal, and plastic to phones and computers can be recycled. The more we recycle our waste, the less we damage our planet.

SEE ALSO

- Changing world pp.50–51
- Climate change p.60
- Computers p.71
- Metals p.162
- Plastic p.195
- Pollution p.198

Paper and cardboard
Old paper and cardboard can be mashed up in water, then rolled flat and dried to make new paper products.

Food waste
Leftover food can be fed to animals, such as pigs or chickens, or used to make compost to help plants grow.

Plastic
Most of the plastic we throw away can be chopped up, melted down, and re-formed into new items.

Metal
Cans can be melted down. They are either remade into more cans or used to make other metal goods.

Glass
Bottles and jars made of glass can be cleaned and used again or melted down to make new glass objects.

Electronics
Devices such as phones and laptops can be repaired or have their valuable metal parts taken out to be reused.

Festivals

Festivals are celebrated across the world. Some festivals, like Eid or Christmas, mark important religious events. Others, like the Chinese New Year, mark the passing of time. Festivals are often a time of joy. People might put up lights, dance, or give each other presents.

Christmas

Every year at Christmas, Christians celebrate the birth of Jesus Christ. Some go to church and sing carols or special songs about the event. Most people give presents to each other and have a large meal with special food. Many people spend Christmas with friends and family.

Christmas trees are often finished with a star or angel on top.

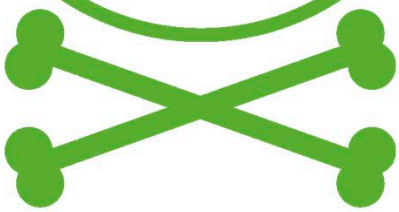
Presents are placed below a decorated Christmas tree.

The "Elegant Skull" is a symbol of the Day of the Dead.

Elegant Skull statue

Day of the Dead

In Mexico, people celebrate the Day of the Dead for three days at the start of November. This ancient festival is held to remember friends and family who have died. People build shrines to the dead and bring gifts of food and drink to their graves.



A Chinese Dragon puppet that is used in festival celebrations.

Chinese New Year

Celebrations for the Chinese New Year last for 15 days. Families clean their houses to sweep away bad luck, decorate their windows and doors with red paper shapes, and enjoy a big feast together. Some people throw firecrackers to make a big noise, and dragons dance in the streets.

At New Year, Chinese parents give their children money in red packets.

Dancers control the colourful dragons using long sticks.

Muslims say the special Eid prayer outside a mosque.

Eid

Muslims celebrate the Eid al-Fitr holiday at the end of Ramadan. During Ramadan, they fast, or go without food during the day. At Eid, Muslims give money to charity, pray together, visit friends and family, and enjoy a feast.

Passover

Jewish people celebrate Passover to remember the escape of the Jews from slavery in Egypt. The festival lasts for seven or eight days and is marked with the special *seder*, or meal, which includes matzo – a flat, or unleavened, bread that hasn't been given time to rise.

Passover is one of the most important Jewish festivals, and is more than 3,000 years old.

The special food on the plate tells the story of the Jews' escape from slavery.

Diwali

The Hindu festival of Diwali takes place every autumn in the north of the world and every spring in the south. It celebrates the victory of light over darkness and good over evil. People light up their homes and public places and set off fireworks.

Fireworks light up the sky at Diwali – the festival of lights.

Religion

A religion is a set of beliefs. Religions often try to explain the world, such as how it came to exist. Religion is an important part of many people's lives. They agree with their religion's teachings, and try to behave by its rules, for example, about how to treat other people. Many religions have central figures that are prayed to, called gods.

SEE ALSO

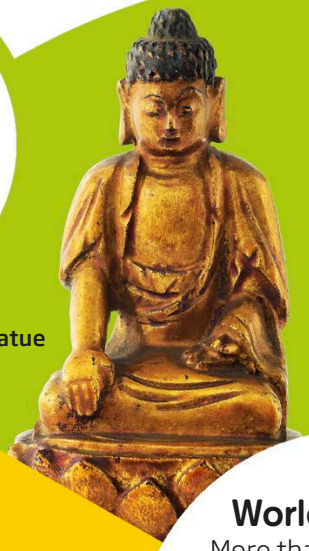
- Dance p.76
- Festivals pp.206–207
- Turkish Empire p.262
- World p.275

Buddhism

Buddhists follow the teaching of Buddha, who lived in India in the fifth century BCE. They meditate, which involves thinking deeply. They believe that they will be reborn after death.



Buddha statue

Judaism

Judaism dates back 4,000 years. Jews believe in one God who created the world. They trace their history back to the Hebrew people of what is now Israel.

Special candlestick called a Chanukiah

Sikhism

Sikhs follow the teachings of Guru Granth Sahib. They believe that all people are equally important. Sikhs pray in grand buildings called Gurdwaras.

Gurdwara

World religions

More than 75 per cent of believers follow Buddhism, Islam, Christianity, or Hinduism. Judaism and Sikhism also have worldwide followings. There are many other religions, but fewer people follow them.

Islam

The followers of Islam are called Muslims. They believe that the Quran, their holy book, is God's word told through his messenger Muhammad, whose teachings they follow.

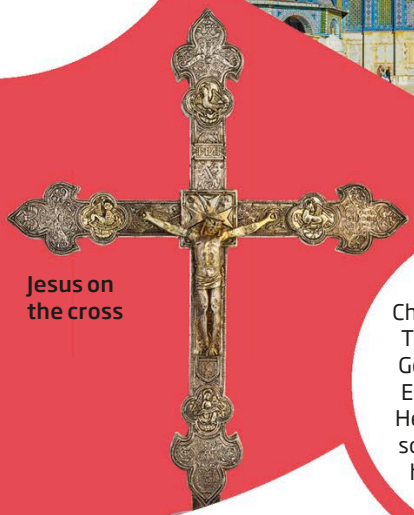
Mosque

The Hindu god Shiva

Hinduism

Hinduism began in India more than 2,500 years ago. Hindus pray to many gods and believe that life is a circle of birth, death, and rebirth.

Jesus on the cross



Christianity

Christians have one God. They believe that their God's son Jesus lived on Earth 2,000 years ago. He died nailed to a cross so that Christians could have life after death.

Renaissance

Italy experienced great change in science and art between 1400 and 1600. This movement then spread across Europe. It was called the "Renaissance", which means "rebirth", because it looked at ideas that originally came from ancient Rome and Greece.

SEE ALSO

- Aircraft p.13
- Ancient Rome p.20
- Art p.28
- Inventions pp.136–137
- Religion p.208
- Writing p.280

Buildings

Renaissance builders copied ancient styles to produce larger, more elegant buildings. These buildings often had columns and domes.

The great dome of the cathedral in Florence was built in 1436.

Science

Scientists began to carry out experiments for the first time. They made important discoveries about space, science, and medicine.

This flying machine was designed by Leonardo da Vinci. It never actually flew.

Art

Renaissance artists used a more realistic style than previous artists. They tried to show light and shade and came up with new types of paint and materials.

This painting, by Pietro Perugino, shows Jesus giving the keys of Heaven to St. Peter.

The people at the front of the painting appear larger than those further away. This is called perspective.

Reptiles

Reptiles are scaly-skinned, cold-blooded animals. Most reptiles lay soft, leathery eggs. A baby reptile grows inside the egg and then, when it's ready, breaks its way out. There are four main groups of reptile.

SEE ALSO

- Amphibians p.15
- Antarctica p.24
- Deserts p.78
- Dinosaurs p.80
- Eggs p.86
- Evolution p.95
- Sun p.247

All reptiles have scaly skin.

Some lizards can move their eyes to look in two directions at once.

Lizards

These reptiles have many skills. This chameleon can change the colour of its skin. Other reptiles can run up walls, or break off their tails to escape danger.

Tortoises have hard shells.

Tortoises and turtles

Turtles live in water and tortoises live on the land. Their shells protect them, but are heavy, so they move very slowly out of the water.

Reptiles live on every continent except Antarctica.

Crocodiles and alligators

These giant reptiles have existed since before dinosaurs. They hide under water, then spring up to catch their prey and drag it under.

Crocodiles and alligators have strong jaws.

Snakes

All snakes swallow their prey whole. They smell using their tongues. Some snakes have poisonous bites, but most are not dangerous to people.

Basking

Reptiles are cold-blooded animals. They get the heat their bodies need from the world around them, lying in the sunshine to warm up. They hide in the shade to stop overheating.

Rivers

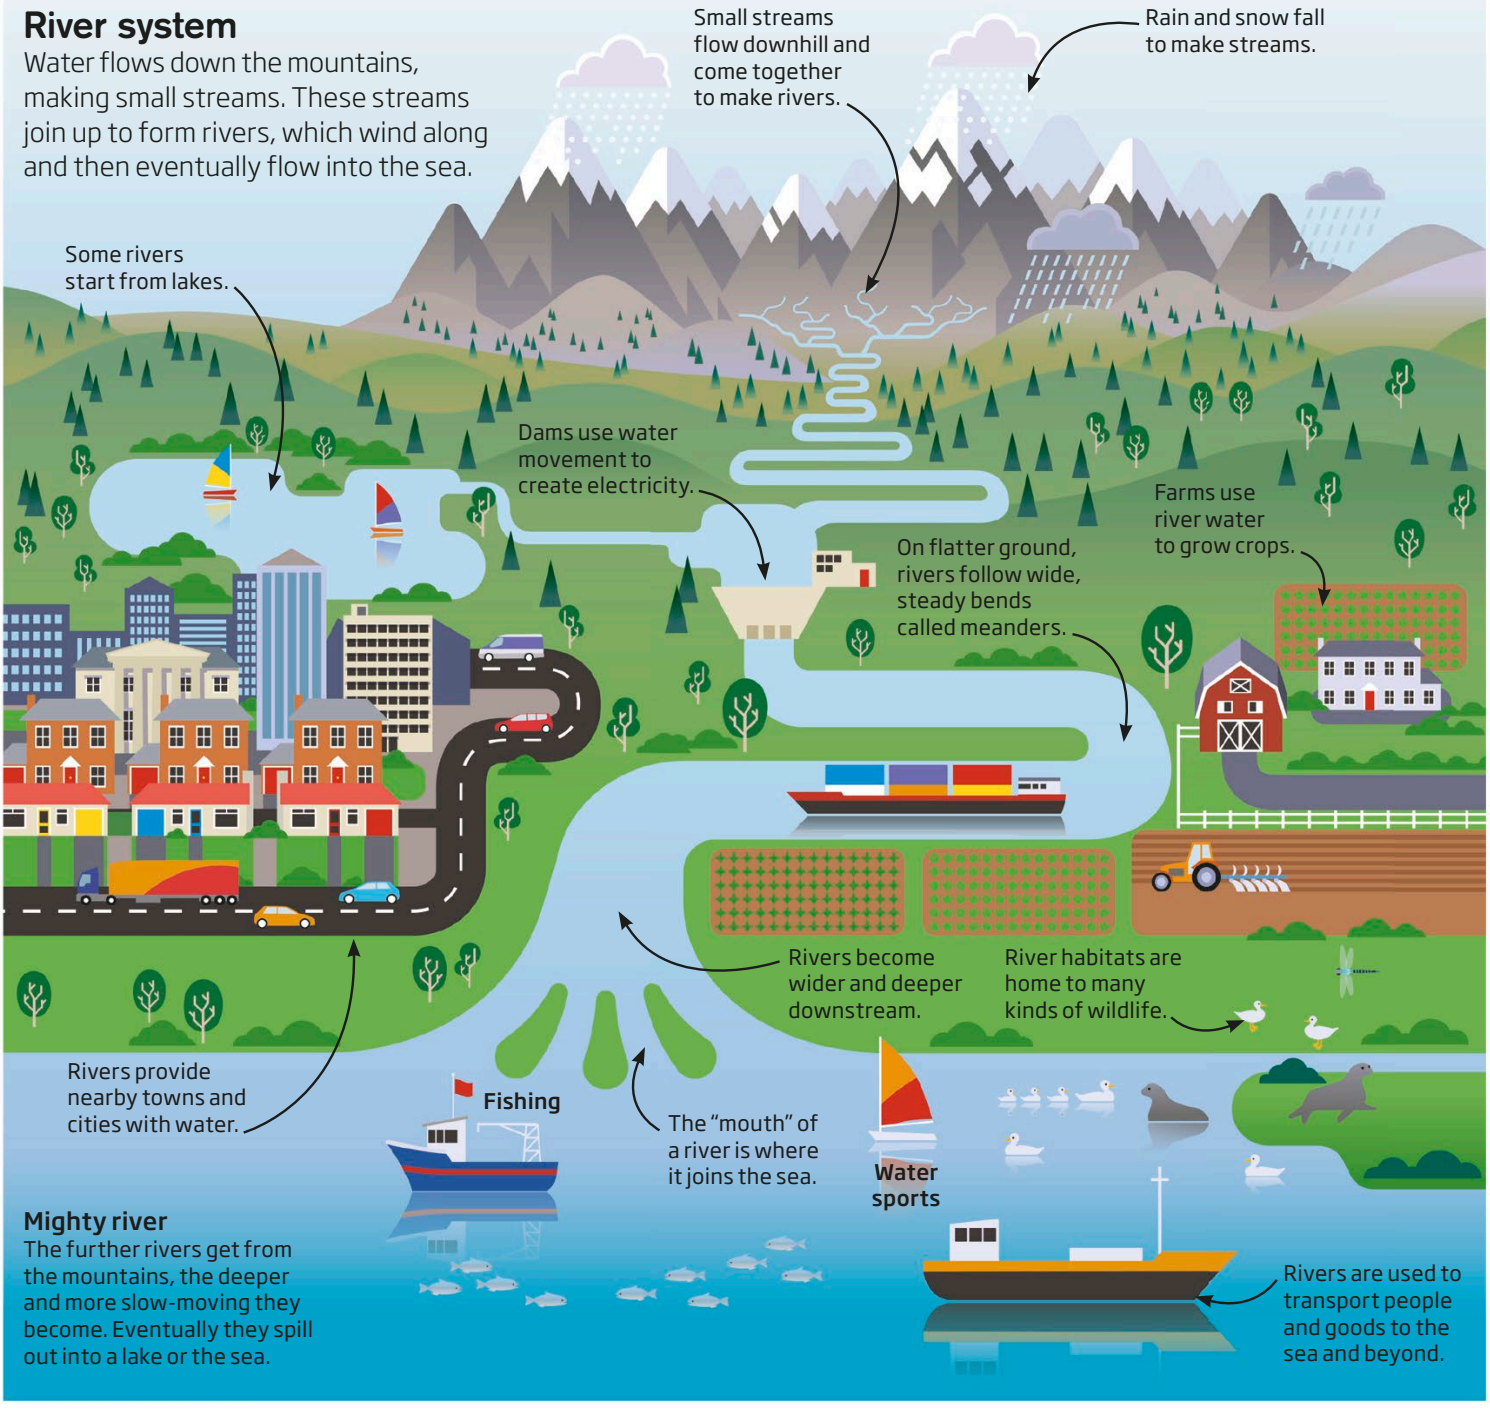
Starting as tiny streams, rivers flow from mountaintops down to the sea. They provide a home to lots of wildlife. People transport things along rivers, grow crops next to them, and even use rivers for spare-time activities, such as sailing and fishing.

SEE ALSO

- Farming p.98
- Water pp.120–121
- Glaciers p.122
- Lakes p.143
- Water cycle p.270
- Weather p.271

River system

Water flows down the mountains, making small streams. These streams join up to form rivers, which wind along and then eventually flow into the sea.



Mighty river

The further rivers get from the mountains, the deeper and more slow-moving they become. Eventually they spill out into a lake or the sea.

Robots

Robots are computer-controlled machines that do jobs for us. They can be used in many ways, such as helping doctors, building things, and doing jobs that would be too dangerous for people to do.

SEE ALSO

- Computers p.71
- Factories p.97
- Machines p.150
- Medicine p.160
- Space travel p.237

Types of robot

Robots are carefully designed to do their jobs. Each type of robot has its own unique look.

Each "finger" has a different function.

Medical robot
Robots are capable of performing very delicate movements. They can help doctors operate on their patients.

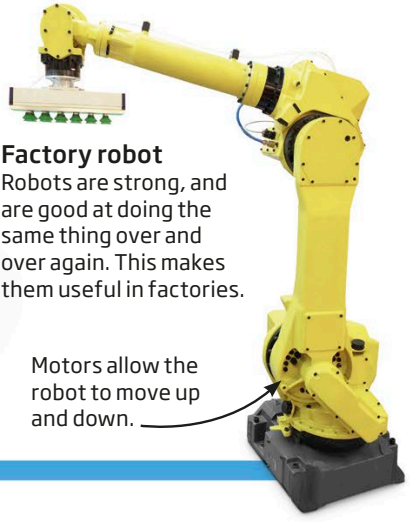
Eye sensors allow the robot to "see".

Humanoid robot
Some robots are designed to look a bit like people. This robot is called NAO. It can dance and speak.

Robots can see and feel, but not like humans. Their sensors use code to interpret feedback.

Hand sensors allow NAO to "feel" objects.

Foot sensors are used for walking, climbing stairs, and detecting obstacles.

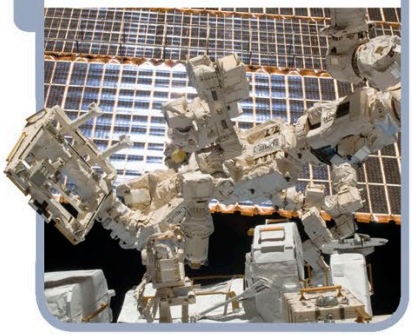


Factory robot
Robots are strong, and are good at doing the same thing over and over again. This makes them useful in factories.

Motors allow the robot to move up and down.

Robots in space

NASA uses robots to perform dangerous tasks in outer space. This robot mends things on the International Space Station.

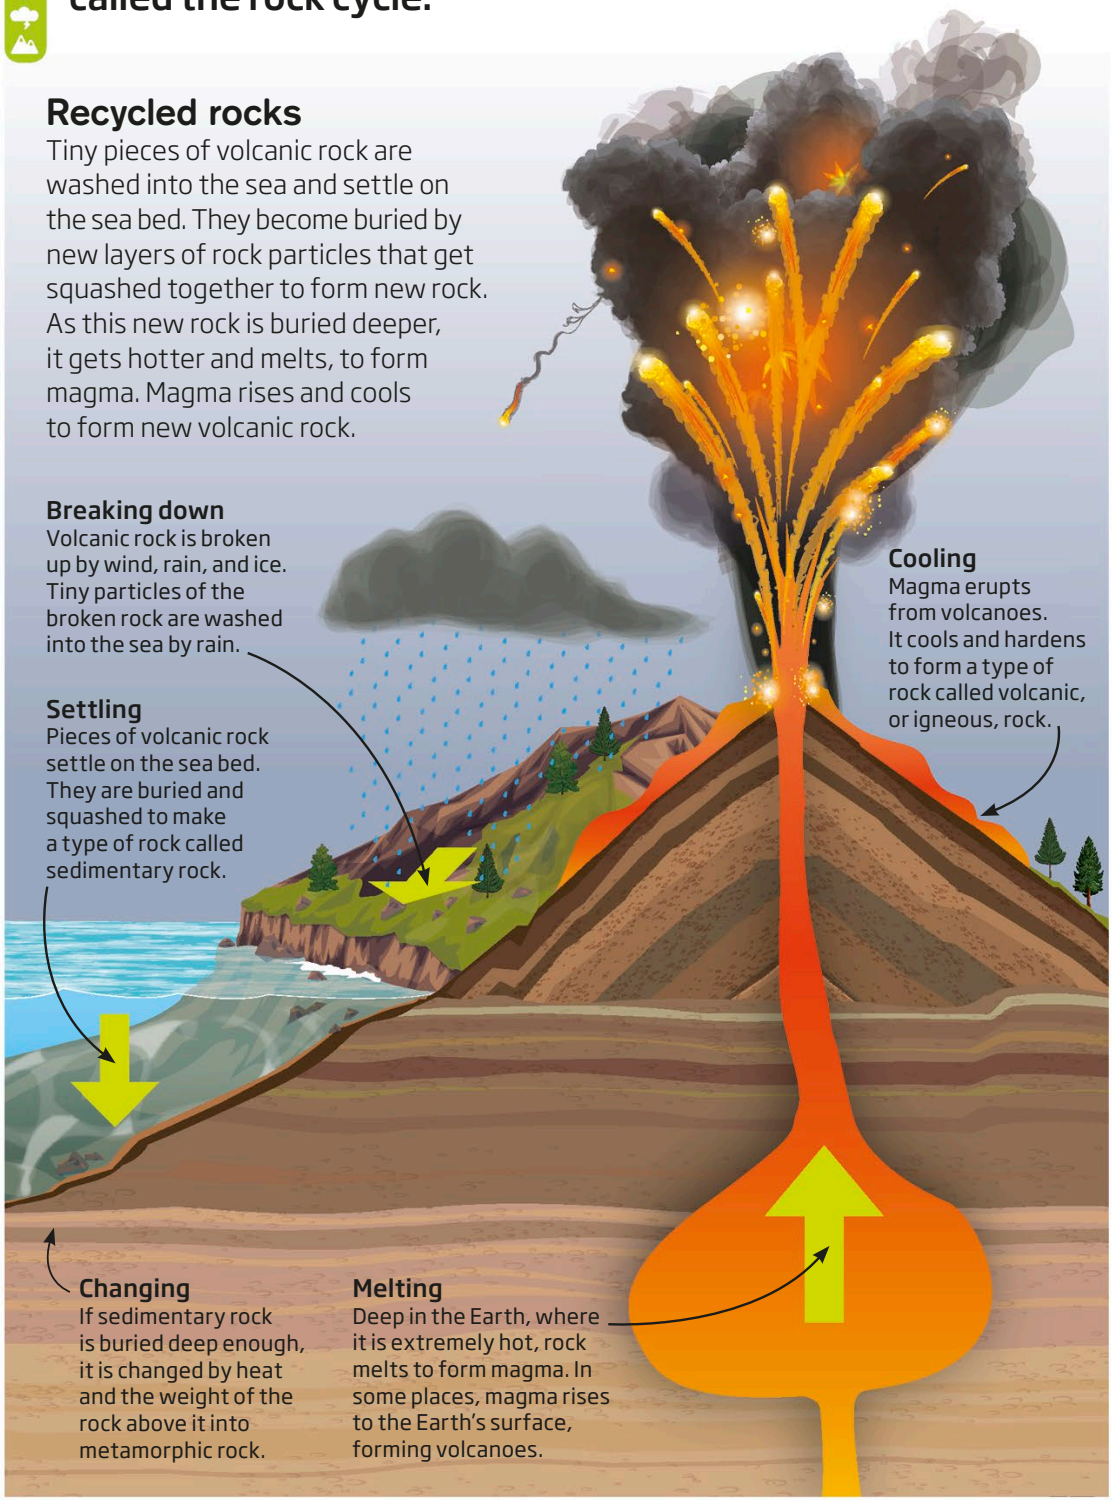


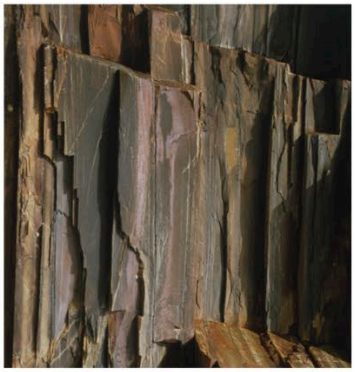
Rock cycle

Rock may be very hard, but it does not last for ever. It is constantly being worn away by wind, water, and ice. At the same time, new rock is being made at the bottom of the sea and by volcanoes. This is called the rock cycle.

SEE ALSO

- Earth's surface p.84
- Erosion p.93
- Inside Earth p.135
- Mountains p.172
- Rocks and minerals p.214
- Volcanoes p.268





Heated and squashed

Any rock can be changed into metamorphic rock by the heat and the weight of the rock above it. Slate, which is used to make roof tiles, is a common metamorphic rock.

Lots of layers

Most rocks being formed today are sedimentary rocks. They are made from tiny pieces of older rocks that build up on the sea bed in layers. Sandstone is a common sedimentary rock.

Rocks and minerals

The Earth's surface is made up of hard natural objects called rocks. Rocks are made up of a mixture of substances called minerals. There are many different kinds of rocks and minerals.

SEE ALSO

- Earth's surface p.84
- Elements p.90
- Gemstones p.118
- Metals p.162
- Rock cycle p.213
- Volcanoes p.268

Rocks

Types of rock have different names depending on how they were formed. The three types are called sedimentary, igneous, and metamorphic.

Metamorphic rock
Under great heat and pressure, metamorphic rock is formed deep inside the Earth.

Sedimentary rock
When particles of minerals settle and are squashed together, they slowly become sedimentary rock.

Igneous rock
This type of rock is formed when melted rock cools down and becomes solid.

Minerals

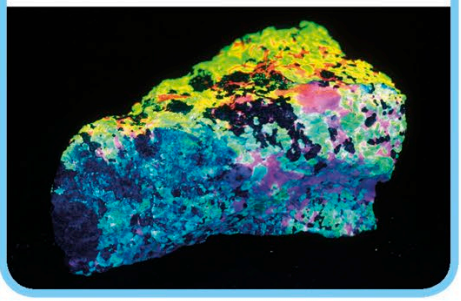
A mineral is a naturally occurring solid. It is made from chemical elements – simple substances that cannot be broken down further. Minerals grow together to form rocks.

There are nearly **4,000** different types of **mineral** on Earth.

Serpentine Amethyst Garnet Opal

Glowing rocks

Some rocks look plain in daylight, but their minerals change colour under special "ultraviolet" light. The glowing minerals in this rock are called calcite and willemite.



Satellites

Satellites are objects that go around, or orbit, something bigger. There are more than 2,000 artificial satellites orbiting the Earth. They are used for a variety of different jobs. Some track the weather while others let us communicate with each other.

SEE ALSO

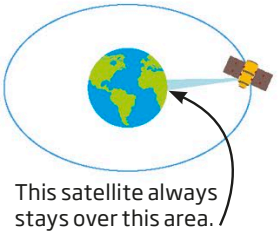
- Astronomy p.32
- Clouds p.64
- Communication p.69
- Internet p.138
- Solar System p.233
- Universe p.263

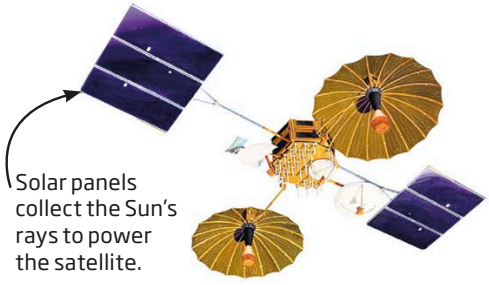
GPS satellite

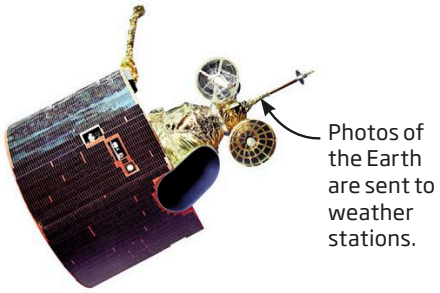
The global positioning system (GPS) gives us our exact position on the Earth. The system uses more than 20 satellites, working together to pinpoint your location.

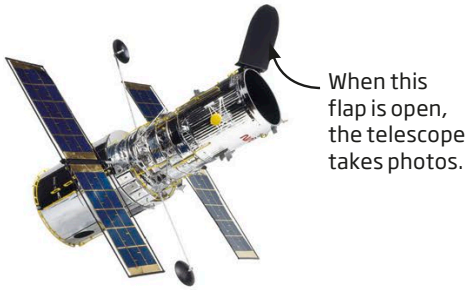
Local satellites

Some types of satellite stay over the same area as they orbit the Earth. These are called geostationary satellites. To cover the whole Earth, many satellites are needed.









Communication satellite

These satellites pick up signals and send them to other places in the world. They are used for phone calls and live video communications.

Weather satellite

These satellites take pictures of the clouds and measure land and sea temperatures. This information helps us to study and forecast the weather.

Hubble space telescope

This satellite points away from the Earth and takes detailed images of the Universe. It lets us see further into space than we could from the Earth.

Saturn

Saturn is the second largest planet in the Solar System after Jupiter and the sixth furthest planet from the Sun. It is a "gas giant", mainly made of hydrogen and helium, and is best known for its rings.

SEE ALSO

- Astronomy p.32
- Atmosphere p.33
- Jupiter p.141
- Moon p.171
- Exploration pp.180–181
- Solar System p.233

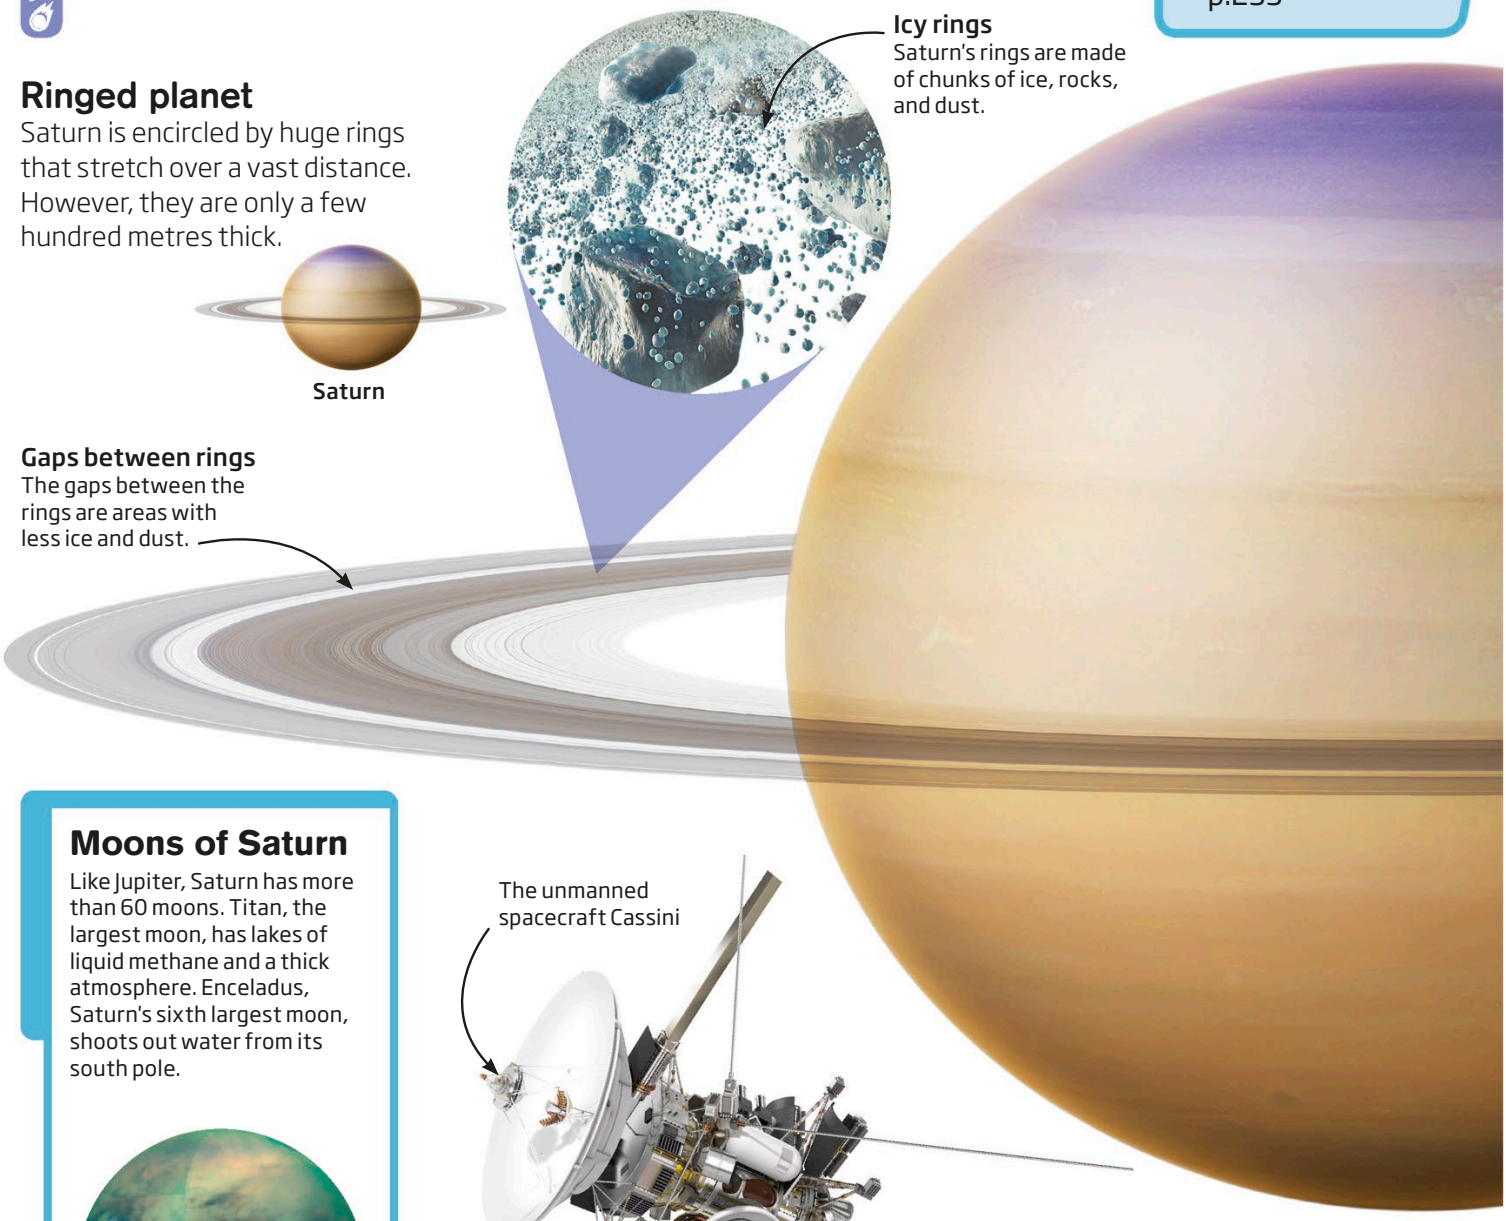
Ringed planet

Saturn is encircled by huge rings that stretch over a vast distance. However, they are only a few hundred metres thick.

Saturn

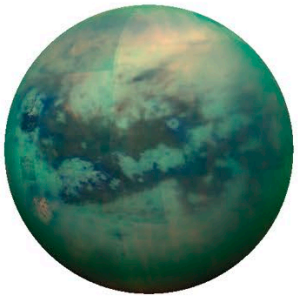
Icy rings
Saturn's rings are made of chunks of ice, rocks, and dust.

Gaps between rings
The gaps between the rings are areas with less ice and dust.



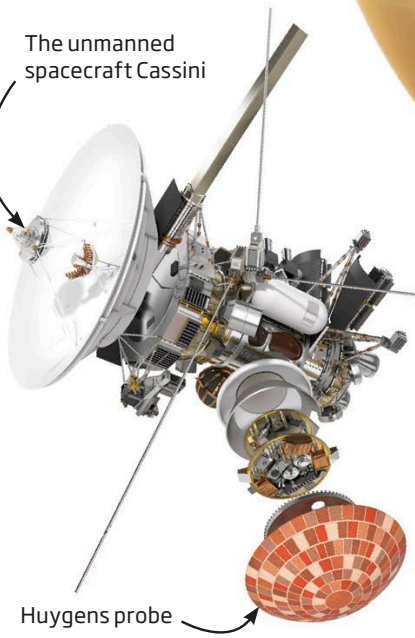
Moons of Saturn

Like Jupiter, Saturn has more than 60 moons. Titan, the largest moon, has lakes of liquid methane and a thick atmosphere. Enceladus, Saturn's sixth largest moon, shoots out water from its south pole.



Titan

The unmanned spacecraft Cassini



Huygens probe

Cassini-Huygens

The Cassini spacecraft explored Saturn between 2004 and 2017. A probe called Huygens, carried by Cassini, landed on the surface of Saturn's moon Titan in 2005.

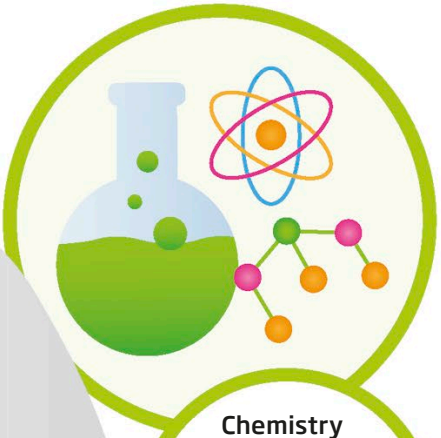
Science

Science is the search for truth and knowledge. It's about understanding the world and learning how and why things work the way they do. Science includes doing experiments to test predictions and collect evidence. We divide science into three main areas: chemistry, biology, and physics.

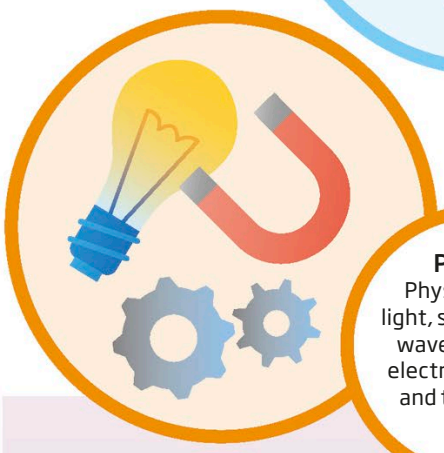
SEE ALSO

- Astronomy p.32
- Biology p.38
- Chemistry p.58
- Medicine p.160
- Physics p.192
- The sciences pp.218–219

Biology
The study of living things and their surroundings is called biology. It includes the human body, plants, and animals.



Chemistry
Looking at what things are made of is known as chemistry. This includes the tiny building blocks of all materials, called atoms.



Physics
Physics studies light, sound, forces, waves, magnets, electricity, energy, and the planets.

Scientists

Scientists are people who investigate the world to answer questions and find solutions to problems. They do experiments to see if ideas are right or wrong, and they share information.

Inventions

Studying science helps us to create new things. For example, if we understand movement, we can design better cars. If we understand the body, we can invent medicines to help fight off sickness.

Copy of Edison's light bulb

Thomas Edison invented the electric light bulb in 1879, while studying electricity.

Science isn't just facts in a book – it's a whole way of thinking and discovering.

The sciences

For thousands of years, people have been observing the world around them and coming up with ideas to explain why things behave the way they do. Science is about answering questions with ideas, evidence, and experience.

Notches around the edge were lined up with objects in the sky.

Some of the earliest doctors were ancient Egyptian women,

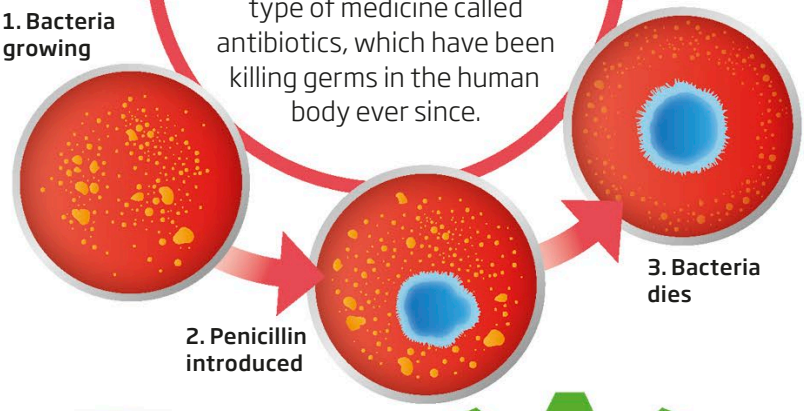
5,000

years ago.

Child making a wave in a bottle

Curing diseases

In 1928, Scottish scientist Alexander Fleming noticed how a mould called penicillin killed bacteria. This discovery led to a type of medicine called antibiotics, which have been killing germs in the human body ever since.



1. Bacteria growing
2. Penicillin introduced
3. Bacteria dies

Experiments

In ancient Greece, a man called Aristotle said that people should look at nature and carry out experiments to find answers to their questions. Scientist do experiments to test their ideas and make new discoveries.

Compasses helped explorers to travel the world and discover new ideas.

Early compass

Renaissance

Starting in the 15th century, the Renaissance was an explosion of ideas that transformed science and art in Europe. Leading experiments, gathering evidence, and sharing ideas became popular – this led to new inventions and discoveries.

Nebra Sky Disk

Accidental inventions

Many great scientific discoveries have been made by accident. For example, German scientist Wilhelm Conrad Röntgen accidentally discovered X-rays in 1885. He was sending electricity through tubes of gas when he noticed that he could see what was inside a nearby box. He then used this finding to take pictures of the bones inside his wife.

Early X-ray

X-rays pass through skin and flesh but bounce back off bones.

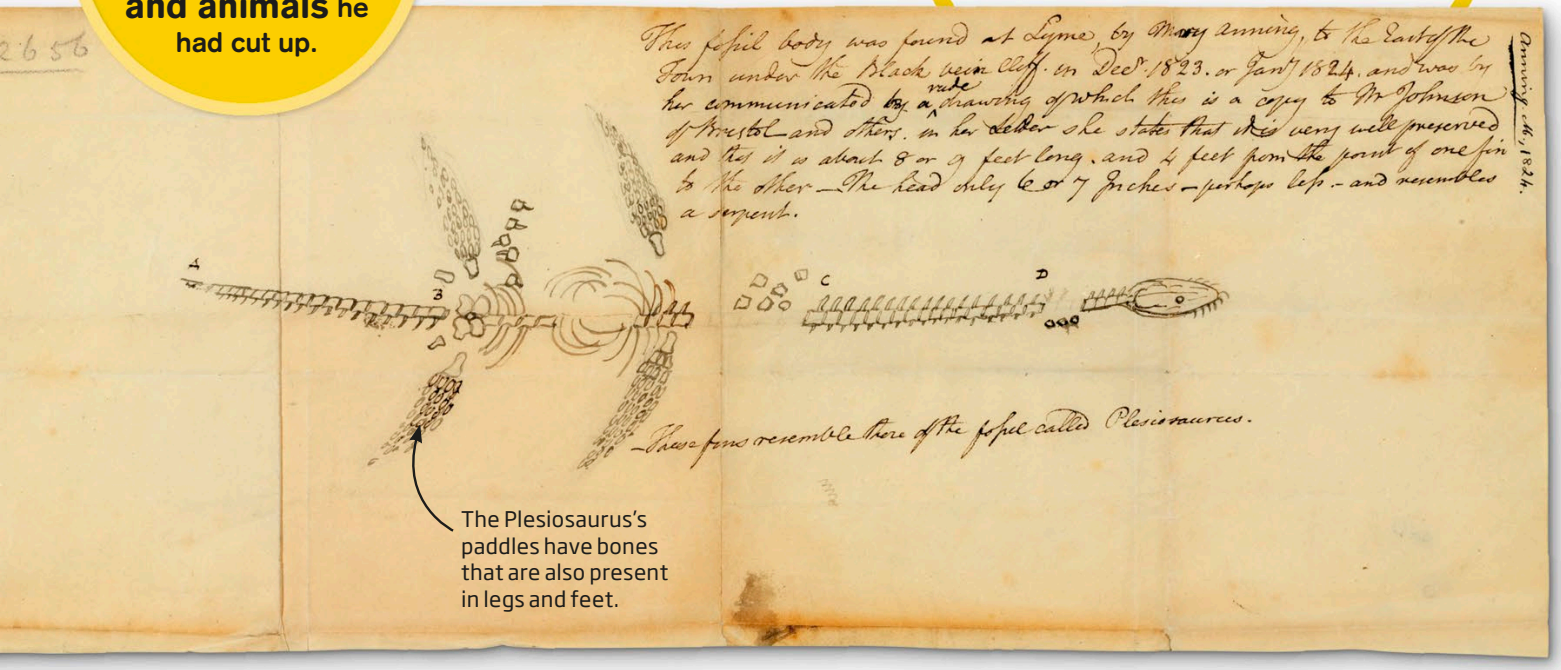
The night sky

One of the earliest sciences was studying the movements of the Moon, planets, and stars. This is now called astronomy. Moon calendars were first made about 10,000 years ago. Around 4,000 years ago, the Nebra Sky Disk was used to track seasons and the Sun's position.

Scientific drawings

Many scientists create beautiful, precise drawings to record their findings. Mary Anning was a famous British fossil hunter who lived in the 1800s. Mary found her first fossils as a child and made drawings of them. Her discoveries helped scientists to understand how life existed in the oceans millions of years ago.

Renaissance artist and scientist Leonardo da Vinci sketched pictures of humans and animals he had cut up.



The Plesiosaurus's paddles have bones that are also present in legs and feet.

Plesiosaurus drawn by Mary Anning in 1824

Seashore

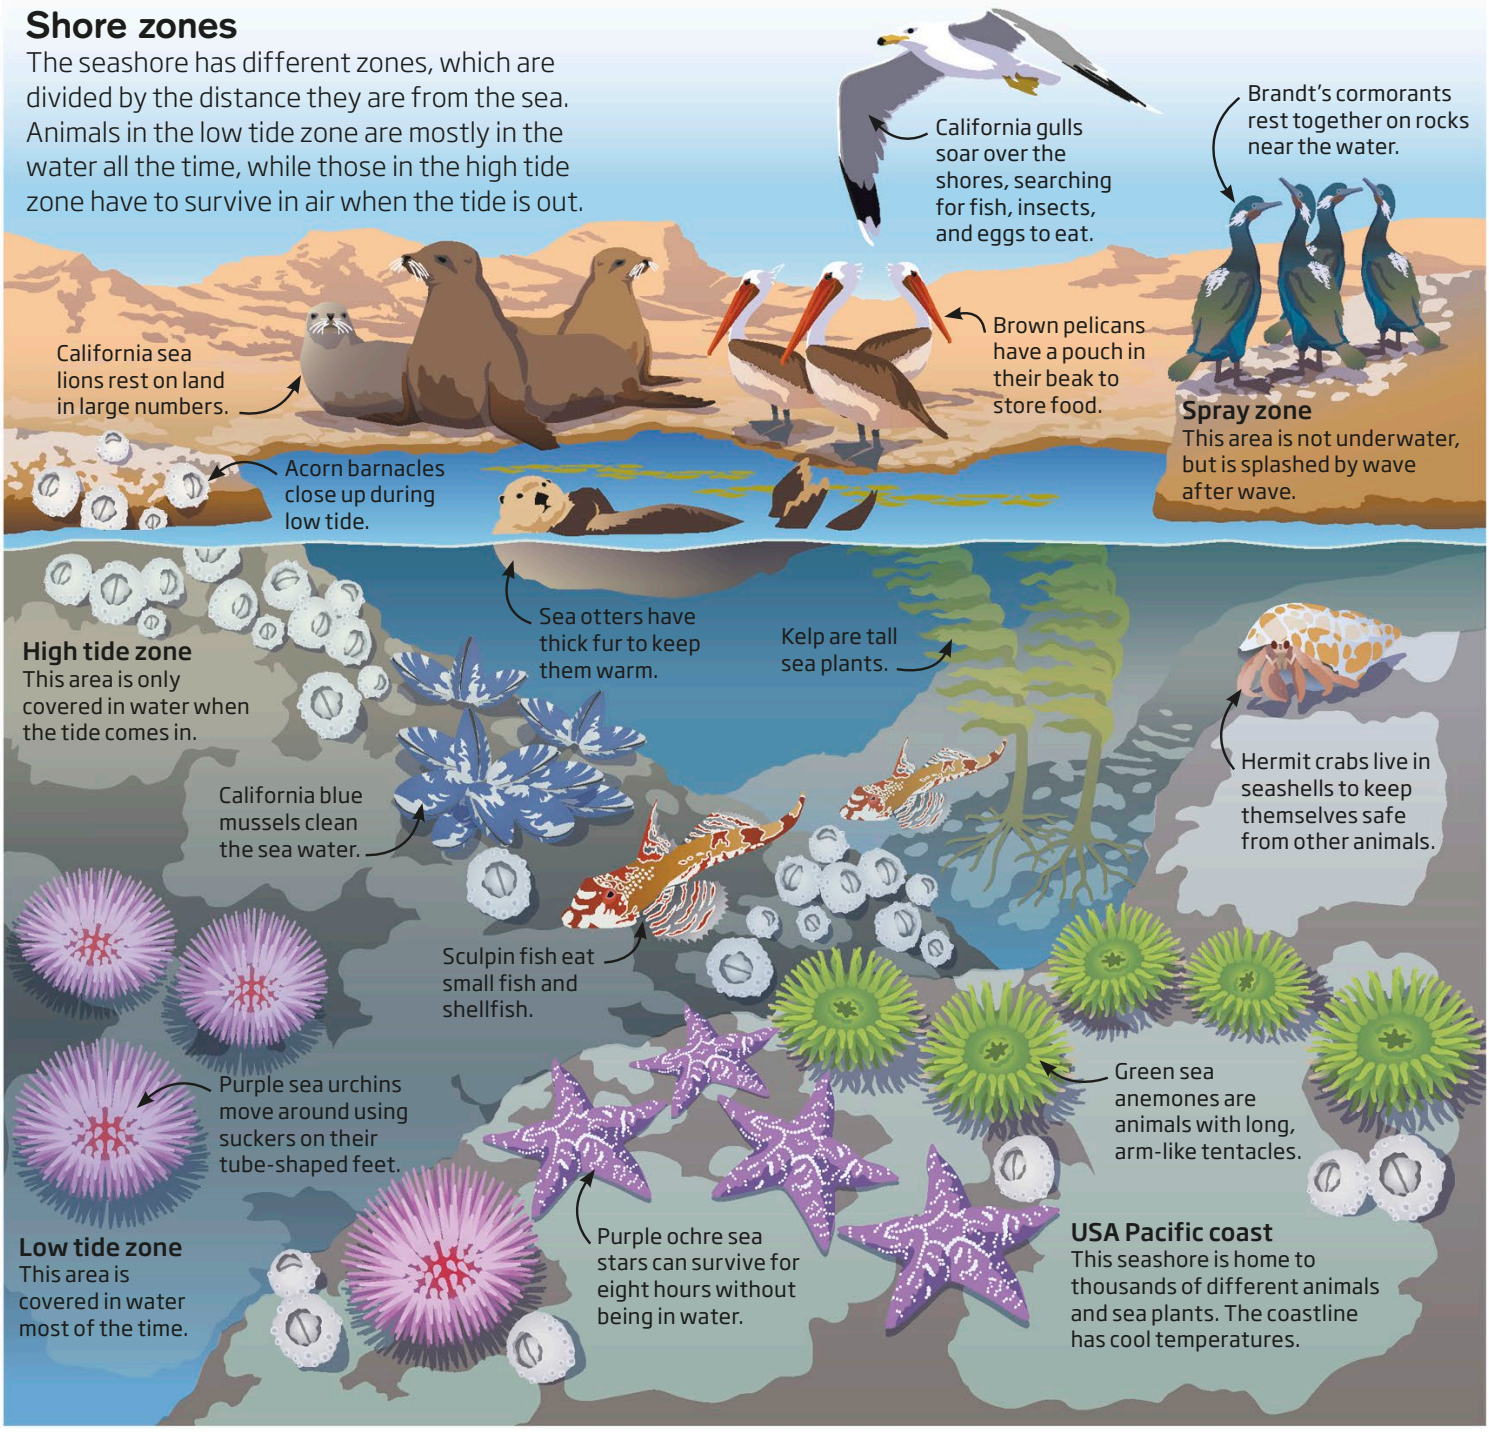
The area where land meets the sea or ocean is called the seashore. It may be sand, mud, or rock. Animals and plants that live here have to be able to survive crashing waves and the water level changing twice a day.

SEE ALSO

- Birds p.39
- Habitats p.126
- Invertebrates p.139
- North America p.184
- Oceans and seas p.187
- Tides p.254

Shore zones

The seashore has different zones, which are divided by the distance they are from the sea. Animals in the low tide zone are mostly in the water all the time, while those in the high tide zone have to survive in air when the tide is out.



Seasons

In many parts of the world, the year has four seasons. These seasons are winter, spring, summer, and autumn. The lives of plants and animals, the weather, and the hours of daylight all change from one season to the next. In some hot parts of the world, there are just two seasons.

SEE ALSO

- Climate change p.60
- Day and night p.77
- Hibernation p.129
- Solar System p.233
- Trees p.261
- Weather p.271

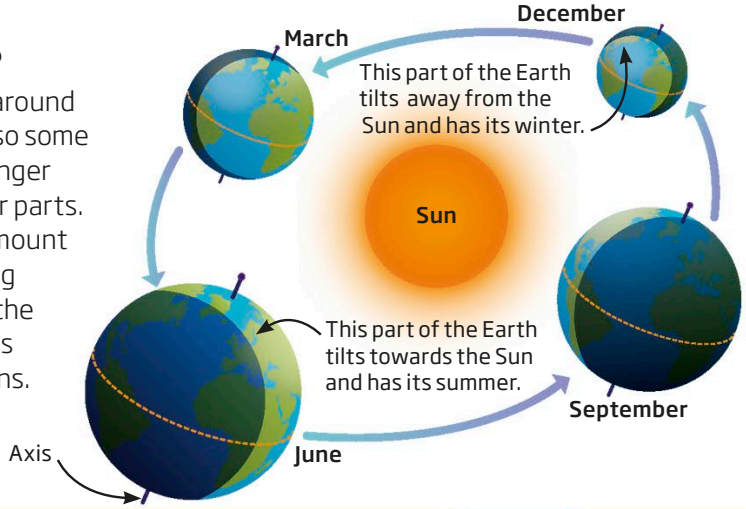
Changing seasons

In the cold winter, plants stop growing. In spring, they begin to grow again and baby animals are born. Summer sees the hottest weather, and then in autumn leaves change colour and fall off the trees.

Winter | Spring | Summer | Autumn

What causes the seasons?

The Earth travels around the Sun. It is tilted so some parts of it get stronger sunlight than other parts. As it moves, the amount of sunlight reaching different parts of the Earth changes. This gives us our seasons.



Monsoons

Tropical parts of the Earth are warm all year round. There are often just two seasons – a dry season and a rainy season, called a monsoon.

Shapes

Shapes are areas with different outlines. In maths, there are two types of shape. Two-dimensional shapes have length and width, while three-dimensional shapes have length, width, and height. Shapes can be made of straight or curved lines, or a mixture such as in a semi-circle.

SEE ALSO

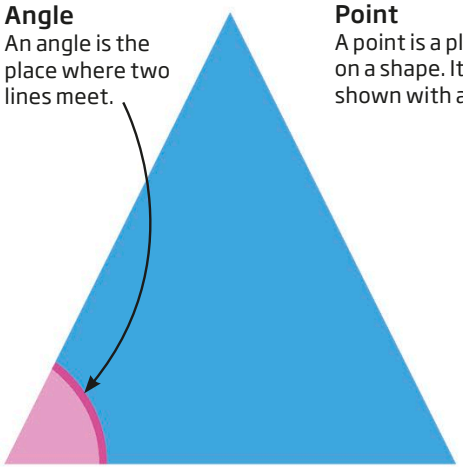
- Constellations p.73
- Flags p.102
- Maps p.155
- Numbers p.185
- Symmetry p.248
- Volume p.269

What makes a shape?

A shape is named depending on the number of sides and angles it has. Regular shapes have sides that are all the same length.

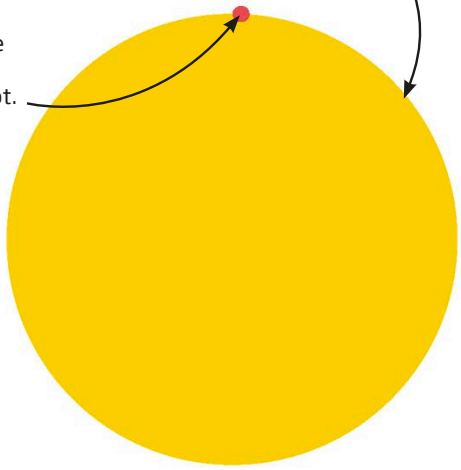
Angle
An angle is the place where two lines meet.

Point
A point is a place on a shape. It is shown with a dot.



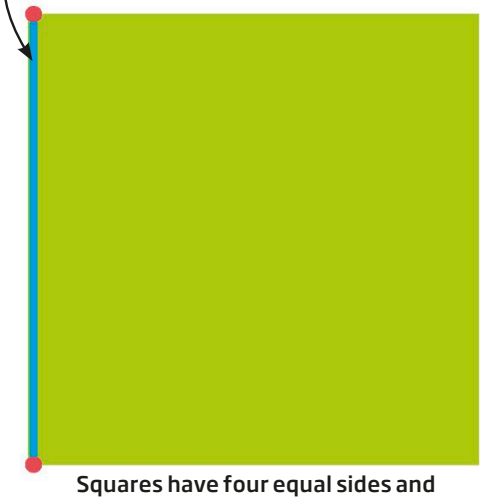
Triangles have three sides and three inside angles adding up to 180°.

Edge
The side of a shape is called an edge.



Circles have one long, round side.

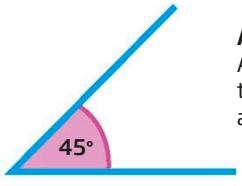
Line
A straight line is the shortest distance between two points.



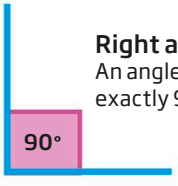
Squares have four equal sides and four right angles.

Angles

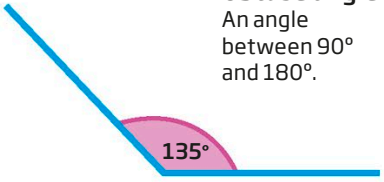
Angles are measured in degrees (°) out of 360. Angles have different names depending on how big they are.



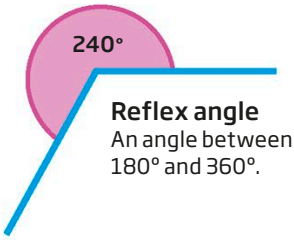
Acute angle
An angle less than a right angle (90°).



Right angle
An angle of exactly 90°.



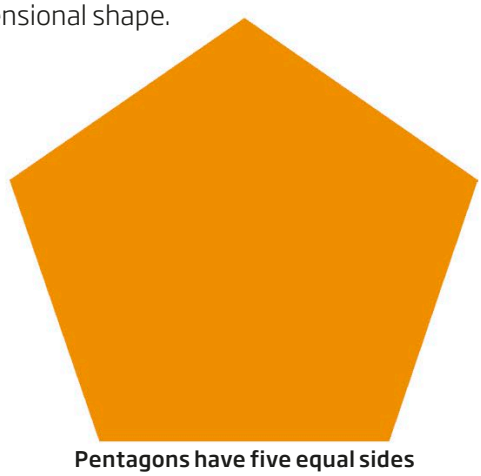
Obtuse angle
An angle between 90° and 180°.



Reflex angle
An angle between 180° and 360°.

Polygons

"Polygon" is the name for any flat, two-dimensional shape.



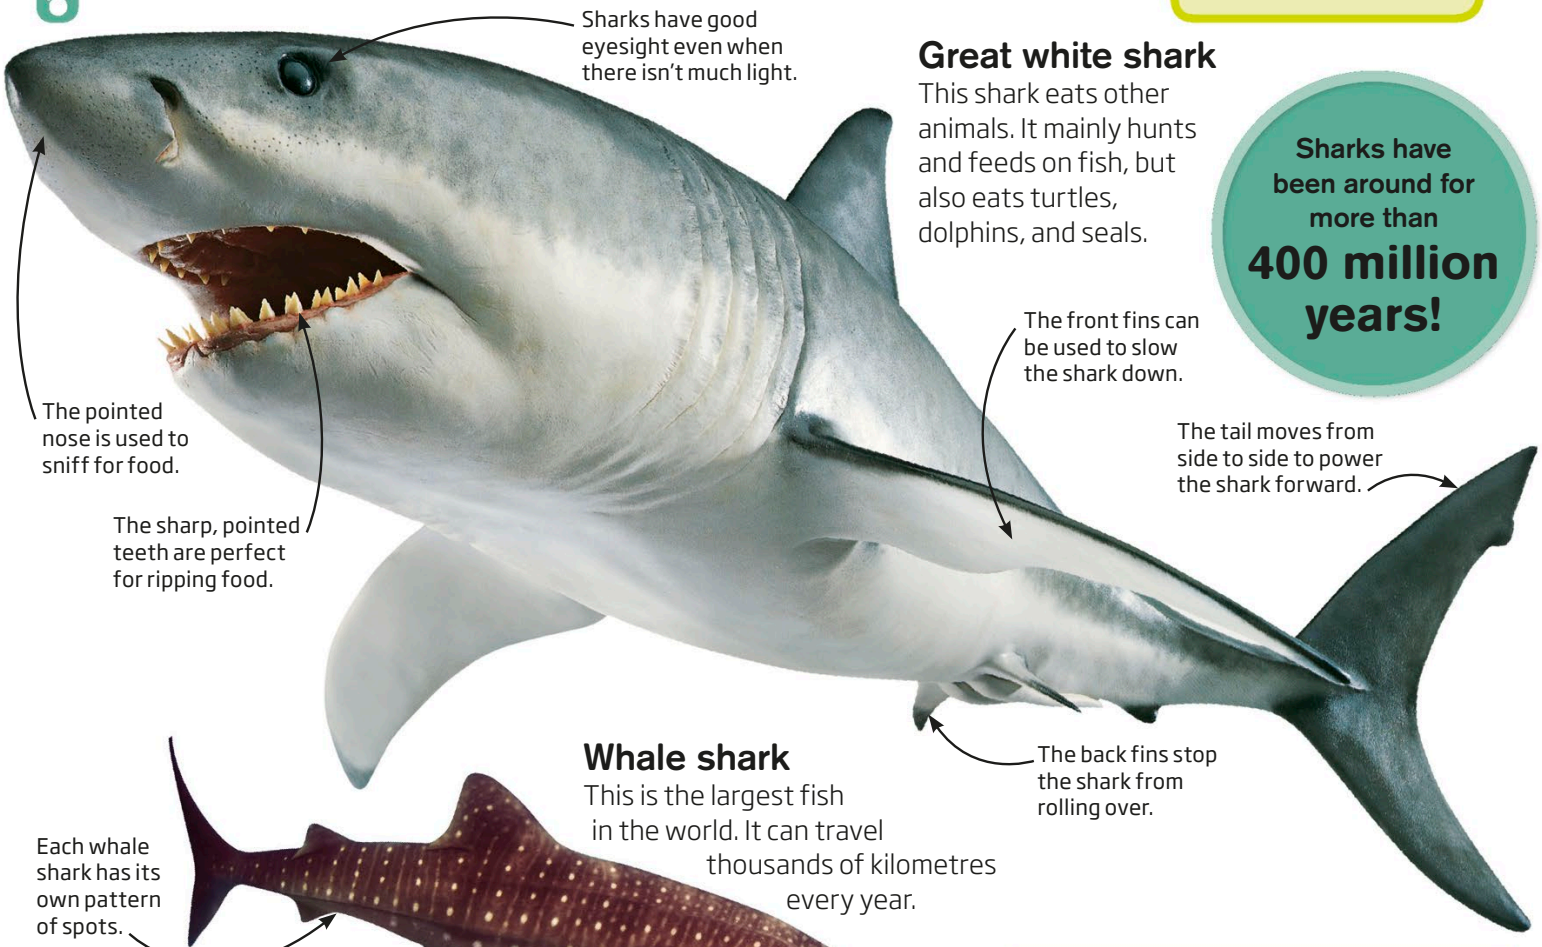
Pentagons have five equal sides and five inside angles.

Sharks

Sharks are a type of fish. Almost all of them eat meat. They are found in every ocean and some rivers. There are more than 400 types of shark. Most are active during the day, but some hunt at night.

SEE ALSO

- Conservation p.72
- Fish p.101
- Food chains p.107
- Oceans and seas p.187
- Prehistoric life p.202



Great white shark

This shark eats other animals. It mainly hunts and feeds on fish, but also eats turtles, dolphins, and seals.

Sharks have been around for more than 400 million years!

Whale shark

This is the largest fish in the world. It can travel thousands of kilometres every year.

Hammerhead shark

Hammerhead sharks use their wide heads to pin down stingrays on the ocean floor.

Sharks under threat

The number of sharks is getting smaller because they are hunted for their fins, teeth, and fish oil. Scientists try to learn about sharks, so that they can help them.

Ships

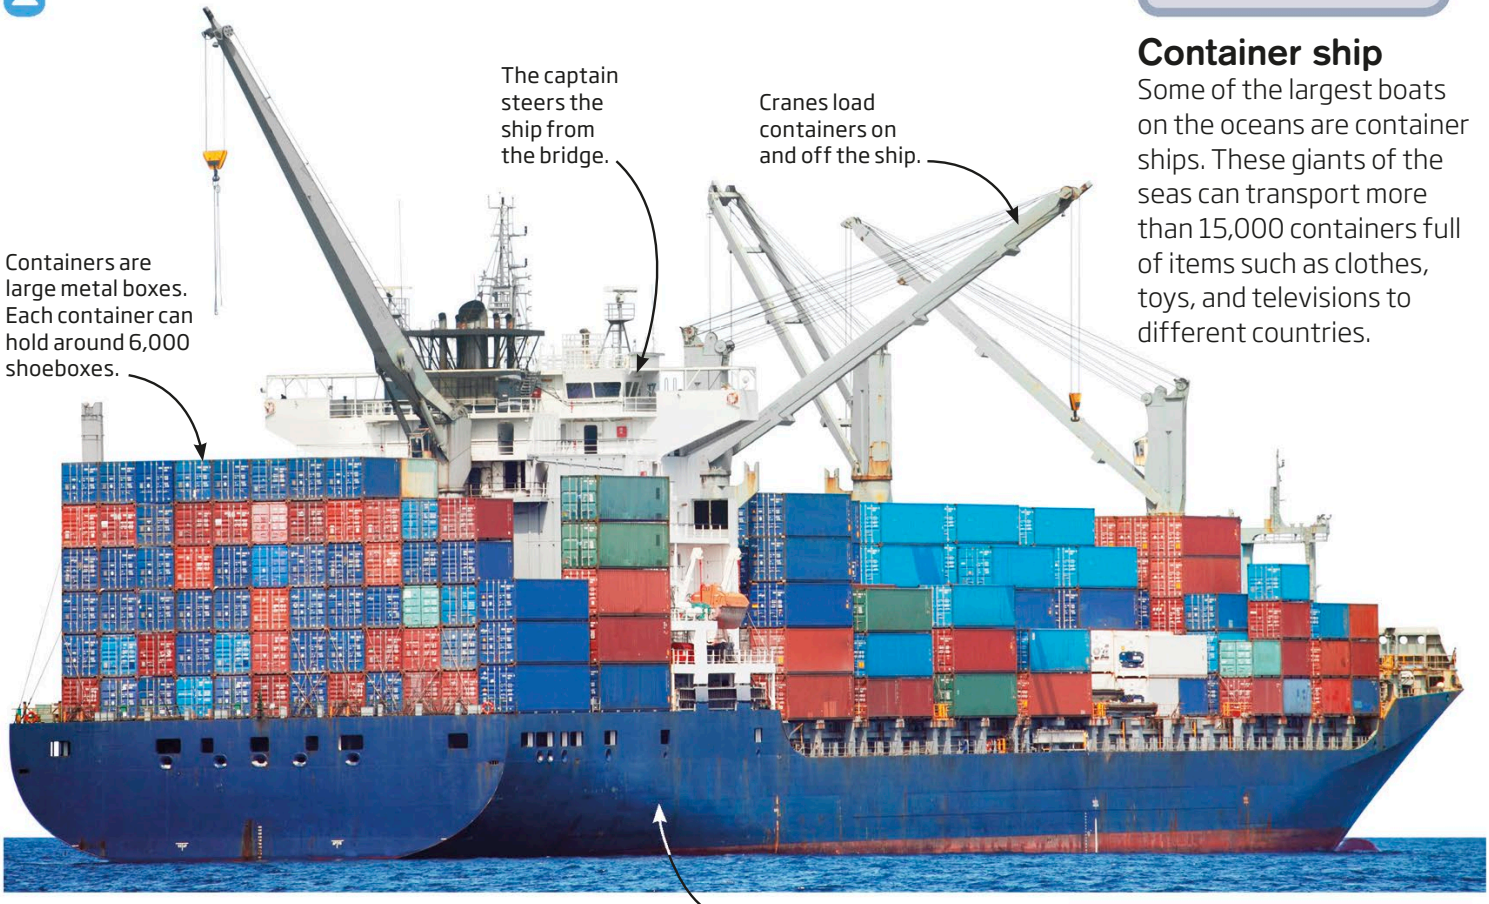
Sea transport comes in all shapes and sizes, from tiny sailing boats to large cruise liners and gigantic container ships. They can be used for sport, to take people on holiday, and to move things from one country to another.

SEE ALSO

- Oceans and seas p.187
- Sport p.239
- Trade p.257
- Transport pp.258–259
- Work p.274

Container ship

Some of the largest boats on the oceans are container ships. These giants of the seas can transport more than 15,000 containers full of items such as clothes, toys, and televisions to different countries.



Sailing boat

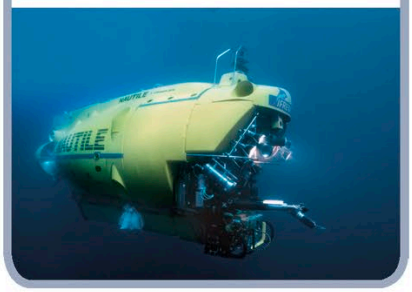
This tiny boat doesn't have an engine. It is powered by wind, which is caught in the sail to push the boat across the water.

Cruise ship

A cruise ship is a floating hotel that takes tourists to different countries. On board are swimming pools, theatres, and water slides.

Submersible

This craft doesn't travel on the ocean, but underneath it. It can take scientists deep underwater to look at sea life and study the ocean floor.



Sickness

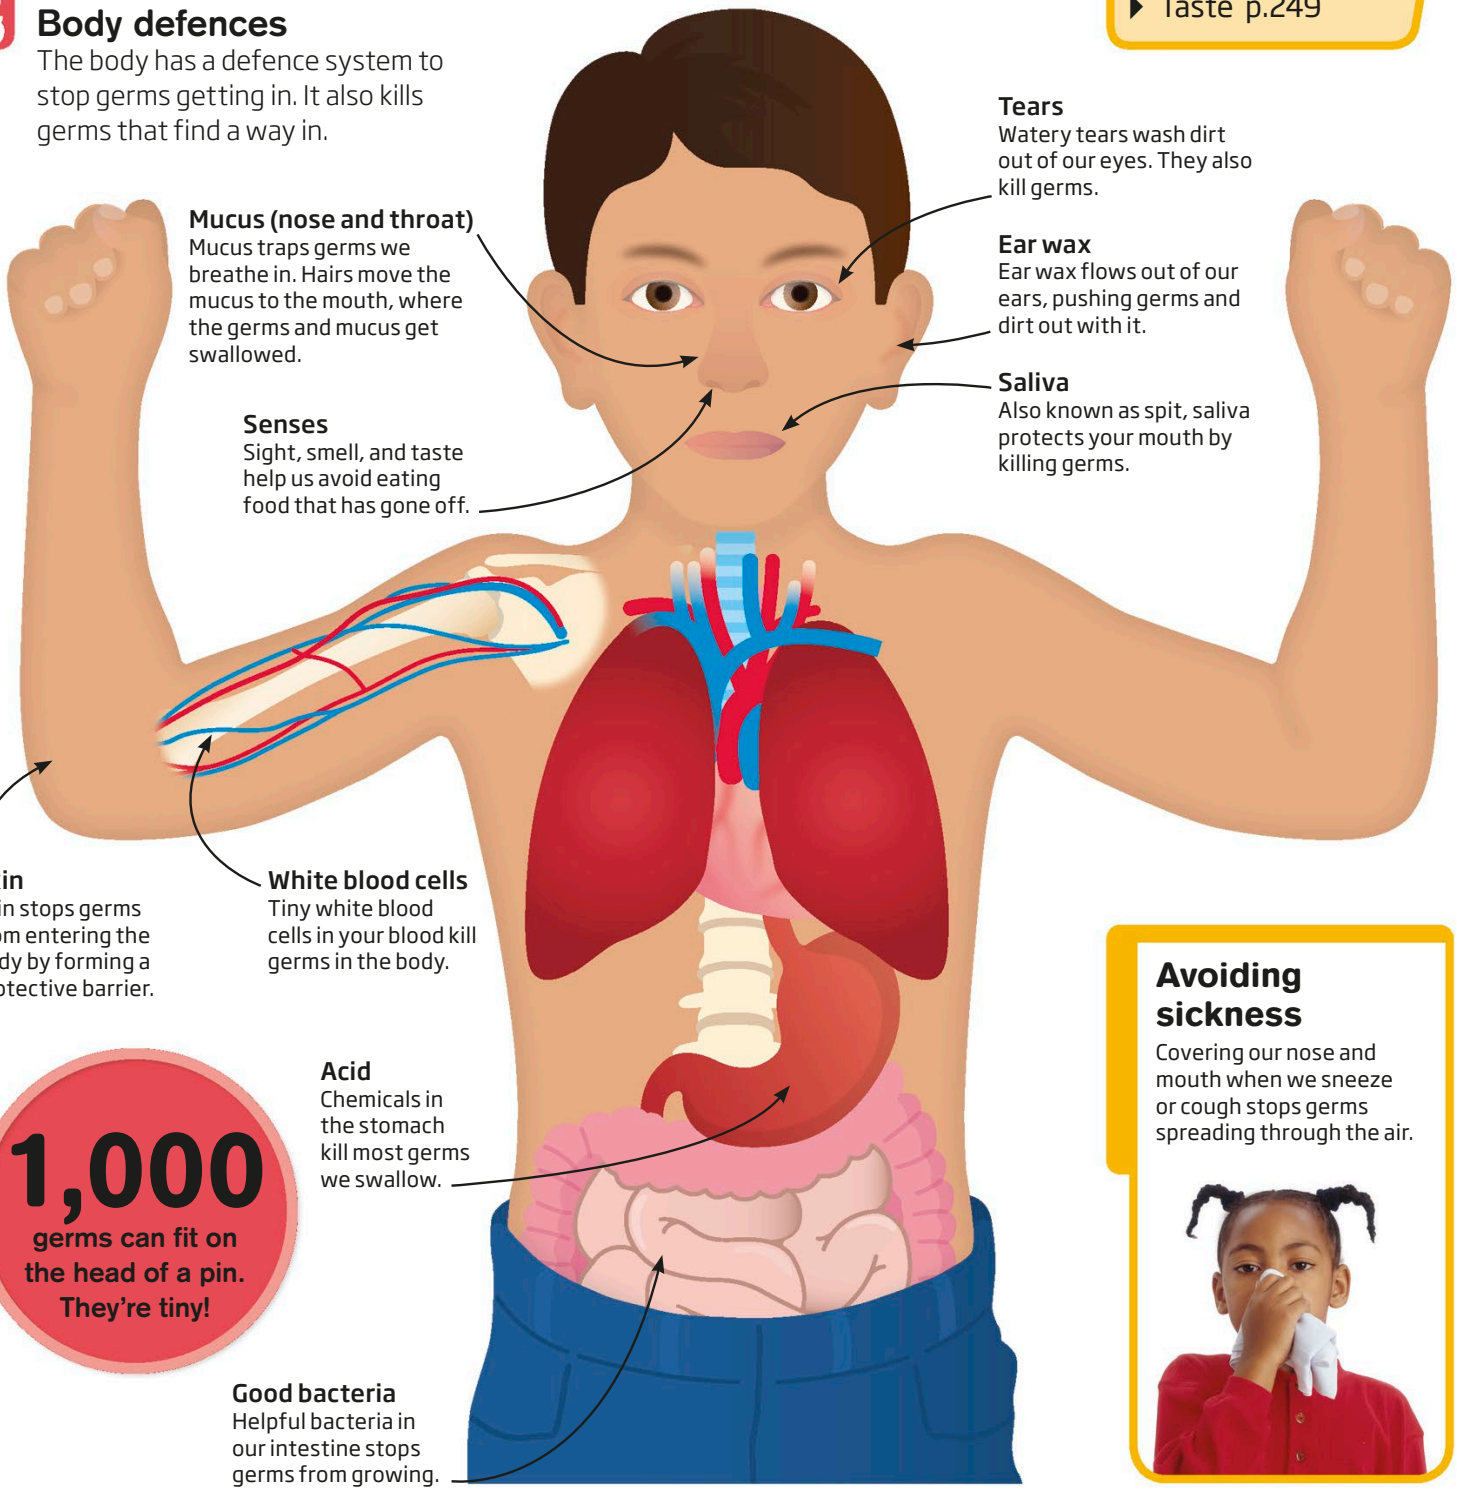
Tiny living things called germs can make us sick if they get inside our bodies. Germs are all around us – in the air, in our food, and on the things we touch. Our bodies have many different ways to stop them harming us.

SEE ALSO

- Body cells p.41
- Human body p.130
- Medicine p.160
- Microscopic life p.165
- Skin p.229
- Taste p.249

Body defences

The body has a defence system to stop germs getting in. It also kills germs that find a way in.



Tears
Watery tears wash dirt out of our eyes. They also kill germs.

Mucus (nose and throat)
Mucus traps germs we breathe in. Hairs move the mucus to the mouth, where the germs and mucus get swallowed.

Ear wax
Ear wax flows out of our ears, pushing germs and dirt out with it.

Saliva
Also known as spit, saliva protects your mouth by killing germs.

Senses
Sight, smell, and taste help us avoid eating food that has gone off.

Skin
Skin stops germs from entering the body by forming a protective barrier.

White blood cells
Tiny white blood cells in your blood kill germs in the body.

Acid
Chemicals in the stomach kill most germs we swallow.

Good bacteria
Helpful bacteria in our intestine stops germs from growing.

1,000
germs can fit on the head of a pin. They're tiny!

Avoiding sickness

Covering our nose and mouth when we sneeze or cough stops germs spreading through the air.

Sight

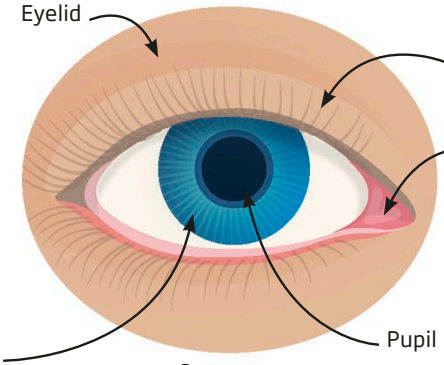
Sight is seeing the shapes, sizes, and colours of nearby and far-away objects within our surroundings. When we see, coloured light is bouncing off objects and into our eyes.

SEE ALSO

- Body cells p.41
- Brain p.45
- Cells p.56
- Hearing p.127
- Light p.147
- Muscles p.173
- Smell p.232

How we see

Tiny sensors at the back of the eye receive light and send signals to the brain to make an image from the light we see.



Outer eye

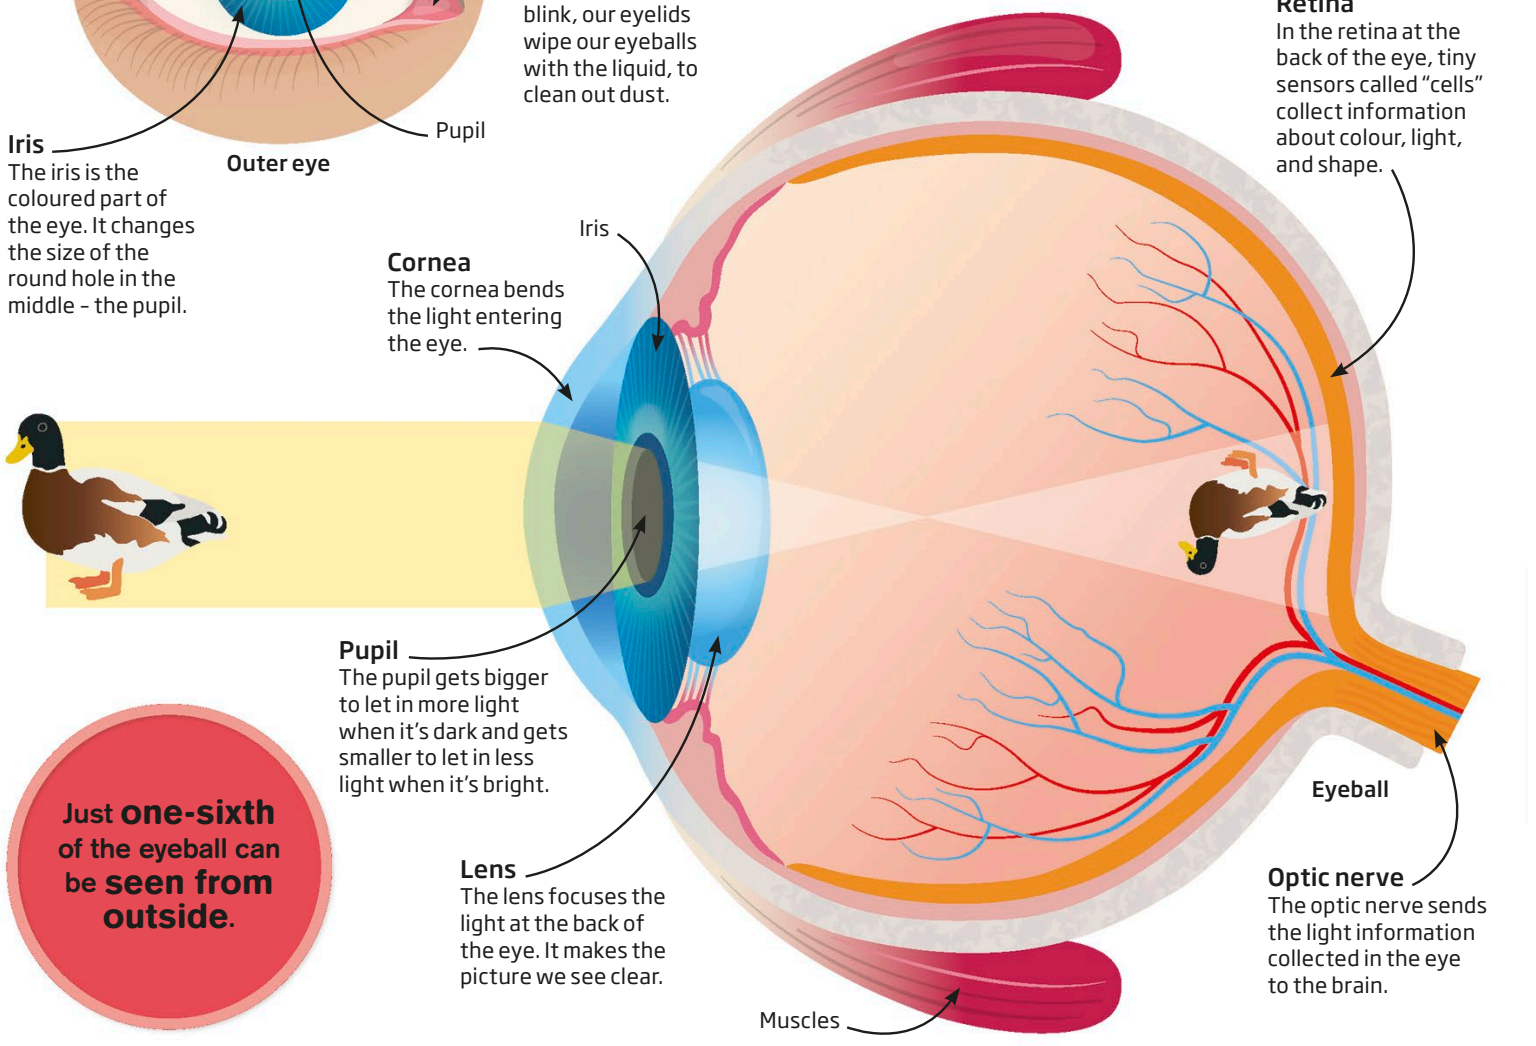
Tear duct
Liquid is made here. When we blink, our eyelids wipe our eyeballs with the liquid, to clean out dust.

Iris
The iris is the coloured part of the eye. It changes the size of the round hole in the middle – the pupil.

Glasses

If an eye lens doesn't focus the light in the right place, the image is blurred. Glasses contain lenses that change where the light focuses in the eye, so the image becomes clear.

Some people use glasses to help them read



Just **one-sixth** of the eyeball can be **seen from outside**.

Sinking and floating

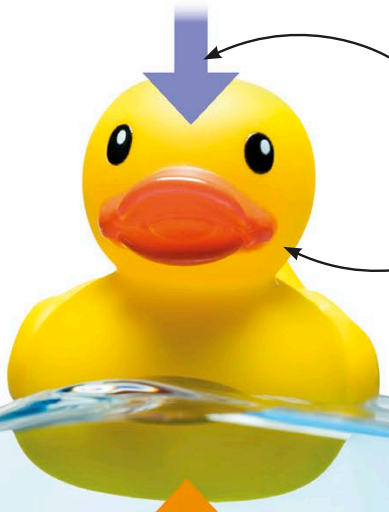
When we place objects in water they can float on the surface or sink below it. The heavier and more packed together a material is, the more likely it is to sink. Materials like stone and metal usually sink, while wood and plastics usually float.

SEE ALSO

- Forces p.108
- Gases p.117
- Gravity p.125
- Materials p.157
- Metals p.162
- Ships p.224

Floating

If the downwards force of an object's weight is less than the force of the water pushing up on it, it will float. The more air an object contains, the more likely it is to float.



The weight of the duck pushes down.

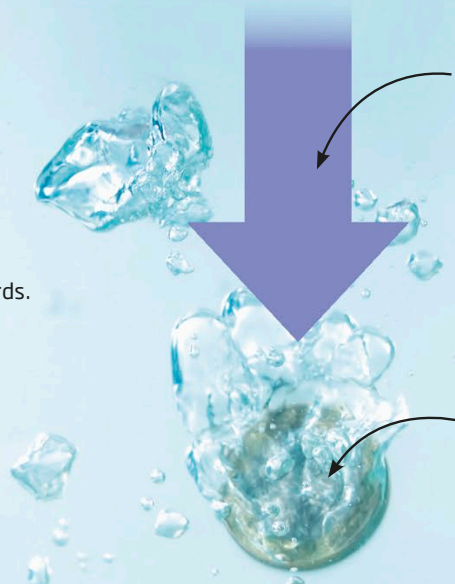
The duck is full of air, making it light and buoyant.

Salt water has more buoyancy than fresh water, so we can float more easily in the sea than in a lake.

Buoyancy

As the duck pushes some of the water out of the way, the water pushes back on the duck. The effect of the upward push of the water is a force called buoyancy.

Buoyancy pushes the duck upwards.



The weight of the coin is pushing it down.

The coin sinks because its weight is greater than its buoyancy.

Massive ships

It seems amazing that huge metal ships float while small metal coins sink. Ships float because they are full of air and because they have a large surface area. The force of buoyancy pushing upwards is spread out and is greater than the ship's overall weight.

The buoyancy of the coin pushes it up.

Sinking

An object sinks when the force of its weight pushing downwards is greater than the force of buoyancy pushing back up on it.

Skeleton

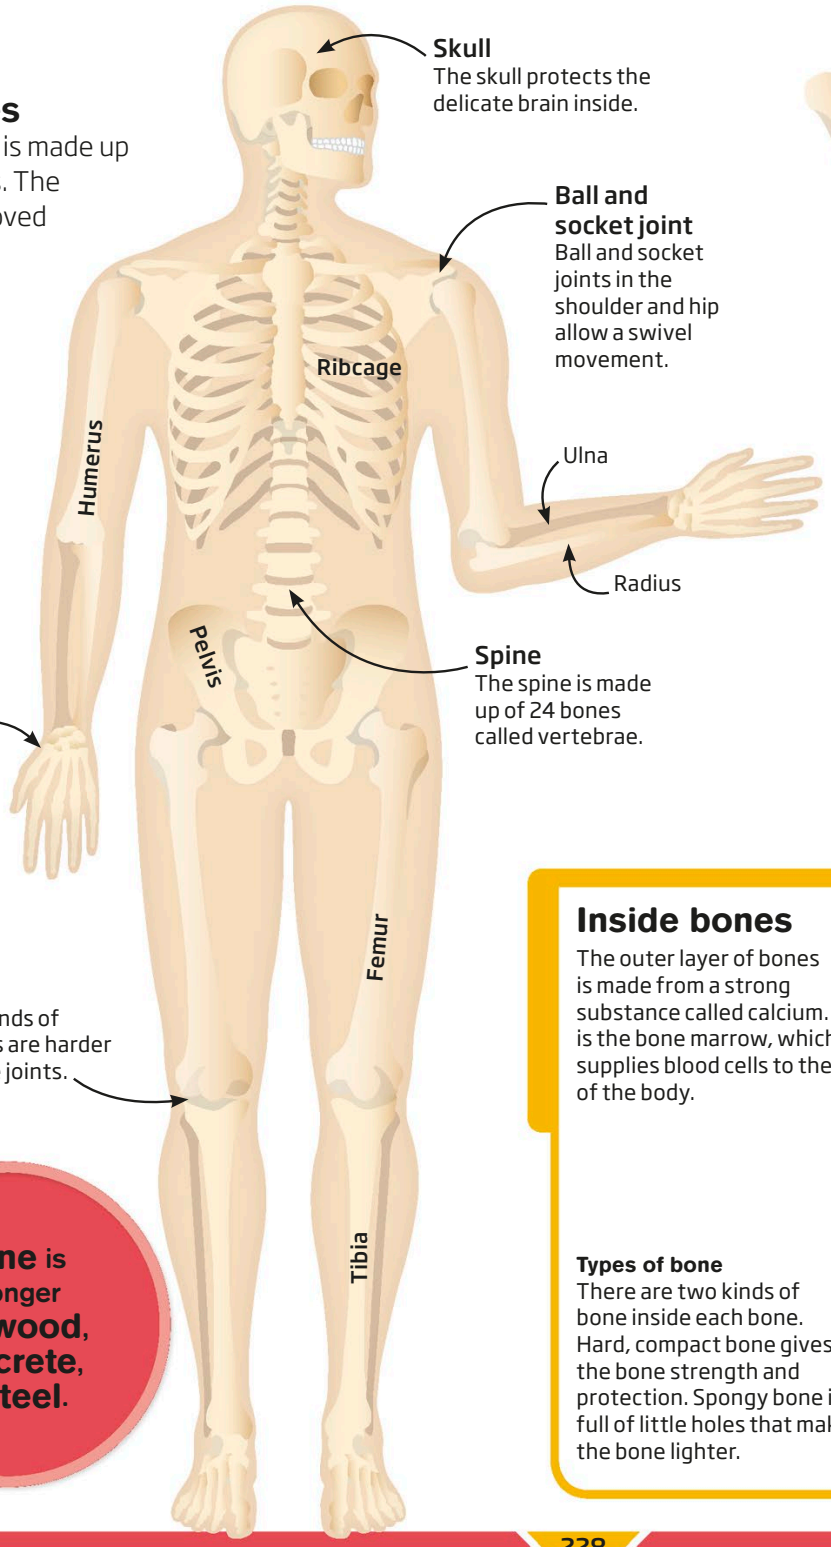
All the bones in the human body fit together in the skeleton. They make up the shape of the human body. The skeleton forms a protective cage around the soft, inner organs like the lungs and the heart.

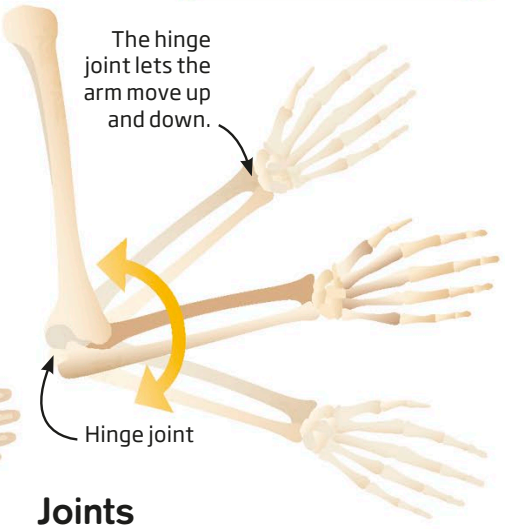
SEE ALSO

- Brain p.45
- Heart p.128
- Human body p.130
- Lungs p.149
- Muscles p.173

Our bones

The skeleton is made up of 206 bones. The bones are moved by muscles.





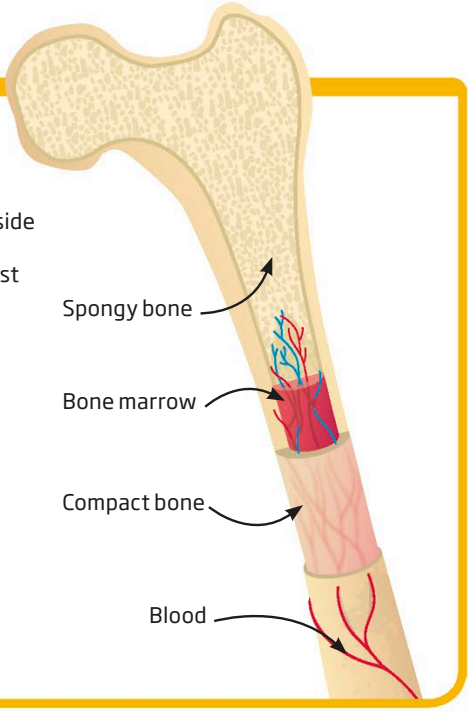
Joints

Joints are the places where one bone joins another to allow movement. They let our bones move side to side, up and down, or in circles. Joints have fluid in them to help make movement smooth.

Bone is stronger than wood, concrete, or steel.

Inside bones

The outer layer of bones is made from a strong substance called calcium. Inside is the bone marrow, which supplies blood cells to the rest of the body.



Types of bone

There are two kinds of bone inside each bone. Hard, compact bone gives the bone strength and protection. Spongy bone is full of little holes that make the bone lighter.

Skin

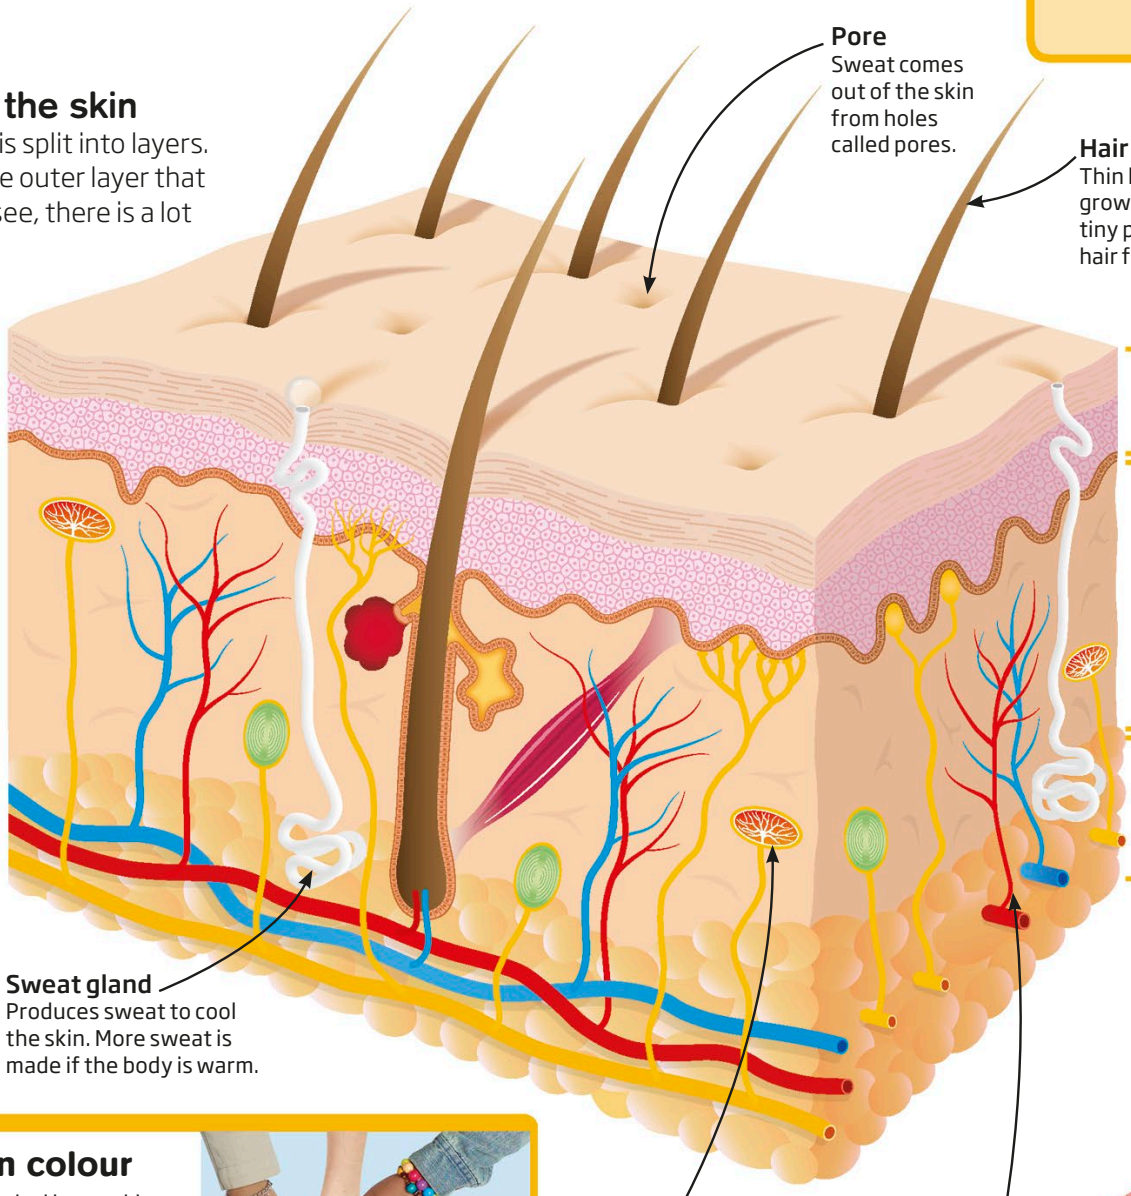
Skin is the stretchy outer layer of the body. It keeps our inside parts inside and germs outside. It protects us from water and sunshine, and keeps us at the right temperature. The outer layer continually flakes off as new skin is made.

SEE ALSO

- Body cells p.41
- Cells p.56
- Genes p.119
- Heart p.128
- Human body p.130
- Touch p.256

Inside the skin

The skin is split into layers. Below the outer layer that you can see, there is a lot going on.



Pore
Sweat comes out of the skin from holes called pores.

Hair
Thin hairs grow out of tiny pits called hair follicles.

Epidermis
The epidermis is the stretchy outer layer of skin we can see.

Dermis
This is the area where sweat, and oil are made to keep the skin stretchy.

Fat
Fat helps cushion knocks and bumps. It also stores energy for the body.

Sweat gland
Produces sweat to cool the skin. More sweat is made if the body is warm.

Nerves
Nerves send signals to the brain that tell us the texture, temperature, and pressure of the things we touch.

Blood vessels
These tubes carry blood around the body. They get wider to allow more blood to flow and to help the body to cool down.

Skin colour

A chemical in our skin called melanin controls skin colour. The more melanin you have in your skin, the darker it is. It is made in the epidermis, the top layer of skin.

Skin is the body's biggest organ. It weighs 4 kg (8.8 lb)!

Slavery

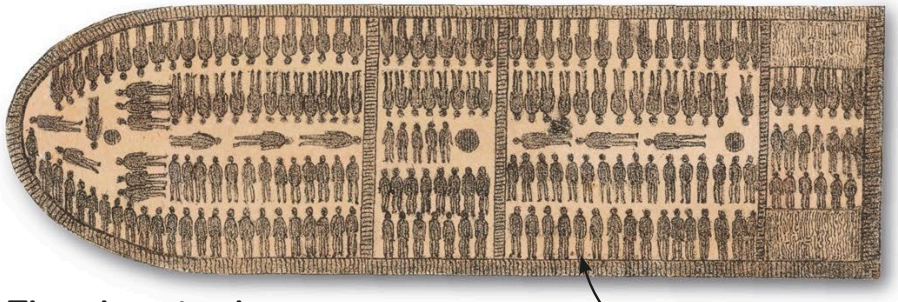
Slaves are people who have had their rights taken away and are treated like property. They may have been captured in war, owe more money than they can pay, or have parents who are slaves. Slavery has been used throughout history, but today it is against the law in every country in the world.

SEE ALSO

- Africa p.12
- Ancient Rome p.20
- Law p.145
- North America p.184
- Ships p.224
- Trade p.257

Slave labour

In the early 1800s, big farms called plantations in the USA used slave labour to pick cotton, cut sugar cane, and perform other tasks. Slaves worked long hours in very bad conditions.



People were often chained and packed tightly into slave ships.

The slave trade

To keep American plantations supplied with workers, ships carried slaves from Africa to America. Between 1450 and 1850, 12 million people crossed the Atlantic Ocean.

Slavery today

Though slavery is now illegal, over 20 million people are still kept as slaves, mostly in Asia and Africa. Groups around the world are working to solve this terrible problem.

Sleep

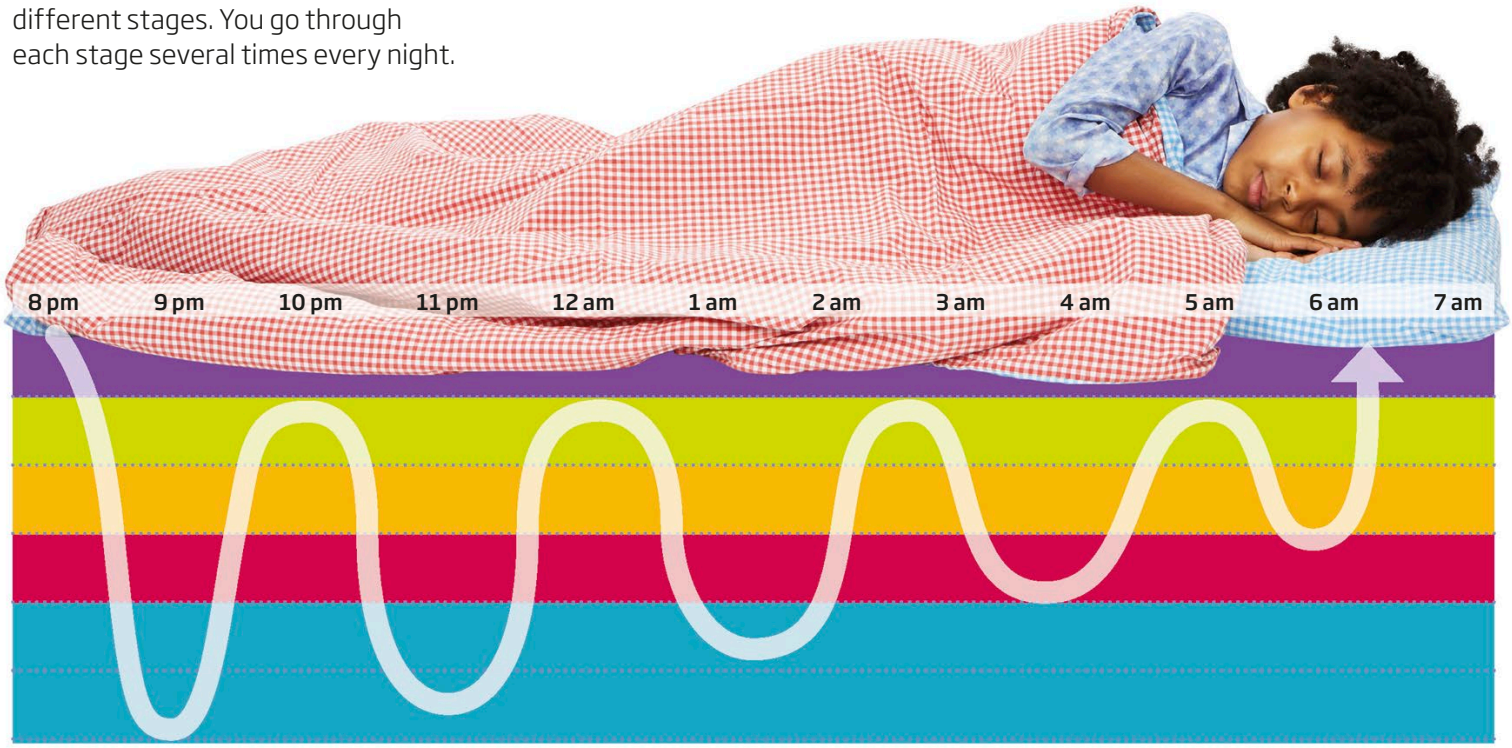
Every night we sleep and our bodies rest, repair, and grow. While we sleep our brains sort through the information gathered from our senses and some of it is deleted and some is stored as memories. We need sleep to stay fit and healthy.

SEE ALSO

- Brain p.45
- Eating pp.104–105
- Hibernation p.129
- Human body p.130
- Sickness p.225

Sleep patterns

Our sleep follows a pattern of different stages. You go through each stage several times every night.



Awake
When we wake up, we become alert and aware of our surroundings.

Dreaming
We dream when we're close to waking. We have three to seven dreams a night.

Light sleep
Breathing slows down but the brain is still active and you can wake up easily.

Shallow sleep
We move around more during shallow sleep than during deep sleep.

Deep sleep
This is when our bodies are growing and repairing muscle, tissue, and bones.

Why do we sleep?

Sleep is important because without it our brain and body slowly stop working.

Memory
Our brain deletes useless information and stores more important things while we sleep.

Energy
If we don't get enough sleep, we lack energy and want sugary food.

Healing
Our bodies heal better and faster when we get plenty of solid sleep.

Growth
Our bodies grow and repair muscles and bones while we are in a deep sleep.

You will spend one-third of your life asleep. This is around 30 years in total!

Smell

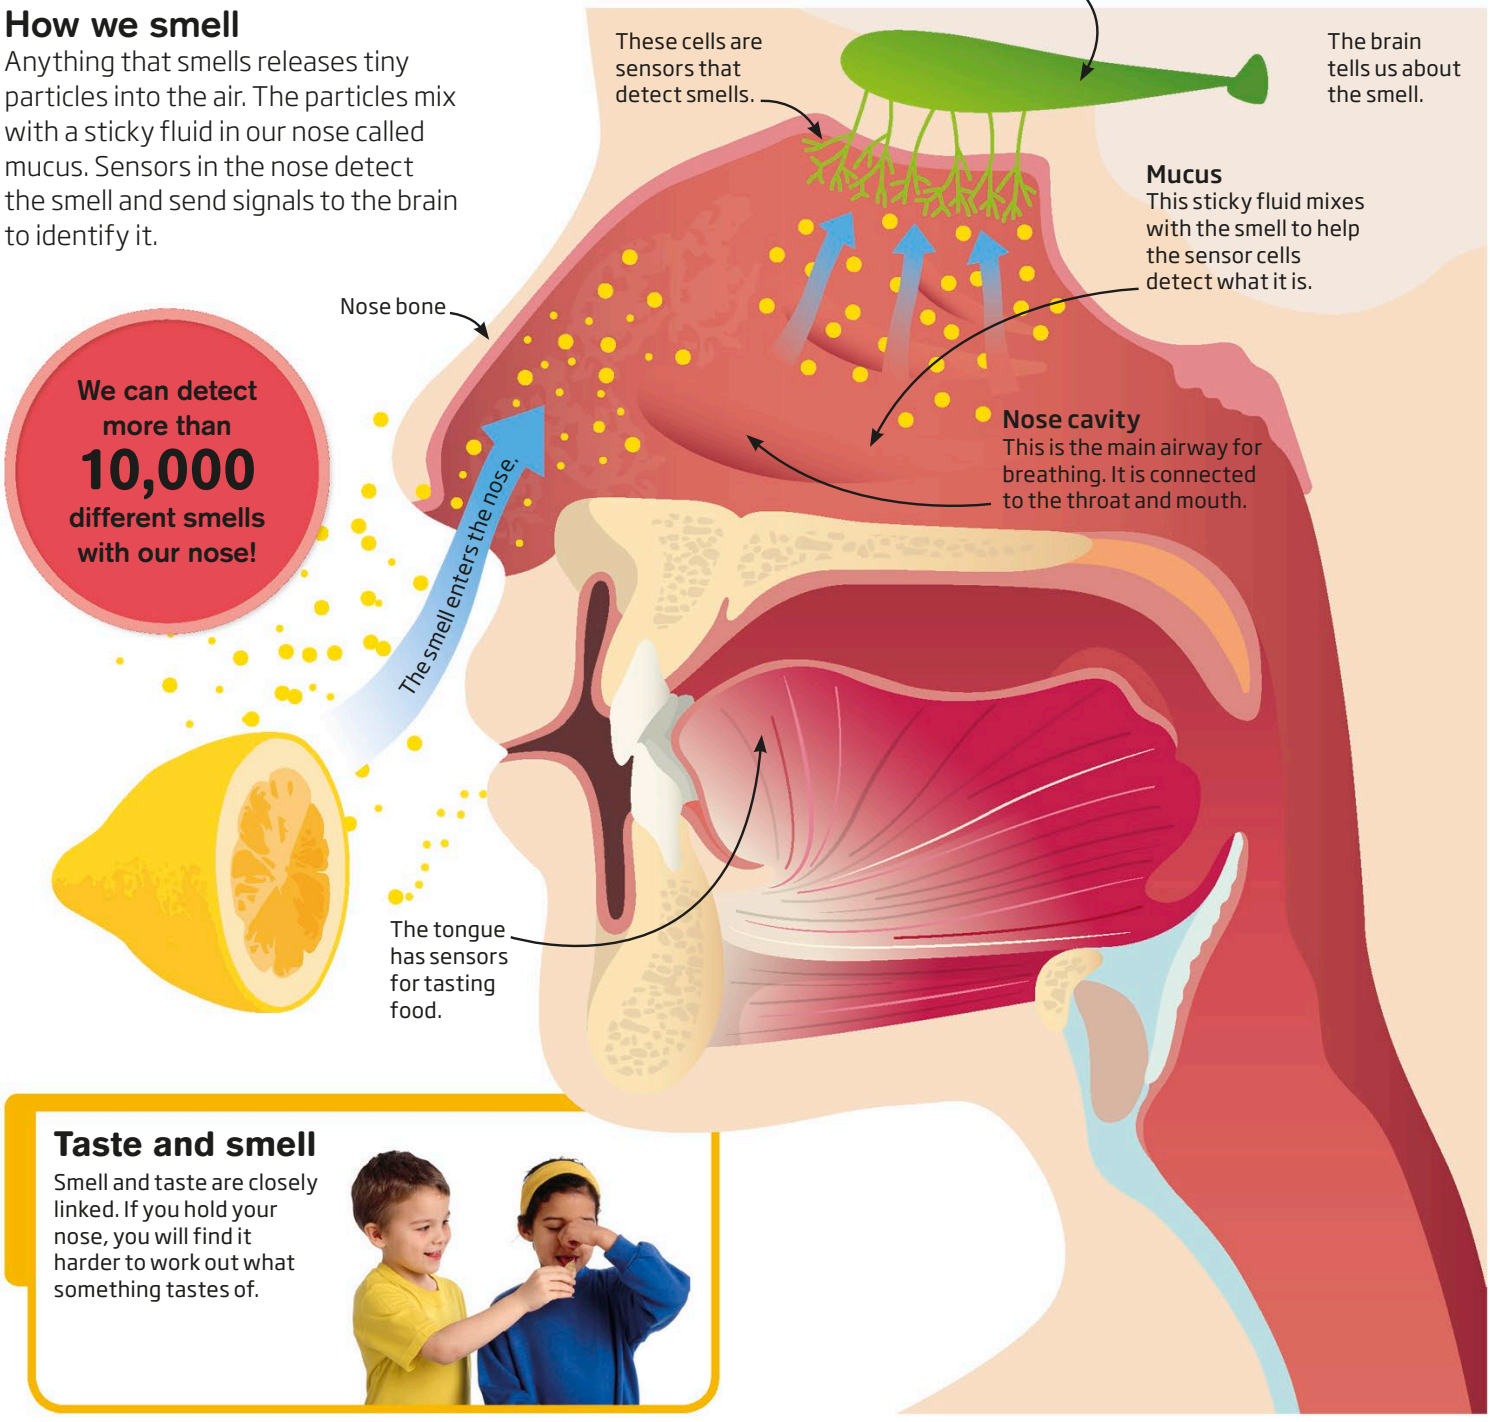
Smell is one of our senses. When tiny parts of something float through the air and into our nose we identify a smell. The brain tells us what it smells like compared to other things we've smelled before.

SEE ALSO

- Brain p.45
- Hearing p.127
- Human body p.130
- Muscles p.173
- Skeleton p.228
- Taste p.249

How we smell

Anything that smells releases tiny particles into the air. The particles mix with a sticky fluid in our nose called mucus. Sensors in the nose detect the smell and send signals to the brain to identify it.



Taste and smell

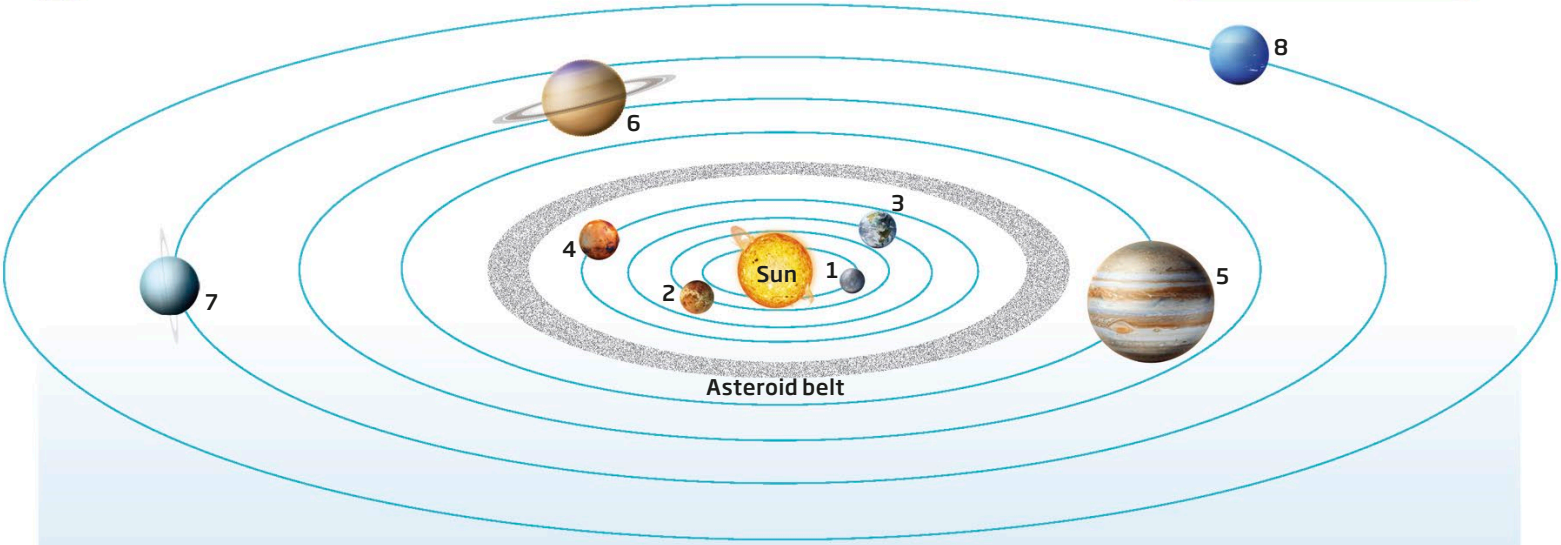
Smell and taste are closely linked. If you hold your nose, you will find it harder to work out what something tastes of.

Solar System

The Solar System is made up of our star, the Sun, and everything that travels around it. This includes eight planets and their moons, asteroids, and comets. Scientists think the Solar System formed 4.6 billion years ago, from a massive spinning cloud of gas and dust.

SEE ALSO

- Asteroids p.30
- Comets p.68
- Earth p.83
- Jupiter p.141
- Neptune p.183
- Sun p.247
- Universe p.263



Orbiting planets

The Sun is the centre of the Solar System. Everything in the Solar System travels around, or orbits, the Sun.

1. Mercury
Mercury is the smallest planet.

2. Venus
The surface of Venus is super-hot.

3. Earth
Earth has lots of liquid water.

4. Mars
Mars has a red, dusty surface.

5. Jupiter
Jupiter is the largest planet.

6. Saturn
Saturn is famous for the rings around it.

7. Uranus
Uranus is thought to be the coldest planet.

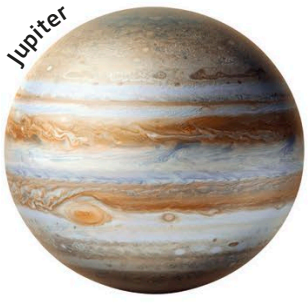
8. Neptune
Neptune has strong winds and giant storms.

Types of planet

There are three types of planet in the Solar System. The rocky planets orbit close to the Sun, and the gas and ice giants orbit further away.

Rocky planets
Mercury, Venus, Earth, and Mars are small and rocky with solid surfaces.

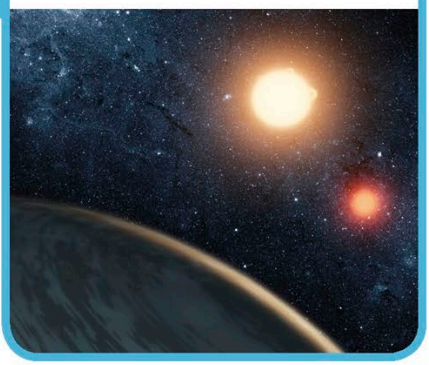
Ice giants
Uranus and Neptune are made of a mixture of gas and icy materials.



Gas giants
Jupiter and Saturn are huge planets made of gas.

Kepler-16b

There are many other solar systems in the Universe. Scientists have even found a planet, called Kepler-16b, that orbits two suns.



Solids

Solids are materials that keep their shape. They don't flow like water – they stay where you put them. Solids are useful for making many things, from mobile phones to houses. They are usually hard materials, but soft materials that keep their shape are solid, too.

SEE ALSO

- Changing states p.57
- Gases p.117
- Liquids p.148
- Materials p.157
- Metals p.162
- Plastic p.195

What solids do

Solids can be hard, bendy, strong, squishy, see-through, or magnetic. The behaviours of a solid are called its properties.

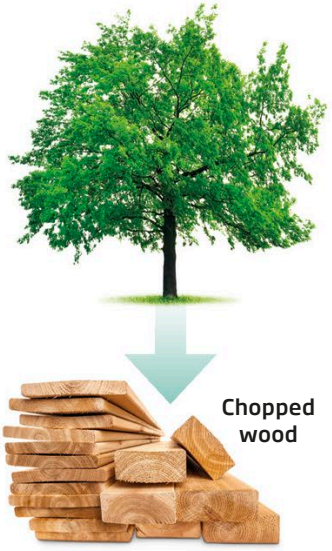
Particles

Solids are made from tiny particles that are close together. If enough heat is added, they start to move past each other to become liquid.

Solid rocks become liquid lava when heated to very high temperatures.

Cutting solids

We can cut solids into different shapes. Wood is a solid material that comes from trees. We cut and shape it to make furniture.



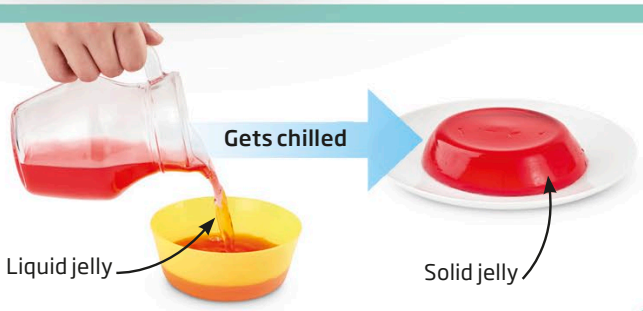
Shaping solids

Metal is a hard solid we can find underground. We heat metal to make it soft, then bend and hammer it into the shape we want. When it cools, metal keeps its shape.

A hot metal horseshoe

Making new solids

We can make new solid materials by mixing other materials together. For example, jelly is made by adding hot water to jelly cubes to make a liquid. The liquid then cools into a solid.

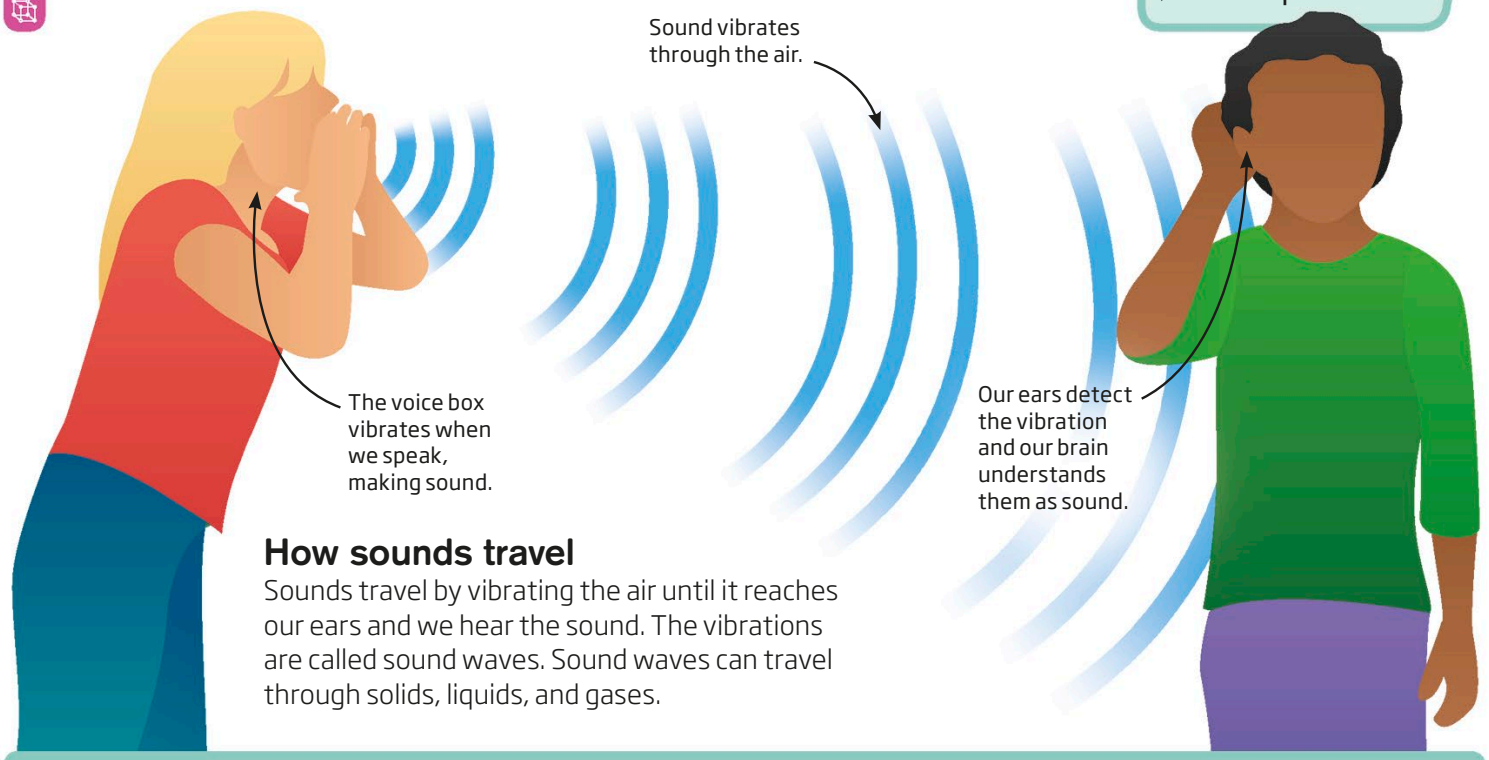


Sound

A sound is made when something vibrates. The bigger the vibration, the louder the sound is. The faster something vibrates, the higher pitched the sound is. Sound vibrations travel through things to get to our ears.

SEE ALSO

- Gases p.117
- Hearing p.127
- Liquids p.148
- Musical instruments p.175
- Music pp.176–177
- Solids p.234



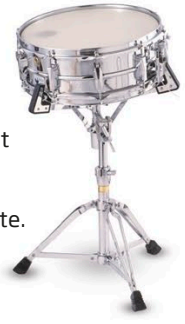
How sounds travel

Sounds travel by vibrating the air until it reaches our ears and we hear the sound. The vibrations are called sound waves. Sound waves can travel through solids, liquids, and gases.

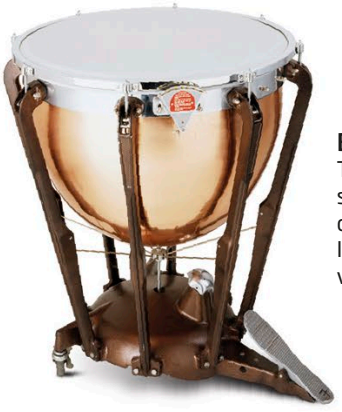
Volume

Volume changes depending on how big a vibration is. The bigger the vibration, the louder the sound. How high or low a sound is depends on how fast something vibrates. The faster the vibration, the higher the sound.

Things sound louder when they are close to us.



Small drum
We can hit a small drum harder to make it louder, but it vibrates at the same speed so it has a constant note.



Big drum
The big drum vibrates more slowly, so it has a lower note compared to the small drum. It's bigger, so it makes bigger vibrations that are louder.

South America

The continent of South America is surrounded by ocean, except at the top where it joins with North America. One-third of the continent is covered by a huge jungle, called the Amazon rainforest. The Andes mountain range stretches all the way down one side of South America.

SEE ALSO

- Amphibians p.15
- Explorers p.96
- Incas p.132
- North America p.184
- Rainforests p.204
- World p.275

The giant tortoises of the Galápagos Islands can live for more than 150 years.

Giant tortoise

About South America

Population: 422.5 million

Highest point: Aconcagua

Lowest point: Laguna del Carbón

Biggest desert: Atacama Desert

Longest river: Amazon

Andean condor

Amazon rainforest

The world's biggest forest, the Amazon, is home to thousands of species of plant and animal. Many native, or indigenous, tribes live in the forest, too.

Leatherback turtle

Christ the Redeemer

This soapstone statue is 39 m (128 ft) high. It overlooks the Brazilian city of Rio de Janeiro.

Machu Picchu

Built by Inca Emperor Pachacuti in 15th-century Peru, Machu Picchu is a spectacular mountain-top town. Many thousands of people visit it every year.

Inca builders used interlocking stones that fitted together very tightly.

The skin of the golden poison dart frog is covered in a deadly poison.

Space travel

Space travel is how we explore the Solar System and learn about our place in the Universe. Most space travel is done using robot spacecraft called probes. The furthest in space that humans have travelled themselves is to the Moon.

SEE ALSO

- Astronauts p.31
- Moon p.171
- Exploration pp.180–181
- Radio p.203
- Robots p.212
- Solar System p.233

Humans in space

To get into space, people use super-powered spaceships. Space shuttles like *Atlantis* were used to take people into space for 30 years. Now people use the Russian *Soyuz* spacecraft.

The outside fuel tank is filled with liquid hydrogen and oxygen to power the shuttle's engines.

Astronauts sit in the cockpit.

This booster rocket gives extra power.

Launch of the space shuttle *Atlantis*

It takes a robot spacecraft about six months to travel to Mars.

Solar cells use the Sun's power to make the probe work.

***Juno* probe**

Magnetometer measures magnetic fields.

Robots in space

Probes gather data using cameras, magnetometers, and radars, then send the data back to Earth.

Extreme environment

Space is not an easy place for people to be in. It can be both extremely hot and cold. There are dangerous rays from the Sun and there is no air to breathe. Spaceships and stations are carefully designed to keep astronauts safe.

Astronaut Karen Nyberg washes her hair on board the International Space Station.

Spiders

Spiders are animals with two body segments and eight legs. They are predators, hunting other small animals to eat. They do not chew their food, but turn it into liquid before sucking it up.

SEE ALSO

- Animal groups p.22
- Animal homes p.23
- Food chains p.107
- Insects p.134
- Invertebrates p.139
- Sight p.226

Tarantula

Some of the world's largest spiders are tarantulas. As they get bigger, their old skin comes off and they grow a new one.

Tarantulas bite with their venomous fangs, but their bite is less harmful to humans than a bee's sting.

Leg hairs help tarantulas feel the vibrations of other animals nearby.

Spiders can grow back their legs if they break off.

The row of eyes help the jumping spider see all around it.

Jumping spider

Jumping spiders can jump 30 times their body size. They use their good eyesight to spot other animals.

The body is designed for speed.

Huntsman spider

These spiders don't build webs, but hunt and forage for insects. Females can go for three weeks without eating.

Spider webs

Many spiders build webs, using silk that they make in their bodies. Some spiders use their web to trap and store the insects they eat.

Sport

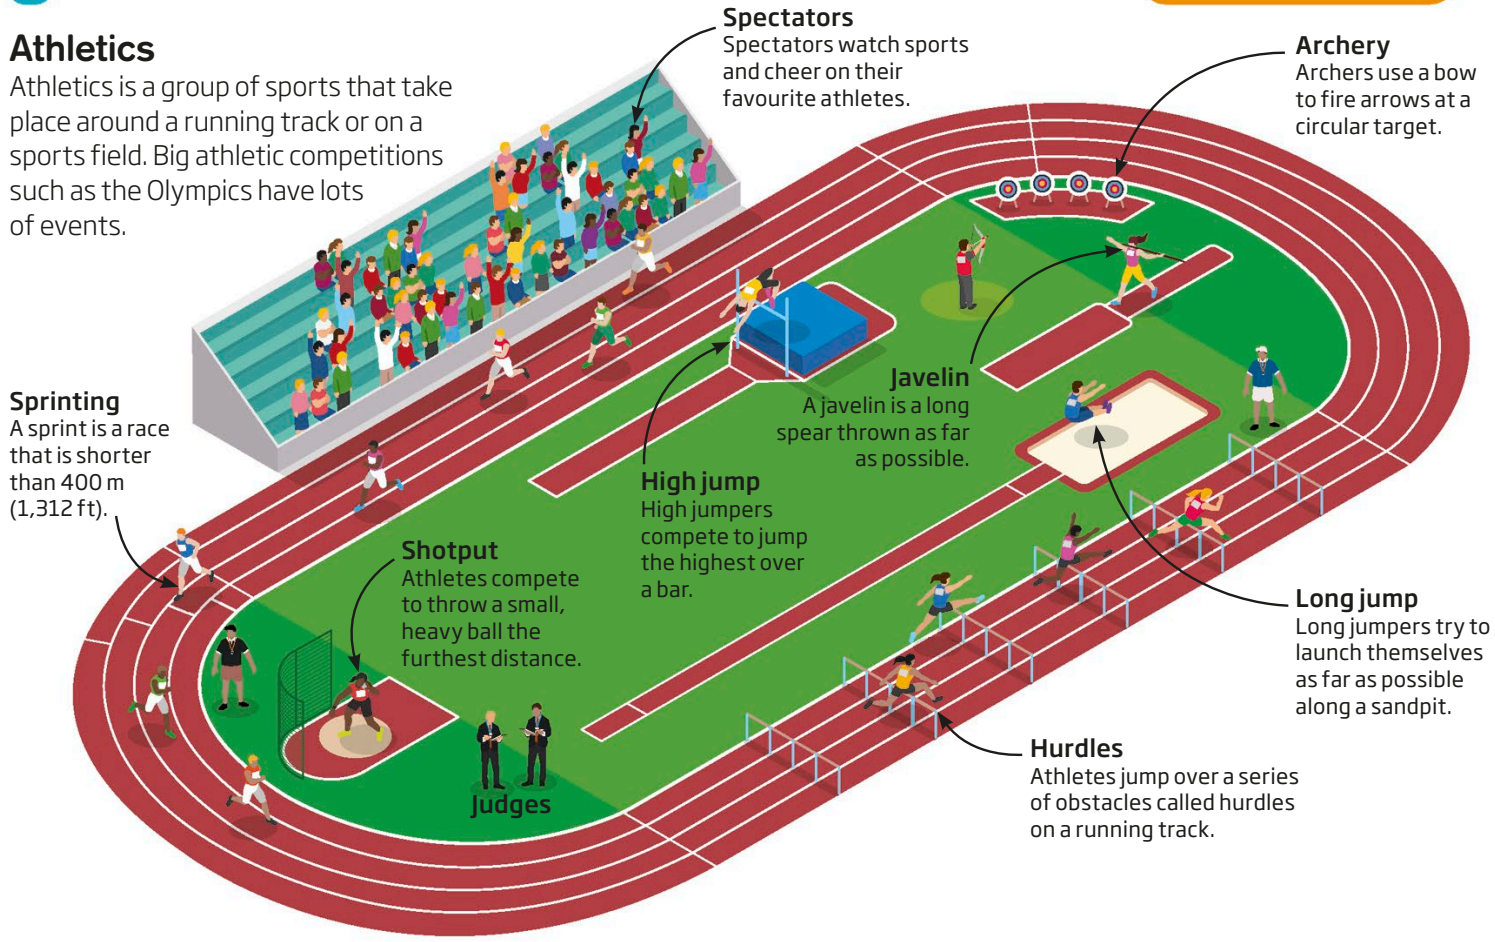
Sport is a physical activity performed by individuals or teams of players. There are usually rules to sports, and team sports often take place in a set amount of time. Individuals and teams compete against each other to achieve the best result or the highest score.

SEE ALSO

- Ancient Greece p.18
- Bicycles p.36
- Dance p.76
- Games pp.240–241
- School pp.272–273

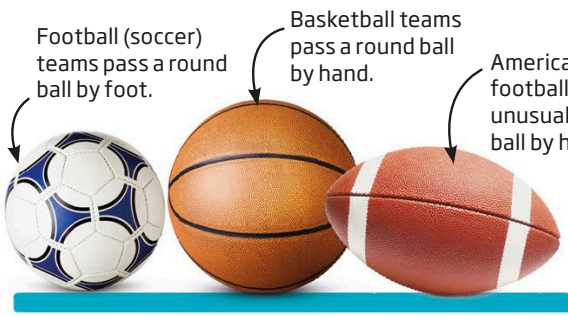
Athletics

Athletics is a group of sports that take place around a running track or on a sports field. Big athletic competitions such as the Olympics have lots of events.



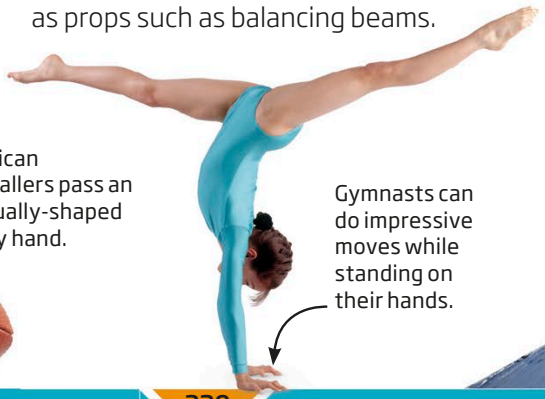
Team sports

Sports such as football, rugby, and cricket are played between two opposing teams. The team that scores the most goals or gets the highest number of runs or points wins the game.



Gymnastics

Strong gymnasts use their bendy bodies for moves including flips and handstands. They use the floor as well as props such as balancing beams.



Winter sports

In cold weather, competitors use snow and ice to ice-skate, ski, snowboard, and bobsleigh. Many winter sports involve performing tricky moves, or racing.

Games

A game is an activity or sport played using a set of rules. Games are played by individuals or by teams of players, who compete against each other. Some games use balls and bats or rackets and are played on special courts; others use boards with specially designed game pieces.

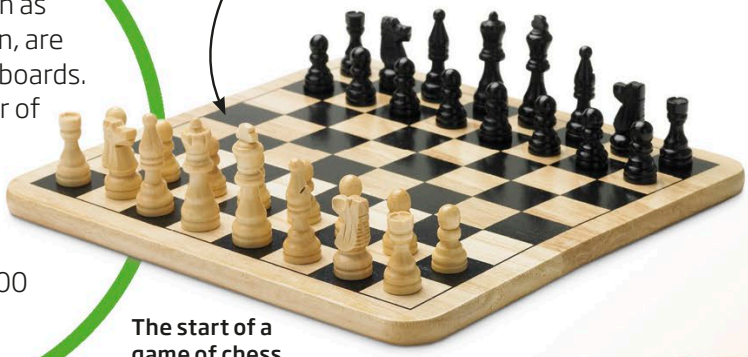
Racket sports

Tennis, badminton, and squash are sports played using a racket on a special court. In tennis, opponents hit the ball across a central net, and in badminton they hit a shuttlecock. In squash, the players hit the ball against a wall.

The tennis racket frame has strings pulled tightly across it.

Board games

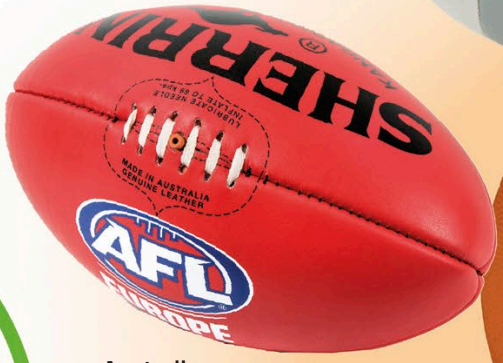
Table-top games, such as chess and backgammon, are played on purpose-built boards. Each player has a number of pieces, such as chessmen, that they move according to a set of rules. Board games were first played in ancient Egypt 5,500 years ago.



A chessboard has a grid of black and white squares.

The start of a game of chess

Table tennis ball

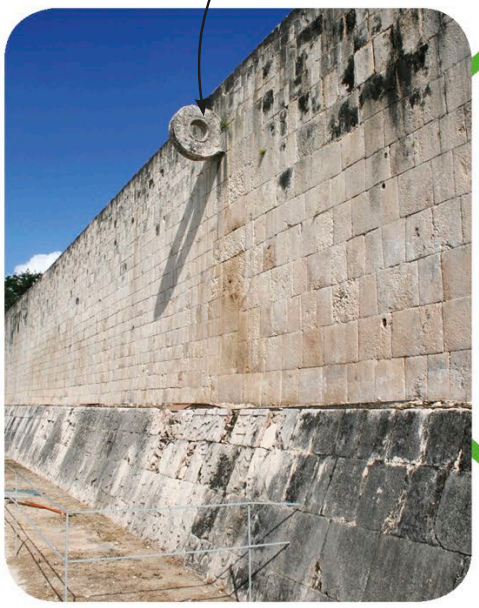


Australian rules football

Handball

Baseball

Stone ring to hit the ball through.



Stone-walled Mayan ball court

Ball and wall games

The ancient Mayans of Central America played a ball game on long, narrow, stone-walled courts. Players used a solid rubber ball, which they had to keep in play by using only their hips and arms – they weren't allowed to touch it with their hands or feet.

The first **Olympic Games** were held in ancient Greece in 776 BCE.

The Olympics

Every four years, athletes compete for their country in the Olympic Games. The Olympics includes lots of different sporting events, including athletics, gymnastics, and team sports.

Olympic sprint relay race

Lacrosse ball

American football

Golf ball

Volleyball

Football

The first **computer game** was developed in 1947. Players fired a dot at a target.

Computer games

Computer games are played on a computer or through a console on a TV screen. Many games include special effects and music. They can be one-player or multi-player games.

Ball sports

Ball sports are among the most popular games of all. Teams of up to 15 players-a-side play in matches of football, rugby, basketball, American football, Australian rules football, cricket, and other games. Huge crowds watch these matches, many of which are shown on television.

Basketball

Rugby ball

A child plays a computer game.

Stars

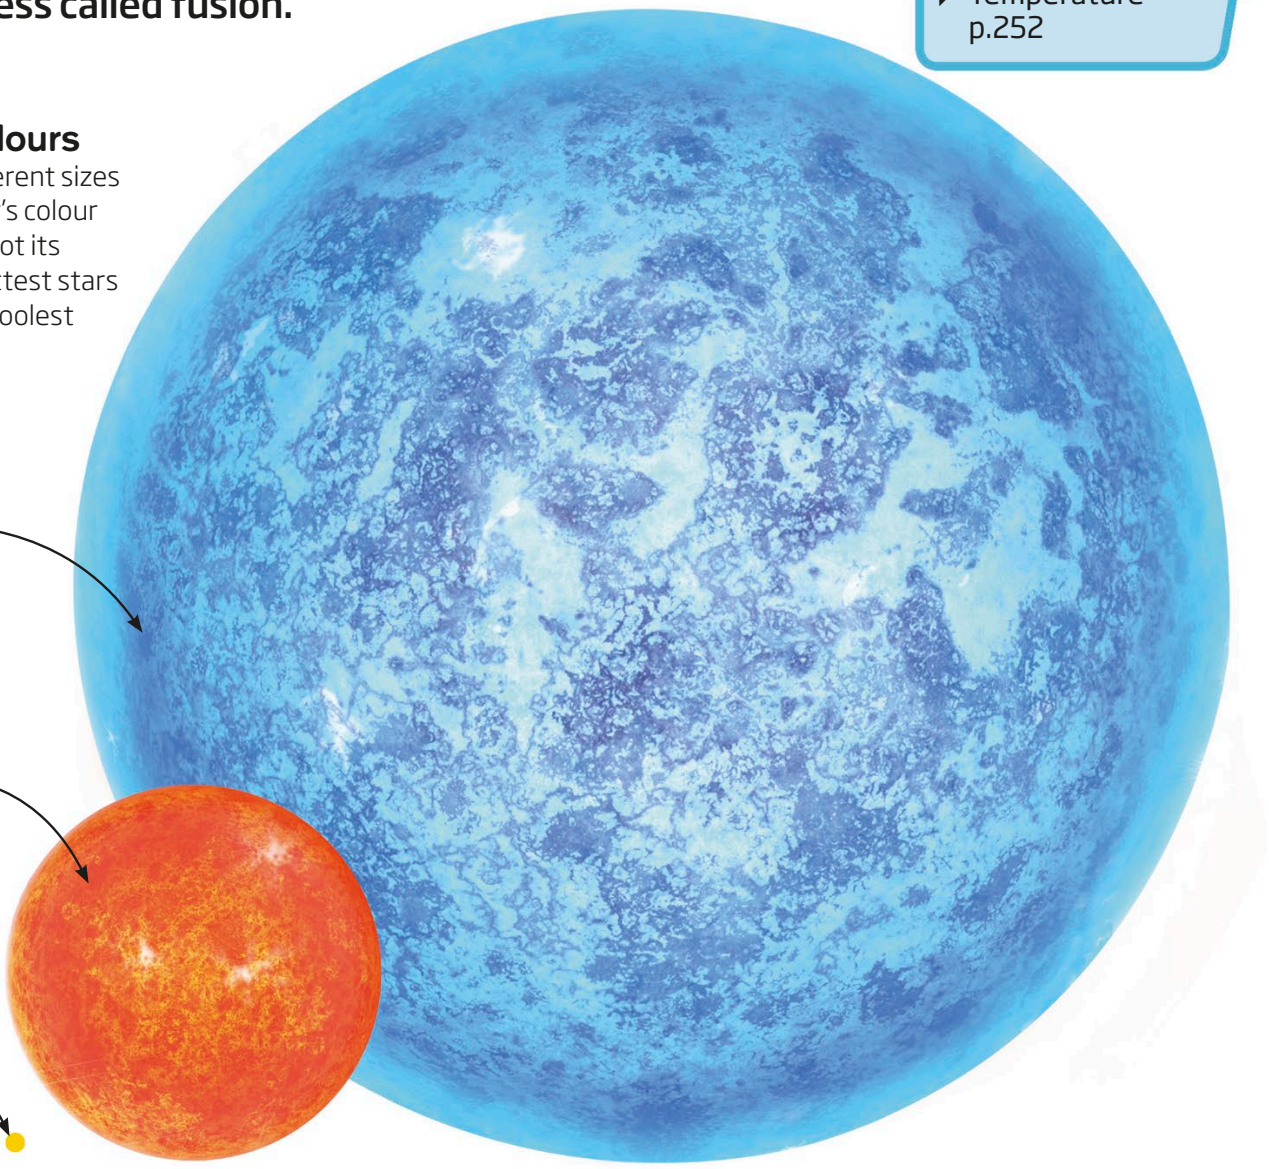
Stars are balls of very hot gas, deep in space. From Earth, they look like tiny dots but are actually huge. The smallest ordinary star is about the same size as Jupiter. Stars shine because the gases inside them constantly crash together in a process called fusion.

SEE ALSO

- Colour pp.26–27
- Galaxies p.116
- Light p.147
- Solar System p.233
- Sun p.247
- Temperature p.252

Sizes and colours

Stars come in different sizes and colours. A star's colour depends on how hot its surface is. The hottest stars are blue, and the coolest ones are red.



Blue supergiant
These stars are very young and extremely hot.

Red giant star
Red giants are older stars with cool surface temperatures.

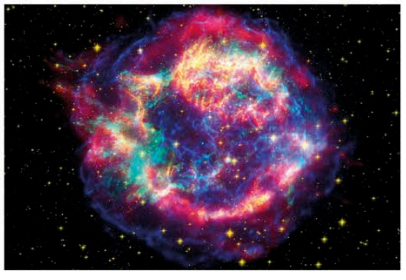
Sun
Our Sun is a middle-aged, medium-sized star with a medium surface temperature.

The nearest star

The star closest to the Earth after our Sun is Proxima Centauri, a red dwarf with at least one planet. This star is 9,000 times further away than Neptune, the planet furthest from the Sun.

Star deaths

Some stars end their lives in a spectacular explosion called a supernova. Others slowly fade as they run out of energy.



Cloud of material from a supernova explosion

Stone Age

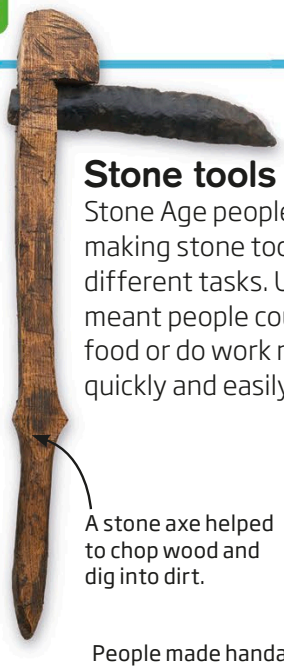
The Stone Age was a period of time that began about 3.3 million years ago and lasted until about 4,000 years ago. In the Stone Age, people made tools out of stone for the first time. They used them to cut meat and plants, to build shelters, and, in the late Stone Age, for farming.

SEE ALSO

- Art p.28
- Buildings p.48
- Caves p.55
- Early humans p.82
- Farming p.98
- Food p.106

Stone tools

Stone Age people began making stone tools to do different tasks. Using tools meant people could get food or do work more quickly and easily.



A stone axe helped to chop wood and dig into dirt.

People made handaxes to help them cut meat and chop hard plants.

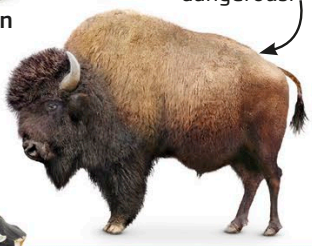
Finding food

Finding food was the most important part of life for people in the Stone Age. They ate wild plants, and animals from land and sea.

Blueberries

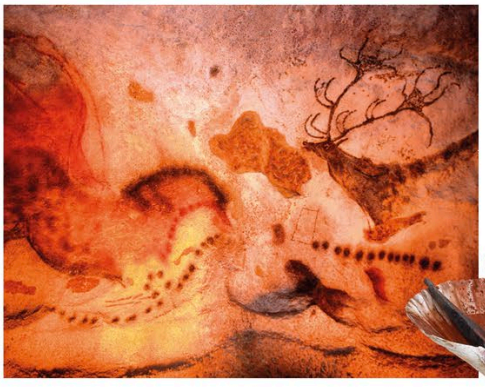
Salmon

Bison
Hunting for big animals, such as bison, could be dangerous.



Cave painting

Some Stone Age peoples made beautiful artwork on cave walls, often showing the animals they would hunt. These paintings are still being found today.



Lascaux cave paintings in France

Paint could be made from powdered fats and minerals.

Buildings

The first Stone Age buildings were made of wood and animal skins. By the end of the Stone Age, people had begun building large stone structures called megaliths.

Stonehenge in England is a famous Stone Age megalith that is still standing today.

Homes

A home is a house or building in which you live. That home might be built of canvas, stone, bricks, wood, or ice. It could even be carved out of solid rock. Homes can be built separately as single, detached houses or built together as rows of terraces. Some homes are built on top of each together in blocks called flats or apartments.

Grand palaces

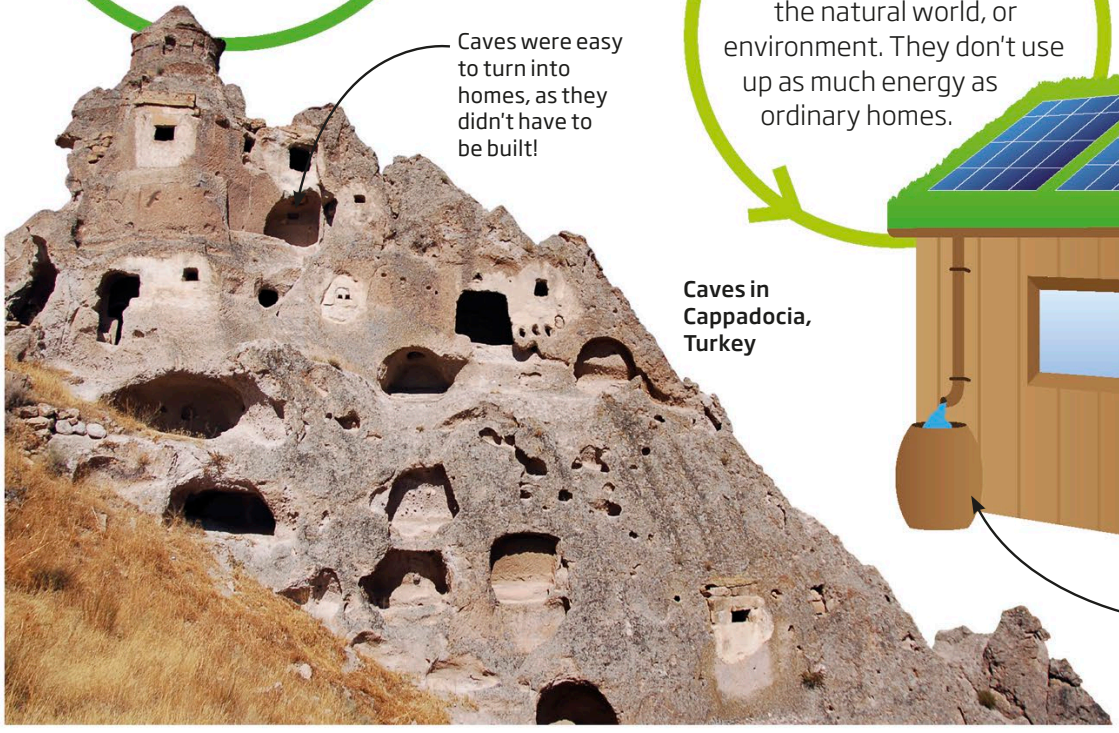
The kings and queens of Europe were very rich and lived in magnificent palaces and castles. They feasted in great halls and received visitors in grand throne rooms.

Neuschwanstein Castle in Germany

Early homes

Some early people made their homes in caves or holes dug into sides of mountains and hills. Others cut down trees to build simple wooden huts, which they draped with animal skins.

Some early people built simple **grass shelters**. The layering of grasses is called **thatching**.

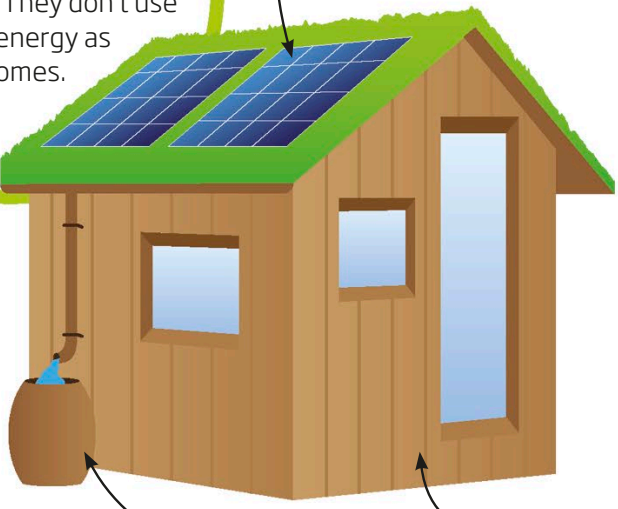


Caves were easy to turn into homes, as they didn't have to be built!

Caves in Cappadocia, Turkey

Eco homes

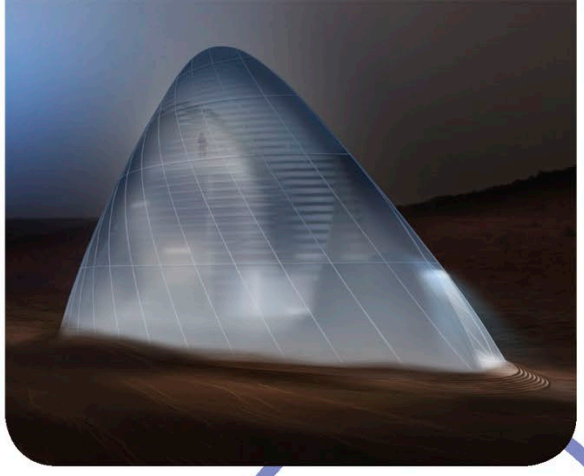
Today, some homes are specially built to work with the natural world, or environment. They don't use up as much energy as ordinary homes.



Solar panels on the roof make energy from sunshine.

Rainwater is collected for reuse.

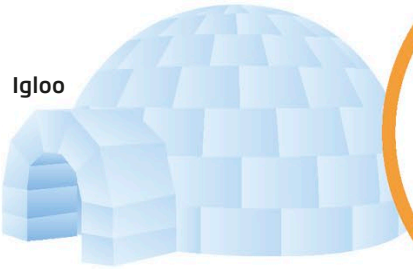
Walls have added layers to save heat (this is called insulation).



Plan for 3D-printed houses on the planet Mars

Future homes

What will homes of the future look like? Some might be built using a method called "3D printing". With this method, robots add material layer upon layer to create a three-dimensional shape.



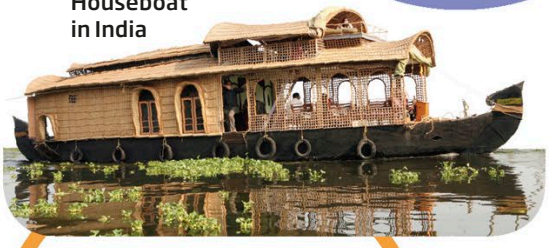
Igloo

Extreme homes

In the cold Arctic, some Inuit people build shelters called igloos out of blocks of ice. Igloos keep out the wind and are warm inside.

House designed by Antoni Gaudí

Houseboat in India



Moving homes

Some people live in homes that can move from place to place. They float in houseboats on water or live in wheeled caravans towed by cars or horses.

Architecture

Architecture is the art of designing and making buildings. In Barcelona in Spain, architect Antoni Gaudí was inspired by nature and decorated his buildings with different materials and colourful patterns.

Storms

Storms are powerful winds that often bring rain, thunder and lightning, snow, hail, dust, or sand. Storms can cause serious damage if they have very high wind speeds or heavy rain that leads to flooding. Tornadoes, hurricanes, and thunderstorms are all types of storm.

SEE ALSO

- Climate change p.60
- Clouds p.64
- Electricity p.87
- Erosion p.93
- Water cycle p.270
- Weather p.271

Tropical giants

The biggest and most destructive storms, called hurricanes or typhoons, happen in tropical areas, above warm water. They begin when groups of smaller storms spin together into a spiral shape.

Hurricanes are given people's names, such as Alex, Matthew, and Patricia.

Thunderstorms

Storms with thunder and lightning are common in summer. They often have heavy rain or hail that can break things and cause floods.

Tornadoes

Tornadoes are fast-spinning columns of air that form during massive thunderstorms. A tornado can destroy everything in its path.

Sun

The Sun is the star at the centre of our Solar System. It is one of at least 100 billion stars in our Milky Way galaxy. The Sun gives off light and heat, making it possible for life to exist on Earth.

SEE ALSO

- Atmosphere p.33
- Atoms p.34
- Gases p.117
- Magnets p.151
- Milky Way p.167
- Solar System p.233
- Stars p.242

Massive explosions send jets of gas out from the surface.

Yellow dwarf

Astronomers describe the Sun as a yellow dwarf, although it is a medium-sized star. It is a hot ball of gases that are constantly on the move, creating energy.

Dark sunspots are the cooler regions on the Sun's surface.

These bright bursts of energy are called solar flares.

Loops of gas are called prominences.

The Sun is **1.3 million** times bigger than Earth.

Auroras

Towards the top and bottom of the Earth (at its poles), particles from the Sun meet Earth's magnetic field. This colourful glow is called an aurora.

Final stages of the Sun

In about 5 billion years time, the Sun will have used up most of the gases that keep it shining. It will collapse into a small, very hot white dwarf. It will then slowly cool down and eventually fade away.

Symmetry

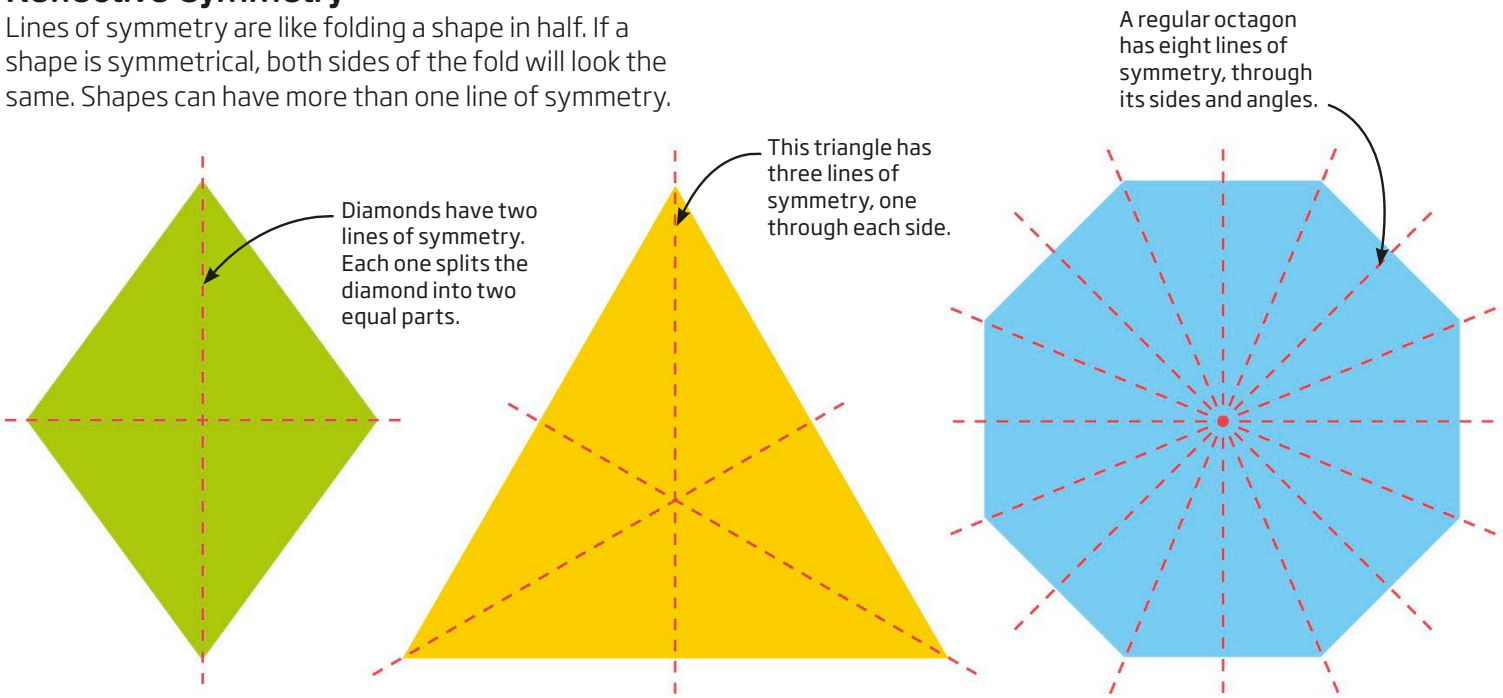
There are two types of symmetry. Reflective symmetry is when lines can be drawn to divide a shape into identical parts. Rotational symmetry is when a shape can be turned round (rotated) and still look the same.

SEE ALSO

- Art p.28
- Flowers p.103
- Human body p.130
- Shapes p.222
- Sight p.226
- Games pp.240–241

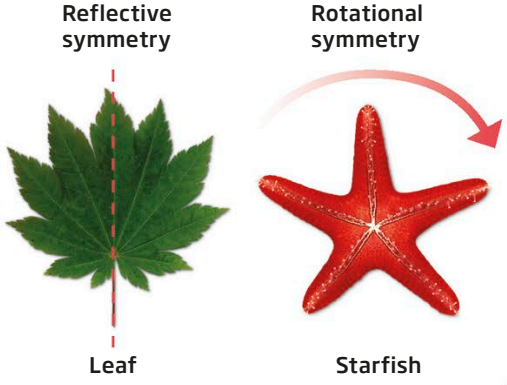
Reflective symmetry

Lines of symmetry are like folding a shape in half. If a shape is symmetrical, both sides of the fold will look the same. Shapes can have more than one line of symmetry.



Symmetry in nature

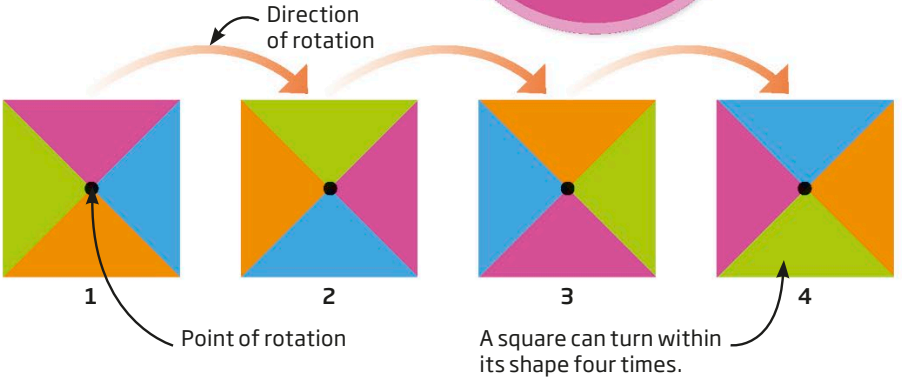
Nature has many examples of both types of symmetry. Most animals, including humans, are roughly the same on both sides – they have a line of symmetry down the middle.



Rotational symmetry

If a shape can be turned and its outline looks the same, it has rotational symmetry. This sequence shows how a square has rotational symmetry.

A circle has a never-ending number of lines of rotational symmetry.



Taste

When we eat food, tiny bumps in our mouth sense if it tastes sweet, sour, salty, savoury, or bitter. The mouth sends information to our brain, which works out the flavours of what we are eating and drinking.

SEE ALSO

- Colour pp.26–27
- Brain p.45
- Digestion p.79
- Food p.106
- Fruit and seeds p.115
- Smell p.232

Taste and smell

The sense of taste from the tongue and the sense of smell from the nose work together to tell us how our food tastes.

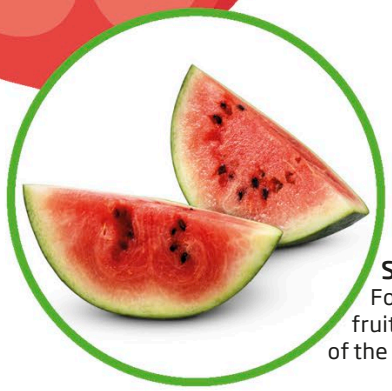
Sour
Lemons, limes, and grapefruit taste sour. A sour taste can also be a warning that food has gone bad.

Bitter
Bitter-tasting foods include olives, coffee beans, and cocoa beans.

Savoury
Savoury flavours include soy sauce and parmesan cheese.

Salt
Salt is added to dishes to help them to taste better. Our bodies need a small amount of salt to stay healthy, but too much salt is bad for us.

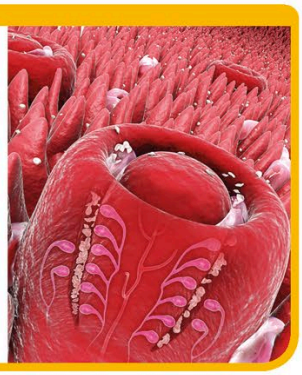
The body regrows all of our taste buds every two weeks.



Sweet
Foods such as honey and fruit taste sweet because of the natural sugar in them.

Taste buds

The little bumps in our tongue and mouth have tiny taste sensors in them called taste buds. We have around 10,000 taste buds.



Telephones

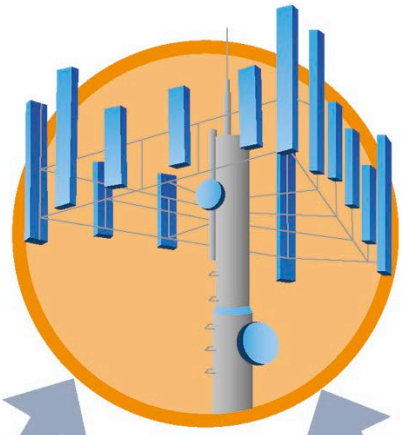
Telephones allow people to speak to each other from anywhere in the world. They turn the sound of our voices into signals, which are sent through radio waves or cables to another phone. That phone then changes the signals back into sound.

SEE ALSO

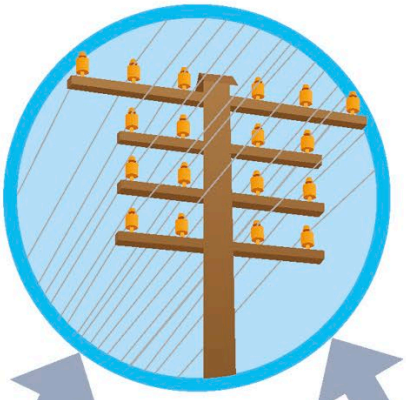
- Codes pp.66-67
- Communication p.69
- Computers p.71
- Electricity p.87
- Hearing p.127
- Internet p.138

Where does your voice go?

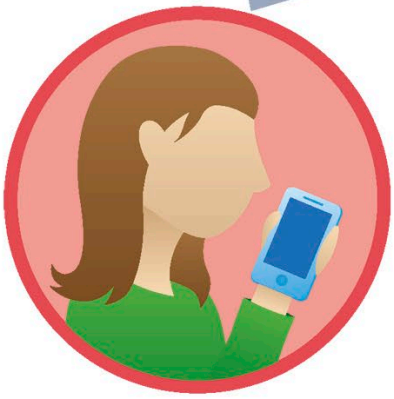
When you speak into a phone, the sound of your voice is turned into electrical signals. A network of telephone lines and phone towers let us speak to people over long distances.



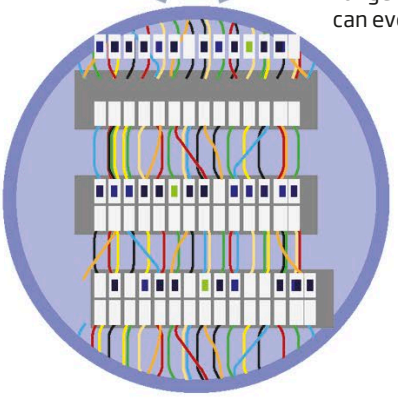
Mobile phone tower
These towers send and receive signals between mobile phones and a telephone exchange.



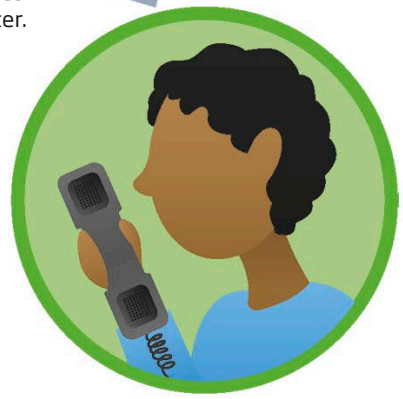
Telephone lines
Phone lines carry phone signals long distances by holding the wires up above the ground. For longer distances, cables can even go underwater.



Mobile phones
Mobile phones send and receive signals as radio waves. They don't work if they are too far away from a mobile phone tower.



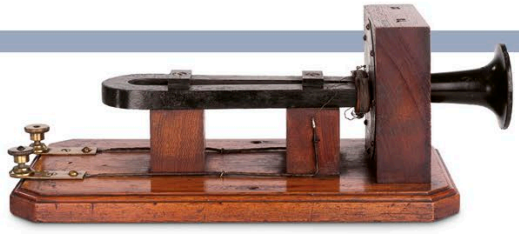
Telephone exchange
This place connects telephone calls using computers. It sends incoming signals to the right phone.



Wired phones
Landline phones have a cable that plugs into a wall. They send a signal through a network of wires.

Past and present

The way that phones send and receive signals has changed since they were first invented. Early telephones sent sounds short distances through pipes or tubes. From the 1800s, telephones sent electrical signals through wires. Mobile phones use radio waves to pick up signals.



First telephone
The telephone was invented in 1876 by Alexander Graham Bell, a Scottish music teacher.

Smartphone
A smartphone is a pocket computer that can be used to make phone calls, record videos, and play games.

Television

Television lets people watch the news, documentaries, films, cartoons, and gameshows without leaving the house. It is one of the world's most popular forms of entertainment.

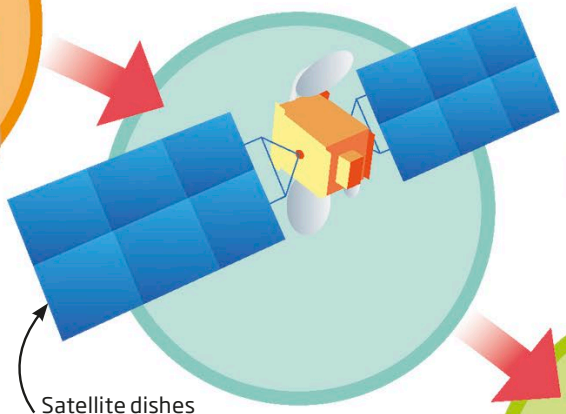
SEE ALSO

- Communication p.69
- Factories p.97
- Hearing p.127
- Radio p.203
- Satellites p.215
- Sight p.226

Sounds and pictures are recorded, using a video camera.

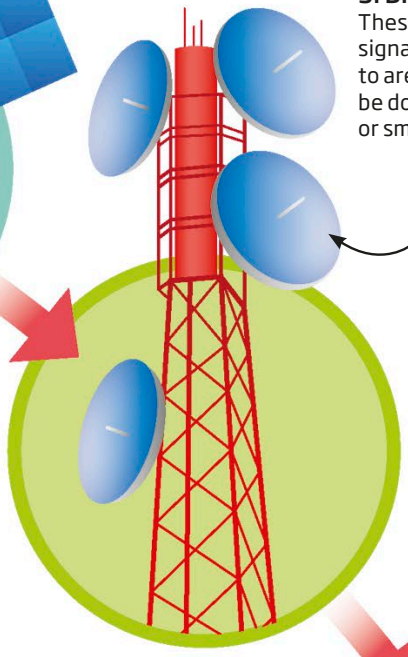
1. Filming
Television programmes are recorded using video cameras. When a programme is ready, the production company sends, or transmits, it.

2. Television satellite
The recorded programme is sent as signals to machines in space, called satellites. The signals are then sent back to many places on Earth.



Satellite dishes send signals to and from Earth.

3. Broadcast tower
These towers pick up satellite signals and send them out to areas nearby. This can be done using special cables or small satellite dishes.



Televisions pick up the signals from their nearest tower.

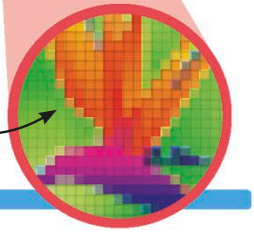
Sending signals

The pictures and sounds of a television programme are sent, or transmitted, around the world as signals. Televisions pick up the signals and change them back into moving images.

John Logie Baird invented the first television in 1926, using biscuit tins, hat boxes, bicycle lights, and needles.

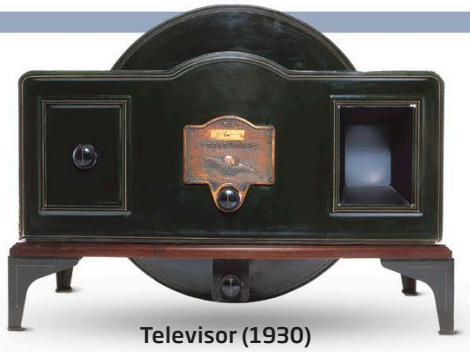
4. Television
The signals are turned back into pictures and sounds using electricity. We can then watch the television programme.

The picture on the screen is made up of thousands of tiny coloured squares, called pixels.



Early television

The first television sets were big boxes with small screens. They showed programmes in black and white. By the 1950s, colour televisions became more common in homes.



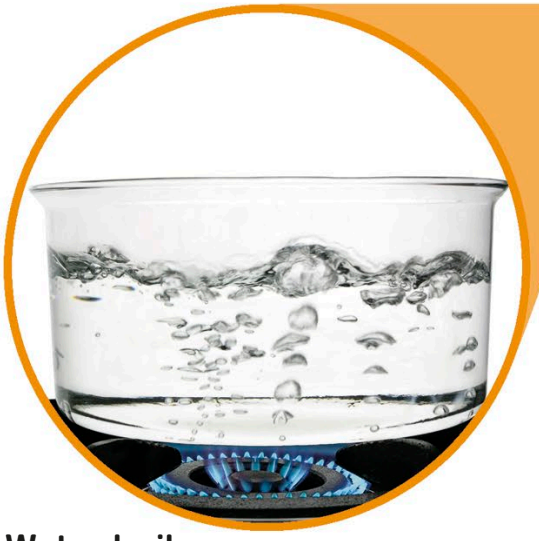
Televisor (1930)

Temperature

Temperature is a measurement of how hot or cold something is. We measure temperature in degrees of Celsius (°C) or Fahrenheit (°F). We can use a thermometer to measure the temperature of the air, liquids, or the human body.

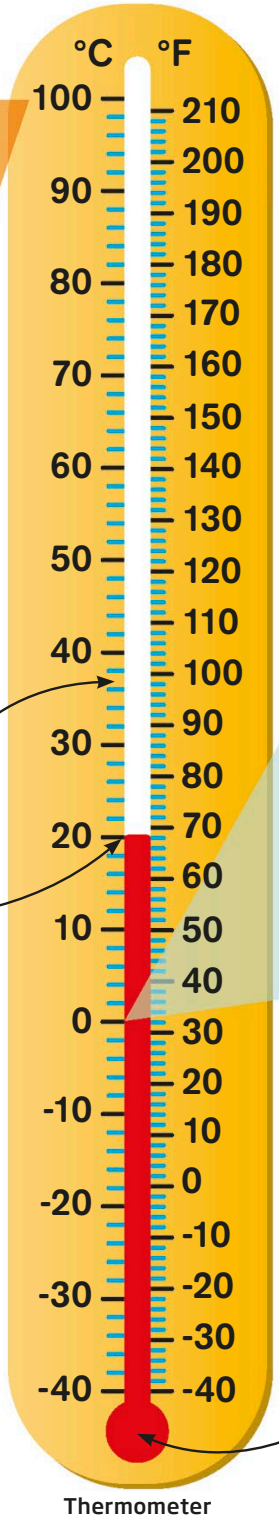
SEE ALSO

- Changing states p.57
- Gases p.117
- Human body p.130
- Liquids p.148
- Measuring p.159
- Solids p.234



Water boils

When liquid water reaches a temperature of 100°C (212°F), it boils and changes from a liquid into a gas called water vapour.



Body temperature

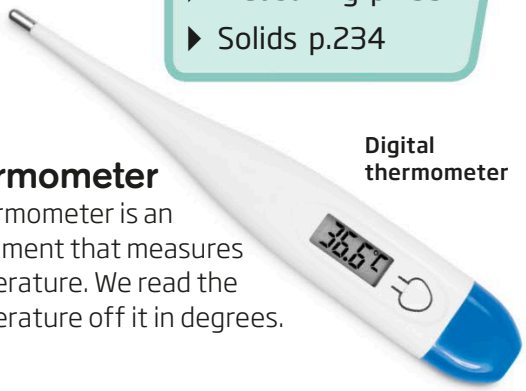
Room temperature
We use the term "room temperature" to describe normal conditions. The average temperature of a room is 20°C (68°F).

Thermometer

The red liquid goes up or down to show the temperature.

Thermometer

A thermometer is an instrument that measures temperature. We read the temperature off it in degrees.



Digital thermometer

Water freezes

When the temperature of the air around us gets to 0°C (32°F), liquid water freezes and becomes a solid called ice.

Body temperature

A healthy body temperature is about 37°C (98.6°F). Doctors can check body temperature by putting an electric thermometer in our mouth or ear.

Lightning is 29,727°C (53,540°F), which makes it the hottest natural thing on Earth.

Theatre

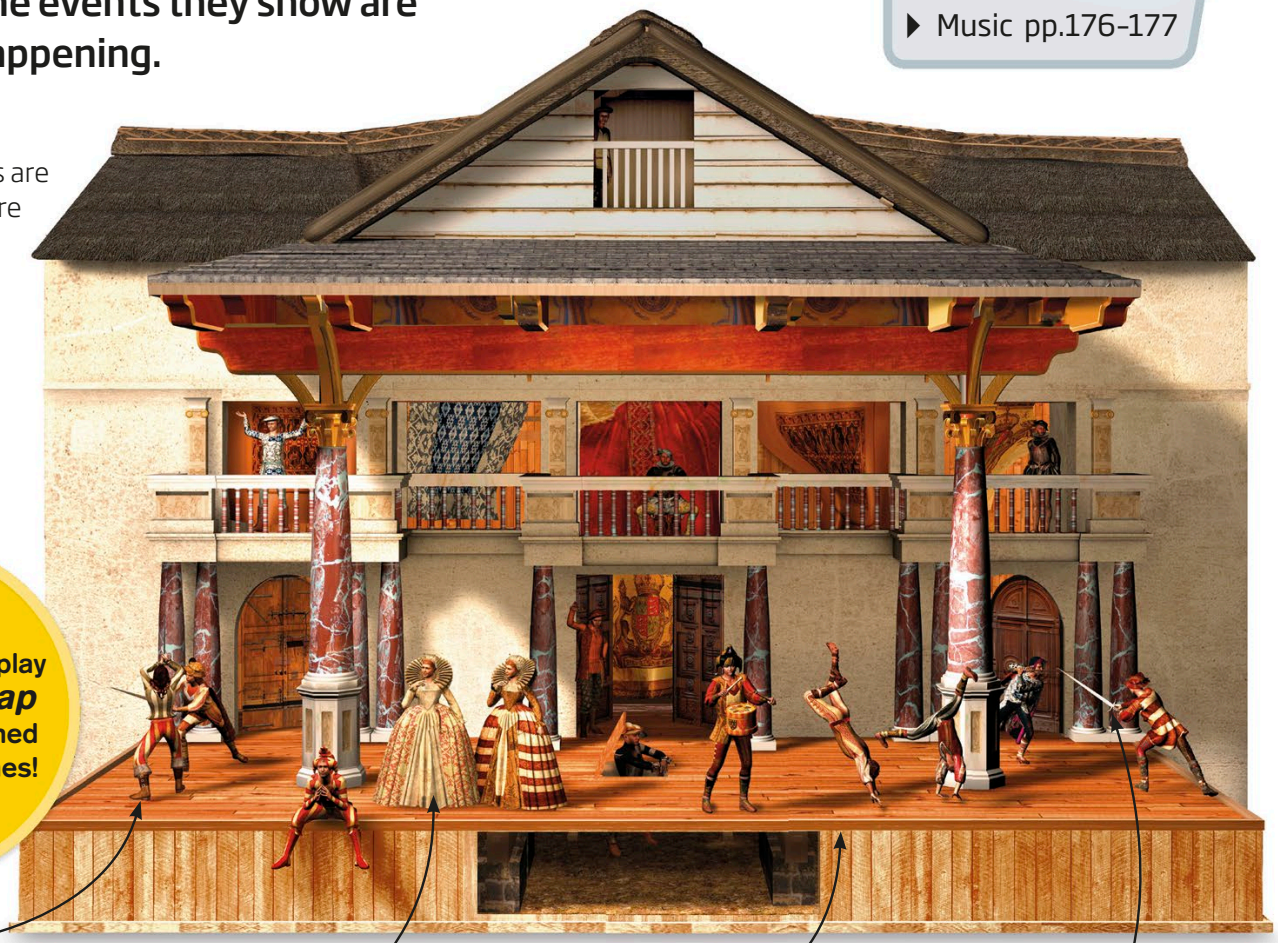
People have acted out stories for thousands of years. These stories are plays, and the theatre is the exciting place in which they are performed. Theatre performers try to make you believe that the characters in a play are real, and that the events they show are actually happening.

SEE ALSO

- Ancient Greece p.18
- Books p.44
- Buildings p.48
- Clothing pp.62–63
- Film p.100
- Music pp.176–177

On stage

The area where plays are performed in a theatre is called the stage. Many actors can be on stage at the same time. Music, sounds, and lighting on stage make the play more exciting.



British author Agatha Christie's play *The Mousetrap* has been performed over 25,000 times!

Actor
The people in plays who pretend to be characters are called actors.

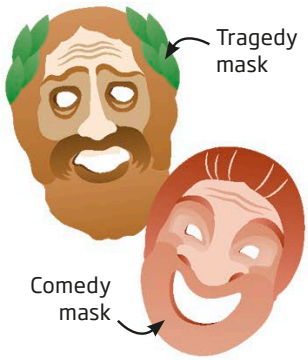
Costume
The clothing an actor wears is called their costume.

Stage
The stage is usually in front of the audience.

Prop
Props are things used in plays to make them more lifelike, such as weapons.

Ancient plays

The first plays were written in ancient Greece, around 700 BCE. Greek playwrights mainly wrote sad plays, called tragedies, and funny plays, called comedies.



Greek theatre masks

Puppets

Models controlled by strings or rods are called puppets. They are given voices by performers and tell stories on small stages. Puppet shows have been performed for at least 3,000 years.

Tides

Tides are daily changes in the level of the sea on the coast. They are mainly caused by the Moon's gravity, which is an invisible force that pulls on the Earth. When the water is high up the coast, it is called high tide, and when it falls it is low tide.

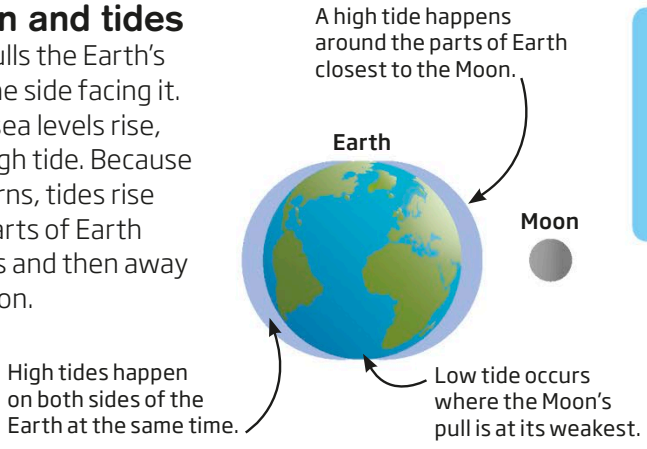
SEE ALSO

- Day and night p.77
- Gravity p.125
- Moon p.171
- Oceans and seas p.187
- Seashore p.220
- Sun p.247

Low tide
When the pull of the Moon is weak, water levels fall and the tide goes out.

High tide
When the pull of the Moon is strong, water levels rise and the tide comes in.

The Moon and tides
The Moon pulls the Earth's oceans on the side facing it. This makes sea levels rise, creating a high tide. Because the Earth turns, tides rise and fall as parts of Earth turn towards and then away from the Moon.



Living between tides
The part of the coast that is covered up and then uncovered between the tides is called the intertidal zone. Many living things are found here. They have to be tough to cope with battering waves at high tide, and air and sunlight at low tide.

Mussels live on rocks. They shut their shells when the tide is out.

Time zones

Clocks do not show the same time all over the world. If they did, it would be dark at noon and light at midnight in some places. To avoid this, the world is divided into 24 areas called time zones. There is a difference of one hour between time zones that are next to each other.

SEE ALSO

- Aircraft p.13
- Clocks p.61
- Day and night p.77
- Maps p.155
- Sun p.247
- World p.275

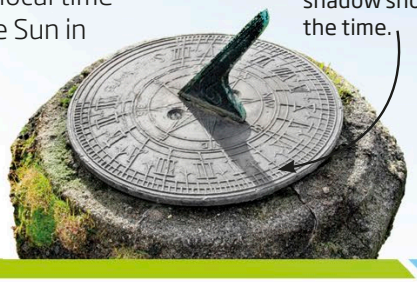
Times around the world

Time zones are based on the time in Greenwich, in London, UK, which is known as Greenwich Mean Time. The time in the zones to the west of Greenwich are earlier, and the times in the zones to the east are later.

Russia is such a big country that it stretches across 11 time zones.

Sundials

Before time zones were invented, people worked out the local time from the position of the Sun in the sky using a sundial. The shadow cast by a pointer on the dial showed the time.



Jet lag

Travelling quickly across several time zones can confuse our bodies, which still think they are in the original time zone. This state, called jet lag, can cause tiredness, headaches, and problems sleeping.

Touch

Touching is how we feel the world around us. When we touch something, sensors in our skin send information to our brain. We can tell if things are rough or smooth, hot or cold, and how much something pushes against us.

SEE ALSO

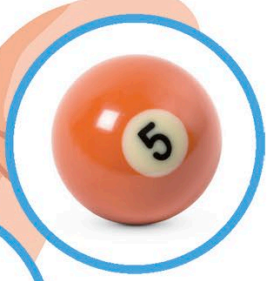
- Body cells p.41
- Brain p.45
- Human body p.130
- Muscles p.173
- Skin p.229
- Temperature p.252

Feeling things out

There are tiny sensors in our skin called cells or neurons. These neurons collect information about what we touch and send electrical signals to the brain.

Hard and soft
We can feel how hard things are by how much they push back against our touch.

Hot and cold
We can detect if things are hot or cold. If something is too hot, our skin tells us to move away quickly.



Smooth and rough
We are able to feel very small bumps and differences in texture.

Wet and dry
We can tell the difference between wet, sticky, and dry things just by touching them.

Blind people can read by touching a series of tiny bumps on a page called braille.

Pain

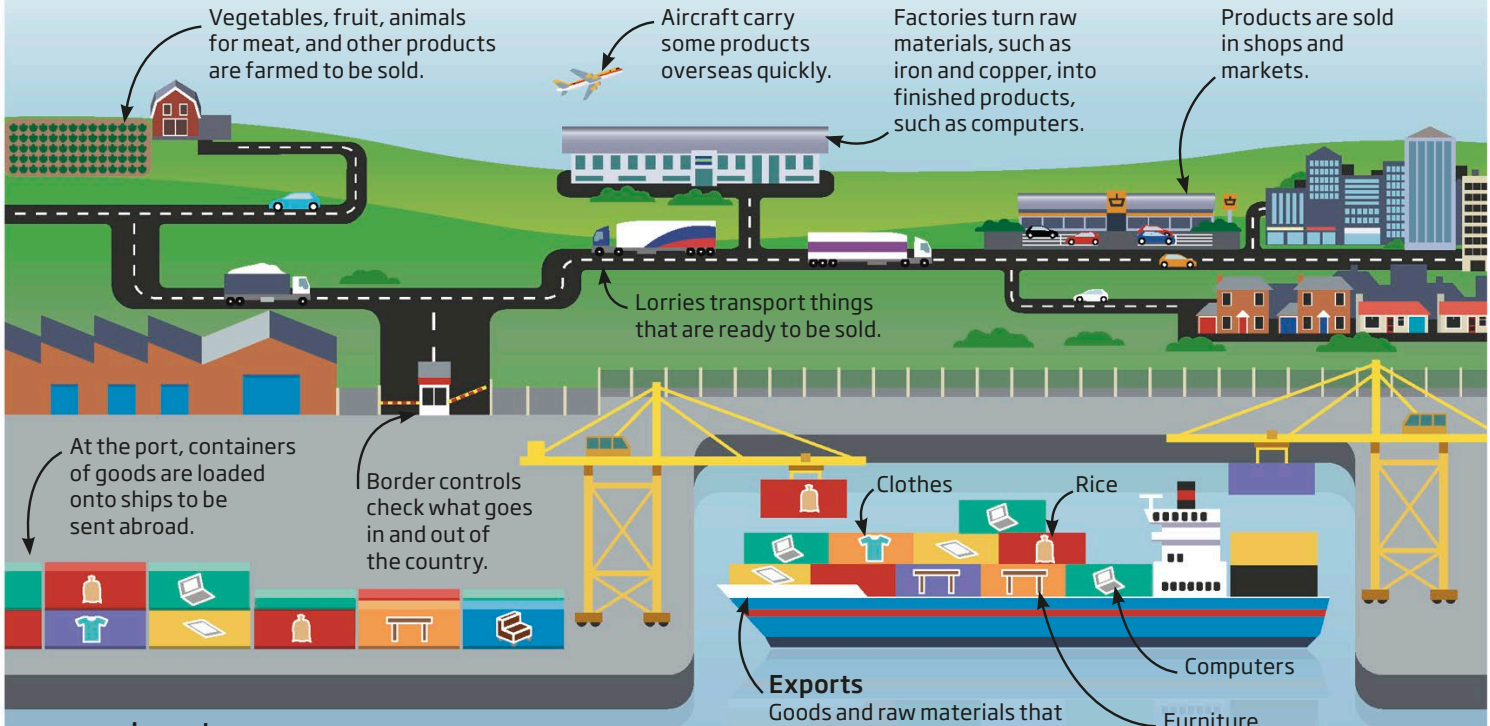
The neurons in your skin can also detect damage. If we cut or burn ourselves, the neurons send a message to our brain that we feel as pain.

Trade

Trade is buying and selling. We trade raw materials, like metal, to make things, as well as trading the things they are made into, like phones. Everything we eat, wear, and use is the result of trade. You can also buy and sell services, which are jobs people do, such as computer coding.

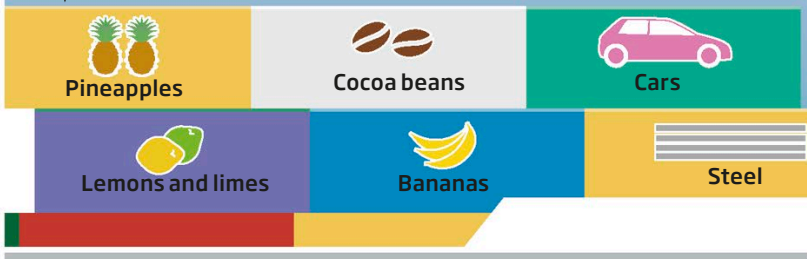
SEE ALSO

- Farming p.98
- Governments p.123
- Materials p.157
- Money p.169
- Transport pp.258–259
- Work p.274



Exports
Goods and raw materials that are sent overseas are known as exports. Most exports go by boat. Some go by plane, train, or road.

Imports
Goods and raw materials coming into a country are known as imports. These are often items that cannot be made or grown in that country.



International trade

Countries all over the world send goods to each other. They can make money by charging the other country tax (money) for the right to sell its goods within their borders.

Spice trade

One of the oldest trades in the world is the spice trade. Cinnamon, turmeric, and other spices are grown in Asia and used around the world to flavour food. When the trade began, spices were carried by land across Asia.

Cinnamon

Transport

Humans have been inventing new ways of moving from one place to another for thousands of years. At first, people used animals for transport on land. Later, the wheel was invented, then engines. People started crossing water using rafts and simple dug-out canoes, while air travel began with hot-air balloons. We have even travelled into space!

Green transport

The bicycle is one of the most environmentally friendly (green) forms of transport, as it has no engine to release harmful gases into the air. Other forms of green transport include electric cars and buses that run on clean hydrogen gas.

Horse and cart

Animals

Animals were our first type of transport other than walking. At first, people rode on them. In 3500 BCE the wheel was invented, and carts and carriages were pulled by horses, oxen, and other animals.

Cyclists and their passengers wear a helmet to keep their head protected if they fall.

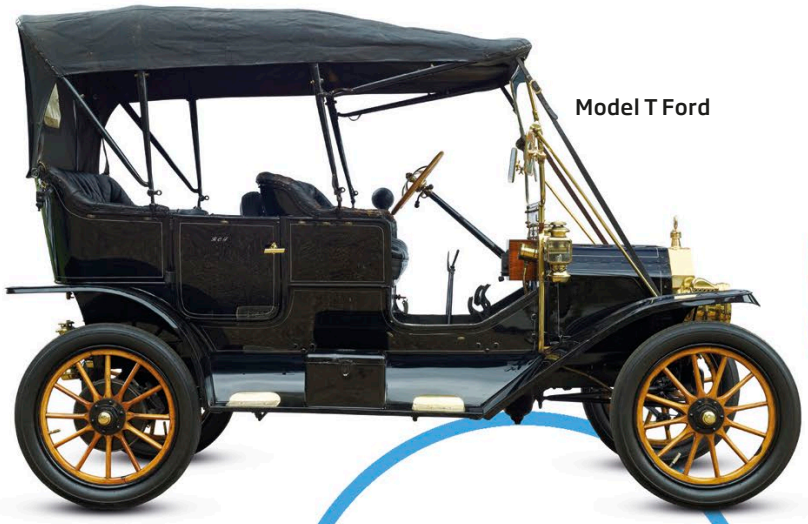
Ancient boats were powered by people using oars.

Model of a boat, from ancient Egypt

Crossing water

The first boats were log boats, carved out of tree trunks, and basic rafts made from reeds and sticks. People used them to travel around and also for fishing.

Turning the pedals makes a bicycle's wheels go round.



Model T Ford

Air travel

A few decades after the first powered flight in 1903, aircraft were developed to take people around the world faster than ever before. Today, the longest nonstop flight takes 17 hours and 27 minutes from New Zealand to Qatar.

Poster for Korean Air Lines

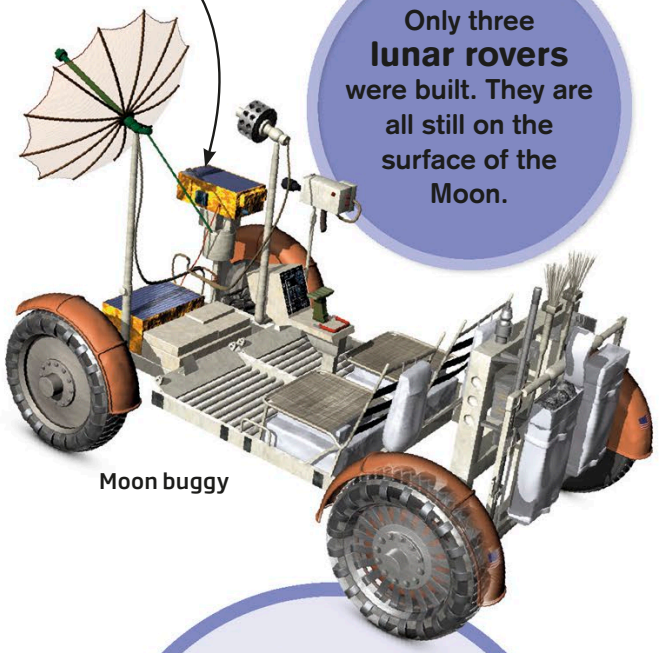
Cars for all

In 1908, the Model T Ford became the first car that was cheap enough for many people to buy. More than 15 million were built. Most cars at the time cost nearly $3,000 (£2,300), but the Model T Ford was only $850 (£650).

There are more than **one billion** bikes on the planet.

Video camera records moving colour images of the Moon.

Only three **lunar rovers** were built. They are all still on the surface of the Moon.



Moon buggy

Lunar Rover

The Lunar Roving Vehicle was designed to transport astronauts on the Moon's surface. Three of these battery-powered craft drove on the Moon. They could transport two astronauts at speeds of up to 13 kph (8mph).

Trains

Trains are vehicles that move along tracks. The first trains were powered by steam, but modern trains use diesel, electricity, or even magnets. They are a fast way for passengers to travel and for goods to be transported.

SEE ALSO

- Asia p.29
- Engines p.92
- Inventions pp.136–137
- Magnets p.151
- Trade p.257
- Transport pp.258–259

There are three types of seating, the most luxurious being "Gran Class".

Each train can carry more than 900 passengers in 12 carriages.

The driver uses levers and computer screens to control the train.

The nose is angled so the train can move faster through the air.

Shinkansen trains operate on special high-speed tracks.

Shinkansen

Bullet train

The *Shinkansen* is also known as a bullet train. It travels long distances between Japanese cities at speeds of up to 320 kph (199 mph).

The world's longest train had eight engines and 682 wagons!

In the cab, coal is fed into a fire. This heats water in a boiler to create steam that powers the train.

Aerolite, 1902

The large, powered wheel is called the driving wheel.

Steam engine

The earliest trains used steam for power. Water was heated by a coal fire in the engine. The first working train, Stephenson's *Rocket*, was built in 1829.

Underground trains

Many cities have underground railways known as metro systems. Avoiding the busy traffic above, these underground trains can quickly move people around a city.

The Paris metro

Trees

A tree is a plant with a woody stem called a trunk. Trees are found all over the world, except in Antarctica. There are two main types of tree – deciduous and evergreen.

SEE ALSO

- Forests p.109
- Fruit and seeds p.115
- Habitats p.126
- Materials p.157
- Photosynthesis p.191
- Plants p.194

Deciduous trees

These trees have leaves that die and drop off in the autumn. In the spring, their leaves grow back again.

Leaves
Leaves make the food a tree needs to grow. They come in all shapes and sizes depending on the type of tree.

Oak tree

Bark
The tree trunk is covered in bark, a rough covering that protects the tree.

Needles
Needles are leaves that are curled up into a tough pointed shape.

Sicilian fir

Evergreen trees

These trees keep their leaves all year round. They have flat, hard leaves called needles or scales.

Tree rings

You can tell how old a tree is by counting the rings in its trunk. Each ring shows a year in the tree's life.

Turkish Empire

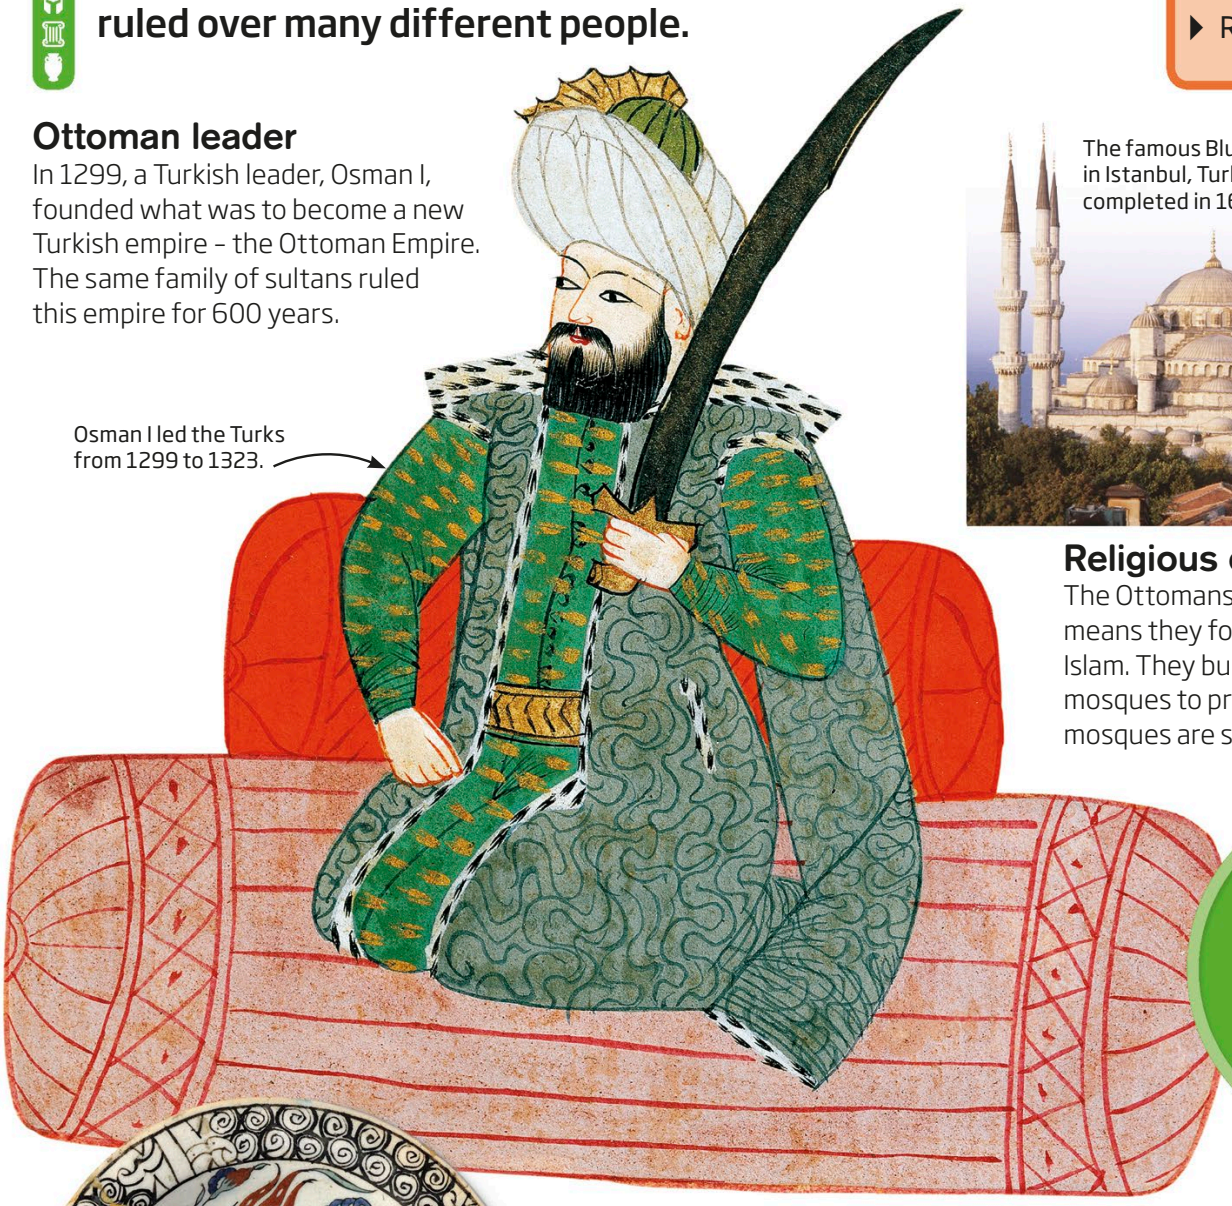
For hundreds of years, the Ottoman Turks ruled one of the largest empires the world has ever seen. It stretched from North Africa across the Middle East to the Indian Ocean. The Ottomans were Muslims, but they ruled over many different people.

SEE ALSO

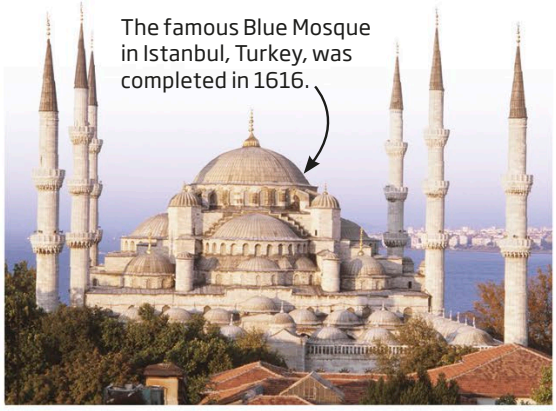
- Africa p.12
- Asia p.29
- Buildings p.48
- Crafts p.75
- Europe p.94
- Flags p.102
- Religion p.208

Ottoman leader

In 1299, a Turkish leader, Osman I, founded what was to become a new Turkish empire – the Ottoman Empire. The same family of sultans ruled this empire for 600 years.



Osman I led the Turks from 1299 to 1323.



The famous Blue Mosque in Istanbul, Turkey, was completed in 1616.

Religious empire

The Ottomans were Muslims, which means they followed the religion of Islam. They built grand buildings called mosques to pray in. Many of their mosques are still in use today.

The capital of the Ottoman Empire was Constantinople, which is now known as Istanbul.

Flower patterns were often used to decorate Iznik pottery.

Turkish art

The Turks made beautiful pottery in the town of Iznik in northwest Turkey. They also wove woollen carpets and tapestries.

The republic

The Ottoman Empire ended in 1922, and the sultans were no longer in charge. The next year, Turkey became a republic, with its people voting to choose the leaders.

Flag of Turkey

Universe

The Universe is everything around us: matter, energy, and space. This means the Earth, the Solar System, the Milky Way, and other galaxies are part of the Universe. The Universe is very big and is always changing.

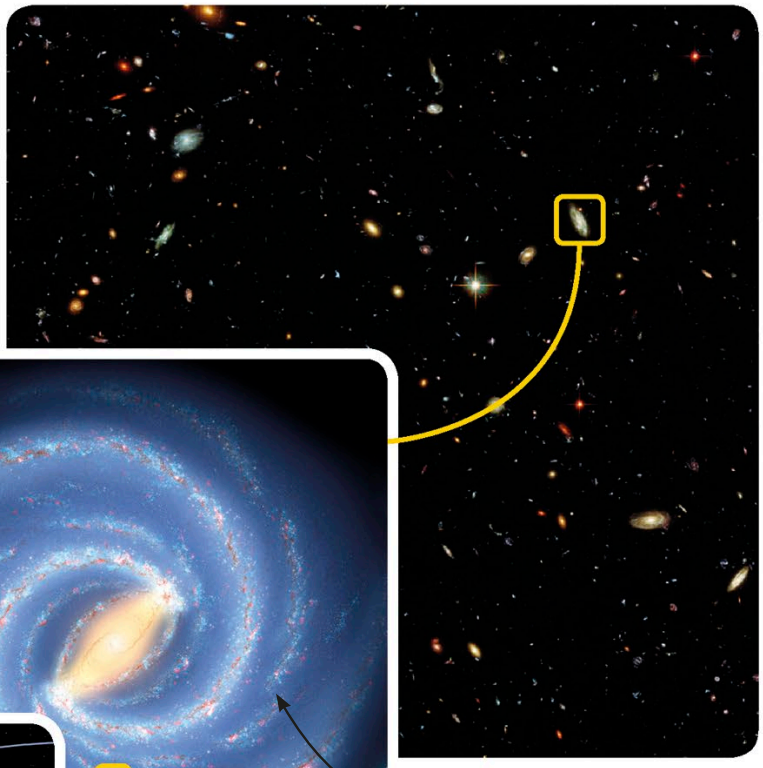
SEE ALSO

- Atoms p.34
- Big Bang p.37
- Earth p.83
- Galaxies p.116
- Milky Way p.167
- Solar System p.233

Where are we?

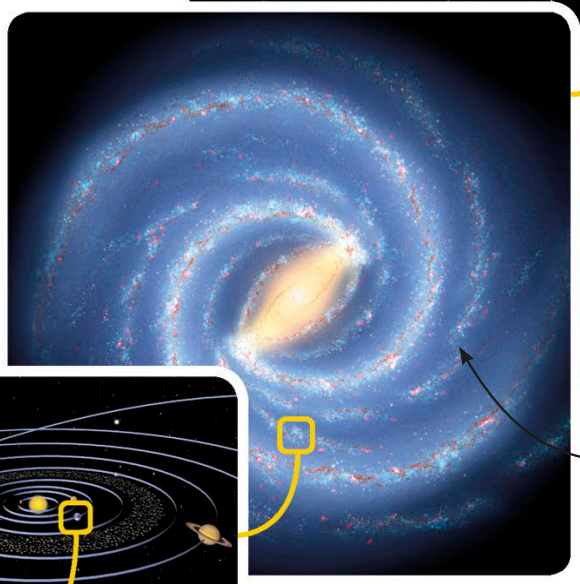
The Universe is so huge that it is hard to understand. This diagram shows how Earth fits with the rest of the Universe.

Universe
The Universe is made up of billions of galaxies that cluster together, with huge empty spaces between them.



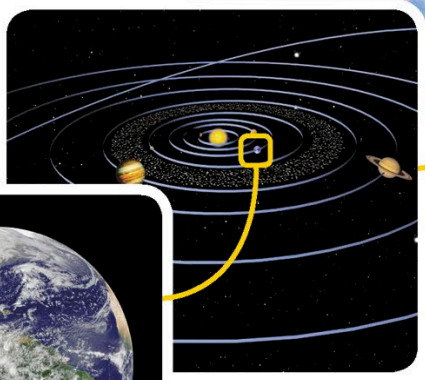
The **Universe** has **no centre**, and is filled with galaxies in all directions – it **goes on forever**.

The Milky Way
The Solar System orbits the centre of our home galaxy, which is known as the Milky Way.



Scientists thought the Milky Way was the only galaxy until the early 20th century.

The Solar System
The Sun and its family of planets are known as the Solar System.



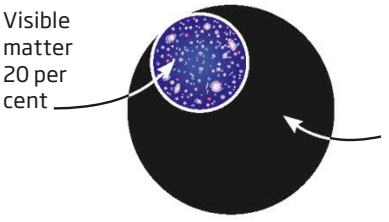
The Earth
Our planet is one of eight planets that move around the Sun.

Earth was thought to be the centre of the Universe until the 16th century.

City landscape
Our planet is home to 7 billion people living in towns, cities, and the countryside.

Dark matter

Scientists think that dark matter is made of particles smaller than atoms. Dark matter is invisible to us, but we know it exists because its force of gravity pulls nearby space objects towards it.



Uranus

Uranus is the third largest planet in the Solar System, after Jupiter and Saturn. It is the second furthest planet from the Sun. From Earth, Uranus looks like a very faint star.

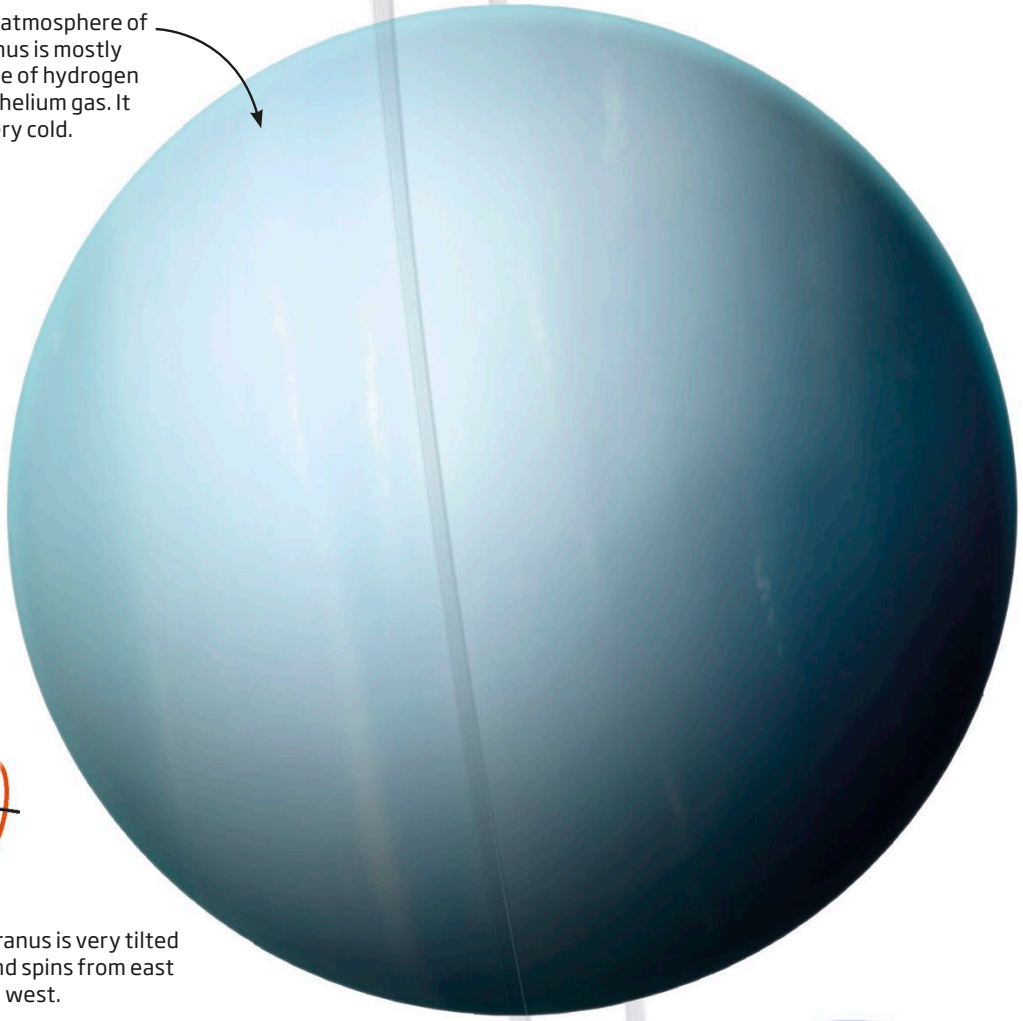
SEE ALSO

- Atmosphere p.33
- Elements p.90
- Gases p.117
- Mixtures p.168
- Neptune p.183
- Solar System p.233

Ice giant

Uranus is an "ice giant" – it has a rocky core that is surrounded by a mixture of liquid ices. Uranus has no solid surface.

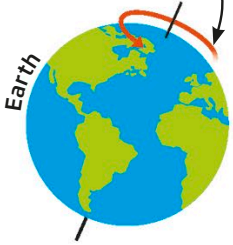
The atmosphere of Uranus is mostly made of hydrogen and helium gas. It is very cold.

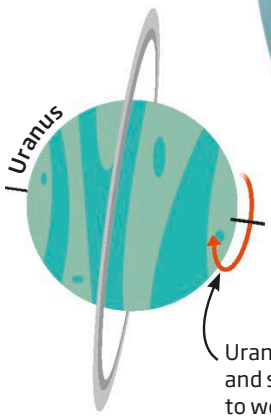


Rolling planet

Most planets spin like tops on their axis, but Uranus spins on its side like a rolling ball. Its tilt was probably caused by a giant crash with another planet-sized body.

Earth is slightly tilted and spins from west to east.





Uranus is very tilted and spins from east to west.

Voyager 2

Few features

The spacecraft *Voyager 2* visited the Uranus system in 1986. Images sent back to Earth revealed 10 new moons and two new rings but few other features.

Uranus has thin, dark rings that are hard to see.

Uranus is the coldest planet in the Solar System, with temperatures as low as -224°C (-371°F).

Venus

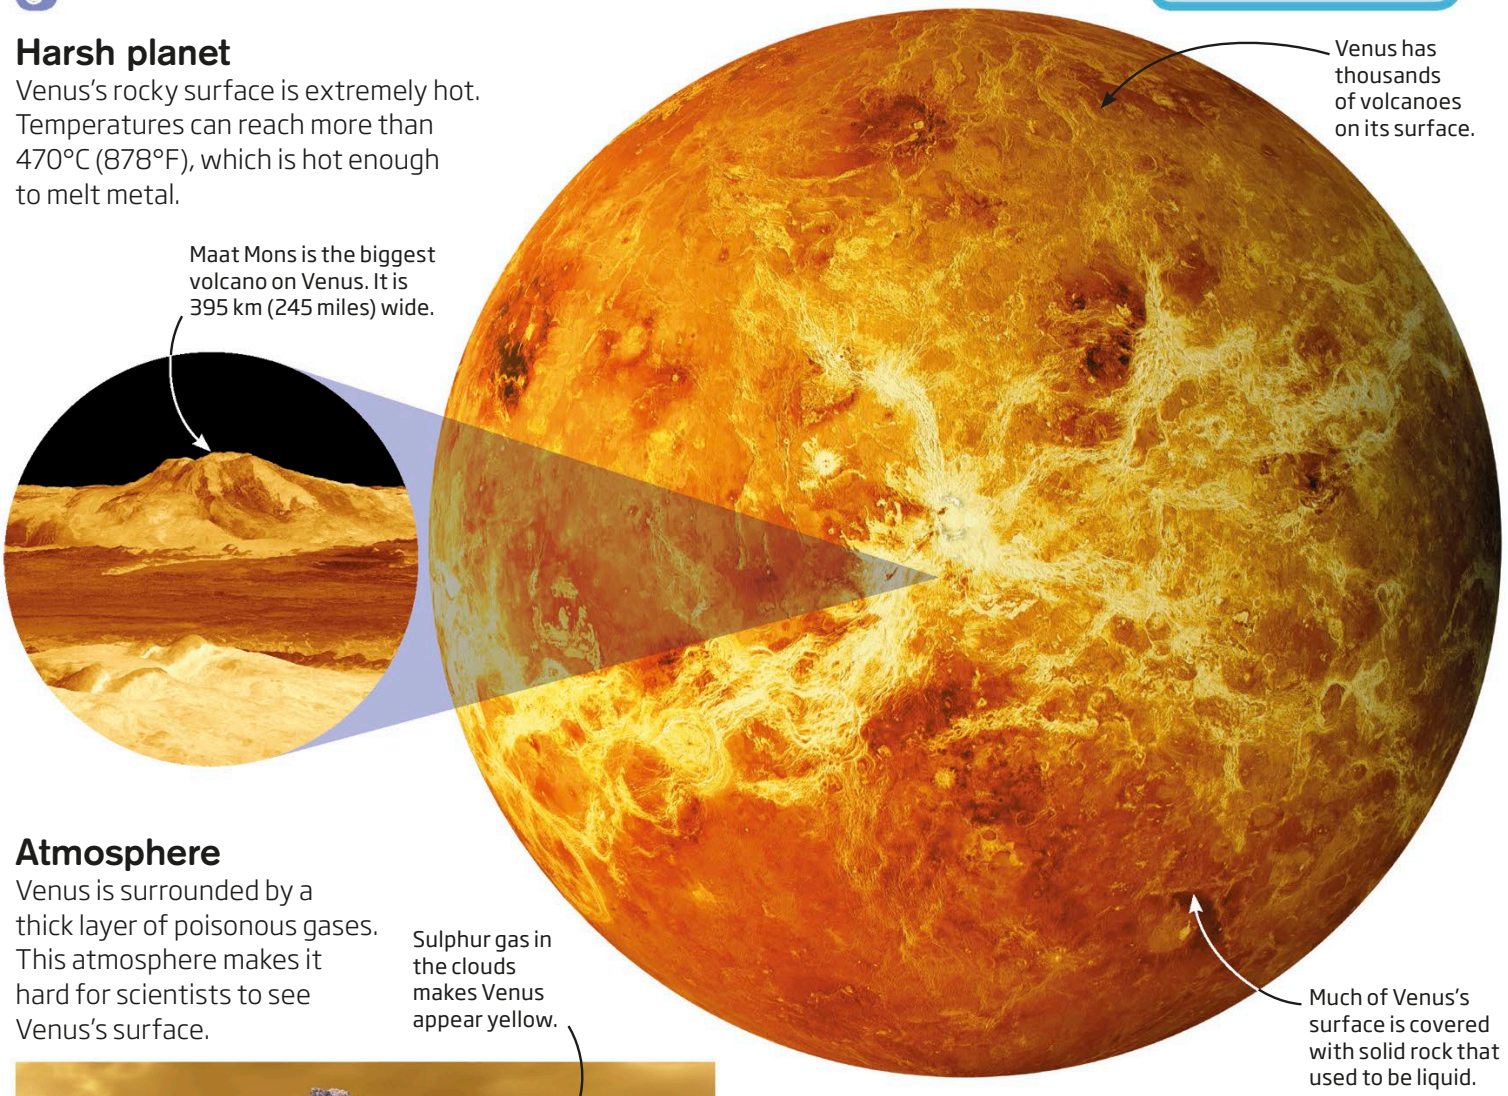
Venus is a rocky planet that is only slightly smaller than Earth. It is the second planet away from the Sun, and sits between Mercury and Earth. Venus spins very slowly and has the longest day of all the planets in the Solar System.

SEE ALSO

- Atmosphere p.33
- Earth p.83
- Gases p.117
- Mercury p.161
- Solar System p.233
- Temperature p.252
- Volcanoes p.268

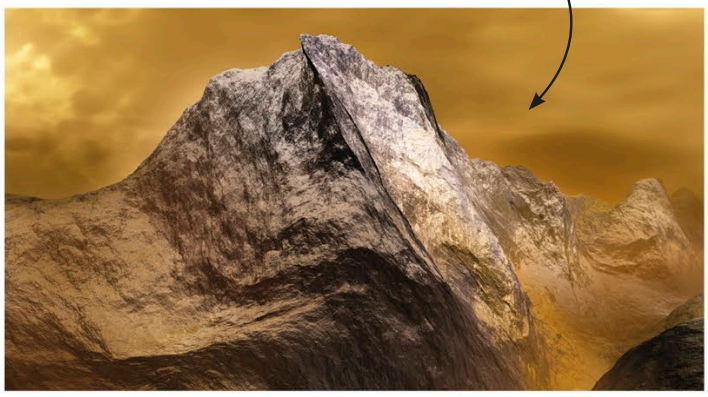
Harsh planet

Venus's rocky surface is extremely hot. Temperatures can reach more than 470°C (878°F), which is hot enough to melt metal.



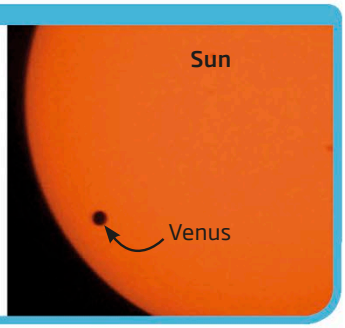
Atmosphere

Venus is surrounded by a thick layer of poisonous gases. This atmosphere makes it hard for scientists to see Venus's surface.



Transit of Venus

Venus is closer to the Sun than the Earth is. We sometimes see Venus moving in front of the Sun. It looks like a small, dark disk moving across the bright Sun. This is called the transit of Venus.



Vertebrates

Vertebrates are animals that have a backbone. The skeleton is a frame that helps the body move around. Mammals, amphibians, reptiles, fish, and birds are all vertebrates.

SEE ALSO

- Amphibians p.15
- Birds p.39
- Fish p.101
- Invertebrates p.139
- Mammals p.154
- Reptiles p.210
- Skeleton p.228

Mammals

All mammals have a similar skeleton. Only mammals have a lower jawbone that is joined to the skull by a hinge.

The skull protects the soft brain inside.

The small, linked-up bones in the back are called vertebrae.

Having lots of little bones in the tail means it can be moved around easily.

The ribcage holds the tiger's lungs in place.

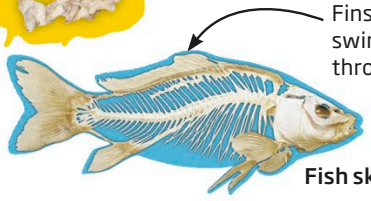
Strong bones in the legs let the tiger jump a long way.

Tiger skeleton

Frog skeleton

Amphibians

Frogs and toads don't have ribs. They have strong leg bones for jumping.



Fins let the fish swim smoothly through water.

Fish skeleton

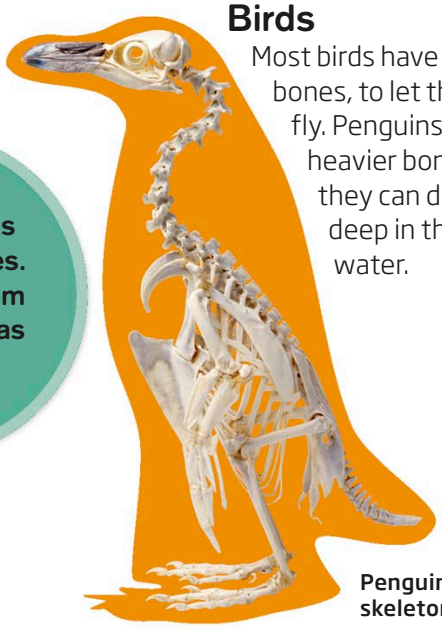
Fish

Only some fish have bony skeletons. Others, such as sharks, have skeletons made from a bendy substance called cartilage.

Bird skeletons are full of holes. This helps them to be as light as possible.

Birds

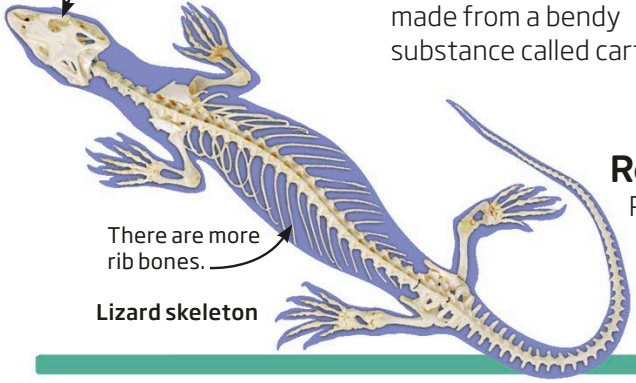
Most birds have light bones, to let them fly. Penguins have heavier bones so they can dive deep in the water.



Penguin skeleton

The jaw have extra bones.

There are more rib bones.



Lizard skeleton

Reptiles

Reptiles have more bones in their skeletons than other animals. This makes them very bendy.

Vikings

Starting in the year 800, people from Norway, Sweden, and Denmark set out to travel long distances and explore the world. We call these people Vikings. At home they had been farmers and craftspeople. On their travels, Vikings traded with or sometimes stole from others.

SEE ALSO

- Crafts p.75
- Europe p.94
- Explorers p.96
- Myths and legends p.178
- Oceans and seas p.187
- Ships p.224

Viking longship

Longships were fast ships Vikings used to travel across the Atlantic Ocean and up rivers in Europe. They were powered by oars and a sail.

In 1004, Viking woman Gudrid Thorbjarnardóttir **led a voyage** from Greenland to Canada.

Viking longhouse

Vikings built houses using wood. The roofs were either wooden or thatched (woven using straw or other soft materials). Inside were several different rooms for the family, slaves, and animals.

Volcanoes

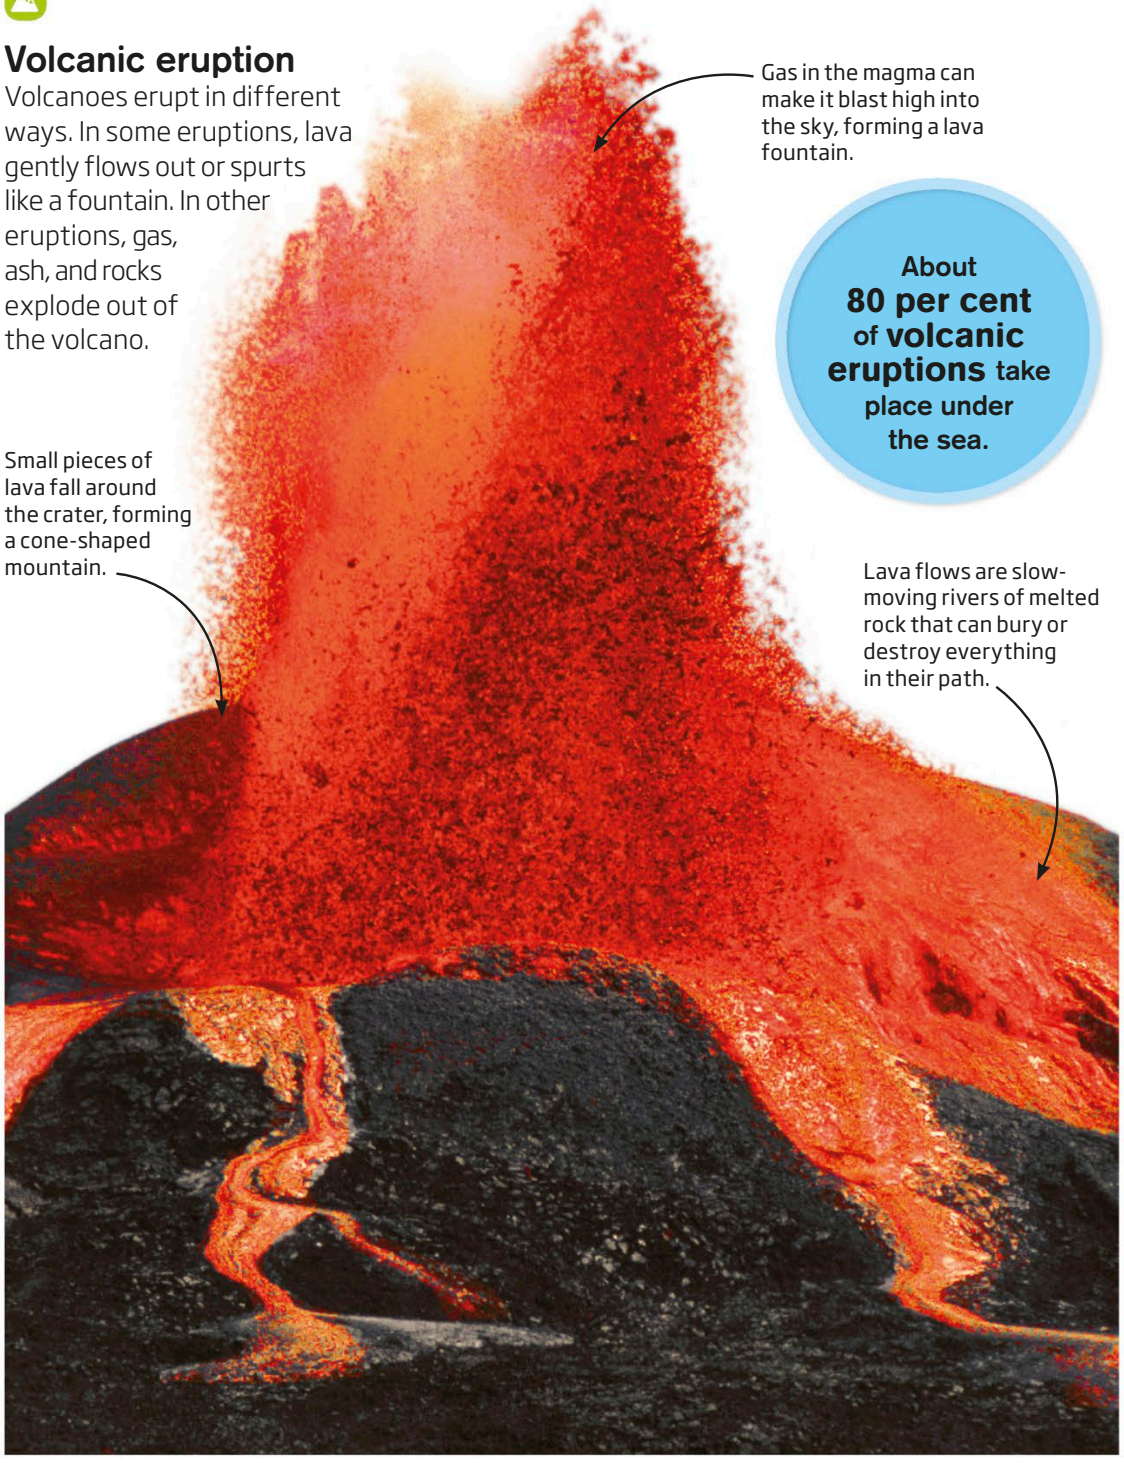
A volcano is a mountain or crater that forms when melted rock, called magma, breaks through the Earth's surface. As soon as the magma breaks through, or erupts, from, a volcano, it is known as lava. Every year around the world, between 50 and 70 volcanoes erupt.

SEE ALSO

- Earth's surface p.84
- Earthquakes p.85
- Inside Earth p.135
- Rock cycle p.213
- Rocks and minerals p.214

Volcanic eruption

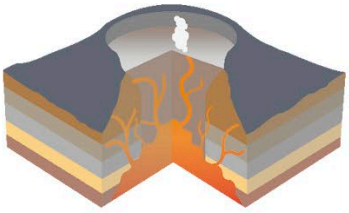
Volcanoes erupt in different ways. In some eruptions, lava gently flows out or spurts like a fountain. In other eruptions, gas, ash, and rocks explode out of the volcano.



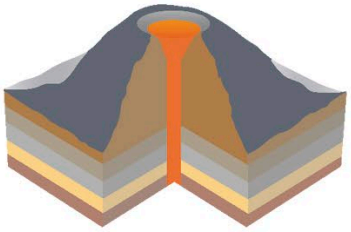
About **80 per cent** of **volcanic eruptions** take place under the sea.

Types of volcano

Volcanoes come in all shapes and sizes. Some are small, cone-shaped hills formed in a single eruption. Others are giant mountains built up by many eruptions.



Caldera
The biggest volcanic eruptions leave behind an enormous crater known as a caldera. Some craters fill with water and become lakes.



Cinder cone
Built of fragments of cooled lava called cinders, cinder cones are the smallest and most common type of volcano.

Stratovolcano
This type of volcano is made up of layers of ash and lava from many eruptions. Stratovolcanoes are steep-sided and cone-shaped.

Volume

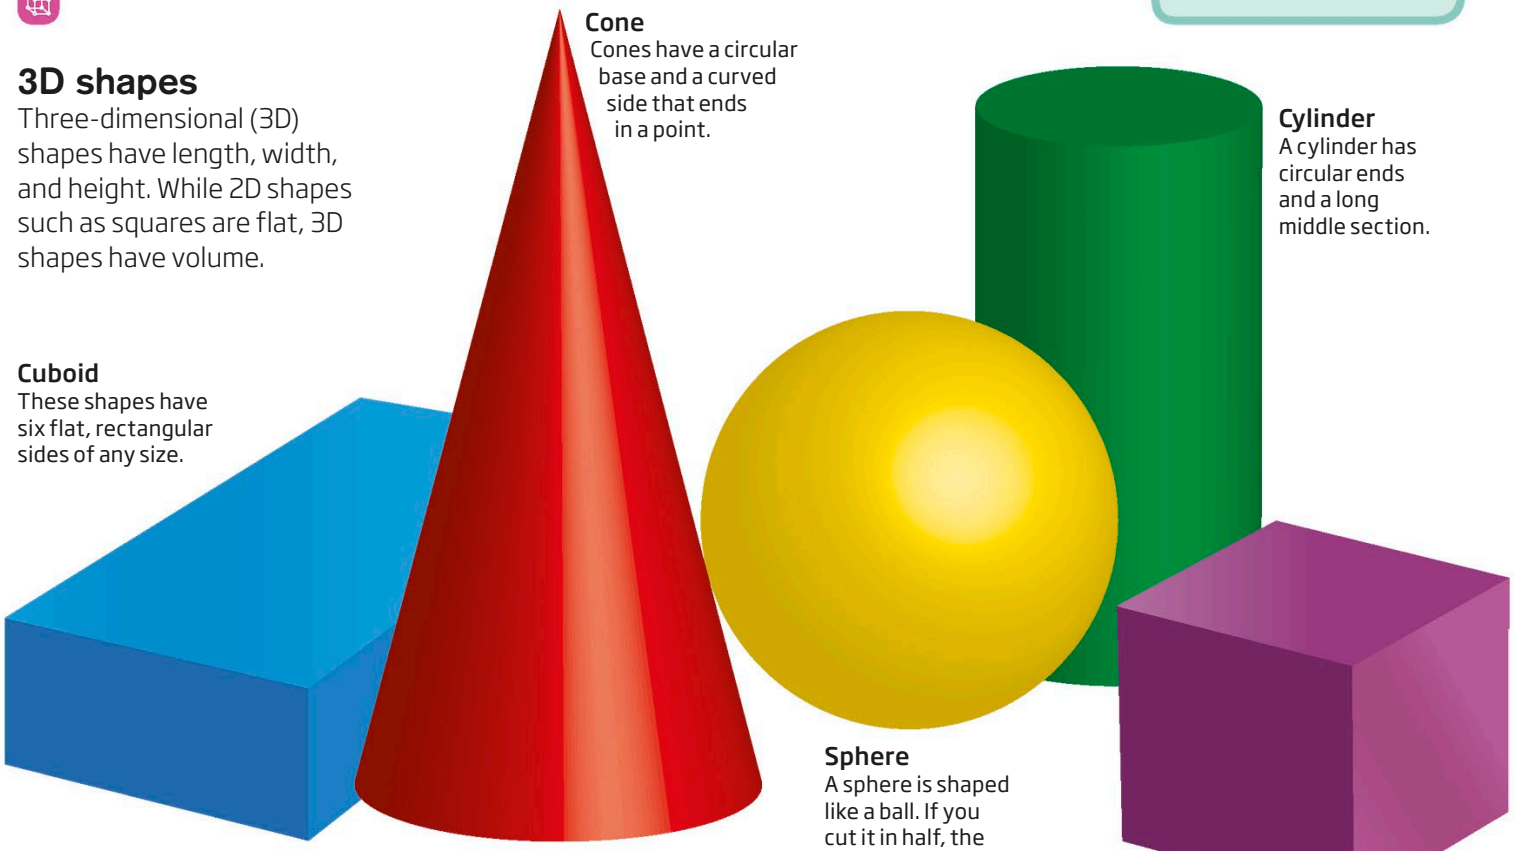
In maths, volume is the amount of space inside a shape. The volume of a shape is measured in "cubed" units, such as cubic centimetres (cm^3) or cubic inches (in^3).

SEE ALSO

- Ancient Greece p.18
- Human body p.130
- Measuring p.159
- Numbers p.185
- Science p.217
- Shapes p.222

3D shapes

Three-dimensional (3D) shapes have length, width, and height. While 2D shapes such as squares are flat, 3D shapes have volume.



Cone
Cones have a circular base and a curved side that ends in a point.

Cylinder
A cylinder has circular ends and a long middle section.

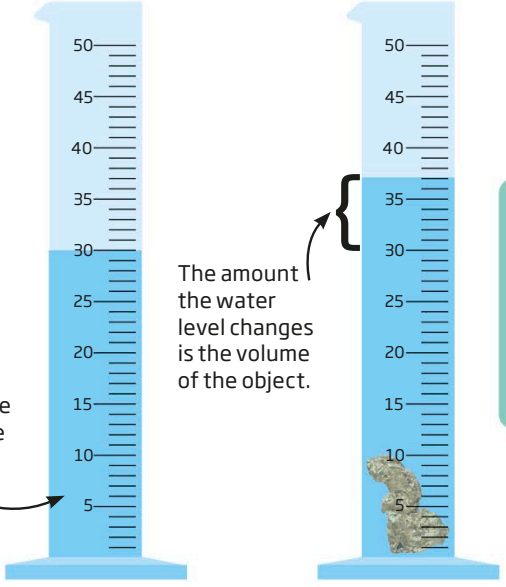
Cuboid
These shapes have six flat, rectangular sides of any size.

Sphere
A sphere is shaped like a ball. If you cut it in half, the sliced face would be circular.

Cube
Cubes have six equal-sized, square sides.

Finding volume

The volume of any object can be found by putting it in water. The volume of the water is measured first. The object is added, then the water is measured again.



Eureka!

An ancient Greek mathematician called Archimedes realized that the amount of water he pushed out when he got in the bath was the same volume as his body. He shouted "Eureka!", which means "I have found it!"

Archimedes in the bath

Water cycle

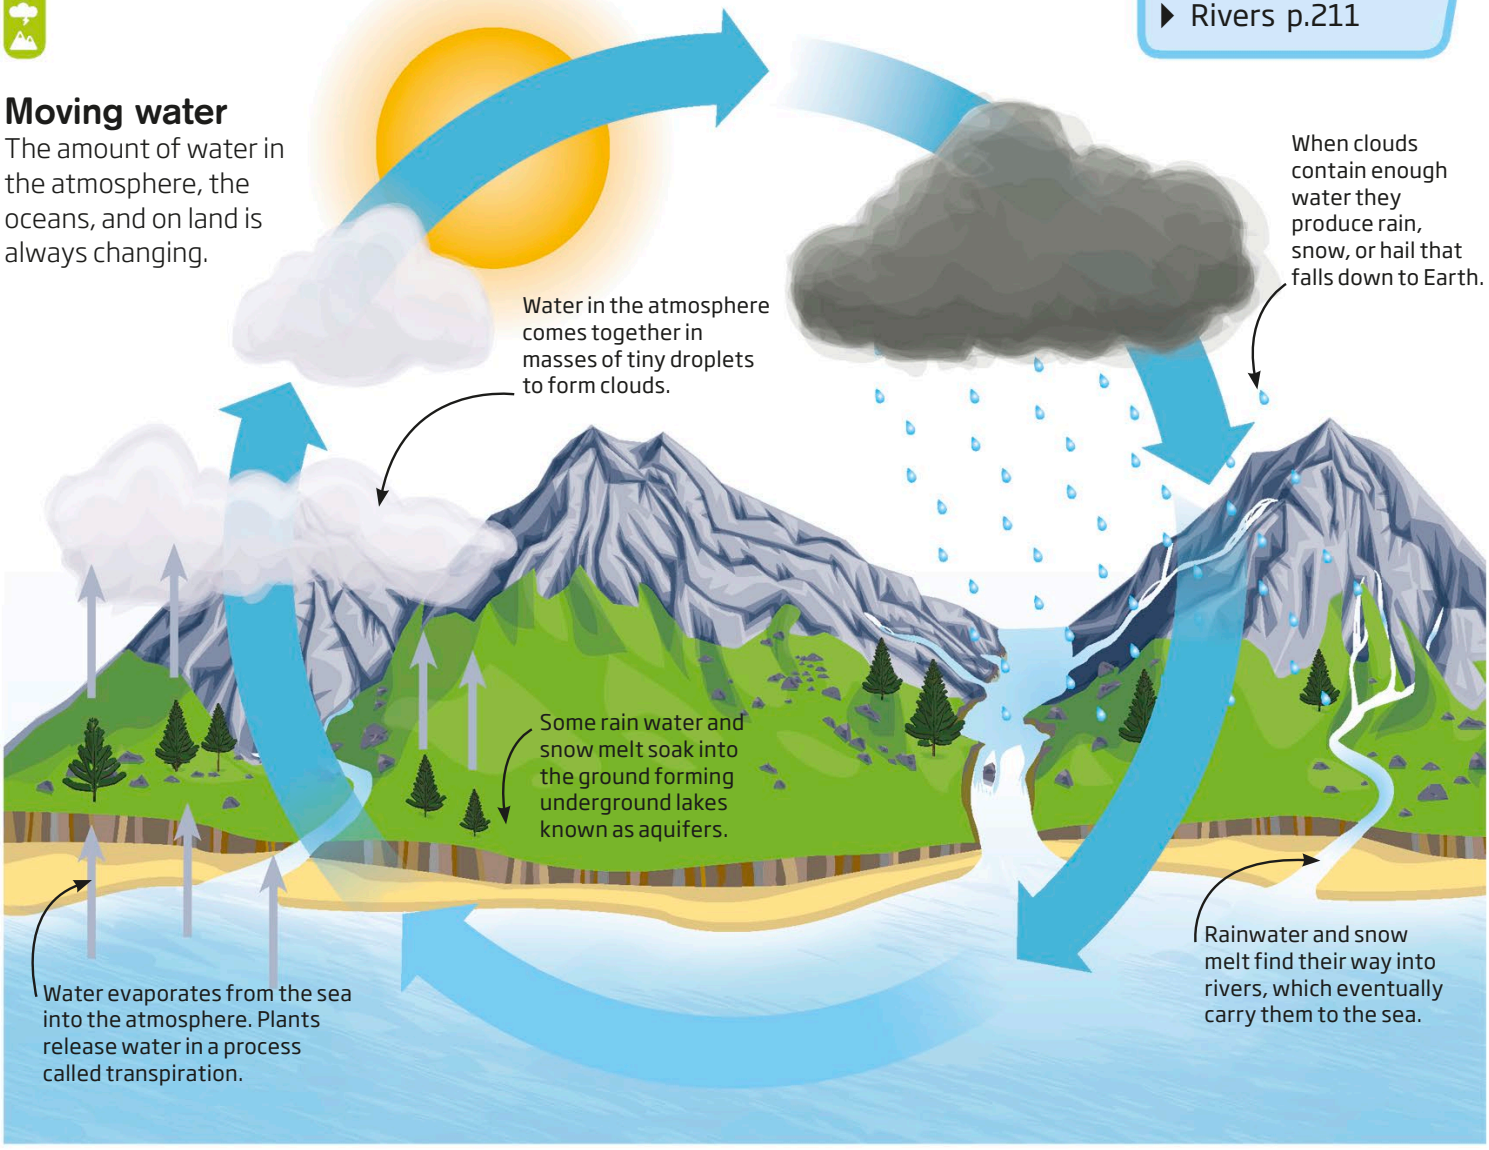
The Earth always has the same amount of water, but it is constantly moving between the oceans, rivers, underground reservoirs, ice caps, and the atmosphere. This continuous movement is called the water cycle.

SEE ALSO

- Clouds p.64
- Water pp.120–121
- Glaciers p.122
- Lakes p.143
- Oceans and seas p.187
- Rivers p.211

Moving water

The amount of water in the atmosphere, the oceans, and on land is always changing.



Water of life

Without water there would be no life on Earth. Even plants and animals that live in very dry places, such as deserts, need some water to stay alive.

Breaking the cycle

Humans break the water cycle in several ways. We dam rivers, suck up water from underground, and use water for washing and drinking.

Weather

The weather is what is happening in the atmosphere, or air and sky, outside. It could be sunny or cloudy, windy or calm, rainy or dry, or foggy or clear. In tropical parts of the world, it is hot and sunny most of the time. Further north or south, the weather can be different every day.

SEE ALSO

- Atmosphere p.33
- Changing world pp.50–51
- Clouds p.64
- Seasons p.221
- Storms p.246
- Water cycle p.270

Sunny
When there is bright sunshine, it is often warm with clear blue skies. Plants grow well in this kind of weather. If it is too hot and dry, however, they might die.

Windy
The wind is the movement of the air. Winds may be warm or cold, depending on the direction they blow in from. Very strong winds can damage buildings and blow down trees.

Rainy
Water droplets that fall from clouds are called rain. Plants need rain to grow, but too much rain can cause floods. When it is very cold, rain falls as snow.

Foggy
Fog and mist are made up of water droplets. They are clouds at ground level. Fogs are thicker than mists. People driving in fog need to be very careful as it is hard to see ahead.

The **story** of...

School

A school is where children go to learn subjects, such as reading and writing, that help them to understand the world. Going to school gives us the knowledge and skills that help us to get a job.

Madrasa

In parts of the Islamic world, children go to a school known as a madrasa. Here they learn more about their religion by studying the Quran.

First schools

Boys first started to go to school in ancient Greece, Rome, China, and India. Later, in Europe, church schools were set up. Girls were not always sent to school.

A school in ancient Rome

Students take ten billion trips every year on school buses in the United States and Canada.

Extra flashing lights help children see that the school bus is coming.

School buses have extra wing mirrors to help the driver spot children.

Education for all

Today, both boys and girls go to school from around the age of five. They learn maths, reading, and writing. Older children study other subjects too.

University

A university or college is where people over 18 can study a subject in great detail for three or four years. They are awarded a degree when they finish their course (graduate).

Graduation cap

Degree certificate

Almost **two million** children are home-schooled in the USA.

Getting to school

Many students walk to school, others are taken there in special school buses or by car or train. In the USA, school buses are painted bright yellow.

Home school

Some children stay at home during the day and are given lessons by their parents. They get to study all the subjects they would learn at school. Children that live a long way from the nearest school join in lessons over the Internet.

Victorian desktop blackboard

Tools for school

In the past, children wrote out their lessons using chalk on a small blackboard. Today, some schools use computers and tablets, although exams and lessons usually have to be written out on paper.

Work

Work provides people with money to pay for the things they need, such as food and somewhere to live. There are lots of different types of work you can do. Many jobs need special skills that you must train for. Some people stay doing the same work all their lives. Others learn new skills and change jobs.

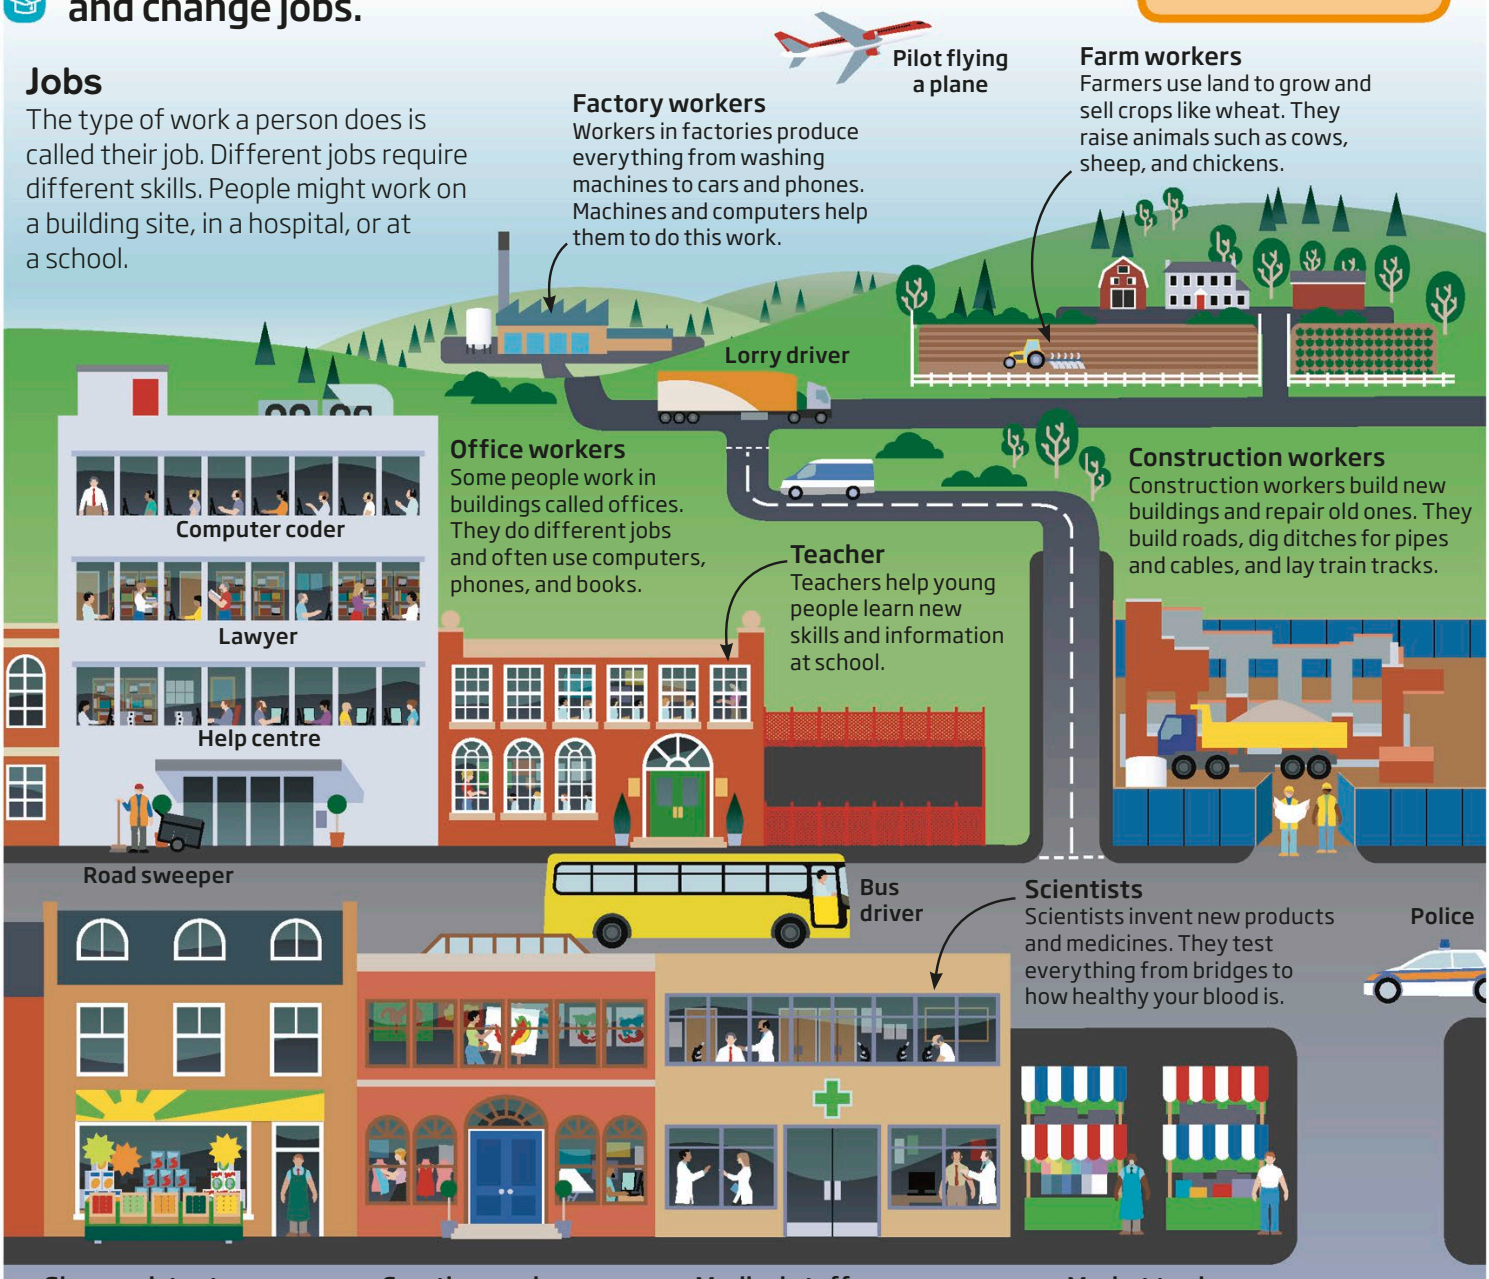
- Farming p.98
- Inventions pp.136–137
- Law p.145
- Medicine p.160
- Money p.169
- School pp.272–273

Jobs

The type of work a person does is called their job. Different jobs require different skills. People might work on a building site, in a hospital, or at a school.



Shop assistants
Shop workers sell things to people in stores, such as food, clothes, shoes, books, and music.

Creative work
Some people use their imaginations to create websites, design books and posters, and make music and films.

Medical staff
Doctors, nurses, and surgeons in clinics and hospitals try to cure you if you're ill. Carers look after people who need extra help.

Market traders
Many people sell fruit, vegetables, plants, flowers, and household goods on market stalls.

World

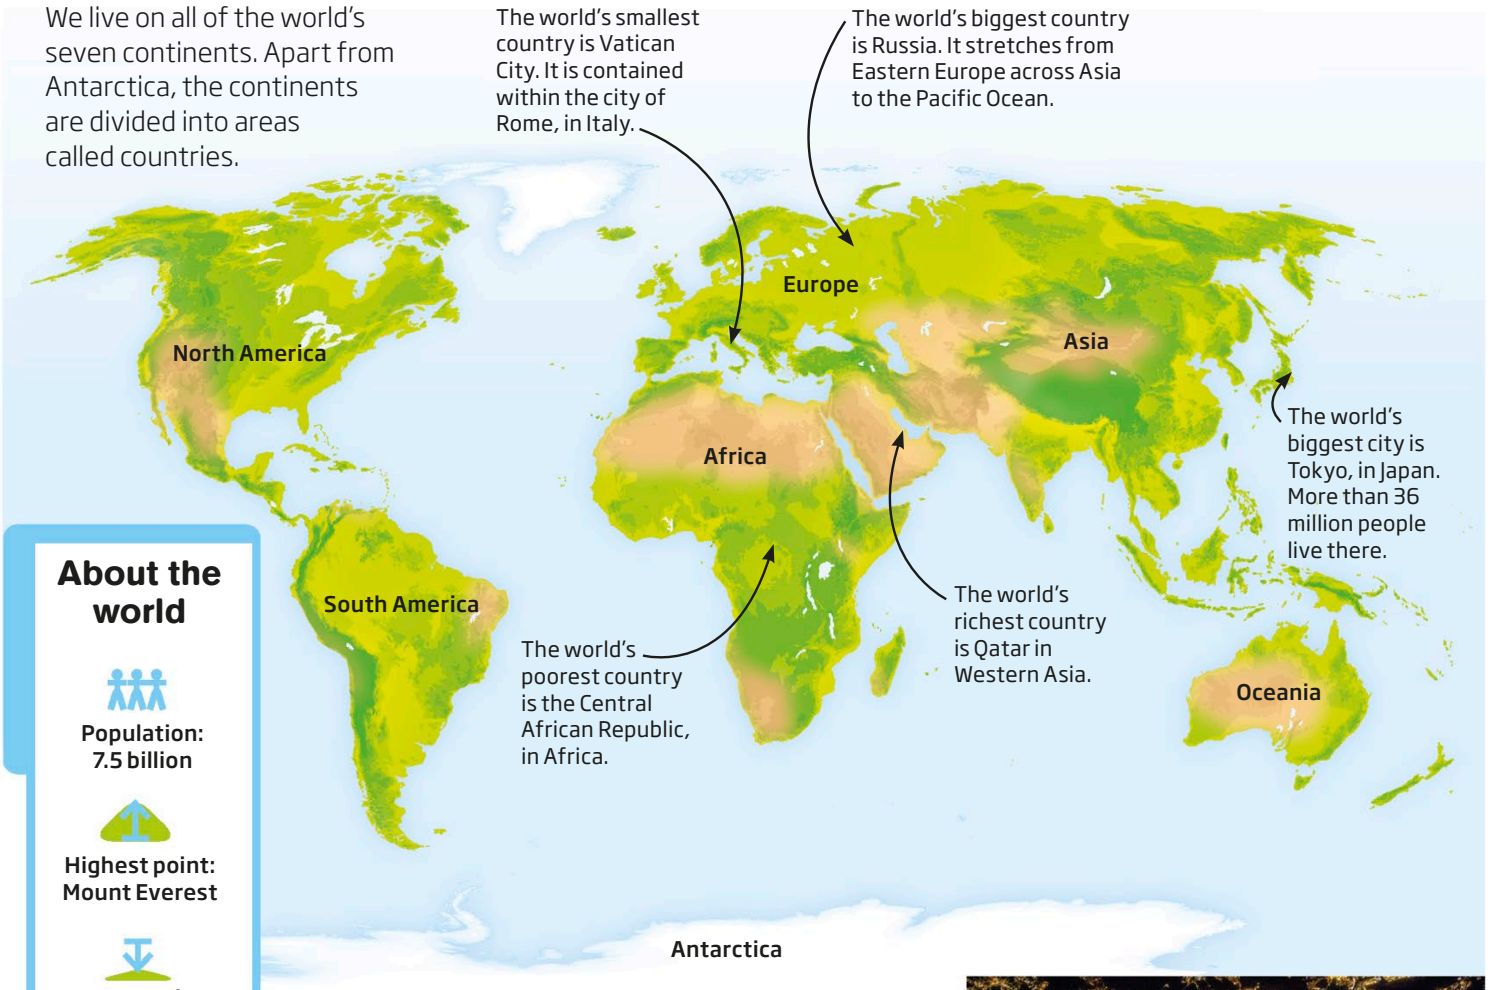
The Earth and everything that lives on it make up the world. We often show the world as a map. Just over one-quarter of it is land, which is divided into seven huge areas, called continents. The rest of the world is covered in water, or oceans.

SEE ALSO

- Changing world pp.50–51
- Climate change p.60
- Earth p.83
- Earth's surface p.84
- Maps p.155

Where we live

We live on all of the world's seven continents. Apart from Antarctica, the continents are divided into areas called countries.



About the world

Population: 7.5 billion

Highest point: Mount Everest

Lowest point: Mariana Trench

Biggest desert: Sahara Desert (hot) or Antarctica (cold)

Longest river: Nile

There are more than **7.5 billion people** in the world, living in about **200 countries**.

City life

Half of all the people on Earth live in cities. Many live in one of the world's 35 megacities, each of which has more than ten million people.

This night-time photograph of the megacity Paris, in France, was taken from space.

World War I

In 1914, war broke out in Europe and spread across the world. In this war, planes and tanks were used for the first time. The fighting lasted for four years and millions of soldiers were killed. Peace was declared in 1918.

Trench warfare

In Western Europe, the opposing armies defended the land they held by digging lines of deep trenches. Trenches protected the soldiers from enemy fire but were dangerous and very dirty.

- Europe p.94
- Factories p.97
- Flags p.102
- Work p.274
- World p.275
- World War II p.277
- War pp.278–279

Women at war

With the men away fighting, women worked in factories to make weapons and ammunition (bullets and shells). They also worked on farms.

Allies and Central Powers

The warring countries formed two groups, with the Allies fighting the Central Powers.

Allies:

Britain, France, Italy, Russia, USA

Central Powers:

Germany, Austria-Hungary, Ottoman Empire

World War II

In 1939, Germany invaded Poland and a war broke out in Europe. Fighting spread across the world, with massive battles on land, at sea, and in the air. The war lasted six years and was the most violent conflict in history, with more than 60 million people killed. Peace was restored in 1945.

- Aircraft p.13
- Europe p.94
- Religion p.208
- Ships p.224
- World p.275
- World War I p.276
- War pp.278–279

Kindertransport

Almost 10,000 mainly Jewish children who were threatened with persecution were brought to safety in Britain from mainland Europe. This was called the *Kindertransport*, or "children's transport".

British fighter plane
British Spitfire fighter aircraft brought down many German planes during the Battle of Britain in 1940.

German tank
Germany made thousands of powerful, well-armed tanks to attack both Western Europe and the Soviet Union (Russia).

US ship
The US Navy fought a series of fierce battles in the Pacific Ocean against the Japanese Navy.

Allies and Axis

The four main Allies faced the three Axis nations of Germany, Italy, and Japan. Fighting between them took place in Europe, Africa, Asia, and Oceania.

Main Allies:

Britain, France, USA, Soviet Union

Axis:

Germany, Italy, Japan

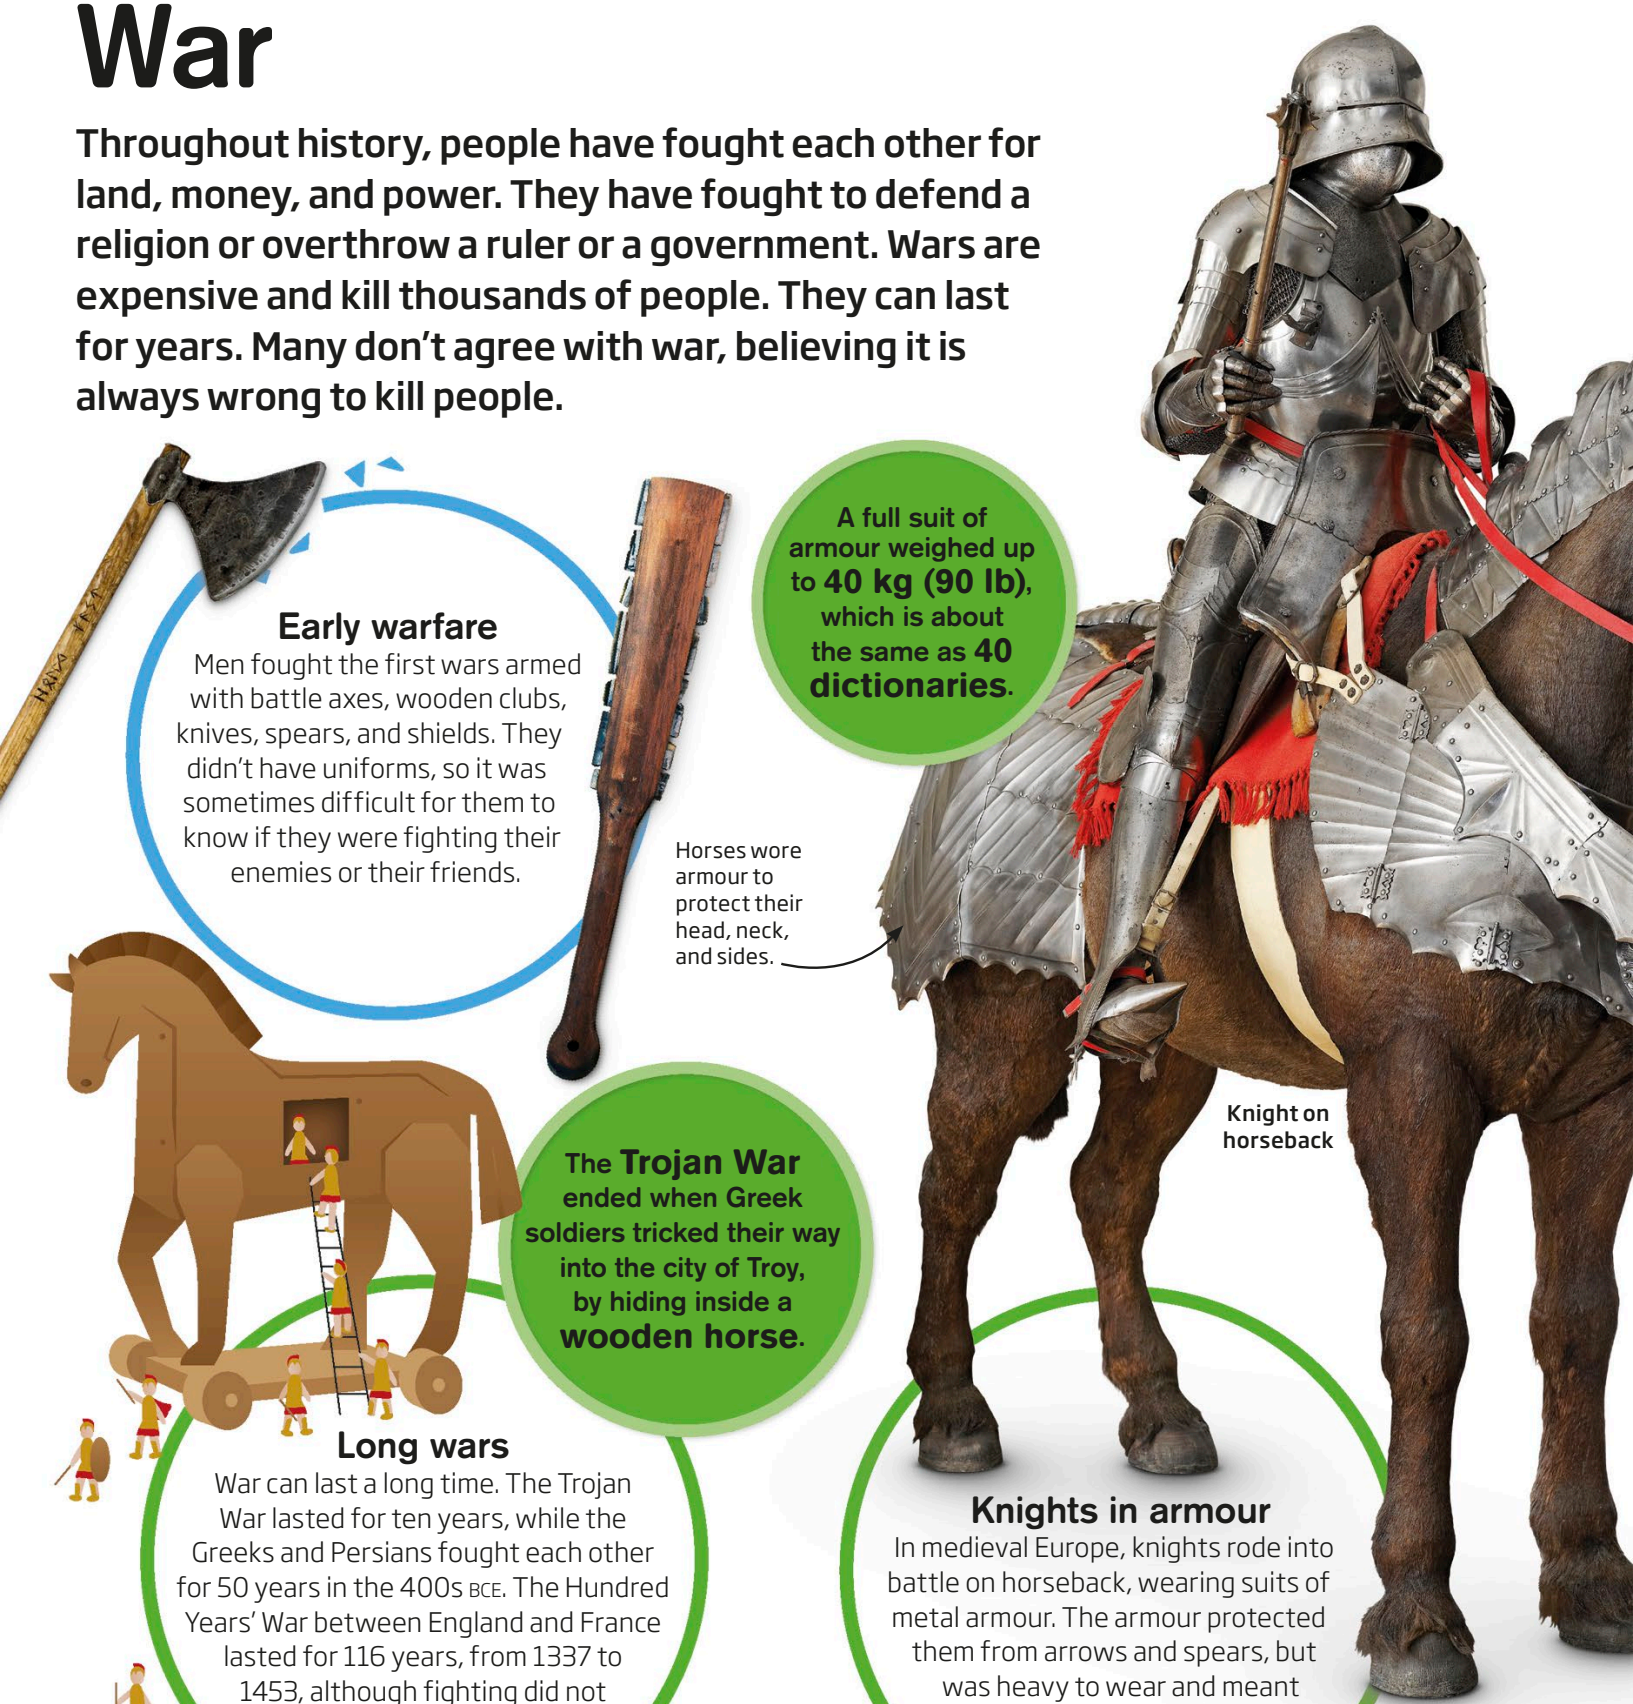
War

Throughout history, people have fought each other for land, money, and power. They have fought to defend a religion or overthrow a ruler or a government. Wars are expensive and kill thousands of people. They can last for years. Many don't agree with war, believing it is always wrong to kill people.

Early warfare

Men fought the first wars armed with battle axes, wooden clubs, knives, spears, and shields. They didn't have uniforms, so it was sometimes difficult for them to know if they were fighting their enemies or their friends.

A full suit of armour weighed up to 40 kg (90 lb), which is about the same as 40 dictionaries.



Horses wore armour to protect their head, neck, and sides.

Knight on horseback

The **Trojan War** ended when Greek soldiers tricked their way into the city of Troy, by hiding inside a **wooden horse**.

Long wars

War can last a long time. The Trojan War lasted for ten years, while the Greeks and Persians fought each other for 50 years in the 400s BCE. The Hundred Years' War between England and France lasted for 116 years, from 1337 to 1453, although fighting did not take place every day.

Knights in armour

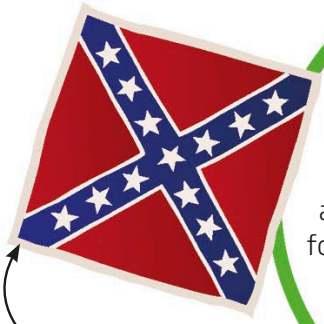
In medieval Europe, knights rode into battle on horseback, wearing suits of metal armour. The armour protected them from arrows and spears, but was heavy to wear and meant they couldn't see very well.

The Spanish Armada was made up of **130 ships**, that carried **2,500 guns** and **30,000 soldiers and sailors**.

A painting of the Spanish Armada in 1588.

War at sea

Many battles take place at sea. Sea battles can be very dangerous as ships can quickly sink, killing everyone on board. If rival boats get close together, soldiers can scramble across onto an enemy ship.



This flag was used by the rebel states during the US Civil War.

Civil wars

Most wars are fought between countries, but wars can also break out between groups within a country – these are known as civil wars. The USA fought a war against Britain to win its independence in 1783, and then fought a bitter civil war from 1861 to 1865.

The first official flag of the USA had 13 stars and 13 stripes to represent each of the colonies in 1777.

A modern submachine gun can fire

1,200 bullets

a minute, which is 20 every second.

Gunpowder

Gunpowder is an explosive material that was first invented in China in the 800s. It can be used in guns to propel bullets and shells very fast and over long distances against an enemy army.

Prussian soldier

War graves

Cost of war

Soldiers are killed or die of their wounds, and civilians caught up in the fighting can be killed by accident. If a person refuses to fight in a war because they don't believe in killing people, they are known as a conscientious objector.

Writing

Writing is putting the words we speak down on paper or on a screen. We do this using sets of characters, such as the letters in an alphabet. Characters represent the different letters or words of a language. The many different languages in the world have different systems of writing.

SEE ALSO

- Storytelling pp.42-43
- Books p.44
- Codes pp.66-67
- Language p.144
- Philosophy p.189

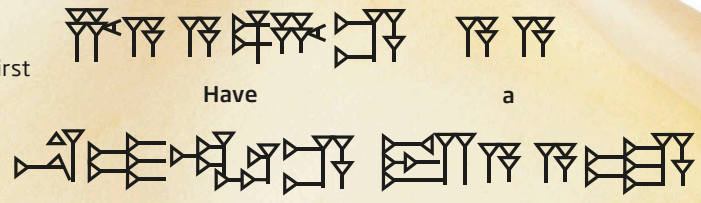
Writing systems

Written characters can be joined together to form words, or sometimes form words on their own. Different systems are written left to right, right to left, or downwards.

Writing tools

The first words were carved into soft clay using a hard reed or piece of wood. Today we write with pencils, crayons, and pens. Brushes can be used to paint beautiful characters.

Cuneiform
Used in ancient Iraq, this was one of the first writing systems. Cuneiform means "wedge-shaped".



English
The English alphabet has 26 letters. These letters are used by many languages across the world.

Have a nice day

Chinese
These characters are formed of pictures that often show an object. A character forms one word or part of a word.

祝你过一个好天

Have a nice day

Cyrillic
This alphabet is used to write Russian and other Eastern European and Central Asian languages.

Хорошего дня!

Have a nice day

Hindi
The Hindi language of India is written in the beautiful Devanagari alphabet. It has 47 different letters.

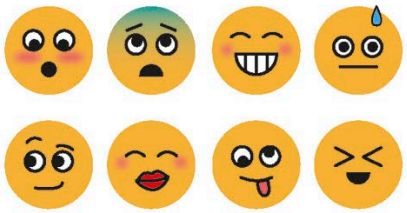
आप का दिन अच्छा बीते!

Have a nice day

Some Chinese dictionaries list more than 40,000 characters!

Emojis

Emoji means "picture character" in Japanese. Emojis are used on mobile phones and computers as a quick way to show feelings or words.



Zoo

Zoos are home to animals from all over the world. Scientists work in zoos to learn about the animals, and how animals live in the wild. The oldest zoos have been around for hundreds of years. Millions of people visit zoos to see animals and learn more about them.

SEE ALSO

- Animal families p.21
- Conservation p.72
- Farming p.98
- Pets pp.152–153
- Mammals p.154
- Work p.274

Natural spaces
Zoos try to keep animals in spaces that are like where they would be in the wild. This is good for the animals and helps people learn about these places.

Zoo people
Lots of different people work in zoos. Zookeepers look after the animals every day; zoologists are scientists that study the animals; and vets keep the animals healthy.

Conservation
Zoos protect animal numbers in the wild and work to stop animals from becoming extinct. For example, Californian zoos have set up breeding programmes to save the endangered Californian condor.

Bad zoos
Not all zoos are good. Some don't look after their animals properly or keep them in the right spaces. Good zoos are part of zoo organisations that make sure they keep animals safe and healthy.

Zoo visit

Here are some things to bear in mind if you visit a zoo.

Don't feed the animals
Feeding animals food that is not part of their diet can make them ill.

Don't make loud noises
Loud noises scare the animals, so try not to shout.

Listen to the zookeepers
The keepers know a lot. You can learn about animals by listening to them and reading the signs.

Reference

In this section you'll find a useful collection of lists and diagrams packed with helpful information.

Artists

An artist is someone who creates art by painting, sculpting, or making. Even early humans made cave paintings. Many artists are famous for inventing new styles of art and ways of painting.

Giotto (around 1266-1337)
Italian painter who started painting in a more lifelike way. His pictures mark the start of the Renaissance style of painting, which was more realistic than what had been before.

Jan van Eyck (around 1390-1441)
The first great painter to develop the use of oil paints. He came from what is now Belgium.

Leonardo da Vinci (1452-1519)
Italian painter, inventor, and thinker who painted people with natural expressions. His most famous works are the *Mona Lisa* and the wall painting *The Last Supper*.

Michelangelo Buonarroti (1475-1564)
Italian painter, sculptor, architect, and poet, often called simply "Michelangelo". His large religious paintings on the ceiling and walls of the Sistine Chapel in Rome are among the most famous of all artworks.

Raphael (Raffaello Sanzio, 1483-1520)
Italian painter of religious works and portraits. He used Leonardo's and Michelangelo's techniques to make paintings that influenced art for hundreds of years.

Titian (around 1488-1576)
Painter from Venice, Italy, whose works include mythological scenes and realistic portraits of people, and are well known for their bright colours.

Peter Paul Rubens (1577-1640)
Artist and diplomat who lived in what is now Belgium. He was the most famous painter of the Baroque style, which came after the Renaissance and features dramatic situations and emotions.

Claude Lorrain (around 1600-1682)
French landscape painter who mainly worked in Italy. His landscapes often include ancient ruins, and inspired the fashion for landscape gardening, where people tried to make their land look like his paintings.

Rembrandt (Rembrandt van Rijn, 1606-1669)
Dutch painter whose great skill as an artist helped him paint people's emotions. Many of his best paintings are self-portraits.

Francisco Goya (1746-1828)
Spanish artist who became official painter to the King of Spain, but whose works also include nightmare scenes and paintings of the horrors of war.

Katsushika Hokusai (1760-1849)
Japanese artist who excelled in painting scenes from everyday life and landscapes. Many of his works feature the snow-capped Japanese volcano, Mount Fuji.

J. M. W. Turner (1775-1851)
English landscape painter whose works show his interests in travel, the sea, history, and literature. In his later paintings the scenes are sometimes almost completely hidden by mist, rain, or snow.

John Constable (1776-1837)
English landscape painter known for his everyday countryside scenes. His famous paintings include *The Hay Wain* and *The Cornfield*.

Eugène Delacroix (1798-1863)
French painter of the Romantic period, when art, writing, and music focused on emotions. He chose dramatic subjects, deliberately painting so that his individual brushstrokes could be seen.

Paul Cézanne (1839-1906)
French painter, sometimes called the father of modern art. He mainly painted landscapes and still lifes (objects like flowers and fruits), building up his pictures with large blocks of colour.

Claude Monet (1840-1926)
French landscape painter who invented the Impressionist style of art, which tried to paint the overall effect of a moment in time.

Vincent van Gogh (1853-1890)
Dutch painter who developed a unique style featuring bright colours and dramatic brushstrokes. He was not well known until after he died.

Edvard Munch (1863-1944)
Norwegian painter who had a tragic childhood and painted many works expressing fear and anxiety. His most famous painting is *The Scream*.

Qi Baishi (1864-1957)
Popular Chinese artist whose many works include a variety of subjects such as paintings of individual animals and plants.

Henri Matisse (1869-1954)
French painter. His brightly coloured, usually cheerful works are sometimes abstract, but usually he painted recognizable objects in a simplified style.

Abanindranath Tagore (1871-1951)
Indian painter and author who helped develop Indian art that was less dependent on British influence (Britain ruled India at the time). His uncle was the poet Rabindranath Tagore (see "Writers" list).

Pablo Picasso (1881-1973)
Spanish artist, probably the most famous painter of the 20th century. He painted in a variety of modern art styles and helped invent Cubism, which includes lots of geometric shapes such as squares and triangles.

Edward Hopper (1882-1967)
American painter of realistic scenes, often city streets or buildings, either deserted or with lonely-looking people in them.

Diego Rivera (1886-1957)
Mexican painter best known for his colourful, action-packed wall paintings that often have a political message. Husband of Frida Kahlo.

Mark Rothko (1903-1970)
American abstract artist whose work features rectangular blocks of colour painted without sharp edges.

Salvador Dalí (1904-1989)
Spanish painter and sculptor who belonged to the art movement called Surrealism, which created made-up subjects. His work features dreamlike impossible scenes, painted in a highly realistic way.

Frida Kahlo (1907-1954)
Mexican painter known for her self-portraits. She had a complex life, affected by accident and illness as a child. Wife of Diego Rivera.

Jackson Pollock (1912-1956)
American painter best known for his "action paintings" – abstract works created by dribbling swirls of paint on a canvas.

Andy Warhol (1928-1987)
American founder of Pop Art, which takes everyday images such as soup cans or celebrities' faces and uses them as the basis for artworks.

Antony Gormley (born 1950)
British sculptor whose works include the huge outdoor winged figure the *Angel of the North* near Newcastle upon Tyne, UK.

Writers

People have written things down for thousands of years. Writing can include books, poems, or plays. It can tell a story or record facts.

Homer (around 800 BCE)
Legendary blind author of the Greek epic poems the *Iliad* and the *Odyssey*, set at the time of the Trojan War.

Sappho (around 630 BCE)
Greek poet famous for her passionate love poetry. Only a small amount of her work now survives.

Qu Yuan (around 340–278 BCE)
Ancient Chinese poet and public servant. His most famous poem is called *The Lament*.

Virgil (70–19 BCE)
Roman author of the epic poem the *Aeneid*, which tells the legendary story of the creation of the city of Rome.

Imru' al-Qais (around 500)
Arabian poet whose works are full of passionate feeling. He is sometimes called the father of Arabic poetry.

Dante Alighieri (1265–1321)
Italian author of the *Divine Comedy*, a three-part epic poem describing hell, heaven, and purgatory (a place in between heaven and hell).

Geoffrey Chaucer (around 1343–1400)
English author of *The Canterbury Tales*, entertaining stories told in the voice of different pilgrims (people travelling to a sacred place).

Miguel de Cervantes (1547–1616)
Spanish writer whose comic book *Don Quixote*, about the adventures of a well-meaning but silly knight, is often described as Europe's first novel.

William Shakespeare (1564–1616)
English playwright and poet whose many famous plays include *Hamlet*, *Macbeth*, *Romeo and Juliet*, and *A Midsummer Night's Dream*.

Molière (1622–1673)
Famous French actor and author of funny comic plays. Molière was his stage name, his real name was Jean-Baptiste Poquelin.

Matsuo Bashō (1644–1694)
Japanese poet, a master of the short type of Japanese poem called a haiku, which contains just 17 syllables (single sounds in words).

Voltaire (1694–1778)
French writer and thinker, whose real name was François-Marie Arouet. He attacked old-fashioned ideas in his funny and controversial writings.

Johann Wolfgang von Goethe (1749–1832)
German writer, poet, and thinker, whose wide-ranging works include *Faust*, a long drama finished just before his death.

Robert Burns (1759–1796)
Scotland's national poet. He wrote or revised the words for hundreds of Scottish songs including *Auld Lang Syne*.

William Wordsworth (1770–1850)
English poet who used nature as a source of inspiration.

Sir Walter Scott (1771–1832)
Scottish writer and poet. He was the first great historical novelist, with works including *Ivanhoe*, *Old Mortality*, and *The Heart of Midlothian*.

Jane Austen (1775–1817)
English author whose funny and clever novels, including *Emma* and *Pride and Prejudice*, are still popular today.

Hans Christian Andersen (1805–1875)
Danish writer best known for his children's stories, including *The Ugly Duckling*, *The Little Mermaid*, and *The Snow Queen*.

Charles Dickens (1812–1870)
English author of many famous novels including *Oliver Twist*, *David Copperfield*, and *A Tale of Two Cities*.

Charlotte Brontë (1816–1855)
English author of *Jane Eyre* and other novels. Her sisters Emily (1818–1848, author of *Wuthering Heights*) and Anne (1820–1849) are also well-known writers.

Charles Baudelaire (1821–1867)
French poet whose subjects include city life and the unhappy side of emotions. He was a big influence on later poets.

Leo Tolstoy (1828–1910)
Russian author of the famous novels *Anna Karenina* and *War and Peace*.

Emily Dickinson (1830–1886)
American poet whose deeply felt, personal poems only became well known after her death.

Lewis Carroll (1832–1898)
English author and mathematician. His real name was Charles Lutwidge Dodgson. He wrote the stories *Alice's Adventures in Wonderland* and *Through the Looking-Glass*.

Mark Twain (1835–1910)
American author, whose real name was Samuel Langhorne Clemens. His many works include the novels *The Adventures of Tom Sawyer* and *The Adventures of Huckleberry Finn*.

Oscar Wilde (1854–1900)
Irish author whose works include the play *The Importance of Being Earnest* and his only novel *The Picture of Dorian Gray*.

Rabindranath Tagore (1861–1941)
Indian poet, novelist, composer, and thinker who wrote mainly in the Bengali language. He won the Nobel Prize for Literature in 1913.

H. G. Wells (1866–1946)
English author and thinker. He wrote works of science fiction such as *The Time Machine* and *The War of the Worlds*.

James Joyce (1882–1941)
Irish author of famous novels including *Ulysses* and *Finnegans Wake*.

Virginia Woolf (1882–1941)
English novelist whose works feature a style of writing called stream-of-consciousness where you read a person's thoughts as they think them.

T. S. Eliot (1888–1965)
American–English poet whose works include *The Waste Land*. His humorous poems about cats became the inspiration for the musical *Cats*. He won the Nobel Prize for Literature in 1948.

Ernest Hemingway (1899–1961)
American author whose books include *A Farewell to Arms* and *For Whom the Bell Tolls*, both set in wartime. He won the Nobel Prize for Literature in 1954.

George Orwell (1903–1950)
English novelist and essay writer. He wrote the famous political novels *Animal Farm* and *Nineteen Eighty-Four*.

Gabriel García Márquez (1927–2014)
Colombian author whose novels, originally written in Spanish, include *One Hundred Years of Solitude* and *Love in the Time of Cholera*. He won the Nobel Prize for Literature in 1982.

Wole Soyinka (born 1934)
Nigerian playwright, poet, and novelist whose works often deal with African political and social issues. He won the Nobel Prize for Literature in 1986.

J. K. Rowling (born 1965)
British author of the hugely successful *Harry Potter* series of books about a young wizard.

Alphabets and writing systems

An alphabet is a set of marks that each means a sound. It is used to write down the words of a language.

Ancient Greek

Αα	Ββ	Γγ	Δδ	Εε	Ζζ	Ηη	Θθ
alpha	beta	gamma	delta	epsilon	zeta	eta	theta
Ιι	Κκ	Λλ	Μμ	Νν	Ξξ	Οο	Ππ
iota	kappa	lambda	mu	nu	ksi	omicron	pi
Ρρ	Σσς	Ττ	Υυ	Φφ	Χχ	Ψψ	Ωω
rho	sigma	tau	upsilon	phi	chi	psi	omega

Ancient Greek letters

The ancient Greeks used an alphabet with 24 letters. The Latin alphabet is based on it.

Latin (Roman)

Aa	Bb	Cc	Dd	Ee	Ff	Gg	Hh	Ii	Jj	Kk	Ll	Mm
Nn	Oo	Pp	Qq	Rr	Ss	Tt	Uu	Vv	Ww	Xx	Yy	Zz

Latin letters

The Latin alphabet is still used today in many European languages. Three letters have been added since ancient times: J, U, and W.

Arabic

ص	ش	س	ز	ر	ذ	د	خ	ح	ج	ث	ت	ب	ا	
ي	و	ه	ن	م	ل	ك	ق	ف	غ	ع	ظ	ط	ض	

Arabic letters

The Arabic alphabet has 28 letters. It reads from right to left and does not have separate capital letters. Some vowels have their own letters, but some are added to the consonants.

Chinese (Mandarin)

女	男	子	头	手	脚	日	月
woman	man	child	head	hand	foot	sun	moon
土	水	火	金	木	山	云	龙
earth	water	fire	metal	tree	mountain	cloud	dragon
狗	猫	马	鸟	北	南	大	小
dog	cat	horse	bird	north	south	big	small
刀	叉	辣	冷	春天	夏天	秋天	冬天
knife	fork	hot	cold	spring	summer	autumn	winter

Chinese characters

Chinese writing does not have an alphabet; instead, symbols called characters represent whole words. More than one language is spoken in China. Mandarin is the most common.

Scientists

For thousands of years, scientists have made all sorts of important inventions and discoveries. Today, they are still answering important questions about the Universe.

Aristotle (384-322 BCE)
Ancient Greek philosopher and scientist. His ideas on physics are out of date but he was a good biologist, pointing out many facts about animals for the first time.

Aristarchus of Samos (around 310-230 BCE)
Greek astronomer who first suggested that the Earth goes around the Sun, instead of the other way round, as was thought before. Copernicus came up with the same idea much later on.

Zhang Heng (78-139 CE)
Chinese scientist and mathematician who invented a device that would detect earthquakes up to 500 km (310 miles) away.

Galen (around 129-200)
Greek doctor who studied the parts of the human body. Although many of his ideas were later proved to be wrong, people treated his writings on medicine very seriously for over 1,300 years.

Alhazen (around 965-1039)
Arab mathematician, astronomer, and physicist. He was probably the best scientist of medieval times, writing a major work on the theory of light and vision.

Nicolaus Copernicus (1473-1543)
Polish astronomer who showed both that the Earth was not standing still, but instead spinning on its axis once a day, and that it orbits the Sun once a year, instead of the Sun orbiting the Earth.

Galileo Galilei (1564-1642)
Italian physicist and astronomer. He was the first person to use a telescope in astronomy, discovering among other things that Jupiter had moons.

Johannes Kepler (1571-1630)
German astronomer who improved Copernicus's theory that the Earth and other planets moved around the Sun, by showing that their orbits are ellipses (oval shapes), not circles.

William Harvey (1578-1657)
English doctor who discovered that the heart pumps blood around the body, pushing it outwards through arteries and back through veins.

Isaac Newton (1642-1727)
English physicist and mathematician who explained gravity for the first time. In physics, he put forward his famous "three laws of motion", which explain how objects move and interact with each other.

Carl Linnaeus (1707-1778)
Swedish biologist who introduced the idea of naming living things by giving them a name in Latin, for example, *Homo sapiens* for humans.

James Hutton (1726-1797)
Scottish geologist whose work showed that the Earth's rocks formed over a huge time period as a result of very slow changes.

Antoine Lavoisier (1743-1794)
French chemist, often called the father of modern chemistry. He introduced the idea of a chemical element, and named the gas oxygen.

Alessandro Volta (1745-1827)
Italian physicist who in 1800 invented the electric battery, which first allowed a steady electric current to be produced. The unit of electricity, the volt, is named in his honour.

Michael Faraday (1791-1867)
English physicist and chemist. He showed that a moving magnet creates an electric current in a wire and invented the theory of electric and magnetic fields to explain his discoveries.

Charles Darwin (1809-1882)
English biologist whose 1859 book *On the Origin of Species* argued that new species can evolve from existing ones by natural selection.

Ada Lovelace (1815-1852)
English mathematician who put together the world's first computer program. She wrote it for a never-completed mechanical computer built by the inventor Charles Babbage.

Gregor Mendel (1822-1884)
Austrian science teacher and monk. He carried out careful experiments on plants to show how features such as flower colour and seed shape are passed on to the next generation.

Louis Pasteur (1822-1895)
French chemist who proved that tiny living things cause rotting and decay. He also showed how people could be protected from diseases by immunizing them.

Dmitri Mendeleev (1834-1907)
Russian chemist who created the first periodic table of elements. He arranged the elements in increasing size of their atoms and whether they have similar properties.

Marie Curie (1867-1934)
Polish-French physicist. Along with her husband, Pierre, she was one of the first people to research radioactivity, and discovered the radioactive elements radium and polonium. She won Nobel prizes in 1903 and 1911.

Ernest Rutherford (1871-1937)
New Zealand physicist who discovered that all atoms have a tiny central nucleus containing most of their mass (weight). He won the Nobel Prize for Chemistry in 1908.

Albert Einstein (1879-1955)
German-born physicist best known for his theories of relativity, including that matter and energy can be turned into each other (described by his famous equation $E = MC^2$). He won the Nobel Prize for Physics in 1921.

Alfred Wegener (1880-1930)
German weather scientist who suggested that the Earth's continents slowly move over time (continental drift).

Neils Bohr (1885-1962)
Danish physicist who added to Ernest Rutherford's ideas to suggest that electrons move around an atom in fixed orbits. He won the Nobel Prize for Physics in 1922.

Dorothy Hodgkin (1910-1994)
English chemist who worked out how to discover the shapes of complicated molecules in the body, such as penicillin and insulin. She won the Nobel Prize for Chemistry in 1964.

Alan Turing (1912-1954)
English mathematician and founder of computer science. During World War II he helped crack German military codes, and later he was involved with some of the first practical computers designed for general use.

Francis Crick (1916-2004) and James Watson (born 1928)
Crick (an English physicist) and Watson (an American biologist) co-discovered the spiral (double helix) shape of DNA in 1953. With a third scientist, they won the Nobel Prize for Medicine in 1962.

Rosalind Franklin (1920-1958)
English chemist who provided much of the evidence that Francis Crick and James Watson used in discovering the spiral shape of DNA.

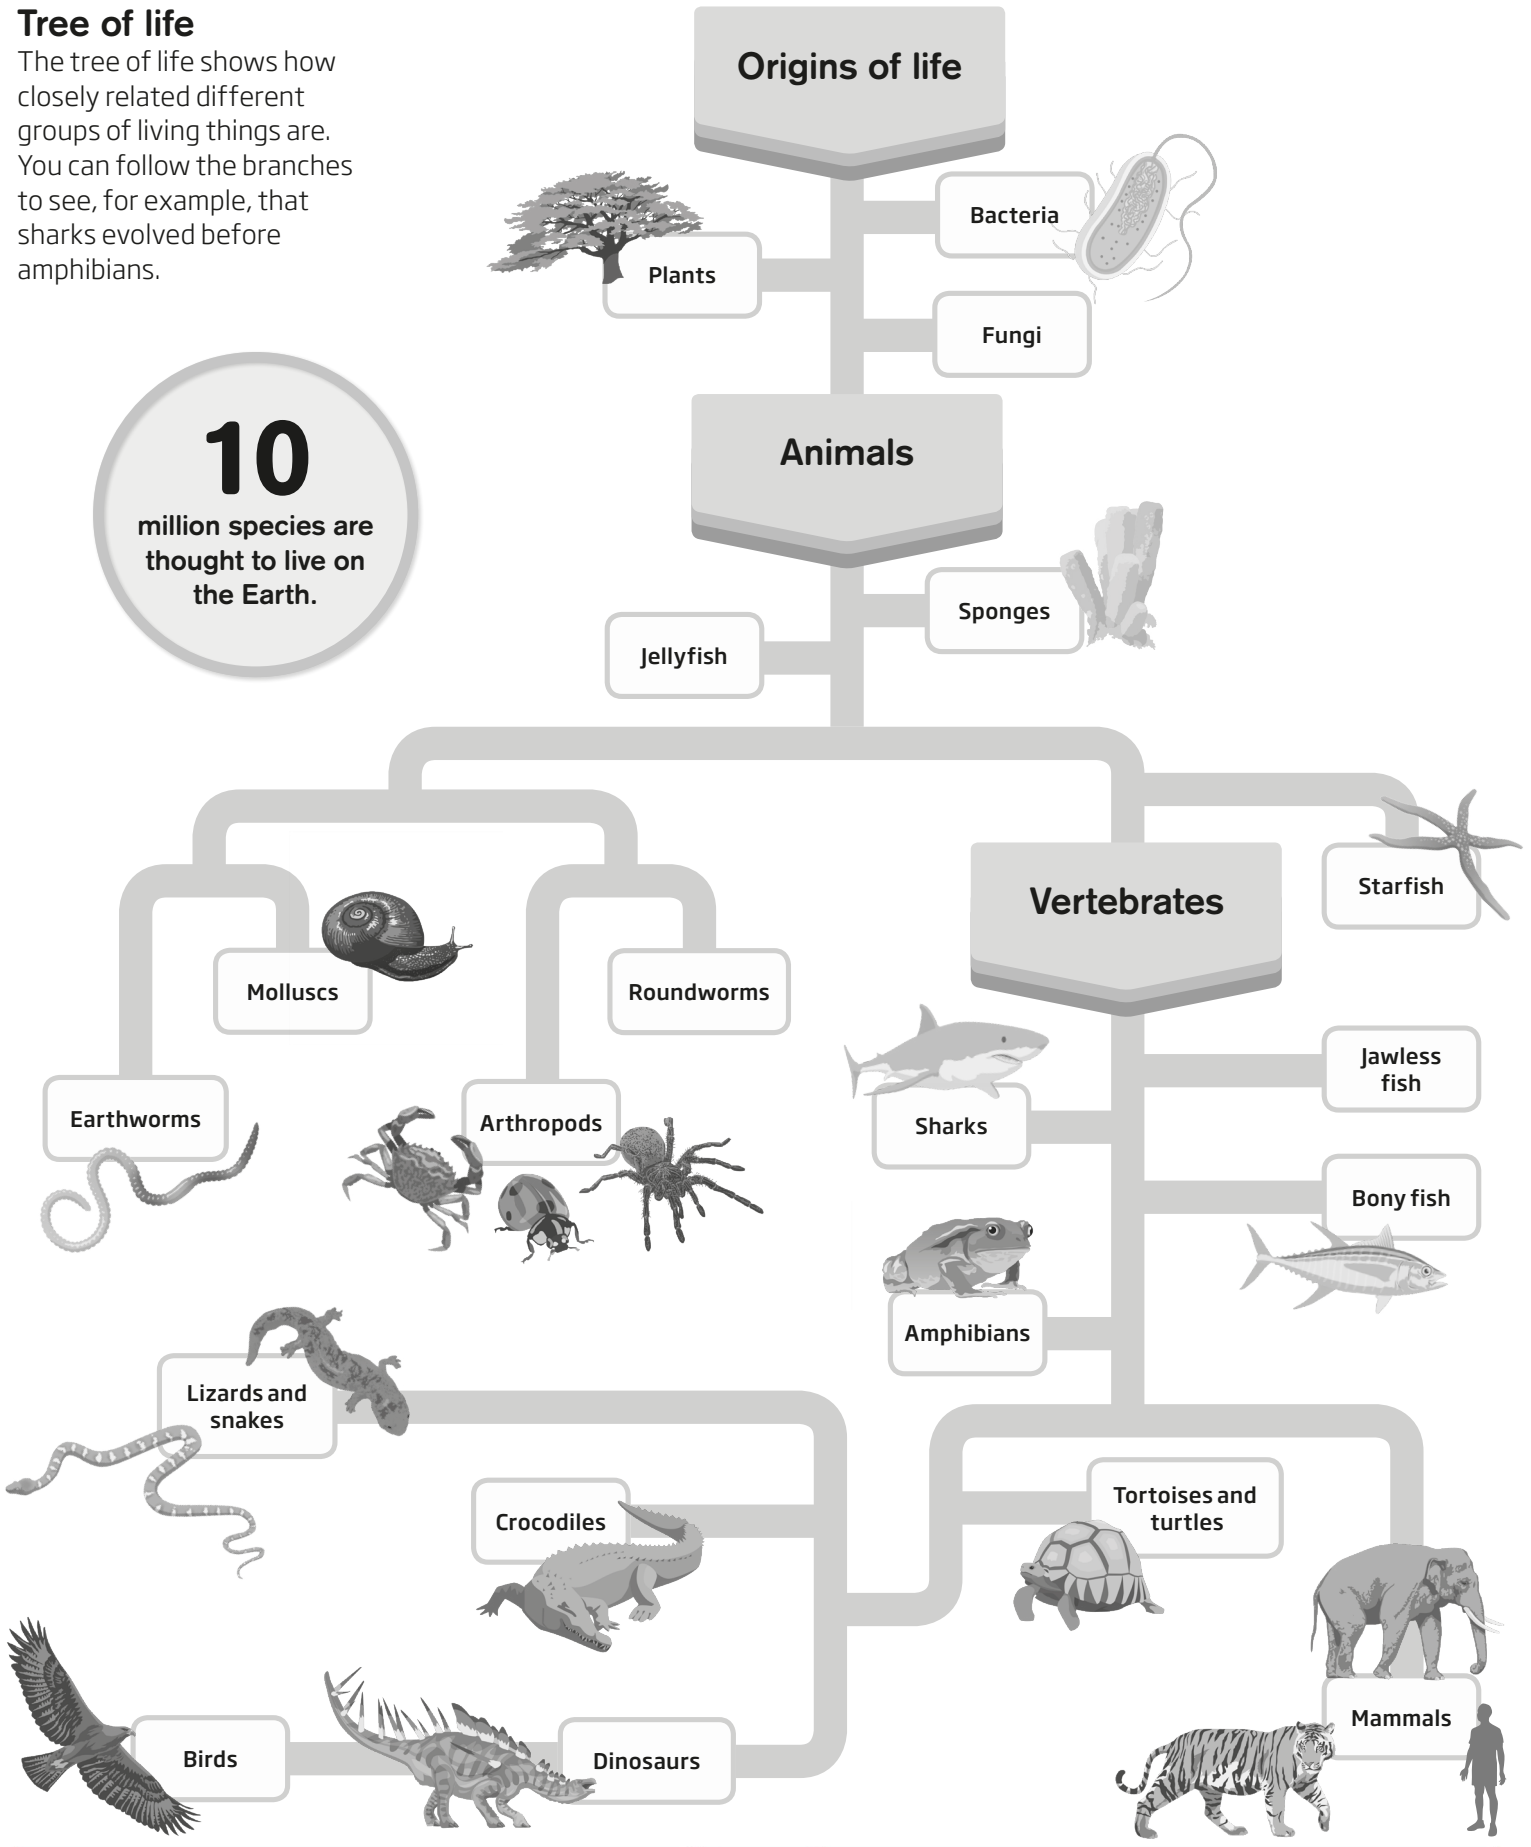
Lynn Margulis (1938-2011)
American biologist who developed the theory that the complicated cells of animals and plants came from smaller bacteria-sized cells that started to live inside each other.

Stephen Hawking (born 1942)
English physicist who has helped us to understand black holes, the origin of the Universe, and the nature of time.

Tree of life

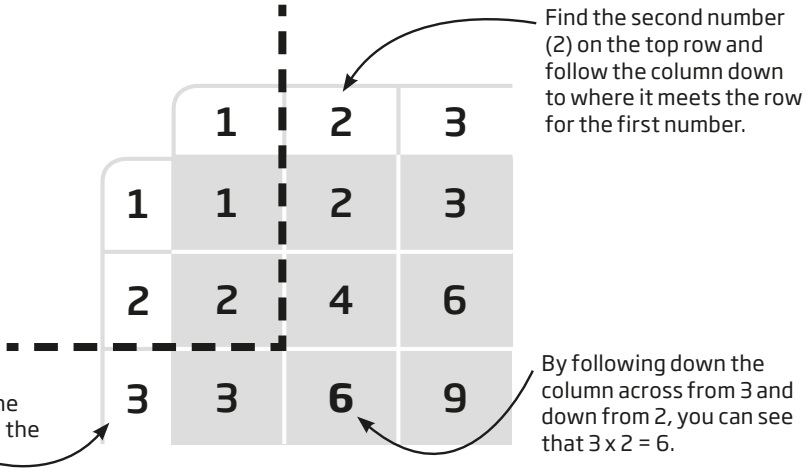
The tree of life shows how closely related different groups of living things are. You can follow the branches to see, for example, that sharks evolved before amphibians.

10
million species are thought to live on the Earth.



Multiplication

If you times two numbers together you are multiplying them. You can use this table to quickly work out the answer to multiplying any two numbers between 1 and 20.



When we multiply a number by itself, we say it has been "squared".

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
2	2	4	6	8	10	12	14	16	18	20	22	24	26	28	30	32	34	36	38	40
3	3	6	9	12	15	18	21	24	27	30	33	36	39	42	45	48	51	54	57	60
4	4	8	12	16	20	24	28	32	36	40	44	48	52	56	60	64	68	72	76	80
5	5	10	15	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95	100
6	6	12	18	24	30	36	42	48	54	60	66	72	78	84	90	96	102	108	114	120
7	7	14	21	28	35	42	49	56	63	70	77	84	91	98	105	112	119	126	133	140
8	8	16	24	32	40	48	56	64	72	80	88	96	104	112	120	128	136	144	152	160
9	9	18	27	36	45	54	63	72	81	90	99	108	117	126	135	144	153	162	171	180
10	10	20	30	40	50	60	70	80	90	100	110	120	130	140	150	160	170	180	190	200
11	11	22	33	44	55	66	77	88	99	110	121	132	143	154	165	176	187	198	209	220
12	12	24	36	48	60	72	84	96	108	120	132	144	156	168	180	192	204	216	228	240
13	13	26	39	52	65	78	91	104	117	130	143	156	169	182	195	208	221	234	247	260
14	14	28	42	56	70	84	98	112	126	140	154	168	182	196	210	224	238	252	266	280

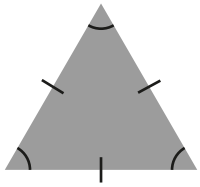
Flat shapes

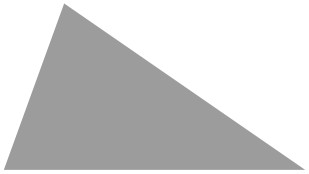
Flat, or 2D, shapes have length and width but no depth. Triangles have three straight sides, and quadrilaterals have four straight sides.

KEY

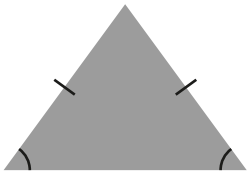
- Equal angles
- Right angle
- Equal sides
- Equal sides



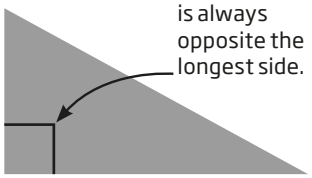
Equilateral triangle
All three sides and all three angles in an equilateral triangle are equal.



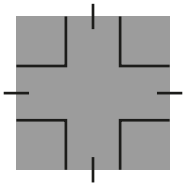
Scalene triangle
All three sides and all three angles in a scalene triangle are different.



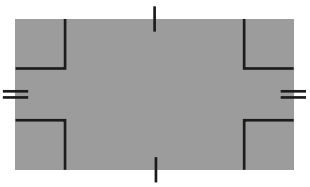
Isosceles triangle
An isosceles triangle has two sides of equal length and two angles of equal size.



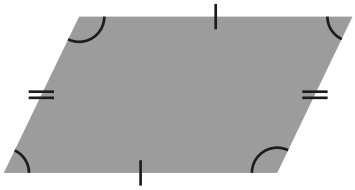
Right-angled triangle
A right-angled triangle has one right angle, but the other angles and sides vary.



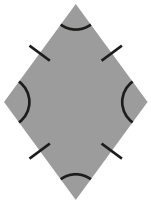
Square
All four sides in a square are of equal length and all four angles are right angles.



Rectangle
A rectangle has two pairs of sides that are the same length and four right angles.



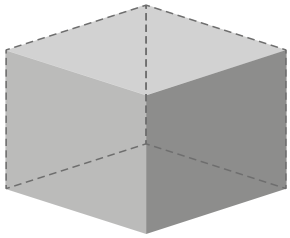
Parallelogram
A parallelogram has two pairs of sides that are equal lengths and two pairs of angles that are the same size.



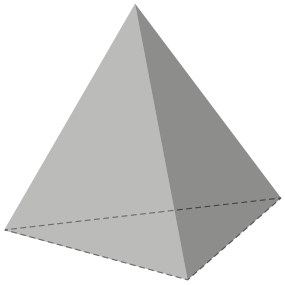
Rhombus
All the sides in a rhombus are equal lengths and it has two pairs of angles of equal size.

Solid shapes

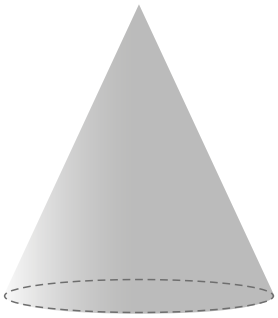
Solid, or 3D, shapes have depth as well as length and width.



Cube
A cube has 12 edges of equal length and six faces of equal size.



Pyramid
A pyramid can have a triangular base, as seen here, or a square base. A triangular-based pyramid has four faces and six edges.

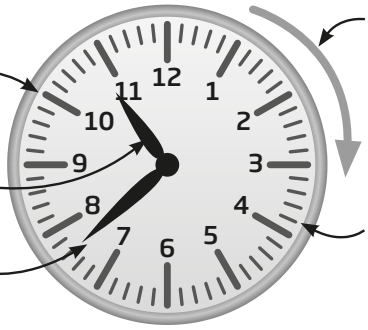


Cone
Cones have two faces and only one edge. The point is above the centre of the circular base.

Cylinder
A cylinder has three faces and two edges. The two circular faces are opposite each other.

Time

We divide time into hours, minutes, and seconds. A clock or watch is used to tell what time of day it is.



O'clock
When the minute hand points to 12, the time is exactly the hour shown by the hour hand.

Half past
When the minute hand points to 6, we know it is half past the hour.

Minutes past
When the minute hand is on the right of the clock, we say how many minutes are past the hour.

Quarter past
When the minute hand points to 3, we know it is quarter past the hour.

Quarter to
When the minute hand points to 9, we know it is quarter to the hour.

Minutes to
When the minute hand is on the left of the clock, we say how many minutes are to the hour.

The planets

There are eight planets in our Solar System, but they are all very different. Here you can compare them – the days and hours given are equal to the time they take on Earth.

Planet name	Distance from the Sun	Width	Orbit time around the Sun	Day length	Number of moons
Mercury	58 million km (36 million miles)	4,879 km (3,032 miles)	88 days	59 days	0
Venus	108 million km (67 million miles)	12,104 km (7,521 miles)	225 days	243 days	0
Earth	150 million km (93 million miles)	12,756 km (7,926 miles)	1 year	24 hours	1
Mars	228 million km (142 million miles)	6,792 km (4,220 miles)	1 year 322 days	25 hours	2
Jupiter	778 million km (484 million miles)	142,984 km (88,846 miles)	11 years 315 days	10 hours	At least 67
Saturn	1,427 million km (887 million miles)	120,536 km (74,898 miles)	29 years 163 days	11 hours	At least 62
Uranus	2,871 million km (1,784 million miles)	51,118 km (31,763 miles)	84 years 6 days	17 hours	At least 27
Neptune	4,498 million km (2,795 million miles)	49,528 km (30,775 miles)	163 years 289 days	16 hours	At least 14

243
Earth days in a single day on Venus.

Kings and queens of England and Britain

England became a single kingdom in 927 CE, after several kingdoms merged together. It was ruled by Anglo-Saxon and Danish kings until it was conquered by Normans from France in 1066. In 1603, the kings and queens of England and Scotland became the same rulers, when James VI of Scotland also became James I of England. Beside each monarch (king or queen) listed here is the name of the group that they belonged to.

Athelstan	Anglo-Saxon	925-940
Edmund I	Anglo-Saxon	940-946
Eadred	Anglo-Saxon	946-955
Eadwig	Anglo-Saxon	955-959
Edgar	Anglo-Saxon	959-975
Edward the Martyr	Anglo-Saxon	975-978
Aethelred the Unready	Anglo-Saxon	978-1013
Svein	Danish	1013-1014
Aethelred the Unready	Anglo-Saxon	1014-1016
Edmund Ironside	Anglo-Saxon	1016
Canute	Danish	1016-1035
Harold Harefoot	Danish	1035-1040
Hardicanute	Danish	1040-1042
Edward the Confessor	Anglo-Saxon	1042-1066
Harold II	Anglo-Saxon	1066
William the Conqueror	Norman	1066-1087
William II	Norman	1087-1100
Henry I	Norman	1100-1135
Stephen	Norman	1135-1154
Henry II	Plantagenet	1154-1189
Richard the Lionheart	Plantagenet	1189-1199
John	Plantagenet	1199-1216
Henry III	Plantagenet	1216-1272
Edward Longshanks	Plantagenet	1272-1307
Edward II	Plantagenet	1307-1327
Edward III	Plantagenet	1327-1377
Richard II	Plantagenet	1377-1399
Henry IV	Lancastrian	1399-1413
Henry V	Lancastrian	1413-1422
Henry VI	Lancastrian	1422-1461
Edward IV	Yorkist	1461-1470
Henry VI	Lancastrian	1470-1471
Edward IV	Yorkist	1471-1483
Edward V	Yorkist	1483
Richard III	Yorkist	1483-1485
Henry VII	Tudor	1485-1509
Henry VIII	Tudor	1509-1547
Edward VI	Tudor	1547-1553
Mary I	Tudor	1553-1558
Elizabeth I	Tudor	1558-1603
James I (James VI of Scotland)	Stuart	1603-1625
Charles I	Stuart	1625-1649
Temporary republic, 1649-1660 (no kings or queens)		
Oliver Cromwell	Commonwealth	1653-1658
Richard Cromwell	Commonwealth	1658-1659
Charles II	Stuart	1660-1685
James II	Stuart	1685-1688
William III and Mary II	Stuart	1689-1702
Anne	Stuart	1702-1714
George I	Hanoverian	1714-1727
George II	Hanoverian	1727-1760
George III	Hanoverian	1760-1820
George IV	Hanoverian	1820-1830
William IV	Hanoverian	1830-1837
Victoria	Hanoverian	1837-1901
Edward VII	Saxe-Coburg-Gotha	1901-1910
George V	Windsor	1910-1936
Edward VIII	Windsor	1936
George VI	Windsor	1936-1952
Elizabeth II	Windsor	1952-

Prime ministers of Britain

The prime minister is the head of the king or queen's government. The idea of a prime minister grew gradually, as British monarchs became less powerful and their ministers got more control. The first minister powerful enough to be called prime minister was Sir Robert Walpole. Alongside the name of the prime minister here is the party (political group) that they belonged to. Coalition means that more than one party was sharing power.

Sir Robert Walpole	Whig	1721-1742
Earl of Wilmington	Whig	1742-1743
Henry Pelham	Whig	1743-1754
Duke of Newcastle	Whig	1754-1756
Duke of Devonshire	Whig	1756-1757
Duke of Newcastle	Whig	1757-1762
Earl of Bute	Tory	1762-1763
George Grenville	Whig	1763-1765
Marquess of Rockingham	Whig	1765-1766
William Pitt the Elder, Earl of Chatham	Whig	1766-1768
Duke of Grafton	Whig	1768-1770
Lord North	Tory	1770-1782
Marquess of Rockingham	Whig	1782
Earl of Shelburne	Whig	1782-1783
Duke of Portland	coalition	1783
William Pitt the Younger	Tory	1783-1801
Henry Addington	Tory	1801-1804
William Pitt the Younger	Tory	1804-1806
Lord Grenville	coalition	1806-1807
Duke of Portland	Tory	1807-1809
Spencer Perceval	Tory	1809-1812
Earl of Liverpool	Tory	1812-1827

George Canning	Tory	1827
Viscount Goderich	Tory	1827–1828
Duke of Wellington	Tory	1828–1830
Earl Grey	Whig	1830–1834
Viscount Melbourne	Whig	1834
Duke of Wellington	Tory	1834
Sir Robert Peel	Conservative	1834–1835
Viscount Melbourne	Whig	1835–1841
Sir Robert Peel	Conservative	1841–1846
Lord John Russell	Whig	1846–1852
Earl of Derby	Conservative	1852
Earl of Aberdeen	coalition	1852–1855
Viscount Palmerston	Liberal	1855–1858
Earl of Derby	Conservative	1858–1859
Viscount Palmerston	Liberal	1859–1865
Earl Russell	Liberal	1865–1866
Earl of Derby	Conservative	1866–1868
Benjamin Disraeli	Conservative	1868
William Gladstone	Liberal	1868–1874
Benjamin Disraeli	Conservative	1874–1880
William Gladstone	Liberal	1880–1885
Marquis of Salisbury	Conservative	1885–1886
William Gladstone	Liberal	1886
Marquis of Salisbury	Conservative	1886–1892
William Gladstone	Liberal	1892–1894
Earl of Rosebery	Liberal	1894–1895
Marquis of Salisbury	Conservative	1895–1902
Arthur Balfour	Conservative	1902–1905
Henry Campbell-Bannerman	Liberal	1905–1908
Herbert Asquith	Liberal	1908–1916
David Lloyd George	coalition	1916–1922
Andrew Bonar Law	Conservative	1922–1923
Stanley Baldwin	Conservative	1923–1924
Ramsay MacDonald	Labour	1924
Stanley Baldwin	Conservative	1924–1929
Ramsay MacDonald	Labour/coalition	1929–1935
Stanley Baldwin	coalition	1935–1937
Neville Chamberlain	coalition	1937–1940
Winston Churchill	coalition	1940–1945
Clement Attlee	Labour	1945–1951
Winston Churchill	Conservative	1951–1955
Anthony Eden	Conservative	1955–1957
Harold Macmillan	Conservative	1957–1963
Alec Douglas-Home	Conservative	1963–1964
Harold Wilson	Labour	1964–1970
Edward Heath	Conservative	1970–1974
Harold Wilson	Labour	1974–1976
James Callaghan	Labour	1976–1979
Margaret Thatcher	Conservative	1979–1990
John Major	Conservative	1990–1997
Tony Blair	Labour	1997–2007
Gordon Brown	Labour	2007–2010
David Cameron	coalition/Conservative	2010–2016
Theresa May	Conservative	2016–

Religions

Religion is a set of beliefs and ideas about a god or many gods. There are lots of different religions and they are practised all over the world.

Baha'i
Founded in Iran in the 19th century, the Baha'i religion seeks to achieve peace and togetherness for all humankind.

Buddhism
Buddhism was developed around 500 BCE by an Indian prince who later became called the Buddha (the "Enlightened One"). It teaches the need for a spiritual journey to free people from wants and pain.

Cao Dai
A modern religion founded in Vietnam in 1926 that believes in peace and non-violence.

Christianity
A faith centred on the belief that Jesus Christ, who preached in Palestine around 2,000 years ago, is the son of God and came down to Earth to rescue people from sin (doing wrong).

Confucianism
An ancient Chinese religious philosophy that began with the teachings of the philosopher Confucius, who lived around 500 BCE.

Hinduism
An ancient Indian religion that includes a belief that every person goes through a cycle of life, death, and then rebirth in a future life. Hinduism features many different gods and goddesses.

Islam
Followers of the Islamic faith are called Muslims. They believe that the true word of Allah (God) was revealed to the Prophet Muhammad around 607 CE and written down in the sacred text called the Quran.

Jainism
Jainism is an ancient Indian religion that emphasizes non-violence towards people and animals.

Judaism
The religion of the Jewish people, Judaism also influenced the development of Christianity and Islam. Jews worship one God and their sacred text is called the Torah.

Shamanism
A system of belief common in small traditional societies. Shamans are individuals who believe they have special access to the spirit world, often by going into a dream, which they use to help their community.

Shinto
The traditional religion of Japan, followers of Shinto believe that there are spirits called *kami* everywhere in the world.

Sikhism
A faith that developed in northern India around 1500 CE and encourages tolerance between religions. Sikhs worship one God and Sikh men traditionally wear a turban to cover their hair, which they leave uncut.

Taoism
An ancient Chinese religion and philosophy that involves accepting, and following, the natural power of the Universe.

Zoroastrianism
Zoroastrianism is an ancient religion of Persia (modern-day Iraq) that features the idea of an unending struggle between good and evil. It is only a small religion today.

The world

Land covers about a third of the Earth's surface. The land is broken up into seven large blocks called continents. The continents are divided into smaller areas called countries.

Europe

This map shows Europe in more detail, as there is not enough space to show all the European countries on the main map.

Glossary

abstract
Art that does not copy real life exactly, but may only look a bit like an object, or represent a feeling

adaptation
Way in which an animal or a plant becomes better-suited to its habitat

algebra
Type of maths that uses letters to stand for numbers or amounts

amphibians
Cold-blooded vertebrates that start life in water before moving between land and water when fully grown

ancestor
Ancient relative

ancient
Very old

antenna
One of two feelers found on an insect's head with which they can sense their surroundings

appliance
Machine used for a certain job that is usually electrical, such as a toaster

aqueduct
Channel or bridge built to carry water

architect
Person who plans and designs buildings

armour
Hard covering that provides protection

army
Organized group of soldiers

artificial
Object that is made by humans and is not found naturally

asteroid
Small, rocky object that orbits the Sun

asteroid belt
Area of the Solar System between Mars and Jupiter containing a large number of asteroids

astronaut
Someone who is trained to travel and work in a spacecraft

astronomy
Study of space

atmosphere
Layer of gas that surrounds a planet

atom
Smallest part of an element that can take part in a chemical reaction

attract
When two things pull towards each other

avalanche
Sudden movement of a large amount of snow or rock down a mountainside

axis
Imaginary line that passes through the centre of a planet or star, around which it rotates

bacteria
Tiny organisms that live everywhere on Earth, such as inside food, soil, or even in the human body

BCE
Before Common Era, or all the years before year 0

beliefs
Set of views that people hold about the world, life, and the afterlife

biology
Study of living things and their relationship with their habitat. Someone who studies biology is called a biologist

birds
Warm-blooded vertebrates with a beak and feathers that can usually fly. They lay hard-shelled eggs to produce young

black hole
Object in space with such a strong force of gravity that nothing can escape it, not even light

boil
When a liquid is heated to a temperature at which it bubbles and turns into a gas or vapour

boundary
The point where one area ends and another begins.

breed
Variety of a pet or farmed animal; for example, a pug is a breed of dog

burrow
Hole or tunnel dug in the ground by an animal, to live in

calendar
Breakdown of the year into days and months; used to work out the date

camouflage
Colours or patterns that help something appear to blend in with its environment

carnivore
Animal that eats only meat

cartilage
Tough but flexible material found in animals that, among other things, makes up the human nose and ears, and the skeletons of sharks

catapult
Ancient war machine used to hurl rocks over long distances

CE
Common Era, or all the years after year 0

chemical
Substance used in, or made by, a reaction between particles such as atoms

chemistry
Study of chemicals and their reactions. Someone who studies chemistry is called a chemist

chrysalis
Hard casing, often camouflaged, that a caterpillar wraps itself in during metamorphosis

circuit
Loop that an electric current travels around

circulation
Path that blood travels around the body, out from the heart through arteries and back to the heart through veins

citizen
Someone who lives in a certain city or country is a citizen of that place

civil war
War between people who belong to the same country

civilization
Society where people have built a complex city or country

climate
Weather that is usual for an area over a long period of time

code
Written commands, or language, used in a computer program

cold-blooded
Animal with a body temperature that goes up and down to match the surrounding air or water temperature

colony
Large group of animals that live together

comet
Object made of dust and ice that orbits around the Sun, developing a tail as it gets close to the Sun

competition
Contest between two or more people, groups, or living things where one is trying to win a prize or resource

computers
Machines that can perform difficult tasks by following programs

condensation
When a gas cools and becomes liquid. Often seen as droplets of water that form on cold surfaces, such as windows

conductor
Substance that allows heat or electricity to pass through it easily

coniferous tree
Type of evergreen tree, usually with needle-like leaves

conquer
Act of one country taking over another country

conservation
Trying to stop a plant or animal from becoming extinct

consumer
Animal that eats a producer or other consumers

continent
One of seven large areas of land that the world is divided into: Africa, Antarctica, Asia, Europe, North America, Oceania, and South America

coral
Hard outer skeleton of tiny sea animals, which can build up into large coral reefs

core
Centre part of a planet, star, or moon

country
Area of Earth that is governed by the same leaders and has the same flag

court
Place where it is decided if someone has broken the law

crater
Bowl-shaped dent on the surface of a planet or other body in space, caused by a collision with a rock

crime
Activity that is against the law

crop
Group of plants that are grown as food

crust
Outer layer of a planet

culture
Way of life and beliefs of the people of a region or country

deciduous tree
Type of tree that loses all its leaves at the same time during the winter or the dry season

decomposer
Living thing, often a fungus, that breaks down dead matter to create nutrients

deforestation
Destruction of forests

democracy
System of government where people outside the government have a say in how the country is run, usually by voting

desert
Dry region that gets 25 cm (10 in) or less of rainfall in a year. Deserts can be hot or cold

dictator
Ruler with total power

dinosaur
Group of reptiles, often very big, that lived millions of years ago

diplomat
Person from one country who travels to another to make sure the two countries have a good relationship

direction
Way in which an object is travelling, such as up or down, or right or left

disability
Something that makes certain activities difficult or impossible for a person to do

disease
Condition that makes a person ill, often caused by germs

drought
Period when there is little or no rainfall

earthquake
Shaking of the Earth's surface caused by moving tectonic plates or volcanic activity

eclipse
When an object in space passes into the shadow of another object

election
Event where people vote to decide who will be part of the government

electricity
Type of energy that can be used to power appliances such as lights. It is also found naturally as lightning

element
One of 118 chemical substances that are made of the same type of atom, such as gold, oxygen, and helium. The elements are arranged on the periodic table

emperor
Ruler of an empire

empire
Large area with different peoples, ruled by a single government or person

endangered
When an animal or plant species is in danger of becoming extinct

energy
Source of power such as electrical energy or heat energy

environment
Surroundings in which something lives

equality
Equal rights for all people

equator
Imaginary line around the centre of the Earth that is an equal distance from the North and South poles

erosion
Gradual wearing away of rocks due to water and weather

eruption
When lava, ash, rock, or gas shoots or flows out of a volcano

ethical
Something that is done the right way, with thought as to how it will affect others

evaporation
When a liquid is heated and turns into a gas or vapour

evolution
Process where living things change, over many generations, to become new species

exoplanet
Planet that orbits a star other than the Sun

exoskeleton
Hard outer casing of animals such as arthropods that do not have an inside skeleton

experiment
Test to see how something works

explorer
Someone who travels to unmapped places to find out what is there

extinction
When all of a particular animal or plant species dies out and there are none left in the world

factory
Building where products are made

fertilize
Process by which cells from a male and female join to create offspring, such as male plant pollen and a female plant ovum joining to create a seed

fins
Flattened limbs found on animals that live in water that help them swim

fish
Cold-blooded vertebrates that live underwater and have scales

flexible
Bendy

float
Stay at the surface of a liquid, rather than sinking

forage
Searching for food in the wild

force
Push or pull that causes things to start moving, move faster, change direction, slow down, or stop moving

foreign
Something or someone from a different country or place

fossil
Remains of a dead dinosaur, other animal, or plant, which has been preserved in rock over time

fossil fuels
Fuels made from animals and plants that died millions of years ago, such as coal and oil

friction
Force created when two surfaces rub or slide against each other

fuel
Substance that is burned to create heat or power

fungi
Group of living things, including mushrooms and moulds, that break down dead plants and animals to make their food

galaxy
Huge group of stars, gas, and dust held together by gravity

gas
State of matter with no fixed shape, such as air, that fills any space it is in

generation
Group of living things that are of a similar age, and usually related; for example, brothers and sisters are one generation and their parents are another

genetics
Study of the genes in DNA that cause characteristics like hair colour to be passed from one generation to the next. Someone who studies genetics is called a geneticist

geometry
Type of maths that deals with solids, surfaces, lines, angles, and space

germs
Tiny life forms, such as bacteria or viruses, that cause disease

gills
Organs of fish and some amphibians that allow them to breathe underwater

glacier
Huge, thick sheet of ice moving very slowly, either down the side of a mountain or over land. Glaciers help to shape and form the landscape

government
Group of people who run a country

grasslands
Open land covered in grass and sometimes a few small bushes

gravity
Invisible force that pulls objects towards each other

habitat
Natural home environment of an animal or plant

hardware
Physical parts of a computer, such as the keyboard and screen

hatch
Process by which an animal breaks out of an egg

hemisphere
Top or bottom half of the Earth

herbivore
Animal that eats only plants

herd
Group of animals, particularly hoofed mammals

hibernation
Period of inactivity that some animals go through in the winter

holy
Something or somewhere sacred to a religion

hurricane
Violent storm with extremely strong winds that can cause a great deal of damage

identical
Two or more people or things that look exactly the same

imports
Goods or services bought from another country

incubation
Keeping an egg warm until it hatches

instruction
Command that tells something or someone what to do

insulator
Substance that does not allow heat or electricity to pass easily through it

interact
When two or more things communicate or do something that affects the other

Internet
Network that links computers across the world

invertebrate
Animal that does not have a backbone

jewel
A precious gemstone that has been cut and polished

joint
Place in the body where two bones meet, such as the knee or elbow

king
Man who rules a country

knowledge
Understanding of a topic

laboratory
Place where scientific experiments are done

lake
Large body of water surrounded by land

landfill
Place where rubbish is buried in the ground

landslide
Sudden movement of a large amount of earth down a hill or mountainside

latitude
Horizontal line around the Earth that tells you how far up or down the globe a place is

lava
Hot, melted rock on the Earth's surface

light
Type of energy that allows humans and other animals to see, and plants to make food

light year
Distance travelled by light in a year, equal to about 9.5 trillion km (5.9 trillion miles)

liquid
State of matter that flows and takes the shape of any container it is in, such as water

longitude
Vertical line around the Earth that tells you how far east or west around the globe a place is

lungs
Breathing organs found inside the body of vertebrates

luxury
Expensive activity or item that is not neccessary but wanted

machine
Something that is powered by energy and carries out a task

magma
Hot, melted rock below the Earth's surface

magnetic field
Area of magnetism surrounding a magnet or a planet, star, or galaxy

magnetism
Invisible force that is created by magnets, which pull certain metals towards them

magnify
Make something appear larger than it is

mammals
Warm-blooded vertebrates that have skin covered in hair and feed their young milk

mantle
Thick layer of hot rock between the core and the crust of a planet or moon

manuscript
Handwritten book, poem, or other document

mate
When a male and female animal produce young together

material
Substance that can be used to make or build things. It can be natural or made by humans

mathematics
Study of numbers and equations. Someone who studies mathematics is called a mathematician

matter
Stuff that all things are made of

melt
When a solid is heated and becomes a liquid

memory
Ability to remember things that have happened, or where computers store their information

merchant
Person whose job is buying and selling things, often from a foreign country

metamorphosis
Process by which some animals transform themselves into a different form from youth to adulthood

meteor
Streak of light caused by a meteoroid burning up as it enters Earth's atmosphere, sometimes called a "falling star"

meteorite
Rock from space that lands on a planet or moon's surface

microscope
Instrument that magnifies things and is used to look at tiny objects

microscopic
Very small and only able to be seen with a microscope

migration
Regular movement of animals over long distances, often to feed or breed

Milky Way
Galaxy we live in

mine
Place where naturally occurring resources such as coal, iron, copper, or gold, and gemstones such as diamonds and rubies are dug out of the ground

mineral
Natural substance that grows in crystals, such as salt. Minerals can be polished to make gemstones. All rocks are made from minerals

mixture
Combination of more than one type of thing

monument
Statue put up to remember a person or event

moon
Object made of rock, or rock and ice that orbits a planet or an asteroid

navigation
Way of finding a path from one place to another

Nobel Prize
Special prize given to people for different subjects in both science and the arts, once a year

novel
Story book

nucleus
Central part of an atom or cell

nutrients
Food or substance that gives a living thing the energy or chemicals that it needs to live, grow, and move

omnivore
Animal that eats both plants and meat

orbit
Path an object takes when travelling around another object when pulled by its gravity

orchestra
Group of muscians and their instruments playing together

organ
Body part that has a certain job; for example, the heart, which pumps blood

organism
Living thing

particle
Extremely small part of a solid, liquid, or gas

periodic table
Set arrangement of elements into a grid

persecution
Bad treatment of people because of their beliefs

philosophy
Study of how we live, such as whether things are wrong or right. Someone who studies philosophy is called a philosopher

photosynthesis
Process that green plants use to make food from sunlight

physics
Study of the Universe and forces. Someone who studies physics is called a physicist

planet
Large, round object that orbits a star

poisonous
Substance that may be deadly if touched or eaten

pollen
Powder that comes from flowering plants and is used in pollination

pollination
Transfer of pollen from one plant to another so those plants can reproduce

pollution
Harmful substances in the air, soil, or water

power source
Energy that is used to make a machine work, such as electricity

predator
Animal that hunts other living animals for food

prehistoric
Time before written history

prey
Animal that is hunted for food

primate
Type of mammal, which includes monkeys and humans

prison
Building where people who have broken the law are locked up as a punishment

probe
Unmanned spacecraft designed to study objects in space and send information back to Earth

producer
Living thing such as a plant that makes its own food and is eaten by animals

program
Set of instructions a computer follows to complete a task

queen
Woman who rules a country

recycle
Use something old to make something new

renewable
Type of energy that will not run out, such as solar power

reptiles
Cold-blooded vertebrates with scaly skin that usually reproduce by laying eggs

republic
State ruled by elected officials instead of a royal family or emperor

robot
Machine that is programmed by a computer to do different tasks

rock
Naturally occuring solid made from different minerals, such as granite. Rocks make up the surface of planets and moons

rover
Robot used to explore the surface of a rocky planet or moon

reaction
Effect when two chemicals cause a change in each other

reflect
When light or sound bounces off a surface

repel
When two objects push away from each other

reproduce
Have young

reservoir
Large store of something, usually water

satellite
Any object that goes around a planet, usually a moon or a human-made machine

scavenger
Animal that feeds on the leftover meat of another animal that has already died

shadow
Area of darkness formed when light rays are blocked by a solid object

shield
Object that protects something from damage or attack

society
Organized group of people with a shared culture

software
Programs and instructions that are used by a computer

Solar System
The Sun and all the objects that orbit it, including the planets

solid
State of matter that holds its shape

solidify
When a liquid cools and becomes a solid

solution
Mixture that is created when a solid dissolves in a liquid and disappears

sound
Form of energy that is produced when objects vibrate, or shake

space
Place beyond Earth's atmosphere

spacecraft
Vehicle that travels in space

species
Specific type of an animal or plant that can mate and produce young together

spectrum
Range of something; for example, the range of colours in a rainbow

stalactite
Piece of rock that hangs down from the roof of a cave and looks like an icicle

stalagmite
Piece of rock that points upwards, slowly growing from the floor of a cave

star
Huge, hot sphere of gas in space that releases energy from its core and gives off heat and light

sustainable
Able to be supported for a long time

tame
Animal that is used to people, such as a pet dog or cat

technology
Using scientific knowledge to create machinery and devices, such as computers

tectonic plate
Large, slow-moving piece of the Earth's crust

telescope
Instrument used to look at distant objects

temperature
Measure of how hot or cold things are

temple
Home for a god or gods and a place for worshipping them

traditional
When something has been done in the same way for a long time

transmit
Pass something, such as information, between two places

tropical
Area or climate with hot temperatures

tsunami
Giant wave created by an earthquake or a volcanic eruption

turbine
Wheel or rotor that is turned to make power

Universe
All space and everything in it

venomous
Substance that may be deadly if injected by an animal or plant, through a sting or fangs

vertebrate
Animal that has a backbone

vibrate
Moving back and forth small amounts very quickly

volcano
Opening in the Earth's crust, usually in the shape of a mountain, out of which lava, ash, rock, and gas erupt, sometimes explosively

voyage
A journey, often over water

warm-blooded
Animal that keeps a constant body temperature

weight
Amount of the force of gravity that acts on an object, making it feel heavy. The more mass something has, the larger the force of gravity on the object, and the heavier it feels

wildlife
Animals found in a certain area

womb
Organ in which baby animals develop

worship
Praying to a god or gods

X-ray
Radiation used to create shadows of bones and other organs in the body. Images on an X-ray photo can reveal internal damage and disease

young
Babies, or not very old

zoo
Place where wild animals are kept, so people can see and study them

Index
