Agricultural biochemistry.

**Z (zusammen):** Z the notation for the stereochemical arrangement in which the higher-ranked substituent groups are on the same side of the double bond.

**"E" Dimension:** The outside diameter of neck on a threaded bottle neck (finish). The diameter of the neck (finish) is measured across the root of the threads.

**"F" style can:** A rectangular base can fitted with a screw cap.

**"H" Dimension:** the height of the bottle finish measured from the sealing surface, in a line parallel to the axis of the finish and tangent to the threads on the finish, down to a point where the line intersects the body (shoulder)

of the container. The inside height of the closure measured from the bottom of the closure, in a line tangent to the threads of the closure and terminating at the inside, top of closure.

**"I.D.":** an abbreviation for inside diameter.

**"I" dimension:** a specified minimum diameter inside the bottle neck. A minimum diameter is specified to allow sufficient clearance for filling tubes to enter the bottle neck easily.

**"I" style thread:** a type of thread contour (cross-section) roughly trapezoidal in outline. The outermost part is radiussed a "general purpose" thread contour designed for use with metal or plastic closures.

**"S" dimension:** locates the position of the bottle thread with respect to the sealing surface. The "s" dimension is the vertical distance from the sealing surface to the intersection of the finish wall and the top part of the first part of bottle thread where full depth contour exists.

**"T" dimension:** the outside diameter of the thread helix on a bottle finish.

**(61)Cu-ATSM:** A lipophilic copper(II)bis(thiosemicarbazone) labeled with the positron-emitting isotope (61)Cu with hypoxia-selective and radioisotopic activities. With a high membrane permeability and redox potential, (61)Cu-ATSM easily enters and selectively resides in hypoxic cells. The extent of (61)Cu-ATSM retention in tissue is inversely related to the state of tissue oxygenation allowing the quantitation of tissue hypoxia with positron emission tomography (PET).

**(pi) bond:**  $\pi$  a bond formed by the side-to-side overlap of atomic orbitals. A  $\pi$  bond is weaker than a  $\sigma$  bond because of poor orbital overlap caused by nuclear repulsion. Unsaturated molecules are created by  $\pi$  bonds.

**(sigma) antibonding molecular orbital:** a  $\sigma$  molecular orbital in which one or more of the electrons are less stable than when localized in the isolated atomic orbitals from which the molecular orbital was formed.

**(sigma) bond:**  $\sigma$  a bond formed by the linear combination of orbitals in such a way that the maximum electron density is along a line joining the two nuclei of the atoms.

**(sigma) bonding molecular orbital:**  $\sigma$  a  $\sigma$  molecular orbital in which the electrons are more stable than when they are localized in the isolated atomic orbitals from which the molecular orbital was formed.

**[18F]-labeled substance P antagonist receptor quantifier:** A radioconjugate consisting of the positron emitting radioisotope fluorine F 18 conjugated to the substance P antagonist receptor quantifier (SPA-RQ) used in radioimaging. [18F]-labeled substance P antagonist receptor quantifier is an antagonist of the neurokinin 1 (substance P) receptor (NK1R) and can function as a positron emission tomography (PET) imaging agent for detecting NK1R-expressing cells and tissues. NK1Rs are frequently expressed on the plasma membranes of tumor cells from glioblastoma and breast and pancreatic carcinomas.

**[18F]-ML-10:** A small molecular-weight, malonic acid-based probe [(2-(5-fluoro-pentyl)-2-methyl-malonic acid or ML-10] labeled with the radioactive isotope fluorine F 18 with potential apoptosis radioimaging use. Upon administration, [F18]-ML-10 binds selectively to apoptotic cells due to apoptotic cell membrane features that differ from those of normal, healthy and necrotic cell membranes. Upon entering the apoptotic cell, this agent accumulates within the cytoplasm where it can be imaged using positron emission tomography (PET). Detection of apoptotic cells using this imaging technology may be useful in monitoring tumor responses to cytotoxic therapies. ML-10 appears to mimic the alkyl-malonic acid motif present in gamma -carboxyglutamic (Gla), an amino acid that plays a crucial role in the binding of clotting factors to negatively-charged phospholipids exposed on the surfaces of apoptotic cells.

**[18F]L-FAC:** A deoxycytidine analog and high-affinity substrate for deoxycytidine kinase (DCK), labeled with fluorine F 18, with potential diagnostic activity upon positron emission tomography (PET) imaging. [18F]L-FAC is preferentially taken up by and accumulated in cells with high deoxycytidine kinase (DCK) levels, such as in tumor cells with dysregulated nucleoside metabolism. Upon uptake through the nucleoside transporter, [18F]L-FAC is phosphorylated by DCK and, subsequently, the 18F moiety can be visualized upon PET imaging. As many nucleoside analog prodrugs are chemotherapeutic agents that require DCK for activation, [18F]L-FAC can potentially be used as a marker to predict chemotherapeutic efficacy of these prodrugs. In addition, as DCK is upregulated in certain immune cells, such as activated T-cells, [18F]L-FAC can also be used to measure immune activation in response to immunomodulating agents. DCK, a rate-limiting enzyme in the nucleoside salvage pathway for DNA synthesis, is overexpressed in certain solid

tumors, lymphoid and myeloid malignancies and certain immune cells, such as proliferating T-lymphocytes.

**[18F]L-FMAC:** A radioconjugate composed of 2'-deoxy-2'-18F-fluoro-5-methyl-beta-L-arabinofuranosylcytosine ([18F]L-FMAC), a L-deoxycytidine analog and high-affinity substrate for deoxycytidine kinase (DCK), labeled with fluorine F 18, with potential diagnostic activity during positron emission tomography (PET) imaging. Upon administration, [18F]L-FMAC is preferentially taken up by and accumulated in cells with high DCK levels, including tumor cells with dysregulated nucleoside metabolism. After phosphorylation by DCK, the 18F moiety can be visualized by PET imaging. As many nucleoside analog prodrugs are chemotherapeutic agents that require DCK for their phosphorylation and activation, [18F]L-FMAC can potentially be used as a marker to measure DCK activity and to predict the chemotherapeutic efficacy of DCK-dependent prodrugs. DCK, a rate-limiting enzyme in the deoxyribonucleoside salvage pathway for DNA synthesis, is overexpressed in certain solid tumors, lymphoid and myeloid malignancies and certain immune cells, such as proliferating T-lymphocytes. The L-enantiomer is less susceptible to deamination by cytidine deaminase (CDA) than the D-enantiomer and increases the stability of this radioconjugate. Check for active clinical trials using this agent.

**[F-18]HX4:** A 2-nitroimidazole labeled with the positron-emitting radioisotope fluorine F 18. HX4, the 2-nitroimidazole moiety of [F-18]HX4, is selectively bioreduced and bound in hypoxic tumor cells, permitting the imaging of hypoxic tumor cells with positron emission tomography (PET).

**[F18]VM4-037:** A radiopharmaceutical consisting of a sulfonamide covalently attached to the positron-emitting isotope fluorine F 18 with CA-IX-binding and radioisotopic activities. Upon administration, the sulfonamide moiety of [F18]VM4-037 binds to the cell-surface tumor-associated antigen (TAA) carbonic anhydrase IX isoenzyme (CA-IX); CA-IX-expressing tumor cells can then be visualized using positron emission tomography (PET). CA-IX has been found to be elevated in a variety of hypoxic tumors; elevated CA-IX has been positively correlated with tumor growth, tumor invasion and poor prognosis.

**11C topotecan:** A semisynthetic derivative of camptothecin, a cytotoxic, quinoline-based alkaloid extracted from the Asian tree *Camptotheca acuminata* radiolabeled with carbon 11 (11C) with antineoplastic and radiotracer properties. During the S phase of the cell cycle, topotecan inhibits topoisomerase I activity by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks that inhibit DNA replication and trigger apoptotic cell death. Quantitation of 11C topotecan accumulated in tumor tissues by positron emission tomography (PET) may help predict responses to topotecan therapy.

**123-I-MIP-1095:** An iodine 123-radiolabeled small molecule that exhibits high affinity for prostate-specific membrane antigen (PSMA) with potential use in molecular imaging. 123-I-MIP-1095, a radiolabeled glutamate-urea-lysine analogue, selectively binds PSMA, which allows imaging of PSMA-expressing prostate cancer cells with gamma scintigraph. PSMA is a transmembrane glycoprotein highly expressed by malignant prostate epithelial cells and vascular endothelial cells of various solid tumors.

**131I-TM-601:** An iodine 131 (I 131) radioconjugate of the synthetic chlorotoxin (CTX) TM-601 with potential antiangiogenic and antineoplastic activities. CTX is a 36 amino acid neurotoxin found in the venom of the giant yellow scorpion *Leiurus quinquestriatus* that preferentially binds malignant cells of neuroectodermal origin. The recombinant version of this peptide, TM-601, is expressed in and purified from *E. coli* and then covalently linked to I 131 to produce 131I-TM-601. 131I-TM-601 binds to tumor cells of neuroectodermal origin and is internalized; administered once, it may be used as a radioimaging agent; repeated administration may result in a tumor-specific, cumulative radiocytotoxic dose of I 131. In addition, TM-601 alone, similar to native CTX, may inhibit angiogenesis due to its ability to bind to and inhibit matrix metalloproteinase 2 (MMP-2), an endopeptidase involved in tissue remodeling processes such as angiogenesis.

**14C BMS-275183:** The orally bioavailable C-4 methyl carbonate analogue of paclitaxel, labeled with radioactive carbon 14, with radioisotope and potential antineoplastic activities. 14C BMS-275183 binds to tubulin and inhibits microtubule disassembly, which may result in cell cycle arrest at the G2/M phase and inhibition of cell division, and subsequently cell death.

This agent may be useful for treating multi-drug resistant (MDR) tumors because it does not appear to be a substrate for P-glycoprotein.

**16, 16-dimethyl prostaglandin E2:** A stable derivative of prostaglandin E2 (PGE2) with potential hematopoietic activity. Administration of 16,16 dimethyl-prostaglandin E2 (dmPGE2) appears to lead to increased formation of hematopoietic stem and progenitor cells. Even though the exact mechanism of action has yet to be fully elucidated, this agent may stimulate hematopoiesis by activating the Wnt signaling pathway, which increases cellular levels of beta-catenin, a subunit of the cadherin protein complex.

**18-F-fluoroacetate:** A radioconjugate and an acetate analog labeled with fluorine F 18 ((18)F-FAC), a positron-emitting isotope, with potential prostate tumor tracer property using positron emission tomography (PET). Although the mechanism of action is unclear, fluorine F 18 acetate preferentially accumulates in tumor tissue, serving as a tracer for imaging tumors with PET. Fluorine 18 has a longer radioactive half-life (110 min) vs. the half-life of carbon-11 acetate (20.4 min). Furthermore, (18)F-FAC showed a rapid clearance from liver and extensive excretion to bile and urine in comparison with carbon-11 acetate, therefore this tracer may be a useful alternative to C-11 acetate for the detection of prostate tumors by PET.

**18F-FHBG:** A fluorine-18-labeled acycloguanosine derivative substrate for herpes simplex virus type-1 thymidine kinase (HSV1-tk). 18F-FHBG is used as a reporter probe to image the expression of the herpes simplex virus type-1 thymidine kinase (HSV1-tk) gene in gene transfer therapy. HSV1-tk and HSV1-tk-metabolized 18F-FHBG co-localize, allowing positron emission tomography (PET) localization of HSV1-tk gene-transfected tissue and the assessment of gene transfer efficiency.

**18F-fluoroazomycin arabinoside:** A radiofluorinated 2-nitroimidazole derivative with hypoxia-specific tracer activity. 18F-fluoroazomycin arabinoside is reduced under hypoxic conditions and is often seen in various malignant tumors, forming highly reactive intermediates. In its reduced form, 18F-fluoroazomycin arabinoside covalently binds to macromolecules, thereby accumulating in hypoxic cells and allowing radioisotopic imaging of these particular cells. Compared to 18F-misonidazole, 18F-fluoroazomycin arabinoside has a lower octanol:water partition coefficient;

it therefore has less tendency to accumulate in lipophilic tissues and exhibits a faster renal clearance, leading to an improved imaging ability of hypoxic tissue. Check for active clinical trials using this agent.

**18F-fluoromethylcholine:** A radiotracer consisting of methylcholine labeled with the positron-emitting radioisotope fluorine F 18 (18F-FMCH) with potential imaging use. Upon administration, 18F-fluoromethylcholine incorporates into tumor cells through an active, carrier-mediated transport mechanism for choline and then is phosphorylated intracellularly by choline kinase, an enzyme frequently upregulated in human tumors, yielding phosphoryl 18F-fluoromethylcholine. In turn, phosphoryl 18F-fluoromethylcholine is integrated into phospholipids in the cell membrane as part of phosphatidylcholine. As the proliferation of cancer cells is much higher than normal cells, tumor cells exhibit an increased rate of 18F-FMCH uptake and incorporation, allowing tumor imaging with positron emission tomography (PET).

**18F-fluoromisonidazole:** A radiofluorinated 2-nitroimidazole derivative with hypoxia-specific tracer activity. Misonidazole is reduced under hypoxic conditions and in reduced form covalently binds to macromolecules in hypoxic cells. 18F (fluorine-18) radiofluorination of misonidazole to form 18F-fluoromisonidazole allows radioisotopic imaging of reduced misonidazole bound to macromolecules in hypoxic cells.

**18F-labeled mini-PEG spaced RGD dimer:** A radiotracer containing a pegylated dimeric Arg-Gly-Asp (RGD) peptide (NH<sub>2</sub>-mini-PEG-E[c(RGDyK)]<sub>2</sub> or PRGD<sub>2</sub>) radiolabeled with fluorine 18F-fluorobenzoate (18F-FB), with potential alphaVbeta3 integrin imaging activity upon positron emission tomography (PET). Upon administration, the RGD moiety of 18F-labeled mini-PEG spaced RGD dimer (18F-FPRGD<sub>2</sub>) binds to alphaVbeta3 integrin. Upon PET, alphaVbeta3-expressing tumor cells can be visualized and the degree of tumor angiogenesis can be determined. This agent exhibits increased integrin receptor binding affinity, tumor cell uptake and increased radiolabeling yield as compared to the non-pegylated form (18F-FRGD<sub>2</sub>). Integrins, transmembrane glycoproteins, may be upregulated on proliferating tumor vessel endothelial cells and various cancer cells; their overexpression has been associated with neovascularization, differentiation, proliferation of tumor cells, metastasis and an overall poor prognosis.

**2-O, 3-O desulfated heparin:** A non-anticoagulant heparin derivative in which the 2-O and 3-O sulfate groups of heparin are removed, with potential anti-inflammatory and antineoplastic activity. Upon administration, 2-O, 3-O desulfated heparin (ODSH) prevents the interaction of the receptor for advanced glycation end-products (RAGE) to its ligands, such as advanced glycation end-products (AGEs), Mac-1 (CD11b/CD18), the nuclear protein high mobility group box protein-1 (HMGB-1), carboxymethyl lysine-bovine serum albumin (CML-BSA) and members of the S100 calgranulin family. In addition, this agent inhibits the enzymes heparanase, cathepsin G, and human leukocyte elastase, which are involved in inflammation and metastasis. ODSH also inhibits selectins, thereby preventing the adhesion of tumor cells to endothelium and platelets. Altogether, this may inhibit tumor cell invasiveness and metastasis. Unlike heparin, this agent does not induce heparin-induced thrombocytopenia (HIT). RAGE, a receptor belonging to the immunoglobulin superfamily, plays a key role in inflammation and is overexpressed in a variety of cancers.

**2-Component Molding:** A means of producing a part with two or more materials, 1st part is generally thermoplastic injection molded part or a plastic or metal part inserted into the mold. Liquid silicone rubber or plastic is then injected onto to the part, attaching by means of mechanical or chemical bond

**2-fluoropropionyl-labeled pegylated dimeric RGD peptide:** A radiopharmaceutical agent comprised of a pegylated dimeric arginine-glycine-aspartic acid (RGD)-based peptide labeled with 2-fluoropropionyl, with potential  $\alpha V\beta 3$  integrin imaging activity upon positron emission topography (PET). The RGD moiety of 2-fluoropropionyl-labeled pegylated dimeric RGD peptide targets and binds to  $\alpha V\beta 3$  integrin. Upon PET imaging,  $\alpha V\beta 3$  integrin-expressing tumor cells can be visualized and expression levels can be quantified. Compared to other fluorine F 18 labeled RGD-containing peptides, this agent shows increased affinity to  $\alpha V\beta 3$  integrin, enhanced tumor uptake as well as improved pharmacokinetics.  $\alpha V\beta 3$  integrin, overexpressed on certain tumor cells and tumor endothelial cells, plays a key role in angiogenesis, tumor proliferation and survival.

**2-hydroxyflutamide depot:** A depot formulation containing a bioresorbable, controlled-release, calcium sulphate-based paste of the nonsteroidal antiandrogen 2-hydroxyflutamide (2-HOF) with potential antineoplastic activity. Upon injection into the tumor site in the prostate, 2-hydroxyflutamide depot slowly releases 2-HOF, which competitively binds to androgen receptors (ARs), blocking the binding of dihydrotestosterone (DHT). This may inhibit androgen-dependent DNA and protein synthesis, resulting in tumor cell growth arrest and decreased cellular proliferation. In addition, 2-HOF inhibits nuclear uptake of androgen in androgen-responsive tissues.

**2-hydroxyoleic acid:** An orally bioavailable, synthetic analog of the fatty acid oleic acid, with potential antitumor activity. Upon administration, 2-hydroxyoleic acid (2OHOA) activates sphingomyelin synthase (SMS), thereby increasing the concentration of sphingomyelin (SM) and diacylglycerol (DAG) in the tumor cell membrane and decreasing membrane levels of phosphatidylethanolamine (PE) and phosphatidylcholine (PC). This restores the normal, healthy levels and ratios of membrane lipids. By restoring normal membrane lipid structure and composition, this agent inhibits membrane-protein associated signaling and the aberrant activity of signaling pathways in certain tumor cells, including the Ras/MAPK and PI3K/Akt pathways. This inhibits tumor cell proliferation, induces tumor cell differentiation, and eventually can cause cell death.

**2-methoxyestradiol:** An orally bioavailable estradiol metabolite with potential antineoplastic activity. 2-Methoxyestradiol inhibits angiogenesis by reducing endothelial cell proliferation and inducing endothelial cell apoptosis. This agent also inhibits tumor cell growth by binding to tubulin, resulting in antimetabolic activity, and by inducing caspase activation, resulting in cell cycle arrest in the G2 phase, DNA fragmentation, and apoptosis.

**2'-F-ara-deoxyuridine:** A deoxyuridine prodrug with potential antineoplastic activity. Upon cellular uptake, 2'-F-ara-deoxyuridine (FAU) is phosphorylated by thymidine kinase to FAU monophosphate and subsequently methylated in the 5'-position by thymidylate synthase (TS) to its activated form, 1-(2-deoxy-2-fluoro-beta-D-arabinofuranosyl) 5-methyluracil monophosphate (FMAUMP). FMAUMP is incorporated into

DNA leading to an inhibition of DNA synthesis and so cell growth. The catalytic activity of TS is critical to activation of FAU and subsequent incorporation into DNA. FAU may be beneficial in the case of tumors with high TS activity that are resistant to TS inhibitors.

**2G-1 TCR retroviral vector-transduced lymphocytes:** A preparation of autologous human T-lymphocytes isolated from renal cell cancer (RCC) patient and transduced with 2G-1 TCR, a retroviral vector encoding the alpha and beta chains of a T-cell receptor that recognizes TNF-related apoptosis inducing ligand (TRAIL) bound to death receptor 4 (DR4), with potential immunostimulating and antineoplastic activities. After transduction, expansion in culture, and introduction into the RCC patient, 2G-1 TCR retroviral vector-transduced lymphocytes may stimulate a cytotoxic T lymphocyte (CTL) response against RCC cells with TRAIL bound to DR4 on their surfaces. TRAIL, a member of the TNF superfamily, is a homotrimeric type II membrane protein that rapidly induces oligomerization of receptor intracellular death domains and apoptosis in a variety of tumor cells when bound to its receptors; DR4 (TRAIL receptor 1), a member of the TNF receptor family, is overexpressed by a variety of malignant cell types.

**3-21G:** A VDZ basis set. See also 6-31G.

**3-21G\*:** The asterisk indicates that a set of polarizing d-functions (6D) is included to supplement the 3-21G basis, but only on second-row and heavier atoms (beyond neon). Also denoted 3-21G(\*) or 3-21G(d).

**3-deazauridine:** A synthetic analogue of nucleoside uridine lacking a ring nitrogen in the 3-position. 3-deazauridine inhibits cytidine synthase, thereby reducing intracellular levels of cytidine and deoxycytidine and disrupting DNA and RNA synthesis. This agent may trigger apoptosis and enhance differentiation of neoplastic cells..

**3,4-methylenedioxymethamphetamine:** A ring-substituted amphetamine derivative, structurally related to the hallucinogen mescaline, with entactogenic, neurotoxic, and motor-stimulatory activities. 3,4-methylenedioxymethamphetamine (MDMA) produces an acute, rapid enhancement in both the release of serotonin from and the inhibition of serotonin reuptake by serotonergic nerve endings in the brain. Once within the cell, MDMA depletes stores of tryptophan hydroxylase (TPH) via acute oxidative inactivation; in turn, depleted stores of TPH leave cell terminals

open to damage from oxidative stress, possibly a source of MDMA neurotoxicity. This agent also induces norepinephrine, dopamine, and acetylcholine release and can act directly on a number of receptors, including alpha 2-adrenergic and 5-hydroxytryptamine (5-HT) 2A receptors. MDMA may suppress the dyskinesia associated with long-term use of L-dopamine (L-DOPA) without affecting the efficacy of L-DOPA treatment.

**3' end:** The end of a nucleic acid that lacks a nucleotide bound at the 3' position of the terminal residue.

**3'-aminomethyl nicotine-P. aeruginosa r-exoprotein A conjugate vaccine:** A hapten-carrier immunoconjugate composed of the hapten trans-3'-aminomethyl nicotine conjugated to a recombinant P. aeruginosa exoprotein A, rendered nontoxic through amino acid depletion, with potential immunostimulating activity. Upon vaccination with 3'-aminomethyl nicotine-P. aeruginosa r-exoprotein A conjugate vaccine, the immune system may produce anti-nicotine antibodies. Antibody-bound nicotine cannot pass the blood brain barrier (BBB) to activate brain nicotine receptors. Nicotine, a small organic molecule that is not immunogenic, must be haptenized and conjugated to a carrier protein, such as nontoxic recombinant P. aeruginosa exoprotein A, to induce an antibody response. Aluminium hydroxide may be used as an adjuvant for this vaccine.

**3'-C-ethynylcytidine:** A synthetic cytidine nucleoside containing a covalently bound ethynyl group with potential antineoplastic and radiosensitizing activities. 3'-C-ethynylcytidine is metabolized in tumor cells to ethynylcytidine triphosphate (ECTP), which inhibits RNA synthesis by competitive inhibition of RNA polymerases I, II and III; subsequently, RNase L is activated, resulting in apoptosis. RNase L is a potent antiviral and antiproliferative endoribonuclease that cleaves singled stranded RNA, causes 28s rRNA fragmentation, and activates Janus Kinase (JAK), a mitochondrial-dependent apoptosis signaling molecule. Check for active clinical trials using this agent.

**3D QSAR:** Three-Dimensional quantitative structure-activity relationships are QSAR studies which analyses the biological activities of a series of compounds with respect to their spatial properties using statistical methods.

**4-nitroestrone 3-methyl ether:** A synthetic derivative of estradiol. 4-nitroestrone 3-methyl ether inhibits estrogen sulfotransferase (EST), a

progesterone-induced secretory endometrial enzyme which affects estrogen receptor levels. This agent has been shown to be an effective growth inhibitor of some chemically induced animal mammary tumors.

**4-peptide melanoma vaccine:** An emulsion of 4 melanoma peptides with potential immunomodulating and antineoplastic activities. Upon vaccination, 4-peptide melanoma vaccine may stimulate an immune response against 4 different melanoma associated antigens. This may lead to a reduction in tumor cell proliferation of cancer cells expressing these antigens. Check for active clinical trials using this agent.

**4-thio-2-deoxycytidine:** An orally bioavailable 4-thio modified 2-deoxycytidine analog, with potential antineoplastic activity. Upon administration of 4-thio-2-deoxycytidine (TdCyd), this cytidine analog is incorporated into DNA during replication and inhibits the activity of DNA methyltransferase 1 (DNMT1), which blocks DNA hypermethylation. This results in DNMT1 depletion, hypomethylation of DNA, and the reactivation of tumor suppressor genes that were silenced by hypermethylation; this results in antitumor activity and an inhibition of tumor cell proliferation.

**4'-iodo-4'-deoxydoxorubicin:** An iodinated doxorubicin analogue with anti-amyloid activity. 4'-Iodo-4'-deoxydoxorubicin (IDOX) binds with high affinity to five types of natural amyloid fibrils including immunoglobulin light chains, amyloid A, transthyretin (methionine-30 variant),  $\beta$ -protein (Alzheimer), and  $\beta$ 2-microglobulin. This agent may inhibit fibril growth, increasing the solubility of amyloid tissue deposits and facilitating their clearance. IDOX has also been shown to inhibit insulin amyloid fibrillogenesis in vitro.

**4H11-28z/fIL-12/EGFRt-expressing autologous T lymphocytes:** A preparation of genetically modified autologous T-lymphocytes transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) targeting the human tumor-associated antigen (TAA) MUC16ecto and encoding the human pro-inflammatory cytokine interleukin-12 (IL-12), fused to the signaling domain of the zeta chain of the TCR/CD3 complex (28z), and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, 4H11-28z/fIL-12/EGFRt-expressing autologous T-lymphocytes are directed to and induce selective toxicity in MUC16-expressing tumor cells. In addition, the T-cells secrete IL-12 which

induces secretion of interferon-gamma, promotes the activation of natural killer cells (NKs), and induces cytotoxic T-cell responses against tumor cells, which may result in immune-mediated tumor cell death and inhibition of tumor cell proliferation. Devoid of both ligand binding domains and tyrosine kinase activity, the expressed EGFRt both facilitates in vivo detection of the administered, transduced T-cells and can promote elimination of those cells through a cetuximab-induced antibody-dependent cellular cytotoxicity (ADCC) response. MUC16, a transmembrane protein and glycosylated mucin, is overexpressed on the cell surface of the majority of ovarian cancer cells but not on healthy cells. MUC16ecto is the extracellular portion of MUC-16 and is the part that is retained by cells after cleavage of CA-125.

**4SCAR-GD2-modified T lymphocytes:** Genetically modified autologous T lymphocytes transduced with a lentiviral vector encoding a fourth generation specific chimeric antigen receptor (4SCAR) specific for the disialoganglioside GD2 and which includes the CD3zeta chain and the signaling domains of the co-stimulatory molecules CD28, CD137, and CD27 fused with the suicide gene inducible caspase 9 (iCasp9), with potential immunomodulating and antineoplastic activities. Upon intravenous administration of 4SCAR-GD2 T cells, these cells target the GD2 antigen on tumor cells to induce selective toxicity against GD2-expressing tumor cells. The tumor-associated antigen (TAA) GD2 is overexpressed on the surface of neuroblastoma cells and by other neuroectoderm-derived neoplasms, while it is minimally expressed on normal cells. iCasp9 consists of a human FK506 drug-binding domain with an F36V mutation (FKBP12-F36V) linked to human caspase 9. If the administered T cells lead to unacceptable side effects, the chemical homodimerizer AP1903 can be administered; this binds to the drug binding FKBP12-F36V domain and activates caspase 9, which results in the apoptosis of the administered T cells and enhances safety of this agent. CD28, CD137 and CD27, T-cell surface-associated co-stimulatory molecules, are required for full T cell activation. Check for active clinical trials using this agent.

**5-[18F]fluorouracil:** The fluorine-18 (18F)-radiolabeled pyrimidine analog 5-fluorouracil (5-FU) with positron-emitting activity. Upon administration, 5-[18F]fluorouracil distribution in tumor tissue may be measured with positron emission tomography (PET). The degree of 5-

[18F]fluorouracil uptake in tumor tissue may help to predict the response to 5-fluorouracil-based chemotherapy or to determine the response to other therapeutic agents used to treat 5-FU-sensitive tumors.

**5-FITC-labeled colon-heptapeptide:** A radioconjugate consisting of a 7 amino acid peptide sequence, KCCFPAQ, that specifically targets human colon cancer and that is labeled, via the linker, GGGSK, with the fluorescent dye, fluorescein isothiocyanate (5-FITC), with potential imaging activity. Following spray application to the colon wall during colonoscopy in areas that look abnormal, the colon heptapeptide moiety of 5-FITC-labeled colon-heptapeptide specifically targets and binds to a cell surface target overexpressed on pre-cancerous or cancerous colon cells. Upon internalization, the FITC moiety allows for fluorescent imaging and the area of interest for biopsies can then be visualized.

**5-FITC-labeled GI-heptapeptide:** A radioconjugate consisting of the 7 amino acid peptide sequence ASYNYDA (GI heptapeptide) and labeled with the fluorescent dye fluorescein isothiocyanate (5-FITC), with potential imaging activity. Upon topical application to the esophageal mucosa using a spray, the heptapeptide moiety of 5-FITC-labeled GI-heptapeptide binds to abnormal cells in the esophagus; the FITC moiety allows for imaging with white light and the area of interest for biopsies can then be visualized.

**5-fluoro-2-deoxycytidine:** A fluorinated pyrimidine analogue antimetabolite with potential antineoplastic activity. As a prodrug, 5-fluoro-2-deoxycytidine is converted by intracellular deaminases to the cytotoxic agent 5-fluorouracil (5-FU). 5-FU is subsequently metabolized to active metabolites including 5-fluoro-2-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP). FdUMP binds to and inhibits thymidylate synthase, thereby reducing the production of thymidine monophosphate, which leads to depletion of thymidine triphosphate and the inhibition of DNA synthesis and cell division. FUTP competes with uridine triphosphate (UTP) for incorporation into the RNA strand, which results in the inhibition of RNA and protein synthesis and cell proliferation. Other fluorouracil metabolites also get incorporated into both DNA and RNA, with further inhibition of cellular growth.

**5-fluorouracil/salicylic acid topical solution:** A topical formulation containing 0.5 % of antimetabolite 5-fluorouracil (5-FU) and 10% of salicylic acid, with potential antimitotic and keratolytic activity. Upon

cutaneous application, 5-FU in the 5-fluorouracil/salicylic acid topical solution impedes pyrimidine metabolism thereby inhibiting cell growth, while the salicylic acid induces anti-inflammatory response and results in keratolytic effect. This may result in the breakdown of keratinocytes and prevent proliferation of keratinocytes locally.

**5' end:** The end of a nucleic acid that lacks a nucleotide bound at the 5' position of the terminal residue.

**50% oxygen/50% nitrous oxide premix:** An equimolar gas mixture of oxygen (O<sub>2</sub>) and nitrous oxide (N<sub>2</sub>O) with potential analgesic activity. Upon inhalation, 50% oxygen/50% nitrous oxide premix produces rapidly reversible analgesia. The exact mechanism through which nitrous oxide exerts its analgesic effect has yet to be fully elucidated, but it appears to be associated with the neuronal release of endogenous opioid peptides.

**50% Probability level:** A scale factor used for Ortep representations in which the instantaneous position of the atomic center will be within the ellipsoid 50% of the time.

**5D:** Indicates that five functions are used in each d-set.

**6-31++G\*:** Augmented 6-31+G\* basis; the second "+" indicates that a set of diffuse s-functions has been added to each hydrogen atom. Also denoted 6-31++G(d).

**6-31+G\*:** Augmented 6-31G\* basis; the single "+" indicates that a set of diffuse s-functions and a set of diffuse p-functions has been added to each heavy atom. Also denoted 6-31+G(d).

**6-311+G(3df,2p):** In addition to the 6-311G basis, the "+" indicates that diffuse s- and p-functions are added to heavy atoms, the "3df" indicates that three sets of polarization d-functions and one set of polarization f-functions are added to heavy atoms, and the "2p" indicates that two sets of polarization p-functions are added to hydrogen.

**6-311G:** A popular VTZ basis set similar to the small 6-31G set. Usually supplemented with polarization functions. Built like 6-31G but with a third layer of valence functions composed of a single, uncontracted primitive set. Some workers consider this basis to be less flexible than a "real" triple-zeta basis.

**6-311G\*:** The asterisk indicates that a set of polarization d-functions (5D) has been added to heavy atoms to supplement the 6-311G basis; also

denoted 6-311G(d).

**6-311G\*\*:** The second asterisk indicates that a set of polarization p-functions has been added to hydrogen; also denoted 6-311G(d,p).

**6-31G:** A VDZ basis set from the Pople school. Very popular, often used with a set of heavy-atom polarization functions (see 6-31G\*). The "6" indicates that each core basis function is built using six primitives. The "3" indicates that the inner valence basis functions are each built using three primitives. The "1" indicates that the outer valence basis functions are each built using a single uncontracted primitive. The "G" stands for "Gaussian", indicating the type of primitive function. (Recently-developed basis sets don't include the "G" or its equivalent since they are essentially all based upon Gaussian functions.)

**6-31G\*:** A polarized VDZ basis set from the Pople school. Maybe the most popular basis set in use today. The single asterisk indicates that a set of polarizing d-functions (6D) is included on "heavy" atoms (beyond helium). Also denoted 6-31G(d).

**6-31G\*\*:** A polarized VDZ basis set from the Pople school. A set of polarizing d-functions (6D) is included on "heavy" atoms and a set of p-functions on hydrogen. Also denoted 6-31G(d,p).

**6-azauridine:** A synthetic triazine analogue of uridine with antimetabolite activity. 6-azauridine inhibits de novo pyrimidine synthesis and DNA synthesis and is converted intracellularly into mono-, di-, and triphosphate derivatives, which incorporate into RNA and inhibit protein synthesis.

**6-phosphofructo-2-kinase/ fructose-2,6-bisphosphatases isoform 3 inhibitor ACT-PFK-158:** An inhibitor of 6-phosphofructo-2-kinase/fructose-2,6-bisphosphatases (PFK-2/FBPase) isoform 3 (PFKFB3) and derivative of 3-(3-pyridinyl)-1-[4-pyridinyl]-2-propen-1-one (3PO), with potential antineoplastic activity. Upon administration, PFKFB3 inhibitor PFK-158 binds to and inhibits the activity of PFKFB3, which leads to the inhibition of both the glycolytic pathway in and glucose uptake by cancer cells. This prevents the production of macromolecules and energy that causes the enhanced cellular proliferation in cancer cells as compared to that of normal, healthy cells. Depriving cancer cells of nutrients and energy leads to the inhibition of cancer cell growth. PFKFB3, an enzyme that catalyzes the conversion of fructose-6-phosphate to fructose-2,6-bisphosphate, is highly expressed and active in human cancer cells; it plays

a key role in increasing both glycolytic flux in and proliferation of cancer cells.

**6,8-bis(benzylthio)octanoic acid:** A racemic mixture of the enantiomers of a synthetic alpha-lipoic lipoic acid analogue with potential chemopreventive and antineoplastic activities. Although the exact mechanism of action is unknown, 6,8-bis(benzylthio)octanoic acid has been shown to inhibit metabolic and regulatory processes required for cell growth in solid tumors. Both enantiomers in the racemic mixture exhibit antineoplastic activity.

**6D:** Indicates that six (cartesian) functions are used in each d-set. This includes the s-like combination ( $x^2 + y^2 + z^2$ ).

**7-cyanoquinocarcinol:** A semisynthetic analogue of the Streptomyces melanovinaceus-derived tetracyclic antitumor antibiotic quinocarmycin with potential antineoplastic activity. Quinocarmycin belongs to the naphthyridinomycin/saframycin class of antitumor antibiotics. These antibiotics appear to act through DNA alkylation.

**7-hydroxystaurosporine:** A synthetic derivative of staurosporine with antineoplastic activity. 7-hydroxystaurosporine inhibits many phosphokinases, including the serine/threonine kinase AKT, calcium-dependent protein kinase C, and cyclin-dependent kinases. This agent arrests tumor cells in the G1/S of the cell cycle and prevents nucleotide excision repair by inhibiting the G2 checkpoint kinase chk1, resulting in apoptosis.

**8-hydroxyquinoline sulfate ointment:** An ointment formulation containing the sulfate salt of 8-hydroxyquinoline in a petrolatum and lanolin base with skin-protecting activity. Upon topical application, 8-hydroxyquinoline sulfate exhibits antiseptic activity while lanolin moisturizes and softens skin. Check for active clinical trials using this agent.

**851B gel:** A topical gel containing a peptide derived from the human papillomavirus (HPV). Application of 851B gel may stimulate the host immune system to trigger a cytotoxic T-lymphocyte response to cells that express HPV.

**852A:** A synthetic imidazoquinoline Toll-like receptor 7 (TLR7) agonist with immunostimulating and potential antitumor activities. TLR7 agonist 852A binds to and activates TLR7, thereby stimulating plasmacytoid dendritic cells (pDC) through the TLR7-MyD88-dependent signaling

pathway. Activation of pDC results in secretion of interferon alpha, the production of proinflammatory cytokines, the upregulation of co-stimulatory molecules, and enhanced T and B-cell stimulatory responses.

**A form:** A form. A duplex DNA structure with right-handed twisting in which the planes of the base pairs are tilted about 70° with respect to the helix axis.

**A horizon:** the uppermost soil horizon; characterized by the downward movement of water.

**A-Hydrocort:** (Other name for: hydrocortisone sodium succinate)

**A-Side:** Often referred to the “cavity,” this is the half of the mold that usually creates the exterior of a cosmetic part. The A-side generally does not have moving parts built into it.

**A-stage:** This is a very early stage in the reaction of certain thermosetting resins where the molecular weight is low and the resin is still soluble in some liquids and still fusible.

**A33:** A type of monoclonal antibody used in cancer detection or therapy. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells.

**A5SC Flat Wire Belt:** The A5SC belt was specifically designed for the can industry by Ashworth Bros., Inc. Its special construction allows it to run under inverted cans, without pinching and upsetting them, which can occur at the discharge of the dryer section in a can washer, where the cans transfer onto the take-away conveyor.

**A6:** A substance being studied in the treatment of cancer. A6 is a small piece of a protein called urokinase (an enzyme that dissolves blood clots or prevents them from forming). It is a type of antiangiogenesis agent and a type of antimetastatic agent. Also called urokinase plasminogen activator (uPA)-derived peptide A6.

**AAP:** An enzyme that is normally found in healthy kidneys. It may be found at high levels in the urine when there are kidney problems. It is used as a biomarker to detect damage to the kidneys caused by drugs and other agents. It may also be used to diagnose certain kidney and liver disorders. Also called alanine aminopeptidase.

**Ab initio:** (Latin: from the beginning) in chemistry means computational chemistry predictions or calculations solely based on quantum theory rather

than experimental data.

**abacavir sulfate:** A sulfate salt form of abacavir, a nucleoside reverse transcriptase inhibitor analog of guanosine. This agent decreases HIV viral loads, retards or prevents the damage to the immune system, and reduces the risk of developing AIDS. Check for active clinical trials using this agent.

**abagovomab:** A murine IgG1 monoclonal anti-idiotypic antibody, containing a variable antigen-binding region that functionally mimics the three-dimensional structure of a specific epitope on the ovarian cancer tumor-associated antigen CA-125, with potential antineoplastic activity. With a variable antigen-binding region that acts as a surrogate antigen for CA-125, abagovomab may stimulate the host immune system to elicit humoral and cellular immune responses against CA-125-positive tumor cells, resulting in inhibition of tumor cell proliferation.

**abarelix:** A synthetic decapeptide and antagonist of naturally occurring gonadotropin-releasing hormone (GnRH). Abarelix directly and competitively binds to and blocks the gonadotropin releasing hormone receptor in the anterior pituitary gland, thereby inhibiting the secretion and release of luteinizing hormone (LH) and follicle stimulating hormone (FSH). In males, the inhibition of LH secretion prevents the release of testosterone. As a result, this may relieve symptoms associated with prostate hypertrophy or prostate cancer, since testosterone is required to sustain prostate growth. OR A drug used to reduce the amount of testosterone made in patients with advanced symptomatic prostate cancer for which no other treatment options are available. It belongs to the family of drugs called gonadotropin-releasing hormone (GnRH) antagonists. Also called Plenaxis.

**abatacept:** A soluble fusion protein consisting of the extracellular domain of human cytotoxic T lymphocyte-associated antigen 4 (CTLA-4) linked to a modified Fc (hinge, CH2, and CH3 domains) portion of human immunoglobulin G1 (IgG1) with immunosuppressive activity. Abatacept binds CD80 and CD86 on antigen presenting cells (APCs), blocking interaction with CD28 on T lymphocytes, which initiates a co-stimulatory signal required for full activation of T lymphocytes.

**ABBV-221:** An intravenously-administered agent capable of modulating the activity of epidermal growth factor receptor (EGFR), with potential antineoplastic activity.

**ABCA1 pathway :** Describes a group of proteins in a cell that work together to help remove extra cholesterol and certain fats from tissue in the body. Changes in the ABCA1 pathway may lead to diseases of the heart and blood vessels. Drugs or substances that affect this pathway are being studied in the prevention and treatment of some diseases.

**ABCD rating :** A staging system for prostate cancer that uses ABCD. “A” and “B” refer to cancer that is confined to the prostate. “C” refers to cancer that has grown out of the prostate but has not spread to lymph nodes or other places in the body. “D” refers to cancer that has spread to lymph nodes or to other places in the body. Also called Jewett staging system and Whitmore-Jewett staging system.

**abdomen :** The area of the body that contains the pancreas, stomach, intestines, liver, gallbladder, and other organs.

**abdominal :** Having to do with the abdomen, which is the part of the body between the chest and the hips that contains the pancreas, stomach, intestines, liver, gallbladder, and other organs.

**abdominal ultrasound :** A procedure used to examine the organs in the abdomen. An ultrasound transducer (probe) is pressed firmly against the skin of the abdomen. High-energy sound waves from the transducer bounce off tissues and create echoes. The echoes are sent to a computer, which makes a picture called a sonogram. Also called transabdominal ultrasound.

**abdominal x-ray :** An x-ray of the organs inside the abdomen. An x-ray is a type of radiation that can pass through the body and onto film, making pictures of areas inside the body. X-rays may be used to help diagnose disease.

**abdominoperineal resection :** Surgery to remove the anus, the rectum, and part of the sigmoid colon through an incision made in the abdomen. The end of the intestine is attached to an opening in the surface of the abdomen and body waste is collected in a disposable bag outside of the body. This opening is called a colostomy. Lymph nodes that contain cancer may also be removed during this operation.

**Abegrin :** A substance being studied in the treatment of some types of cancer and other conditions. Abegrin binds to a protein on the surface of blood vessels and may prevent the growth of new blood vessels that tumors need to grow. It may also prevent the spread of cancer. It is a type of antiangiogenesis agent, a type of metastasis inhibitor, and a type of

monoclonal antibody. Also called etaracizumab, humanized monoclonal antibody MEDI-522, and MEDI-522.

**Abelcet:** (Other name for: liposomal amphotericin B)

**abemaciclib:** An orally available cyclin-dependent kinase (CDK) inhibitor that targets the CDK4 (cyclin D1) and CDK6 (cyclin D3) cell cycle pathway, with potential antineoplastic activity. Abemaciclib specifically inhibits CDK4 and 6, thereby inhibiting retinoblastoma (Rb) protein phosphorylation in early G1. Inhibition of Rb phosphorylation prevents CDK-mediated G1-S phase transition, thereby arresting the cell cycle in the G1 phase, suppressing DNA synthesis and inhibiting cancer cell growth. Overexpression of the serine/threonine kinases CDK4/6, as seen in certain types of cancer, causes cell cycle deregulation. Check for active clinical trials using this agent.

**Aberel:** (Other name for: tretinoin)

**aberrant crypt foci :** Clusters of abnormal tube-like glands in the lining of the colon and rectum. Aberrant crypt foci form before colorectal polyps and are one of the earliest changes that can be seen in the colon that may lead to cancer. Also called ACF.

**abexinostat:** A novel, broad-spectrum hydroxamic acid-based inhibitor of histone deacetylase (HDAC) with potential antineoplastic activity. Abexinostat inhibits several isoforms of HDAC, resulting in an accumulation of highly acetylated histones, followed by the induction of chromatin remodeling; the selective transcription of tumor suppressor genes; and the tumor suppressor protein-mediated inhibition of tumor cell division and induction of tumor cell apoptosis. HDAC, upregulated in many tumor types, is an enzyme that is responsible for the deacetylation of chromatin histone proteins.

**ABI-007:** A drug used to treat breast cancer that has come back or spread to other parts of the body. It is also used with carboplatin to treat advanced non-small cell lung cancer in patients who are not able to have surgery or radiation therapy. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that has spread to other parts of the body. It is being studied in the treatment of other types of cancer. ABI-007 is a form of the anticancer drug paclitaxel and may cause fewer side effects than paclitaxel. It stops cancer cells from growing and dividing, and may kill them. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called

Abiraterone, nanoparticle paclitaxel, paclitaxel albumin-stabilized nanoparticle formulation, and protein-bound paclitaxel.

**abiotic:** This is a term used to describe anything which is characterized by the absence of life or incompatible with life. In toxicology and ecotoxicology it refers to physical (e.g. heat, sunlight) or chemical processes (e.g. hydrolysis) that are capable of modifying chemical structures.

**Abiotic Disintegration:** The disintegration of plastic materials by means other than by the biological process such as dissolving, heat ageing or ultraviolet aging.

**Abiotic factors:** Non living; moisture, soil, nutrients, fire, wind, temperature, climate

**abiotic transformation:** Any process in which a chemical in the environment is modified by non-biological mechanisms (see also biotransformation) (WHO, 1979).

**abiraterone acetate:** An orally active acetate salt of the steroidal compound abiraterone with antiandrogen activity. Abiraterone inhibits the enzymatic activity of steroid 17alpha-monooxygenase (17alpha-hydroxylase/C17,20 lyase complex), a member of the cytochrome p450 family that catalyzes the 17alpha-hydroxylation of steroid intermediates involved in testosterone synthesis. Administration of this agent may suppress testosterone production by both the testes and the adrenals to castrate-range levels. or A drug used with prednisone to treat prostate cancer that has spread to other parts of the body and has not gotten better with other hormone therapy. It is also being studied in the treatment of other types of cancer. Abiraterone acetate lowers the amount of androgens (male hormones), such as testosterone, made by the body. This may stop the growth of cancer cells that need androgens to grow. Abiraterone acetate is a type of antiandrogen. Also called Zytiga.

**Abitrexate:** (Other name for: methotrexate)

**ablation :** In medicine, the removal or destruction of a body part or tissue or its function. Ablation may be performed by surgery, hormones, drugs, radiofrequency, heat, or other methods.

**ablation (glacial):** All processes, which include melting, evaporation (sublimation), wind erosion, and calving (breaking off of ice masses), that

remove snow or ice from a glacier or snowfield. The term also refers to the amount of snow or ice removed by these processes.

**Ablavar:** (Other name for: gadofosveset trisodium)

**abnormal :** Not normal. Describes a state, condition, or behavior that is unusual or different from what is considered normal. An abnormal lesion or growth in or on the body may be benign (not cancer), precancerous or premalignant (likely to become cancer), or malignant (cancer).

**ABO blood group system :** A system used to group human blood into different types, based on the presence or absence of certain markers on the surface of red blood cells. The four main blood types are A, B, O, and AB. For a blood transfusion, the ABO blood group system is used to match the blood type of the donor and the person receiving the transfusion. People with blood type O can donate blood to anyone and are called universal donors. People with blood type AB can accept blood from all donors and are called universal recipients. People with type A or B can receive matching blood or type O blood.

**ABR test :** A test used to detect some types of hearing loss, such as hearing loss caused by injury or tumors that affect nerves involved in hearing. Electrodes are placed on the head and certain tones or clicking sounds are made. The electrodes measure nerve signals in the brain when it reacts to the sounds. Also called auditory brain stem response test, BAER test, and brain stem auditory evoked response test.

**Abrading:** The use of materials such as glasspaper, wet-or-dry paper, sanding discs, etc. to smooth down a surface prior to painting, or to matt down existing coatings to provide a 'key' for subsequent coats of paint.

**Abrasion:** Wearing, grinding, or rubbing away by friction. OR Surface wear caused by relative motion between two or more contacting objects or Rocks bang into each other and become smaller and more rounded.

**Abrasion Resistance:** Resistance to being worn away by rubbing or friction; related more to toughness than to hardness. A necessary quality for floor finishes, enamels and varnishes. OR The ability to withstand the effects of repeated wearing, rubbing, scraping, etc., that tend to remove material from its surface. OR The ability of a material to withstand rubbing, scraping or erosion from mechanical systems, that ultimately ruin a metal surface. Ability of a plastic to withstand mechanical action that tends to wear material from its surface. Or The ability of a rubber compound to

resist surface wearing by mechanical action or the ability to withstand the effects of repeated wearing, rubbing, scraping, etc., that tend to remove material from its surface. or the ability to withstand the effects of repeated wearing, rubbing, scraping, etc., that tend to remove material from its surface. The ability of a material to withstand mechanical actions such as rubbing, scraping, or erosion, that tend progressively to remove material from its surface. OR Capability of material to resist mechanical actions such as rubbing, scraping, erosion which wear down material. In general, the abrasion behaviour of plastics is good, especially in the case of sliding surfaces where foreign particles, as well as particles generated through abrasion, are pressed into the surface and thus lose their abrasive effect. This is why plastics mostly withstand sliding abrasion, grain abrasion and frictional abrasion better than metallic materials. or Abrasion Resistance The ability a material has to withstand rubbing and scraping. Fre-Thane™ Polyurethane Tubing has a high level of abrasion resistance.

**ABRASIVE:** Used for wearing away a surface by rubbing. Examples are powdered pumice, rottenstone, sandpaper, sandpaper, steel wool. OR A very hard, brittle, heat-resistant substance that is used to grind the edges or rough surfaces of an object. boron carbide, diamond, and corundum are abrasives.

**Abraxane :** A drug used to treat breast cancer that has come back or spread to other parts of the body. It is also used with carboplatin to treat advanced non-small cell lung cancer in patients who are not able to have surgery or radiation therapy. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Abraxane is a form of the anticancer drug paclitaxel and may cause fewer side effects than paclitaxel. It stops cancer cells from growing and dividing, and may kill them. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called ABI-007, nanoparticle paclitaxel, paclitaxel albumin-stabilized nanoparticle formulation, and protein-bound paclitaxel.

**ABS:** Acrylonitrile-butadiene-styrene or Acrylonitrile Butadiene Styrene is a thermoplastic copolymer that can withstand high temperatures and has good adhesive properties. It is one of the most widely used engineering thermoplastic . ABS extrusions are mainly used for indoor purposes. The plastic product has excellent surface appearance, strength and

stiffness, toughness and chemical resistance—as well as its processing ease and versatility. ABS is often used for refrigerator door liners, interior automotive trims, and housings for business machines, small appliances, telephones, and other consumer electronics. Furthermore, ABS offers a broad processing window with resins tailored for plastic extrusion manufacture, injection moulding, sheet extrusion and coextrusion, plating, roto moulding, compression, cold forming, and blow moulding.

**abscess :** An enclosed collection of pus in tissues, organs, or confined spaces in the body. An abscess is a sign of infection and is usually swollen and inflamed.

**abscission:** Shedding by a plant of its parts, such as leaves, flowers, fruits, or seeds. The process is regulated by the plant hormone abscisic acid.

**absolute configuration:** The configuration of four different substituent groups around an asymmetric carbon atom, in relation to D- and L-glyceraldehyde. Or The configuration of four different substituent groups around an asymmetric carbon atom, in relation to D- and L-glyceraldehyde. absolute configuration The configuration of four different substituent groups around an asymmetric carbon atom, in relation to D- and L-glyceraldehyde.

**Absolute Density:** The absolute density is a measure of the mass of one milliliter of gas at standard temperature and pressure.

**absolute error:** absolute uncertainty. Compare with relative error. The uncertainty in a measurement, expressed with appropriate units. For example, if three replicate weights for an object are 1.00 g, 1.05 g, and 0.95 g, the absolute error can be expressed as  $\pm 0.05$  g. Absolute error is also used to express inaccuracies; for example, if the "true value" is 1.11 g and the measured value is 1.00 g, the absolute error could be written as  $1.00 \text{ g} - 1.11 \text{ g} = -0.11 \text{ g}$ . Note that when absolute errors are associated with indeterminate errors, they are preceded with " $\pm$ "; when they are associated with determinate errors, they are preceded by their sign.

**Absolute mV mode:** a mode of operation of a pH/mV meter, which allows the actual true potential of the electrode to be displayed. In the absolute millivolt mode the calibration control (asymmetry potential control) does not change the readings.

**absolute neutrophil count :** A measure of the number of neutrophils in the blood. Neutrophils are a type of white blood cell. They help the body fight

infection. An absolute neutrophil count may be used to check for infection, inflammation, leukemia, and other conditions. The lower a person's absolute neutrophil count is, the higher the risk is of getting an infection. Having an absolute neutrophil count of less than 500 means there is a high risk of getting an infection. Cancer treatment, such as chemotherapy, may reduce the absolute neutrophil count. Also called ANC.

**absolute risk :** A measure of the risk of a certain event happening. In cancer research, it is the likelihood that a person who is free of a specific type of cancer at a given age will develop that cancer over a certain period of time. For example, a woman 35 years of age, with no known risk factors for breast cancer, has an absolute risk of getting breast cancer over a lifetime of 90 years of about 13.5%, meaning one out of every seven women will develop breast cancer.

**absolute temperature:** Temperature measured on a scale that sets absolute zero as zero. In the SI system, the kelvin scale is used to measure absolute temperature.

**Absolute Viscosity:** The tangential force on unit area of either of two parallel planes at unit distance apart when the space between the planes is filled with the fluid in question and one of the planes moves with unit differential velocity in its own plane. The C.G.S. unit for absolute (or dynamic) viscosity is poise (dyne-sec./sq. cm.). Centipoise (0.01) is often used.

**absolute zero:** The temperature at which the volume of an ideal gas becomes zero; a theoretical coldest temperature that can be approached but never reached. Absolute zero is zero on the Kelvin scale,  $-273.15^{\circ}\text{C}$  on the Celsius scale, and  $-459.67^{\circ}\text{F}$  on the Fahrenheit scale.

**absorbable adhesion barrier gel:** An isotonic, sterile, absorbable adhesion barrier gel composed of polyethylene oxide and sodium carboxymethylcellulose, with protective activity. Upon application of a single layer into the uterine cavity at the end of any hysteroscopic surgery, the absorbable adhesion barrier gel may provide a protective barrier which protects the traumatized tissue and allows for healing. This gel may therefore prevent the formation of post-surgical intrauterine adhesions.

**absorbable fibrin sealant patch:** A sterile, absorbable surgical sealing patch composed of an equine collagen sponge coated with the coagulation factors human fibrinogen and human thrombin, with potential hemostatic

activity. Applied on the wound tissue, the absorbable fibrin sealant patch adheres to the tissue and the solid fibrinogen and thrombin dissolve upon contact with the physiological fluid. In turn, fibrinogen is converted to fibrin monomers by thrombin, and polymerize to form a fibrin clot at the wound surface. This causes the patch to adhere to the wound surface and promotes tissue sealing. This may reduce lymphatic drainage and prevent seroma formation.

**absorbable gelatin sponge:** A sterile hemostatic agent composed of purified porcine-derived gelatin. In regional chemotherapy, absorbable gelatin sponge may be used to embolize arteries in the region of a tumor in order to block or retard blood flow; this blockage results in a locally increased concentration of chemotherapeutic agents delivered to the tumor when chemotherapeutic agents are infused into the embolized arterial circulation upstream of the blockage.

**absorbable modified polymer hemostatic powder:** A hemostatic powder composed of hydrophilic, absorbable modified polymers (AMPs) derived from plant starch, with potential anti-hemorrhagic activity. Upon local administration of the AMP hemostatic powder directly sprayed over the bleeding surface, this powder adheres to the bleeding area, and the AMPs are able to absorb fluid and therefore soak up blood at the bleeding site. This leads to the formation of a gelled matrix that seals the affected site, and allows platelets, red blood cells and clotting factors in the blood to concentrate at the wound. In turn, this promotes the coagulation cascade, helps to stop or control bleeding, and prevents further blood loss. The AMP particles are naturally degraded by human enzymes over time.

**absorbance:** (A, D, E) optical density; extinction; decadic absorbance. A measure of the amount of light absorbed by a sample. The absorbance (A) equals minus the base-10 log of the transmittance.

**Absorbance (A) :** a physical quantity, which expresses the amount of light absorbed by a sample solution. When a light beam passes through a sample, the amount of light absorbed is the difference between the incident radiation ( $I_0$ ) and the transmitted radiation (I). Absorbance is defined:  $A = \log I_0/I$ .

**absorbed dose (in radiation):** The energy imparted to matter in a suitably small element of volume by ionizing radiation divided by the mass of that element of volume (ISO, 1972). The SI unit for absorbed dose is joule per kilogram ( $J\ kg^{-1}$ ) and its special name is gray (Gy) (ISO, 1972).

**absorbed dose (in toxicology):** The amount of a chemical absorbed into the body or into organs and tissues of interest (WHO, 1978a).

**Absorbency:** The degree to which a surface can soak up a liquid. Some surfaces have varying absorbency, for instance, softwoods vary in grain pattern. One of the requirements of a primer is to produce a non-absorbent surface.

**absorption:** Transport of the products of digestion from the intestinal tract into the blood. OR Not to be confused with adsorption, absorption is one substance is taken up into the interior of another - adsorption with a 'd' is entirely a surface effect. Examples are the swelling of a poly(acrylamide) polymer with aqueous solution (in a disposable nappy) or the dissolution of carbon dioxide in seawater (one of the possible antidotes to global warming that crops up in models of world climate. OR A process in which a gas mixture contacts a liquid solvent and a component (or several components) of the gas dissolves in the liquid. In an absorption column or absorption tower (or simply absorber), the solvent enters the top of a column, flows down, and emerges at the bottom, and the gas enters at the bottom, flows up (contacting the liquid), and leaves at the top OR The taking in or soaking up of one substance into the body of another by molecular or chemical action (as tree roots absorb dissolved nutrients in the soil). OR absorb; absorbent. Compare with adsorption and sorption.

1. Penetration of molecules into the bulk of a solid or liquid, forming either a solution or compound. Absorption can be a chemical process (a strong solution of NaOH absorbs CO<sub>2</sub> from the air) or a physical process (palladium absorbs hydrogen gas). 2. Capture and transformation of energy by a substance; for example, copper looks reddish because it absorbs blue light. An absorbent captures another material and distributes it throughout; an adsorbent captures another material and distributes it on its surface only.

**absorption :** The process of taking nutrients from the digestive system into the blood so they can be used in the body.

**absorption (in colloid and surface chemistry):** A process whereby, when two phases are brought into contact, a given component is transferred from one phase to the other (after IUPAC, 1972). Experimental differentiation of absorption and adsorption (q.v.) may be difficult, and sometimes the two processes occur simultaneously; in such cases the term ``sorption" is used (WHO, 1979).

**absorption (in radiation):** A phenomenon in which radiation transfers to matter which it traverses some or all of its energy (ISO, 1972).

**absorption coefficient:** A measure of the amount of radiant energy, incident normal to a planar surface, that is absorbed per unit distance or unit mass of a substance.

**Absorption Field:** A system of properly sized and constructed narrow trenches partially filled with a bed of washed gravel or crushed stone into which perforated or open joint pipe is placed. The discharge from the septic tank is distributed through these pipes into trenches and surrounding soil. While seepage pits normally require less land area to install, they should be used only where absorption fields are not suitable and well-water supplies are not endangered.

**absorption spectroscopy:** Compare with absorption spectrum. A technique for determining the concentration and structure of a substance by measuring the amount of electromagnetic radiation the sample absorbs at various wavelengths.

**absorption spectrum:** absorption spectra. Compare with absorption spectroscopy. A plot that shows how much radiation a substance absorbs at different wavelengths. Absorption spectra are unique for each element and compound and they are often used as chemical "fingerprints" in analytical chemistry. The spectrum can be represented by a plot of either absorbance or transmittance versus wavelength, frequency, or wavenumber.

**Absorption spectrum :** a plot of absorption light wavelength versus the amount of light absorbed by the molecules.

**absorptivity:** (a) extinction coefficient; absorption cross section; decadic absorptivity. Compare with molar absorptivity and absorbance. The absorbance of a solution per unit of path length and per unit concentration;  $a = A/(bc)$  where  $a$ ,  $A$ ,  $b$ , and  $c$  are the absorptivity, absorbance, path length, and concentration, respectively. Absorptivity varies with wavelength of the incident light.

**ABT-263:** A substance being studied in the treatment of lymphomas and other types of cancer. It blocks some of the enzymes that keep cancer cells from dying. It is a type of Bcl-2 family inhibitor. Also called navitoclax.

**ABT-510:** A synthetic peptide that mimics the anti-angiogenic activity of the endogenous protein thrombospondin-1 (TSP-1). ABT-510 inhibits the actions of several pro-angiogenic growth factors important to tumor neovascularization; these pro-angiogenic growth factors include vascular endothelial growth factor (VEGF), basic fibroblast growth factor (bFGF), hepatocyte growth factor (HGF), and interleukin 8 (IL-8). Check for active clinical trials using this agent. OR A substance being studied in the treatment of cancer. It is a type of angiogenesis inhibitor.

**ABT-751:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called sulfonamides. OR An orally bioavailable antimitotic sulfonamide. ABT-751 binds to the colchicine-binding site on beta-tubulin and inhibits the polymerization of microtubules, thereby preventing tumor cell replication. This agent also disrupts tumor neovascularization, reducing tumor blood flow and so inducing a cytotoxic effect.

**ABT-869:** A substance being studied in the treatment of several types of cancer. ABT-869 blocks the action of several growth factors. It may also block the growth of new blood vessels that tumors need to grow and may cause cancer cells to die. It is a type of receptor tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called multitargeted receptor tyrosine kinase inhibitor ABT-869.

**ABT-888:** A substance being studied in the treatment of breast cancers caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is also being studied in the treatment of other types of cancer. It blocks an enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. ABT-888 may cause cancer cells to die. It is a type of poly(ADP-ribose) polymerase inhibitor. Also called PARP-1 inhibitor ABT-888 and veliparib.

**ABVD:** An abbreviation for a chemotherapy combination used to treat Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vinblastine sulfate, and dacarbazine. Also called ABVD regimen.

**ABVD regimen :** An abbreviation for a chemotherapy combination used to treat Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vinblastine sulfate, and dacarbazine. Also

called ABVD. OR A chemotherapy regimen consisting of doxorubicin hydrochloride (Adriamycin), bleomycin, vinblastine and dacarbazine, used alone or in combination with radiation therapy, for the primary treatment of Hodgkin lymphoma.

**ABVE:** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, and etoposide. Also called ABVE regimen, DBVE, and DBVE regimen.

**ABVE regimen :** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, and etoposide. Also called ABVE, DBVE, and DBVE regimen. OR A regimen containing doxorubicin hydrochloride, bleomycin sulfate, vincristine sulfate and etoposide used in combination with radiation therapy for the treatment of low-risk, childhood Hodgkin lymphoma.

**ABVE-PC:** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, etoposide, prednisone, and cyclophosphamide. Also called ABVE-PC regimen, DBVE-PC, and DBVE-PC regimen.

**ABVE-PC regimen :** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, etoposide, prednisone, and cyclophosphamide. Also called ABVE-PC, DBVE-PC, and DBVE-PC regimen. OR A regimen consisting of doxorubicin, bleomycin, vincristine, etoposide, prednisone and cyclophosphamide, given in combination with radiation therapy and used for the treatment of high-risk, childhood Hodgkin's lymphoma.

**ABX-EGF:** A human monoclonal antibody that is being used to treat colorectal cancer that has spread to other parts of the body. It is used in patients whose disease has not gotten better during or after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. ABX-EGF

binds to the epidermal growth factor receptor (EGFR) and may block tumor cell growth. Also called panitumumab and Vectibix.

**abyssal fan:** a fan-shaped accumulation of sediment that forms at the mouth of submarine canyons.

**abyssal plain:** a very flat expanse of horizontally deposited sediment that accumulates on the ocean floor at the base of a continental rise.

**AC:** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer, including breast cancer that has spread or come back. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide. Also called AC regimen.

**AC regimen :** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer, including breast cancer that has spread or come back. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide. Also called AC. OR A chemotherapy regimen consisting of doxorubicin hydrochloride (Adriamycin) and cyclophosphamide used in the adjuvant setting for the primary treatment of breast cancer. This regimen is also used for the treatment of recurrent and metastatic breast cancer.

**AC-T:** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol). Also called AC-T regimen and AC-Taxol regimen.

**AC-T regimen :** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol). Also called AC-T and AC-Taxol regimen. OR A chemotherapy regimen consisting of doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by paclitaxel (Taxol), administered on either a dose-dense or sequential schedule and used as an adjuvant treatment for breast cancer.

**AC-T-T:** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol) and trastuzumab (Herceptin). Also called AC-T-T regimen, AC-TH regimen, and sequential AC/Taxol-Trastuzumab regimen.

**AC-T-T regimen :** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol) and trastuzumab (Herceptin). Also called AC-T-T, AC-TH regimen, and sequential AC/Taxol-Trastuzumab regimen.

**AC-Taxol regimen :** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol). Also called AC-T and AC-T regimen.

**AC-TH regimen :** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol) and trastuzumab (Herceptin). Also called AC-T-T, AC-T-T regimen, and sequential AC/Taxol-Trastuzumab regimen.

**acadesine:** A 5-aminoimidazole-4-carboxamide (AICA) riboside, a purine nucleoside analog, and a nucleotide biosynthesis precursor with B cell proapoptotic activity. Following cellular uptake, acadesine is phosphorylated to AICA ribotide (ZMP), which mimics 5'-adenosine monophosphate (AMP). Both AMP-activated protein kinase (AMPK) and AMPK kinase (AMPKK) are activated by ZMP, which appears to be necessary for the induction of apoptosis. Acadesine-induced apoptosis also appears to require cytochrome c release from mitochondria and caspase activation and is p53-independent. However, the exact mechanism of acadesine-induced apoptosis is unknown. T cells are significantly less susceptible than B cells to acadesine-induced apoptosis. AMPK regulates several cellular systems including the cellular uptake of glucose, the beta-oxidation of fatty acids, protein synthesis, and the biogenesis of glucose transporter 4 (GLUT4) and mitochondria.

**acai berry juice:** A juice product obtained from the fruit of the acai palm tree (*Euterpe oleracea*) with anti-inflammatory, antioxidant and potential chemopreventive activities. Besides high amounts of vitamins, minerals and fatty acids, acai berry is rich in phytonutrients such as anthocyanins and flavones which are potent scavengers of reactive oxygen species. The fruit also contains high amounts of the flavone velutin which exhibits potent anti-inflammatory properties. Velutin is able to inhibit the degradation of the inhibitor of nuclear factor kappa-B (NF-kB), thereby blocking the activation of NF-kB, as well as inhibiting phosphorylation of mitogen-

activated protein kinase p38 and JNK. Inhibition of these processes results in suppression of the production of proinflammatory cytokines, such as tumor necrosis factor alpha and interleukin 6.

**acalabrutinib:** An orally available inhibitor of Bruton's tyrosine kinase (BTK) with potential antineoplastic activity. Upon administration, acalabrutinib inhibits the activity of BTK and prevents the activation of the B-cell antigen receptor (BCR) signaling pathway. This prevents both B-cell activation and BTK-mediated activation of downstream survival pathways. This leads to an inhibition of the growth of malignant B cells that overexpress BTK. BTK, a member of the src-related BTK/Tec family of cytoplasmic tyrosine kinases, is overexpressed in B-cell malignancies; it plays an important role in B lymphocyte development, activation, signaling, proliferation and survival.

**ACAPHA :** A mixture of six herbs that has been used in China to prevent and treat diseases such as lung and esophageal cancers. It is being studied in the United States and Canada in the prevention of lung cancer in people who used to smoke.

**acarbose:** A pseudotetrasaccharide and inhibitor of alpha-glucosidase and pancreatic alpha-amylase with antihyperglycemic activity. Acarbose binds to and inhibits alpha-glucosidase, an enteric enzyme found in the brush border of the small intestines that hydrolyzes oligosaccharides and disaccharides into glucose and other monosaccharides. This prevents the breakdown of larger carbohydrates into glucose and decreases the rise in postprandial blood glucose levels. In addition, acarbose inhibits pancreatic alpha-amylase which hydrolyzes complex starches to oligosaccharides in the small intestines.

**Accelerated Life Test:** Any set of test conditions designed to reproduce, in a short time, the deteriorating effect obtained under normal service conditions

**accelerated partial-breast irradiation :** A type of radiation therapy given only to the part of the breast that has cancer in it. Accelerated partial-breast irradiation gives a higher dose over a shorter time than is given in standard whole-breast radiation therapy. Accelerated partial-breast irradiation may be given using internal or external sources of radiation. Also called partial-breast irradiation.

**accelerated phase chronic myelogenous leukemia :** A phase of chronic myelogenous leukemia in which the disease is progressing. In this phase, 10% to 19% of the cells in the blood and bone marrow are blast cells (immature blood cells).

**accelerated radiation therapy :** Radiation treatment in which the total dose of radiation is given over a shorter period of time (fewer days) compared to standard radiation therapy.

**Accelerated stability tests:** A series of tests using high temperatures and/or humidities over the course of several months. These data are used to estimate the expiration date of the drug product.

**Accelerated weathering:** Laboratory or field tests intended to simulate natural outdoor weathering in an intensified or accelerated degree. There is no generally accepted type of laboratory test and expert opinion does not accept that such artificial tests give a true reflection of natural behaviour.

**accelerated-fraction radiation therapy :** Radiation treatment in which the total dose of radiation is divided into small doses and the treatments are given more than once a day. The total dose of radiation is also given over a shorter period of time (fewer days) compared to standard radiation therapy.

**acceleration:** Measure of how fast velocity is changing, so we can think of it as the change in velocity over change in time. The most common use of acceleration is acceleration due to gravity, which can also appear as the gravitational constant (9.8 m/s<sup>2</sup>).

**accelerator:** 1. A substance that makes vulcanization of rubber occur more quickly or at a lower temperature. 2. A substance that makes crosslinking in a polymer occur more quickly or at a lower temperature, e. g., accelerators are added to Super Glue to make it set up quickly. OR A substance that hastens a reaction, particularly one which speeds up the vulcanization of rubber. Also known as Promoter. Or A substance that speeds up curing or vulcanization of natural/synthetic rubbers

**acceptable daily intake:** This is an estimate of the amount of substance in the food that can be ingested daily over a lifetime by humans without appreciable health risk. The concept of the ADI has been developed principally by WHO and FAO and is relevant to chemicals such as additives to foodstuffs, residues of pesticides and veterinary drugs in foods. ADIs are derived from laboratory toxicity data, and from human experiences of such chemicals when this is available, and incorporate the safety factor.

**acceptable daily intake (pesticide residues):** The acceptable daily intake of a chemical is the daily intake which, during an entire life time, appears to be without appreciable risk to the health of the consumer on the basis of all the known facts at the time when a toxicological assessment is carried out. It is expressed in milligrams of the chemical per kilogram of body weight (Vettorazzi, 1980).

**acceptable daily intake for man (ADI) (food additives):** The acceptable daily intake (ADI) for man, expressed on a body weight basis (mg/kg body weight) is the amount of a food additive that can be taken daily in the diet, even over a lifetime, without risk. It is allocated only to substances for which the available data include either the results of adequate short-term and long-term toxicological investigations, or satisfactory information on the biochemistry and metabolic fate of the compound, or both (Vettorazzi, 1980).

**acceptable daily intake not specified:** An ADI without an explicit indication of the upper limit of intake may be assigned to substances of very low toxicity, especially those that are food constituents or that may be considered as foods or normal metabolites in man. This expression was adopted as a more suitable expression than "ADI not limited", which was previously used. An additive having an "ADI not specified" must meet the criteria of good manufacturing practices. For example, it should have proved technological efficacy and be used at the minimum level of technological efficacy, it should not conceal inferior food quality or adulteration, and it should not create a nutritional imbalance. The above expression means that, on the basis of available data (chemical, biochemical, and toxicological), the total daily intake of the substance arising from its use or uses at levels necessary to achieve the desired effect and from its acceptable background in food, does not represent a hazard to health. For this reason, and for reasons stated in the individual evaluations, the establishment of an acceptable daily intake expressed in mg/kg body weight is not deemed necessary (Vettorazzi, 1980).

**acceptable daily intake not specified (pesticide residues):** An ADI without an explicit indication of the upper limit of intake may be assigned to substances of very low toxicity, especially those that are food constituents or that may be considered as foods or normal metabolites in man. This expression was adopted as a more suitable expression than "ADI

not limited" which was previously used. An additive having an "ADI not specified" must meet the criteria of good manufacturing practices, for example, it should have proved technological efficacy and be used at the minimum level of technological efficacy, it should not conceal inferior food quality or adulteration, and it should not create a nutritional imbalance. The above expression means that, on the basis of available data (chemical, biochemical, and toxicological), the total daily intake of the substance arising from its use or uses at levels necessary to achieve the desired effect and from its acceptable background in food, does not represent a hazard to health. For this reason, and for reasons stated in the individual evaluations, the establishment of an acceptable daily intake expressed in mg/kg body weight is not deemed necessary (Vettorazzi, 1980).

**acceptable level of treatment:** Acceptable daily intakes are usually expressed as milligrams of the substance in question per kilogram of body weight. There are, however, certain food additives that are more appropriately limited in terms of levels of treatment applied (Vettorazzi, 1980).

**acceptable residue:** Acceptable residues in human food that have been established for antibiotics found in foods (Vettorazzi, 1980).

**acceptable risk:** This concept relates to the probability of suffering disease or injury that will be tolerated by an individual, group or society. Acceptability of risk depends on the scientific data, social, economic and political factors, and on the perceived benefits arising from the a chemical or process.

**Acceptable Runner/Cavity Ratio:** Runner systems designed for high pressure drops to minimize material usage and increase frictional heating in the runner.

**acceptor control:** The regulation of the rate of respiration by the availability of ADP as phosphate group acceptor.

**Access hatch:** An airtight door system that preserves the pressure integrity of the containment structure of a nuclear reactor, while allowing access to personnel and equipment.

**accessory pigments:** Visible lightabsorbing pigments (carotenoids, xanthophyll, and phycobilins) in plants and photosynthetic bacteria that complement chlorophylls in trapping energy from sunlight.

**acclimation (acclimatization):** Change that occurs in an organism to allow it to tolerate a new environment.

**Accolate :** A drug used to prevent and treat symptoms of asthma. It blocks substances that cause inflammation in the lungs. It is a type of antiasthmatic agent and a leukotriene receptor antagonist. Also called zafirlukast.

**accreted terrane:** a terrane that appears to have formed in place along a continent's margin through accumulation and orogeny.

**accretionary wedge:** an accumulation of marine sediment, derived from the subducting plate, that builds up at the edge of a subduction zone.

**accumulation:** Successive additions of a substance to a target organism, or organ, or to part of the environment, resulting in an increasing quantity or concentration of the substance in the organism, organ, or environment.

**accumulation (glacial):** All processes, which include snowfall, condensation, avalanching, snow transport by wind, and freezing of liquid water, that add snow or ice to a glacier, floating ice, or snow cover. The term also includes the amount of snow or other solid precipitation added to a glacier or snowfield by these processes.

**Accumulator:** A term used mainly with reference to blow molding equipment which designates an auxiliary ream extruder which is used to provide extremely fast parison delivery. The accumulator cylinder is filled with plasticated melt coming from the extruder between parison deliveries or "shots" and is stored or "accumulated" until the plunger is required to deliver the next parison.

**accuracy:** (i) The closeness of agreement between the "true" value and the measured values (ISO, 1981); (ii) the degree to which a measurement, or an estimate based on measurements, represents the true value of the attribute that is being measured (Last, 1988). OR the closeness of a measured value to the known "true" value of the measurand. OR comparison to an accepted standard. OR Accuracy is the correctness of a single measurement. The accuracy of a measurement is assessed by comparing the measurement with the true or accepted value, based on evidence independent of the measurement. The closeness of an average to a true value is referred to as "trueness".

**Accutane:** (Other name for: isotretinoin)

**ACE inhibitor :** A drug that is used to lower blood pressure. An ACE inhibitor is a type of antihypertensive agent. Also called angiotensin-converting enzyme inhibitor.

**Acelarin:** (Other name for: gemcitabine-phosphoramidate NUC-1031)

**acelular cadaveric dermal matrix:** A human dermis-derived allograft material. Acellular cadaveric dermal matrix (ACDM) is derived from human cadaveric dermis from which the epidermis, all viable cells and major histocompatibility class (MHC) II antigens have been removed to minimize alloimmunogenicity, while the dermal collagen matrix is preserved. ACDM may be placed over wounds to aid as a substitute for skin when necessary such as for surgical reconstruction or for protection against wound exposure and breakdown and wound infection. Check for active clinical trials using this agent.

**acenocoumarol:** A 4-hydroxycoumarin derivative with anticoagulant activity. As a vitamin K antagonist, acenocoumarol inhibits vitamin K epoxide reductase, thereby inhibiting the reduction of vitamin K and the availability of vitamin K<sub>1</sub>. This prevents gamma carboxylation of glutamic acid residues near the N-terminals of the vitamin K-dependent clotting factors, including factor II, VII, IX, and X and anticoagulant proteins C and S. This prevents their activity and thus thrombin formation. Compared to other coumarin derivatives, acenocoumarol has a short half-life.

**Aceon:** (Other name for: perindopril erbumine)

**ACES II:** An ab initio software package that emphasizes coupled-cluster methods (3,4).

**Acetal:** The product formed by the successive condensation of two alcohols with a single aldehyde. It contains two ether-linked oxygens attached to a central carbon atom.

**Acetal (POM):** Acetal is a highly crystalline thermoplastic engineering resin that offers high mechanical properties and resists many chemicals. There are two basic types of Acetal resins: homopolymer and copolymer. Acetal is known for its high strength, creep resistance, resilience, surface hardness and lubricity, toughness, and excellent solvent and petrol resistance. Additionally, it absorbs little water. Acetals can be processed by conventional extrusion and injection moulding techniques. Applications: Acetals are widely used for plastic pipes

and tubes in plumbing and irrigation because they resist scale build-up, and have excellent thread strength. Furthermore this material is used for moulded and machined rollers, bearings, gears, conveyor chains, and housings. Automotive applications include, door handles, ventilation and cooling system parts, fuel system components, and many more.

**Acetaldehyde:** Oops, I should have used the systematic name, ethanal! This is a good example of a case where the IUPAC system may be logical, but can easily engender no end of confusion.

**Acetaldehyde or ethanal:** Acetaldehyde (or ethanal) is a two-carbon aldehyde used as an intermediate in the production of acetic acid. Acetaldehyde is produced by direct oxidation of ethylene. Acetic acid used to be the major derivative for acetaldehyde, but except in China, this is no longer the case. Major end-uses include ethyl acetate, isobutyl acetate, synthetic pyridine derivatives and peracetic acid.

**acetaminophen:** A p-aminophenol derivative with analgesic and antipyretic activities. Although the exact mechanism through which acetaminophen exert its effects has yet to be fully determined, acetaminophen may inhibit the nitric oxide (NO) pathway mediated by a variety of neurotransmitter receptors including N-methyl-D-aspartate (NMDA) and substance P, resulting in elevation of the pain threshold. The antipyretic activity may result from inhibition of prostaglandin synthesis and release in the central nervous system (CNS) and prostaglandin-mediated effects on the heat-regulating center in the anterior hypothalamus. or A drug that reduces pain and fever (but not inflammation). It belongs to the family of drugs called analgesics.

**acetate:** ( $\text{CH}_3\text{COO}^-$ ,  $\text{C}_2\text{H}_3\text{O}_2^-$ ) acetate ion. 1. an ion formed by removing the acidic hydrogen of acetic acid,  $\text{HC}_2\text{H}_3\text{O}_2$ . 2. a compound derived by replacing the acidic hydrogen in acetic acid. 3. A fiber made of cellulose acetate. Or A form of acetic acid (an acid found in vinegar).

**Acetic Acid:** Acetic acid is a colourless liquid traditionally made by fermentation (vinegar is mainly acetic acid). It is a raw material for several key petrochemical intermediates and products, including vinyl acetate monomer (VAM) for coatings and adhesives, purified terephthalic acid (PTA) for polyester production, acetate esters, cellulose acetate, acetic anhydride and monochloroacetic acid (MCA). Acetic acid is now mainly produced via methanol carbonylation, but ethane, ethylene or acetaldehyde

oxidation processes are also commercially employed. or A synthetic carboxylic acid with antibacterial and antifungal properties. Although its mechanism of action is not fully known, undissociated acetic acid may enhance lipid solubility allowing increased fatty acid accumulation on the cell membrane or in other cell wall structures. Acetic acid, as a weak acid, can inhibit carbohydrate metabolism resulting in subsequent death of the organism. OR An acid found in vinegar. Acetic acid is also used to dissolve substances needed to make some medicines and other products, such as plastics.

**acetohexamide:** An intermediate-acting, first-generation sulfonylurea with hypoglycemic activity. Acetohexamide is metabolized in the liver to its active metabolite hydroxyhexamide.

**Acetone:** Acetone is a commodity solvent commonly produced as a co-product during cumene oxidation for phenol, which consumes benzene and propylene, and for this reason on-purpose acetone production has declined. On purpose production consumes either propylene or isopropanol. Acetone is used in the production of bisphenol A and methyl methacrylate, intermediates to PMMA and Polycarbonate engineering resins, respectively, along with methyl isobutyl ketone (MIBK) and others. It also has major use as a solvent in industrial and household applications, e.g., paints and ink. Acetone is produced in all regions. or A chemical substance found naturally in small amounts in plants, trees, volcanoes, and forest fires. Acetone is also made by the body when fats are broken down. It is also found in tobacco smoke, car exhaust, and trash landfills. In industry, acetone is used in some plastics, fibers, medicines, household cleaners, glues, and nail polish removers. Being exposed to high levels of acetone may irritate the skin, eyes, nose, throat, and lungs. It can cause headaches, nausea, vomiting, dizziness, confusion, loss of consciousness, and other health problems.

**Acetyl CoA:** Acetyl-coenzyme A, a high-energy ester of acetic acid that is important both in the tricarboxylic acid cycle and in fatty acid biosynthesis.

**acetyl group :** A small molecule made of two carbon, three hydrogen, and one oxygen atoms. Acetyl groups are added to or removed from other molecules and may affect how the molecules act in the body.

**acetyl-L-carnitine :** A form of the natural substance carnitine that is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is made in muscle and liver tissue and is found in certain foods,

such as meat, poultry, fish, and some dairy products. It is used by many cells in the body to make energy from fat. Also called acetyl-L-carnitine hydrochloride and ALCAR.

**acetyl-L-carnitine hydrochloride :** A form of the natural substance carnitine that is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is made in muscle and liver tissue and is found in certain foods, such as meat, poultry, fish, and some dairy products. It is used by many cells in the body to make energy from fat. Also called acetyl-L-carnitine and ALCAR.

**acetylation :** A chemical reaction in which a small molecule called an acetyl group is added to other molecules. Acetylation of proteins may affect how they act in the body.

**acetylcholine :** A chemical made by some types of nerve cells. It is used to send messages to other cells, including other nerve cells, muscle cells, and gland cells. It is released from the nerve ending and carries signals to cells on the other side of a synapse (space between nerve cells and other cells). Acetylcholine helps control memory and the action of certain muscles. It is a type of neurotransmitter.

**acetylcysteine:** A synthetic N-acetyl derivative of the endogenous amino acid L-cysteine, a precursor of the antioxidant enzyme glutathione. Acetylcysteine regenerates liver stores of glutathione. This agent also reduces disulfide bonds in mucoproteins, resulting in liquification of mucus. Some evidence suggests that acetylcysteine may exert an anti-apoptotic effect due to its antioxidant activity, possibly preventing cancer cell development or growth. In addition, acetylcysteine has inhibited viral stimulation by reactive oxygen intermediates, thereby producing antiviral activity in HIV patients. OR A drug usually used to reduce the thickness of mucus and ease its removal. It is also used to reverse the toxicity of high doses of acetaminophen. Also called N-acetyl-L-cysteine and N-acetylcysteine.

**acetylglutamate:** N An allosteric activator of mammalian carbamoyl phosphate synthetase, which catalyses the synthesis of urea.

**Acetyls:** The Acetyls family are those chemicals derived from acetic acid, the simplest carboxylic acid.

**acetylsalicylic acid:** An orally administered non-steroidal antiinflammatory agent. Acetylsalicylic acid binds to and acetylates serine

residues in cyclooxygenases, resulting in decreased synthesis of prostaglandin, platelet aggregation, and inflammation. This agent exhibits analgesic, antipyretic, and anticoagulant properties.

**acetylsalicylic acid/simvastatin/atenolol/ramipril/thiazide capsule:** An orally bioavailable combination pill containing aspirin, simvastatin, atenolol, ramipril and thiazide with preventive activity against cardiovascular disease (CVD). Aspirin is a cyclooxygenase inhibitor with antiplatelet, analgesic, antipyretic and anti-inflammatory activities; simvastatin is a statin with a cholesterol lowering effect; and the beta-blocker atenolol as well as the ACE inhibitor ramipril and the thiazide diuretic all have blood pressure lowering activity. Upon oral administration of aspirin/simvastatin/atenolol/ramipril/thiazide capsule, the combined effects of the active ingredients in this formulation lower the risk of CVD.

**ACF:** Clusters of abnormal tube-like glands in the lining of the colon and rectum. ACF form before colorectal polyps and are one of the earliest changes that can be seen in the colon that may lead to cancer. Also called aberrant crypt foci.

**achiral:** Describes any molecule or object that is superimposable upon its mirror image.

**achlorhydria :** A lack of hydrochloric acid in the digestive juices in the stomach. Hydrochloric acid helps digest food.

**Achromycin:** (Other name for: tetracycline hydrochloride)

**Acicular Habit:** An acicular habit describes the shape of a large crystal that looks like spikes coming out from one point. Think about those koosh balls for this example.

**Acid:** 1. a compound which releases hydrogen ions ( $H^+$ ) in solution (Arrhenius). 2. a compound containing detachable hydrogen ions (Bronsted-Lowry). 3. a compound that can accept a pair of electrons from a base (Lewis)..OR There are three definitions - Arrhenius, Bronsted, and Lewis Acids. In the Lewis conception, which is the most general and useful, an acid is essentially any compound that needs electrons, and a base is basically any compound that wants to give them away. OR An acid is a substance that forms a solution with a pH value of less than 7. Acidic solutions contain an excess of hydrogen ions,  $H^+(aq)$ . OR A compound that produces hydrogen ions in water solution. OR Compound that gives off  $H^+$  ions in solution. OR any substance capable of giving up a proton; a

substance that ionizes in solution to give the positive ion of the solvent; a solution with a pH measurement less than 7. OR A substance that dissolves in water with the formation of hydrogen ions, contains hydrogen which may be replaced by metals to form salt, and/or is corrosive.

**acid :** A chemical that gives off hydrogen ions in water and forms salts by combining with certain metals. Acids have a sour taste and turn certain dyes red. Some acids made by the body, such as gastric acid, can help organs work the way they should. An example of an acid is hydrochloric acid. Acidity is measured on a scale called the pH scale. On this scale, a value of 7 is neutral, and a pH value of less than 7 to 0 shows increasing acidity.

**Acid anhydride:** Take two carboxylic acid molecules - for example, salicylic acid - and remove water to give a molecule containing a  $-(C=O)-O-(C=O)-$  link - this molecule will be an acid anhydride. For example: ethanoic anhydride: OR Nonmetallic oxides or organic compounds that react with water to form acids. For example,  $SO_2$ ,  $CO_2$ ,  $P_2O_5$ , and  $SO_3$  are the acid anhydrides of sulfurous, carbonic, phosphoric, and sulfuric acids, respectively. Acetic anhydride  $(CH_3CO)_2O$  reacts with water to form acetic acid.

**Acid chloride:** Take a carboxylic acid and replace the OH group with a Chlorine atom. What you now have is an acid chloride. Acid chlorides react readily with water to regenerate carboxylic acid + HCl. For example, ethanoyl chloride:

**acid dissociation constant:** The equilibrium constant for the dissociation of an acid into a hydrogen ion and an anion. For example, the acid dissociation constant for acetic acid is the equilibrium constant for  $HC_2H_3O_2(aq) \rightleftharpoons H^+(aq) + C_2H_3O_2^-(aq)$ , which is  $K_a = \frac{[H^+][C_2H_3O_2^-]}{[HC_2H_3O_2]}$ .

**acid error:** A systematic error that occurs when glass pH electrodes are used in strongly acidic solutions. Glass electrodes give pH readings that are consistently too high in these solutions.

**acid halide:** acid chloride; acyl halide; acyl chloride. Compounds containing a carbonyl group bound to a halogen atom.

**Acid rain:** All rainfall is slightly acidic because of the dissolved carbon dioxide. The term acid rain refers to rain that is extra acidic because of large amounts of dissolved gases such as nitrogen oxides and sulfur oxides. These can make nitric acid and sulfuric acid as well as many others. OR an

environmentally harmful acidic rain that results from rain mixing with chemical pollutants in the atmosphere. OR The deposition of acids (sulphuric and nitric) in rain. An environmental problem resulting from certain industrial activities and the burning of petroleum based fuels (traffic exhaust gases). OR Acid rain is so called because it has a pH value below 5 due to acidic pollutant gases in the atmosphere.

**Acid Resistance:** Withstands the action of acid

**acid test:** tests a mineral or rock for calcite or calcium in its composition.

**acid-base balance :** In medicine, the state of having the right amount of acid and base in the blood and other body fluids. Keeping a normal acid-base balance is important for the body to work the way it should. Also called acid-base equilibrium.

**acid-base equilibrium :** In medicine, the state of having the right amount of acid and base in the blood and other body fluids. Keeping a normal acid-base equilibrium is important for the body to work the way it should. Also called acid-base balance.

**acid-base indicator:** A weak acid that has acid and base forms with sharply different colors. Changes in pH around the acid's pKa are "indicated" by color changes.

**acid-base reaction:** a neutralization reaction in which the products are a salt and water.

**acidic:** Describes a solution with a high concentration of H<sup>+</sup> ions. OR Forming or containing an acid.

**acidic solution:** A solution in which the hydrogen ion activity is higher than that of the hydroxide ion, when the solvent is water.

**acidification:** The process of increasing the hydrogen ion concentration. Or The process of making or becoming an acid. An acid is a substance that gives off hydrogen ions in water and forms salts by combining with certain metals.

**Acidity:** the quantitative capacity of aqueous solutions to react with hydroxyl ions. It is measured by titration with a standard solution of base to a specified end point. OR The capacity of water or wastewater to neutralize bases. Acidity is expressed in milligrams per liter of equivalent calcium carbonate. Acidity is not the same as pH.

**acidity :** Describes the amount of acid in a substance. An acid is a chemical that gives off hydrogen ions in water and forms salts by combining with certain metals. Acidity is measured on a scale called the pH scale. On this scale, a pH value of 7 is neutral, and a pH value of less than 7 to 0 shows increasing acidity.

**acidity profile:** The acid concentration in ice core layers as a function of depth as determined from electrical measurements. The magnitudes of some volcanic eruptions in the Northern Hemisphere have been estimated from the acidity of annual layers in ice cores taken in Greenland. This methodology is sometimes referred to as acidity signal or acidity record.

**acidosis:** A metabolic condition in which the capacity of the body to buffer H<sup>+</sup> is diminished; usually accompanied by decreased blood pH.

**Acids:** one of a class of substances compounds of hydrogen and one of more other element, capable of uniting with a base to form a salt, and in aqueous solution, turning blue litmus paper red.

**acidulant:** A substance added to food or beverages to lower pH and to impart a tart, acid taste. Phosphoric acid is an acidulant added to cola drinks.

**Aciphex:** (Other name for: rabeprazole sodium)

**ACIS:** A standard computer file format for exchanging CAD data, typically from AutoCAD programs. ACIS is an acronym that originally stood for “Andy, Charles and Ian's System.”

**acitretin:** An orally-active metabolite of the synthetic aromatic retinoic acid agent etretinate with potential antineoplastic, chemopreventive, anti-psoratic, and embryotoxic properties. Acitretin activates nuclear retinoic acid receptors (RAR), resulting in induction of cell differentiation, inhibition of cell proliferation, and inhibition of tissue infiltration by inflammatory cells. This agent may also inhibit tumor angiogenesis. OR A substance that is used in the prevention of cancer and in the treatment of psoriasis. It belongs to the family of drugs called retinoids.

**acivicin:** A modified amino acid and structural analog of glutamine. Acivicin inhibits glutamine amidotransferases in the purine and pyrimidine biosynthetic pathways, thereby inhibiting tumor growth in cell lines dependent on glutamine metabolism.

**aclarubicin:** An oligosaccharide anthracycline antineoplastic antibiotic isolated from the bacterium *Streptomyces galilaeus*. Aclarubicin

intercalates into DNA and interacts with topoisomerases I and II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. Aclarubicin is antagonistic to other agents that inhibit topoisomerase II, such as etoposide, teniposide and amsacrine. This agent is less cardiotoxic than doxorubicin and daunorubicin.

**ACN53:** A substance that has been studied in the treatment of some types of cancer. ACN53 is a weakened adenovirus that carries the p53 gene into tumor cells, causing them to die. It is a type of gene therapy. Also called rAd/p53, recombinant adenovirus-p53, and SCH-58500.

**acne :** A disorder of the skin in which oil glands and hair glands become inflamed.

**Acnestrol:** (Other name for: diethylstilbestrol)

**ACNU 50:** (Other name for: nimustine)

**acodazole:** A synthetic imidazoquinoline with antineoplastic activity. Acodazole intercalates into DNA, resulting in disruption of DNA replication. Use of this agent has been associated with significant cardiotoxicity.

**acolbifene hydrochloride :** A substance being studied in the prevention of breast cancer in women at high risk of breast cancer. Acolbifene hydrochloride binds to estrogen receptors in the body and blocks the effects of estrogen in the breast. It is a type of selective estrogen receptor modulator (SERM).

**acoustic :** Having to do with sound or hearing.

**acoustic coupling fluid:** A brain mimicking fluid with an attenuation coefficient similar to that found in the adult human brain, which can potentially improve the quality of an image acquired during intraoperative ultrasonography. Upon administration into the resection cavity during surgical removal of a brain tumor, the acoustic coupling fluid may both increase the quality of the ultrasound image and improve the visualization of the tumor. This may facilitate the surgical removal of residual tumor while sparing normal, healthy brain tissue. Check for active clinical trials using this agent.

**acoustic neurofibromatosis :** A genetic condition in which tumors form on the nerves of the inner ear and cause loss of hearing and balance. Tumors may also occur in the brain and on nerves in the skull and spinal

cord, and may cause loss of speech, eye movement, and the ability to swallow. Also called neurofibromatosis type 2 and NF2.

**ACPF:** Averaged coupled-pair functional. Pretty high level of multi-reference electron correlation, requires skill to use.

**acquired immunodeficiency syndrome :** A disease caused by the human immunodeficiency virus (HIV). People with acquired immunodeficiency syndrome are at an increased risk for developing certain cancers and for infections that usually occur only in individuals with a weak immune system. Also called AIDS.

**acquired pure red cell aplasia :** A rare disorder in which the bone marrow makes almost no red blood cells. It may be caused by infection or by certain drugs. Patients with this disorder may also have a thymoma (a tumor of the thymus) or an autoimmune condition such as lupus erythematosus or rheumatoid arthritis.

**acre-foot:** the volume of water, 43,560 cubic feet, that will cover an area of one acre to a depth of one foot; a term used in sewage treatment in measuring the volume of material in a trickling filter.

**acridine carboxamide:** A tricyclic acridine-based (or carboxamide-based) drug with dual topoisomerase inhibitor and potential antineoplastic activities. Acridine carboxamide inhibits both topoisomerases I and II and intercalates into DNA, resulting in DNA damage, the disruption of DNA repair and replication, the inhibition of RNA and protein synthesis, and cell death. or A substance being studied in the treatment of cancer. It is a type of topoisomerase inhibitor. Also called DACA.

**acrochordon :** A small, benign skin growth that may have a stalk (peduncle). Acrochordons most commonly appear on the neck, axillary, groin, and inframammary regions. Also called skin tag.

**acromegaly :** A condition in which the pituitary gland makes too much growth hormone after normal growth of the skeleton is finished. This causes the bones of the hands, feet, head, and face to grow larger than normal. Acromegaly can be caused by a pituitary gland tumor.

**Acrylamide :** Acrylamide is a monomer used primarily as a building block in the production of synthetic water soluble polymers.

**Acrylate resins:** a class of thermoplastic resins produced by polymerization of acrylic acids derivatives.

**Acrylic:** A polymer for which resistance to air and hot oil at temperatures above 30 degrees Fahrenheit is required

**Acrylic:** A waterborne latex used in emulsion paint and universally accepted. A synthetic polymer used in high performance latex or water-based paints as the paint's binder acrylic resins enable the coating to last longer and retain its colour. OR A synthetic resin used in high-performance water-based coatings. A coating in which the binder contains acrylic resins.

**Acrylic Acid:** Acrylic acid is used in the production of acrylate esters, superabsorbent polymers, detergents and flocculants. Acrylate esters are mostly used in coatings, adhesives, and elastomers applications, while superabsorbents are used in diapers etc, and most other derivatives are performance chemicals for cleaning or water treatment, also firefighting. Acrylic Acid is a propylene derivative which is produced by propylene vapor-phase oxidation. Acetylene based production of acrylic acid has now ceased, and new processes based on propane are being developed. Acrylic acid tends to be produced close to major consumers as melting of transportable solid can be hazardous. Alternative names for acrylic acid include: acroleic acid, ethylene carboxylic acid, propenoic acid.

**Acrylic emulsions:** These are prepared from acrylic derivatives and normally show very good toughness and adhesion even under wet conditions as well as very good alkali resistance.

**Acrylic Resin .:** A synthetic resin prepared from acrylic acid or from a derivative of acrylic acid,

**Acrylonitril(e) :** Acrylonitrile is a monomer used as a building block in the production of synthetic polymers and as raw material in production of acrylamide.

**Acrylonitrile:** A monomer with the structure (CH<sub>2</sub>:CHCN). It is most useful in copolymers. Its copolymer with butadiene is nitrile rubber, and several copolymers with styrene exist that are tougher than polystyrene. It is also used as a synthetic fiber and as a chemical intermediate.

**Acrylonitrile:** Acrylonitrile is used as an intermediate in the production of acrylic fibers as well as acrylonitrile butadiene styrene (ABS) and SAN resins, and as monomer for polyacrylonitrile. Acrylonitrile is a propylene derivative which is produced by the reaction of propylene and ammonia. Acrylonitrile is produced in all regions, although most new projects are either located in Asia where demand growth is strongest, or in the Middle

East where there is increasing feedstock availability. OR A common monomer used in free-radical polymerisation. Here is a picture: Acrylonitrile is one of the more toxic monomers, and is a proven carcinogen; one of its main applications is in the production of carbon fibres.

**acrylonitrile** : A substance used to make plastics, rubber, and textiles. Being exposed to acrylonitrile may increase the risk of developing certain cancers, such as lung, brain, or prostate cancer.

**Acrylonitrile butadiene styrene (ABS):** Acrylonitrile butadiene styrene (ABS) is a copolymer made from polymerizing styrene and acrylonitrile in the presence of polybutadiene. ABS is stronger than polystyrene, and is used to make light, rigid products such as pipes and toys. It is a high volume engineering polymer that exhibits good strength and high gloss properties and is used widely in the production of electronics and automotive applications.

**Acrylonitrile-Butadiene-Styrene (ABS):** A rigid thermoplastic polymer common in piping applications. It is the counterpart to off-white PVC pipe; ABS pipes are black. ABS is very durable but breaks down when exposed to acetone. Or Acrylonitrile and styrene liquids and butadiene gas are polymerized together in a variety of ratios to produce the family of ABS resins.

**Actemra:** (Other name for: tocilizumab)

**ACTH:** A hormone made in the pituitary gland. ACTH acts on the outer part of the adrenal gland to control its release of corticosteroid hormones. More ACTH is made during times of stress. Also called adrenocorticotropic hormone and corticotropin.

**ActHIB:** (Other name for: Haemophilus influenzae b vaccine)

**Actigall:** (Other name for: ursodiol)

**Actimmune:** (Other name for: recombinant interferon gamma)

**Actin:** A protein found in combination with myosin in muscle and also found as filaments constituting an important part of the cytoskeleton in many eukaryotic cells. OR A protein making up the thin filaments of muscle; also an important component. of the cytoskeleton of many eukaryotic cells.

**Actinex :** A drug put on the skin to treat growths caused by sun exposure. A form of Actinex that is taken by mouth is being studied in the treatment of prostate cancer. Actinex is an antioxidant, and it may block certain enzymes needed for tumor growth. Also called masoprocol, NDGA, and nordihydroguaiaretic acid.

**actinic keratosis :** A thick, scaly patch of skin that may become cancer. It usually forms on areas exposed to the sun, such as the face, scalp, back of the hands, or chest. It is most common in people with fair skin. Also called senile keratosis and solar keratosis.

**actinide:** Elements 89-102 are called actinides. Electrons added during the Aufbau construction of actinide atoms go into the 5f subshell. Actinides are unstable and undergo radioactive decay. The most common actinides on Earth are uranium and thorium.

**Actinide Series:** The actinide series is one of two series of inner transition elements. Elements 89 through 103 are a part of this series. The elements include uranium, berkelium, and nobelium.

**Actinium:** Symbol:"Ac" Atomic Number:"89" Atomic Mass: 227.03amu. It is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. Actinium is the first element of the actinide series. It is used as a source of neutrons in experiments that involve radioactivity. You will not find the element in regular use anywhere in the natural world.

**actinium Ac 225 lintuzumab:** A radioimmunoconjugate consisting of the humanized monoclonal antibody lintuzumab conjugated to the alpha-emitting radioisotope actinium Ac 225 with potential antineoplastic activity. The monoclonal antibody moiety of actinium Ac 225 lintuzumab specifically binds to the cell surface antigen CD33 antigen, delivering a cytotoxic dose of alpha radiation to cells expressing CD33. CD33 is a cell surface antigen expressed on normal non-pluripotent hematopoietic stem cells and overexpressed on myeloid leukemia cells.

**Actinomycin D:** An antibiotic that binds to DNA and inhibits RNA chain elongation.

**actinomycin D :** A drug used to treat Ewing sarcoma, gestational trophoblastic tumor, Wilms tumor, and certain types of testicular cancer. It is also used to treat rhabdomyosarcoma in children. It is being studied in the treatment of other types of cancer. Actinomycin D comes from the

bacterium *Streptomyces parvulus*. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called Cosmegen and dactinomycin.

**action level:** (i) The level of a pollutant at which specified emergency countermeasures, such as the seizure and destruction of contaminated materials, evacuation of the local population or closing down the sources of pollution, are to be taken (UN, 1972); (ii) the level at which some kind of preventive action (not necessarily of an emergency nature) is to be taken; (iii) a level of exposure of workers to airborne harmful substances in workrooms to be determined by the competent authority; it is distinctly below the exposure limit and consequently such exposures below the action level do not usually necessitate application of all the preventive measures, especially of a medical nature, foreseen for exposures exceeding the action level. This level may lie between a third and a half of the exposure limit (ILO, 1977).

**action study :** In cancer prevention clinical trials, a study that focuses on finding out whether actions people take can prevent cancer.

**Actiq:** (Other name for: fentanyl citrate)

**Activase :** A form of tissue plasminogen activator that is made in the laboratory. It helps dissolve blood clots and is used to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. It is a type of systemic thrombolytic agent. Also called Alteplase, r-tPA, and recombinant tissue plasminogen activator.

**activate :** In biology, to stimulate a cell in a resting state to become active. This causes biochemical and functional changes in the activated cell.

**activated charcoal:** A porous form of carbon that acts as a powerful adsorbent, used to decolorize liquids, recover solvents, and remove toxins from water and air.

**activated complex:** molecules at an unstable intermediate stage in a reaction. OR The highest free energy state of a complex in going from reactants to products. OR An intermediate structure formed in the conversion of reactants to products. The activated complex is the structure at the maximum energy point along the reaction path; the activation energy is the difference between the energies of the activated complex and the reactants.

**activated marrow infiltrating lymphocytes:** A preparation of cells, which consists of autologous marrow infiltrating lymphocytes (MILs), that are manipulated in vitro, with potential antitumor and immune stimulating activities. MILs are harvested from autologous bone marrow from multiple myeloma patients and, in vitro, are exposed to and activated by anti-CD3/anti-CD28 monoclonal antibodies covalently attached to super-paramagnetic microbeads. After removal of the beads and expansion of the cells in culture, the activated MILs (aMILs) are re-introduced into the patient. The aMILs possess enhanced myeloma specificity, and are able to infiltrate the tumor microenvironment and initiate tumor cell lysis. CD3 and CD28, co-stimulatory molecules expressed on the surface of T-lymphocytes, play a key role in the activation of T-cells.

**Activated sludge:** removes organic matter from sewage by saturating it with air and microbial organisms. OR Sludge particles produced in raw or settled wastewater (primary effluent) by the growth of organisms (including zooglyphic bacteria) in aeration tanks in the presence of dissolved oxygen. The term "activated" comes from the fact that the particles are teeming with fungi, bacteria, and protozoa. Activated sludge is different from primary sludge in that the sludge particles contain many living organisms which can feed on the incoming wastewater.

**activating group:** a group that increases the rate of electrophilic aromatic substitution when bonded to an aromatic ring.

**activation:** treatment of a substance by heat, radiation, or activating reagent to produce a more complete or rapid chemical or physical change. OR The process of making a radioisotope by bombarding a stable element with neutrons or protons.

**Activation Energy:** When reactions proceed, a certain amount of energy is needed for the whole process to begin. The energy needed to get the reaction started (get it over the hump) is called the activation energy. The energy required to start a chemical reaction. If a reaction is not spontaneous, it requires a specific amount of energy to proceed. That required energy is the activation energy. Enzymes and catalysts can decrease the activation energy of a reaction. OR is the minimum energy required to start a chemical reaction OR The activation energy is the minimum amount of energy required for reactants to form products in a chemical reaction. OR the energy that must be supplied to chemicals to initiate a reaction; the

difference in potential energy between the ground state and the transition state of molecules. Molecules of reactants must have this amount of energy to proceed to the product state. OR The minimum energy required to convert reactants into products; the difference between the energies of the activated complex and the reactants.

**Activation energy (Arrhenius activation energy):** A physicochemical quantity that represents the barrier for a chemical reaction.

**activation energy ( $\Delta G^\circ$ ):** The amount of energy (in joules) required to convert all the molecules in 1 mole of a reacting substance from the ground state to the transition state.

**activator:** (1) A DNA-binding protein that positively regulates the expression of one or more genes; that is, transcription rates increase when an activator is bound to the DNA. (2) A positive modulator of an allosteric enzyme.

**Activator (also accelerator, promotor):** A chemical compound used with a catalyst to permit polymerisation at room temperature.

**Active Centre:** In chain-growth polymerisation, the highly-reactive spot on the growing polymer chain where new monomer is added. The four most common types are a free-radical (atom with an unpaired electron), carbanion (carbon-centred negative ion), carbocation (carbon-centred positive ion) or a metal complex (as in Ziegler-Natta polymerisation).

**active continental margin:** marked by a landward continental shelf, a continental slope that forms a sidewall of an oceanic trench and is much steeper than that of a passive continental margin, and an irregular ocean bottom that may contain volcanic seamounts; an area of earthquake and volcano activity. OR plate boundary where mountains are formed.

**Active fuel length:** The end-to-end dimension of fuel material within a fuel assembly (also known as a "fuel bundle" or "fuel element").

**Active Principle:** The active principle is the compound(s) in the mixture that is responsible for that mixture's biological activity.

**Active site:** the portion of an enzyme that interacts with the substrate. OR The region of an enzyme molecule that contains the substrate binding site and the catalytic site for converting the substrate(s) into product(s). OR A pocket or crevice on an enzyme molecule that fits reactant molecules like a

hand in a glove. The active site lowers the activation energy for reaction.  
OR The region of an enzyme surface that binds the substrate molecule and catalytically transforms it; also known as the catalytic site.

**active surveillance :** A treatment plan that involves closely watching a patient's condition but not giving any treatment unless there are changes in test results that show the condition is getting worse. Active surveillance may be used to avoid or delay the need for treatments such as radiation therapy or surgery, which can cause side effects or other problems. During active surveillance, certain exams and tests are done on a regular schedule. It may be used in the treatment of certain types of cancer, such as prostate cancer, urethral cancer, and intraocular (eye) melanoma. It is a type of expectant management.

**active transport:** the movement of molecules across a membrane from a region of low concentration to a region of high concentration that requires the expenditure of energy (ATP). OR The energy-dependent transport of a substance across a membrane. OR Energy-requiring transport of a solute across a membrane in the direction of increasing concentration.

**active volcano:** volcano that has erupted in recorded history.

**Activella:** (Other name for: estradiol/norethindrone acetate tablet)

**ActiVin:** (Other name for: IH636 grape seed proanthocyanidin extract)

**activin type 2B receptor Fc fusion protein STM 434:** A soluble fusion protein containing the extracellular domain of the activin receptor type 2B (ACVR2B or ActRIIB) fused to a human Fc domain, with potential antineoplastic activity. Upon intravenous administration, STM 434 selectively binds to the growth factor activin A, thereby preventing its binding to and the activation of endogenous ActRIIB. This prevents activin A/ActRIIB-mediated signaling and inhibits the proliferation of activin A-overexpressing tumor cells. Activin A, a member of the transforming growth factor beta (TGF-beta) superfamily, is overexpressed in a variety of cancers and plays a key role in promoting cancer cell proliferation, migration, and survival. Check for active clinical trials using this agent.

**activities of daily living :** The tasks of everyday life. These activities include eating, dressing, getting into or out of a bed or chair, taking a bath or shower, and using the toilet. Instrumental activities of daily living are activities related to independent living and include preparing meals,

managing money, shopping, doing housework, and using a telephone. Also called ADL.

**Activity:** the effective amount of a free ion in solution. The amount and type of other ions in the solution influence the chemical effectiveness of an ion, so that varying the solution composition makes a fixed concentration of a given ion more or less "active". In dilute solutions, ionic activity and concentration are practically identical, but in solutions containing many ions, activity may differ from concentration. Ionic activity, not concentration, determines both the rate and the extent of chemical reactions. OR The rate of disintegration (transformation) or decay of radioactive material per unit time. The units of activity (also known as radioactivity) are the curie (Ci) and the becquerel (Bq). For related information, see Measuring Radiation. OR An effective concentration used in thermodynamic calculations in place of the actual concentration to allow equations developed for ideal solutions to be used to treat real solutions. OR The true thermodynamic activity or potential of a substance, as distinct from its molar concentration.

**Activity coefficient:** a factor, which relates the activity to the concentration of a species in solution, such that:  $A_x = f_x C_x$  (where:  $A_x$  = Activity of the species x;  $f_x$  = Activity coefficient of the species x;  $C_x$  = Concentration of the species x). The activity coefficient is dependent on the ionic strength of the solution (ions of similar size and charge have similar activity coefficients). It becomes progressively lower as the ionic strength increases, due to interionic interactions. The activity coefficient for any ion in solution can be calculated using the DebyeHuckel equation. OR The ratio of activity to concentration;  $a = \gamma c$  where  $a$ ,  $\gamma$ , and  $c$  are the activity, activity coefficient, and concentrations, respectively. Activity coefficients are usually obtained from measurements of the emf of electrochemical cells or the colligative properties of solutions. OR The factor by which the numerical value of the concentration of a solute must be multiplied to give its true thermodynamic activity.

**Actonel:** (Other name for: risedronate sodium)

**Actos :** (Other name for: pioglitazone hydrochloride) OR A drug that is used to treat type 2 diabetes and is being studied in the prevention of head and neck cancer. It may be able to stop leukoplakia (a condition affecting

the mouth ) from developing into cancer. It is a type of thiazolidinedione. Also called pioglitazone.

**Actuation:** to put into mechanical action or motion.

**Actuator:** a device, which uses the signal, from the sensors to perform some action. An example can be an alarm with a smoke detector or a hydraulic valve coupled to a pH electrode.

**acupoint :** A specific spot on the body where an acupuncture needle may be inserted to control pain and other symptoms. Also called acupuncture point.

**acupressure :** The application of pressure or localized massage to specific sites on the body to control symptoms such as pain or nausea. It is a type of complementary and alternative medicine.

**acupuncture :** The technique of inserting thin needles through the skin at specific points on the body to control pain and other symptoms. It is a type of complementary and alternative medicine.

**acupuncture needle :** A stainless steel needle that is slightly thicker than a human hair. Acupuncture needles are inserted through the skin at specific points on the body to control pain and other symptoms.

**acupuncture point :** A specific spot on the body where an acupuncture needle may be inserted to control pain and other symptoms. Also called acupoint.

**acupuncture point injection :** A procedure in which drugs, vitamins, herbal extracts, or other fluids are injected into the body at an acupuncture point using a syringe and needle.

**acupuncture-like transcutaneous electrical nerve stimulation :** A procedure in which mild electric currents are applied to certain acupuncture points (spots on the body where an acupuncture needle may be inserted to control pain and other symptoms) on the skin. It is being studied in the treatment of dry mouth caused by radiation therapy for cancer. Also called ALTENS.

**acupuncturist :** A person trained in acupuncture (therapy that uses thin needles inserted through the skin at specific points on the body to control pain and other symptoms). Acupuncture is a type of complementary and alternative medicine.

**acustimulation :** Mild electrical stimulation of acupuncture points to control symptoms such as nausea and vomiting.

**acute :** Symptoms or signs that begin and worsen quickly; not chronic.

**acute bacterial prostatitis :** Inflammation of the prostate gland that begins suddenly and gets worse quickly. It is caused by a bacterial infection. Symptoms include fever and chills, body aches, pain in the lower back and genital area, a burning feeling during urination, and problems with emptying the bladder all the way.

**acute effects:** Effects that occur rapidly following exposure and are of short duration (WHO, 1979).

**acute leukemia :** A rapidly progressing cancer that starts in blood-forming tissue such as the bone marrow, and causes large numbers of white blood cells to be produced and enter the blood stream.

**acute lymphoblastic leukemia :** A type of leukemia (blood cancer) that comes on quickly and is fast growing. In acute lymphoblastic leukemia, there are too many lymphoblasts (immature white blood cells) in the blood and bone marrow. Also called acute lymphocytic leukemia and ALL.

**acute lymphocytic leukemia :** A type of leukemia (blood cancer) that comes on quickly and is fast growing. In acute lymphocytic leukemia, there are too many lymphoblasts (immature white blood cells) in the blood and bone marrow. Also called acute lymphoblastic leukemia and ALL.

**acute myeloblastic leukemia :** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute myelogenous leukemia, acute myeloid leukemia, acute nonlymphocytic leukemia, AML, and ANLL.

**acute myelogenous leukemia :** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute myeloblastic leukemia, acute myeloid leukemia, acute nonlymphocytic leukemia, AML, and ANLL.

**acute myeloid leukemia :** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute

myeloblastic leukemia, acute myelogenous leukemia, acute nonlymphocytic leukemia, AML, and ANLL.

**acute nonlymphocytic leukemia :** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute myeloblastic leukemia, acute myelogenous leukemia, acute myeloid leukemia, AML, and ANLL.

**acute pain :** Pain that comes on quickly, can be severe, but lasts a relatively short time.

**acute promyelocytic leukemia :** An aggressive (fast-growing) type of acute myeloid leukemia in which there are too many immature blood-forming cells in the blood and bone marrow. It is usually marked by an exchange of parts of chromosomes 15 and 17. Also called APL and promyelocytic leukemia.

**acute radiation sickness :** Serious illness caused by being exposed to high doses of certain types of radiation, usually over a short period of time. Symptoms of acute radiation sickness usually occur right after exposure but they may happen over time, and they may come and go. Symptoms include nausea and vomiting, diarrhea, headache, dizziness, weakness, fatigue, bleeding, hair loss, swelling, itching, and redness of the skin, and other skin problems. Very large doses of radiation may cause death. Also called acute radiation syndrome, radiation poisoning, radiation sickness, and radiation sickness syndrome.

**acute radiation syndrome :** Serious illness caused by being exposed to high doses of certain types of radiation, usually over a short period of time. Symptoms of acute radiation syndrome usually occur right after exposure but they may happen over time, and they may come and go. Symptoms include nausea and vomiting, diarrhea, headache, dizziness, weakness, fatigue, bleeding, hair loss, swelling, itching, and redness of the skin, and other skin problems. Very large doses of radiation may cause death. Also called acute radiation sickness, radiation poisoning, radiation sickness, and radiation sickness syndrome.

**acute toxicity:** The adverse effects occurring within a short time of administration of a single dose or multiple doses given within 24 hours (Hagan, 1959).

**acute toxicity test:** An experimental animal study in which the adverse effects occur in a short time (from 1-7 days) following the administration of a single or multiple doses of a chemical. The most frequently used acute toxicity test involves determination of the median lethal dose (LD50) of the compound. The LD50 has been defined as "a statistically derived expression of a single administered dose of a material that can be expected to kill 50% of the animals" (WHO, 1978a).

**acyclovir:** A synthetic analog of the purine nucleoside, guanosine, with potent antiviral activity against herpes simplex viruses type 1 and 2, varicella-zoster virus and other viruses. After conversion in vivo to the active metabolite acyclovir triphosphate, acyclovir competitively inhibits viral DNA polymerase, incorporates into and terminates the growing viral DNA chain, and inactivates viral DNA polymerase. The greater antiviral activity of acyclovir against HSV compared to VZV is due to its more efficient phosphorylation by the thymidine kinase of HSV. A substance used to prevent or treat cytomegalovirus and herpes simplex infections that may occur when the body is immunosuppressed. It belongs to the family of drugs called antivirals. OR

**acyclovir sodium:** The sodium salt form of acyclovir, a synthetic analog of the purine nucleoside, guanosine, with potent antiviral activity against herpes simplex viruses type 1 and 2, varicella-zoster virus and other viruses. After conversion in vivo to the active metabolite acyclovir triphosphate, acyclovir competitively inhibits viral DNA polymerase, incorporates into and terminates the growing viral DNA chain, and inactivates viral DNA polymerase. The greater antiviral activity of acyclovir against HSV compared to VZV is due to its more efficient phosphorylation by the thymidine kinase of HSV.

**acyl group:** a group with the following structure, where R can be either an alkyl or aryl group.

**acyl halide:** a compound with the general structural formula:

**acyl phosphate:** Any molecule with the general chemical form

**acylation:** a reaction in which an acyl group is added to a molecule.

**acylium ion:** the resonance stabilized cation:

**Aczone Gel:** (Other name for: dapsone gel, 5%)

**AD 32:** A drug used to treat bladder cancer that does not respond to BCG (Bacillus Calmette Guerin). It is an anthracycline and is a type of antitumor antibiotic. Also called valrubicin.

**Ad-hCMV-Flt3L:** A human serotype 5, replication-defective, first generation adenoviral vector, with the viral E1a and E3 protein encoding regions deleted, which is engineered to express the soluble, immune-mediated stimulatory gene human fms-like tyrosine kinase 3 ligand (Flt3L), under the transcriptional control of the CMV promoter, with potential immunostimulating activity. Upon administration, Ad-hCMV-Flt3L is transduced into tumor cells and Flt3L is expressed. Flt3L stimulates both the proliferation of dendritic cells (DCs) and their migration to the tumor site. Upon exposure to the tumor-associated antigens (TAA) released from dying glioma cells, which were killed by thymidine kinase-mediated valacyclovir-induced tumor cell death, the DCs initiate a specific immune response against any remaining TAA-expressing tumor cells. Flt3L is a hematopoietic growth factor and ligand for the Flt3 tyrosine kinase receptor.

**Ad-hCMV-TK:** A human serotype 5, replication-defective, first generation adenoviral vector, with the viral E1a and E3 protein encoding regions deleted, which is engineered to express the herpes simplex virus thymidine kinase (HSV-tk) gene under the transcriptional control of the CMV promoter. This agent, when administered in conjunction with a synthetic acyclic guanosine analogue, possesses potential antineoplastic activity. Upon administration into the peritumoral region after tumor resection, adenoviral vector encoding HSV thymidine kinase is transduced into tumor cells, and HSV-tk is expressed. Tumor cells expressing HSV-tk are sensitive to synthetic acyclic guanosine analogues. Subsequent administration of a synthetic acyclic guanosine analogue, such as valacyclovir (VCV) or ganciclovir (GCV), kills the tumor cells expressing HSV-tk. The release of tumor-associated antigens (TAA) by dying tumor cells may then stimulate an antitumor cytotoxic T lymphocyte (CTL) response, directed against any remaining tumor cells.

**Ad-ISF35:** A replication-defective adenovirus vector (Ad-ISF35), which encodes a membrane-stabilized, chimeric human-mouse CD40 binding protein (CD40 ligand; CD40L; CD154), with potential immunomodulatory and antineoplastic activities. Upon intratumoral administration, Ad-ISF35 preferentially transduces tumor cells and immunoregulatory cells in the

tumor microenvironment. This increases the expression of CD154 in tumor cells, activates CD40 and stimulates signaling and immunoactivation, which are both mediated by CD40. This increases the expression of co-stimulatory molecules on these cells, which enhances their ability to function as antigen presenting cells (APCs) and increases their apoptotic potential. This leads to an increase in the infiltration of macrophages and neutrophils, which promote direct cytotoxicity, enhances the production of pro-inflammatory cytokines in the tumor microenvironment, and induces a specific cytotoxic T-lymphocyte (CTL) response against the tumor cells. In addition, transduction with Ad-ISF35 induces direct tumor cell death, probably through an anti-viral immune response. Ad-ISF35 also exerts a strong bystander effect in non-transduced cells thereby further inducing tumor cell death. Altogether, this will eradicate tumor cells. CD154, the main ligand for CD40, plays a key role in the activation of APCs, promotes immunoactivation, and increases apoptotic potential. The protein encoded by Ad-ISF35 does not contain the mouse antibody binding domains and does not induce human neutralizing antibodies. The metalloprotease cleavage site is deleted in this chimeric CD154 and thus it resists cleavage; the encoded protein also contains amino acid substitutions within the carboxy-terminal. Both sets of engineered mutations promote cell surface expression. Check for active clinical trials using this agent.

**Ad-REIC/DKK3 vaccine:** A replication incompetent adenoviral vector encoding the full-length tumor suppressor gene Reduced Expression in Immortalized Cells (REIC or DKK3) (ad-REIC/DKK3), with potential antineoplastic activity. Upon intratumoral injection, tumor cells express REIC/DKK3 protein. This may result in the activation of c-Jun-NH2-kinase (JNK) and ultimately apoptosis via Bcl2 suppression and caspase-3 activation. Expression of REIC/DKK3 is normal in healthy cells but reduced or absent in many cancer cells; Forced overexpression of REIC/DKK3 in cancer cells may lead to an induction of tumor cell apoptosis and reduction of tumor cell growth while sparing normal, healthy cells naturally expressing endogenous REIC/DKK3.

**Ad-sig-hMUC-1/ecdCD40L vaccine:** A cancer vaccine consisting of a recombinant adenoviral vector encoding the tumor-associated antigen (TAA) human MUC-1 (hMUC-1) linked to the extracellular domain (ecd) of the co-stimulatory molecule CD40 ligand (CD40L) and an adenovirus signal sequence that encodes a secretory signal peptide (Ad-sig) with

potential immunostimulating and antineoplastic activities. Due to the presence of the secretory signal peptide expressed by Ad-sig in the vaccine construct, transfected cells may secrete a fusion protein composed of hMUC-1 and the CD40L ecd. The CD40L moiety part of the fusion protein binds to CD40 receptors on dendritic cells (DCs). Subsequently, DCs may be activated and migrate, T-cells may expand, and a cytotoxic T lymphocyte (CTL) response against tumor cells that overexpress hMUC-1 may follow. MUC-1 is a hypoglycosylated TAA overexpressed by epithelial cancer cells.

**Ad5-CMV-NIS:** A recombinant type 5 adenovirus (Ad5), encoding the gene for the human sodium-iodide symporter (NIS) linked to the cytomegalovirus (CMV) promoter, with potential gene transfection activity. Upon intratumoral injection, Ad5-CMV-NIS is taken up by tumor cells, resulting in the cellular expression of NIS. Subsequently, orally administered iodine 131 is taken up by NIS-expressing tumor cells, which may result in the selective accumulation of a cytotoxic dose of beta and gamma radiation in non-thyroidal tumor cells, sparing adjacent normal tissue. NIS, an intrinsic membrane glycoprotein, is an ion pump that actively transports iodide into cells which concentrate iodine; in addition to thyroid epithelial cells, it is found in non-thyroidal tissues including the salivary glands, the gastric mucosa, and lactating mammary glands.

**Ad5-yCD/mutTK(SR39)rep-ADP:** A second generation, replication-competent adenovirus type 5 containing a yeast cytosine deaminase(yCD)/mutant sr39 herpes simplex virus thymidine kinase fusion (yCD/mutTKsr39) gene and the 11.6 kDa adenovirus death protein (ADP) gene with potential oncolytic activity. Upon intratumoral administration and transduction of Ad5-yCD/mutTK(SR39)rep-ADP into tumor cells and subsequent expression of cytosine deaminase and viral thymidine kinase, administered prodrugs 5-fluorocytosine (5-FC) and ganciclovir are converted into their respective metabolites 5-fluorouracil (5-FU) and ganciclovir-5-monophosphate (ganciclovir-MP); 5-FU is subsequently metabolized to cytotoxic active metabolites 5-fluoroxymethyluridine monophosphate (F-UMP) and 5-fluoro-2'-deoxyuridine-5'-O-monophosphate (F-dUMP); ganciclovir-TP subsequently is converted by mammalian thymidine kinase to cytotoxic ganciclovir-triphosphate (ganciclovir-TP). Tumor cells adjacent to tumor cells transduced with this agent may be killed through a "bystander effect". ADP may enhance spread

and oncolytic activity of replication-competent adenoviruses. In addition to its oncolytic activity, Ad5-yCD/mutTK(SR39)rep-ADP may exhibit radiosensitizing activity.

**Ad5-yCD/mutTKSR39rep-hIL12:** A replication-competent oncolytic adenovirus encoding the murine pro-inflammatory cytokine interleukin-12 (IL-12) gene and two suicide fusion genes, a yeast cytosine deaminase (yCD) and a mutant form of herpes simplex virus type 1 thymidine kinase (HSV-1 TKSR39), with potential immunomodulating and antineoplastic activities. Upon intratumoral administration of Ad5-yCD/mutTKSR39rep-hIL12, the adenovirus selectively infects and replicates in tumor cells, which results in direct tumor cell lysis. Synergistically, IL-12 expressed by the adenovirus may activate the immune system by promoting the activation of natural killer cells (NKs), inducing secretion of interferon-gamma (IFN-g) and inducing cytotoxic T-lymphocyte (CTL) responses against tumor cells, which may result in immune-mediated tumor cell death, inhibition of tumor cell proliferation and inhibition of tumor angiogenesis. In addition, Ad5-yCD/mutTKSR39rep-hIL12-infected cancer cells express yCD and TKSR39; upon administration of the prodrugs 5-fluorocytosine (5-FC) and valganciclovir (vGCV), the yCD and HSV-1 TKSR39 activate these prodrugs to form 5-fluorouracil (5-FU) and ganciclovir, respectively. 5-FU gets converted to 5-fluoro-uridine monophosphate (5-FUMP) and subsequently to 5-fluoro-deoxyuridine monophosphate (5-FdUMP); 5-FdUMP irreversibly inhibits thymidylate synthase, inhibits deoxythymidine triphosphate (dTTP) formation and halts DNA synthesis. Once phosphorylated intracellularly, ganciclovir triphosphate competitively inhibits deoxyguanosine triphosphate (dGTP) incorporation into DNA and inhibits DNA synthesis.

**Ad5.SSTR/TK.RGD:** An RGD-4C–modified, infectivity-enhanced, bicistronic type 5 adenovirus expressing herpes simplex virus thymidine kinase (HSV-tk) gene, a therapeutic suicide gene, and the somatostatin receptor type 2 (SSTR2) gene with potential antineoplastic activity. Modification with the double cyclic peptide RGD-4C allows the virus to bind to cellular integrins, frequently expressed on the surfaces of ovarian cancer cells, instead of the coxsackie and adenovirus (CAR) receptor, which is often nonfunctional in ovarian cancer cells. Upon intratumoral administration, Ad5.SSTR/TK.RGD transfects tumor cells and expresses the HSV-tk gene. After subsequent administration of a synthetic acyclic

guanosine analogue prodrug like ganciclovir (GCV), expressed HSV-tk phosphorylates and activates the prodrug, which may result in inhibition of DNA synthesis and apoptosis in HSV-tk-expressing cancer cells.

Additionally, as a bystander effect, adjacent non-transfected cells may be killed by the activated antiviral drug. SSTR2 expression allows imaging of gene transfer into tumor cells using a radiolabeled somatostatin analogue.

**Ad5CMV-p53 gene:** A replication-defective adenoviral-CMV vector that encodes a wild-type p53 gene. Ad5CMV-p53 induces tumor cells that have been transfected with the vector to produce wild-type p53, a tumor suppressor gene that is deleted or mutated in a significant number of cancers. In transfected tumor cells, the wild-type p-53 gene product exerts an antitumor effect by blocking cell cycle progression at the G1/S regulation point, activating DNA repair proteins in the presence of DNA damage, and initiating apoptosis when DNA damage is irreparable.

**Ad5F35-LMP1/LMP2-transduced autologous dendritic cells:**

Autologous dendritic cells (DCs) transduced with the replication-deficient adenoviral vector Ad5F53 encoding the Epstein-Barr virus (EBV) transmembrane latent membrane proteins 1 and 2 (LMP1/LMP2) with potential immunostimulatory activity. Vaccination with Ad5F35-LMP1/LMP2-transduced autologous dendritic cells may stimulate a specific cytotoxic T-lymphocyte (CTL) response against LMP1- and LMP2-expressing tumor positive cells, resulting in tumor cell lysis and inhibition of tumor cell proliferation. LMP1 and LMP2 are expressed in various malignancies including nasopharyngeal cancer and EBV-positive Hodgkin disease.

**Adacel:** (Other name for: diphtheria toxoid/tetanus toxoid/acellular pertussis vaccine adsorbed)

**Adanon:** (Other name for: methadone hydrochloride)

**Adapin:** (Other name for: doxepin hydrochloride)

**adaptation:** The adjustment of an organism or population to a new or altered environment through genetic changes brought about by natural selection.

**ADAPTER:** In an extruder, the portion of the die assembly that attaches the die to the extruder and provides a flow channel for the molten plastic between the extruder and the die. OR A long heated cylindrical pipe used to convey molten resin from an extruder into an extrusion die.

**ADC:** A substance made up of a monoclonal antibody chemically linked to a drug. The monoclonal antibody binds to specific proteins or receptors found on certain types of cells, including cancer cells. The linked drug enters these cells and kills them without harming other cells. Some ADCs are used to treat cancer. Also called antibody-drug conjugate.

**ADCC:** A type of immune reaction in which a target cell or microbe is coated with antibodies and killed by certain types of white blood cells. The white blood cells bind to the antibodies and release substances that kill the target cells or microbes. Also called antibody-dependent cell-mediated cytotoxicity and antibody-dependent cellular cytotoxicity.

**Adcetris :** (Other name for: brentuximab vedotin) OR A drug used to treat Hodgkin lymphoma in patients who did not get better with other treatment, cannot be treated with autologous stem cell transplant (ASCT), or have a high risk that the cancer will come back or get worse after ASCT. It is also used to treat systemic anaplastic large cell lymphoma that did not get better with other treatment. It is also being studied in the treatment of other types of lymphoma. Adcetris is made up of a monoclonal antibody linked to an anticancer drug. It binds to a protein called CD30, which is on the surface of some lymphoma cells, and may kill cancer cells. Adcetris is a type of antibody-drug conjugate. Also called brentuximab vedotin and SGN-35.

**Adderall :** (Other name for: dextroamphetamine-amphetamine) OR A combination of drugs used as a treatment for attention deficit hyperactivity disorder (ADHD) and narcolepsy (a sleep disorder). It is a type of stimulant. Also called dextroamphetamine-amphetamine.

**Adderall XR:** (Other name for: dextroamphetamine-amphetamine)

**addiction :** An uncontrollable craving, seeking, and use of a substance, such as a drug or alcohol.

**Addison disease :** A rare disorder in which the adrenal glands do not make enough of certain hormones. Symptoms include weight loss, loss of appetite, nausea and vomiting, diarrhea, muscle weakness, fatigue, low blood sugar, low blood pressure, and patchy or dark skin. Most cases of the disorder are caused by immune system problems, but may also be caused by infection, cancer, or other diseases. Also called adrenal insufficiency.

**addition:** anti the addition of atoms to opposite sides of a molecule. (Compare with "syn addition.") OR a reaction that produces a new compound by combining all of the elements of the original reactants.

**addition compound:** An addition compound contains two or more simpler compounds that can be packed in a definite ratio into a crystal. A dot is used to separate the compounds in the formula. For example,  $\text{ZnSO}_4 \cdot 7 \text{H}_2\text{O}$  is an addition compound of zinc sulfate and water. This represents a compound, and not a mixture, because there is a definite 1:7 ratio of zinc sulfate to water in the compound. Hydrates are a common type of addition compound.

**addition elimination mechanism:** the two-stage mechanism by which nucleophilic aromatic substitution occurs. In the first stage, addition of the nucleophile to the carbon bearing the leaving group occurs. An elimination follows in which the leaving group is expelled.

**addition method:** Sometimes called the elimination method, it is a method for solving a system of two equations. One or both of the equations needs to be modified so that when the two equations are added, one of the variables is eliminated.

**Addition Polymerisation:** Also known as chain-growth polymerisation. The mechanism in which large numbers of usually identical small molecules are joined together to rapidly form a single large molecule. This involves the addition of reactive centre (anion, cation, or unpaired electron) to a multiple bond to form a new bond and a new reactive centre - which reacts with another multiple bond, et cetera... The finished chain then hangs around without reacting while more of the starting material reacts to form new polymer chains.

**Addition polymerisation** : One long single molecule is made from many short chain monomers. All the starting material is incorporated in the final polymer. An addition reaction takes place each time the chain is extended.

**addition property of equations:** An equation is still true if the same term is added to (or subtracted from) both sides of an equation.

**Addition reaction** : A substance is reacted with an alkene to form a compound with a single bond between the two formerly double bonded carbon atoms. An example is the decolourisation of bromine.

**ADDITIVE:** Any material added to a base stock to change its properties, characteristics or performance. OR A substance added to a formulation in relatively small amounts to impart or improve desirable properties or suppress undesirable properties. OR A substance mixed or compounded in a

plastic or resin that improves the quality of the resulting product. Or A substance compounded into a resin to enhance or improve certain characteristics. Or A compound or substance added to polymer to alter or improve its characteristics such as slip, antiblock, or color pigments. Or A substance added to a plastic compound to alter its characteristics. Examples are plasticizers, reinforcements, and flame-retardants. or Any substance compounded into resin to modify its properties. Additives can be antioxidants, colorants, pigments, light stabilizers, etc. or Any substance that is added to another substance. Usually a material added in minor amounts to alter the properties of a resin or compound. Or A compound or substance added to a polymer plastic to improve and alter characteristics of a polymer, such as a lubricant, stabilizer, plasticizer, etc. or A substance compounded into a resin to enhance or improve certain characteristics.

**additive effect:** An additive effect is the overall consequence which is the result of two chemicals acting together and which is the simple sum of the effects of the chemicals acting independently. See also antagonistic effect, synergistic effect.

**Additive manufacturing/ 3D printing:** Commonly used interchangeably, additive manufacturing (3D printing) involves a CAD model or scan of an object that is reproduced, layer by layer, as a physical three-dimensional object. Stereolithography, selective laser sintering, fused deposition modeling and direct metal laser sintering are some of the commonly employed additive processes.

**Additives :** Additives are materials that are added to a polymer to produce a desired change in material properties or characteristics. A wide variety of additives are currently used in thermoplastics, to expand or extend material properties, enhance processability, modify aesthetics, or increase environmental resistance. Additives enhance properties like flame retardancy and UV light stability. OR These compounds are added to resins to improve the overall performance and appearance of finished products. A key trend in this area today is using additives that are made from organic materials such as eggshells, wood pulp, rice hulls or materials that improve the biodegradability of the plastic.

**adduct:** the product of an addition reaction.

**ADE:** An abbreviation for a chemotherapy combination used to treat childhood acute myeloid leukemia (AML). It includes the drugs cytarabine

(Ara-C), daunorubicin hydrochloride, and etoposide phosphate. Also called ADE regimen.

**ADE regimen:** A regimen consisting of cytarabine (Ara-C), daunorubicin and etoposide, that is used as an induction treatment for pediatric acute myeloid leukemia (AML)

**ADE regimen :** An abbreviation for a chemotherapy combination used to treat childhood acute myeloid leukemia (AML). It includes the drugs cytarabine (Ara-C), daunorubicin hydrochloride, and etoposide phosphate. Also called ADE.

**adecatumumab:** A recombinant human IgG1 monoclonal antibody (MoAb) directed against the tumor associated antigen (TAA) epithelial cell adhesion molecule (EpCAM) with potential antitumor activity.

Adecatumumab binds to EpCAM, which may result in antibody-dependent cellular cytotoxicity (ADCC) directed against EpCAM-expressing tumor cells. EpCAM (CD326), a cell surface protein upregulated on many tumor cell types, promotes the proliferation, migration and invasiveness of tumor cells; for some cancers, overexpression has been correlated with decreased survival.

**adefovir dipivoxil:** An acyclic nucleotide adenine analogue with potent antiviral activity. Adefovir is activated in vivo to a diphosphate metabolite which is incorporated into viral DNA, leading to viral RNA-dependent DNA polymerase inhibition, DNA chain termination and impairment of viral replication. This agent inhibits the reverse transcriptases of hepatitis B, herpes and HIV viruses, induces natural killer cell activity, and stimulates endogenous interferon production. Viral resistance to adefovir develops at a slower rate compared to other antivirals.

**Adenine:** A purine base found in DNA or RNA.

**adenine :** A chemical compound that is used to make one of the building blocks of DNA and RNA. It is also a part of many substances in the body that give energy to cells. Adenine is a type of purine.

**adenocarcinoma :** Cancer that begins in glandular (secretory) cells. Glandular cells are found in tissue that lines certain internal organs and makes and releases substances in the body, such as mucus, digestive juices, or other fluids. Most cancers of the breast, pancreas, lung, prostate, and colon are adenocarcinomas.

**adenocarcinoma in situ** : A condition in which abnormal cells are found in the glandular tissue that lines certain internal organs, such as the uterus, cervix, lung, pancreas, and colon. Adenocarcinoma in situ, which occurs most often in the cervix, may become cancer and spread to nearby normal tissue. Also called AIS.

**adenoid cystic carcinoma** : A rare type of cancer that usually begins in the salivary glands.

**adenoma** : A tumor that is not cancer. It starts in gland-like cells of the epithelial tissue (thin layer of tissue that covers organs, glands, and other structures within the body).

**adenopathy** : Large or swollen lymph glands.

**adenosarcoma** : A tumor that is a mixture of an adenoma (a tumor that starts in the gland-like cells of epithelial tissue) and a sarcoma (a tumor that starts in bone, cartilage, fat, muscle, blood vessels, or other connective or supportive tissue). An example of an adenosarcoma is Wilms tumor.

**Adenosine**: A purine nucleoside found in DNA, RNA, and many cofactors.

**adenosine 3',5'-cyclic monophosphate**: See cyclic AMP.

**adenosine A2A receptor antagonist PBF-509**: An orally bioavailable adenosine A2A receptor (A2AR) antagonist, with potential antineoplastic activity. Upon administration, A2AR antagonist PBF-509 selectively binds to and inhibits A2AR expressed on T lymphocytes. This abrogates the adenosine/A2AR-mediated inhibition of T-lymphocytes and activates a T-cell-mediated immune response against tumor cells, thereby reducing proliferation of susceptible tumor cells. A2AR, a G protein-coupled receptor, is highly expressed on the cell surfaces of T-cells and, upon activation by adenosine, inhibits their proliferation and activation.

Adenosine is often produced in excess by cancer cells.

**adenosine A3 receptor agonist CF102**: An orally bioavailable, synthetic, highly selective adenosine A3 receptor (A3AR) agonist with potential antineoplastic activity. Adenosine A3 receptor agonist CF102 selectively binds to and activates the cell surface-expressed A3AR, deregulating Wnt and NF-kB signal transduction pathways downstream, which may result in apoptosis of A3AR-expressing tumor cells. A3AR, a G protein-coupled receptor, is highly expressed on the cell surfaces of various solid tumor cell

types, including hepatocellular carcinoma (HCC) cells, and plays an important role in cellular proliferation.

**adenosine diphosphate:** See ADP.

**Adenosine diphosphate (ADP):** Adenosine diphosphate (ADP). The nucleotide formed by adding a pyrophosphate group to the 5'-OH group of adenosine.

**adenosine triphosphate :** A substance present in all living cells that provides energy for many metabolic processes and is involved in making RNA. Adenosine triphosphate made in the laboratory is being studied in patients with advanced solid tumors to see if it can decrease weight loss and improve muscle strength. Also called ATP.

**adenosine triphosphate (ATP):** the chemical substance that serves as the currency of energy in cells.

**Adenosine triphosphate (ATP):** The nucleotide formed by adding yet another phosphate group to the pyrophosphate group on ADP.

**adenosine-A2A receptor antagonist CPI-444:** A small molecule immune checkpoint inhibitor of the adenosine A2A receptor (ADORA2A) with potential antineoplastic activity. Upon oral administration, adenosine-A2A receptor antagonist CPI-444 binds to adenosine A2A receptors expressed on the surface of immune cells, including T-lymphocytes, natural killer (NK) cells, macrophages and dendritic cells (DCs). This prevents tumor-released adenosine from interacting with the A2A receptors on these key immune surveillance cells, thereby abrogating adenosine-induced immunosuppression in the tumor microenvironment. This may stimulate anti-tumor immune responses, resulting in tumor regression.

**adenosis :** A disease or abnormal change in a gland. Breast adenosis is a benign condition in which the lobules are larger than usual.

**adenosquamous carcinoma :** A type of cancer that contains two types of cells: squamous cells (thin, flat cells that line certain organs) and gland-like cells.

**adenosylmethionine:** S An activated methyl donor that consists of an adenosyl group linked to the sulfur atom of methionine.

**adenovector encoding MDA7:** A nonreplicating adenoviral vector (adenovector) encoding the melanoma differentiation-associated 7 gene (MDA7) with potential antineoplastic activity. After intratumoral injection

and adenovector-mediated gene transfer of MDA7 into tumor cells, the expressed MDA7 transgene may inhibit tumor cell proliferation and induce tumor cell apoptosis. Check for active clinical trials using this agent.

**adenovector-transduced AP1903-inducible MyD88/CD40-expressing autologous PSMA-specific prostate cancer vaccine BPX-201:** A genetically-modified, dendritic cell (DC)-based vaccine in which the autologous cells are transduced with an adenoviral vector expressing the tumor antigen prostate-specific membrane antigen (PSMA) and a fusion protein composed of synthetic ligand inducible adjuvant iMC composed of a drug-inducible costimulatory CD40 receptor (iCD40) and the adaptor protein MyD88, with potential immunomodulating and antineoplastic activities. The iCD40 contains a membrane-localized cytoplasmic CD40 domain fused to the FK506 modified drug-binding protein 12 (FKBP12). Upon intradermal administration of BPX-201, these DCs accumulate in local draining lymph nodes. Twenty-four hours after vaccination, the dimerizing agent AP1903 is administered. AP1903 binds to the drug binding domain, leading to iMC oligomerization and activation of iCD40 and MyD88-mediated signaling in iMC-expressing DCs. This signaling pathway activates the DCs and stimulates a cytotoxic T-lymphocyte (CTL) response against host tumor cells that express PSMA. PSMA, a glycoprotein secreted by prostatic epithelial and ductal cells, is overexpressed in prostate cancer cells and is used as a tumor marker for both diagnosis and treatment evaluation. MyD88 is involved in interleukin 1 receptor (IL1R) and toll-like receptor (TLR) signaling.

**adenoviral vector Ad5-CEA(6D) vaccine:** A replication-defective, E1- and E2b-deleted oncolytic adenoviral serotype 5 (Ad5) encoding an epitope of human carcinoembryonic antigen (CEA) with potential antineoplastic activity. Adenoviral vector Ad5-CEA(6D) vaccine expresses a highly immunogenic analogue of CEA [CAP1-(6D)]. Upon administration, this vaccine may induce both humoral and cellular immune responses against tumor cells expressing the CEA antigen, thereby resulting in the immune-mediated inhibition of tumor cell proliferation and tumor cell death. CEA, a tumor-associated antigen, is overexpressed in various tumor cell types. Deletion of early genes E1 and E2b in Ad5 potentially circumvents pre-existing anti-adenovirus immunity and is capable of inducing strong immune responses.

**adenoviral-transduced hIL-12-expressing autologous dendritic cells INXN-3001 plus activator ligand INXN-1001:** Autologous dendritic cells transduced with a replication incompetent adenovirus encoding human pro-inflammatory cytokine interleukin-12 (IL-12) (INXN-3001) in combination with the proprietary orally bioavailable, small molecule activator ligand INXN-1001, with potential immunomodulating and antineoplastic activities. Production of IL-12 is controlled by an inducible DNA element that allows transcription initiation only in the presence of the ligand inducer INXN-1001. Upon intratumoral injection of INXN-3001 and subsequent oral administration of activator ligand, INXN-1001 is able to induce expression of IL-12 in INXN-3001. IL-12 expressed by the adenovirus may activate the immune system by promoting the activation of natural killer cells, inducing the secretion of interferon-gamma and inducing a cytotoxic T lymphocyte response against tumor cells, which may result in immune-mediated tumor cell death and inhibition of tumor cell proliferation. As INXN-1001 regulates both the timing and the levels of IL-12 expression, IL-12 toxicity can be reduced.

**adenovirus :** A member of a family of viruses that can cause infections in the respiratory tract, eye, and gastrointestinal tract. Forms of adenoviruses that do not cause disease are used in gene therapy. They carry genes that may fix defects in cells or kill cancer cells.

**adenovirus 5-human guanylyl cyclase C-PADRE vaccine:** A replication-defective, recombinant adenoviral serotype 5 (Ad5) encoding human guanylyl cyclase C (hGCC) and the synthetic Pan DR epitope (PADRE), with potential antineoplastic and immunomodulating activities. Upon intramuscular administration, the Ad5-hGCC-PADRE vaccine expresses hGCC, which may induce both humoral and cellular immune responses against tumor cells expressing the hGCC antigen. This results in the immune-mediated inhibition of tumor cell proliferation, and leads to tumor death. The hGCC protein is normally restricted to intestinal epithelial cells but is overexpressed by metastatic colorectal tumors. PADRE is a helper T-lymphocyte epitope that is able to augment the magnitude and duration of the cytotoxic T-lymphocyte (CTL) response.

**adenovirus B7-1:** A gene-viral vector complex comprised of an adenovirus vector and B7-1 gene targeting the CD80 antigen. Adenovirus

B7-1 is used as a component in antineoplastic vaccines to elicit a cytotoxic T-cell response.

**adenovirus encoding E.coli PNP:** A replication-incompetent adenovirus encoding E. coli purine nucleoside phosphorylase (Ad/PNP) used as a prodrug activating agent. Administered intratumorally, Ad/PNP expresses the enzyme PNP, which may catalyze systematically administered fludarabine phosphate prodrug into its active form 2-fluoroadenine (F-Ade). F-Ade inhibits DNA polymerase alpha, ribonucleotide reductase and DNA primase, thereby interrupting DNA synthesis and inhibiting tumor cell growth. Localized prodrug activation provides targeted chemotherapy, thereby potentially reducing systemic side effects. Check for active clinical trials using this agent.

**adenovirus encoding human aquaporin-1:** A replication-deficient, recombinant adenovirus encoding human aquaporin-1 with potential membrane water channel activity. Upon transfection of salivary glands, adenovirus encoding human aquaporin-1 (AdhAQP1) directs human aquaporin-1 (hAQP1) expression in the apical and basolateral plasma membranes of salivary secretory cells, which may result in increased saliva production. hAQP1, a water channel protein, is one of several highly conserved water channel proteins that mediate water permeability in cells of water-transporting tissues.

**adenovirus encoding rat Her-2/neu:** A replication-defective oncolytic adenovirus, encoding rat Her-2/neu (ErbB-2), with potential antineoplastic activity. Upon administration, adenovirus encoding rat HER-2/neu may induce an immune response against tumor cells expressing the HER-2/neu antigen, which may result in the immune-mediated inhibition of tumor cell proliferation and tumor cell death. Her-2/neu, a tumor-associated antigen and member of the epidermal growth factor receptor (EGFR) family of tyrosine kinases, is overexpressed in various tumor cell types.

**adenovirus encoding recombinant human endostatin:** A replication-defective, recombinant oncolytic adenovirus encoding human endostatin with potential antineoplastic activity. Endostatin, a 20 kDa C-terminal proteolytic fragment of collagen XVIII, is an important angiogenesis inhibitor. Upon intratumoral administration, the adenovirus infects and replicates in tumor cells. The expressed endostatin may inhibit endothelial

cell proliferation and angiogenesis which may result in a reduction of tumor growth.

**adenovirus encoding tyrosinase, MART-1/MAGE-A6-transduced autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) transduced with a recombinant adenoviral vector encoding three full-length human melanoma associated antigens (MAAs), tyrosinase, melan-A (MART-1) and the melanoma antigen A6 (MAGEA6), with potential antineoplastic activity. Upon intradermal administration, adenovirus encoding tyrosinase/MART-1/MAGEA6-transduced autologous DC vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tyrosinase/MART-1/MAGEA6-positive tumor cells, which may result in tumor cell death and decreased tumor growth. Tyrosinase, a melanoma-specific differentiation antigen, catalyzes the first step of melanin synthesis in melanocytes. Vaccination with multi-antigen modified DC may improve the efficacy of the DC immunotherapy.

**adenovirus HER2-transduced autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) transduced with a replication-deficient adenovirus vector encoding HER-2 with potential antineoplastic activity. Upon administration, adenovirus HER2-transduced autologous dendritic cell vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against HER-2-positive tumor cells, which may result in tumor cell death and decreased tumor growth. HER-2, a tyrosine kinase receptor for epidermal growth factor (EGF) (also known as neu and ErbB2), is overexpressed by some breast, ovarian, and gastric cancers.

**adenovirus vector:** One of a number of genetically-engineered adenoviruses designed to insert a gene of interest into a eukaryotic cell where the gene of interest is subsequently expressed. Unlike most other vectors, adenovirus vectors have the ability to infect post-mitotic cells. Thus, these agents are especially useful for gene transfer into neuronal cells.

**adenovirus-mediated human interleukin-12:** A replication-incompetent adenovirus encoding human pro-inflammatory cytokine interleukin-12 (IL-12) (Ad.hIL-12), with potential immunomodulating and antineoplastic activities. Upon intratumoral administration, the adenovirus selectively infects and replicates in tumor cells, which may result in tumor cell lysis.

Synergistically, IL-12 expressed by the adenovirus may activate the immune system by promoting the activation of natural killer cells (NKs), inducing secretion of interferon-gamma and inducing cytotoxic T cell responses against tumor cells, which may result in immune-mediated tumor cell death and inhibition of tumor cell proliferation.

**adenovirus-mediated human interleukin-12 INXN-2001 plus**

**veledimex:** A replication incompetent adenovirus encoding the human pro-inflammatory cytokine interleukin-12 (IL-12) (INXN-2001) in combination with the proprietary activator ligand veledimex, with potential immunomodulating and antineoplastic activities. Production of IL-12 is controlled by an inducible DNA element that allows transcription initiation only in the presence of the ligand inducer. Upon intratumoral administration of INXN-2001 and oral administration of veledimex, veledimex is able to induce expression of IL-12 from INXN-2001. IL-12 expressed by the adenovirus may activate the immune system by promoting the activation of natural killer cells (NKs), inducing secretion of interferon-gamma and inducing cytotoxic T cell responses against tumor cells, which may result in immune-mediated tumor cell death and inhibition of tumor cell proliferation. Check for active clinical trials using this agent.

**adenovirus-p53 transduced dendritic cell vaccine:** A cancer vaccine consisting of autologous dendritic cells (DCs) transduced with a recombinant adenovirus encoding p53 peptide, with potential immunomodulating activity. Intradermal vaccination with adenoviral-p53 transduced dendritic cell vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing mutant p53, resulting in tumor cell lysis. p53, a tumor suppressor gene, is mutated in many tumor cells, resulting in the loss of apoptosis regulation and abnormal cell proliferation.

**adenovirus-PSA prostate cancer vaccine:** A cancer vaccine composed of a genetically engineered, replication-deficient type 5 adenovirus carrying the human prostate-specific antigen (PSA), with potential immunostimulating and antineoplastic activities. Upon subcutaneous vaccination with the adenovirus-PSA prostate cancer vaccine, the adenovirus infects cells and expresses PSA. In turn, PSA may activate the immune system and may induce a cytotoxic T-lymphocyte response against PSA-expressing tumor cells. PSA, a tumor associated antigen, is expressed

by prostate epithelial cells and is overexpressed in prostate cancer. Check for active clinical trials using this agent.

**adenovirus/cytomegalovirus/Epstein-Barr virus-specific allogeneic cytotoxic T lymphocytes:** Allogeneic tri-viral specific, adenovirus, cytomegalovirus and Epstein-Barr virus (Adv, CMV and EBV or ACE), cytotoxic T-lymphocytes (CTLs) with potential antiviral activity. Donor-derived T-cells were exposed to dendritic cells nucleofected with DNA plasmids encoding Hexon and Penton (Adv), pp65 and IE1 (CMV), and LMP2, EBNA1 and BZLF1 (EBV), all are critical proteins for the proliferation of these viruses, and subsequently maintained in the presence of interleukins 4 and 7 with a novel culture device to expand and sustain the repertoire of CTLs. After an allogeneic hematopoietic stem cell transplant (HSCT), infusion of these CTLs primed towards Adv, CMV and EBV may prevent viral infection by these pathogens. Check for active clinical trials using this agent.

**Adenylate cyclase:** The enzyme that catalyzes the formation of cyclic 3',5' adenosine monophosphate (cAMP) from ATP.

**AdGMCAIX-transduced autologous dendritic cells:** Autologous dendritic cells (DCs) transduced with a recombinant, replication-defective adenoviral vector expressing the fusion gene granulocyte-macrophage colony-stimulating factor (GM-CSF) and carbonic anhydrase IX (CA-IX or CA9) (GMCA-9), with potential immunomodulating activity. The autologous DCs are transduced *ex vivo* and express the GMCA-9 fusion protein on the cell surface. Upon intradermal administration of the AdGMCAIX-transduced autologous DCs back into the patient, the DCs activate the immune system to both mount a cytotoxic T lymphocyte-mediated response against tumor cells positive for the CA9 antigen, and generate memory T cells. This may result in decreased tumor growth. CA9, also known as G250, is a renal cell carcinoma (RCC)-associated antigen and a member of the carbonic anhydrase family that contains a human leukocyte antigen (HLA)-A2.1-restricted epitope; it is found in a majority of renal cell carcinomas while absent in most normal tissues. The cytokine GM-CSF enhances the immunogenicity of CA9-based DC vaccines.

**ADH:** A benign (not cancer) condition in which there are more cells than normal in the lining of breast ducts and the cells look abnormal under a

microscope. Having ADH increases the risk of breast cancer. Also called atypical ductal breast hyperplasia and atypical ductal hyperplasia.

**ADH-1:** A small, cyclic pentapeptide vascular-targeting agent with potential antineoplastic and antiangiogenic activities. ADH-1 selectively and competitively binds to and blocks N-cadherin, which may result in disruption of tumor vasculature, inhibition of tumor cell growth, and the induction of tumor cell and endothelial cell apoptosis. N-cadherin, a cell-surface transmembrane glycoprotein of the cadherin superfamily of proteins involved in calcium-mediated cell-cell adhesion and signaling mechanisms; may be upregulated in some aggressive tumors and the endothelial cells and pericytes of some tumor blood vessels.

**Adhere:** To cling or stick together

**Adhesion:** The degree of attachment of a paint coating to a surface. Weak adhesion of paint to a surface is a common cause of paint failure. The quality or degree of attachment between a paint coating and the surface or paint beneath it. The ability of dry paint to remain on the surface without blistering, flaking or cracking. Adhesion is probably the single most important property of paint. OR Adhesion is one type of attraction force between the molecules of a substance and the container or another object. You stay wet when you get out of the bathtub because of adhesive forces. Some of the water molecules want to stick to you. OR The ability of dry paint to attach to and remain fixed on the surface without blistering, flaking, cracking or being removed by tape. OR The ability of a coating to stick to a surface. OR the force or attraction that holds two separate objects together. OR Attraction between different substances on either side of a phase boundary. OR Tendency of rubber to bond or cling to a contact surface

**Adhesion failure on metal:** Adhesion failure on metal substrates, resulting in blistering, flaking/delamination and corrosion, is usually due either to surface contamination or poor surface preparation. Among the most common types of surface contamination are grease on new galvanised surfaces, which should be cleaned with Dulux Oil and Grease Remover; and wax residue resulting from the use of chemical paint strippers, which can be removed with Dulux Oil and Grease Remover. Dust and general debris should always be vacuumed away before painting. In terms of surface preparation, the failure to remove millscale from hot rolled mild steel prior to painting can lead to serious problems months or even years

later. Similarly, painting over rust can result in the paint film flaking or the rust breaking through the paint film.

**Adhesion Promoter:** A coating which is applied to the substrate before it is extrusion coated with the plastic and which improves the adhesion of the plastic to the substrate.

**Adhesive:** A substance which applied as an intermediate is capable of holding materials together by surface attachment.

**Adhesive Assembly:** The process of joining two or more plastic parts by means of an adhesive.

**ADI-PEG 20:** A substance being studied in the treatment of melanoma, liver cancer, and other types of cancer. It breaks down the amino acid arginine and may block the growth of cancer cells that need arginine to grow. It is a type of iminohydrolase. Also called pegylated arginine deiminase.

**adiabat:** A line on an indicator diagram that represents an adiabatic process.

**ADIABATIC:** This adjective denotes a process in which no heat is added or removed. The term is used incorrectly to describe an extruder where the mechanical energy from the screw is sufficient to plastify the polymer and the barrel controller set-points are set so that little or no heating or cooling is required.

**Adiabatic Extrusion:** A type of extrusion in which the only source of heat is the conversion of drive energy through the viscous resistance of the plastics mass in the extruder.

**adiabatic ionization energy:** The lowest energy required to remove an electron from an atom, ion, or molecule in the gas phase. The adiabatic ionization energy is the difference between the ground state energy of the ion formed and the energy of the original atom, molecule, or ion.

**adiabatic process:** A thermodynamic change of state of a system such that no heat or mass is transferred across the boundaries of the system. In an adiabatic process, expansion always results in cooling, and compression in warming.

**adiabatic warming:** See adiabatic process.

**Adipocyte:** A specialized cell that functions as a storage depot for lipid.

**adipocyte:** An animal cell specialized for the storage of fats (triacylglycerols).

**adipose tissue:** Connective tissue specialized for the storage of large amounts of triacylglycerols.

**adipose-derived regenerative cells:** A population of cells derived from adipose tissue with stem cell and wound repair activities. Adipose-derived regenerative cells (ADRC) consists of several cell types, such as adult stem cells, vascular endothelial cells, and vascular smooth muscle cells, among others. These cells contribute to wound repair through a variety of mechanisms by promoting blood vessel growth and blocking apoptosis. In addition, ADRC can differentiate into several tissue types, such as bone, cartilage, fat, skeletal muscle, smooth muscle and cardiac muscle.

**adipose-derived stromal vascular fraction cells:** A population of stromal vascular fraction (SVF) cells derived from autologous adipose tissue, with potential tissue regenerative activity. SVF cells are obtained through liposuction and contain multiple cell types, including adipose-derived stem cells (ADSCs), mesenchymal and endothelial progenitor cells, leukocyte subtypes, lymphatic cells, pericytes, and vascular smooth muscle cells. The SVF cells are processed in such a way as to contain a reproducible and consistent composition of heterogeneous cells. Upon processing and administration, the adipose-derived SVF cells can differentiate into different tissue types, support neovascularization, replace cells and repair injured tissue.

**adjacent keywords:** Two keywords that are next to each other (even if a word such as "the" appears between the keywords).

**Adjunct:** A substance added to a drug formulation to improve its pharmaceutical performance.

**adjunct agent :** In cancer therapy, a drug or substance used in addition to the primary therapy.

**adjunct therapy :** Another treatment used together with the primary treatment. Its purpose is to assist the primary treatment. Also called adjunctive therapy.

**adjunctive therapy :** Another treatment used together with the primary treatment. Its purpose is to assist the primary treatment. Also called adjunct therapy.

**adjustment disorder** : A condition in which a person responds to a stressful event (such as an illness, job loss, or divorce) with extreme emotions and actions that cause problems at work and home.

**adjuvant therapy** : Additional cancer treatment given after the primary treatment to lower the risk that the cancer will come back. Adjuvant therapy may include chemotherapy, radiation therapy, hormone therapy, targeted therapy, or biological therapy.

**ADL**: Activities of daily living. The tasks of everyday life. Basic ADLs include eating, dressing, getting into or out of a bed or chair, taking a bath or shower, and using the toilet. Instrumental activities of daily living (IADL) are activities related to independent living and include preparing meals, managing money, shopping, doing housework, and using a telephone. Also called activities of daily living.

**ADME**: Abbreviation for Absorption, Distribution, Metabolism, Excretion. Sometimes referred to as ADMET or ADME-Tox to account for toxicity.

**administration** : In medicine, the act of giving a treatment, such as a drug, to a patient. It can also refer to the way it is given, the dose, or how often it is given.

**admixture mapping** : A method used to identify genetic variants associated with traits and/or diseases in ethnic groups whose genomes resulted from a recent mixture of two or more geographically distinct ancestral populations.

**adnexal mass** : A lump in tissue near the uterus, usually in the ovary or fallopian tube. Adnexal masses include ovarian cysts, ectopic (tubal) pregnancies, and benign (not cancer) or malignant (cancer) tumors.

**ado trastuzumab emtansine**: An antibody-drug conjugate (ADC) consisting of the recombinant anti-epidermal growth factor receptor 2 (HER2) monoclonal antibody trastuzumab conjugated to the maytansinoid DM1 via a nonreducible thioether linkage (MCC) with potential antineoplastic activity. The trastuzumab moiety of this ADC binds to HER2 on tumor cell surface surfaces; upon internalization, the DM1 moiety is released and binds to tubulin, thereby disrupting microtubule assembly/disassembly dynamics and inhibiting cell division and the proliferation of cancer cells that overexpress HER2. Linkage of antibody and drug through a nonreducible linker has been reported to contribute to

the improved efficacy and reduced toxicity of this ADC compared to similar ADCs constructed with reducible linkers.

**ado-trastuzumab emtansine :** A drug used to treat HER2-positive breast cancer that has spread to other parts of the body. It is used in patients who have already been treated with the anticancer drug called trastuzumab and a type of drug called a taxane. It may also be used in patients whose cancer has recurred (come back) after adjuvant therapy with these drugs. It is also being studied in the treatment of other types of cancer. Ado-trastuzumab emtansine contains a monoclonal antibody called trastuzumab that binds to a protein called HER2, which is found on some breast cancer cells. It also contains an anticancer drug called DM1, which may help kill cancer cells. Ado-trastuzumab emtansine is a type of antibody-drug conjugate. Also called Kadcyla and T-DM1.

**adolescent :** A young person who has begun puberty but has not yet become an adult. During adolescence a child experiences physical and hormonal changes that mark the transition into adulthood. Adolescents are generally between the ages of 10 and 19 years.

**adoptive cellular therapy :** A treatment used to help the immune system fight diseases, such as cancer and infections with certain viruses. T cells are collected from a patient and grown in the laboratory. This increases the number of T cells that are able to kill cancer cells or fight infections. These T cells are given back to the patient to help the immune system fight disease. Also called cellular adoptive immunotherapy.

**adozelesin:** An alkylating agent that bind to the DNA minor groove in a sequence-specific manner and form covalent adducts with adenines, resulting in the inhibition of DNA replication and induction of apoptosis.

**ADP:** Adenosine diphosphate. See ATP.

**ADP (adenosine diphosphate):** A ribonucleoside 5'-diphosphate serving as phosphate group acceptor in the cell energy cycle.

**adrenal cancer :** Cancer that forms in the tissues of the adrenal glands (two glands located just above the kidneys). The adrenal glands make hormones that control heart rate, blood pressure, and other important body functions. Adrenal cancer that starts in the outside layer of the adrenal gland is called adrenocortical carcinoma. Adrenal cancer that starts in the center of the adrenal gland is called malignant pheochromocytoma.

**adrenal cortex :** The outer part of the adrenal gland (a small organ on top of each kidney). The adrenal cortex makes androgen and corticosteroid hormones.

**adrenal gland :** A small gland that makes steroid hormones, adrenaline, and noradrenaline. These hormones help control heart rate, blood pressure, and other important body functions. There are two adrenal glands, one on top of each kidney. Also called suprarenal gland.

**adrenal glands:** two glands lying atop the kidneys that produce a family of steroids.

**adrenal insufficiency :** A rare disorder in which the adrenal glands do not make enough of certain hormones. Symptoms include weight loss, loss of appetite, nausea and vomiting, diarrhea, muscle weakness, fatigue, low blood sugar, low blood pressure, and patchy or dark skin. Most cases of the disorder are caused by immune system problems, but may also be caused by infection, cancer, or other diseases. Also called Addison disease.

**adrenal medulla :** The inner part of the adrenal gland (a small organ on top of each kidney). The adrenal medulla makes chemicals such as epinephrine (adrenaline) and norepinephrine (noradrenaline) which are involved in sending nerve signals.

**adrenalectomy :** Surgery to remove one or both adrenal glands (a small organ on top of each kidney).

**adrenaline :** A hormone and neurotransmitter. Also called epinephrine.

**adrenocortical :** Having to do with or made by the outer layer of the adrenal gland, which produces steroid hormones. There is an adrenal gland on top of each kidney.

**adrenocortical cancer :** A rare cancer that forms in the outer layer of tissue of the adrenal gland (a small organ on top of each kidney that makes steroid hormones, adrenaline, and noradrenaline to control heart rate, blood pressure, and other body functions). Also called adrenocortical carcinoma and cancer of the adrenal cortex.

**adrenocortical carcinoma :** A rare cancer that forms in the outer layer of tissue of the adrenal gland (a small organ on top of each kidney that makes steroid hormones, adrenaline, and noradrenaline to control heart rate, blood pressure, and other body functions). Also called adrenocortical cancer and cancer of the adrenal cortex.

**adrenocorticotrophic hormone:** A hormone secreted by the anterior portion of the pituitary gland and regulates hormone, primarily cortisol, secreted by the adrenal gland. OR A hormone made in the pituitary gland. Adrenocorticotrophic hormone acts on the outer part of the adrenal gland to control its release of corticosteroid hormones. More adrenocorticotrophic hormone is made during times of stress. Also called ACTH and corticotropin.

**AdreView :** A drug containing a form of radioactive iodine called I 123 that is used to detect certain types of tumors, including pheochromocytomas and neuroblastomas. Radiation from the I 123 may help show where cancer cells are in the body. AdreView is a type of radioimaging agent and a type of radioconjugate. Also called 123I-MIBG, iobenguane I 123, and iodine I 123 metaiodobenzylguanidine.

**Adriamycin PFS :** A brand name for doxorubicin hydrochloride, which is used to treat many types of cancer. Adriamycin PFS brand has been taken off the market and is no longer available.

**Adriamycin RDF :** A brand name for doxorubicin hydrochloride, which is used to treat many types of cancer. Adriamycin RDF brand has been taken off the market and is no longer available.

**AdRTVP-1-transduced prostate cancer cell-based vaccine:** A cell-based vaccine comprised of prostate cancer cells transduced with an adenoviral vector encoding human RTVP-1 (AdRTVP-1), with potential immunostimulating and antineoplastic activities. RTVP-1, also referred to as glioma pathogenesis-related protein 1 (GLIP1), is down-regulated in prostate tumors. Regulated by tumor suppressor p53, the expression of RTVP-1 functions as a tumor suppressor, and is abundant in normal human prostate epithelial cells as well as in differentiated macrophages. Administration of AdRTVP-1-transduced prostate cancer cell-based vaccine leads to an induction of apoptosis through the expression of RTVP-1, which may result in a reduction in prostate cancer cellular proliferation. In addition, this vaccine may induce a cytotoxic T lymphocyte (CTL) response against prostate specific tumor- associated antigens.

**adsorb:** To collect molecules of a substance on a surface.

**adsorbent:** A substance that collects molecules of another substance on its surface. For example, gases that make water taste bad are strongly adsorbed on activated charcoal granules in water filters.

**Adsorbtion:** A process in which a gas or liquid mixture contacts a solid (the adsorbent) and a mixture component (the adsorbate) adheres to the surface of the solid. OR The gathering of a gas, liquid, or dissolved substance on the surface or interface zone of another substance. OR the adhesion of an extremely thin layer solid, liquid, or vapor molecules to the surface of a solid or liquid. OR The concentration of a substance on the surface of another substance, which is usually solid. OR A process whereby one or more components of an interfacial layer between two bulk phases are either enriched or depleted (IUPAC, 1972). OR In chemistry, often refers to situations where a molecule adheres to a surface. OR Not to be confused with absorption, adsorption is the build up of a molecule at a surface (such as an oil/water interface). Adsorption generally occurs because different parts of a molecule have an affinity for the two different phase on either side of the interface. OR Adsorption is collection of a substance on the surface of a solid or a liquid. For example, gases that make water taste bad are strongly adsorbed on charcoal granules in water filters.

**adsorption chromatography:** A technique for separating or analyzing mixtures that contain at least one component that is preferentially adsorbed by the stationary phase as it moves over it.

**adsorption indicator:** A substance that indicates an excess of a reactant in a precipitation reaction. For example, dichlorofluorescein is added to an NaCl solution being titrated with silver nitrate. Before the endpoint, excess chloride ions make the surface of the AgCl precipitate negative, and dichlorofluorescein anions remain in solution. After the endpoint, the excess silver ions make the surface of the AgCl precipitate positive, and the dichlorofluorescein anions are adsorbed onto their surface. Adsorption changes the color of the indicator from yellow-green to pink.

**adult progeria :** An inherited disorder marked by rapid aging that begins in early adolescence. Patients may be shorter than average, and have health problems such as loss and graying of hair, hardening of the arteries, thinning of the bones, diabetes, and thin, hardened skin. They also have an increased risk of cancer, especially osteosarcoma (a type of bone cancer). Adult progeria is caused by a mutation (change) in a gene involved in cell division. It is a type of autosomal recessive gene disease. Also called Werner syndrome and WS.

**adult rickets :** A condition in adults in which bones become soft and deformed because they don't have enough calcium and phosphorus. It is usually caused by not having enough vitamin D in the diet, not getting enough sunlight, or a problem with the way the body uses vitamin D. Symptoms include bone pain and muscle weakness. When the condition occurs in children, it is called rickets. Also called osteomalacia.

**adult T-cell leukemia/lymphoma :** An aggressive (fast-growing) type of T-cell non-Hodgkin lymphoma caused by the human T-cell leukemia virus type 1 (HTLV-1). It is marked by bone and skin lesions, high calcium levels, and enlarged lymph nodes, spleen, and liver. Also called ATLL.

**adulterant :** A substance added to a product but not listed as an ingredient, or a substance that ends up in a product by accident when the product is made. Adulterants may be in foods, drugs, and other products. An adulterant may cause a product to be harmful, cheaper to make, or not work as it should.

**advance directive :** A legal document that states the treatment or care a person wishes to receive or not receive if he or she becomes unable to make medical decisions (for example, due to being unconscious or in a coma). Some types of advance directives are living wills and do-not-resuscitate (DNR) orders.

**advanced cancer :** Cancer that has spread to other places in the body and usually cannot be cured or controlled with treatment.

**advanced practice nurse :** A registered nurse who has additional education and training in how to diagnose and treat disease. Advanced practice nurses are licensed at the state level and certified by national nursing organizations. In cancer care, an advanced practice nurse may manage the primary care of patients and their families, based on a practice agreement with a doctor. Also called APN, NP, and nurse practitioner.

**advanced waste treatment:** any treatment method or process employed following biological treatment (1) to reduce pollution load (2) to remove substances that may be harmful to receiving waters or the environment (3) to produce a high-quality effluent suitable for reuse in any specific manner or for discharge under critical conditions. The term tertiary treatment is commonly used to denote advanced waste treatment methods.

**advancing glacier:** a glacier that exhibits outward or downslope movement.

**advected fog:** fog caused by air moving from one region to another region with a different surface temperature.

**advection:** movement of air from one area to another, creating unusually warm or cold conditions.

**advection:** The predominately horizontal large-scale movement of air that causes changes in temperature or other physical properties. In oceanography, advection is the horizontal or vertical flow of sea water as a current.

**adverb:** a word that modifies a noun, pronoun, or another adverb.

**adverbial clause:** subordinate clauses that begin with subordinate conjunctions; they function as adverbs within the sentence and cannot stand alone as sentences.

**adverse effect:** This is abnormal, undesirable or harmful effect to an organism, indicated by some result such as mortality, altered food consumption, altered body and organ weights, altered enzyme levels or visible (pathological) change. An effect may be classed as adverse effect if it causes functional or anatomical damage, causes irreversible changes or increases the susceptibility of the organism to other chemical or biological stress. A non-adverse effect will usually be reversed when exposure to the chemical ceases.

**adverse effect :** An unexpected medical problem that happens during treatment with a drug or other therapy. Adverse effects do not have to be caused by the drug or therapy, and they may be mild, moderate, or severe. Also called adverse event.

**adverse event :** An unexpected medical problem that happens during treatment with a drug or other therapy. Adverse events do not have to be caused by the drug or therapy, and they may be mild, moderate, or severe. Also called adverse effect.

**ADVEXIN:** (Other name for: Ad5CMV-p53 gene)

**Advil :** A drug used to treat fever, swelling, pain, and redness by preventing the body from making a substance that causes inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called ibuprofen and Motrin.

**AE-941:** A substance made from shark cartilage that is being studied for its ability to prevent the growth of new blood vessels that tumors need to grow.

It is a type of antiangiogenesis agent.

**AE37 peptide/GM-CSF vaccine:** A vaccine containing HER2/Neu-derived epitope (amino acids 776-790) linked to Ii-Key peptide (Ii-Key/HER2/neu hybrid peptide or AE37), and combined with granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential antineoplastic and immunoadjuvant activities. Upon vaccination, AE37 may activate the immune system and stimulate T-helper cells against HER2/Neu expressing cancer cells. GM-CSF may potentiate the immune response against cancer cells expressing the HER2/Neu antigen. The Ii-Key moiety, a 4-amino acid (LRMK) epitope from the MHC class II-associated invariant chain (Ii protein), increases T-helper cell stimulation against HER2/neu antigen when compared to unmodified class II epitopes. HER2/neu, a tumor associated antigen (TAA), is overexpressed in a variety of tumor cell types and is highly immunogenic.

**AEE788:** An orally bioavailable multiple-receptor tyrosine kinase inhibitor. AEE788 inhibits phosphorylation of the tyrosine kinases of epidermal growth factor receptor (EGFR), human epidermal growth factor receptor 2 (HER2), and vascular endothelial growth factor receptor 2 (VEGF2), resulting in receptor inhibition, the inhibition of cellular proliferation, and induction of tumor cell and tumor-associated endothelial cell apoptosis. Check for active clinical trials using this agent. OR A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called protein tyrosine kinase inhibitors and angiogenesis inhibitors.

**AEG35156:** A second-generation synthetic antisense oligonucleotide with potential antineoplastic activity. AEG35156 selectively blocks the cellular expression of X-linked inhibitor of apoptosis protein (XIAP), a pivotal inhibitor of apoptosis that is overexpressed in many tumors. This agent reduces total levels of XIAP in tumor cells, working synergistically with cytotoxic drugs to overcome tumor cell resistance to apoptosis. XIAP interferes with both the intrinsic and extrinsic program-death signaling pathways, which may render tumor cells resistant to apoptosis. OR A substance being studied in the treatment of cancer. AEG35156 may kill cancer cells by blocking the production of a protein called XIAP that helps cells live longer. It also makes cancer cells more sensitive to anticancer

drugs. It is a type of antisense oligonucleotide, and a type of chemosensitizing agent. Also called GEM640.

**Aeration:** The process of adding air to water. In wastewater treatment, air is added to freshen wastewater and to keep solids in suspension. OR Preparation of a saturated solution of air gases by either spraying the solution in air or by bubbling air through it.

**Aeration tank:** The tank where raw or settled wastewater is mixed with return sludge and aerated. This is the same as an aeration bay, aerator, or reactor.

**aerobic:** living or occurring only in the presence of oxygen. OR An organism that lives in air and uses oxygen as the terminal electron acceptor in respiration. OR An organism that utilizes oxygen for growth. OR An organism that requires free oxygen for growth.

**aerobic :** In biochemistry, reactions that need oxygen to happen or happen when oxygen is present.

**aerobic biological oxidation:** any waste treatment process or other process utilizing aerobic organisms, in the presence of air or oxygen, as the agent for reducing pollution load, oxygen demand, or the amount of organic substance in waste. The term is used in reference to secondary treatment of wastes.

**Aerobic Degradation:** Degradation in the presence of air. Composting is a way of aerobic degradation.

**aerobic exercise :** Physical activity that increases the heart rate and the body's use of oxygen. It helps improve a person's physical fitness.

**aerobic metabolism :** A chemical process in which oxygen is used to make energy from carbohydrates (sugars). Also called aerobic respiration, cell respiration, and oxidative metabolism.

**aerobic respiration :** A chemical process in which oxygen is used to make energy from carbohydrates (sugars). Also called aerobic metabolism, cell respiration, and oxidative metabolism.

**aerodigestive tract :** The combined organs and tissues of the respiratory tract and the upper part of the digestive tract (including the lips, mouth, tongue, nose, throat, vocal cords, and part of the esophagus and windpipe).

**aerodynamic diameter of a particle:** The diameter of a spherical particle of unit density that has the same settling velocity in air as the particle in

question (IAEA, 1978).

**aerogel:** A porous solid formed by replacing the liquid in a gel with a gas; what remains when the liquid part of an alcogel is removed without damaging the solid part.

**Aeroseb-HC:** (Other name for: therapeutic hydrocortisone)

**aerosol:** This is a very broad term applied to any suspension of solid or liquid particles in a gas. They are fine enough in the particle size (0.001 to 100 micrometers) to remain dispersed for a period of the time. OR A product feature that uses compressed gas to spray the product from its container. OR A colloid in which solid particles or liquid droplets are suspended in a gas. Smoke is an example of a solid aerosol; fog is an example of a liquid aerosol. OR Particulate material, other than water or ice, in the atmosphere ranging in size from approximately  $10 \times 10^{-3}$  to larger than  $10 \times 10^2$   $\mu$  m in radius. Aerosols are important in the atmosphere as nuclei for the condensation of water droplets and ice crystals, as participants in various chemical cycles, and as absorbers and scatterers of solar radiation, thereby influencing the radiation budget of the earth-atmosphere system, which in turn influences the climate on the surface of the Earth.

**aerosol sargramostim:** An aerosol inhalation formulation containing a yeast-derived glycosylated recombinant form of human granulocyte macrophage colony stimulating factor (GM-CSF) with potential immunostimulating activity. Sargramostim binds to specific cell surface receptors, modulating the proliferation and differentiation of a variety of hematopoietic progenitor cells with some specificity towards stimulation of leukocyte production. This agent also activates neutrophils, monocytes, macrophages, and dendritic cells and promotes antigen presentation, upregulates antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated, lymphokine-activated killer cell function. Aerosol inhalation may help achieve high concentrations of sargramostim in the lung.

**aerosolize :** In medicine, to turn a liquid drug into a fine mist that can be inhaled.

**aerosolized aldesleukin:** An aerosol formulation of aldesleukin, a recombinant form of interleukin-2 (IL-2), with potential immunostimulating activity. Upon IL-2 inhalation, this cytokine activates lymphokine-activated

killer cells and natural killer cells, and induces expression of cytotoxic cytokines, such as interferon-gamma and transforming growth factor-beta. This may eventually halt tumor cell growth. Localized administration of IL-2 may decrease toxicity and increase efficacy.

**aerosolized liposomal rubitecan:** An aerosolized liposomal preparation of a water-insoluble derivative of camptothecin with potential antineoplastic activity. 9-nitro-20 (S)-camptothecin and its active metabolite 9-aminocamptothecin (9-AC) selectively stabilize topoisomerase I-DNA covalent complexes during S-phase, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery. This agent is formulated with dilauroylphosphatidylcholine and nebulized in particle sizes of 1.2-1.6 micrometer mass median aerodynamic diameter.

**Aerrane:** (Other name for: isoflurane)

**Aesthetic Fill:** Filling to a specific level in a clear package where the fill level is visible.

**Aesthetics:** The sum total of the visual response to the beauty of an object. Elements of aesthetics may include: color, shape or particular features of the object.

**Aezea®:** (Other name for: cenersen)

**afamelanotide:** A synthetic peptide analogue of the naturally occurring alpha-melanocyte stimulating hormone (a-MSH) with potential photoprotective activity. Mimicking the action of a-MSH, afamelanotide stimulates melanocytes to increase the production and release of melanin. Increased melanocyte melanin may protect against ultraviolet radiation (UVR)-initiated cellular DNA damage, oxidation of membrane proteins, and alterations in intracellular signaling processes in epidermal cells. Endogenously, a-MSH is released by skin cells in response to UVR exposure, stimulating melanocytes to produce and release melanin.

**afatinib dimaleate:** The dimaleate salt form of afatinib, an orally bioavailable anilino-quinazoline derivative and inhibitor of the receptor tyrosine kinase (RTK) epidermal growth factor receptor (ErbB; EGFR) family, with antineoplastic activity. Upon administration, afatinib selectively and irreversibly binds to and inhibits the epidermal growth factor receptors 1 (ErbB1; EGFR), 2 (ErbB2; HER2), and 4 (ErbB4;

HER4), and certain EGFR mutants, including those caused by EGFR exon 19 deletion mutations or exon 21 (L858R) mutations. This may result in the inhibition of tumor growth and angiogenesis in tumor cells overexpressing these RTKs. Additionally, afatinib inhibits the EGFR T790M gatekeeper mutation which is resistant to treatment with first-generation EGFR inhibitors. EGFR, HER2 and HER4 are RTKs that belong to the EGFR superfamily; they play major roles in both tumor cell proliferation and tumor vascularization and are overexpressed in many cancer cell types. or A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients with certain mutations (changes) in a cell protein called epidermal growth factor receptor (EGFR). It is also being studied in the treatment of other types of cancer. Afatinib dimaleate blocks certain EGFRs, which may help keep cancer cells from growing. It may also prevent the growth of new blood vessels that tumors need to grow. Afatinib dimaleate is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called Gilotrif.

**affected :** Individuals in a pedigree who exhibit the specific phenotype under study.

**afferent neurons:** neurons that project into the cortex of the brain; sensory neurons are afferents

**Affinitac:** (Other name for: ISIS 3521)

**Affinitak:** (Other name for: ISIS 3521)

**Affinity:** Refers to a molecule's tendency associate with another. Drug affinity refers to a drug's ability to bind to a biological target.

**Affinity:** The attraction for another substance.

**affinity :** In chemistry and biology, the strength of the attraction between two substances, such as two chemicals, or an antigen and an antibody.

**Affinity chromatography:** A protein-purification technique based on the high affinity of many proteins for specific chemical groups. Such groups are attached to an inert matrix, and the protein sample is applied; only those proteins with an affinity for the groups will bind. Or A column chromatographic technique that employs attached functional groups that have a specific affinity for sites on particular proteins. or Affinity chromatography. A column chromatographic technique that employs

attached functional groups that have a specific affinity for sites on particular proteins.

**Affinity labeling:** A means of mapping the active site of an enzyme by using a substrate analog that binds to the active site and forms a covalent bond with a nearby amino acid.

**affinity reagent :** In chemistry and biology, a compound that binds specific substances, such as proteins or nucleic acids. Many affinity reagents are antibodies. They are used to analyze tissue samples to help diagnose diseases.

**afimoxifene:** A tamoxifen metabolite with both estrogenic and anti-estrogenic effects. Afimoxifene has a higher affinity for the estrogen receptor than tamoxifen, and functions as an antagonist in breast cancer cells.

**Afinitor :** (Other name for: everolimus) OR A drug used with exemestane to treat some postmenopausal women with advanced breast cancer that is hormone-receptor positive and HER2 negative. It is also used to treat certain types of pancreatic, lung, and gastrointestinal neuroendocrine tumors that cannot be removed by surgery, are advanced, or have spread to other parts of the body. It is also used to treat advanced renal cell carcinoma (a type of kidney cancer) and subependymal giant cell astrocytoma in some patients, including children. Afinitor is being studied in the treatment of other types of cancer. It stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It also lowers the body's immune response. Afinitor is a type of kinase inhibitor, a type of angiogenesis inhibitor, and a type of immunosuppressant. Also called Afinitor Disperz, everolimus, and RAD001.

**Afinitor Disperz :** (Other name for: everolimus tablets for oral suspension) OR A drug used with exemestane to treat some postmenopausal women with advanced breast cancer that is hormone-receptor positive and HER2 negative. It is also used to treat certain types of pancreatic, lung, and gastrointestinal neuroendocrine tumors that cannot be removed by surgery, are advanced, or have spread to other parts of the body. It is also used to treat advanced renal cell carcinoma (a type of kidney cancer) and subependymal giant cell astrocytoma in some patients, including children. Afinitor Disperz is being studied in the treatment of other types of cancer. It stops cancer cells from dividing and may prevent the growth of new blood

vessels that tumors need to grow. It also lowers the body's immune response. Afinitor Disperz is a type of kinase inhibitor, a type of angiogenesis inhibitor, and a type of immunosuppressant. Also called Afinitor, everolimus, and RAD001.

**aflatoxin :** A harmful substance made by certain types of mold (*Aspergillus flavus* and *Aspergillus parasiticus*) that is often found on poorly stored grains and nuts. Consumption of foods contaminated with aflatoxin is a risk factor for primary liver cancer.

**Aflodac:** (Other name for: sulindac)

**AFP:** A protein normally produced by a fetus. AFP levels are usually undetectable in the blood of healthy adult men or women (who are not pregnant). An elevated level of AFP suggests the presence of either a primary liver cancer or germ cell tumor. Also called alpha-fetoprotein.

**AFP gene hepatocellular carcinoma vaccine:** A cancer vaccine composed of naked plasmid DNA of the gene for the tumor-associated antigen alpha-fetoprotein (AFP), a macromolecule that acts as a specific immunologic target for hepatocellular carcinoma. This agent exerts an antitumor effect by inducing cytotoxic T-lymphocytes to attack AFP-expressing tumor cells. Check for active clinical trials using this agent.

**AFP464:** A synthetic lysyl prodrug of the amino-substituted flavone derivative aminoflavone with antiproliferative and antineoplastic activities. AFP464 is rapidly converted to aminoflavone in plasma. Aminoflavone activates the aryl hydrocarbon receptor (AhR) signaling pathway leading to an increase in cytochrome P450 1A1 (CYP1A1) and cytochrome P450 1A2 (CYP1A2) expression and, to a lesser extent, an increase in cytochrome P450 1B1 (CYP1B1) expression. Subsequently, aminoflavone is metabolized to toxic metabolites by the cytochrome P450 enzymes that it induces; these toxic metabolites covalently bind to DNA, resulting in the phosphorylation of p53, the induction of the p53 downstream target p21Waf1/Cip1, and apoptosis. Pulmonary toxicity may be dose-limiting. OR A substance being studied in the treatment of cancer. AFP464 kills cancer cells or stops them from dividing. It is a type of aminoflavone.

**After Cure:** Continuation of curing after heat source removed ie injection mold or compression mold.

**aftershock:** one of the small earthquakes that may follow the main earthquake.

**afuresertib:** An orally bioavailable inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity.

Afuresertib binds to and inhibits the activity of Akt, which may result in inhibition of the PI3K/Akt signaling pathway and tumor cell proliferation and the induction of tumor cell apoptosis. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**AG-013736:** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called angiogenesis inhibitors and protein tyrosine kinase inhibitors.

**AG-024322:** A cyclin-dependent kinase (CDK) inhibitor with antineoplastic activity. AG-024322 selectively inhibits cyclin-dependent kinases (particularly CDK1,2 and 4), enzymes that regulate cell cycle progression. Inhibition of CDK may result in cell cycle arrest, induction of apoptosis, and inhibition of DNA replication and tumor cell proliferation. Check for active clinical trials using this agent.

**AG014699:** A substance being studied in the treatment of breast cancers caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is also being studied in the treatment of other types of cancer. It blocks an enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. AG014699 may cause cancer cells to die. It is a type of poly(ADP-ribose) polymerase inhibitor. Also called PARP-1 inhibitor AG014699.

**AG2037:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called glycinamide ribonucleotide formyl transferase inhibitors.

**AG3340:** A substance that is being studied in the treatment of cancer. It is a matrix metalloproteinase inhibitor and belongs to the family of drugs called angiogenesis inhibitors. Also called prinomastat.

**AG337:** A substance that is being studied in the treatment of liver cancer. It belongs to the family of drugs called thymidylate synthase inhibitors. Also called nolatrexed and Thymitaq.

**aganglionic megacolon :** A condition in which certain nerve cells are missing from the muscle layers of part of the large intestine. This causes

severe constipation or blockage of the large intestine. Constipation is when stool becomes hard, dry, and difficult to pass and bowel movements occur less often than normal. Other symptoms include swollen abdomen, vomiting, bloody diarrhea, gas, lack of energy, and trouble gaining weight. Aganglionic megacolon is present from birth, but the symptoms may not appear until later in a child's life. This condition has been linked to an increased risk of thyroid cancer and neuroblastoma. Also called Hirschsprung disease.

**agar:** A gel made from seaweed used to make salt bridges.

**Agaricus blazei Murill extract:** A dietary supplement containing an extract of the Basidiomycete fungus *Agaricus blazei* Murill with potential chemopreventive, antineoplastic and immunopotentiating activities. *Agaricus blazei* Murill extract contains high levels of phytochemicals, especially beta-D-glucans. Beta-D-glucans may promote dendritic cell (DC) maturation; increase interferon gamma (IFN-gamma), tumor necrosis factor alpha (TNF-alpha) and immunoglobulin levels; and may enhance natural killer (NK) cell activity, potentially boosting anti-tumor host immune responses.

**agatolimod sodium:** The tricosasodium salt of a synthetic 24-mer oligonucleotide containing 3 CpG motifs with potential antineoplastic and immunostimulatory activity. Agatolimod selectively targets Toll-like receptor 9 (TLR9), thereby activating dendritic and B cells and stimulating cytotoxic T cell and antibody responses against tumor cells bearing tumor antigens.

**AGC:** A finding of abnormal cells in a Pap test. The glandular cells come from the inner part of the cervix or the lining of the uterus. This finding may be a sign of cancer or other serious condition, and more testing may be needed. Also called atypical glandular cells.

**age-related macular degeneration :** A condition in which there is a slow breakdown of cells in the center of the retina (the light-sensitive layers of nerve tissue at the back of the eye). This blocks vision in the center of the eye and can cause problems with activities such as reading and driving. Age-related macular degeneration is most often seen in people who are over the age of 50. Also called AMD, ARMD, and macular degeneration.

**agent study :** In cancer prevention, a clinical trial that studies whether taking certain medicines, vitamins, minerals, or food supplements can

prevent cancer. Also called chemoprevention study.

**agglomeration:** In meteorology, the process by which precipitation particles grow larger by collision or contact with cloud particles or other precipitation particles.

**agglutinin :** A substance that makes particles (such as bacteria or cells) stick together to form a clump or a mass.

**aggravating factor :** Something that makes a condition worse. For example, tobacco smoke is an aggravating factor for asthma.

**Aggregate:** A collection of minerals, i.e. fine particles of stone, grit, mica, etc. which provide the textured finish of materials, such as Weather-coat No.1.

**aggressive :** In medicine, describes a tumor or disease that forms, grows, or spreads quickly. It may also describe treatment that is more severe or intense than usual.

**aggressive lymphoma :** A type of lymphoma that grows and spreads quickly and has severe symptoms. Also called high-grade lymphoma and intermediate-grade lymphoma.

**Aging:** The change in physical and chemical properties of an elastomer that has been exposed to a particular environment over time The change of a material with time under defined environmental conditions, leading to improvement or deterioration of properties. OR The change of a material with time under defined environmental conditions, leading to improvement or deterioration of properties. OR The change of a material with time under defined environmental conditions, leading to improvement or deterioration of properties. OR The physical and/or chemical change of a material with respect to time, under defined environmental conditions, leading to improvement or deterioration of properties. The effect of exposing plastic to a specific environment for an extended period of time. OR The change of a material with time under defined environmental conditions, leading to improvement or deterioration of properties. OR The process of, or the results of, exposure of plastics to natural or artificial environmental conditions for a prolonged period of time.

**Aging, Accelerated:** Tests run on destructive influence of light, oxygen, heat and ozone in as short a period as possible

**agitation :** A condition in which a person is unable to relax and be still. The person may be very tense and irritable, and become easily annoyed by small things. He or she may be eager to have an argument, and be unwilling to work with caregivers to make the situation better.

**aglatimagene besadenovec:** An adenoviral vector engineered to express the herpes simplex virus thymidine kinase (HSV-tk) gene, which, when administered in conjunction with a synthetic acyclic guanosine analogue, possesses potential antineoplastic activity. Aglatimagene besadenovec is transduced into tumor cells, sensitizing tumor cells that overexpress HSV-tk to synthetic acyclic guanosine analogues. Subsequently, a low dose of a synthetic acyclic guanosine analogue such as valacyclovir (VCV) or ganciclovir (GCV) is given, which may preferentially kill tumor cells containing the adenoviral vector and overexpressing HSV-tk. Release of tumor-associated antigens (TAAs) by dying tumor cells may then stimulate an antitumor cytotoxic T lymphocyte (CTL) response.

**agnogenic myeloid metaplasia :** A progressive, chronic disease in which the bone marrow is replaced by fibrous tissue and blood is made in organs such as the liver and the spleen, instead of in the bone marrow. This disease is marked by an enlarged spleen and progressive anemia. Also called chronic idiopathic myelofibrosis, idiopathic myelofibrosis, myelosclerosis with myeloid metaplasia, and primary myelofibrosis.

**Agonist:** A drug or an endogenous ligand that can bind to a receptor and elicit a biological response characteristic of the receptor. Note the existence of partial agonists, inverse agonists, and superagonists. Or A drug or substance that binds to a receptor inside a cell or on its surface and causes the same action as the substance that normally binds to the receptor.

**agonistic anti-CD40 monoclonal antibody ADC-1013:** A human immunoglobulin (Ig) G1 monoclonal antibody directed against the cell surface receptor CD40 with potential immunostimulatory and antineoplastic activities. Upon intratumoral administration, agonistic anti-CD40 monoclonal antibody ADC-1013 binds to CD40 on antigen-presenting dendritic cells, which leads to the activation and proliferation of effector and memory T-cells, and enhances the immune response against tumor cells. In addition, this agent binds to the CD40 antigen present on the surfaces of tumor cells, which induces antibody-dependent cytotoxicity (ADCC). This eventually inhibits the proliferation of CD40-expressing

tumor cells. CD40, a stimulatory receptor and a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells, such as macrophages, dendritic cells and various tumor cell types; it plays a key role in the activation of the immune system.

**agonistic anti-OX40 monoclonal antibody MEDI6383:** An agonistic monoclonal antibody against receptor OX40 (CD134), with potential immunostimulatory activity. Upon administration, anti-OX40 monoclonal antibody MEDI6383 selectively binds to and activates the OX40 receptor, by mimicking the action of endogenous OX40 ligand (OX40L). OX40 receptor activation induces proliferation of memory and effector T lymphocytes. In the presence of tumor-associated antigens (TAAs), this may promote an immune response against the TAA-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor (TNF) receptor family, is expressed on T-lymphocytes and provides a co-stimulatory signal for the proliferation and survival of activated T cells. Check for active clinical trials using this agent.

**agonistic anti-OX40 monoclonal antibody MEDI6469:** An agonistic monoclonal antibody against the co-stimulatory receptor OX40 (CD134), with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, anti-OX40 monoclonal antibody MEDI6469 selectively binds to and activates OX40. OX40 activation induces proliferation of effector T-lymphocytes. In the presence of tumor-associated antigens (TAAs), this may promote an immune response against the TAA-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on T-lymphocytes and provides a co-stimulatory signal for the proliferation and survival of activated T-cells.

**agoraphobia :** An intense fear of being in open places or in situations where it may be hard to escape, or where help may not be available. People with agoraphobia are usually very anxious about having a panic attack in a public place. They may also have a fear of being alone or have trouble leaving their home. They usually avoid elevators, bridges, and public places. Agoraphobia is a type of phobia and a type of anxiety disorder.

**agranulocyte :** A type of white blood cell. Monocytes and lymphocytes are agranulocytes.

**Agreement State:** A State that has signed an agreement with the NRC authorizing the State to regulate certain uses of radioactive materials within the State. For additional detail, see Agreement State Program and Map and State Regulations.

**Agriflu:** (Other name for: trivalent influenza vaccine)

**Agrylin:** (Other name for: anagrelide hydrochloride)

**Agung:** Active volcano 10,380 ft (3,141 m) high in Bali, Indonesia. Last eruption was in 1964.

**AGUS:** A term that has been used to describe abnormal cells that come from glands in the walls of the cervix (the lower, narrow end of the uterus). These abnormal cells are found in a small number of Pap smears (a procedure used to detect cervical cancer) and may be a sign of more serious lesions or cancer. The term used now is atypical glandular cells. Also called atypical glandular cells of uncertain significance and atypical glandular cells of undetermined significance.

**AHA:** One of a group of substances that are found in several types of fruit and in milk. They are used in skin care products to reduce wrinkles and soften the skin. Examples of AHAs are glycolic acid, lactic acid, and citric acid. Also called alpha hydroxyl acid and fruit acid.

**Aicardi syndrome :** A rare, genetic disorder marked by a lack of tissue connecting the left and right halves of the brain, seizures, lesions on the back of the eye (retina), and other brain and eye abnormalities. Other problems may include unusual facial features, defects of the hands, spine, and ribs, and developmental and gastrointestinal problems. When Aicardi syndrome occurs, it is almost always in a newborn girl. People with Aicardi syndrome have an increased risk of certain tumors, such as hepatoblastoma (a type of liver cancer) and choroid plexus tumors (a rare tumor that forms in the brain).

**AIDS :** A disease caused by the human immunodeficiency virus (HIV). People with AIDS are at an increased risk for developing certain cancers and for infections that usually occur only in individuals with a weak immune system. Also called acquired immunodeficiency syndrome.

**AIDS-related cancer :** Types of cancer that are more likely to occur in people who are infected with the human immunodeficiency virus (HIV). The most common AIDS-related cancers are Kaposi sarcoma, non-Hodgkin

lymphoma, and cervical cancer. People infected with HIV who develop any one of these cancers are considered to have AIDS. Other less common types of AIDS-related cancers include cancers of the mouth, throat, liver, lung, colon, rectum, anus, testes, and skin.

**AIM:** Atoms-in-molecules. An analysis method based upon the shape of the total electron density; used to define bonds, atoms, etc. (5). Atomic charges computed using this theory are often quite different from those from other analyses (e.g., from Mulliken populations). Such charges are probably the most justifiable theoretically, but meet some resistance because the values obtained may be quite different from those from older theories (6).

**AIM2(-1)/HT001(-1)/TAF1B(-1) frameshift peptide vaccine:** A cancer vaccine containing the three frame shift peptides (FSP) AIM2(-1), HT001(-1) and TAF1B(-1), with potential immunomodulating activity. Upon administration, the AIM2(-1)/HT001(-1)/TAF1B(-1) FSP vaccine may induce an immune response against microsatellite instability (MSI) colorectal cancer-associated antigens. Frame shift mutations of AIM2 (absent in melanoma 2, an interferon-inducible protein), HT001 (asteroid homolog 1 or ASTE1, with an unknown function) and TAF1B (TATA box-binding protein-associated RNA polymerase I B, a transcription factor) are seen in MSI-positive colorectal cancers and may be associated with malignant transformation, tumor progression and the presence of tumor-infiltrating lymphocytes. These FSPs all have one-base deletions.

**Air:** The mixture of gases which we breathe! Most of the air (almost 4/5) is nitrogen with oxygen making up 1/5 and small amounts of argon (1%) and other gases in even smaller amounts. Carbon dioxide is only present in very small quantities. Water vapour is present in varying amounts depending on where you are in the world.

**Air Cure:** One method by which liquid coatings cure to a dry film. Oxygen from the air enters the film and cross-links the resin molecules. Also called "Air Dry" and "Oxidizing."

**AIR GAP:** In extrusion coating, the distance from the die opening to the tip formed by the pressure roll and chill roll. OR In extrusion coating, the distance from the die opening to the nip formed by the pressure roll and the chill roll.

**air mass:** large mass of air at the surface of the Earth with similar characteristics of temperature and humidity throughout the mass.

**Air pollutants:** Substances directly produced by a process, such as ash from a volcanic eruption or carbon monoxide gas from motor vehicle exhaust

**air pollution:** The presence of substances in the atmosphere resulting either from human activity or natural processes, present in sufficient concentration, for a sufficient time and under circumstances such as to interfere with the comfort, health, or welfare of persons or the environment (ISO, 1980). OR Substances that have been released into the air that are not natural. In the past, people have not been very concerned about waste being put into the atmosphere. Many thought that a tall chimney would remove the problem. Nowadays we are much more careful and take more care to dispose of problem gases, smoke and dusts in a more responsible way.

**Air Ring:** A circular manifold used to distribute an even flow of the cooling medium, air, onto a hollow tubular form passing through the center of the ring. In blown tubing, the air cools the tubing uniformly to provide uniform film thickness. OR In blown film extrusion, a circular manifold mounted above the extrusion die used to distribute an even flow of air against a blown film bubble.

**Air sampling:** The collection of samples of air to measure the radioactivity or to detect the presence of radioactive material, particulate matter, or chemical pollutants in the air. For related information, see Detecting Radiation and Regulatory Guide 8.25 , "Air Sampling in the Workplace."

**Air Trap:** Surface markings or depressions due to air caught between the material being cured and the mold surface

**Air-assist Forming:** A method of thermoforming in which a flow of air pressure is employed to partially pre-form the sheet immediately prior to the final pull down onto the mold using vacuum.

**Air-drying:** A description used for paints that dry solely or mainly during exposure to air at normal temperatures, as distinct from those that require heat-treatment (stoving and force-dried paints) or those that set independently of the surrounding atmosphere (catalysed or "accelerated" paints).

**airborne fraction:** The portion of CO<sub>2</sub> released from all energy consumption and land use activities that remains in the atmosphere as opposed to the amounts absorbed by plants and oceans. How the world's total carbon is partitioned among the oceanic, terrestrial, and atmospheric pools is determined by complex biogeochemical and climatological interactions.

**airborne particulates:** Total suspended matter found in the atmosphere as solid pieces or liquid droplets. Airborne particulates include windblown dust, emissions from industrial processes, smoke from the burning of wood and coal, and the exhaust of motor vehicles.

**Airborne radioactivity area:** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), the airborne radioactivity area is a room, enclosure, or area in which airborne radioactive materials, composed wholly or partially of licensed material, exist in concentrations that (1) exceed the derived air concentration limits (DACs), or (2) would result in an individual present in the area without respiratory protection exceeding, during those hours, 0.6 percent of the annual limit on intake (ALI) or 12 DAC-hours. For additional detail, see Appendix B to 10 CFR Part 20, "Standards for Protection Against Radiation," and Information for Radiation Workers.

**AIRLESS SPRAY:** A spray that increases the fluid pressure of paint by means of a pump that causes atomization with air, resulting in higher film build and little or no over-spray.

**airmass:** A widespread body of air in the atmosphere that gains certain meteorological or polluted characteristics while set in one location. The characteristics can change as it moves away.

**AIS:** A condition in which abnormal cells are found in the glandular tissue that lines certain internal organs, such as the uterus, cervix, lung, pancreas, and colon. AIS, which occurs most often in the cervix, may become cancer and spread to nearby normal tissue. Also called adenocarcinoma in situ.

**Aisle:** The side portions of a church parallel to the nave. Any passage way divided off by pillars.

**AJCC staging system :** A system to describe the amount and spread of cancer in a patient's body, using TNM. T describes the size of the tumor and any spread of cancer into nearby tissue; N describes spread of cancer to nearby lymph nodes; and M describes metastasis (spread of cancer to other

parts of the body). This system was created and is updated by the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC). The AJCC staging system is used to describe most types of cancer. Also called TNM staging system.

**AK 3012:** A proprietary topical formulation. Upon subcutaneous administration, the active ingredient in AK 3012 may inhibit actinic keratosis. Check for active clinical trials using this agent.

**Aknoten:** (Other name for: tretinoin)

**Akt:** A group of enzymes involved in several processes related to cell growth and survival. Akt enzymes help to transfer signals inside cells. An Akt enzyme is a type of serine/threonine protein kinase. Also called protein kinase B.

**AKT 1/2 inhibitor BAY1125976:** An orally bioavailable inhibitor of the serine/threonine protein kinase AKT (protein kinase B) isoforms 1 and 2 (AKT1/2) with potential antineoplastic activity. AKT1/2 inhibitor BAY1125976 selectively binds to and inhibits the phosphorylation and activity of AKT1/2 in a non-ATP competitive manner, which may result in the inhibition of the phosphatidylinositol 3 (PI3K)/AKT/mammalian target of rapamycin (mTOR) signaling pathway. This may lead to both the reduction of cell proliferation and the induction of cell apoptosis in AKT-overexpressing tumor cells. The AKT signaling pathway is often deregulated in cancer and is associated with tumor cell proliferation, survival and migration.

**Akt antisense oligonucleotide RX-0201:** A 20-mer antisense oligodeoxynucleotide (ODN) against the proto-oncogene Akt with potential antineoplastic activity. Akt-1 antisense oligonucleotide RX-0201 binds to Akt-1 mRNA, inhibiting translation of the transcript; suppression of Akt-1 expression may result in the inhibition of cellular proliferation and the induction of apoptosis in tumor cells that overexpress Akt-1. Akt-1 is a serine-threonine protein kinase that stimulates proliferation and inhibits apoptosis of tumor cells.

**AKT inhibitor ARQ 092:** An orally bioavailable inhibitor of the serine/threonine protein kinase AKT (protein kinase B) with potential antineoplastic activity. AKT inhibitor ARQ 092 binds to and inhibits the activity of AKT in a non-ATP competitive manner, which may result in the inhibition of the PI3K/AKT signaling pathway. This may lead to the

reduction in tumor cell proliferation and the induction of tumor cell apoptosis. The AKT signaling pathway is often deregulated in cancer and is associated with tumor cell proliferation, survival and migration. Check for active clinical trials using this agent.

**Akt inhibitor AZD5363:** A novel pyrrolopyrimidine derivative, and an orally available inhibitor of the serine/threonine protein kinase AKT (protein kinase B) with potential antineoplastic activity. AKT inhibitor AZD5363 binds to and inhibits all AKT isoforms. Inhibition of AKT prevents the phosphorylation of AKT substrates that mediate cellular processes, such as cell division, apoptosis, and glucose and fatty acid metabolism. A wide range of solid and hematological malignancies show dysregulated PI3K/AKT/mTOR signaling due to mutations in multiple signaling components. By targeting AKT, the key node in the PI3K/AKT signaling network, this agent may be used as monotherapy or combination therapy for a variety of human cancers.

**Akt inhibitor GSK2141795:** An orally bioavailable inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity. Akt inhibitor GSK2141795 binds to and inhibits the activity of Akt, which may result in inhibition of the PI3K/Akt signaling pathway and tumor cell proliferation and the induction of tumor cell apoptosis. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**Akt inhibitor LY2780301:** An orally bioavailable inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity. Akt inhibitor LY2780301 binds to and inhibits the activity of Akt, which may result in inhibition of the PI3K/Akt signaling pathway, thereby leading to inhibition of cell proliferation and the induction of apoptosis in tumor cells. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**Akt inhibitor MK2206:** An orally bioavailable allosteric inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity. Akt inhibitor MK2206 binds to and inhibits the activity of Akt in a non-ATP competitive manner, which may result in the

inhibition of the PI3K/Akt signaling pathway and tumor cell proliferation and the induction of tumor cell apoptosis. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**Akt inhibitor SR13668:** An orally bioavailable indole-3-carbinol (I3C) analogue inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic and antiangiogenic activities. Akt inhibitor SR13668 binds to and inhibits the activity of Akt, which may result in inhibition of the PI3K/Akt signaling pathway and tumor cell proliferation, and the induction of tumor cell apoptosis. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**Akt/ERK inhibitor ONC201:** A water soluble, orally bioavailable inhibitor of the serine/threonine protein kinase Akt (protein kinase B) and extracellular signal-regulated kinase (ERK), with potential antineoplastic activity. Upon administration, Akt/ERK inhibitor ONC201 binds to and inhibits the activity of Akt and ERK, which may result in inhibition of the phosphatidylinositol 3-kinase (PI3K)/Akt signal transduction pathway as well as the mitogen-activated protein kinase (MAPK)/ERK-mediated pathway. This may lead to the induction of tumor cell apoptosis mediated by tumor necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL)/TRAIL death receptor type 5 (DR5) signaling in AKT/ERK-overexpressing tumor cells. The PI3K/Akt signaling pathway and MAPK/ERK pathway are upregulated in a variety of tumor cell types and play a key role in tumor cell proliferation, differentiation and survival by inhibiting apoptosis. In addition, ONC201 is able to cross the blood-brain barrier.

**Akti-1/2 inhibitor treated tumor infiltrating lymphocytes:** Autologous tumor infiltrating lymphocytes (TILs) harvested directly from the infiltrate of a patient's tumor and treated with an inhibitor of the serine/threonine kinases Akt-1 and -2 (Akti-1/2) during ex vivo expansion, with potential antineoplastic activity. Upon reintroduction into the patient, the Akti-1/2-treated TILs recognize and kill cancer cells. Akt inhibition promotes the

immunologic memory of the TILs and enhances their expansion, in vivo long-term persistence and antitumor activity.

**Akubras:** We thought we would put this in because we have met people from New Zealand who didn't know what they were and understand that there are a few New Zealanders in New South Wales. Akubras are a kind of you beaut hat that all real Ostrayans (e.g., Greg Norman) wear.

**Akynzeo :** (Other name for: netupitant and palonosetron hydrochloride)  
OR A combination of two drugs used to prevent nausea and vomiting caused by chemotherapy. It is a combination of netupitant and palonosetron hydrochloride. Akynzeo blocks the action of chemicals in the brain that may trigger nausea and vomiting. Akynzeo is a type of antiemetic. Also called netupitant and palonosetron hydrochloride.

**Alagille syndrome :** A rare disorder in which there are defects in the small tubes that carry bile (fluid that helps digest fat) out of the liver. These small tubes may be narrow or have an abnormal shape, or there may be fewer of them than normal. This can cause bile to build up in the liver, which may lead to cirrhosis (scarring of the liver) and liver damage. Alagille syndrome can also affect other parts of the body, including the heart, kidneys, blood vessels, eyes, face, and spine. It usually occurs in infants and children and may be inherited.

**alanine:** A naturally occurring aliphatic amino acid which is required for protein synthesis but is not essential in the diet. Beta-alanine ( $\text{NH}_2\text{CH}_2\text{CH}_2\text{COOH}$ ) also occurs naturally.

**alanine aminopeptidase :** An enzyme that is normally found in healthy kidneys. It may be found at high levels in the urine when there are kidney problems. It is used as a biomarker to detect damage to the kidneys caused by drugs and other agents. It may also be used to diagnose certain kidney and liver disorders. Also called AAP.

**alanine transferase :** An enzyme found in the liver and other tissues. A high level of alanine transferase released into the blood may be a sign of liver damage, cancer, or other diseases. Also called serum glutamate pyruvate transaminase and SGPT.

**alanosine :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antimetabolites. Also called SDX-102.

**ALARA:** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), ALARA is an acronym for "as low as (is) reasonably achievable," which means making every reasonable effort to maintain exposures to ionizing radiation as far below the dose limits as practical, consistent with the purpose for which the licensed activity is undertaken, taking into account the state of technology, the economics of improvements in relation to state of technology, the economics of improvements in relation to benefits to the public health and safety, and other societal and socioeconomic considerations, and in relation to utilization of nuclear energy and licensed materials in the public interest. For additional detail, see Dose Limits for Radiation Workers and Dose Limits for Radiation Workers.

**albedo:** The fraction of the total solar radiation incident on a body that is reflected by it.

**albinism :** A group of genetic conditions marked by little or none of the pigment melanin in the skin, hair, and/or eyes. People with albinism may have vision problems and white or yellow hair; reddish, violet, blue or brown eyes; and pale skin.

**albumin :** A type of protein found in blood, egg white, milk, and other substances.

**albuterol sulfate:** The sulfate salt of the short-acting sympathomimetic agent albuterol, a 1:1 racemic mixture of (R)-albuterol and (S)-albuterol with bronchodilator activity. Albuterol stimulates beta<sub>2</sub>-adrenergic receptors in the lungs, thereby activating the enzyme adenylate cyclase that catalyzes the conversion of ATP to cyclic-3',5'-adenosine monophosphate (cAMP). Increased cAMP concentrations relax bronchial smooth muscle, relieve bronchospasms, and reduce inflammatory cell mediator release, especially from mast cells. To a lesser extent albuterol stimulates beta<sub>1</sub>-adrenergic receptors, thereby increasing the force and rate of myocardial contraction.

**Alcaptonuria:** A relatively harmless hereditary disorder resulting from the aberrant breakdown of tyrosine and phenylalanine.

**ALCAR :** A form of the natural substance carnitine that is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is made in muscle and liver tissue and is found in certain foods, such as meat, poultry, fish, and some dairy products. It is used by many cells in the body

to make energy from fat. Also called acetyl-L-carnitine and acetyl-L-carnitine hydrochloride.

**Alchemy:** Alchemy is an ancient, non-scientific form of chemistry. In the middle ages, alchemists were people who tried to turn one element into another (usually lead (Pb) into gold (Au)).

**ALCL:** An aggressive (fast-growing) type of non-Hodgkin lymphoma that is usually of the T-cell type. The cancer cells express a marker called CD30 or Ki-1 on the surface, and may appear in the lymph nodes, skin, bones, soft tissues, lungs, or liver. Also called anaplastic large cell lymphoma.

**alcogel:** A gel formed by the coagulation of a sol in which the liquid is alcohol; at the gel point, the mixture forms a rigid substance that can stand on its own. The liquid and solid parts of an alcogel occupy the same volume.

**Alcohol:** A molecule with a hydroxyl group attached to a carbon atom. OR an organic chemical that contains an —OH group. OR "Any chemical compound where the hydroxy functional group -O-H is bound to a carbon skeleton. You are probably most familiar with the diols (compounds with two hydroxy groups), which are used in the manufacture of polyesters, and the phenols, where an hydroxy group is bound to an arene. OR Any class of organic compounds containing the hydroxyl group, OH. Specifically, the term is applied to ethyl alcohol (C<sub>2</sub>H<sub>5</sub>OH). OR A class of organic compounds which has an OH group covalently bonded to a carbon atom.

**alcohol :** A chemical substance found in drinks such as beer, wine, and liquor. It is also found in some medicines, mouthwashes, household products, and essential oils (scented liquid taken from certain plants). It is made by a chemical process called fermentation that uses sugars and yeast. There are different types of alcohol. The type used to make alcoholic drinks is called ethyl alcohol (ethanol). Drinking regular or large amounts of alcohol may increase the risk of certain types of cancer, such as cancer of the mouth, throat, esophagus, breast, liver, colon, and rectum.

**alcohol ablation :** An injection of ethanol (alcohol) through the skin directly into a tumor to kill cancer cells. Ultrasound or a CT scan is used to guide the needle into the tumor. Also called ethanol ablation, PEI, and percutaneous ethanol injection.

**alcohol dependence :** A chronic disease in which a person craves drinks that contain alcohol and is unable to control his or her drinking. A person

with this disease also needs to drink greater amounts to get the same effect and has withdrawal symptoms after stopping alcohol use. Alcohol dependence affects physical and mental health, and can cause problems with family, friends, and work. Regular heavy alcohol intake increases the risk of several types of cancer. Also called alcoholism.

**Alcoholic fermentation:** The anaerobic conversion of glucose into ethanol with the concomitant production of ATP.

**alcoholism :** A chronic disease in which a person craves drinks that contain alcohol and is unable to control his or her drinking. A person with this disease also needs to drink greater amounts to get the same effect and has withdrawal symptoms after stopping alcohol use. Alcoholism affects physical and mental health, and can cause problems with family, friends, and work. Regular heavy alcohol intake increases the risk of several types of cancer. Also called alcohol dependence.

**alcohols:** The alcohols are a family of organic compounds containing the  $-OH$  (hydroxide) grouping.

**Alcove:** A recess or niche; sometimes flanked by columns.

**Aldactone:** (Other name for: spironolactone)

**Aldara :** (Other name for: imiquimod) OR A drug used to treat early basal cell skin cancer and certain other skin conditions. It is being studied in the treatment of other types of cancer. Aldara is a type of biological response modifier. Also called imiquimod.

**Aldehyde:** Any chemical compound containing the functional group  $-C(O)H$ . Acrolein, the simplest aldehyde that is also a monomer capable of undergoing addition polymerisation, is responsible for the distinctive smell of burning fat. Here is a picture: OR an organic chemical that contains a  $-CHO$  group. Water addition to terminal alkynes forms aldehydes. OR A molecule containing a doubly bonded oxygen and a hydrogen attached to the same carbon atom. OR An aldehyde is an organic compound with a carbon bound to a  $-(C=O)-H$  group. Examples are formaldehyde ( $HCHO$ ), acetaldehyde,  $CH_3CHO$ , and benzaldehyde,  $C_6H_5CHO$ .

**aldehyde :** A type of chemical substance made from alcohol. Aldehydes are found in essential oils (scented liquid taken from plants).

**aldesleukin:** A drug used to treat some types of cancer. It is a form of interleukin-2, a cytokine made by leukocytes (white blood cells), that is

made in the laboratory. Aldesleukin increases the activity and growth of white blood cells called T lymphocytes and B lymphocytes. It is a type of biological response modifier. Also called Proleukin and recombinant human interleukin-2. OR A recombinant analog of the endogenous cytokine interleukin-2 (IL-2) with immunoregulatory and antineoplastic activities. Aldesleukin binds to and activates the IL-2 receptor, followed by heterodimerization of the cytoplasmic domains of the IL-2R beta and gamma(c) chains; activation of the tyrosine kinase Jak3; and phosphorylation of tyrosine residues on the IL-2R beta chain, resulting in an activated receptor complex. Various cytoplasmic signaling molecules are recruited to the activated receptor complex and become substrates for regulatory enzymes that are associated with the receptor complex. This agent enhances lymphocyte mitogenesis; stimulates long-term growth of human IL-2 dependent cell lines; enhances lymphocyte cytotoxicity; induces lymphokine-activated killer (LAK) cell and natural killer (NK) cell activities; and induces expression of interferon-gamma. Aldesleukin may induce T cell-mediated tumor regression in some tumor types.

**Aldol condensation:** The combination of two carbonyl compounds (e.g., an aldehyde and a ketone) to form a  $\beta$ -hydroxycarbonyl compound, or aldol.

**Aldose:** A monosaccharide whose C-1 carbon atom contains an aldehyde group.

**aldose:** A simple sugar in which the carbonyl carbon atom is an aldehyde; that is, the carbonyl carbon is at one end of the carbon chain.

**aldosterone :** A steroid hormone made by the adrenal cortex (the outer layer of the adrenal gland). It helps control the balance of water and salts in the kidney by keeping sodium in and releasing potassium from the body. Too much aldosterone can cause high blood pressure and a build-up of fluid in body tissues. Aldosterone is a type of mineralocorticoid hormone.

**aldoxorubicin:** A 6-maleimidocaproyl hydrazone derivative prodrug of the anthracycline antibiotic doxorubicin (DOXO-EMCH) with antineoplastic activity. Following intravenous administration, aldoxorubicin binds selectively to the cysteine-34 position of albumin via its maleimide moiety. Doxorubicin is released from the albumin carrier after cleavage of the acid-sensitive hydrazone linker within the acidic environment of tumors and, once located intracellularly, intercalates DNA, inhibits DNA synthesis, and

induces apoptosis. Albumin tends to accumulate in solid tumors as a result of high metabolic turnover, rapid angiogenesis, hypervascularity, and impaired lymphatic drainage. Because of passive accumulation within tumors, this agent may improve the therapeutic effects of doxorubicin while minimizing systemic toxicity.

**Aldrich syndrome :** An inherited immune disorder that occurs in young boys. It causes eczema (a type of skin inflammation), a decrease in the number of platelets (blood cells that help prevent bleeding), and frequent bacterial infections. People with Aldrich syndrome are at increased risk of developing leukemia and lymphoma. Also called Wiskott-Aldrich syndrome.

**Alecensa :** (Other name for: alectinib) OR A drug used to treat non-small cell lung cancer that has spread to other parts of the body and has a mutated (changed) form of a gene called anaplastic lymphoma kinase (ALK). It is used in patients whose cancer has gotten worse after treatment with or who cannot receive crizotinib (a type of anticancer drug). Alecensa blocks the protein made by the mutated ALK gene. Blocking this protein may stop the growth and spread of cancer cells. Alecensa is a type of tyrosine kinase inhibitor. Also called alectinib.

**alectinib:** An orally available inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) with antineoplastic activity. Upon administration, alectinib binds to and inhibits ALK kinase, ALK fusion proteins as well as the gatekeeper mutation ALK L1196M known as one of the mechanisms of acquired resistance to small-molecule kinase inhibitors. The inhibition leads to disruption of ALK-mediated signaling and eventually inhibits tumor cell growth in ALK-overexpressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK dysregulation and gene rearrangements are associated with a series of tumors. OR A drug used to treat non-small cell lung cancer that has spread to other parts of the body and has a mutated (changed) form of a gene called anaplastic lymphoma kinase (ALK). It is used in patients whose cancer has gotten worse after treatment with or who cannot receive crizotinib (a type of anticancer drug). Alectinib blocks the protein made by the mutated ALK gene. Blocking this protein may stop the growth and spread of cancer cells. Alectinib is a type of tyrosine kinase inhibitor. Also called Alecensa.

**alefacept:** A drug that is used to treat certain skin conditions and is being studied in the treatment of cutaneous (skin-related) T-cell cancer and T-cell non-Hodgkin lymphoma. Alefacept is made by combining part of an antibody with a protein that blocks the growth some types of T cells. It is a type of fusion protein and a type of immunosuppressant. Also called Amevive. OR A recombinant dimeric fusion protein consisting of the extracellular CD2-binding domain of the human leukocyte function-associated antigen 3 (LFA-3; CD58) linked to the Fc portion of human immunoglobulin G1 (IgG1) with potential immunosuppressive activity. Alefacept binds to the CD2 receptor expressed on the majority of T lymphocytes, blocking the binding of endogenous LFA-3, located on antigen-presenting cells (APCs), to the CD2 receptor; the activation and proliferation of T lymphocytes in response to LFA-3 binding is thus inhibited. In addition, binding of the IgG1 moiety of this agent to the Fc gamma receptor on the surface of natural killer (NK) cells may bridge NK cells and target T lymphocytes, initiating NK cell-mediated apoptosis of T lymphocytes.

**alemtuzumab:** A recombinant DNA-derived humanized monoclonal antibody directed against the cell surface glycoprotein CD52. Alemtuzumab is an IgG1 kappa with human variable framework and constant regions, and complementarity-determining regions derived from a rat monoclonal antibody. This agent selectively binds to CD52, thereby triggering a host immune response that results in lysis of CD52 + cells. CD52 is a glycoprotein expressed on the surface of essentially all normal and malignant B and T cells, a majority of monocytes, macrophages and natural killer (NK) cells, a subpopulation of granulocytes, and tissues of the male reproductive system. or A drug used to treat B-cell chronic lymphocytic leukemia. It is also being studied in the treatment of other types of cancer. Alemtuzumab binds to a protein called CD52, which is found on some types of immune cells and cancer cells. This may help the immune system kill cancer cells. Alemtuzumab is a type of monoclonal antibody. Also called Campath.

**alendronate sodium:** The sodium salt of alendronate, a second generation bisphosphonate and synthetic analog of pyrophosphate with bone anti-resorption activity. Alendronate sodium binds to and inhibits the activity of geranyltranstransferase (farnesyl pyrophosphate synthetase), an enzyme involved in terpenoid biosynthesis. Inhibition of this enzyme prevents the

biosynthesis of isoprenoid lipids (FPP and GGPP) that are donor substrates of farnesylation and geranylgeranylation during the post-translational modification of small GTPase signalling proteins, which is important in the process of osteoclast turnover. As a result, osteoclast activity is inhibited and bone resorption and turnover are reduced. Check for active clinical trials using this agent. OR A drug used to treat certain bone conditions, such as osteoporosis and Paget disease of the bone. It is also being studied in the treatment of hypercalcemia (high levels of calcium in the blood) and bone pain caused by cancer. Alendronate sodium slows the breakdown of bone and prevents the loss of calcium. It is a type of bisphosphonate. Also called Fosamax.

**Alfenta:** (Other name for: alfentanil hydrochloride)

**alfentanil hydrochloride:** The hydrochloride salt of alfentanil, a synthetic short-acting opioid with analgesic and local anesthesia enhancing activity. Alfentanil hydrochloride primarily binds to mu-opioid receptor, a G-protein-coupled receptor, thereby mimicking the actions of morphine, the prototypical mu receptor agonist. This agent induces anti-nociception responses mediated through inhibiting the release of various neurotransmitters such as substance P, GABA, dopamine, acetylcholine and noradrenaline; in addition, the release of vasopressin, somatostatin, insulin and glucagon are also inhibited.

**Alferon:** (Other name for: recombinant interferon alpha-2a)

**Alferon N:** (Other name for: recombinant interferon alfa)

**Alfisols:** An order of soils with a medium-to-high base supply, horizons of clay accumulation, and gray-brown surface horizons.

**Alfred Nobel:** A Swedish inventor, businessman and famous posthumous philanthropist (1833-1896). He developed the mercury percussion detonator (1863) and numerous other advances in explosives technology to make blasting safer and easier. He made a lot of money, which he left in his will to provide prizes for people whose work had been of great benefit to humanity, and economists. See Nobel Prize.

**alfuzosin hydrochloride:** The hydrochloride salt of alfuzosin, a quinazoline compound with smooth muscle-relaxing activity. Alfuzosin selectively binds to and antagonizes post-synaptic alpha1-adrenoreceptors in smooth muscle of the prostate, bladder base, bladder neck, prostatic capsule, and prostatic urethra, initiating relaxation of smooth muscle and

resulting in improvement of urine flow and the symptoms of benign prostatic hyperplasia (BPH). This agent also blocks alpha1-adrenoreceptors in peripheral vascular smooth muscle, resulting in vasodilatation and a decrease in peripheral vascular resistance.

**algae:** a large number of photosynthetic organisms that are generally unicellular and not classified as plants. OR Simple rootless plants that grow in sunlit waters in relative proportion to the amounts of nutrients available. They are food for fish and small aquatic animals.

**algaecide:** chemical agent added to water to destroy algae.

**algal blooms:** Sudden spurts of algal growth that can indicate potentially hazardous changes in local water chemistry.

**algebraic equation:** A statement that two algebraic expressions are equal.

**algebraic expression:** A collection of numbers, variables, operations, and grouping symbols.

**algenpantucel-L:** A cancer vaccine comprised of irradiated allogeneic pancreatic cancer cells transfected to express murine alpha-1,3-galactosyltransferase with potential antitumor activity. Vaccination is associated with the expression of murine alpha-1,3-galactosyl (alpha-gal) carbohydrate residues on cell membrane glycoproteins and glycolipids of the vaccine pancreatic cancer cell allograft; murine alpha-gal epitopes, not present on human cells, then induce a hyperacute rejection of the vaccine pancreatic cancer cell allograft. The hyperacute rejection involves the binding of pre-existing human anti-alpha-gal antibodies (which naturally occur against gut flora) to murine alpha-gal epitopes, resulting in the rapid activation of antibody-dependent cell-mediated cytotoxicity (ADCC) towards allograft cells. The host immune system then attacks endogenous pancreatic cancer cells, resulting in ADCC towards endogenous pancreatic cancer cells.

**ALH:** A benign (not cancer) condition in which there are more cells than normal in the breast lobules and the cells look abnormal under a microscope. Having ALH increases the risk of breast cancer. Also called atypical lobular breast hyperplasia and atypical lobular hyperplasia.

**alicyclic compound:** an aliphatic cyclic hydrocarbon, which means that a compound contains a ring but not an aromatic ring.

**ALIMTA:** (Other name for: pemetrexed disodium)

**Alimta :** A drug used alone or with another drug to treat certain types of non-small cell lung cancer and malignant pleural mesothelioma. It is being studied in the treatment of other types of cancer. Alimta blocks DNA synthesis and may kill cancer cells. It is a type of folate antagonist. Also called LY231514 and pemetrexed disodium.

**Alinia:** (Other name for: nitazoxanide)

**Aliphatic:** derived from or related to fats and other derivatives of the paraffin hydrocarbons, including unsaturated compounds of the ethylene and acetylene series.

**aliphatic compound:** a straight- or branched-chain hydrocarbon; an alkane, alkene, or alkyne.

**aliquot:** A sample of precisely determined amount taken from a material.

**alisertib:** A second-generation, orally bioavailable, highly selective small molecule inhibitor of the serine/threonine protein kinase Aurora A kinase with potential antineoplastic activity. Alisertib binds to and inhibits Aurora A kinase, which may result in disruption of the assembly of the mitotic spindle apparatus, disruption of chromosome segregation, and inhibition of cell proliferation. Aurora A kinase localizes to the spindle poles and to spindle microtubules during mitosis, and is thought to regulate spindle assembly. Aberrant expression of Aurora kinases occurs in a wide variety of cancers, including colon and breast cancers.

**alitretinoin:** An orally- and topically-active naturally-occurring retinoic acid with antineoplastic, chemopreventive, teratogenic, and embryotoxic activities. Alitretinoin binds to and activates nuclear retinoic acid receptors (RAR) and retinoid X receptors (RXR); these activated receptors act as transcription factors, regulating gene expression that results in the inhibition of cell proliferation, induction of cell differentiation, and apoptosis of both normal cells and tumor cells.

**ALK gene :** A gene that makes a protein called anaplastic lymphoma kinase (ALK), which may be involved in cell growth. Mutated (changed) forms of the ALK gene and protein have been found in some types of cancer, including neuroblastoma, non-small cell lung cancer, and anaplastic large cell lymphoma. These changes may increase the growth of cancer cells. Checking for changes in the ALK gene in tumor tissue may help to plan cancer treatment. Also called anaplastic lymphoma kinase gene.

**ALK Inhibitor ASP3026:** An orally available, small molecule inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK), with potential antineoplastic activity. Upon oral administration, ASP3026 binds to and inhibits ALK tyrosine kinase, ALK fusion proteins and ALK point mutation variants. Inhibition of ALK leads to the disruption of ALK-mediated signaling and the inhibition of cell growth in ALK-expressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK is not expressed in healthy adult human tissue but ALK dysregulation and gene rearrangements are associated with a series of tumors. Additionally, ALK mutations are associated with acquired resistance to small molecule tyrosine kinase inhibitors. Check for active clinical trials using this agent.

**ALK inhibitor RO5424802:** An orally available inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) with antineoplastic activity. Upon administration, ALK inhibitor RO5424802 binds to and inhibits ALK kinase, which leads to a disruption of ALK-mediated signaling and eventually inhibits tumor cell growth in ALK-overexpressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK dysregulation and gene rearrangements are associated with a series of tumors. Additionally, ALK mutations are associated with acquired resistance to small molecule tyrosine kinase inhibitors.

**ALK inhibitor X-396:** An orally available small molecule inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) with potential antineoplastic activity. Upon oral administration, X-396 binds to and inhibits ALK kinase, ALK fusion proteins and ALK point mutation variants. Inhibition of ALK leads to the disruption of ALK-mediated signaling and eventually inhibits tumor cell growth in ALK-expressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK is not expressed in healthy adult human tissue but ALK dysregulation and gene rearrangements are associated with a series of tumors; ALK mutations are associated with acquired resistance to small molecule tyrosine kinase inhibitors.

**ALK-FAK inhibitor CEP-37440:** An orally available dual kinase inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) and focal adhesion kinase (FAK), with potential antineoplastic activity.

Upon administration, ALK-FAK inhibitor CEP-37440 selectively binds to and inhibits ALK kinase and FAK kinase. The inhibition leads to disruption of ALK- and FAK-mediated signal transduction pathways and eventually inhibits tumor cell growth in ALK- and FAK-overexpressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development; its dysregulation and gene rearrangements are associated with a variety of tumors. The cytoplasmic tyrosine kinase FAK, a signal transducer for integrins, is upregulated and constitutively activated in various tumor types; it plays a key role in tumor cell migration, proliferation, survival, and tumor angiogenesis.

**ALK/FAK/Pyk2 inhibitor CT-707:** An orally available inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK), focal adhesion kinase (FAK) and proline-rich tyrosine kinase 2 (Pyk2), with potential antineoplastic activity. Upon administration, ALK/FAK/Pyk2 inhibitor CT-707 selectively binds to and inhibits ALK, FAK and Pyk2. The inhibition leads to disruption of ALK-, FAK- and Pyk2-mediated signal transduction pathways and eventually inhibits tumor cell growth in ALK-, FAK- and Pyk2-overexpressing tumor cells. Expression of these tyrosine kinases is dysregulated in various tumor types; they play a key role in tumor cell migration, proliferation, survival, and tumor angiogenesis.

**ALK/ROS1 inhibitor PF-06463922:** An orally available, ATP-competitive inhibitor of the receptor tyrosine kinases, anaplastic lymphoma kinase (ALK) and C-ros oncogene 1 (Ros1), with potential antineoplastic activity. Upon administration, ALK/ROS1 inhibitor PF-06463922 binds to and inhibits both ALK and ROS1 kinases. The kinase inhibition leads to disruption of ALK- and ROS1-mediated signaling and eventually inhibits tumor cell growth in ALK- and ROS1-overexpressing tumor cells. In addition, PF-06463922 is able to cross the blood brain barrier. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development; ALK dysregulation and gene rearrangements are associated with a series of tumors. ROS1, overexpressed in certain cancer cells, plays a key role in cell growth and survival of cancer cells.

**ALK/TRK inhibitor TSR-011:** An orally available inhibitor of both the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) and the tropomyosin-related kinases (TRK) TRKA, TRKB, and TRKC, with potential antineoplastic activity. Upon administration, ALK/TRK inhibitor

TSR-011 binds to and inhibits both ALK and TRK kinases. The inhibition leads to disruption of ALK- and TRK-mediated signaling and impedes tumor cell growth in ALK/TRK-overexpressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development; ALK dysregulation and gene rearrangements are associated with a series of tumors. TRK, a family of receptor tyrosine kinases activated by neurotrophins, is mutated in a variety of cancer cell types and plays an important role in tumor cell growth and survival.

**ALK5 inhibitor TEW-7197:** An orally bioavailable inhibitor of the serine/threonine kinase, transforming growth factor (TGF)-beta receptor type 1 (TGFBR1), also known as activin receptor-like kinase 5 (ALK5), with potential antineoplastic activity. Upon oral administration, ALK5 inhibitor TEW-7197 inhibits the activity of TGFBR1 and prevents TGF-beta/TGFBR1-mediated signaling. This suppresses tumor growth in TGFBR1-overexpressing tumor cells. TGFBR1, which is overexpressed in a variety of tumor cell types, plays a key role in tumor cell proliferation. Expression of TGF-beta promotes tumor cell proliferation, enhances the migration of tumor cells and suppresses the response of the host immune system to tumor cells.

**Alka Seltzer Gold:** (Other name for: sodium bicarbonate/potassium bicarbonate/anhydrous citric acid)

**Alkagin:** (Other name for: zinc oxide/aluminum starch octenylsuccinate/glycyrrheticin phytosome/vitamin E/botanical extracts-based skin protectant paste)

**alkali:** An alkali is a substance that dissolves in water to form a solution with a pH value greater than 7. Alkaline solutions contain an excess of hydroxide ions, OH<sup>-</sup>(aq).

**alkali :** A chemical that can dissolve in water, combine with acids to form salts, and make acids less acidic. Alkalis have a bitter taste and turn certain dyes blue. Some alkalis can help the body work the way it should. An example of an alkali is sodium hydroxide.

**alkali metal:** The Group 1 elements, lithium (Li), sodium (Na), potassium (K), rubidium (Rb), cesium (Cs), and francium (Fr) react with cold water to form strongly alkaline hydroxide solutions, and are referred to as "alkali metals". Hydrogen is not considered an alkali metal, despite its position on some periodic tables.

**alkali metals:** the column of elements from lithium to francium.

**alkali metals:** The alkali metals are the elements in Group 1 of the Periodic Table lithium, sodium, potassium, rubidium, caesium, and francium.

**Alkali resisting primer:** A paint used as a barrier to alkaline substances in the surface which would otherwise attack the paint film. Alkaline surfaces which are continually damp are not effectively sealed for long periods by this method.

**Alkali silica reaction (ASR):** ASR is a chemical combining of reactive silica from the concrete aggregate with the alkali from the cement paste in the presence of moisture. The result of the reaction is a gel, which can expand and may cause micro-cracks in the concrete.

**alkali soil:** a pedocal type of soil toxic to plant growth because of its high salt content.

**Alkalies:** compounds capable of neutralizing acids and usually characterized by an acrid taste. Can be mild like baking soda or highly caustic like lye.

**alkaline:** Describes an alkali (basic) or a solution that has excess of hydroxide ions. OR Forming or containing an alkali, and by extension, any base. Strictly speaking, an alkali is the hydroxide or carbonate salt of an element in the first two columns of the periodic table (those unstable alkali and alkaline earth metals things). OR Having a pH greater than 7.

**alkaline earth:** An oxide of an alkaline earth metal, which produces an alkaline solution in reaction with water. OR The Group 2 elements, beryllium (Be), magnesium (Mg), calcium (Ca), strontium (Sr), barium (Ba), and radium (Ra) form alkaline oxides and hydroxides and are called "alkaline earth metals". OR The alkaline earth metals are the elements in Group 2 of the Periodic Table beryllium, magnesium, calcium, strontium, barium, and radium. OR the column of elements from beryllium to radium.

**alkaline error:** A systematic error that occurs when glass electrodes are used to read the pH of an extremely alkaline solution; the electrode responds to sodium ions as though they were hydrogen ions, giving a pH reading that is consistently too low.

**Alkaline substance:** Chemical compounds in which the basic hydroxide (OH<sup>-</sup>) ion is united with a metallic ion, such as sodium hydroxide (NaOH)

or potassium hydroxide (KOH). These substances impart alkalinity to water and are employed for neutralization of acids. Lime is the most commonly used alkaline material in wastewater treatment.

**alkalinity:** A pressure- and temperature-independent property of seawater that determines in part the carbon content of seawater. Carbonate alkalinity is the sum of the concentration of bicarbonate plus two times the concentration of the carbonate ions. Total alkalinity is the amount of acid required to bring seawater to a pH at which all dissolved inorganic carbon becomes freely exchangeable. The alkalinity of the oceans is determined with potentiometric or normal titration techniques that detect and measure the presence of bicarbonate, carbonate, and borate ions. OR the capacity of water to neutralize acids, a property imparted by the water's content of carbonate, bicarbonate, hydroxide, and on occasion borate, silicate, and phosphate. It is expressed in milligrams per liter of equivalent calcium carbonate (mg/l CaCO<sub>3</sub>). OR A measure of a material's ability to neutralize acids. Alkalinity is usually determined using titration. or Refers to the amount of alkali. An alkali is a chemical that can dissolve in water, combine with acids to form salts, and make acids less acidic.

**alkalinization :** A process that lowers the amount of acid in a solution. In medicine, an alkali, such as sodium bicarbonate, may be given to patients to lower high levels of acid in the blood or urine that can be caused by certain medicines or conditions.

**alkaloid:** A class of bitter-tasting, basic organic compounds with nitrogen-containing rings. Alkaloids often have powerful effects on living things. Examples are cocaine, nicotine, strychnine, caffeine, and morphine. Or A member of a large group of substances found in plants and in some fungi. Alkaloids contain nitrogen and can be made in the laboratory. Nicotine, caffeine, codeine, and vincristine are alkaloids. Some alkaloids, such as vincristine, are used to treat cancer.

**Alkaloids:** A class of over 3,000 nitrogen-containing chemicals (such as caffeine and cocaine) that are produced by plants but have effects in humans and animals or Nitrogen-containing organic compounds of plant origin; often basic, and having intense biological activity.

**alkalosis:** A metabolic condition in which the capacity of the body to buffer OH<sup>-</sup> is diminished; usually accompanied by an increase in blood pH.

**alkane:** A saturated hydrocarbon with the general formula  $C_nH_{2n+2}$ . OR An alkane is a saturated hydrocarbon; that is, it contains only single covalent bonds. Their general formula is  $C_nH_{2n+2}$ . For example, ethane is  $C_2H_6$  and pentane is  $C_5H_{12}$ . OR Carbon compound containing only carbon and hydrogen, and single bonds only. OR a hydrocarbon without a double bond, triple bond, or ring structure. OR a hydrocarbon that contains only single covalent bonds. The alkane general formula is  $C_nH_{2n+2}$ . OR A series of organic compounds with general formula  $C_nH_{2n+2}$ . Alkane names end with -ane. Examples are propane (with  $n=3$ ) and octane (with  $n=8$ ). OR A hydrocarbon that has only single bonds. It is a saturated hydrocarbon.

**Alkanoic acid:** The proper IUPAC term for what we typically call carboxylic acids.

**ALKANOLAMINE:** An amine where some or all of the alkyl groups attached to the nitrogen contain hydroxyl functionality. For example; triethanolamine (TEA), monisopropanolamine (MIPA).

**alkene:** An alkene is an unsaturated hydrocarbon, that is a hydrocarbon whose molecules contain one or more double covalent bonds between its carbon atoms. OR Carbon compound containing carbon and hydrogen incorporating one or more double bonds. OR a hydrocarbon with one or more double bonds and no triple bond. OR a hydrocarbon that contains a carbon-carbon double bond. The alkene general formula is  $C_nH_{2n}$ . OR A compound that consists of only carbon and hydrogen, that contains at least one carbon-carbon double bond. Alkene names end with -ene. Examples are ethylene ( $CH_2=CH_2$ ); 1-propene ( $CH_2=CH_2CH_3$ ), and 2-octene ( $CH_3CH_2=CH(CH_2)_4CH_3$ ).

**Alkeran:** (Other name for: melphalan hydrochloride) or (Other name for: melphalan)

**Alkeran for Injection :** A drug used to treat multiple myeloma in patients who cannot take melphalan by mouth. It is also being studied in the treatment of other types of cancer. Alkeran for Injection may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called Evomela and melphalan hydrochloride.

**Alkeran Tablets :** A drug used to treat multiple myeloma. It is also used to treat ovarian epithelial cancer that cannot be removed by surgery. It is also being studied in the treatment of other types of cancer. Alkeran Tablets may

kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called melphalan.

**alkoxide:** An ionic compound formed by removal of hydrogen ions from the hydroxyl group in an alcohol using reactive metals, e. g. sodium. For example, potassium metal reacts with methanol (CH<sub>3</sub>OH) to produce potassium methoxide (KOCH<sub>3</sub>).

**alkoxide ion:** an anion formed by removing a proton from an alcohol; the RO<sup>-</sup> ion.

**alkoxy free radical:** a free radical formed by the homolytic cleavage of an alcohol —OH bond; the RO· free radical.

**Alkyd:** Synthetic resin modified with oil. Coating that contains alkyd resins in the binder. OR A type of "synthetic" resin that is built up from relatively simple non-resinous components. In practice an alkyd varnish is made by adding such components to a drying oil and treating to produce an "oil-modified alkyd varnish". This process is distinct from the traditional method in which a separate gum or resin is "cooked" with a drying oil to produce a varnish.

**Alkyd Resin:** Polyester resins made with some fatty acid as a modifier. OR a class of resins produced by condensation of a polybasic acid or anhydride and a polyhydric alcohol. OR Alkyd resins are polyesters modified by the addition of fatty acids. Alkyd (oil-based) paints are durable, provide gloss, have gloss retention, and are fast-drying, but they also contain and emit high levels of chemical vapors, including Volatile Organic Compounds (VOCs).

**Alkyl:** A general term for monovalent aliphatic hydrocarbon radicals. OR Composite material made up by blending polymers or copolymers with other polymers or elastomers under selected conditions, e.g., styrene-acrylonitrile copolymer resins blended with butadiene-acrylonitrile rubbers.

**alkyl:** A molecular fragment derived from an alkane by dropping a hydrogen atom from the formula. Examples are methyl (CH<sub>3</sub>) and ethyl (CH<sub>2</sub>CH<sub>3</sub>).

**alkyl group:** an alkane molecule from which a hydrogen atom has been removed. Alkyl groups are abbreviated as "R" in structural formulas.

**Alkyl Halide:** A carbon compound containing a covalent bond between a halogen (fluorine, chlorine, bromine, iodine) and an alkane.

**alkyl-substituted cycloalkane:** a cyclic hydrocarbon to which one or more alkyl groups are bonded. (Compare with "cycloalkyl alkane.")

**ALKYLATE:** The product of a reaction between an olefin, such as 1-dodecene or Tetramer-M, and an aromatic hydrocarbon, such as benzene, toluene or diphenyl oxide.

**alkylated:** A molecule that has attached to it an alkyl group (derived from an alkane —  $C_nH_{2n+2}$ ), which is a saturated hydrocarbon with a single bond available.

**alkylating agent :** A type of drug that is used in the treatment of cancer. It interferes with the cell's DNA and inhibits cancer cell growth.

**alkylation:** a reaction in which an alkyl group is added to a molecule.

**alkyne:** A compound that consists of only carbon and hydrogen, that contains at least one carbon-carbon triple bond. Alkyne names end with -yne. Examples are acetylene ( $CHCH$ ); 1-propyne ( $CH_2CH_2CH_3$ ), and 2-octyne ( $CH_3CH_2CH_2(CH_2)_4CH_3$ ). OR a hydrocarbon that contains a triple bond. The alkyne general formula is  $C_nH_{2n-2}$ . OR a hydrocarbon with one or more triple bonds. OR Carbon compound containing carbon and hydrogen incorporating one or more triple bonds

**ALL:** A type of leukemia (blood cancer) that comes on quickly and is fast growing. In ALL, there are too many lymphoblasts (immature white blood cells) in the blood and bone marrow. Also called acute lymphoblastic leukemia and acute lymphocytic leukemia.

**all-trans retinoic acid :** A nutrient that the body needs in small amounts to function and stay healthy. All-trans retinoic acid is made in the body from vitamin A and helps cells to grow and develop, especially in the embryo. A form of all-trans retinoic acid made in the laboratory is put on the skin to treat conditions such as acne and is taken by mouth to treat acute promyelocytic leukemia (a fast-growing cancer in which there are too many immature blood-forming cells in the blood and bone marrow). All-trans retinoic acid is being studied in the prevention and treatment of other types of cancer. Also called ATRA, retinoic acid, tretinoin, and vitamin A acid.

**Allegation:** A declaration, statement, or assertion of impropriety or inadequacy associated with NRC-regulated activities, the validity of which has not been established. For additional detail, see What is an Allegation.

**Allegra :** (Other name for: fexofenadine hydrochloride) OR A drug used to treat certain allergy symptoms. It blocks a chemical released during an allergic response that causes itching, sneezing, runny nose, wheezing, and watery eyes. It is a type of antihistamine. Also called fexofenadine.

**allele :** One of two or more DNA sequences occurring at a particular gene locus. Typically one allele (“normal” DNA sequence) is common, and other alleles (mutations) are rare.

**Alleles:** Alternative forms of a gene at a particular site on a chromosome.

**alleles:** different forms of the same gene.

**allelic heterogeneity :** Different mutations in the same gene that cause different phenotypic manifestations or severity of disease.

**allergen:** This descriptor may be used to any substance which produces an allergic reaction. Or A substance that causes an allergic response. Examples include pollen, molds, and certain foods.

**allergic response :** A hypersensitive immune reaction to a substance that normally is harmless or would not cause an immune response in most people. An allergic response may cause harmful symptoms such as itching or inflammation or tissue injury.

**allergy:** A broad term applied to disease symptoms following exposure to a previously encountered substance (allergen), often one which would otherwise be classified as harmless. Essentially it is a malfunction of the immune system. See sensitization.

**AllerNaze:** (Other name for: triamcinolone acetonide)

**allo:** A prefix that designates the more stable of a pair of geometric isomers. allo- is sometimes used less precisely to designate isomers or close relatives of a compound.

**allobar:** A form of an element that has isotopic abundances that are different from the naturally occurring form. For example, "depleted" uranium has had most of the uranium-235 removed, and is an allobar of natural uranium.

**allodepleted haploidentical T cells expressing inducible Caspase 9:**

Allodepleted haploidentical T-lymphocytes transduced with the Gal-V pseudotyped retrovirus vector encoding SFG.iCasp9-2A-deltaCD19, with potential immune reconstitution property. SFG.iCasp9-2A-deltaCD19 contains the suicide gene inducible caspase 9 (iCasp9) linked with a 2A-like

cleavable peptide to the selectable marker, truncated human CD19 (deltaCD19). iCasp9 consists of a human FK506 drug-binding domain with an F36V mutation (FKBP12-F36V) linked to human caspase 9 using a short linker (SGGGS). Donor T cell therapy may help control transplant-related viral infections following allogeneic hematopoietic stem cell transplantation. However, even the addition of allodepleted donor T cells can lead to graft-versus-host disease (GVHD). In the event that GVHD begins to develop, the chemical homodimerizer AP1903 can be administered, which binds to the FKBP12-F36V domain activating caspase 9. This results in the death of T cells causing GVHD while sparing the virus reactive T-cells.

**allodepleted T cell immunotherapeutic ATIR101:** A cell-based immunotherapeutic product containing T-lymphocyte-enriched leukocytes that are devoid of alloreactive T-lymphocytes, that can potentially be used to restore lymphocyte levels after stem cell transplantations and are derived from partially matched (haploidentical) family donors for blood cancer patients who do not have a matching stem cell donor available. Host alloreactive T-cells, which can cause graft-versus-host disease (GVHD), are eliminated from the donor lymphocytes ex vivo using photodynamic therapy. After allogeneic hematopoietic stem cell transplantation (HSCT), allodepleted T cell immunotherapeutic ATIR101 is administered. This maintains a T-cell-mediated immune response against tumor cells and the donor T-cells can prevent opportunistic infections. ATIR101 does not cause severe, acute GVHD. In addition, administration of ATIR101 eliminates the need for immunosuppressants.

**Allodepleted T-cell Immunotherapeutics:** (Other name for: allodepleted T cell immunotherapeutic ATIR101)

**AlloDerm:** (Other name for: acellular cadaveric dermal matrix)

**allogeneic :** Taken from different individuals of the same species. Also called allogenic.

**allogeneic acute myeloid leukemia antigen-expressing dendritic cell vaccine:** A cancer vaccine consisting of allogeneic, immortalized dendritic precursor cells derived from a patient with acute myelogenous leukemia (AML), with potential immunostimulatory and antineoplastic activities. Upon ex vivo stimulation and expansion of the precursor cells into mature, fully functional dendritic cells (DCs) and subsequent administration, the

allogeneic AML antigen-expressing DC vaccine may elicit a potent cytotoxic T-cell (CTL) and antibody response against AML antigen-expressing cells, resulting in tumor cell death.

**allogeneic adenovirus-specific cytotoxic T lymphocytes:** A population of allogeneic cytotoxic T-lymphocytes (CTLs) specifically reactive to human adenovirus (Ad) with potential immunomodulating and anti-adenoviral activities. Upon immunoprophylactic adoptive cell therapy, infusion of allogeneic Ad-specific CTLs may help reconstitute Ad-specific CTL responses in patients at risk of developing Ad infections after allogeneic stem cell transplant or in Ad-infected immunocompromised hosts. These allogeneic Ad-specific CTLs are prepared by multiple rounds of stimulation with donor peripheral blood mononuclear cells and lymphoblastoid cell lines that have been transduced with Ad5f35, a recombinant adenoviral vector carrying no transgene. Check for active clinical trials using this agent.

**allogeneic B7.1/HLA-A1 transfected tumor cell vaccine:** An allogeneic whole cell vaccine, derived from irradiated allogeneic tumor cells manipulated to express human B7.1 (CD80 antigen) and human leukocyte antigen (HLA) A1, with potential antitumor activity. Vaccination with allogeneic B7.1/HLA-A1 transfected tumor cell vaccine may elicit a cytotoxic T lymphocyte (CTL) response against similar host tumor cells, resulting in decreased tumor cell proliferation.

**allogeneic bone marrow transplantation :** A procedure in which a person receives stem cells (cells from which all blood cells develop) from a genetically similar, but not identical, donor.

**allogeneic CD19-specific CAR-modified CD8 positive central memory-derived virus-specific T cells:** A preparation of allogeneic Epstein-Barr virus (EBV)- and human cytomegalovirus (CMV)-specific CD8<sup>+</sup> central memory-derived T effector-lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) anti-CD19/CD3 zeta chain fusion protein coupled to the intracellular signal domain of CD28 antigen, with potential immunostimulating, anti-viral and antineoplastic activities. Upon infusion, allogeneic CD19-specific CAR-modified CD8<sup>+</sup> central memory-derived virus-specific T cells directs the T-lymphocytes to CD19-expressing tumor cells, stimulating a selective toxicity to tumor cells which may eventually result in tumor cell lysis. CD19 antigen is a B-cell

specific cell surface antigen expressed in all B-cell lineage malignancies. The viral specific T-cells exert antiviral immunity.

**allogeneic CD4+ memory Th1-like T cells/microparticle-bound anti-CD3/anti-CD28:** A preparation consisting of allogeneic, differentiated Th1-like T cells bound to T cell-stimulating monoclonal antibodies with potential antitumor activity. More specifically, allogeneic CD4+ memory Th1-like T cells/microparticle-bound anti-CD3/anti-CD28 are composed of a proprietary preparation of mismatched, allogeneic differentiated CD4+ memory Th1-like T cells bound to paramagnetic, epoxy-covered 4.5 micron microparticles with covalently bound anti-CD3/anti-CD28 monoclonal antibodies at a 2:1 bead:cell ratio. The CD4+ memory Th1-like T cells are derived from precursors found in the circulation of a normal donor. Stimulated by the microparticle-bound monoclonal antibodies, the infused T cells produce pro-inflammatory, anti-tumor cytokines such as like IFN-gamma, TNF-beta, and IL-2, disabling tumor immune avoidance mechanisms and stimulating the host immune system to both reject the infused T cells and kill tumor cells.

**allogeneic CMV/AdV-specific cytotoxic T lymphocytes:** A population of allogeneic cytotoxic T lymphocytes (CTLs) specifically reactive to cytomegalovirus (CMV) and adenovirus (AdV) with potential antiviral activity. Allogeneic CMV/AdV-specific cytotoxic T lymphocytes are prepared by exposing donor-derived CTLs to a lethally irradiated Epstein-Barr virus-positive lymphoblastoid B cell line (EBV-LCL) that has been transduced with a clinical-grade adenoviral vector (Ad5f35CMVpp65) as a source of CMV and AdV antigens. Infusion of these CTLs into stem cell transplant recipients may prevent CMV and AdV viral disease.

**allogeneic cytomegalovirus-specific cytotoxic T lymphocytes:** A population of allogeneic cytotoxic T lymphocytes (CTLs) specifically reactive to the herpes virus cytomegalovirus (CMV) with potential immunomodulating and antiviral activities. Upon immunoprophylactic adoptive cell therapy infusion with allogeneic cytomegalovirus-specific cytotoxic T lymphocytes, these CTLs may help reconstitute CMV-specific CTL responses in CMV-infected immunocompromised hosts after allogeneic hematopoietic stem cell transplant, thereby potentially preventing the occurrence of CMV viral disease or reducing the amount of antiviral drug therapy.

**allogeneic dendritic cell vaccine COMBIG-DC:** A cancer vaccine consisting of allogeneic, immortalized dendritic cells (DCs) loaded with tumor specific antigens and activated, with potential immunostimulatory and antineoplastic activities. Upon intratumoral administration of the allogeneic dendritic cell vaccine COMBIG-DC, these activated DCs attract natural killer (NK) cells, induce an anti-inflammatory response leading to the induction of NK-cell-mediated tumor cell death. Upon release of tumor associated antigens (TAAs) from the lysed tumor cells, these antigens are taken up by antigen presenting cells which activate the immune system to elicit a potent cytotoxic T-cell (CTL) response against the TAAs, resulting in the death of TAAs-expressing tumor cells. Check for active clinical trials using this agent.

**allogeneic dendritic cell-myeloma idiotype vaccine:** A cell-based vaccine composed of allogeneic dendritic cells pulsed ex-vivo with an autologous myeloma idiotype with potential antineoplastic activity. Upon administration, allogeneic dendritic cell-myeloma idiotype vaccine may stimulate the host immune system to mount a specific cytotoxic T-lymphocyte (CTL) response against myeloma cells, resulting in cell lysis.

**allogeneic Epstein-Barr virus-specific cytotoxic T lymphocytes:** A preparation of lymphocytes harvested from a patient with an Epstein-Barr virus (EBV)-positive tumor. Ex vivo, the lymphocytes are activated against EBV-specific antigens and then returned to the patient, where they mount a specific immune response against EBV-positive tumor cells.

**allogeneic glioblastoma stem-like cell line lysate-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysates from an allogeneic glioblastoma (GBM) stem-like cell line, with potential immunostimulatory and antineoplastic activities. Upon administration allogeneic glioblastoma stem-like cell line lysate-pulsed autologous dendritic cell vaccine exposes the immune system to GBM stem cell antigens, which may result in cytotoxic T lymphocyte (CTL) and antibody responses against GBM cells. This leads to GBM cell lysis. GBM stem-like cells contain a specific range of antigens that are essential for the neoplastic growth and survival of GBM cells.

**allogeneic GM-CSF-secreting breast cancer vaccine:** An allogenic vaccine consisting of irradiated breast cancer cells transfected with the

granulocyte macrophage-colony-stimulating factor (GM-CSF) gene. Upon vaccination, the genetically modified cells secrete GM-CSF, thereby potentiating a tumor-specific T cell response against breast cancer cell-associated antigens.

**allogeneic GM-CSF-secreting lethally irradiated whole melanoma cell vaccine:** An allogeneic cancer vaccine composed of lethally irradiated whole melanoma cancer cells that are genetically modified to secrete the immunostimulatory cytokine granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential immunostimulating and antineoplastic activities. Upon intradermal injections, allogeneic GM-CSF-secreting lethally irradiated whole melanoma cell vaccine secretes GM-CSF. In turn, GM-CSF may stimulate the body's immune system against tumor cells by enhancing the activation of dendritic cells (DCs) and promoting antigen presentation to both B- and T-lymphocytes. In addition, GM-CSF promotes antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated lymphokine-activated killer cell function. Check for active clinical trials using this agent.

**allogeneic GM-CSF-secreting tumor vaccine PANC 10.05 pcDNA-1/GM-Neo:** An allogeneic cancer vaccine composed of lethally irradiated, whole pancreatic cancer cells transfected with a plasmid carrying the gene for cytokine granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential immunostimulating and antineoplastic activities. Allogeneic GM-CSF-secreting tumor vaccine PANC 10.05 pcDNA-1/GM-Neo secretes GM-CSF thereby activating dendritic cells, promoting antigen presentation to B- and T-cells, and promoting a cytotoxic T-lymphocyte (CTL) response. This may eventually kill tumor cells. The pancreatic tumor cells are derived from the PANC 10.05 tumor cell line.

**allogeneic GM-CSF-secreting tumor vaccine PANC 6.03 pcDNA-1/GM-Neo:** An allogeneic cancer vaccine composed of lethally irradiated, whole pancreatic cancer cells transfected with a plasmid carrying the gene for cytokine granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential immunostimulating and antineoplastic activities. Allogeneic GM-CSF-secreting tumor vaccine PANC 6.03 pcDNA-1/GM-Neo secretes GM-CSF thereby activating dendritic cells, promoting antigen presentation to B- and T-cells, and promoting a cytotoxic T-lymphocyte (CTL) response.

This may eventually kill tumor cells. The pancreatic tumor cells are derived from the PANC 6.03 tumor cell line.

**allogeneic GM-CSF-transfected myeloma cell vaccine:** An allogeneic tumor cell vaccine containing myeloma cancer cells transfected with the granulocyte macrophage-colony-stimulating factor (GM-CSF) gene with potential antineoplastic activity. Upon vaccination, allogeneic GM-CSF-based myeloma cellular vaccine secretes GM-CSF, which may potentiate a tumor-specific cytotoxic T-lymphocyte (CTL) response against myeloma cancer cell-associated antigens.

**allogeneic HLA A2/4-1BB ligand-expressing melanoma vaccine:** An allogeneic melanoma cell vaccine derived from a cell line with high expression of melanoma associated antigens and genetically modified to express both HLA-A2 and 4-1BB ligand, with potential immunostimulating and antineoplastic activities. Upon administration, the 4-1BB ligand of the allogeneic HLA-A2/4-1BB ligand-expressing melanoma vaccine binds to 4-1BB on activated T-lymphocytes, which induces a strong immune response against HLA-A2 positive melanoma cells. Check for active clinical trials using this agent.

**allogeneic IL13-zetakine/HyTK-expressing-glucocorticoid resistant cytotoxic T lymphocytes GRm13Z40-2:** A preparation of glucocorticoid receptor (GR) negative, allogeneic cytotoxic T-lymphocytes (CTLs) expressing a membrane-tethered interleukin 13 (IL13) cytokine chimeric T-cell antigen receptor (zetakine), with potential antineoplastic activity. Upon transfection of donor T-lymphocytes with a plasmid encoding a fusion protein of the IL13-zetakine and the selection-suicide expression enzyme HyTK, these modified CTLs are expanded and introduced into a patient with glioblastoma multiforme (GBM). This agent specifically targets IL13 receptor alpha2, a glioma-restricted cell-surface epitope; the CTLs exert their cytolytic effect thereby killing IL13Ra2-expressing glioma cells. In addition, IL13-zetakine redirected CTLs induce production of certain cytokines. Furthermore, due to the fact that these CTLs are GR negative, they can be used concomitantly with glucocorticoid therapy. The IL13-zetakine consists of an extracellular IL-13 E13Y mutein-human IgG4 hinge-Fc chimera fused to human cytoplasmic CD3-zeta via the transmembrane domain of human CD4.

**allogeneic irradiated melanoma cell vaccine CSF470:** An allogeneic cancer vaccine composed of a mixture of lethally irradiated whole melanoma cancer cells obtained from four different melanoma cell lines, with potential immunostimulating and antineoplastic activities. Upon intradermal injections, allogeneic irradiated melanoma cell vaccine may stimulate the body's immune system to exert a cytotoxic T-lymphocyte response and antibody-dependent cellular cytotoxicity (ADCC) against the melanoma cancer cells.

**allogeneic large multivalent immunogen breast cancer vaccine:** A cancer vaccine, containing human-specific large multivalent immunogens (LMIs) isolated from the membrane fraction of cells from a breast cancer cell line, with potential immunostimulatory and antineoplastic activities. Upon administration, allogeneic large multivalent immunogen breast cancer vaccine may stimulate a cytotoxic T lymphocyte (CTL) immune response against tumor cells that express the breast cancer cell-specific LMIs.

**allogeneic large multivalent immunogen melanoma vaccine LP2307:** A cancer vaccine, containing human-specific large multivalent immunogen (LMI) isolated from plasma membrane fractions of the melanoma cell lines MSM-M1 and MSM-M2, with potential immunostimulating and antineoplastic activities. Upon administration, allogeneic large multivalent immunogen melanoma vaccine LP2307 may stimulate a CD8<sup>+</sup> cytotoxic T lymphocyte (CTL) response against melanoma tumor cells that express melanoma-specific LMI.

**allogeneic LMP1-/LMP2- specific cytotoxic T-lymphocytes:** A preparation of cytotoxic T-lymphocytes (CTL), specifically reactive to the Epstein-Barr virus (EBV) latent membrane proteins (LMP) 1 and 2, with potential antineoplastic activity. Peripheral blood mononuclear cells (PBMC) are collected from a donor and are exposed *ex vivo* to dendritic cells (DCs) transfected with a replication-deficient adenovirus encoding EBV LMP1/2 to generate LMP1/2-specific CTL which are subsequently expanded. Administration of allogeneic LMP1-/LMP2- specific CTL to patients with LMP1/2-positive tumors may result in a specific CTL response against tumor cells expressing LMP1 and LMP2, resulting in cell lysis and inhibition of tumor cell proliferation. As tumor associated antigens (TAAs), LMP1 and LMP2 are expressed in various malignancies including

nasopharyngeal cancer and EBV-positive Hodgkin lymphoma. Check for active clinical trials using this agent.

**allogeneic melanoma vaccine AGI-101H:** A cancer vaccine derived from two genetically modified human melanoma cell lines with potential antineoplastic activity. Allogeneic melanoma vaccine AGI-101H consists of a 1:1 mixture of cells from two genetically modified human melanoma cell lines, designated as Mich1H6 and Mich2H6, that have been gamma-irradiated to render the cells non-proliferative. Upon administration, this vaccine may stimulate a cytotoxic immune response against melanoma tumor cells.

**allogeneic mesothelioma tumor lysate-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with a mixture of lysates from five allogeneic mesothelioma tumor cell lines, with potential immunostimulatory and antineoplastic activities. Upon leukapheresis, DCs are loaded with allogeneic mesothelioma tumor cell lysates. Upon re-administration of the allogeneic mesothelioma tumor lysate-pulsed autologous DC vaccine, the immune system is exposed to an undefined amount of mesothelioma-associated antigens, which stimulates the induction of a specific cytotoxic T-lymphocyte (CTL) response against mesothelioma tumor cells and leads to tumor cell lysis.

**allogeneic multipotent adult progenitor cells:** A biologic product that consists of undifferentiated stem cells, obtained from adult bone marrow or other non-embryonic tissue sources, that are expanded in vitro and deposited in master cell banks for "off-the-shelf" use, with potential hematopoiesis-inducing and immunomodulating activities. Allogeneic multipotent adult progenitor cells (MAPCs) are non-immunogenic due to the lack of major histocompatibility (MHC) molecule expression, and so elicit no immune response upon administration. In vivo, bone marrow-derived adult stem cells are capable of maturing into a broad range of cell types and may help restore the immune system by producing multiple therapeutic molecules in response to inflammation and tissue damage.

**allogeneic multivirus-specific cytotoxic T lymphocytes:** A population of closely human leukocyte antigen (HLA)-matched, donor-derived cytotoxic T lymphocytes (CTLs) that are specifically reactive towards five viruses, Epstein-Barr virus (EBV), cytomegalovirus (CMV), adenovirus (AdV),

human herpesvirus 6 (HHV6), and human polyomavirus type I (BKV), with potential antiviral activity. Infusion of the multivirus-specific CTLs into allogeneic hematopoietic stem cell transplant (HSCT) recipients provides virus-specific cellular immunity and causes specific anti-viral effects against active viral infections. The administered CTLs also prevent EBV, CMV, AdV, HHV6, and BKV reactivation and infection as well as inhibiting viral-associated diseases in immunocompromised patients. The allogeneic multivirus-specific CTLs may also provide cellular immunity towards the human polyomavirus type II (JC virus; JCV), which is highly homologous to BKV.

**allogeneic natural killer cell line MG4101:** A population of allogeneic, cytotoxic natural killer (NK) cells with potential antitumor activity.

Allogeneic natural killer cell line MG4101 is derived from cells of a normal, healthy donor upon leukapheresis and activation.

**allogeneic natural killer cell line NK-92:** A proprietary, human cytotoxic cell line composed of allogeneic, activated, interleukin-2 (IL-2) dependent-natural killer cells derived from a 50-year old male patient with rapidly progressive non-Hodgkin's lymphoma, with potential antineoplastic activity. As NK-92 cells are devoid of killer inhibitory receptors (KIRs; also called killer cell immunoglobulin-like receptors), which are negative regulators of NK cell activity, cancer cells are unable to suppress the cancer cell killing ability of the NK-92 cells. Upon infusion of the allogeneic NK cell line NK-92, the NKs recognize and bind to tumor cells. This leads to the secretion and release of perforins, granzymes, cytokines and chemokines, which results in cancer cell lysis and apoptosis. In addition, NK-92 cells express high affinity Fc receptors, which bind to therapeutic antibodies; therefore, this agent can enhance antibody dependent cellular cytotoxicity (ADCC) of co-administered therapeutic antibodies.

**allogeneic renal cell carcinoma vaccine MGN1601:** A whole cell vaccine comprised of irradiated allogeneic renal cell carcinoma (RCC) with potential immunostimulating and antineoplastic activities. Allogeneic renal cell carcinoma vaccine MGN1601 contains two active ingredients: 1) genetically modified allogeneic RCC cells that are transiently transfected with four different MIDGE (Minimalistic Immunogenically Defined Gene Expression) vectors encoding IL-7, GM-CSF, CD80 and CD154 and 2) the synthetic DNA-based immunomodulator dSLIM-30L1, a TLR9 agonist.

Vaccination results in expression of IL-7, GM-CSF, CD80 and CD154, which all contribute to the activation or enhancement of immune responses. Furthermore, administration of this RCC vaccine may elicit a cytotoxic T lymphocyte (CTL) response against similar host tumor cells, resulting in decreased tumor growth. TLR9 is a member of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity. Check for active clinical trials using this agent.

**allogeneic stem cell transplantation :** A procedure in which a person receives blood-forming stem cells (cells from which all blood cells develop) from a genetically similar, but not identical, donor. This is often a sister or brother, but could be an unrelated donor.

**allogeneic T lymphocytes BPX-501:** Allogeneic T lymphocytes with potential immune reconstitution activity. Donor T lymphocytes are transduced with a retroviral vector (BPZ-1001) encoding the inducible suicide gene caspase 9 (iCasp9) and linked to a drug binding domain. Donor T-cell therapy may help control transplant-related infections following allogeneic hematopoietic stem cell transplantation. However, the addition of donor T cells can lead to graft-versus-host disease (GVHD). In the event that GVHD begins to develop, the chemical homodimerizer AP1903 can be administered, which binds to the drug binding domain and induces caspase 9 expression. This activates apoptosis in the T cells causing GVHD.

**allogeneic tumor cell vaccine:** A vaccine composed of tumor cells isolated from the tumor of one patient, killed and processed, and administered to another patient in order to stimulate cytotoxic immune responses to a similar tumor cell type. The cells found in this type of whole-cell vaccine express many cell-surface tumor-associated antigens. This vaccine is frequently administered with an adjuvant immunostimulant.

**allogenic :** Taken from different individuals of the same species. Also called allogeneic.

**allograft :** The transplant of an organ, tissue, or cells from one individual to another individual of the same species who is not an identical twin.

**allomer:** Substances with different chemical composition but the same crystalline form.

**allopathic medicine :** A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat

symptoms and diseases using drugs, radiation, or surgery. Also called biomedicine, conventional medicine, mainstream medicine, orthodox medicine, and Western medicine.

**allopurinol:** A structural isomer of hypoxanthine. Allopurinol inhibits xanthine oxidase, an enzyme that converts oxypurines to uric acid. By blocking the production of uric acid, this agent decreases serum and urine concentrations of uric acid, thereby providing protection against uric acid-mediated end organ damage in conditions associated with excessive production of uric acid, i.e. the massive cell lysis associated with the treatment of some malignancies. OR A drug that lowers high levels of uric acid (a byproduct of metabolism) in the blood caused by some cancer treatments.

**Allosteric:** A binding site is said to be allosteric if it's a binding site other than the one used by the endogenous ligand.

**allosteric Bcr-Abl tyrosine kinase inhibitor ABL001:** An orally bioavailable, allosteric Bcr-Abl tyrosine kinase inhibitor with potential antineoplastic activity. Designed to overcome resistance, ABL001 binds to the Abl portion of the Bcr-Abl fusion protein at a location that is distinct from the ATP-binding domain. This binding results in the inhibition of Bcr-Abl-mediated proliferation and enhanced apoptosis of Philadelphia chromosome-positive (Ph<sup>+</sup>) hematological malignancies. The Bcr-Abl fusion protein tyrosine kinase is an abnormal enzyme produced by leukemia cells that contain the Philadelphia chromosome.

**allosteric effect:** A change in the behavior of one part of a molecule caused by a change in another part of the molecule.

**Allosteric enzyme:** An enzyme whose active site can be altered by the binding of a small molecule at a nonoverlapping site. OR A regulatory enzyme, with catalytic activity modulated by the noncovalent binding of a specific metabolite at a site other than the active site.

**Allosteric interaction:** An interaction between a small molecule (a ligand) and a site on a protein that may be some distance away from the active site; the interaction causes a conformational change and consequent alteration in the catalytic activity of the protein.

**allosteric site:** The specific site on the surface of an allosteric enzyme molecule to which the modulator or effector molecule is bound.

**allotrope:** Allotropes are different forms of the same element. The difference is that the atoms of each allotrope are bonded together in different arrangements. OR Some elements occur in several distinct forms called allotropes. Allotropes have different chemical and physical properties. For example, graphite and diamond are allotropes of carbon.

**allotrope (allotropic form):** Different bonding arrangements allowing for different forms of matter to be made from a single type of atom. Different forms of matter made in this way are called allotropes. For example, ozone (O<sub>3</sub>) and dioxygen (O<sub>2</sub>) are allotropes of the element oxygen. Also, diamond, buckyball, and graphite are allotropes of carbon.

**Allovectin-7 :** A substance that is being studied as a gene therapy agent in the treatment of cancer. It increases the ability of the immune system to recognize cancer cells and kill them.

**alloy:** Alloys are mixtures of metals. OR A mixture containing mostly metals. For example, brass is an alloy of copper and zinc. Steel contains iron and other metals, but also carbon. OR A mixture of different metals. Bronze, brass, duralumin are some typical examples of alloys. OR Composite material made up by blending polymers or copolymers with other polymers or elastomers under selected conditions. e.g., styrene-acrylonitrile copolymer resins blended with butadiene-acrylonitrile rubbers. OR A term used in the plastics industry to denote blends of polymers or copolymers with other polymers or elastomers. – e.g. Polycarbonate. OR A combination of two or more plastics that form a new plastic. OR A polymer blend having a modified interface and/or morphology. OR A plastic alloy is a physical modification of an existing plastic to achieve higher performance and or functionality. These alloys are often used in the automobile industry and to replace metal parts. OR Composites of polymers or copolymers with other polymers or elastomers, e.g. ABS/Polycarbonate. ABS/PC alloys are used to make structurally strong parts for use in such market areas as appliances, automotive, for building and construction, chemical processing, consumer goods, electronics, health care, and packaging. OR Composite material made up by blending polymers or copolymers with other polymers or elastomers under selected conditions. e.g., styrene-acrylonitrile copolymer resins blended with butadiene-acrylonitrile rubbers. OR A term used in the plastics industry to

denote blends of polymers or copolymers with other polymers or elastomers. - i.e. ABS/Polycarbonate.

**alluvial fan:** a feature similar to a delta; a large, fanlike accumulation of sediment dropped where a stream emerges from rugged terrain, such as the edge between a mountain canyon and a flat plain.

**allyl:** A molecular fragment derived by removing a methyl hydrogen from propene ( $-\text{CH}_2-\text{CH}=\text{CH}_2$ ). For example, "allyl chloride" is 3-chloropropene,  $\text{Cl}-\text{CH}_2-\text{CH}=\text{CH}_2$ .

**allyl group:** the  $\text{H}_2\text{C}=\text{CHCH}_2-$  group.

**Allyl Resin:** A synthetic resin formed by the polymerization of chemical compounds containing the group  $\text{CH}_2=\text{CH}-\text{CH}_2-$ . The principal commercial allyl resin is a casting material that yields allyl carbonate polymer. OR a class of resins produced from an ester or other derivative of allyl alcohol by polymerization.

**allylic carbocation:** the  $\text{H}_2\text{C}=\text{CHCH}_2^+$  ion.

**almurtide:** A synthetic muramyl dipeptide (MDP) H8analogue with potential immunostimulating and antineoplastic activity. As a derivative of the mycobacterial cell wall component MDP, almuride activates both monocytes and macrophages. This results in the secretion of cytokines and induces the recruitment and activation of other immune cells, which may result in indirect tumoricidal or cytostatic effects.

**Alocrest:** (Other name for: injectable liposomal vinorelbine)

**aloe vera gel:** A preparation of leaf pulp from the parenchymal tissue of the plant Aloe vera (Liliaceae). Aloe vera gel contains carbohydrate polymers, such as glucomannans or pectic acid, and various vitamins and essential amino acids, as well as other organic and inorganic compounds. This agent has been used internally or externally for sunburn, skin problems, insect bites, ulcers, arthritis, constipation, and as an immune system enhancer. Check for active clinical trials using this agent.

**aloe-emodin :** A substance found in certain plants, including aloe vera. It belongs to a family of compounds called anthraquinones, which have shown anti-inflammatory and anticancer effects.

**aloe/anise/ascorbic acid/clove/glycerin/peppermint/spearmint/thyme-based herbal mouthwash:** A herbal-based mouthrinse containing aloe, anise, ascorbic acid, clove, peppermint, spearmint and thyme, with potential

anti-mucositis activity. When aloe/anise/ascorbic acid/clove/peppermint/spearmint/thyme-based mouthwash is used as a rinse, the ingredients in this agent may prevent or decrease inflammation and bacterial infections. This may prevent or inhibit radiotherapy- or chemotherapy-induced mucositis and decreases the pain associated with mucositis. Check for active clinical trials using this agent.

**alogliptin:** A selective, orally bioavailable, pyrimidinedione-based inhibitor of dipeptidyl peptidase 4 (DPP-4), with hypoglycemic activity. In addition to its effect on glucose levels, alogliptin may inhibit inflammatory responses by preventing the toll-like receptor 4 (TLR-4)-mediated formation of proinflammatory cytokines.

**alopecia :** The lack or loss of hair from areas of the body where hair is usually found. Alopecia can be a side effect of some cancer treatments.

**Aloxi :** (Other name for: palonosetron hydrochloride) OR A drug used to prevent nausea and vomiting caused by chemotherapy. It is also used to prevent nausea and vomiting after surgery. Aloxi blocks the action of the chemical serotonin in the brain, which may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called palonosetron hydrochloride.

**alpelisib:** An orally bioavailable phosphatidylinositol 3-kinase (PI3K) inhibitor with potential antineoplastic activity. Alpelisib specifically inhibits PIK3 in the PI3K/AKT kinase (or protein kinase B) signaling pathway, thereby inhibiting the activation of the PI3K signaling pathway. This may result in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**alpha electron:** An electron with spin up.

**alpha emitter radiation therapy :** Therapy that uses a radioactive substance that gives off a type of high-energy radiation called an alpha-particle to kill cancer cells. The radioactive substance is injected into a vein, travels through the blood, and collects in certain tissues in the body, such as areas of bone with cancer. This type of radiation may cause less damage to nearby healthy tissue. Alpha emitter radiation therapy is used to treat prostate cancer that has spread to the bone, and it is being studied in the treatment of other types of cancer.

**alpha fetoprotein adenoviral vector vaccine:** A vaccine consisting of a recombinant adenoviral vector encoding alpha fetoprotein. After vaccination, expressed alpha fetoprotein may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells that express alpha fetoprotein, resulting in tumor cell lysis.

**alpha fetoprotein plasmid DNA vaccine:** A vaccine consisting of plasmid DNA encoding alpha fetoprotein. After vaccination, expressed alpha fetoprotein may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells that express alpha fetoprotein, resulting in tumor cell lysis. Check for active clinical trials using this agent.

**alpha hydroxyl acid :** One of a group of substances that are found in several types of fruit and in milk. They are used in skin care products to reduce wrinkles and soften the skin. Examples of alpha hydroxyl acids are glycolic acid, lactic acid, and citric acid. Also called AHA and fruit acid.

**Alpha Olefins:** Alpha olefins are straight chained olefins with a double bond between the end two carbons in a chain (the "alpha" position). These olefins are very reactive and as such have a number of uses. Light alpha olefins (butene-1, hexene-1 and octene-1) are consumed mainly in the production of polyethylene, including LLDPE. Decene-1 is principally used to manufacture polyalpha olefins for the production of high performance lubricants. High alpha olefins are consumed in the manufacture of detergent alcohols. There are two main ways to produce linear alpha olefins - via ethylene oligomerization and via Fischer-Tropsch process via syngas (applicable only to SASOL). In regions of low cost ethylene (eg Middle East) ethylene dimerisation is also used to produce butene-1 and recently ethylene trimerisation has been used to produce hexene-1 Producers either manufacture a specific linear alpha olefin (on-purpose) or a range.

**alpha particle:** a cluster of 2 protons and 2 neutrons emitted from a nucleus in one type of radioactivity. OR A particle that is commonly ejected from radioactive nuclei, consisting of two protons and two neutrons. Alpha particles are helium nuclei. Alpha particles have a mass of  $6.644\ 655\ 98 \times 10^{-27}$ kg or 4.001 506 1747 atomic mass units. [1998 CODATA values] OR A positively charged particle ejected spontaneously from the nuclei of some radioactive elements. It is identical to a helium nucleus that has a mass number of 4 and an electrostatic charge of +2. It has low penetrating power and a short range (a few centimeters in air). The most energetic alpha

particle will generally fail to penetrate the dead layers of cells covering the skin, and can be easily stopped by a sheet of paper. Alpha particles are hazardous when an alpha-emitting isotope is inside the body. For additional detail, see Radiation Basics. OR are helium nuclei (no electrons) produced in nuclear reactions. They are helium ions,  $\text{He}^{+2}$ .

**alpha ray:** A stream of alpha particles. Alpha rays rapidly dissipate their energy as they pass through materials, and are far less penetrating than beta particles and gamma rays.

**alpha-1-proteinase inhibitor human:** Human serum-derived alpha-1 proteinase inhibitor (alpha-1-antitrypsin or AAT) with immunomodulating and anti-inflammatory activity. Upon administration, AAT reduces the production of proinflammatory cytokines, such as tumor necrosis factor-alpha, interleukin (IL)-1 beta, IL-32, IL-6, and proteinase 3, and induces the production of anti-inflammatory cytokines, such as IL-10 and the IL-1 receptor antagonist IL-1RN. This agent also downregulates heparan sulfate and reduces the expansion of cytotoxic effector T cells, interferes with the maturation of dendritic cells and increases T regulatory cells. Altogether, AAT may attenuate acute graft-versus-host disease (GvHD) and may facilitate graft acceptance and survival. In addition, AAT enhances levels of cAMP and activation of cAMP-dependent protein kinase A. AAT, a 52kD protein and serine protease inhibitor, belongs to the serpin superfamily.

**alpha-1,3-galactosyltransferase-expressing allogeneic lung tumor cell vaccine:** An allogeneic lung cancer vaccine with potential immunostimulating and antineoplastic activities. Derived from allogeneic lung tumor cells, alpha-1,3-galactosyltransferase-expressing allogeneic lung tumor cell vaccine is engineered to express the murine alpha-1,3-galactosyltransferase (GalT), an enzyme humans lack. GalT catalyzes the expression of foreign alpha-1,3-galactosyl (alpha-gal) carbohydrate epitopes in glycoproteins and in glycolipids on the cell membranes of the allogeneic lung tumor cells present in the vaccine, essentially producing a "xenograft". The hyperacute rejection involves pre-existing human anti-alpha-gal antibodies that bind the foreign alpha-gal epitopes expressed by the vaccine tumor cell "xenograft", resulting in complement-mediated cytotoxicity (CMC) and antibody-dependent cell-mediated cytotoxicity (ADCC) towards endogenous lung tumor cells with unmodified carbohydrate epitopes.

**alpha-1,3-galactosyltransferase-expressing allogeneic renal cell carcinoma vaccine:** An allogeneic renal cell cancer (RCC) vaccine composed of cell line-derived RCCs that are genetically engineered to express the murine alpha-1,3-galactosyltransferase (GalT), with potential immunostimulatory and antineoplastic activities. Not naturally occurring in humans, GalT catalyzes the expression of foreign alpha-1,3-galactosyl (alpha-gal) carbohydrate epitopes on the cell membranes of the allogeneic RCCs present in the vaccine. This induces a hyperacute rejection reaction involving pre-existing human anti-alpha-gal antibodies, which bind to the foreign alpha-gal epitopes expressed by the allogeneic RCCs. This results in complement-mediated cytotoxicity (CMC) and antibody-dependent cell-mediated cytotoxicity (ADCC) towards endogenous RCCs with unmodified carbohydrate epitopes.

**alpha-adrenergic antagonist :** A substance that relaxes muscle tissue in blood vessels and in the prostate gland, which improves the flow of urine and blood. Alpha-adrenergic antagonists are used to treat the symptoms of many conditions, such as benign prostatic hyperplasia (BPH), high blood pressure, and some blood circulation problems. Also called alpha-blocker.

**alpha-blocker :** A substance that relaxes muscle tissue in blood vessels and in the prostate gland, which improves the flow of urine and blood. Alpha-blockers are used to treat the symptoms of many conditions, such as benign prostatic hyperplasia (BPH), high blood pressure, and some blood circulation problems. Also called alpha-adrenergic antagonist.

**Alpha-cellulose:** Very pure cellulose prepared by special chemical treatment.

**alpha-fetoprotein :** A protein normally produced by a fetus. Alpha-fetoprotein levels are usually undetectable in the blood of healthy adult men or women (who are not pregnant). An elevated level of alpha-fetoprotein suggests the presence of either a primary liver cancer or germ cell tumor. Also called AFP.

**alpha-fetoprotein peptide-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine comprising autologous dendritic cells pulsed with four alpha-fetoprotein (AFP) peptides, with potential immunostimulatory and antineoplastic activities. Upon administration, AFP peptide-pulsed autologous dendritic cell vaccine may stimulate anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against AFP-expressing cancer

cells, resulting in tumor cell lysis. AFP is overexpressed in a variety of cancer cells.

**alpha-folate receptor-targeting thymidylate synthase inhibitor ONX-0801:** An alpha-folate receptor (aFR)-mediated inhibitor of thymidylate synthase (TS), with potential antineoplastic activity. Upon intravenous infusion, ONX-0801 selectively targets and binds to aFR-expressing tumor cells. Upon uptake by aFR, this agent binds to and inhibits TS. This reduces thymine nucleotide synthesis, inhibits both DNA synthesis and cell division, and leads to tumor cell apoptosis. TS catalyzes the conversion of deoxyuridine monophosphate (dUMP) to deoxythymidine monophosphate (dTMP), an essential precursor for DNA synthesis, and plays a key role in cell growth and division. aFR, a cell-surface receptor glycoprotein, is overexpressed on various tumor cell types, but is minimally expressed by normal, healthy tissue.

**alpha-Gal glycosphingolipids:** A preparation of glycosphingolipids (GSL), containing the disaccharide epitope galactose-alpha-1,3-galactose (alpha-Gal), with potential antineoplastic activity. Upon intratumoral injection, alpha-Gal glycosphingolipids may stimulate the immune system to mount complement-mediated cytotoxicity (CMC) and antibody-dependent cell-mediated cytotoxicity (ADCC) responses against alpha-Gal GSL, which may result in tumor cell death; these responses involve natural anti-alpha-Gal immunoglobulins (Igs). As antibodies that occur naturally due to sensitization to alpha-Gal present on symbiotic bacterial flora, anti-alpha-Gal Igs are present in unusually high amounts in human sera. GSL represent a glycolipid subtype containing the amino alcohol sphingosine; tumor-associated GSL antigens contain various oligosaccharide residues.

**alpha-galactosylceramide-pulsed autologous dendritic cells:** A cancer vaccine comprised of autologous dendritic cells (DCs) pulsed with the marine sponge glycolipid alpha-galactosylceramide (alpha-GalCer) with potential immunostimulatory and antimetastatic activities. Upon administration, alpha-galactosylceramide-pulsed autologous dendritic cells may result in the activation and proliferation of a subset of endogenous natural killer T (NKT) cells, B cells, and CD4+ and CD8+ T cells, and the production of interferon-gamma and interleukin-12; these cascade events may result in a T helper-1 cell-biased proinflammatory antitumor immune

response. The NKT cell ligand alpha-GalCer was originally isolated from the marine sponge *Agelas mauritanus*.

**alpha-lipoic acid:** A naturally occurring micronutrient, synthesized in small amounts by plants and animals (including humans), with antioxidant and potential chemopreventive activities. Alpha-lipoic acid acts as a free radical scavenger and assists in repairing oxidative damage and regenerates endogenous antioxidants, including vitamins C and E and glutathione. This agent also promotes glutathione synthesis. In addition, alpha-lipoic acid exerts metal chelating capacities and functions as a cofactor in various mitochondrial enzyme complexes involved in the decarboxylation of alpha-keto acids. OR A substance that is being studied for its ability to protect normal cells from the side effects of chemotherapy and prevent peripheral neuropathy (numbness, tingling, burning, and weakness in the hands or feet). Alpha-lipoic acid is made by the body and can be found in foods such as organ meats, spinach, broccoli, peas, brussel sprouts, and rice bran. It can also be made in the laboratory. Alpha-lipoic acid is a type of antioxidant and chemoprotective agent.

**alpha-lipoic acid/vitamin/mineral supplement PolyMVA:** A proprietary water- and lipid-soluble polymer-based nutritional supplement composed of a complex mixture of alpha-lipoic acid bound to palladium (palladium lipoic acid complex (PdLA)) and other minerals, vitamins and amino acids, including vitamins B1, B2 and B12, formylmethionine, acetyl cysteine, and trace amounts of molybdenum, rhodium, and ruthenium, with potential antioxidant and cytoprotective activities. Upon oral administration, the alpha-lipoic acid-palladium/vitamin/mineral supplement acts as a free radical scavenger, crosses the cell membrane and is able to transfer electrons from fatty acids to DNA via the electron transport chain in mitochondria, which protects against DNA damage. This could protect non-cancerous cells from the oxidative damage caused by radiation and chemotherapy. In addition, in the hypoxic conditions found within tumors, the excess electrons can generate free radicals within mitochondria and could induce both cytochrome c release and apoptosis.

**alpha-tocopherol:** A naturally-occurring form of vitamin E, a fat-soluble vitamin with potent antioxidant properties. Considered essential for the stabilization of biological membranes (especially those with high amounts of polyunsaturated fatty acids), d-alpha-Tocopherol is a potent peroxy

radical scavenger and inhibits noncompetitively cyclooxygenase activity in many tissues, resulting in a decrease in prostaglandin production. Vitamin E also inhibits angiogenesis and tumor dormancy through suppressing vascular endothelial growth factor (VEGF) gene transcription. OR A nutrient that the body needs in small amounts to stay healthy and work the way it should. It is fat-soluble (can dissolve in fats and oils) and is found in seeds, nuts, leafy green vegetables, and vegetable oils. Alpha-tocopherol boosts the immune system and helps keep blood clots from forming. It also helps prevent cell damage caused by free radicals (highly reactive chemicals). Alpha-tocopherol is being studied in the prevention and treatment of some types of cancer. It is a type of antioxidant. Also called vitamin E.

**alpha-tocopheryloxyacetic acid:** An orally bioavailable vitamin E derivative with potential antineoplastic and immunostimulating activities. Upon administration, alpha-tocopheryloxyacetic acid (alpha-TEA) induces tumor autophagy; the autophagosomes formed, which carry tumor associated antigens (TAAs), allow for increased cross-presentation of TAAs by professional antigen-presenting cells (APCs). This activates a T-cell-mediated T-helper type 1 (TH1) response, generates a cytotoxic T-lymphocyte (CTL) response against cancer cells, and reduces the frequency of regulatory T-cell (Treg) differentiation. In addition, alpha-TEA modulates the release of various cytokines and chemokines and induces tumor cell apoptosis. Altogether, this results in decreased tumor cell proliferation.

**alpha-type-1 polarized dendritic cells:** A population of mature polarized dendritic cells with potent immunostimulating activity. Treating bone marrow-derived dendritic cells (DCs) with interferon-alpha (IFN- $\alpha$ ), polyinosinic:polycytidylic acid (poly I:C) and bacterial CpG-DNA produces mature but not exhausted alpha type-1 polarized DCs (alphaDC1) that are capable of: 1) high responsiveness to other lymphoid chemokines, and 2) producing high levels of interleukin-12p70 (IL-12p70), characteristics found in human type-1 polarized dendritic cells. When pulsed with specific tumor associated antigens (TAAs), alphaDC1 may induce a potent cytotoxic T lymphocyte (CTL) response against TAA-expressing tumor cells.

**alpine:** referring to high mountain regions.

**alpine glaciation:** glaciation usually restricted to deep valleys in high mountainous terrain.

**alprazolam:** A triazolobenzodiazepine agent with anxiolytic, sedative-hypnotic and anticonvulsant activities. Alprazolam binds to a specific site distinct from the inhibitory neurotransmitter gamma-aminobutyric acid (GABA) binding site on the benzodiazepine-GABA-A-chloride ionophore receptor complex located in the limbic, thalamic and hypothalamic regions of the central nervous system (CNS). This binding causes an allosteric modification of the receptor and enhances the affinity of GABA to the receptor leading to an increase in the frequency of chloride-channel opening events. This leads to an increase in chloride ion conductance, neuronal hyperpolarization, inhibition of the action potential and leads to a decrease in neuronal excitability. OR A drug used to treat anxiety disorders and panic attacks. It is being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of benzodiazepine. Also called Xanax.

**alprostadil:** The naturally occurring prostaglandin E1 (PGE1) which displays a variety of pharmacologic actions. Alprostadil is a potent vasodilator agent that increases peripheral blood flow, inhibits platelet aggregation, and induces bronchodilation. Used in the treatment of erectile dysfunction, this agent produces corporal smooth muscle relaxation by binding to PGE receptors, resulting in the activation of adenylate cyclase and the subsequent accumulation of 3'5'-cAMP. OR A drug that is used to treat impotence (inability to have an erection) and is being studied in the treatment of sexual problems in men who have had surgery for prostate cancer. It is a type of vasodilator. Also called PGE1 and prostaglandin E1.

**Altace:** (Other name for: ramipril)

**ALTENS :** A procedure in which mild electric currents are applied to certain acupuncture points (spots on the body where an acupuncture needle may be inserted to control pain and other symptoms) on the skin. It is being studied in the treatment of dry mouth caused by radiation therapy for cancer. Also called acupuncture-like transcutaneous electrical nerve stimulation.

**alteplase:** A recombinant therapeutic agent which is chemically identical to or similar to endogenous tissue plasminogen activator (tPA). tPA is a serine protease which converts plasminogen to plasmin, a fibrinolytic

enzyme. Upon administration, alteplase increases plasmin enzymatic activity, resulting in hyperfibrinolysis and potential dissolution of a thrombus or embolism.

**Alteplase :** A form of tissue plasminogen activator that is made in the laboratory. It helps dissolve blood clots and is used to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. It is a type of systemic thrombolytic agent. Also called Activase, r-tPA, and recombinant tissue plasminogen activator.

**alteration :** A change resulting in something that is different from the original.

**alternating current (ac):** current that reverses its direction at regular intervals, such as a common 115 volt circuit.

**alternative medicine :** Treatments that are used instead of standard treatments. Standard treatments are based on the results of scientific research and are currently accepted and widely used. Less research has been done for most types of alternative medicine. Alternative medicine may include special diets, megadose vitamins, herbal preparations, special teas, and magnet therapy. For example, a special diet may be used instead of anticancer drugs as a treatment for cancer.

**Alternative splicing:** The generation of unique but related mrna molecules by the differential splicing of the pre-mrna transcript. By allowing the synthesis of more than one mrna molecule from a premrna transcript, alternative splicing increases the encoding potential of the genome.

**Althose:** (Other name for: methadone hydrochloride)

**altiratinib:** An orally bioavailable inhibitor of c-Met/hepatocyte growth factor receptor (HGFR), vascular endothelial growth factor receptor type 2 (VEGFR2), Tie2 receptor tyrosine kinase (TIE2), and tropomyosin receptor kinase (Trk), with potential antiangiogenic and antineoplastic activities. Upon administration, altiratinib selectively binds to c-Met, VEGFR2, Tie2 and Trk tyrosine kinases, which may lead to the inhibition of endothelial cell migration, proliferation and survival. This also results in both an inhibition of tumor cell proliferation and increased tumor cell death in c-Met/VEGFR2/Tie2/Trk-expressing cells. These receptor tyrosine kinases (RTKs), frequently overexpressed or mutated by a variety of tumor cell

types, play crucial roles in the regulation of angiogenesis, tumor cell growth and survival.

**altithermal period:** A period of high temperature, particularly the one from 8000 to 4000 B.P. (before the present era), which was apparently warmer in summers, as compared with the present, and with the precipitation zones shifted poleward. Also called the hypsithermal period.

**altitude:** angle of a celestial object above the horizon.

**altretamine:** A synthetic cytotoxic s-triazine derivative similar in structure to alkylating agent triethylenemelamin with antineoplastic activity.

Although the precise mechanism by which altretamine exerts its cytotoxic effect is unknown, N-demethylation of altretamine may produce reactive intermediates which covalently bind to DNA, resulting in DNA damage.

OR An anticancer drug that belongs to the family of drugs called alkylating agents.

**Alum:** Astringent crystalline double sulfate of an alkali.  $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$ . Used in the processing of pickles and as a flocking agent. Excess aluminum in the environment can be hazardous. OR technically, a double sulfate of ammonium or a univalent or trivalent metal but commonly used to denote aluminum sulfate ( $Al_2(SO_4)_3$ ).

**alum :** A chemical substance that contains aluminum sulfate and a second chemical, usually potassium sulfate. It is used to shrink tissues, to stop bleeding, and to boost the immune response to a vaccine.

**alum adjuvant:** An aluminum compound with immune adjuvant activity. This agent adsorbs and precipitates protein antigens in solution; the resulting precipitate improves vaccine immunogenicity by facilitating the slow release of antigen from the vaccine depot formed at the site of inoculation.

**Aluminum:** Symbol:"Al" Atomic Number:"13" Atomic Mass: 26.98amu. Aluminum is a light element and classified as a basic metal. There is more aluminum than any other metal in the Earth's crust. You will also find aluminum in utensils, foil wrap, power lines, soda cans, and airplane structures. or A metallic element that is found combined with other elements in the earth's crust. It is also found in small amounts in soil, water, and many foods. It is used in medicine and dentistry and in many products such as foil, cans, pots and pans, airplanes, siding, and roofs. High levels of aluminum in the body can be harmful.

**Aluminum hydrate (Al(OH)<sub>3</sub>) :** The main raw material for aluminum-based coagulants. The hydrate is produced of alumina, Al<sub>2</sub>O<sub>3</sub>, which originates from bauxite ore.

**ALVAC-CEA vaccine:** A cancer vaccine consisting of ALVAC, a highly attenuated poxvirus strain derived from the canarypox virus, encoding for the tumor associated antigen (TAA) carcinoembryonic antigen (CEA), with potential antineoplastic activity. Upon administration, ALVAC-CEA vaccine expresses CEA and may stimulate a host immune response against tumor cells expressing CEA. This may result in the inhibition of tumor growth and/or metastasis. CEA is overexpressed in a variety of tumor cell types. Check for active clinical trials using this agent. OR A cancer vaccine made with a form of the canarypox virus that does not cause disease in people. It is being studied in the treatment of some kinds of cancer. The virus is changed in the laboratory to make a protein called carcinoembryonic antigen (CEA), which is a tumor marker. ALVAC-CEA vaccine may help the immune system find and kill cancer cells that make CEA.

**ALVAC-ESO-1 vaccine:** A cancer vaccine consisting of a replication-defective recombinant canarypox virus (ALVAC) encoding the cancer-testis antigen NY-ESO-1, with potential immunostimulatory and antineoplastic activities. Upon administration, ALVAC-ESO-1 vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against NY-ESO-1-expressing cancer cells, which may result in the inhibition of tumor cell proliferation. NY-ESO-1, a tumor associated antigen (TAA), is found in normal testis and on the surface of various tumor cells.

**ALVAC-hB7.1:** A vaccine comprise of a canarypox viral vector that carries the gene for human B7.1 (CD80 antigen) with potential use as an autologous therapeutic cancer vaccine. Tumor cells harvested from a patient are infected with ALVAC-hB7.1, thereby producing an autologous cell line that exhibits increased expression of HLA class I and class II, CD54 (ICAM), and CD80. Increased expression of these proteins by this autologous cell line may activate an antitumor T-cell response when the modified cells are administered to the patient.

**ALVAC-MART-1 vaccine:** A cancer vaccine containing a replication-defective recombinant canarypox virus (ALVAC), encoding an epitope of

MART-1 (melanoma antigen recognized by T-cells), with potential immunostimulatory and antineoplastic activities. Upon administration, the MART-1 epitope is expressed by the ALVAC vector in ALVAC-MART-1 vaccine; a host cytotoxic T lymphocyte (CTL) response against MART-1-expressing tumor cells may follow, resulting in tumor cell lysis and decreased tumor cell proliferation.

**ALVAC(2) melanoma multi-antigen therapeutic vaccine:** A therapeutic cancer vaccine, based on a replication-defective recombinant canarypox virus (ALVAC) encoding multiple melanoma antigens, with potential immunostimulatory and antineoplastic activities. Vaccination with ALVAC(2) melanoma multi-antigen therapeutic vaccine may stimulate the host immune system to mount an immune response against antigen-expressing melanoma cells, resulting in inhibition of tumor growth and/or metastasis.

**ALVAC(2)-NY-ESO-1 (M)/TRICOM vaccine:** A cancer vaccine consisting of a replication-defective recombinant canarypox virus [ALVAC(2)] encoding the cancer-testis antigen NY-ESO and the TRIad of COstimulatory Molecules (B7-1, ICAM-1 and LFA-3; also called TRICOM), with potential immunostimulatory and antineoplastic activities. Upon administration, ALVAC(2)/NY-ESO (M)/TRICOM vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against NY-ESO-expressing cancer cells, which may result in the inhibition of tumor cell proliferation. NY-ESO-1, a tumor associated antigen (TAA), is found in normal testis and on the surface of various tumor cells, including bladder, breast, hepatocellular, melanoma, and prostate tumor cells. TRICOM may enhance antigen presentation and activate cytotoxic T-cells. In addition, ALVAC(2) encodes the vaccinia virus (vv) E3L and K3L genes, which may potentiate the translation of the NY-ESO and TRICOM genes.

**alvelestat:** An orally bioavailable, selective and reversible inhibitor of human neutrophil elastase (NE), with potential anti-inflammatory activity. Upon administration, alvelestat binds to and inhibits the activity of human NE. This inhibits NE-mediated inflammatory responses, which may prevent lung inflammation and injury, and may improve lung function associated with NE-induced respiratory diseases. NE, a serine protease released by

neutrophils during inflammation, is upregulated in a number of respiratory diseases.

**alveolar rhabdomyosarcoma :** A soft tissue tumor that is most common in older children and teenagers. It begins in embryonic muscle cells (cells that develop into muscles in the body). It can occur at many places in the body, but usually occurs in the trunk, arms, or legs. Also called ARMS.

**alveolar soft part sarcoma :** A soft tissue tumor that is most common in older children and teenagers. It begins in the soft supporting tissue that connects and surrounds the organs and other tissues. Alveolar soft part sarcoma usually occurs in the legs, but can also occur in the arms, hands, head, or neck. It can cause the growth of new blood vessels that help the tumor grow and spread. Also called ASPS.

**alveoli:** microscopic air sacs that are surrounded by a rich network of blood vessels in mammalian lungs that function in gas exchange; the air sacs are at the end of the bronchioles. Or Tiny air sacs at the end of the bronchioles (tiny branches of air tubes) in the lungs. The alveoli are where the lungs and the bloodstream exchange carbon dioxide and oxygen. Carbon dioxide in the blood passes into the lungs through the alveoli. Oxygen in the lungs passes through the alveoli into the blood.

**alvespimycin hydrochloride:** The hydrochloride salt of alvespimycin, an analogue of the antineoplastic benzoquinone antibiotic geldanamycin. Alvespimycin binds to HSP90, a chaperone protein that aids in the assembly, maturation and folding of proteins. Subsequently, the function of Hsp90 is inhibited, leading to the degradation and depletion of its client proteins such as kinases and transcription factors involved with cell cycle regulation and signal transduction.

**alvimopan:** A synthetic trans-3,4-dimethyl-4-(3-hydroxyphenyl) piperidine with peripherally selective opioid mu receptor antagonist activity. Alvimopan is a selective and competitive antagonist at mu-opioid receptors, found in myenteric and submucosal neurons and the immune cells of the lamina propria in the human gut. Upon administration, this agent binds to mu-opioid receptors in the gut, thereby reversing opioid-related disturbances in gut motility. Alvimopan is approximately three to nine times more potent than naloxone. Check for active clinical trials using this agent.

**alvocidib:** A synthetic N-methylpiperidinyl chlorophenyl flavone compound. As an inhibitor of cyclin-dependent kinase, alvocidib induces cell cycle arrest by preventing phosphorylation of cyclin-dependent kinases (CDKs) and by down-regulating cyclin D1 and D3 expression, resulting in G1 cell cycle arrest and apoptosis. This agent is also a competitive inhibitor of adenosine triphosphate activity. OR A substance being studied in the treatment of several types of cancer. It stops cells from dividing and may kill cancer cells. It is a type of cyclin-dependent kinase (CDK) inhibitor. Also called flavopiridol and HMR 1275.

**Alzheimer dementia :** A brain disorder that usually starts in late middle age or old age and gets worse over time. Symptoms include loss of memory, confusion, difficulty thinking, and changes in language, behavior, and personality. Also called Alzheimer disease.

**Alzheimer disease :** A brain disorder that usually starts in late middle age or old age and gets worse over time. Symptoms include loss of memory, confusion, difficulty thinking, and changes in language, behavior, and personality. Also called Alzheimer dementia.

**AM1:** Austin model 1. One of the most popular semi-empirical MO theories.

**amalgam:** An alloy of mercury with another metal, often used as a dental filling.

**Amanita phalloides :** A type of poisonous mushroom that has harmful effects on the kidneys and liver. It is responsible for most fatal cases of mushroom poisoning. Also called death cap.

**Amanitin:** A cyclic octapeptide from the mushroom *Amanita phalloides* (the destroying angel) that is a potent inhibitor of the elongation phase of RNA synthesis catalyzed by RNA polymerase II.

**amantadine hydrochloride:** The hydrochloride salt of amantadine, a synthetic tricyclic amine with antiviral, antiparkinsonian, and antihyperalgesic activities. Amantadine appears to exert its antiviral effect against the influenza A virus by interfering with the function of the transmembrane domain of the viral M2 protein, thereby preventing the release of infectious viral nucleic acids into host cells; furthermore, this agent prevents virus assembly during virus replication. Amantadine exerts its antiparkinsonian effects by stimulating the release of dopamine from striatal dopaminergic nerve terminals and inhibiting its pre-synaptic

reuptake. This agent may also exert some anticholinergic effect through inhibition of N-methyl-D-aspartic acid (NMDA) receptor-mediated stimulation of acetylcholine, resulting in antihyperalgesia. or A drug used to treat infections caused by the influenza A virus. It blocks the ability of the virus to infect cells and to make more virus particles. It is also used to treat the symptoms of Parkinson disease. Amantidine hydrochloride is a type of antiviral agent.

**Amaryl:** (Other name for: glimepiride)

**amatuximab:** A humanized IgG1 monoclonal antibody directed against human mesothelin with potential antineoplastic activity. Amatuximab binds to mesothelin, triggering an antibody dependent cellular cytotoxicity (ADCC)-mediated host immune response against mesothelin-expressing tumor cells, which may result in tumor cell lysis. Mesothelin, a 40kDa cell surface glycoprotein, is overexpressed in several human tumors, including mesothelioma and ovarian and pancreatic adenocarcinomas. or A substance being studied in the treatment of mesothelioma. Amatuximab binds to a protein called mesothelin, which is found on some cancer cells.

Amatuximab may help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called anti-mesothelin monoclonal antibody MORAb-009 and MORAb-009.

**Amber:** A chromatic (brown) color of glass or plastic containers. It is used principally to protect the contents of the container from exposure to light. OR A yellowish-brown color of glass or plastic containers used primarily to protect light-sensitive contents.

**Ambien :** (Other name for: zolpidem tartrate) OR A drug used to treat insomnia (inability to sleep), and anxiety. It is a type of imidazopyridine (sedative hypnotic). Also called zolpidem.

**Ambient Temperature:** The temperature of the environment surrounding a particular object OR The temperature of a medium surrounding an object. The term is often used to denote prevailing room temperature.

**AmBisome:** (Other name for: liposomal amphotericin B)

**Ambochlorin:** (Other name for: chlorambucil)

**Amboclorin:** (Other name for: chlorambucil)

**AMD:** A condition in which there is a slow breakdown of cells in the center of the retina (the light-sensitive layers of nerve tissue at the back of

the eye). This blocks vision in the center of the eye and can cause problems with activities such as reading and driving. AMD is most often seen in people who are over the age of 50. Also called age-related macular degeneration, ARMD, and macular degeneration.

**AMD 3100:** A drug used before autologous stem cell transplantation in patients with non-Hodgkin lymphoma or multiple myeloma. AMD 3100 is given together with granulocyte-colony stimulating factor (G-CSF) to help move stem cells from the bone marrow to the blood. The stem cells can then be collected, stored, and given back to the patient. AMD 3100 is a type of chemokine receptor antagonist. Also called Mozobil and plerixafor.

**Amdray:** (Other name for: valspodar)

**amelanotic melanoma :** A type of skin cancer in which the cells do not make the pigment melanin. Skin lesions are often irregular and may be pink, red, or have light brown, tan, or gray at the edges.

**amenorrhea:** lack of menses

**American Chemical Society:** A large and influential professional society for professionals and students in chemistry and related fields.

**American ginseng:** The aromatic root of the perennial herb *Panax quinquefolius*, native to eastern North America. American ginseng, used in Chinese traditional medicine and available as a nutritional supplement, is classified as an adaptogenic herb with multiple effects, many of which are regulatory in nature. It contains a complex mixture of saponin glycosides, also known as ginsenosides or panaxosides. Although the mechanism of action is unclear, this agent is reported to enhance the immune system and reduce fatigue.

**American Society of Testing and Materials (ASTM):** The main standardization body for materials standards in the United States. Including materials standards and testing protocols for plastic sheeting.

**Americium:** Symbol:"Am" Atomic Number:"95" Atomic Mass: (243)amu. Americium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. This element is radioactive and can be safely used in small amounts. You might find it in nuclear reactors and some smoke detectors.

**Ames test:** A simple, rapid means of detecting carcinogens by measuring a chemical's ability to induce mutations in *Salmonella* bacteria. OR A

simple bacterial test for carcinogens, based on the assumption that carcinogens are mutagens.

**amethopterin** : A drug used to treat some types of cancer, rheumatoid arthritis, and severe skin conditions, such as psoriasis. Amethopterin stops cells from making DNA and may kill cancer cells. It is a type of antimetabolite. Also called methotrexate, MTX, and Rheumatrex.

**Amevive:** (Other name for: alefacept) or A drug that is used to treat certain skin conditions and is being studied in the treatment of cutaneous (skin-related) T-cell cancer and T-cell non-Hodgkin lymphoma. Amevive is made by combining part of an antibody with a protein that blocks the growth some types of T cells. It is a type of fusion protein and a type of immunosuppressant. Also called alefacept.

**Amfebutamone:** (Other name for: bupropion hydrochloride)

**AMG 102:** A substance being studied in the treatment of cancer. It binds to a protein called hepatocyte growth factor (HGF), which may cause cancer cells to grow. Blocking this may cause cancer cells to die. AMG 102 is a type of monoclonal antibody. Also called anti-HGF monoclonal antibody AMG 102.

**AMG 162:** A drug used to prevent or treat certain bone problems. Under the brand name Xgeva, it is used to prevent broken bones and other bone problems caused by solid tumors that have spread to bone. It is also used in certain patients to treat giant cell tumor of the bone that cannot be removed by surgery. Under the brand name Prolia, it is used to treat osteoporosis (a decrease in bone mass and density) in postmenopausal women who have a high risk of breaking bones. AMG 162 is also being studied in the treatment of other conditions and types of cancer. It binds to a protein called RANKL, which keeps RANKL from binding to another protein called RANK on the surface of certain bone cells, including bone cancer cells. This may help keep bone from breaking down and cancer cells from growing. AMG 162 is a type of monoclonal antibody. Also called denosumab, Prolia, and Xgeva.

**AMG 531:** A drug used to treat patients with immune thrombocytopenic purpura (ITP) who do not get better with other forms of treatment. In ITP, platelets (cells that cause blood clots to form) are destroyed by the immune system. AMG 531 is being studied as a way to treat low platelet counts caused by chemotherapy. It binds to the thrombopoietin receptor and causes the bone marrow to make more platelets. AMG 531 is also being studied in

the treatment of myelodysplastic syndromes (a group of diseases in which the bone marrow does not make enough healthy blood cells). It is a type of thrombopoietin agonist. Also called Nplate and romiplostim.

**AMG 706:** A substance that is being studied in the treatment of some types of cancer. It belongs to the families of drugs called angiogenesis inhibitors and protein kinase inhibitors.

**Amicar:** (Other name for: aminocaproic acid)

**amide:** an organic functional group that has the following structure: OR A functional group which can act as an epoxy resin curing agent. OR Any carbon compound containing the functional group  $-C(O)NH$ . Acrylamide,  $CH_2=CH-C(O)NH$ , is one of the nastiest pieces of work you could hope to come across, but poly(acrylamide) is an innocuous compound found in disposable nappies. Get a disposable nappy and tear it open; you will find cottony padding stuff, and a gritty substance - this grit is small particles of cross-linked poly(acrylamide). OR An amide is an organic compound that contains a carbonyl group bound to nitrogen: . The simplest amides are formamide ( $HCONH_2$ ) and acetamide ( $CH_3CONH_2$ ).

**amifampridine:** An organic compound derived from pyridine with potassium channel inhibition activity. Amifampridine inhibits potassium channel efflux, increasing the duration of the action potential, which results in an increase in the duration of calcium channel opening and enhanced acetylcholine (ACh) release. Increased ACh availability at the motor end plate allows muscles to contract.

**amifostine :** A drug used as a chemoprotective drug to control some of the side effects of chemotherapy and radiation therapy.

**amifostine trihydrate:** The trihydrate form of a phosphorylated aminosulphydryl compound. After dephosphorylation of amifostine by alkaline phosphatase to an active free sulphydryl (thiol) metabolite, the thiol metabolite binds to and detoxifies cytotoxic platinum-containing metabolites of cisplatin and scavenges free radicals induced by cisplatin and ionizing radiation. The elevated activity of this agent in normal tissues results from both the relative abundance of alkaline phosphatase in normal tissues and the greater vascularity of normal tissues compared to tumor tissues.

**amikacin :** An antibiotic drug used to treat infection. It belongs to the family of drugs called aminoglycoside antibiotics.

**Amiloride-sensitive sodium channel:** A sodium channel important in the detection of the taste of salt. Such channels are inhibited by amiloride, which also mutes the taste of salt.

**Amines:** Any carbon compound containing the nitrogen bound only to carbon or hydrogen. The functional group for a primary amine is  $\text{-NH}_2$ , for a secondary amine  $\text{-NH-}$ , and for a tertiary amine a nitrogen bound to three carbon chains. Amino acids are carbon compounds containing both amine and carboxylic acid groups - e.g., glycine,  $\text{NH}_2\text{-CH}_2\text{-COOH}$ . (Biochemists give this compound the symbol (G)) OR An amine is an organic compound that contains a nitrogen atom bound only to carbon and possibly hydrogen atoms. Examples are methylamine,  $\text{CH}_3\text{NH}_2$ ; dimethylamine,  $\text{CH}_3\text{NHCH}_3$ ; and trimethylamine,  $(\text{CH}_3)_3\text{N}$ . OR a class of organic compounds of nitrogen that may be considered as derived from ammonia ( $\text{NH}_3$ ) by replacing one or more of the hydrogen atoms by organic radicals, such as  $\text{CH}_3$  or  $\text{C}_6\text{H}_5$ , as in methylamine and aniline. The former is a gas at ordinary temperature and pressure, but other amines are liquids or solids. All amines are basic in nature and usually combine readily with hydrochloric or other strong acids to form salts. OR Used as accelerators for polyester resins. OR any of a class of organic compounds derived from ammonia by replacement of hydrogen with one or more alkyl groups. OR any of a class of organic compounds derived from ammonia by replacement of hydrogen with one or more alkyl groups. OR Any of a class of organic compounds derived from ammonia by replacement of hydrogen with one or more alkyl groups.

**Amino acid:** A carbon compound containing both an amine ( $\text{NH}_2$ ) and an carboxylic acid ( $\text{-C(O)-OH}$ ) functional group. Amino acids are the building blocks of proteins, which can be considered a special case of condensation polymers. Twenty main amino acids are responsible for most of the incredible variation in proteins, and these have been given one letter symbols (G, Q, V, etc.) by biochemists. An example is glycine,  $\text{NH}_2\text{-CH}_2\text{-COOH}$ . (Biochemists give this compound the symbol (G))" OR An organic acid with an  $\alpha$ -carbon atom linked to a carboxylic acid, an amino group, a hydrogen atom, and a side chain (the R group). Twenty different amino acids are the building blocks of proteins.

**amino acid :** One of several molecules that join together to form proteins. There are 20 common amino acids found in proteins. Or the building

blocks of proteins. OR A class of 20 chemical units that are the building blocks of peptides and proteins OR  $\alpha$ -Amino-substituted carboxylic acids, the building blocks of proteins.

**amino acid activation:** ATP-dependent enzymatic esterification of the carboxyl group of an amino acid to the 3'-hydroxyl group of its corresponding tRNA.

**amino acid injection:** A concentrated dietary supplement for injection containing the essential amino acids leucine, isoleucine, lysine, valine, phenylalanine, histidine, threonine, methionine and tryptophan as well as the non-essential amino acids alanine, arginine, glycine, proline, serine and tyrosine, with potential anabolic and anti-catabolic activities. Upon dilution and intravenous infusion of the amino acid nutritional supplement, the amino acids serve as protein building blocks, promote protein synthesis in muscle cells and prevent protein breakdown.

**amino acid sequence :** The arrangement of amino acids in a protein. Proteins can be made from 20 different kinds of amino acids, and the structure and function of each protein are determined by the kinds of amino acids used to make it and how they are arranged.

**Amino Group:** The amino group is a functional group with one nitrogen and two hydrogen atoms. You will find them on all of the amino acids. It can be synthesized from ammonia.

**Amino sugar:** A sugar that contains an amino group rather than a hydroxyl group at the C-2 position; the most common amino sugars are glucosamine and galactosamine.

**amino-terminal residue:** The only amino acid residue in a polypeptide chain with a free  $\alpha$ -amino group; defines the amino terminus of the polypeptide.

**Aminoacyl-trna:** An amino acid ester of transfer RNA.

**aminoacyl-tRNA:** An aminoacyl ester of a tRNA.

**Aminoacyl-trna synthetase:** An enzyme that activates an amino acid and then links it to transfer RNA. Also known as an activating enzyme, each aminoacyl-trna synthetase is specific for a particular amino acid.

**aminoacyl-tRNA synthetases:** Enzymes that catalyze synthesis of an aminoacyltRNA at the expense of ATP energy.

**aminobenzoate potassium:** The potassium salt form of aminobenzoate, with anti-inflammatory and antifibrotic activities. Aminobenzoate potassium increases oxygen uptake at the tissue level and may enhance monoamine oxidase (MAO) activity, which requires oxygen as a substrate. Enhanced MAO activity maybe accountable for the prevention or regression of fibrosis, which may occur due to too much serotonin or too little MAO activity.

**aminobenzoic acid :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Bacteria that live in the intestines need aminobenzoic acid to survive. Aminobenzoic acid is found in grains and foods from animals. It is being studied as a radiosensitizer (a substance that makes tumor cells more sensitive to radiation therapy) and in the treatment of certain skin disorders. Also called PABA and para-aminobenzoic acid.

**aminocamptothecin:** A water-insoluble camptothecin derivative. Aminocamptothecin binds to the nuclear enzyme topoisomerase I, thereby inhibiting repair of single-strand DNA breakages. Because the terminal lactone ring of aminocamptothecin required for the agent's antitumor activity spontaneously opens under physiological conditions to an inactive carboxy form, the drug must be administered over an extended period of time to achieve effective cytotoxicity. or An anticancer drug that belongs to the family of drugs called topoisomerase inhibitors.

**aminocaproic acid:** A synthetic lysine derivative with antifibrinolytic activity. Aminocaproic acid competitively inhibits activation of plasminogen, thereby reducing conversion of plasminogen to plasmin (fibrinolysin), an enzyme that degrades fibrin clots as well as fibrinogen and other plasma proteins including the procoagulant factors V and VIII. Aminocaproic acid competitively reduces the conversion of plasminogen to plasmin by plasminogen activators. It directly inhibits proteolytic activity of plasmin, but higher doses are required than are needed to reduce plasmin formation. Aminocaproic acid is used in the treatment of hemorrhage and prophylactically against hemorrhage, including hyperfibrinolysis-induced hemorrhage and postsurgical hemorrhage.

**aminoglutethimide :** An anticancer drug that belongs to the family of drugs called nonsteroidal aromatase inhibitors. Aminoglutethimide is used to decrease the production of sex hormones (estrogen in women or

testosterone in men) and suppress the growth of tumors that need sex hormones to grow.

**aminoglycoside antibiotic :** A substance that works against many types of bacteria and includes streptomycin, gentamicin, and neomycin. An aminoglycoside antibiotic is used to treat bacterial infections.

**aminolevulinic acid :** The active ingredient in a drug used to treat actinic keratosis (a skin condition that may become cancer). The drug is also being studied in the treatment of squamous cell and basal cell skin cancers and other types of cancer. When aminolevulinic acid is taken up by cells, including cancer cells, and then exposed to certain types of light, it becomes active and kills the cells. It is a type of photosensitizing agent.

**aminolevulinic acid hydrochloride :** A drug used to treat actinic keratosis (a skin condition that may become cancer). The drug is also being studied in the treatment of squamous cell and basal cell skin cancers and other types of cancer. When aminolevulinic acid hydrochloride is taken up by cells, including cancer cells, and then exposed to certain types of light, it becomes active and kills the cells. It is a type of photosensitizing agent. Also called Levulan and Levulan Kerastick. OR A topically administered metabolic precursor of protoporphyrin IX. After topical administration, aminolevulinic acid hydrochloride (ALA HCl) is converted to protoporphyrin IX (PpIX) which is a photosensitizer. When the proper wavelength of light activates protoporphyrin IX, singlet oxygen is produced, resulting in a local cytotoxic effect.

**aminophylline:** A methylxanthine and derivative of theophylline. Aminophylline relaxes smooth muscles, particularly bronchial muscles. This xanthine most likely exerts its effect by inhibiting cAMP or cGMP phosphodiesterases, thereby increasing levels of the second messenger cAMP or cGMP intracellularly. Other mode of actions include an adenosine antagonistic effect on the activity of CD4 lymphocytes and mediator release from mast cells thereby decreasing lung sensitivity to allergens and other substances that cause inflammation. Aminophylline also acts as a CNS stimulant and exerts a positive chronotropic and inotropic effect on the heart.

**aminopterin:** A synthetic derivative of pterins with antineoplastic and immunosuppressive properties. As a folate analogue, aminopterin competes for the folate binding site of the enzyme dihydrofolate reductase, thereby

blocking tetrahydrofolate synthesis, and resulting in depletion of nucleotide precursors and inhibition of DNA, RNA and protein synthesis. or An anticancer drug that belongs to the family of drugs called antimetabolites.

**aminothiadiazole:** A synthetic derivative of nicotinamide adenine dinucleotide (NAD). Aminothiadiazole competitively inhibits inosine 5-monophosphate dehydrogenase, thereby disrupting the regulation of cell proliferation and differentiation in a number of cells. This agent is also a selective human adenosine A<sub>3</sub> receptor antagonist.

**Aminotransferase:** A class of enzymes that transfer an  $\alpha$ -amino group from an  $\alpha$ -amino acid to an  $\alpha$ -keto acid. Also called transaminases.

**aminotransferases:** Enzymes that catalyze the transfer of amino groups from  $\alpha$ -amino to  $\alpha$ -keto acids; also called transaminases.

**amiodarone hydrochloride:** The hydrochloride salt of an iodine-rich benzofuran derivative with antiarrhythmic and vasodilatory activities. As a class III antiarrhythmic agent, amiodarone blocks the myocardial calcium, potassium and sodium channels in cardiac tissue, resulting in prolongation of the cardiac action potential and refractory period. In addition, this agent inhibits alpha- and beta-adrenergic receptors, resulting in a reduction in sympathetic stimulation of the heart, a negative chronotropic effect, and a decrease in myocardial oxygen demands. Amiodarone may cause vasodilation by stimulation of the release of nitric oxide and cyclooxygenase-dependent relaxing endothelial factors. or A drug used to treat certain types of abnormal heart rhythms that have not gotten better with other drugs. Amiodarone hydrochloride affects the electrical activity of the heart. It is a type of antiarrhythmic agent. Also called Corderone.

**Amitiza:** (Other name for: lubiprostone)

**amitriptyline :** A drug that is used to treat depression and may be given to treat anxiety, sleep disorders, and pain. It is also being studied in an oral or gel form in the treatment of nerve pain caused by chemotherapy.

Amitriptyline is a type of tricyclic antidepressant. Also called amitriptyline hydrochloride.

**amitriptyline hydrochloride:** The hydrochloride salt of the tricyclic dibenzocycloheptadiene amitriptyline with antidepressant and antinociceptive activities. Amitriptyline inhibits the re-uptake of norepinephrine and serotonin by the presynaptic neuronal membrane in the central nervous system (CNS), thereby increasing the synaptic

concentration of norepinephrine and serotonin. Due to constant stimulation to these receptors, amitriptyline may produce a downregulation of adrenergic and serotonin receptors, which may contribute to the antidepressant activity. In the CNS the antinociceptive activity of this agent may involve high affinity binding to and inhibition of N-methyl-D-aspartate (NMDA) receptors and/or the enhancement of the action of serotonin at the spinal terminals of an opioid-mediated intrinsic analgesia system. OR A drug that is used to treat depression and may be given to treat anxiety, sleep disorders, and pain. It is also being studied in an oral or gel form in the treatment of nerve pain caused by chemotherapy. Amitriptyline hydrochloride is a type of tricyclic antidepressant. Also called amitriptyline.

**AML:** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute myeloblastic leukemia, acute myelogenous leukemia, acute myeloid leukemia, acute nonlymphocytic leukemia, and ANLL.

**AML mRNA plus lysate loaded autologous dendritic cell vaccine:** A cancer vaccine consisting of autologous dendritic cells loaded with separate preparations of acute myelogenous leukemia (AML) cell lysate and AML-specific messenger RNA (mRNA) with potential immunostimulatory and antineoplastic activities. Upon administration, AML mRNA plus lysate loaded autologous dendritic cell vaccine may elicit a potent cytotoxic T-cell (CTL) response against AML cells, resulting in tumor cell death. Autologous dendritic cells doubly-loaded with AML cell lysate and AML-specific mRNA may elicit superior primary, recall, and effector lytic immune responses compared to autologous dendritic cells loaded with tumor lysate or tumor mRNA alone.

**ammine:** A metal ion complex containing ammonia as a ligand. The ammonia nitrogen is bound directly to a metal ion in amines; amines differ in that the ammonia nitrogen is directly bound to a carbon atom.

**Ammoidin:** (Other name for: methoxsalen)

**Ammonia:** Ammonia is an inorganic compound comprising nitrogen and hydrogen in the ratio 1:3. Ammonia is produced from hydrocarbons, mainly natural gas, and nitrogen extracted from air. Ammonia occurs both in solution and as anhydrous ammonia, the latter finding its main application in fertilizers. Ammonia is also consumed in various other chemical and

industrial applications such as the production of nitrate-based explosives, and in aqueous solution as a solvent.

**ammonia** : A gas made of nitrogen and hydrogen. It has a strong odor and can irritate the skin, eyes, nose, throat, and lungs. Ammonia is made by bacteria and decaying plants and animals and is found in water, soil, and air. Ammonia is also made by the body when proteins break down. In the laboratory, ammonia can be changed to a liquid and used in medicines, fertilizers, household cleaning liquids, and other products. It is also added to cigarettes to increase the effect of nicotine on the body.

**ammonia N-13**: A radiopharmaceutical composed of ammonia labeled with the radioisotope nitrogen N 13 that can be used, during positron emission tomography (PET), as a blood flow imaging agent and potentially as a tumor imaging agent. Upon intravenous administration, ammonia N 13 distributes to various organs in the body, such as the myocardium, liver, kidneys and brain. This agent is taken up by cells and is retained following conversion to glutamine N 13 by glutamine synthetase (GS). Upon PET, organ perfusion and the presence of cancer cells can be assessed. GS, an enzyme that catalyzes the synthesis of glutamine from glutamate and ammonia, is overexpressed in a variety of cancers and plays a key role in cancer cell proliferation.

**Ammonia oxidation**: Test drawn during manufacturing process to evaluate the ammonia oxidation rate for the nitrifiers.

**ammonia<sub>3</sub>**: Pure NH<sub>3</sub> is a colorless gas with a sharp, characteristic odor. It is easily liquified by pressure, and is very soluble in water. Ammonia acts as a weak base. Aqueous solutions of ammonia are (incorrectly) referred to as "ammonium hydroxide".

**Ammoniotelic**: Characteristic of organisms in which excess ammonia is directly secreted; many aquatic animals are ammoniotelic.

**ammonium ion<sub>4+</sub>**: NH<sub>4</sub><sup>+</sup> is a cation formed by neutralization of ammonia, which acts as a weak base.

**ammonium tetrathiomolybdate** : A substance being studied in the treatment of many types of cancer. Ammonium tetrathiomolybdate removes extra copper from the body. Removing the copper may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. Ammonium tetrathiomolybdate is a type of chelating agent and a type of antiangiogenesis agent.

**ammonium trichlorotellurate:** A synthetic non-toxic tellurium derivative, structurally similar to cisplatin, with immuno-modulating, antiviral, and hair growth-promoting activities. Ammonium trichlorotellurate may inhibit the inflammatory cytokine interleukin-10 (IL-10) and may induce hematopoietic cells to express interleukin-2 (IL-2), IL-2 receptors, granulocyte-macrophage colony-stimulating factor (GM-CSF), IL-3, tumor necrosis factor (TNF) and interferons (INFs). This agent is also a potent inducer of IL-1 and IL-6. Accordingly, ammonium trichlorotellurate may protect against chemotherapy-induced myelosuppression. In addition, this agent exhibits hair growth-promoting activity by inducing anagen production and inhibiting catagen production, resulting in the promotion of follicular keratinocyte proliferation and interference with follicular keratinocyte terminal differentiation, respectively. Accordingly, ammonium trichlorotellurate may protect against chemotherapy-induced alopecia.

**ammonotelic:** Excreting excess nitrogen in the form of ammonia.

**Amnesteem:** (Other name for: isotretinoin)

**AmnioFix:** (Other name for: dehydrated human amnion/chorion membrane)

**amnion-derived cellular cytokine solution:** A topical cellular cytokine solution containing a distinct combination of growth factors and cytokines secreted by and released from amnion-derived multipotent progenitor (AMP) cells, with potential immunomodulating and skin healing activities. The amnion-derived cellular cytokine solution (ACCS) contains near physiological levels of transforming growth factor beta, tissue inhibitor of metalloproteinase-1 (TIMP-1) and TIMP-2, as well as the angiogenesis factors platelet-derived growth factor (PDGF), vascular endothelial growth factor (VEGF) and angiogenin that are normally found in healing wounds. Upon spraying the solution onto affected areas, the cytokines and growth factors in ACCS appear to increase the migration, proliferation and differentiation of both keratinocytes and fibroblasts; enhance the migration and phagocytosis of macrophages in wounds; and increase epithelialization. Together these processes may accelerate skin healing and tissue repair. Also, ACCS may be beneficial in the treatment of radiation burns of the skin.

**amoeba:** single-celled organisms with no distinct shape; members of the phylum Sarcodina.

**amonafile :** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called topoisomerase inhibitors and intercalating agents.

**amonafile dihydrochloride:** The dihydrochloride salt of amonafile, an imide derivative of naphthalic acid. Amonafile intercalates into DNA and inhibits topoisomerase II, resulting in protein-associated strand breaks and impaired DNA and RNA synthesis.

**amonafile L-malate:** The malate salt of amonafile, an imide derivative of naphthalic acid, with potential antineoplastic activity. Amonafile intercalates into DNA and inhibits topoisomerase II, resulting in DNA double-strand breaks (DSB) and inhibition of DNA replication and RNA synthesis.

**amorphous:** A solid that does not have a repeating, regular three-dimensional arrangement of atoms, molecules, or ions.

**AMORPHOUS:** Having no crystallinity. At processing temperatures most plastics are amorphous. OR Latin meaning without form. Non-crystalline structure. OR Devoid of crystallinity or stratification. Most plastics are amorphous at processing temperatures. Material assumes more random molecular structure when cooling. OR A plastic material in which the molecular structure is random and becomes mobile over a wide temperature range. See crystalline. OR Latin meaning without form. Non-crystalline structure. OR Latin meaning without form. Non-crystalline structure. OR Non-crystalline. Most plastics are amorphous at extrusion processing temperatures. The material assumes a more random molecular structure when cooling. OR Devoid of crystallinity or stratification. Most plastics are amorphous at processing temperatures. Material assumes more random molecular structure when cooling.

**Amorphous form:** A solid that does not give a distinctive powder X-ray diffraction pattern. Amorphous solids are usually considered noncrystalline materials (i.e., glasses).

**Amorphous Phase:** Devoid of crystallinity – no definite order. At processing temperatures, the plastic is normally in the amorphous state.

**Amorphous Polymer:** Amorphous means irregular, having no discernible order or shape. In the context of solids, the molecules are randomly arranged, as in glass, rather than periodically arranged as in a crystalline material. Amorphous polymer has a glass like structure with tangled chain

and no long range order. OR A polymer having no crystallinity. Polystyrene is an amorphous polymer while HDPE is semi-crystalline.

**Amorphous Solid:** An amorphous solid has no specific organization of molecules. The other end of the spectrum would be a crystal with a highly organized set of molecules. Plastic is an example of a vitreous solid. Because of their combination of atoms, amorphous solids do not have a specific melting point. They become a liquid over a wide temperature range.

**amount:** The number that is a percentage of the base. It is the number in the numerator in a percent ratio:

**amoxicillin:** A broad-spectrum, semisynthetic aminopenicillin antibiotic with bactericidal activity. Amoxicillin binds to and inactivates penicillin-binding protein (PBP) 1A located on the inner membrane of the bacterial cell wall. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity. This interrupts bacterial cell wall synthesis and results in the weakening of the bacterial cell wall and causes cell lysis. OR A drug used to treat some bacterial infections. Amoxicillin is a form of penicillin that is made in the laboratory. It kills certain types of bacteria. It is a type of antibiotic.

**amoxicillin-clavulanate potassium:** A combination of the semisynthetic broad-spectrum antibiotic amoxicillin and the beta-lactamase enzyme inhibitor clavulanate potassium. Clavulanate potassium increases the serum half-life of amoxicillin by inhibiting beta-lactamase-mediated metabolism of amoxicillin. Amoxicillin inhibits bacterial cell wall synthesis by binding to penicillin binding proteins and inhibiting peptidoglycan synthesis, a critical component of bacterial cell walls.

**amoxicillin-clavulanate potassium :** A drug used to treat bacterial infections. Adding the chemical clavulanate potassium to the antibiotic amoxicillin increases the amount of time the antibiotic stays active in the body. Amoxicillin-clavulanate potassium is a type of combination antibiotic. Also called Augmentin.

**Amoxil:** (Other name for: amoxicillin)

**AMP-dependent protein kinase:** A protein kinase, conserved among eukaryotes, that is activated on binding of AMP and inhibited by ATP; consequently, it functions as a cellular fuel gauge, inhibiting certain process by phosphorylating key enzymes when the energy supply is low.

**amperage:** The amount of charge moved per second by an electric current, measured in amperes.

**Ampere:** A measure of electrical current: the flow of  $6.24 \times 10^{18}$  charges per second.

**ampere:** The SI unit of electric current, equal to flow of 1 coulomb of charge per second. An ampere is the amount of current necessary to produce a force of 0.2 micronewtons per meter between two arbitrarily long, arbitrarily thin wires, placed parallel in a vacuum and exactly 1 m apart. Named for 19th century physicist André Marie Ampère.

**amperometry:** Determining the concentration of a material in a sample by measuring electric current.

**amphetamines:** Any of the compounds which are substituted or slightly modified amphetamine molecules.

**amphi-:** A prefix used to name certain members of a series of geometric isomers or stereoisomers.

**amphibolic pathway:** A metabolic pathway used in both catabolism and anabolism.

**Amphibolic reactions:** Metabolic reactions that can be anabolic or catabolic, depending on the energy conditions in the cell.

**Amphipathic:** Amphipathic molecules have one hydrophobic end and one hydrophilic end. You can find these molecules in the cell membrane.

**amphipathic:** Containing both polar and nonpolar domains.

**Amphipathic molecule:** A molecule, such as a membrane lipid, that contains both a hydrophobic and a hydrophilic moiety.

**Amphiphilic:** From the greek meaning 'both' (something like amphi) and 'lover' (something like philos). An amphiphile is a molecule that has a strong attraction towards both polar solvents (like a hydrophile) and non-polar solvents (like a hydrophobe) and will end up concentrated at the interface between the two.

**amphiprotic solvent:** Solvents that exhibit both acidic and basic properties; amphiprotic solvents undergo autoprotolysis. Examples are water, ammonia, and ethanol.

**amphoteric:** A compound that can act as a base and an acid. OR A substance that can act as either an acid or a base in a reaction. For example,

aluminum hydroxide can neutralize mineral acids (  $\text{Al(OH)}_3 + 3 \text{HCl} = \text{AlCl}_3 + 3 \text{H}_2\text{O}$  ) or strong bases (  $\text{Al(OH)}_3 + 3 \text{NaOH} = \text{Na}_3\text{AlO}_3 + 3 \text{H}_2\text{O}$  ). OR Capable of donating and accepting protons, thus able to serve as an acid or a base.

**amphoteric oxide:** Amphoteric oxides react with both acidic and alkaline solutions.

**AMPHOTERIC SURFACTANT:** A surfactant in which the hydrophile has both positive and negative charges. Examples; betaines and amine oxides. (see RFF 750.10.01 - SURFACTANTS)

**amphotericin B :** A drug used in the treatment of infections caused by fungi. It is a type of antifungal.

**amphotericin B deoxycholate:** The deoxycholate salt of amphotericin B, a polyene antifungal antibiotic produced by *Streptomyces nodosus*, with antifungal activity. Amphotericin B binds to ergosterol, an essential component of the fungal cell membrane, resulting in depolarization of the membrane; alterations in cell membrane permeability and leakage of important intracellular components; and cell rupture. This agent may also induce oxidative damage in fungal cells and has been reported to stimulate host immune cells.

**ampicillin sodium/sulbactam sodium:** A combination formulation of the sodium salts of the antibiotic ampicillin and the beta-lactamase inhibitor sulbactam with antibacterial activity. Ampicillin, a broad-spectrum, semisynthetic penicillin, binds to and inactivates penicillin-binding proteins (PBP) located on the inner membrane of the bacterial cell wall, thereby interfering with the cross-linking of peptidoglycan chains necessary for bacterial cell wall strength and rigidity. As a result, the cell wall is weakened and the cell lyses. The sulbactam component irreversibly binds to bacterial beta-lactamase at or near its active site, thereby interfering with substrate binding and inhibiting bacterial metabolism of penicillin and cephalosporin beta-lactam antibiotics, effectively extending their antibiotic spectrum to include many beta-lactam-resistant bacteria.

**Ampligen:** (Other name for: rintatolimod)

**Amplimexon :** A substance that is being studied in the treatment of some types of cancer, including pancreatic, lung, breast, prostate, melanoma, and multiple myeloma. It belongs to the family of drugs called cyanoaziridine derivatives. Also called imexon.

**amplitude:** The displacement of a wave from zero. The maximum amplitude for a wave is the height of a peak or the depth of a trough, relative to the zero displacement line.

**ampulla :** A sac-like enlargement of a canal or duct.

**ampulla of Vater :** An enlargement of the ducts from the liver and pancreas at the point where they enter the small intestine.

**ampulla of Vater cancer :** Cancer that forms in the ampulla of Vater (an enlargement of the ducts from the liver and pancreas where they join and enter the small intestine). Symptoms include jaundice, abdominal pain, nausea, vomiting, and weight loss. Also called ampullary cancer.

**ampullary cancer :** Cancer that forms in the ampulla of Vater (an enlargement of the ducts from the liver and pancreas where they join and enter the small intestine). Symptoms include jaundice, abdominal pain, nausea, vomiting, and weight loss. Also called ampulla of Vater cancer.

**amputation :** The removal by surgery of a limb (arm or leg) or other body part because of injury or disease, such as diabetes or cancer.

**amrubicin :** A substance being studied in the treatment of lung cancer. It is a type of anthracycline analog.

**amrubicin hydrochloride:** The hydrochloride salt of a third-generation synthetic 9-amino-anthracycline with antineoplastic activity. Amrubicin intercalates into DNA and inhibits the activity of topoisomerase II, resulting in inhibition of DNA replication, and RNA and protein synthesis, followed by cell growth inhibition and cell death. This agent has demonstrated a higher level of anti-tumor activity than conventional anthracycline drugs without exhibiting any indication of the cumulative cardiac toxicity common to this class of compounds. Check for active clinical trials using this agent.

**Amsa P-D:** (Other name for: amsacrine)

**amsacrine:** An aminoacridine derivative with potential antineoplastic activity. Although its mechanism of action is incompletely defined, amsacrine may intercalate into DNA and inhibit topoisomerase II, resulting in DNA double-strand breaks, arrest of the S/G2 phase of the cell cycle, and cell death. This agent's cytotoxicity is maximal during the S phase of the cell cycle when topoisomerase levels are greatest. In addition, amsacrine may induce transcription of tumor promoter p53 protein and block p53

ubiquitination and proteasomal degradation, resulting in p53-dependent tumor cell apoptosis. or An anticancer drug that belongs to the family of drugs called topoisomerase inhibitors.

**amsilarotene:** A retinobenzoic acid with potential antineoplastic activity. Amsilarotene inhibits retinoblastoma-gene product (RB) phosphorylation and increases the presence of 2 cyclin-dependent kinase (CDK) inhibitors, resulting in cell cycle arrest. This agent also causes a cytotoxic decline in cyclin A and thymidylate synthase expression.

**amuvatinib:** An orally bioavailable synthetic carbothioamide with potential antineoplastic activity. Amuvatinib binds to mutant forms of the stem cell factor receptor (c-Kit; SCFR), inhibiting clinically relevant mutants of this receptor tyrosine kinase that may be associated with resistance to therapy. In addition, amuvatinib inhibits activities of other receptor tyrosine kinases, such as c-Met, Ret oncoprotein, and mutant forms of Flt3 and PDGFR alpha, which are frequently dysregulated in variety of tumors. This agent also suppresses the induction of DNA repair protein Rad51, thereby potentiating the activities of DNA damage-inducing agents. Mutant forms of c-Kit are often associated with tumor chemoresistance. Check for active clinical trials using this agent. OR A substance being studied in the treatment of some types of cancer. It may block certain proteins involved in cancer cell growth and DNA repair. Blocking these proteins may make cancer cells more sensitive to anticancer drugs and radiation therapy. Amuvatinib is a type of tyrosine kinase inhibitor. Also called MP470.

**amygdalin :** A substance found in the pits of many fruits such as apricots and papayas, and in other foods. It has been tried in some countries as a treatment for cancer, but it has not been shown to work in clinical studies. Amygdalin is not approved for use in the United States. Also called laetrile.

**amylase :** An enzyme that helps the body digest starches.

**amyloidosis :** A group of diseases in which protein builds up in certain organs (localized amyloidosis) or throughout the body (systemic amyloidosis). Amyloidosis may be either primary (with no known cause), secondary (caused by another disease, including some types of cancer, such as multiple myeloma), or hereditary (passed down from parents to children). Many organs are affected by amyloidosis. The organs affected

may depend on whether the amyloidosis is the primary, secondary, or hereditary form.

**Amylopectin:** The branched form of starch, containing glucose residues in about one  $\alpha$ -1,6 linkage per thirty  $\alpha$ -1,4 linkages. Or A form of starch made of glucose molecules linked in a branching pattern.

**Amylose:** The unbranched form of starch, containing glucose residues in  $\alpha$ -1,4 linkage. Or A form of starch made of long, unbranched chains of -D-glucose molecules.

**Amytal:** A barbiturate that blocks the respiratory chain by inhibiting electron transfer in the NADH-Q reductase complex.

**Anabolic A:** type of reaction or series of reactions in which complex molecules are synthesized from simpler ones; the opposite of catabolic

**Anabolic steroid:** A steroid, such as testosterone, that acts through the androgen receptor to stimulate genes that enhance the development of lean muscle mass. Or A type of steroid that is used in medicine to repair body tissues and to increase appetite and the growth of muscles. Anabolic steroids are made in the laboratory from testosterone (a male hormone).

**anabolism:** the process of synthesizing large molecules by joining smaller molecules together. OR The set of metabolic reactions that require energy to synthesize molecules from simpler precursors. OR The phase of intermediary metabolism concerned with the energyrequiring biosynthesis of cell components from smaller precursors. or Metabolic synthesis of proteins, fats and other constituents of living organisms from molecules or simple precursors, which usually requires an input of energy.

**anadromous:** Fish that spend their adult lives in the sea but swim upriver to freshwater spawning grounds to reproduce.

**Anaerobe:** An organism that lives and reproduces in the absence of dissolved oxygen, instead deriving oxygen from the breakdown of complex substances. OR An organism that lives without oxygen. Obligate anaerobes die when exposed to oxygen. OR living or occurring only in the absence of free oxygen. OR organisms that thrive in an oxygen-free environment. OR In the absence of oxygen. OR Occurring in the absence of air or oxygen.

**anaerobic biological treatment:** any waste treatment process utilizing anaerobic or facultative organisms in the absence of air to reduce the organic matter in water.

**Anaerobic Degradation:** Degradation in the absence of air, as occurs in dry landfills. Anaerobic degradation is also called biometanization.

**anaerobic waste treatment:** (sludge processing) waste stabilization brought about through the action of microorganisms in the absence of air or elemental oxygen.

**anagrelide :** A drug that is used to decrease the number of platelets in the blood in order to prevent blood clotting.

**anagrelide hydrochloride:** The hydrochloride salt of a synthetic quinazoline derivative, anagrelide hydrochloride reduces platelet production through a decrease in megakaryocyte maturation. Anagrelide inhibits cyclic AMP phosphodiesterase, as well as ADP- and collagen-induced platelet aggregation. At therapeutic doses, it does not influence white cell counts or coagulation parameters. Anagrelide is used for treatment of essential thrombocythemia to reduce elevated platelet counts and the risk of thrombosis.

**anagrelide prolonged-release formulation:** A prolonged-release tablet formulation containing the quinazoline anagrelide, with antiplatelet activity. Although the exact mechanism of action through which anagrelide exerts its effect has yet to be fully elucidated, this agent inhibits the maturation of megakaryocytes into platelets, which reduces platelet production. Anagrelide also inhibits cyclic AMP phosphodiesterase III (PDEIII), which prevents PDEIII-mediated platelet aggregation. This may prevent essential thrombocythemia and thrombosis. Check for active clinical trials using this agent.

**anakinra :** A substance that is used to treat rheumatoid arthritis, and is being studied in the treatment of cancer. Anakinra blocks the action of interleukin 1 (IL-1). It is a type of interleukin receptor antagonist. Also called Kinaret. OR A recombinant human nonglycosylated interleukin-1 (IL-1) receptor antagonist with potential antineoplastic activity. Anakinra binds to the IL-1 receptor, thereby blocking the binding of the IL-1 to and activation of its receptor. Blockade of IL-1 activity may inhibit the cascade of downstream pro-angiogenic factors such as vascular endothelial cell growth factor, tumor necrosis factor-alpha, and IL-6, resulting in inhibition of tumor angiogenesis.

**anal :** Having to do with the anus. The anus is the opening of the rectum (last part of the large intestine) to the outside of the body.

**anal cancer :** Cancer that forms in tissues of the anus. The anus is the opening of the rectum (last part of the large intestine) to the outside of the body.

**anal Pap smear :** A procedure in which cells are scraped from the lining of the anus (the opening of the rectum to the outside of the body) and looked at under a microscope. It is used to find cancer and changes in cells that may lead to cancer. An anal Pap smear can also show conditions that are not cancer, such as infection or inflammation. Also called anal Pap test.

**anal Pap test :** A procedure in which cells are scraped from the lining of the anus (the opening of the rectum to the outside of the body) and looked at under a microscope. It is used to find cancer and changes in cells that may lead to cancer. An anal Pap test can also show conditions that are not cancer, such as infection or inflammation. Also called anal Pap smear.

**analgesia :** Pain relief.

**analgesic:** An analgesic is a substance that acts as a painkiller, e.g. aspirin.

**analog :** In chemistry, a substance that is similar, but not identical, to another.

**analog (climate):** A large-scale weather pattern of the past that is similar to a current situation in its essential characteristics.

**Analog multiplexer :** a device that increase the number of measurements channels while still using a single instrumentation amplifier.

**analogies:** Similarities in relationships between two items. Or in organic chemistry, chemicals that are similar to each other, but not identical. For example, the hydrocarbons are all similar to each other, but an alkane is different from the alkenes and alkynes because of the types of bonds they contain. Therefore, an alkane and an alkene are analogues.

**analysis:** Determination of the composition of a sample. Or A process in which anything complex is separated into simple or less complex parts.

**analyte:** An analyte is the sample constituent whose concentration is sought in a chemical analysis.

**analytic study:** A hypothesis-testing method of investigating the association between a given disease or health state or other dependent variable and possible causative factors. In an analytic study, individuals in the study population may be classified according to absence or presence (or future development) of specific disease and according to "attributes" that

may influence disease occurrence. Attributes may include age, race, sex, other disease(s), genetic, biochemical, and physiological characteristics, economic status, occupation, residence, and various aspects of the environment or personal behaviour. Three types of analytic study are cross-sectional (prevalence), cohort (prospective), and case control (retrospective) (Last, 1983).

**anamorelin hydrochloride:** The orally bioavailable hydrochloride salt of a synthetic, small-molecule ghrelin mimetic with appetite-stimulating and anabolic activities. Anamorelin binds to and stimulates the growth hormone secretagogue receptor (GHSR) centrally, thereby mimicking the appetite-stimulating and growth hormone-releasing effects of ghrelin. Stimulation of GHSR may also reduce the production of the pro-inflammatory cytokines TNF-alpha and interleukin-6, which may play a direct role in cancer-related loss of appetite. Check for active clinical trials using this agent.

**anaphase:** a phase during mitosis in which chromatids separate to become visible chromosomes and migrate to opposite poles.

**anaphase I:** a phase during meiosis in which homologous chromosomes separate.

**anaphase II:** a phase during meiosis II in which the centromeres divide and the chromosomes separate from one another.

**anaphylactic shock :** A severe and sometimes life-threatening immune system reaction to an antigen that a person has been previously exposed to. The reaction may include itchy skin, edema, collapsed blood vessels, fainting, difficulty in breathing, and death.

**anaplastic :** A term used to describe cancer cells that divide rapidly and have little or no resemblance to normal cells.

**anaplastic large cell lymphoma :** An aggressive (fast-growing) type of non-Hodgkin lymphoma that is usually of the T-cell type. The cancer cells express a marker called CD30 or Ki-1 on the surface, and may appear in the lymph nodes, skin, bones, soft tissues, lungs, or liver. Also called ALCL.

**anaplastic lymphoma kinase gene :** A gene that makes a protein called anaplastic lymphoma kinase (ALK), which may be involved in cell growth. Mutated (changed) forms of the ALK gene and protein have been found in some types of cancer, including neuroblastoma, non-small cell lung cancer, and anaplastic large cell lymphoma. These changes may increase the

growth of cancer cells. Checking for changes in the anaplastic lymphoma kinase gene in tumor tissue may help to plan cancer treatment. Also called ALK gene.

**anaplastic lymphoma receptor tyrosine kinase :** A protein that is found on the outside of cells that sends signals into the cells. These signals help control cell growth and division. It is made by the anaplastic lymphoma kinase (ALK) gene, which may be changed in some types of cancer, such as anaplastic large cell lymphoma, neuroblastoma, and non-small cell lung cancer. These changes in the ALK gene can cause the cancer cells to grow and spread.

**anaplastic thyroid cancer :** A rare, aggressive type of thyroid cancer in which the malignant (cancer) cells look very different from normal thyroid cells.

**anaplerotic reaction:** An enzyme-catalyzed reaction that can replenish the supply of intermediates in the citric acid cycle. OR From the Greek for “fill up,” referring to a reaction that replenishes intermediates removed from a metabolic pathway. The most common example is the reaction catalyzed by pyruvate carboxylase, in which the carboxylation of pyruvate produces oxaloacetate, a key component of the citric acid cycle.

**anastomosis :** A procedure to connect healthy sections of tubular structures in the body after the diseased portion has been surgically removed.

**anastrozole:** A nonsteroidal inhibitor of estrogen synthesis that resembles paclitaxel in chemical structure. As a third-generation aromatase inhibitor, anastrozole selectively binds to and reversibly inhibits aromatase, a cytochrome P-450 enzyme complex found in many tissues including those of the premenopausal ovary, liver, and breast; aromatase catalyzes the aromatization of androstenedione and testosterone into estrone and estradiol, the final step in estrogen biosynthesis. In estrogen-dependent breast cancers, anastrozole may inhibit tumor growth. OR A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Anastrozole lowers the amount of estrogen made by the body. This may stop the growth of cancer cells that need estrogen to grow. Anastrozole is a type of nonsteroidal aromatase inhibitor. Also called Arimidex.

**anatomic :** Having to do with anatomy (the study of the structure of a plant or animal).

**anatomist** : A person who has special training in anatomy (the study of the structures of animals or plants).

**anatomy** : The study of the structure of a plant or animal.

**anaxirone**: A synthetic triepoxide alkylating agent with potential antineoplastic activity. Anaxirone alkylates DNA via actual or derived epoxide groups, resulting in inhibition of DNA synthesis. This agent has been shown to exhibit a broad spectrum of antineoplastic activity against experimental tumors, including those resistant to other alkylating agents.

**ANC**: A measure of the number of neutrophils in the blood. Neutrophils are a type of white blood cell. They help the body fight infection. An ANC may be used to check for infection, inflammation, leukemia, and other conditions. The lower a person's ANC is, the higher the risk is of getting an infection. Having an ANC of less than 500 means there is a high risk of getting an infection. Cancer treatment, such as chemotherapy, may reduce the ANC. Also called absolute neutrophil count.

**Ancef**: (Other name for: cefazolin sodium)

**Ancestim**: (Other name for: recombinant human stem cell factor)

**ancestim** : A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. It is being studied in the treatment of myelodysplasia. Ancestim is a type of recombinant stem cell growth factor. Also called r-metHuSCF, recombinant human methionyl stem cell factor, and Stemgen.

**ANCHORING**: Mechanical bonding of a coating to a rough surface as contrasted with adhesion, which is chemical bonding.

**ancillary test** : In a clinical trial, a medical test on a patient that is not a part of the original study design.

**ancitabine hydrochloride**: The hydrochloride salt of a cytarabine congener prodrug with antineoplastic activity. Upon administration, ancitabine is slowly hydrolyzed into cytarabine. Subsequently, cytarabine is converted to the triphosphate form within the cell and then competes with cytidine for incorporation into DNA. Because the arabinose sugar sterically hinders the rotation of the molecule within DNA, DNA replication ceases, specifically during the S phase of the cell cycle. Cytarabine agent also inhibits DNA polymerase, resulting in a decrease in DNA replication and

repair. Compared to cytarabine, a more prolonged, consistent cytarabine-mediated therapeutic effect may be achieved with ancitabine because of the slow hydrolytic conversion of ancitabine to cytarabine.

**Ancobon:** (Other name for: flucytosine)

**Andersen's disease:** A disease due to an inability to introduce  $\alpha$ -1,6-glycosidic bonds during the synthesis of glycogen. Glycogen is present in normal amounts but with long outer branches; clinically, the disease is characterized by progressive cirrhosis of the liver.

**androblastoma :** A rare type of ovarian tumor in which the tumor cells secrete a male sex hormone. This may cause virilization (the appearance of male physical characteristics in females). Also called arrhenoblastoma and Sertoli-Leydig cell tumor of the ovary.

**AndroGel:** (Other name for: testosterone gel)

**androgen :** A type of hormone that promotes the development and maintenance of male sex characteristics.

**androgen ablation :** Treatment to suppress or block the production or action of male hormones. This is done by having the testicles removed, by taking female sex hormones, or by taking drugs called antiandrogens. Also called androgen deprivation and androgen suppression.

**androgen antagonist APC-100:** An orally available, vitamin E derivative and androgen receptor (AR) antagonist with potential anti-oxidant, chemopreventative and antineoplastic activity. APC-100 binds to ARs in target tissues thereby inhibiting androgen-induced receptor activation and facilitating the formation of inactive complexes that cannot be translocated to the nucleus. By inhibiting the formation of the complex between androgen activated AR- and the AP1 transcription factor JunD, the expression of androgen-responsive genes is blocked. One such gene is spermidine/spermine N1-acetyl transferase gene (SSAT) which is responsible for the breakdown of polyamines, which are produced in high levels by prostatic epithelial cells, into reactive oxygen species (ROS) that cause cellular damage. APC-100 may ultimately lead to an inhibition of growth in both AR-dependent and AR-independent prostate tumor cells.

**androgen deprivation :** Treatment to suppress or block the production or action of male hormones. This is done by having the testicles removed, by

taking female sex hormones, or by taking drugs called antiandrogens. Also called androgen ablation and androgen suppression.

**androgen receptor** : A protein that binds male hormones called androgens. Androgen receptors are found inside the cells of male reproductive tissue, some other types of tissue, and some cancer cells. In prostate cancer, androgens bind to androgen receptors inside the cancer cells, which causes the cancer cells to grow. Also called AR.

**androgen receptor antagonist SHR3680**: An orally bioavailable androgen receptor (AR) antagonist with potential antineoplastic activity. Upon administration, SHR3680 competitively binds to AR in target tissues, which both prevents androgen-induced receptor activation and facilitates the formation of inactive complexes that cannot be translocated to the nucleus. This prevents binding to and transcription of AR-responsive genes, inhibits the expression of genes that regulate prostate cancer cell proliferation, and may lead to an inhibition of cell growth of AR-expressing tumor cells. ARs are overexpressed in prostate cancer and play a key role in prostate cancer cell proliferation.

**androgen receptor antisense oligonucleotide AZD5312**: An antisense oligonucleotide targeting the androgen receptor (AR) mRNA, with potential antineoplastic activity. Upon intravenous administration, AZD5312 hybridizes with AR mRNA, which blocks translation of the AR protein. This both inhibits AR-induced tumor cell growth and promotes apoptosis in AR-overexpressing tumor cells. AR is overexpressed in certain breast and prostate cancers and is involved in tumor cell proliferation and survival.

**androgen receptor antisense oligonucleotide EZN-4176**: A locked nucleic acid (LNA)-based antisense oligonucleotide targeting the androgen receptor (AR) mRNA, with potential antineoplastic activity. Upon administration, EZN-4176 is hybridized and releases the complementary sequences of AR mRNA, thereby blocking translation of the AR protein and inhibiting AR-induced tumor cell growth and promoting tumor cell apoptosis in AR-overexpressing tumor cells. AR is overexpressed in certain breast and prostate cancers and is involved in tumor cell proliferation and survival. LNAs contain a methylene bridge linking 2'-oxygen and 4'-carbon of ribose sugar rings, thereby increasing their thermal stability and decreasing degradation. Check for active clinical trials using this agent.

**androgen receptor inhibitor EPI-506:** An orally bioavailable, small molecule inhibitor of the N-terminal domain (NTD) of the androgen receptor (AR), with potential antineoplastic activity. Upon oral administration, AR inhibitor EPI-506 specifically binds to the NTD of AR, thereby inhibiting both AR activation and the AR-mediated signaling pathway. This inhibits cell growth in AR-overexpressing tumor cells. AR is overexpressed in prostate cancers and is involved in proliferation, survival and chemoresistance of tumor cells.

**androgen receptor ligand-binding domain-encoding plasmid DNA vaccine MVI-118:** A cancer vaccine containing pTVG4 plasmid DNA encoding the human androgen receptor (AR) ligand-binding domain (LBD) (pTVG-AR), with potential immunostimulating and antineoplastic activities. Upon intradermal administration of AR LBD-encoding plasmid DNA vaccine MVI-118, the plasmid DNA vaccine expresses AR LBD and may stimulate the host immune system to generate a cytotoxic T-lymphocyte (CTL) response against AR LBD-expressing prostate cancer cells. This reduces proliferation of AR-expressing tumor cells. AR, a tumor-associated antigen (TAA) overexpressed in prostate cancer cells, plays a key role in the development and progression of prostate cancer; its expression is correlated with poor prognosis.

**androgen receptor positive :** Describes cells that have a protein that binds to androgens (male hormones). Cancer cells that are androgen receptor positive may need androgens to grow. These cells may stop growing or die when they are treated with substances that block the binding and actions of androgen hormones. Also called AR+.

**androgen suppression :** Treatment to suppress or block the production or action of male hormones. This is done by having the testicles removed, by taking female sex hormones, or by taking drugs called antiandrogens. Also called androgen ablation and androgen deprivation.

**androgen-independent :** Describes the ability of tumor cells to grow in the absence of androgens (hormones that promote the development and maintenance of male sex characteristics). Many early prostate cancers require androgens for growth, but advanced prostate cancers are often androgen-independent.

**androgens:** hormones, such as testosterone, produced from the testes that promote secondary male characteristics. OR A class of steroid hormones,

exemplified by testosterone, that are responsible for the development of male secondary sexual characteristics; synthesized by the testes.

**Android-F:** (Other name for: fluoxymesterone)

**androstane steroid HE3235:** An orally bioavailable adrenal steroid analogue with potential antineoplastic activity. Androstane steroid HE3235 appears to bind the androgen receptor (AR), down-regulating anti-apoptotic genes, such as Bcl-2, while increasing the expression of pro-apoptotic genes, such as caspases. In vitro and in vivo studies indicate that this agent inhibits androstenediol-dependent LNCaP cell tumor growth. In addition, HE3235 may potentiate chemotherapeutic agents by down-regulating ABCG2, the gene encoding the multi-drug resistant (MDR) protein MDR2.

**androstanolone :** A hormone made from testosterone in the prostate, testes, and certain other tissues. It is needed to develop and maintain male sex characteristics, such as facial hair, deep voice, and muscle growth. High amounts of androstanolone may increase the growth of prostate cancer and make it harder to treat. Also called DHT and dihydrotestosterone.

**anecdotal report :** An incomplete description of the medical and treatment history of one or more patients. Anecdotal reports may be published in places other than peer-reviewed, scientific journals.

**anemia :** A condition in which the number of red blood cells is below normal.

**anemometer:** instrument used to determine wind speed.

**anesthesia :** A loss of feeling or awareness caused by drugs or other substances. Anesthesia keeps patients from feeling pain during surgery or other procedures. Local anesthesia is a loss of feeling in one small area of the body. Regional anesthesia is a loss of feeling in a part of the body, such as an arm or leg. General anesthesia is a loss of feeling and a complete loss of awareness that feels like a very deep sleep.

**anesthesiologist :** A doctor who has special training in giving drugs or other agents to prevent or relieve pain during surgery or other procedures.

**anesthetic:** A substance that produces loss of sensation, sometimes with loss of consciousness as well.

**anesthetic :** A drug or other substance that causes a loss of feeling or awareness. Local anesthetics cause a loss of feeling in one small area of the body. Regional anesthetics cause a loss of feeling in a part of the body, such

as an arm or leg. General anesthetics cause a loss of feeling and a complete loss of awareness that feels like a very deep sleep.

**anetholtrithione** : A substance that is being studied in the treatment of cancer.

**anetumab raptansine**: A fully human IgG1 monoclonal antibody directed against the cell surface glycoprotein mesothelin and conjugated to the maytansinoid DM4 with potential antineoplastic activity. The monoclonal antibody moiety of anetumab raptansine targets and binds to the tumor associated antigen mesothelin; upon internalization, the DM4 moiety binds to tubulin and disrupts microtubule assembly/disassembly dynamics, resulting in inhibition of cell division and cell growth of mesothelin-expressing tumor cells. Mesothelin is overexpressed on all mesotheliomas as well as many ovarian and pancreatic cancers while minimally expressed on normal tissue.

**aneuploidy** : The occurrence of one or more extra or missing chromosomes leading to an unbalanced chromosome complement, or any chromosome number that is not an exact multiple of the haploid number (which is 23).

**Aneustat**: (Other name for: multifunctional/multitargeted anticancer agent OMN54)

**ANF-Rho**: (Other name for: pegfilgrastim anti-neutropenic factor)

**Ang2/VEGF-binding peptides-antibody fusion protein CVX-241**: A fusion protein containing angiopoietin-2 (Ang2) and vascular endothelial growth factor (VEGF) derived peptides covalently attached, via a proprietary diketone linker, to a proprietary humanized catalytic aldolase monoclonal antibody, with potential antiangiogenic and antineoplastic activities. The Ang2/VEGF peptide moieties of Ang2/VEGF-binding peptides-antibody fusion protein CVX-241 bind to Ang2 and VEGF receptors, which may inhibit tumor angiogenesis and tumor cell proliferation. The proprietary humanized catalytic IgG1 monoclonal aldolase antibody contains reactive lysine residues in its binding sites, which react covalently with compounds having a diketone function; the Ang2 and VEGFR peptide moieties are then covalently attached to the diketone linkers via a proprietary spacer. Both VEGF and Ang2 are upregulated in a variety of cancer cell types and play a crucial role in

angiogenesis. This agent possesses an enhanced half-life compared to the naked peptides.

**angelica root :** The root of any of a group of herbs called Angelica. It has been used in some cultures to treat certain medical problems, including gastrointestinal problems such as loss of appetite, feelings of fullness, and gas.

**Angelica sinensis root extract:** An herbal extract derived from the root of the plant *Angelica sinensis* with possible antiinflammatory, antispasmodic, vasodilatory, estrogenic, and antitumor activities. *Angelica sinensis* contains volatile oils, including safrole, isosafrole, and n-butylphthalide; coumarin derivatives, including psoralens, bergapten, osthol, imperatorin, and oxypeucedanin; and ferulic acid. The coumarin derivatives in this agent may vasodilate and relax smooth muscle and may exhibit additive anticoagulant effects. Ferulic acid, a phenolic phytochemical present in plant cell walls, may neutralize free radicals such as reactive oxygen species. In addition, *Angelica sinensis* extract has been shown to inhibit the growth and induce apoptosis of glioblastoma multiforme brain tumor cells through p53-dependent and p53-independent pathways.

**Angiocal:** (Other name for: anti-VEGF anticlin PRS-050-PEG40)

**Angiocept :** (Other name for: pegdinetanib) OR A substance being studied in the treatment of cancer. Angiocept may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of vascular endothelial growth factor receptor-2 (VEGFR-2) inhibitor and a type of antiangiogenesis agent. Also called CT-322 and VEGFR-2 inhibitor CT-322.

**angiofibroma :** (AN-jee-oh-fy-BROH-muh)

**angiofollicular lymph node hyperplasia :** A benign (not cancer) tumor that is made up of blood vessels and fibrous (connective) tissue.

Angiofibromas usually appear as small, red bumps on the face, especially on the nose and cheeks. They are common in patients with tuberous sclerosis (a genetic disorder that causes skin lesions, seizures, and mental problems). Angiofibromas are a type of vascular tumor.

**angiogenesis :** A rare disorder in which benign (not cancer) growths form in lymph node tissue. There are two main ways that angiofollicular lymph node hyperplasia occurs: localized (unicentric) and multicentric. Unicentric angiofollicular lymph node hyperplasia affects only one group of lymph

nodes in one part of the body, usually in the chest or abdomen. It may not cause symptoms. Multicentric angiofollicular lymph node hyperplasia affects many groups of lymph nodes and lymphoid tissue all through the body. It can weaken the immune system and cause problems such as infection, fever, weight loss, fatigue, night sweats, nerve damage, and anemia. People with angiofollicular lymph node hyperplasia have an increased risk of lymphoma. Also called Castleman disease and giant lymph node hyperplasia.

**angiogenesis inhibitor :** Blood vessel formation. Tumor angiogenesis is the growth of new blood vessels that tumors need to grow. This process is caused by the release of chemicals by the tumor and by host cells near the tumor.

**angiogenesis inhibitor GT-111:** An adenovirus encoding an endothelial cell-specific, murine pre-proendothelin-1 (PPE-1) promoter and a Fas-based chimeric death receptor with potential anti-angiogenic activity. Endothelial cell-specific transcriptional control of the adenoviral vector is achieved by the use of a modified murine PPE-1 promoter that is specifically activated in PPE-1-expressing angiogenic endothelial cells residing in the tumor microvasculature. Subsequently, the Fas-c (Fas-chimeric) death receptor, containing Fas and tumor necrosis factor (TNF) receptor 1 (TNFR1) moieties, is expressed in angiogenic endothelial cells; endothelial cell-specific Fas-mediated apoptosis is initiated by the binding of TNF-alpha, abundant in the tumor microenvironment, to the TNFR1 moiety of the expressed Fas-c death receptor. Check for active clinical trials using this agent.

**angiogenesis inhibitor JI-101:** An orally active inhibitor of vascular endothelial growth factor receptor 2 (VEGFR2), platelet-derived growth factor receptor beta (PDGFRb), and the ephrin B4 receptor B4 (EphB4) with potential antiangiogenic and antineoplastic activities. Angiogenesis inhibitor JI-101 binds to and inhibits VEGFR2, PDGFRb and EphB4, which may inhibit tumor angiogenesis and, so, cellular proliferation in tumor cells overexpressing VEGFR2, PDGFRb and EphB4. The receptor tyrosine kinases VEGFR2, PDGFRb and EphB4 may be overexpressed in a number of different cancer cell types and may play crucial roles in tumor angiogenesis.

**angiogenesis/heparanase inhibitor PG545:** A synthetic heparan sulfate mimetic with potential anti-angiogenic and antineoplastic activity. PG545 inhibits the cleavage of heparan sulfate from cell surface proteoglycan by heparanase and thus inhibits the neovascularization induced by interaction between heparan sulfate and other extracellular matrix proteins. In this manner, this agent may have the potential to slow the progression of growth of solid tumors.

**angiogram :** A drug or substance that keeps new blood vessels from forming. In cancer treatment, angiogenesis inhibitors may prevent the growth of new blood vessels that tumors need to grow. Also called antiangiogenesis agent.

**angiography :** An x-ray or computer image (CT scan or MRI) of the blood vessels and blood flow in the body. A dye may be injected through a catheter (small tube) into an artery or vein to make the blood vessels easier to see. An angiogram may be used to check for an aneurysm (a bulge in a blood vessel wall), blockages in arteries, blood clots, or other problems, such as a tumor.

**angioblastic T-cell lymphoma :** A procedure to x-ray blood vessels. The blood vessels can be seen because of an injection of a dye that shows up in the x-ray.

**angiokeratoma:** benign cutaneous injury of capillaries resulting in small lesions on the skin; typically having a red to blue color

**angiokeratoma corporis diffusum:** hyperkeratinized deep-red to blue-black skin lesions

**angiolymphoid hyperplasia with eosinophilia :** An aggressive (fast-growing) type of T-cell non-Hodgkin lymphoma marked by enlarged lymph nodes and hypergammaglobulinemia (increased antibodies in the blood). Other symptoms may include a skin rash, fever, weight loss, or night sweats.

**angiomyolipoma :** (AN-jee-oh-LIM-foyd HY-per-PLAY-zhuh ... EE-oh-SIH-noh-FIH-lee-uh)

**angioplasty :** A rare benign (not cancer) tumor of small blood vessels surrounded by lymphocytes and eosinophils (types of white blood cells). Angiolymphoid hyperplasia with eosinophilia usually forms on or in the skin, especially the skin of the head, but can occur in other areas of the

body, such as in bone. On the skin, it may appear as firm pink to red bumps that may be itchy or painful. If the tumor is in bone, it may cause swelling and pain. Angiolymphoid hyperplasia with eosinophilia is sometimes caused by injury and often comes back after treatment. Angiolymphoid hyperplasia with eosinophilia is most common in young and middle-aged adults. It is a type of vascular tumor. Also called epithelioid hemangioma and histiocytoid hemangioma.

**angiosarcoma :** A benign (noncancer) tumor of fat and muscle tissue that usually is found in the kidney. Angiomyolipomas rarely cause symptoms, but may bleed or grow large enough to be painful or cause kidney failure. They are common in patients with tuberous sclerosis (a genetic disorder in which benign tumors grow in the kidneys, brain, eyes, heart, lungs, and skin, causing seizures, mental problems, and skin lesions).

**angiostatin:** Encoded by human PLG Gene (Plasminogen Family) and expressed in the kidney, angiostatin is an angiogenesis inhibitor present in plasma and other extracellular fluids that blocks neovascularization and mediates suppression of metastases. Containing at least three kringles, angiostatin is a 38-kD internal (serine protease) proteolytic fragment of plasminogen. OR A procedure to enlarge the opening in a blood vessel that has become narrowed or blocked by plaque (a buildup of fat and cholesterol on the inner wall of the blood vessel). Examples of angioplasty are balloon angioplasty and laser angioplasty.

**angiotensin-converting enzyme inhibitor :** A type of cancer that begins in the cells that line blood vessels or lymph vessels. Cancer that begins in blood vessels is called hemangiosarcoma. Cancer that begins in lymph vessels is called lymphangiosarcoma.

**Angiozyme:** (Other name for: anti-FLT-1 ribozyme) or A protein normally made by the body. It can also be made in the laboratory, and is being studied in the treatment of cancer. Angiostatin may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent.

**angle:** Two rays sharing the same endpoint. (A ray is a part of a line that looks like an arrow. It begins at one point and goes on forever in the opposite direction.)

**Angle iron:** Used to describe any cast or rolled steel strip of L section.

**Angle of incidence:** The angle at which X-rays strike a plane in the crystal.

**angle of repose:** the steepest angle at which loose material will remain in place.

**angle of rotation:** ( $\alpha$ ) in a polarimeter, the angle right or left in which plane-polarized light is turned after passing through an optically active compound in solution.

**Angle Press:** A hydraulic molding press equipped with horizontal and vertical rams, and specially designed for the production of complex moldings containing deep undercuts.

**angle strain:** the strain created by the deformation of bond angles from their normal values.

**angstrom:** a unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundredth-millionth of a centimeter ( $1 \times 10^{-8}$  cm). OR A unit of length equal to  $1 \times 10^{-8}$  cm or .1 nanometer. It was named after A. J. Angstrom (1814-1874), a Swedish spectroscopist. OR A non-SI unit of length used to express wavelengths of light, bond lengths, and molecular sizes.  $1 \text{ \AA} = 10^{-10} \text{ m} = 10^{-8} \text{ cm}$ .

**angstrom (Å):** A unit of length ( $10^{-8}$  cm) used to indicate molecular dimensions.

**anguidine:** A trichothecene mycotoxin and potent teratogen. Anguidine inhibits initiation of protein synthesis, resulting in the death of rapidly proliferating cells. Anguidine also has been shown to both potentiate and protect against the cytotoxic effects of other drugs.

**angular momentum quantum number:** A quantum number that labels the subshells of an atom. Sometimes called the orbital angular momentum quantum number, this quantum number dictates orbital shape. can take on values from 0 to  $n-1$  within a shell with principal quantum number  $n$ .

**angular unconformity:** the contact that separates a younger, gently dipping rock unit from older underlying rocks that are tilted or deformed layered rock.

**Anhydrate:** A crystal form that contains no solvent of crystallization.

**anhydride:** The product of the condensation of two carboxyl or phosphate groups in which the elements of water are eliminated to form a compound with the general structure  $\text{X}_2\text{O}$ , where X is either carbon or phosphorus.

**Anhydrous:** Very dry. No water or dampness is present.

**anhydrous:** A compound with all water removed, especially water of hydration. For example, strongly heating copper(II) sulfate pentahydrate ( $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ ) produces anhydrous copper(II) sulfate ( $\text{CuSO}_4$ ).

**anhydrovinblastine :** A drug that is used to lower blood pressure. An angiotensin-converting enzyme inhibitor is a type of antihypertensive agent. Also called ACE inhibitor.

**anidulafungin :** A substance being studied in the treatment of cancer. Angiozyme is a special type of RNA made in the laboratory. It stops a protein called vascular endothelial growth factor receptor (VEGFR) from being made. This may prevent the growth of new blood vessels that tumors need to grow. It is a type of angiogenesis inhibitor and a type of ribozyme. Also called RPI.4610. OR A cyclic lipopeptide echinocandin derivative with antifungal activity. Anidulafungin inhibits 1,3 beta-D-glucan synthase, an enzyme involved in fungal cell wall synthesis, resulting in cell lysis and death. This agent is active against *Candida* species and *Aspergillus*. Check for active clinical trials using this agent.

**Aniline:** Aniline is an aromatic derivative produced by hydrogenation of nitrobenzene and is used primarily for the production of MDI (methylene diphenyl diisocyanate).

**aniline mustard:** An alkylating mustard with antineoplastic activity. Aniline mustard forms covalent linkages with nucleophilic centers, resulting in depurination, base miscoding and strand scission, and crosslinking of DNA strands, all of which contribute to its cytotoxicity.

**Aniline Point:** The lowest temperature at which equal volume of pure, fresh aniline and oil will completely dissolve in one another is the aniline point of the oil.

**animal model :** An anticancer drug that belongs to the family of drugs called mitotic inhibitors.

**animal study :** A drug that is used to treat infections caused by fungi. It belongs to the family of drugs called antifungals.

**animal-assisted therapy :** An animal with a disease either the same as or like a disease in humans. Animal models are used to study the development and progression of diseases and to test new treatments before they are given to humans. Animals with transplanted human cancers or other tissues are called xenograft models.

**Animalia:** the kingdom that includes the animals.

**Anion:** A negatively charged ion in an electrolyte solution, attracted to the anode under the influence of a difference in electrical potential. Chloride is an anion. OR ion having a negative charge; an atom with extra electrons. Atoms of non-metals, in solution, become anions. OR An anion is a negatively charged ion. Nonmetals typically form anions.

**anion gap:** defined as difference in concentration of cations other than  $\text{Na}^+$  and anions other than  $\text{Cl}^-$  and  $\text{HCO}_3^-$ : value determined by equation as follows  $[\text{Na}^+ - (\text{Cl}^- + \text{HCO}_3^-)]$

**anion-exchange resin:** A polymeric resin with fixed cationic groups; used in the chromatographic separation of anions.

**Anionic:** A negatively charged chemical species, like the hydroxide  $\text{OH}^-$ , carbonate  $\text{CO}_3^{2-}$ , or sulphate  $\text{SO}_4^{2-}$ , is called an anion. In an electrochemical cell, an anion will move towards the anode to lose its extra electron and generate a current.

**Anionic product :** A product carrying negative charge in its structure.

**ANIONIC SURFACTANT:** A surfactant in which the hydrophile is negatively charged. Examples; sulfonates and sulfates. (see RFF 750.10.01 - SURFACTANTS).

**anions:** Anions are negatively charged ions (so called because they are attracted to the anode – the positive electrode – during electrolysis).

**aniridia :** A laboratory experiment using animals to study the development and progression of diseases. Animal studies also test how safe and effective new treatments are before they are tested in people.

**Anisotropic behavior:** A term used to describe cases where a solid-state reaction proceeds through different directions of the crystal at different rates; also referring to any observed property that varies in different directions in or on a crystal.

**Anisotropic shrinkage:** Shrinkage that occurs more in one direction (usually the direction of flow; reinforced materials shrink more across the direction of flow) than another.

**ANISOTROPY:** The situation where properties vary according to the direction in which they are measured.

**Anisotropy:** The tendency of a material to react differently to stresses applied in different directions.

**ANLL:** A type of therapy that uses dogs or other pets to improve the physical and mental health of patients with certain acute or chronic diseases. It is being studied as a way to relieve distress in cancer patients undergoing treatment for pain. Also called pet-facilitated therapy.

**anlotinib hydrochloride:** The hydrochloride salt form of anlotinib, a receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic and anti-angiogenic activities. Upon administration, anlotinib targets multiple RTKs, including vascular endothelial growth factor receptor type 2 (VEGFR2) and type 3 (VEGFR3). This agent may both inhibit angiogenesis and halt tumor cell growth.

**annamycin :** A disorder in which a person is born without part or all of the iris (colored tissue at the front of the eyeball). Aniridia usually affects both eyes and causes other eye problems, including being sensitive to light and loss of vision.

**Anneal:** To prevent the formation of or remove stresses in plastics by cooling from a suitable temperature. OR (1) To heat a molded plastic article to a predetermined temperature and slowly cool it. to relieve stresses. (2) To heat steel to a predetermined temperature above the critical range and slowly cool it, to relieve stresses and reduce harness. (Annealing of molded or machined parts may be done dry as in an oven or wet as in a heated tank of mineral oil.) OR To heat a molded part up to a temperature just below its melting point and slowly cool it back down to room temperature This relieves molded stresses See conditioning. OR a procedure for preventing or removing stresses within a material through the use of controlled heating and subsequent cooling of the material. OR to prevent the formation of or remove stresses in plastics by cooling from a suitable temperature. OR (1) To heat a molded plastic article to a predetermined temperature and slowly cool it to relieve stresses. (2) To heat steel to a predetermined temperature above the critical range and slowly cool it, to relieve stresses and reduce harness. (Annealing of molded or machined parts may be done dry as in an oven or wet as in a heated tank of mineral oil.)

**Annealing:** The process of relieving internal stresses of molded plastic articles by heating to a predetermined temperature, maintaining this temperature for a predetermined length of time, and slowly cooling. OR A process of holding a material at a temperature mean, but below its melting point, the objective being to permit stress relaxation without distortion of

shape. It is often used on molded articles to relieve stresses set up by flow into the molds. OR A metallurgic term used in plastics to describe the heating of a polymer to just below the melting point. The process reconfigures the plastic molecules, re-setting the plastic's "memory." OR The process of relieving internal stresses of molded plastic articles by heating to a predetermined temperature, maintaining this temperature for a predetermined length of time, and slowly cooling the articles.

**Annonaceous acetogenins:** A family of naturally occurring polyketides that consist of C32 or C34 long chain fatty acids and combined with a propan-2-ol unit at C-2 to form a gamma-lactone, which are isolated from various species of the plant family Annonaceae, with potential antineoplastic and antimicrobial activity. Annonaceous acetogenins bind to the ubiquinone catalytic site(s) within the mitochondrial NADH:ubiquinone oxidoreductase (complex I), and block the electron transport chain in mitochondria. In addition, the acetogenins bind to and block the activity of ubiquinone-linked NADH oxidase, an enzyme overexpressed in the plasma membranes of cancer cells. This inhibits adenosine triphosphate (ATP) production, decreases intracellular ATP levels, and induces tumor cell apoptosis. Compared to normal cells, cancer cells have higher ATP demands. The Annonaceous acetogenins also inhibit microbial glucose dehydrogenase 6.

**Annual limit on intake (ALI):** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), ALI is the derived limit for the amount of radioactive material taken into the body of an adult worker by inhalation or ingestion in a year. ALI is the smaller value of intake of a given radionuclide in a year by the "reference man" that would result in a committed effective dose equivalent (CEDE) of 5 rems (0.05 sievert) or a committed dose equivalent (CDE) of 50 rems (0.5 sievert) to any individual organ or tissue. ALI values for intake by ingestion and inhalation of selected radionuclides are given in Table 1, Columns 1 and 2, of Appendix B to 10 CFR Part 20, "Standards for Protection Against Radiation." For additional detail, see Information for Radiation Workers.

**ANO:** Atomic natural orbital. Very large basis sets derived from correlated atomic calculations. More expensive to use than the corresponding

correlation consistent basis sets (e.g., cc-pVDZ) but not often significantly more accurate.

**anode:** The electrode where electrons are lost (oxidized) in redox reactions.

**Anodising:** A method of treating aluminium or light alloy to provide a non-corroding oxide film on the surface of the metal.

**anodize:** Anodizing is the process of coating an aluminium surface with a thicker than usual coating of aluminium oxide. This is done by making aluminium the anode (positive electrode) in an electrolytic cell.

**anomers:** Two stereoisomers of a given sugar that differ only in the configuration about the carbonyl (anomeric) carbon atom.

**anorexia :** An aggressive (fast-growing) disease in which too many myeloblasts (immature white blood cells that are not lymphoblasts) are found in the bone marrow and blood. Also called acute myeloblastic leukemia, acute myelogenous leukemia, acute myeloid leukemia, acute nonlymphocytic leukemia, and AML.

**anorexia nervosa :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called anthracycline antibiotics.

**ANS:** An abnormal loss of the appetite for food. Anorexia can be caused by cancer, AIDS, a mental disorder (i.e., anorexia nervosa), or other diseases.

**Ansaid:** (Other name for: flurbiprofen)

**ansamycin :** An eating disorder marked by an intense fear of gaining weight, a refusal to maintain a healthy weight, and a distorted body image. People with anorexia nervosa have an abnormal loss of appetite for food, try to avoid eating, and eat as little as possible.

**ANSI:** Abbreviation for American National Standards Institute.

**Antabuse:** (Other name for: disulfiram)

**antacids:** Antacids are basic substances (such as magnesium hydroxide) used to neutralize excess acid in the stomach.

**Antagonist:** A molecule that binds to a receptor protein but does not trigger the signaling pathway. Such molecules are like competitive inhibitors for enzymes. Or The part of the nervous system that controls muscles of internal organs (such as the heart, blood vessels, lungs, stomach,

and intestines) and glands (such as salivary glands and sweat glands). One part of the ANS helps the body rest, relax, and digest food and another part helps a person fight or take flight in an emergency. Also called autonomic nervous system and involuntary nervous system.

**antagonistic effect:** This is the consequence of one chemical (or a group of chemicals) interacting the situation in which the combined effect of two or more chemicals is less than the simple sum of their independent effects. In bioassay, the term may be used to refer to the situation when a specified response is produced by exposure to either of two factors but not by exposure to both together (Last, 1983).

**Antarctic Ice Sheet:** See ice sheet.

**antecedent:** the noun or group of words acting as a noun to which the pronoun refers.

**antenatal :** An anticancer drug that belongs to the family of drugs called antineoplastic antibiotics.

**anterior :** In medicine, a substance that stops the action or effect of another substance. For example, a drug that blocks the stimulating effect of estrogen on a tumor cell is called an estrogen receptor antagonist.

**anterior mediastinotomy :** Having to do with the time a female is pregnant, before birth occurs. Also called prenatal.

**anterior mediastinum :** In human anatomy, has to do with the front of a structure, or a structure found toward the front of the body.

**anterior pelvic exenteration :** A procedure in which a tube is inserted into the chest to view the tissues and organs in the area between the lungs and between the breastbone and heart. The tube is inserted through an incision next to the breastbone. This procedure is usually used to get a tissue sample from the lymph nodes on the left side of the chest. Also called Chamberlain procedure.

**anterior urethral cancer :** The area in the front part of the chest between the lungs. Also called prevascular space.

**anthocyanin:** A family of pigments that give flowers, fruits, and leaves of some plants their red or blue coloring. Anthocyanins consist of sugar molecules bound to a benzopyrylium salt (called anthocyanidin). See Water to Wine for more about anthocyanins.

**anthocyanin-rich corn extract:** A corn-based, water-soluble extract rich in the polyphenol anthocyanin, with potential antioxidant, anti-inflammatory and chemoprotective activities. Upon administration of the anthocyanin-rich corn extract, the anthocyanins scavenge reactive oxygen species (ROS), which protects healthy cells from radiation-induced oxidative stress and DNA damage. In addition, anthocyanins modulate the expression of various genes and proteins involved in inflammation, tumor cell proliferation, angiogenesis, tumor cell invasion and differentiation. This agent also chelates metals and induces the expression of enzymes involved in Phase II antioxidant and detoxification pathways, which may further protect cells against oxidative stress induced by toxins and carcinogens.

**anthracenedione :** Surgery to remove the urethra, lower part of the ureters, uterus, cervix, vagina, and bladder.

**anthracycline :** A disease in which malignant (cancer) cells are found in the part of the urethra (the tube through which urine leaves the body) that is closest to the outside of the body.

**anthracycline analogue GPX-150:** A synthetic non-cardiotoxic analogue of the anthracycline antibiotic doxorubicin with potential antineoplastic activity. Anthracycline analogue GPX-150 intercalates DNA and impedes the activity of topoisomerase II, inducing single and double-stranded breaks in DNA; inhibiting DNA replication and/or repair, transcription, and protein synthesis; and activating tumor cell apoptosis.

**anthraquinone :** An anticancer drug that belongs to the family of drugs called anticancer antibiotics.

**Anthropogenic:** A fancy way of saying "man-made" that hides its lack of political correctness in greek. Think of 'anthropoid' and 'genesis'.

**anti c-KIT antibody-drug conjugate LOP628:** An antibody-drug conjugate (ADC) consisting of a humanized monoclonal antibody against the stem cell factor receptor c-Kit (SCFR) and conjugated, via a non-cleavable linker, to the cytotoxic agent maytansine, with potential antineoplastic activity. The monoclonal antibody moiety of anti c-KIT ADC LOP628 targets and binds to the cell surface antigen c-Kit. After antibody-antigen interaction followed by internalization, the maytansine moiety binds to tubulin, inhibits microtubule assembly, and induces microtubule disassembly. This leads to a disruption of mitosis and the inhibition of cell proliferation in cancer cells expressing c-Kit. c-Kit, a transmembrane

protein and receptor tyrosine kinase, is overexpressed in solid tumors and hematological malignancies; it plays a key role in the regulation of cell differentiation and proliferation.

**anti-5T4 antibody-drug conjugate PF-06263507:** An antibody-drug conjugate composed of an antibody directed against 5T4 and conjugated, via the stable linker maleimidocaproyl (mc), to the microtubule inhibitor monomethyl auristatin phenylalanine (MMAF), with potential antineoplastic activity. Upon administration, the antibody moiety of PF-06263507 selectively binds to cells expressing the 5T4 oncofetal antigen. After internalization and enzymatic cleavage of the immunoconjugate within the tumor cell cytosol, free MMAF binds to tubulin and inhibits its polymerization, which may result in G2/M phase arrest and tumor cell apoptosis. 5T4, a transmembrane glycoprotein, is overexpressed by a variety of cancer cell types; its expression is correlated with increased invasiveness.

**anti-A33 monoclonal antibody KRN330:** A recombinant fully human monoclonal antibody directed against the human A33 antigen, with potential immunomodulatory and antineoplastic activity. Anti-A33 monoclonal antibody KRN330 recognizes and binds to the human A33 antigen, which may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against A33-positive colorectal cancers. A33 antigen, a 43 kDa transmembrane glycoprotein of the immunoglobulin superfamily, is highly and homogeneously expressed in 95% of colorectal cancer cancers with only restricted expression in normal colonic mucosa and small bowel epithelia.

**anti-A5B1 integrin monoclonal antibody PF-04605412:** A monoclonal antibody directed against the human alpha5beta1 integrin with potential antiangiogenic and antineoplastic activities. Anti-alpha5beta1 integrin monoclonal antibody PF-04605412 selectively binds to alpha5beta1 integrin, preventing the binding of integrin ligands. This may result in the inhibition of endothelial cell-cell interactions, endothelial cell-matrix interactions, and integrin-mediated tumor angiogenesis and metastasis in alpha5beta1-expressing tumor cells. Alpha5beta1 integrin, a cell adhesion and signaling receptor, is often overexpressed on the surface of tumor vessel endothelial cells and plays a crucial role in endothelial cell adhesion and migration.

**anti-AGS-16 monoclonal antibody AGS-16M18:** A humanized monoclonal antibody directed against the activator of g-proteins signaling (AGS) cell surface protein AGS-16 with potential antineoplastic activity. Anti-AGS-16 monoclonal antibody AGS-16M18 selectively binds to AGS-16, triggering complement-dependent cell lysis (CDCL) and antibody-dependent cell-mediated cytotoxicity (ADCC) in tumor cells expressing AGS-16. While normally expressed at low levels in the proximal tubules of the kidney, AGS-16 has been found to be overexpressed in more than 95% of kidney and 40% of liver neoplasms.

**anti-AGS-5 antibody-drug conjugate ASG-5ME:** An antibody drug conjugate (ADC) containing the fully human IgG2k monoclonal antibody targeting an epitope of SLC44A4 (AGS-5) linked, via a valine-citrulline (vc) maleimidocaproyl (mc) linker, to the antimicrotubulin drug monomethyl auristatin E (MMAE), with potential antineoplastic activity. The monoclonal antibody moiety of ASG-5ME selectively binds to AGS-5. After internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and tumor cell apoptosis. SLC44A4, potentially a sodium-dependent transmembrane transport protein, is overexpressed on more than 80 percent of samples derived from patients with pancreatic, prostate and gastric cancers.

**anti-AGS-8 monoclonal antibody AGS-8M4:** A humanized monoclonal antibody directed against the activator of g-proteins signaling (AGS) cell surface protein AGS-8 with potential antineoplastic activity. Anti-AGS-8 monoclonal antibody AGS-8M4 selectively binds to AGS-8, triggering complement-dependent cell lysis and antibody-dependent cell-mediated cytotoxicity in tumor cells expressing AGS-8. While normally expressed at low levels in the heart in response to ischemia, AGS-8 has been found to be expressed in more than 70% of ovarian neoplasms.

**anti-ALK-1 monoclonal antibody PF-03446962:** A fully human, IgG2 monoclonal antibody directed against activin-like receptor kinase 1 (ALK-1) with potential antineoplastic activity. Anti-ALK-1 monoclonal antibody PF-03446962 binds to and neutralizes ALK-1. This may disrupt tumor endothelial cell function and inhibit tumor angiogenesis, eventually leading to an inhibition of tumor cell proliferation. ALK-1, a member of the transforming growth factor beta (TGF- $\beta$ ) type I receptor family, is

overexpressed on endothelial cells in a variety of tumor cell types and increases endothelial cell proliferation and migration.

**anti-amyloid monoclonal antibody NEOD001:** A monoclonal antibody against amyloid with potential use in the treatment of amyloid light chain (AL) and AA amyloidosis. Upon intravenous administration, anti-amyloid monoclonal antibody NEOD001 specifically binds to amyloid fibrils. This prevents the formation of amyloid deposits in certain organs and facilitates their clearance. It also reduces the level of amyloid deposits in organs and prevents organ dysfunction.

**anti-ANG2 monoclonal antibody MEDI-3617:** A fully human IgG1 monoclonal antibody against angiopoietin 2 (ANG2), with potential antiangiogenic activity. Anti-ANG2 monoclonal antibody MEDI-3617 binds to Ang2 and interferes with the interaction between Ang2 and its receptor TEK tyrosine kinase (Tie2), thereby resulting in the disruption of vascular remodeling. This may inhibit angiogenesis and may eventually lead to an inhibition of tumor cell proliferation.

**anti-B4 blocked ricin immunotoxin:** An immunotoxin comprised of an anti-B4 (anti-CD19) murine monoclonal antibody linked to the modified plant-derived toxin blocked ricin. The antibody moiety of anti-B4 blocked ricin immunotoxin binds to B lymphocytes that express B4; after internalization of the immunotoxin by the B4-expressing B cell, the ricin moiety cleaves the N-glycosidic bond between the ribose and adenine base at position 4324 in the B lymphocyte 28S ribosomal RNA, resulting in ribosome inactivation, inhibition of protein synthesis, and cell death. "Blocked" ricin is ricin which has been chemically modified such that the lectin binding sites of the B chain (galactose-binding sites) have been blocked by covalent attachment of affinity ligands, leaving the ribosome-inactivating activity of the ricin A chain intact.

**anti-B7-H3 antibody DS-5573a:** An antibody directed against the immunoregulatory protein B7-homologue 3 (B7-H3, CD276), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, anti-B7-H3 antibody DS-5573a binds to the cell surface antigen B7-H3, thereby blocking B7-H3-mediated signaling. This abrogates the inhibitory effect on T-cell activation and may activate the immune system to exert a cytotoxic T-lymphocyte (CTL) response against B7-H3-expressing tumor cells. B7-H3, a type I transmembrane protein and

a member of the B7 co-stimulatory protein superfamily, is overexpressed on certain tumor cell types and on various immune cells. It is a negative regulator of the T-cell activation and its overexpression plays a key role in tumor cell invasion and metastasis.

**anti-BCMA antibody-drug conjugate GSK2857916:** An antibody-drug conjugate (ADC) consisting of an afucosylated, humanized monoclonal antibody, directed against the B-cell maturation antigen (BCMA), conjugated to the auristatin analogue and microtubule inhibitor monomethyl auristatin phenylalanine (MMAF), with potential antineoplastic activity. The anti-BCMA antibody moiety of anti-BCMA ADC GSK2857916 selectively binds to the BCMA on tumor cell surfaces. Upon internalization, the MMAF moiety binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and induces tumor cell apoptosis. In addition, GSK2857916 induces antibody-dependent cellular cytotoxicity (ADCC). Altogether, this results in the inhibition of cellular proliferation in tumor cells that overexpress BCMA. BCMA, a receptor for a proliferation-inducing ligand and B-cell activating factor, is a member of the tumor necrosis factor (TNF) receptor superfamily and plays a key role in plasma survival; it is found on the surfaces of plasma cells and overexpressed on malignant plasma cells. Afucosylation of the antibody moiety increases ADCC.

**anti-c-fms monoclonal antibody AMG 820:** A fully human IgG2 monoclonal antibody against the colony-stimulating factor-1 (CSF-1 or M-CSF) receptor c-fms (or CSFR1), with potential antineoplastic activity. Upon administration, anti-c-fms monoclonal antibody AMG 820 binds to and blocks c-fms, thereby blocking CSF-1 binding to its receptor and suppressing CSF-1-induced c-fms signaling. This results in the suppression of recruitment and activation of tumor associated macrophages (TAM) within the tumor microenvironment. This eventually leads to a decrease in tumor growth. c-fms, a transmembrane protein belonging to the tyrosine kinase family, is overexpressed in certain tumor cell types and plays an essential role in macrophage differentiation and regulation of cell proliferation. The presence of TAM is correlated with tumor proliferation, invasion and a poor prognosis.

**anti-c-KIT monoclonal antibody KTN0158:** A humanized immunoglobulin (Ig) G1 monoclonal antibody against the stem cell factor

receptor c-Kit (SCFR; KIT; CD117), with potential antineoplastic and anti-allergic activities. Upon administration, the anti-c-KIT monoclonal antibody KTN0158 binds to and inhibits the activation of the cell surface antigen c-Kit. This leads to an inhibition of the activation of c-KIT-mediated signal transduction pathways and inhibits cell proliferation in cancer cells expressing c-Kit. In mast cells, inhibition of c-KIT and c-KIT-mediated signaling prevents mast cell activation, degranulation and subsequent cytokine release. c-Kit, a transmembrane protein and receptor tyrosine kinase, is overexpressed in various cell types, including certain cancer cells and mast cells; it plays a key role in the regulation of cell differentiation and proliferation.

**anti-c-Met monoclonal antibody ABT-700:** A monoclonal antibody directed against human hepatocyte growth factor receptor (HGFR or c-Met), with potential antineoplastic activity. Anti-c-Met monoclonal antibody ABT-700 binds to c-Met, thereby preventing c-Met binding to its ligand, HGF and the subsequent activation of the HGF/c-Met signaling pathway. This may cause cell death in c-Met-expressing tumor cells. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**anti-c-Met monoclonal antibody ARGX-111:** A human monoclonal antibody targeting c-Met, with potential antineoplastic activity. Anti-c-Met monoclonal antibody ARGX-111 binds to c-Met, and blocks both ligand-dependent and -independent activation of c-Met-mediated signaling pathways. In addition, this agent enhances antibody-dependent cellular cytotoxicity (ADCC). This leads to a reduction in cell proliferation of c-Met-expressing cancer cells. c-Met, a receptor tyrosine kinase overexpressed in certain cancer cell types, is involved in cell proliferation, angiogenesis and metastasis in multiple solid tumors. Compared to other c-Met targeting monoclonal antibodies, ARGX-111 shows increased antibody circulation time, enhanced tissue distribution and increased efficacy. ARGX-111 is obtained through active immunization with C-met antigen in Camelids and utilizes the Camelid V-domains fused with human antibody backbones.

**anti-c-MET monoclonal antibody LY2875358:** A humanized IgG4 monoclonal antibody directed against human hepatocyte growth factor

receptor (HGFR or c-MET) with potential antineoplastic activity. Anti-c-MET monoclonal antibody LY2875358 binds to c-MET, thereby preventing the binding of HGF to its receptor c-Met and subsequent activation of the HGF/c-Met signaling pathway. This may result in cell death in c-Met-expressing tumor cells. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**anti-C-met monoclonal antibody SAIT301:** A humanized monoclonal antibody targeting the alpha chain of the extracellular domain of human hepatocyte growth factor receptor (HGFR or c-Met), with potential antineoplastic activity. Anti-c-Met monoclonal antibody SAIT301 binds to c-Met, thereby preventing both binding of its ligand, HGF, and the subsequent activation of the HGF/c-Met signaling pathway. In addition, SAIT301 induces c-Met internalization and subsequent degradation, which further inhibits c-Met-mediated signaling. This leads to a reduction in the proliferation of c-Met-expressing cancer cells. c-Met, a proto-oncogene receptor tyrosine kinase overexpressed in certain cancer cell types, is involved in various tumors. Check for active clinical trials using this agent.

**anti-C4.4a antibody-drug conjugate BAY1129980:** An antibody-drug conjugate (ADC) composed of an antibody against a structural homolog of the urokinase-type plasminogen activator receptor (uPAR) and tumor-associated antigen, C4.4a, and conjugated with a cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, anti-C4.4a antibody-drug conjugate BAY1129980 targets and binds to C4.4a-expressing tumor cells. Upon binding and cell entry, the cytotoxic agent kills the tumor cell. C4.4a, a glycolipid-anchored membrane protein and a member of the Ly-6 family, is overexpressed by a variety of cancer cell types whereas it is minimally expressed on healthy cells.

**anti-CA19-9 monoclonal antibody 5B1:** A human monoclonal antibody against the carbohydrate antigen sialyl-Lewis A (carbohydrate antigen 19-9; CA19-9), with potential antineoplastic activity. Upon administration, monoclonal antibody 5B1 binds to CA19-9 and kills CA19-9-expressing tumor cells, possibly through the induction of both complement-dependent cytotoxicity (CDC) and antibody-dependent cell-mediated cytotoxicity (ADCC). CA19-9 is overexpressed on a number of different tumor cell types, and plays a key role in tumor cell survival and metastasis.

**anti-CA6-DM4 immunoconjugate SAR566658:** An immunoconjugate consisting of a humanized monoclonal antibody against the tumor-associated sialoglycotope CA6 (huDS6) conjugated to the cytotoxic maytansinoid DM4, with potential antineoplastic activity. The anti-CA6 monoclonal antibody moiety of SAR566658 targets and binds to the cell surface antigen CA6. Upon antibody/antigen binding and internalization, the immunoconjugate releases DM4, which binds to tubulin and disrupts microtubule assembly/disassembly dynamics, resulting in inhibition of cell division and cell growth of CA6-expressing tumor cells. The CA6 epitope is found on a variety of solid tumors, including breast, ovarian, cervical, lung and pancreatic tumors.

**anti-CCR2 monoclonal antibody MLN1202 :** Treatment to stop or prevent cancer.

**anti-CD123 monoclonal antibody KHK2823:** A fully humanized monoclonal antibody against CD123 (interleukin-3 receptor alpha chain) with potential antineoplastic activity. Anti-CD123 monoclonal antibody KHK2823 binds to and neutralizes CD123, which is upregulated on leukemic stem cells (LSC) found in myelodysplastic syndrome (MDS) or acute myeloid leukemia (AML). This agent may inhibit IL-3-dependent signaling and proliferation and may prevent the uncontrolled growth and differentiation of mutated LSC.

**anti-CD123 x anti-CD3 bispecific antibody XmAb14045:** An anti-CD123/anti-CD3 bispecific monoclonal antibody, in which most of the naturally-occurring Fc domain is maintained, with potential immunostimulatory and antineoplastic activities. Anti-CD123/CD3 monoclonal antibody XmAb14045 possesses two antigen-recognition and binding sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for CD123, a tumor-associated antigen (TAA) overexpressed on the surface of certain tumor cells. Upon administration of XmAb14045, this bispecific antibody simultaneously binds to both CD3-expressing T cells and CD123-expressing cancer cells, thereby crosslinking CD123-expressing tumor cells and cytotoxic T lymphocytes (CTLs). This may result in potent CTL-mediated cell lysis of CD123-expressing tumor cells. CD123, the interleukin-3 receptor alpha chain, is overexpressed in a variety of hematological malignancies; its expression is low or absent in normal

hematopoietic progenitors and stem cells. The Fc domain on the antibody prolongs the half-life of the bispecific antibody and enhances T-cell-mediated tumor cell killing through its binding to the Fc receptors. Check for active clinical trials using this agent.

**anti-CD123/CD3 bispecific antibody JNJ-63709178:** A humanized anti-CD123/anti-CD3 bispecific monoclonal antibody, with potential immunostimulating and antineoplastic activities. Anti-CD123/CD3 bispecific antibody JNJ-63709178 possesses two antigen-recognition and binding sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for CD123, a tumor-associated antigen (TAA) overexpressed on the surface of certain tumor cells. Upon administration of JNJ-63709178, this bispecific antibody simultaneously binds to both CD3-expressing T cells and CD123-expressing cancer cells, thereby crosslinking CD123-expressing tumor cells and cytotoxic T lymphocytes (CTLs). This may result in potent CTL-mediated cell lysis of CD123-expressing tumor cells. CD123, the interleukin-3 receptor alpha chain, is overexpressed in a variety of cancers; its expression is low or absent in normal, healthy cells. Check for active clinical trials using this agent.

**anti-CD123/CD3 monoclonal antibody MGD006:** An anti-CD123/anti-CD3 bispecific humanized monoclonal antibody with potential immunostimulatory and antineoplastic activities. Anti-CD123/CD3 monoclonal antibody MGD006 possesses two antigen-recognition and binding sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for CD123, a tumor-associated antigen (TAA) overexpressed on the surface of certain tumor cells. Upon administration of MGD006, this bispecific antibody simultaneously binds to both CD3-expressing T-cells and CD123-expressing cancer cells, thereby crosslinking CD123-expressing tumor cells and cytotoxic T-lymphocytes (CTLs). This may result in potent CTL-mediated cell lysis of CD123-expressing tumor cells. CD123, the interleukin-3 receptor alpha chain, is overexpressed in a variety of hematological malignancies; its expression is low or absent in normal hematopoietic progenitors and stem cells. Check for active clinical trials using this agent.

**anti-CD133-CAR vector-transduced allogeneic T lymphocytes:** A preparation of allogeneic peripheral blood T lymphocytes (PBTL) that have been genetically modified to express a chimeric antigen receptor (CAR) specific for the chimeric CD (cluster of differentiation) 133 antigen receptor, with potential immunostimulating and antineoplastic activities. Upon administration, anti-CD133-CAR vector-transduced allogeneic T lymphocytes specifically recognize and kill CD133-expressing tumor cells. CD133, a tumor associated antigen (TAA), is overexpressed on a variety of tumor cell types.

**anti-CD157 monoclonal antibody MEN1112:** A humanized, Fc-engineered, de-fucosylated monoclonal immunoglobulin G1 (IgG1) antibody directed against the bone marrow stromal cell antigen 1 (BST1/CD157), with potential antineoplastic activity. Upon intravenous infusion, anti-CD157 monoclonal antibody MEN1112 specifically binds to and induces an antibody-dependent cell cytotoxic (ADCC) response against CD157-expressing tumor cells. CD157, also known as ADP-ribosyl cyclase 2, is a glycosyl-phosphatidylinositol (GPI)-anchored transmembrane protein belonging to the ADP-ribosyl-cyclase family and is overexpressed on certain cancer cell types. Fc-optimization of MEN1112, which involves the removal of fucose residues from its Fc domain, allows for enhanced Fc-gamma receptor binding on effector cells, such as natural killer (NK) cells, and further enhances tumor cell lysis. Check for active clinical trials using this agent.

**anti-CD19 fully human monoclonal antibody MDX-1342:** A fully human anti-CD19 monoclonal antibody directed against the B-cell-specific membrane protein CD-19 with potential antineoplastic activity. Anti-CD19 monoclonal antibody MDX-1342 binds to CD19, depleting and eliminating CD19-expressing B-cells. CD19 is widely expressed during B-cell development, from pro-B-cell to early plasma cell stages.

**anti-CD19 immunotoxin :** Having to do with preventing or delaying the development of cancer.

**anti-CD19 monoclonal antibody DI-B4:** A low-fucosylated, humanized, IgG1 isotype, monoclonal antibody directed against the B-cell-specific membrane protein CD19 with potential immunostimulating and antineoplastic activities. Anti-CD19 monoclonal antibody DI-B4 binds to CD19, which may result in a strong antibody-dependent cellular

cytotoxicity (ADCC) directed at CD19-expressing B-cells but with minimal complement dependent cytotoxicity. DI-B4 contains low levels of fucose, which contributes to its enhanced ADCC activity. CD19 is a B-cell specific membrane antigen that is widely expressed during B-cell development and in all B-cell lineage malignancies.

**anti-CD19 monoclonal antibody MEDI-551:** A humanized immunoglobulin IgG1 kappa monoclonal antibody directed against the B-cell-specific membrane protein CD-19 with potential immunostimulating and antineoplastic activities. Anti-CD19 monoclonal antibody MEDI-551 binds to CD19, which may result in a cytotoxic T-lymphocyte (CTL) response and antibody-dependent cellular cytotoxicity (ADCC) to CD19-expressing B-cells. The Fc portion of MEDI-551 does not contain a fucose sugar moiety, which may contribute to its enhanced ADCC activity. CD19 is a membrane antigen that is widely expressed during B-cell development, from pro-B-cell to early plasma cell stages.

**anti-CD19 monoclonal antibody XmAb5574:** An Fc engineered, humanized anti-CD19 monoclonal antibody directed against the B-cell-specific membrane protein CD19 with potential immunostimulating and antineoplastic activities. Anti-CD19 monoclonal antibody XmAb5574 targets and binds to CD19, thereby depleting and eliminating CD19-expressing B-cells. The modified Fc region of XmAb5574 increases binding affinity to Fc-gamma receptors of effector cells and thereby enhances antibody-dependent cellular cytotoxicity (ADCC) and antibody-dependent cell-mediated phagocytosis (ADCP). CD19 is widely expressed during B-cell development, from pro-B-cell to early plasma cell stages.

**anti-CD19-CAR FMC63-28Z retroviral vector-transduced allogeneic T lymphocytes:** Allogeneic T-lymphocytes derived from peripheral blood mononuclear cells (PBMC) transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of both the light and heavy chain variable regions of anti-CD19 monoclonal antibody FMC63, coupled to the molecule CD28 and the signaling domain of the zeta chain of the T-cell receptor (TCR) (FMC63-28Z), with potential immunomodulating and antineoplastic activities. Upon transfusion, the anti-CD19-CAR FMC63-28Z retroviral vector-transduced allogeneic T lymphocytes specifically recognize and kill CD19-expressing tumor cells. CD19 antigen is a B-cell

specific cell surface antigen, which is expressed in all B-cell lineage malignancies and normal B-cells.

**anti-CD19-CAR retroviral vector-transduced autologous T cells:** A preparation of autologous peripheral blood T-lymphocytes (PBTL) that have been genetically modified to express a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment); an extracellular portion of human CD28 and the entire transmembrane and cytoplasmic portion of human CD28; and the cytoplasmic portion of the human TCR-[zeta] molecule with potential immunostimulating and antineoplastic activities. Upon administration, anti-CD19-CAR retroviral vector-transduced autologous T cells may stimulate host cytotoxic T lymphocyte (CTL) and antibody responses against CD19-expressing tumor cells, resulting in tumor cell lysis. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. CD3 zeta is one of several membrane-bound polypeptides found in the T-cell receptor (TCR)/CD3 complex and regulates the assembly of complete TCR complexes and their expression on the cell surface. CD28 is essential for CD4+ T-cell proliferation, interleukin-2 production, and T-helper type-2 (Th2) development.

**anti-CD19-CAR-CD3zeta-4-1BB-expressing natural killer cells:** Allogeneic natural killer (NK) cells transduced with an mRNA expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) and the zeta chain of the TCR/CD3 complex (CD3-zeta), coupled to the signaling domain of 4-1BB (CD137), with potential immunomodulating and antineoplastic activities. NK cells from haploidentical donors are expanded in culture and electroporated with the CAR mRNA. Upon transfusion of the transduced cultured cells, CD19CAR-CD3zeta-4-1BB-expressing allogeneic NK cells bind to and induce selective cytotoxicity in CD19-expressing tumor cells. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19. Its inclusion may also increase antitumor activity, when compared to the inclusion of the CD3-zeta chain alone. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. Check for active clinical trials using this agent.

**anti-CD19-DM4 immunoconjugate SAR3419:** An immunoconjugate consisting of an anti-CD19 monoclonal antibody conjugated to the

maytansinoid DM4, a derivative of the cytotoxic agent maytansine (DM1), with potential antineoplastic activity. Anti-CD19-DM4 conjugate SAR3419 targets the cell surface antigen CD19, found on a number of B-cell-derived cancers. Upon antibody/antigen binding and internalization, the immunoconjugate releases DM4, which binds to tubulin and disrupts microtubule assembly/disassembly dynamics, resulting in inhibition of cell division and cell growth of CD19-expressing tumor cells.

**anti-CD19/CD22 bispecific ligand-directed toxin DT2219ARL:** An immunotoxin consisting of two scFv ligands recognizing human CD19 and CD22 linked to the first 389 amino acids of diphtheria toxin (DT), DT 390, with potential antineoplastic activity. The VH and VL regions of anti-CD22 (sFv) and anti-CD19 are reversed and linked by an aggregation stabilizing linker (ARL) consisting of a 20 amino acid segment of human muscle aldolase (hma) and an XhoI -compatible restriction site; the CDR3 region of the VH of anti-CD22 sFv is mutated to enhance its affinity. The anti-CD19 and anti CD-22 portions of the immunotoxin specifically bind to CD19 and CD22 receptors on tumor B cells. Upon internalization, DT catalyzes ADP ribosylation of elongation factor 2 (EF-2) which may result in the irreversible inhibition of protein synthesis and cell death in CD19- and CD22-expressing tumor cells. CD19 and CD22 transmembrane proteins upregulated on malignant B cells.

**anti-CD19/CD28/CD3zeta CAR gammaretroviral vector-transduced autologous T lymphocytes KTE-C19:** A preparation of autologous peripheral blood T-lymphocytes (PBTL) that have been transduced with a gammaretroviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 single chain variable fragment (scFv) coupled to the costimulatory signaling domain CD28 and the zeta chain of the T-cell receptor (TCR)/CD3 complex (CD3 zeta), with potential immunostimulating and antineoplastic activities. Upon intravenous infusion and re-introduction of the anti-CD19/CD28/CD3zeta CAR gammaretroviral vector-transduced autologous T lymphocytes KTE-C19 into the patient, these cells bind to and induce selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen that is expressed in all B-cell lineage malignancies. CD3 zeta is one of several membrane-bound polypeptides found in the TCR/CD3 complex; it regulates both the assembly and cell surface expression of TCR complexes. CD28 is essential

for CD4+ T-cell proliferation, interleukin-2 production, and T-helper type-2 (Th2) development.

**anti-CD19/CD3 tetravalent antibody AFM11:** An anti-CD19/anti-CD3 bispecific tetravalent antibody with potential immunostimulatory and antineoplastic activities. Anti-CD19/CD3 tetravalent antibody AFM11 possesses two antigen-recognition and binding sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for CD19, a tumor-associated antigen (TAA) overexpressed on the surface of B-cells. Upon bolus infusion of AFM11, this bispecific antibody binds to CD3-expressing T-cells and CD19-expressing cancer cells, thereby crosslinking CD19-expressing tumor B-cells and cytotoxic T-lymphocytes (CTLs). This may result in a potent CTL-mediated cell lysis of CD19-expressing B-lymphocytes. CD19, a B-cell specific membrane antigen, is expressed during both B-cell development and B-cell malignant growth.

**anti-CD20 B9E9 scFv-streptavidin fusion protein:** An Escherichia coli periplasm-expressed tetrameric fusion protein composed of four single-chain variable regions (scFv) of the murine immunoglobulin (Ig) G2a anti-CD20 monoclonal antibody B9E9 fused to the streptavidin (SA) gene of Streptomyces avidinii (scFv-SA), with potential use in pretargeted radioimmunotherapy (PRIT). Upon intravenous administration of the anti-CD20 B9E9 scFv-SA fusion protein, this agent targets and binds to CD20-expressing tumor cells. Subsequently, a biotinylated N-acetylgalactosamine-containing clearing agent is administered, which binds to the streptavidin moiety of the unbound fusion protein and promotes its hepatic excretion. In turn, radiolabeled DOTA (1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid)-biotin is administered and, due to its small size, quickly distributes. The biotin moiety efficiently binds to the SA moiety of the bound fusion protein, which localizes the biotin-conjugated radionuclide to the tumor site. CD20, a tumor-associated antigen (TAA), is overexpressed on B-cell malignancies. PRIT increases both tumor uptake and renal elimination of the radionuclide conjugate as compared to conventional radioimmunotherapy (RIT), where the radioisotope is bound to the antibody before administration; this increases the dose of radionuclide delivered to the tumor while limiting radiation exposure for normal, healthy tissues.

**anti-CD20 monoclonal antibody SCT400:** A chimeric monoclonal antibody directed against human CD20, with potential antineoplastic activity. Anti-CD20 monoclonal antibody SCT400 binds to the B cell-specific cell surface antigen CD20, which triggers an immune response against CD20-positive B-cells, leading to apoptosis. CD20, a non-glycosylated cell surface phosphoprotein, is exclusively expressed on B-cells during most stages of B-cell development and is often overexpressed in B-cell malignancies.

**anti-CD20 monoclonal antibody TL011:** A monoclonal antibody directed against human CD20 with potential antineoplastic activity. Anti-CD20 monoclonal antibody TL011 specifically binds to the B cell-specific cell surface antigen CD20 antigen (MS4A1; membrane-spanning 4-domains, subfamily A, member 1), thereby potentially triggering an immune response against CD20-positive B cells, leading to B cell apoptosis. CD20 is a non-glycosylated cell surface phosphoprotein that is exclusively expressed on B cells during most stages of B cell development and is often overexpressed in B-cell malignancies.

**anti-CD20 monoclonal antibody-interferon alpha fusion protein IGN002:** A humanized monoclonal antibody directed against the human B-cell-specific cell surface antigen CD20 and fused to the recombinant cytokine, interferon-alpha (IFN-a), with potential antineoplastic and immunomodulating activities. Upon administration of anti-CD20 monoclonal antibody-interferon alpha fusion protein IGN002, the antibody moiety specifically targets and binds to CD20. In turn, the IFN-a moiety binds to the IFN receptor, and activates IFN-mediated signal transduction, which induces the transcription and translation of genes whose protein products mediate anticancer effects. This results in the induction of both G2 cell cycle arrest and apoptosis in CD20-expressing tumor cells. In addition, IGN002 causes the induction of complement-dependent cytotoxicity (CDC) and antibody-dependent cell-mediated cytotoxicity (ADCC) against CD20-expressing B-cells, which leads to B-cell apoptosis and the inhibition of tumor cell proliferation. CD20, a non-glycosylated cell surface phosphoprotein that is exclusively expressed on B-cells during most stages of B-cell development, is often overexpressed in B-cell malignancies. Check for active clinical trials using this agent.

**anti-CD20-CAR-CD3zeta-4-1BB-expressing autologous T**

**lymphocytes:** A preparation of autologous blood T-lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) consisting of an anti-CD20 scFv (single chain variable fragment); the cytoplasmic portion of the human TCR-[zeta] molecule; and the co-stimulatory molecule 4-1BB (CD137), with potential immunostimulating and antineoplastic activities. Upon transfusion, anti-CD20-CAR-CD3zeta-4-1BB-expressing autologous T-lymphocyte cells direct T-cells to CD20-expressing tumor cells. This results in cytotoxic T lymphocyte (CTL) and antibody responses against CD20-expressing tumor cells, causing tumor cell lysis. The CD20 antigen, a non-glycosylated cell surface phosphoprotein, is a B-cell specific cell surface antigen expressed in B-cell lineage malignancies. CD3 zeta is one of several membrane-bound polypeptides found in the T-cell receptor (TCR)/CD3 complex and regulates the assembly of complete TCR complexes and their expression on the cell surface. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD20; the inclusion of this signaling domain may increase the antitumor activity compared to the inclusion of the CD3-zeta chain alone. Check for active clinical trials using this agent.

**anti-CD20-engineered toxin body MT-3724:** An engineered toxin body (ETB) composed of the single-chain variable fragment (ScFv) from an antibody targeting CD20 that is linked to a modified form of the ribosome-inactivating alpha subunit of Shiga-like toxin 1 (Shiga-like Toxin-1 A or SLT-1A), with antineoplastic activity. Upon administration, the ScFv moiety of anti-CD20-engineered toxin body MT-3724 targets and binds to the CD20 antigen expressed on tumor cells. Upon internalization, the SLT-1A moiety is released and acts as an N-glycosidase, which binds to and cleaves an adenine nucleobase in the 28S RNA component of the 60S subunit of ribosomes and prevents ribosome activity. This inhibits protein synthesis and eventually leads to apoptosis of CD20-expressing tumor cells. CD20, a B-cell specific transmembrane protein and tumor-associated antigen (TAA), is expressed during most stages of B-cell development and is often overexpressed in B-cell malignancies.

**anti-CD20/CD3 monoclonal antibody REGN1979:** A bispecific, human monoclonal antibody with potential antineoplastic activity. Anti-CD20/CD3 monoclonal antibody REGN1979 contains two antigen-recognition sites:

one for human CD3, a T cell surface antigen, and one for human CD20, a tumor-associated antigen that is exclusively expressed on B-cells during most stages of B-cell development and is often overexpressed in B-cell malignancies. Upon administration, REGN1979 binds to both T-cells and CD20-expressing tumor B-cells, which cross-links the T-cells to tumor cells, and may result in a potent cytotoxic T-lymphocyte (CTL) response against CD20-expressing tumor B-cells.

**anti-CD20 monoclonal antibody ALXN6000:** A humanized monoclonal antibody directed against the human immunosuppressive molecule CD20 (OX-2) with potential immunomodulating and antineoplastic activities. Anti-CD20 monoclonal antibody ALXN6000 binds to CD20, blocking the binding of CD20 to its receptor, CD200R, present on cells of the macrophage lineage; inhibition of CD20 may augment the cytotoxic T-lymphocyte (CTL) mediated immune response against CD20-expressing tumor cells. CD200 is a type 1a transmembrane protein, related to the B7 family of co-stimulatory receptors, and is upregulated on the surface of multiple hematologic malignant cells; this transmembrane protein appears to be involved in the downregulation of a Th1 (helper T cell) immune response. Check for active clinical trials using this agent.

**anti-CD22 CAR-expressing T lymphocytes:** A preparation of human T lymphocytes transduced with a recombinant viral vector encoding a chimeric T-cell receptor (chimeric antigen receptor or CAR) consisting of one or more binding domains targeting the tumor-associated antigen (TAA) CD22 and fused to one or more co-stimulatory, TCR-signaling domains, with potential immunostimulating and antineoplastic activities. Upon administration, the anti-CD22 CAR-expressing T lymphocytes, express anti-CD22-CAR on their cell surfaces and bind to the CD22 antigen on tumor cell surfaces. Subsequently, CD22-expressing B cells are lysed. CD22, a B-lineage-restricted, transmembrane phosphoglycoprotein, is expressed on malignant B cells. Check for active clinical trials using this agent.

**anti-CD22 immunotoxin :** A substance being studied as a treatment for atherosclerosis (a build-up of fat in the arteries). It is also being studied in the treatment of cancers that spread to the bone. Anti-CCR2 monoclonal antibody MLN1202 binds to a protein called CCR2, which is found on the surface of certain bone cells, white blood cells, and cancer cells. Anti-

CCR2 monoclonal antibody MLN1202 blocks the action of a substance that is involved in keeping healthy bone mass. It may help keep the cancer cells from spreading to and growing in the bone. It is a type of monoclonal antibody. Also called MLN1202.

**anti-CD22 immunotoxin CAT-8015 :** A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of some types of B-cell cancer. Anti-CD19 immunotoxin is made in the laboratory. It binds to CD19, a protein on the surface of normal B cells and B-cell tumors, and kills the cells.

**anti-CD22 monoclonal antibody-MMAE conjugate DCDT2980S:** An antibody-drug conjugate (ADC) composed of MCDT2219A , a humanized IgG1 anti-CD22 monoclonal antibody covalently linked, via a protease-cleavable peptide linker, to monomethyl auristatin E (MMAE), an auristatin derivative and a potent microtubule disrupting agent, with potential antineoplastic activity. Upon administration, the monoclonal antibody moiety of DCDT2980S binds to B-cell-specific CD22 receptors and is rapidly internalized, thereby delivering MMAE intracellularly. Upon proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, resulting in G2/M phase arrest and tumor cell apoptosis. CD22, a cell surface glycoprotein, is expressed on mature B-cells and on most malignant B-cells.

**anti-CD22 scFv TCRz:41BB-CAR lentiviral vector-transduced autologous T lymphocytes:** Autologous human T lymphocytes transduced with a recombinant lentiviral vector encoding a chimeric T cell receptor consisting of an anti-CD22 single chain variable fragment (scFv) and the co-stimulatory domain 4-1BB (CD137) coupled to the zeta chain of the TCR/CD3 complex (CD3-zeta), with potential immunostimulating and antineoplastic activities. Autologous peripheral blood lymphocytes (PBLs) from a patient with CD22-positive cancer are transduced with this lentiviral vector that encodes the CAR gene specific for CD22. After isolation, transduction, expansion in culture and reintroduction into the patient, the anti-CD22 scFv TCRz:41BB-CAR lentiviral vector-transduced autologous T lymphocytes express anti-CD22-CAR on their cell surfaces and bind to the CD22 antigen on tumor cell surfaces. Subsequently, CD22-expressing tumor cells are lysed. CD22, a B-lineage-restricted, transmembrane phosphoglycoprotein, is expressed on malignant B cells.

**anti-CD22-CAR m971-BBz lentiviral vector-transduced autologous T lymphocytes:** Autologous human T-lymphocytes transduced with a recombinant lentiviral vector encoding a chimeric T-cell receptor (chimeric antigen receptor or CAR) consisting of an anti-CD22 single chain variable fragment (scFv) derived from the monoclonal antibody (moAb) 971 (m971), and the co-stimulatory domain 4-1BB (CD137) coupled to the zeta chain of the TCR/CD3 complex (CD3-zeta), with potential immunostimulating and antineoplastic activities. Autologous peripheral blood lymphocytes (PBLs) from a patient with CD22-positive cancer are transduced with this lentiviral vector that encodes the CAR gene specific for CD22. After expansion in culture and reintroduction into the patient, the anti-CD22-CAR m971-BBz lentiviral vector-transduced autologous T-lymphocytes express anti-CD22-CAR on their cell surfaces and bind to the CD22 antigen on tumor cell surfaces. Subsequently, CD22-expressing tumor cells are lysed. CD22, a B-lineage-restricted, transmembrane phosphoglycoprotein, is expressed on malignant B-cells. m971 binds to a membrane proximal epitope on CD22 and has a higher binding affinity compared to any other anti-CD22 moAb.

**anti-CD25-PBD antibody-drug conjugate ADCT-301:** An immunoconjugate consisting of a human immunoglobulin (Ig) G1 monoclonal antibody directed against the alpha subunit of the interleukin-2 receptor (IL-2R alpha or CD25) and conjugated, via a cleavable linker, to a synthetic, cross-linking agent pyrrolobenzodiazepine (PBD) dimer that targets DNA minor grooves, with potential antineoplastic activity. The monoclonal antibody portion of the anti-CD25 antibody-drug conjugate (ADC) ADCT-301 specifically binds to the cell surface antigen CD25. This causes the internalization of ADCT-301 and the subsequent release of the cytotoxic PBD moiety. The imine groups of the PBD moiety bind to the N2 positions of guanines on opposite strands of DNA. This induces interstrand cross-links in the minor groove of DNA and inhibits DNA replication, which inhibits the proliferation of CD25-overexpressing tumor cells. CD25, a transmembrane receptor and tumor-associated antigen (TAA), is expressed on certain cancer cells.

**anti-CD27L antibody-drug conjugate AMG 172:** An immunoconjugate consisting of a human IgG1 monoclonal antibody directed against CD27L conjugated, via a non-cleavable linker, to the cytotoxic agent maytansinoid DM1, with potential antineoplastic activity. The monoclonal antibody

moiety of this immunoconjugate binds to CD27L on tumor cell surfaces. After internalization, the DM1 moiety binds to tubulin, thereby disrupting microtubule assembly/disassembly dynamics and inhibiting both cell division and proliferation of cancer cells that express CD27L. CD27L, a type II transmembrane protein and member of the tumor necrosis factor family, is a co-stimulatory molecule constitutively expressed on a subset of activated T-cells, B-cells, and dendritic cells, which is overexpressed in certain tumor cell types.

**anti-CD3 immunotoxin A-dmDT390-bisFv(UCHT1):** A bivalent recombinant fusion protein immunotoxin derived from the anti-CD3 monoclonal antibody UCHT1 with potential antineoplastic activity. Anti-CD3 immunotoxin A-dmDT390-bisFv(UCHT1) consists of 1-390 amino acid residues of chain A diphtheria toxin (DT) joined via a spacer to the Fv fragment of UCHT1, which is connected to a second UCHT1 Fv fragment via a disulfide bond (hence the "bisFv" designation); the addition of the second Fv fragment overcomes the steric hindrance of immunotoxin binding due to the large N-terminal DT domain. Once inside target T cells, the DT moiety catalyzes the transfer of the ADP-ribose moiety of NAD to diphthamide, a posttranslationally modified histidine residue found in elongation factor 2 (EF-2); inactivation of EF-2, disruption of polypeptide chain elongation, and cell death ensue. CD3 is a complex of five cell-surface polypeptides associated with the T cell receptor (TCR) complex.

**anti-CD3 x anti-CD20 bispecific antibody-armed activated T cells:** Autologous activated T cells that have been coated with bispecific antibodies (BiAb), with potential antineoplastic and immunomodulating activities. In vitro, T cells are activated through exposure to the anti-CD3 murine monoclonal antibody OKT3 and low-dose interleukin 2 (Il-2) for 6-14 days and then armed with anti-CD3 x anti-CD20 bispecific antibody (CD20Bi). Upon administration, anti-CD3 x anti-CD20 bispecific antibody-armed activated T cells (AATC) attach to CD3-expressing T cells and CD20-expressing tumor cells, selectively cross-linking T cells and tumor cells. This may result in the recruitment and activation of cytotoxic T lymphocyte (CTLs), CTL-mediated specific tumor cell lysis, and the secretion of antitumor cytokines and chemokines. CD20, a cell surface phosphoprotein, is found on normal B cells and most B-cell tumors.

**anti-CD3/anti-CD20 trifunctional bispecific monoclonal antibody**

**FBTA05:** A trifunctional bispecific monoclonal antibody with potential antineoplastic activity. FBTA05 contains two antigen-recognition sites: one for human CD3, a T cell surface antigen; and one for human CD20, a tumor-associated antigen that is exclusively expressed on B cells during most stages of B-cell development and often overexpressed in B-cell malignancies. In addition, the modified Fc portion of this antibody binds Fc receptors on antigen presenting cells (APCs) such as macrophages and dendritic cells (DCs). FBTA05 brings T cells, CD20-expressing tumor B-cells and APCs together into tricellular complexes, which may result in a potent cytotoxic T-lymphocyte (CTL) response against CD20-expressing tumor B-cells. Fc-mediated binding of APCs in the tricellular complex potentiates CD20 antigen presentation to T cells and the activation of anti-tumor cytotoxic T cells. Check for active clinical trials using this agent.

**anti-CD3/humanized 3F8 bispecific antibody-activated T lymphocytes:**

Autologous activated T cells that have been coated with bispecific antibodies (BiAb) comprised of anti-CD3 murine monoclonal antibody OKT3 heteroconjugated to anti-GD2 humanized monoclonal antibody 3F8 (hu3F8), with potential antineoplastic and immunomodulating activities. In vitro, T cells are exposed to OKT3, which binds to the T cell receptor-CD3 complex on the T cell surface, crosslinks the CD3 receptors and leads to T cell activation. In turn, the hu3F8 monoclonal antibody is heteroconjugated to OKT3. Upon administration, anti-CD3 x anti-GD2 bispecific antibody-armed activated T cells attach to GD2-expressing tumor cells, thereby selectively cross-linking T cells and tumor cells. This results in selective cytotoxicity towards the GD2-expressing tumor cells. In addition, cytokine and chemokine secretion by the T cells further activates the immune system, which leads to the recruitment and activation of cytotoxic T lymphocytes (CTLs), and additional CTL-mediated tumor-specific cell lysis. GD2, a disialoganglioside and tumor-associated antigen, is overexpressed in a variety of tumor cell types. CD3 is part of the functional T cell receptor (TCR) complex, which is necessary for antigen recognition by T cells, and is required for signal transduction.

**anti-CD30 monoclonal antibody MDX-1401:** A fully human, second-generation, nonfucosylated monoclonal antibody directed against the cell surface receptor CD30 with potential immunomodulating and antineoplastic activities. Anti-CD30 monoclonal antibody MDX-1401 specifically binds

to the CD30 antigen, which may result in a cytotoxic T lymphocyte (CTL) response against CD30-expressing tumor cells. CD30, a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on activated lymphocytes transiently and is constitutively expressed in hematologic malignancies including Hodgkin's disease and some T-cell non-Hodgkin's lymphomas. Compared to conventional antibodies, deletion of fucose molecules on the antibody backbone, as is done in MDX-1401, may result in an increased affinity for Fc receptors and an enhanced antibody-dependent cellular cytotoxicity (ADCC). Check for active clinical trials using this agent.

**anti-CD30 monoclonal antibody XmAb2513:** A humanized monoclonal antibody directed against the cell surface receptor CD30 with potential immunotherapeutic activity. Anti-CD30 monoclonal antibody XmAb2513 specifically binds to the CD30 antigen, which may result in a cytotoxic T lymphocyte (CTL) response against CD30-expressing tumor cells. CD30, a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on activated lymphocytes transiently and is constitutively expressed in hematologic malignancies including Hodgkin's disease and some T-cell non-Hodgkin's lymphomas.

**anti-CD30/CD16A monoclonal antibody AFM13:** A tetravalent bispecific antibody directed against human CD30 and the human low affinity IgG Fc region receptor (FCGR3A; CD16A), with potential immunomodulating and antineoplastic activities. Anti-CD30/CD16A monoclonal antibody AFM13 binds to the CD16A expressed on natural killer (NK) cells with two of its binding sites and to CD30 on CD30-expressing tumor cells with the other two binding sites, thereby selectively cross-linking tumor and NK cells. This may result in NK cell activation, antibody-dependent cellular cytotoxicity (ADCC) and eventually tumor cell lysis. CD30, a cell surface receptor and a member of the tumor necrosis factor (TNF) receptor superfamily, is overexpressed in hematologic malignancies; CD16A is specifically expressed on the surface of NK cells.

**anti-CD33 monoclonal antibody BI 836858:** An engineered, fully human, immunoglobulin (Ig) G1 anti-CD33 monoclonal antibody, with potential antineoplastic activity. Upon administration, anti-CD33 monoclonal antibody BI 836858 induces an antibody-dependent cellular cytotoxicity (ADCC) against CD33-expressing tumor cells, leading to cell death. CD33,

a cell surface antigen expressed on normal non-pluripotent hematopoietic stem cells, is overexpressed on myeloid leukemia cells.

**anti-CD33 monoclonal antibody-DM4 conjugate AVE9633:** An immunoconjugate consisting of the humanized monoclonal antibody huMy9-6 conjugated to the cytotoxic maytansinoid DM4 with potential antineoplastic activity. The monoclonal antibody portion of anti-CD33 monoclonal antibody-DM4 conjugate AVE9633 specifically binds to the cell surface antigen CD33 expressed on myeloid leukemia cells; upon internalization, the DM4 moiety is released, binds tubulin, and disrupts microtubule assembly/disassembly dynamics, resulting in the inhibition of cell division and cell growth in myeloid leukemia cells that express CD33. CD33 is expressed on normal non-pluripotent hematopoietic stem cells as well as on myeloid leukemia cells. Check for active clinical trials using this agent.

**anti-CD33/CD3 BiTE antibody AMG 330:** A proprietary recombinant bispecific T-cell engager (BiTE) antibody composed of two single-chain variable fragments (scFv), one directed against the tumor-associated antigen (TAA) CD33 fused to one that is directed against the CD3 antigen found on T-lymphocytes, with potential immunostimulating and antineoplastic activities. Upon administration of anti-CD33/CD3 BiTE antibody AMG 330, this bispecific antibody binds to both the CD3 antigen on cytotoxic T-lymphocytes (CTLs) and the CD33 antigen found on CD33-expressing tumor cells. This activates and redirects CTLs to CD33-expressing tumor cells, which results in the CTL-mediated cell death of CD33-expressing tumor cells. CD33, a myeloid differentiation antigen, is expressed on normal non-pluripotent hematopoietic stem cells and overexpressed on neoplastic cells in patients with acute myeloid leukemia.

**anti-CD37 antibody-drug conjugate IMG529:** An immunoconjugate that consists of a humanized IgG1 antibody K7153A against the cell-surface antigen CD37 that is covalently linked via the uncleavable, maleimide-derived thioether-based linker SMCC to the maytansinoid DM1, with potential pro-apoptotic and cytotoxic activities. The antibody moiety of IMG529 binds to CD37 on tumor B cells and induces an antibody-dependent cell-mediated cytotoxicity (ADCC) and complement-dependent cytotoxicity (CDC), thereby showing pro-apoptotic activity. In addition, after the internalization of this agent and lysosomal degradation, the DM1

moiety binds to tubulin and inhibits tubulin polymerization and microtubule assembly, resulting in a disruption of microtubule activity and cell division, and eventually causing cell death in CD37-positive B cells. CD37, a transmembrane glycoprotein, is overexpressed in B-cell malignancies. Compared to reducible, cleavable linkers, the non-reducible SMCC linker shows increased stability in plasma. Check for active clinical trials using this agent.

**anti-CD37 monoclonal antibody BI 836826:** An Fc-engineered, chimeric immunoglobulin (Ig) G1 monoclonal antibody against the tumor-associated antigen (TAA) CD37, with potential antineoplastic activity. Upon administration, the anti-CD37 monoclonal antibody BI 836826 both activates the immune system to induce an antibody-dependent cell-mediated cytotoxicity (ADCC) against CD37-overexpressing tumor cells and induces apoptosis in these tumor cells. BI 836826 is Fc-engineered to improve ADCC activity and enhance affinity for the receptor Fc-gamma-R1IIa, which is expressed on human natural killer (NK) cells. CD37, a member of the tetraspanin superfamily of cell surface antigens, is overexpressed on a variety of cancer cell types and plays a key role in tumor cell proliferation.

**anti-CD38 monoclonal antibody MOR03087:** A fully human monoclonal antibody directed against the cell surface glycoprotein CD-38 with potential antineoplastic activity. Anti-CD38 monoclonal antibody MOR03087 specifically binds to CD38 on CD38-positive tumor cells. This may trigger antitumoral antibody-dependent cellular cytotoxicity (ADCC) and may eventually lead to cell lysis in CD38-expressing tumor cells. CD38, a type II transmembrane glycoprotein, is present on various immune cells and hematologic malignancies, and its expression has been correlated with poor prognosis.

**anti-CD38 monoclonal antibody SAR650984:** A humanized IgG1 monoclonal antibody directed against the cell surface glycoprotein CD-38 with potential antineoplastic activity. Anti-CD38 monoclonal antibody SAR650984 specifically binds to CD38 on CD38-positive tumor cells. This may trigger antitumoral antibody-dependent cellular cytotoxicity (ADCC), complement-dependent cytotoxicity (CDC) and apoptosis eventually leading to cell lysis in CD38-expressing tumor cells. CD38, a type II transmembrane glycoprotein, is present on various immune cells and

hematologic malignancies, and its expression has been correlated with poor prognosis.

**anti-CD40 monoclonal antibody Chi Lob 7/4:** An IgG1 chimeric monoclonal antibody agonist of the cell surface receptor CD40 with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, anti-CD40 monoclonal antibody Chi Lob 7/4 binds to CD40 on a variety of immune cell types, triggering the cellular proliferation and activation of antigen-presenting cells (APCs), activating B cells and T cells, and enhancing the immune response; in addition, this agent binds to the CD40 antigen present on the surfaces of some solid tumor cells, resulting in complement-dependent cytotoxicity (CDC) and antibody-dependent cytotoxicity (ADCC) eventually resulting in decreased tumor growth. CD40, a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells, many B-cell malignancies, and many solid tumors, mediating both indirect tumor cell death through the activation of the immune system and direct tumor cell apoptosis. Check for active clinical trials using this agent.

**anti-CD40 monoclonal antibody SEA-CD40:** A proprietary, non-fucosylated monoclonal antibody directed against the cell surface receptor CD40 with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, anti-CD40 monoclonal antibody SEA-CD40 binds to CD40 on a variety of immune cell types, triggering both cellular proliferation and activation of antigen-presenting cells (APCs), which activates B-cells and T-cells, and enhances the immune response against tumor cells. In addition, this agent binds to the CD40 antigen present on the surfaces of tumor cells, which induces antibody-dependent cytotoxicity (ADCC), and eventually inhibits the proliferation of CD40-expressing tumor cells. CD40, a stimulatory receptor and a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells, such as macrophages, dendritic cells and various tumor cell types; it plays a key role in the activation of the immune system. The non-fucosylated antibody shows increased efficacy as compared to its fucosylated counterpart.

**anti-CD40L Fc-fusion protein BMS-986004:** A dimeric fusion protein composed of the C-terminus of the domain antibody (dAb) BMS2h-572-633 targeting the CD40 ligand (CD40L or CD154) linked to a modified Fc

fragment of immunoglobulin G1 (IgG1), with potential immunomodulatory activity. Upon intravenous administration, the peptide moiety of anti-CD40L antibody BMS-986004 specifically targets and binds to CD40L expressed on T lymphocytes. This prevents the binding of CD40L to its cognate receptor CD40 expressed on B lymphocytes, macrophages, and dendritic cells (DCs). This prevents T-cell mediated proliferation and differentiation of B cells, and prevents the production of antibodies. By inhibiting both the production of anti-glycoprotein (GP) IIb/IIIa antibodies by B cells and GPIIb/IIIa-dependent T-cell proliferation, BMS-986004 may prevent platelet destruction and may increase platelet counts in idiopathic thrombocytopenic purpura (ITP). The direct binding of BMS-986004 to CD40L on platelets further prevents CD40L/CD40-mediated destruction by macrophages and DCs in ITP. The modified Fc domain prevents the binding of BMS-986004 to the Fc receptor FcγRIIA on platelets, thereby preventing FcγRIIA-dependent platelet activation and anti-CD40L-induced thromboembolism. CD40L, a transmembrane protein of the tumor necrosis factor (TNF) superfamily, is primarily expressed on activated T cells, but is also expressed on eosinophils, basophils, natural killer (NK) cells, mast cells, platelets and activated endothelial cells.

**anti-CD44 monoclonal antibody RO5429083:** A recombinant, humanized monoclonal antibody targeting the cancer stem cell (CSC) antigen CD44, with potential immunomodulating and antineoplastic activities. Upon administration, RO5429083 binds to the constant region of the extracellular domain of CD44, thereby preventing the activation of various CD44-mediated signal transduction pathways. This may lead to a reduction in the proliferation of CD44-expressing tumor stem cells. CD44, a transmembrane glycoprotein and hyaluronic acid receptor, is expressed in healthy tissue and overexpressed in numerous cancer cell types; it plays a key role in tumor cell proliferation, migration and survival. Check for active clinical trials using this agent.

**anti-CD45 monoclonal antibody:** A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of some types of B-cell cancer. Anti-CD22 immunotoxin is made in the laboratory. It binds to CD22, a protein on the surface of normal B cells and B-cell tumors, and kills the cells. OR A monoclonal antibody directed against the receptor-like leukocyte cell surface glycoprotein CD45 with leukocyte-depleting activity. Upon administration, anti-CD45 monoclonal antibody binds to leukocyte

surface-expressed CD45, which may result in the transient depletion of circulating leukocytes including circulating T cell depletion (TCD). CD45, a receptor-like protein-tyrosine phosphatase that consists of several isoforms, is present on all differentiated hematopoietic cells except erythrocytes and plasma cells and is essential for T cell development and lymphocyte activation. Check for active clinical trials using this agent.

**anti-CD45 monoclonal antibody AHN-12:** A high affinity IgG1 monoclonal antibody with potential immunotherapeutic activity. Anti-CD45 monoclonal antibody AHN-12 recognizes CD45, a transmembrane protein tyrosine phosphatase that is expressed on the surface of normal and malignant hematopoietic cells.

**anti-CD45 monoclonal antibody BC8:** A murine IgG1 anti-CD45 monoclonal antibody (MoAb) with immunotherapeutic activity. CD45 antigen, a receptor protein-tyrosine phosphatase essential for T cell development and lymphocyte activation, is expressed on virtually all leukocytes. MoAb BC8 has specificity for hematopoietic tissues and may be used in targeted immunotherapy.

**anti-CD45 monoclonal antibody BC8-streptavidin conjugate:** An immunoconjugate containing a monoclonal antibody directed against the CD45 antigen BC8, conjugated to streptavidin, a nonglycosylated homotetrameric protein that has four high affinity binding sites for biotin. Anti-CD45 BC8 antibody-streptavidin conjugate binds to CD45, a transmembrane protein tyrosine phosphatase that is expressed on the surface of normal and malignant hematopoietic cells. Upon administration of a biotin-based radioconjugate, the biotin moiety of the radioconjugate binds to the streptavidin moiety of anti-CD45 BC8 antibody-streptavidin conjugate and, upon cellular internalization, specifically delivers cytotoxic radiation to CD45-expressing tumor cells.

**anti-CD47 monoclonal antibody CC-90002:** A monoclonal antibody targeting the human cell surface antigen CD47, with potential phagocytosis-inducing and antineoplastic activities. Upon administration, anti-CD47 monoclonal antibody CC-90002 selectively binds to CD47 expressed on tumor cells and blocks the interaction of CD47 with signal regulatory protein alpha (SIRPa), a protein expressed on phagocytic cells. This prevents CD47/SIRPa-mediated signaling and abrogates the CD47/SIRPa-mediated inhibition of phagocytosis. This induces pro-phagocytic signaling

mediated by the binding of calreticulin (CRT), which is specifically expressed on the surface of tumor cells, to low-density lipoprotein (LDL) receptor-related protein (LRP), expressed on macrophages. This results in macrophage activation and the specific phagocytosis of tumor cells. In addition, blocking CD47 signaling activates both an anti-tumor T-lymphocyte immune response and T cell-mediated killing of CD47-expressing tumor cells. CD47, also called integrin-associated protein (IAP), is a tumor-associated antigen (TAA) expressed on normal, healthy hematopoietic stem cells (HSC) and overexpressed on the surface of a variety of cancer cells. Expression of CD47, and its interaction with SIRPa, leads to the inhibition of macrophage activation and protects cancer cells from phagocytosis, which allows cancer cells to proliferate.

**anti-CD47 monoclonal antibody Hu5F9-G4:** A humanized monoclonal antibody targeting the human cell surface antigen CD47, with potential immunostimulating and antineoplastic activities. Upon administration, anti-CD47 monoclonal antibody Hu5F9-G4 selectively binds to CD47 expressed on tumor cells and blocks the interaction of CD47 with its ligand signal regulatory protein alpha (SIRPa), a protein expressed on phagocytic cells. This prevents CD47/SIRPa-mediated signaling, allows the activation of macrophages, through the induction of pro-phagocytic signaling mediated by calreticulin, which is specifically expressed on the surface of tumor cells, and results in specific tumor cell phagocytosis. In addition, blocking CD47 signaling activates an anti-tumor T-lymphocyte immune response and T-cell mediated cell killing. CD47, a tumor associated antigen expressed on normal, healthy hematopoietic stem cells (HSC), is overexpressed on the surface of a variety of cancer cells. Expression of CD47, and its interaction with SIRP-alpha, leads to inhibition of macrophages and protects cancer cells from phagocytosis thereby allowing cancer cells to proliferate.

**anti-CD70 antibody-drug conjugate MDX-1203:** An antibody-drug conjugate (ADC) containing a fully human monoclonal antibody, directed against the extracellular domain of the human CD70 molecule, conjugated to a prodrug of a CC-1065 (rachelmycin) analogue via a stable peptide-based linker, with potential antineoplastic activity. The anti-CD70 antibody moiety of the anti-CD70 antibody-drug conjugate MDX-1203 selectively binds to the extracellular domain of CD70 on tumor cell surfaces. Upon internalization, the prodrug moiety is released and activated and binds to double-stranded B-DNA within the minor groove, thereby alkylating the –3

position of adenine, which may result in the inhibition of cellular proliferation of tumor cells that overexpress CD70. CD70, the ligand for the costimulatory receptor CD27 and a member of the tumor necrosis factor (TNF) family, is found on the surfaces of various types of cancer cells. The antitumor antibiotic CC-1065, a DNA minor-groove-binding alkylating agent, was originally isolated from the bacterium *Streptomyces zelensis*. Check for active clinical trials using this agent.

**anti-CD70 antibody-drug conjugate SGN-CD70A:** An antibody-drug conjugate (ADC) containing an engineered cysteine monoclonal antibody (EC-mAb), directed against the extracellular domain of the human CD70 molecule, conjugated to the synthetic, cytotoxic, DNA minor-groove crosslinking agent, pyrrolobenzodiazepine (PBD) dimer, via a stable, protease-cleavable, peptide-based linker, with potential antineoplastic activity. The anti-CD70 antibody moiety of the anti-CD70 antibody-drug conjugate SGN-CD70A selectively binds to the extracellular domain of CD70 on tumor cell surfaces. Upon internalization, the PBD dimer moiety is released and covalently binds, through its imine moieties, to the N2 positions of guanines on opposite strands of DNA. This induces DNA double strand breaks and inhibits DNA replication, which lead to the inhibition of cell growth of tumor cells that overexpress CD70. CD70, the ligand for the costimulatory receptor CD27 and a member of the tumor necrosis factor (TNF) family, is found on the surfaces of various types of cancer cells. The cysteine moiety of the EC-mAb allows for the stable conjugation of the PBD to the antibody.

**anti-CD70 monoclonal antibody ARGX-110:** A defucosylated, humanized IgG1 monoclonal antibody directed against the extracellular domain of the human CD70 molecule with potential antineoplastic activity. Upon administration, anti-CD70 monoclonal antibody ARGX-110 selectively binds to, and neutralizes the activity of CD70, which may also induce an antibody-dependent cellular cytotoxicity (ADCC) response against CD70-expressing tumor cells. CD70, the ligand for the costimulatory receptor CD27 and a member of the tumor necrosis factor (TNF) family, is found on a number of solid and hematological tumors. Its overexpression may play an important role in evasion of immune surveillance. Check for active clinical trials using this agent.

**anti-CD70 monoclonal antibody MDX-1411:** A glycoengineered, fully humanized IgG1 monoclonal antibody directed against the extracellular domain of the human CD70 molecule with potential antineoplastic activity. Anti-CD70 fully human monoclonal antibody MDX-1411 selectively binds to the extracellular domain of CD70, which may induce an antibody-dependent cellular cytotoxicity (ADCC) response against CD70-expressing tumor cells. CD70, the ligand for the costimulatory receptor CD27 and a member of the tumor necrosis factor (TNF) family, is found on renal cell carcinoma (RCC) cells among other cancer cell types. Check for active clinical trials using this agent.

**anti-CD73 monoclonal antibody MEDI9447:** A monoclonal antibody against the ectoenzyme CD73 (cluster of differentiation 73), also known as 5'-nucleotidase (5'-NT; ecto-5'-nucleotidase) with potential antineoplastic activity. Upon administration, anti-CD73 monoclonal antibody MEDI9447 targets and binds to CD73, leading to clustering of and internalization of CD73. This prevents CD73-mediated conversion of adenosine monophosphate (AMP) to adenosine and decreases the amount of free adenosine. This prevents adenosine-mediated lymphocyte suppression and increases the activity of CD8-positive effector cells. This also activates macrophages, and reduces both myeloid-derived suppressor cells (MDSCs) and regulatory T-lymphocytes. By abrogating the inhibitory effect on the immune system and enhancing the cytotoxic T-cell-mediated immune response against cancer cells, tumor cell growth decreases. In addition, clustering and internalization of CD73 decreases the migration of cancer cells and prevents metastasis. CD73, a plasma membrane protein upregulated on a number of cancer cell types, catalyzes the conversion of extracellular nucleotides, such as AMP, to membrane-permeable nucleosides, such as adenosine; it plays a key role in adenosine-mediated immunosuppression within the tumor microenvironment. Check for active clinical trials using this agent.

**anti-CD98 monoclonal antibody IGN523:** A humanized, monoclonal antibody targeting the CD98 (gp125) antigen, with potential immunomodulatory and antineoplastic activities. Upon intravenous administration, IGN523 binds to CD98 expressed on the tumor cell surface and elicits both natural killer (NK)-cell mediated antibody-dependent cellular cytotoxicity (ADCC) and complement-dependent cytotoxicity towards CD98-expressing tumor cells. In addition, IGN523 inhibits

essential amino acid uptake by rapidly proliferating tumor cells. CD98, a type II transmembrane glycoprotein, is involved in both integrin signaling and amino acid transport processes; it is overexpressed in certain cancer cells and plays a key role in the proliferation, survival, and metastasis of tumor cells.

**anti-CEA antibody :** A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of some types of B-cell cancer. Anti-CD22 immunotoxin CAT-8015 is made in the laboratory. It binds to CD22, a protein on the surface of normal B cells and B-cell tumors, and kills the cells. Also called CAT-8015.

**anti-CEA BiTE monoclonal antibody AMG211:** A recombinant, proprietary bispecific T-cell engagers (BiTE) antibody directed against human carcinoembryonic antigen (CEA), with potential immunostimulating and antineoplastic activities. Anti-CEA BiTE monoclonal antibody MEDI-565 possesses two antigen-recognition sites, one for CEA and one for the CD3 complex, a group of T cell surface glycoproteins that complex with the T cell receptor (TCR). This bispecific monoclonal antibody brings CEA-expressing tumor cells and cytotoxic T lymphocytes (CTLs) and helper T lymphocytes (HTLs) together, which may result in the CTL- and HTL-mediated cell death of CEA-expressing cells. CEA, a tumor associated antigen, is overexpressed in many cancer types, including gastrointestinal, breast, non-small cell lung, and thyroid cancers.

**anti-CEA IgCD28TCR-transduced autologous T cells:** A population of autologous tumor infiltrating lymphocytes (TIL) transduced with a retroviral vector encoding the chimeric gene IgCD28TCR with potential immunostimulating and antineoplastic activities. The chimeric IgCD28TCR gene consists of portions of CD28, the zeta chain of the T-cell receptor (TCRzeta), and a single chain antibody domain (sFv) specific for the tumor-associated antigen CEA. Upon administration, these gene-modified TIL bind to tumor cells expressing CEA, which may result in activation and proliferation of TIL and an enhanced cytotoxic T-lymphocyte (CTL) response against CEA-expressing tumor cells. CEA may be overexpressed in various gastrointestinal and breast cancers. CD28, a T-cell surface-associated co-stimulatory molecule, is required for full T-cell activation, proliferation, and survival; expression of the CD28 fragment in this

chimeric gene construct may impede activation-induced cell death (AICD) of TIL.

**anti-CEA TCR retroviral vector-transduced autologous lymphocytes:**

Autologous human peripheral blood lymphocytes (PBLs), transduced with a retroviral vector encoding both the alpha and beta chains of a T cell receptor (TCR) specific for the carcinoembryonic antigen (CEA), with potential immunostimulating and antineoplastic activities. After transduction, expansion in culture, and reintroduction into the patient, anti-CEA TCR retroviral vector-transduced autologous lymphocytes bind to tumor cells expressing CEA, which may result in cytokine expression, activation and proliferation of T-cells, and a specific cytotoxic T-lymphocyte (CTL) response against CEA-expressing tumor cells. The tumor-associated antigen (TAA) CEA is overexpressed by a variety of cancer cell types, including those of the gastrointestinal tract, lung, and breast.

**anti-CEA-CAR autologous T lymphocytes:** Autologous lymphocytes transduced with a retroviral vector encoding a chimeric antigen receptor (CAR) specific for the tumor-associated antigen human carcinoembryonic antigen (CEA), with potential immunostimulating and antineoplastic activities. Upon administration, the anti-CEA-CAR autologous T-lymphocytes target and bind to tumor cells expressing CEA, which results in the cytotoxic T-lymphocyte (CTL)-mediated cell killing of CEA-expressing tumor cells. CEA is overexpressed in various tumor cell types. Check for active clinical trials using this agent.

**anti-CEA/anti-DTPA-In (F6-734) bispecific antibody:** A bispecific monoclonal antibody (BsMAb) consisting of the Fab fragment of an anti-CEA monoclonal antibody (F6) coupled to the Fab fragment of an anti-DTPA-In monoclonal antibody (734) with potential radioimmunotherapeutic activity. In a two-step "pretargeted" radioimmunotherapeutic approach, this BsMAb, localizing to CEA-expressing tumor cells via the F6 Fab fragment, is introduced into patient first, followed by injection of indium 131-radiolabeled DTPA, which is recognized by the 734 Fab fragment of the BsMAb. Accordingly, a potentially lethal dose of indium 131 is delivered specifically to CEA-expressing tumor cells while minimizing radiotoxicity to normal tissues. CEA (carcinoembryonic antigen) is a tumor antigen overexpressed in many

cancer types, including gastrointestinal, breast, non-small cell lung, and thyroid cancers. DTPA (diethylenetriaminepentaacetic acid) is a bivalent hapten. Check for active clinical trials using this agent.

**anti-CEA/anti-HSG bispecific monoclonal antibody TF2:** A tri-Fab bispecific monoclonal antibody (BiMoAb) divalent for the carcinoembryonic antigen (CEA) and monovalent for histamine-succinyl-glycine (HSG) peptide-hapten. Anti-CEA/anti-HSG bispecific monoclonal antibody TF2 binds to the tumor associated antigen (TAA) CEA on CEA-expressing tumor cells. Subsequently, an HSG peptide-hapten carrying a radionuclide is administered, binding to the anti-HSG binding fragment on the BiMoAb. Depending on the characteristics of the radionuclide used, CEA-expressing tumor cells may then be radioimaged and/or treated radioimmunotherapeutically.

**anti-CEA/CD3 bispecific antibody RO6958688:** An anti-carcinoembryonic antigen (CEA)/anti-CD3 bispecific monoclonal antibody with potential antineoplastic activity. Anti-CEA/CD3 monoclonal antibody RO6958688 contains two antigen-recognition sites: one for human CD3, a T-cell surface antigen, and one for human CEA, a tumor-associated antigen that is specifically expressed on certain tumor cells. Upon intravenous administration, RO6958688 binds to both T-cells and CEA-expressing tumor cells, which cross-links the T-cells with the tumor cells. This may result in a potent cytotoxic T-lymphocyte (CTL) response against CEA-expressing tumor cells. CEA is overexpressed in many cancer cell types.

**anti-CEACAM1 monoclonal antibody CM-24:** A humanized monoclonal immunoglobulin G4 (IgG4) antibody targeting the anti-carcinoembryonic antigen (CEA)-related cell adhesion molecule 1 (CEACAM1; CD66a), with potential immunomodulating and antineoplastic activities. Upon administration of anti-CEACAM1 monoclonal antibody CM-24, this agent binds to CEACAM1 on cancer cells and certain immune cells. This blocks the binding of CEACAM1-expressing cancer cells to CEACAM1-expressing immune cells and abrogates CEACAM1-mediated immunosuppression. This enhances the activation of cytotoxic T-lymphocytes (CTLs) and natural killer (NK) cells and increases CTL- and NK-mediated killing of CEACAM1-overexpressing cancer cells. CEACAM1, a member of the CEA family of proteins that plays a key role in cell migration, cell invasion, and cell adhesion, is overexpressed by a

variety of cancer cell types. Its overexpression is correlated with both immunosuppression and poor prognosis.

**anti-CEACAM5 antibody-drug conjugate SAR408701:** An immunoconjugate consisting of anti-carcinoembryonic antigen-related cell adhesion molecule 5 (CEACAM5) conjugated to a cytotoxic agent, with potential antineoplastic activity. Upon administration of anti-CEACAM5 antibody-drug conjugate SAR408701, the antibody moiety targets CEACAM5 on tumor cells. Upon antibody/antigen binding and internalization, the immunoconjugate releases the cytotoxic agent, which results in tumor cell death. CEACAM5, a member of the CEA family of proteins that plays a key role in cell migration, cell invasion, and cell adhesion, is overexpressed by a variety of cancer cell types.

**anti-CEACAM6 AFAIKL2 antibody fragment/Jack Bean urease immunoconjugate L-DOS47:** A lyophilized formulation of DOS47, an immunoconjugate composed of AFAIKL2, a recombinant camelid single-domain antibody which recognizes carcinoembryonic antigen-related cell adhesion molecule 6 (CEACAM6), and the enzyme urease derived from the plant *Canavalia ensiformis* (Jack bean), with potential antineoplastic activity. Upon intravenous administration, the AFAIKL2 antibody fragment moiety of L-DOS47 specifically targets and binds to CEACAM6 expressed on certain tumor cells. In turn, the urease moiety of L-DOS47 catalyzes the hydrolysis of urea into ammonia, which is further hydrolyzed to produce hydroxyl ions, and causes a locally increased concentration of the toxic waste product ammonia, which under normal conditions is converted into the nontoxic substance urea via the urea cycle. This increases the pH of the tumor microenvironment and alkalinizes the highly acidic environment that is needed for cancer cell survival and proliferation. In addition, the ammonia diffuses into cancer cells and exerts a cytotoxic effect. Altogether, this leads to cell death of CEACAM6-expressing cancer cells. The naturally-occurring enzyme urease catalyzes the hydrolysis of urea into ammonia and carbon dioxide. CEACAM6, a tumor-associated antigen and CEA family member, is overexpressed in a variety of tumor cells and plays a key role in tumor initiation, progression, metastasis and survival.

**anti-CLDN6 monoclonal antibody IMAB027:** A monoclonal antibody directed against the cell surface protein claudin 6 (CLDN6), with potential immunostimulating and antineoplastic activities. Upon administration, the

anti-CLDN6 monoclonal antibody IMAB027 binds to CLDN-6 and may stimulate the immune system to exert both an antibody-dependent cellular cytotoxicity (ADCC) and a complement-dependent cytotoxicity (CDC)-mediated immune response against CLDN-6-expressing tumor cells. This may inhibit tumor cell growth. CLDN-6, a tight-junction protein and embryonic antigen, is expressed on a variety of tumor cells but is not expressed on normal, healthy adult cells.

**Anti-corrosive:** A general term for paints used to prevent the corrosion of metal, especially of iron and steel.

**ANTI-CORROSIVE PAINT:** Metal paint designed to inhibit corrosion. Applied directly to metal.

**anti-CSF-1R monoclonal antibody IMC-CS4:** A monoclonal antibody directed against colony stimulating factor 1 receptor (CSF1R) with potential antineoplastic activity. CSF1R monoclonal antibody IMC-CS4 binds to CSF1R which may trigger antitumoral antibody-dependent cell-mediated cytotoxicity (ADCC) in tumor cells overexpressing CSF1R. CSF1R, also known as macrophage colony-stimulating factor receptor (M-CSFR) and CD115 (cluster of differentiation 115), is a cell-surface receptor for its ligand colony stimulating factor 1 (CSF1); this receptor is overexpressed or mutated in certain tumor cell types and plays major roles in tumor cell proliferation and metastasis. Check for active clinical trials using this agent.

**anti-CSF1R monoclonal antibody FPA008:** A humanized monoclonal antibody directed against the tyrosine kinase receptor colony stimulating factor 1 receptor (CSF1R; CSF-1R), also known as macrophage colony-stimulating factor receptor (M-CSFR) and CD115 (cluster of differentiation 115), with potential antineoplastic activity. Upon administration, anti-CSF1R monoclonal antibody FPA008 binds to CSF1R expressed on monocytes, macrophages, and osteoclasts and inhibits the binding of the CSF1R ligands colony-stimulating factor-1 (CSF-1) and interleukin-34 (IL-34), to CSF1R. This prevents CSF1R activation and CSF1R-mediated signaling in these cells. This blocks the production of inflammatory mediators by macrophages and monocytes and reduces inflammation. By blocking the recruitment to the tumor microenvironment and activity of CSF1R-dependent tumor-associated macrophages (TAMs), FPA008 enhances T-cell infiltration and antitumor T-cell immune responses, which inhibits the proliferation of tumor cells. Additionally, FPA008 prevents the

activation of osteoclasts and blocks bone destruction. TAMs play key roles in immune suppression and promoting inflammation, tumor cell proliferation and survival. Check for active clinical trials using this agent.

**anti-CTGF monoclonal antibody FG-3019:** A human monoclonal antibody targeting connective tissue growth factor (CTGF) with potential anti-fibrotic and antineoplastic activities. FG-3019 binds to CTGF thereby preventing the binding of the ligand to the receptor and subsequent receptor activation. As CTGF enhances the production of collagen and fibronectin, FG-319 may prevent and reverse fibrosis. In addition, FG-3019 may prevent tumor cell proliferation in CTGF-expressing tumor cells. CTGF, a member of the CCN family (CTGF, CYR61/CEF and NOV), is expressed in a variety of tumor cell types and is involved in processes such as cell proliferation, cell migration, cell adhesion, differentiation and angiogenesis. Check for active clinical trials using this agent.

**anti-CTLA-4 mAb RNA-transfected autologous dendritic cell vaccine:** An autologous dendritic cell (DC) cancer vaccine with potential immunostimulatory activity. Anti-CTLA4 MoAb RNA-transfected autologous DC vaccine is prepared by transfecting DCs with RNAs encoding humanized heavy and light chains of the anti-CTLA4 (cytotoxic T-Lymphocyte-Associated Antigen 4); expression of anti-CTLA4 blocks the inhibitory effect of CTLA4 on the activation of T-lymphocytes. Co-vaccination of this vaccine with melanoma antigen specific vaccine may eliminate the adverse effects associated with systemic administration of immune modulators, while also enhancing vaccine-induced immune responses.

**anti-CTLA-4 monoclonal antibody AGEN1884:** A recombinant human monoclonal antibody directed against the human T-cell receptor cytotoxic T-lymphocyte-associated antigen 4 (CTLA4), with immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-CTLA4 monoclonal antibody AGEN1884 binds to CTLA4 expressed on T cells and inhibits the CTLA4-mediated downregulation of T-cell activation. This leads to a cytotoxic T-lymphocyte (CTL)-mediated immune response against cancer cells. CTLA4, an inhibitory receptor and member of the immunoglobulin superfamily, plays a key role in the downregulation of the immune system.

**anti-CTLA4 mAb RNA/GITRL RNA-transfected autologous dendritic cell vaccine:** An autologous dendritic cell (DC) cancer vaccine with potential immunostimulatory activity. Anti-CTLA4 MoAb RNA/GITRL RNA-transfected DC vaccine is prepared by transfecting DCs with RNAs encoding humanized heavy and light chains of the anti-CTLA4 (cytotoxic T-Lymphocyte-Associated Antigen 4) monoclonal antibody and tumor necrosis factor (ligand) superfamily, member 18 (TNFSF18 or GITRL); expression of anti-CTLA4 blocks the inhibitory effect of CTLA4 on the activation of T-lymphocytes, while expression of GITRL modulates T lymphocyte survival in peripheral tissues. Co-vaccination of this vaccine with melanoma antigen specific vaccine may eliminate the adverse effects associated with systemic administration of immune modulators, while also enhancing vaccine-induced immune responses.

**anti-denatured collagen recombinant monoclonal antibody TRC093:** A humanized, affinity-matured IgG1k antibody directed against denatured collagens (I-IV) with potential antiangiogenic and antineoplastic activities. Anti-denatured collagen recombinant monoclonal antibody TRC093 binds to multiple epitopes on denatured collagens, inhibiting proteolytic collagen-mediated signaling in the extracellular matrix (ECM) that is important to tumor angiogenesis, tumor growth, and metastasis. The epitopes on denatured collagen bound by this antibody are considered "cryptic" because, in vivo, they are accessible only on the subendothelial basement membrane of tumors or in normal tissues undergoing neovascularization.

**anti-DKK-1 monoclonal antibody LY2812176:** A human monoclonal antibody directed against the WNT antagonist dickkopf homolog 1 (DKK1), with potential anti-osteolytic activity. Anti-DKK1 monoclonal antibody LY2812176 binds to and inhibits DKK1, thereby restoring signaling through the WNT pathway, which may result in osteoblast differentiation and activation within the bone matrix and the reversal of tumor-induced osteolytic disease. DKK1, overexpressed by myeloma cells, is an inhibitor of the WNT signaling pathway and prevents the mediated formation of bone.

**anti-DKK1 monoclonal antibody BHQ880:** A humanized monoclonal antibody directed against Wnt antagonist Dickkopf-1 (DKK1) with potential anti-osteolytic activity. Anti-DKK1 monoclonal antibody BHQ880 binds to and inhibits DKK1, enhancing signaling through the Wnt pathway,

which may result in osteoblast differentiation and activation within the bone matrix and the reversal of tumor-induced osteolytic disease. DKK1 is a potent Wnt signaling pathway antagonist. Check for active clinical trials using this agent.

**anti-DLL4 monoclonal antibody MEDI0639:** An immunoglobulin G1 lambda monoclonal antibody directed against the Notch ligand delta-like 4 (DLL4) with potential antineoplastic activity. Anti-DLL4 monoclonal antibody MEDI0639 specifically binds to DLL4 and prevents its interaction with Notch receptors, thereby inhibiting Notch-mediated signaling and gene transcription, which may block tumor angiogenesis and eventually the inhibition of tumor cell growth. Activation of Notch receptors by DLL4 stimulates proteolytic cleavage of the Notch intracellular domain (NICD); after cleavage, NICD is translocated to the nucleus and mediates the transcriptional regulation of a variety of genes involved in vascular development. The expression of DLL4 is highly restricted to the vascular endothelium; DLL4/Notch signaling is required for the development of functional tumor blood vessels.

**anti-DLL4 monoclonal antibody REGN421:** A human monoclonal antibody directed against Delta-like ligand-4 (DLL4) with potential antineoplastic activity. Anti-DLL4 monoclonal antibody REGN421 specifically binds to human DLL4, preventing its binding to Notch receptors and inhibiting Notch signaling, which may result in defective tumor vascularization and, so, the inhibition of tumor cell growth. DLL4 is the only Notch ligand selectively expressed on endothelial cells; DLL4/Notch signaling is required for the development of functional tumor blood vessels.

**anti-DLL4/VEGF bispecific monoclonal antibody OMP-305B83:** A bispecific monoclonal antibody directed against both the Notch ligand delta-like 4 (DLL4) and the human tyrosine kinase vascular endothelial growth factor (VEGF), with potential anti-angiogenic and antineoplastic activities. The anti-DLL4 moiety of anti-DLL4/VEGF monoclonal antibody OMP-305B83 specifically binds to DLL4, prevents its interaction with Notch receptors, and inhibits Notch-mediated signaling and gene transcription, which may both block tumor angiogenesis and inhibit tumor cell growth. The anti-VEGF moiety binds to VEGF and prevents the binding of VEGF to its receptor, which blocks VEGF-mediated signaling

and further inhibits the growth and maintenance of tumor blood vessels. The expression of DLL4 is highly restricted to the vascular endothelium; DLL4/Notch signaling is required for the development of functional tumor blood vessels. The expression of the pro-angiogenic growth factor VEGF is associated with tumor angiogenesis and tumor cell proliferation and invasion.

**anti-DR5 agonist monoclonal antibody TRA-8:** An agonist mouse monoclonal antibody directed against TRAIL death receptor type 5 (DR5) with potential antineoplastic activity. Anti-DR5 agonist monoclonal antibody TRA-8 binds DR5, which may induce apoptosis in DR5-expressing tumor cells. DR5 is a tumor cell surface ligand that crosslinks with death receptor type 4 (DR4) when bound by TRAIL [Tumor necrosis (TNF)-related apoptosis-inducing ligand], triggering apoptosis via a death receptor signaling pathway. The apoptotic activity of this antibody may not require DR4/DR5 crosslinking.

**anti-EGFL7 monoclonal antibody MEGF0444A:** A humanized IgG1 monoclonal antibody directed against the epidermal growth factor-like domain multiple 7 (EGFL7) with potential antineoplastic activity. Anti-EGFL7 monoclonal antibody MEGF0444A binds to EGFL7, thereby preventing the activities of EGFL7 on endothelial cells and inhibiting the survival and migration of endothelial cells during angiogenesis. EGFL7, a vascular-restricted extracellular matrix protein which is upregulated during angiogenesis and which regulates vascular development, may be overexpressed on the cell surfaces of various solid tumor cell types.

**anti-EGFR monoclonal antibody ABT-806:** A humanized monoclonal antibody (MoAb) against human epidermal growth factor receptor (EGFR) with antineoplastic activity. MoAb ABT-806 targets the EGFR deletion variant, de2-7 EGFR as well as wild-type EGFR expressed in cells overexpressing the receptor, thereby preventing the activation and subsequent dimerization of the receptor; the decrease in receptor activation and dimerization result in an inhibition in signal transduction and anti-proliferative effects. This MoAb targets cells expressing aberrant EGFR, hence making it an ideal candidate for generation of radioisotope or toxin conjugates.

**anti-EGFR monoclonal antibody GC1118:** A recombinant, human monoclonal antibody directed against the epidermal growth factor receptor

(EGFR) with potential antineoplastic activity. Upon intravenous administration, GC1118 binds to and blocks the ligand binding site of EGFR, which prevents receptor dimerization and activation. This may lead to an inhibition of both EGFR-dependent downstream pathways and EGFR-dependent tumor cell proliferation and metastasis. EGFR, a receptor tyrosine kinase, may be overexpressed on the surfaces of various tumor cell types.

**anti-EGFR monoclonal antibody mixture MM-151:** An oligoclonal therapeutic composed of three fully human monoclonal antibodies targeting epidermal growth factor receptor (EGFR or ErbB1), with potential antineoplastic activity. Upon administration of MM-151, the three antibodies bind to distinct, non-overlapping epitopes of EGFR, thereby preventing the binding of a full range of both high and low affinity EGFR ligands and inhibiting EGFR-ERK-mediated signaling. This eventually inhibits tumor cell proliferation in EGFR-overexpressing tumor cells. Furthermore, multi antibody-antigen bindings cause crosslinking of EGFR and downregulate receptor signalings that are mediated via heterodimerization of EGFR with other members of the EGFR family. EGFR, a receptor tyrosine kinase overexpressed in a variety of cancer cell types, is a key regulator of cancer cell proliferation, apoptosis, invasion, and metastasis. Check for active clinical trials using this agent.

**anti-EGFR monoclonal antibody mixture sym004:** A mixture of two recombinant IgG1 antibodies directed against different epitopes in the epidermal growth factor receptor (EGFR) extracellular domain III, with potential antineoplastic activity. Anti-EGFR monoclonal antibody mixture Sym004 binds to the extracellular domain of EGFR, thereby preventing ligand binding. This may prevent activation and subsequent dimerization of the receptor; the decrease in receptor activation may result in an inhibition of downstream ERK and JNK signaling pathways and thus inhibition of EGFR-dependent tumor cell proliferation and metastasis. In addition, binding of Sym004 to EGFRs causes EGFR internalization and degradation. EGFR, a receptor tyrosine kinase, often is overexpressed on the cell surfaces of various solid tumor cell types.

**anti-EGFR monoclonal antibody RO5083945:** A glycoengineered monoclonal antibody directed against the epidermal growth factor receptor (EGFR) with potential antineoplastic activity. anti-EGFR monoclonal

antibody RO5083945 binds to the extracellular domain of EGFR, preventing the activation and subsequent dimerization of the receptor; the decrease in receptor activation and dimerization may result in an inhibition of downstream ERK and JNK signaling pathways and so inhibition of EGFR-dependent tumor cell proliferation and metastasis. EGFR, a member of the epidermal growth factor family of extracellular protein ligands, may be overexpressed on the cell surfaces of various solid tumor cell types.

**anti-EGFR monoclonal antibody SYN004:** A glyco-engineered monoclonal antibody directed against the receptor tyrosine kinase epidermal growth factor receptor (EGFR), with potential antineoplastic activity. Upon administration, anti-EGFR monoclonal antibody SYN004 binds to the extracellular domain of EGFR, which prevents ligand binding and the subsequent activation and dimerization of the receptor. This inhibits the activation of EGFR-mediated signaling pathways and inhibits EGFR-dependent tumor cell proliferation. EGFR, a member of the EGFR receptor tyrosine kinase family, may be overexpressed on the cell surfaces of various tumor cell types.

**anti-EGFR TAP antibody-drug conjugate IMGN289:** A targeted antibody payload (TAP)-based immunoconjugate consisting of a human monoclonal antibody directed against the epidermal growth factor receptor (EGFR) conjugated, via a nonreducible thioether linker (succinimidyl trans-4-(maleimidylmethyl)cyclohexane-1-carboxylate or SMCC), to the cytotoxic agent maytansinoid mertansine (DM1), with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of immunoconjugate IMGN289 binds to and inhibits EGFR on tumor cell surfaces. Inhibition of EGFR prevents EGFR-mediated signaling and may inhibit tumor cell proliferation. After internalization, the mertansine moiety binds to tubulin and interferes with microtubule assembly/disassembly dynamics. This inhibits both cell division and the proliferation of cancer cells that express EGFR. EGFR, overexpressed by a variety of cancers, plays a key role in tumor cell proliferation and survival. Linkage of the antibody and drug, through a nonreducible linker, appears to contribute to the improved efficacy and reduced toxicity of this antibody-drug conjugate (ADC) compared to similar ADCs constructed with reducible linkers.

**anti-EGFR/c-Met bispecific antibody JNJ-61186372:** A human bispecific antibody targeting both epidermal growth factor receptor EGFR and hepatocyte growth factor receptor (HGFR; cMet), with potential antineoplastic activity. Upon administration, anti-EGFR/c-Met bispecific antibody JNJ-61186372 simultaneously targets and binds to wild-type or certain mutant forms of both EGFR and cMet expressed on cancer cells, thereby preventing receptor phosphorylation. This prevents the activation of both EGFR- and cMet-mediated signaling pathways. In addition, binding results in receptor degradation, which further inhibits EGFR- and cMet-mediated signaling. JNJ-61186372 also causes antibody-dependent cellular cytotoxicity (ADCC). Altogether, this results in the inhibition of tumor cell proliferation. EGFR and cMet, both upregulated or mutated in a variety of tumor cell types, play key roles in tumor cell proliferation. Check for active clinical trials using this agent.

**anti-EGFR/HER3 monoclonal antibody MEHD7945A:** An immunoglobulin (Ig) G1 monoclonal antibody directed against both human epidermal growth factor receptor 3 (HER3 or ERBB3) and human epidermal growth factor receptor (EGFR), with potential antineoplastic activity. Anti-EGFR/HER3 Monoclonal Antibody MEHD7945A binds to both EGFR and HER3 and inhibits their activation. This may prevent EGFR/HER3-mediated signaling and inhibit EGFR/HER3-dependent tumor cell proliferation. In addition, MEHD7945A induces antibody-dependent cell-mediated cytotoxicity (ADCC) against EGR/HER3-expressing tumor cells. EGFR and HER3, members of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, are frequently overexpressed in tumors; their expression is associated with both poor prognosis and drug resistance.

**anti-EGFRvIII antibody drug conjugate AMG 595:** An immunoconjugate consisting of a human monoclonal antibody directed against the deletion-mutant of epidermal growth factor receptor, EGFRvIII, conjugated via a non-cleavable linker to the cytotoxic agent maytansinoid DM1, with potential antineoplastic activity. The monoclonal antibody moiety of this immunoconjugate binds to EGFRvIII on tumor cell surfaces. After internalization, the DM1 moiety binds to tubulin, thereby disrupting microtubule assembly/disassembly dynamics and inhibiting cell division and the proliferation of cancer cells that express the EGFRvIII mutant. EGFRvIII, a deletion mutation of exons 2-7 in the epidermal growth factor

receptor gene, is overexpressed by a variety of cancers, including glioblastoma multiforme, non-small cell lung carcinoma, and breast carcinoma.

**anti-EGFRvIII CAR-transduced allogeneic T lymphocytes:** Allogeneic human T lymphocytes transduced with a retroviral vector encoding an anti-epidermal growth factor receptor (EGFR) variant III (EGFRvIII) mutant chimeric T-cell receptor (chimeric antigen receptor or CAR) gene coupled to the signaling domains from CD8, CD28, 4-1BB (CD137) and CD3 zeta, with potential immunostimulatory and antineoplastic activities. Upon administration, the anti-EGFRvIII CAR-transduced allogeneic T lymphocytes bind to the EGFRvIII antigen on tumor cell surfaces; subsequently, EGFRvIII-expressing tumor cells may be lysed. EGFRvIII, an in-frame deletion of exons 2-7 in the EGFR gene, is overexpressed by a variety of cancer cell types and absent in normal, healthy cells; it plays a key role in tumor cell proliferation, tumor angiogenesis and radio- and chemoresistance.

**anti-EGFRvIII immunotoxin MR1-1:** A recombinant immunotoxin consisting of single-chain variable domain fragment antibody directed against the tumor-specific antigen EGFRvIII (MR1scFv) fused to domains II and III of the Pseudomonas exotoxin (PE38KDEL), with potential antineoplastic activity. Upon administration, the antibody moiety of anti-EGFRvIII immunotoxin MR1-1 binds to EGFRvIII; upon internalization, the exotoxin portion inhibits protein synthesis, resulting in a reduction in tumor cell proliferation of EGFRvIII-expressing tumor cells. EGFRvIII, a type III in-frame deletion mutation of the epidermal growth factor receptor (EGFR) gene, is expressed by a variety of cancers, including glioblastoma multiforme, non-small lung carcinoma, and breast carcinoma. Compared to intact IgG antibodies, single-chain antibodies such as MR1scFv are smaller and may penetrate tumors better. Pseudomonas exotoxin PE38KDEL was modified to remove the natural cell binding domain. Check for active clinical trials using this agent.

**anti-EGP-2 immunotoxin MOC31-PE:** An immunotoxin consisting of a monoclonal antibody directed against epithelial glycoprotein-2 (EP-2, or epithelial cell adhesion molecule (EpCAM)) conjugated to the bacterial toxin Pseudomonas exotoxin A (PE) with potential antineoplastic activity. Upon administration of anti-EGP-2 immunotoxin MOC31-PE, the

monoclonal antibody moiety targets and binds to EP-2. Upon internalization, the Pseudomonas exotoxin A moiety then inactivates elongation factor 2 (EF-2) through ADP ribosylation, resulting in inhibition of protein synthesis in EP-2-expressing cells. EP-2, a tumor-associated antigen, is overexpressed in a variety of cancer cell types.

**anti-endoglin monoclonal antibody TRC105:** A human/murine chimeric monoclonal antibody directed against endoglin (CD105) with potential antiangiogenic and antineoplastic activities. Anti-endoglin monoclonal antibody TRC105 binds to endoglin, which may result in inhibition of tumor angiogenesis and decreased tumor cell proliferation. The glycoprotein endoglin is a transforming growth factor beta-1 (TGF beta-1) accessory receptor that is highly expressed on tumor vessel endothelial cells and appears to be essential for angiogenesis.

**anti-endosialin/TEM1 monoclonal antibody MORAb-004:** A humanized IgG1 monoclonal antibody directed against human endosialin/TEM1 (tumor endothelial marker;CD248) with potential antiangiogenic and antineoplastic activities. Anti-endosialin/TEM1 monoclonal antibody MORAb-004 binds to and inhibits the activity of cell surface protein endosialin/TEM1, which may result in the inhibition of angiogenesis, tumor cell proliferation and metastasis. Endosialin/TEM1 plays a key role in angiogenesis and may be overexpressed on tumor stromal cells and endothelial cells.

**anti-ENPP3 antibody-drug conjugate AGS-16C3F:** An antibody-drug conjugate (ADC) containing a fully human monoclonal antibody (AGS-16C) directed to the ectonucleotide pyrophosphatase/phosphodiesterase family member 3 (ENPP3), conjugated via a non-cleavable linker to monomethyl auristatin F (MMAF), an auristatin derivative and a potent microtubule inhibitor, that has potential antineoplastic activity. Upon intravenous administration of ADC AGS-16C3F, the monoclonal antibody moiety of this conjugate selectively binds to ENPP3 then is internalized and undergoes proteolytic cleavage to release MMAF. MMAF binds to and inhibits tubulin polymerization, resulting in G2/M phase arrest and tumor cell apoptosis. While normally expressed at low levels in the proximal tubules of the kidney, the type II transmembrane glycoprotein ENPP3 has been found to be overexpressed in renal neoplasms. Check for active clinical trials using this agent.

**anti-EpCAM antibody fragment -Pseudomonas exotoxin fusion**

**protein:** A substance used to treat diarrhea (frequent and watery bowel movements). OR A fusion protein immunotoxin consisting of a humanized, single-chain monoclonal antibody fragment specific for the epithelial cell adhesion molecule (EpCAM) conjugated with a truncated form of Pseudomonas exotoxin A with potential antineoplastic activity. Anti-EpCAM-Pseudomonas-exotoxin fusion protein binds to Ep-CAM-positive tumor cells, thereby delivering the Pseudomonas exotoxin A moiety specifically; the Pseudomonas exotoxin A moiety then inactivates elongation factor 2 (EF-2) through ADP ribosylation, resulting in inhibition of protein synthesis in target cells. EpCAM, a cell surface protein, is expressed by a variety of tumor cells and is frequently found in head and neck cancers.

**anti-EphA2 monoclonal antibody DS-8895a:** A monoclonal antibody directed against the ephrin receptor A2 (EphA2), with potential antineoplastic activity. Upon administration, anti-EphA2 monoclonal antibody DS-8895a selectively binds to cells expressing the EphA2 receptor. This blocks EphA2 activation and EphA2-mediated signaling. In addition, DS-8895a may activate an immune response against EphA2-expressing tumor cells. The cell-surface receptor EphA2, a member of the ephrin family of receptor tyrosine kinases (RTKs) that are involved in mammalian development, is overexpressed by a variety of cancer cell types and plays an important role in tumor growth.

**anti-EphA2 monoclonal antibody-MMAF immunoconjugate MEDI-547:** An auristatin analogue immunoconjugate directed against Eph receptor A2 (EphA2)-positive cancer cells with potential antineoplastic activity. Anti-EphA2 monoclonal antibody-MMAF immunoconjugate MEDI-547 is generated by conjugating the fully human IgG1 anti-EphA2 monoclonal antibody (1C1) to the small-molecule microtubule inhibitor monomethyl auristatin phenylalanine (MMAF) via the stable linker maleimidocaproyl (mc) (1C1-mcMMAF). The monoclonal antibody moiety of this agent selectively binds to cells expressing the EphA2 receptor. After internalization and enzymatic cleavage of the immunoconjugate within the tumor cell cytosol, free MMAF binds to tubulin and inhibits its polymerization, which may result in G2/M phase arrest and tumor cell apoptosis. The cell-surface receptor EphA2, a member of the ephrin family

of receptor tyrosine kinases (RTKs) involved in mammalian development, is overexpressed by a variety of different cancer cell types.

**anti-EphA3 monoclonal antibody KB004:** A non-fucosylated monoclonal antibody directed against the ephrin receptor A3 (EphA3), with potential antineoplastic activity. Upon administration, anti-EphA3 monoclonal antibody KB004 selectively binds to tumor cells expressing EphA3. This blocks both EphA3 activation and EphA3-mediated signaling, and induces apoptosis in EphA3-expressing tumor cells. In addition, KB004 can stimulate antibody dependent cell-mediated cytotoxicity (ADCC) against EphA3-expressing tumor cells. This agent also prevents tumor cell proliferation by inhibiting both EphA3 signaling and proliferation of endothelial cells in the tumor vasculature. The cell-surface receptor EphA3, a member of the ephrin family of receptor tyrosine kinases (RTKs) that are involved in mammalian development, is overexpressed by a variety of tumor types but is not expressed in normal healthy adult tissues. It plays an important role in tumor cell proliferation. Non-fucosylation of the antibody enhances its ADCC activity.

**anti-epidermal growth factor receptor 2 antibody expressing pluripotent killer T lymphocytes:** A specific population of pluripotent killer (PIK) T cells that have been induced to express high levels of antibodies against human epidermal growth factor receptor 2 (ERBB2; HER2), with potential antitumor activity. Although the exact mechanism(s) of action through which PIK-HER2 cells exert their effects has yet to be elucidated, upon infusion, these cells secrete antibodies targeting HER2 expressed on the surface of tumor cells. This may inhibit HER2-dependent signaling, which may lead to inhibition of cellular proliferation and differentiation. Additionally, these cells may stimulate the host immune system to mount both a highly-specific cytotoxic T-lymphocyte (CTL) response and antibody-dependent cell cytotoxicity (ADCC) directed against HER2-overexpressing tumors, which leads to tumor cell lysis. HER2 is a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases and is frequently overexpressed in solid tumors.

**anti-ErbB2/anti-ErbB3 bispecific monoclonal antibody MM-111:** A bispecific monoclonal antibody directed against the human epidermal growth factor receptors ErbB2 (Her2) and ErbB3 (Her3) with potential antineoplastic activity. The anti-ErbB2 targeting arm of anti-ErbB2/anti-

ErbB3 bispecific monoclonal antibody MM-111 binds to ErbB2 on tumor cells with high affinity while the anti-Erb3 therapeutic arm binds to ErbB3, which may result in the inhibition of cellular proliferation and differentiation in ErbB2-overexpressing tumor cells via inhibition of ErbB3-dependent signal transduction pathways. ErbB2 and ErbB3 are members of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases and are frequently overexpressed in solid tumors.

**anti-ErbB3 monoclonal antibody AV-203:** A humanized monoclonal antibody (MoAb) directed against the human receptor tyrosine-protein kinase ErbB-3 (HER3) with potential antineoplastic activity. Anti-ErbB3 MoAb AV-203 binds to and inhibits both ligand neuregulin-1 (NRG-1)-dependent and ligand-independent ErbB3 activation, which may result in inhibition of ErbB3-dependent PI3K/Akt signaling and may lead to inhibition of cellular proliferation and differentiation. ErbB3, a member of the epidermal growth factor receptor (EGFR) family, is frequently overexpressed in solid tumors and its overexpression generally correlates with poor prognosis and tumor resistance; it has no active kinase domain itself but is activated through heterodimerization with other members of the EGFR receptor family that do. Check for active clinical trials using this agent.

**anti-ErbB3 monoclonal antibody KTN3379:** A monoclonal antibody directed against the human epidermal growth factor receptor ErbB3 (Her3) with potential antineoplastic activity. Anti-ErbB3 monoclonal antibody KTN3379 binds to and prevents ligand binding to ErbB3, which may inhibit ErbB3-dependent phosphatidylinositol-3 kinase (PI3K)/Akt signaling and may lead to the inhibition of cellular proliferation and differentiation. ErbB3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in a variety of solid tumors and its overexpression generally correlates with poor prognosis and tumor resistance.

**anti-ErbB3 monoclonal antibody REGN1400:** A human monoclonal antibody directed against the human epidermal growth factor receptor ErbB3 (Her3) with potential antineoplastic activity. Anti-ErbB3 receptor monoclonal antibody REGN1400 binds to ErbB3 and prevents neuregulin 1 ligand binding to ErbB3, which may result in an inhibition of ErbB3-dependent phosphatidylinositol-3 kinase (PI3K)/Akt signaling. This

eventually leads to the inhibition of cellular proliferation and differentiation. ErbB3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in a variety of solid tumors and its overexpression generally correlates with poor prognosis and tumor resistance.

**anti-ErbB3/anti-IGF-1R bispecific monoclonal antibody MM-141:** A bispecific monoclonal antibody directed against the human epidermal growth factor receptor ErbB3 (Her3) and the human insulin-like growth factor-1 receptor (IGF-1R), with potential antineoplastic activity. The anti-IGF-1R targeting arm of anti-IGF-1R/anti-ErbB3 bispecific monoclonal antibody MM-141 binds to IGF-1R on tumor cells thereby preventing the binding of the natural ligands IGF-1, 2 and heregulin (HRG) to IGF-1R; the anti-ErbB3 therapeutic arm prevents the binding of neuregulin (NRG) to ErbB3. This prevents the activation of the PI3K/AKT signal transduction pathway and may result in both the induction of apoptosis and a decrease in cellular proliferation in IGF-1R and ErbB3-overexpressing tumor cells. IGF-1R, a receptor tyrosine kinase of the insulin receptor superfamily, and ErbB3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, are frequently overexpressed in solid tumors.

**anti-FGF23 IgG1 monoclonal antibody KRN23:** An orally bioavailable recombinant human immunoglobulin G1 monoclonal antibody directed against human fibroblast growth factor 23 (FGF23), that can be used to increase serum phosphate levels. Upon subcutaneous administration, anti-FGF23 IgG1 monoclonal antibody KRN23 binds to and inhibits FGF23, thereby interfering with FGF23 signaling. This increases tubular phosphate reabsorption, decreases excretion of phosphate, and increases serum phosphate levels, resulting in enhanced bone mineralization. FGF23, a member of the fibroblast growth factor (FGF) family produced by osteocytes, plays a key role in hypophosphatemic rickets/osteomalacia, such as X-linked hypophosphatemia (XLH) and tumor-induced rickets/osteomalacia. Increased FGF23 levels lead to decreased expression of the sodium-phosphate co-transporters in the proximal tubules, reduced renal phosphate reabsorption, increased excretion by the kidneys, and low serum phosphate concentration.

**anti-FGFR2 antibody BAY1179470:** An antibody against the fibroblast growth factor receptor type 2 (FGFR2), with potential antineoplastic

activity. Upon administration, the anti-FGFR2 antibody BAY1179470 binds to and inhibits FGFR2, which may result in the inhibition of both FGFR2 phosphorylation and FGFR2-mediated signal transduction pathways. This results in the inhibition of cell proliferation and the induction of cell death of FGFR2-expressing tumor cells. FGFR2, upregulated in many tumor cell types, is a receptor tyrosine kinase, which is essential to tumor cellular proliferation, differentiation and survival.

**anti-FGFR2 antibody-drug conjugate BAY1187982:** An antibody-drug conjugate (ADC) directed against the fibroblast growth factor receptor type 2 (FGFR2) and conjugated to an as of yet unidentified toxin, with potential antineoplastic activity. Upon intravenous administration, the anti-FGFR2 ADC BAY1187982 binds to FGFR2. Upon binding, the toxin selectively induces cell death, through an as of yet undisclosed mechanism of action, in FGFR2-expressing tumor cells. FGFR2, a receptor tyrosine kinase upregulated in many tumor cell types, plays an essential role in tumor cell proliferation, differentiation and survival.

**anti-FGFR2 monoclonal antibody FPA144:** A glycoengineered, humanized monoclonal antibody directed against the fibroblast growth factor receptor type 2b (FGFR2b), with potential antineoplastic activity. Upon administration, the anti-FGFR2 antibody FPA144 specifically binds to and inhibits FGFR2b on tumor cell surfaces, which prevents FGFR2 from binding to its ligands, FGFR2b activation and the activation of FGFR2b-mediated signal transduction pathways. The binding of FPA144 to FGFR2b protein also induces antibody-dependent cell-mediated cytotoxicity (ADCC) against FGFR2b-expressing tumor cells. This results in the inhibition of cell proliferation and the induction of cell death of FGFR2-expressing tumor cells. FGFR2b, a specific isoform of the receptor tyrosine kinase FGFR2 upregulated in many tumor cell types, is essential to tumor proliferation, differentiation and survival. Glycoengineering enhances the FPA144-mediated ADCC.

**anti-FGFR3 antibody-drug conjugate LY3076226:** An antibody-drug conjugate (ADC) composed of a human monoclonal antibody against the fibroblast growth factor receptor type 3 (FGFR3) and conjugated to an as of yet not publicly known cytotoxic agent, with potential antineoplastic activity. Upon administration, the antibody moiety of anti-FGFR3 ADC LY3076226 binds to FGFR3. Upon internalization, the cytotoxic moiety

causes cell death in FGFR3-expressing tumor cells. FGFR3, a receptor tyrosine kinase upregulated or mutated in many tumor cell types, plays a key role in tumor cell proliferation.

**anti-FGFR3 monoclonal antibody B-701:** A human immunoglobulin G1 (IgG1) monoclonal antibody directed against the fibroblast growth factor receptor type 3 (FGFR3), with potential antineoplastic activity. Upon intravenous administration, the anti-FGFR3 monoclonal antibody B-701 specifically binds to and inhibits both wild-type and mutated forms of FGFR3. This may result in the inhibition of FGFR3 phosphorylation, thereby preventing its activation and FGFR3-mediated signal transduction pathways. This results in the inhibition of cell proliferation and the induction of cell death in FGFR3-expressing tumor cells. FGFR3, a receptor tyrosine kinase upregulated or mutated in many tumor cell types, plays a key role in tumor cell proliferation.

**anti-FGFR3 monoclonal antibody MFGR1877S:** A human monoclonal antibody against the fibroblast growth factor receptor type 3 (FGFR3), with potential antineoplastic activity. Upon administration, the anti-FGFR3 antibody MFGR1877S binds to and inhibits FGFR3, which may result in the inhibition of both FGFR3 phosphorylation and FGFR3-mediated signal transduction pathways. This results in the inhibition of cell proliferation and the induction of cell death in FGFR3-expressing tumor cells. FGFR3, upregulated or mutated in many tumor cell types, is a receptor tyrosine kinase, and plays a key role in tumor cell proliferation. Check for active clinical trials using this agent.

**anti-FGFR4 monoclonal antibody U3-1784:** A human monoclonal antibody against human fibroblast growth factor receptor 4 (FGFR4), with potential antineoplastic activity. Upon administration, U3-1784 specifically binds to and blocks FGFR4. This prevents the activation of FGFR4, inhibits FGFR4-mediated signaling and leads to an inhibition of cell proliferation in FGFR4-overexpressing tumor cells. FGFR4, a receptor tyrosine kinase overexpressed by certain tumor cell types, is involved in tumor cell proliferation, differentiation, angiogenesis, and survival. Check for active clinical trials using this agent.

**anti-FLT-1 ribozyme:** A nuclease-stabilized synthetic ribozyme (ribonucleic acid enzyme) with potential anti-angiogenesis activity. Ribozyme RPI.4610 specifically recognizes the mRNA for FLT1 (vascular

endothelial growth factor receptor 1; VEGFR1), and hydrolyzes the mRNA, thereby preventing VEGFR1 proteins from being made. This may prevent VEGF-stimulated angiogenesis in cancerous tissue and metastasis.

**anti-FLT3 monoclonal antibody IMC-EB10:** A fully human, IgG1 monoclonal antibody directed against the FLT3 tyrosine kinase receptor (CD135) with potential antineoplastic activity. Upon binding to FLT3, anti-FLT3 monoclonal antibody IMC-EB10 blocks FLT3 ligand binding to FLT3 and subsequent FLT3 phosphorylation, which may result in the inhibition of FLT3-mediated signal transduction pathways. In addition, this agent may stimulate an anti-FLT3 antibody-dependent cell-mediated cytotoxicity (ADCC) against FLT3-expressing tumor cells, which may result in the inhibition of cellular proliferation and survival in FLT3-expressing cells. FLT3 (FLK2), a class III tyrosine kinase receptor, is overexpressed or mutated in most B lineage and acute myeloid leukemias.

**Anti-fouling:** Compositions used to prevent the growth of barnacles, arine weed and other organisms on ships' bottoms.

**Anti-fouling Paint:** Paints formulated especially for boat decks and hulls, docks and other below-water-line surfaces and structures to prevent the growth of barnacles and other organisms on the bottom of ships.

**Anti-friction Compounds:** Materials specifically formulated to reduce or eliminate friction.

**anti-fucosyl-GM1 monoclonal antibody BMS-986012:** A monoclonal antibody directed against the ganglioside fucosyl-GM1, with potential antineoplastic and immunomodulating activities. Upon administration, anti-fucosyl-GM1 monoclonal antibody BMS-986012 binds to fucosyl-GM1 on cancer cells and may activate both antibody-dependent cellular cytotoxicity (ADCC) and complement-dependent cytotoxicity against the bound tumor cells. This may inhibit the proliferation of GM1-expressing tumor cells. Fucosyl-GM1, a sphingolipid monosialoganglioside and tumor-associated antigen (TAA), is overexpressed on the surface of many cancer cells while its expression is minimal or non-existent in normal tissues.

**anti-ganglioside GM2 monoclonal antibody BIW-8962:** A humanized anti-ganglioside GM2 (GM2) monoclonal antibody with potential antineoplastic and immunomodulating activities. Upon administration, anti-ganglioside GM2 monoclonal antibody BIW-8962 may activate an antibody dependent cellular cytotoxicity (ADCC) against GM2-expressing tumor

cells. GM2 is a tumor associated antigen (TAA) overexpressed on the surface of many cancer cells, such as multiple myeloma (MM) cells and neuroblastoma cells.

**anti-GCC antibody-drug conjugate MLN0264:** An antibody-drug conjugate (ADC) containing a monoclonal antibody directed against guanylyl cyclase C (GCC or GUCY2C) conjugated to monomethylauristatin E (MMAE), an auristatin derivative and a potent microtubule inhibitor, with potential antineoplastic activity. The monoclonal antibody moiety of MLN0264 selectively binds to GCC, a transmembrane receptor normally found on intestinal cells and dopamine neurons in the brain, but is also overexpressed on the surface of gastrointestinal cancers. Upon internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, resulting in G2/M phase arrest and tumor cell apoptosis in GCC-expressing tumor cells.

**anti-GD2 monoclonal antibody hu14.18K322A:** A monoclonal antibody directed against human glycosphingolipid GD2 with potential antineoplastic activity. Upon binding to the GD2 antigen, anti-GD2 monoclonal antibody hu14.18K322A triggers a host immune response against GD2-expressing tumor cells, which may result in tumor cell death. GD2, an O-acetylated disialoganglioside with expression in normal tissues restricted primarily to the cerebellum and peripheral nerves, is commonly expressed at high levels on tumors of neuroectodermal origins such as melanomas and neuroblastomas.

**anti-GD2 monoclonal antibody MORAb-028:** A human IgM monoclonal antibody directed against disialoganglioside GD2 with potential immunomodulating activity. Upon administration, anti-GD2 monoclonal antibody MORAb-028 may stimulate the immune system to exert a complement-mediated cytotoxic response against GD2-expressing tumor cells. The glycosphingolipid GD2 is a tumor associated antigen (TAA) overexpressed on the surface of many cancer cells. Check for active clinical trials using this agent.

**anti-GITR agonistic monoclonal antibody INCAGN01876:** An anti-human glucocorticoid-induced tumor necrosis factor receptor (tumor necrosis factor superfamily, member 18; TNFRSF18; GITR; CD357) agonistic humanized monoclonal antibody, with potential immune checkpoint modulating activity. Anti-GITR antibody INCAGN01876 binds

to and activates GITRs found on multiple types of T cells. This stimulates the immune system, induces both the activation and proliferation of tumor-antigen-specific T-effector cells (Teffs), and suppresses the function of activated T-regulatory cells (Tregs). This leads to tumor cell eradication. GITR, a member of the TNF receptor superfamily and T-cell receptor co-stimulator, is expressed on the surface of multiple immune cell types, including Tregs, Teffs, B-cells, and natural killer (NK) cells. Inappropriately activated Tregs suppress Teffs and suppress T-cell receptor (TCR) signaling.

**anti-GITR monoclonal antibody GWN 323:** An anti-human glucocorticoid-induced tumor necrosis factor receptor (tumor necrosis factor superfamily, member 18; TNFRSF18; GITR; CD357) agonistic monoclonal antibody, with potential immune checkpoint modulating activity. Anti-GITR antibody GWN 323 binds to and activates GITRs found on multiple types of T-cells. This stimulates the immune system, induces both the activation and proliferation of tumor-antigen-specific T effector cells (Teff), and suppresses the function of activated T regulatory cells (Tregs). This leads to tumor cell eradication. GITR, a member of the TNF receptor superfamily and T-cell receptor-co-stimulator, is expressed on the surface of multiple immune cell types, including Tregs, Teffs, B-cells, and natural killer (NK) cells. Inappropriately activated Tregs suppress both Teffs and T-cell receptor (TCR) signaling.

**anti-GITR monoclonal antibody MK-4166:** An anti-human glucocorticoid-induced tumor necrosis factor receptor (GITR) agonistic monoclonal antibody (MoAb) with potential immunomodulating activity. Anti-GITR monoclonal antibody MK-4166 binds to and activates GITRs found on multiple types of T-cells. This stimulates the immune system and induces both the activation and proliferation of tumor-antigen-specific T effector cells, and suppresses the function of activated T regulatory cells. This leads to tumor cell eradication. Also, this agent is shown to act synergistically with chemotherapeutic drugs in multiple cancer models. GITR, a member of the TNF receptor superfamily, is expressed on the surface of multiple types of immune cells, including regulatory T-cells, effector T-cells, B-cells, and natural killer (NK) cells. Check for active clinical trials using this agent.

**anti-GnRH vaccine PEP223:** A peptide vaccine derived from the synthetic peptide pyroEHWSYGLRPG, corresponding to amino acids 22-31 of mouse gonadotropin releasing hormone (GnRH), with potential immunocastration activity. PEP223 is dimerized and contains a D-lysine (k) substitution at position 6 (pyroEHWSYkLRPG) to increase its immunogenicity. Anti-GnRH vaccine PEP223 may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against GnRH, neutralizing its activity. In turn, testosterone production and tumor cell growth may be inhibited in testosterone-sensitive tumors. Check for active clinical trials using this agent.

**anti-gpA33/CD3 monoclonal antibody MGD007:** An anti-glycoprotein A33 (gpA33)/anti-CD3 bispecific humanized monoclonal antibody with potential immunostimulatory and antineoplastic activities. Anti-gpA33/CD3 monoclonal antibody MGD007 possesses two antigen-recognition sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for gpA33, a tumor-associated antigen (TAA) overexpressed on the surface of certain tumor cells. Upon administration of MGD007, this bispecific antibody simultaneously binds to both CD3-expressing T-cells and gpA33-expressing cancer cells, thereby crosslinking cytotoxic T-lymphocytes (CTLs) to gpA33-expressing tumor cells. This may result in CTL-mediated cell lysis of the crosslinked tumor cells. The gpA33 antigen, a member of the immunoglobulin superfamily, is expressed in certain malignancies, including colon and gastrointestinal cancers.

**anti-GPC3 monoclonal antibody GC33:** A humanized monoclonal antibody directed against the cell surface oncofetal protein glypican-3 (GPC3) with potential antineoplastic activity. Anti-GPC3 monoclonal antibody GC33 binds to GPC3 and triggers a host immune response against GPC3-expressing tumor cells, which may result in tumor cell death. GPC3, a heparin sulfate proteoglycan, is frequently upregulated in hepatocellular carcinoma and mesoderm-derived organs such as the liver, lungs, and kidney.

**anti-GPC3-CAR autologous T lymphocytes:** A preparation of autologous T-lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) specific for glypican-3 (GPC3), with potential immunostimulating and antineoplastic activities. Upon administration, anti-

GPC3-CAR autologous T-lymphocytes specifically target and bind to GPC3-expressing tumor cells, resulting in tumor cell lysis. GPC3, a heparan sulfate proteoglycan and a member of the glypican family, is overexpressed on certain tumor cell types while minimally expressed in normal, healthy cells; GPC3 plays an important role in cellular proliferation and differentiation.

**anti-GRP78 monoclonal antibody PAT-SM6:** A IgM monoclonal antibody (MoAb) against 78-kDa glucose-regulated protein (GRP78; also called BiP or HSPA5), with potential proapoptotic and antineoplastic activities. Upon intravenous administration of the anti-GRP78 monoclonal antibody PAT-SM6, the MoAb strongly binds to GRP78, thereby preventing the activation of multiple GRP78-mediated pathways and blocking the GRP78-induced suppression of apoptotic pathways. This eventually leads to the induction of tumor cell apoptosis and a reduction in tumor cell proliferation. GRP78, the endoplasmic reticulum (ER) chaperone and unfolded protein response (UPR) regulator, is overexpressed on the surface of a variety of cancer cell types; its expression is associated with increased tumor cell survival and proliferation, as well as angiogenesis and resistance to chemotherapy.

**anti-HB-EGF monoclonal antibody KHK2866:** A proprietary fucose-free monoclonal antibody directed against human heparin-binding EGF-like growth factor (HBEGF) with potential antineoplastic activity. Anti-HB-EGF monoclonal antibody KHK2866 binds to HBEGF, thereby blocking its binding to the EGF receptors. This prevents EGF receptor activation and the subsequent induction of cell growth signaling. HBEGF is mitogenic for fibroblasts and smooth muscle and may be involved in macrophage-mediated cellular proliferation. The fucose-free monoclonal antibodies enhance antigen dependent cellular cytotoxicity (ADCC), and increase binding affinity to the Fc receptor to overcome genetic polymorphism. Check for active clinical trials using this agent.

**anti-HBEGF monoclonal antibody U3-1565:** A humanized monoclonal antibody directed against human heparin-binding EGF-like growth factor (HBEGF) with potential antineoplastic activity. Anti-HBEGF monoclonal antibody U3-1565 binds to HBEGF and blocks the binding of HBEGF to the EGF receptors. This prevents EGF receptor activation and the subsequent induction of cell growth signaling. HBEGF is mitogenic for

fibroblasts and smooth muscle and may be involved in macrophage-mediated cellular proliferation.

**anti-HCV E2 monoclonal antibody MBL-HCV1:** A neutralizing, human monoclonal antibody against the hepatitis C virus (HCV) E2 envelope glycoprotein, with potential immunomodulatory and antiviral activities against HCV. Upon administration, anti-HCV E2 monoclonal antibody MBL-HCV1 recognizes and binds to the E2 glycoprotein of HCV. This suppresses HCV load and provides passive immunization against HCV. This may prevent both infection by HCV in immunocompromised patients and hepatitis C-related liver disease. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family.

**anti-Her-2-CAR retroviral vector-transduced autologous peripheral blood lymphocytes:** Autologous human peripheral blood lymphocytes (PBLs) transduced with a retroviral vector encoding an anti-Her-2 (epidermal growth factor receptor 2) chimeric T cell receptor (chimeric antigen receptor or CAR) gene with potential immunostimulatory and antineoplastic activities. Autologous PBLs from a patient with Her-2-positive cancer are pulsed with a retroviral vector that encodes the CAR gene specific for Her-2. After expansion in culture and reintroduction into the patient, anti-Her-2-CAR retroviral vector-transduced autologous peripheral blood lymphocytes, expressing anti-Her-2-CAR on their cell surfaces, bind to Her-2 antigen on tumor cell surfaces; subsequently, Her-2-expressing tumor cells may be lysed. Her-2 (ErbB-2), a receptor tyrosine kinase (RTK) overexpressed by a variety of cancer cell types, belongs to the EGFR superfamily and plays key roles in tumor cell proliferation and tumor angiogenesis.

**anti-HER2 ADC DS-8201a:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody targeting human epidermal growth factor receptor 2 (ERBB2; EGFR2; HER2) conjugated to a derivative of the camptothecin analog exatecan (DXd; DX-8951 derivative), a DNA topoisomerase 1 (topoisomerase I; Top1) inhibitor, with potential antineoplastic activity. Upon administration of anti-HER2 ADC conjugate DS-8201a, the antibody moiety targets and binds to HER2 on tumor cells. Upon antibody/antigen binding and internalization, the DX-8951 derivative moiety binds to and inhibits Top1-DNA complexes, which results in an inhibition of DNA replication, cell cycle arrest and tumor cell apoptosis.

HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types. In addition, DS-8201a induces antibody-dependent cell-mediated cytotoxicity (ADCC) and causes a bystander killing effect, thereby killing neighboring HER2-expressing tumor cells.

**anti-HER2 antibody-drug conjugate ARX788:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody targeting human epidermal growth factor receptor 2 (EGFR2; HER2) site-specifically conjugated, via the non-natural amino acid linker para-acetyl-phenylalanine (pAcF), to the auristatin analog and potent microtubule inhibitor monomethyl auristatin F (MMAF), with potential antineoplastic activity. Upon administration of anti-HER2 ADC ARX788, the antibody moiety targets and binds to HER2 on tumor cells. Upon antibody/antigen binding and internalization, MMAF binds to and inhibits tubulin polymerization, which results in G2/M phase arrest and tumor cell apoptosis. HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types. The site-specific conjugation of the cytotoxic agent to the antibody improves the biophysical properties of ARX788, increases payload stability and optimizes its efficacy.

**anti-HER2 antibody-drug conjugate MEDI4276:** An antibody-drug conjugate (ADC) composed of a bispecific antibody against the extracellular domain of human epidermal growth factor receptor 2 (HER2; ERBB2) comprised of the single-chain variable fragment (scFv) of the anti-HER2 monoclonal antibody trastuzumab, which binds to domain IV of HER2, fused to the heavy chains of the anti-HER2 monoclonal antibody 39S, which binds to domain II of HER2, and conjugated, via a cleavable linker, to the cytotoxic anti-microtubule agent tubulysin, with potential antineoplastic activity. Upon administration of MEDI4276, the anti-HER2 bispecific antibody specifically targets and binds to HER2 on the surface of certain cancer cells. Upon binding, crosslinking and internalization of antibody-HER2 complexes occurs and MEDI4276 is transported to the lysosome where the linker is cleaved, thereby delivering tubulysin inside HER2-expressing cancer cells. Tubulysin binds to tubulin and inhibits microtubule polymerization, which blocks cell division. This results in G2/M phase arrest, tumor cell apoptosis, and decreased proliferation of HER2-expressing tumor cells. HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types. Check for active clinical trials using this agent.

**anti-HER2 monoclonal antibody CT-P6:** A monoclonal antibody directed against the human epidermal growth factor receptor 2 (HER2) with potential immunomodulating and antineoplastic activity. After binding to HER2 on the tumor cell surface, anti-HER2 monoclonal antibody CT-P6 may induce a cytotoxic T-lymphocyte (CTL) as well as an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells that overexpress HER2. HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types.

**anti-HER2-CAR autologous CMV-specific cytotoxic T lymphocytes:** Autologous human cytomegalovirus (CMV)-specific human cytotoxic T lymphocytes (CTLs) transduced with a retroviral vector encoding a human anti-HER2 (epidermal growth factor receptor 2) chimeric T cell receptor (CAR) gene with potential immunostimulatory and antineoplastic activities. Autologous CTLs from a patient with HER2- and CMV-positive glioblastoma multiforme (GBM) are genetically modified to express CAR gene specific for HER2 on their cell surfaces. After expansion in culture and reintroduction into the patient, the anti-HER2-CAR autologous CMV-specific CTLs bind to HER2 antigen on tumor cell surfaces; subsequently, HER2-positive tumor cells and stem cells may be lysed. HER2 (ErbB2), a receptor tyrosine kinase (RTK) overexpressed by a variety of cancer cell types, plays key roles in tumor cell proliferation and tumor angiogenesis. CMV is present in the majority of GBM tumors.

**anti-HER3 monoclonal antibody GSK2849330:** A monoclonal antibody directed against the human epidermal growth factor receptor 3 (HER3; ERBB3) with potential antineoplastic activity. Anti-HER3 monoclonal antibody GSK2849330 binds to HER3 and inhibits its activation. This may prevent HER3-mediated signaling and inhibit HER3-dependent tumor cell proliferation and differentiation. HER3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in tumors and is associated with poor prognosis and drug resistance; it has no active kinase domain but is activated through heterodimerization with other members of the EGFR receptor family, such as HER2.

**anti-HER3 monoclonal antibody LJM716:** A human monoclonal antibody directed against the human epidermal growth factor receptor HER3 (ErbB3) with potential antineoplastic activity. Anti-HER3

monoclonal antibody LJM716 possesses a novel mechanism of action; LJM716 binds to and locks HER3 in the inactive conformation and does not interfere with its interaction with neuregulin (NRG). The inactivated form of HER3 blocks the PI3K/Akt signaling pathway, thereby inhibiting cellular proliferation in HER2 or NRG expressing tumor cells. HER3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in tumors; it has no active kinase domain but is activated through heterodimerization with other members of the EGFR receptor family, such as HER2.

**anti-HGF monoclonal antibody AMG 102 :** A vaccine made of antigens and antigen-presenting cells (APCs). APCs boost an immune response by presenting antigens on their surfaces to other cells of the immune system. Also called APC vaccine.

**anti-HGF monoclonal antibody TAK-701:** A humanized monoclonal antibody directed against human hepatocyte growth factor (HGF) with potential antineoplastic activity. Anti-HGF monoclonal antibody TAK-701 binds to the soluble ligand HGF, preventing HGF binding to and activation of the HGF receptor c-Met and so the activation of the c-Met signaling pathway; this may result in the induction of cell death in c-Met-expressing tumor cells. c-Met, a receptor tyrosine kinase overexpressed or mutated in a variety of tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis. Check for active clinical trials using this agent.

**anti-HIF-1alpha LNA antisense oligonucleotide EZN-2968:** A synthetic antisense oligodeoxynucleotide (AS ODN) targeting hypoxia-inducible factor-1alpha (HIF-1alpha) with potential antineoplastic activity. Anti-HIF-1alpha LNA antisense oligonucleotide EZN-2968 hybridizes with HIF-1alpha mRNA and blocks HIF-1 alpha protein expression, which may result in the inhibition of angiogenesis, the inhibition of tumor cell proliferation, and apoptosis. HIF-1alpha, normally activated in response to hypoxia-induced stress, is a key transcription regulator of a large number of genes important in cellular adaptation to low-oxygen conditions, including angiogenesis, cell proliferation, apoptosis, and cell invasion.

**anti-HLA-A2/NY-ESO-1 TCR-transduced autologous T lymphocytes:** Autologous human peripheral blood T lymphocytes transduced with a lentiviral or retroviral vector encoding a human leukocyte antigen A2

(HLA-A2)-restricted anti-cancer-testis antigen 1 (NY-ESO-1) T-cell receptor (TCR) gene, with potential antineoplastic activity. Following leukapheresis, isolation of lymphocytes, expansion ex vivo, transduction, and re-introduction into the patient, the anti-HLA-A2/NY-ESO-1 TCR-transduced autologous T lymphocytes recognize and bind to NY-ESO-1/HLA-A2-positive tumor cells. This results in cytotoxic T-lymphocyte (CTL)-mediated elimination of NY-ESO-1-positive cancer cells. NY-ESO-1, a tumor-associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types.

**anti-HLA-DR monoclonal antibody IMMU-114:** A humanized IgG4 monoclonal antibody that targets the human leukocyte antigen HLA-DR, with potential antineoplastic activity. Upon administration, anti-HLA-DR monoclonal antibody IMMU-114 binds to HLA-DR on HLA-DR-expressing tumor cells and, although the exact mechanism has yet to be fully elucidated, appears to induce hyperactivation of ERK- and JNK-dependent mitogen activated protein kinase signaling pathways. This may lead to mitochondrial membrane depolarization and reactive oxygen species (ROS) generation. This eventually leads to an induction of tumor cell apoptosis and a reduction in tumor cell proliferation. IMMU-14 may be beneficial in the treatment of graft versus host disease (GVHD) as it appears to suppress T-lymphocyte proliferation and natural killer (NK) cell activation. As the Fc region of the original IgG1 MoAb was replaced with the IgG4 isotype, IMMU-114 does not induce a complement cytotoxicity (CDC) or an antibody-dependent cell-mediated cytotoxicity (ADCC). HLA-DR, a MHC class II molecule, is found on various B-cell hematologic malignancies and in autoimmune diseases as well as on normal cells.

**anti-human chorionic gonadotropin vaccine:** A peptide vaccine consisting of the whole or partial beta subunit of human chorionic gonadotrophin hormone (hCG), linked to an adjuvant carrier of bacterial or viral origin, with anti-fertility activity. Anti-human chorionic gonadotropin vaccine blocks the activity of hCG which is naturally produced by the trophoblast of the pre-implantation embryo within a few days of fertilization. hCG is required for the maintenance of the corpus luteum in the ovary thus ensuring its continued production of progesterone, which is required for the successful completion of implantation of the blastocyst. Without progesterone, the corpus luteum regresses, and menstruation is initiated.

**anti-human GITR monoclonal antibody TRX518:** A humanized, Fc disabled anti-human glucocorticoid-induced tumor necrosis factor receptor (GITR) monoclonal antibody (MoAb) with immunomodulating activity. Anti-human GITR MoAb TRX518 blocks the interaction of GITR, found on multiple types of T cells, with its ligand, thereby inducing both the activation of tumor-antigen-specific T effector cells, as well as abrogating the suppression induced by inappropriately activated T regulatory cells. This agent is shown to act synergistically with chemotherapeutic drugs in multiple cancer models.

**anti-human integrin alpha v subunit monoclonal antibody EMD 525797:** A humanized monoclonal antibody directed against the human alpha v integrin subunit with potential antiangiogenic and antineoplastic activities. Anti-human integrin alpha v subunit monoclonal antibody EMD 525797, a chimeric antibody which includes the antigen binding sites of the anti-integrin mouse antibody 17E6, binds to and inhibits the activity of alphavbeta3 integrin (vitronectin receptor); this may result in the inhibition of endothelial cell-cell interactions, endothelial cell-matrix interactions, and integrin-mediated tumor angiogenesis and metastasis in alphavbeta3-expressing tumor cells. Alphavbeta3 integrin, a cell adhesion and signaling receptor, is expressed on the surface of tumor vessel endothelial cells and plays a crucial role in endothelial cell adhesion and migration.

**anti-ICAM-1 monoclonal antibody BI-505:** A fully human IgG1 monoclonal antibody directed against intercellular adhesion molecule-1 (ICAM-1 or CD54), with potential antineoplastic activity. Anti-ICAM-1 monoclonal antibody BI-505 selectively binds to the adhesion protein ICAM-1, which may result in antibody-dependent cellular cytotoxicity (ADCC), hyper-cross-linking-induced apoptosis, and a decrease in cellular proliferation of ICAM-1-expressing tumor cells. ICAM-1, normally expressed on leukocytes and endothelial cells, may be overexpressed in a variety of cancers.

**anti-ICOS agonist antibody GSK3359609:** An agonistic antibody for the inducible T-cell co-stimulator (ICOS; CD278), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-ICOS agonist antibody GSK3359609 targets and binds to ICOS expressed on tumor infiltrating CD4-positive T cells. This stimulates ICOS-positive T-cell proliferation, enhances cytotoxic T-lymphocyte (CTL)

survival and increases CTL-mediated immune responses against tumor cells. ICOS, a T-cell specific, CD28-superfamily costimulatory molecule and immune checkpoint protein, is normally expressed on certain activated T cells and plays a key role in the proliferation and activation of T cells.

**anti-ICOS monoclonal antibody MEDI-570:** An Fc-optimized humanized immunoglobulin (Ig) G1 monoclonal antibody (MoAb) directed against the inducible T-cell co-stimulator (ICOS, CD278), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-ICOS MoAb MEDI-570 targets and binds to ICOS expressed on tumor infiltrating CD4-positive T-cells. This prevents the interaction between ICOS-positive T-cells and plasmacytoid dendritic cells (pDCs), which express the ICOS ligand (ICOSL). Blocking ICOS activation prevents the pDC-induced proliferation and accumulation of regulatory ICOS-positive T-cells (ICOS<sup>+</sup> Tregs) and inhibits interleukin-10 (IL-10) secretion by CD4<sup>+</sup> infiltrating T-cells. This may abrogate Treg-mediated immune suppression and may enhance cytotoxic T-lymphocyte (CTL)-mediated immune responses against tumor cells. Fc optimization enhances antibody-dependent cellular cytotoxicity (ADCC). ICOS, a T-cell specific, CD28-superfamily costimulatory molecule and immune checkpoint protein, plays a key role in the proliferation and activation of T-cells. It is normally expressed on both activated CD4<sup>+</sup> T-cells, which is a subset of memory T-cells (T<sub>m</sub>), and follicular helper T-cells (T<sub>fh</sub>). ICOS is highly expressed on Tregs infiltrating various tumors and its expression is associated with a poor prognosis; ICOS-positive Tregs play a key role in immune suppression and tumor immune evasion.

**anti-idiotypic vaccine :** Treatment with drugs, surgery, or radiation in order to block the production or action of a hormone. Antihormone therapy may be used in cancer treatment because certain hormones are able to stimulate the growth of some types of tumors.

**anti-IGF-1R monoclonal antibody AVE1642:** A humanized monoclonal antibody directed against the human insulin-like growth factor-1 receptor (IGF-1R/CD221) with potential antineoplastic activity. Anti-IGF-1R monoclonal antibody AVE1642 specifically binds to and blocks membrane-bound IGF-1R, preventing the binding of the natural ligand IGF-1 and the subsequent activation of PI3K/AKT signal transduction, which may result in the induction of apoptosis and a decrease in cellular proliferation.

Activation of IGF-1R , a receptor tyrosine kinase of the insulin receptor superfamily overexpressed by various cancer cell types, stimulates cell proliferation, promotes angiogenesis, enables oncogenic transformation, and suppresses apoptosis.

**anti-IGF-1R recombinant monoclonal antibody BIIB022:** A recombinant, human monoclonal antibody directed against the insulin-like growth factor 1 receptor (IGF-1R) with potential antineoplastic activity. Anti-IGF-1R recombinant monoclonal antibody BIIB022 binds to membrane-bound IGF-1R, preventing binding of the ligand IGF-1 and the subsequent triggering of the PI3K/Akt signaling pathway; inhibition of this survival signaling pathway may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. The activation of IGF-1R, a tyrosine kinase and a member of the insulin receptor family, stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF-1R signaling has been highly implicated in tumorigenesis and metastasis.

**anti-IGF1/2 monoclonal antibody MEDI-573:** A humanized monoclonal antibody directed against insulin-like growth factors 1 and 2 (IGF-1/2) with potential antineoplastic activity. Anti-IGF1/2 monoclonal antibody MEDI-573 inhibits IGF1- and IGF2-stimulated activation of membrane-bound IGF receptors and the subsequent triggering of proliferation and survival signaling pathways. This may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. IGF1/2 ligands stimulate cell proliferation, enable oncogenic transformation, and suppress apoptosis; IGF1/2 signaling has been highly implicated in tumorigenesis and metastasis.

**anti-IGF1R recombinant monoclonal antibody MK-0646 :** A type of drug used to treat high blood pressure. There are many different types of antihypertensive agents, and they work in different ways to lower blood pressure. Some remove extra fluid and salt from the body. Others relax and widen the blood vessels or slow the heartbeat. A person may respond better and have fewer side effects with one drug than with another. Some patients need more than one antihypertensive agent to lower their blood pressure.

**anti-IL-1 alpha monoclonal antibody CA-18C3:** A "true human" (cloned from human B lymphocytes) monoclonal antibody directed against interleukin-1 alpha (IL1a) with potential antineoplastic activity. Anti-IL-1

alpha monoclonal antibody CA-18C3 binds to IL1a and may block the activity of IL1a. IL1a, an inflammatory mediator, plays a key role in interleukin-mediated tumor cell activity such as angiogenesis, tissue matrix remodeling, metastasis and tumor cell invasion. Check for active clinical trials using this agent.

**anti-IL-13 humanized monoclonal antibody TNX-650:** A humanized monoclonal antibody directed against interleukin-13 (IL-13) with potential antineoplastic activity. Anti-IL-13 humanized monoclonal antibody TNX-650 binds to and blocks the activity of IL-13, which may result in the inhibition of Hodgkin lymphoma cell proliferation. IL-13 cytokine, an important mediator in allergic inflammation, may be an autocrine growth factor for Hodgkin lymphoma cells.

**anti-IL-15 monoclonal antibody AMG 714:** A human immunoglobulin G1 (IgG1) monoclonal antibody directed against the human pro-inflammatory cytokine interleukin-15 (IL-15), with potential anti-inflammatory, immunomodulating and antineoplastic activities. Upon administration, anti-IL-15 monoclonal antibody AMG 714 binds to and neutralizes IL-15, thereby preventing IL-15-mediated pro-inflammatory signaling. By inhibiting IL-15-mediated immune responses, AMG 714 decreases natural killer (NK) cell activation and proliferation, reduces T-cell infiltration, increases T-cell apoptosis, and may prevent the growth of IL-15-driven cancer cells. IL-15 plays a key role in inflammation and is associated with a variety of autoimmune and inflammatory disorders as well as with cell proliferation in certain cancer types, such as T-cell lymphomas. IL-15 is required for the proliferation of certain T-cells and NK cells.

**anti-IL-4/IL-13 combination agent QBX258:** A combination agent composed of the two human monoclonal antibodies VAK694 (VAK296), targeting interleukin-4 (IL-4), and dectrekumab, targeting IL-13, that can potentially be used to block signaling mediated by IL-4 and IL-13. Upon intravenous administration of the anti-IL-4/IL-13 combination agent QBX258, the two antibodies VAK694 and dectrekumab target and block the activity of the two cytokines IL-4 and IL-13, respectively, which prevents IL-4/IL-13-mediated signaling. In patients with breast cancer related lymphedema (BCRL), this agent may prevent lymphedema-associated effects, such as fibrosis, hyperkeratosis, the deposition of fibroadipose

tissue, fluid accumulation, limb swelling, reduction of skin elasticity, and pain. By reducing the excess volume, QBX258 may improve lymphatic and arm functions. The development of lymphedema after lymphatic injury is associated with tissue inflammation, the infiltration of CD4-positive cells and their differentiation to the type 2 helper T-cell (Th2) phenotype. Th2 cells produce IL-4 and IL-13 that play a key role in the development of lymphedema-associated symptoms as well as other Th2-mediated diseases.

**anti-IL-6 chimeric monoclonal antibody :** A vaccine made of antibodies that see other antibodies as the antigen and bind to it. Anti-idiotypic vaccines can stimulate the body to produce antibodies against tumor cells.

**anti-IL-8 monoclonal antibody HuMax-IL8:** A human monoclonal antibody against the pro-inflammatory mediator interleukin-8 (IL-8; CXCL8), with potential antineoplastic activities. Upon administration, HuMax-IL8 directly binds to IL-8, thereby inhibiting the binding of IL-8 to its receptors CXCR1 and CXCR2. This inhibits activation of IL-8-mediated signaling transduction pathways, which decreases proliferation of susceptible tumor cells. Also, HuMax-IL8 effectively blocks binding of IL-8 to neutrophils and inhibits neutrophil activation and recruitment towards sites of inflammation, which reduces inflammation. IL-8, a member of the CXC chemokine family, is upregulated in a variety of cancer cell types and inflammatory diseases; it plays a key role in tumor cell proliferation, endothelial cell proliferation, and cancer stem cell (CSC) renewal.

**anti-inflammatory :** A substance being studied in the treatment of many types of cancer. Anti-IGF1R recombinant monoclonal antibody MK-0646 binds to a protein called insulin-like growth factor receptor (IGFR) on the surface of cells. This may prevent the cells from growing when IGF is present. It may also kill cancer cells. Anti-IGF1R recombinant monoclonal antibody MK-0646 is a type of monoclonal antibody. Also called MK-0646.

**anti-inflammatory agent :** A drug used to treat a rare condition called Castleman disease in patients who do not have HIV or human herpesvirus 8. It is also being studied in the treatment of multiple myeloma. Anti-IL-6 chimeric monoclonal antibody binds to a protein called interleukin-6 (IL-6), which is made by some white blood cells and other cells in the body. Anti-IL-6 chimeric monoclonal antibody may help reduce inflammation and stop the growth of cancer cells or abnormal blood cells. It is a type of

monoclonal antibody. Also called cCLB8, CNTO 328, siltuximab, and Sylvant.

**anti-inflammatory antibody ALXN1007:** A proprietary antibody that targets the complement inflammatory pathway with potential immunomodulating and anti-inflammatory activities. Upon intravenous administration, anti-inflammatory antibody ALXN1007 modulates the complement inflammatory pathway through binding to an as of yet undisclosed target. This may help in the treatment of certain inflammatory-mediated disorders, such as antiphospholipid syndrome (APS). This agent may also influence the progression of graft-versus-host disease (GvHD). Check for active clinical trials using this agent.

**anti-integrin monoclonal antibody-DM4 immunoconjugate IMGN388:** An immunoconjugate consisting of an anti-integrin monoclonal antibody covalently attached to the maytansinoid DM4, a derivative of the cytotoxic agent maytansine (DM1), with potential antineoplastic activity. Anti-integrin monoclonal antibody-DM4 immunoconjugate IMGN388 binds to tumor cell surface integrins; upon internalization, the DM4 moiety is released from the immunoconjugate, binding to tubulin and disrupting microtubule assembly/disassembly dynamics, which may result in inhibition of cell division and cell growth of integrin-expressing tumor cells. Integrins, a class of transmembrane cell surface receptors, link the extracellular matrix (ECM) to intracellular signaling pathways that control cell proliferation and differentiation.

**anti-interferon gamma monoclonal antibody NI-0501:** A human monoclonal antibody against the cytokine interferon-gamma (IFN-gamma; IFN $\gamma$ ), with potential immunomodulating activity. Upon administration, the anti-IFN $\gamma$  monoclonal antibody NI-0501 binds to and neutralizes IFN $\gamma$ . This inhibits IFN $\gamma$ -mediated signaling pathways and suppresses the activation of the immune system. IFN $\gamma$ , a cell-signaling protein, plays a key role in the regulation and activation of the immune system; its upregulation is associated with certain auto-immune and auto-inflammatory diseases in which the immune system is abnormally activated.

**anti-interleukin 6 monoclonal antibody ALD518:** A humanized monoclonal antibody directed against the pro-inflammatory cytokine interleukin-6 (Il-6) with potential immunomodulating activity. Upon administration, anti-interleukin 6 monoclonal antibody ALD518 binds to

and blocks the activity of IL-6, which may mitigate the catabolic effects of IL-6.

**anti-interleukin-1 alpha monoclonal antibody MABp1:** A human IgG1 monoclonal antibody targeting the inflammatory cytokine interleukin-1 alpha (IL1a) with potential antineoplastic, anti-cachectic and anti-angiogenic activities. Anti-IL1a monoclonal antibody MABp1 targets and binds to IL1a and prevents IL1a activity. This prevents IL1a-mediated tumorigenesis and angiogenesis. In addition, MABp1 abrogates IL1a-mediated cachexia. IL1a, an inflammatory mediator expressed on monocytes, platelets and overexpressed by certain tumors, plays a key role in the promotion of tumor cell growth, metastasis and invasion. In addition, IL1a stimulates metabolic activity in the central nervous system.

**anti-KIR monoclonal antibody IHP 2101:** A human monoclonal antibody directed against the human inhibitory killer IgG-like receptor (KIR) with potential immunostimulating and antineoplastic activities. Anti-KIR monoclonal antibody IPH 2101 binds to the KIR receptor expressed on human natural killer (NK) cells, which may prevent KIR-mediated inhibition of NK cells and permit NK cell-mediated anti-tumor cytotoxicity. KIRs are surface glycoproteins that bind to major histocompatibility complex (MHC)/human leukocyte antigen (HLA) class I subtypes on target cells; binding of KIRs inhibits NK cell-mediated cytotoxicity.

**anti-KIR3DL2 monoclonal antibody IPH4102:** A humanized monoclonal antibody against the immune receptor human killer cell immunoglobulin-like receptor, three domains, long cytoplasmic tail, 2 (KIR3DL2), with potential immunomodulating and antineoplastic activities. Upon administration, the anti-KIR3DL2 monoclonal antibody IPH4102 binds to KIR3DL2 expressed on certain tumor cells. This recruits natural killer (NK) cells and leads to lysis of KIR3DL2-expressing tumor cells. In addition, IPH4102 induces antibody-dependent cellular cytotoxicity (ADCC), thereby further eliminating tumor cells. KIR3DL2, a tumor-associated antigen (TAA) and inhibitory receptor of the KIR family, is specifically expressed in most subtypes of cutaneous T-cell lymphomas (CTCL) and expressed only on a fraction of normal NK cells. Check for active clinical trials using this agent.

**anti-LAG-3 monoclonal antibody BMS-986016:** A monoclonal antibody directed against the inhibitor receptor lymphocyte activation gene-3 (LAG-

3), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, the anti-LAG-3 monoclonal antibody BMS-986016 binds to LAG-3 on tumor infiltrating lymphocytes (TILs). This may activate antigen-specific T-lymphocytes and enhance cytotoxic T cell-mediated tumor cell lysis, which leads to a reduction in tumor growth. LAG-3 is a member of the immunoglobulin superfamily (IgSF) and binds to major histocompatibility complex (MHC) class II. LAG-3 expression on TILs is associated with tumor-mediated immune suppression.

**anti-LAG-3 monoclonal antibody LAG525:** A humanized monoclonal antibody directed against the inhibitory receptor lymphocyte activation gene-3 (LAG-3), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, the anti-LAG-3 monoclonal antibody LAG525 binds to LAG-3 expressed on tumor-infiltrating lymphocytes (TILs) and blocks its binding with major histocompatibility complex (MHC) class II molecules expressed on tumor cells. This activates antigen-specific T-lymphocytes and enhances cytotoxic T-cell-mediated tumor cell lysis, which leads to a reduction in tumor growth. LAG-3, a member of the immunoglobulin superfamily (IgSF) and expressed on various immune cells, negatively regulates cellular proliferation and activation of T-cells. Its expression on TILs is associated with tumor-mediated immune suppression.

**anti-LAMP1 antibody-drug conjugate SAR428926:** An antibody-drug conjugate (ADC) consisting of a monoclonal antibody against lysosome-associated membrane protein 1 (LAMP1) conjugated, via the disulfide-containing cleavable linker N-succinimidyl-4-(2-pyridyldithio)butyrate (SPDB), to the cytotoxic maytansinoid DM4, with potential antineoplastic activity. Upon administration of anti-LAMP1 ADC SAR428926, the anti-LAMP1 monoclonal antibody moiety targets and binds to the cell surface antigen LAMP1. After antibody-antigen interaction and internalization, the SPDB linker is selectively cleaved by proteases in the cytosol and the DM4 moiety is released. DM4 binds to tubulin and disrupts microtubule assembly/disassembly dynamics, thereby inhibiting both cell division and cell growth of LAMP1-expressing tumor cells. LAMP1, overexpressed on a variety of cancer cells, plays a key role in cell-cell adhesion and migration. The SPDB linker is resistant to cleavage in the bloodstream, which may increase stability and reduce toxicity.

**anti-LGR5 monoclonal antibody BNC101:** A humanized monoclonal antibody targeting leucine-rich repeat-containing G-protein coupled receptor 5 (LGR5), with potential antineoplastic activity. Upon administration, the anti-LGR5 humanized monoclonal antibody BNC101 targets and binds to LGR5, thereby inhibiting LGR5-mediated signal transduction pathways. This prevents proliferation of LGR5-expressing tumor cells. LGR5, a member of the Wnt signaling pathway, is a cancer stem cell (CSC) receptor overexpressed on certain cancer cells; it plays a key role in CSC proliferation and survival.

**anti-LIV-1 monoclonal antibody-MMAE conjugate SGN-LIV1A:** An antibody-drug conjugate (ADC) composed of a humanized monoclonal antibody directed against the anti-solute carrier family 39 zinc transporter member 6 (SLC39A6; LIV-1; ZIP6) protein that is conjugated, via a protease-cleavable linker, to the cytotoxic agent monomethyl auristatin E (MMAE), with potential antineoplastic activity. Upon administration and internalization by LIV-1-positive tumor cells, anti-LIV-1 antibody-drug conjugate SGN-LIV1A undergoes enzymatic cleavage to release MMAE into the cytosol. In turn, MMAE binds to and inhibits tubulin polymerization, which may result in G2/M phase cell cycle arrest and apoptosis in LIV-1-expressing tumor cells. LIV-1, a member of the zinc transporter family, is expressed in several types of solid tumors and plays a key role in tumor cell progression and metastasis. The linkage system in SGN-LIV1A is highly stable in plasma, resulting in cytotoxic specificity against LIV-1-positive cells.

**anti-LOXL2 monoclonal antibody GS-6634:** A humanized monoclonal antibody against lysyl oxidase-like 2 (LOXL2), with potential antineoplastic activity. Anti-LOXL2 monoclonal antibody AB0024 targets and specifically binds to the scavenger receptor cysteine rich domain 4 (SRCR-4) on LOXL2, thereby preventing the crosslinking of collagen and inhibiting the recruitment and activation of fibroblasts. Inhibiting fibroblast activation and the subsequent production of growth factors and chemokines may lead to an inhibition of tumor cell proliferation. LOXL2, a member of the lysyl oxidase (LO) gene family, is an extracellular, copper-dependent enzyme overexpressed in a variety of tumor cell types, and contributes to tumor cell invasion and metastasis.

**anti-Ly6E antibody-drug conjugate DLYE5953A:** An antibody-drug conjugate (ADC) composed of an antibody against the tumor-associated antigen (TAA) lymphocyte antigen 6 complex locus E (Ly6E) and linked to an as of yet undisclosed cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, the antibody moiety of DLYE5953A targets and binds to Ly6E expressed on tumor cells. Upon binding and internalization, the cytotoxic agent is released and kills, through an as of yet unknown mechanism of action, the Ly6E-expressing cancer cells. Ly6E, an interferon (IFN)-inducible glycosylphosphatidylinositol (GPI)-linked cell membrane protein, is expressed on a variety of tumor cell types.

**Anti-M-CSF monoclonal antibody MCS110:** A humanized monoclonal antibody directed against macrophage colony-stimulating factor (M-CSF) with potential anti-osteolytic activity. Anti-M-CSF monoclonal antibody MCS110 binds to M-CSF and blocks M-CSF-mediated signaling through the M-CSF receptor CD116 expressed on osteoclasts, which may result in inhibition of M-CSF-induced osteoclast differentiation and so osteoclastic bone resorption. Osteoclasts are derived through the fusion of cells of the monocyte/macrophage lineage. Osteoblasts and stromal cells may react to bone metastases by producing M-CSF and its osteoclastogenic cofactor RANKL (receptor activator of NF-kappaB ligand).

**anti-Markovnikov addition:** a reaction in which the hydrogen atom of a hydrogen bromide bonds to the carbon of a double bond that is bonded to fewer hydrogen atoms. The addition takes place via a free-radical intermediate rather than a carbocation. (Compare with "Markovnikov rule.")

**anti-MASP-2 monoclonal antibody OMS721:** A monoclonal antibody against mannan-binding lectin (MBL)-associated serine protease-2 (MASP-2), with potential anti-thrombotic and immunomodulating activities. Upon subcutaneous administration, OMS721 binds to and inhibits MASP-2. This prevents the activation of MASP-2, the cleavage of certain complement components, and the activation of the complement lectin pathway. This inhibits complement deposition and complement-induced thrombus formation. MASP-2, a pro-inflammatory protein, plays a key role in the activation of the lectin complement pathway, which is a key component in the immune system, and is associated with complement-mediated diseases,

such as thrombotic microangiopathies (TMAs), which includes hematopoietic stem cell transplant (HSCT)-related TMA, atypical hemolytic uremic syndrome (aHUS), and thrombotic thrombocytopenic purpura (TTP).

**anti-mesothelin antibody-drug conjugate BMS-986148:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody directed against the cell surface glycoprotein mesothelin and conjugated to an as of yet undisclosed cytotoxic drug, with potential antineoplastic activity. The monoclonal antibody moiety of anti-mesothelin ADC BMS-986148 targets and binds to the tumor-associated antigen mesothelin. Upon internalization, the cytotoxic agent kills or prevents cellular proliferation of mesothelin-expressing tumor cells through an as of yet undescribed mechanism of action. Mesothelin is overexpressed by all mesotheliomas and a variety of other cancers, while it is minimally expressed in normal tissue.

**anti-mesothelin CAR vector-transduced autologous T lymphocytes:** Genetically modified, autologous T lymphocytes transduced with a retroviral vector encoding a chimeric antigen receptor (CAR) consisting of an anti-human tumor-associated antigen (TAA) mesothelin single chain variable fragment (scFv), the intracellular CD3 zeta T-cell receptor domain and the 4-1BB (cd137) costimulatory domain, with potential immunomodulating and antineoplastic activities. After isolation, transduction, expansion in culture, and reintroduction into the patient, the anti-mesothelin CAR vector-transduced autologous T lymphocytes specifically target and kill mesothelin-expressing tumor cells. Mesothelin, a cell surface glycoprotein involved in cell adhesion, is overexpressed in a variety of cancer cell types.

**anti-mesothelin cytolytic fusion protein LMB-100:** An anti-mesothelin (MSLN) recombinant cytolytic fusion protein (cFP) composed of a humanized Fab fragment of anti-MSLN monoclonal antibody SS1 linked to a truncated and de-immunized 24 kDa fragment of the *Pseudomonas* exotoxin (PE) (PE24), with potential antineoplastic activity. Upon intravenous administration of anti-MSLN-PE24 cFP LMB-100, the anti-MSLN moiety targets and binds to MSLN-expressing tumor cells. Upon binding and internalization through endocytosis, the toxin moiety ADP-ribosylates and inactivates eukaryotic elongation factor 2 (eEF2), preventing the elongation step of protein synthesis and leading to both an

inhibition of protein synthesis and an induction of MSLN-expressing tumor cell apoptosis. MSLN, a tumor-associated antigen overexpressed in a variety of cancer cell types, plays a key role in tumor cell proliferation and migration. The engineered PE24 portion of LMB-100 does contain the targeting domain and furin cleavage site, which are needed for cytotoxicity, but most of the translocation domain II is deleted and the catalytic domain III contains point mutations, which result in the deletion and silencing of most T- and B-cell epitopes; therefore, the immunogenicity and toxicity is reduced compared to non-engineered PE toxin, which allows for the administration of larger doses of LMB-100.

#### **anti-mesothelin iCasp9M28z CAR-transduced autologous T**

**lymphocytes:** Genetically modified, autologous T lymphocytes transduced with a retroviral vector encoding a chimeric antigen receptor (CAR) specific for mesothelin linked to the signaling domains for the co-stimulatory molecules CD28 and CD3 zeta, as well as the suicide gene inducible caspase 9 (iCasp9 or iC9), with potential immunomodulating and antineoplastic activities. Upon intravenous administration, anti-mesothelin iCasp9M28z CAR-transduced autologous T lymphocytes specifically target and kill mesothelin-expressing tumor cells. iCasp9 consists of a human FK506 drug-binding domain with an F36V mutation (FKBP12-F36V) linked to human caspase 9. If administration of the T cells lead to unacceptable side effects, a dimerizing agent can be administered which binds to the FKBP12-F36V drug-binding domain and activates caspase 9, resulting in the apoptosis of the administered T-cells. Mesothelin, a tumor-associated antigen, is overexpressed in a variety of cancer cell types.

**anti-mesothelin monoclonal antibody MORAb-009 :** A drug or substance that reduces inflammation (redness, swelling, and pain) in the body. Anti-inflammatory agents block certain substances in the body that cause inflammation. They are used to treat many different conditions. Some anti-inflammatory agents are being studied in the prevention and treatment of cancer.

#### **anti-mesothelin-CAR mRNA-transduced autologous T lymphocytes:**

Autologous chimeric immune receptor (CIR) T cells transfected with anti-mesothelin chimeric T cell receptor mRNA, with potential antineoplastic activity. The anti-mesothelin mRNA encodes a single chain antibody variable fragment (ScFv), the intracellular CD 3 zeta T cell receptor domain

and the 4-1BB (cd137) costimulatory domain. Upon intravenous administration, the anti-mesothelin-CAR mRNA-transduced autologous T lymphocytes may attach to cancer cells expressing mesothelin. This may stimulate the secretion of multiple cytokines and may result in cell lysis of mesothelin-expressing cancer cells. Mesothelin is a cell surface glycoprotein involved in cell adhesion and is overexpressed in many epithelial-derived cancers.

**anti-Met monoclonal antibody mixture Sym015:** A mixture of two humanized immunoglobulin G1 (IgG1) monoclonal antibodies, Hu9006 and Hu9338, which recognize non-overlapping epitopes in the extracellular domain of the human hepatocyte growth factor receptor (MET; HGFR; c-Met), with potential antineoplastic activity. Upon administration, anti-MET monoclonal antibody mixture Sym015 targets and binds to the extracellular domain of MET, thereby preventing the binding of its ligand, hepatocyte growth factor (HGF). This may prevent activation of the receptor and MET-mediated signal transduction pathways. This inhibits MET-dependent tumor cell proliferation. MET, a receptor tyrosine kinase, is overexpressed on the cell surfaces of various solid tumor cell types; it plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**anti-Met/EGFR monoclonal antibody LY3164530:** A monoclonal antibody (MoAb) against human epidermal growth factor receptor (EGFR) and human hepatocyte growth factor receptor (HGFR or c-Met), with potential antineoplastic activity. Upon administration, anti-Met/EGFR MoAb LY3164530 targets and prevents the activation of EGFR and c-Met. This leads to a downstream inhibition of EGFR/c-Met-mediated signal transduction pathways, and prevents cellular proliferation in tumor cells overexpressing EGFR and c-Met. EGFR, a member of the epidermal growth factor family of extracellular protein ligands, may be overexpressed on the cell surface of various solid tumor cell types. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**anti-MMP-9 monoclonal antibody GS-5745:** A humanized monoclonal antibody against matrix metalloproteinase 9 (MMP-9), with potential antineoplastic activity. Upon administration, anti-MMP-9 monoclonal antibody GS-5745 binds to MMP-9 and inhibits its enzymatic activity. This

results in an inhibition of extracellular matrix protein degradation and, potentially, the inhibition of angiogenesis, tumor growth, invasion, and metastasis. MMP-9, a protein belonging to the MMP family, plays a key role in the degradation of collagens and proteoglycans; increased activity of MMP-9 has been associated with increased invasion and metastasis of cancer. Check for active clinical trials using this agent.

**anti-MUC1 CAR-transduced autologous T lymphocytes:** Autologous T lymphocytes transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of a single chain variable fragment (scFv) against the human tumor-associated epithelial antigen mucin 1 (MUC1), with potential immunomodulating and antineoplastic activities. Autologous PBLs from a patient with MUC1-positive cancer are transduced with a retroviral vector that encodes the CAR gene specific for MUC1. After expansion in culture and reintroduction into the patient, anti-MUC1 CAR-transduced autologous T lymphocytes target and induce selective toxicity in MUC1-expressing tumor cells. MUC-1 is a human, hypoglycosylated tumor-associated antigen (TAA) overexpressed by epithelial cancer cells.

**anti-myeloma monoclonal antibody-DM4 immunoconjugate BT-062:** An immunoconjugate consisting of a monoclonal antibody directed against a highly-expressed myeloma cell surface antigen covalently attached to the maytansinoid DM4, a derivative of the cytotoxic agent maytansine (DM1), with potential antineoplastic activity. Anti-myeloma monoclonal antibody-DM4 immunoconjugate BT-062 binds to an unspecified cell surface antigen highly expressed on myeloma cells; upon internalization the DM4 moiety is released, binding to tubulin and disrupting microtubule assembly/disassembly dynamics, which may result in the inhibition of cell division and cell growth of myeloma tumor cells.

**anti-myostatin monoclonal antibody LY2495655:** A monoclonal antibody against myostatin (MSTN) with potential anti-cachexia activity. Upon administration, anti-myostatin monoclonal antibody LY2495655 binds to and neutralizes the MSTN protein, thereby blocking the MSTN signalling pathway. This may help decrease muscle protein breakdown and muscle weakness and may attenuate cancer cachexia. MSTN, a member of the transforming growth factor-beta (TGF-beta) superfamily, is a negative

regulator of muscle growth and development. Check for active clinical trials using this agent.

**anti-NaPi2b/MMAE antibody-drug conjugate DNIB0600A:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody directed against the sodium-dependent phosphate transport protein 2B (NaPi2b), and covalently linked to monomethyl auristatin E (MMAE), an auristatin derivative and a potent microtubule disrupting agent, with potential antineoplastic activity. Upon administration, the monoclonal antibody moiety of DNIB0600A binds to NaPi2b-expressing tumor cells and is internalized, thereby delivering MMAE intracellularly. Proteolytic cleavage releases MMAE, which then binds to tubulin and inhibits its polymerization, resulting in G2/M phase arrest and tumor cell apoptosis. NaPi2b, a tumor-associated antigen (TAA), overexpressed in a variety of cancer cell types, plays a key role in transport of inorganic phosphate and the maintenance of phosphate homeostasis.

**anti-nectin 4 antibody-drug conjugate ASG-22CE:** An antibody drug conjugate (ADC) containing a human monoclonal antibody AGS-22 targeting the cell adhesion molecule nectin-4 and conjugated to the cytotoxic agent monomethyl auristatin E (MMAE), via a proprietary enzyme-cleavable linker (AGS-22CE), with potential antineoplastic activity. The monoclonal antibody moiety of AGS-22CE selectively binds to nectin-4. After internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and induces apoptosis in nectin-4 overexpressing tumor cells. Nectin-4, a tumor associated antigen belonging to the nectin family, is overexpressed in a variety of cancers, including breast, bladder, lung and pancreatic cancer.

**anti-Nectin-4 monoclonal antibody-drug conjugate AGS-22M6E:** An antibody drug conjugate (ADC) containing a fully human monoclonal antibody AGS-22 targeting the cell adhesion molecule nectin-4 and conjugated, via a proprietary enzyme-cleavable linker, to the cytotoxic agent monomethyl auristatin E (MMAE) (AGS-22M6E), with potential antineoplastic activity. The monoclonal antibody moiety of AGS-22M6E selectively binds to nectin-4. After internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and induces apoptosis in nectin-4 overexpressing tumor cells. Nectin-4, a tumor associated antigen belonging to the nectin family, is

overexpressed in a variety of cancers, including breast, bladder, lung and pancreatic cancer.

**anti-neuropilin-1 monoclonal antibody MNRP1685A:** A human IgG1 monoclonal antibody directed against neuropilin-1 (NRP1), with potential antiangiogenic and antineoplastic activities. Upon intravenous administration, MNRP1685A specifically targets and binds to NRP1; the antibody-NRP1 complex prevents the subsequent coupling of NRP1 to VEGFR2, thereby potentially inhibiting VEGF-mediated signaling and potentially preventing angiogenesis. In combination with other anti-VEGF therapies, MNRP1685A may enhance their anti-angiogenic effect. NRP1 is a membrane-bound co-receptor normally expressed by endothelial cells and overexpressed by certain tumor cells, and plays a role in angiogenesis, cell survival, migration, and invasion.

**anti-nf-P2X7 antibody ointment BIL-010t:** An ointment formulation composed of a purified sheep immunoglobulin G (IgG) antibody against the non-functional form of the purinergic P2X7 receptor (nf-P2X7), with potential antineoplastic activity. Upon topical application of the anti-nf-P2X7 antibody ointment BIL-010t, the antibody binds to nf-P2X7 and inhibits its antiapoptotic activity. This may induce apoptosis and inhibit the growth of nf-P2X7-overexpressing cancer cells. P2X7, an ATP-gated cation-selective channel, plays a role in the induction of apoptosis; nf-P2X7, is upregulated in a variety of cancer cell types while not expressed on normal, healthy cells and is unable to form a large transmembrane, apoptotic pore upon exposure to ATP and prevents apoptosis.

**anti-nucleolin aptamer AS1411:** A 26-base guanine-rich oligodeoxynucleotide aptamer with potential apoptotic induction activity. Upon administration, anti-nucleolin aptamer AS1411 targets and binds to nucleolin, a nucleolar phosphoprotein which is overexpressed on the surface of certain cancer cells. Via binding to cell surface nucleolin, AS1411 is internalized and may prevent nucleolin from binding to and stabilizing mRNA of the anti-apoptotic BCL2, thereby destabilizing BCL2 mRNA, leading to a reduction in BCL2 protein synthesis. This may lead to the induction of apoptosis.

**anti-NY-ESO1 TCR-transduced autologous CD62L+-derived T lymphocytes:** Human autologous CD62L-positive T lymphocytes transduced with a retroviral vector encoding a T cell receptor (TCR)

specific for the cancer-testis antigen NY-ESO-1, with potential antineoplastic activity. Following leukapheresis, isolation of lymphocytes, expansion ex vivo, transduction, and reintroduction into the patient, the anti-NY-ESO1 TCR-transduced autologous CD62L<sup>+</sup>-derived T lymphocytes bind to NY-ESO-1-overexpressing tumor cells. This may result in cytotoxic T-lymphocyte (CTL)-mediated elimination of NY-ESO-1-positive cancer cells. NY-ESO-1, a tumor associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types. CD62L, also called L-selectin, is a lymphoid homing receptor and differentiation marker and is expressed on a subset of CD8-positive T-lymphocytes; it is involved in the migration of T-lymphocytes to lymph nodes and may improve the efficacy for ex vivo-expanded T-cells following adoptive cell therapy.

**anti-OX40 antibody BMS 986178:** An agonistic monoclonal antibody against the co-stimulatory receptor OX40 (CD134; TNFRSF4), with potential immunostimulatory activity. Upon administration, anti-OX40 monoclonal antibody BMS 986178 selectively binds to and activates the OX40 receptor, by mimicking the action of the endogenous OX40 ligand (OX40L). OX40 receptor activation induces proliferation of memory and effector T-lymphocytes. In the presence of tumor-associated antigens (TAAs), this may promote an immune response against the TAA-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor receptor family (TNFRSF), is expressed on T-lymphocytes and provides a co-stimulatory signal for the proliferation and survival of activated T-cells.

**anti-OX40 antibody PF-04518600:** An agonistic antibody that recognizes the co-stimulatory receptor OX40 (CD134;TNFRSF4), with potential immunostimulatory activity. Upon administration, anti-OX40 antibody PF-04518600 selectively binds to and activates OX40; which induces proliferation of memory and effector T-lymphocytes. In the presence of tumor-associated antigens (TAAs), this may promote a T-cell-mediated immune response against TAA-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor receptor superfamily (TNFRSF), is expressed on T-lymphocytes and plays an essential role in T-cell activation.

**anti-OX40 monoclonal antibody:** An agonistic monoclonal antibody against receptor OX40 (CD134), with potential immunostimulatory activity. Mimicking the natural OX4 ligand (OX40L), anti-OX40 monoclonal antibody selectively binds to and activates the OX40 receptor. Receptor activation induces proliferation of memory and effector T lymphocytes. In the presence of tumor associated antigens (TAAs), this may promote an immune response against the TAA-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor (TNF) receptor family, is expressed by CD4 T cells and provides a costimulatory signal for T cell activation. Check for active clinical trials using this agent.

**anti-OX40 monoclonal antibody MEDI0562:** An agonistic, humanized monoclonal antibody against receptor OX40 (CD134), with potential immunostimulatory activity. Upon administration, anti-OX40 monoclonal antibody MEDI0562 selectively binds to and activates the OX40 receptor. OX40 receptor activation induces proliferation of memory and effector T-lymphocytes. In the presence of tumor-associated antigens (TAAs), this agent may promote an immune response against TAAs-expressing tumor cells. OX40, a cell surface glycoprotein and member of the tumor necrosis factor (TNF) receptor family, is expressed on T-lymphocytes and provides a co-stimulatory signal for the proliferation and survival of activated T-cells.

**anti-p53 T-cell receptor-transduced peripheral blood lymphocytes:** Human autologous peripheral blood lymphocytes (PBLs) transduced with an anti-p53 T cell receptor gene with potential antineoplastic activity. PBLs are harvested from a patient and pulsed with a retroviral vector that encodes the T-cell receptor gene specific for a mutated form of p53. The transduced PBLs are then expanded in culture. When reintroduced to the patient, these modified PBLs express the anti-p53 T cell receptor which binds to mutant p53-overexpressing tumor cells; PBL-mediated tumor growth inhibition may follow. Many tumor cell types overexpress mutant p53 proteins, which are associated with the loss of apoptosis regulation and abnormal cell proliferation.

**anti-PD-1 checkpoint inhibitor PF-06801591:** An inhibitor of the human inhibitory receptor programmed cell death 1 (PD-1; PDCD1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD-1 checkpoint inhibitor PF-06801591 targets and binds to PD-1 and blocks the interaction between PD-1 and its ligands, PD-

1 ligand 1 (PD-L1) and PD-1 ligand 2 (PD-L2). This prevents the activation of PD-1 and its downstream signaling pathways. This may restore immune function through the activation of natural killer (NK) cells and cytotoxic T-lymphocytes (CTLs) against tumor cells. PD-1, an inhibitory receptor belonging to the B7-receptor family, is expressed on activated T-lymphocytes, B-cells and NK cells; it functions as an immune checkpoint that negatively regulates T-cell activation and effector function when activated by its ligands, and plays an important role in tumor evasion from host immunity.

**anti-PD-1 fusion protein AMP-224:** A recombinant B7-DC Fc-fusion protein composed of the extracellular domain of the PD-1 ligand programmed cell death ligand 2 (PD-L2, B7-DC) and the Fc region of human immunoglobulin (Ig) G1, with potential immune checkpoint inhibitory and antineoplastic activities. Anti-PD-1 fusion protein AMP-224 specifically binds to PD-1 on chronically stimulated T-cells and reduces their proliferation. This may restore immune function and may result in the activation of cytotoxic T-cells and cell-mediated immune responses against tumor cells. PD-1, a transmembrane protein of Ig superfamily and inhibitor receptor expressed on activated T-cells, negatively regulates T-cell activation and effector function when activated by its ligands, and plays an important role in tumor evasion from host immunity. AMP-224 does not bind normal activated T-cells.

**anti-PD-1 monoclonal antibody BGB-A317:** A monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed cell death 1 (PD-1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD-1 monoclonal antibody BGB-A317 binds to PD-1 and inhibits the binding of PD-1 to the PD-1 ligands programmed cell death-1 ligand 1 (PD-L1), and PD-1 ligand 2 (PD-L2). This prevents the activation of PD-1 and its downstream signaling pathways. This may restore immune function through the activation of both T-cells and T-cell-mediated immune responses against tumor cells. PD-1, a transmembrane protein in the immunoglobulin (Ig) superfamily expressed on activated T-cells, negatively regulates T-cell activation and effector function when activated by its ligands; it plays an important role in tumor evasion from host immunity.

**anti-PD-1 monoclonal antibody MEDI0680:** A humanized immunoglobulin (Ig) G4 monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed cell death 1 (PD-1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD-1 monoclonal antibody MEDI0680 binds to and inhibits PD-1 and its downstream signaling pathways. This may restore immune function through the activation of T-cells and cell-mediated immune responses against tumor cells. PD-1, a transmembrane protein in the Ig superfamily expressed on T cells, functions as an immune checkpoint that negatively regulates T-cell activation and effector function when activated by its ligands programmed cell death ligand 1 (PD-L1) or 2 (PD-L2); it plays an important role in tumor evasion from host immunity.

**anti-PD-1 monoclonal antibody PDR001:** A fully humanized monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed death-1 (PD-1, PCD-1), with immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD1 monoclonal antibody PDR001 binds to PD-1 expressed on activated T-cells and blocks the interaction with its ligands, programmed cell death 1 ligand 1 (PD-L1, PD-1L1) and PD-1 ligand 2 (PD-L2, PD-1L2). The inhibition of ligand binding prevents PD-1-mediated signaling and results in both T-cell activation and the induction of T-cell-mediated immune responses against tumor cells. PD-1, an immunoglobulin (Ig) superfamily transmembrane protein and inhibitory receptor, negatively regulates T-cell activation.

**anti-PD-1 monoclonal antibody REGN2810:** A human monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed cell death 1 (PD-1, PCD-1) protein, with potential immune checkpoint inhibitory and antineoplastic activity. Upon administration, anti-PD-1 monoclonal antibody REGN2810 binds to PD-1, inhibits its binding to the PD-1 ligand programmed cell death-1 ligand 1 (PD-L1), and prevents the activation of its downstream signaling pathways. This may restore immune function through the activation of cytotoxic T-cells. PD-1, a transmembrane protein in the immunoglobulin superfamily expressed on activated T-cells, negatively regulates T-cell activation and effector function when activated by its ligand; it plays an important role in tumor evasion from host immunity. Check for active clinical trials using this agent.

**anti-PD-1 monoclonal antibody SHR-1210:** A monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed death-1 (PD-1, PCD-1,) with immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD-1 monoclonal antibody SHR-1210 binds to and blocks the binding of PD-1, expressed on activated T-lymphocytes, B-cells and natural killer (NK) cells, to its ligands programmed cell death ligand 1 (PD-L1), overexpressed on certain cancer cells, and programmed cell death ligand 2 (PD-L2), which is primarily expressed on antigen presenting cells (APCs). This prevents the activation of PD-1 and its downstream signaling pathways. This restores immune function through the activation of cytotoxic T-lymphocytes (CTLs) and cell-mediated immune responses against tumor cells or pathogens. Activated PD-1 negatively regulates T-cell activation and plays a key role in tumor evasion from host immunity.

**anti-PD-1 monoclonal antibody TSR-042:** A humanized monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed cell death 1 (PD-1; programmed death-1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, anti-PD-1 monoclonal antibody TSR-042 binds to and inhibits PD-1 and its downstream signaling pathways. This may restore immune function through the activation of T cells. PD-1, a transmembrane protein in the Ig superfamily expressed on T cells, functions as an immune checkpoint protein that negatively regulates T-cell activation and T-cell-mediated immune responses when activated by its ligands programmed cell death receptor ligand 1 (PD-L1) or 2 (PD-L2); it plays an important role in tumor evasion from host immunity.

**anti-PD-L1 monoclonal antibody MDX-1105:** A fully human monoclonal antibody directed against programmed cell death-1 ligand 1 (PD-L1) with immune checkpoint inhibitory and potential antineoplastic activities. Anti-PD-L1 monoclonal antibody MDX-1105 binds to PD-L1, blocking its binding to and activation of its receptor programmed death 1 (PD-1), which may enhance the T-cell-mediated immune response to neoplasms and reverse T-cell inactivation. PD-L1 is overexpressed by many human cancer cell types. PD-L1 binding to PD-1 on T-cells suppresses the immune system and results in immune evasion. PD-1, a transmembrane protein expressed on activated T-cells, is a negative regulator of the immune system that limits the expansion and survival of CD8<sup>+</sup> T cells.

**anti-PDGFR alpha monoclonal antibody IMC-3G3 :** A substance that protects cells from the damage caused by free radicals (unstable molecules made by the process of oxidation during normal metabolism). Free radicals may play a part in cancer, heart disease, stroke, and other diseases of aging. Antioxidants include beta-carotene, lycopene, vitamins A, C, and E, and other natural and manufactured substances.

**anti-PDGFR alpha monoclonal antibody MEDI-575:** A humanized monoclonal antibody directed against the platelet-derived growth factor receptor (PDGFR) alpha with potential antineoplastic activity. Anti-PDGFR alpha monoclonal antibody MEDI-575 inhibits activation of the cell-surface tyrosine kinase PDGFR alpha subunit and subsequent triggering of mitogenic signaling pathways, including the JAK/STAT, PI3K/Akt, and MAP kinase pathways. PDGFR alpha acts as a mitogenic signaling receptor for cells of mesenchymal origin and inhibition of receptor activity may inhibit tumor cell proliferation.

**anti-PGF monoclonal antibody RO5323441:** A humanized IgG1 monoclonal antibody directed against the placenta growth factor (PGF), with potential anti-angiogenic and antineoplastic activities. Anti-PGF monoclonal antibody RO5323441 binds to both PGF-1 and -2, thereby inhibiting the binding of PGF-1 and -2 to the vascular endothelial growth factor receptor-1 (VEGFR-1) and subsequent VEGFR-1 phosphorylation. This may result in the inhibition of tumor angiogenesis and tumor cell proliferation. PGF, a member of the VEGF sub-family and a key molecule in angiogenesis and vasculogenesis, is upregulated in many cancers.

**anti-PKN3 siRNA Atu027:** A lipoplexed formulation consisting of short-interfering RNAs (siRNAs) directed against protein kinase N3 (PKN3) encapsulated in cationic and fusogenic lipids with potential antineoplastic activity. Upon administration, cationic and fusogenic lipids promote anti-PKN3 siRNA Atu02 uptake by tumor cells; the siRNAs moieties are subsequently released once inside the cell. The siRNAs bind to PKN3 mRNAs, which may result in the inhibition of translation and expression of the PKN3 protein and, so, growth inhibition of tumor cells that overexpress PKN3. The protein kinase C-related molecule PKN3, downstream in the phosphoinositide-3-kinase (PI3K) signaling pathway, is upregulated in many tumor cells and plays an important role in invasive cell growth and metastasis.

**anti-platelet-derived growth factor receptor alpha monoclonal antibody IMC-3G3:** A drug used to treat infections caused by bacteria and parasites. It is also used in the treatment of some cancers.

**anti-PLGF monoclonal antibody TB-403:** A humanized monoclonal antibody directed against placental growth factor (PLGF) with potential anti-angiogenic and antineoplastic activities. Anti-PLGF monoclonal antibody TB-403 binds to PLGF, inhibiting the binding of PLGF to the vascular endothelial growth factor receptor, which may result in the inhibition of tumor angiogenesis and tumor cell proliferation. PLGF is a protein that belongs to the family of vascular endothelial growth factors (VEGFs).

**anti-PR1/HLA-A2 monoclonal antibody Hu8F4:** A T-cell receptor (TCR)-like monoclonal antibody against PR1, a 9 amino-acid (VLQELNVTV) human leukocyte antigen (HLA)-A2-restricted leukemia-associated antigen (LAA) derived from the myeloid leukemia-associated antigens proteinase 3 (P3) and neutrophil elastase (NE), with potential immunostimulating and antineoplastic activities. Upon administration, anti-PR1/HLA-A2 monoclonal antibody Hu8F4 selectively binds to a combined epitope of the PR1/HLA-A2 complex expressed on acute myeloid leukemia (AML) blasts and leukemic stem cells (LSC), and prevents PR1/HLA-A2-mediated signaling. This induces complement-dependent cytotoxicity (CDC), to a lesser extent, antibody-dependent cell-mediated cytotoxicity (ADCC), and CDC/ADCC-independent cytolysis of myeloid leukemia cells. This results in a reduction of cellular proliferation in PR1/HLA-A2-overexpressing leukemic cells. PR1 in combination with the HLA-A2 molecule is highly expressed on AML blasts and LSCs.

**anti-programmed cell death protein 1 antibody expressing pluripotent killer T lymphocytes:** A specific population of pluripotent killer (PIK) T cells that have been induced to express high levels of antibodies against the negative immunoregulatory human cell surface receptor programmed cell death protein 1 (PD-1; PDCD1; CD279), with potential antitumor activity. Although the exact mechanism(s) of action through which PIK-PD-1 cells exert their effects has yet to be elucidated, upon infusion, these cells secrete antibodies that target PD-1 expressed on the surface of activated T cells and tumor cells. This may block the interaction of PD-1 with its ligands, programmed cell death 1 ligand 1 (PD-L1, PD-1L1; CD274) and PD-1

ligand 2 (PD-L2, PD-1L2; CD273). The inhibition of ligand binding prevents PD-1-mediated signaling and results in both T-cell activation and the induction of T-cell-mediated immune responses against tumor cells. PD-1, an immunoglobulin (Ig) superfamily transmembrane protein and inhibitory receptor, negatively regulates T-cell activation; PD-L1 is overexpressed on certain cancer cells, and PD-L2 is primarily expressed on antigen presenting cells (APCs).

**anti-prolactin receptor antibody LFA102:** A neutralizing antibody against the prolactin receptor (PRLR) with potential antineoplastic activity. Upon administration, anti-prolactin receptor antibody LFA102 binds to PRLR and prevents the binding of the peptide hormone prolactin (PRL) to its receptor. This binding induces an antibody-dependent cellular cytotoxicity (ADCC) and may eventually prevent tumor cell proliferation in PRLR-positive cancer cells. PRLR/PRL signaling pathway is frequently overexpressed in breast and prostate cancer. Check for active clinical trials using this agent.

**anti-PSCA fully human monoclonal antibody AGS-1C4D4:** An IgG1k fully human monoclonal antibody directed against the human prostate stem cell antigen (PSCA) with potential antineoplastic activity. Anti-PSCA fully human monoclonal antibody AGS-1C4D4 selectively targets and binds to PSCA, triggering complement-dependent cell lysis and antibody-dependent cell-mediated cytotoxicity in tumor cells expressing PSCA. PSCA is a glycosyl-phosphatidylinositol (GPI)-linked cell surface antigen found in cancers of the bladder, pancreas, and prostate. Check for active clinical trials using this agent.

**anti-PSMA monoclonal antibody MDX1201-A488:** A recombinant, human monoclonal antibody targeting an extracellular epitope of human prostate specific membrane antigen (PSMA) that is conjugated with a fluorescent dye A488, with potential imaging activity. Upon intravenous administration, the MDX1201 moiety of anti-PSMA monoclonal antibody MDX1201-A488 targets PSMA expressed on cancer cells. Subsequently, the A488 moiety can then be visualized by fluorescence-based imaging and the amount of PSMA-expressing tumor cells can be assessed. A488 is a photostable fluorescent dye with a high quantum yield. PSMA, a tumor-associated antigen and type II transmembrane protein, is expressed on the

membrane of prostatic epithelial cells and overexpressed on prostate tumor cells.

**anti-PSMA monoclonal antibody-MMAE conjugate:** An antibody-drug conjugate (ADC) containing a fully human monoclonal antibody directed against prostate-specific membrane antigen (PSMA), conjugated via a stable, enzyme-cleavable linker to monomethylauristatin E (MMAE), an auristatin derivative and a potent microtubule inhibitor, with potential antineoplastic activity. The monoclonal antibody moiety of this conjugate selectively binds to PSMA, a protein which is abundantly expressed on the surface of metastatic and hormone-refractory prostate cancer cells. Upon internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, resulting in G2/M phase arrest and tumor cell apoptosis.

**anti-PSMA/CD3 BiTE monoclonal antibody MT112:** A recombinant T-cell engaging bispecific monoclonal antibody (BiTE) directed against human prostate specific membrane antigen (PSMA) and the CD3 epsilon subunit of the T cell receptor complex, with potential immunostimulating and antineoplastic activities. Anti-PSMA/CD3 BiTE monoclonal antibody MT112 possesses two antigen-recognition sites, one for PSMA, and one for the CD3 complex, a group of T cell surface glycoproteins that complex with the T cell receptor (TCR). This bispecific monoclonal antibody brings PSMA-expressing tumor cells and cytotoxic T lymphocytes (CTLs) together, which may result in the CTL-mediated cell death of PSMA-expressing cells. PSMA, a tumor associated antigen, is overexpressed on the surface of metastatic and hormone-refractory prostate cancer cells.

**anti-PSMA/CD3 monoclonal antibody MOR209/ES414:** An anti-prostate specific membrane antigen (PSMA)/anti-CD3 bispecific humanized monoclonal antibody, with potential immunostimulatory and antineoplastic activities. Anti-PSMA/CD3 monoclonal antibody MOR209/ES414 possesses two antigen-recognition sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for PSMA, a tumor-associated antigen (TAA) overexpressed on the surface of prostate tumor cells. Upon intravenous administration of MOR209/ES414, this bispecific antibody simultaneously binds to both CD3-expressing T-cells and PSMA-expressing cancer cells, thereby crosslinking PSMA-expressing tumor cells and cytotoxic T-

lymphocytes (CTLs). This results in CTL-mediated cancer cell lysis of prostate cancer cells expressing PSMA.

**anti-RSPO3 monoclonal antibody OMP-131R10:** An immunoglobulin (Ig) G1 humanized monoclonal antibody targeting human R-spondin 3 (RSPO3), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, the anti-RSPO3 monoclonal antibody OMP-131R10 targets and binds to RSPO3 expressed on tumor cells. This prevents the activation of RSPO3, and inhibits both the binding of RSPO3 to leucine-rich repeat-containing G-coupled receptors (LGRs) and the activation of the RSPO-LGR pathway. This may result in an inhibition of both cancer stem cell (CSC) survival and the proliferation of cancer cells in which this pathway is overactivated. The RSPO-LGR pathway is a CSC pathway activated in a variety of cancer cell types.

**anti-sCLU monoclonal antibody AB-16B5:** A humanized, immunoglobulin (Ig) G2 monoclonal antibody against the secreted form of human clusterin (sCLU) expressed by tumor cells, with potential antineoplastic and anti-metastatic activities. Upon administration, anti-sCLU monoclonal antibody AB-16B5 specifically binds to tumor-associated sCLU and inhibits its activity. This inhibits both the sCLU-mediated signal transduction pathways and epithelial-to-mesenchymal transition (EMT), which leads to the inhibition of tumor cell migration and invasion. In addition, AB-16B5 enhances chemo-sensitivity. sCLU, a heterodimeric disulfide-linked glycoprotein overexpressed by various types of cancer cells, contributes to proliferation and survival of cancer cells, and stimulates tumor cell EMT.

**anti-SEMA4D monoclonal antibody VX15/2503:** A humanized IgG4 monoclonal antibody against the semaphorin 4D (SEMA4D; CD100) with potential immunomodulating and antineoplastic activities. Upon administration, anti-SEMA4D monoclonal antibody VX15/2503 binds to and neutralizes SEMA4D, thereby preventing binding of SEMA4D to its receptor plexin-B1 (PLXNB1). By blocking the interaction of SEMA4D and PLXNB1, VX15/2503 may cause an inhibition of endothelial cell activation and migration, eventually leading to an inhibition of angiogenesis and tumor cell proliferation. Semaphorin 4D, a large cell surface antigen found on the resting T-cell and overexpressed in a variety of tumor cell types, plays an important role in vascular growth, tumor progression,

invasion and immune cell regulation. Check for active clinical trials using this agent.

**anti-SLITRK6 monoclonal antibody-MMAE conjugate AGS15E:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody directed against SLIT and NTRK-like protein 6 (SLITRK6), covalently linked to the cytotoxic agent monomethyl auristatin E (MMAE), an auristatin derivative and a potent inhibitor of microtubule polymerization, with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of AGS15E binds to SLITRK6 expressed on tumor cells, which facilitates both AGS15E internalization and the intracellular delivery of MMAE. Upon cleavage, MMAE binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and tumor cell apoptosis. SLITRK6, a member of the Slitrk family of leucine-rich repeat (LRR) neuronal transmembrane proteins, is minimally expressed in normal tissue but overexpressed in a variety of cancers, including bladder cancer, some forms of lung cancer, breast cancer and glioblastoma.

**anti-TA-MUC1 monoclonal antibody PankoMab:** A humanized monoclonal antibody recognizing the tumor-specific epitope of mucin-1 (TA-MUC1), with potential antineoplastic activity. Anti-TA-MUC1 monoclonal antibody PankoMab targets and binds to the TA-MUC1 epitopes expressed on the cell surface of tumor cells, thereby potentially activating the immune system to induce an antibody-dependent cellular cytotoxicity (ADCC) against the TA-MUC1-expressing tumor cells. TA-MUC1 is designated to MUC1 epitopes with O-glycosylated carbohydrate-induced conformational structures that are tumor-specific, thereby enabling PankoMab to differentiate between tumor MUC1 and non-tumor MUC1 epitopes.

**anti-TF monoclonal antibody ALT-836:** A recombinant human-mouse chimeric monoclonal antibody against human tissue factor (TF), with potential antiangiogenic, anticoagulant and anti-inflammatory activities. Upon administration, anti-TF monoclonal antibody ALT-836 binds to TF or the TF-Factor VIIa (FVIIa) complex preventing binding and activation of Factor X (FX) and Factor IX (FIX). This may prevent thrombin formation and cancer-associated venous thromboembolism, and may inhibit angiogenesis and tumor cell proliferation. TF, a transmembrane protein and procoagulant, is overexpressed in many tumor cell types, and is correlated

with metastasis, angiogenesis, tumor growth and tumor-associated thrombosis.

**anti-TF monoclonal antibody-MMAE conjugate:** An antibody-drug conjugate (ADC) comprised of a monoclonal antibody against human tissue factor (TF) covalently coupled, via a protease-cleavable peptide linker, to monomethyl auristatin E (MMAE), an auristatin derivative and potent microtubule disrupting agent, with potential antiangiogenic, anticoagulant and antineoplastic activities. Upon administration, anti-TF monoclonal antibody-MMAE conjugate binds to cell surface TF and is internalized. The antibody moiety prevents binding of TF to factor VIIa (FVIIa) and interferes with the activation of factor X (FX) into FXa. This may prevent thrombin formation and cancer-associated venous thromboembolism, and may inhibit angiogenesis and tumor cell proliferation. After internalization of the agent, the MMAE moiety is released by proteolytic cleavage. It then binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and apoptosis. TF, a transmembrane protein and initiator of the coagulation cascade, is overexpressed in many tumor cells and tumor-resident endothelial cells. Expression of TF is correlated with metastasis, angiogenesis, tumor cell growth and tumor-associated thrombosis.

**anti-TGF-beta monoclonal antibody GC1008 :** Treatment with antisense oligonucleotides. These are small pieces of DNA or RNA that can bind to specific molecules of RNA. This blocks the cell's ability to use the RNA to make a protein or work in other ways. Antisense oligonucleotides are being studied in the treatment of many types of cancer. Also called antisense oligonucleotide therapy.

**anti-TGF-beta RII monoclonal antibody IMC-TR1:** A monoclonal antibody directed against transforming growth factor-beta receptor type II (TGF-beta RII) with potential antineoplastic activity. Anti-TGF-beta RII monoclonal antibody IMC-TR1 specifically targets and binds to TGF-beta R11, thereby preventing the activation of TGF-beta RII-mediated signaling pathways. TGF-beta RII is mutated in a number of cancer cell types and is involved in cancer cell proliferation and tumor progression.

**anti-thymocyte globulin:** A purified gamma immunoglobulin (IgG) with immunosuppressive activity. Obtained from rabbits that have been immunized with human thymocytes, antithymocyte globulin specifically recognizes and destroys T lymphocytes. Although the exact mechanism of

action is not completely understood, it appears to involve T lymphocyte clearance from the circulation and modulation of T lymphocyte activity. Administering antithymocyte globulin with chemotherapy prior to stem cell transplantation may reduce the risk of graft-versus-host disease.

**anti-thyroglobulin mTCR-transduced autologous peripheral blood lymphocytes:** Peripheral blood lymphocytes (PBLs) transduced with a gene encoding for a thyroglobulin (TG)-specific murine T-cell receptor (mTCR), with potential antineoplastic activity. PBLs are harvested from a thyroid cancer patient, and transfected with a retroviral vector that encodes the mTCR gene specific for the human TG antigen. The transduced PBLs are then expanded in culture. When reintroduced to the patient, these anti-TG mTCR-expressing PBLs target and bind to TG-overexpressing tumor cells, which results in both cytokine secretion and tumor cell lysis. TG is a thyroid-specific protein. Check for active clinical trials using this agent.

**anti-TIM-3 monoclonal antibody TSR-022:** A monoclonal antibody against the inhibitory T-cell receptor, T-cell immunoglobulin and mucin domain-containing protein 3 (TIM-3; TIM3; hepatitis A virus cellular receptor 2; HAVCR2), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, the anti-TIM-3 monoclonal antibody TSR-022 binds to TIM-3 expressed on certain T cells, including tumor infiltrating lymphocytes (TILs). This abrogates T-cell inhibition, activates antigen-specific T lymphocytes and enhances cytotoxic T-cell-mediated tumor cell lysis, which results in a reduction in tumor growth. TIM-3, a transmembrane protein and immune checkpoint receptor, is associated with tumor-mediated immune suppression. Check for active clinical trials using this agent.

**anti-tissue factor monoclonal antibody MORAb-066:** A humanized monoclonal antibody against human tissue factor (TF), with potential antiangiogenic, anticoagulant and anti-inflammatory activities. Upon administration, anti-TF monoclonal antibody MORAb-066 binds to TF and prevents Factor VIIa (FVIIa) from binding, thereby interfering with the activation of Factor X (FX) into FXa. This may prevent thrombin formation and cancer-associated venous thromboembolism, and may inhibit angiogenesis and tumor cell proliferation. TF, a transmembrane protein and initiator of the coagulation cascade, is overexpressed in many tumor cells

and tumor endothelial cells; its expression is correlated with metastasis, angiogenesis, tumor cell growth and tumor-associated thrombosis.

**anti-TLR2 monoclonal antibody OPN-305:** A humanized immunoglobulin (Ig) G4 monoclonal antibody directed against toll-like receptor type 2 (TLR2), with potential anti-inflammatory and antineoplastic activities. Upon intravenous administration, OPN-305 binds to the ligand-binding site on the TLR2 receptor and blocks the activation of TLR2-mediated innate immunity signaling. This prevents the TLR2-mediated production of pro-inflammatory mediators and prevents inflammation. TLR2, a member of the TLR family primarily found on leukocytes, plays a key role in the activation of innate immunity; it is overexpressed in various inflammatory diseases and in certain types of cancer.

**anti-TRAIL R1-mAb :** A substance being studied in the treatment of breast cancer that has spread to other parts of the body. It is also being studied in the treatment of other cancers and conditions. Anti-TGF-beta monoclonal antibody GC1008 binds to a protein called transforming growth factor-beta (TGF-beta), which is found on some cancer cells. Anti-TGF-beta monoclonal antibody GC1008 may help keep cancer cells from growing and prevent the growth of new blood vessels that tumors need to grow. It is a type of monoclonal antibody and a type of antiangiogenesis agent. Also called fresolimumab and GC1008.

**anti-TRAIL R2 mAb HGS-ETR2 :** Serum from blood that contains antibodies that bind to human T cells. Antithymocyte globulin is given to a patient before a stem cell transplant to kill T cells and lower the risk of graft-versus-host disease (GVHD). It is also used to treat GVHD and after a kidney transplant to help keep the body from rejecting the kidney. Also called antilymphocyte globulin.

**anti-transthyretin siRNA ALN-TTR02:** A lipid nanoparticle (LNP)-based formulation consisting of small-interfering RNAs (siRNAs) directed against transthyretin (TTR)-encapsulated in lipids, which has potential use in the treatment of TTR-mediated amyloidosis (ATTR). Upon intravenous administration of ALN-TTR02, the lipid formulation promotes the uptake by cells. The siRNAs bind to TTR mRNAs, which may result in the inhibition of both the translation and expression of the TTR protein. ATTR is caused by mutations in the TTR gene and results in the formation of

abnormal amyloid proteins that accumulate in and cause damage to various body organs and tissues.

**anti-TWEAK monoclonal antibody RO5458640:** A humanized monoclonal antibody directed against the apoptotic ligand TNF-like weak inducer of apoptosis (TWEAK) with potential antineoplastic activity. Anti-TWEAK monoclonal antibody RO5458640 binds to TWEAK and prevents the binding of TWEAK to its receptor, FGF-inducible molecule 14 (Fn14), thereby blocking the TWEAK/Fn14 signaling. This may prevent tumor cell proliferation, invasion, migration and angiogenesis. TWEAK has pleiotropic effects, mediating proinflammatory and pro-angiogenic activity as well as stimulation of invasion, migration, and survival mediated via its receptor Fn14; Fn14 is expressed at relatively low levels in normal tissues, but is elevated in tumor cells and locally in injured and diseased tissues.

**anti-VEGF anticalin PRS-050-PEG40:** A pegylated, proprietary lipocalin that targets human vascular endothelial growth factor (VEGF), with potential antineoplastic activity. Pegylated anti-VEGF anticalin PRS-050 specifically targets and binds to VEGF receptor 2 (VEGFR2 or KDR), thereby preventing its activity. This may inhibit angiogenesis and eventually reduce tumor cell growth. Check for active clinical trials using this agent.

**anti-VEGF-C monoclonal antibody VGX-100:** A fully human monoclonal antibody directed against the human vascular endothelial growth factor C (VEGFC or Flt4 ligand) with potential antiangiogenic activity. Anti-VEGFC monoclonal antibody VGX-100 specifically binds to and inhibits VEGFC protein, thereby preventing its binding to VEGFR3 (FLT4) or VEGFR2 (KDR or FLK1). This may prevent VEGFC-mediated signaling and may lead to the inhibition of vascular and lymphatic endothelial cell proliferation. The inhibition of tumor angiogenesis and lymphangiogenesis may eventually decrease tumor cell proliferation and prevent metastasis. VEGFC is overexpressed in a variety of cancer cells, and is associated with increased invasiveness and decreased survival. Check for active clinical trials using this agent.

**anti-VEGF/ANG2 nanobody BI 836880:** A nanobody directed against angiopoietin-2 (Ang2; ANGPT2)- and vascular endothelial growth factor (VEGF)-derived peptides, with potential antiangiogenic and antineoplastic activities. Anti-VEGF/ANG2 nanobody BI 836880 binds to Ang2 and

VEGF and inhibits receptor binding; this prevents Ang2- and VEGF-mediated signaling and inhibits both tumor angiogenesis and tumor cell proliferation. Both VEGF and Ang2 are upregulated in a variety of cancer cell types and each plays a crucial role in angiogenesis. The nanobody is based on functional fragments of single-chain antibodies. Check for active clinical trials using this agent.

**anti-VEGFR monoclonal antibody :** Having to do with stopping abnormal cell growth.

**anti-VEGFR-2 fully human monoclonal antibody IMC-1121B :** A type of anticancer drug that blocks cell growth by interfering with DNA, the genetic material in cells. Also called anticancer antibiotic and antineoplastic antibiotic.

**anti-VEGFR2-CAR retroviral vector-transduced autologous T lymphocytes:** Autologous human CD8-positive T-lymphocytes transduced with a recombinant retroviral vector encoding a chimeric T cell receptor (chimeric antigen receptor or CAR) consisting of an anti-vascular endothelial growth factor receptor type 2 (VEGFR2) scFv (single chain variable fragment), linked to the transmembrane domain of human CD8alpha and coupled to the costimulatory signaling domains of both CD28 and 4-1BB (CD137), and the CD3 zeta chain of the T-cell receptor (TCR), with potential immunostimulating and antineoplastic activities. Autologous peripheral blood lymphocytes (PBLs) from a patient with VEGFR2-positive cancer are pulsed with a retroviral vector that encodes the CAR gene specific for VEGFR2. After expansion in culture and reintroduction into the patient, the anti-VEGFR2 CAR-gene engineered CD8+ lymphocytes express anti-VEGFR2-CAR on their cell surfaces and bind to the VEGFR2 antigen on tumor cell surfaces. Subsequently, VEGFR2-expressing tumor cells are lysed. VEGFR2, a receptor tyrosine kinase (RTK) overexpressed by a variety of cancer cell types, belongs to the VEGFR superfamily and plays key roles in tumor cell proliferation, survival, invasion and tumor angiogenesis. The co-stimulatory molecules are required for optimal T-cell activation.

**anti-VEGFR3 monoclonal antibody IMC-3C5:** A fully-human monoclonal antibody directed against human vascular endothelial growth factor receptor 3 (VEGFR-3; Flt-4) with antiangiogenic activity. Anti-VEGFR-3 monoclonal antibody IMC-3C5 specifically binds to and inhibits

VEGFR-3, which may result in inhibition of tumor angiogenesis and a decrease in tumor nutrient supply. VEGFR-3 plays a critical role in the embryonic vascular system development but is restricted postnatally to endothelial cells of lymphatic vessels and found to be expressed in many solid and hematologic malignancies.

**anti-VISTA monoclonal antibody JNJ 61610588:** A human monoclonal antibody against the protein V-domain immunoglobulin (Ig) suppressor of T-cell activation (VISTA; programmed death 1 homolog; PD1H; PD-1H), with potential negative checkpoint regulatory and antineoplastic activities. Upon administration, JNJ 61610588 targets and binds to VISTA. This inhibits VISTA signaling, abrogates the VISTA-induced suppression of T-lymphocyte-mediated immune responses, enhances cytotoxic T-cell responses against tumor cells and inhibits tumor cell growth. VISTA, mainly expressed on hematopoietic cells, plays a key role in immunosuppression.

**anti-von Willebrand factor nanobody:** A humanized, bivalent anti-von Willebrand factor (VWF) nanobody with potential anti-platelet activity. Anti-von Willebrand factor nanobody specifically binds to the A1 domain of the VWF molecule, thereby inhibiting and neutralizing VWF activity. This prevents the interaction of VWF with the platelet glycoprotein (Gp)Ib-IX-V receptor and prevents VWF-mediated platelet aggregation. VWF is a glycoprotein and plays a key role in blood coagulation. Increased VWF, which is seen in a number of diseases, is associated with an increased risk in thrombosis. The nanobody formulation allows for rapid distribution, onset of action and clearance. The nanobody is based on the smallest functional fragments of single-chain antibodies that naturally occur in the Camelidae family.

**antiandrogen :** A type of antibiotic that comes from certain types of Streptomyces bacteria. Anthracyclines are used to treat many types of cancer. Anthracyclines damage the DNA in cancer cells, causing them to die. Daunorubicin, doxorubicin, and epirubicin are anthracyclines.

**antiandrogen therapy :** A type of anticancer drug.

**antiangiogenesis :** A substance that keeps androgens (male hormones) from binding to proteins called androgen receptors, which can be found in prostate cells and cells of some other tissues. Treatment with antiandrogens may stop prostate cancer cells from growing. Examples of antiandrogens

used to treat prostate cancer are flutamide, bicalutamide, enzalutamide, and nilutamide.

**antiangiogenesis agent :** Treatment with drugs to block the action of androgens (male hormones) in the body. Androgens, such as testosterone, bind to proteins called androgen receptors, which are found in prostate cancer cells and in cells of some other tissues. Antiandrogen therapy keeps androgens from binding to these receptors and may keep cancer cells from growing. It is used to treat prostate cancer.

**antiangiogenic :** Prevention of the growth of new blood vessels.

**antiangiogenic drug combination TL-118:** A proprietary, oral suspension containing a combination of agents comprised of a nonsteroidal anti-inflammatory agent, an alkylating agent, a histamine H<sub>2</sub> antagonist and a sulfonamide with potential anti-angiogenic and antineoplastic activities. Antiangiogenic drug combination TL-118 is administered as a specific dosing regimen and may result in a synergistic effect and reduce angiogenesis and inhibit tumor cell proliferation. Check for active clinical trials using this agent.

**antianxiety agent :** A drug or substance that keeps new blood vessels from forming. In cancer treatment, antiangiogenesis agents may prevent the growth of new blood vessels that tumors need to grow. Also called angiogenesis inhibitor.

**antiapoptotic :** Having to do with reducing the growth of new blood vessels.

**antiaromaticity:** The unusual instability that results from a continuous cyclic system of  $4n$  pi electrons (where  $n$  is any integer).

**antibacterial :** A drug used to treat symptoms of anxiety, such as feelings of fear, dread, uneasiness, and muscle tightness, that may occur as a reaction to stress. Most antianxiety agents block the action of certain chemicals in the nervous system. Also called anxiolytic and anxiolytic agent.

**Antibiotic:** A natural product that inhibits bacterial growth (is bacteriostatic) and sometimes results in bacterial death (is bacteriocidal).  
OR One of many different organic compounds that are formed and secreted by various species of microorganisms and plants, are toxic to other species, and presumably have a defensive function.

**antibiotic :** Something that prevents apoptosis. Apoptosis is a type of cell death in which a series of molecular steps in a cell leads to its death.

**Antibiotic resistance:** The ability of a microorganism to withstand the effects of antibiotic medicines or When antibiotics are incorrectly used (to treat bacteria that are not sensitive to the specific antibiotic or to treat viruses, which NEVER respond to antibiotics) and are not taken for the full term prescribed (usually from 5 to 21 days, depending on the specific antibiotic and disease being treated), surviving pathogenic organisms develop immunity to the antibiotic and pass it along to descendants and might choose to pass the trait along to unrelated bacteria via a process known as horizontal gene transfer.

**antibiotic SQ109:** An orally available, acid-stable diamine antibiotic, with potential antimicrobial activity against a variety of bacteria including *Helicobacter pylori* (*H. pylori*) and *Mycobacterium tuberculosis* (*M. tuberculosis*). As an ethambutol analogue with asymmetric structure, SQ109 does not act on the same target as ethambutol. However, this agent interferes with cell wall synthesis, thereby causing weakening of the cell wall and ultimately cell lysis.

**Antiblock:** Additive used to give surface of film a rougher texture at a microscopic level. Without additives, film has tacky texture similar to cling wrap. Prevents film from sticking together, or “blocking”.

**ANTIBLOCK AGENT:** Additive incorporated in film to prevent the adhesion (sticking) between touching layers of film during fabrication, storage, or use. For example, these additives can be diatomaceous earth, silica, and talc. OR Additive used to improve the electrical conductivity of the plastic extrusions or other plastic profiles so that any charge can readily go to ground and not remain in the part.

**antibodies:** proteins synthesized by plasma cells that are released into the circulation to the antigen site and destroy the microorganisms by chemically reacting with them.

**Antibody:** A specific protein that interacts with a foreign substance (antigen) in a specific way. OR A defense protein synthesized by the immune system of vertebrates. See also immunoglobulin. OR A protein produced in body in response, and specific for, a foreign substance or antigen.

**antibody** : A substance that kills bacteria or stops them from growing and causing disease.

**antibody therapy** : A drug used to treat infections caused by bacteria and other microorganisms.

**antibody-dependent cell-mediated cytotoxicity** : A protein made by plasma cells (a type of white blood cell) in response to an antigen (a substance that causes the body to make a specific immune response). Each antibody can bind to only one specific antigen. The purpose of this binding is to help destroy the antigen. Some antibodies destroy antigens directly. Others make it easier for white blood cells to destroy the antigen. An antibody is a type of immunoglobulin.

**antibody-dependent cellular cytotoxicity** : Treatment that uses antibodies to help the body fight cancer, infection, or other diseases. Antibodies are proteins made by the immune system that bind to specific markers on cells or tissues. Monoclonal antibodies are a type of antibody made in the laboratory that can be used in diagnosis or treatment. In cancer treatment, monoclonal antibodies may kill cancer cells directly, they may block development of tumor blood vessels, or they may help the immune system kill cancer cells.

**antibody-drug conjugate** : A type of immune reaction in which a target cell or microbe is coated with antibodies and killed by certain types of white blood cells. The white blood cells bind to the antibodies and release substances that kill the target cells or microbes. Also called ADCC and antibody-dependent cellular cytotoxicity.

**antibody-drug conjugate ABBV-085**: An antibody-drug conjugate (ADC) composed of a proprietary monoclonal antibody against a tumor-associated antigen (TAA) linked to an as of yet undisclosed cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of ABBV-085 targets and binds to the TAA expressed on tumor cells. Upon binding and internalization, the cytotoxic agent is released and kills the TAA-expressing cancer cells, through an as of yet unknown mechanism of action. Check for active clinical trials using this agent.

**antibody-drug conjugate ADCT-402**: An antibody-drug conjugate (ADC) consisting of an anti-CD19 humanized monoclonal antibody conjugated, via a cleavable linker comprised of valine-alanine and maleimide, to a

cytotoxic, cross-linking agent pyrrolobenzodiazepine (PBD) dimer, which targets DNA minor grooves, with potential antineoplastic activity. Upon administration, the monoclonal antibody portion of anti-CD19-PBD conjugate ADCT-402 targets the cell surface antigen CD19 on various cancer cells. Upon antibody/antigen binding and internalization, the cytotoxic PBD moiety is released. The imine groups of the PBD moiety bind to the N2 positions of guanines on opposite strands of DNA. This induces interstrand cross-links in the minor groove of DNA and inhibits DNA replication, which inhibits the proliferation of CD19-overexpressing tumor cells. CD19, a transmembrane receptor and tumor-associated antigen (TAA), is expressed on a number of B-cell-derived cancers.

**antibody-drug conjugate BAY79-4620:** A monoclonal antibody (MoAb) directed against the MN protein with potential antineoplastic activity. Upon administration of BAY79-4620, this MoAb may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response and an antibody mediated cellular cytotoxicity (ADCC) against MN-expressing tumor cells. MN, a transmembrane glycoprotein, is expressed in some human carcinomas and appears to be involved in cancer cell proliferation and transformation.

**antibody-drug conjugate DFRF4539A:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody directed against a specific myeloma antigen and conjugated to monomethyl auristatin E (MMAE), an auristatin derivative and a potent microtubule inhibitor, with potential antineoplastic activity. Upon administration, the monoclonal antibody moiety of DFRF4539A selectively binds to a specific protein expressed on the surface of myeloma cells. Upon internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, which results in G2/M phase arrest and tumor cell apoptosis.

**antibody-drug conjugate PF-06647020:** An antibody-drug conjugate (ADC) composed of a proprietary monoclonal antibody against an unnamed tumor-associated antigen (TAA) linked to an as of yet undisclosed cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of PF-06647020 targets and binds to the TAA expressed on tumor cells. Upon binding and internalization, the cytotoxic agent is released and kills the TAA-expressing

cancer cells, through an as of yet unknown mechanism of action. Check for active clinical trials using this agent.

**antibody-drug conjugate SC-002:** An antibody-drug conjugate (ADC) composed of an as of yet publicly unknown monoclonal antibody against a tumor-associated antigen (TAA) linked to an as of yet undisclosed cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of SC-002 targets and binds to the TAA expressed on tumor cells. Upon binding and internalization, the cytotoxic agent is released and kills the TAA-expressing cancer cells, through an as of yet unknown mechanism of action. Check for active clinical trials using this agent.

**antibody-drug conjugate SC-003:** An antibody-drug conjugate (ADC) composed of a proprietary monoclonal antibody against a tumor-associated antigen (TAA) linked to an as of yet undisclosed cytotoxic agent, with potential antineoplastic activity. Upon intravenous administration, the monoclonal antibody moiety of SC-003 targets and binds to the TAA expressed on tumor cells. Upon binding and internalization, the cytotoxic agent is released and kills the TAA-expressing cancer cells, through an as of yet unknown mechanism of action. Check for active clinical trials using this agent.

**Antibody-drug conjugates:** Drugs that are covalently linked to antibodies. One purpose is to enhance drug site-specificity.

**antibody-mediated immunity:** the process by which antibodies bind to antigens and destroy the microorganisms in a highly specific manner.

**antibonding molecular orbital:** a molecular orbital that contains more energy than the atomic orbitals from which it was formed; in other words, an electron is less stable in an antibonding orbital than it is in its original atomic orbital.

**antibonding orbital:** A molecular orbital that can be described as the result of destructive interference of atomic orbitals on bonded atoms. Antibonding orbitals have energies higher than the energies its constituent atomic orbitals would have if the atoms were separate.

**anticachexia :** A type of immune reaction in which a target cell or microbe is coated with antibodies and killed by certain types of white blood cells. The white blood cells bind to the antibodies and release substances that kill

the target cells or microbes. Also called ADCC and antibody-dependent cell-mediated cytotoxicity.

**anticachexia agent MT-102:** A small molecule with potential anticachexia activity. The anticachexia agent MT-102 may increase protein synthesis and decrease muscle protein breakdown. This may result in improved body weight, muscle mass and may improve weakness and fatigue associated with cancer-related cachexia.

**anticancer antibiotic :** A substance made up of a monoclonal antibody chemically linked to a drug. The monoclonal antibody binds to specific proteins or receptors found on certain types of cells, including cancer cells. The linked drug enters these cells and kills them without harming other cells. Some antibody-drug conjugates are used to treat cancer. Also called ADC.

**anticancer therapy :** Describes a drug or effect that works against cachexia (loss of body weight and muscle mass).

**anticarcinogenic :** A type of anticancer drug that blocks cell growth by interfering with DNA, the genetic material in cells. Also called antineoplastic antibiotic and antitumor antibiotic.

**antichlor:** A chemical compound that reacts with chlorine-based bleaches to stop the bleaching. Thiosulfate compounds are antichlors.

**Anticipated transient without scram (ATWS):** An ATWS is one of the "worst case" accidents, consideration of which frequently motivates the NRC to take regulatory action. Such an accident could happen if the scram system (which provides a highly reliable means of shutting down the reactor) fails to work during a reactor event (anticipated transient). The types of events considered are those used for designing the plant.

**anticline:** parallel rock layers folded upward, like an arch.

**anticoagulant :** A substance being studied in the treatment of some types of leukemia and lymphoma. Anti-CD45 monoclonal antibody binds to a protein called CD45, which is found on most types of blood cells and some types of leukemia and lymphoma cells. Anti-CD45 monoclonal antibody may help the immune system kill cancer cells. It is a type of monoclonal antibody.

**anticodon:** the complementary codon present on a tRNA molecule. OR A sequence of three bases on the transfer RNA that pair with the bases in the

corresponding codon on the messenger RNA. OR Three-nucleotide sequence of tRNA that base-pairs with a codon in mRNA.

**anticonvulsant** : An antibody against carcinoembryonic antigen (CEA), a protein present on certain types of cancer cells.

**anticyclone (high-pressure area)**: An atmospheric high-pressure closed circulation with clockwise rotation in the Northern Hemisphere, counterclockwise in the Southern Hemisphere, and undefined at the Equator.

**antidepressant** : A substance that is used to prevent and treat blood clots in blood vessels and the heart. Also called blood thinner.

**antidiarrheal** : A drug or other substance used to prevent or stop seizures or convulsions. Also called antiepileptic.

**antiemetic** : A drug used to treat depression.

**antiepileptic** : A drug that prevents or reduces nausea and vomiting.

**antiestrogen** : A substance being studied in the treatment of certain types of head and neck cancer. Anti-EpCAM-Pseudomonas-exotoxin fusion protein is made by linking a monoclonal antibody fragment to a toxic protein that may kill cancer cells. It binds to EpCAM (a protein on the surface of epithelial cells and some types of cancer cells). Also called Proxinium and VB4-845.

**ANTIFOAM**: An additive used to suppress the foaming characteristics of a formulation in service.

**Antifogger**: An additive that prevents condensation of moisture on glass and other transparent materials, such as windshields or lenses.

**antifolate** : A drug or other substance used to prevent or stop seizures or convulsions. Also called anticonvulsant.

**antifungal** : A substance that keeps cells from making or using estrogen (a hormone that plays a role in female sex characteristics, the menstrual cycle, and pregnancy). Antiestrogens may stop some cancer cells from growing and are used to prevent and treat breast cancer. They are also being studied in the treatment of other types of cancer. An antiestrogen is a type of hormone antagonist. Also called estrogen blocker.

**antifungal agent F901318**: A systemic antifungal agent that can potentially be used in the treatment of systemic fungal infections.

**Antigen:** A foreign substance that elicits the synthesis of an antibody. OR A molecule capable of eliciting the synthesis of a specific antibody in vertebrates. Or The descriptor applied to any substance that produces a specific immune response and is recognised as foreign by the immune system when it enters the tissue of an animal or human. OR A foreign substance that triggers antibody formation and is bound by the corresponding antibody. or A type of drug that stops cells from using folic acid to make DNA and may kill cancer cells. Certain antifolates are used to treat some types of cancer and inflammatory conditions, such as rheumatoid arthritis. Also called folate antagonist and folic acid antagonist.

**antigen-presenting cell :** A drug that treats infections caused by fungi.

**antigen-presenting cell vaccine :** Any substance that causes the body to make an immune response against that substance. Antigens include toxins, chemicals, bacteria, viruses, or other substances that come from outside the body. Body tissues and cells, including cancer cells, also have antigens on them that can cause an immune response. These antigens can also be used as markers in laboratory tests to identify those tissues or cells.

**antigen-targeted personalized breast cancer vaccine:** An individualized, therapeutic cancer vaccine (IVAC) composed of liposomes containing RNA encoding two or three tumor-associated antigens (TAAs) that are specifically expressed in the patient's individual cancer selected from a warehouse ("off the shelf") and p53 RNA, with potential immunostimulatory and antineoplastic activities. Upon administration, the antigen-targeted personalized breast cancer vaccines are translated by antigen presenting cells (APCs) and the expressed protein is presented via major histocompatibility complex (MHC) molecules on the surface of the APCs. This leads to an induction of both cytotoxic T-lymphocyte (CTL) and memory T-cell immune responses against the TAAs. The RNAs in the vaccine are specifically selected for an individual patient after RNA profiling of the patient's tumor.

**Antigenic determinant:** Site on an antigen to which an antibody binds. Also called an epitope.

**antigens:** the immune-stimulating polysaccharides on the surface of cells.

**antiglobulin test :** A type of immune cell that boosts immune responses by showing antigens on its surface to other cells of the immune system. An antigen-presenting cell is a type of phagocyte. Also called APC.

**antihemophilic factor, human recombinant:** The recombinant form of human antihemophilic factor (AH) (Factor VIII) with coagulation promoting activity. Antihemophilic factor binds to factor IXa in the coagulation cascade along with calcium and phospholipid. This complex converts factor X to the activated form, factor Xa. In turn, factor Xa/Va complex activates thrombin, which cleaves fibrinogen into fibrin, eventually resulting in blood clot formation.

**antihistamine :** A laboratory test to identify antibodies that can bind to the surface of red blood cells or platelets and destroy them. This test is used to diagnose certain blood disorders in which patients make antibodies to their own red blood cells or platelets. It is also used to determine blood type. Also called Coombs test.

**antihormone therapy :** A substance being studied in the treatment of cancer. It binds to a protein called hepatocyte growth factor (HGF), which may cause cancer cells to grow. Blocking this may cause cancer cells to die. Anti-HGF monoclonal antibody AMG 102 is a type of monoclonal antibody. Also called AMG 102.

**antihypertensive agent :** A type of drug that blocks the action of histamines, which can cause fever, itching, sneezing, a runny nose, and watery eyes. Antihistamines are used to prevent fevers in patients receiving blood transfusions and to treat allergies, coughs, and colds.

**antilymphocyte globulin :** Having to do with reducing inflammation.

**antimatter:** Any subatomic particle identical in mass to a proton, neutron, or electron, but with the opposite charge. For example, a positron is a positive electron. A collision between a particle and its respective antiparticle results in both being annihilated, with their masses converted to photons of equivalent energy.

**antimetabolite :** Serum from blood that contains antibodies that bind to human T cells. Antilymphocyte globulin is given to a patient before a stem cell transplant to kill T cells and lower the risk of graft-versus-host disease (GVHD). It is also used to treat GVHD and after a kidney transplant to help keep the body from rejecting the kidney. Also called antithymocyte globulin.

**antimetabolite FF-10502:** An antimetabolite with potential antineoplastic activity. Upon administration, FF-10502 is able to enter the nucleus where it

inhibits DNA polymerases, thereby preventing DNA synthesis and halting tumor cell proliferation.

**ANTIMICROBIAL:** A chemical which either destroys or inhibits the growth of microscopic and sub-microscopic organisms.

**antimicrobial :** A substance being studied in the treatment of mesothelioma. Anti-mesothelin monoclonal antibody MORAb-009 binds to a protein called mesothelin, which is found on some cancer cells. Anti-mesothelin monoclonal antibody MORAb-009 may help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called amatuximab and MORAb-009.

**antimicrotubule agent :** A drug that is very similar to natural chemicals in a normal biochemical reaction in cells but different enough to interfere with the normal division and functions of cells.

**antimitotic agent :** A substance that kills microorganisms such as bacteria or mold, or stops them from growing and causing disease.

**Antimony:** Symbol:"Sb" Atomic Number:"51" Atomic Mass: 121.75amu. Antimony has been used for thousands of years. The pure metal is quite brittle. You will find the element used in batteries, alloys, and in the creation of paints and enamels.

**ANTIMONY OXIDE:** A white, odorless, fine powder widely used as a flame retardant in plastics.

**Antimony trioxide (Sb<sub>2</sub>O<sub>3</sub>):** A commonly-used flame retardant additive for plastics, especially polyesters.

**Antimycin A:** An antibiotic from Streptomyces that inhibits the respiratory chain by blocking electron transfer in the cytochrome reductase complex.

**antineoplastic :** A type of drug that blocks cell growth by stopping mitosis (cell division). Antimicrotubule agents interfere with microtubules (cellular structures that help move chromosomes during mitosis). They are used to treat cancer.

**antineoplastic agent combination SM-88:** An orally bioavailable, proprietary combination of four agents with potential antineoplastic activity. Although the four agents and their exact mechanisms of action are not publicly known, the components of SM-88 appear, upon oral administration, to work synergistically to increase the amount of free

radicals in cancer cells, thereby inducing oxidative stress and selective killing of the cancer cells.

**antineoplastic agent TRX-818:** An orally bioavailable agent with potential antineoplastic and anti-vasculogenic mimicry (VM) activities. Although the exact multiple mechanisms of action through which this agent exerts its effects have yet to be fully elucidated, TRX-818, upon oral administration appears to induce cancer cell apoptosis and inhibits cancer cell proliferation. This agent also prevents tumor cell VM by blocking the formation of vasculogenic-like tubular structures through an as of yet undetermined mechanism of action. Check for active clinical trials using this agent.

**antineoplastic antibiotic :** A type of drug that blocks cell growth by stopping mitosis (cell division). They are used to treat cancer. Also called mitotic inhibitor.

**antineoplaston :** Blocking the formation of neoplasms (growths that may become cancer).

**antineoplaston A10:** A piperidinedione antineoplaston with potential antineoplastic activity. Antineoplaston A10 was originally isolated from human urine but is now synthetically derived. This agent intercalates into DNA, resulting in cell cycle arrest in G1 phase, reduction of mitosis, and decreased protein synthesis. Antineoplaston A10 may also inhibit ras-oncogene expression and activate tumor suppressor gene p53, leading to cell differentiation and apoptosis.

**antineoplaston AS2-1:** A 4:1 mixture of phenylacetate and phenylacetylglutamine, degradation products of the antineoplaston agent A10. Antineoplaston AS2-1 inhibits the incorporation of L-glutamine into tumor-cell proteins, leading to cell cycle arrest in the G1 phase and inhibition of mitosis. This agent may also inhibit RAS oncogene expression and activate tumor suppressor gene p53, resulting in cell differentiation and apoptosis.

**antioncogene :** A type of gene that regulates cell growth. When an antioncogene is mutated, uncontrolled cell growth may occur. This may contribute to the development of cancer. Also called tumor suppressor gene.  
OR A type of anticancer drug that blocks cell growth by interfering with DNA, the genetic material in cells. Also called anticancer antibiotic and antitumor antibiotic.

**antioxidant:** Antioxidants are compounds that slow oxidation processes that degrade foods, fuels, rubber, plastic, and other materials. Antioxidants like butylated hydroxyanisole (BHA) are added to food to prevent fats from becoming rancid and to minimize decomposition of vitamins and essential fatty acids; they work by scavenging destructive free radicals from the food. OR Substance which prevents or slows down oxidation of material exposed to air. OR Additive which prevents degradation and oxidation of material when exposed to ambient air during processing and storage of finished product. OR An additive which inhibits the degradation/oxidation of a material when exposed to ambient air, during processing and subsequently in the end-product form. OR Any organic compound that slows the process of oxidation OR Additive used to reduce degradation from oxygen attack at normal or elevated temperatures. Sources such as heat, age, chemicals, and/or stress may accelerate oxygen attack. OR An additive, that when exposed to ambient air, inhibits the degradation and oxidation of material. OR A chemical substance added to a plastic resin to minimize or prevent the effects of oxygen attack on the plastic, e.g., yellowing or degradation. Chemical attacks by oxygen can render a plastic brittle or cause it to lose desired mechanical properties.

**antioxidant :** A substance isolated from normal human blood and urine that is being tested as a type of treatment for some tumors and AIDS.

**Antioxidants & Antiozonants:** These additives are used to prevent the negative effects of oxygen and ozone on the resin materials.

**antiozonant:** Substances that reverse or prevent severe oxidation by ozone. Antiozonants are added to rubber to prevent them from becoming brittle as atmospheric ozone reacts with them over time. Aromatic amines are often used as antiozonants. OR Any substance that slows the severe oxidizing effect of ozone on elastomers. Exposure to ozone typically causes surface cracking in many rubbers

**Antiozonants:** These additives are used to prevent the negative effects of ozone on the resin materials.

**antiparallel:** Describing two linear polymers that are opposite in polarity or orientation.

**Antiparallel b-pleated sheet (b-sheet):** A hydrogen bonded secondary structure formed between two or more extended polypeptide chains.

**antiparasitic** : A type of gene that makes a protein called a tumor suppressor protein that helps control cell growth. Mutations (changes in DNA) in antioncogenes may lead to cancer. Also called tumor suppressor gene.

**antiperspirant cream F511**: A cream formulation containing aluminum chlorohydrate with astringent and antiperspirant activities. Upon topical application of F511 cream, aluminium chlorohydrate forms a gel matrix in the sweat gland which subsequently reduces, then stops the flow of water. In addition, this agent exerts an astringent effect, thereby further preventing sweat formation. Hyperhidrosis appears to play a role in the development of certain mucocutaneous reactions, such as palmar-plantar erythrodysesthesia (PPE), upon administration of chemotherapeutic agents such as doxorubicin, 5-fluorouracil, and capecitabine.

**antiport**: Cotransport of two solutes across a membrane in opposite directions.

**Antiporter**: A transport system in which a molecule is carried across a membrane in the direction opposite that of an ion, which in turn is pumped back across the membrane through active transport linked to ATP hydrolysis.

**antiprogesterin** : A substance being studied in the treatment of glioblastoma (a type of brain tumor) that has come back. It binds to receptors for a protein called platelet-derived growth factor (PDGF). This keeps PDGF from binding to the cells. This may stop the growth of cancer cells and blood vessels that have the receptors for PDGF. It is a type of monoclonal antibody. Also called anti-platelet-derived growth factor receptor alpha monoclonal antibody IMC-3G3 and IMC-3G3.

**antipsychotic** : A substance being studied in the treatment of glioblastoma (a type of brain tumor) that has come back. It binds to receptors for a protein called platelet-derived growth factor (PDGF). This keeps PDGF from binding to the cells. This may stop the growth of cancer cells and blood vessels that have the receptors for PDGF. It is a type of monoclonal antibody. Also called anti-PDGFR alpha monoclonal antibody IMC-3G3 and IMC-3G3.

**antipsychotic agent** : A substance that prevents cells from making or using progesterone (a hormone that plays a role in the menstrual cycle and pregnancy). Antiprogesterins may stop some cancer cells from growing and

they are being studied in the treatment of breast cancer. An antiprogestin is a type of hormone antagonist.

**antipyretic:** A substance that can lessen or prevent fever.

**antiretroviral therapy :** A type of drug used to treat symptoms of psychosis. These include hallucinations (sights, sounds, smells, tastes, or touches that a person believes to be real but are not real), delusions (false beliefs), and dementia (loss of the ability to think, remember, learn, make decisions, and solve problems). Most antipsychotics block the action of certain chemicals in the nervous system. Also called antipsychotic agent and neuroleptic agent.

**antisense:** Having a sequence complementary to a segment of genetic material and serving to inhibit gene function.

**antisense agent :** A type of drug used to treat symptoms of psychosis. These include hallucinations (sights, sounds, smells, tastes, or touches that a person believes to be real but are not real), delusions (false beliefs), and dementia (loss of the ability to think, remember, learn, make decisions, and solve problems). Most antipsychotic agents block the action of certain chemicals in the nervous system. Also called antipsychotic and neuroleptic agent.

**antisense c-fos :** Treatment with drugs that inhibit the ability of the human immunodeficiency virus (HIV) or other types of retroviruses to multiply in the body.

**antisense DNA :** Small pieces of DNA or RNA that can bind to specific molecules of RNA. This blocks the ability of the RNA to make a protein or work in other ways. Antisense agents may be used to block the production of proteins needed for cell growth. They are being studied in the treatment of several types of cancer. Also called antisense oligonucleotide.

**antisense oligonucleotide :** A substance that has been studied in the treatment of cancer and is being studied in the treatment of rheumatoid arthritis and certain skin conditions. It blocks the production of a protein called c-fos, which helps control cell growth. This may kill cancer cells that need c-fos to grow. It is a type of antisense oligonucleotide. Also called c-fos antisense oligonucleotide.

**antisense oligonucleotide therapy :** Small pieces of DNA that can bind to specific molecules of RNA and block the cell's ability to use the RNA to

make a protein or work in other ways. Antisense DNA may be used to block the production of proteins needed for cell growth. It is being studied in the treatment of many types of cancer.

**antisense RNA :** Small pieces of DNA or RNA that can bind to specific molecules of RNA. This blocks the ability of the RNA to make a protein or work in other ways. Antisense oligonucleotides may be used to block the production of proteins needed for cell growth. They are being studied in the treatment of several types of cancer. Also called antisense agent.

**antisense therapy :** Treatment with antisense oligonucleotides. These are small pieces of DNA or RNA that can bind to specific molecules of RNA. This blocks the cell's ability to use the RNA to make a protein or work in other ways. Antisense oligonucleotides are being studied in the treatment of many types of cancer. Also called antisense therapy.

**Antiserum:** Serum prepared from the blood of an immunized animal containing soluble antibodies specific for a particular antigen.

**antisocial :** Small pieces of RNA that can bind to specific molecules of RNA and block the cell's ability to use the RNA to make a protein or work in other ways. Antisense RNA may be used to block the production of proteins needed for cell growth. It is being studied in the treatment of many types of cancer.

**Antistat:** Plastic has a natural tendency to attract static electricity. Additives put in to dissipate static are referred to as antistats.

**Antistatic Agent:** Additive used to improve the electrical conductivity of the plastic part so that any charge can readily go to ground and not remain in the part. OR Agents which, when added to the molding material or applied on the surface of the molded object, make it less conducting (thus hindering the fixation of dust). OR Additive which reduces or eliminates the build-up of static electricity in the material. This can be used in all processes including plastic extrusion manufacturing. OR Additive which imparts a slight degree of electrical conductivity to plastics, permitting the dissipation of static electricity. OR a chemical substance applied to the surface of a plastic article or incorporated in the plastic from which the article is made. The antistatic agent renders the surface of the plastic article less susceptible to the accumulation of electrostatic charges which attract and hold fine dirt or dust on the surface of the plastic article. OR Additive used to improve the electrical conductivity of the plastic part so that

any charge can readily go to ground and not remain in the part. OR Agents which, when added to the molding material or applied on the surface of the molded object, make it less conducting (thus hindering the fixation of dust). OR A chemical substance applied to the surface of a plastic article or incorporated in the plastic from which the article is made. The anti-static agent renders the surface of the plastic article less susceptible to the accumulation of electrostatic charges which attract and hold fine dirt or dust on the surface of the plastic article. OR Additive used to improve the electrical conductivity of the plastic part so that any charge can readily go to ground and not remain in the part. OR Methods of minimizing static electricity in plastic materials. Such agents are of two basic types: (1) metallic devices which come into contact with the plastics and conduct the static to earth. Such devices give complete neutralization at the time, but because they do not modify the surface of the material it can become prone to further static during subsequent handling; (2) chemical additives which, mixed with the compound during processing, give a reasonable degree of protection to the finished products.

**Antistats:** The use of these additives will eliminate or lessen static electricity.

**antithymocyte globulin :** Describes behavior that ignores the rights of others and the practices and laws of society.

**antituberculosis :** A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL R1 on the surface of some tumor cells. This may kill the tumor cells. Anti-TRAIL R1-mAb is a type of monoclonal antibody. Also called HGS-ETR1 and mapatumumab.

**antitumor :** A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL-R2 on the surface of some tumor cells, which may kill the tumor cells. Anti-TRAIL R2 mAb HGS-ETR2 is a type of monoclonal antibody. Also called HGS-ETR2 and lexatumumab.

**antitumor antibiotic :** Describes a drug or effect that works against tuberculosis (a contagious bacterial infection that usually affects the lungs).

**antiviral :** A substance that binds to receptors for a protein called vascular endothelial growth factor (VEGF), which may be found on some types of cancer cells. This may prevent the growth of new blood vessels that tumors need to grow. There are different types of anti-VEGFR monoclonal

antibodies being studied in the treatment of cancer. These substances are a type of antiangiogenesis agent and a type of monoclonal antibody.

**antiviral agent CSJ148:** An antiviral agent that can potentially be used to prevent replication of human cytomegalovirus (HCMV).

**ANTIWEAR ADDITIVE:** Compounds which form, or react to form, thin films on highly loaded parts in operation to prevent metal to metal contact, thereby reducing friction at the point of contact.

**Antoine equation:** A simple 3-parameter fit to experimental vapor pressures measured over a restricted temperature range:  $\log P = A - \frac{B}{C + T}$  - where A, B, and C are "Antoine coefficients" that vary from substance to substance. Sublimations and vaporizations of the same substance have separate sets of Antoine coefficients, as do components in mixtures. The Antoine equation is accurate to a few percent for most volatile substances (with vapor pressures over 10 Torr).

**Antrin:** (Other name for: motexafin lutetium)

**Antrodia cinnamomea supplement:** A dietary supplement containing extract from the medicinal fungus *Antrodia cinnamomea* with potential antiangiogenic, hepatoprotective and antioxidant activities. The components in *Antrodia cinnamomea* supplement are rather complex, however, rich in triterpenoids, polysaccharides, nucleosides (adenosine) nucleic acids, superoxide dismutase, other small molecular weight proteins and steroid like compounds. Neutral sugars in this supplement show inhibitory activity on endothelial tube formation, while maleimide and maleic anhydride derivative components in the extract, such as antrodin B and antrodin C and their metabolites, exhibit significant cytotoxic effects on tumor cells and hepatitis C virus.

**anus :** A drug used with other drugs to treat colorectal cancer and non-small cell lung cancer that have spread to other parts of the body. It is used alone or with another drug to treat cancer of the stomach or gastroesophageal junction (area where the esophagus connects to the stomach) that is advanced or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Anti-VEGFR-2 fully human monoclonal antibody IMC-1121B binds to receptors for a protein called vascular endothelial growth factor (VEGF), which may be found on some types of cancer cells. This may prevent the growth of new blood vessels that tumors need to grow. Anti-VEGFR-2 fully human monoclonal

antibody IMC-1121B is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called Cyramza, IMC-1121B, and ramucirumab.

**anxiety** : A drug used to treat infections caused by viruses.

**anxiolysis** : The opening of the rectum to the outside of the body.

**anxiolytic** : Feelings of fear, dread, and uneasiness that may occur as a reaction to stress. A person with anxiety may sweat, feel restless and tense, and have a rapid heart beat. Extreme anxiety that happens often over time may be a sign of an anxiety disorder.

**anxiolytic agent** : A level of sedation in which a person is very relaxed and may be awake. The person is able to answer questions and follow instructions. Anxiolysis is caused by special drugs and is used to help relieve anxiety during certain medical or surgical procedures. Also called minimal sedation.

**Anzemet** : A drug used to treat symptoms of anxiety, such as feelings of fear, dread, uneasiness, and muscle tightness, that may occur as a reaction to stress. Most anxiolytics block the action of certain chemicals in the nervous system. Also called antianxiety agent and anxiolytic agent.

**aorta**: the major artery of the human circulatory system that receives blood from the left ventricle. Or A drug used to treat symptoms of anxiety, such as feelings of fear, dread, uneasiness, and muscle tightness, that may occur as a reaction to stress. Most anxiolytic agents block the action of certain chemicals in the nervous system. Also called antianxiety agent and anxiolytic.

**aortocoronary bypass** : A drug used to prevent nausea and vomiting caused by chemotherapy. It is also used to prevent nausea and vomiting after surgery. Anzemet blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called dolasetron mesylate.

**AP23573**: The largest artery in the body. It carries oxygen-rich blood away from the heart to vessels that reach the rest of the body.

**AP5346**: Surgery in which a healthy blood vessel taken from another part of the body is used to make a new path for blood around a blocked artery

leading to the heart. This restores the flow of oxygen and nutrients to the heart. Also called CAB and coronary artery bypass.

**apalutamide:** A small molecule and androgen receptor (AR) antagonist with potential antineoplastic activity. Apalutamide binds to AR in target tissues thereby preventing androgen-induced receptor activation and facilitating the formation of inactive complexes that cannot be translocated to the nucleus. This prevents binding to and transcription of AR-responsive genes. This ultimately inhibits the expression of genes that regulate prostate cancer cell proliferation and may lead to an inhibition of cell growth in AR-expressing tumor cells. Check for active clinical trials using this agent.

**apatinib:** An orally bioavailable, small-molecule receptor tyrosine kinase inhibitor with potential antiangiogenic and antineoplastic activities. Apatinib selectively binds to and inhibits vascular endothelial growth factor receptor 2, which may inhibit VEGF-stimulated endothelial cell migration and proliferation and decrease tumor microvessel density. In addition, this agent mildly inhibits c-Kit and c-SRC tyrosine kinases.

**apatorsen:** A second-generation antisense oligonucleotide targeting heat shock protein 27 (Hsp27) with potential antitumor and chemosensitizing activities. Apatorsen suppresses tumor cell expression of Hsp27, which may induce tumor cell apoptosis and enhance tumor cell sensitivity to cytotoxic agents. Hsp27, a chaperone belonging to the small heat shock protein (sHsp) group of proteins, is a cytoprotective protein that supports cell survival under conditions of stress; it has been found to be over-expressed in a variety of human cancers.

**apaziquone:** An indolequinone bioreductive prodrug and analog of mitomycin C with potential antineoplastic and radiosensitization activities. Apaziquone is converted to active metabolites in hypoxic cells by intracellular reductases, which are present in greater amounts in hypoxic tumor cells. The active metabolites alkylate DNA, resulting in apoptotic cell death. This agent displays activity towards both hypoxic solid tumors, which exhibits higher expression of cytochrome P450 reductase, and well-oxygenated malignant cells that overexpress the bioreductive enzyme NQO1 (NAD(P)H: quinone oxidoreductase). Apaziquone may selectively sensitize hypoxic tumor cells to radiocytotoxicity. Check for active clinical trials using this agent.

**APC:** A substance being studied in the treatment of soft tissue and bone cancers. It is also being studied in the treatment of other solid tumors and hematologic cancer. AP23573 stops cells from dividing and may cause cancer cells to die. It is a type of mTOR inhibitor. Also called ridaforolimus.

**APC vaccine :** A substance being studied in the treatment of head and neck cancer. It may kill cancer cells by carrying an anticancer drug into the tumor. It is a type of platinum compound.

**APC8015:** A type of immune cell that boosts immune responses by showing antigens on its surface to other cells of the immune system. An APC is a type of phagocyte. Also called antigen-presenting cell.

**APC8015F:** A vaccine made of antigens and antigen-presenting cells (APCs). APCs boost an immune response by presenting antigens on their surfaces to other cells of the immune system. Also called antigen-presenting cell vaccine. OR A cell-based vaccine composed of previously frozen autologous antigen-presenting peripheral blood mononuclear cells (enriched for a dendritic cell fraction) that have been exposed to a recombinant protein consisting of granulocyte-macrophage colony-stimulating factor (GM-CSF) fused to prostatic-acid phosphatase (PAP), a protein expressed by prostate cancer cells. Upon administration, the vaccine may stimulate an antitumor T-cell response against tumor cells expressing PAP.

**APF530:** A controlled-release formulation of the 5-hydroxytryptamine 3 (5-HT<sub>3</sub>) antagonist granisetron, in which granisetron is encapsulated in a biodegradable poly(ortho ester) polymer, with antiemetic activity. Upon subcutaneous administration, APF530 slowly erodes and releases the active ingredient granisetron over a period of approximately 5 days. As a selective serotonin receptor antagonist, granisetron competitively blocks the action of serotonin at 5-HT<sub>3</sub> receptors, resulting in the suppression of nausea and vomiting.

**aphanitic:** fine grained.

**aphelion:** point in an orbit farthest from the Sun.

**apheresis :** A drug used to treat prostate cancer that has spread. It is made from immune system cells collected from a patient with prostate cancer. The cells are treated with a protein that is made by combining a protein found on prostate cancer cells with a growth factor. When the cells are injected back into the patient, they may stimulate T cells to kill prostate

cancer cells. APC8015 is a type of vaccine and a type of cellular adoptive immunotherapy. Also called Provenge and sipuleucel-T.

**API separator:** A facility developed by the Committee on Disposal or Refinery Wastes of the American Petroleum Institute for separation of oil from wastewater in a gravity differential and equipped with means for recovering the separated oil and removing sludge

**Apidra :** A vaccine made from immune system cells taken from a patient with prostate cancer and frozen for future use. The cells are treated in the laboratory with a growth factor attached to a protein called prostatic-acid phosphatase (PAP), which is found on prostate cancer cells. When APC8015F is injected into the patient, it may cause T cells (a type of white blood cell) to kill tumor cells that have PAP on them.

**apilimod dimesylate capsule:** A capsule containing the dimesylate salt form of apilimod, an inhibitor of the class III PI kinase phosphatidylinositol-3-phosphate 5-kinase (PIKfyve), with potential antineoplastic and immunomodulatory activities. Upon oral administration of apilimod dimesylate capsule, apilimod selectively binds to and inhibits PIKfyve. The inhibition leads to disruption of PIKfyve-mediated signal transduction pathways and eventually inhibits tumor cell growth in PIKfyve-overexpressing tumor cells. Also, PIKfyve inhibition by apilimod inhibits the toll-like receptor (TLR)-induced production of various cytokines, including interleukin-12 (IL-12) and IL-23, thereby preventing IL-12/IL-23-mediated immune responses. PIKfyve, a lipid kinase dysregulated in various tumor types, plays a key role in TLR signaling and tumor cell migration, proliferation and survival.

**apixaban:** An orally active inhibitor of coagulation factor Xa with anticoagulant activity. Apixaban directly inhibits factor Xa, thereby interfering with the conversion of prothrombin to thrombin and preventing formation of cross-linked fibrin clots.

**APL:** A procedure in which blood is collected, part of the blood such as platelets or white blood cells is taken out, and the rest of the blood is returned to the donor. Also called pheresis.

**aplastic anemia :** A drug used to control the amount of sugar in the blood of patients with diabetes mellitus. It is a form of the hormone insulin that is made in the laboratory. Apidra gets into the blood faster than insulin when

it is injected under the skin before or shortly after a meal. It is a type of therapeutic insulin. Also called insulin glulisine.

**Aplidin:** (Other name for: plitidepsin)

**aplidine :** An aggressive (fast-growing) type of acute myeloid leukemia in which there are too many immature blood-forming cells in the blood and bone marrow. It is usually marked by an exchange of parts of chromosomes 15 and 17. Also called acute promyelocytic leukemia and promyelocytic leukemia.

**APN:** A condition in which the bone marrow is unable to produce blood cells.

**Apo-2L :** A substance that is being studied in the treatment of cancer. It is obtained from a marine organism.

**Apoactivator:** A regulatory protein that stimulates transcription from one or more genes in the presence of a coactivator molecule.

**apocrine gland :** A registered nurse who has additional education and training in how to diagnose and treat disease. APNs are licensed at the state level and certified by national nursing organizations. In cancer care, an APN may manage the primary care of patients and their families, based on a practice agreement with a doctor. Also called advanced practice nurse, NP, and nurse practitioner.

**apoenzyme:** The protein portion of an enzyme, exclusive of any organic or inorganic cofactors or prosthetic groups that might be required for catalytic activity.

**apogee:** point in an orbit farthest from the Earth.

**apolipoprotein:** The protein component of a lipoprotein.

**apolizumab:** A cell protein that can attach to certain molecules in some cancer cells and may kill the cells. Apo-2L is being studied in the treatment of cancer. Also called TNF-related apoptosis-inducing ligand, TRAIL, and tumor necrosis factor-related apoptosis-inducing ligand. OR A humanized monoclonal antibody directed against 1D10, a polymorphic determinant on the HLA-DR beta chain that is expressed on normal and neoplastic B cells. Apolizumab induces complement-mediated cytotoxicity, antibody-dependent cell-mediated cytotoxicity, and apoptosis of 1D10 antigen-positive B cells in vitro.

**apomab:** A fully human monoclonal antibody directed against human death receptor 5 (DR5; TRAIL-R2; TNFRSF10B) with potential proapoptotic and antineoplastic activities. Mimicking the natural ligand TRAIL (tumor necrosis factor-related apoptosis inducing ligand), apomab binds to DR5, which may directly activate the extrinsic apoptosis pathway and indirectly induce the intrinsic apoptosis pathway in tumor cells. DR5 is a cell surface receptor of the TNF-receptor superfamily and is expressed in a broad range of cancers.

**Apoptosis:** A cascade of proteolytic enzymes that results in controlled cell death in response to significant cell damage or specific developmental programs. Also called programmed cell death. OR term defining the process of programmed cell death

**apoptosis :** A type of gland that is found in the skin, breast, eyelid, and ear. Apocrine glands in the breast secrete fat droplets into breast milk and those in the ear help form earwax. Apocrine glands in the skin and eyelid are sweat glands. Most apocrine glands in the skin are in the armpits, the groin, and the area around the nipples of the breast. Apocrine glands in the skin are scent glands, and their secretions usually have an odor. Another type of gland (eccrine gland or simple sweat gland) produces most sweat.

**apoptosis inducer BZL101:** An orally active aqueous extract derived from the plant *Scutellaria barbata* with potential antineoplastic activity. Sparing normal cells, apoptosis inducer BZL101 specifically facilitates translocation of the protein apoptosis-inducing factor (AIF) from the mitochondrial membrane into the nucleus in tumor cells, thereby causing tumor cell-specific chromatin condensation and DNA degradation followed by the induction of caspase-independent apoptosis. AIF is both a mitochondrial intermembrane flavoprotein with oxidoreductase activity and a caspase-independent death effector that, similar to cytochrome c, is released from mitochondria early in the apoptotic process. Check for active clinical trials using this agent.

**apoptosis inducer GCS-100:** A galectin-binding polysaccharide derived from citrus pectin with potential antineoplastic activity. Apoptosis inducer GCS-100 binds to the carbohydrate-binding domain of the lectin galectin-3, which may result in apoptosis mediated through mitochondria/caspase activation cascades; this agent may overcome tumor growth mediated through anti-apoptotic protein Bcl-2, heat shock protein-27 (Hsp-27), and

nuclear factor-kappa B (NF-kB). Galectin-3, a chimeric molecule consisting of both carbohydrate recognition and collagen-like domains, interacts with a variety of carbohydrate and protein ligands to form pentamers with unique crosslinking abilities; this lectin also exhibits anti-apoptotic properties, perhaps, in part, through the regulation of intracellular signaling pathways.

**apoptosis inducer MPC-2130:** A broad-acting, apoptosis-inducing, small molecule with potential antineoplastic activity. Although the exact mechanism of action has yet to be fully elucidated, apoptosis inducer MPC-2130 exhibits proapoptotic activities in tumor cells, including membrane phosphatidylserine externalization, release of cytochrome C from mitochondria, caspase activation, cell condensation, and DNA fragmentation. In addition, because this agent is not a substrate for several types of multidrug resistance (MDR) ABC superfamily transporters, such as P-glycoprotein 1 (MDR-1), multidrug resistance-associated protein 1 (MRP1), and breast cancer resistance protein 1 (BCRP1/ABCG2), it may be useful in treating MDR tumors that express these particular MDR efflux pumps. Check for active clinical trials using this agent.

**apoptotic autologous tumor cells-pulsed alpha-type-1 polarized dendritic cells:** A cell-based cancer vaccine composed of mature polarized dendritic cells (DCs) and pulsed with apoptotic autologous tumor cells that has potential immunostimulating and antineoplastic activities. Dendritic cells (DCs) were treated with interleukin-1 beta, tumor necrosis factor alpha, interferon-alpha (IFN-a), IFN-gamma and polyinosinic:polycytidylic acid (p-I:C) to produce mature alpha type-1 polarized DCs (alphaDC1) that are capable of producing high levels of interleukin-12p70 (IL-12p70). The alphaDC1 are subsequently pulsed with apoptotic autologous tumor cells. Upon administration, these DCs are able to induce a potent cytotoxic T lymphocyte (CTL) response against tumor associated antigens (TAAs), resulting in tumor cell lysis and inhibition of tumor cell growth. Apoptotic tumor cells contain an array of TAAs.

**APOTONE:** (Other name for: androstane steroid HE3235)

**apparent diameter:** the diameter of an object as it appears to an observer; changes with distance.

**apparent magnitude:** how bright a star appears to someone on Earth.

**APPARENT SHEAR RATE:** The shear rate determined in capillary viscometers without making a correction (Rabinowitsch) for shear thinning.

It turns out that the apparent shear rate is equal to  $4Q/p R^3$  where Q is the volumetric flow rate ( $m^3/s$ ) and R is the radius (m) of the capillary.

**APPARENT VISCOSITY:** The viscosity determined in capillary viscometry without making a correction (Rabinowitsch) for shear thinning. The apparent viscosity is equal to the shear stress divided by the apparent shear rate, which is where DP is the pressure drop (Pa), Q is the volumetric flow rate ( $m^3/s$ ), L is the length (m) and R is the radius (m) of the capillary die.

**appendage :** A substance being studied in the treatment of hematologic (blood) cancers. Apolizumab binds to a protein called ID10, which is found on the surface of some types of immune cells and cancer cells. It may help the immune system kill cancer cells. It is a type of monoclonal antibody.

**appendectomy :** A type of cell death in which a series of molecular steps in a cell lead to its death. This is one method the body uses to get rid of unneeded or abnormal cells. The process of apoptosis may be blocked in cancer cells. Also called programmed cell death.

**appendix :** a small fingerlike process that may be a vestige of larger organs functional in human ancestors. Or In medicine, a body part (such as an arm or leg) that is attached to the main part of the body.

**appetite :** Surgery to remove the appendix (small finger-shaped pouch at the end of the first part of the large intestine).

**Application:** The act of applying or putting to use. What the molded plastic article will be in its final form. OR The act of putting something to use—a material's final purpose is its application. OR The act of applying or putting to use, i.e. What the plastic extrusion profile will be used for in its final form.

**Application Torque:** The torque force, measured in inch-pounds, required to screw a closure onto a container.

**Applicator Cap:** A closure designed to apply the contents of the container.

**appositive:** a word or group of words that restates or identifies the noun or pronoun it is next to.

**aprepitant:** A small molecule, high-affinity substance P antagonist (SPA) with antiemetic activity. Crossing the blood brain barrier, aprepitant binds selectively to the human substance P/neurokinin 1 receptor in the central nervous system (CNS), thereby inhibiting receptor binding of endogenous

substance P and substance P-induced emesis. This agent has little or no affinity for serotonin type 3 (5-HT<sub>3</sub>), dopamine, and corticosteroid receptors. or A small, fingerlike pouch that sticks out from the cecum (the first part of the large intestine near the end of the small intestine).

**apricoxib:** An orally bioavailable nonsteroidal anti-inflammatory agent (NSAID) with potential antiangiogenic and antineoplastic activities. Apricoxib binds to and inhibits the enzyme cyclooxygenase-2 (COX-2), thereby inhibiting the conversion of arachidonic acid into prostaglandins. Apricoxib-mediated inhibition of COX-2 may induce tumor cell apoptosis and inhibit tumor cell proliferation and tumor angiogenesis. COX-related metabolic pathways may represent crucial regulators of cellular proliferation and angiogenesis.

**Apriso:** (Other name for: mesalamine)

**aprotic solvent:** A solvent that does not act as an acid or as a base; aprotic solvents don't undergo autoprotolysis. Examples are pentane, pet ether, and toluene.

**aprotinin bovine:** A single chain polypeptide isolated from bovine lung with antifibrinolytic and anti-inflammatory activities. As a broad-spectrum serine protease inhibitor, aprotinin bovine competitively and reversibly inhibits the activity of a number of different esterases and proteases, including trypsin, chymotrypsin, kallikrein, plasmin, tissue plasminogen activator, and tissue and leukocytic proteinases, resulting in attenuation of the systemic inflammatory response (SIR), fibrinolysis, and thrombin generation. This agent also inhibits pro-inflammatory cytokine release and maintains glycoprotein homeostasis. Check for active clinical trials using this agent.

**Aptivus :** A desire to satisfy a physical or mental need, such as for food, sex, or adventure.

**Aptosyn:** (Other name for: exisulind)

**AQL:** Accepted quality level

**aqua regia:** A mixture of nitric and hydrochloric acids, usually 1:3 or 1:4 parts HNO<sub>3</sub> to HCl, used to dissolve gold.

**Aquacel AG with Hydrofiber:** (Other name for: ionic silver-impregnated sodium carboxymethyl cellulose antimicrobial dressing)

**Aquacel Dressing:** (Other name for: sodium carboxymethylcellulose dressing)

**Aquadiol:** (Other name for: therapeutic estradiol)

**Aquaphor:** (Other name for: petrolatum-mineral oil-lanolin-ceresin ointment)

**Aquasol A:** (Other name for: retinol)

**aqueous:** refers to a solution with water as solvent. OR A substance dissolved in water. Or A drug used together with other drugs to prevent and control the nausea and vomiting caused by cancer treatment. It is also used to treat nausea and vomiting after surgery. It is a type of antiemetic and a type of substance P/neurokinin 1 receptor antagonist. Also called Emend.

**aquiclude:** an impermeable layer such as clay that retards the flow of groundwater.

**aquifer:** a porous, permeable, saturated formation of rock or soil through which groundwater flows easily. Or a subsurface geological structure that contains water. Or Water bearer. Earth materials that contain ground water and through which ground water may flow freely. Some examples of these include sand, porous sandstone, and gravel. Aquifers vary widely in their ability to hold water and the speed at which water flows through them.

**aquitard:** a formation such as shale, clay, or unfractured igneous rocks that retards water flow.

**AR:** A drug used with another drug, ritonavir, to treat patients who are infected with HIV (the virus that causes AIDS) and have been treated with other anti-HIV drugs. Aptivus blocks the HIV virus from making copies of itself. It is a type of anti-HIV agent and a type of protease inhibitor. Also called tipranavir sodium.

**AR antagonist BMS-641988:** A nonsteroidal androgen receptor (AR) antagonist with anti-androgenic and potential antineoplastic activities. AR antagonist BMS-641988 binds to ARs in target tissues and prevents AR activation, which may result in the inhibition of AR-mediated transcriptional activity and tumor cell death in susceptible tumor cell populations. Global gene expression analysis has shown that exposure to this agent may result in a phenotype that is closer to a castration phenotype than is achievable with other antiandrogens such as bicalutamide.

**AR antagonist ODM-201:** A formulation containing an androgen receptor (AR) antagonist with potential antineoplastic activity. AR antagonist ODM-201 binds to ARs in target tissues; subsequently, inhibiting androgen-induced receptor activation and facilitating the formation of inactive complexes that cannot translocate to the nucleus. This prevents binding to and transcription of AR-responsive genes that regulate prostate cancer cell proliferation. This ultimately leads to an inhibition of growth in AR-expressing prostate cancer cells.

**AR+ :** Having to do with water.

**Arachidonate:** Derived from linoleate, a 20:4 fatty acid that is a major precursor to several classes of signal molecules, including prostaglandins.

**arachnodactyly:** abnormally long and slender fingers and toes

**aragonite:** A mineral species of calcium carbonate ( $\text{CaCO}_3$ ) with a crystal structure different from that of vaterite and calcite, which are the other two forms of  $\text{CaCO}_3$ . It is precipitated from ocean surface waters mainly by organisms (e.g., coral) that use it to make their shells and skeletons.

**Aralast:** (Other name for: alpha-1-proteinase inhibitor human)

**Aramid:** any of a group of lightweight by very strong heat-resistant synthetic aromatic polyamide materials that are fashioned into fibers, filaments, or sheets.

**Aranelle:** (Other name for: ethinyl estradiol/norethindrone)

**Aranesp:** (Other name for: darbepoetin alfa)

**Arava:** (Other name for: leflunomide)

**Arc:** 1) A luminous glow formed by the flow of electric current through ionized air, gas or vapor between separated electrodes or contacts. 2) A portion of the circumference of a circle.

**Arc Resistance:** 1) The resistance to the flow of current offered by the voltaic arc (i.e., if the carbons of an arc lamp are  $1/32$ " apart, the arc resistance will be  $1-1/2$  ohms). 2) The resistance of a material to the effects of an arc passing across its surface stated as a measure of the total elapsed time taken to form a conducting path (of material carbonizing by the arc flame) across the surface under prescribed conditions of applications of a high voltage, low current arc (as across an insulator).

**arc-continent convergence:** the result when intervening ocean is destroyed by subduction, welding an island arc to the continental edge.

**archaebacteria:** ancient bacteria that have a different ribosomal structure, membrane composition, and cell wall composition than modern bacteria.

**Archexin:** (Other name for: Akt antisense oligonucleotide RX-0201)

**Architrave:** A carpentry term which describes the moulding surrounding a door or window opening.

**arcitumomab:** A murine IgG monoclonal Fab fragment antibody labeled with technetium-99m directed against carcinoembryonic antigen (CEA), a protein that is overexpressed by many tumor cell types. For tumors that overexpress CEA, arcitumomab may be used as an adjunct diagnostic imaging tool to obtain prognostic information following resection and to monitor for recurrent disease.

**Arcoxia:** (Other name for: etoricoxib)

**Arctic haze:** A persistent winter diffuse layer in the Arctic atmosphere whose origin may be related to long-range transport of midlatitude continental man-made pollutants.

**arctigenin :** A protein that binds male hormones called androgens. ARs are found inside the cells of male reproductive tissue, some other types of tissue, and some cancer cells. In prostate cancer, androgens bind to ARs inside the cancer cells, which causes the cancer cells to grow. Also called androgen receptor.

**arctiin :** Describes cells that have a protein that binds to androgens (male hormones). Cancer cells that are AR+ may need androgens to grow. These cells may stop growing or die when they are treated with substances that block the binding and actions of androgen hormones. Also called androgen receptor positive.

**arcus cornea:** whitish ring on the peripheral cornea

**area:** Measures the size of a surface using length measurements in two dimensions. OR The amount of surface enclosed by a closed figure.

**Aredia :** (Other name for: pamidronate disodium) OR A substance found in certain plants, including burdock. It has shown antiviral and anticancer effects. Arctigenin belongs to a group of substances called lignans.

**Arene:** Any carbon compound containing a six membered ring of carbons, each of which forms only one chemical bond outside of the ring. This is called a phenyl ring, and though it looks like it has alternating single and double bonds, all the bonds are actually the same. Benzene is the

simplest arene; other examples are toluene, fulvic acid, and trinitrotoluene OR an aromatic hydrocarbon. OR A hydrocarbon that contains at least one aromatic ring.

**areola :** A substance found in certain plants, including burdock. It has shown anticancer effects. Arctiin belongs to a group of substances called lignans.

**arete:** a sharp ridge that commonly extends downward from a horn to separate two adjacent glacial valleys.

**arginine :** A drug used to treat hypercalcemia (high blood levels of calcium) caused by certain types of cancer. It is also used with other anticancer drugs to treat multiple myeloma and breast cancer that has spread to bone. It is also used to treat Paget disease of the bone. Aredia may help keep bone from breaking down and prevent the loss of calcium from the bones. It is a type of bisphosphonate. Also called pamidronate disodium.

**arginine butyrate:** The area of dark-colored skin on the breast that surrounds the nipple. OR The butyric acid salt of the amino acid arginine. In EBV-related lymphomas, arginine butyrate induces EBV thymidine kinase transcription and may act synergistically with the antiviral agent ganciclovir to inhibit cell proliferation and decrease cell viability. In addition, the butyrate moiety inhibits histone deacetylase, which results in hyperacetylation of histones H3 and H4. Acetylated histones have a reduced affinity for chromatin; this reduced histone-chromatin affinity may allow chromosomal unfolding, potentially enhancing the expression of genes related to tumor cell growth arrest and apoptosis.

**arginine/omega-3 fatty acids/nucleotides oral supplement:** An oral nutritional supplement, containing substantial amounts of polyunsaturated fatty acids, arginine, and nucleotides, with potential immunostimulating activity. Omega-3 fatty acids/arginine/nucleotides oral supplement may enhance activities of key components of the immune system, including lymphocytes, antigen presenting cells (APCs), and various cytokines.

**arginine61442:** An essential amino acid and building block of proteins. Arginine acts as a base under physiological conditions; the double-bonded nitrogen on the end of the side chain readily captures a hydrogen ion, becoming positively charged. This charged side group makes arginine hydrophilic.

**ArginMax:** (Other name for: L-arginine/Korean ginseng/ Ginkgo biloba/damiana-based supplement)

**Argon:** Symbol:"Ar" Atomic Number:"18" Atomic Mass: 39.95amu. Argon has no color, no smell, and is one of the noble or inert gases. It can be found in welding, making silicon chips, light bulbs, and radio tubes.

**argon beam coagulator ablation :** One of the twenty common amino acids (building blocks of proteins). Arginine is being studied as a nutritional supplement in the treatment and prevention of cancer and other conditions. Also called L-arginine.

**argonaute:** proteins that are components of the RISC

**Aricept:** (Other name for: donepezil hydrochloride)

**arid:** climates that are extremely dry, with low precipitation and high evapotranspiration.

**Arimidex:** (Other name for: anastrozole) OR A substance that is being studied in the treatment of cancer.

**Aristocort:** (Other name for: triamcinolone)

**Aristocort A:** (Other name for: triamcinolone acetonide)

**Arixtra:** (Other name for: fondaparinux sodium) or A procedure that destroys tissue with an electrical current passed through a stream of argon gas to the tissue. It is used to treat endometriosis and other conditions, and to stop blood loss during surgery.

**ARMD:** A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Arimidex lowers the amount of estrogen made by the body. This may stop the growth of cancer cells that need estrogen to grow. Arimidex is a type of nonsteroidal aromatase inhibitor. Also called anastrozole.

**armodafinil:** The R-enantiomer of the racemic synthetic agent modafinil with central nervous system (CNS) stimulant and wakefulness-promoting activities. Although the exact mechanism of action has yet to be fully elucidated, armodafinil appears to inhibit the reuptake of dopamine by binding to the dopamine-reuptake pump, which leads to an increase in extracellular dopamine levels in some brain regions. This agent does not bind to or inhibit several receptors and enzymes that may be involved in sleep/wake regulation and is not a direct- or indirect-acting dopamine

receptor agonist. Armodafinil has a longer half-life than modafinil. OR A drug used to prevent blood clots from forming inside blood vessels in the leg. It is being studied in the prevention of blood clots in some cancer patients, including women having surgery for cancer of the reproductive tract. It is a type of anticoagulant. Also called fondaparinux and fondaparinux sodium.

**ARMS:** A condition in which there is a slow breakdown of cells in the center of the retina (the light-sensitive layers of nerve tissue at the back of the eye). This blocks vision in the center of the eye and can cause problems with activities such as reading and driving. ARMD is most often seen in people who are over the age of 50. Also called age-related macular degeneration, AMD, and macular degeneration.

**Arnebia Indigo Jade Pearl topical cream:** A proprietary multiherbal topical cream based on Chinese herbal medicine with potential antineoplastic, antiviral, antibacterial and immunostimulatory activities. Arnebia Indigo Jade Pearl topical cream contains 12 ingredients including 9 herbs infused in sesame oil, with an additional three powdered ingredients and beeswax added to the infused oil to create the salve. The purported mechanism(s) of action is unclear due to the complexity of the herbal mixture.

**Aromasin :** A drug that is used to treat certain sleep disorders, such as narcolepsy. It makes patients feel more alert and awake. It is also being studied in the treatment of insomnia and fatigue in patients treated for cancer. Armodafinil acts in a part of the brain that controls sleep and wakefulness. It is a type of wakefulness-promoting agent. Also called Nuvigil.

**aromatase inhibitor :** A soft tissue tumor that is most common in older children and teenagers. It begins in embryonic muscle cells (cells that develop into muscles in the body). It can occur at many places in the body, but usually occurs in the trunk, arms, or legs. Also called alveolar rhabdomyosarcoma.

**aromatherapist :** A drug used to treat advanced breast cancer and to prevent recurrent breast cancer in postmenopausal women who have already been treated with tamoxifen. It is also being studied in the treatment of other types of cancer. Aromasin causes a decrease in the amount of

estrogen made by the body. It is a type of aromatase inhibitor. Also called exemestane.

**aromatherapy** : A drug that prevents the formation of estradiol, a female hormone, by interfering with an aromatase enzyme. Aromatase inhibitors are used as a type of hormone therapy for postmenopausal women who have hormone-dependent breast cancer.

**aromatherapy infusion** : A person who practices a type of complementary medicine called aromatherapy. This therapy uses plant oils that give off strong, pleasant smells to promote relaxation and a sense of well-being. The plant oils are usually inhaled or put on the skin using wet cloths, baths, or massage.

**aromatherapy massage** : A type of complementary and alternative medicine that uses plant oils that give off strong pleasant aromas (smells) to promote relaxation, a sense of well-being, and healing.

**aromatic**: refers to an organic compound with a benzene-like ring. OR A large class of cyclic organic compounds derived from, or characterized by the presence of the benzene ring and its homologs.

**aromatic** : The process of heating (without boiling) a mixture of water and an essential oil (scented liquid taken from a plant) to release a pleasant aroma. Aromatherapy infusion may also refer to the process of heating an herb in liquid to release the essential oils. Inhaled oxygen scented by aromatherapy infusion is being studied as a complementary therapy (used in addition to standard treatments) to relieve pain and shorten recovery time in patients undergoing colonoscopy.

**aromatic compound**: a compound that possesses a closed-shell electron configuration as well as resonance. This type of compound obeys Hückel's rule. OR A compound containing an aromatic ring. Aromatic compounds have strong, characteristic odors.

**Aromatic Hydrocarbons**: Hydrocarbons derived from or characterized by presence of unsaturated resonant ring structures.

**aromatic ring**: An exceptionally stable planar ring of atoms with resonance structures that consist of alternating double and single bonds, e. g. benzene:

**aromaticity**: The unusual stability that results from a continuous cyclic system of  $4n + 2$  (where  $n$  is any integer) pi-electrons in a cyclic compound.

This stability results from complete filling of bonding pi molecular orbitals.

**Aromatics Family:** The Aromatics are a group of unsaturated hydrocarbons all sharing a common unsaturated six carbon ring. Benzene is the simplest aromatic compound and consists solely of this ring structure, with the other members having hydrocarbon side groups connected to the main ring. Aromatics are named Aromatic after the sharp smell associated with the family and are produced in processes involving the pyrolysis of hydrocarbon streams such as steam crackers and refinery reformer units.

**Aroplatin:** (Other name for: liposomal oxaliplatin) or (Other name for: liposomal NDDP)

**arousal :** A type of complementary and alternative medicine that uses rubbing and kneading of the skin with plant oils that give off strong, pleasant aromas (smells) to promote relaxation, a sense of well-being, and healing.

**Arranon:** (Other name for: nelarabine)

**Arranon :** Having an odor, which often is pleasant or spicy.

**Arrestin:** A protein that plays a role in the termination of the visual signal-transduction pathway by binding to phosphorylated rhodopsin and preventing further interaction with transducin. Arrestin may function similarly in other 7TM-dependent signal-transduction pathways.

**Arrhenius equation:** In 1889, Svante Arrhenius explained the variation of rate constants with temperature for several elementary reactions using the relationship  $k = A \exp(-E_a/RT)$  where the rate constant  $k$  is the total frequency of collisions between reaction molecules  $A$  times the fraction of collisions  $\exp(-E_a/RT)$  that have an energy that exceeds a threshold activation energy  $E_a$  at a temperature of  $T$  (in kelvins).  $R$  is the universal gas constant.

**Arrhenius theory:** a theory (limited to aqueous systems) that defines an acid as a compound that liberates hydrogen ions and a base as a compound that liberates hydroxide ions. A neutralization is the reaction of a hydrogen ion with a hydroxide ion to form water.

**arrhenoblastoma :** The state of being alert and ready to respond, or waking from sleep.

**Arris:** The sharp edge formed by the intersection of two surfaces. This term is commonly used to refer to the edges in a moulding.

**arroyo:** a narrow gorge with steep walls and a gravel bottom; produced over time by flash floods.

**Arsenate Mineral:** A mineral that is made up of compounds with an arsenic atom or arsenic oxide group bonded to a metal. Erythrite is a good example of a arsenate mineral.

**Arsenic:** Symbol:"As" Atomic Number:"33" Atomic Mass: 74.92amu. Classified as a semi-metallic element, Arsenic is probably best known as a poison. While highly toxic, this grey, semi-metallic element is used in lasers, insecticides, and in some fireworks.

**arsenic :** A drug used to treat certain types of T-cell acute lymphoblastic leukemia (T-ALL) and T-cell lymphoblastic lymphoma (T-LBL). It belongs to the family of drugs called antimetabolites. Also called 506U78 and nelarabine.

**arsenic trioxide:** A rare type of ovarian tumor in which the tumor cells secrete a male sex hormone. This may cause virilization (the appearance of male physical characteristics in females). Also called androblastoma and Sertoli-Leydig cell tumor of the ovary. OR A small-molecule arsenic compound with antineoplastic activity. The mechanism of action of arsenic trioxide is not completely understood. This agent causes damage to or degradation of the promyelocytic leukemia protein/retinoic acid receptor-alpha (PML/RARa) fusion protein; induces apoptosis in acute promyelocytic leukemia (APL) cells and in many other tumor cell types; promotes cell differentiation and suppresses cell proliferation in many different tumor cell types; and is pro-angiogenic.

**ART:** A term used to describe collectively a number of noncoital methods of conception that are used to treat infertility with donor or nondonor eggs and sperm including in vitro fertilization (IVF), gamete intrafallopian transfer (GIFT), and zygote intrafallopian transfer (ZIFT). Also called assisted reproductive technology.

**art therapy :** A poisonous chemical used to kill weeds and pests. Also used in cancer therapy.

**artemether sublingual spray:** A sublingual spray containing artemether, a semisynthetic derivative of artemisinin, an endoperoxide extracted from the Chinese herb qinghaosu (*Artemisia annua* or annual wormwood), with antiparasitic and potential antineoplastic activity. Upon sublingual application of the spray, artemether exerts its antineoplastic activity through

as of yet not fully elucidated mechanism(s) of action. This agent binds to heme molecules inside cells, thereby inducing reactive oxygen species (ROS)-mediated damage which selectively kills cancer cells. In addition, artemether appears to target and modulate the expression of various proteins involved in cancer cell proliferation, angiogenesis, invasion and metastasis. Also, this agent depletes T regulatory cells, and modulates the production of inflammatory cytokines, such as interleukin-4 and interferon-gamma. Altogether, this inhibits tumor cell proliferation. The sublingual spray allows faster absorption of a higher percentage of the artemether dose, when compared to the oral form, as it avoids first pass metabolism; this results in an increased efficacy.

**Artemisia vulgaris:** An herbal remedy containing the leaves and/or flowering tops of a species of wormwood (*Artemisia absinthium*) with potential anticachexia activity. Upon oral consumption, *Artemisia absinthium* may decrease production of pro-inflammatory cytokines such as TNF-alpha. As increased levels of pro-inflammatory cytokines is correlated with decreased appetite and weight loss, *Artemisia absinthium* may increase appetite and improve weight gain.

**arterial embolization :** A drug used to treat acute promyelocytic leukemia (APL) that has not gotten better or that has come back after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Also called Trisenox.

**arteries:** the channels through which fluid flows away from the heart.

**arteriogram :** Treatment that uses the making of art and the response to art to improve one's physical, mental, and emotional well-being. Art therapy is sometimes used together with psychotherapy (talk therapy).

**arteriography :** A procedure in which the blood supply to a tumor or an abnormal area of tissue is blocked. During arterial embolization, a small incision (cut) is made in the inner thigh and a catheter (thin, flexible tube) is inserted and guided into an artery near the tumor or abnormal tissue. Once the catheter is in place, small particles made of tiny gelatin sponges or beads are injected. This blocks the artery and stops the flow of blood to the tumor or abnormal area of tissue. Arterial embolization is used to treat some types of liver cancer, kidney cancer, and neuroendocrine tumors. It may also be used to treat uterine fibroids, aneurysms, and other conditions. Also called TAE and transarterial embolization.

**artery :** An x-ray of arteries. The person receives an injection of a dye that outlines the vessels on the x-ray.

**artesian well:** a well that taps water from a confined aquifer.

**artesunate:** A water-soluble, semi-synthetic derivative of the sesquiterpene lactone artemisinin with anti-malarial, anti-shistosomiasis, antiviral, and potential anti-neoplastic activities. Upon hydrolysis of artesunate's active endoperoxide bridge moiety by liberated heme in parasite-infected red blood cells, reactive oxygen species and carbon-centered radicals form, which have been shown to damage and kill parasitic organisms.

Additionally, in vitro studies demonstrate that this agent induces DNA breakage in a dose-dependent manner. Artesunate has also been shown to stimulate cell differentiation, arrest the cell cycle in the G1 and G2/M phases, inhibit cell proliferation, and induce apoptosis through mitochondrial and caspase signaling pathways. Artemisinin is isolated from the plant *Artemisia annua*.

**arthralgia :** A procedure to x-ray arteries. The arteries can be seen because of an injection of a dye that outlines the vessels on the x-ray.

**arthritis :** A blood vessel that carries blood from the heart to tissues and organs in the body.

**artichoke whole phytocomplex concentrate:** A whole phytocomplex concentrate (W.P.C.) composed of a standardized extract of the *Cynara scolymus* (artichoke) leaf with potential antioxidant, protective and chemopreventive activities. Artichoke W.P.C. is high in flavonoids and polyphenols, such as caffeoylquinic acids, which are mainly responsible for the pharmacological effects of the extract. Artichoke W.P.C. also contains protein, fiber, vitamins, minerals, numerous enzymes, volatile oils, phytosterols and polyunsaturated fatty acids.

**articular cartilage:** cartilage covering the bony ends of the articulating joints

**artificial pacemaker :** Joint pain.

**Artificially balanced runner system :** balancing a runner system by adjusting the pressure drop of a long large diameter runner against a short small diameter runner. Since pressure drop over the small diameter runner will be much more affected by heat loss than the large diameter runner, an artificially balanced runner system will work with a set range of molding

conditions. The width of this range of molding conditions determines the stability of the molding.

**aryl:** A molecular fragment or group attached to a molecule by an atom that is on an aromatic ring.

**aryl group:** a group produced by the removal of a proton from an aromatic molecule.

**aryl halide:** a compound in which a halogen atom is attached to an aromatic ring.

**Arzerra :** A disease that causes inflammation and pain in the joints.

**arzoxifene hydrochloride:** (Other name for: ofatumumab) OR The hydrochloride salt of arzoxifene, a synthetic aromatic derivative with anti-estrogenic properties. Arzoxifene binds to estrogen receptors as a mixed estrogen agonist/antagonist. In comparison to other selective estrogen receptor modulators (SERMs), arzoxifene exhibits greater bioavailability and higher anti-estrogenic potency in the breast than raloxifene; it exhibits reduced estrogenicity in the uterus compared with either tamoxifen or raloxifene. This agent may have beneficial effects on bone and the cardiovascular system. or An electronic device that is implanted in the body to monitor heart rate and rhythm. It gives the heart electrical stimulation when it does not beat normally. It runs on batteries and has long, thin wires that connect it to the heart. Also called cardiac pacemaker and pacemaker.

**AS03-adjuvanted H1N1 pandemic influenza vaccine:** A split-virus, inactivated influenza A (H1N1) vaccine containing H1N1 immunizing antigen combined with the adjuvant AS03, with potential immunostimulating activity. Upon intramuscular vaccination, AS03-adjuvanted H1N1 influenza vaccine may elicit an immune response against the H1N1 virus and the production of anti-H1N1 antibodies. AS03 is a stabilized oil-in-water emulsion adjuvant containing DL-alpha-tocopherol, squalene and polysorbate 80 that non-specifically stimulates cell-mediated immune antigen responses.

**ASA:** Acrylic-styrene-acrylonitrile

**Asacol:** (Other name for: mesalamine)

**asaley:** An L-leucine derivative of melphalan with antineoplastic activity. Asaley alkylates and crosslinks DNA, resulting in disruption of DNA synthesis. Check for active clinical trials using this agent.

**Asbestos:** A gray, non-burning, non-conductive and chemical resistant material occurring in long fibers or fibrous masses, sometimes used as a filler for reinforcement.

**asbestos :** A drug used to treat chronic lymphocytic leukemia (CLL) that has not gotten better with other anticancer drugs. It is also used with chlorambucil in patients who have not already been treated and cannot receive certain anticancer drugs. It is also being studied in the treatment of other types of cancer. Arzerra binds to a protein called CD20, which is found on B cells (a type of white blood cell) and some types of leukemia and lymphoma cells. This may help the immune system kill cancer cells. Arzerra is a type of monoclonal antibody. Also called HuMax-CD20 and ofatumumab.

**Asbestos cement:** Usually refers to a type of asbestos sheet, or to casting where the asbestos is bonded together with Portland cement, e.g. asbestos, cement sheet, tiles, rain-water pipes, etc.

**asbestosis:** The damage to the the lungs caused specifically by exposure to, and inhalation of, asbestos fibres.

**asbestosis :** A substance being studied in the treatment of osteoporosis and breast cancer. Arzoxifene hydrochloride is made in the laboratory and binds to estrogen receptors in the body. It is a type of selective estrogen receptor modulator (SERM). Also called LY353381 hydrochloride.

**ASC-H:** A group of minerals that take the form of tiny fibers. Asbestos has been used as insulation against heat and fire in buildings. Loose asbestos fibers breathed into the lungs can cause several serious diseases, including lung cancer and malignant mesothelioma (cancer found in the lining of the lungs, chest, or abdomen). Asbestos that is swallowed may cause cancer of the gastrointestinal tract.

**ASC-US:** A nutrient that the body needs in small amounts to function and stay healthy. Ascorbic acid helps fight infections, heal wounds, and keep tissues healthy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Ascorbic acid is found in all fruits and vegetables, especially citrus fruits, strawberries, cantaloupe, green peppers, tomatoes, broccoli, leafy greens, and potatoes. It is water-soluble (can dissolve in water) and must be taken in every day. Ascorbic acid is being studied in the prevention and treatment of some types of cancer. Also called vitamin C.

**ascites** : A lung disease caused by breathing in particles of asbestos (a group of minerals that take the form of tiny fibers). Symptoms include coughing, trouble breathing, and chest pain caused by scarring and permanent damage to lung tissue. Asbestosis increases the risk of lung cancer and malignant mesothelioma (cancer found in the lining of the lungs, chest, or abdomen).

**Ascorbate (vitamin C):** A water-soluble vitamin that functions as an antioxidant and is required for the hydroxylation of collagen; scurvy results if ascorbate is deficient.

**ascorbic acid:** A natural water-soluble vitamin (Vitamin C). Ascorbic acid is a potent reducing and antioxidant agent that functions in fighting bacterial infections, in detoxifying reactions, and in the formation of collagen in fibrous tissue, teeth, bones, connective tissue, skin, and capillaries. Found in citrus and other fruits, and in vegetables, vitamin C cannot be produced or stored by humans and must be obtained in the diet. OR A finding of abnormal cells in a Pap test. It means there are abnormal squamous cells in the tissue that lines the outer part of the cervix. ASC-H may be a sign of a high-grade squamous intraepithelial lesion (HSIL), which may become cervical cancer if untreated. More testing may be needed. Also called atypical squamous cells, cannot exclude a high-grade lesion.

**ASCUS** : Abnormal buildup of fluid in the abdomen that may cause swelling. In late-stage cancer, tumor cells may be found in the fluid in the abdomen. Ascites also occurs in patients with liver disease.

**aseismic ridge:** a chain of seamounts and guyots; so called because it is not associated with earthquakes.

**Aseptic:** Free from living germs of disease, fermentation or putrefaction.

**aseptic necrosis** : A finding of abnormal cells in the tissue that lines the outer part of the cervix. ASCUS is the most common abnormal finding in a Pap test. It may be a sign of infection with certain types of human papillomavirus (HPV). It may also be a sign of a benign (not cancer) growth, such as a cyst or polyp or, in menopausal women, of low hormone levels. More testing, such as an HPV test, may be needed. Also called ASC-US and atypical squamous cells of undetermined significance.

**Asexual reproduction:** Growth and cell duplication that does not involve the union of nuclei from cells of opposite mating types.

**Ash Content :** The solid residue remaining after a substance has been incinerated or heated to a temperature sufficient to drive off all combustible or volatile substances.

**Ashkenazi Jews :** One of two major ancestral groups of Jewish individuals, comprised of those whose ancestors lived in Central and Eastern Europe (e.g., Germany, Poland, Russia). The other group is designated Sephardic Jews and includes those whose ancestors lived in North Africa, the Middle East, and Spain. Most Jews living in the United States are of Ashkenazi descent. OR A finding of abnormal cells in the tissue that lines the outer part of the cervix. ASC-US is the most common abnormal finding in a Pap test. It may be a sign of infection with certain types of human papillomavirus (HPV). It may also be a sign of a benign (not cancer) growth, such as a cyst or polyp or, in menopausal women, of low hormone levels. More testing, such as an HPV test, may be needed. Also called ASCUS and atypical squamous cells of undetermined significance.

**Ashlar:** Stones which have been cut square are called ashlar as opposed to rough stoned which have been quarried.

**ashwagandha root powder extract:** A dietary supplement containing an extract powder derived from the root of the ashwagandha shrub with potential antineoplastic, antioxidant, immunostimulating and anti-angiogenic activities. Ashwagandha root powder extract contains numerous alkaloids, including withanine as the primary alkaloid, and steroidal lactone withanolides. The withanolides in this agent may suppress nuclear factor-kappaB activation and nuclear factor-kappaB-regulated gene expression, potentiating apoptosis and inhibiting tumor cell invasion. Cultivated in India and North America, ashwagandha (*Withania somnifera* Dunal or Indian ginseng) belongs to the Solanaceae (nightshade) family.

**Asian ginseng:** The aromatic root of perennial herbs of *Panax ginseng*. Ginseng, used in traditional Chinese medicine and available as a nutritional supplement, is classified as an adaptogenic herb with multiple effects, many of them are regulatory in nature. It contains a complex mixture of saponins, ginsenosides and panaxosides. Although the mechanism of action is unclear, ginseng is reported to enhance the immune system and reduce fatigue. Check for active clinical trials using this agent.

**ASK1 inhibitor GS-4997:** An orally bioavailable inhibitor of apoptosis signal-regulating kinase 1 (ASK1), with potential anti-inflammatory, antineoplastic and anti-fibrotic activities. Upon oral administration, ASK1 inhibitor GS-4997 targets and binds to the catalytic kinase domain of ASK1 in an ATP-competitive manner, thereby preventing its phosphorylation and activation. This prevents the phosphorylation of downstream kinases, such as c-Jun N-terminal kinases (JNKs) and p38 mitogen-activated protein kinase (p38 MAPK). By preventing the activation of ASK1-dependent signal transduction pathways, GS-4997 prevents the production of inflammatory cytokines, down-regulates the expression of genes involved in fibrosis, suppresses excessive apoptosis and inhibits cellular proliferation. ASK1, also called mitogen-activated protein kinase kinase kinase 5 (MAP3K5), is activated in response to oxidative and endoplasmic reticulum (ER) stress, calcium influx and infection. It plays a key role in the development of certain cardiovascular and neurodegenerative diseases, diabetes, as well as certain types of cancer.

**ASONEP:** (Other name for: sonopcizumab)

**Asorbicap:** (Other name for: ascorbic acid)

**ASP4132:** A molecule with potential antineoplastic activity. Upon oral administration, ASP4132 affects oxidative phosphorylation in mitochondria of metabolically-active tumor cells, which reduces both energy production and tumor cell proliferation. Mitochondrial oxidative phosphorylation is hyperactivated in tumor cells and plays a key role in the promotion of tumor cell proliferation.

**ASP9853:** An orally bioavailable small molecule, with potential antineoplastic activity.

**asparaginase:** An enzyme isolated from the bacterium *Escherichia coli* or the bacterium *Erwinia carotovora* with antileukemic activity. Asparaginase hydrolyzes L-asparagine to L-aspartic acid and ammonia in leukemic cells, resulting in the depletion of asparagine, inhibition of protein synthesis, cell cycle arrest in the G1 phase, and apoptosis in susceptible leukemic cell populations. Asparagine is critical to protein synthesis in leukemic cells; some leukemic cells cannot synthesize this amino acid de novo due to the absent or deficient expression of the enzyme asparagine synthase. The *E. carotovora*-derived form of asparaginase is typically reserved for cases of asparaginase hypersensitivity. Check for active clinical trials using this

agent. or A condition in which there is a loss of blood flow to bone tissue, which causes the bone to die. It is most common in the hips, knees, shoulders, and ankles. It may be caused by long-term use of steroid medicines, alcohol abuse, joint injuries, and certain diseases, such as cancer and arthritis. It may also occur at some point in time after cancer treatment that included methotrexate, bisphosphonates, or corticosteroids. Also called avascular necrosis, ischemic necrosis, and osteonecrosis.

**asparaginase Erwinia chrysanthemi:** An enzyme isolated from the bacterium *Erwinia chrysanthemi* (*E. carotovora*). Asparagine is critical to protein synthesis in leukemic cells, which cannot synthesize this amino acid due to the absence of the enzyme asparagine synthase. Asparaginase hydrolyzes L-asparagine to L-aspartic acid and ammonia, thereby depleting leukemic cells of asparagine and blocking protein synthesis and tumor cell proliferation, especially in the G1 phase of the cell cycle. This agent also induces apoptosis in tumor cells. The *Erwinia*-derived product is often used for those patients who have experienced a hypersensitivity reaction to the *E. Coli* formulation. OR One of two major ancestral groups of Jewish individuals. The ancestors of Ashkenazi Jews lived in Central and Eastern Europe (e.g., Germany, Poland, Russia). The other group is called Sephardic Jews and includes those whose ancestors lived in North Africa, the Middle East, and Spain. Most Jews living in the United States are of Ashkenazi descent.

**asparagine:** A natural amino acid that is the amide of aspartic acid.

**aspartate transaminase :** A drug that is used to treat acute lymphoblastic leukemia (ALL) and is being studied in the treatment of some other types of cancer. It is an enzyme taken from the bacterium *Escherichia coli* (*E. coli*). It breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. Also called Elspar and L-asparaginase.

**aspartic acid<sup>22</sup>:** A nonessential amino acid that is abundant in molasses. The carboxylic acid group on the side chain is ionized under physiological conditions, making aspartic acid residues in proteins hydrophilic.

**Aspartyl proteases:** A class of protein-degrading enzymes whose activity is dependent on an aspartate residue at the active site. An aspartyl protease is required for HIV replication.

**Aspect Ratio:** Ratio of total flow length to average wall thickness. OR The length/diameter ratio of a fibre. OR

**aspergillois :** A drug used with other anticancer drugs to treat acute lymphoblastic leukemia (ALL). It is an enzyme that comes from the Erwinia chrysanthemi bacterium. It is used in patients who cannot take a similar drug that comes from the E. coli bacterium. It is also being studied in the treatment of other types of cancer. It breaks down the amino acid asparagine and may block the growth of cancer cells that need asparagine to grow. It may also kill cancer cells. Also called Erwinaze.

**Aspergillus :** An enzyme found in the liver, heart, and other tissues. A high level of aspartate transaminase released into the blood may be a sign of liver or heart damage, cancer, or other diseases. Also called serum glutamic-oxaloacetic transaminase and SGOT.

**Aspergum:** (Other name for: acetylsalicylic acid)

**aspirate:** An infectious fungal disease that occurs most often in the skin, ears, nasal sinuses, and lungs of people with suppressed immune systems.

**aspiration :** Fungi commonly found in soil. Certain types of Aspergillus may cause disease, especially in people who have suppressed immune systems.

**aspirin :** Aspirate (pronounced AS-pih-rit) refers to fluid, tissue, or other substance that is withdrawn from a body cavity, cyst, or tumor. Aspirate (pronounced AS-pih-rayt) refers to the act of withdrawing the fluid, tissue, or other substance through a needle. It also refers to the accidental breathing in of food or fluid into the lungs. This can cause serious problems, such as pneumonia and other lung problems.

**ASPS:** Removal of fluid or tissue through a needle. Also, the accidental breathing in of food or fluid into the lungs.

**assay:** The quantitative or quantitative evaluation of a hazardous substance; the results of such an evaluation (Last, 1988). Or A drug that reduces pain, fever, inflammation, and blood clotting. Aspirin belongs to the family of drugs called nonsteroidal anti-inflammatory agents. It is also being studied in cancer prevention.

**Assembly:** A secondary manufacturing function of joining finished parts together.

**assent process :** A soft tissue tumor that is most common in older children and teenagers. It begins in the soft supporting tissue that connects and surrounds the organs and other tissues. ASPS usually occurs in the legs, but can also occur in the arms, hands, head, or neck. It can cause the growth of new blood vessels that help the tumor grow and spread. Also called alveolar soft part sarcoma.

**assessment :** A laboratory test to find and measure the amount of a specific substance.

**Assimilate:** To take in, similar to eating food.

**assimilation:** the process by which pieces of the country rock melt and mix within a body of magma.

**assisted reproductive technology :** A term used to describe collectively a number of noncoital methods of conception that are used to treat infertility with donor or nondonor eggs and sperm including in vitro fertilization (IVF), gamete intrafallopian transfer (GIFT), and zygote intrafallopian transfer (ZIFT). Also called ART.

**assistive device :** A process that is required by law in which children or adolescents are given easy-to-understand information about a clinical trial to help them decide if they want to take part in the trial. The patient is given a chance to ask questions about what will happen during the trial, why it's being done, and what they will be asked to do. Formal consent to enter the trial comes from the parent or guardian.

**assistive technology :** In healthcare, a process used to learn about a patient's condition. This may include a complete medical history, medical tests, a physical exam, a test of learning skills, tests to find out if the patient is able to carry out the tasks of daily living, a mental health evaluation, and a review of social support and community resources available to the patient.

**associativity:** A property in math which states that:  $(A+B)+C=A+(B+C)$  and  $(A*B)*C=A*(B*C)$ .

**Assumptions (for IPEs, IPEEs, and PRAs):** In the context of individual plant examinations (IPEs), individual plant examinations for external events (IPEEE), and probabilistic risk assessments (PRAs), assumptions are those parts of the mathematical models that the analyst expects will hold true for the range of solutions used for making decisions. Without assumptions,

even the most powerful computers may not be able to provide useful solutions for the models.

**Astatine:** Symbol:"At" Atomic Number:"85" Atomic Mass: (210)amu. Astatine is a member of the halogen group. This element is often found during reactions with uranium in nuclear reactors. It is not found in nature and has no uses.

**asteroid:** Any of the thousands of small bodies that revolve about the sun in orbits lying mostly between those of Mars and Jupiter. Also known as a minor planet.

**asteroid belt:** the orbiting band of rocks between Mars and Jupiter.

**asthenia :** A tool that helps a person with a disability to do a certain task. Examples are a cane, wheelchair, scooter, walker, hearing aid, or special bed.

**asthenosphere:** The asthenosphere is the region of the mantle that lies below the lithosphere and contains between 1 and 10 per cent molten material. OR an area composed of the flexible mantle beneath the lithosphere. OR the outer layer of the Earth's mantle, which has a plastic-like composition; site of convection currents that move the plates on the surface.

**asthma :** Any device or technology that helps a disabled person. Examples are special grips for holding utensils, computer screen monitors to help a person with low vision read more easily, computers controlled by talking, telephones that make the sound louder, and lifters to help a person rise out of a chair.

**ASTM:** Abbreviation for American Society for Testing and Materials. OR Abbreviation of American Society for Testing and Materials, an association for establishing standard testing and reporting procedures. OR American Society for Testing and Materials, An organization for issuing standard specifications on materials

**Astragalus-based formulation Qing Shu Yi Qi Tang:** An herbal remedy containing Astragalus membranaceus, Panax ginseng, Atractylodes chinensis Koidz, Cimicifuga foetida, A. macrocephala Koidz, Alisma orientale Juzep, and Citrus reticulata Blanco, with potential immunomodulating, anti-oxidant and anticachexia activities. Upon oral consumption, the ingredients in this herbal supplement may modulate the

activity of the immune system through a decrease in both the expression of nuclear factor-kappa B (NF- $\kappa$ B) and the production of pro-inflammatory cytokines such as interleukin-1beta (IL-1b), IL-6, and tumor necrosis factor-alpha (TNF-alpha). Increased levels of pro-inflammatory cytokines are correlated with decreased appetite and weight loss; thus, this herbal remedy may improve immune function, appetite and weight gain, which could prevent cachexia.

**astrocyte :** Weakness; lack of energy and strength.

**astrocytoma :** A chronic disease in which the bronchial airways in the lungs become narrowed and swollen, making it difficult to breathe. Symptoms include wheezing, coughing, tightness in the chest, shortness of breath, and rapid breathing. An asthma attack may be brought on by pet hair, dust, smoke, pollen, mold, exercise, cold air, or stress.

**astronomical unit:** measurement used in the solar system, the average distance from the Earth to the Sun (150,000,000 km or 93,000,000 mi).

**Astugenal:** (Other name for: antineoplaston AS2-1)

**astuprotimut-R:** A cancer vaccine consisting of a recombinant form of human melanoma antigen A3 (MAGE-A3) combined with a proprietary adjuvant with potential immunostimulatory and antineoplastic activities. Upon administration, astuprotimut-R may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing the MAGE-A3 antigen, resulting in tumor cell death. MAGE-A3, a tumor-associated antigen (TAA) originally discovered in melanoma cells, is expressed by various tumor types. The proprietary immunostimulating adjuvant in this agent is composed of a specific combination of immunostimulating compounds selected to increase the anti-tumor immune response to MAGE-A3. Check for active clinical trials using this agent.

**asulacrine isethionate:** The isethionate salt of an amsacrine analogue with antineoplastic properties. Asulacrine inhibits the enzyme topoisomerase II, thereby blocking DNA replication and RNA and protein synthesis.

**asunaprevir:** An orally bioavailable inhibitor of the nonstructural protein 3 (NS3), with potential activity against hepatitis C virus (HCV). Upon administration, asunaprevir binds to the active center of the HCV NS3 and prevents NS3 protease-mediated polyprotein maturation. This disrupts the processing of viral proteins required for HCV replication. NS3, a serine protease, is essential for the proteolytic cleavages within the HCV

polyprotein and plays a key role during HCV viral RNA replication. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family.

**Asymmetric carbon:** A carbon that is covalently bonded to four different groups.

**asymmetric carbon atom:** A carbon atom that is covalently bonded to four different groups and thus may exist in two different tetrahedral configurations.

**asymmetry :** A large, star-shaped cell that holds nerve cells in place and helps them develop and work the way they should. An astrocyte is a type of glial cell.

**Asymmetry potential:** the potential across a glass pH electrode membrane when the inside and outside of the membrane are in contact with solutions of identical pH. This term has also been used to define the observed potential differences between identical electrode pairs placed in identical solutions. Differences can occur because of variability in the potentials of the internal reference elements of both the sensing and the reference electrodes, differences in liquid junction potentials, and differences in internal filling solutions. These variations in electrode potential are compensated for by the instrument calibration control (asymmetry potential control).

**asymptomatic :** A tumor that begins in the brain or spinal cord in small, star-shaped cells called astrocytes.

**asymptomatic inflammatory prostatitis :** Lack or absence of balanced proportions between parts of a thing.

**AT/RT:** Having no signs or symptoms of disease.

**AT7519M:** Inflammation of the prostate gland where the only symptom is the presence of white blood cells in the prostate fluid.

**AT9283:** An aggressive cancer of the central nervous system, kidney, or liver that occurs in very young children. Also called ATT/RHT and atypical teratoid/rhabdoid tumor.

**Atacand:** (Other name for: candesartan cilexetil)

**Atactic:** a polymer exhibiting no stereochemical regularity of structure.

**atamestane:** A synthetic steroidal substance with antineoplastic activity. Atamestane binds irreversibly to and inhibits the enzyme aromatase,

thereby blocking the conversion of cholesterol to pregnenolone and the peripheral aromatization of androgenic precursors into estrogens. or A substance being studied in the treatment of some types of cancer. AT7519M blocks enzymes needed for cells to divide. It is a type of cyclin-dependent kinase inhibitor. Also called CDK inhibitor AT7519M.

**ataxia:** inability to coordinate voluntary muscle movements; unsteady movements and staggering gait or A substance being studied in the treatment of some types of cancer. It blocks enzymes (Aurora kinases) involved in cell division and may kill cancer cells. AT9283 is a type of serine/threonine protein kinase inhibitor. Also called Aurora kinase inhibitor AT9283.

**ataxia-telangiectasia :** A substance that is being studied in the treatment of cancer. Atamestane blocks the production of the hormone estrogen in the body. It belongs to the family of drugs called antiestrogens.

**ataxic gait :** Loss of muscle coordination.

**atelectasis :** A rare, inherited, progressive, degenerative disease of childhood that causes loss of muscle control, a weakened immune system, and an increased risk of cancer.

**Atengenal:** (Other name for: antineoplaston A10)

**atenolol:** A synthetic isopropylamino-propanol derivative used as an antihypertensive, hypotensive and antiarrhythmic. Atenolol acts as a peripheral, cardioselective beta blocker specific for beta-1 adrenergic receptors, without intrinsic sympathomimetic effects. It reduces exercise heart rates and delays atrioventricular conduction, with overall decreasing oxygen requirements.

**atezolizumab:** A human, Fc optimized, monoclonal antibody directed against the protein ligand PD-L1 (programmed cell death-1 ligand 1), with potential immune checkpoint inhibitory and antineoplastic activities. Atezolizumab binds to PD-L1, blocking its binding to and activation of its receptor programmed death 1 (PD-1) expressed on activated T-cells, which may enhance the T-cell-mediated immune response to neoplasms and reverse T-cell inactivation. In addition, by binding to PD-L1, atezolizumab also prevents binding of this ligand to B7.1 expressed on activated T cells, which further enhances the T-cell-mediated immune response. PD-L1 is overexpressed on many human cancer cell types and on various tumor-infiltrating immune cells. PD-L1 binding to PD-1 on T-cells suppresses the

immune system and results in increased immune evasion. PD-1, a transmembrane protein, is a negative regulator of the immune system that limits the expansion and survival of CD8+ T cells. The Fc region of atezolizumab is modified in such a way that it does not induce either antibody-dependent cytotoxicity (ADCC) or complement-dependent cytotoxicity (CDC). or Awkward, uncoordinated walking.

**ATGAM:** (Other name for: anti-thymocyte globulin)

**atheromas:** fat deposits in the arteries

**atherosclerosis:** A disease of the arterial walls characterized by fatty deposits and abnormal tissue growth. Or condition in which an artery wall thickens as the result of a build up of fatty materials such as cholesterol

**Athrombin-K:** (Other name for: warfarin)

**athymic nude mouse :** Failure of the lung to expand (inflate) completely. This may be caused by a blocked airway, a tumor, general anesthesia, pneumonia or other lung infections, lung disease, or long-term bedrest with shallow breathing. Sometimes called a collapsed lung.

**atiprimod:** An orally bioavailable small molecule belonging to the azaspirane class of cationic amphiphilic agents with anti-inflammatory, antineoplastic, and antiangiogenic properties. Atiprimod inhibits the phosphorylation of signal transducer and activator of transcription 3 (STAT3), blocking the signalling pathways of interleukin-6 and vascular endothelial growth factor (VEGF) and downregulating the anti-apoptotic proteins Bcl-2, Bcl-XL, and Mcl-1, thereby inhibiting cell proliferation, inducing cell cycle arrest, and inducing apoptosis. or A drug used to treat urothelial cancer (a type of bladder cancer) that has advanced or spread to other parts of the body. It is used in patients whose disease got worse during or after treatment with anticancer drugs that included platinum. It is also being studied in the treatment of other types of cancer. Atezolizumab binds to a protein called PD-L1, which is found on some cancer cells.

Atezolizumab may block this protein and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called Tecentriq.

**Ativan:** (Other name for: lorazepam)

**atlantoaxial sublaxation:** a mis-alignment between the 1st and 2nd cervical vertebrae

**ATLL:** A type of laboratory mouse that is hairless, lacks a normal thymus gland, and has a defective immune system because of a genetic mutation. Athymic nude mice are often used in cancer research because they do not reject tumor cells, from mice or other species.

**ATM kinase inhibitor AZD0156:** An orally bioavailable ataxia telangiectasia mutated (ATM) kinase inhibitor, with potential chemo-/radio-sensitizing and antineoplastic activities. Upon oral administration, AZD0156 targets and binds to ATM, thereby inhibiting the kinase activity of ATM and ATM-mediated signaling. This prevents DNA damage checkpoint activation, disrupts DNA damage repair, induces tumor cell apoptosis, and leads to cell death of ATM-overexpressing tumor cells. In addition, AZD0156 sensitizes tumor cells to chemo- and radiotherapy. ATM, a serine/threonine protein kinase, is upregulated in a variety of cancer cell types; it is activated in response to DNA damage and plays a key role in DNA-strand repair. Check for active clinical trials using this agent.

**atmosphere:** Unit of pressure equal to 101325 pascals or 760mmHg. Its symbol is atm. OR the gas layer surrounding the Earth. OR A unit of pressure, equal to a barometer reading of 760 mm Hg. 1 atmosphere is 101325 pascals and 1.01325 bar.

**atmosphere (An):** A standard unit of pressure representing the pressure exerted by a 29.92-in. column of mercury at sea level at 45 degrees latitude and equal to 1000 g/cm<sup>2</sup>.

**atmosphere (The):** The envelope of air surrounding the Earth and bound to it by the Earth's gravitational attraction. Studies of the chemical properties, dynamic motions, and physical processes of this system constitute the field of meteorology.

**atmospheres:** Common units for measuring pressure.

**atmospheric turbulence:** A state of the flow of air in which apparently random irregularities occur in the air's instantaneous velocities, often producing major deformations of the flow.

**atmospheric window:** The spectral region between 8.5 and 11.0 microns where the atmosphere is essentially transparent to longwave radiation.

**ATN-161:** A small peptide antagonist of integrin alpha5beta1 with potential antineoplastic activity. ATN-161 selectively binds to and blocks the receptor for integrin alpha5beta1, thereby preventing integrin

alpha5beta1 binding. This receptor blockade may result in inhibition of endothelial cell-cell interactions, endothelial cell-matrix interactions, angiogenesis, and tumor progression. Integrin alpha5beta1 is expressed on endothelial cells and plays a crucial role in endothelial cell adhesion and migration. or A substance being studied in the treatment of certain multiple myelomas and other advanced cancers. Atiprimod may block the growth of tumors and may prevent the growth of new blood vessels that tumors need to grow. Atiprimod is a type of signal transduction inhibitor and a type of antiangiogenesis agent. Also called azaspirane and SK&F106615.

**ATN-224:** An aggressive (fast-growing) type of T-cell non-Hodgkin lymphoma caused by the human T-cell leukemia virus type 1 (HTLV-1). It is marked by bone and skin lesions, high calcium levels, and enlarged lymph nodes, spleen, and liver. Also called adult T-cell leukemia/lymphoma.

**atoll:** a circular reef in deep water that shelters a lagoon; the result of reef development around the flank of a volcano that has since subsided but to which the corals are still anchored. OR ring of coral reefs surrounding a sunken island.

**atom:** An atom is the smallest particle of an element that retains the chemical properties of the element. Atoms are electrically neutral, with a positively charged nucleus that binds one or more electrons in motion around it. OR The smallest particle of an element that cannot be divided or broken up by chemical means. It consists of a central core (or nucleus), containing protons and neutrons, with electrons revolving in orbits in the region surrounding the nucleus. OR An example would be dissolving salt in water. The change can be reversed simply by evaporating the water. OR The smallest particle of an element. OR The smallest particle of matter that maintains the property of an element in the periodic table; atoms are composed of subatomic particles called electrons, neutrons, and protons, which themselves are composed of even tinier subatomic particles such as quarks OR the smallest part of an element that can enter into various combinations with atoms of other elements. OR the smallest amount of an element; a nucleus surrounded by electrons. OR An atom is the smallest particle of an element that can still be defined as that element. OR is the smallest particle of a chemical element. OR The smallest unit of an element which has all the properties of the element. It is composed of protons,

neutrons and electrons. OR The smallest object that retains properties of an element. Composed of electrons and a nucleus (containing protons and neutrons). OR the smallest particle of an element which can exist alone or enter into a chemical combination.

**atom** : A substance being studied in the treatment of some types of cancer. ATN-161 may prevent the spread of tumor cells and may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent.

**atomic 1s orbital** : s the spherical orbital nearest the nucleus of an atom.

**atomic absorption**: quantitative chemical method used for the analysis of elemental constituents.

**Atomic displacement parameter**: A measure of the mobility or disorder of a given atom in a crystal structure, formerly called the temperature factor.

**Atomic energy**: The energy that is released through a nuclear reaction or radioactive decay process. Of particular interest is the process known as fission, which occurs in a nuclear reactor and produces energy usually in the form of heat. In a nuclear power plant, this heat is used to boil water in order to produce steam that can be used to drive large turbines. This, in turn, activates generators to produce electrical power. Atomic energy is more correctly called nuclear energy.

**Atomic Energy Commission**: The Federal agency (known as the AEC), which was created in 1946 to manage the development, use, and control of atomic (nuclear) energy for military and civilian applications. The AEC was subsequently abolished by the Energy Reorganization Act of 1974 and succeeded by the Energy Research and Development Administration (now part of the U.S. Department of Energy) and the U.S. Nuclear Regulatory Commission. For related information, see Our History.

**Atomic Heat**: This is a measure of the atomic weight of a substance multiplied by its specific heat.

**atomic mass**: (A) the sum of the weights of the protons and neutrons in an atom. (A proton and neutron each have a mass of 1 atomic mass unit.) OR is the average mass of the isotopes of an element. It is the decimal number on the periodic chart. It depends upon both the isotopes' masses and the amount of each isotope present. OR The atomic mass is the total mass of

one atom of an element. It is the mass of the protons, electrons, and neutrons combined. The mass of all atoms is based on the mass of carbon. Carbon's mass is twelve AMU. Atomic mass is not measured in pounds or grams, scientists used something called Daltons. One Dalton is equal to one-twelfth the mass of a carbon atom. Scientists also call a Dalton an Atomic Mass Unit (amu). OR the mass of an atom expressed in atomic mass units (amu); the total number of protons and neutrons in the nucleus.

**atomic mass unit:** A unit of mass equal to 1/12 the mass of a carbon-12 nucleus, which is  $1.660\,538\,73 \times 10^{-27} \text{ kg} \pm 0.000\,000\,13 \times 10^{-27} \text{ kg}$  [1998 CODATA values]. Abbreviated as amu or u. Sometimes called the dalton, after John Dalton, architect of the first modern atomic theory. OR a unit of mass equal to 1/12 the mass of the carbon isotope with mass number 12, approximately  $1.6604 \times 10^{-24} \text{ gram}$ .

**atomic mass/weight:** the total number of protons and neutrons in an atom.

**atomic nucleus:** A tiny, incredibly dense positively charged mass at the heart of the atom. The nucleus is composed of protons and neutrons (and other particles). It contains almost all of the mass of the atom but occupies only a tiny fraction of the atom's volume.

**atomic number:** the number of protons in the nucleus of an atom. OR Number of protons in an element. OR The atomic number is the number of an element on the periodic table. It is also equal to the number of protons inside of an atom. A neutral atom has equal numbers of electrons and protons. The atomic number for oxygen is 8. OR is the number of protons in the nucleus of an atom. It is the whole number on the periodic chart. It is also the number of electrons in a neutral atom (where protons = electrons). OR The atomic number is the number of protons in an atom (which equals the number of electrons). OR the number of protons in the nucleus of the chemical element. OR (Z) the number of protons or electrons in an atom. OR the number of protons in the nucleus of an atom as well as the number of electrons in a neutral atom. OR The number of positively charged protons in the nucleus of an atom. OR The number of protons in an atomic nucleus. The atomic number and the element symbol are two alternate ways to label an element. In nuclide symbols, the atomic number is a leading subscript; for example, in  ${}^{12}_6\text{C}$ , the "6" is the atomic number. OR Z the number of protons or electrons in an atom.

**atomic orbital:** a region in space around the nucleus of an atom where the probability of finding an electron is high. OR A wavefunction that describes the behavior of an electron in an atom.

**atomic p orbital:** p an hourglass-shaped orbital, oriented on x, y, and z axes in three-dimensional space.

**atomic radius:** One half the distance between nuclei of atoms of the same element, when the atoms are bound by a single covalent bond or are in a metallic crystal. The radius of atoms obtained from covalent bond lengths is called the covalent radius; the radius from interatomic distances in metallic crystals is called the metallic radius.

**atomic theory:** An explanation of chemical properties and processes that assumes that tiny particles called atoms are the ultimate building blocks of matter.

**atomic unit:** A system of non-SI units used in quantum chemistry to simplify calculations and mathematical expressions. The definitions of atomic units include physical constants (like the speed of light, the rest mass of the electron, and other quantities that never change), so that all constants drop out of expressions when atomic units are used.

**atomic weight:** the weight in grams of one mole of the chemical element; approximately the number of protons and neutrons in the nucleus. OR The average mass of an atom of an element, usually expressed in atomic mass units. The terms mass and weight are used interchangeably in this case. The atomic weight given on the periodic table is a weighted average of isotopic masses found in a typical terrestrial sample of the element. the average weight of an atom of an element, usually expressed relative to one atom of the carbon isotope taken to have a standard weight of 12.

**atomoxetine hydrochloride:** The hydrochloride salt of atomoxetine, a phenoxy-3-propylamine derivative and selective non-stimulant, norepinephrine reuptake inhibitor with cognitive-enhancing activity. Although its precise mechanism of action is unknown, atomoxetine appears to selectively inhibit the pre-synaptic norepinephrine transporter, resulting in inhibition of the presynaptic reabsorption of norepinephrine and prolongation of norepinephrine activity in the synaptic cleft; the effect on cognitive brain function may result in improved attention and decreased impulsivity and activity levels.

**atorvastatin :** A substance being studied in the treatment of cancer. It may prevent the growth of new blood vessels that tumors need to grow. ATN-224 also blocks enzymes that cells need to divide and grow, and it may kill cancer cells. It is a type of antiangiogenesis agent and a type of superoxide dismutase inhibitor. Also called SOD1 inhibitor ATN-224.

**atorvastatin calcium:** The calcium salt of atorvastatin, a synthetic lipid-lowering agent. Atorvastatin competitively inhibits hepatic hydroxymethylglutaryl coenzyme A (HMG-CoA) reductase, the enzyme which catalyzes the conversion of HMG-CoA to mevalonate, a key step in cholesterol synthesis. This agent increases the number of LDL receptors on hepatic cell surfaces, enhancing the uptake and catabolism of LDL and reducing LDL production and the number of LDL particles, and lowers plasma cholesterol and lipoprotein levels. Like other statins, atorvastatin may also display direct antineoplastic activity, possibly by inhibiting farnesylation and geranylgeranylation of proteins such as small GTP-binding proteins, which may result in the arrest of cells in the G1 phase of the cell cycle. This agent may also sensitize tumor cells to cytostatic drugs, possibly through the mTOR-dependent inhibition of Akt phosphorylation. OR The smallest part of a substance that cannot be broken down chemically. Each atom has a nucleus (center) made up of protons (positive particles) and neutrons (particles with no charge). Electrons (negative particles) move around the nucleus. Atoms of different elements contain different numbers of protons, neutrons, and electrons.

**ATP:** Adenosine triphosphate. Chemical energy generated by substrate oxidations is conserved by formation of high-energy compounds such as adenosine diphosphate (ADP) and adenosine triphosphate (ATP) or compounds containing the thioester bond or The active ingredient in a drug used to lower the amount of cholesterol in the blood and to prevent stroke, heart attack, and angina (chest pain). It is also being studied in the prevention and treatment of some types of cancer and other conditions. Atorvastatin blocks an enzyme that helps make cholesterol in the body. It also causes an increase in the breakdown of cholesterol. It is a type of HMG-CoA reductase inhibitor and a type of statin.

**ATP (adenosine 5'-triphosphate):** A nucleotide consisting of adenine, ribose, and triphosphate units that serves as the cellular energy currency.

**ATP (adenosine triphosphate):** A ribonucleoside 5'-triphosphate functioning as a phosphate group donor in the cell energy cycle; carries chemical energy between metabolic pathways by serving as a shared intermediate coupling endergonic and exergonic reactions.

**ATP Adenosine triphosphate:** The energy currency of metabolism in all organisms

**ATP synthase:** Molecular assembly of the inner mitochondrial membrane responsible for the respiratory-chain-driven synthesis of ATP. Also called Complex V, mitochondrial atpase, H<sup>+</sup>-atpase, or F<sub>0</sub>F<sub>1</sub>-atpase. OR An enzyme complex that forms ATP from ADP and phosphate during oxidative phosphorylation in the inner mitochondrial membrane or the bacterial plasma membrane, and during photophosphorylation in chloroplasts.

**ATP-ADP translocase:** An adenine nucleotide carrying a transport protein that carries ADP into the mitochondria and ATP out in a coupled fashion.

**ATP-binding cassette (ABC) domain:** The ATP-binding domain characteristic of specific membranetransport proteins, called ABC transporters; these transporters also contain a membrane-spanning region.

**ATP-grasp fold:** A protein domain that surrounds ATP and orients it for nucleophilic attack at the  $\gamma$  phosphate. Enzymes with these domains catalyze the formation of carbon-nitrogen bonds through acylphosphate intermediates.

**ATPase:** An enzyme that hydrolyzes ATP to yield ADP and phosphate; usually coupled to some process requiring energy.

**ATR kinase inhibitor AZD6738:** An orally available morpholino-pyrimidine-based inhibitor of ataxia telangiectasia and rad3 related (ATR) kinase, with potential antineoplastic activity. Upon oral administration, ATR kinase inhibitor AZD6738 selectively inhibits ATR activity by blocking the downstream phosphorylation of the serine/threonine protein kinase CHK1. This prevents ATR-mediated signaling, and results in the inhibition of DNA damage checkpoint activation, disruption of DNA damage repair, and the induction of tumor cell apoptosis. In addition, AZD6738 sensitizes tumor cells to chemo- and radiotherapy. ATR, a serine/threonine protein kinase upregulated in a variety of cancer cell types, plays a key role in DNA repair, cell cycle progression, and survival; it is activated by DNA damage caused during DNA replication-associated stress.

**ATR kinase inhibitor VX-970:** An inhibitor of ataxia telangiectasia and rad3-related (ATR) kinase, a DNA damage response kinase, with potential antineoplastic activity. ATR kinase inhibitor VX-970 selectively inhibits ATR kinase activity and prevents ATR-mediated signaling in the ATR-checkpoint kinase 1 (Chk1) signaling pathway. This prevents DNA damage checkpoint activation, disrupts DNA damage repair, and induces tumor cell apoptosis. In addition, VX-970 sensitizes tumor cells to chemo- and radiotherapy. ATR, a serine/threonine protein kinase upregulated in a variety of cancer cell types, plays a key role in DNA repair, cell cycle progression, and survival; it is activated by DNA damage caused during DNA replication-associated stress.

**ATR-101:** An orally bioavailable agent that is selective towards adrenal cortex cells with potential antitumor activity. Upon administration, ATR-101 selectively kills adrenal and adrenal cancer cells, through an unknown mechanism.

**ATRA :** A drug used to lower the amount of cholesterol in the blood and to prevent stroke, heart attack, and angina (chest pain). It is also being studied in the prevention and treatment of some types of cancer and other conditions. Atorvastatin calcium blocks an enzyme that helps make cholesterol in the body. It also causes an increase in the breakdown of cholesterol. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called Lipitor.

**Atractyloside:** A plant glycoside that inhibits ATP-ADP translocase.

**Atragen:** (Other name for: liposomal tretinoin)

**atrasentan :** A substance present in all living cells that provides energy for many metabolic processes and is involved in making RNA. ATP made in the laboratory is being studied in patients with advanced solid tumors to see if it can decrease weight loss and improve muscle strength. Also called adenosine triphosphate.

**atrasentan hydrochloride:** The orally available hydrochloride salt of pyrrolidine-3-carboxylic acid with potential antineoplastic activity. As a selective antagonist of the endothelin-A (ETA) receptor, atrasentan binds selectively to the ETA receptor, which may result in inhibition of endothelin-induced angiogenesis and tumor cell proliferation.

**atrium :** a thin-walled receiving chamber in which blood accumulates in fishes.

**Atromid-S:** (Other name for: clofibrate)

**atrophy:** The process which is observed during the wasting of a tissue or an organ.

**atropine sulfate :** A nutrient that the body needs in small amounts to function and stay healthy. ATRA is made in the body from vitamin A and helps cells to grow and develop, especially in the embryo. A form of ATRA made in the laboratory is put on the skin to treat conditions such as acne and is taken by mouth to treat acute promyelocytic leukemia (a fast-growing cancer in which there are too many immature blood-forming cells in the blood and bone marrow). ATRA is being studied in the prevention and treatment of other types of cancer. Also called all-trans retinoic acid, retinoic acid, tretinoin, and vitamin A acid. OR The sulfate salt of atropine, a naturally-occurring alkaloid isolated from the plant *Atropa belladonna*. Atropine functions as a sympathetic, competitive antagonist of muscarinic cholinergic receptors, thereby abolishing the effects of parasympathetic stimulation. This agent may induce tachycardia, inhibit secretions, and relax smooth muscles. Check for active clinical trials using this agent.

**atropine suppression test :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called endothelin-1 protein receptor antagonists.

**ATT/RHT:** A drug used to block nerve stimulation of muscles and glands and relax smooth muscles. It is also used to increase heart rate, reduce secretions, and treat the effects of certain poisons. It is a type of antimuscarinic agent and a type of tropane alkaloid.

**Attached growth:** Wastewater treatment processes in which the microorganisms and bacteria treating the wastes are attached to the media in the reactor. The wastes being treated flow over the media. Trickling filters, bio-towers, and RBCs are attached growth reactors. These reactors can be used for removal of BOD, nitrification, and denitrification.

**attending physician :** A test used to help find out if secretion of pancreatic polypeptide (a protein released by the pancreas) is normal or caused by a tumor. A drug called atropine sulfate is injected into the patient's vein and level of pancreatic polypeptide in the blood is measured. If there is a tumor, the injection will not change the level of pancreatic polypeptide. If there is no tumor, the level of pancreatic polypeptide will drop.

**attenuated** : An aggressive cancer of the central nervous system, kidney, or liver that occurs in very young children. Also called AT/RT and atypical teratoid/rhabdoid tumor.

**attenuated chimpanzee adenovirus 5T4 vaccine:** A cancer vaccine comprised of a recombinant, attenuated, replication-defective simian adenovirus vector (ChAdOx1) encoding the human 5T4 fetal oncoprotein (ChAdOx1.5T4), with potential immuno-activating and antineoplastic activities. Upon administration of the recombinant attenuated chimpanzee adenovirus 5T4 vaccine, the viral vector expresses 5T4 and stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing 5T4, which results in tumor cell lysis. 5T4, a transmembrane glycoprotein, is overexpressed by a variety of cancer cell types; its expression is correlated with increased invasiveness.

**attenuated Listeria monocytogenes CRS-100:** A live-attenuated strain of the Gram-positive bacterium Listeria monocytogenes (Lm) with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, attenuated Listeria monocytogenes CRS-100 may accumulate in and infect liver cells where it may activate a potent innate immune response and an adaptive immune response involving the by recruitment and activation of T lymphocytes. This agent may potentiate the immune response to vaccines against various liver neoplasms. Check for active clinical trials using this agent.

**Attenuation:** In bacteria, a mechanism for transcriptional regulation in which a decrease in the rate of translation of an mRNA operon reduces the rate of transcription of that operon. or The process by which the number of particles or photons entering a body of matter is reduced by absorption and scattered radiation.

**attenuator:** An RNA sequence involved in regulating the expression of certain genes; functions as a transcription terminator. OR A provisional transcription stop signal. OR Attenuator. A provisional transcription signal.

**atto-:** Prefix used in the SI system meaning "multiply by  $10^{-18}$ ". For example, 3 am means  $3 \times 10^{-18}$  meters.

**Attraction Forces:** Attraction forces hold molecules next to each other. When something is in a liquid, the attraction forces hold the liquid together.

If you raise the temperature of the liquid, the molecules are given more energy and break free of the attraction forces to become a gas.

**attributable risk** : Proportion of a disease in exposed individuals that can be attributed to an exposure. In the context of genetic studies, the "exposure" is the frequency of a specific genetic variant.

**atypia** : A medical doctor who is responsible for the overall care of a patient in a hospital or clinic setting. An attending physician may also supervise and teach medical students, interns, and residents involved in the patient's care.

**atypical ductal breast hyperplasia** : Weakened or thinned. Attenuated strains of disease-causing bacteria and viruses are often used as vaccines. The weakened strains are used as vaccines because they stimulate a protective immune response while causing no disease or only mild disease in the person receiving the vaccine.

**atypical ductal hyperplasia** : State of being not typical or normal. In medicine, atypia is an abnormality in cells in tissue.

**atypical glandular cells** : A benign (not cancer) condition in which there are more cells than normal in the lining of breast ducts and the cells look abnormal under a microscope. Having atypical ductal breast hyperplasia increases the risk of breast cancer. Also called ADH and atypical ductal hyperplasia.

**atypical glandular cells of uncertain significance** : A benign (not cancer) condition in which there are more cells than normal in the lining of breast ducts and the cells look abnormal under a microscope. Having atypical ductal hyperplasia increases the risk of breast cancer. Also called ADH and atypical ductal breast hyperplasia.

**atypical glandular cells of undetermined significance** : A finding of abnormal cells in a Pap test. The glandular cells come from the inner part of the cervix or the lining of the uterus. This finding may be a sign of cancer or other serious condition, and more testing may be needed. Also called AGC.

**atypical hyperplasia** : A term that has been used to describe abnormal cells that come from glands in the walls of the cervix (the lower, narrow end of the uterus). These abnormal cells are found in a small number of Pap smears (a procedure used to detect cervical cancer) and may be a sign of

more serious lesions or cancer. The term used now is atypical glandular cells. Also called AGUS and atypical glandular cells of undetermined significance.

**atypical lobular breast hyperplasia :** A term that has been used to describe abnormal cells that come from glands in the walls of the cervix (the lower, narrow end of the uterus). These abnormal cells are found in a small number of Pap smears (a procedure used to detect cervical cancer) and may be a sign of more serious lesions or cancer. The term used now is atypical glandular cells. Also called AGUS and atypical glandular cells of uncertain significance.

**atypical lobular hyperplasia :** A benign (not cancer) condition in which cells look abnormal under a microscope and are increased in number.

**atypical mole :** A benign (not cancer) condition in which there are more cells than normal in the breast lobules and the cells look abnormal under a microscope. Having atypical lobular breast hyperplasia increases the risk of breast cancer. Also called ALH and atypical lobular hyperplasia.

**atypical squamous cells of undetermined significance :** A benign (not cancer) condition in which there are more cells than normal in the breast lobules and the cells look abnormal under a microscope. Having atypical lobular hyperplasia increases the risk of breast cancer. Also called ALH and atypical lobular breast hyperplasia.

**atypical squamous cells, cannot exclude a high-grade lesion :** A type of mole that looks different from a common mole. Several different types of moles are called atypical. Atypical moles are often larger than common moles and have regular or ragged or blurred borders that are not easy to see. Colors of atypical moles may be the same as the rest of the skin, or lighter, darker, or uneven. Parts or all of the mole may be raised above the skin surface. It is rare, but some atypical moles can develop into melanoma (a type of skin cancer). An atypical mole is sometimes called a Spitz nevus, a congenital nevus, a birthmark, or a dysplastic nevus.

**atypical teratoid/rhabdoid tumor :** A finding of abnormal cells in the tissue that lines the outer part of the cervix. Atypical squamous cells of undetermined significance is the most common abnormal finding in a Pap test. It may be a sign of infection with certain types of human papillomavirus (HPV). It may also be a sign of a benign (not cancer) growth, such as a cyst or polyp or, in menopausal women, of low hormone

levels. More testing, such as an HPV test, may be needed. Also called ASC-US and ASCUS.

**AU:** arbitrary unit.

**audience:** refers to the reader at the other end of your writing; you should consider your audience's position and experiences when deciding on the appropriate language, style, and tone for your essay.

**auditory :** A finding of abnormal cells in a Pap test. It means there are abnormal squamous cells in the tissue that lines the outer part of the cervix. Atypical squamous cells, cannot exclude a high-grade lesion may be a sign of a high-grade squamous intraepithelial lesion (HSIL), which may become cervical cancer if untreated. More testing may be needed. Also called ASC-H.

**auditory brain stem response test :** An aggressive cancer of the central nervous system, kidney, or liver that occurs in very young children. Also called AT/RT and ATT/RHT.

**auditory nerve:** the nerve within the ear that carries impulses to the brain for interpretation.

**aufbau buildup:** the order in which electrons fill atomic orbitals according to energy factors.

**aufbau principle:** An approximate procedure for writing the ground state electronic configuration of atoms. The configuration of an atom is obtained by inserting one electron into the configuration of the atom immediately to its left on the periodic table. The electron is inserted into the subshell indicated by the element's period and block.

**aug-cc-pVDZ:** Augmented cc-pVDZ basis (diffuse functions added).

**Augmentin :** Having to do with the ear and the sense of hearing. OR (Other name for: amoxicillin-clavulanate potassium)

**augmerosen :** A test used to detect some types of hearing loss, such as hearing loss caused by injury or tumors that affect nerves involved in hearing. Electrodes are placed on the head and certain tones or clicking sounds are made. The electrodes measure nerve signals in the brain when it reacts to the sounds. Also called ABR test, BAER test, and brain stem auditory evoked response test.

**auranofin:** An orally available, lipophilic, organogold compound, used to treat rheumatoid arthritis, with anti-inflammatory and potential

antineoplastic activities. Auranofin interacts with selenocysteine residue within the redox-active domain of mitochondrial thioredoxin reductase (TrxR), thereby blocking the activity of TrxR. As a result, this agent induces mitochondrial oxidative stress leading to the induction of apoptosis. Furthermore, this agent strongly inhibits the JAK1/STAT3 signal transduction pathway, thereby suppressing expression of immune factors involved in inflammation. TrxR, overexpressed in many cancer cell types, inhibits apoptosis, promotes cell growth and survival and plays a role in resistance to chemotherapy; TrxR catalyzes the reduction of oxidized thioredoxin (Trx) and plays a central role in regulating cellular redox homeostasis. Check for active clinical trials using this agent.

**auricular :** A drug used to treat bacterial infections. Adding the chemical clavulanate potassium to the antibiotic amoxicillin increases the amount of time the antibiotic stays active in the body. Augmentin is a type of combination antibiotic. Also called amoxicillin-clavulanate potassium.

**Aurimmune :** (Other name for: colloidal gold-bound tumor necrosis factor) OR A substance being studied in the treatment of cancer. It may kill cancer cells by blocking the production of a protein that makes cancer cells live longer and by making them more sensitive to anticancer drugs. It is a type of antisense oligodeoxyribonucleotide. Also called bcl-2 antisense oligodeoxynucleotide G3139, Genasense, and oblimersen sodium.

**Aurolate:** (Other name for: gold sodium thiomalate)

**aurora:** light created in the sky by the interference of charged solar particles with the magnetic field of the Earth.

**Aurora A kinase inhibitor TAS-119:** An orally bioavailable inhibitor of the serine/threonine protein kinase aurora A, with potential antimetabolic and antineoplastic activities. Upon intravenous administration, aurora A kinase inhibitor TAS-119 binds to and inhibits aurora A kinase, which may result in disruption of the assembly of the mitotic spindle apparatus, disruption of chromosome segregation, inhibition of cell division and the induction of apoptosis in cells overexpressing aurora A kinase. Aurora A kinase localizes to the spindle poles and to spindle microtubules during mitosis; it plays an essential role in the regulation of spindle assembly. Aurora kinase A is overexpressed in a wide variety of cancers.

**Aurora A kinase/tyrosine kinase inhibitor ENMD-2076:** An orally bioavailable synthetic small molecule with potential antiangiogenic and

antineoplastic activities. Aurora A kinase/tyrosine kinase inhibitor ENMD-2076 selectively binds to and inhibits non-specified tyrosine kinases and Aurora kinases (AKs). The inhibition of AKs may result in the inhibition of cell division and proliferation and may induce apoptosis in tumor cells that overexpress AKs; antiangiogenic activity is related to the inhibition of angiogenic tyrosine kinases. AKs are serine-threonine kinases that play an essential role in mitotic checkpoint control during mitosis and are important regulators of cell division and proliferation.

**Aurora B kinase inhibitor TAK-901:** A small-molecule inhibitor of the serine-threonine kinase Aurora B with potential antineoplastic activity. Aurora B kinase inhibitor TAK-901 binds to and inhibits the activity of Aurora B, which may result in a decrease in the proliferation of tumor cells that overexpress Aurora B. Aurora B is a positive regulator of mitosis that functions in the attachment of the mitotic spindle to the centromere; the segregation of sister chromatids to each daughter cell; and the separation of daughter cells during cytokinesis. This serine/threonine kinase may be amplified and overexpressed by a variety of cancer cell types.

**Aurora B/C kinase inhibitor GSK1070916A:** An ATP-competitive inhibitor of the serine/threonine kinases Aurora B and C with potential antineoplastic activity. Aurora B/C kinase inhibitor GSK1070916A binds to and inhibits the activity of Aurora kinases B and C, which may result in inhibition of cellular division and a decrease in the proliferation of tumor cells that overexpress the Aurora kinases B and C. Aurora kinases play essential roles in mitotic checkpoint control during mitosis, and are overexpressed by a wide variety of cancer cell types. or Having to do with the ear.

**Aurora kinase inhibitor AMG 900:** A small-molecule inhibitor of Aurora kinases A, B and C with potential antineoplastic activity. Aurora kinase inhibitor AMG 900 selectively binds to and inhibits the activities of Aurora kinases A, B and C, which may result in inhibition of cellular division and proliferation in tumor cells that overexpress these kinases. Aurora kinases are serine-threonine kinases that play essential roles in mitotic checkpoint control during mitosis and are overexpressed by a wide variety of cancer cell types.

**Aurora kinase inhibitor AT9283 :** A substance being studied in the treatment of some types of cancer. Aurimmune is made in the laboratory by

binding a cancer-killing protein called tumor necrosis factor (TNF) to the surface of very tiny particles of gold. These TNF-gold particles may kill cancer cells without harming healthy tissue. Also called colloidal gold-bound tumor necrosis factor and TNF-bound colloidal gold.

**Aurora kinase inhibitor BI 811283:** A small molecule inhibitor of the serine/threonine protein kinase Aurora kinase with potential antineoplastic activity. Aurora kinase inhibitor BI 811283 binds to and inhibits Aurora kinases, resulting in disruption of the assembly of the mitotic spindle apparatus, disruption of chromosome segregation, and inhibition of cell proliferation.

**Aurora kinase inhibitor MLN8054:** An orally bioavailable, highly selective small molecule inhibitor of the serine/threonine protein kinase Aurora A kinase with potential antineoplastic activity. Aurora kinase inhibitor MLN8054 binds to and inhibits Aurora kinase A, resulting in disruption of the assembly of the mitotic spindle apparatus, disruption of chromosome segregation, and inhibition of cell proliferation. Aurora A localizes in mitosis to the spindle poles and to spindle microtubules and is thought to regulate spindle assembly. Aberrant expression of Aurora kinases occurs in a wide variety of cancers, including colon and breast cancers. Check for active clinical trials using this agent.

**Aurora kinase inhibitor PF-03814735:** An orally bioavailable, ATP-competitive, reversible small-molecule Aurora kinase inhibitor with potential antineoplastic activity. Aurora kinase inhibitor PF-03814735 binds to and inhibits Aurora kinases A and B, which may result in the inhibition of cellular division and proliferation in tumor cells that overexpress these kinases. Aurora kinases are serine-threonine kinases that play essential roles in mitotic checkpoint control during mitosis.

**Aurora kinase inhibitor SNS-314:** A synthetic small molecule Aurora kinase (AK) inhibitor with potential antineoplastic activity. Aurora kinase inhibitor SNS-314 selectively binds to and inhibits AKs A and B, which may result in the inhibition of cellular division and proliferation in tumor cells that overexpress AKs. AKs are serine-threonine kinases that play essential roles in mitotic checkpoint control during mitosis.

**Aurora kinase inhibitor TTP607:** A small-molecule pan-Aurora kinase inhibitor with potential antineoplastic activity. Aurora kinase inhibitor TTP607 selectively binds to and inhibits Aurora kinases A, B and C, which

may result in the disruption of the assembly of the mitotic spindle apparatus, disruption of chromosome segregation, and inhibition of cellular division and proliferation in Aurora kinase-overexpressing tumor cells. Aurora kinases A, B and C, are serine/threonine kinases that play essential roles in mitotic checkpoint control and are overexpressed by a wide variety of tumor cell types.

**Aurora kinase/VEGFR2 inhibitor CYC116:** An orally bioavailable small molecule multi-kinase inhibitor with antineoplastic activity. Aurora kinase/VEGFR 2 inhibitor CYC116 inhibits Aurora kinases A and B and vascular endothelial growth factor receptor 2 (VEGFR2), resulting in disruption of the cell cycle, rapid cell death, and the inhibition of angiogenesis. Aurora kinases are serine/threonine protein kinases that are only expressed in actively dividing cells and are critical in division or mitosis. VEGFR2 is a receptor tyrosine kinase that appears to account for most of the mitogenic and chemotactic effects of vascular endothelial growth factor (VEGF) on adult endothelial cells.

**aurotherapy :** A substance being studied in the treatment of some types of cancer. It blocks certain enzymes (Aurora kinases) involved in cell division and may kill cancer cells. It is a type of serine/threonine protein kinase inhibitor. Also called GSK1070916A.

**Australian Research Council:** Australia's peak science funding body. The ARC is responsible for running the competitive grant process which is used to determine which proposed research is funded by the Commonwealth government. The ARC's Research Centres Programme established and continues to support the Key Centre for Polymer Colloids.

**auto-ignition temperature:** Minimum temperature at which the vapor/air mixture over a liquid spontaneously catches fire.

**autoantibody :** A substance being studied in the treatment of some types of cancer. It blocks enzymes (Aurora kinases) involved in cell division and may kill cancer cells. Aurora kinase inhibitor AT9283 is a type of serine/threonine protein kinase inhibitor. Also called AT9283.

**Autoclavable:** A method used to sterilize containers with superheated steam under pressure.

**autoclave:** An airtight chamber use for processes requiring dry temperatures above 212 degrees F.

**autoclave :** A procedure that uses gold salts (a salt form of the metal element gold) to treat diseases, such as rheumatoid arthritis. The gold salts stop cells from releasing chemicals that can harm tissues. Also called chrysotherapy and gold therapy.

**Autoclave Molding:** Modification of the pressure bag method for molding reinforced plastics. After lay-up, entire assembly is placed in steam autoclave at 50 to 100 psi. Additional pressure achieves higher reinforcement loadings and improved removal of air.

**autoclave-resistant factor :** An antibody made against substances formed by a person's own body. Autoantibodies can directly destroy cells that have the substances on them or can make it easier for other white blood cells to destroy them. Some autoimmune diseases are caused by autoantibodies.

**Autoimmune disease:** A disease, such as insulin-dependent diabetes and multiple sclerosis, that result from a failure to suppress the immune response to self-antigens.

**autoimmune disease :** A device that uses steam under high pressure to sterilize medical and laboratory supplies and equipment.

**autoimmune enteropathy :** A substance found in soybeans that may slow down or stop the spread of cancer. This substance does not break down in an autoclave (a device that uses steam under high pressure to sterilize medical and laboratory supplies and equipment).

**autoimmune hemolytic anemia :** A condition in which the body recognizes its own tissues as foreign and directs an immune response against them.

**autoimmune thyroiditis :** A rare disease in which certain cells in the intestine are destroyed by a patient's immune system. It causes severe, chronic, diarrhea and usually occurs in children.

**autologous :** A condition in which the body's immune system stops red blood cells from forming or causes them to clump together. Autoimmune hemolytic anemia can occur in patients who have chronic lymphocytic leukemia (CLL). Also called immune complex hemolytic anemia and immunohemolytic anemia.

**autologous Ad-CD154-transduced CLL B cells:** An autologous tumor cell vaccine containing chronic lymphocytic leukemia (CLL) B cells transduced with an adenoviral vector carrying chimeric CD154 (ad-CD154)

with potential antineoplastic activity. Administration of autologous ad-CD154 transduced CLL B cells may result in increases in the numbers of leukemia-specific CD4+ T cells and high serum-levels of IL-12 and IFN-gamma. Due to ligation of CD154 to CD40 on CLL cells, this agent may induce CLL cells to express the proapoptotic molecule Bid and death receptors CD95 (Fas) and DR5, rendering CLL B cells first resistant and then sensitive to Fas-mediated apoptosis. In addition, autologous ad-CD154 transduced CLL B cells may induce MHC class I-dependent cytotoxic T lymphocyte (CTL) responses against autologous leukemia cells. CD154 is a type II membrane glycoprotein and ligand for CD40; both molecules are important in cognate co-stimulatory cell-cell interactions. Check for active clinical trials using this agent.

**autologous anti-CD123 CAR TCR/4-1BB-expressing T lymphocytes:**

Autologous, genetically engineered T lymphocytes that have been electroporated with a messenger RNA (mRNA) encoding a chimeric antigen receptor (CAR) consisting of an anti-human interleukin-3 receptor alpha chain (IL3RA; CD123) single chain variable fragment (scFv) coupled to the co-stimulatory signaling domains of 4-1BB (CD137) and the zeta chain of the T-cell receptor (TCR) CD3 complex (CD3-zeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, the mRNA-electroporated autologous anti-CD123 CAR TCR/4-1BB expressing T lymphocytes attach to cancer cells expressing CD123. This induces selective toxicity in and causes lysis of CD123-expressing tumor cells. The 4-1BB co-stimulatory molecule signaling domain enhances T cell activation and signaling after recognition of CD123. CD123 is normally expressed on committed blood progenitor cells in the bone marrow; its overexpression is associated with both increased leukemic cell proliferation and aggressiveness.

**autologous anti-CD19 CAR-expressing T lymphocytes:** A preparation of autologous T lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) that targets the human tumor associated antigen (TAA) CD19, with potential immunostimulating and antineoplastic activities. Upon administration, autologous anti-CD19 CAR-expressing T lymphocytes bind to and induce selective toxicity against CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies.

**autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing CD4+/CD8+ central memory T lymphocytes JCAR014:** A defined preparation of CD4+ and CD8+ central memory (CM) autologous T lymphocytes transduced with a lentiviral vector expressing a chimeric antigen receptor (CAR) containing an anti-CD19 single chain variable fragment (scFv) fused to the signaling domains of CD28, 4-1BB (CD137), the zeta chain of the TCR/CD3 complex (CD3-zeta), and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing CD4+/CD8+CM T lymphocytes JCAR014 are directed to and induce selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell-specific cell surface antigen expressed in all B-cell lineage malignancies. Devoid of both ligand binding domains and tyrosine kinase activity, the expressed EGFRt both facilitates in vivo detection of the administered, transduced T cells and can promote elimination of those cells through a cetuximab-induced antibody-dependent cellular cytotoxicity (ADCC) response. The 4-1BB costimulatory signaling domain enhances both proliferation of T cells and antitumor activity.

**autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing CD4+/CD8+ T lymphocytes JCAR017:** A preparation of a defined ratio of CD4+ and CD8+ autologous T lymphocytes transduced with a lentiviral vector expressing a chimeric antigen receptor (CAR) containing an anti-CD19 single chain variable fragment (scFv) fused to the signaling domain of 4-1BB (CD137), the zeta chain of the TCR/CD3 complex (CD3-zeta), and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing CD4+/CD8+ T lymphocytes JCAR017 are directed to and induce selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. Devoid of both ligand binding domains and tyrosine kinase activity, the expressed EGFRt both facilitates in vivo detection of the administered, transduced T cells and can promote elimination of those cells through a cetuximab-induced antibody dependent cellular cytotoxicity (ADCC) response. The 4-1BB costimulatory signaling domain enhances both proliferation of T cells and antitumor activity.

**autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing T lymphocytes:** A preparation of genetically modified CD8<sup>+</sup> central memory (T<sub>cm</sub>) and CD4<sup>+</sup> autologous T-lymphocytes (1:1) transduced with a replication incompetent, self-inactivating (SIN) lentiviral vector expressing a chimeric antigen receptor (CAR) containing an anti-CD19 single chain variable fragment (scFv) derived from the murine IgG1 monoclonal antibody (mAb) FMC63, fused to the signaling domain of 4-1BB (CD137), the zeta chain of the TCR/CD3 complex (CD3-zeta), and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, autologous anti-CD19CAR-4-1BB-CD3zeta-EGFRt-expressing T lymphocytes are directed to and induce selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. Devoid of both ligand binding domains and tyrosine kinase activity, the expressed EGFRt both facilitates in vivo detection of the administered, transduced T-cells and can promote elimination of those cells through a cetuximab-induced antibody dependent cellular cytotoxicity response. The 4-1BB costimulatory signaling domain enhances both proliferation of T-cells and antitumor activity. Check for active clinical trials using this agent.

**autologous anti-gp100:154-162 T-cell receptor gene-engineered peripheral blood lymphocytes:** Human autologous peripheral blood lymphocytes (PBLs) transduced with a glycoprotein 100 (gp100) epitope-determined T cell receptor (TCR) gene, with potential antineoplastic activity. PBLs are isolated from a melanoma patient and pulsed with a viral vector encoding the TCR specific for amino acid residues 154-162 of gp100 (KTWGQYWQV). After expansion ex vivo, the transduced autologous PBLs, expressing this specific TCR, are reintroduced into the patient and bind to melanoma cells expressing the gp100 protein, which may result in specific cytotoxic T-lymphocyte (CTL) killing of gp100-expressing melanoma cells. gp100 is a melanocyte lineage-specific antigen overexpressed in melanomas. Check for active clinical trials using this agent.

**autologous anti-MART-1 F5 T-cell receptor gene-engineered peripheral blood lymphocytes:** Human autologous peripheral blood lymphocytes (PBLs) transduced with a melanoma antigen MART-1 epitope-determined T cell receptor (TCR) gene, with potential antineoplastic activity. PBLs are

isolated from a melanoma patient and pulsed with a viral vector that encodes the TCR specific for an epitope of MART-1 (F5 TCR). After expansion ex vivo, the transduced autologous PBLs, expressing this specific TCR, are reintroduced into the patient, and bind to melanoma cells expressing the MART-1 antigen, which may result in specific cytotoxic T-lymphocyte (CTL) killing of MART-1-expressing melanoma cells. MART-1 (melanoma antigen recognized by T cells 1), also known as Melan-A, is a melanocyte lineage-specific transmembrane protein.

**autologous anti-PSMA gene-modified T-cells:** Autologous prostate specific membrane antigen (PSMA) gene-modified T lymphocytes with potential antineoplastic activity. Human autologous T-lymphocytes are isolated and transduced ex vivo with a retrovirus encoding a chimeric immune receptor (CIR) consisting of an antibody fragment against PSMA fused with signaling domains of the T cell. Upon reintroduction into the patient, autologous anti-PSMA gene-modified T-cells bind to PSMA-expressing prostate cancer cells, which may result in specific cytotoxic T-lymphocyte (CTL) tumor cell killing.

**autologous beta-A(T87Q)-globin gene-transduced CD34-positive cells:** A preparation of autologous, CD34-positive hematopoietic stem cells (HSCs) transduced ex vivo with the BB305 recombinant replication-defective, self-inactivating lentiviral vector encoding for an engineered form of human beta-globin (hemoglobin-beta, HBB) gene, beta-A-T87Q (b-A-T87Q) where the threonine at position 87 has been substituted with glutamine, with potential to restore beta-globin expression and function. Autologous CD34-positive stem cells are isolated from the patient's own bone marrow and the cells are transduced with the lentiviral vector. Upon re-infusion of the b-A-T87Q-globin gene transduced CD34-positive cells back into the patient, these cells express b-A-T87Q-globin, thereby allowing the body to make normal hemoglobin and thus normal, healthy red blood cells. Beta-globin, the beta-chain of the most common form of hemoglobin, is encoded by the HBB gene; mutations in this gene prevent normal beta-globin production and are associated with beta-thalassemia and sickle cell anemia. The b-A-T87Q form of beta-globin has increased antisickling activity compared to the wild type protein.

**autologous bone marrow :** An autoimmune condition of the thyroid gland (a gland located beneath the larynx). It is caused by the formation of

antibodies that attack the thyroid gland and it usually causes hypothyroidism (too little thyroid hormone). Symptoms include fatigue, weight gain, constipation, dry skin, depression, and the inability to exercise. It is more common in females and can run in families. Also called Hashimoto disease and Hashimoto thyroiditis.

**autologous bone marrow transplantation :** Taken from an individual's own tissues, cells, or DNA.

**autologous bone marrow-derived CD34/CXCR4-positive stem cells**

**AMR-001:** A cell-based product containing autologous bone marrow derived CD34 positive and C-X-C chemokine receptor type 4 (CXCR4) positive stem cells with potential antiapoptotic and proangiogenic activities. Upon intracoronary infusion after a myocardial infarction (MI), autologous bone marrow-derived CD34/CXCR4-positive stem cells may preserve cardiac muscle cells and prevent apoptosis; thus improving myocardial perfusion. CD34/CXCR4-positive stem cells are naturally mobilized upon cell injury through signaling by hypoxia inducing factor (HIF), which is secreted in response to hypoxia. In turn, HIF induces the synthesis of stromal-derived factor 1 (SDF-1) and vascular endothelial growth factor (VEGF) which mobilize CD34/CXCR4 positive stem cells; CXCR4 is the receptor for stromal-derived factor 1 (SDF-1).

**autologous CD123CAR-CD28-CD3zeta-EGFRt-expressing T**

**lymphocytes:** A preparation of genetically modified autologous T-cells transduced with a replication-incompetent, self-inactivating lentiviral vector expressing a hinge-optimized, chimeric antigen receptor (CAR), containing a CD28 co-stimulatory signaling domain fused to CD3 zeta, the single-chain variable fragment of CD123 (interleukin-3 receptor alpha chain or IL3RA) antigen, and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, autologous CD123CAR-CD28-CD3zeta-EGFRt-expressing T lymphocytes are directed to and induce selective toxicity in CD123-expressing tumor cells. CD123 is normally expressed on committed blood progenitor cells in the bone marrow; its overexpression is associated with increased leukemic cell proliferation and aggressiveness. Devoid of both ligand binding domains and tyrosine kinase activity, EGFRt both facilitates detection of the administered T-cells in vivo and can promote elimination of those cells

following a cetuximab-induced antibody-dependent cellular cytotoxicity response. The costimulatory signaling domain enhances both proliferation of T-cells and antitumor activity. Hinge optimization prevents recognition of the CAR by Fc receptors (FcRs).

**autologous CD133-positive BTSC mRNA-pulsed autologous dendritic cell vaccine:** A cancer vaccine consisting of autologous dendritic cells (DCs) loaded with CD133-positive autologous brain tumor stem cells (BTSCs) –derived mRNA with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, autologous CD133-positive BTSC mRNA-pulsed autologous dendritic cell vaccine may elicit a cytotoxic T-lymphocyte (CTL) response against the CD133-positive BTSCs from which the autologous tumor mRNA is derived. CD133, a tumor-associated antigen (TAA) and neural stem cell marker, has been found on a specific subset of glioblastoma multiforme (GBM) stem cells; its presence has been correlated with resistance to conventional chemotherapy and radiotherapy.

**autologous CD171-specific CAR-CD28 zeta-4-1-BB-EGFRt-expressing T lymphocytes:** A preparation of genetically modified autologous human T-lymphocytes transduced with a lentiviral vector expressing a chimeric antigen receptor (CAR) specific for the L1 cell adhesion molecule (L1-CAM/CD171) antigen, and the co-stimulatory signaling domains CD28, 4-1BB (CD137) and CD3 zeta, and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon re-infusion into the patient, the autologous L1-CAM-specific CAR-CD28 zeta-4-1-BB-EGFRt-expressing T-lymphocytes are directed to and induce selective toxicity in L1-CAM-expressing tumor cells. L1-CAM, a neuronal cell adhesion molecule and member of the L1 protein family, plays a key role in the development of the nervous system; it is overexpressed in various tumor cell types and is associated with increased chemoresistance, tumor progression, migration and metastasis. Devoid of both ligand-binding domains and tyrosine kinase activity, EGFRt facilitates both the detection of the administered T-cells in vivo and the elimination of the modified T-cells following a cetuximab-induced antibody-dependent cellular cytotoxicity (ADCC) response. The co-stimulatory signaling domains enhance both proliferation of T-cells and antitumor activity.

**autologous CD19-28z chimeric antigen receptor-expressing T**

**lymphocytes:** Genetically modified autologous T-lymphocytes transduced with a replication-incompetent retroviral vector expressing a chimeric T-cell antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment), fused to the extracellular, transmembrane and intracellular signaling domains of the T cell co-stimulatory receptor CD28 and the cytoplasmic signaling domain of the zeta chain of the TCR/CD3 complex (CD3-zeta) (CAR19-28z), with potential antineoplastic activities. Upon intravenous administration, autologous CD19-28z CAR-expressing T-lymphocytes are directed to CD19-expressing tumor cells, which induces selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. The CD28 co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19. The inclusion of the CD28 signaling domain may increase proliferation of T-cells and antitumor activity compared to the inclusion of the CD3-zeta chain alone. Check for active clinical trials using this agent.

**autologous CD19CAR-CD28-CD3zeta-EGFRt-expressing Tcm-**

**enriched T cells:** A preparation of genetically modified autologous central memory (Tcm) enriched T-cells transduced with a replication incompetent lentiviral vector expressing a chimeric antigen receptor (CAR), containing a CD28 signaling domain fused to both CD3 zeta, which targets the CD19 antigen, and a truncated form of the human epidermal growth factor receptor (EGFRt), with potential immunostimulating and antineoplastic activities. Upon intravenous administration, autologous CD19CAR-CD28-CD3zeta-EGFRt-expressing Tcm-enriched T cells are directed to CD19-expressing tumor cells, thereby inducing a selective toxicity in CD19-expressing tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. Devoid of both ligand binding domains and tyrosine kinase activity, EGFRt both facilitates in vivo detection of the administered T-cells and can promote elimination of those cells upon a cetuximab-induced antibody dependent cellular cytotoxicity response. The costimulatory signaling domain enhances proliferation of T cells and antitumor activity.

**autologous CD34-positive hematopoietic progenitor cells:** A population of autologous CD34-positive hematopoietic progenitor cells (HPCs) that can be used for autotransplantation. CD34+ HPCs are isolated from human

blood stem cells upon apheresis. Upon transplantation with the CD34+ HPCs, these cells can differentiate into a variety of cell types including fibroblasts, osteoblasts, chondrocytes, myocytes, adipocytes, and endothelial cells. Check for active clinical trials using this agent.

**autologous CD8-positive PBL sensitized to Drosophila cell-presented melanoma peptides:** A preparation of autologous CD8+ (cytotoxic) human peripheral blood lymphocytes (PBLs) sensitized to Drosophila cell-presented melanoma peptides, with potential immunostimulating and antineoplastic activities. Autologous CD8+ T-lymphocytes, isolated from a melanoma patient, are exposed in vitro to melanoma peptide-pulsed HLA-A2-expressing Drosophila cells, expanded, and reintroduced into the patient; these tumor-reactive T-cells may stimulate a host immune response against tumor cells expressing the melanoma antigens, resulting in tumor cell lysis. Drosophila cells, which do not express any native MHC molecules, have been shown to potently stimulate tumor-reactivity in vitro from human peripheral blood lymphocytes (PBL) when stably transfected with human MHC molecules and appropriate adhesion and costimulatory molecules.

**autologous CD8+ melanoma-specific T cells:** Autologous CD8 T lymphocytes against melanoma-associated antigens, with potential immunomodulating and antineoplastic activities. Following leukapheresis and the ex vivo expansion of cytotoxic T-lymphocytes, the autologous CD8+ melanoma-specific T cells are re-introduced into the melanoma patient. These cytotoxic T-cells recognize and kill the patient's own melanoma cells.

**autologous CEA-specific cytotoxic T-lymphocytes:** Autologous cytotoxic T-lymphocytes (CTLs) specifically reactive to the tumor-associated antigen (TAA) human carcinoembryonic antigen (CEA), with potential antineoplastic activity. Dendritic cells (DCs) isolated from the patient's blood are infected with recombinant adeno-associated virus (AAV) expressing the CEA gene. Exposure of T-lymphocytes to DCs creates CEA-specific CTLs which are expanded. Upon reintroduction of these CTLs into the patient, these cells recognize and kill CEA-expressing tumor cells. CEA, a tumor-associated antigen and a member of the CEA family of proteins, plays a key role in cell migration, cell invasion, and cell adhesion and is overexpressed by a variety of cancer types.

**autologous colon cancer cell vaccine:** A personalized, proprietary cancer vaccine composed of sterile, irradiated, non-dividing, live colon cancer cells obtained from an individual after tumor resection, with potential immunoactivating and antineoplastic activities. Upon intradermal administration, the autologous colon cancer cell vaccine activates the immune system and elicits a cytotoxic T-lymphocytic (CTL) response against the residual colon cancer cells, which results in tumor cell death. This may prevent cancer recurrence. According to the vaccination schedule, the first two out of the four doses are co-administered with the immunoadjuvant bacillus Calmette-Guerin (BCG), which is an attenuated strain of *Mycobacterium bovis* that non-specifically enhances the immune response.

**autologous colorectal tumor antigen-pulsed dendritic cell vaccine:** A dendritic cell (DC)-based cancer vaccine composed of autologous DCs pulsed with tumor cell lysates from a colorectal cancer patient containing tumor-associated antigens (TAAs), with potential immunostimulatory and antineoplastic activities. Upon administration, autologous colorectal tumor antigen-pulsed DC vaccine exposes the immune system to colorectal tumor cell antigens, which may result in cytotoxic T-lymphocyte (CTL)-mediated immune responses against the colorectal cancer cells. This leads to cancer cell lysis. The tumor cell lysate contains a range of antigens that are essential for the neoplastic growth and survival of the cancer cells.

**autologous CT7/MAGE-A3/WT1 mRNA-electroporated Langerhans-type dendritic cells:** An autologous tumor cell vaccine containing CD34+ hematopoietic progenitor cell (HPC)-derived Langerhans-type dendritic cells (LCs) electroporated with mRNA encoding the full-length cancer-testis antigens, CT7 and melanoma-associated antigen 3 (MAGE-A3), and the self-differentiation tumor antigen, Wilms tumor 1 (WT1) with potential immunomodulating and antineoplastic activity. The autologous CT7/MAGE-A3/WT1 mRNA-electroporated Langerhans-type dendritic cells are prepared by drawing a blood sample containing the CD34+ HPCs from a cancer patient. The CD34+ HPCs are treated with a combination of cytokines which specifically support LC development, and the LC population is enriched and expanded *ex vivo*. The cultured LCs are allowed to mature for one day and then electroporated separately with CT7, MAGE-A3 or WT1 mRNA before final maturation. Upon intradermal administration into the patient, the mature LCs may activate cell-mediated

immunity and induce both cytotoxic CD8+ T cells and CD4+ helper T cells against cancer cells expressing CT7, MAGE-A3 and WT1 tumor antigens. This may result in the immune-mediated inhibition of tumor cell proliferation, leading to tumor cell death. CT7 and MAGE-A3 are tumor-specific proteins overexpressed in a number of cancers but not in healthy tissues other than testis and placenta. WT1 is a transcription factor important in development and cancer pathogenesis, which is overexpressed in a variety of cancers, including multiple myeloma, leukemia, ovarian cancer, malignant mesothelioma, neural tumors and renal carcinoma.

**autologous cultured acute myeloid leukemia-specific cytotoxic T lymphocytes:** A preparation of cytotoxic, autologous acute myelogenous leukemia (AML)-reactive T lymphocytes (CTL), with potential immunomodulating and antineoplastic activities. The autologous cultured AML-specific CTLs are prepared using a specific AML-CTL culture method. Autologous peripheral blood lymphocytes are taken from an AML patient and the autologous AML blasts are treated with granulocyte macrophage colony-stimulating factor (GM-CSF) and interleukin 4 (IL-4), both of which promote ex vivo differentiation of AML blasts into dendritic cells (DCs). In the same culture, T cells are treated and activated by low-dose interleukin 2 (IL-2), and expanded using anti-CD3. This results in cultured AML-reactive CTLs which are administered back into the patient after autologous hematopoietic stem cell transplant (AHSCT). The autologous cultured AML-specific CTLs may eradicate residual AML cells.

**autologous cytotoxic T lymphocytes induced with MUC1 gene-transfected dendritic cells:** A preparation of autologous cytotoxic T-lymphocytes (CTL), specifically reactive to the tumor-associated antigen (TAA) mucin-1 (MUC1), with potential antineoplastic activity. Peripheral blood mononuclear cells (PBMCs) are collected from the patient with MUC1-positive tumors and are exposed ex vivo to dendritic cells (DCs) transfected with a replication-deficient adenovirus encoding MUC1 to generate MUC1-specific CTLs, which are subsequently expanded in vitro. Upon re-infusion of autologous CTLs induced with MUC1 gene-transfected DCs to the patient, the CTLs target and lyse the MUC1-expressing tumor cells. This inhibits tumor cell proliferation. MUC1 is expressed by a variety of tumor cell types.

**autologous cytotoxic T lymphocytes induced with MUC1 peptide-transfected dendritic cells:** A preparation of autologous cytotoxic T-lymphocytes (CTL), specifically reactive to the tumor-associated antigen (TAA) mucin-1 (MUC1), with potential antineoplastic activity. Peripheral blood mononuclear cells (PBMCs) are collected from the patient with MUC1-positive tumors and are exposed ex vivo to dendritic cells (DCs) that are pulsed with a MUC1 peptide to generate MUC1-specific CTLs, which are subsequently expanded in vitro. Upon re-infusion of autologous CTLs induced with MUC1 peptide-pulsed DCs to the patient, the CTLs target and lyse the MUC1-expressing tumor cells. This inhibits tumor cell proliferation. MUC1 is expressed by a variety of tumor cell types.

**autologous dendritic cell vaccine ACT2001:** A cell-based cancer vaccine composed of autologous, immature dendritic cells (DCs), with potential immunostimulating and antineoplastic activities. Upon leukapheresis, immature DCs are isolated and re-administered intra-tumorally. The immature DCs internalize and process the tumor-associated antigens (TAAs), migrate to the lymphatic system, and then expose the immune system to the TAAs. This induces a specific cytotoxic T-lymphocyte (CTL) response against the cancer cells leading to tumor cell lysis.

**autologous dendritic cell-adenovirus CCL21 vaccine:** A cancer vaccine comprised of autologous dendritic cells (DCs) that have been transduced ex vivo with an adenoviral vector containing the CCL21 gene with potential immunostimulatory and antineoplastic activities. Upon intratumoral administration, autologous dendritic cell-adenovirus CCL21 vaccine expresses the chemokine CCL21, which may induce an antitumoral cytotoxic immune response in the tumor microenvironment. CCL21 [chemokine (C-C motif) ligand 21] has been shown to attract antigen presenting cells (APCs), like leukocytes and DCs, and natural killer (NK) cells and their T-cell effectors to induce a cytotoxic immune response.

**autologous dendritic cell-adenovirus p53 vaccine:** An autologous vaccine composed of dendritic cells (DC) that have been transduced with a p53 tumor suppressor gene-modified virus. When the autologous dendritic cell-adenovirus p53 vaccine is administered, the host cytotoxic T lymphocytes (CTL) are directed against p53-positive tumor cells, which may result in tumor cell death and decreased tumor growth.

**autologous dendritic cell-allogeneic melanoma tumor cell lysate**

**vaccine:** A cell-based vaccine composed of autologous dendritic cells (DCs) pulsed with lysates from heat-treated allogeneic melanoma tumor cells. Upon administration, this vaccine may stimulate anti-tumoral cytotoxic T-cell and antibody responses to melanoma cells bearing shared melanoma antigens such as MelanA/MART-1, gp100, MAGE3, resulting in tumor cell lysis.

**autologous dendritic cell-autologous tumor mRNA-human CD40L**

**vaccine:** A cancer vaccine consisting of autologous dendritic cells transfected with autologous tumor mRNA and the human CD40 ligand (CD40L) gene with immunostimulatory and antitumor activities.

Vaccination with autologous dendritic cell-autologous tumor mRNA-human CD40L vaccine may elicit a cytotoxic T cell response against tumor cells from which the autologous tumor mRNA was derived. When expressed by dendritic cells, tumor antigens and the co-stimulatory molecule CD40L, which binds to CD40 receptors on antigen presenting cells (APC), facilitate both humoral and cellular immune responses against tumor cells.

**autologous dendritic cell-based immunotherapeutic AV0113:** A

therapeutic interleukin-12 (IL-12)-expressing dendritic cell (DC)-based vaccine composed of autologous monocyte-derived DCs loaded with autologous tumor cell lysate and exposed to the microbial cell wall component lipopolysaccharide (LPS), with potential immunomodulating and antineoplastic activities. The monocyte-derived immature DCs are loaded with autologous tumor cell lysates and are subsequently exposed to LPS and interferon-gamma (IFN-gamma). Upon administration of autologous DC-based immunotherapeutic AV0113, the mature DCs migrate into the lymph nodes, express the immune stimulatory cytokine interleukin-12 (IL-12) and activate the immune system by promoting the activation of natural killer (NK) cells and induce a cytotoxic T-lymphocyte (CTL)-mediated immune response against tumor cells, which may result in immune-mediated tumor cell death and inhibition of tumor cell proliferation. Exposure to LPS and IFN-gamma allows the maturation of DCs and optimizes the presentation of tumor-associated antigens (TAAs) by DCs to T-lymphocytes.

**autologous dendritic cell-tumor fusion vaccine:** A therapeutic cancer vaccine consisting of autologous dendritic cells (DCs) fused with

autologous tumor cells with potential immunostimulatory and antineoplastic activities. Autologous dendritic cell-tumor fusion vaccine is generated in vitro by mixing DCs and irradiated tumor cells harvested from individual patients and treating them with polyethylene glycol (PEG) to produce DC-tumor cell fusion hybrid cells. Upon administration, autologous dendritic cell-tumor fusion vaccine may elicit antitumor humoral and cellular immune responses.

**autologous dinitrophenyl-modified ovarian cancer vaccine:** A cancer vaccine consisting of autologous ovarian cancer cell peptide antigens conjugated to the hapten 2,4-dinitrophenol (DNP) with potential immunostimulating and antineoplastic activities. Administration of autologous dinitrophenyl-modified ovarian cancer vaccine may induce a cytotoxic T-lymphocyte (CTL) response against ovarian cancer cells. DNP conjugation may enhance the immunogenicity of weakly immunogenic antigens.

**autologous EBV-CTL CD19CAR zeta:** Autologous Epstein-Barr virus (EBV)-specific cytotoxic T-lymphocytes (CTL) that have been genetically modified to express a T-cell chimeric antigen receptor (CAR) targeting the CD19 antigen, with potential immunotherapeutic activity. The CAR consists of a single chain Fv of anti-CD19 IgG1 coupled with an intracellular signaling region of the zeta-chain of the TCR/CD3 complex (CD3 zeta). Autologous EBV-CTL CD19CAR zeta directs the T-lymphocytes to CD19-expressing tumor cells, stimulating a selective toxicity to tumor cells. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies.

**autologous EBV-transformed B lymphoblastoid-tumor fusion cell vaccine:** A cell-based vaccine composed of autologous tumor cells fused with Epstein-Barr virus-transformed B-lymphoblastoid cells. Upon administration, this vaccine may stimulate a cytotoxic T cell response against tumor cells, resulting in tumor cell lysis.

**autologous Epstein-Barr virus-specific cytotoxic T lymphocytes:** A preparation of lymphocytes harvested from a patient with an Epstein-Barr virus (EBV)-positive tumor. Ex vivo, the lymphocytes are activated against EBV-specific antigens and then returned to the patient, where they mount a specific immune response against EBV-positive tumor cells.

**autologous Epstein-Barr virus-transformed B-lymphoblastoid cell vaccine:** A cell-based vaccine composed of autologous lymphoblastoid B cells activated against Epstein-Barr virus (EBV) in vitro with potential immunoprotective activity. Upon prophylactic administration, this vaccine may stimulate specific cytotoxic T-lymphocyte (CTL) and antibody responses against EBV-transformed B cells, thereby preventing an EBV-induced post-transplantation lymphoproliferative disorder. Check for active clinical trials using this agent.

**autologous expanded mesenchymal stem cells OTI-010:** Multipotent self-renewing adherent non-hematopoietic stromal cells harvested from a patient's bone marrow and grown in vitro. When injected back into the patient, autologous expanded mesenchymal stem cells OTI-010 may differentiate into various mesenchyme-derived cell types and, in some instances, may augment bone marrow engraftment after whole-body irradiation. OR In transplantation, refers to a person's own bone marrow. Bone marrow is the soft, sponge-like tissue in the center of most large bones that produces white blood cells, red blood cells, and platelets.

**autologous glioma cell lysate:** A cell lysate derived from glioma cells with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, the autologous glioma cell lysate exposes the immune system to an undefined amount of glioma-type tumor associated antigens (TAA), which may result in the induction of both specific anti-tumoral cytotoxic T lymphocytes (CTL) and antibody-dependent responses against the glioma TAA-expressing cells, resulting in glioma cell lysis. Check for active clinical trials using this agent.

**autologous GM-CSF-secreting breast cancer vaccine:** An autologous tumor cell vaccine containing irradiated breast cancer cells transfected with the granulocyte macrophage-colony-stimulating factor (GM-CSF) gene with potential antineoplastic activity. Autologous breast cancer cells are transduced ex vivo with an adenovirus vector encoding the GM-CSF gene and irradiated and then reintroduced into the patient. Upon repeated subcutaneous administration of the vaccine, autologous GM-CSF-secreting breast cancer cells secrete GM-CSF, which may stimulate a tumor-specific cytotoxic T-lymphocyte (CTL) response.

**autologous GM-CSF-secreting lethally irradiated colorectal cancer cell vaccine:** A lethally irradiated, autologous colorectal cancer vaccine

consisting of patient-specific colorectal cancer cells genetically modified to secrete the cytokine granulocyte-macrophage colony stimulating factor (GM-CSF), with potential immunostimulating and antineoplastic activities. Upon vaccination, the autologous GM-CSF-secreting lethally irradiated colorectal cancer cell vaccine releases GM-CSF. In turn, GM-CSF may increase the body's immune response against tumor cells by promoting the maturation and activation of dendritic cells (DCs), and enhancing tumor-specific antigen presentation to both B- and T-cells, which leads to better recognition of tumors by the immune system. In addition, GM-CSF promotes antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated lymphokine-activated killer cell function.

**autologous HBV-specific TCR-redirection T lymphocytes:** A preparation of human autologous T-lymphocytes transduced with a viral vector encoding for a T cell receptor (TCR) specific for a human hepatitis B virus (HBV) surface antigen (HBsAg), with potential antineoplastic activity. Following administration, the autologous HBV antigen specific TCR-redirection autologous T lymphocytes recognize and bind to the HBV antigen-positive cells, which induces cytotoxic T-lymphocyte (CTL)-mediated elimination of HBV antigen-positive cancer cells. HBV antigens are found on HBV-positive cells and HPV-induced hepatocellular carcinoma (HCC).

**autologous heat-shock protein 70 peptide vaccine AG-858:** A recombinant cancer vaccine made with tumor-derived heat shock protein 70 (HSP70) peptide complexes. HSP70 associates with antigenic peptides, transporting them into antigen presenting cells (APC) for processing. Tumor-derived HSP70-peptide complexes used in vaccine preparations have been shown to prime tumor immunity and tumor-specific T cells in animal models.

**autologous HER2 chimeric receptor/TGFbeta dominant negative receptor-expressing EBV-specific cytotoxic T lymphocytes:** A preparation of transforming growth factor-beta (TGF-beta)-resistant Epstein-Barr virus (EBV)-specific cytotoxic T-lymphocytes (CTLs) directed to EBV through their native receptor and HER2 through a retrovirally transduced HER2 chimeric antigen receptor (CAR) with potential antineoplastic activity. Autologous EBV-specific CTLs are produced by exposing autologous CTLs to "stimulator" autologous EBV-

transformed lymphoblastoid cell lines (EBV-LCLs). Subsequently, autologous EBV-specific CTLs are transduced with retroviral vectors expressing the mutant type II TGF-beta dominant-negative receptor (DNR), which blocks signaling by all three TGF-beta isoforms, and the HER2 CAR. After transduction, transgenic EBV-CTLs are expanded on EBV-LCLs. Upon administration, autologous HER2 chimeric receptor/TGFbeta dominant negative receptor-expressing EBV-specific cytotoxic T lymphocytes may bind to HER2-expressing tumors cells, which may result in CTL-mediated cell lysis and inhibition of tumor cell proliferation. Tumor-expressed TGF-beta inhibits T lymphocyte activation and expansion.

**autologous HNSCC DNA-transfected semi-allogeneic fibroblasts MRC-5 vaccine:** A vaccine consisting of lethally irradiated human fetal lung fibroblasts (Medical Research Council 5 or MRC-5) transfected with autologous tumor DNA derived from a head and neck squamous cell carcinoma (HNSCC), with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, the autologous HNSCC DNA-transfected semi-allogeneic fibroblasts MRC-5 vaccine expresses HNSCC tumor-associated antigens (TAAs), which may activate the immune system to induce a cytotoxic T-lymphocyte (CTL) response against HNSCC cells. The MRC-5 cell line, established in 1966, is a human diploid lung fibroblast cell line derived from the human lung tissue of a 14-week-old male fetus.

**autologous HPV-16/18 E6/E7-specific TGF-beta-resistant T lymphocytes:** A preparation of autologous transforming growth factor-beta (TGF-beta)-resistant cytotoxic T-lymphocytes (CTL) reactive to human papilloma virus (HPV) types 16 and 18 E6/E7 antigens, with potential antineoplastic activity. Autologous T-lymphocytes from a HPV-positive cancer patient are exposed to and stimulated with dendritic cells (DCs) loaded with the HPV-16/18 proteins E6 and E7. In turn, the HPV-16/18 E6/E7-specific T-lymphocytes are transduced with a retroviral vector expressing a dominant-negative mutant of type II transforming growth factor (TGF)-beta receptor, which blocks signaling mediated by all three TGF-beta isoforms. Following re-administration to patients with HPV-positive tumors, the HPV-16/18 E6/E7-specific TGF-beta-resistant T-lymphocytes target HPV16/18 E6/E7-positive cells, which may result in a specific cytotoxic T-lymphocyte (CTL) response, followed by cell lysis and

the inhibition of tumor cell proliferation. Tumors expressing TGF-beta inhibit T-lymphocyte activation and expansion.

**autologous iC9-GD2-CAR-expressing VZV-specific T lymphocytes:**

Genetically modified, autologous varicella zoster virus (VZV)-specific T-lymphocytes transduced with a retroviral vector encoding a chimeric antigen receptor (CAR) specific for the disialoganglioside GD2, which contains the signaling domains for the co-stimulatory molecules CD28 and CD134 (OX-40), and the suicide gene, inducible caspase 9 (iCasp9 or iC9), with potential immunomodulating and antineoplastic activities. Upon intravenous administration, iC9-GD2-CD28-OX40-expressing T lymphocytes target the GD2 antigen on tumor cells for selective toxicity against GD2-expressing tumor cells. iCasp9 consists of a full-length caspase 9, including its caspase recruitment domain, linked to a human FK506 drug-binding domain with an F36V mutation (FKBP12-F36V). If the administered T cells lead to unacceptable side effects, the chemical homodimerizer AP1903 can be administered, which binds to the FKBP12-F36V drug binding domain, activates caspase 9, and results in apoptosis of the administered T-cells. Expression of the iCasp9 gene in T cells for adoptive transfer increases safety and broadens the scope for their clinical applications. The tumor-associated antigen GD2 is overexpressed on the surface of almost all tumors of neuroectodermal origin. OX40 and CD28, both T-cell surface-associated co-stimulatory molecules, are required for full T-cell activation. An additional VZV vaccine can be administered to increase T-cell activity.

**autologous IL-21-modulated CD8+ MART1-specific T cells: A**

preparation of interleukin 21 (IL-21) stimulated, CD8+ T-lymphocytes sensitized to MART-1 (melanoma antigen recognized by T-cells) antigen with potential immunostimulating and antineoplastic activities. CD8+ T-lymphocytes are exposed ex vivo to autologous dendritic cells (DCs) pulsed with MART-1 antigen peptide and grown in the presence of IL-21. These tumor-reactive T-cells may stimulate a host immune response against tumor cells expressing the MART-1 antigen, resulting in tumor cell lysis. MART-1 is expressed by certain types of melanoma cells. IL-21, a cytokine involved in the regulation of cellular immune responses, may play a key role during priming of antigen-specific CD8+ T cells and may enhance proliferation of the CTLs.

**autologous immunoglobulin idiotype-KLH conjugate vaccine:** A cancer vaccine composed of tumor-specific idiotype determinants derived from an individual's tumor cells which are conjugated to keyhole limpet hemocyanin, an immunostimulant carrier protein. When injected into the individual from whom the tumor cells were isolated, this vaccine may stimulate an antitumoral cytotoxic T-lymphocytic immune response.

**autologous interferon-producing killer dendritic cells:** A preparation of autologous dendritic cells (DC) with a molecular expression profile similar to both natural killer (NK) cells and DCs, with potential antineoplastic activity. Autologous interferon-producing killer dendritic cells (IKDCs) are characterized by double-negative expression of CD3 and CD19; these cells also express low levels of CD11 and are positive for B220. They are distinguished from plasmacytoid DCs (pDCs) by the absence of lymphocyte antigen 6C (Ly6C, Gr-1) expression. IKDCs produce interferon gamma (IFN-gamma) and interleukin (IL) -12, and are able to kill typical NK target cells using NK receptors while retaining DC-like antigen-presenting activity. Upon administration of the autologous IKDCs, these cells secrete high levels of IFN-gamma and, when in contact with tumor cells, mediate TNF-related apoptosis-inducing ligand (TRAIL)-dependent direct lysis of tumor cells. The resulting apoptotic tumor antigens may be presented by the IKDCs, thus activating the immune system to exert a cytotoxic T-lymphocyte (CTL) response to further eliminate tumor cells.

**autologous LMP1-/LMP2- specific cytotoxic T-lymphocytes:** A preparation of cytotoxic T-lymphocytes (CTL), specifically reactive to the Epstein-Barr virus (EBV) latent membrane proteins (LMP) 1 and 2, with potential antineoplastic activity. Autologous dendritic cells and EBV-infected lymphoblastoid cell lines (LCL) from patients with EBV-positive nasopharyngeal carcinoma (NPC) are transduced with an LMP1/LMP2-expressing adenoviral vector, are irradiated, and then are used to stimulate and expand autologous CTL to produce autologous LMP1-/LMP2-specific CTL *ex vivo*. Administration of autologous LMP1-/LMP2- specific cytotoxic T-lymphocytes may result in a specific CTL response against tumor cells expressing LMP1 and LMP2, resulting in cell lysis and inhibition of tumor cell proliferation *in vivo*. Among a limited set of viral antigens expressed by NPC cells, LMP1 and LMP2 are weak immunogens which, nevertheless, are capable of inducing a T-lymphocyte response.

**autologous lymphocyte :** A procedure in which bone marrow is removed from a person, stored, and then given back to the person after intensive treatment.

**autologous lymphoid effector cells specific against tumor cells:** A preparation of cytotoxic, autologous lymphoid effector cells specifically targeted towards tumor cells, with potential immunomodulating and antineoplastic activities. The autologous lymphoid effector cells are prepared by drawing a blood sample containing the required precursors for CD4+ helper T-cells, CD8+ cytotoxic T-cells, and natural killer (NK) cells from a cancer patient. The precursor cells are activated, selected and expanded to generate mature autologous lymphoid effector cells with the potential for enhanced tumor recognition. Upon readministration into the patient, the autologous lymphoid effector cells may induce both humoral and cellular immune responses against tumor cells. This may result in the immune-mediated inhibition of tumor cell proliferation, leading to tumor cell death.

**autologous lymphoma cell lysate-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysate from autologous lymphoma cells with potential immunostimulatory and antineoplastic activities. Upon intranodal administration, autologous lymphoma cell lysate-pulsed autologous DC vaccine may stimulate the immune system to mount anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against lymphoma cells, which may result in lymphoma cell lysis.

**autologous lymphoma cell/allogeneic dendritic cell electrofusion hybrid vaccine:** A cell-based cancer vaccine consisting of hybrid cells created by electrofusing autologous dendritic cells (DCs) and allogeneic lymphoma cells with potential immunostimulating and antitumor activities. Upon administration, autologous lymphoma cell/allogeneic dendritic cell electrofusion hybrid vaccine may stimulate the immune system to mount a specific cytotoxic T-lymphocyte (CTL) response against specific autologous lymphoma-associated antigens, resulting in lymphoma cell apoptosis.

**autologous lymphoma cell/autologous dendritic cell electrofusion hybrid vaccine:** A cell-based cancer vaccine consisting of hybrid cells created by electrofusing autologous dendritic cells (DCs) and autologous

lymphoma cells with potential immunostimulating and antitumor activities. Upon administration, autologous lymphoma cell/autologous dendritic cell electrofusion hybrid vaccine may stimulate the immune system to mount a specific cytotoxic T-lymphocyte (CTL) response against specific autologous lymphoma-associated antigens, resulting in lymphoma cell apoptosis. Check for active clinical trials using this agent.

**autologous lymphoma immunoglobulin-derived scFv-chemokine DNA vaccine:** A plasmid DNA vaccine encoding an autologous lymphoma-derived idiotype-targeting immunoglobulin (Ig)-derived single chain variable fragment (scFv) fused to the chemokine macrophage inflammatory protein 3 alpha (MIP3a), with potential immunostimulating and antineoplastic activities. Upon intramuscular vaccination, the autologous lymphoma immunoglobulin-derived scFv-chemokine DNA vaccine is taken up by antigen-presenting cells (APCs) and stimulates the immune system to exert a cytotoxic T-lymphocyte (CTL) response against the idiotype expressed on the surface of B lymphoma cells. MIP3a, also called chemokine (C-C motif) ligand 20 (CCL20), is a chemotactic cytokine able to enhance the immune response through binding to chemokine receptors expressed on APCs.

**autologous MAGE-A3-specific, HLA-A\*01-restricted T cell receptor gene engineered lymphocytes:** Human autologous T-lymphocytes transduced with a retroviral vector encoding a T-cell receptor (TCR) specific for the human leukocyte antigen (HLA)-A\*01-restricted, human melanoma-associated antigen A3 (MAGE-A3), with potential antineoplastic activity. Peripheral blood mononuclear cells (PBMCs) are isolated from a patient, transduced with an anti-MAGE-A3-HLA-A\*01 restricted TCR, expanded ex vivo, and reintroduced into the HLA-A\*01-positive patient. Then, the autologous MAGE-A3-specific, HLA-A\*01-restricted TCR gene engineered lymphocytes bind to tumor cells expressing the MAGE-A3 antigen, which may increase cell death and halt the growth of MAGE-A3-expressing cancer cells. The tumor-associated antigen MAGE-A3 is overexpressed by a variety of cancer cell types. Check for active clinical trials using this agent.

**autologous melanoma lysate-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysate from autologous melanoma cells containing tumor

associated antigens (TAAs) with potential immunostimulatory and antineoplastic activities. Upon administration, autologous melanoma lysate-pulsed autologous DC vaccine may stimulate the immune system to mount anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against melanoma cells, which may result in melanoma cell lysis.

**autologous melanoma lysate/KLH-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysate from autologous melanoma cells containing tumor associated antigens (TAAs) and conjugated to the immunostimulant Keyhole limpet hemocyanin (KLH), with potential immunostimulatory and antineoplastic activities. Upon administration, autologous melanoma lysate/KLH-pulsed autologous dendritic cell vaccine may stimulate the immune system to mount anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against melanoma cells, which may result in melanoma cell lysis. KLH is an immunogenic carrier and serves as an immunostimulant to improve antigenic immune recognition and T-cell responses and can be used to evaluate vaccine efficacy. Check for active clinical trials using this agent.

**autologous melanoma lysate/NY-ESO-1-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with both a lysate from autologous melanoma cells containing tumor associated antigens (TAAs) and a synthetic peptide derived from the tumor associated antigen human cancer-testis antigen NY-ESO-1, with potential immunostimulatory and antineoplastic activities. Upon administration, autologous melanoma lysate/NY-ESO-1-pulsed autologous DC vaccine may stimulate the immune system to mount anti-tumoral cytotoxic T lymphocyte (CTL) and antibody-mediated immune responses against melanoma cells, which may result in melanoma cell lysis. NY-ESO-1 is expressed in normal testes and on the surfaces of various tumor cells, and plays a key role in tumor cell proliferation and survival.

**autologous mesenchymal stem cells apceth\_101:** Human autologous mesenchymal stem cells (MSCs) harvested from the bone marrow of a patient and genetically modified with a self-inactivating retroviral vector expressing the suicide gene herpes simplex virus thymidine kinase (HSV-TK), that can be used to activate synthetic acyclic guanosine analogues when co-administered. Upon intravenous administration of autologous

mesenchymal stem cells apceth\_101, the cells are actively recruited to the tumor stroma, differentiate into more mature mesenchymal cells, and become part of the tumor microenvironment. When a synthetic acyclic guanosine analogue, such as ganciclovir, is co-administered, the HSV-TK within the HSV-TK-transduced MSCs will monophosphorylate this prodrug. Subsequently the monophosphate form is further converted to the diphosphate form and then to its active triphosphate form by cellular kinases. The active form of ganciclovir kills the HSV-TK-transduced MSCs and leads to a bystander effect, which eliminates neighboring cancer cells. Therefore, synthetic acyclic guanosine analogues are activated only at the tumor site, which increases their local efficacy and reduces systemic toxicity.

**autologous MUC1-mannan fusion protein pulsed dendritic cell**

**vaccine:** A cancer vaccine containing autologous dendritic cells pulsed with a fusion product of an epitope of human tumor-associated epithelial mucin 1 (MUC1) antigen and the vaccine adjuvant mannan (oxidized mannose), with potential antineoplastic activity. When the modified dendritic cells are returned to the patient, they may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells positive for the MUC1 antigen, resulting in tumor cell lysis. Addition of manna in this vaccine, enhances immune recognition. MUC1 antigen, a high-molecular-weight transmembrane glycoprotein, is overexpressed on many tumor cells.

**autologous neuroblastoma lysate/KLH-pulsed dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with a cell lysate from an autologous neuroblastoma containing tumor-associated antigens (TAAs), which are conjugated to the immunostimulant keyhole limpet hemocyanin (KLH), with potential immunostimulatory and antineoplastic activities. Upon administration, autologous neuroblastoma lysate/KLH-pulsed DC vaccine may stimulate the immune system to mount an anti-tumoral cytotoxic T-lymphocyte (CTL) response against neuroblastoma cells, which may result in tumor cell lysis. KLH is an immunogenic carrier and serves as an immunostimulant to improve antigenic immune recognition and T-cell responses.

**autologous NSCLC DNA-transfected semi-allogeneic fibroblasts MRC-5 vaccine:** A vaccine consisting of irradiated human fetal lung fibroblasts

(Medical Research Council 5 or MRC-5) transfected with autologous non-small cell lung cancer (NSCLC)-derived DNA with potential immunostimulatory and antineoplastic activities. Upon administration, autologous NSCLC DNA-transfected semi-allogeneic fibroblasts MRC-5 vaccine expresses NSCLC tumor-associated antigens (TAAs) in addition to MHC class I-determinants and the co-stimulatory molecule B7.1, which may induce a cytotoxic T-lymphocyte (CTL) response against NSCLC cells. The MRC-5 cell line, established in 1966, is a human diploid lung fibroblast cell line that is permissive for infection by a wide range of human viruses including human cytomegalovirus (HCMV) and coxsackie B viruses.

**autologous NSCLC peptide-specific dendritic cell vaccine:** A personalized cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with immunogenic peptides derived from autologous non-small cell lung cancer (NSCLC) cells, with potential immunostimulating and antineoplastic activities. During leukapheresis, mature DCs are loaded with autologous NSCLC-derived peptides. Upon re-administration of the NSCLC peptide-specific DC vaccine, the immune system is exposed to NSCLC-associated antigens. This results in the induction of a specific cytotoxic T-lymphocyte (CTL) response against NSCLC cells and tumor cell lysis.

**autologous NY-ESO-1-melanoma-specific CD8+ T cells:** A preparation of autologous CD8+ (cytotoxic) T-lymphocytes sensitized to cancer-testis antigen NY-ESO-1 antigen with potential immunostimulating and antineoplastic activities. Autologous CD8+ T-lymphocytes, isolated from a melanoma patient, are exposed to an NY-ESO-1 peptide ex vivo, expanded, and reintroduced into the patient; these tumor-reactive T-cells may stimulate a host immune response against tumor cells expressing the NY-ESO-1 antigen, resulting in tumor cell lysis. NY-ESO-1, an antigen found in normal testis, may be upregulated in various cancers, including bladder, breast, hepatocellular, melanoma, and prostate cancers.

**autologous OFA-iLRP RNA-transfected dendritic cell vaccine:** A cancer vaccine consisting of autologous, mature monocyte-derived dendritic cells (DCs) transfected with oncofetal antigen immature laminin receptor protein (OFA-iLRP) RNA, with potential antineoplastic activity. Upon administration, DCs in the OFA-iLRP RNA-transfected autologous

dendritic cell vaccine express, process, and present OFA-iLRP to the host immune system, which may mount a potent cytotoxic T-cell (CTL) response against OFA-iLRP-expressing tumor cells. As a highly conserved protein, OFA-iLRP is preferentially expressed in fetal tissues and in many types of cancer, including hematopoietic malignancies, but is not detectable in normal differentiated adult cells.

**autologous ovarian tumor cell lysate-pulsed dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous, irradiated dendritic cells (DCs) pulsed with ovarian tumor cell lysate containing tumor-associated antigens (TAAs) with potential immunostimulatory and antineoplastic activities. Upon administration, autologous ovarian tumor cell lysate-pulsed dendritic cell vaccine may stimulate an anti-tumoral cytotoxic T-lymphocyte (CTL) response against ovarian tumor cells expressing the patients ovarian tumor cell-specific TAAs, which may result in ovarian tumor cell lysis.

**autologous oxidized ovarian tumor cell lysate vaccine:** An autologous cancer vaccine composed of oxidized ovarian tumor cell lysate, with potential immunostimulatory and antineoplastic activities. Upon administration, the autologous oxidized ovarian tumor cell lysate vaccine exposes the immune system to an undefined amount of tumor-associated antigens (TAAs), which may result in the induction of both anti-tumor cytotoxic T-lymphocytes (CTLs) and antibody-dependent responses against TAA-expressing cells, leading to tumor cell lysis. Compared to non-oxidized tumor cell lysate vaccines, oxidized tumor cell lysate vaccines induce necrotic cell death, increase the immunogenicity of the TAAs and may enhance the anti-tumor immune response.

**autologous peripheral blood lymphocytes cotransduced with retroviral vectors encoding inducible IL-12 and anti-NY-ESO-1 TCR:** Human autologous peripheral blood lymphocytes (PBLs) transduced with two retroviral vectors, one encoding a T-cell receptor (TCR) specific for the cancer-testis antigen NY-ESO-1 and a second that encodes an inducible single-chain form of interleukin-12 (IL-12) driven by a nuclear factor of activated T-cells (NFAT)-responsive promoter, with potential immunomodulating and antineoplastic activities. Following isolation of lymphocytes, retroviral vector transduction, and expansion of the cells ex vivo, the inducible IL-12/anti-NY-ESO-1 TCR-expressing autologous PBLs

are re-administered into the patient by intravenous injection. As the transduced PBLs traverse the patient's circulatory system, they can bind to NY-ESO-1-overexpressing tumor cells. This binding activates the TCR signaling pathway in the transduced PBLs, which promotes NFAT-dependent gene transcription and induces expression of the cotransduced IL-12. IL-12 expression activates the immune system by promoting the secretion of interferon-gamma, activating natural killer cells (NKs), and inducing cytotoxic T-cell responses, which may result in both decreased cell proliferation and increased cell death for the NY-ESO-1-overexpressing tumor cells. NY-ESO-1, a tumor-associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types. NFAT, a family of transcription factors involved in immune responses, is activated by calcium signaling, which can occur downstream of TCR activation. Use of a retroviral vector to express an inducible IL-12 may remove the requirement for concomitant administration of interleukin-2 (IL-2) that is a component of conventional cell transfer immunotherapies.

**autologous pluripotent ALDH<sup>br</sup> stem cells ALD-451:** A specific population of autologous, pluripotent bone marrow derived cells that express high levels of the cytosolic enzyme aldehyde dehydrogenase (ALDH) with potential protective and neuro-cognition improving activity. Expression of high levels of ALDH is an indicator of the biological activity in heterogenous early stage stem cells. Upon intravenous administration, these ALDH bright cells may protect normal cells and may repair damaged cells. These cells may also protect brain cells from damage and may improve neurocognition.

**autologous prostate cancer antigen-expressing dendritic cell vaccine BPX-101:** A genetically-modified autologous dendritic cell-based vaccine expressing a drug-inducible costimulatory CD40 receptor (iCD40) with potential immunomodulating and antineoplastic activities. Autologous dendritic cells (DCs) are genetically modified to express the iCD40 receptor and are pulsed with tumor antigen. Upon intradermal administration, these DCs accumulate in local draining lymph nodes. Twenty-four hours after vaccination, the dimerizer agent AP1903 is administered; AP1903 binds to and activates iCD40 receptors presented on DC cell surfaces, thus activating the DCs and stimulating a cytotoxic T-lymphocyte (CTL) response against host tumor cells that express the tumor antigen. This delayed activation strategy optimizes DC accumulation in local draining

lymph nodes prior to DC activation. iCD40 contains a membrane-localized cytoplasmic CD40 domain fused to a drug-binding domain.

**autologous prostate stem cell antigen-specific CAR T cells BPX-601:** A preparation of autologous T lymphocytes expressing a chimeric antigen receptor (CAR) consisting of an anti-human prostate stem cell antigen (PSCA) scFv (single chain variable fragment) coupled to the zeta chain of the T-cell receptor (TCRzeta) and a drug-induced co-stimulatory molecule, composed of an inducible, chimeric MyD88/CD40 (inducible MC; iMC) co-stimulatory domain, in which both the MyD88 and CD40 lack their extracellular domains, with potential antineoplastic activity. Upon administration of BPX-601, the T cells target and bind to PSCA-expressing cancer cells. Upon subsequent administration of the chemical inducer of dimerization (CID) agent rimiducid, this agent targets and binds to the drug binding domain, which leads to iMC expression, activation of both CD40- and MyD88-mediated signal transduction pathways, and an induction of selective cytotoxicity in, and eradication of PSCA-expressing cancer cells. iMC activation by rimiducid increases T-cell survival and anti-tumor activity of the administered T cells, compared to T cells without the drug iMC activation-switch. As these T cells are engineered to only be fully activated by binding to both antigen and rimiducid, T-cell proliferation, activity and toxicity can be controlled by adjusting the dose of rimiducid, thereby preventing uncontrolled T-cell activation which increases the safety of the administered T cells. PSCA is a glycosylphosphatidylinositol (GPI)-anchored cell surface antigen overexpressed in many cancer cell types.

**autologous renal cell carcinoma tumor lysate-dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with renal cell carcinoma (RCC) tumor cell lysate containing tumor associated antigens (TAAs) with potential immunostimulatory and antineoplastic activities. Upon administration, autologous renal cell carcinoma tumor lysate-dendritic cell vaccine may stimulate anti-tumoral cytotoxic T-lymphocyte (CTL) and antibody responses against RCC tumor cells expressing RCC TAAs, resulting in RCC tumor cell lysis.

**autologous sarcoma cell lysate:** A cell lysate derived from sarcoma cells with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, the autologous sarcoma cell lysate exposes the immune system to an undefined amount of sarcoma-type tumor associated

antigens (TAA), which may result in the induction of both specific anti-tumoral cytotoxic T lymphocytes (CTL) and antibody-dependent responses against the sarcoma TAA-expressing cells, resulting in sarcoma cell lysis.

**autologous sarcoma lysate-pulsed dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysates from sarcoma cells with potential immunostimulatory and antineoplastic activities. Upon administration, the autologous sarcoma lysate-pulsed dendritic cell vaccine exposes the immune system to an undefined amount of sarcoma-type tumor associated antigens (TAA), which may result in the induction of both specific anti-tumoral cytotoxic T lymphocytes (CTL) and antibody-dependent responses against the sarcoma TAA-expressing cells, resulting in sarcoma cell lysis.

**autologous stem cell transplantation :** A product that is made of special stem cells taken from a patient's bone marrow and grown in the laboratory. After a patient's bone marrow is destroyed by treatment with whole body irradiation or chemotherapy, these cells are injected back into the patient to help rebuild bone marrow. Autologous expanded mesenchymal stem cells OTI-010 has been studied in the prevention of graft-versus-host disease during stem cell transplant in patients receiving treatment for cancer. Autologous expanded mesenchymal stem cells OTI-010 is used in cellular therapy. Also called Stromagen.

**autologous T lymphocytes expressing NY-ESO-1-C259-specific enhanced T cell receptors:** Human autologous lymphocytes transduced with a retroviral vector encoding a T cell receptor (TCR) specific for the cancer/testis antigen NY-ESO-1, with potential antineoplastic activity. Upon isolation, transduction, expansion ex vivo, and reintroduction into the patient, the autologous T lymphocytes expressing NY-ESO-1-C259-specific enhanced T cell receptors bind to NY-ESO-1-overexpressing tumor cells. This may result in the specific cytotoxic T-lymphocyte (CTL) killing of NY-ESO-1-positive cancer cells. NY-ESO-1, a tumor-associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types; the TCR is specific for SLLMWITQC, an NY-ESO-1-derived peptide, in a complex with human leukocyte antigen (HLA) A2 peptide.

**autologous TARP peptide-pulsed dendritic cell vaccine:** A cell-based cancer vaccine comprised of autologous dendritic cells pulsed with autologous T cell receptor gamma-chain alternate reading frame protein

(TARP) peptide with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, autologous TARP peptide-pulsed dendritic cell vaccine may stimulate anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against TARP-expressing cancer cells, resulting in tumor cell lysis. The highly immunogenic nuclear protein TARP is commonly expressed in breast and prostate cancer cells.

**autologous tumor cell :** In transplantation, refers to a person's own white blood cells. Lymphocytes have a number of roles in the immune system, including the production of antibodies and other substances that fight infections and other diseases.

**autologous tumor cell proteoliposome chronic lymphocytic leukemia vaccine:** An autologous chronic lymphocytic leukemia cancer vaccine consisting of patient-specific membrane proteins directly extracted from autologous tumor cells and incorporated into liposomes along with Interleukin 2 (IL-2) to produce membrane-patched proteoliposomes, with potential immunostimulating and antineoplastic activities. After subcutaneous injection of the autologous tumor cell proteoliposomes chronic lymphocytic leukemia vaccine, liposomes deliver the encapsulated tumor antigens into the cytosol of antigen presenting cells (APCs). Subsequently, the APCs process the antigens and present antigen-derived peptides to the immune system. This may enhance recognition of tumors by the immune system, and activate both cytotoxic CD8<sup>+</sup> T cells and CD4<sup>+</sup> helper T cells against tumor cells. IL-2 is incorporated into the vaccine to leverage its ability to expand activated T cells.

**autologous tumor cell vaccine:** A therapeutic agent produced by isolating tumor cells from an individual and processing these tumor cells into a vaccine formulation in vitro; the vaccine is then administered to the individual from whom the tumor cells were isolated. Typically combined with an adjuvant immunostimulant, an autologous cell vaccine may elicit a cytotoxic T-lymphocytic immune response to cell surface-expressed tumor-associated antigens (TAAs), resulting in tumor cell death.

**autologous tumor infiltrating lymphocytes LN-144:** A preparation of autologous tumor infiltrating lymphocytes (TILs), with potential antineoplastic activity. TILs are isolated from a patient's tumor tissue, cultured in vitro with high-dose interleukin-2 (IL-2), further selected based on antigen specificity and tumor reactivity, and the selected TILs are

subsequently expanded. Upon re-introduction of LN-144 into the patient, the TILs re-infiltrate the tumor, specifically recognize the tumor-associated antigens (TAAs), and initiate tumor cell lysis. IL-2 induces the proliferation and expansion of TILs in vitro.

**autologous tumor-associated peptide antigen-pulsed dendritic cell vaccine:** A dendritic cell (DC)-based cancer vaccine composed of autologous DCs pulsed with specific tumor-associated peptide antigens (TAPA), with potential immunostimulatory and antineoplastic activities. Upon administration, autologous TAPA-pulsed DC vaccine exposes the immune system to the specific TAPAs, which may result in cytotoxic T-lymphocyte (CTL)-mediated immune responses against the TAPA-expressing cancer cells. This leads to cancer cell lysis. This vaccine is specific towards peptides derived from the following proteins: sperm autoantigenic protein 17 (SP17), ropporin, A-kinase anchor protein 4 (AKAP4), pituitary tumor-transforming 1 (PTTG1) and SPANX family member B (SPANX-B).

**autologous WT1-TCRc4 gene-transduced CD8-positive Tcm/Tn lymphocytes:** Autologous, human CD8 T-lymphocytes, comprised of both central memory T-cells (Tcm) and naïve T-cells (Tn), that are transduced, ex vivo, with a self-inactivating (SIN) lentiviral vector encoding a high-affinity T-cell receptor (TCRc4) specific for the human tumor antigen Wilms tumor 1 (WT1) epitope 126-134 (RMFPNAPYL), with potential antineoplastic activity. Upon isolation of peripheral blood lymphocytes (PBLs), transduction, expansion ex vivo, priming of the Tn subset, but not the Tcm subset, with interleukin-21 (IL-21), and reintroduction of equal amounts of Tcm and Tn cells into the patient, WT1-TCRc4 gene-transduced CD8-positive Tcm/Tn lymphocytes redirect T-lymphocytes to WT1-expressing tumor cells and specifically bind to and lyse those cells. This inhibits proliferation of WT1-expressing tumor cells. WT1 protein, a zinc finger DNA-binding transcriptional regulator, is overexpressed in most leukemias and various solid tumors, while expression in normal, healthy tissues is very limited; its expression is correlated with aggressiveness and poor prognosis.

**Automated diffractometer:** See Diffractometer.

**AUTOMATIC MOLD:** A mold for injection, compression or transfer molding that repeatedly goes through the entire molding cycle, including ejection, without human assistance. OR A mold for injection, compression

or transfer molding that repeatedly goes through the entire molding cycle, including ejection, without human assistance. OR A mold for injection, compression or transfer molding that repeatedly goes through the entire molding cycle, including ejection, without the assistance of an operator. A mold for injection or compression molding that repeatedly goes through the entire cycle, including ejection, without human assistance.

**Automatic operation:** The term used to define the mode in which a molding machine is operating when there is no need for an operator to start each cycle.

**Automatic temperature compensation (ATC):** automatic instrumental adjustment of the measured parameter to correct for variations in sensor (e.g. electrode) slope due to temperature changes. The output of a thermistor probe regulates the correction factor.

**autonomic nervous system:** a subdivision of the peripheral nervous system, which is divided into the sympathetic and parasympathetic nervous systems.

**autonomic nervous system :** A procedure in which blood-forming stem cells (cells from which all blood cells develop) are removed, stored, and later given back to the same person.

**autooxidation:** oxidation caused by the atmosphere; an oxidation reaction that is self-catalyzed and spontaneous; an oxidation reaction begun only by an inductor.

**autophagy :** A cancer cell from an individual's own tumor.

**autoprotolysis:** Transfer of a hydrogen ion between molecules of the same substance, e. g. the autoprotolysis of methanol ( $2 \text{CH}_3\text{OH} = \text{CH}_3\text{OH}_2^+ + \text{CH}_3\text{O}^-$ ). Autoprotolysis of water into hydronium ions and hydroxide ions results in equilibrium concentrations that satisfy  $K_w = [\text{H}_3\text{O}^+][\text{OH}^-]$ , where the autoprotolysis constant  $K_w$  is equal to  $1.01 \times 10^{-14}$  at  $25^\circ\text{C}$ .

**Autoradiography:** The technique of exposing film in the presence of disintegrating radioactive particles Used to obtain information on the distribution of radioactivity in a gel or a thin cell section. OR A means of detecting radioactive molecules immobilized in a separation medium such as polyacrylamide; the radioactivity of the molecules will blacken x-ray film.

**Autoregulation:** The process in which a gene regulates its own expression.

**autosomal :** Refers to any of the chromosomes numbered 1-22 or the genes on chromosomes 1-22. This term excludes the sex-determining chromosomes, X and Y.

**autosomal dominant :** Autosomal dominant inheritance refers to genetic conditions that occur when a mutation is present in one copy of a given gene (i.e., the person is heterozygous).

**autosomal recessive :** Autosomal recessive inheritance refers to genetic conditions that occur only when mutations are present in both copies of a given gene (i.e., the person is homozygous for a mutation, or carries two different mutations of the same gene, a state referred to as compound heterozygosity).

**autosomes:** the 22 pairs of human chromosomes that are not sex chromosomes.

**Autotroph:** An organism that can form its organic constituents from CO<sub>2</sub>. OR An organism that can synthesize its own complex molecules from very simple carbon and nitrogen sources, such as carbon dioxide and ammonia.

**autotrophic:** certain bacteria that synthesize their own foods. OR An organism that produces food from inorganic substances.

**Autotrophs:** Photosynthetic organisms that synthesize glucose from carbon dioxide and water, by using sunlight as an energy source; the glucose is then used as a fuel for cellular metabolism.

**Autotrophy:** A unique form of metabolism found only in bacteria. Inorganic compounds (e.g., NH<sub>3</sub>, NO<sub>2</sub><sup>-</sup>, S<sub>2</sub>, and Fe<sup>2+</sup>) are oxidized directly (without using sunlight) to yield energy. This metabolic mode also requires energy for CO<sub>2</sub> reduction, like photosynthesis, but no lipid-mediated processes are involved. This metabolic mode has also been called chemotrophy, chemoautotrophy, or chemolithotrophy.

**autoxidation:** Oxidation caused by exposure to air. Rust is an example of autoxidation. Autoxidation makes ether taken from half-filled bottles very dangerous, because air oxidizes ether to highly explosive organic peroxides.

**autumnal equinox:** September 23, when the vertical ray of the Sun is at the Equator; the entire Earth has 12 hours of day and 12 hours of night.

**Auxiliary building:** A building at a nuclear power plant, which is frequently located adjacent to the reactor containment structure, and houses most of the auxiliary and safety systems associated with the reactor, such as

radioactive waste systems, chemical and volume control systems, and emergency cooling water systems.

**Auxiliary Drive:** The sprocket drive that sets the belt speed. This normally is located at the discharge of a spiral conveyor just before the take-up. See also take-up and tension drive.

**Auxiliary feedwater:** Backup water supply used during nuclear plant startup and shutdown to supply water to the steam generators during accident conditions for removing decay heat from the reactor.

**Auxin:** A plant growth hormone usually concentrated in the apical bud. OR A plant growth hormone.

**auxochrome:** A group or substructure in a molecule that influences the intensity of absorption of the molecule.

**Auxotroph:** A mutant that cannot grow on the minimal medium on which a wild-type member of the same species can grow.

**auxotrophic mutant (auxotroph):** A mutant organism defective in the synthesis of a given biomolecule, which must therefore be supplied for the organism's growth.

**Avage :** (Other name for: tazarotene) OR The part of the nervous system that controls muscles of internal organs (such as the heart, blood vessels, lungs, stomach, and intestines) and glands (such as salivary glands and sweat glands). One part of the autonomic nervous system helps the body rest, relax, and digest food and another part helps a person fight or take flight in an emergency. Also called ANS and involuntary nervous system.

**avanafil:** An orally available phosphodiesterase type 5 (PDE5) inhibitor with vasodilatory activity. Avanafil selectively inhibits PDE5, thus inhibiting the degradation of cyclic guanosine monophosphate (cGMP) found in the smooth muscle of the corpus cavernosa of the penis. The inhibition of cGMP degradation results in prolonged muscle relaxation, vasodilation, and blood engorgement of the corpus cavernosa, thereby prolonging penile erection.

**Avandia:** (Other name for: rosiglitazone maleate) or A normal process in which a cell destroys proteins and other substances in its cytoplasm (the fluid inside the cell membrane but outside the nucleus), which may lead to cell death. Autophagy may prevent normal cells from developing into

cancer cells, but it may also protect cancer cells by destroying anticancer drugs or substances taken up by them.

**avascular necrosis :** A drug used on the skin to treat several skin conditions. It is also being studied in the treatment of basal cell skin cancer and basal cell nevus syndrome. Avage is related to vitamin A and is made in the laboratory. It turns on a gene that may help stop the growth of skin cancer cells. Avage is a type of synthetic retinoid. Also called tazarotene and Tazorac.

**Avastin :** (Other name for: bevacizumab) OR A drug that helps control the amount of glucose (sugar) in the blood and is being studied in the prevention and treatment of some types of cancer. Avandia stops cells from growing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of thiazolidinedione and a type of antiangiogenesis agent. Also called rosiglitazone maleate.

**Aveeno cream:** (Other name for: colloidal oatmeal cream)

**Avelox :** (Other name for: moxifloxacin hydrochloride) OR A condition in which there is a loss of blood flow to bone tissue, which causes the bone to die. It is most common in the hips, knees, shoulders, and ankles. It may be caused by long-term use of steroid medicines, alcohol abuse, joint injuries, and certain diseases, such as cancer and arthritis. It may also occur at some point in time after cancer treatment that included methotrexate, bisphosphonates, or corticosteroids. Also called aseptic necrosis, ischemic necrosis, and osteonecrosis.

**avelumab:** A human immunoglobulin G1 (IgG1) monoclonal antibody directed against the human immunosuppressive ligand programmed death-ligand 1 (PD-L1) protein, with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, avelumab binds to PD-L1 and prevents the interaction of PD-L1 with its receptor programmed cell death protein 1 (PD-1). This inhibits the activation of PD-1 and its downstream signaling pathways. This may restore immune function through the activation of cytotoxic T-lymphocytes (CTLs) targeted to PD-L1-overexpressing tumor cells. In addition, avelumab induces an antibody-dependent cellular cytotoxic (ADCC) response against PD-L1-expressing tumor cells. PD-1, a cell surface receptor belonging to the immunoglobulin superfamily expressed on T-cells, negatively regulates T-cell activation and effector function when activated by its ligand, and plays an important role

in tumor evasion from host immunity. PD-L1, a transmembrane protein, is overexpressed on a variety of tumor cell types and is associated with poor prognosis.

**Avemar:** (Other name for: fermented wheat germ extract)

**Aventyl :** A drug used alone or with other drugs to treat certain types of cervical, colorectal, lung, kidney, ovarian, fallopian tube, and primary peritoneal cancer, and glioblastoma (a type of brain cancer). It is also being studied in the treatment of other types of cancer. Avastin binds to a protein called vascular endothelial growth factor (VEGF). This may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called bevacizumab.

**average bond enthalpy:** Average enthalpy change per mole when the same type of bond is broken in the gas phase for many similar substances

**Average Energy:** This is a measure of the overall energy of a sample. Some areas might be hotter and some might be colder, but the average energy is how scientists measure the temperature of a system.

**Average Molecular Weight (viscosity method):** The molecular weight of polymeric materials determined by the viscosity of the polymer in solution at a specific temperature. This gives an average molecular weight of the molecular chains in the polymer independent of specific chain length. Falls between weight average and number average molecular weight.

**Average number:** the number of instantaneous readings of the sensor (e.g. electrode potential), taken for example at onesecond intervals, used to calculate the average value for the millivolts. An operatorselectable variable in computer interface software which helps to reduce noise and increase the precision of ISE measurements.

**Average planar linear heat generation rate (APLGHR):** The average value of the linear heat generation rate of all the fuel rods at any given horizontal plane along a fuel assembly (also known as a "fuel bundle" or "fuel element").

**Avidity:** The strength of an interaction comprising multiple independent binding interactions between partners, as would take place between an antigen and antibody.

**Avinza:** (Other name for: morphine sulfate)

**Avita :** (Other name for: tretinoin) OR A drug used to treat bacterial infections. It is a type of fluoroquinolone. Also called moxifloxacin and moxifloxacin hydrochloride.

**avitinib maleate:** The maleate salt form of avitinib, an orally available, irreversible, epidermal growth factor receptor (EGFR) mutant-selective inhibitor, with potential antineoplastic activity. Upon oral administration, avitinib covalently binds to and inhibits the activity of mutant forms of EGFR, including the drug-resistant T790M EGFR mutant, which prevents signaling mediated by mutant forms of EGFR. This may both induce cell death and inhibit tumor growth in EGFR-mutated tumor cells. EGFR, a receptor tyrosine kinase that is mutated in a variety of cancers, plays a key role in tumor cell proliferation and tumor vascularization. As this agent is selective towards mutant forms of EGFR, its toxicity profile may be reduced when compared to non-selective EGFR inhibitors, which also inhibit wild-type EGFR. Check for active clinical trials using this agent.

**Avmacol:** (Other name for: broccoli sprout/broccoli seed extract supplement)

**AVN944:** An orally available, synthetic small molecule with potential antineoplastic activity. AVN944 inhibits inosine monophosphate dehydrogenase (IMPDH), an enzyme involved in the de novo synthesis of guanosine triphosphate (GTP), a purine molecule required for DNA and RNA synthesis. Inhibition of IMPDH deprives cancer cells of GTP, resulting in disruption of DNA and RNA synthesis, inhibition of cell proliferation, and the induction of apoptosis. AVN944 appears to have a selective effect on cancer cells in that deprivation of GTP in normal cells results in a temporary slowing of cell growth only. IMPDH is overexpressed in some cancer cells, particularly in hematological malignancies. Check for active clinical trials using this agent. or A drug used to treat depression. It may also be used to treat panic or anxiety disorders and certain types of pain, and to help people quit smoking. Aventyl increases the levels of norepinephrine and other natural chemicals in the brain. This helps improve mood and may reduce a person's craving for nicotine. It is a type of tricyclic antidepressant. Also called nortriptyline and Pamelor.

**Avodart :** A topical preparation of tretinoin that is used to treat acne. Tretinoin is a form of vitamin A.

**Avogadro:** Italian chemist and physicist Amadeo Avogadro (1776-1856) proposed a correct molecular explanation for Gay-Lussac's law of combining volumes. His work provided a simple way to determine atomic weights and molecular weights of gases.

**Avogadro number:** The number of particles in one mole, equal to  $6.02214199 \times 10^{23} \text{ mol}^{-1}$  ( $\pm 0.00000047 \text{ mol}^{-1}$ ) [1998 CODATA values]

**Avogadro's Hypothesis:** Amadeo Avogadro came up with this idea. He said that if you have two volumes of gas, they would have the same number of molecules inside if the pressure and temperatures inside were equal. One liter of oxygen and one liter of carbon dioxide (at the same temperature and pressure) would have an equal number of molecules.

**Avogadro's law:** equal volumes of gases at the same temperature and pressure that contain the same number of molecules. OR Equal volumes of an ideal gas contain equal numbers of molecules, if both volumes are at the same temperature and pressure. For example, 1 L of ideal gas contains twice as many molecules as 0.5 L of ideal gas at the same temperature and pressure.

**Avogadro's number:** Number representing the number of molecules in one (1) mole:  $6.022 \times 10^{23}$ . OR The number of particles present in 1 mole of a substance, experimentally determined to be  $6.02 \times 10^{23}$ . OR This is one of the constants of Chemistry. Amadeo Avogadro determined that there were  $6.02 \times 10^{23}$  atoms in one mole of any substance. So if you have one gram of hydrogen, you have that many  $6.02 \times 10^{23}$  atoms.  $6.02 \times 10^{23}$  OR 60,220,000, 000,000 ,000,000,000. The value represents the number of atoms or molecules in one mole of a substance. OR  $6.02 \times 10^{23}$ , the number of molecules in 1 mole of a substance. OR The number of molecules in a gram molecular weight (a mole) of any compound ( $6.02 \times 10^{23}$ ). OR The number of molecules in a gram molecular weight of any compound ( $6.023 \times 10^{23}$ ).

**avoidance :** A substance being studied in the treatment of cancer. It blocks cells from making DNA and RNA and may kill cancer cells. It is a type of inosine monophosphate dehydrogenase (IMPDH) inhibitor.

**Avrami–Erofe'ev equation:** The equation that treats a solid-state reaction as a process controlled by random nuclei growing in three dimensions and ingesting other nuclei.

**Avycaz:** (Other name for: ceftazidime/avibactam sodium)

**AWG:** abbreviation for American Wire Gauge, a standard system for designating wire diameter.

**AWT:** Advanced Waste Treatment - any process of water renovation that upgrades treated wastewater to meet reuse requirements.

**axial:** 1. An atom, bond, or lone pair that is perpendicular to equatorial atoms, bonds, and lone pairs in a trigonal bipyramidal molecular geometry.

**axial bond:** a bond positioned perpendicularly to the general plane of a cyclohexane ring.

**Axial hole:** This is a hole that is parallel to the axis of revolution of a turned part, but does not need to be concentric to it.

**axial hypotonia:** a floppiness associated with the inability to sit

**axial plane:** of a fold, the plane that separates rocks on one side of a fold from those that dip in the opposite direction on the other side.

**Axial Seal:** A face seal squeezed on both the top and bottom surfaces of the seal's cross section

**axilla :** A drug used to treat symptoms of an enlarged prostate gland. It is being studied in the treatment of male hair loss and prostate cancer. Avodart blocks enzymes the body needs to make male sex hormones. It is a type of 5-alpha reductase inhibitor. Also called dutasteride and GG745.

**axillary :** The act of staying away from people, places, and thoughts that may cause anxiety, pain, or unpleasant feelings. Some types of cancer-related avoidance include refusing to accept a cancer diagnosis or get treatment, and using alcohol or other drugs to forget about having cancer.

**axillary dissection :** The underarm or armpit.

**axillary lymph node :** Pertaining to the armpit area, including the lymph nodes that are located there.

**axillary lymph node dissection :** Surgery to remove lymph nodes found in the armpit region. Also called axillary lymph node dissection.

**axitinib:** An orally bioavailable tyrosine kinase inhibitor. Axitinib inhibits the proangiogenic cytokines vascular endothelial growth factor (VEGF) and platelet-derived growth factor receptor (PDGF), thereby exerting an anti-angiogenic effect. Check for active clinical trials using this agent. or A lymph node in the armpit region that drains lymph from the breast and nearby areas.

**AXL inhibitor BGB324:** An orally available and selective inhibitor of the AXL receptor tyrosine kinase (UFO), with potential antineoplastic activity. Upon administration, BGB324 targets and binds to the intracellular catalytic kinase domain of AXL and prevents its activity. This blocks AXL-mediated signal transduction pathways and inhibits the epithelial-mesenchymal transition (EMT), which, in turn, inhibits tumor cell proliferation and migration. In addition, BGB324 enhances chemo-sensitivity. AXL, a member of the TAM (TYRO3, AXL and MER) family of receptor tyrosine kinases overexpressed by many tumor cell types, plays a key role in tumor cell proliferation, survival, invasion and metastasis; its expression is associated with drug resistance and poor prognosis.

**AXL kinase inhibitor TP-0903:** An orally available and selective inhibitor of the receptor tyrosine kinase AXL (UFO), with potential antineoplastic activity. Upon administration, TP-0903 targets and binds to AXL and prevents its activity. This blocks AXL-mediated signal transduction pathways and inhibits the epithelial-mesenchymal transition (EMT), which, in turn, inhibits tumor cell proliferation and migration. In addition, TP-0903 enhances chemo-sensitivity to certain other chemotherapeutic agents. AXL, a member of the Tyro3, AXL and Mer (TAM) family of receptor tyrosine kinases and overexpressed by many tumor cell types, plays a key role in tumor cell proliferation, survival, invasion and metastasis. Its expression is associated with drug resistance and poor prognosis.

**axon:** the long extension of a neuron.

**Axoneme:** The fundamental design structure of cilia and flagella; it consists of a bundle of microtubules, enclosed in a membrane, in which nine microtubule doublets surround two microtubule singlets.

**Aygestin:** (Other name for: norethindrone acetate)

**Ayurveda :** Surgery to remove lymph nodes found in the armpit region. Also called axillary dissection.

**Ayurvedic medicine :** A drug used to treat advanced renal cell carcinoma (the most common type of kidney cancer). It is used in patients who have not gotten better with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Axitinib blocks the action of proteins called growth factor receptors and may prevent the growth of new blood

vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called Inlyta.

**azacitidine:** A pyrimidine nucleoside analogue of cytidine with antineoplastic activity. Azacitidine is incorporated into DNA, where it reversibly inhibits DNA methyltransferase, thereby blocking DNA methylation. Hypomethylation of DNA by azacitidine may activate tumor suppressor genes silenced by hypermethylation, resulting in an antitumor effect. This agent is also incorporated into RNA, thereby disrupting normal RNA function and impairing tRNA cytosine-5-methyltransferase activity. or A medical system from India that has been used for thousands of years. The goal is to cleanse the body and to restore balance to the body, mind, and spirit. It uses diet, herbal medicines, exercise, meditation, breathing, physical therapy, and other methods. It is a type of Complementary and Alternative Medicine (CAM) therapy. Also called Ayurvedic medicine.

**azapicyl:** A hydrazine compound that has been investigated for antineoplastic activity. Check for active clinical trials using this agent.

**azaserine:** A naturally occurring serine derivative diazo compound with antineoplastic properties, Azaserine functions as a purine antagonist and glutamine analogue (glutamine amidotransferase inhibitor) that competitively inhibits pathways in which glutamine is metabolized. An antibiotic and antitumor agent, Azaserine is used in clinical studies as a potential antineoplastic agent.

**AzaSite:** (Other name for: azithromycin)

**azaspirane :** A medical system from India that has been used for thousands of years. The goal is to cleanse the body and to restore balance to the body, mind, and spirit. It uses diet, herbal medicines, exercise, meditation, breathing, physical therapy, and other methods. It is a type of Complementary and Alternative Medicine (CAM) therapy. Also called Ayurveda.

**azathioprine sodium:** The sodium salt form of azathioprine, a pro-drug of purine analogue with immunosuppressive activity. Azathioprine is converted in vivo to its active metabolite 6-mercaptopurine (6-MP), which substitutes for the normal nucleoside and mistakenly gets incorporated into DNA sequences. This leads to inhibition of DNA, RNA, and protein synthesis. As a result, cell proliferation may be inhibited, particularly in lymphocytes and leukocytes. or A drug that is used to treat myelodysplastic

syndromes and is being studied in the treatment of other types of cancer. It belongs to the family of drugs called antimetabolites. Also called Mylosar and Vidaza.

**AZD0530:** A substance being studied in the treatment of certain multiple myelomas and other advanced cancers. Azaspirane may block the growth of tumors and may prevent the growth of new blood vessels that tumors need to grow. Azaspirane is a type of signal transduction inhibitor and a type of antiangiogenesis agent. Also called atiprimod and SK&F106615.

**AZD2171:** A drug used to keep a patient from rejecting a transplanted kidney. It is also used in the treatment of rheumatoid arthritis that does not get better with other types of treatment. Azathioprine sodium blocks the growth of white blood cells and the synthesis of DNA, RNA, and protein. It is a type of immunosuppressant.

**AZD2281:** A substance being studied in the treatment of some types of cancer. AZD0530 blocks enzymes needed for cancer growth. It is a type of tyrosine kinase inhibitor.

**AZD6244:** A substance being studied in the treatment of some types of cancer. AZD2171 may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of antiangiogenesis agent and a type of vascular endothelial growth factor (VEGF) receptor tyrosine kinase inhibitor. Also called cediranib maleate and Recentin.

**Azedra:** (Other name for: cold contaminant-free iobenguane I 131)

**azeotrope:** A solution that does not change composition when distilled. For example, if a 95% (w/w) ethanol solution in water is boiled, the vapor produced also is 95% ethanol- and it is not possible to obtain higher percentages of ethanol by distillation.

**azimuth:** direction along the horizon when looking for an object in the sky.

**aziridinybenzoquinone RH1:** A water-soluble, synthetic aziridinybenzoquinone with potential antineoplastic activity. Bioactivation of aziridinybenzoquinone RH1 occurs through the two-electron reduction of the quinone to the hydroquinone by the two-electron quinone reductase DT-diaphorase (DTD). The resultant hydroquinone selectively alkylates and cross-links DNA at the 5'-GNC-3' sequence, inhibiting DNA replication, inducing apoptosis, and inhibiting tumor cell proliferation. DTD is over-

expressed in many tumors relative to normal tissue, including lung, colon, breast and liver tumors.

**azithromycin:** An azalide, derived from erythromycin, and a member of a subclass of macrolide antibiotics with bacteriocidal and bacteriostatic activities. Azithromycin reversibly binds to the 50S ribosomal subunit of the 70S ribosome of sensitive microorganisms, thereby inhibiting the translocation step of protein synthesis, wherein a newly synthesized peptidyl tRNA molecule moves from the acceptor site on the ribosome to the peptidyl (donor) site, and consequently inhibiting RNA-dependent protein synthesis leading to cell growth inhibition and cell death.

**Azixa:** (Other name for: verubulin hydrochloride)

**azo:** The azo group has the general structure  $\text{Ar-N=N-Ar}'$ , where Ar and Ar' indicate substituted aromatic rings. Compounds containing the azo compounds are often intensely colored and are economically important as dyes. Methyl orange is an example of an azo dye.

**azoospermia :** A drug used to treat advanced ovarian cancer caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is used in patients who have already received other anticancer drugs. It is also being studied in the treatment of other types of cancer. AZD2281 blocks an enzyme involved in many cell functions, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. AZD2281 may cause cancer cells to die. It is a type of targeted therapy agent and a type of poly (ADP-ribose) polymerase inhibitor. Also called Lynparza, olaparib, and PARP inhibitor AZD2281.

**azoxymethane :** A substance being studied in the treatment of several types of cancer. AZD6244 blocks proteins needed for cell growth and may kill cancer cells. It is a type of protein kinase inhibitor. Also called MEK inhibitor AZD6244 and selumetinib.

**AZP:** An aziridinyl-substituted cyclophosphazene and a putrescence derivative that may cause DNA cross-linkage.

**AZQ:** A condition in which there are no sperm in the semen when a man ejaculates. This may be because the man does not make sperm or because the sperm is blocked from entering the semen. Azoospermia may be caused by hormone problems, certain genetic conditions, previous vasectomy or other surgery, or other conditions. It may also be caused by certain cancer

treatments. Azoospermia can cause infertility (the inability to produce children).

**AZT:** A substance that is used in cancer research to cause colon tumors in laboratory animals. This is done to test new diets, drugs, and procedures for use in cancer prevention and treatment.

**Azulfidine:** (Other name for: sulfasalazine)

**azurin-derived cell-penetrating peptide p28:** A water-soluble, amphipathic, 28 amino acid (amino acids 50-77), 2.9 kD fragment peptide (p28) derived from the protein azurin with potential antineoplastic and antiangiogenic activities. Although the mechanism has yet to be fully elucidated, the preferential cellular uptake of azurin-derived cell-penetrating peptide p28 by tumor cells and endothelial cells is likely via caveolae-mediated endocytosis; the C-terminal 18 amino acid residues (50-67) appear to be responsible for this preferential uptake. After cell entry, the first 12 amino acid residues interact with tumor suppressor p53 and form a p28:p53 complex, which may result in a reduction of proteasomal degradation of p53, increased p53 levels, and p53-mediated cell cycle inhibition and apoptosis. Azurin is a cupredoxin secreted by the bacterium *Pseudomonas aeruginosa*. Cell penetrating peptides (CPPs) are cationic and/or amphipathic peptides, typically less than 30 amino acids in length, that can penetrate cell membranes easily and may transport molecular cargo.

**B cell:** One of the major types of cells in the immune system. B cells can differentiate to form memory cells or antibody-forming cells. Or An anticancer drug that is able to cross the blood-brain barrier and kill cancer cells in the central nervous system. Also called diaziquone.

**B form:** The most common form of duplex DNA, containing a right-handed helix and about 10 (10.5 exactly) base pairs per turn of the helix axis.

**B horizon:** the middle soil horizon into which the leached materials from the A horizon often precipitate.

**B lymphocyte :** A drug that inhibits the human immunodeficiency virus (HIV) that causes AIDS. Also called zidovudine.

**B lymphocytes:** white blood cells within the lymph nodes; stimulated by microorganisms or other foreign materials in the blood.

**B-cell acute lymphoblastic leukemia :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antitumor antibiotics. Also called pixantrone. Or A substance that is being studied in the treatment of cancer. It belongs to the family of platinum-based drugs.

**B-cell leukemia/lymphoma 2 protein :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many B-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. It is the most common type of acute lymphoblastic leukemia (ALL). Also called B-cell acute lymphocytic leukemia and precursor B-lymphoblastic leukemia.

**B-cell lymphoma :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many B-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. It is the most common type of acute lymphoblastic leukemia (ALL). Also called B-cell acute lymphoblastic leukemia and precursor B-lymphoblastic leukemia.

**B-DNA helix:** A right-handed double helix with the following characteristics: the two strands are antiparallel; the bases are inside the helix and the phosphates and deoxyribose sugars are on the outside; adenine forms hydrogen bonds with thymine, and guanine forms them with cytosine; the bases in each pair are coplanar; there are 10.4 residues per turn, with a pitch of 35 Å.

**B-Raf/VEGFR-2 inhibitor RAF265:** An orally bioavailable small molecule with potential antineoplastic activity. B-Raf/VEGFR-2 inhibitor RAF265 binds and inhibits Raf kinases, which may result in a reduction of tumor cell growth and proliferation, and tumor cell death. In addition, this agent inhibits vascular endothelial growth factor receptor type 2 (VEGFR-2), thereby disrupting tumor angiogenesis. Raf kinases are critical enzymes in the Ras/Raf/MEK/ERK signaling pathway and are frequently upregulated in neoplasms.

**B-Side:** Sometimes called the “core,” it is the half of the mold where ejectors, side-action cams and other complex components are located. On a cosmetic part, the B-side usually creates the inside of the part.

**B-stage:** This describes an intermediate stage of reaction where the material will soften when heated and swells in the presence of certain liquids, but may not completely fuse or dissolve. The resin is usually supplied in this uncured state. OR An intermediate stage in the cure reaction

of certain thermosetting resins, in which the material is still to some extent soluble and fusible. OR This describes an intermediate stage of a thermoset resin reaction where the material will soften when heated and swells in the presence of certain liquids, but may not completely fuse or dissolve. The resin is usually supplied in this uncured state.

**B16alphaGal melanoma vaccine:** A whole cell melanoma cancer vaccine with potential immunostimulating and antineoplastic activities.

B16alphaGal melanoma vaccine contains three types of human melanoma cell lines that are genetically engineered to express the alpha(1,3)-galactosyl (alphaGal) epitope on cell surfaces. The agent stimulates a hyperacute rejection of whole melanoma cancer cells expressing alphaGal epitopes, initiated by opsonization by anti-alphaGal antibodies and followed by antibody-dependent cell-mediated cytotoxicity (ADCC) and cell lysis. This results in the stimulation of a broader cytotoxic T-lymphocyte response (CTL) directed against tumor antigens on melanoma cells that do not express alphaGal. AlphaGal is not normally expressed in humans because alpha(1,3)-galactosyltransferase (Alpha-GT), the enzyme that catalyzes the synthesis of alphaGal epitopes on glycoproteins and glycolipids, is not naturally present in humans and other primates.

**B3 monoclonal antibody :** A type of white blood cell that makes antibodies. B cells are part of the immune system and develop from stem cells in the bone marrow. Also called B lymphocyte.

**B3LYP:** DFT using Becke exchange functional and Lee-Yang-Parr correlation functional, as well as Hartree-Fock exchange. A hybrid method; the parameters were optimized for thermochemistry, but using a different functional and numerical (basis set-free) code (7,8). Very popular.

**B43-PAP immunotoxin:** A mouse-derived anti-human CD19 monoclonal antibody linked to pokeweed (*Phytolacca americana*) antiviral protein (PAP) with antileukemic activity. The monoclonal antibody portion specifically binds to the CD19 antigen, a cell surface molecule normally expressed only by B lymphocytes and follicular dendritic cells and over-expressed in B-lineage lymphocytic leukemia cells. Following internalization, PAP, a plant hemitoxin and a ribosome-inactivating protein, is cleaved from the immunoconjugate and released into the cytoplasm where it enzymatically removes a single adenine base from a conserved, surface exposed loop sequence of rRNA leading to inhibition of protein

synthesis and cell growth, but not necessarily cell death. or A type of white blood cell that makes antibodies. B lymphocytes are part of the immune system and develop from stem cells in the bone marrow. Also called B cell.

**B7-1:** A substance that binds to a molecule called Lewis Y antigen that is found on many types of tumor cells and some normal cells. It is being studied in the treatment of several types of cancer that express the Lewis Y antigen. It is a type of monoclonal antibody.

**B7-DC cross-linking antibody rHIgM12B7:** A recombinant form of the monoclonal IgM antibody M12 isolated from a Waldenstrom macroglobulinaemia patient (rHIgM12) with potential immunomodulating activity. B7-DC cross-linking antibody rHIgM12B7 binds and crosslinks the B7 co-stimulatory family member B7-DC (PD-L2) on dendritic cells (DCs), antigen presenting cells (APCs) that play a crucial role in the human immune response. This results in enhanced activation of DCs; enhanced antigen-presenting activity; and increased production of immunomodulatory cytokines (especially interleukin 12); and may potentiate a specific cytotoxic T lymphocyte (CTL) response against Waldenstrom macroglobulinaemia B cells.

**Babinski reflex:** the great toe flexes toward the of the foot and the other toes fan out after the sole of the foot has been firmly stroked; also known as the extensor plantar reflex

**BAC-MP4:** Bond-additivity-corrected MP4. A method in which an MP4 energy is corrected using empirical parameters that depend upon the atoms in the molecule, bond distances, and nearest neighbors. Method developed by Carl Melius (Sandia); not well-described in the open literature.

**bacilli:** the rod-shaped bacteria (singular, bacillus).

**bacillus Calmette-Guérin :** A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**bacillus Calmette-Guérin solution :** A protein found on the surface of some immune system cells, including B cells and monocytes. Cells with B7-1 on their surface cause T cells to make substances that help control immune responses. Also called CD80.

**bacillus Calmette-Guérin vaccine :** A weakened form of the bacterium *Mycobacterium bovis* (bacillus Calmette-Guérin) that does not cause disease. Bacillus Calmette-Guérin is used in a solution to stimulate the

immune system in the treatment of bladder cancer and as a vaccine to prevent tuberculosis. Also called BCG.

**Bacitracin:** An antibiotic that blocks the transfer of oligosaccharides from dolichol phosphate to proteins.

**bacitracin:** A complex of cyclic polypeptide antibiotics, mainly bacitracin A, produced by spore-forming organisms belonging to the licheniformin group of the *Bacillus subtilis* with antibacterial activity. Bacitracin binds to C55-isoprenyl pyrophosphate, a biphosphate lipid transport molecule that carries the building blocks of the peptidoglycan bacterial cell wall. The binding interferes with the enzymatic dephosphorylation of the C55-isoprenyl pyrophosphate and prevents peptidoglycan synthesis, thereby inhibiting bacterial cell growth.

**Back Pressure:** The resistance of the molten plastic material to forward flow. In molding, back pressure increases the temperature of the melt, and contributes to better mixing of colors and homogeneity of the material. As back pressure increases, so does cycle time. OR The resistivity of molten plastic material to forward flow. OR In extrusion, the resistance of molten polymer to flow forward, caused by a pressure difference between two points along the path of flow. OR The viscosity resistance of a material to continued flow when a mold is closing. In extrusion, the resistance to the forward flow of molten material. OR The applied hydraulic pressure used to restrict the shot size formation. Applied to the back of a melt accumulator or reciprocating screw. Used to control screw drift, mixing, and shot size adjustments. In molding, back pressure increases the temperature of the melt, and contributes to better mixing of colors and homogeneity of the material. OR The resistance of the molten plastic material to forward flow. In molding, back pressure increases the temperature of the melt, and contributes to better mixing of colors and homogeneity of the material. However, as back pressure increases, so does cycle time. OR The applied hydraulic pressure used to restrict the shot size formation. Applied to the back of a melt accumulator or reciprocating screw. Used to control screw drift, mixing, and shot size adjustments. In molding, back pressure increases the temperature of the melt, and contributes to better mixing of colors and homogeneity of the material.

**Back Rind:** Distortion of the mold parting line, usually in the form of a ragged or torn indentation

**BACK TAPER:** Reverse draft used in mold to prevent molded articles from drawing freely. See UNDERCUT.

**back titration:** Determining the concentration of an analyte by reacting it with a known number of moles of excess reagent. The excess reagent is then titrated with a second reagent. The concentration of the analyte in the original solution is then related to the amount of reagent consumed.

**back-mutation:** A mutation that causes a mutant gene to regain its wild-type base sequence.

**BACK-PRESSURE:** The resistance that reduces forward flow in an extruder.

**backarc basin:** the area on the continental side of an island arc or magmatic arc.

**backarc thrust belt:** the belt of rocks that has been thrust toward the continental interior from the magmatic arc area along low-angle faults.

**backbone :** A type of biologic therapy used to treat early stage bladder cancer. The solution is made from a weakened form of a bacterium called *Mycobacterium bovis* (bacillus Calmette-Guérin) that does not cause disease. It is given through a catheter that is placed into the bladder where the solution is held for about two hours. Bacillus Calmette-Guérin solution may help the body's immune system kill cancer cells. Also called BCG solution.

**Backflow:** molten resin flows back out of the mold, returning to the runners.

**backflow prevention:** a system designed to protect potable water from wastewater contamination which could occur if wastewater pressure exceeds potable water pressure over a cross-connection where one or more check valves fail.

**Background radiation:** The natural radiation that is always present in the environment. It includes cosmic radiation which comes from the sun and stars, terrestrial radiation which comes from the Earth, and internal radiation which exists in all living things. The typical average individual exposure in the United States from natural background sources is about 300 millirems per year. For additional information, see *Natural Background Sources and Doses in Our Daily Lives*.

**Backing Plate:** A plate used as a support for the mold cavity block, guide pins, bushings, etc. OR In injection molding, a plate used as a support for the cavity blocks, guide pins, bushings, etc. OR A plate, which supports the mold, pins and bushings in the injection machine. OR In mold construction, a plate used as a support for the cavity blocks, guide pins, bushings, etc. OR A plate which supports the mold, pins and bushings in the injection machine.

**Backputty:** The layer of putty which is put first in the sash bar before inserting the glass.

**Backside Treat:** Film defect when areas of the untreated/lamination side of film test positive for corona treatment.

**backsiphonage:** the backflow of contaminated or polluted water, from a plumbing fixture or cross-connection into a water supply line, due to a lowering of the pressure in the line.

**backswamp:** a poorly drained and marshy area behind a natural levee.

**Backup ring:** A washer-like device of a relatively hard, tough material installed in the gland on the downstream side of the seal to prevent seal extrusion into the diametrical gap while under pressure

**Backup washer:** A washer made from certain material that will add strength or support when installed next to the seal. This prevents the seal from being pinched and evenly distributes the load

**backwash:** the water that flows back down the beach into the surf zone.

**backwashing:** the process of cleaning a rapid sand or mechanical filter by reversing the flow of water.

**baclofen:** A synthetic chlorophenyl-butanoic acid derivative with muscle relaxant activity. Baclofen acts as a gamma-aminobutyric acid (GABA) agonist specific for GABA-B receptors in the central nervous system (CNS). At spinal and supraspinal sites, this agent reduces excitatory transmission. or A vaccine used to prevent tuberculosis (TB) in people who are at a high risk of TB or where TB is common. It is rarely given in the U.S. It is made from a weakened form of a bacterium called *Mycobacterium bovis* (bacillus Calmette-Guérin), which is similar to the bacteria that cause TB. The vaccine may help the body's immune system make antibodies to destroy the TB bacteria. It also may help the immune

system kill cancer cells and is being studied in the treatment of melanoma. Also called BCG vaccine.

**baclofen/amitriptyline/ketamine gel:** A topical preparation of baclofen, amitriptyline, and ketamine compounded in a penetration-enhancing polaxamer-lecithin organogel (PLO) with potential antineuralgic activity. The gamma-aminobutyric acid (GABA) analogue baclofen appears to activate the inhibitory GABA(B) receptor, a G protein-coupled receptor, which may result in hyperpolarization of the neuronal cell membrane and inhibition of neurotransmitter release. Amitriptyline likely produces antineuralgic effects via modulation of multiple subtypes of glutamate (Glu) receptors, independent of its antidepressant actions. Ketamine displays complex pharmacologic actions including biogenic amine uptake inhibition, interaction with opioid receptors, and inhibition of N-methyl D-aspartate (NMDA) receptors. Stimulation of GABA(B) receptor activity, modulation of Glu receptor activity, and inhibition of NMDA receptor activity may be of benefit in managing neuropathic pain. or The bones, muscles, tendons, and other tissues that reach from the base of the skull to the tailbone. The backbone encloses the spinal cord and the fluid surrounding the spinal cord. Also called spinal column, spine, and vertebral column.

**Bacteria:** Living organisms, microscopic in size, which usually consist of a single cell. Most bacteria use organic matter for their food and produce waste products as a result of their life processes. OR any of numerous unicellular microorganisms of the class Schizomycetes, occurring in a wide variety of forms, existing either as free-living organisms or parasites, and having a wide range of biochemical, often pathogenic properties. Some bacteria are capable of causing human, animal or plant diseases; others are essential in pollution control because they break-down organic matter in air and water. OR Single-celled organisms that probably provide the bulk of the biomass on our planet. There are more bacterial cells within your body than human cells. One of the most interesting things about bacteria is that our macroscopic concepts of 'species' are rather inappropriate - genetic material can be swapped from one 'species' to another with disturbing ease, leading some scientists to call all bacteria a single 'superorganism'. The fantastic durability and longevity of bacteria (some concentrate plutonium inside themselves and happily live inside high level nuclear waste facilities, while others are believed to have survived for tens of millions of years in rock formations) have led some other scientists to speculate they are

adapted to life in deep space and are continually raining down on us from above. or A drug that is used to treat certain types of muscle spasms and is being studied in the treatment of liver cancer. Baclofen relaxes muscles by blocking certain nerve receptors in the spinal cord. It is a type of antispasmodic. Also called Kemstro and Lioresal.

**Bacterial:** A light-dependent, anaerobic mode of metabolism. Carbon dioxide is reduced to glucose, which is used for both biosynthesis and energy production. Depending on the hydrogen source used to reduce CO<sub>2</sub>, both photolithotrophic and photoorganotrophic reactions exist in bacteria.

**bacterial examination:** the examination of water and wastewater to determine the presence, number, and identification of bacteria. Also called bacterial analysis.

**bacterial toxin :** A substance being studied in the treatment of peripheral neuropathy (pain, numbness, tingling, burning, or weakness in the hands or feet) caused by chemotherapy. It contains three drugs, baclofen, amitriptyline, and ketamine, that relax muscles by blocking nerve receptors. The gel is applied to the skin of affected areas. It is a type of analgesic. Also called BAK gel.

**bacteriophage (phage):** A virus capable of replicating in a bacterial cell.

**bacteriophage phi X 174:** A bacteriophage that infects E. coli. Its genome is a circular DNA of 5386 bases. Check for active clinical trials using this agent.

**Bacteriorhodopsin:** A 26-kd integral membrane protein that absorbs light and converts its energy into proton-motive force, which is then used to synthesize ATP.

**Bactrim:** (Other name for: trimethoprim-sulfamethoxazole)

**BAER test :** A large group of single-cell microorganisms. Some cause infections and disease in animals and humans. The singular of bacteria is bacterium.

**Baeyer reagent:** Cold, dilute potassium permanganate, which is used to oxidize alkenes and alkynes.

**bafetinib:** An orally bioavailable 2-phenylaminopyrimidine derivative with potential antineoplastic activity. Bafetinib specifically binds to and inhibits the Bcr/Abl fusion protein tyrosine kinase, an abnormal enzyme produced by Philadelphia chromosomal translocation associated with chronic myeloid

leukemia (CML). This agent also inhibits the Src-family member Lyn tyrosine kinase, upregulated in imatinib-resistant CML cells and in a variety of solid cancer cell types. The inhibitory effect of bafetinib on these specific tyrosine kinases may decrease cellular proliferation and induce apoptosis in tumor cells that overexpress these kinases. CML patients may be refractory to imatinib, which sometimes results from point mutations occurring in the kinase domain of the Bcr/Abl fusion product. Due to its dual inhibitory activity, the use of bafetinib has been shown to overcome this particular drug resistance.

**Baffle:** A device used to restrict or divert the passage of fluid through a pipe line or in a tank. OR A device used to restrict or divert the passage of fluid through a pipe line or channel. In hydraulic systems the device, which often consists of a disc with a small central perforation, restricts the flow of hydraulic fluid in a high pressure line. A common location for the disc is in a joint in the line. When applied to molds, the term is indicative of a plug or similar device located in a steam or water channel in the mold and designed to divert and restrict the flow to a desired path.

**Bag Balm:** (Other name for: 8-hydroxyquinoline sulfate ointment)

**Bag molding:** A method of applying pressure during bonding or molding, in which a flexible cover, usually in connection with a rigid die or mold, exerts pressure on the material being molded, through the application of air pressure or drawing of a vacuum.

**BAGLEY CORRECTION:** A term used in capillary viscometry to describe the excess pressure drop in the entrance to the capillary due to extensional (elongational) viscosity. It might be negligible when very long capillaries are used (i.e.  $L/D > 35$ ). If shorter capillaries are used the errors in viscosity measurement might be 10-30% or even higher.

**Bail:** The curved handle of a pail.

**bajada:** the joining of alluvial fans at the front of a mountain range in a rolling surface of sediment and gravel.

**BAK gel :** A harmful substance made by bacteria that can cause illness. Bacterial toxins can also be made in the laboratory and attached to monoclonal antibodies that bind to cancer cells. These toxins may help kill cancer cells without harming normal cells.

**Bake Out:** A process whereby a vacuum system is heated for a given time at some predetermined temperature to de-gas all the components, such as gauges, fittings, valves, seals

**Bakelite:** The proprietary name for phenolic and other plastics materials produced by Bakelite Limited, but often used indiscriminately to describe any phenolic molding material or molding. The name is derived from that of Dr. Leo Hendrik Baekeland (1863-1944), a Belgian who, through his work on synthesis of phenolic resins and their commercial development in the early 1900's, is generally considered to be the "father" of the plastic industry.

**balance:** n. Any piece of apparatus used to determine the mass of a sample of matter.v. as in balance an equation: to have equal numbers of atoms of each element on the opposite sides of an equation.

**balanced budget:** of a glacier, a situation in which there is neither advancement nor recession.

**Balanced chemical equation** : The smallest particle that can be recognised as being an element. If you break an atom into its smaller pieces (protons, neutrons and electrons) you can no longer identify a particular element. OR A balanced chemical equation has equal numbers of atoms on each side of the equation. If one side of the equation has five oxygen atoms, the other side must also have five (to be balanced). OR A balanced equation is a chemical reaction represented by the formulae of reactants and products, showing the same number of each type of atom before and after the reaction. e.g.  $2\text{Mg(s)} + \text{O}_2\text{(g)} \rightarrow 2\text{MgO(s)}$  OR A description of a chemical reaction that gives the chemical formulas of the reactants and the products of the reaction, with coefficients introduced so that the number of each type of atom and the total charge is unchanged by the reaction. For example, a balanced equation for the reaction of sodium metal (Na(s)) with chlorine gas (Cl<sub>2</sub>(g)) to form table salt (NaCl(s)) would be  $2\text{Na(s)} + \text{Cl}_2\text{(g)} = 2\text{NaCl(s)}$ , NOT  $\text{Na(s)} + \text{Cl}_2\text{(g)} = \text{NaCl(s)}$ .

**balanced crystalloid solution:** A multiple electrolyte, isotonic, crystalloid solution for intravenous infusion containing sodium chloride, sodium gluconate, sodium acetate, potassium chloride and magnesium chloride, which can restore electrolyte balance, normalize pH, and provide hydration. Upon intravenous administration, the balanced crystalloid solution will

replace lost body fluids and electrolytes thereby providing hydration, normalizing electrolyte concentrations and regulating acid-base balance.

**Balanced Runner:** A runner system designed to place all cavities at the same distance from the sprue.

**Balanced Weave:** A woven fabric consisting of alternating right and left hand spirals joined by crimped connecting rods to form a continuous belt. In some fabrics straight connecting rods are used.

**Ball mill:** A relatively high-energy mill consisting of one or more balls in a chamber and used to reduce the particle size of solids. In the process, the ball mill may induce undesired solid-solid reactions or create amorphous material.

**balloon angioplasty :** A test used to detect some types of hearing loss, such as hearing loss caused by injury or tumors that affect nerves involved in hearing. Electrodes are placed on the head and certain tones or clicking sounds are made. The electrodes measure nerve signals in the brain when it reacts to the sounds. Also called ABR test, auditory brain stem response test, and brain stem auditory evoked response test.

**balloon catheter radiation :** A substance being studied in the treatment of peripheral neuropathy (pain, numbness, tingling, burning, or weakness in the hands or feet) caused by chemotherapy. It contains three drugs, baclofen, amitriptyline, and ketamine, that relax muscles by blocking nerve receptors. The gel is applied to the skin of affected areas. It is a type of analgesic. Also called baclofen/amitriptyline/ketamine gel.

**Balmer series:** A series of lines in the emission spectrum of hydrogen that involve transitions to the  $n=2$  state from states with  $n>2$ .

**Baluster:** A column in a balustrade used to describe the posts supporting a handrail. See also 'banister'.

**Balziva:** (Other name for: ethinyl estradiol/norethindrone)

**BANBURY MIXER:** A high-intensity batch mixer composed of a "figure-eight" shaped chamber and a pair of counter-rotating rotors that masticate the materials.

**band:** 1. A set of closely spaced energy levels in an atom, molecule, or metal. 2. A set of closely spaced lines in an absorption spectrum or emission spectrum. 3. A range of frequencies or wavelengths.

**band :** When chromosomes at a particular stage in cell division are stained using one of several laboratory techniques, a specific pattern of light and dark stripes (bands) appears when the chromosomes are viewed through a microscope; the banding pattern assists in assigning each chromosome its particular number and evaluating its structure.

**BAND HEATER:** Electrical heating units fitted to extruder barrels, adaptors, dies, nozzles, etc. Utilized for heating the polymer to a desired temperature.

**band spectrum:** An emission spectrum that contains groups of sharp peaks that are so close together that they are not distinguishable separately, but only as a "band".

**Banister:** The posts supporting a handrail on a staircase. If turned in the form of ornamental columns they are more correctly termed 'balusters'.

**banks, sludge:** accumulations of solid, sewage, or industrial waste deposits on the bed of a waterway.

**banoxantrone:** A bioreductive, alkylaminoanthraquinone prodrug with antineoplastic activity. Under hypoxic conditions, often seen in solid tumors, banoxantrone (AQ4N) is converted and activated by cytochrome P450 enzymes, which are upregulated in certain tumors, to the cytotoxic DNA-binding agent AQ4. Banoxantrone intercalates into and crosslinks DNA, and inhibits topoisomerase II. This results in an inhibition of DNA replication and repair in tumor cells. Combined with conventional therapeutic agents, both oxygenic and hypoxic regions of tumors can be targeted.

**bar:** an elongate sedimentary accumulation of sand or gravel deposited by current action in a stream or other body of water. OR Unit of pressure. 1 bar = 10<sup>5</sup> pascals = 1.01325 atmospheres.

**Bar Capping:** Wear strips, typically UHMW, installed on the cage bars.

**Bar Links:** Links typically used on Omniflex, Mega-Flex and Hybriflex belts that determine the strength of the belt. The bar links are assembled in a "shingled" configuration to allow the links to nest as the inside belt edge collapses in a turn.

**Baraclude:** (Other name for: entecavir)

**barasertib:** An orally bioavailable, small-molecule, dihydrogen phosphate prodrug of the pyrazoloquinazoline Aurora kinase inhibitor AZD1152–

hydroxyquinazoline pyrazol anilide (AZD1152-HQPA) with potential antineoplastic activity. Upon administration and rapid conversion from the prodrug form in plasma, barasertib specifically binds to and inhibits Aurora kinase B, which results in the disruption of spindle checkpoint functions and chromosome alignment and, so, the disruption of chromosome segregation and cytokinesis. Consequently, cell division and cell proliferation are inhibited and apoptosis is induced in Aurora kinase B-overexpressing tumor cells. Aurora kinase B, a serine/threonine protein kinase that functions in the attachment of the mitotic spindle to the centromere, is overexpressed in a wide variety of cancer cell types.

**barbiturate :** A procedure to enlarge the opening in a blood vessel that has become narrowed or blocked by plaque (a buildup of fat and cholesterol on the inner wall of the blood vessel). A small balloon is filled with air inside the blood vessel to push the plaque against the blood vessel wall and increase the opening.

**barchan dune:** a solitary, crescent-shaped dune that forms in areas of sparse sand.

**barchanoid dune:** a variety of dune intermediate between barchan and transverse dunes; barchanoid dunes form scalloped rows of sand perpendicular to the wind.

**bardoxolone:** A synthetic triterpenoid compound with potential antineoplastic and anti-inflammatory activities. Bardoxolone blocks the synthesis of inducible nitric oxide synthase (iNOS) and inducible cyclooxygenase (COX-2), two enzymes involved in inflammation and carcinogenesis. This agent also inhibits the interleukin-1 (IL-1)-induced expression of the pro-inflammatory proteins matrix metalloproteinase-1 (MMP-1) and matrix metalloproteinase-13 (MMP-13) and the expression of Bcl-3; Bcl-3 is an IL-1-responsive gene that preferentially contributes to MMP-1 gene expression.

**BAREFOOT:** A resin or film containing no additives. OR Polyethylene resins which have no additives, slip, or antiblock.

**Barge board:** The board at the top of a gable where the wall meets the rough edge. Also called a parge board.

**baricitinib:** An orally bioavailable inhibitor of Janus kinases 1 and 2 (JAK1/2), with potential anti-inflammatory, immunomodulating and antineoplastic activities. Upon administration, baricitinib binds to JAK1/2,

which inhibits JAK1/2 activation and leads to the inhibition of the JAK-signal transducers and activators of transcription (STAT) signaling pathway. This decreases the production of inflammatory cytokines and may prevent an inflammatory response. In addition, baricitinib may induce apoptosis and reduce proliferation of JAK1/2-expressing tumor cells. JAK kinases are intracellular enzymes involved in cytokine signaling, inflammation, immune function and hematopoiesis; they are also upregulated and/or mutated in various tumor cell types.

**Barium:** Symbol:"Ba" Atomic Number:"56" Atomic Mass: 137.33amu. Barium is a member of the alkaline metals group. Barium is only found as a part of compounds when found in nature. The element is used in paints, fireworks, medicine, and the process of making glass.

**barium enema :** A system used to deliver internal radiation therapy to breast cancer patients after surgery to remove their cancer. Balloon catheter radiation targets only the part of the breast where the cancer was found. After a patient has had a lumpectomy to remove the cancer, a small balloon on the end of a catheter (thin tube) is inserted into the empty space left by the surgery. The balloon is then filled with liquid and left in place. Using the catheter, radioactive seeds are put into the balloon twice a day for five days and removed each time. Once treatment has ended, the catheter and balloon are removed. Balloon catheter radiation is a type of intracavitary brachytherapy and partial breast irradiation therapy (PBRT). Also called MammoSite.

**barium solution :** A type of drug that causes a decrease in brain activity. Barbiturates may be used to treat insomnia, seizures, and convulsions, and to relieve anxiety and tension before surgery. A barbiturate is a type of central nervous system (CNS) depressant.

**barium sulfate:** The sulfate salt of barium, an alkaline, divalent metal. Barium sulfate is quite insoluble in water, and is used as a radiopaque agent to diagnose gastrointestinal medical conditions. Barium sulfate is taken by mouth or given rectally. OR A procedure in which a liquid that contains barium sulfate is put through the anus into the rectum and colon. Barium sulfate is a silver-white metallic compound that helps show pictures of the colon, rectum, and anus on an x-ray.

**barium swallow :** A liquid that contains barium sulfate (a form of the silver-white metallic element barium). It is used to show pictures of parts of

the digestive system in x-rays.

**bark:** the structure of vascular plants formed between the phloem and the cork.

**baroclinic model:** A model of atmospheric circulation that, in contrast with barotropic models, does not constrain constant-pressure surfaces to coincide with constant-density surfaces.

**Barometer:** A device that measures atmospheric pressure. OR An instrument that measures atmospheric pressure. A mercury barometer is a closed tube filled with mercury inverted in a mercury reservoir. The height of the mercury column indicates atmospheric pressure (with 1 atm = 760 mm of mercury). An aneroid barometer consists of an evacuated container with a flexible wall. When atmospheric pressure changes, the wall flexes and moves a pointer which indicates the changing pressure on a scale.

**Barrel:** The section of a molding machine that contains the feed screw, also the section where resin heating and mixing occurs. OR Cylinder that contains the screw and the heaters. Built to withstand pressure of 7,500-20,000 psi. OR Section of the extrusion machine that contains the plastic extrusion feed screw, which can be single or twin screw. This is also the section where resin heating and mixing occurs. OR The tubular portion of the extruder in which the extruder screw is placed and rotates. OR The part of the extruder encasing the screw or plunger. OR A metallic cylinder containing the injection screw (or plunger) Also called cylinder. OR The part of the molding press where resin is melted. OR A component of the injection-molding machine wherein the resin pellets are melted, compressed and injected into the mold's runner system. OR The portion of the molding press where resin is melted. OR Cylinder that contains the screw and the heaters. Built to withstand pressure of 7,500-20,000 psi.

**Barrel Heaters :** Heaters that raise the barrel temperature in order to transform the thermoplastic material into a melt.

**Barrel Liner:** The sleeve forming the inner surface of the barrel.

**Barrett esophagus :** A silver-white metallic compound made from the mineral barite. It is mixed with water and used in barium swallows and barium enemas to help show parts of the digestive system on an x-ray.

**Barrier:** Protection from deterioration or admittance of moisture or other elements (such as oxygen and other gases) through package material.

**barrier :** The process of getting x-ray pictures of the esophagus or the upper gastrointestinal (GI) tract (esophagus, stomach, and duodenum). The x-ray pictures are taken after the patient drinks a liquid that contains barium sulfate (a form of the silver-white metallic element barium). The barium sulfate coats and outlines the inner walls of the esophagus and the upper GI tract so that they can be seen on the x-ray pictures.

**Barrier Coat:** A surface coating to improve permeation resistance and/or protect the container from scuffing.

**barrier island:** a large, elongate mass of sand that parallels a coast and forms an island.

**barrier reef:** an elongate reef that develops offshore parallel to a coastline and is separated from the coastline by a deep lagoon.

**Barrier Resins:** A group of resins specially formulated to resist the transmission of oxygen, water, solvents, essential oils, etc. OR Polymers which have very low permeability to gases.

**BARRIER SCREWS:** Screws where a second flight (barrier), with a larger radial clearance than a normal flight, separates the solid bed from melt in the compression section. Barrier screws have significantly higher melting capacity than conventional screws.

**Barseb HC:** (Other name for: therapeutic hydrocortisone)

**basal cell :** A condition in which the cells lining the lower part of the esophagus have changed or been replaced with abnormal cells that could lead to cancer of the esophagus. The backing up of stomach contents (reflux) may irritate the esophagus and, over time, cause Barrett esophagus.

**basal cell cancer :** Something that blocks, prevents, separates, or limits.

**basal cell carcinoma :** A small, round cell found in the lower part (or base) of the epidermis, the outer layer of the skin.

**basal cell nevus syndrome :** Cancer that begins in the lower part of the epidermis (the outer layer of the skin). It may appear as a small white or flesh-colored bump that grows slowly and may bleed. Basal cell cancers are usually found on areas of the body exposed to the sun. Basal cell cancers rarely metastasize (spread) to other parts of the body. They are the most common form of skin cancer. Also called basal cell carcinoma.

**basal metabolic rate:** The rate of oxygen consumption by an animal's body at complete rest, long after a meal.

**basal sliding:** the movement of a glacier generated by its sliding on a thin film of water resulting from the pressure of the glacier's weight.

**basal sliding (basal slip):** The movement or speed of movement of a glacier on its bed.

**Basalt** : If ever you write a chemical equation using symbols it MUST be balanced. That means that there must be the same number of each kind of atom on either side of the equation.

**Base:** A substance which dissociates (separates) in aqueous solution to yield hydroxyl ions, or one containing hydroxyl ions (OH<sup>-</sup>) which reacts with an acid to form a salt or which may react with metal to form a precipitate. OR any substance which contains hydroxyl (OH) groups and furnishes hydroxide ions in solution; a molecular or ionic substance capable of combining with a proton to form a new substance; a substance that provides a pair of electrons for a covalent bond with an acid; a solution with a pH of greater than 7. OR The adenine, guanine, cytosine or thymine group attached to a nucleotide or nucleoside Also may be used to refer to a nucleic acid unit within a polynucleotide chain, as when a gene is said to be 2000 bases long. OR A substance that will neutralise an acid is called a base. When an acid reacts with a base, a salt and water is formed. If a base is soluble in water, it is called an alkali. OR The number that is in the denominator in a percent ratio: OR a compound that yields OH<sup>-</sup> ions in solution or a solution in which the concentration of OH<sup>-</sup> exceeds H<sup>+</sup>. OR Substance which gives off hydroxide ions (OH<sup>-</sup>) in solution. OR A compound that produces hydroxide ions in water solution. OR A base is a compound that reacts with an acid to neutralize it, producing a salt and water. Ammonia and compounds containing a hydroxide group are examples of bases. OR The bottom of a wall or column. OR 1. a compound that reacts with an acid to form a salt. 2. a compound that produces hydroxide ions in aqueous solution (Arrhenius). 3. a molecule or ion that captures hydrogen ions.(Bronsted-Lowry). 4. a molecule or ion that donates an electron pair to form a chemical bond.(Lewis). OR The material woven (such as paper, woven cotton, glass fabric, or glass fiber mat, felted asbestos, aramid fibers, graphite and nylon fabrics) in the form of sheets or rolls which can be impregnated with resin to form laminated plastics. OR The bottom of the bottle or jar, often marked with a recycle code and indentations used during filling and labeling. OR the material woven (such

as paper, woven cotton, fabric, or glass fiber mat, felted asbestos, aramid fibers, graphite, and nylon fabrics) in the form of sheets or rolls which can be impregnated with resin to form laminated plastics.

**base :** Cancer that begins in the lower part of the epidermis (the outer layer of the skin). It may appear as a small white or flesh-colored bump that grows slowly and may bleed. Basal cell carcinomas are usually found on areas of the body exposed to the sun. Basal cell carcinomas rarely metastasize (spread) to other parts of the body. They are the most common form of skin cancer. Also called basal cell cancer.

**base (of a triangle):** One of the three sides of a triangle that is perpendicular to the height.

**Base analog:** A compound, usually a purine or a pyrimidine, that differs somewhat from a normal nucleic acid base.

**base hydrolysis constant:** ( $K_b$ ) base ionization constant; basic hydrolysis constant. Compare with acid dissociation constant. The equilibrium constant for the hydrolysis reaction associated with a base. For example,  $K_b$  for ammonia is the equilibrium constant for  $\text{NH}_3(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{NH}_4^+(\text{aq}) + \text{OH}^-(\text{aq})$ , or  $K_b = \frac{[\text{NH}_4^+][\text{OH}^-]}{[\text{NH}_3]}$ .

**Base Line:** The mark from which all features are dimensioned or measured from

**BASE OIL (NAPHTHENIC):** A type of petroleum oil fluid derived from naphthenic crude oil. Contains a high degree of closed ring methylene groups.

**BASE OIL (PARAFFINIC):** A type of petroleum oil fluid derived from paraffinic crude oil, containing a high proportion of straight chain saturated hydrocarbons.

**base pair:** Two nucleotides in nucleic acid chains that are paired by hydrogen bonding of their bases; for example, A with T or U, and G with C.

**base pair :** Two nitrogen-containing bases pair together between double-stranded DNA; only specific combinations of these bases (e.g., adenine with thymine; guanine with cytosine) are possible, a fact which facilitates accurate DNA replication; when quantified (e.g., 8 base pairs, or bp), this term refers to the actual number of base pairs in a sequence of nucleotides.  
OR A genetic condition that causes unusual facial features and disorders of

the skin, bones, nervous system, eyes, and endocrine glands. People with this syndrome have a higher risk of basal cell carcinoma. Also called Gorlin syndrome and nevoid basal cell carcinoma syndrome.

**Base stacking:** The close packing of the planes of base pairs, commonly found in DNA and RNA structures.

**BASE STOCK:** The base carrier fluid, usually a refined petroleum fraction or synthetic fluid, into which additives are blended to produce finished lubricants.

**base unit:** Base units are units that are fundamental building blocks in a system of measurement. There are seven base units in the SI system.

**Base-excision repair:** A means of repairing DNA in which the damaged base is removed and replaced by a base complementary to the undamaged DNA strand.

**baseline :** In chemistry, a substance that can accept hydrogen ions in water and can neutralize an acid. Bases feel soapy or slippery on the skin and they can turn certain dyes blue. An example of a base is sodium hydroxide. Basicity is measured on a scale called the pH scale. On this scale, a pH value of 7 is neutral, and a pH value of more than 7 to 14 shows increasing basicity.

**Baseline Inspection Program:** The normal inspection program performed at all nuclear power plants. The program focuses on plant activities that are not adequately measured by performance indicators, on the corrective action program, and on verifying the accuracy of the performance indicators.

**Basen:** (Other name for: voglibose)

**bases:** compounds that attract hydrogen atoms when placed in water.

**basic:** Having the characteristics of a base.

**basicity :** Molecules called nucleotides, on opposite strands of the DNA double helix, that form chemical bonds with one another. These chemical bonds act like rungs in a ladder and help hold the two strands of DNA together. There are four nucleotides, or bases, in DNA: adenine (A), cytosine (C), guanine (G), and thymine (T). These bases form specific pairs (A with T, and G with C).

**basiliximab:** A recombinant, chimeric, human-murine monoclonal antibody directed against the alpha subunit of the interleukin-2 receptor (IL-

2R alpha) with immunosuppressant activity. Basiliximab selectively binds to and blocks IL-2R alpha, expressed on the surface of activated T-lymphocytes, thereby preventing interleukin-2 binding and inhibiting the interleukin-2-mediated activation of lymphocytes.

**Basin and Range topography:** a series of steep mountain ranges separated by broad valley floors.

**basis function:** A mathematical function that can be used to build a description of wavefunctions for electrons in atoms or molecules.

**basis set:** The set of mathematical functions (basis functions) used to describe the molecular orbitals. Gaussian functions predominate heavily, but occasional papers use the old "Slater" orbitals or functions, which are exponentials. OR A set of mathematical functions that are combined to approximate the wavefunctions for electrons in atoms and molecules.

**basophil :** An initial measurement that is taken at an early time point to represent a beginning condition, and is used for comparison over time to look for changes. For example, the size of a tumor will be measured before treatment (baseline) and then afterwards to see if the treatment had an effect.

**basophils:** the white blood cells that function in allergic responses.

**batabulin sodium:** A synthetic pentafluorophenylsulfonamide with potential antineoplastic activity. Batabulin sodium covalently binds to and selectively modifies the beta 1, beta 2, beta 3, and beta 4 isotypes of beta tubulin at a conserved cysteine residue, resulting in disruption of microtubule polymerization, collapse of the cytoskeleton, an increase in chromosomal ploidy, cell cycle arrest, and tumor cell apoptosis.

**Batch:** The product of one mixing operation or shipment of Liquid Silicone Rubber

**Batch Number:** The assigned number that identifies a batch of Silicone Rubber

**Batch process:** A treatment process in which a tank or reactor is filled, the wastewater (or solution) is treated or a chemical solution is prepared and the tank is emptied. The tank may then be filled and the process repeated. Batch processes are also used to cleanse, stabilize or condition chemical solutions for use in industrial manufacturing and treatment processes.

**batholith:** a pluton larger than 100 kilometers at the earth's surface; usually granitic and made up of diapirs.

**bathymetry:** The science of measuring ocean depths to determine the topography of the sea floor.

**batimastat :** In chemistry, the quality of being a base (not an acid). A base is a substance that can accept hydrogen ions in water and can neutralize an acid. Basicity is measured on a scale called the pH scale. On this scale, a pH value of 7 is neutral, and a pH value of more than 7 to 14 shows increasing basicity.

**batracylin :** A type of immune cell that has granules (small particles) with enzymes that are released during allergic reactions and asthma. A basophil is a type of white blood cell and a type of granulocyte.

**Batten:** A strip of wood, usually pine or fir, and between two and nine inches wide but less than nine inches.

**battery:** An electrochemical cell that can be used as a source of direct current at a constant voltage.

**battery acid:** A solution of approximately 6M sulfuric acid used in the lead storage battery.

**Baumé:** A, Be scale related to specific gravities, devised by the French chemist Antoine Baumé for marking hydrometers. At 60°F, specific gravity can be calculated from degrees Baumé by the following formulas:

**bauxite:** Bauxite is an ore of aluminium containing aluminium oxide.

**bavituximab:** An IgG3 monoclonal antibody directed against anionic phospholipids with potential antineoplastic activity. Chimeric anti-phosphatidylserine monoclonal antibody binds to anionic phospholipids in a beta 2-glycoprotein I-dependent manner, inhibiting tumor growth by stimulating antibody-dependent cellular cytotoxicity (ADCC) to tumor vessels. or An anticancer drug that belongs to the family of drugs called angiogenesis inhibitors. Batimastat is a matrix metalloproteinase inhibitor.

**Bay:** Any part of a building cut off by timbers, buttresses, beams, etc. Especially used for sections of roof or floor between beams or arches.

**BAY 12-9566:** A substance being studied in the treatment of cancer. It may kill cancer cells by causing damage to the DNA. Batracylin is a type of heterocyclic aryl amine.

**BAY 43-9006:** A substance being studied in the treatment of several types of cancer and infections caused by certain viruses. It binds to substances on the surface of tumor cells, certain viruses, and cells infected with a virus. The immune system detects bavituximab on the cells and the viruses and may destroy them. It is a type of monoclonal antibody and a type of targeted therapy agent. Also called Tarvacin.

**BAY 56-3722:** An anticancer drug that belongs to the family of drugs called angiogenesis inhibitors. OR A water-soluble camptothecin derivative conjugated to a carbohydrate moiety exhibiting antineoplastic activity. BAY 56-3722 stabilizes the topoisomerase I-DNA covalent complex and forms an enzyme-drug-DNA ternary complex. As a consequence of the formation of this complex, both the initial cleavage reaction and religation steps are inhibited and subsequent collision of the replication fork with the cleaved strand of DNA results in inhibition of DNA replication, double strand DNA breakage and triggering of apoptosis. The peptide carbohydrate moiety of this agent stabilizes the lactone form of camptothecin in blood.

**BAY 59-8862:** A drug used to treat advanced kidney cancer and a type of liver cancer that cannot be removed by surgery. It is also used to treat a type of advanced thyroid cancer that did not get better with radioactive iodine treatment. It is being studied in the treatment of other types of cancer. BAY 43-9006 stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of kinase inhibitor and a type of antiangiogenesis agent. Also called Nexavar and sorafenib tosylate.

**Bayesian estimation:** A mathematical formulation, using Bayes' theorem, by which the likelihood of an event can be estimated taking explicit consideration of certain contextual features (such as amount of data, nature of decision, etc.).

**Bayesian prior:** A way to express the context of a Bayesian estimation in which initial data are updated as new data become available.

**BayGam:** (Other name for: therapeutic immune globulin)

**bazedoxifene:** An indole derivative and third-generation selective estrogen receptor modulator (SERM) with potential antineoplastic activity. Upon administration, bazedoxifene specifically binds to estrogen receptors in responsive tissues, including liver, bone, breast, and endometrium. The resulting ligand-receptor complex is translocated to the nucleus where,

depending on the tissue type, it either promotes or suppresses the transcription of estrogen-regulated genes. Bazedoxifene acts as an estrogen antagonist in uterine and breast tissue, thereby blocking the proliferative effects of estrogen-binding to ER-positive cells in these tissues.

Bazedoxifene functions as an estrogen agonist in lipid metabolism, thereby decreasing total and LDL cholesterol levels. In bone, it decreases bone resorption and bone turnover and increases bone mineral density.

**BB-10901:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called camptothecins.

**BBB:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called taxanes.

**BBBD:** A substance that combines a monoclonal antibody (huN901) with an anticancer drug (DM1), and is being studied in the treatment of certain cancers, including non-small cell lung cancer. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells.

**BBIC:** A network of blood vessels and tissue that is made up of closely spaced cells and helps keep harmful substances from reaching the brain. The BBB lets some substances, such as water, oxygen, carbon dioxide, and general anesthetics, pass into the brain. It also keeps out bacteria and other substances, such as many anticancer drugs. Also called blood-brain barrier.

**BBR 2778:** The use of drugs to create openings between cells in the blood-brain barrier. The blood-brain barrier is a protective network of blood vessels and tissue that protects the brain from harmful substances, but can also prevent anticancer drugs from reaching the brain. Once the barrier is opened, anticancer drugs may be infused into an artery that goes to the brain, in order to treat brain tumors. Also called blood-brain barrier disruption.

**BBR 3464:** A substance that is made from soybeans and is being studied in the prevention of cancer. It blocks the action of enzymes that are needed for cancer cells to form. It is a type of protease inhibitor. Also called Bowman-Birk inhibitor concentrate.

**BC-819 plasmid/polyethylenimine complex:** A plasmid DNA encoding for the A fragment of Diphtheria Toxin (DTA) under the control of the H19 gene promoter (BC-819 or DTA-H19) and mixed with the transfectant polyethylenimine (PEI), with potential antineoplastic activity. Upon administration, the PEI moiety enhances the entry of the agent into rapidly

dividing cells. Upon cell entry, activation of the H19 gene promoter-containing plasmids and DTA expression are limited to tumor cells, as high levels of H19 expression are only found in tumor cells. DTA disrupts protein synthesis. Tumor-cell selective expression of this toxin leads to the selective destruction of the tumor while sparing healthy, normal cells. H19, an oncofetal, regulatory RNA, is overexpressed in certain cancer cells while its expression in normal cells is minimal or absent; it plays a key role in cancer progression, angiogenesis and metastasis. Check for active clinical trials using this agent.

**BCG:** A protein that helps control whether a cell lives or dies by blocking a type of cell death called apoptosis. The gene for the B-cell leukemia/lymphoma 2 protein is found on chromosome 18, and transfer of the B-cell leukemia/lymphoma 2 gene to a different chromosome is seen in many B-cell leukemias and lymphomas. This causes the B-cell leukemia/lymphoma 2 protein to be made in larger amounts, which may keep cancer cells from dying. Also called BCL2.

**BCG solution:** A solution containing an attenuated, live culture preparation of the Bacillus Calmette Guerin (BCG) strain of Mycobacterium bovis with potential immunostimulating activity. Although the precise mechanism of action is unknown, upon intravesical administration, attenuated, live BCG bacteria in the solution come into direct contact with the bladder wall, inciting an antitumor granulomatous inflammatory reaction. Check for active clinical trials using this agent. or A type of cancer that forms in B cells (a type of immune system cell). B-cell lymphomas may be either indolent (slow-growing) or aggressive (fast-growing). Most B-cell lymphomas are non-Hodgkin lymphomas. There are many different types of B-cell non-Hodgkin lymphomas. These include Burkitt lymphoma, chronic lymphocytic leukemia/small lymphocytic lymphoma (CLL/SLL), diffuse large B-cell lymphoma, follicular lymphoma, and mantle cell lymphoma. Prognosis and treatment depend on type and stage of the cancer.

**BCG vaccine:** A vaccine containing bacillus Calmette-Guerin (BCG), an attenuated strain of Mycobacterium bovis, with non-specific immunoadjuvant and immunotherapeutic activities. Although the mechanism of its anti-tumor activity is unclear, immunization with BCG vaccine likely activates a Th1 cytokine response that includes the induction

of interferon. Vaccination with BCG vaccine may be immunoprotective against infection with Mycobacterium tuberculosis. or A weakened form of the bacterium Mycobacterium bovis (bacillus Calmette-Guérin) that does not cause disease. BCG is used in a solution to stimulate the immune system in the treatment of bladder cancer and as a vaccine to prevent tuberculosis. Also called bacillus Calmette-Guérin.

**bcl-2 antisense oligodeoxynucleotide G3139 :** A vaccine used to prevent tuberculosis (TB) in people who are at a high risk of TB or where TB is common. It is rarely given in the U.S. It is made from a weakened form of a bacterium called Mycobacterium bovis (bacillus Calmette-Guérin), which is similar to the bacteria that cause TB. The vaccine may help the body's immune system make antibodies to destroy the TB bacteria. It also may help the immune system kill cancer cells and is being studied in the treatment of melanoma. Also called bacillus Calmette-Guérin vaccine.

**Bcl-2 inhibitor BCL201:** A selective inhibitor of the anti-apoptotic protein B-cell lymphoma 2 (Bcl-2), with potential pro-apoptotic and antineoplastic activities. Upon administration, Bcl-2 inhibitor BCL201 binds to and inhibits the activity of Bcl-2. This restores apoptotic processes in tumor cells. Bcl-2 protein is overexpressed in many cancers and plays an important role in the negative regulation of apoptosis; its expression is associated with increased drug resistance and tumor cell survival.

**BCL2:** A type of biologic therapy used to treat early stage bladder cancer. The solution is made from a weakened form of a bacterium called Mycobacterium bovis (bacillus Calmette-Guérin) that does not cause disease. It is given through a catheter that is placed into the bladder where the solution is held for about two hours. BCG solution may help the body's immune system kill cancer cells. Also called bacillus Calmette-Guérin solution.

**BCMA-specific CAR-expressing T lymphocytes:** A preparation of autologous peripheral blood T-lymphocytes (PBTL) that have been genetically modified to express a chimeric antigen receptor (CAR) specific for the B cell maturation antigen (BCMA), with potential immunostimulating and antineoplastic activities. Upon administration, BCMA-specific CAR-expressing T-lymphocytes specifically recognize and kill BCMA-expressing tumor cells. BCMA, a tumor specific antigen and a receptor for both a proliferation-inducing ligand and B-cell activating

factor, is a member of the tumor necrosis factor (TNF) receptor superfamily and plays a key role in plasma survival; it is found on the surfaces of plasma cells and overexpressed on malignant plasma cells.

**BCNU:** A protein that helps control whether a cell lives or dies by blocking a type of cell death called apoptosis. The gene for BCL2 is found on chromosome 18, and transfer of the BCL2 gene to a different chromosome is seen in many B-cell leukemias and lymphomas. This causes the BCL2 protein to be made in larger amounts, which may keep cancer cells from dying. Also called B-cell leukemia/lymphoma 2 protein.

**BCOP:** A substance being studied in the treatment of cancer. It may kill cancer cells by blocking the production of a protein that makes cancer cells live longer and by making them more sensitive to anticancer drugs. It is a type of antisense oligodeoxyribonucleotide. Also called augmerosen, Genasense, and oblimersen sodium.

**bcr-abl (b2a2)-derived peptide vaccine:** A peptide vaccine consisting of the bcr-abl b2a2 fusion oncoprotein, frequently expressed in chronic myelogenous leukemia (CML), with potential antineoplastic activity. Vaccination with the bcr-abl (b2a2)-derived peptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells that express the bcr-abl b2a2 fusion protein. Fusion genes in CML typically result from the fusion of either BCR exon b2 or BCR exon b3 to ABL exon a2, a 'b3a2' or a 'b2a2' fusion.

**bcr-abl (b3a2)-derived peptide vaccine:** A peptide vaccine consisting of the bcr-abl b3a2 fusion oncoprotein, frequently expressed in chronic myelogenous leukemia (CML), with potential antineoplastic activity. Vaccination with the bcr-abl (b3a2)-derived peptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells that express the bcr-abl b3a2 fusion protein. Fusion genes in CML typically result from the fusion of either BCR exon b2 or BCR exon b3 to ABL exon a2, a 'b3a2' or a 'b2a2' fusion.

**BCR-ABL fusion gene :** A drug used to treat certain types of brain tumors. It is also used with prednisone to treat multiple myeloma and with other drugs to treat Hodgkin lymphoma and non-Hodgkin lymphoma that have not gotten better with other treatment or have come back. It is also being studied in the treatment of other types of cancer. BCNU damages the cell's

DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea. Also called BiCNU and carmustine.

**BCR-ABL fusion protein :** A licensed pharmacist with special training in how to design, give, monitor, and change chemotherapy for cancer patients. Also called board certified oncology pharmacy specialist and oncology pharmacy specialist.

**bcr-abl p210-b3a2 breakpoint-derived multipeptide vaccine:** A multipeptide vaccine consisting of five peptides derived from the bcr-abl p210-b3a2 breakpoint fusion protein with potential antineoplastic activity. Vaccination with bcr-abl p210-b3a2 breakpoint-derived multipeptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells that express the bcr-abl p210-b3a2 breakpoint fusion protein. In chronic myelogenous leukemia (CML), fusion genes typically result from the fusion of either bcr exon b2 or exon b3 to abl exon a2, resulting in either a b3a2 or a b2a2 gene fusion product. Check for active clinical trials using this agent.

**bcr-abl peptide vaccine:** A multivalent antineoplastic vaccine comprised of the bcr-abl oncogene breakpoint fusion peptide that elicits a bcr-abl specific T-cell immune response. Check for active clinical trials using this agent.

**BCX-1777:** A gene formed when pieces of chromosomes 9 and 22 break off and trade places. The ABL gene from chromosome 9 joins to the BCR gene on chromosome 22, to form the BCR-ABL fusion gene. The changed chromosome 22 with the fusion gene on it is called the Philadelphia chromosome. The BCR-ABL fusion gene is found in most patients with chronic myelogenous leukemia (CML), and in some patients with acute lymphoblastic leukemia (ALL) or acute myelogenous leukemia (AML).

**BD:** Brueckner doubles. Very similar to CCSD and QCISD. Although BD only involves doubles, the Brueckner orbitals are those for which the singles contribution is zero. So BSD would be the same thing.

**BDC:** A protein made from pieces of two genes that get joined together. It is found in most patients with chronic myelogenous leukemia (CML), and in some patients with acute lymphoblastic leukemia (ALL) or acute myelogenous leukemia (AML). Inside the leukemia cells, the ABL gene from chromosome 9 joins to the BCR gene on chromosome 22 to form the BCR-ABL fusion gene, which makes the BCR-ABL fusion protein.

**beach:** the strip of sand or gravel (more rarely silt) that covers a shoreline from the low-water edge to a well-defined point of higher elevation.

**beach drift:** the zig-zag pattern by which sediment is moved across a beach face by breaking waves.

**beach face:** the side of a beach facing the ocean.

**BEACOPP :** A substance being studied in the treatment of some types of leukemia and lymphoma. It is a type of purine nucleoside phosphorylase (PNP) inhibitor. Also called forodesine and forodesine hydrochloride.

**BEACOPP regimen:** A rare type of kidney cancer that grows and spreads quickly. It begins in the duct of Bellini in the kidney. Also called Bellini duct carcinoma. OR A chemotherapy regimen consisting of bleomycin, etoposide, doxorubicin hydrochloride (Adriamycin), cyclophosphamide, vincristine (Oncovin), procarbazine and prednisone, used for the treatment of advanced-stage Hodgkin lymphoma.

**Bead:** Correctly refers to any small moulding in the form of beads on a string but is commonly used to describe small mouldings of other designs. OR On Hinge-Guard/J-Cap style neck finishes, the collar of plastic beneath the neck area that snap-on caps rest against.

**Bead blasting:** Using abrasives in a pressurized air blast to create a surface texture on the part.

**Bead Block Compressible Microspheres:** (Other name for: PVA microporous hydrospheres)

**Beam:** Any horizontal structure usually supported at each end. The term is therefore used to describe horizontal projection, whether load-bearing or not.

**becatecarin:** A synthetic diethylaminoethyl analogue of the indolocarbazole glycoside antineoplastic antibiotic rebeccamycin. Becatecarin intercalates into DNA and stabilizes the DNA-topoisomerase I complex, thereby interfering with the topoisomerase I-catalyzed DNA breakage-reunion reaction and initiating DNA cleavage and apoptosis.

**Becenum:** (Other name for: carmustine)

**Beckwith-Wiedemann syndrome :** An abbreviation for a chemotherapy combination used to treat advanced Hodgkin lymphoma. It includes the drugs bleomycin sulfate, etoposide phosphate, doxorubicin hydrochloride (Adriamycin), cyclophosphamide, vincristine sulfate (Oncovin),

procarbazine hydrochloride, and prednisone. Also called BEACOPP regimen.

**beclin 1** : An abbreviation for a chemotherapy combination used to treat advanced Hodgkin lymphoma. It includes the drugs bleomycin sulfate, etoposide phosphate, doxorubicin hydrochloride (Adriamycin), cyclophosphamide, vincristine sulfate (Oncovin), procarbazine hydrochloride, and prednisone. Also called BEACOPP.

**beclomethasone** : A rare, overgrowth disorder in which babies are large at birth and may develop low blood sugar. Other common symptoms are a large tongue, large internal organs, and defects of the abdominal wall near the navel. Beckwith-Wiedemann syndrome increases the risk of developing certain cancers, especially Wilms tumor.

**beclomethasone dipropionate**: The dipropionate salt of a synthetic glucocorticoid with anti-inflammatory and immunomodulating properties. After cell surface receptor attachment and cell entry, beclomethasone enters the nucleus where it binds to and activates specific nuclear receptors, resulting in an altered gene expression and inhibition of proinflammatory cytokine production.

**Beclovent**: (Other name for: beclomethasone dipropionate)

**Beconase**: (Other name for: beclomethasone dipropionate)

**Becquerel (Bq)**: One of three units used to measure radioactivity, which refers to the amount of ionizing radiation released when an element (such as uranium) spontaneously emits energy as a result of the radioactive decay (or disintegration) of an unstable atom. Radioactivity is also the term used to describe the rate at which radioactive material emits radiation, or how many atoms in the material decay (or disintegrate) in a given time period. As such, 1 Bq represents a rate of radioactive decay equal to 1 disintegration per second, and 37 billion ( $3.7 \times 10^{10}$ ) Bq equals 1 curie (Ci).

**Bed**: The horizontal surface of a stone. Also used to describe the large flat areas of a ceiling between beams.

**bed load**: of a stream, the heavier, coarser-grained earth material that travels on or near the bed of a stream. OR of wind, the heavier grains (usually sand) that hop and skip along the ground by saltation.

**bedding:** the pattern (usually horizontal) of layering in which sediments are deposited.

**bedding planes:** demarcations of different layers of sediments.

**Beer's law:** In absorption spectroscopy, the absorbance of a dilute solution is equal to its absorptivity times the path length times the concentration of the absorbing solute. OR The relations between the absorbance of light (A) by a compound, its extinction coefficient ( $\epsilon$ ), concentration (c) and the length (l) of the light path:  $A = \epsilon cl$

**Beesix:** (Other name for: pyridoxine hydrochloride)

**BeetElite NeoShot:** (Other name for: concentrated beet crystals)

**beetroot juice:** The juice of the beetroot, with potential antioxidant and protective activities. Beetroot juice contains antioxidants, including betacyanin, which scavenge free radicals. In addition, beetroot contains high levels of nitrates and folic acid. Consumption of beetroot juice leads to the conversion of nitrate to nitric oxide (NO) in the body. This juice may have a beneficial effect on blood flow and blood pressure through the induction of NO-mediated vasodilation. Additionally, this agent may decrease fatigue and increase physical performance.

**Begedina:** (Other name for: begelomab)

**begelomab:** A monoclonal antibody against the human dipeptidyl peptidase 4 (dipeptidylpeptidase IV, DPP4, DPP4; CD26), with potential activity against graft-versus-host disease (GvHD). Upon administration, begelomab binds to CD26 expressed on T-cells. This inhibits the stimulation of T-cells and may prevent GvHD. CD26, a membrane-bound glycoprotein with dipeptidyl peptidase activity, plays a key role in T-cell activation and immune regulation. Check for active clinical trials using this agent.

**behavior modification :** A protein involved in autophagy (the process by which a cell destroys proteins and other substances in its cytoplasm). Beclin 1 is found at lower levels in several types of cancer cells than in normal cells. It is a type of tumor suppressor.

**Behcet disease :** A drug being studied in the treatment of graft-versus-host disease. It belongs to a family of drugs called corticosteroids.

**Behcet syndrome :** A technique used to help people change the way they react to certain triggers in the environment that cause a negative reaction. In

cancer treatment, behavior modification may be used to help patients who have become nauseous during previous cancer treatments cope with nausea they feel when they enter the therapy room to begin a new round of treatment.

**belagenpumatucel-L:** A transforming growth factor beta2 (TGF-beta2) antisense gene-modified allogeneic tumor cell vaccine with potential immunostimulatory and antineoplastic activities. Belagenpumatucel-L is prepared by transfecting allogeneic non-small cell lung cancer (NSCLC) cells with a plasmid containing a TGF-beta2 antisense transgene, expanding the cells, and then irradiating and freezing them. Upon administration, this agent may elicit a cytotoxic T lymphocyte (CTL) response against host NSCLC cells, resulting in decreased tumor cell proliferation; vaccine immunogenicity may be potentiated by suppression of tumor TGF-beta2 production by antisense RNA expressed by the vaccine plasmid TGF-beta2 antisense transgene. Elevated levels of TGF-beta2 are frequently linked to immunosuppression in cancer patients and may be inversely correlated with prognosis in patients with NSCLC.

**Beleodaq :** (Other name for: belinostat) OR A rare disorder that causes the blood vessels to become inflamed. Symptoms include sores in the mouth and on the sex organs and other skin problems, inflammation in parts of the eye, and pain, swelling, and stiffness of the joints. Other serious symptoms include blood clots, blindness, and inflammation of the brain, spinal cord, and digestive system. The symptoms may come and go on their own. Behcet disease is most common in young adults and its cause is unknown. Also called Behcet syndrome.

**belimumab:** A fully human IgG1 monoclonal antibody directed against B-Lymphocyte stimulator protein (BlyS or TNFSF13B) with potential immunomodulating activity. Belimumab specifically recognizes and inhibits the biological activity of BlyS, thereby preventing the binding of BlyS to B-lymphocytes. This inhibits the maturation of B-lymphocytes and may induce apoptosis in B-lymphocytes. In addition, it may decrease B-lymphocyte proliferation and/or survival. BlyS, a member of TNF family supporting B-lymphocyte maturation and survival, has been implicated in the pathogenesis of autoimmune diseases and B-lymphocyte malignancies.

**belinostat:** A novel hydroxamic acid-type histone deacetylase (HDAC) inhibitor with antineoplastic activity. Belinostat targets HDAC enzymes,

thereby inhibiting tumor cell proliferation, inducing apoptosis, promoting cellular differentiation, and inhibiting angiogenesis. This agent may sensitize drug-resistant tumor cells to other antineoplastic agents, possibly through a mechanism involving the down-regulation of thymidylate synthase. Check for active clinical trials using this agent. OR A rare disorder that causes the blood vessels to become inflamed. Symptoms include sores in the mouth and on the sex organs and other skin problems, inflammation in parts of the eye, and pain, swelling, and stiffness of the joints. Other serious symptoms include blood clots, blindness, and inflammation of the brain, spinal cord, and digestive system. The symptoms may come and go on their own. Behcet syndrome is most common in young adults and its cause is unknown. Also called Behcet disease.

**Bellini duct carcinoma :** A drug used to treat peripheral T-cell lymphoma that has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Beleodaq blocks certain enzymes needed for cell division and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow and may help make cancer cells easier to kill with other anticancer drugs. It is a type of histone deacetylase (HDAC) inhibitor, a type of angiogenesis inhibitor, and a type of chemosensitizer. Also called belinostat and PXD101.

**belotecan :** A drug used to treat peripheral T-cell lymphoma that has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Belinostat blocks certain enzymes needed for cell division and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow and may help make cancer cells easier to kill with other anticancer drugs. It is a type of histone deacetylase (HDAC) inhibitor, a type of angiogenesis inhibitor, and a type of chemosensitizer. Also called Beleodaq and PXD101.

**belotecan hydrochloride:** The hydrochloride salt of the semi-synthetic camptothecin analogue belotecan with potential antitumor activity. Belotecan binds to and inhibits the activity of topoisomerase I, stabilizing the cleavable complex of topoisomerase I-DNA, which inhibits the religation of single-stranded DNA breaks generated by topoisomerase I; lethal double-stranded DNA breaks occur when the topoisomerase I-DNA complex is encountered by the DNA replication machinery, DNA

replication is disrupted, and the tumor cell undergoes apoptosis.

Topoisomerase I is an enzyme that mediates reversible single-strand breaks in DNA during DNA replication. or A rare type of kidney cancer that grows and spreads quickly. It begins in the duct of Bellini in the kidney. Also called BDC.

**Belt:** The completed product consisting of a skeleton with or without mesh and attachments suitable for flexing around pulleys or sprockets and used primarily as a means of conveyance.

**Belt Supports:** Structure that the belt rides on (also called supports).

Typical belt supports are UHMW and metal rails which can be arranged in a herring bone pattern or arranged horizontally in the direction of belt travel.

**Belt Trackers (Control Rolls):** Devices called control rolls are used to guide the belt's path. Control rolls are placed 1.5 x BW from terminals.

**bemiparin sodium:** The sodium salt of bemiparin, a second generation, synthetic, low-molecular-weight heparin (LMWH) with anticoagulant activity. Derived, after depolymerisation and fractionation, from medical-grade porcine unfractionated heparin (UFH), bemiparin has an average molecular weight of 3,600 daltons and has a higher anti-factor Xa/anti-factor IIa ratio (8:1) than first-generation LMWHs. This anticoagulant binds to antithrombin III, thereby enhancing the inactivation of activated Factor X (Factor Xa) and, to a lesser extent, activated factor II (Factor IIa).

Compared to unfractionated heparins, the use of bemiparin is associated with lower incidences of major bleeding, osteoporosis, and heparin-induced thrombocytopenia. Bemiparin also promotes a greater release of tissue factor pathway inhibitor than UFH or dalteparin.

**Benadryl:** (Other name for: diphenhydramine hydrochloride)

**benazepril hydrochloride:** The hydrochloride salt of benazepril, a carboxyl-containing angiotensin-converting enzyme (ACE) inhibitor with antihypertensive activity. As a prodrug, benazepril is metabolized to its active form benazeprilat. Benazeprilat competitively binds to and inhibits ACE, thereby blocking the conversion of angiotensin I to angiotensin II. This prevents the potent vasoconstrictive actions of angiotensin II, resulting in vasodilation. Benazeprilat also decreases angiotensin II-induced aldosterone secretion by the adrenal cortex, which leads to an increase in sodium excretion and subsequently increases water outflow. Check for active clinical trials using this agent.

**Bence Jones protein :** The active ingredient in a substance being studied in the treatment of small cell lung cancer and other types of cancer. It blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of camptothecin analog and a type of topoisomerase inhibitor.

**Bench scale analysis:** Also known as: "bench test". A method of studying different ways of treating wastewater and solids on a small scale in a laboratory. While some competitors of Alken-Murray Corporation will experiment with treatments by selling a product that they "hope" will work and then advising the client to change products every month as one treatment after another fails to deliver the desired results, Alken-Murray will examine information provided on the appropriate diagnostic survey form, by either the client or authorized distributor, to select standard products, blends of standard products or totally customized blends for the authorized distributor to test against freshly collected samples of pollution from the client's project, with tests performed locally in the distributor's laboratory. Sometimes a distributor will test up to 25 different treatment options to finally achieve a sufficiently high quality result to deliver a confidence level sufficient to ensure that the positive bench test results will scale up to deliver similar results when scaled up to pilot or full-scale application. If Alken-Murray and its authorized distributor cannot achieve this result from bench scale testing as many potential treatments as Valerie could devise from initially submitted information, the distributor will usually enlist the aid of an accredited, independent drinking water or environment pollution testing laboratory, paid for by the client, to see if some undisclosed or previously unencountered compounds are inhibiting bacterial performance. If nothing new is disclosed from these new chemical analysis, the client is advised to consider alternative treatments (incineration, chemical reaction, filtering, etc.) from other vendors, but if one or more new pollutants ARE discovered, Alken-Murray research staff examine the chemistry of the new pollutants to study its shape for possible attach by enzymes that have been discovered in previous screenings. If Sigma-Aldrich or another laboratory chemical supply company carries the chemical(s) in pure form, Alken-Murray will purchase enough to prepare a broth media, featuring the new pollutant(s) as sole source of organic carbon, so that any growth or reproduction will indicate potential talent for digesting the new pollutant(s). Following filter-sterilizing or autoclaving,

ten mL of the broth is dispensed into sterile, fifteen mL, screw-cap test tubes. Each tube is then inoculated with a single colony picked from a 24-hour-old TSA plate growth of a stock Alken-Murray collection strain, selected for demonstrating the ability to digest related or similarly shaped chemical compounds, in the past. Inoculated test tubes are incubated at their optimal temperature for up to 7 days, with a well-mixed sample tested spectrophotometrically for signs of growth and reproduction daily. Five mL from the original 10 mL broth media in a test tube showing strong growth is inoculated into 100 ml of fresh broth media, using the same recipe with the pollutant(s) as sole organic carbon source, contained in a 250 mL Erlenmeyer flask, incubated at the selected strain's optimum temperature, with shaking at 200 rpm. A chemical analysis protocol is selected to enable measurement of the pollutant(s) in the broth media. Appropriate samples are withdrawn to perform chemical analyses on the pollutant(s) in the media and the growth rate of the inoculated strain in each flask. If pollutant(s) disappear at a similar rate as the growth rate of the culture, the strain is then tested for synergy with other strains known to be required to digest known pollutants in client's polluted site, with these results guiding actual new custom formulas sent to distributor to test with fresh samples of client's pollution project. If final results of one of the new formulas delivers a confidence level sufficient to ensure that positive bench test results will scale up properly to a full-scale application, a new Alken-Murray product is officially named and the sale is made. This close cooperation between Alken-Murray Corporation and its authorized distributors is responsible for our strong reputation for a high success rate worldwide.

**bench-to-bedside :** A substance being studied in the treatment of small cell lung cancer and other types of cancer. It blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of camptothecin analog and a type of topoisomerase inhibitor.

**Bend Radius:** The measurement of how far a tube can be bent before it kinks.

**bendamustine :** A small protein made by plasma cells (white blood cells that produce antibodies). It is found in the urine of most people with multiple myeloma (cancer that begins in plasma cells).

**bendamustine hydrochloride:** TA term used to describe the process by which the results of research done in the laboratory are directly used to

develop new ways to treat patients. OR he hydrochloride salt of bendamustine, a bifunctional mechlorethamine derivative with alkylator and antimetabolite activities. Bendamustine possesses three active moieties: an alkylating group; a benzimidazole ring, which may act as a purine analogue; and a butyric acid side chain. Although its exact mechanism of action is unknown, this agent appears to act primarily as an alkylator. Bendamustine metabolites alkylate and crosslink macromolecules, resulting in DNA, RNA and protein synthesis inhibition, and, subsequently, apoptosis. Bendamustine may differ from other alkylators in that it may be more potent in activating p53-dependent stress pathways and inducing apoptosis; it may induce mitotic catastrophe; and it may activate a base excision DNA repair pathway rather than an alkyltransferase DNA repair mechanism. Accordingly, this agent may be more efficacious and less susceptible to drug resistance than other alkylators.

**bendamustine-containing nanoparticle-based formulation RXDX-107:**

A nanoparticle-based formulation containing the alkyl ester of bendamustine, a bifunctional mechlorethamine derivative, encapsulated in human serum albumin (HSA), with potential alkylating and antineoplastic activities. Upon administration of the alkyl ester bendamustine-containing nanoparticle formulation RXDX-107, the nanoparticle formulation permits high concentrations of the alkyl ester of bendamustine be localized at the tumor site. The modified bendamustine alkylates and crosslinks macromolecules, resulting in DNA, RNA and protein synthesis inhibition, and, subsequently, apoptosis.

**bendamustine-vorinostat fusion molecule EDO-S101:** An alkylating histone-deacetylase inhibitor (HDACi) fusion molecule composed of the alkylating agent bendamustine fused to the pan-HDACi vorinostat, with potential bi-functional antineoplastic activity. Upon administration of the bendamustine-vorinostat fusion molecule EDO-S101, the vorinostat moiety targets and binds to HDACs. This leads to an accumulation of highly acetylated histones, which results in an induction of chromatin remodeling, a modulation of gene expression, an inhibition of tumor cell division and the induction of tumor cell apoptosis. The bendamustine moiety binds to, alkylates and crosslinks macromolecules, inhibiting DNA, RNA and protein synthesis, which also results in tumor cell apoptosis. Thus, EDO-S101 shows superior efficacy compared to the activity of either agent alone. In addition, the inhibition of HDAC6 activity by EDO-S101 induces the

activation of inositol-requiring enzyme 1 (IRE-1), the key regulatory protein for the unfolded protein response (UPR). Induction of the UPR increases the sensitivity of certain cancer cell types to certain chemotherapeutic agents, such as proteasome inhibitors. Therefore, EDO-S101 may work synergistically with proteasome inhibitors. HDACs, enzymes that deacetylate chromatin histone proteins, are overexpressed in various cancers and play a key role in proliferation and resistance of tumor cells.

**Bendopa:** (Other name for: levodopa)

**Benefin:** (Other name for: shark cartilage)

**benegrastim:** A recombinant dimeric fusion peptide of the human granulocyte colony-stimulating factor (G-CSF; filgrastim), with immunomodulating and hematopoietic activities. Benegrastim binds to the cell surface G-CSF receptors (G-CSFRs) inducing receptor dimerization and activation of signaling cascades such as the Jak-STAT and mitogen-activated protein kinase pathways. This stimulates neutrophil progenitor proliferation and differentiation. Compared to other preparations of monomer recombinant G-CSF, dimeric filgrastim may allow for stronger activation of G-CSFRs and a faster myeloid precursor response thus enhancing neutrophil recovery upon myelosuppressive therapy.

**Benemid:** (Other name for: probenecid)

**Beneo Synergy 1:** (Other name for: oligofructose-enriched inulin)

**benign:** This adjective is applied to any growth which does not invade surrounding tissue. See malignant, tumour.

**benign :** The active ingredient in a drug that is used to treat chronic lymphocytic leukemia (CLL), to treat slow-growing B-cell non-Hodgkin lymphoma (NHL) that has gotten worse within 6 months of treatment with other anticancer drugs, and is being studied in the treatment of other types of cancer. Bendamustine may damage the DNA in cancer cells and cause them to die. It is a type of alkylating agent and a type of antimetabolite.

**benign breast disease :** A drug used to treat chronic lymphocytic leukemia (CLL). It is also used to treat slow-growing B-cell non-Hodgkin lymphoma (NHL) that has gotten worse within 6 months of treatment with other anticancer drugs. It is being studied in the treatment of other types of cancer. Bendamustine hydrochloride may damage the DNA in cancer cells

and cause them to die. It is a type of alkylating agent and a type of antimetabolite. Also called Treanda.

**benign proliferative breast disease :** Not cancerous. Benign tumors may grow larger but do not spread to other parts of the body. Also called nonmalignant.

**benign prostatic hyperplasia :** A group of conditions marked by changes in breast tissue that are benign (not cancer). There are different types of benign breast disease, including some types caused by an increase in the number of cells or by the growth of abnormal cells in the breast ducts or lobes. Signs and symptoms of benign breast disease include irregular lumps or cysts, breast swelling or discomfort, skin redness or thickening, and nipple discharge. Most benign breast conditions do not increase the risk of breast cancer. Also called mammary dysplasia. or A group of noncancerous conditions marked by an increase in the growth of certain cells in the breast. Having one of these conditions may increase the risk of breast cancer. Examples include ductal hyperplasia, lobular hyperplasia, and papillomas.

**benign tumor :** A benign (not cancer) condition in which an overgrowth of prostate tissue pushes against the urethra and the bladder, blocking the flow of urine. Also called benign prostatic hypertrophy and BPH.

**benign vascular tumor :** A benign (not cancer) condition in which an overgrowth of prostate tissue pushes against the urethra and the bladder, blocking the flow of urine. Also called benign prostatic hyperplasia and BPH.

**Benioff zone:** a zone that slopes downward from an oceanic trench and underneath the overlying crustal plate at 30 to 60 degrees; an area of earthquake origination.

**Benlysta:** (Other name for: belimumab)

**Benoquin:** (Other name for: monobenzone)

**benthic organism (benthos):** A form of aquatic plant or animal life that is found on or near the bottom of a stream, lake, or ocean.

**benthic region:** The bottom layer of a body of water.

**benzaldehyde :** A growth that is not cancer. It does not invade nearby tissue or spread to other parts of the body.

**benzaldehyde dimethane sulfonate:** A dimethane sulfonate derivative and alkylating agent with a structure similar to other alkylating agents such as

chlorambucil, busulfan and melphalan, with potential antineoplastic activity. Although the exact mechanism of action has yet to be fully elucidated, benzaldehyde dimethane sulfonate alkylates DNA, which results in DNA double strand breaks, inhibition of DNA replication, cell cycle arrest and cell death. In addition, this agent is metabolized by the enzyme aldehyde dehydrogenase (ALDH) into the active carboxylic acid metabolite benzoic acid dimethane sulfonate (BA), which further contributes to its alkylating activity. Unlike other alkylating agents, benzaldehyde dimethane sulfonate has demonstrated antitumor activity in renal cell carcinoma.

**Benzene:** An aromatic hydrocarbon which is a colorless, volatile, flammable liquid. Benzene is obtained chiefly from coal tar and is used as a solvent for resins and fats in dye manufacture. OR A primary petrochemical building block used in the production of styrene, phenol and caprolactam. Benzene is an aromatic compound consisting of six carbon unsaturated ring structure. Benzene is produced predominantly as a by-product from naphtha or heavy liquid cracking.

**benzene :** A type of benign (not cancer) tumor that forms from cells that make blood vessels or lymph vessels. Benign vascular tumors may occur anywhere in the body, and a patient may have several tumors in different parts of the body. They may grow large and sometimes spread to nearby tissue. The most common type of benign vascular tumor is hemangioma, which usually occurs in infants and goes away on its own.

**Benzene Ring:** The basic structure of benzene, the most important aromatic chemical. It is an unsaturated, resonant 6-carbon ring having three double bonds. One or more of the 6 hydrogen atoms of benzene may be replaced by other atoms or groups.

**benzenoid ring:** an aromatic ring with a benzene-like structure.

**benzo(a)pyrene :** A chemical used in flavorings and in some dyes, perfumes, and medicines. It is found in essential oils made from almonds and peach pits and in other foods. It can also be made in the laboratory.

**benzodiazepine :** A chemical that is used widely by the chemical industry, and is also found in tobacco smoke, vehicle emissions, and gasoline fumes. Exposure to benzene may increase the risk of developing leukemia.

**Benzoyl Peroxide:** Aromatic peroxide. OR A common initiator used to start chain growth polymerisation. It undergoes a decomposition reaction at the peroxide (O-O) bond. Here is a picture:

**benzoylphenylurea:** A low molecular weight agent with antineoplastic activity. Benzoylphenylurea binds to the colchicine binding site on tubulin, thereby blocking tubulin polymerization and disrupting mitotic function. This agent also inhibits DNA polymerase, and has been shown to arrest leukemia cells in the G1-S transition phase of the cell cycle. Check for active clinical trials using this agent. or A chemical that comes from certain substances when they are not burned completely. It is found in car exhaust, smoke from wood fires, tobacco, oil and gas products, charred or grilled foods, and other sources. It may also be found in water and soil. Benzo(a)pyrene can cause a skin rash, a burning feeling, skin color changes, warts, and bronchitis. It may also cause cancer. It is a type of polycyclic aromatic hydrocarbon. Also called 3,4-benzopyrene.

**benzodiazepine :** A type of drug used to relieve anxiety and insomnia (trouble sleeping). Benzodiazepines are also used to relax muscles and prevent seizures. They increase the effect of a chemical in the brain called GABA, which is a neurotransmitter (a substance that nerves use to send messages to one another). This causes brain activity to slow down. Benzodiazepines are a type of CNS depressant.

**benzidamine hydrochloride:** An indazole non-steroidal anti-inflammatory drug (NSAID) with analgesic, antipyretic, and anti-edema properties. Unlike other NSAIDs, benzidamine hydrochloride does not inhibit cyclooxygenases (COX) but stabilizes membranes, resulting in local anesthesia; inhibits the production of pro-inflammatory cytokines; inhibits the generation of reactive oxygen species by neutrophils; inhibits leukocyte aggregation and adhesion; and exhibits antimicrobial properties.

**benzyl group:** the  $C_6H_5CH_2$  group.

**benzyne:** an unstable intermediate that consists of a benzene ring with an additional bond that is created by the side-to-side overlap of  $sp^2$  orbitals on adjacent carbons of the ring.

**BEP:** A substance being studied in the treatment of cancer. It is a type of antitubulin agent. Also called BPU.

**BEP regimen:** A chemotherapy regimen consisting of bleomycin, etoposide and cisplatin used for the treatment of ovarian and testicular germ cell tumors (GCTs). Or A substance being studied as a mouth rinse treatment for oral mucositis (painful mouth sores) caused by cancer therapy. It is a type of nonsteroidal anti-inflammatory drug (NSAID).

**berberine chloride:** The orally bioavailable, hydrochloride salt form of berberine, a quaternary ammonium salt of an isoquinoline alkaloid and active component of various Chinese herbs, with potential antineoplastic, radiosensitizing, anti-inflammatory, anti-lipidemic and antidiabetic activities. Although the mechanisms of action through which berberine exerts its effects are not yet fully elucidated, upon administration this agent appears to suppress the activation of various proteins and/or modulate the expression of a variety of genes involved in tumorigenesis and inflammation, including, but not limited to transcription factor nuclear factor-kappa B (NF-kB), myeloid cell leukemia 1 (Mcl-1), B-cell lymphoma 2 (Bcl-2), B-cell lymphoma-extra large (Bcl-xl), cyclooxygenase (COX)-2, tumor necrosis factor (TNF), interleukin (IL)-6, IL-12, inducible nitric oxide synthase (iNOS), intercellular adhesion molecule-1 (ICAM-1), E-selectin, monocyte chemoattractant protein-1 (MCP-1), C-X-C motif chemokine 2 (CXCL2), cyclin D1, activator protein (AP-1), hypoxia-inducible factor 1 (HIF-1), signal transducer and activator of transcription 3 (STAT3), peroxisome proliferator-activated receptor (PPAR), arylamine N-acetyltransferase (NAT), and DNA topoisomerase I and II. The modulation of gene expression may induce cell cycle arrest and apoptosis, and inhibit cancer cell proliferation. In addition, berberine modulates lipid and glucose metabolism.

**bereavement :** An abbreviation for a chemotherapy combination used to treat ovarian and testicular germ cell tumors. It includes the drugs bleomycin sulfate, etoposide phosphate, and cisplatin (Platinol). Also called BEP regimen.

**bergamot :** An abbreviation for a chemotherapy combination used to treat ovarian and testicular germ cell tumors. It includes the drugs bleomycin sulfate, etoposide phosphate, and cisplatin (Platinol). Also called BEP.

**bergschrund:** a crevasse, commonly filled with rock fall debris, that forms where a glacier separates from a cirque wall.

**Beriberi:** A neurologic and cardiovascular disorder caused by a dietary deficiency of thiamine (vitamin B1).

**Berkelium:** Symbol:"Bk" Atomic Number:"97" Atomic Mass: (247)amu. Berkelium is only one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a radioactive metal with no known applications.

**berm:** the landward edge of a beach.

**berubicin hydrochloride:** The hydrochloride salt of the anthracycline derivative berubicin with potential antineoplastic activity. Berubicin intercalates into DNA and interrupts topoisomerase II activity, resulting in the inhibition of DNA replication and repair, and RNA and protein synthesis. Unlike other anthracycline derivatives, this agent crosses the blood-brain barrier (BBB).

**Beryllium:** Symbol:"Be" Atomic Number:"4" Atomic Mass: 9.01amu. Beryllium is member of the alkaline metals family. Beryllium is a silvery, very light metallic element. You might find the element in nuclear reactors, springs, satellites, and the space shuttle. OR Element 4, atomic weight 9.0122, an extremely toxic metal used as a neutron source and in phosphors.

**best practice :** A state of sadness, grief, and mourning after the loss of a loved one.

**BET (Brunauer–Emmet–Teller) adsorption isotherm:** A curve (usually sigmoidal) that describes the manner in which a substance absorbs a monolayer of an inert gas (usually nitrogen or krypton) at reduced temperatures.

**BET bromodomain inhibitor ZEN-3694:** An orally bioavailable inhibitor of the bromodomain and extra-terminal (BET) family of proteins, with potential antineoplastic activity. Upon oral administration, the BET inhibitor ZEN-3694 binds to the acetylated lysine recognition motifs in the bromodomains of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histones. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an inhibition of proliferation in BET-overexpressing tumor cells. BET proteins, comprised of BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during development and cellular growth.

**BET bromodomains 2/3/4 inhibitor MK-8628:** A synthetic, small molecule inhibitor of the BET (Bromodomain and Extra-Terminal) family of bromodomain-containing proteins 2, 3 and 4 with potential antineoplastic activity. Upon administration, the BET bromodomains 2, 3 and 4 inhibitor MK-8628 binds to the acetylated lysine recognition motifs on the bromodomain of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histone peptides. This disrupts chromatin

remodeling and gene expression. Prevention of the expression of certain growth-promoting genes, including c-Myc-dependent target genes, may lead to an inhibition of tumor cell growth. Characterized by a tandem repeat of bromodomain at the N-terminus, the BET proteins BRD2, BRD3, BRD4 are transcriptional regulators that play an important role in cellular growth.

**BET inhibitor BAY1238097:** An inhibitor of the Bromodomain (BRD) and Extra-Terminal domain (BET) family of proteins, with potential antineoplastic activity. Upon administration, the BET inhibitor BAY1238097 binds to the acetylated lysine recognition motifs on the BRD of BET proteins, thereby preventing the interaction between BET proteins and histones. This disrupts chromatin remodeling and prevents the expression of certain growth-promoting genes. This leads to an inhibition of tumor cell growth. BET proteins (BRD2, BRD3, BRD4 and BRDT) are transcriptional regulators that bind to acetylated lysines on the tails of histones H3 and H4, and regulate chromatin structure and function; they play an important role in the modulation of gene expression during development and cellular growth. Check for active clinical trials using this agent.

**BET inhibitor BMS-986158:** An inhibitor of the bromodomain (BRD) and extra-terminal domain (BET) family of proteins, with potential antineoplastic activity. Upon administration, the BET inhibitor BMS-986158 binds to the acetyl-lysine binding site in the BRD of BET proteins, thereby preventing the interaction between BET proteins and acetylated histones. This disrupts chromatin remodeling and prevents the expression of certain growth-promoting genes, resulting in an inhibition of tumor cell growth. BET proteins (BRD2, BRD3, BRD4 and BRDT) are transcriptional regulators that bind to acetylated lysines on the tails of histones H3 and H4, and regulate chromatin structure and function; they play an important role in the modulation of gene expression during development and cellular growth.

**BET inhibitor CPI-0610:** A small molecule inhibitor of the Bromodomain and Extra-Terminal (BET) family of proteins, with potential antineoplastic activity. Upon administration, the BET inhibitor CPI-0610 binds to the acetylated lysine recognition motifs on the bromodomain of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histone peptides. This disrupts chromatin remodeling and gene expression.

Prevention of the expression of certain growth-promoting genes may lead to an inhibition of tumor cell growth. Characterized by a tandem repeat of two bromodomains at the N-terminus, the BET proteins (BRD2, BRD3, BRD4 and BRDT) are transcriptional regulators that play an important role during development and cellular growth. Check for active clinical trials using this agent.

**BET inhibitor FT-1101:** An orally bioavailable inhibitor of the Bromodomain and Extra-Terminal (BET) family of proteins, with potential antineoplastic activity. Upon administration, the BET inhibitor FT-1101 binds to the acetylated lysine recognition motifs in the bromodomain sites of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histones. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to the inhibition of tumor cell growth. BET proteins, comprised of BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during development and cellular growth. Check for active clinical trials using this agent.

**BET inhibitor GSK2820151:** An orally bioavailable inhibitor of the bromodomain and extra-terminal (BET) family of proteins, with potential antineoplastic activity. Upon oral administration, the BET inhibitor GSK2820151 binds to the acetylated lysine recognition motifs in the bromodomains of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histones. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an inhibition of tumor cell growth. BET proteins, comprised of BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during development and cellular growth. Check for active clinical trials using this agent.

**BET inhibitor GSK525762:** A small molecule inhibitor of the BET (Bromodomain and Extra-Terminal) family of bromodomain-containing proteins with potential antineoplastic activity. Upon administration, the BET inhibitor GSK525762 binds to the acetylated lysine recognition motifs on the bromodomain of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histone peptides. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an inhibition of tumor cell

growth. Characterized by a tandem repeat of bromodomain at the N-terminus, BET proteins, comprising of BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during development and cellular growth. Check for active clinical trials using this agent.

**BET inhibitor INCB054329:** An inhibitor of the bromodomain and extra-terminal (BET) family of bromodomain-containing proteins with potential antineoplastic activity. Upon administration, the BET inhibitor INCB054329 binds to the acetylated lysine recognition motifs on the bromodomain of BET proteins, thereby preventing the interaction between the BET proteins and acetylated histones. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an inhibition of tumor cell growth. Characterized by a tandem repeat of bromodomain at the N-terminus, BET proteins, BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during cellular growth.

**BET inhibitor TEN-010:** A small molecule inhibitor of the BET (Bromodomain and Extra-Terminal) family of bromodomain-containing proteins with potential antineoplastic activity. Upon administration, the BET inhibitor TEN-010 binds to the acetylated lysine recognition motifs found in the bromodomain of BET proteins, which prevents the interaction between BET proteins and acetylated histones. This interaction disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an inhibition of tumor cell growth. Characterized by a tandem repeat of bromodomains at the N-terminus, BET proteins, comprised of BRD2, BRD3, BRD4 and BRDT, are transcriptional regulators that play an important role during cellular development and growth.

**beta alethine :** A type of orange tree grown in Italy. The essential oil from the peel of this orange is used in perfume, to get rid of insects, and to flavor tea. Bergamot oil is also used in aromatherapy for depression, anxiety, and poor digestion. The scientific name for the bergamot orange tree is *Citrus bergamia*.

**beta carotene:** A naturally-occurring retinol (vitamin A) precursor obtained from certain fruits and vegetables with potential antineoplastic and chemopreventive activities. As an anti-oxidant, beta carotene inhibits free-

radical damage to DNA. This agent also induces cell differentiation and apoptosis of some tumor cell types, particularly in early stages of tumorigenesis, and enhances immune system activity by stimulating the release of natural killer cells, lymphocytes, and monocytes. or Treatment that is accepted by medical experts as a proper treatment for a certain type of disease and that is widely used by healthcare professionals. Also called standard medical care, standard of care, and standard therapy.

**beta cell neoplasm :** A substance that is being studied in the treatment of cancer. It belongs to a family of chemicals called disulfides.

**beta cell tumor of the pancreas :** A substance found in yellow and orange fruits and vegetables and in dark green, leafy vegetables. The body can make vitamin A from beta carotene. Beta carotene is being studied in the prevention of some types of cancer. It is a type of antioxidant.

**beta electron:** An electron with spin down.

**BETA GAUGE:** A device for measuring the thickness of plastic films, sheets or extruded shapes. It consists of a Beta-ray emitting source and a detecting element.

**beta hemolytic streptococcus group B :** An abnormal mass that grows in the beta cells of the pancreas that make insulin. Beta cell neoplasms are usually benign (not cancer). They secrete insulin and are the most common cause of low blood sugar caused by having too much insulin in the body. Also called beta cell tumor of the pancreas, insulinoma, and pancreatic insulin-producing tumor.

**Beta particle:** are electrons produced in nuclear reactions. They are Electrons. OR A charged particle (with a mass equal to  $1/1837$  that of a proton) that is emitted from the nucleus of a radioactive element during radioactive decay (or disintegration) of an unstable atom. A negatively charged beta particle is identical to an electron, while a positively charged beta particle is called a positron. Large amounts of beta radiation may cause skin burns, and beta emitters are harmful if they enter the body. Beta particles may be stopped by thin sheets of metal or plastic. For additional detail, see Radiation Basics. OR An electron emitted by an unstable nucleus, when a neutron decays into a proton and an electron. In some cases, beta radiation consists of positrons ("antielectrons" which are identical to electrons but carry a +1 charge.") Note that beta

particles are created in nuclear decay; they do not exist as independent particles within the nucleus.

**beta-2-microglobulin :** An abnormal mass that grows in the beta cells of the pancreas that make insulin. Beta cell tumors of the pancreas are usually benign (not cancer). They secrete insulin and are the most common cause of low blood sugar caused by having too much insulin in the body. Also called beta cell neoplasm, insulinoma, and pancreatic insulin-producing tumor.

**Beta-bend:** Beta-bend (b-bend) or turn. A characteristic way of turning an extended polypeptide chain in a different direction, involving the minimum number of residues, and held together by hydrogen bonding.

**Beta-bend (b-bend) or turn:** A characteristic way of turning an extended polypeptide chain in a different direction, involving the minimum number of residues, and held together by hydrogen bonding.

**beta-elemene:** One of the isomers of elemene, a lipid soluble sesquiterpene and the active component isolated from the Chinese medicinal herb *Rhizoma zedoariae* with potential antineoplastic and chemopreventive activities. Although the exact mechanism of action through which beta-elemene exerts its effect has yet to be fully elucidated, this agent appears to induce apoptosis through different mechanisms of action and induces cell cycle arrest at different stages based on the tumor cell type involved. Beta-elemene may sensitize cancer cells to other chemotherapeutic agents. or A type of bacterium often found in the vagina. It can cause systemic infections in people with suppressed immune systems.

**beta-glucan:** A polysaccharide isolated from the cell walls of bacteria, plants, and fungi with immunostimulant and antineoplastic activities. In a solubilized form, beta-glucan binds to a lectin site within complement receptor 3 (CR3) on leukocytes, priming the receptor to trigger cytotoxic degranulation of leukocytes when leukocyte CR3 binds to complement 3 (iC3b)-coated tumors. Thus, the attachment of beta-glucan to CR3 of circulating leukocytes simulates leukocytes to kill iC3b-coated tumor cells in the same way as they kill iC3b-coated yeast. or A small protein normally found on the surface of many cells, including lymphocytes, and in small amounts in the blood and urine. An increased amount in the blood or urine may be a sign of certain diseases, including some types of cancer, such as multiple myeloma or lymphoma.

**beta-glucan MM-10-001:** A powder formulation containing a triple helix beta-glucan, isolated from the cell walls of the shiitake mushroom (*Lentinula edodes*), with potential immunostimulating activity. The beta-glucan in beta-glucan MM-10-001 binds to a lectin site within the complement receptor 3 (CR3 or iC3b receptor) on leukocytes, priming the receptor to trigger cytotoxic degranulation of leukocytes when leukocyte CR3 binds to iC3b-opsonized tumor cells. iC3b is the proteolytically inactive product of the complement cleavage fragment C3b. Check for active clinical trials using this agent.

**beta-glucan/alginate/hyaluronic acid/squalene/avocado oil-containing emulsion:** A topical emulsion containing beta-glucan (5%), alginate, hyaluronic acid, squalene and avocado oil, with cutaneous protective activity. Upon topical application of beta-glucan/alginate/hyaluronic acid/squalene/avocado oil-containing emulsion, the naturally-occurring polysaccharide beta-glucan acts as an immunomodulator by activating the innate immune response, in particular through the activation of macrophages and migration of neutrophils. Alginate acts as a moisturizer and supports skin healing. Hyaluronic acid, squalene and avocado oil provide barrier protection, help maintain skin integrity and are natural emollients and moisturizers. This emulsion may accelerate wound healing and may prevent radiation-induced dermatitis.

**beta-glucan/Lactobacillus casei/Bifidobacterium lactis-based supplement:** A synbiotic supplement containing beta-1,3-glucan, bacteria *Lactobacillus casei* (*L. casei*) and *Bifidobacterium lactis* (*B. lactis*), with potential immunomodulating activity. The naturally-occurring bacterial components in this dietary supplement may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal microflora. During colonization of the GI tract, the bacteria may form a protective intestinal barrier, thereby preventing attachment of potential pathogens. Both the probiotics and beta-glucan have been shown to stimulate the immune system. This supplement also contains several vitamins and other insoluble polysaccharides.

**beta-hCG :** A substance produced in the brain, especially in the pituitary gland, that blocks the sensation of pain. It is produced in response to pain, exercise, and other forms of stress. It is a type of polypeptide hormone.

**beta-human chorionic gonadotropin :** A substance found in bacteria, plants, and certain foods, such as baker's yeast, cereal grains, and mushrooms. It is a type of polysaccharide that is made of a string of glucose (sugar) molecules joined together. Beta-glucan may stimulate the immune system and help kill cancer cells. It is being studied in the treatment of cancer. It is a type of biological response modifier.

**beta-hydroxy-beta-methylbutyrate supplement:** A nutritional supplement containing the active metabolite of the essential amino acid leucine, with potential anti-catabolic and anabolic activities. Upon oral administration of beta-hydroxy-beta-methylbutyrate (HMB), this leucine metabolite may decrease protein breakdown and increase protein synthesis thereby increasing muscle strength and mass. Although the exact mechanisms remain to be fully elucidated, multiple mechanisms have been proposed: 1) HMB is a precursor of cholesterol synthesis in skeletal muscle cells thereby increasing sarcolemmal integrity; 2) HMB may inhibit the ubiquitin-proteasome proteolytic pathway responsible for the specific degradation of intracellular proteins, thereby preventing muscular proteolysis; and/or 3) HMB may stimulate protein synthesis through a mammalian target of rapamycin (mTOR)-mediated mechanism.

**beta-lapachone:** A poorly soluble, ortho-naphthoquinone with potential antineoplastic and radiosensitizing activity. Beta-lapachone (b-lap) is bioactivated by NAD(P)H:quinone oxidoreductase-1 (NQO1), creating a futile oxidoreduction that generates high levels of superoxide. In turn, the highly reactive oxygen species (ROS) interact with DNA, thereby causing single-strand DNA breaks and calcium release from endoplasmic reticulum (ER) stores. Eventually, the extensive DNA damage causes hyperactivation of poly(ADP-ribose) polymerase-1 (PARP-1), an enzyme facilitating DNA repair, accompanied by rapid depletion of NAD<sup>+</sup>/ATP nucleotide levels. As a result, a caspase-independent and ER-stress induced mu-calpain-mediated cell death occurs in NQO1-overexpressing tumor cells. NQO1, a flavoprotein and two-electron oxidoreductase, is overexpressed in a variety of tumors.

**beta-lapachone prodrug ARQ 761:** A synthetic, soluble prodrug of beta-lapachone, a poorly soluble, ortho-naphthoquinone with potential antineoplastic and radiosensitizing activity. ARQ 761 is converted to beta-lapachone (b-lap) in vivo. When b-lap is activated by NAD(P)H:quinone

oxidoreductase-1 (NQO1) this agent creates a futile oxidoreduction, generating highly reactive oxygen species (ROS) that results in DNA damage. The activation of b-lap also causes hyperactivation of poly (ADP-ribose) polymerase-1 (PARP-1), an enzyme that facilitates DNA repair, accompanied by rapid depletion of NAD<sup>+</sup>/ATP nucleotide levels. As a result, a caspase-independent and endoplasmic reticulum (ER) stress-induced mu-calpain-mediated cell death occurs in NQO1-overexpressing tumor cells. In addition, b-lap induces expression of the checkpoints activator E2F transcription factor 1 (E2F1) and thereby activates the E2F1-mediated checkpoint pathway that directly triggers apoptosis. As ARQ 761 is soluble and requires less solvent, this formulation may cause less hemolytic anemia associated with administration of the synthetic b-lap ARQ 501. Check for active clinical trials using this agent.

**Beta-oxidation :** Beta-oxidation (b-oxidation). Oxidative degradation of fatty acids that occurs by the successive oxidation of the b-carbon atom.

**Beta-oxidation (b-oxidation):** bOxidative degradation of fatty acids that occurs by the successive oxidation of the b-carbon atom.

**Beta-sheet (b-sheet):** bA sheetlike structure formed by the interaction between two or more extended polypeptide chains.

**beta-sitosterol :** A hormone found in the blood and urine during pregnancy. It may also be found in higher than normal amounts in patients with some types of cancer, including testicular, ovarian, liver, stomach, and lung cancers, and in other disorders. Measuring the amount of beta-hCG in the blood or urine of cancer patients may help to diagnose cancer and find out how well cancer treatment is working. Beta-hCG is a type of tumor marker. Also called beta-human chorionic gonadotropin.

**beta-thioguanine deoxyriboside:** A thiopurine nucleoside derivative with antineoplastic activity. After conversion to the triphosphate, beta-thioguanine deoxyriboside is incorporated into DNA, resulting in inhibition of DNA replication. This agent is cytotoxic against leukemia cell lines and has demonstrated some activity against leukemia cells in vivo. Beta-thioguanine deoxyriboside demonstrates antineoplastic activity against 6-thioguanine-resistant tumor cells. Check for active clinical trials using this agent.

**Betadine:** (Other name for: povidone-iodine solution)

**Betadine Solution:** (Other name for: povidone-iodine solution)

**BetaMarc:** (Other name for: formoterol fumarate/roxithromycin)

**betamethasone:** A synthetic glucocorticoid with metabolic, immunosuppressive and anti-inflammatory activities. Betamethasone binds to specific intracellular glucocorticoid receptors and subsequently binds to DNA to modify gene expression. The synthesis of certain anti-inflammatory proteins is induced while the synthesis of certain inflammatory mediators is inhibited. As a result, there is an overall reduction in chronic inflammation and autoimmune reactions.

**Betaseron:** (Other name for: recombinant interferon beta)

**betel quid with tobacco :** A hormone found in the blood and urine during pregnancy. It may also be found in higher than normal amounts in patients with some types of cancer, including testicular, ovarian, liver, stomach, and lung cancers, and in other disorders. Measuring the amount of beta-human chorionic gonadotropin in the blood or urine of cancer patients may help to diagnose cancer and find out how well cancer treatment is working. Beta-human chorionic gonadotropin is a type of tumor marker. Also called beta-hCG.

**betulinic acid:** A pentacyclic lupane-type triterpene derivative of betulin (isolated from the bark of *Betula alba*, the common white birch) with antiinflammatory, anti-HIV and antineoplastic activities. Betulinic acid induces apoptosis through induction of changes in mitochondrial membrane potential, production of reactive oxygen species, and opening of mitochondrial permeability transition pores, resulting in the release of mitochondrial apoptotic factors, activation of caspases, and DNA fragmentation. Although originally thought to exhibit specific cytotoxicity against melanoma cells, this agent has been found to be cytotoxic against non-melanoma tumor cell types including neuroectodermal and brain tumor cells.

**bevacizumab:** A recombinant humanized monoclonal antibody directed against the vascular endothelial growth factor (VEGF), a pro-angiogenic cytokine. Bevacizumab binds to VEGF and inhibits VEGF receptor binding, thereby preventing the growth and maintenance of tumor blood vessels. OR A substance found in various nuts, beans, seeds, fruits, and vegetables. It may also be used in dietary supplements. Beta-sitosterol may help lower cholesterol levels in the blood by decreasing the amount of

cholesterol absorbed from the diet. It may also slow the growth of some types of cancer cells and kill them. It is a type of phytosterol.

**bevacizumab-IRDye 800CW:** An immunoconjugate and a fluorescent tracer consisting of the recombinant humanized anti-vascular endothelial growth factor (VEGF) monoclonal antibody bevacizumab conjugated to the N-hydroxysuccinamide (NHS) ester form of the near-infrared (NIR) fluorescent dye IRDye 800CW, that may be used for VEGF-specific tumor imaging. Upon administration, the bevacizumab moiety of bevacizumab-IRDye 800CW binds to VEGF and the fluorescent signal can be visualized using NIR fluorescence imaging (700–1,000 nm).

**Bevel:** Also known as a “chamfer,” it is a flat truncated corner.

**bexarotene:** A synthetic retinoic acid agent with potential antineoplastic, chemopreventive, teratogenic and embryotoxic properties. Bexarotene selectively binds to and activates retinoid X receptors (RXRs), thereby inducing changes in gene expression that lead to cell differentiation, decreased cell proliferation, apoptosis of some cancer cell types, and tumor regression. OR A type of smokeless tobacco that is made in India and is widely used throughout Asia. It is a mixture of tobacco, crushed areca nut (also called betel nut), spices, and other ingredients. It is used like chewing tobacco and is placed in the mouth, usually between the gum and cheek. Betel quid with tobacco contains nicotine and many harmful, cancer-causing chemicals. Using it can lead to nicotine addiction and can cause cancers of the lip, mouth, tongue, throat, and esophagus. Also called gutka.

**Bextra:** (Other name for: valdecoxib)

**Bexxar:** (Other name for: tositumomab and iodine I 131 tositumomab) or A drug used alone or with other drugs to treat certain types of cervical, colorectal, lung, kidney, ovarian, fallopian tube, and primary peritoneal cancer, and glioblastoma (a type of brain cancer). It is also being studied in the treatment of other types of cancer. Bevacizumab binds to a protein called vascular endothelial growth factor (VEGF). This may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called Avastin.

**Bexxar regimen :** A drug used to treat skin problems caused by cutaneous T-cell lymphoma that have not gotten better after other treatment. It is also

being studied in the treatment of other types of cancer. Bexarotene is a type of retinoid. Also called LGD1069 and Targretin.

**Beyond design-basis accidents:** This term is used as a technical way to discuss accident sequences that are possible but were not fully considered in the design process because they were judged to be too unlikely. (In that sense, they are considered beyond the scope of design-basis accidents that a nuclear facility must be designed and built to withstand.) As the regulatory process strives to be as thorough as possible, "beyond design-basis" accident sequences are analyzed to fully understand the capability of a design.

**BFGS:** An optimization method often used in geometry optimization (four people with initials B, F, G, S).

**BG00001:** A combination of drugs used to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of cancer. Bexxar is made up of a monoclonal antibody called tositumomab and a form of tositumomab that is linked to a radioactive substance called iodine I 131. It is a type of radioimmunoconjugate. Also called Bexxar regimen and tositumomab and iodine I 131 tositumomab.

**BH3 mimetic ABT-737:** An orally bioavailable, selective small molecule B-cell lymphoma 2 (Bcl-2) Homology 3 (BH3) mimetic, with potential pro-apoptotic and antineoplastic activities. ABT-737 binds to the hydrophobic groove of multiple members of the anti-apoptotic Bcl-2 protein family, including Bcl-2, Bcl-xl and Bcl-w. This inhibits the activity of these pro-survival proteins and restores apoptotic processes in tumor cells, via activation of Bak/Bax-mediated apoptosis. The pro-survival Bcl-2 proteins are overexpressed in many cancers and play important roles in the regulation of apoptosis. Their expression is associated with increased drug resistance and tumor cell survival. ABT-737 does not inhibit the pro-survival proteins Mcl-1, Bcl-B, Bfl-1 (A1); therefore, tumors that overexpress these Bcl-2 family proteins are resistant to ABT-737.

**Bi:** A prefix meaning two

**BI 2536:** A combination of drugs used to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of cancer. Bexxar regimen is made up of a monoclonal antibody called tositumomab and a form of tositumomab that is linked to a radioactive

substance called iodine I 131. It is a type of radioimmunoconjugate. Also called Bexxar and tositumomab and iodine I 131 tositumomab.

**BI 2536:** A small molecule compound with potential antineoplastic activities. BI 2536 binds to and inhibits Polo-like kinase 1 (Plk1), resulting in mitotic arrest, disruption of cytokinesis, and apoptosis in susceptible tumor cell populations. Plk1, a serine/threonine-protein kinase, is a key regulator of multiple processes fundamental to mitosis and cell division. Check for active clinical trials using this agent.

**bi-functional alkylating agent VAL-083:** A bi-functional alkylating agent, with potential antineoplastic activity. Upon administration, VAL-083 crosses the blood brain barrier (BBB) and appears to be selective for tumor cells. This agent alkylates and crosslinks DNA which ultimately leads to a reduction in cancer cell proliferation. In addition, VAL-083 does not show cross-resistance to other conventional chemotherapeutic agents and has a long half-life in the brain. Check for active clinical trials using this agent.

**BI-RADS :** A type of treatment that uses substances made from living organisms to treat disease. These substances may occur naturally in the body or may be made in the laboratory. Some biotherapies stimulate or suppress the immune system to help the body fight cancer, infection, and other diseases. Other biotherapies attack specific cancer cells, which may help keep them from growing or kill them. They may also lessen certain side effects caused by some cancer treatments. Types of biotherapy include immunotherapy (such as vaccines, cytokines, and some antibodies), gene therapy, and some targeted therapies. Also called biological response modifier therapy, biological therapy, and BRM therapy.

**bi-shRNA-furin/GM-CSF-expressing autologous tumor cell vaccine:** Autologous tumor cells transfected with a plasmid expressing recombinant human granulocyte macrophage-colony stimulating factor (rhGM-CSF) and bifunctional short hairpin RNA (bi-shRNA) against furin, with potential immunostimulatory and antineoplastic activities. Upon intradermal vaccination of bi-shRNA-furin/GM-CSF-expressing autologous tumor cell vaccine, expressed GM-CSF protein, a potent stimulator of the immune system, recruits immune effectors to the site of injection and promotes antigen presentation. The furin bifunctional shRNA blocks furin protein production. Decreased levels of furin lead to a reduction in the conversion of transforming growth factor (TGF) beta into TGF beta1 and beta2 protein

isoforms. In turn, as part of the negative feedback mechanism, reduced furin protein levels inhibit TGFbeta1 and TGFbeta2 gene expression, thereby further decreasing TGF levels. As TGFs are potent immunosuppressive cytokines, reducing their levels may activate the immune system locally and this may eventually cause a cytotoxic T-lymphocyte (CTL) response against the tumor cells.

**Biafine cream :** A gene therapy agent that is being studied in the treatment of cancer. It belongs to the family of drugs called biological response modifiers.

**biallelic :** Of or pertaining to both alleles of a single gene (paternal and maternal). For example, biallelic mutation carriers have a mutation (not necessarily the same mutation) in both copies of a particular gene (a paternal and a maternal mutation).

**bias:** Deviation of results or inferences from the truth, or processes leading to such deviation. Any trend in the collection, analysis, interpretation, publication, or review of data that can lead to conclusions that are systematically different from the truth. or A substance being studied in the treatment of cancer. It prevents cells from dividing and may block the growth of some tumors. It is a type of mitotic inhibitor.

**Biaxial crystal:** Crystals in which the propagation of light differs in two directions. These crystals are of the triclinic, monoclinic, and orthorhombic systems.

**Biaxial Orientation:** This term indicates orientation of plastic films in both machine and cross-machine directions by stretching. Biaxially stretched films are generally well balanced in both directions and much stronger in terms of tear strength.

**Biaxin:** (Other name for: clarithromycin)

**BIBF 1120:** A substance that is put on the skin to help repair damaged skin. It may be used on certain wounds and burns, and to treat the redness, burning, and peeling caused by radiation therapy.

**BIBX 1382:** A pyrimido-pyrimidine with antitumor activity. BIBX 1382 inhibits the intracellular tyrosine kinase domain of the Epidermal Growth Factor Receptor (EGFR) thus specifically reversing the aberrant enzymatic activity from overexpressed and constitutively activated EGFR, and subsequently inhibiting cell proliferation and inducing cell differentiation.

**BIBX 1382:** In a scientific research study or clinical trial, a flaw in the study design or the method of collecting or interpreting information. Biases can lead to incorrect conclusions about what the study or clinical trial showed.

**bicalutamide:** A synthetic, nonsteroidal antiandrogen. Bicalutamide competitively binds to cytosolic androgen receptors in target tissues, thereby inhibiting the receptor binding of androgens. This agent does not bind to most mutated forms of androgen receptors. Or A substance being studied in the treatment of some types of cancer. BIBF 1120 blocks enzymes needed for cells to grow, and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called tyrosine kinase inhibitor BIBF 1120.

**Bicitra:** (Other name for: sodium citrate)

**BiCNU:** (Other name for: carmustine) or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called epidermal growth factor receptor (EGFR) inhibitors.

**bicuspid (mitral) valve:** the valve that leads into the left ventricle of the human heart.

**bicyclic ring system:** a molecule made up of two carbon rings that share common sides.

**bidentate:** A ligand that has two "teeth" or atoms that coordinate directly to the central atom in a complex. For example, 1,10-phenanthroline is a bidentate ligand of iron.

**bidri :** A drug used with another drug to treat prostate cancer that has spread to other parts of the body. Bicalutamide binds to proteins called androgen receptors, which are found in some prostate cancer cells. These proteins bind to androgens (male hormones) and may cause cancer cells to grow. Bicalutamide blocks these proteins and may keep cancer cells from growing. It is a type of antiandrogen. Also called Casodex.

**Bidirectional replication:** Replication in both directions away from the origin, as opposed to replication in one direction only (unidirectional replication).

**Bifidobacterium lactis/Lactobacillus acidophilus/L. plantarum/L. salivarius probiotic supplement:** An orally available, probiotic

supplement containing the non-pathogenic microorganisms *Lactobacillus acidophilus*, *L. plantarum*, *L. salivarius* and *Bifidobacterium lactis*, with potential anti-inflammatory, immunomodulating and protective activities. Upon oral ingestion, the naturally-occurring bacterial components in this dietary supplement may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal microflora. During colonization in the GI tract, the bacteria may form a protective intestinal barrier that may prevent both damage to the mucosal epithelia caused by toxins and attachment of potential pathogens, which protects against bacterial translocation and infections. In addition, this agent may both reduce the secretion of pro-inflammatory cytokines, including interleukin-10, and potentiate natural and acquired immunity.

**Bifunctional enzyme:** An enzyme with two different, often opposing, catalytic activities on one polypeptide chain. For instance, phosphofructokinase 2 synthesizes fructose 2,6-bisphosphate and fructose 2,6-bisphosphatase hydrolyzes it, yet both active sites are on the same polypeptide chain.

**bifunctional expression vector plasmid DNA-bi-shRNA EWS/FLI1 type 1 lipoplex:** A proprietary plasmid DNA expression vector encoding bifunctional short hairpin RNAs (bi-shRNAs) targeting the identical type 1 translocation junction region of the human fusion oncogene Ewing sarcoma (EWS)/Ets family transcription factor Friend leukemia virus integration 1 (FLI1) and are encapsulated in liposomal delivery vehicle (lipoplex; LPX), with potential antineoplastic activity. pbi-shRNA EWS/FLI1 type 1 contains 2 stem-loop structures encoded by a plasmid vector: one cleavage-dependent unit with perfectly matched passenger- and guide-strand, which is the small interfering RNA (siRNA)-like component, and one cleavage-independent unit composed of a strategically mismatched double strand, which is the microRNA (miRNA)-like component. Upon intratumoral administration and transcription into tumor cells, one shRNA unit with an imperfectly matched sequence causes inhibition of EWS/FLI1 messenger RNA (mRNA) translation (through mRNA sequestration and cleavage-independent degradation) while the other unit with a perfectly matched sequence promotes EWS/FLI1 mRNA degradation (through cleavage-dependent mRNA silencing). This prevents EWS/FLI1 expression in tumor cells, which results in a reduction of tumor cell proliferation. The

EWS/FLI1 type 1 fusion gene product is overexpressed in type 1 Ewing's sarcoma and correlates with increased tumor proliferation and poor prognosis.

**big-bang hypothesis:** says that origin of the universe was when all matter was collected together and exploded, about 15 billion years ago.

**bilateral :** A drug used to treat certain types of brain tumors. It is also used with prednisone to treat multiple myeloma and with other drugs to treat Hodgkin lymphoma and non-Hodgkin lymphoma that have not gotten better with other treatment or have come back. It is also being studied in the treatment of other types of cancer. BiCNU damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea. Also called BCNU and carmustine.

**bilateral cancer :** A cigarette made by rolling tobacco by hand in a dried leaf from the tendu tree (a member of the ebony family). Most bidis are made in India, and they come in different flavors.

**bilateral nephrectomy :** Affecting both the right and left sides of the body.

**bilateral prophylactic mastectomy :** Cancer that occurs in both of a pair of organs, such as both breasts, ovaries, eyes, lungs, kidneys, or adrenal glands, at the same time.

**bilateral salpingo-oophorectomy :** Surgery to remove both kidneys.

**Bilayer:** A double layer of lipid molecules with the hydrophilic ends oriented outward, in contact with water, and the hydrophobic parts oriented inward. OR A double layer of oriented amphipathic lipid molecules, forming the basic structure of biological membranes. The hydrocarbon tails face inward to form a continuous nonpolar phase.

**bile :** Surgery to remove both breasts in order to reduce the risk of developing breast cancer.

**bile duct :** Surgery to remove both ovaries and both fallopian tubes.

**bile duct cancer :** A fluid made by the liver and stored in the gallbladder. Bile is excreted into the small intestine, where it helps digest fat.

**Bile salts:** Bile salts. Derivatives of cholesterol with detergent properties that aid in the solubilization of lipid molecules in the digestive tract. OR Polar derivatives of cholesterol that are made in the liver, stored in the gall bladder, and released into the small intestine, where they act as detergents to solubilize dietary lipids, facilitating their digestion and absorption. OR

Amphipathic steroid derivatives with detergent properties, participating in digestion and absorption of lipids.

**biliary** : A tube through which bile passes in and out of the liver.

**biliary bypass** : A rare cancer that forms in the bile ducts. A bile duct is a tube that carries bile (fluid made by the liver) between the liver and gallbladder and the small intestine. Intrahepatic bile duct cancer is found inside the liver. Extrahepatic bile duct cancer is found outside the liver. Also called cholangiocarcinoma.

**biliary cirrhosis** : Having to do with the liver, bile ducts, and/or gallbladder.

**biliary system** : Surgery done to help relieve symptoms caused by a blocked bile duct. In biliary bypass, a part of the bile duct before the blockage is connected to either a part of the bile duct that is past the blockage, or to the small intestine. This allows bile (fluid made by the liver) to flow around the blockage to the gallbladder or small intestine. A blocked bile duct may be caused by cancer or other conditions, such as gallstones, infection, or scar tissue. A biliary bypass is usually done in patients who have bile duct tumors that cannot be completely removed by surgery.

**biliary tract** : A type of chronic liver disease in which the tubes that carry bile (fluid that helps digest fat) out of the liver become damaged or blocked over time. This can cause bile and toxic substances to build up in the liver, which may lead to cirrhosis (scarring of the liver) and liver failure. It may also increase the risk of liver cancer. Biliary cirrhosis may be caused by gallstones, injury to the bile ducts, autoimmune disorders, and certain other conditions.

**bilirubin** : The organs and ducts that make and store bile (a fluid made by the liver that helps digest fat), and release it into the small intestine. The biliary system includes the gallbladder and bile ducts inside and outside the liver. Also called biliary tract.

**bilirubin encephalopathy**: characterized by yellow discoloration of the basal ganglia in babies with intense jaundice; commonly referred to as kernicterus

**BIM**: Building Information Modelling (BIM) is used in building design and integrates 3D models with rich information. BIM objects combine

performance, scheduling, fire rating, and many other parameters, with physical geometric attributes, in digital form.

**bimagrumab:** A human monoclonal antibody directed against type II activin receptors (ActRII; ActR2), with potential muscle-sparing and anti-cachectic activities. Upon administration, bimagrumab binds to ActRII, which prevents the binding of the natural ligands, myostatin and activin, to activin receptors and blocks ActRII-mediated signaling. This increases protein synthesis, decreases protein degradation, stimulates skeletal muscle cell growth, and increases muscle function and strength. Overstimulation of the ActRII-mediated signaling pathway is associated with muscle loss and weakness.

**bimatoprost :** The organs and ducts that make and store bile (a fluid made by the liver that helps digest fat), and release it into the small intestine. The biliary tract includes the gallbladder and bile ducts inside and outside the liver. Also called biliary system.

**bimatoprost ophthalmic solution:** A sterile ophthalmic solution containing 0.03% of a synthetic prostaglandin analog bimatoprost with hair-growing and anti-glaucoma activities. Applied once daily to the upper eyelid margin at the base of the eyelashes and, optionally, to the eyebrows, bimatoprost penetrates into the hair follicle and may, through a mechanism that has yet to be fully understood, stimulate the transition of hair follicles from the telogen phase into the anagen phase and may increase the duration of the time follicles spend in anagen. By increasing the numbers of hair follicles in and duration of anagen phase, bimatoprost may help increase eyebrow and eyelash growth and appearance, including their length, thickness and darkness.

**Binary Compound:** A binary compound is a compound that only has two atoms. Think about sodium chloride for binary compounds (NaCl). OR A compound that contains two different elements. NaCl is a binary compound; NaClO is not.

**Binary fission:** During binary fission, a single cell divides transversely to form two new cells called daughter cells. Both daughter cells contain an exact copy of the genetic information contained in the parent cell.

**Binder:** Solid ingredients in a coating that hold the pigment particles in suspension and attach them to the substrate. Consists of resins (e.g., oils, alkyd, latex). The nature and amount of binder determine many of the

paint's performance properties--washability, toughness, adhesion, color retention, etc. OR The binder cements the pigment particles into a uniform paint film and makes the paint adhere to the surface. The nature and amount of binder determine most of the paint's performance properties such as washability, toughness, adhesion and colour retention. OR The organic or inorganic material which encapsulates and holds together the base in reinforced or otherwise heterogeneous composites. OR A resin or other substance that binds two or more items or pieces together. OR A resin or other material used to hold particles together. The binder is the continuous phase in a reinforced plastic which provides mechanical strength or ensures uniform consistency, solidification, or adhesion to a surface coating. Typical binder materials include resin, glue, gum and casein. OR the organic or inorganic material which encapsulates and holds together the base in reinforced or otherwise heterogeneous composites. OR A resin or other material used to hold particles together. The binder is the continuous phase in are inforced plastic, which provides mechanical strength or ensures uniform consistency, solidification, or adhesion to a surface coating. Typical binder materials include resin, glue, gum and casein.

**binding agent :** Substance formed when red blood cells are broken down. Bilirubin is part of the bile, which is made in the liver and is stored in the gallbladder. The abnormal buildup of bilirubin causes jaundice.

**Binding energy:** The minimum energy required to separate the nucleus of an atom into its component neutrons and protons. OR The free energy released in the formation of the weak interactions between enzyme and substrate. OR The energy derived from noncovalent interactions between enzyme and substrate or receptor and ligand.

**Binding Region:** A region within the binding site that can interact with drugs through intramolecular interactions.

**Binding Site:** Regions in a drug target where an endogenous ligand or drug can bind.

**binge drinking:** The consumption of five or more drinks in a row on at least one occasion.

**binimetinib:** An orally available inhibitor of mitogen-activated protein kinase kinase 1 and 2 (MEK1/2) with potential antineoplastic activity. Binimetinib, noncompetitive with ATP, binds to and inhibits the activity of MEK1/2. Inhibition of MEK1/2 prevents the activation of MEK1/2-

dependent effector proteins and transcription factors, which may result in the inhibition of growth factor-mediated cell signaling. This may eventually lead to an inhibition of tumor cell proliferation and an inhibition in production of various inflammatory cytokines including interleukin-1, -6 and tumor necrosis factor. MEK1/2 are dual-specificity threonine/tyrosine kinases that play key roles in the activation of the RAS/RAF/MEK/ERK pathway and are often upregulated in a variety of tumor cell types.

**binomial name:** the scientific name of an organism, which contains two elements.

**Binosto:** (Other name for: alendronate sodium)

**Bio-Tower:** An attached culture system. A tower filled with a media similar to ratchet or plastic rings in which air and water are forced up a counterflow movement in the tower.

**bioaccumulation:** The process by which the amount of a substance in a living organism (or its parts) increases with time (WHO, 1979).

**bioactive compound :** A drug used under the name Latisse to increase the length, thickness, and darkness of eyelashes. It is being studied as a way to increase the growth of eyelashes and eyebrows in patients given chemotherapy for cancer. Bimatoprost is also used under the name Lumigan to treat glaucoma (a build-up of fluid in the eye). It lowers pressure in the eye by increasing the flow of natural eye fluids out of the eye. It is a type of prostaglandin analog.

**bioassay:** an assay method using a change in biological activity as a qualitative or quantitative means of analyzing a material response to industrial waste and other wastewater by using viable organisms or live fish as test organisms.

**Bioassay:** The determination of kinds, quantities, or concentrations and, in some cases, locations of radioactive material in the human body, whether by direct measurement (in vivo counting) or by analysis and evaluation of materials excreted or removed (in vitro) from the human body.

**Bioavailability:** The fraction of an administered unchanged drug that reaches the blood supply. OR A term used to describe the biological availability of a drug. The bioavailability depends on the absorption, distribution, metabolism, and excretion of the drug. For example, the absorption of the drug depends on the dissolution profile of the dosage

form, hence, the importance of dissolution testing in assuring consistent bioavailability. OR The extent to which a chemical substance to which the body is exposed (by ingestion, inhalation, injection, or skin contact) reaches the systemic circulation, and the rate at which this occurs. It is recognized that the bioavailability (for gastrointestinal absorption) of, for example, both essential and non-essential metals, depends on various factors including the composition of the diet and the type of the chemical compound and its state of dispersion. For instance, the absorption of lead and cadmium is increased if the food is deficient in calcium or iron (WHO, 1979).

**bioavailable :** A substance that makes a loose mixture stick together. For example, binding agents can be used to make solid pills from loose powders.

**Biobatch:** Manufactured batch of a drug preparation that is used to test for biological response.

**Biocatalysis:** Chemical reactions mediated by biological systems (microbial communities, whole organisms or cells, cell-free extracts, or purified enzymes aka catalytic proteins).

**biochanin A :** A type of chemical found in small amounts in plants and certain foods (such as fruits, vegetables, nuts, oils, and whole grains). Bioactive compounds have actions in the body that may promote good health. They are being studied in the prevention of cancer, heart disease, and other diseases. Examples of bioactive compounds include lycopene, resveratrol, lignan, tannins, and indoles.

**biochemical mechanism:** This is the general term for any chemical reaction or series of reactions, usually enzyme catalysed, which produces a given physiological effect in a living organism.

**biochemical oxygen demand (BOD):** the quantity of oxygen used in the biochemical oxidation of organic matter in a specified time, at a specified temperature, and under specified conditions; standard test used in assessing wastewater biological oxygen demand.

**Biochemical pathway:** A series of enzyme-catalyzed reactions that results in the conversion of a precursor molecule into a product molecule.

**biochemical reactions :** The ability of a drug or other substance to be absorbed and used by the body. Orally bioavailable means that a drug or

other substance that is taken by mouth can be absorbed and used by the body.

**biochemical recurrence :** An isoflavone found in soy products. Soy isoflavones (estrogen-like substances made by some plants) are being studied to see if they help prevent cancer.

**biochemical relapse :** In living cells, chemical reactions that help sustain life and allow cells to grow.

**biochemist :** A rise in the blood level of PSA (prostate-specific antigen) in prostate cancer patients after treatment with surgery or radiation. Biochemical recurrence may occur in patients who do not have symptoms. It may mean that the cancer has come back. Also called biochemical relapse and PSA failure.

**biochemistry:** The science that makes use of chemistry to learn about and explain biologically important systems. OR The scientific study of the chemistry of living cells, tissues, organs, and organisms OR The chemistry of living things, including the structure and function of biological molecules and the mechanism and products of their reactions.

**biocides:** chemical agents with the capacity to kill biological life forms. Bactericides, insecticides, pesticides, etc. are examples. OR A chemical agent which destroys microscopic and sub-microscopic organisms. OR Biocides are formulations of one or more active substances which can kill or control viruses, bacteria, algae, moulds or yeasts

**Biocides & Fungicides:** These additives act as pesticides and are used to inhibit the growth of fungus and other pests.

**Biocompatible:** A material may be regarded as biocompatible if it may be put into living organisms without rejection or detrimental effects. Materials may also be considered to be bioinert if they do not interact with the body at all (like titanium knee implants).

**bioconcentration:** A process leading to a higher concentration of a chemical in the organism relative to its environment (WHO, 1979).

**biocytin:** The conjugate amino acid residue arising from covalent attachment of biotin, through an amide linkage, to a Lys residue.

**biodegradability:** the susceptibility of a substance to decomposition by microorganisms; specifically, the rate at which compounds may be chemically broken down by bacteria and/or natural environmental factors.

**Biodegradable:** Organic matter that can be broken down by bacteria to more stable forms which will not create a nuisance or give off foul odors. OR The term 'biodegradable' is used to refer to plastics and other materials that can be decomposed naturally by bacteria, once they are thrown away. OR Capable of being eaten or otherwise decomposed by some kind of living creature. Bacteria and fungi are the main culprits; we usually use the word edible for things that can be eaten by animals. It is important to consider the timescale involved - paper is biodegradable, but can kick around for a very long time before succumbing. Most synthetic polymers are not particularly biodegradable (poly(acrylamide) is a rare example of one that is readily degraded), but many are susceptible to breakdown by ultraviolet radiation from the sun and will crumble away in about the same time as an equivalent sheet of paper. OR Capable of being broken down by the action of living things, such as microorganisms OR The American Society of Testing and Materials defines biodegradable as "Capable of undergoing decomposition into carbon dioxide, methane, water, inorganic compounds, or biomass in which the predominant mechanism is the enzymatic action of microorganisms, that can be measured by standardized tests, in a specified period of time, reflecting available disposal condition." For practical purposes claims about biodegradability of plastic should specify a timeframe.

**Biodegradable Plastic:** A degradable plastic in which the degradation results from the action of naturally occurring micro-organisms such as bacteria.

**BIODEGRADATION:** The degradation of plastics by micro-organisms when buried in the soil. Some plastics can be modified to become biodegradable by the incorporation of a biodegradable additive such as corn starch. OR The process of reducing plastics by microorganisms while buried in the soil.

**Bioerodable:** Polymers that exhibit controlled degradation through the incorporation of prodegradant additive master batches or concentrates. Such polymers oxidize and are embrittled in the environment and erode under the influence of weathering.

**biofeedback :** A rise in the blood level of PSA (prostate-specific antigen) in prostate cancer patients after treatment with surgery or radiation. Biochemical relapse may occur in patients who do not have symptoms. It

may mean that the cancer has come back. Also called biochemical recurrence and PSA failure.

**Biofilm:** A slime layer which naturally develops when bacteria attach to an inert support that is made of a material such as stone, metal, or wood. There are also non-filamentous bacteria that will produce an extracellular polysaccharide that acts as a natural glue to immobilize the cells. In nature, nonfilament-forming microorganisms will stick to the biofilm surface, locating within an area of the biofilm that provides an optimal growth environment (i.e., pH, dissolved oxygen, nutrients). Since nutrients tend to concentrate on solid surfaces, a microorganism saves energy through cell adhesion to a solid surface rather than by growing unattached and obtaining nutrients randomly from the medium. Pseudomonas and Nitrosomonas strains are especially well known for their ability to form a strong biofilm.

**biofilm :** A scientist who has special training in the study of the chemicals and processes that occur in all living things.

**Bioflocculation:** The clumping together of fine, dispersed organic particles by the action of certain bacteria and algae.

**Biogas boosting :** Sludge stabilization by anaerobic biological method, i.e., digestion produces biogas. Biogas contains methane, which allows the biogas utilization as biofuel. Biogas boosting refers to digestion process enhancement with addition of suitable chemicals, which increase the biogas generation.

**biogeochemical cycle:** The chemical interactions among the atmosphere, biosphere, hydrosphere, and lithosphere.

**bioinformatics :** A method of learning to voluntarily control certain body functions such as heartbeat, blood pressure, and muscle tension with the help of a special machine. This method can help control pain.

**Bioisostere:** Bioisosteres are chemical groups with similar physicochemical properties which give broadly similar biological properties to a compound.

**biologic agent :** A layer of bacteria or other microbes that grows on and sticks to the surface of a structure. A biofilm may cover natural surfaces, such as teeth. They may also grow in or on medical devices, such as

catheters or artificial joints. Bacteria growing as a biofilm are hard to treat with antibiotics.

**biological :** The science of using computers, databases, and math to organize and analyze large amounts of biological, medical, and health information. Information may come from many sources, including patient statistics, tissue specimens, genetics research, and clinical trials.

**biological agent :** A substance that is made from a living organism or its products and is used in the prevention, diagnosis, or treatment of cancer and other diseases. Biologic agents include antibodies, interleukins, and vaccines. Also called biological agent and biological drug.

**biological assessment of exposure:** Exposure to chemicals may be assessed by the analysis of specimens taken in the environment (air, water, food, etc.) or of specimens of biological material. Most often, urine and blood are analyzed, but other materials such as expired air, faeces, saliva, bile, hair, and biopsy or autopsy material are sometimes analyzed. In these samples, the content of the xenobiotic(s) or its metabolite(s) is determined and, on this basis, the exposure level (concentration in the air, absorbed amount of the substance) or the probability of health impairment due to exposure is derived. Biochemical changes in the components of an organism can also be used for this purpose (e.g., changes in enzyme activity or in the excretion of metabolic intermediates) if they show a relationship to the exposure (WHO, 1979).

**biological assessment of exposure:** Mainly used for hygienic evaluation of workplaces (deducing from the analytical results the level of exposure, sometimes even correlations with the concentration in the air, the possible absorption by other routes than inhalation, etc.) and for medical prevention or diagnostics (probability of health impairment at certain values of the exposure test). The definition of biological assessment of exposure should include only the chemical and haematological analyses already mentioned and should not be extended to include indicators of general health or sickness, or functional tests (WHO, 1979).

**biological cycle:** The process through which a chemical substance passes in the biosphere. It may involve transport through the various media (air, water, soil), followed by environmental transformation, and carriage through various ecosystems. Chemical compounds that occur naturally have a natural biological cycle (WHO, 1979).

**biological drug :** Pertaining to biology or to life and living things. In medicine, refers to a substance made from a living organism or its products. Biologicals may be used to prevent, diagnose, treat or relieve of symptoms of a disease. For example, antibodies, interleukins, and vaccines are biologicals. Biological also refers to parents and children who are related by blood.

**Biological half-life:** The time required for a biological system, such as that of a human, to eliminate, by natural processes, half of the amount of a substance (such as a radioactive material) that has entered it.

**biological half-life :** The time required for the amount of a particular substance in a biological system to be reduced to one-half of its value by biological processes when the rate of removal is approximately exponential (ISO, 1972). For a one-compartment system describing an exponential biological process, biological half-life =  $\log 2/f$  where  $f$  = elimination or decay constant. OR The periodic examination of biological specimens (in accordance with the definition of monitoring). It is usually applied to exposure monitoring but can also apply to effect monitoring (WHO, 1979).

**biological productivity:** The amount of organic matter, carbon, or energy content that is accumulated during a given time period.

**biological profile :** A substance that is made from a living organism or its products and is used in the prevention, diagnosis, or treatment of cancer and other diseases. Biological agents include antibodies, interleukins, and vaccines. Also called biologic agent and biological drug.

**biological response modifier therapy :** A substance that is made from a living organism or its products and is used in the prevention, diagnosis, or treatment of cancer and other diseases. Biological drugs include antibodies, interleukins, and vaccines. Also called biologic agent and biological agent.

**Biological shield:** A mass of absorbing material placed around a reactor or radioactive source to reduce the radiation to a level safe for humans.

**biological therapy :** A summary of the biological actions of a substance. A biological profile may come from patient data or from tests done in the laboratory or in animals.

**biological wastewater treatment:** forms of wastewater treatment in which bacterial or biochemical action is intensified to stabilize, oxidize, and nitrify

the unstable organic matter present. Intermittent sand filters, contact beds, trickling filters, and activated sludge processes are examples.

**Biological weathering:** Rocks can be broken down in many ways. Biological weathering is the breakdown of rocks by biological action. A good example is where the roots of plants growing in cracks in rocks causes them to split..

**Bioluminescence:** The production of light by a biochemical system.

**biomagnification :** A sequence of processes in an ecosystem by which higher concentrations are attained in organisms of higher trophic level, i.e., of higher levels in the food chain (Dustman & Stickel, 1969).

**biomarker :** A type of treatment that uses substances made from living organisms to treat disease. These substances may occur naturally in the body or may be made in the laboratory. Some biological response modifier therapies stimulate or suppress the immune system to help the body fight cancer, infection, and other diseases. Other biological response modifier therapies attack specific cancer cells, which may help keep them from growing or kill them. They may also lessen certain side effects caused by some cancer treatments. Types of biological response modifier therapy include immunotherapy (such as vaccines, cytokines, and some antibodies), gene therapy, and some targeted therapies. Also called biological therapy, biotherapy, and BRM therapy.

**Biomass:** A mass or clump of living organisms feeding on the wastes in wastewater, dead organisms and other debris. OR The total amount of biotic material, usually expressed per unit surface area or volume of a medium such as water (WHO, 1979). OR the total dry weight of food at each level of the food pyramid. OR The total dry organic matter or stored energy content of living organisms that is present at a specific time in a defined unit (community, ecosystem, crop, etc.) of the Earth's surface.

**Biomaterial:** Any material, natural or synthetic, used and adapted for a medical application

**biome:** a group of communities dominated by a particular climax community, such as deserts, forests, and prairies.

**Biomed 101 :** An agent binding to the leukotriene B4 receptor, leading to reduced interleukin-2 mediated hypoxia. Biomed 101 does not affect interleukin-2 antitumor activity. OR A type of treatment that uses

substances made from living organisms to treat disease. These substances may occur naturally in the body or may be made in the laboratory. Some biological therapies stimulate or suppress the immune system to help the body fight cancer, infection, and other diseases. Other biological therapies attack specific cancer cells, which may help keep them from growing or kill them. They may also lessen certain side effects caused by some cancer treatments. Types of biological therapy include immunotherapy (such as vaccines, cytokines, and some antibodies), gene therapy, and some targeted therapies. Also called biological response modifier therapy, biotherapy, and BRM therapy.

**biomedicine** : A biological molecule found in blood, other body fluids, or tissues that is a sign of a normal or abnormal process, or of a condition or disease. A biomarker may be used to see how well the body responds to a treatment for a disease or condition. Also called molecular marker and signature molecule.

**biomethylation**: Becoming methylated through biological action; for example, bacteria can generate methylated mercury in aquatic sediments.

**biometrics** : A substance that is being studied for its ability to decrease the side effects of interleukin-2 (IL-2).

**biometry** : A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery. Also called allopathic medicine, conventional medicine, mainstream medicine, orthodox medicine, and Western medicine.

**biomolecule**: An organic compound normally present as an essential component of living organisms.

**biomonitoring**: the use of living organisms to test the suitability of effluent for discharge into receiving waters and to test the quality of such waters downstream from a discharge.

**Bioperine**: (Other name for: piperine extract (standardized))

**Bioplastics**: Bioplastics, such as thermoplastic starch, cellulose-based plastics, are a form of plastics derived from renewable biological material sources. Biodegradable bioplastics are used for disposable items, such as packaging and catering items (crockery, cutlery, pots, bowls, straws).

Bioplastics are more sustainable because they can break down in the environment faster than fossil-fuel plastics.

**Biopolymer:** A polymer produced by a living plant, animal fungus, bacterium, or other biological entity.

**Bioprecursor prodrug:** Prodrugs that are activated by oxidation or reduction processes rather than simple hydrolysis.

**biopsy :** The science of collecting and analyzing biologic or health data using statistical methods. Biometrics may be used to help learn the possible causes of a cancer or how often a cancer occurs in a certain group of people. Also called biometry and biostatistics.

**biopsy specimen :** The science of collecting and analyzing biologic or health data using statistical methods. Biometry may be used to help learn the possible causes of a cancer or how often a cancer occurs in a certain group of people. Also called biometrics and biostatistics.

**Biopterin:** A cofactor from which the electron carrier tetrahydrobiopterin is derived. OR An enzymatic cofactor derived from pterin and involved in certain oxidation-reduction reactions.

**Biorenewable Materials:** Raw materials, or ingredients, that are derived from plants or other natural sources.

**biorepository :** The removal of cells or tissues for examination by a pathologist. The pathologist may study the tissue under a microscope or perform other tests on the cells or tissue. There are many different types of biopsy procedures. The most common types include: (1) incisional biopsy, in which only a sample of tissue is removed; (2) excisional biopsy, in which an entire lump or suspicious area is removed; and (3) needle biopsy, in which a sample of tissue or fluid is removed with a needle. When a wide needle is used, the procedure is called a core biopsy. When a thin needle is used, the procedure is called a fine-needle aspiration biopsy.

**BioResponse DIM:** (Other name for: oral microencapsulated diindolylmethane)

**Biosensor:** A system or device that detects a chemical or chemicals in a biological material OR an analytical device, containing biologically active material (i.e. enzyme, antibody receptor etc.) introduced into a receptor part (membrane), contacting with an appropriate transducer element to detect

(selectively and reversibly) the concentration of chemical compound in the sample.

**biospecimen :** Tissue removed from the body and examined under a microscope to determine whether disease is present.

**biosphere:** the blanket of living things that surrounds the substratum of the earth. OR The portion of Earth and its atmosphere that can support life. The part (reservoir) of the global carbon cycle that includes living organisms (plants and animals) and life-derived organic matter (litter, detritus). The terrestrial biosphere includes the living biota (plants and animals) and the litter and soil organic matter on land, and the marine biosphere includes the biota and detritus in the oceans. OR All the living matter on or in the earth, the seas, and the atmosphere.

**biostatistics :** A facility that collects, catalogs, and stores samples of biological material, such as urine, blood, tissue, cells, DNA, RNA, and protein, from humans, animals, or plants for laboratory research. If the samples are from people, medical information may also be stored along with a written consent to use the samples in laboratory studies.

**Biostimulation:** Any process that increases the rates of biological degradation, usually by the addition of nutrients, oxygen, or other electron donors and acceptors so as to increase the number of indigenous microorganisms available for degradation of contaminants.

**Biosynthesis:** The production of a chemical by bacteria or other living organisms.

**biota:** Living organisms (WHO, 1979). OR The animal and plant (fauna and flora) life of a given area.

**Biotechnology:** The industrial use of living organisms or biological methods derived through basic research; examples range from genetic engineering to making cheese or bread

**Biotest-HCIG:** (Other name for: hepatitis C immune globulin intravenous)

**biotherapy :** Samples of material, such as urine, blood, tissue, cells, DNA, RNA, and protein from humans, animals, or plants. Biospecimens are stored in a biorepository and are used for laboratory research. If the samples are from people, medical information may also be stored along with a written consent to use the samples in laboratory studies.

**Biotic potential:** All the factors that contribute to a species

**Biotin:** A vitamin that plays a role in carboxylation and decarboxylation reactions. OR A vitamin; an enzymatic cofactor involved in carboxylation reactions.

**biotin :** The science of collecting and analyzing biologic or health data using statistical methods. Biostatistics may be used to help learn the possible causes of a cancer or how often a cancer occurs in a certain group of people. Also called biometrics and biometry.

**biotransformation:** A process in which a chemical is modified by a living organism (WHO, 1979). OR Chemical modifications done by an organism on chemical compounds.

**Birefringence:** An optical property of all anisotropic crystals (i.e., virtually all drugs) observed as light and dark areas while the sample is rotated on the microscope stage of a polarizing microscope. OR The refraction of light in an anisotropic material (as calcite) in two slightly different directions to form two rays. In optical coatings, birefringence creates a distortion of images seen through the optical piece, as well as a reflection or noticeable purple sheen on the surface of the optical piece. It is usually caused by poor refractive index matching between the coatings and the substrate.

**biricodar dicitrate:** The dicitrate salt of a synthetic pipercolinate derivative with potential chemosensitizing activity. Biricodar binds directly to the plasma membrane drug-efflux pumps P-glycoprotein (Pgp) and multidrug resistance protein 1 (MRP-1) and inhibits their activities, which may result in increased intracellular accumulation and retention of cytotoxic agents.

**birinapant:** A synthetic small molecule and peptidomimetic of second mitochondrial-derived activator of caspases (SMAC) and inhibitor of IAP (Inhibitor of Apoptosis Protein) family proteins, with potential antineoplastic activity. As a SMAC mimetic and IAP antagonist, birinapant binds to and inhibits the activity of IAPs, such as X chromosome-linked IAP (XIAP) and cellular IAPs 1 and 2. Since IAPs shield cancer cells from the apoptosis process, this agent may restore and promote the induction of apoptosis through apoptotic signaling pathways in cancer cells. IAPs are overexpressed by many cancer cell types and suppress apoptosis by binding and inhibiting active caspases-3, -7 and -9 via their baculoviral IAP repeat (BIR) domains.

**Birt-Hogg-Dube syndrome :** The use of drugs, devices, or surgery to prevent pregnancy. There are many different types of birth control. These

include barrier methods to keep sperm from fertilizing the egg, hormone methods, intrauterine devices (IUDs), and surgery to close the fallopian tubes in women or close off the two tubes that carry sperm out of the testicles in men. Also called contraception.

**birth canal :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Biotin helps some enzymes break down substances in the body for energy and helps tissues develop. It is found in yeast, whole milk, egg yolks, and organ meats. Biotin is water-soluble (can dissolve in water) and must be taken in every day. Not enough biotin can cause skin, nerve, and eye disorders. Biotin is present in larger amounts in some cancer tissue than in normal tissue. Attaching biotin to substances used to treat some types of cancer helps them find cancer cells. Also called vitamin H.

**birth control :** A method used by radiologists to interpret and report in a standardized manner the results of mammography, ultrasound, and MRI used in breast cancer screening and diagnosis. Also called Breast Imaging Reporting and Data System.

**birth control pill :** The muscular canal that goes from the uterus to the outside of the body. During birth, the baby passes through the birth canal. Also called vagina.

**bisacodyl:** A synthetic pyridinylmethylene-diacetate ester derivative stimulant laxative, Bisacodyl acts with a parasymphathetic effect directly on mucosal sensory nerves, increasing peristaltic contractions. It is used for occasional constipation, in pre- and postoperative treatment, and in conditions that require facilitation of defecation.

**bisantrene hydrochloride:** The hydrochloride salt of an anthracenyl bishydrazone with antineoplastic activity. Bisantrene intercalates with and disrupts the configuration of DNA, resulting in DNA single-strand breaks, DNA-protein crosslinking, and inhibition of DNA replication. This agent is similar to doxorubicin in activity, but unlike doxorubicin, does not exhibit cardiotoxicity.

**bisects:** divides into two equal parts.

**Bismuth:** Symbol:"Bi" Atomic Number:"83" Atomic Mass: 208.98amu. It is classified as a basic metal and is the most diamagnetic metal in the periodic table. Bismuth is a brittle metal often found with tin and lead. You will find it used in magnets, nuclear reactors, alloys, and even cosmetics.

**bismuth** : A pill used to prevent pregnancy. It contains hormones that block the release of eggs from the ovaries. Most birth control pills include estrogen and progestin. Also called oral contraceptive pill.

**bismuth Bi213 monoclonal antibody M195**: A radioimmunoconjugate consisting of murine monoclonal antibody (M195) and bismuth 213 (Bi213). Monoclonal antibody M195 binds to CD33, a surface antigen expressed by myelogenous leukemia cells. Bi213 is an isotope that emits short-ranged high-energy alpha particles. This radioimmunoconjugate selectively delivers alpha particle-mediated cytotoxicity to leukemic cells, thereby limiting the exposure of normal tissues to ionizing radiation.

**bismuth subsalicylate**: A bismuth salt of salicylic acid. Little absorbed from the gastrointestinal tract, bismuth subsalicylate exerts a local effect on the gastric mucosa, coating it and protecting it from the corrosive effects of acid and pepsin. This agent also has local antimicrobial properties.

**bisoprolol fumarate**: The fumarate salt of a synthetic phenoxy-2-propanol-derived cardioselective beta-1 adrenergic receptor antagonist with antihypertensive and potential cardioprotective activities. Devoid of intrinsic sympathomimetic activity, bisoprolol selectively and competitively binds to and blocks beta-1 adrenergic receptors in the heart, decreasing cardiac contractility and rate, reducing cardiac output, and lowering blood pressure. In addition, this agent may exhibit antihypertensive activity through the inhibition of renin secretion by juxtaglomerular epithelioid (JGE) cells in the kidney, thus inhibiting activation of the renin-angiotensin system (RAS). Bisoprolol has been shown to be cardioprotective in animal models.

**bispecific antibody** : An inherited condition in which benign tumors develop in hair follicles on the head, chest, back, and arms. People who have this disorder may be at increased risk of developing colon or kidney cancer.

**bispecific antibody 2B1**: A monoclonal antibody with potential antineoplastic activity. Specific for both the immunoglobulin G (IgG) receptor CD16 and c-erbB-2, bispecific antibody 2B1 may enhance cellular immune responses against c-erbB-2-positive cells, resulting in increased tumor cell lysis.

**bispecific antibody 4G7xH22**: A bispecific antibody containing a 4G7 hybridoma secreting IgG1 antibody specific for B-lymphocytes and a

monoclonal antibody targeting Fc gamma RI-expressing cells. Check for active clinical trials using this agent.

**bispecific antibody MDX-H210:** A humanized bivalent antibody directed against both cytotoxic effector cells expressing Fc gamma receptor type I (Fc gammaRI, or CD64) and HER2/neu-overexpressing tumor cells with potential antineoplastic activity. Bispecific antibody MDX-H210 was constructed by chemically linking Fab' fragments of the anti-HER2/neu-specific monoclonal antibody 520C9 and the Fab' fragments of the anti-Fc gammaRI-specific monoclonal antibody H22. This agent selectively binds to both HER2/neu-expressing tumor cells and Fc gammaRI-expressing cytotoxic effector cells, which may trigger antibody-dependent cell-mediated cytotoxicity (ADCC) and cell lysis of HER2/neu-expressing tumor cells. While HER2/neu is overexpressed in a variety of epithelial malignancies, expression of Fc gammaRI is primarily found in cytotoxic immune cells, including monocytes, macrophages, and cytokine-activated polymorphonuclear (PMN) cells.

**bispecific antibody MDX447:** An antibody with potential antineoplastic activity. Specific for both the high-affinity immunoglobulin G (IgG) receptor CD64 and epidermal growth factor receptor (EGFR), bispecific antibody MDX447 may enhance cellular immune responses against EGFR positive cells, resulting in increased tumor cell lysis.

**bispecific monoclonal antibody :** A silver-white metal used in medicines and other products. Certain forms of bismuth are used to treat diarrhea, heartburn, and upset stomach. Bismuth is also used with certain other drugs to treat stomach ulcers.

**Bisphenol A (BPA):** Bisphenol A (BPA) is an intermediate for polycarbonate resins and epoxy resins, and is used in various minor applications of coatings. It is manufactured by from phenol and acetone in the presence of an acid catalyst, and typically in solid form. BPA is produced in all regions. Alternative names for BPA include: 4,4'-(1-methylethylidene)bis-phenol, 4,4'-isopropylidenedi-phenol OR A carbon-based synthetic compound used to make certain plastics and epoxy resins.

**Bisphenol-A (4,4'-isopropylidenediphenol):** An intermediate used in the production of epoxy, polycarbonate and phenolic resins. The name was coined after the condensation reaction by which it may be formed two(bis) molecules of phenol with one of acetone (A).

**bisphosphonate** : A type of antibody that can bind to two different antigens at the same time. Bispecific antibodies are being studied in the imaging and treatment of cancer. They are made in the laboratory.

**bisphosphonate-associated osteonecrosis** : An antibody that can bind to two different antigens at the same time. Bispecific monoclonal antibodies are being studied in the imaging and treatment of cancer. They are made in the laboratory.

**Bittiness**: A description applied to paint coatings that exhibit bits of skin or other extraneous matter.

**bitumen**: Dark, naturally occurring solid or semisolid substances composed mainly of a mixture of hydrocarbons with little oxygen, nitrogen, or sulfur.

**bituminous coal**: a common form of coal that is soft and black.

**Bituminous paint**: Dark-coloured paints or coatings based on natural bitumens dissolved in organic solvents. They can include paints containing petroleum asphalt but are not generally used to those based completely upon coal-tar.

**bivalent HPV16/18 therapeutic cervical cancer vaccine**: A bivalent human papillomavirus (HPV) therapeutic vaccine containing recombinant inactivated adenylate cyclase (CyaA) from *Bordetella pertussis* carrying a sequence encoding the E7 antigen of both HPV16 and 18, with potential immunostimulatory and antiviral properties. Upon administration of bivalent HPV16/18 therapeutic cervical cancer vaccine, the expressed proteins may activate cell-mediated immunity and induce both cytotoxic CD8<sup>+</sup> T cells and CD4<sup>+</sup> helper T cells against the target antigens HPV16-E7 and HPV18-E7, which leads to HPV viral clearance. Adenylate cyclase is a virulence factor of *Bordetella pertussis*. Its ability to bind to CD11b-expressing dendritic cells and deliver antigens directly to the cytosol allows the activation and induction of T-cell immunity. CyaA may also induce a B cell response.

**bivalent vaccine** : A drug or substance used to treat hypercalcemia (abnormally high blood calcium) and bone pain caused by some types of cancer. Forms of bisphosphonates are also used to treat osteoporosis and for bone imaging. Bisphosphonates inhibit a type of bone cell that breaks down bone. Also called diphosphonate.

**bizelesin:** A synthetic cyclopropylpyrroloindole antineoplastic antibiotic. Bizelesin binds to the minor groove of DNA and induces interstrand cross-linking of DNA, thereby inhibiting DNA replication and RNA synthesis. Bizelesin also enhances p53 and p21 induction and triggers G2/M cell-cycle arrest, resulting in cell senescence without apoptosis. OR The necrosis (death) of bone tissue caused by treatment with a bisphosphonate (a drug or substance used to treat osteoporosis, bone pain caused by some types of cancer, and high blood calcium). It commonly occurs in the jaw bones. There may be pain, swelling and infection in the areas of necrosis. Also called BON.

**BL22 immunotoxin:** A recombinant immunotoxin consisting of the Fv portion of the anti-CD22 antibody RFB4 fused to a fragment of Pseudomonas exotoxin-A with potential antineoplastic activity. BL22 immunotoxin binds to CD22, an antigen expressed in B-cell malignancies, thereby delivering its toxin directly to tumor cells. The toxin moiety induces caspase-mediated apoptosis of tumor cells via a mechanism involving mitochondrial damage; it also blocks translational elongation via binding to elongation factor-2 in eukaryotic cells. Check for active clinical trials using this agent. or A vaccine that works by stimulating an immune response against two different antigens, such as two different viruses or other microorganisms. For example, Cervarix is a bivalent vaccine that helps protect the body against infection with two different types of human papillomaviruses (HPV).

**black cohosh:** A triterpene-containing herb isolated from the roots and rhizomes of the plant Cimicifuga racemosa (also known as Actaea racemosa). While the mechanism of action of black cohosh is not completely understood, it appears to act as a selective estrogen receptor modulator. In vitro, this preparation has been shown to induce cell cycle arrest and caspase-dependent apoptosis of estrogen-sensitive breast cancer cells. OR An anticancer drug that belongs to the family of drugs called alkylating agents. It is also an antitumor antibiotic.

**black raspberry nectar:** A concentrated fruit juice containing black raspberries, with potential antioxidant, pro-apoptotic, anti-angiogenic and chemopreventive activities. In addition to vitamins, minerals and phytosterols, black raspberries are rich in phenolic acids, such as gallic acid, ellagic acid, anthocyanidins, and flavonoids. Upon oral administration,

the phytochemicals in the black raspberry nectar inhibit the activation of several signal transduction pathways involved in carcinogenesis and the expression of downstream target genes that are upregulated in a variety of cancer cell types. In addition, the phytochemicals in black raspberry may protect the oral microbiome and may enhance the bacterial defense against pathogens.

**black smoker:** a submarine hot spring that results from high heat flows and convection currents at divergent plate boundaries and that deposits solid masses of metallic minerals.

**black snakeroot :** A bacterial toxic substance linked to an antibody that attaches to cancer cells and kills them. It belongs to the family of drugs called bacterial immunotoxins.

**Black Specks:** A specific kind of inclusion/contamination often associated with heat-degraded materials.

**Black Specs :** Dark colored wear debris from the system, product or belt that contaminates the product or product appearance.

**black tea:** Black tea is an infusion of dried leaves from plants of the Theaceae family. Due to the alkaloid caffeine, its main effect is stimulation. Black teas also contain other phytochemicals such as flavonoid and flavonoid-related compounds with strong antioxidant effects. They also attenuate atherosclerotic inflammation, reduce thrombosis, promote normal endothelial function, and block expression of cellular adhesion molecules. Black tea may reduce the risk of cancer, heart diseases, infectious diseases, and degenerative diseases.

**Blackfan–Diamond anemia :** An eastern North American perennial herb. A substance obtained from the root of the plant has been used in some cultures to treat a number of medical problems. It is being studied in the treatment of hot flashes and other symptoms of menopause. The scientific name is *Cimicifuga racemosa*. Also called black snakeroot, bugbane, bugwort, and rattlesnake root.

**bladder :** An eastern North American perennial herb. A substance obtained from the root of the plant has been used in some cultures to treat a number of medical problems. It is being studied in the treatment of hot flashes and other symptoms of menopause. The scientific name is *Cimicifuga racemosa*. Also called black cohosh, bugbane, bugwort, and rattlesnake root.

**bladder cancer :** A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with Blackfan–Diamond anemia may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called congenital hypoplastic anemia, congenital pure red cell aplasia, DBA, Diamond-Blackfan anemia, erythrocytopenia, and inherited erythroblastopenia.

**Bladed Habit:** This is a crystal shape that resembles a knife blade because it has very thin layers. You may also think of a messy deck of cards for this example.

**blast :** The organ that stores urine.

**blast crisis :** Cancer that forms in tissues of the bladder (the organ that stores urine). Most bladder cancers are transitional cell carcinomas (cancer that begins in cells that normally make up the inner lining of the bladder). Other types include squamous cell carcinoma (cancer that begins in thin, flat cells) and adenocarcinoma (cancer that begins in cells that make and release mucus and other fluids). The cells that form squamous cell carcinoma and adenocarcinoma develop in the inner lining of the bladder as a result of chronic irritation and inflammation.

**Blast Finishing :** The process of removing flash from molded objects and/or dulling their surfaces, by impinging upon them with sufficient force to remove the flash.

**blastic phase chronic myelogenous leukemia :** An immature blood cell.

**Blasting:** A method of pressure cleaning used to remove rust, millscale or paint coatings in poor condition using grit or water under pressure.

**blastocyst:** a hollow ball of cells resulting after the morula has passed through the Fallopian tubes and enters the female uterus.

**Blastoderm:** The stage in embryogenesis when a unicellular layer at the surface surrounds the yolk mass.

**bleach:** A dilute solution of sodium hypochlorite or calcium hypochlorite which kills bacteria and destroys colored organic materials by oxidizing them.

**Bleaching:** Loss of colour usually caused by exposure to sunlight.

**Bleaching chemical :** A chemical that removes colors and whitens, e.g., fiber, often via oxidation or reduction. Common oxidizing bleaching chemicals are hydrogen peroxide, ozone, peracetic acid, chlorine dioxide and sodium chlorate. Common reducing bleaching chemicals are sodium dithionite and sodium borohydride.

**Bleed:** To give up color when in contact with water or a solvent; undesired movement of certain materials in a plastic (e.g. plasticizers in vinyl) to the surface of the finished article or into an adjacent material. Also called Migration. OR (1) To give up color when in contact with water or a solvent. (2) Undesired movement of certain materials in a plastic (e.g. plasticizers in vinyl) to the surface of the finished article or into an adjacent material. Also called "Migration." (3) An escape passage at the parting line of a mold, like a vent but deeper, which allows material to escape or bleed out. OR (1) To give up color when in contact with water or a solvent. (2) Undesired movement of certain materials in a plastic (e.g. plasticizers in vinyl) to the surface of the finished article or into an adjacent material. Also called "Migration". (3) An escape passage at the parting line of a mold, like a vent but deeper, which allows material to escape or bleed out.

**Bleeding:** Soluble matter leeching out from a substrate or previous coating, causing discolouration of fresh paint, e.g. bitumen bleed or nicotine staining. OR Common causes of bleeding from the surface below include old wallcoverings, bituminous paint and creosoted surfaces, so these should be completely removed before painting. If this is not possible apply one or, in severe cases, two coats of Dulux Aluminium Wood Primer. New creosote or bituminous materials must be aged for at least 12 months before painting. For staining by metallic inks in wallcoverings or felt tip pens, the surface should be touched in locally with Dulux Alkali Resisting Primer.

**BLEEDING:** Undercoat staining through the topcoat.

**Blemish:** A mark, deformity or injury which impairs appearance

**Blend:** A mixture of two or more plastics. OR The mixing of polymers with other polymers, copolymers, or additives to achieve desired physical properties. OR The mixing of polymers with other polymers or copolymers, usually where the mixture results in the desired physical properties. OR An intimate combination of two or more polymer chains having different features, that are not bonded to each other. OR The mixing of polymer plastics with other polymer or copolymers.

**Blenoxane :** (Other name for: bleomycin sulfate) OR A phase of chronic myelogenous leukemia in which tiredness, fever, and an enlarged spleen occur during the blastic phase, when more than 30% of the cells in the blood or bone marrow are blast cells (immature blood cells).

**bleomycin :** A phase of chronic myelogenous leukemia in which 20% or more of the cells in the blood or bone marrow are blast cells (immature blood cells). When tiredness, fever, and an enlarged spleen occur during the blastic phase, it is called blast crisis.

**bleomycin sulfate:** A mixture of the sulfate salts of basic glycopeptide antineoplastic antibiotics isolated from *Streptomyces verticillus*. Bleomycin sulfate forms complexes with iron that reduce molecular oxygen to superoxide and hydroxyl radicals which cause single- and double-stranded breaks in DNA; these reactive oxygen species also induce lipid peroxidation, carbohydrate oxidation, and alterations in prostaglandin synthesis and degradation. OR A drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It comes from the bacterium *Streptomyces verticillus*. Bleomycin damages DNA and may kill cancer cells. It is a type of antineoplastic antibiotic. Also called bleomycin sulfate.

**blessed thistle :** The active ingredient in a drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It comes from the bacterium *Streptomyces verticillus*. Bleomycin damages DNA and may kill rapidly growing cancer cells. It is a type of antineoplastic antibiotic.

**BLI850:** An oral laxative containing sodium sulfate, potassium sulfate, magnesium sulfate and sucralose. Oral sulfate-based laxative BLI850 exhibits osmotic activity, attracting water into the intestinal tract from tissues and increasing the volume and the water content of the stool; gastrointestinal motility is stimulated, resulting in defecation. Sucralose, an artificial sweetener, may contribute to the laxative effect.

**blinatumomab:** A recombinant, single-chain, anti-CD19/anti-CD3 bispecific monoclonal antibody with potential immunostimulating and antineoplastic activities. Blinatumomab possesses two antigen-recognition sites, one for the CD3 complex, a group of T cell surface glycoproteins that complex with the T cell receptor (TCR), and one for CD19, a tumor-associated antigen (TAA) overexpressed on the surface of B cells. This

bispecific monoclonal antibody brings CD19-expressing tumor B-cells and cytotoxic T lymphocytes (CTLs) and helper T lymphocytes (HTLs) together, which may result in the CTL- and HTL-mediated cell death of CD19-expressing B-lymphocytes. or A drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It comes from the bacterium *Streptomyces verticillus*. Bleomycin sulfate damages DNA and may kill cancer cells. It is a type of antineoplastic antibiotic. Also called Blenoxane.

**Blincyto** : (Other name for: blinatumomab) OR A plant whose leaves, stems, and flowers have been used in some cultures to treat certain medical problems. Blessed thistle may have anti-inflammatory and anticancer effects. The scientific name is *Cnicus benedictus*. Also called cardin, holy thistle, spotted thistle, and St. Benedict's thistle.

**blinded study** : A drug used to treat B-cell acute lymphoblastic leukemia that is Philadelphia chromosome negative and has come back or has not gotten better with other anticancer treatment. It is also being studied in the treatment of other types of cancer. Blinatumomab binds to a protein called CD19, which is found on most B cells (a type of white blood cell) and some types of leukemia cells. It also binds to a protein called CD3, which is found on T cells (a type of white blood cell). This may help the immune system kill cancer cells. Blinatumomab is a type of monoclonal antibody. Also called Blincyto.

**Blister**: Pre-formed custom plastic packaging used for consumer goods. The “formed” cavity or pocket contains the product and the “lidding” seals the product in the package. OR An imperfection on a plastic material—normally a bubble or pocket of air. OR An imperfection on the surface of a plastic article caused by a pocket of air or gas beneath the surface. OR An imperfection on the surface of a plastic article caused by a pocket of air or gas beneath the surface. OR A raised area on the surface of a molding caused by the pressure of gases inside it on its incompletely hardened surface. OR A raised area on the surface of a molding caused by the pressure of gases inside it on its incompletely hardened surface. OR As the name says, this is a part defect which appears as a small bubble or blister on the surface of a part and it generally created by gas or air bubbles. OR An imperfection on the surface of plastic extrusions or other plastic profiles caused by a pocket of air or gas beneath the surface. OR A raised area on

the surface of a molding caused by the pressure of gases inside it on its incompletely hardened surface. OR An imperfection on the surface of a plastic article caused by a pocket of air or gas beneath the surface. OR Undesirable raised areas in a moulded part caused by local internal pressure, usually due to trapped air, volatile reaction by-products or water entering by osmosis. OR This is a part defect which appears as a small bubble or blister on the surface of a part and it is generally created by gas or air bubbles. OR undesirable rounded elevation of the surface of a plastic, whose boundaries may be either more or less sharply defined, somewhat resembling in shape a blister on the human skin. A blister may burst and become flat. OR A raised spot on the seal's surface created by an internal void, or air-filled pocket

**blister :** A drug used to treat B-cell acute lymphoblastic leukemia that is Philadelphia chromosome negative and has come back or has not gotten better with other anticancer treatment. It is also being studied in the treatment of other types of cancer. Blincyto binds to a protein called CD19, which is found on most B cells (a type of white blood cell) and some types of leukemia cells. It also binds to a protein called CD3, which is found on T cells (a type of white blood cell). This may help the immune system kill cancer cells. Blincyto is a type of monoclonal antibody. Also called blinatumomab.

**Blistering:** Formation of dome-shaped projections in paints or varnish films resulting from local loss of adhesion and lifting of the film from the underlying surface. OR A 'swelling' of the paint film into the form of blisters often caused by resinous exudation from timber or moisture in the substrate. OR The formation of bubbles or pimples on the painted surface caused by moisture in the wood by painting before the previous coat has dried thoroughly or by excessive heat or grease under the paint.

**Blistering of paint on plaster:** Blistering can occur on plaster if you overcoat solvent-based paints such as gloss or eggshell with a conventional emulsion in an area that suffers from high levels of condensation. To resolve the problem, scrape back the blistered paint until you have a firm edge, feather lightly with abrasive paper and dust off. Now spot, prime and bring forward any bare areas with Dulux Primer Sealer, using Dulux Alkali Resisting Primer on friable surfaces. Finally, repaint the surface using a

thinned first coat of water-based Dulux Trade Quick Drying Eggshell followed by one or two full coats.

**bloating** : A type of study in which the patients (single-blinded) or the patients and their doctors (double-blinded) do not know which drug or treatment is being given. The opposite of a blinded study is an open label study.

**Bloch-decay experiment:** A solid-state NMR experiment where a single pulse on the observed nucleus is followed immediately by acquisition with high-power proton decoupling and usually magic-angle spinning. This technique accentuates highly mobile carbon nuclei.

**block:** A region of the periodic table that corresponds to the type of subshell (s, p, d, or f) being filled during the Aufbau construction of electron configurations.

**Block Copolymer:** An essentially linear copolymer in which there are repeated sequences of polymeric segments of different chemical structure. OR A block copolymer is made when one of the two monomers polymerized together to form a polymer exists as a long section or block in the polymer chain.

**Blocking:** An undesirable adhesion between layers of film or sheeting which may develop during processing or storage. OR An undesirable adhesion between layers of film or sheeting which may have developed during processing, or storage. Blocking can be prevented by adding antiblock agents to the resin.

**Blocking & Anticaking Agents:** These additives are used to prevent the adhesion of two touching layers of film during fabrication and storage. OR These additives are used to prevent the adhesion and agglomeration of ingredients within a resin compound

**blood** : A fluid-filled sac in the outer layer of skin. It can be caused by rubbing, heat, or diseases of the skin. Also called skin vesicle.

**blood alcohol content:** The amount of alcohol in a person's bloodstream measured in percentages. Abbreviated BAL or BAC.

**blood cancer** : A swelling or feeling of fullness in the abdomen. Bloating is usually the result of gas in the intestines and can be caused by many things, including overeating, lactose intolerance, and constipation. Bloating can also be a side effect of cancer or cancer treatment.

**blood cell count :** A tissue with red blood cells, white blood cells, platelets, and other substances suspended in fluid called plasma. Blood takes oxygen and nutrients to the tissues, and carries away wastes.

**blood cell count with differential :** Cancer that begins in blood-forming tissue, such as the bone marrow, or in the cells of the immune system. Examples of blood cancer are leukemia, lymphoma, and multiple myeloma. Also called hematologic cancer.

**blood chemistry study :** A measure of the number of red blood cells, white blood cells, and platelets in the blood. The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A blood cell count is used to help diagnose and monitor many conditions. Also called CBC, complete blood count, and full blood count.

**blood chemistry test :** A measure of the number of red blood cells, white blood cells, and platelets in the blood, including the different types of white blood cells (neutrophils, lymphocytes, monocytes, basophils, and eosinophils). The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A blood cell count with differential is used to help diagnose and monitor many different conditions, including anemia and infection. Also called CBC with differential.

**blood clot :** A test done on a sample of blood to measure the amount of certain substances in the body. These substances include electrolytes (such as sodium, potassium, and chloride), fats, proteins, glucose (sugar), and enzymes. Blood chemistry studies give important information about how well a person's kidneys, liver, and other organs are working. An abnormal amount of a substance in the blood can be a sign of disease or side effect of treatment. Blood chemistry studies are used to help diagnose and monitor many conditions before, during, and after treatment. Also called blood chemistry test.

**blood clotting:** the process in which platelets adhere to the walls of damaged blood vessels, setting off a series of processes leading to the formation of a patchy mesh at the injury site.

**blood culture :** A test done on a sample of blood to measure the amount of certain substances in the body. These substances include electrolytes (such as sodium, potassium, and chloride), fats, proteins, glucose (sugar), and

enzymes. Blood chemistry tests give important information about how well a person's kidneys, liver, and other organs are working. An abnormal amount of a substance in the blood can be a sign of disease or side effect of treatment. Blood chemistry tests are used to help diagnose and monitor many conditions before, during, and after treatment. Also called blood chemistry study.

**blood draw :** A mass of blood that forms when blood platelets, proteins, and cells stick together. When a blood clot is attached to the wall of a blood vessel, it is called a thrombus. When it moves through the bloodstream and blocks the flow of blood in another part of the body, it is called an embolus.

**blood poisoning :** A laboratory test to check for bacteria, yeast, fungi, or other microorganisms in the blood. Blood cultures can help identify the type of microorganism that is causing an infection. This helps determine the best treatment. They may be used to help diagnose septicemia (a serious blood infection) and other conditions.

**blood pressure :** A procedure in which a needle is used to take blood from a vein, usually for laboratory testing. A blood draw may also be done to remove extra red blood cells from the blood, to treat certain blood disorders. Also called phlebotomy and venipuncture.

**blood stasis :** Disease caused by the spread of bacteria and their toxins in the bloodstream. Also called septicemia and toxemia.

**blood stem cell :** The force of circulating blood on the walls of the arteries. Blood pressure is taken using two measurements: systolic (measured when the heart beats, when blood pressure is at its highest) and diastolic (measured between heart beats, when blood pressure is at its lowest). Blood pressure is written with the systolic blood pressure first, followed by the diastolic blood pressure (for example 120/80).

**blood sugar :** In traditional Chinese medicine, a condition described as slowing or pooling of blood, which may cause pain or other symptoms.

**blood test :** An immature cell that can develop into all types of blood cells, including white blood cells, red blood cells, and platelets. Blood stem cells are found in the peripheral blood and the bone marrow. Also called hematopoietic stem cell.

**blood thinner :** Glucose (a type of sugar) found in the blood. Also called glycemia.

**blood transfusion :** A test done on a sample of blood to measure the amount of certain substances in the blood or to count different types of blood cells. Blood tests may be done to look for signs of disease or agents that cause disease, to check for antibodies or tumor markers, or to see how well treatments are working.

**blood urea nitrogen :** A substance that is used to prevent and treat blood clots in blood vessels and the heart. Also called anticoagulant.

**blood vessel :** A procedure in which whole blood or parts of blood are put into a patient's bloodstream through a vein. The blood may be donated by another person or it may have been taken from the patient and stored until needed. Also called transfusion.

**Blood-Brain Barrier:** A highly selective permeability barrier that prevents many compounds from reaching the brain.

**blood-brain barrier :** Nitrogen in the blood that comes from urea (a substance formed by the breakdown of protein in the liver). The kidneys filter urea out of the blood and into the urine. A high level of urea nitrogen in the blood may be a sign of a kidney problem. Also called BUN and urea nitrogen.

**blood-brain barrier disruption :** A tube through which the blood circulates in the body. Blood vessels include a network of arteries, arterioles, capillaries, venules, and veins.

**Bloom:** A visible exudation or efflorescence on the surface of a material.  
OR Migration of additives such as slip to the surface of the film over time. A thin, greasy film on the surface of a plastic film or part usually caused by the exudation of an additive. Slip additives are designed to migrate or bloom to the surface of films. OR A visible exudation or efflorescence on the surface of a plastic. Bloom can be caused by lubricant, plasticizer, etc. OR Also known as migration – an undesirable greasy cloud effect or white powdery deposit on the surface of a plastic product usually caused by the exudation of an additive. OR The residue that in time, comes out of plastics that contain plasticizers, stabilizers or lubricants. Sometimes called a “haze.” OR A visible exudation or efflorescence on the surface of a plastic. Bloom can be caused by lubricant, plasticizer, etc. OR An undesirable cloudy effect or whitish powdery deposit on the surface of a plastic article or to the surrounding environment caused by the exudation of an ingredient

such as a lubricant, stabilizer pigment, plasticizer, or other non-bonded component.

**Bloom syndrome :** A network of blood vessels and tissue that is made up of closely spaced cells and helps keep harmful substances from reaching the brain. The blood-brain barrier lets some substances, such as water, oxygen, carbon dioxide, and general anesthetics, pass into the brain. It also keeps out bacteria and other substances, such as many anticancer drugs. Also called BBB.

**Bloom-Torre-Machacek syndrome :** The use of drugs to create openings between cells in the blood-brain barrier. The blood-brain barrier is a protective network of blood vessels and tissue that protects the brain from harmful substances, but can also prevent anticancer drugs from reaching the brain. Once the barrier is opened, anticancer drugs may be infused into an artery that goes to the brain, in order to treat brain tumors. Also called BBBD.

**Blooming:** A greyish milky-coloured 'haze' appearing on the surface of the paint film usually caused by moisture attack during drying. OR This greyish, milky-coloured "haze"™ on the surface of the paint film is usually caused by moisture attack during drying. Thoroughly clean down the surface to remove all dirt, grease and surface contaminants, then rub down with a suitable abrasive and dust off prior to re-applying paint.

**Blow forming:** A manufacturing process by which hollow plastic parts are formed. It is a process used to produce hollow objects from thermoplastic.

**BLOW HOLE:** Blow-outs or loss of internal air from a blown film bubble usually due to a rupture caused by fisheyes, gels, or contamination.

**Blow Molding:** A method of fabrication in which a warm plastic parison (hollow tube) is placed between the two halves of a mold (cavity) and, by using air pressure, the parison is forced to assume the shape of the cavity. The air pressure is introduced through the inside of the parison. The air pressure forces the plastic against the surface of the mold that defines the shape of the container. OR Method of fabrication in which a warm plastic parison (hollow tube), is placed between the two halves of a mold cavity and forced to assume the shape of that mold cavity by use of air pressure. OR A method of fabrication in which a parison (hollow tube) is forced into the shape of the mold cavity by internal air pressure. OR A method of fabrication of thermoplastic materials in which a parison (hollow tube) is

forced into the shape of the mold cavity by internal air pressure. BLUEING OFF — The checking of the accuracy of mold cutoff surfaces by putting a thin coating of Prussian Blue on one-half and checking the blue transfer to the other half. OR A process for the production of hollow thermoplastic shapes. This method of fabricating involves a plastic parison (hollow tube) placed between two halves of a mold (cavity) and by using air pressure the parison is forced to take the shape of the cavity. The air pressure is introduced through the inside of the parison. The air pressure forces the plastic against the surface of the mold that defines the shape of the container. OR The process follows the basic steps found in glass blowing. A parison (heated plastic mass, generally a tube) is inflated by air. The air pushes the plastic against the mold cavity to form the desired shape. Once cooled, the plastic is ejected. This method is used to make plastic bottles. OR A method of fabrication of thermoplastic materials in which a parison (hollow tube) is forced into the shape of the mold cavity by internal air pressure. BLUEING OFF — The checking of the accuracy of mold cutoff surfaces by putting a thin coating of Prussian Blue on one-half and checking the blue transfer to the other half. OR Method of fabrication in which a warm plastic hollow tube is placed between the two halves of a mold cavity and forced to assume the shape of that mold cavity by use of internal pressure. This process forms hollow articles such as bottles, tanks, etc. OR Method of fabrication in which a warm plastic parison (hollow tube), is placed between the two halves of a mold cavity and forced to assume the shape of that mold cavity by use of air pressure. OR It is also known as blow forming. It is a manufacturing process whereby hollow plastic parts are formed, e.g. bottles, tanks. In general, there are three main types extrusion blow moulding, injection blow moulding, and stretch blow moulding. D W Plastics does not manufacture blow mouldings. It specialises in plastic extrusions.

**Blow Needles, Extrusion Blow Molding :** Device used to pierce and inflate the parison, usually actuated by an air cylinder.

**Blow Pressure:** The air pressure used to form a hollow part by blow molding. OR The pressure required to form the parison or preform into the shape of the mold cavity, in a blow molding operation.

**Blow Pressure, Extrusion Blow Molding:** Dimension of bottle divided by the parison diameter. Bottles usually have many ratios. However, only the

maximum ratio usually needs to be considered.

**Blow Rate:** The speed at which the air enters the parison during the blow loading cycle.

**Blow up Ratio (BUR):** Term used in blown film extrusion that is the ratio of the diameter of the bubble to the diameter of the die.

**BLOW-UP RATIO:** The ratio of the final tube diameter to the die diameter in blown film extrusion. OR In blown film extrusion, the ratio of the final tube diameter to the die diameter.

**blowdown:** removal of liquids and/or solids from a process vessel or storage vessel or line by the use of pressure; often used to remove materials which, in high concentrations, could cause damage to the vessel or line, or exceed limits established by best engineering practices.

**Blowing & Foaming Agents:** Upon addition to plastics or rubbers and then heating, this chemical generates inert gases which results in the resin assuming a cellular structure. OR Additives for plastics or rubbers that generate inert gases within the resinmatrix when heated. The resulting part construction will contain a cellular structure.

**Blowmolding:** A process for forming hollow containers in which the plastic is placed inside a mold and forced outward via air pressure to assume the shape of that mold cavity.

**Blown Film:** Extrusion of a continuous thin walled tube of plastic through a round die and inflating it to form a bubble. The bubble is then collapsed flat between rollers and slit into layflat film which is wound onto rolls. OR Process involves extruding a continuous thin-walled tube of plastic and inflating it immediately after it leaves the die. The pressure is such that the tube stretches, increasing its diameter and reducing its wall thickness to desired gauge. Air is trapped within the blow tube (bubble) between the die and collapsing rolls which convert it to lay-flat film to facilitate winding onto a roll. OR It is a process that involves extruding a continuous thin walled tube of plastic material, and inflating the material immediately after the plastic leaves the die. Air is trapped within the blow tube (bubble) between the die and collapsing rolls which converts it to lay flat plastic film to facilitate winding onto a roll. D W Plastics only specialises in plastic extrusions and does not manufacture blown film. OR Plastic films produced from synthetic resins (such as polyethylene) by the blown process. In this process, the molten resin is extruded through a circular die into a tube. This

tube is expanded ("blown") by internal air pressure into a larger bubble with a much reduced wall thickness and cooled with external air quenching.

**BLOWN FILM TOWER:** Apparatus for handling film in blown film extrusion between the extruder die and take-up equipment. The blown film -tube passes through the tower where it is cooled, sized, and gauged. Nip rolls are located at the top where the inflated tube is collapsed prior to winding.

**Blown Tubing:** A thermoplastic film which is produced by extruding a tube, applying a slight internal pressure to the tube to expand it while still molten and subsequent cooling to set the tube. The tube is then flattened through guides and wound up flat on rolls. The size of blown tubing is determined by the flat width in inches as wound rather than by the diameter as in the case of rigid types of tubing.

**blowoff:** a controlled outlet on a pipeline, tank, or conduit which is used to discharge water or accumulations of material carried by the water.

**blowout:** a bowl-like depression caused by deflation.

**Blowup Ratio:** In blow molding, the ratio of the mold cavity diameter to the parison diameter. In blown tubing (film), the ratio of the final tube diameter (before gusseting, if any) to the original die diameter.

**blue citrus-based herbal capsule:** An oral capsule formulation of a traditional Chinese herbal medicine with potential analgesic activity. In addition to other herbs, seeds and fruits, blue citrus-based herbal capsule contains the Chinese herb blue citrus (qing pi), which is produced from the dried immature green peel of the tangerine *Citrus reticulata* Blanco. Blue citrus contains large amounts of limonene, citral and synephrine, which may attribute to its analgesic activity. However, due to the complexity of its chemical components, the exact mechanism of action of this agent remains to be determined.

**blue shift:** apparent shortening of starlight as it moves toward you (Doppler).

**blue-green algae:** cyanobacteria; members of the kingdom Monera that are photosynthetic and are found in the soil and in freshwater or saltwater environments.

**blueberry powder supplement:** An orally available, dietary supplement consisting of lyophilized blueberry powder, with antioxidant and potential

chemopreventive and chemosensitizing activity. In addition to vitamins and minerals, blueberries are rich in phytonutrients, such as proanthocyanidins, anthocyanins (e.g. malvidin, delphinidin, pelargonidin, cyanidin, petunidin, and peonidin), hydroxycinnamic acids, hydroxybenzoic acids, pterostilbene, resveratrol, and flavonols (e.g. kaempferol, quercetin and myricetin).

Although the exact mechanism of action through which blueberries may exert their anti-tumor effect has yet to be fully elucidated, the effects of blueberry powder on cancer cells may be attributable to the phytonutrient's antioxidant and pro-apoptotic activities.

**Blush:** A cosmetic imperfection that is created where the resin is injected into the part, usually visible as a blotchy discoloration on the finished part at the site of the gate.

**BLUSHING:** A gloss film turning flat or a clear lacquer turning white, usually caused by moisture condensation during the drying process.

**Blushing:** The tendency of a plastic article to turn white or chalky in areas that are highly stressed. OR The tendency of plastic products to turn white or chalky in areas where pressure is applied.

**Blymphocyte:** Precursors to plasma cells, which are antibody-secreting cells.

**BLYP:** DFT using the Becke exchange functional and the Lee-Yang-Parr correlation functional.

**BMC:** See bulk moulding compound.

**BMD:** A rare, inherited disorder marked by height that is shorter than average, a narrow face with redness and a rash, a high-pitched voice, and fertility problems. Patients with this disorder have an increased risk of cancer, especially leukemia and osteosarcoma (bone cancer). Bloom syndrome is caused by changes in a protein that normally helps cells make copies of the DNA. Changes in this protein cause many breaks, rearrangements, and other mutations in the DNA. It is a type of autosomal recessive genetic disease. Also called Bloom-Torre-Machacek syndrome.

**BMD scan :** A rare, inherited disorder marked by height that is shorter than average, a narrow face with redness and a rash, a high-pitched voice, and fertility problems. Patients with this disorder have an increased risk of cancer, especially leukemia and osteosarcoma (bone cancer). Bloom-Torre-Machacek syndrome is caused by changes in a protein that normally helps

cells make copies of the DNA. Changes in this protein cause many breaks, rearrangements, and other mutations in the DNA. It is a type of autosomal recessive genetic disease. Also called Bloom syndrome.

**BMI:** A measure of the amount of minerals (mostly calcium and phosphorous) contained in a certain volume of bone. BMD measurements are used to diagnose osteoporosis (a condition marked by decreased bone mass), to see how well osteoporosis treatments are working, and to predict how likely the bones are to break. Low BMD can occur in patients treated for cancer. Also called bone density, bone mass, and bone mineral density.

**BMI1 inhibitor PTC596:** An orally active inhibitor of the polycomb ring finger oncogene BMI1 (B-cell-specific Moloney murine leukemia virus integration site 1), with potential antineoplastic activity. Upon oral administration, BMI1 inhibitor PTC596 targets BMI1 expressed by both tumor cells and cancer stem cells (CSCs), and induces hyperphosphorylation of BMI1, leading to its degradation. This inhibits BMI1-mediated signal transduction pathways and results in a reduction of proliferation of BMI1-expressing tumor cells. BMI1, a key protein in the polycomb repressive complex 1 (PRC1), is overexpressed in certain tumor cell types, and plays a key role in CSC survival, proliferation and resistance to chemotherapeutics; its expression is associated with increased tumor aggressiveness and a poor prognosis.

**BMS-182751:** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called bone mineral density scan, DEXA, DEXA scan, dual energy x-ray absorptiometric scan, dual x-ray absorptiometry, and DXA.

**BMS-184476:** Body mass index. A measure that relates body weight to height. BMI is sometimes used to measure total body fat and whether a person is a healthy weight. Excess body fat is linked to an increased risk of some diseases including heart disease and some cancers. Also called body mass index.

**BMS-188797:** A substance being studied in the treatment of prostate and other types of cancer. It contains the metal platinum and may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called JM 216 and satraplatin.

**BMS-214662:** A nonsedating benzodiazepine derivative with potential antineoplastic activity. Farnesyltransferase inhibitor BMS-214662 inhibits the enzyme farnesyltransferase and the post-translational farnesylation of number of proteins involved in signal transduction, which may result in the inhibition of Ras function and apoptosis in susceptible tumor cells. This agent may reverse the malignant phenotype of H-Ras-transformed cells and has been shown to be active against tumor cells with and without Ras mutations.

**BMS-214662:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called mitotic inhibitors.

**BMS-247550:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called taxane analogs.

**BMS-275291:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called farnesyltransferase inhibitors.

**BMS-354825:** A drug used to treat metastatic or locally advanced breast cancer that has not improved after treatment with certain other anticancer drugs. It is also being studied in the treatment of other types of cancer. BMS-247550 stops the growth of tumor cells by blocking cell division. It is a type of epothilone analog. Also called ixabepilone and Ixempra.

**BMS-599626:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called matrix metalloproteinase inhibitors (MMPiS).

**BNCT:** A drug used to treat certain types of chronic myeloid leukemia and acute lymphoblastic leukemia. BMS-354825 is also being studied in the treatment of certain other blood diseases and types of cancer. BMS-354825 binds to and blocks BCR-ABL and other proteins that help cancer cells grow. It is a type of tyrosine kinase inhibitor. Also called dasatinib and Sprycel.

**boanmycin hydrochloride:** The hydrochloride salt form of boanmycin (aka bleomycin A6), a component of the antibiotic bleomycin produced by *Streptomyces* species, with potential antineoplastic activity. Upon administration, boanmycin forms complexes with iron that reduce molecular oxygen to superoxide and hydroxyl radicals. This causes single- and double-stranded DNA breaks which eventually leads to cell death. Compared to bleomycin, boanmycin appears to have a more favorable toxicity profile.

**board certified oncology pharmacy specialist :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called protein tyrosine kinase inhibitors.

**board method:** This method can be used to help translate a word problem into an equation if there is a total given in the problem.

**boat conformation:** one of the conformations of the cyclohexanes, which resembles a boat. The boat conformation has high energy because of interactions between eclipsed hydrogen atoms or groups.

**boceprevir:** An orally bioavailable, synthetic tripeptide inhibitor of the nonstructural protein 3 and 4A complex (NS3/NS4A), with potential activity against hepatitis C virus (HCV) genotype 1. Upon administration, boceprevir reversibly binds to the active center of the HCV NS3/NS4A and prevents NS3/NS4A protease-mediated polyprotein maturation. This disrupts the processing of viral proteins and the formation of a viral replication complex, which inhibits viral replication in HCV genotype 1-infected host cells. NS3, a serine protease, is essential for the proteolytic cleavages within the HCV polyprotein and plays a key role during HCV viral RNA replication. NS4A is an activating factor for NS3. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family. Check for active clinical trials using this agent.

**BOD:** Biochemical Oxygen Demand - the rate at which microorganisms use the oxygen in water or wastewater while stabilizing decomposable organic matter under aerobic conditions. In decomposition, organic matter serves as food for the bacteria and energy results from this oxidation.

**BOD (Biochemical Oxygen Demand):** This is defined as the mass of dissolved oxygen required by a specific volume of solution of the substance for process of biochemical oxidation under prescribed conditions. The measurement of BOD indicates the ability of micro-organisms to metabolise an organic substance in the presence of oxygen and thus indicates the potential for depletion of oxygen by the substance. Refers to degradation.

**BOD test:** A procedure that measures the rate of oxygen use under controlled conditions of time and temperature. Standard test conditions include dark incubation at 20 C for a specified time (usually 5 days).

**Body:** The apparent viscosity of a paint, especially in relation to its appearance and behaviour in the container and during application. A high-

viscosity paint may be termed 'full-bodied'. It can also be used to describe the 'build', or coat-thickness, of an applied coat. OR The thickness or thinness of a liquid paint. OR The principal part of a container, usually the largest piece containing the sides. In bottles, the body is the main portion of the bottle without the neck.

**body image :** A type of radiation therapy. A substance that contains boron is injected into a blood vessel. The boron collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with the boron to kill the tumor cells without harming normal cells. BNCT is being studied as a treatment for glioblastoma multiforme and recurrent head and neck cancer. Also called boron neutron capture therapy.

**body mass index :** A licensed pharmacist with special training in how to design, give, monitor, and change chemotherapy for cancer patients. Also called BCOP and oncology pharmacy specialist.

**body wave:** a seismic wave that radiates out from the focus of an earthquake and travels through solid rock.

**Body-centered space group:** A crystallographic space group containing a body-centered lattice, a lattice that contains a site in the center of the unit cell. A crystallographic space group containing a lattice point in the center of the unit cell symbolized by I.

**bohr:** One atomic unit of distance, equal to  $0.5292 \text{ \AA}$  .

**Bohr atom:** A model of the atom that explains emission and absorption of radiation as transitions between stationary electronic states in which the electron orbits the nucleus at a definite distance. The Bohr model violates the Heisenberg uncertainty principle, since it postulates definite paths and momenta for electrons as they move around the nucleus. Modern theories usually use atomic orbitals to describe the behavior of electrons in atoms.

**Bohr effect:** The observation made by Christian Bohr that  $\text{H}^+$  and  $\text{CO}_2$  promote the release of oxygen from oxyhemoglobin.

**Bohr radius $0$ :** The atomic unit of length, equal to  $0.529\,177\,2083 \times 10^{-10} \text{ m}$ , with an uncertainty of  $0.000\,000\,0019 \times 10^{-10} \text{ m}$  [1998 CODATA values]

**Bohr Structure:** Bohr atomic structure is considered the classic structure of an atom. Niels Bohr came up with the idea that there is a nucleus with

protons and neutrons. Surrounding that nucleus are spherical shells where electrons can orbit the nucleus. While there are areas where you can expect to find electrons, we now know that they are not always in spherical shells.

**Bohr's atom:** Bohr made significant contributions to the atom. He understood the line spectra-- the reason why only certain wavelengths are emitted when atoms jump down levels.

**Bohrium:** Symbol:"Bh" Atomic Number:"107" Atomic Mass: (264)amu. Bohrium is of the postactinide elements. Scientists have created these in labs and may have found only a few atoms of the element. You will not find these in use anywhere on Earth.

**Boiler:** A process unit in which tubes pass through a combustion furnace. Boiler feedwater is fed into the tubes, and heat transferred from the hot combustion products through the tube walls converts the feedwater to steam.

**boiling:** Conversion of liquid into gas as bubbles of gas that form within the liquid. Boiling begins at the temperature where the vapor pressure of a liquid would be equal to the external pressure on the liquid. OR When boiling, a liquid is evaporating as fast as it can. If you look at a boiling liquid (careful!) you will see that it is forming bubbles in the body of the liquid.

**Boiling Point:** The boiling point is the temperature when a liquid begins to boil and becomes a gas or vapor. It requires the addition of energy for the matter to move from one state to another. OR The temperature at which the pressure exerted by molecules leaving a liquid equals the pressure exerted by the molecules in the air above it. A free-for-all of molecules leaving the liquid then ensues. In a solution, the boiling point will be increased by a number that depends on the number of particles in solution: OR the temperature at which a liquid changes to a gas. OR temperature at which a liquid changes to a gas. OR This is the maximum temperature a liquid can achieve. For water, the boiling point is 100oC (at standard atmospheric pressure). Pure liquids have a single steady boiling point. OR The temperature at which the vapor pressure of a liquid would be equal to the external pressure on the liquid. The standard boiling point is the temperature at which the vapor pressure of a liquid equals standard pressure.

**Boiling point (at a given pressure):** For a pure species, the temperature at which the liquid and vapor can coexist in equilibrium at the given pressure. When applied to the heating of a mixture of liquids exposed to a gas at the given pressure, the temperature at which the mixture begins to boil.

**boiling point elevation:** an increase in the boiling point of a solution, proportional to the concentration of solute particles.

**boiling point elevation:** The boiling point of a solution is higher than the boiling point of the pure solvent. Boiling point elevation is a colligative property.

**Boiling point range:** In the fractional distillation of crude oil, the substances are collected in groups (fractions) according to their boiling point range.

**Boiling-water reactor (BWR):** A common nuclear power reactor design in which water flows upward through the core, where it is heated by fission and allowed to boil in the reactor vessel. The resulting steam then drives turbines, which activate generators to produce electrical power. BWRs operate similarly to electrical plants using fossil fuel, except that the BWRs are powered by 370–800 nuclear fuel assemblies in the reactor core. For additional detail, see Boiling Water Reactors (BWRs).

**Boltzmann constant:** A fundamental constant equal to the ideal gas law constant divided by Avogadro's number, equal to  $1.3805 \times 10^{-23} \text{ J K}^{-1}$ .

**Boltzmann equation:** A statistical definition of entropy, given by  $S = k \ln W$ , where  $S$  and  $k$  are the entropy and Boltzmann's constant, respectively, and  $W$  is the probability of finding the system in a particular state.

**bolus dose :** The way a person thinks about his or her body and how it looks to others.

**bombesin :** A measure that relates body weight to height. BMI is sometimes used to measure total body fat and whether a person is a healthy weight. Excess body fat is linked to an increased risk of some diseases including heart disease and some cancers. Also called BMI.

**BON:** A single dose of a drug or other substance given over a short period of time. It is usually given by infusion or injection into a blood vessel. It may also be given by mouth.

**bond:** The system whereby stones or bricks are laid in over-lapped courses so that vertical joints in one course do not coincide with those in the next.

OR Physical forces holding together two atoms in a molecule OR A force which holds together two atoms, two ions, two molecules, or a combination of these. OR to attach by means of an adhesive. OR The term commonly used to denote the attachment of a given elastomer to some other member, classified as follows: 1) Mechanical: purely physical attachment accomplished by through holes, interlocking fingers, envelope design in silicone rubber 2) Cold: adhesion of previously vulcanized elastomer to another member through use of suitable bonding agent 3) Chemical: adhesion of an elastomer to a previously primed or glass particle surface using heat and pressure, thus curing the silicone rubber

**bond angle:** the angle formed between two adjacent bonds on the same atom.

**BOND COVALENT:** is the sharing of electrons. There is no rip off because the ionization energies of the atoms are not drastically different in magnitude. The result is neither atom is strong enough to remove the electron from the other atom. (Like two kids of equal strength trying to take a ball away from each other. They both can only hold on to it, neither succeeding in taking it and thus they are bonded).

**Bond energy:** The energy required to break a bond. OR Energy change per mole when a bond is broken in the gas phase for a particular substance. OR The energy required to break a bond.

**bond enthalpy:** Enthalpy change per mole when a bond is broken in the gas phase for a particular substance.

**bond function:** Special basis functions that are centered on a bond midpoint (for example) rather than on an atomic nucleus. Not commonly used.

**BOND IONIC:** is formed by electron transfer (the rip off). An element whose electrons are loosely held (first and second columns of chart) surrenders its outer electron(s) to an element with high ionization energy (that therefore has a high electron affinity). The latter are the right hand side of the chart (like the halogens). When the transfer is completed, we have ions produced. The unlike charges of the ions holds them together electrically. Hence, the ionic bond. Elements from opposite sides of the chart have very different ionization energies, so that one atom is strong enough to rip off electrons from the other.

**bond length:** the equilibrium distance between the nuclei of two atoms or groups that are bonded to each other. OR The average distance between the nuclei of two bonded atoms in a stable molecule.

**bond order:** 1. In Lewis structures, the number of electron pairs shared by two atoms. 2. In molecular orbital theory, the net number of electron pairs in bonding orbitals (calculated as half the difference between the number of electrons in bonding orbitals and the number of electrons in antibonding orbitals).

**bond strength:** the amount of energy needed to homolytically fracture a bond (also called ). OR Some measure of how difficult it is to break a chemical bond, for example, a bond energy or bond enthalpy. OR 1) The measure of the force required to separate objects or materials bonded together. 2) The strength of the bond between fiber and matrix. 3) The degree of attraction between adjacent atoms within a molecule, usually expressed in J/mol.

**bond-dissociation energy:** the amount of energy needed to homolytically fracture a bond.

**Bond, Chemical:** A chemical bond is created when two atoms share or give electrons to each other. There are single, double, and triple bonds. Two major types of bonds are ionic and covalent.

**bonding molecular orbital:** the orbital formed by the overlap of adjacent atomic orbitals.

**Bonds:** There are three main kinds of bonds at GCSE level. An ionic bond holds two ions (of opposite charge) together by electrostatic attraction. Ionic bonding occurs between a metal and a non-metal. A good example is sodium chloride. A covalent bond uses a shared pair of electrons to hold two atoms together. This usually occurs between two non-metal atoms. There are covalent bonds between the atoms in ammonia. A metallic bond is formed by a delocalised sea of electrons surrounding the very tightly packed metal atoms.

**bone cancer :** A peptide (small protein) found in the brain, gastrointestinal tract, and lungs. It causes the release of certain hormones and enzymes. It also causes smooth muscles to contract. Bombesin is found at high levels on small cell lung cancer cells and on other types of cancer cells. It is a type of neuropeptide and a type of hormone.

**bone density :** The necrosis (death) of bone tissue caused by treatment with a bisphosphonate (a drug or substance used to treat osteoporosis, bone pain caused by some types of cancer, and high blood calcium). It commonly occurs in the jaw bones. There may be pain, swelling and infection in the areas of necrosis. Also called bisphosphonate-associated osteonecrosis.

**bone marrow :** Primary bone cancer is cancer that forms in cells of the bone. Some types of primary bone cancer are osteosarcoma, Ewing sarcoma, malignant fibrous histiocytoma, and chondrosarcoma. Secondary bone cancer is cancer that spreads to the bone from another part of the body (such as the prostate, breast, or lung).

**bone marrow ablation :** A measure of the amount of minerals (mostly calcium and phosphorous) contained in a certain volume of bone. Bone density measurements are used to diagnose osteoporosis (a condition marked by decreased bone mass), to see how well osteoporosis treatments are working, and to predict how likely the bones are to break. Low bone density can occur in patients treated for cancer. Also called BMD, bone mass, and bone mineral density.

**bone marrow aspiration :** The soft, sponge-like tissue in the center of most bones. It produces white blood cells, red blood cells, and platelets.

**bone marrow aspiration and biopsy :** A procedure to destroy bone marrow using radiation or high doses of anticancer drugs. It is done before a bone marrow or blood stem cell transplant to kill cancer cells and bone marrow cells. This makes room for healthy stem cells.

**bone marrow biopsy :** A procedure in which a small sample of bone marrow is removed, usually from the hip bone, breastbone, or thigh bone. A small area of skin and the surface of the bone underneath are numbed with an anesthetic. Then, a special wide needle is pushed into the bone. A sample of liquid bone marrow is removed with a syringe attached to the needle. The bone marrow is sent to a laboratory to be looked at under a microscope. This procedure may be done at the same time as a bone marrow biopsy.

**bone marrow cancer :** A procedure in which a small sample of bone marrow (soft, sponge-like tissue in the center of most bones) and bone is removed. A small area of skin and the surface of the bone underneath are numbed with an anesthetic. Then a special wide needle is pushed into the bone. A sample of liquid bone marrow is removed with a syringe attached

to the needle. The syringe is then removed and the needle is rotated to remove a sample of the bone and the bone marrow. Both the bone marrow and bone samples are sent to a laboratory to be looked at under a microscope.

**bone marrow metastasis :** A procedure in which a small sample of bone with bone marrow inside it is removed, usually from the hip bone. A small area of skin and the surface of the bone underneath are numbed with an anesthetic. Then, a special, wide needle is pushed into the bone and rotated to remove a sample of bone with the bone marrow inside it. The sample is sent to a laboratory to be looked at under a microscope. This procedure may be done at the same time as a bone marrow aspiration.

**bone marrow transplantation :** Cancer that forms in the blood-forming stem cells of the bone marrow (soft sponge-like tissue in the center of most bones). Bone marrow cancer includes leukemias and multiple myeloma.

**bone mass :** Cancer that has spread from the original (primary) tumor to the bone marrow.

**bone metastasis :** A procedure to replace bone marrow that has been destroyed by treatment with high doses of anticancer drugs or radiation. Transplantation may be autologous (an individual's own marrow saved before treatment), allogeneic (marrow donated by someone else), or syngeneic (marrow donated by an identical twin).

**bone metastasis targeting peptide-11:** A peptide that mimics naturally occurring interleukin-11 (IL-11) with interleukin receptor binding activity. Upon administration, bone metastasis targeting peptide-11 (BMTP-11) binds to interleukin-11 receptor alpha (IL-11Ra) BMTP-11. This agent might be used to deliver therapeutic agents specifically to IL-11Ra-expressing tumor cells while sparing normal cells. IL-11Ra is a cell surface receptor that may be overexpressed by osteosarcoma cells and by prostate cancer cells in prostate cancer bone metastases.

**bone mineral density :** A measure of the amount of minerals (mostly calcium and phosphorous) contained in a certain volume of bone. Bone mass measurements are used to diagnose osteoporosis (a condition marked by decreased bone mass), to see how well osteoporosis treatments are working, and to predict how likely the bones are to break. Low bone mass can occur in patients treated for cancer. Also called BMD, bone density, and bone mineral density.

**bone mineral density scan :** Cancer that has spread from the original (primary) tumor to the bone.

**bone scan :** A measure of the amount of minerals (mostly calcium and phosphorous) contained in a certain volume of bone. Bone mineral density measurements are used to diagnose osteoporosis (a condition marked by decreased bone mass), to see how well osteoporosis treatments are working, and to predict how likely the bones are to break. Low bone mineral density can occur in patients treated for cancer. Also called BMD, bone density, and bone mass.

**bone scintigraphy :** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called BMD scan, DEXA, DEXA scan, dual energy x-ray absorptiometric scan, dual x-ray absorptiometry, and DXA.

**Bone seeker:** A radioisotope that tends to accumulate in the bones when it is introduced into the body. An example is strontium-90, which behaves chemically like calcium.

**bone-seeking radioisotope :** A procedure to check for abnormal areas or damage in the bones. A very small amount of radioactive material is injected into a vein and travels through the blood. The radioactive material collects in the bones and is detected by a scanner (a special camera that takes pictures of the inside of the body). A bone scan may be used to diagnose bone tumors or cancer that has spread to the bone. It may also be used to help diagnose fractures, bone infections, or other bone problems. Also called bone scintigraphy.

**Bongkreikic acid:** An antibiotic that inhibits the action of ATP-ADP translocase.

**Boniva:** (Other name for: ibandronate sodium)

**Boost:** (Other name for: nutritional supplement drink)

**booster :** A procedure to check for abnormal areas or damage in the bones. A very small amount of radioactive material is injected into a vein and travels through the blood. The radioactive material collects in the bones and is detected by a scanner (a special camera that takes pictures of the inside of the body). A bone scintigraphy may be used to diagnose bone tumors or

cancer that has spread to the bone. It may also be used to help diagnose fractures, bone infections, or other bone problems. Also called bone scan.

**borderline personality disorder :** A radioactive substance that is given through a vein, and collects in bone cells and in tumor cells that have spread to the bone. It kills cancer cells by giving off low-level radiation.

**Bore:** A hole machined in a component which permits the passage of a shaft

**Bore Seal:** A sealing system, usually in a radial orientation, in which the primary sealing surface is between the OD of a silicone rubber seal ring and the ID of a bore

**Boron:** Symbol:"B" Atomic Number:"5" Atomic Mass: 10.81amu. Boron is a non-metallic element never found alone but always with other elements. It is a trace element in your diet. You might find boron in clay pots, detergent, glass, flares, or fiberglass. OR Element 5, atomic weight 10.811. Hard yellow crystals or brown amorphous powder, used as a neutron absorber in nuclear chemistry and as a hardener in alloys.

**boron neutron capture therapy :** In medicine, refers to a vaccination given after a previous vaccination. A booster helps maintain or increase a protective immune response.

**boron phenylalanine :** A serious mental illness marked by unstable moods and impulsive behavior. People with BPD have problems with relationships, family and work life, long-term planning, and self-identity. Symptoms include intense bouts of anger, depression, and anxiety that may lead to self-injury or suicide, drug or alcohol abuse, excessive spending, binge eating, or risky sex. A person with BPD who is diagnosed with cancer may be at an increased risk of suicide. Also called BPD.

**boronophenylalanine-fructose complex:** A boronated phenylalanine complexed with fructose to increase its solubility. When exposed to neutron irradiation, boronophenylalanine absorbs neutrons and self-destructs releasing short-range alpha radiation and 'recoil' lithium in tumor cells, resulting in alpha radiation-induced tumor cell death. This highly selective, localized radiotargeting of tumor cells, known as boron neutron capture therapy (BNCT), spares adjacent normal tissues. OR A type of radiation therapy. A substance that contains boron is injected into a blood vessel. The boron collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with the boron to

kill the tumor cells without harming normal cells. Boron neutron capture therapy is being studied as a treatment for glioblastoma multiforme and recurrent head and neck cancer. Also called BNCT.

**bortezomib:** A dipeptide boronic acid analogue with antineoplastic activity. Bortezomib reversibly inhibits the 26S proteasome, a large protease complex that degrades ubiquitinated proteins. By blocking the targeted proteolysis normally performed by the proteasome, bortezomib disrupts various cell signaling pathways, leading to cell cycle arrest, apoptosis, and inhibition of angiogenesis. Specifically, the agent inhibits nuclear factor (NF)-kappaB, a protein that is constitutively activated in some cancers, thereby interfering with NF-kappaB-mediated cell survival, tumor growth, and angiogenesis. In vivo, bortezomib delays tumor growth and enhances the cytotoxic effects of radiation and chemotherapy. OR A substance used in a type of radiation therapy called boron neutron capture therapy. Boron phenylalanine is injected into a blood vessel and collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with boron phenylalanine to kill the tumor cells without harming normal cells. Also called BPA.

**Boss:** A projection of the plastic part, normally round, which is used to strengthen an area of a part; provide a source of fastening; or to provide an alignment mechanism during assembly. OR The round protrusions on plastic parts and molds, often designed for fasteners. OR A raised stud feature that is used to engage fasteners or support features of other parts passing through them. OR Protuberance on a plastic part designed to add strength, facilitate alignment, provide fastenings, etc OR Projection on a plastic part designed to add strength, to facilitate alignment during assembly, to provide for fastenings, etc. OR A raised feature of a molded part designed to add strength, facilitate alignment during assembly or for attachment to another part.

**Boston Round:** A particular shape of container; cross section as well as shoulders are round.

**Bosulif :** (Other name for: bosutinib) OR A substance used in a type of radiation therapy called boron neutron capture therapy. Boronophenylalanine-fructose complex is injected into a blood vessel and collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with the boron in

boronophenylalanine-fructose complex, producing radioactive particles that kill the tumor cells without harming normal cells. Also called BPA-F.

**bosutinib:** A synthetic quinolone derivative and dual kinase inhibitor that targets both Abl and Src kinases with potential antineoplastic activity. Unlike imatinib, bosutinib inhibits the autophosphorylation of both Abl and Src kinases, resulting in inhibition of cell growth and apoptosis. Because of the dual mechanism of action, this agent may have activity in resistant CML disease, other myeloid malignancies and solid tumors. Abl kinase is upregulated in the presence of the abnormal Bcr-abl fusion protein which is commonly associated with chronic myeloid leukemia (CML).

Overexpression of specific Src kinases is also associated with the imatinib-resistant CML phenotype. Check for active clinical trials using this agent. or A drug used to treat multiple myeloma. It is also used to treat mantle cell lymphoma in patients who have already received at least one other type of treatment and is being studied in the treatment of other types of cancer. Bortezomib blocks several molecular pathways in a cell and may cause cancer cells to die. It is a type of proteasome inhibitor and a type of dipeptidyl boronic acid. Also called PS-341 and velcade.

**Boswellia serrata :** A drug used to treat chronic myelogenous leukemia (CML). It is used in patients who cannot be treated with or have not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Bosulif blocks the action of BCR-ABL and other proteins, which may help keep cancer cells from growing and may kill cancer cells. It is a type of tyrosine kinase inhibitor. Also called bosutinib.

**Boswellia serrata extract:** A standardized extract derived from the plant *Boswellia serrata* of the family Burseraceae with anti-inflammatory activity. *Boswellia serrata* extract contains terpenoid boswellic acids, which are potent inhibitors of 5-lipoxygenase activity and, so, leukotriene synthesis.

**botanical :** A drug used to treat chronic myelogenous leukemia (CML). It is used in patients who cannot be treated with or have not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Bosutinib blocks the action of BCR-ABL and other proteins, which may help keep cancer cells from growing and may kill cancer cells. It is a type of tyrosine kinase inhibitor. Also called Bosulif.

**botanical extracts rinse IZN-6N4:** An oral rinse containing 1% of botanical extracts with potential anti-inflammatory and antimucositis

activity. Upon rinsing with botanical extracts rinse IZN-6N4 in the oral cavity, this agent may prevent inflammation of the mucosal membranes and may decrease chemotherapy- and/or radiation-induced oral mucositis.

Check for active clinical trials using this agent.

**botanical lotion CG428:** A proprietary lotion containing a blend of the four botanicals *Allium cepa* L. (Onion), *Citrus limon* L. (Citrus), *Theobroma cacao* L. (Cocoa), *Paullinia cupana* (Guarana), with potential activity against chemotherapy-induced alopecia (CIA). Upon administration to the scalp, botanical lotion CG428 may normalize the apoptotic process of hair follicular cells and reduce inflammation in the scalp. This may reverse CIA, restore the natural hair cycle, improve hair regrowth, and improve the psychosocial well-being of the affected patient.

**BOTOX:** (Other name for: botulinum toxin type A)

**Botox :** A tree that belongs to the incense tree family. The tree's amber-colored resin is used in incense. The resin has anti-inflammatory effects and has been used to treat arthritis, asthma, and ulcerative colitis. It is also being studied in the treatment of brain tumors. Also called frankincense tree.

**Botox cosmetic:** (Other name for: botulinum toxin type A)

**Bottom Blow:** A specific type of blow molding machine which forms hollow articles by injecting the blowing air into the parison from the bottom of the mold.

**Bottom Plate:** Part of the mold which contains the heel radius and the push-up. OR That part of the mold which contains the heel (base radius) radius and the "push-up" of the container to be formed.

**Bottom rail:** The lowest horizontal member of a framed door.

**Bottom Seal:** Term used to describe bottom of a can liner. The three types of bottom seals are: FLAT SEAL - Straight seal along bottom of a can liner (looks like a pillow case). The flat seal is used to create the strongest possible seal for heavy weight bags. STAR SEAL - The star seal is the most common type of seal in the market. Designed without gussets, the star seal eliminates gaps along the seal where leaks can occur. This allows the bag to easily conform to the shape of the container and distribute the weight of the contents evenly inside the bag. This type of seal maximizes the bag's carrying capacity while minimizing the likelihood of leakage. GUSSET SEAL - A flat-style bag manufactured with both sides tucked in to form

gussets. Also refers to the distance across the open face of the folded side or pleat: can also refer to the tuck or pleat itself.

**Bottoms product:** The product that leaves the bottom of a distillation column. The bottoms product is relatively rich in the less volatile components of the feed to the column.

**bottomset bed:** the finest silt and clay particles that are carried out from a delta into deeper water or slide down a delta front into deeper water.

**botulinum toxin A :** Having to do with, or derived from, plants.

**botulinum toxin type A:** An injectable formulation of a neurotoxin derived through the fermentation of the Hall strain of *Clostridium botulinum* type A with neuromuscular transmission inhibitory and analgesic activities. Upon injection into the affected muscle, the heavy chain portion of onabotulinumtoxinA binds to the cell membrane of the motor nerve and is internalized via endocytosis. Upon entry, the light chain portion of the toxin is activated and cleaves the protein SNAP-25, thereby preventing the fusion of acetylcholine (ACh)-containing synaptic vesicles with the cell membrane and, so, the release of ACh into the neuromuscular junction; subsequent binding of ACh to motor end-plate nicotinic acid receptors and ACh-mediated muscle contraction are thus blocked. In addition to ACh, onabotulinumtoxinA may inhibit the release of neuropeptides, such as substance P and glutamate, which may contribute to its analgesic activity. OR A toxin made by the bacterium *Clostridium botulinum*. It can cause food poisoning. The drug Botox is a form of the toxin that can be used in small amounts to treat certain medical conditions. These include severe underarm sweating and severe muscle spasms in the neck and shoulders. Botox is also used to smooth wrinkles on the face. It is being studied in the treatment of pain in patients with skin leiomyomas (benign smooth muscle tumors) and other conditions. Also called botulinum toxin A and botulinum toxin type A.

**bovine lactoferrin supplement:** A supplement containing lactoferrin derived from bovine milk with potential chemopreventive, immunostimulating, and antimicrobial activity. Upon administration, lactoferrin binds to metal in the oral cavity and may prevent metal-induced oxidation of lipids. This may reduce the metallic taste and taste disturbances induced by certain metal-containing chemotherapeutics; metal-induced lipid oxidation, and the subsequent production of aldehydes and

ketones attributed to the metallic smell. Lactoferrin, a glycoprotein belonging to the transferrin family of metal-binding proteins, can be found in milk and other secretory fluids as well as in polymorphonuclear cells and leukocytes; lactoferrin plays a role in the innate defense of mucosal surfaces and its iron-binding activity is associated with the antibacterial activity. Check for active clinical trials using this agent.

**bowel :** A toxin made by the bacterium *Clostridium botulinum*. It can cause food poisoning. The drug Botox is a form of the toxin that can be used in small amounts to treat certain medical conditions. These include severe underarm sweating and severe muscle spasms in the neck and shoulders. Botulinum toxin A is also used to smooth wrinkles on the face. It is being studied in the treatment of pain in patients with skin leiomyomas (benign smooth muscle tumors) and other conditions. Also called Botox and botulinum toxin type A.

**bowel function :** A toxin made by the bacterium *Clostridium botulinum*. It can cause food poisoning. The drug Botox is a form of the toxin that can be used in small amounts to treat certain medical conditions. These include severe underarm sweating and severe muscle spasms in the neck and shoulders. Botulinum toxin type A is also used to smooth wrinkles on the face. It is being studied in the treatment of pain in patients with skin leiomyomas (benign smooth muscle tumors) and other conditions. Also called Botox and botulinum toxin A.

**bowel movement :** The long, tube-shaped organ in the abdomen that completes the process of digestion. The bowel has two parts, the small bowel and the large bowel. Also called intestine.

**bowel obstruction :** The way the intestines work in terms of how often there are bowel movements, the ability to control when to have a bowel movement, and whether the stools are hard and dry as in constipation or watery as in diarrhea.

**Bowen disease :** Movement of feces (undigested food, bacteria, mucus, and cells from the lining of the intestines) through the bowel and out the anus. Also called defecation.

**Bowen's reaction series:** a description of the progression of mineral formation as magmas cool and crystallize.

**Bowman-Birk inhibitor concentrate:** An extract of soybeans enriched in Bowman-Birk inhibitor (BBI), a soybean-derived, 71-amino acid,

polypeptide and serine protease inhibitor with potential chemopreventive activity. Bowman-Birk inhibitor contains distinct inhibitory sites for trypsin and chymotrypsin. Although the exact mechanism by which BBI suppresses carcinogenesis is unknown, its antiproliferative activity appears to be linked to the chymotrypsin inhibitory region. or A partial or complete block of the small or large intestine that keeps food, liquid, gas, and stool from moving through the intestines in a normal way. Bowel obstructions may be caused by a twist in the intestines, hernias, inflammation, scar tissue from surgery, and certain types of cancer, such as cancers of the stomach, colon, and ovary. They may also be caused by conditions that affect the muscles of the intestine, such as paralysis. Signs and symptoms may include pain and swelling in the abdomen, constipation, diarrhea, vomiting, and problems passing gas. Most bowel obstructions occur in the small intestine. Also called intestinal obstruction.

**Bowman's capsule:** an enlarged cuplike structure below the nephron in the human kidney.

**Box gutter:** Usually a wooden gutter lined with sheet-lead, zinc or asphalt used in roof valleys or parapets.

**Boyle's Law:** A scientist named Robert Boyle came up with an understanding of the way pressure and volume are related (at constant temperatures). His formula shows that the volume of a gas is inversely proportional to the pressure. The idea was written down as  $P=(1/V)k$  (where  $k$  is a constant). OR the volume of a gas varies inversely with pressure. OR The pressure of a ideal gas is inversely proportional to its volume, if the temperature and amount of gas is held constant. Doubling gas pressure halves gas volume, if temperature and amount of gas don't change. If the initial pressure and volume are  $P_1$  and  $V_1$  and the final pressure and volume are  $P_2V_2$ , then  $P_1V_1 = P_2V_2$  at fixed temperature and gas amount.

**BP:** Becke-Perdew. A non-local DFT method employing the Becke exchange and Perdew correlation functionals.

**BP-Cx1-platinum complex BP-C1:** A combination agent composed of the benzo-poly-carbonic-acid polymer BP-Cx1 chelated to platinum with potential antineoplastic activity. Upon intramuscular injection, the polymer moiety of BP-Cx1-Platinum Complex BP-C1 (BP-C1) alters the permeability of the cell membranes, which allows for increased penetration of platinum into tumor cells. In turn, platinum binds to nucleophilic groups

such as GC-rich sites in DNA and induces intrastrand and interstrand DNA cross-links, as well as DNA-protein cross-links. These cross-links result in apoptosis and cell growth inhibition. In addition, the BP-Cx1 ligand is able to stimulate the innate immune system and upregulates a variety of cytokines including interferon, tumor necrosis factor-alpha (TNF-alpha), granulocyte macrophage-colony stimulating factor (GM-CSF), and various interleukins (ILs) such as IL-6 and IL-25. In comparison to cisplatin and other platinum-based compounds, treatment with BP-C1 allows for less platinum administration, which reduces platinum-associated systemic toxicity and side effects, and enhances the safety profile while maintaining or improving its efficacy.

**BPA:** A skin disease marked by scaly or thickened patches on the skin and often caused by prolonged exposure to arsenic. The patches often occur on sun-exposed areas of the skin and in older white men. These patches may become malignant (cancer). Also called precancerous dermatitis and precancerous dermatosis.

**BPA-F:** A substance that is made from soybeans and is being studied in the prevention of cancer. It blocks the action of enzymes that are needed for cancer cells to form. It is a type of protease inhibitor. Also called BBIC.

**BPD:** A substance used in a type of radiation therapy called boron neutron capture therapy. BPA is injected into a blood vessel and collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with BPA to kill the tumor cells without harming normal cells. Also called boron phenylalanine.

**BPH:** A substance used in a type of radiation therapy called boron neutron capture therapy. BPA-F is injected into a blood vessel and collects in tumor cells. The patient then receives radiation therapy with atomic particles called neutrons. The neutrons react with the boron in BPA-F, producing radioactive particles that kill the tumor cells without harming normal cells. Also called boronophenylalanine-fructose complex.

**BPU:** Borderline personality disorder. A serious mental illness marked by unstable moods and impulsive behavior. People with BPD have problems with relationships, family and work life, long-term planning, and self-identity. Symptoms include intense bouts of anger, depression, and anxiety that may lead to self-injury or suicide, drug or alcohol abuse, excessive spending, binge eating, or risky sex. A person with BPD who is diagnosed

with cancer may be at an increased risk of suicide. Also called borderline personality disorder.

**brachial plexopathy :** A benign (not cancer) condition in which an overgrowth of prostate tissue pushes against the urethra and the bladder, blocking the flow of urine. Also called benign prostatic hyperplasia and benign prostatic hypertrophy.

**brachial plexus :** A substance being studied in the treatment of cancer. It is a type of antitubulin agent. Also called benzoylphenylurea.

**Brachytherapy:** A nuclear medicine procedure during which a sealed radioactive source is implanted directly into a person being treated for cancer (usually of the mouth, breast, lung, prostate, ovaries, or uterus). The radioactive implant may be temporary or permanent, and the radiation attacks the tumor as long as the device remains in place. Brachytherapy uses radioisotopes, such as iridium-192 or iodine-125, which are regulated by the NRC and its Agreement States. For additional information, see Brachytherapy.

**brachytherapy :** A condition marked by numbness, tingling, pain, weakness, or limited movement in the arm or hand. It is caused by an impairment of the brachial plexus, a network of nerves that affect the arm and hand.

**brachyury-expressing modified vaccinia Ankara-TRICOM vaccine:** A cancer vaccine composed of a replication-deficient, attenuated derivative of the vaccinia virus strain Ankara expressing both a CD8<sup>+</sup> T-cell epitope from the brachyury protein and a triad of T-cell co-stimulatory molecules (MVA Brachyury-TRICOM), with potential immunomodulating and antineoplastic activities. Upon subcutaneous administration of the brachyury-expressing modified vaccinia Ankara (MVA)-TRICOM vaccine, the expressed brachyury protein induces specific CD8<sup>+</sup> and CD4<sup>+</sup> T-cell responses against brachyury-expressing tumor cells. This causes both tumor cell lysis and a decrease in the growth of brachyury-expressing tumor cells. Brachyury, a member of the T-box family of transcription factors that is overexpressed in numerous cancer cell types, is correlated with increased epithelial-mesenchymal transition (EMT), cancer resistance and cancer progression. TRICOM, a triad of three human T-cell co-stimulatory molecules, B7.1, ICAM-1 and LFA-3, enhances antigen-specific T-cell activation.

**brachyury-expressing yeast vaccine GI-6301:** A cancer vaccine composed of a heat-killed, recombinant form of the yeast *Saccharomyces cerevisiae* that is genetically modified to express the transcription factor brachyury protein, with potential antineoplastic activity. Upon subcutaneous administration, the brachyury-expressing yeast vaccine GI-6301 is recognized by dendritic cells, processed, and presented by Class I and II MHC molecules on the dendritic cell surface. This elicits a targeted CD4+ and CD8+ T-lymphocyte-mediated immune response. This process kills brachyury-expressing tumor cells. Brachyury is overexpressed in a variety of tumor types and plays an important role in cancer progression and metastasis.

**bradykinesia:** slowed ability to start or s movements

**BRAF (V600E) kinase inhibitor RO5185426 :** A network of nerves that sends signals from the spine to the arm and hand.

**BRAF (V600E) mutation :** A type of radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into or near a tumor. Also called implant radiation therapy, internal radiation therapy, and radiation brachytherapy.

**BRAF gene :** A drug used to treat advanced melanoma that has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. BRAF (V600E) kinase inhibitor RO5185426 blocks this mutated protein, which may stop the growth of cancer cells. It is a type of kinase inhibitor and a type of targeted therapy agent. Also called PLX4032, RG7204, vemurafenib, and Zelboraf.

**BRAF inhibitor ARQ 736:** An orally bioavailable, highly soluble phosphate prodrug of B-raf (BRAF) protein kinase with potential antineoplastic activity. BRAF inhibitor ARQ 736 is converted into its active form ARQ 680 in the presence of phosphatases. In turn, ARQ 680 selectively binds to and inhibits the activity of oncogenic B-raf, which may inhibit the proliferation of tumor cells expressing mutated B-raf gene. B-raf belongs to the raf/mil family of serine/threonine protein kinases and plays a role in regulating the MAP kinase/ERKs signaling pathway, which may be constitutively activated due to BRAF gene mutations. The valine to glutamic acid substitution at residue 600 (V600E) accounts for about 90% of BRAF gene mutations.

**BRAF inhibitor PLX8394:** An orally bioavailable inhibitor of serine/threonine-protein kinase B-raf (BRAF) protein with potential antineoplastic activity. BRAF inhibitor PLX8394 appears to selectively bind to and inhibit the activity of both wild-type and mutated forms of BRAF, which may subsequently inhibit the proliferation of tumor cells which express mutated forms of BRAF. This inhibitor appears to be effective against tumors that express multiple mutated forms of the kinase and may be an effective therapeutic agent for tumors that are resistant to other BRAF inhibitor therapies that are specific for the BRAF V600E mutant. BRAF, a member of the raf family of serine/threonine protein kinases, plays a role in the regulation of MAP kinase/ERK signaling pathways, which may be constitutively activated due to BRAF gene mutations. Mutated forms of BRAF are associated with a number of neoplastic diseases. Check for active clinical trials using this agent.

**BRAF kinase inhibitor :** A specific mutation (change) in the BRAF gene, which makes a protein that is involved in sending signals in cells and in cell growth. This BRAF gene mutation may be found in some types of cancer, including melanoma and colorectal cancer. It may increase the growth and spread of cancer cells. Checking for this BRAF mutation in tumor tissue may help to plan cancer treatment.

**BRAF V600E kinase inhibitor RO5212054:** An orally available small-molecule inhibitor of mutant (V600E) v-raf murine sarcoma viral oncogene homolog B1 (BRAF) with potential antineoplastic activity. BRAF(V600E) kinase inhibitor RO5212054 selectively binds to the ATP-binding site of BRAF(V600E) kinase and inhibits its activity, which may result in an inhibition of an over-activated MAPK signaling pathway downstream in BRAF(V600E) kinase-expressing tumor cells and a reduction in tumor cell proliferation. The valine to glutamic acid substitution at residue 600 accounts for about 90% of BRAF gene mutations; the oncogenic product, BRAF(V600E) kinase, exhibits a markedly elevated activity that over-activates the MAPK signaling pathway. The BRAF(V600E) mutation has been found to occur in approximately 60% of melanomas, and in about 8% of all solid tumors.

**BRAF(V600E) inhibitor CEP-32496:** An orally available v-raf murine sarcoma viral oncogene homolog B1 (B-raf) serine/threonine protein kinase inhibitor with potential antineoplastic activity. CEP-32496 specifically and

selectively inhibits the activity of the mutated form (V600E) of B-raf kinase. This inhibits the activation of the RAF/mitogen-activated protein kinase kinase (MEK)/extracellular signal-related kinase (ERK) signaling pathway and may result in a decrease in the proliferation of tumor cells expressing the mutated B-raf gene. The Raf mutation BRAF V600E, in which valine is substituted for glutamic acid at residue 600, is frequently found in a variety of human tumors and results in the constitutive activation of the RAF/MEK/ERK signaling pathway that regulates cellular proliferation and survival.

**BRAF/EGFR inhibitor BGB-283:** An inhibitor of the serine/threonine protein kinase B-raf (BRAF) and epidermal growth factor receptor (EGFR), with potential antineoplastic activity. BRAF/EGFR inhibitor BGB-283 selectively binds to and inhibits the activity of BRAF and certain BRAF mutant forms, and EGFR. This prevents BRAF- and EGFR-mediated signaling and inhibits the proliferation of tumor cells that either contain a mutated BRAF gene or express over-activated EGFR. In addition, BGB-283 inhibits mutant forms of the Ras proteins K-RAS and N-RAS. BRAF and EGFR are mutated or upregulated in many tumor cell types. Check for active clinical trials using this agent.

**Bragg equation:** The equation that relates the scattering of X-rays from a crystal to the d-spacing between planes:

**Braid:** See “Innerbraid”.

**braided stream:** a stream in which the water has lost its main channel and flows in an interconnecting network of rivulets around numerous bars.

**brain metastasis :** A gene that makes a protein called B-RAF, which is involved in sending signals in cells and in cell growth. This gene may be mutated (changed) in many types of cancer, which causes a change in the B-RAF protein. This can increase the growth and spread of cancer cells.

**brain stem :** A substance that blocks a protein called BRAF. BRAF is a kinase enzyme that helps control cell growth and signaling. It may be found in a mutated (changed) form in some types of cancer, including melanoma and colorectal cancer. Blocking mutated BRAF kinase proteins may help keep cancer cells from growing. Some BRAF kinase inhibitors are used to treat cancer.

**brain stem auditory evoked response test :** Cancer that has spread from the original (primary) tumor to the brain.

**brain stem glioma :** The part of the brain that is connected to the spinal cord.

**brain stem tumor :** A test used to detect some types of hearing loss, such as hearing loss caused by injury or tumors that affect nerves involved in hearing. Electrodes are placed on the head and certain tones or clicking sounds are made. The electrodes measure nerve signals in the brain when it reacts to the sounds. Also called ABR test, auditory brain stem response test, and BAER test.

**brain tumor :** A tumor located in the part of the brain that connects to the spinal cord (the brain stem). It may grow rapidly or slowly, depending on the grade of the tumor.

**brain tumor initiating cell vaccine:** A cell-based cancer vaccine comprised of brain tumor initiating cells (BTICs), with potential immunostimulating and antineoplastic activity. BTICs are from the glioblastoma multiforme (GBM) cell line GBM-6 and contain glioma stem-like cell-associated antigens. Upon administration, the BTIC vaccine may stimulate a specific anti-tumoral cytotoxic T –lymphocyte (CTL) response against brain tumor cancer cells and brain tumor stem like cells, resulting in tumor cell lysis. BTIC have unique antigenicity and have the ability to self-renew; vaccination against BTIC antigens may kill these cells and may prevent tumor recurrences.

**Brakiva:** (Other name for: liposomal topotecan hydrochloride)

**Branch migration:** The ability of a DNA strand partly paired with its complementary strand to move, displacing its homologous resident strand and extending the pairing. OR Movement of the branch point in branched DNA formed from two DNA molecules with identical sequences. See also Holliday intermediate.

**Branched:** In molecular structure of polymers (as opposed to Linear), refers to side chains attached to the main chain. Side chains may be long or short.

**branched chain amino acid supplement:** A nutritional supplement containing essential branched-chain amino acids (BCAAs), including leucine, isoleucine and valine, with potential anti-cachectic, antiangiogenic, hepatocellular carcinoma (HCC)-inhibiting and hepatoprotective activities. Upon oral administration, BCAAs inhibit the expression of both hypoxia-inducible factor 1-alpha subunit (HIF-1a) and vascular endothelial growth

factor (VEGF), which prevents VEGF-mediated angiogenesis in HCC cells. In addition, BCAAs inhibit proliferation and induce apoptosis of HCC cells by both suppressing the expression of insulin-like growth factor (IGF), and inhibiting the phosphatidylinositol 3-kinase (PI3K)/Akt/mammalian target of rapamycin (mTOR) pathway. BCAAs also correct the plasma amino acid imbalance and promote protein metabolism, including the synthesis of albumin and glycogen. They reduce oxidative stress by inducing the activation of genes involved in antioxidant defenses, which prevent the production of reactive oxygen species (ROS). BCAAs also strengthen the immune system by increasing hepatic lymphocytes and stimulating natural killer (NK) cell activity. This supplement is able to improve insulin resistance and promote ammonia detoxification through increased glutamine (Gln) production.

**BRANCHED POLYMERS:** Polymers can be classified as linear or branched. Linear polymers have the monomeric units linked together, linearly, with little or no long chain branching. In branched polymers, side chains are attached to the molecular chain backbone. High-density polyethylene (HDPE) is linear, while low-density polyethylene (LDPE) contains both short and long chain branches. Linear LDPE (LLDPE) is a copolymer with controlled short chain branches. This results in polymer that is "stiffer" than LDPE in shear but "softer" in extension. In extension the LLDPE chains slide by without getting entangled since the chain branches are very short.

**branched-chain alkane:** an alkane with alkyl groups bonded to the central carbon chain.

**Branching :** The modification of the molecular structure of a polymer derived from the growth of a new polymer chain from an active site on an established chain, in a direction different from that of the original chain.

**Branchpoint:** An intermediate in a biochemical pathway that can follow more than one route in following steps.

**brass:** A shiny yellow to yellow-orange alloy that contains about two parts copper for every one part zinc.

**Brassica vegetable:** A vegetable belonging to the Brassica genus of plants in the mustard family with potential chemopreventive activity. Brassica vegetables, including broccoli, cabbage, kale, Brussel sprouts, turnip and cauliflower, contain a significant amount of glucosinolates. Glucosinolate

metabolites, such as sulforaphane and indole-3-carbinol, act as antioxidants and may stimulate endogenous phase II detoxifying enzymes, including glutathione S-transferase and quinone reductase. These biotransformation enzymes play major roles in the detoxification of carcinogenic agents. or A tumor in the part of the brain that connects to the spinal cord (the brain stem).

**Bravais Lattice:** The Bravais lattice is the basic structure of a crystal. Each point of the lattice represents the compounds found in the mineral. The shape of an iron pyrite lattice would be cubic. The smallest combination of elements or atoms that forms the lattice is called the unit cell.

**Brazed Edge or Soldered Edge:** An edge finish completed by brazing or soldering only.

**BRCA1:** The growth of abnormal cells in the tissues of the brain. Brain tumors can be benign (not cancer) or malignant (cancer).

**BRCA2:** A member of the family of vegetables that includes broccoli, Brussels sprouts, cabbage, cauliflower, collard greens, kale, and turnips. These vegetables contain substances that may protect against cancer. Also called cruciferous vegetable.

**BRCAPro :** A gene on chromosome 17 that normally helps to suppress cell growth. A person who inherits certain mutations (changes) in a BRCA1 gene has a higher risk of getting breast, ovarian, prostate, and other types of cancer.

**BRD4 inhibitor PLX51107:** An inhibitor of the bromodomain-containing protein 4 (BRD4), with potential antineoplastic activity. Upon administration, the BRD4 inhibitor PLX51107 binds to the acetylated lysine recognition motifs in the bromodomains of the BRD4 protein, thereby preventing the binding of BRD4 to acetylated lysines on histones. This disrupts chromatin remodeling and gene expression. Prevention of the expression of certain growth-promoting genes may lead to an induction of apoptosis and an inhibition of proliferation in BRD4-overexpressing tumor cells. BRD4, a member of the human bromodomain and extra-terminal (BET) family of proteins, is a transcriptional regulator that is overexpressed in certain tumor cells and plays an important role in cellular proliferation.

**breakdown:** failure of insulator or insulating medium to prevent discharge or current flow. OR The disruptive discharge through insulation due to failure under electrostatic stress.

**Breakdown Voltage :** The voltage required, under specific conditions, to cause failure of an insulation material. See Dielectric Strength.

**breaker:** a high wave in which the crest falls forward in front of the main body of the wave.

**BREAKER PLATE:** A perforated plate located at the rear end of an extruder head or die adaptor serving to support the screen pack. The breaker plate also helps to generate back pressure in the extrusion process. OR A perforated plate located at the rear end of an extruder head. It often supports the screens that prevent foreign particles from entering the die. OR A thick metal piece with many holes drilled through it which reinforces the screen pack through which the molten plastic travels when leaving the barrel of the plastic extrusion machine. Breaker plate and screen combination also converts "rotational memory" of the molten plastic into "longitudinal memory".

**Breakfast cereal:** A possible future application for synthetic polymers... Using polyester instead of wheat could give a product with a much longer shelf life, and you probably couldn't tell the difference once it was covered with sugar and artificial colouring.

**breakthrough pain :** A gene on chromosome 13 that normally helps to suppress cell growth. A person who inherits certain mutations (changes) in a BRCA2 gene has a higher risk of getting breast, ovarian, prostate, and other types of cancer.

**breakwater:** a wall built parallel to the shoreline to provide quiet water.

**breast :** A computer program that uses statistics to predict whether a person has an inherited mutation (change) in the BRCA1 and BRCA2 genes. People who have certain mutations in these genes have a higher than normal risk of breast, ovarian, prostate, and other types of cancer. The program is based on personal and family medical histories of breast and ovarian cancer.

**breast cancer :** A sudden increase in pain that may occur in patients who already have chronic pain from cancer, arthritis, fibromyalgia, or other conditions. Breakthrough pain usually lasts for a short time. During breakthrough pain, the level of pain may be severe but the type of pain and where it is in the body are usually the same as the patient's chronic pain. Breakthrough pain may occur with stress, illness, and certain activities, such as exercising or coughing, or when the dose of pain medicine that the

patient is taking wears off. Breakthrough pain is usually not a symptom of a new condition or a condition that has gotten worse. Also called pain flare.

**breast carcinoma in situ :** Glandular organ located on the chest. The breast is made up of connective tissue, fat, and breast tissue that contains the glands that can make milk. Also called mammary gland.

**breast density :** Cancer that forms in tissues of the breast. The most common type of breast cancer is ductal carcinoma, which begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple). Another type of breast cancer is lobular carcinoma, which begins in the lobules (milk glands) of the breast. Invasive breast cancer is breast cancer that has spread from where it began in the breast ducts or lobules to surrounding normal tissue. Breast cancer occurs in both men and women, although male breast cancer is rare.

**breast duct :** There are 3 types of breast carcinoma in situ: ductal carcinoma in situ (DCIS), lobular carcinoma in situ (LCIS), and Paget disease of the nipple. DCIS is a noninvasive condition in which abnormal cells are found in the lining of a breast duct. The abnormal cells have not spread outside the duct to other tissues in the breast. In some cases, DCIS may become invasive cancer and spread to other tissues. At this time, there is no way to know which lesions could become invasive. LCIS is a condition in which abnormal cells are found in the lobules of the breast. This condition seldom becomes invasive cancer. However, having LCIS in one breast increases the risk of developing breast cancer in either breast. Paget disease of the nipple is a condition in which abnormal cells are found in the nipple only. Also called stage 0 breast carcinoma in situ.

**breast duct endoscopy :** Describes the relative amount of different tissues present in the breast. A dense breast has less fat than glandular and connective tissue. Mammogram films of breasts with higher density are harder to read and interpret than those of less dense breasts.

**Breast Imaging Reporting and Data System :** A thin tube in the breast that carries milk from the breast lobules to the nipple. Also called milk duct.

**breast implant :** A method used to examine the lining of the breast ducts to look for abnormal tissue. A very thin, flexible, lighted tube attached to a camera is inserted through the nipple, and threaded into the breast ducts deep in the breast. Tissue and fluid samples may be removed during the procedure.

**breast lobe :** A method used by radiologists to interpret and report in a standardized manner the results of mammography, ultrasound, and MRI used in breast cancer screening and diagnosis. Also called BI-RADS.

**breast lobule :** A silicone gel-filled or saline-filled sac placed under the chest muscle to restore breast shape.

**breast reconstruction :** A section of the breast that contains the lobules (the glands that make milk).

**breast self-exam :** A small part of a lobe in the breast. A breast lobule is a gland that makes milk.

**breast-conserving surgery :** An exam by a woman of her breasts to check for lumps or other changes.

**breast-sparing surgery :** The long flat bone that forms the center front of the chest wall. The breastbone is attached to the collarbone and the first seven ribs. Also called sternum.

**breastbone :** Surgery to rebuild the shape of the breast after a mastectomy.

**BREATHE:** The ability of a paint film to permit the passage of moisture vapor without causing blistering, cracking, or peeling.

**Breathing:** The opening and closing of a mold to allow gases to escape early in the molding cycle. Also called Degassing. When referring to plastic sheeting, “breathing” indicates permeability to air. OR The opening and closing of a mold to allow gases to escape early in the molding cycle. Also called degassing. OR The opening and closing of a mold to allow gases to escape early in the molding cycle. Also called degassing.

**breccia:** rock composed of coarse-grained, angular fragments of broken rocks that have been cemented together and lithified.

**Breeder:** A reactor that produces more nuclear fuel than it consumes. A fertile material, such as uranium-238, when bombarded by neutrons, is transformed into a fissile material, such as plutonium-239, which can be used as fuel.

**Breeze-block:** A building block made from cement and ashes or coke which is used mainly for internal walls.

**Brent Crude Oil:** Brent Crude Oil is a blend of crude oil streams produced from the Brent and Ninian Fields in the North Sea. This crude blend is noted as a benchmark crude as it is traded under contract with prices determined by open market activity on the International Petroleum

Exchange in London. Brent crude is a light, sweet crude and usually trades at a premium to heavier Middle Eastern grades, and is most suited for the production of gasoline and middle distillates.

**brentuximab vedotin:** An antibody-drug conjugate (ADC) directed against the tumor necrosis factor (TNF) receptor CD30 with potential antineoplastic activity. Brentuximab vedotin is generated by conjugating the humanized anti-CD30 monoclonal antibody SGN-30 to the cytotoxic agent monomethyl auristatin E (MMAE) via a valine-citrulline peptide linker. Upon administration and internalization by CD30-positive tumor cells, brentuximab vedotin undergoes enzymatic cleavage, releasing MMAE into the cytosol; MMAE binds to tubulin and inhibits tubulin polymerization, which may result in G2/M phase arrest and tumor cell apoptosis.

Transiently activated during lymphocyte activation, CD30 (tumor necrosis factor receptor superfamily, member 8; TNFRSF8) may be constitutively expressed in hematologic malignancies including Hodgkin lymphoma and some T-cell non-Hodgkin lymphomas. The linkage system in brentuximab vedotin is highly stable in plasma, resulting in cytotoxic specificity for CD30-positive cells. OR An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the cancer is near it. Also called breast-sparing surgery, lumpectomy, partial mastectomy, quadrantectomy, and segmental mastectomy.

**brequinar:** A synthetic quinolinecarboxylic acid analogue with antineoplastic properties. Brequinar inhibits the enzyme dihydroorotate dehydrogenase, thereby blocking de novo pyrimidine biosynthesis. This agent may also enhance the in vivo antitumor effect of antineoplastic agents such as 5-FU.

**Breslow depth :** An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the cancer is near it. Also called breast-conserving surgery, lumpectomy, partial mastectomy, quadrantectomy, and segmental mastectomy.

**Breslow thickness :** A drug used to treat Hodgkin lymphoma in patients who did not get better with other treatment, cannot be treated with

autologous stem cell transplant (ASCT), or have a high risk that the cancer will come back or get worse after ASCT. It is also used to treat systemic anaplastic large cell lymphoma that did not get better with other treatment. It is also being studied in the treatment of other types of lymphoma.

Brentuximab vedotin is made up of a monoclonal antibody linked to an anticancer drug. It binds to a protein called CD30, which is on the surface of some lymphoma cells, and may kill cancer cells. Brentuximab vedotin is a type of antibody-drug conjugate. Also called Adcetris and SGN-35.

**Brevicon:** (Other name for: ethinyl estradiol/norethindrone)

**briciclib sodium:** A benzyl styryl sulfone analog, and a disodium phosphate ester prodrug of ON 013100, with potential antineoplastic activity. Upon hydrolysis, briciclib sodium is converted to ON 013100, which blocks cyclin D mRNA translation and decreases protein expression of cyclin D. This may induce cell cycle arrest and apoptosis in cancer cells overexpressing cyclin D and eventually decrease tumor cell proliferation. This agent may exhibit synergistic antitumor activity in combination with other chemotherapeutic agents. Cyclin D, a member of the cyclin family of cell cycle regulators, plays a key role in cell cycle division and is often overexpressed in a variety of hematologic and solid tumors and is correlated with poor prognosis.

**Bridge tool:** A temporary or interim mold made for the purpose of making production parts until a high-volume production mold is ready. OR An injection mold that makes parts until the final tool is completed. These molds or tools are not meant to be production tools.

**Bridging:** Where a paint film appears to be in continuous contact with a surface but is in reality not in contact at some points, i.e. by spanning or bridging over open cracks with a thick coat of paint. OR Ability of paint to span small gaps or cracks through its cohesion and elastic qualities.

**Bridion:** (Other name for: sugammadex sodium)

**Brief Pain Inventory :** A measure of how deeply a melanoma tumor has grown into the skin. The tumor thickness (depth) is usually measured from the top of the tumor to the deepest tumor cells. If the tumor is ulcerated (the skin is broken), it is measured from the base of the ulcer to the deepest tumor cells. Breslow depth is used to help determine the stage of cancer. Thicker tumors are linked with lower survival rates. Also called Breslow thickness.

**brigatinib:** An orally available inhibitor of receptor tyrosine kinases anaplastic lymphoma kinase (ALK) and the epidermal growth factor receptor (EGFR) with potential antineoplastic activity. Brigatinib binds to and inhibits ALK kinase and ALK fusion proteins as well as EGFR and mutant forms. This leads to the inhibition of ALK kinase and EGFR kinase, disrupts their signaling pathways and eventually inhibits tumor cell growth in susceptible tumor cells. In addition, brigatinib appears to overcome mutation-based resistance. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development; ALK dysregulation and gene rearrangements are associated with a series of tumors. EGFR is overexpressed in a variety of cancer cell types.

**BRIGHT STOCK:** A heavy lubricant stock with a low pour point used in finished blends to provide film strength and to reduce the amount of oil consumed.

**Brighteners:** Are used to add smoother or brighter coatings or finishes. OR Are used to add smoother or brighter coatings.

**brilacidin oral rinse:** An oral rinse containing brilacidin, a defensin mimetic, with potential antimicrobial and anti-mucositic activities. Upon rinsing with the brilacidin oral rinse, brilacidin imitates defensin as a human host defense protein (HDP), and binds to and disrupts the bacterial cell membrane. This causes bacterial cell membrane lysis and leakage of cellular cytoplasmic contents. This inhibits bacterial activity and may prevent or treat radiation-induced mucositis. Defensins, a family of antimicrobial and cytotoxic peptides expressed mainly by epithelial cells and neutrophils, play a key role in the natural human innate immunity against pathogens.

**brincidofovir:** An alkoxyalkyl ester prodrug containing the synthetic, acyclic nucleoside monophosphate analog cidofovir linked, through its phosphonate group, to a lipid, 3-hexadecyloxy-1-propanol, with antiviral activity against double-stranded DNA viruses. Upon oral administration, brincidofovir crosses the intestinal wall and penetrates target viral-infected cells before being cleaved to the free antiviral agent cidofovir. In turn, cidofovir is phosphorylated by pyruvate kinases to its active metabolite cidofovir diphosphate. Cidofovir diphosphate, bearing structural similarity to nucleotides, competes with deoxycytosine-5-triphosphate (dCTP) for viral DNA polymerase and gets incorporated into the growing viral DNA

strands. As a result, it prevents further DNA polymerization and disrupts DNA replication of viruses. Compared to cidofovir, which is given intravenously, hexadecyloxypropyl-cidofovir shows better oral bioavailability, less toxicity and enhanced cellular penetration.

**brine:** Water saturated with salt; a strongly saline solution. OR Brine is a solution of sodium chloride (common salt) OR A solution of sodium chloride (common salt) in water is called brine.

**Bringing forward:** This term is used to describe the preparation and spot priming or other painting which is required to bring repaired or bare surfaces to match the adjacent paintwork so that subsequent painting results in even appearance.

**Brintellix:** (Other name for: vortioxetine hydrobromide)

**British Thermal Unit (B.T.U.):** the quantity of heat required to raise the temperature of one pound of water 1°F from 58.5 to 59.5°F (its point of maximum density).

**british thermal unit (btu):** the quantity of heat necessary to raise the temperature of 1 pound of water by 1 oF. OR The amount of heat required to change the temperature of one pound of water one degree Fahrenheit at sea level.

**brittle strain:** strain that occurs when a stress is great enough to break or fracture a rock.

**Brittle Temperature:** A measure for judging the relative merits of materials for low temperature flexing or impact – i.e., the temperature at which materials rupture by impact under specified conditions.

**brittleness:** the property of matter that is how easily the substance breaks or shatters when force is applied to it. OR Tendency to crack upon physical deformation

**brivanib :** A measure of how deeply a melanoma tumor has grown into the skin. The tumor thickness (depth) is usually measured from the top of the tumor to the deepest tumor cells. If the tumor is ulcerated (the skin is broken), it is measured from the base of the ulcer to the deepest tumor cells. Breslow thickness is used to help determine the stage of cancer. Thicker tumors are linked with lower survival rates. Also called Breslow depth.

**brivanib alaninate:** The alaninate salt of a vascular endothelial growth factor receptor 2 (VEGFR2) inhibitor with potential antineoplastic activity.

Brivanib strongly binds to and inhibits VEGFR2, a tyrosine kinase receptor expressed almost exclusively on vascular endothelial cells; inhibition of VEGFR2 may result in inhibition of tumor angiogenesis, inhibition of tumor cell growth, and tumor regression.

**brivanib alaninate** : A questionnaire used to measure pain.

**brivudine** : A substance being studied in the treatment of cancer. Brivanib may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of vascular endothelial growth factor receptor 2 inhibitor and a type of antiangiogenesis agent.

**brivudine phosphoramidate**: A small molecule phosphoramidate derivative of (E)-5-(2-bromovinyl)-2'-deoxyuridine with potential antineoplastic activity. Selectively active against tumor cells expressing high levels of thymidylate synthase (TS), brivudine phosphoramidate is converted intracellularly by TS to bromovinyldeoxyuridine monophosphate (BVdUMP) which competes with the natural substrate, deoxyuridine monophosphate, for binding to TS. Unlike TS inhibitors, this agent is a reversible substrate for TS catalysis. Thus, TS retains activity and converts BVdUMP into cytotoxic metabolites. As key enzyme in the de novo synthesis of dTMP, TS is an enzyme critical to DNA biosynthesis and is overexpressed in many solid tumors.

**BRM therapy** : A substance being studied in the treatment of cancer. Brivanib alaninate may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of vascular endothelial growth factor receptor 2 inhibitor and a type of antiangiogenesis agent.

**broad-spectrum human papillomavirus vaccine V505**: A non-infectious recombinant cancer vaccine prepared from the human papillomavirus (HPV) with potential immunoprophylactic activity. Vaccination with broad-spectrum human papillomavirus vaccine V505 may stimulate the host immune system to mount humoral and cytotoxic T lymphocyte (CTL) responses against HPV-infected cells. HPV infection, the cause of genital warts, is a risk factor for the development of cancers of the cervix, vagina, vulva, anus, and penis.

**broccoli sprout extract**: A cruciferous vegetable extract with potential chemopreventive activities. Broccoli sprout extract contains a high amount of sulforaphane, a naturally occurring isothiocyanate. Sulforaphane activates the transcription factor NF-E2-related factor 2 (Nrf2), a member

of the basic leucine zipper family, which binds to and activates antioxidant-response elements (AREs). Subsequently, activated AREs mediate the transcription of antioxidant enzymes (particularly glutathione-S-transferase and quinone oxidoreductase), resulting in the detoxification of highly reactive carcinogens. AREs are cis-acting regulatory enhancer elements found in the 5' flanking region of many phase II detoxification enzymes. or A substance that is being studied in the treatment of infections caused by herpesvirus, including herpes-zoster (shingles). It belongs to the family of drugs called antivirals.

**broccoli sprout/broccoli seed extract supplement:** A tablet-based nutritional supplement composed of a mixture of sprout and seed extracts of the cruciferous vegetable broccoli, with potential chemopreventive and antioxidant activities. Broccoli sprout/broccoli seed extract contains a high amount of both the glucosinolate glucoraphanin and the enzyme myrosinase, which catalyzes the production of glucoraphanin to sulforaphane. Upon administration of the broccoli sprout/broccoli seed extract, sulforaphane activates the transcription factor NF-E2-related factor 2 (Nrf2), a member of the basic leucine zipper family, which binds to and activates antioxidant-response elements (AREs). Subsequently, activated AREs promote the transcription of antioxidant and detoxifying enzymes, particularly glutathione-S-transferase and NAD(P)H dehydrogenase [quinone] 1 (NAD(P)H:quinone oxidoreductase; NQO1), resulting in the detoxification of highly reactive carcinogens. This accelerates the elimination of carcinogens, may protect against cellular damage, and prevents cancer formation. AREs are cis-acting regulatory enhancer elements found in the 5' flanking region of many phase II detoxification enzymes. Check for active clinical trials using this agent.

**Broken colour:** A multi-coloured effect obtained usually by the merging of wet paints of different colours during application.

**Broken Mold Marks:** Part surface defects caused by mold damage.

**bromelain:** A proteolytic enzyme obtained from the pineapple plant that cleaves sulhydryl groups. The enzyme is adsorbed intact through the gastrointestinal tract and has demonstrated therapeutic benefit. Bromelain has the ability to modulate cytokines, and has also demonstrated anti-inflammatory activity, immune response activity, and fibrinolytic activity. OR A type of treatment that uses substances made from living organisms to

treat disease. These substances may occur naturally in the body or may be made in the laboratory. Some BRM therapies stimulate or suppress the immune system to help the body fight cancer, infection, and other diseases. Other BRM therapies attack specific cancer cells, which may help keep them from growing or kill them. They may also lessen certain side effects caused by some cancer treatments. Types of BRM therapy include immunotherapy (such as vaccines, cytokines, and some antibodies), gene therapy, and some targeted therapies. Also called biological response modifier therapy, biological therapy, and biotherapy.

**Bromine:** Symbol:"Br" Atomic Number:"35" Atomic Mass: 79.90amu. Bromine is a member of the halogen group. Bromine is the only non-metallic element that is a liquid at room temperature. While it is poisonous you will still find this reddish-brown element used in flame-retardants, water purification systems, and dyes.

**bromocriptine mesylate:** The mesylate salt of bromocriptine, a semisynthetic ergot alkaloid with dopaminergic, antidyskinetic, and antiprolactinemic activities. Bromocriptine selectively binds to and activates postsynaptic dopamine D2 receptors in the corpus striatum of the central nervous system (CNS). Activation of these D2 receptors activate inhibitory G-proteins, which inhibit adenylyl cyclase, preventing signal transduction mediated via cAMP and resulting in the inhibition of neurotransmission and an antidyskinetic effect. This agent also stimulates dopamine D2 receptors in the anterior pituitary gland, which results in the inhibition of prolactin secretion and lactation and may inhibit the proliferation of prolactin-dependent breast cancer cells.

**bromodeoxyuridine:** A halogenated thymidine analogue with potential antineoplastic and radiosensitizing activities. Bromodeoxyuridine competes with thymidine for incorporation into DNA, resulting in DNA mutation and the inhibition of cell proliferation. As a radiosensitizer, this agent is associated with the inhibition of repair of radiation-induced DNA double-strand breaks (DSBs).

**Bromodomain:** A domain consisting of a four-helix bundle that binds peptides containing acetyllysine. Also called an acetyllysine-binding domain. OR domain in proteins that binds to acetylated lysines in histones

**bromodomain inhibitor ABBV-075:** An inhibitor of one or more as of yet undisclosed bromodomain (BRD)-containing protein(s), with potential

antineoplastic activity. Upon administration, the bromodomain inhibitor ABBV-075 binds to the acetyl-lysine binding site in the BRD of certain BRD-containing protein(s), thereby preventing the interaction between those proteins and acetylated histones. This disrupts chromatin remodeling, prevents the expression of certain growth-promoting genes, and leads to an inhibition of cell growth in susceptible tumors.

**bromovinyl-deoxyuridine:** A uridine derivative and nucleoside analog with pro-apoptotic and chemosensitizing properties. In vitro, bromovinyl-deoxyuridine (BVDU) has been shown to downregulate the multifunctional DNA repair enzyme APEX nuclease 1, resulting in the inhibition of DNA repair and the induction of apoptosis. In addition, this agent may inhibit the expression of STAT3 (signal transducer and activator of transcription 3), which may result in the downregulation of vascular endothelial growth factor (VEGF). BVDU has also been found to inhibit the upregulation of chemoresistance genes (Mdr1 and DHFR) during chemotherapy. Overall, the gene expression changes associated with BVDU treatment result in the decrease or prevention of chemoresistance. In addition, this agent has been shown to enhance the cytolytic activity of NK-92 natural killer cells towards a pancreatic cancer cell line in vitro.

**bronchi :** A substance being studied in the prevention of cancer. Broccoli sprout extract comes from newly sprouted broccoli. It causes cells to make enzymes that may protect them against cancer-causing toxins in the body, and it may also block the growth of cancer cells.

**bronchial :** An enzyme found in pineapples that breaks down other proteins, such as collagen and muscle fiber, and has anti-inflammatory properties. It is used as a meat tenderizer in the food industry.

**bronchial adenoma :** The large air passages that lead from the trachea (windpipe) to the lungs.

**bronchial brush biopsy :** Having to do with the bronchi, which are the larger air passages of the lungs, including those that lead from the trachea (windpipe) to the lungs and those within the lungs.

**bronchial brushing :** Cancer that forms in tissues of the bronchi (large air passages in the lungs including those that lead to the lungs from the windpipe).

**bronchial washing :** A procedure in which cells are taken from the inside of the airways that lead to the lungs. A bronchoscope (a thin, tube-like

instrument with a light and a lens for viewing) is inserted through the nose or mouth into the lungs. A small brush is then used to remove cells from the airways. These cells are then looked at under a microscope. A bronchial brush biopsy is used to find cancer and changes in cells that may lead to cancer. It is also used to help diagnose other lung conditions. Also called bronchial brushing.

**bronchiole :** A procedure in which cells are taken from the inside of the airways that lead to the lungs. A bronchoscope (a thin, tube-like instrument with a light and a lens for viewing) is inserted through the nose or mouth into the lungs. A small brush is then used to remove cells from the airways. These cells are then looked at under a microscope. A bronchial brushing is used to find cancer and changes in cells that may lead to cancer. It is also used to help diagnose other lung conditions. Also called bronchial brush biopsy.

**bronchioles:** the branches formed from the bronchi.

**bronchiolitis obliterans :** A procedure in which cells are taken from the inside of the airways that lead to the lungs. A bronchoscope (a thin, tube-like instrument with a light and a lens for viewing) is inserted through the nose or mouth into the lungs. A mild salt solution is washed over the surface of the airways to collect cells, which are then looked at under a microscope. Bronchial washing is used to find infections. It may also help find cancer or changes in cells that may lead to cancer.

**bronchitis :** A tiny branch of air tubes in the lungs.

**bronchodilator :** A condition in which the bronchioles (tiny branches of air tubes in the lungs) become inflamed and blocked. It may be caused by breathing in gases or particles that irritate the bronchioles. This irritation causes scar tissue to form, and makes breathing difficult. Bronchiolitis obliterans may be caused by other factors, and can also occur after a transplant with an organ or stem cells from a matched donor.

**bronchogenic carcinoma :** Inflammation (swelling and reddening) of the bronchi.

**bronchoscope :** A type of drug that causes small airways in the lungs to open up. Bronchodilators are inhaled and are used to treat breathing disorders, such as asthma or emphysema.

**bronchoscopy** : Cancer that begins in the tissue that lines or covers the airways of the lungs, including small cell and non-small cell lung cancer.

**bronchus** : A thin, tube-like instrument used to examine the inside of the trachea, bronchi (air passages that lead to the lungs), and lungs. A bronchoscope has a light and a lens for viewing, and may have a tool to remove tissue.

**Brønsted-Lowry theory of acids and bases:** a Brønsted-Lowry acid is a compound capable of donating a proton (a hydrogen ion), and a Brønsted-Lowry base is capable of accepting a hydrogen ion. In aneutralization, an acid donates a proton to a base, creating a conjugate acid and a conjugate base.

**Brønsted-Lowry theory of acids and bases:** A Brønsted-Lowry acid is a compound capable of donating a proton (a hydrogen ion), and a Brønsted-Lowry base is capable of accepting a hydrogen ion. Inneutralization, an acid donates a proton to a base, creating a conjugate acid and a conjugate base.

**brontictuzumab:** A humanized monoclonal antibody directed against the Notch-1 receptor with potential antineoplastic activity. Upon administration, brontictuzumab binds to Notch-1 on the cell surface, thereby inhibiting Notch-mediated signaling and tumor cell proliferation. Notch 1, a type 1 transmembrane protein belonging to the Notch family, functions as a receptor for membrane bound ligands and has various roles during development; dysregulated Notch signaling is associated with increased cell growth and chemoresistance in cancers. Check for active clinical trials using this agent.

**bronze:** A yellow to yellow-brown alloy that contains mostly copper and tin, with small amounts of other metals.

**bronze diabetes:** bronze skin pigmentation seen in hemochromatosis, coupled with the resultant diabetes

**Bronze paint:** Descriptive of metallic paints composed of copper-bronze or tinted aluminium powder in a clear medium. So-called gold paints are in fact of this type and the term bronze or gold-bronze is used to describe the whole range, irrespective of colour.

**Bronzing:** A metallic lustre or iridescent 'bloom' that may develop on full-coloured paints based on certain pigments, e.g. Prussian and phthalocyanine blues. OR Full coloured paints based on certain pigments, such as Prussian

and phthalocyanine blues, can produce a metallic lustre. To cure this iridescent effect, thoroughly clean down the surface to remove all dirt, grease and surface contaminants, then rub down with a suitable abrasive and dust off before repainting.

**brostallicin:** A synthetic, alpha-bromoacrylic, second-generation minor groove binder (MGB), related to distamycin A, with potential antineoplastic activity. Brostallicin binds to DNA minor groove DNA, after having formed a highly reactive glutathione (GSH)-brostallicin complex in the presence of the enzyme glutathione S-transferase (GST), which is overexpressed in cancer cells; DNA replication and cell division are inhibited, resulting in tumor cell death. Compared to typical MGBs, this agent appears to bind covalently to DNA in a different manner and its activity does not depend on a functional DNA mismatch repair (MMR) mechanism. Accordingly, brostallicin may be effective against MMR-defective tumors that are refractory to various anticancer agents.

**brostallicin hydrochloride :** A procedure that uses a bronchoscope to examine the inside of the trachea, bronchi (air passages that lead to the lungs), and lungs. A bronchoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. The bronchoscope is inserted through the nose or mouth. Bronchoscopy may be used to detect cancer or to perform some treatment procedures.

**Brösted acid:** A material that gives up hydrogen ions in a chemical reaction.

**Brösted base:** A material that accepts hydrogen ions in a chemical reaction.

**Brownian motion:** Small particles suspended in liquid move spontaneously in a random fashion. The motion is caused by unbalanced impacts of molecules on the particle. Brownian motion provided strong circumstantial evidence for the existence of molecules.

**broxuridine :** A large airway that leads from the trachea (windpipe) to a lung. The plural of bronchus is bronchi.

**bruceantin:** A triterpene quassinoid antineoplastic antibiotic isolated from the plant *Brucea antidysenterica*. Bruceantin inhibits the peptidyl transferase elongation reaction, resulting in decreased protein and DNA synthesis. Bruceantin also has antiamebic and antimalarial activity.

**Brunei:** Small country on the north coast of Borneo, wealthy because of its large deposits of crude oil. The Sultan of Brunei has a property in the Northern Territory that is rather larger than the country.

**Brunswick black:** A black varnish, usually a solution of asphaltum.

**Brunswick green:** A green obtained from a mixture of Chrome yellow and Prussian Blue.

**Brush disturbance/floating/flooding:** When pigments have been disturbed in this way, wait until the paint is completely dry. Thoroughly clean down the surface to remove all dirt, grease and surface contaminants, rub down with a suitable abrasive and dust off, then reapply paint.

**bryostatin 1:** A macrocyclic lactone isolated from the bryozoan *Bugula neritina* with antineoplastic activity. Bryostatin-1 binds to and inhibits the cell-signaling enzyme protein kinase C, resulting in the inhibition of tumor cell proliferation, the promotion of tumor cell differentiation, and the induction of tumor cell apoptosis. This agent may act synergistically with other chemotherapeutic agents. OR A substance being studied in the treatment of cancer. Brostallicin hydrochloride binds to DNA and may kill cancer cells. It may also help other drugs kill cancer cells. It is a type of DNA minor groove binding agent.

**BSH:** A drug that makes cancer cells more sensitive to radiation and is also used as a diagnostic agent to determine how fast cancer cells grow.

**BSI-201:** A substance being studied in the treatment of cancer and certain brain conditions such as Alzheimer disease and stroke. It binds to an enzyme involved in cell growth and it may help anticancer drugs work better. Bryostatin 1 comes from a marine organism. It is a type of protein kinase C modulator.

**BSSE:** Basis-set superposition error. An insidious artifact traceable to the fact that one can seldom afford to use a really big basis set. It causes an extra decrease in energy (i.e. more negative energy, greater stability) when two systems (atoms or molecules) are brought together. The energy of one fragment is lowered because its orbitals can use the basis functions on the other fragment, even if the actual electrons and nuclei on the other fragment are not included in the calculation. With a complete basis set, there is no BSSE because the other fragment's basis functions are superfluous. BSSE is usually ignored in thermochemical calculations, except for studies of weak, non-bonded interactions. See "counterpoise."

**BTK inhibitor BGB-3111:** An orally available inhibitor of Bruton tyrosine kinase (BTK) with potential antineoplastic activity. Upon administration, BGB-3111 selectively binds to and inhibits the activity of BTK and prevents the activation of the B-cell antigen receptor (BCR) signaling pathway. This prevents both B-cell activation and BTK-mediated activation of downstream survival pathways. This leads to an inhibition of the growth of malignant B-cells that overexpress BTK. BTK, a member of the TEC family of cytoplasmic tyrosine kinases, is overexpressed in B-cell malignancies; it plays an important role in the development, activation, signaling, proliferation and survival of B-lymphocytes.

**BTK inhibitor CC-292:** An orally bioavailable, selective inhibitor of Bruton's agammaglobulinemia tyrosine kinase (BTK), with potential antineoplastic activity. Upon administration, AVL-292 targets and covalently binds to BTK, thereby preventing its activity. By irreversibly inhibiting BTK, administration of this agent may lead to an inhibition of B cell receptor (BCR) signaling and may inhibit cell proliferation of B-cell malignancies. BTK, a cytoplasmic tyrosine kinase and member of the Tec family of kinases, plays an important role in B lymphocyte development, activation, signaling, proliferation and survival. Check for active clinical trials using this agent.

**BTK inhibitor GDC-0853:** An orally available inhibitor of Bruton's tyrosine kinase (BTK) with potential antineoplastic activity. Upon administration, GDC-0853 inhibits the activity of BTK and prevents the activation of the B-cell antigen receptor (BCR) signaling pathway. This prevents both B-cell activation and BTK-mediated activation of downstream survival pathways, which leads to the inhibition of the growth of malignant B-cells that overexpress BTK. BTK, a member of the Src-related BTK/Tec family of cytoplasmic tyrosine kinases, is overexpressed in B-cell malignancies; it plays an important role in B-lymphocyte development, activation, signaling, proliferation and survival.

**BTK inhibitor ONO-4059:** An orally available formulation containing an inhibitor of Bruton agammaglobulinemia tyrosine kinase (BTK), with potential antineoplastic activity. Upon administration, ONO-4059 covalently binds to BTK within B cells, thereby preventing B-cell receptor signaling and impeding B-cell development. As a result, this agent may inhibit the proliferation of B-cell malignancies. BTK, a cytoplasmic

tyrosine kinase and member of the Tec family of kinases, plays an important role in B lymphocyte development, activation, signaling, proliferation and survival.

**BUBBLE:** A spherical, internal void of air or other gas trapped within a plastic. See VOID.

**Bubble** : A bubble contains a gas. Bubbles in a liquid when it is boiling contain the vapour of that liquid. Bubbles of gas can be formed during a chemical reaction.

**Bubble point (of a mixture of liquids at a given pressure):** The temperature at which the first vapor bubble appears when the mixture is heated

**BUBBLER:** A device inserted into a mold cavity or core, which allows water to flow deep inside the hole into which it is inserted and to discharge through the open end of hole. Uniform cooling of the molds and of isolated mold sections can be achieved in this manner.

**Bubbler mold Cooling (injection molding):** A method of cooling an injection mold in which a stream of cooling liquid flows continuously into a cooling outlet normally positioned at the end opposite the inlet. Uniform cooling can be achieved in this manner.

**BUBBLES:** Air bubbles in a drying paint film caused by excessive brushing during application or by over vigorous mixing that results in air trapment.

**Bubbles:** Air or gas pockets that have formed in the material of the component. Bubbles may vary in size. OR Similar to blisters, gas pockets, or voids that have formed inside the plastic.

**Bubbling/aeration/floating:** There's only one way to cure this problem. Thoroughly clean down the surface to remove all dirt, grease and surface contaminants. Then carefully scrape back any areas of poorly adhering or bubbled coating to a firm edge. Rub down to 'feather' any broken edges, dust off, and reapply paint

**buccal mucosa** : A substance used in a type of radiation therapy called boron neutron capture therapy. BSH is injected into a vein and becomes concentrated in tumor cells. The patient then receives radiation treatment with atomic particles called neutrons. The neutrons react with the boron in

BSH and make radioactive particles that kill the tumor cells without harming normal cells. Also called sodium borocaptate.

**buckminsterfullerene60:** A form of carbon consisting of 60 carbon atoms bound together to make a roughly spherical "buckyball" (which looks rather like a soccer ball).

**budesonide :** A substance being studied in the treatment of some types of cancer. BSI-201 may kill cancer cells. Also called iniparib.

**budesonide/formoterol fumarate dihydrate inhalation aerosol:** An inhalation aerosol formulation containing budesonide and the fumarate dihydrate salt of formoterol with anti-inflammatory and bronchial smooth muscle-relaxing activities. The synthetic corticosteroid steroid budesonide binds to intracellular glucocorticosteroid receptors (GRs), exhibiting inhibitory activities against multiple cell types and mediators associated with allergic inflammation. The long-acting beta-adrenergic receptor agonist formoterol selectively binds to beta-2 adrenergic receptors in bronchial smooth muscle, activating intracellular adenylyl cyclase, an enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3',5'-adenosine monophosphate (cAMP); increased intracellular cAMP result in the relaxation of bronchial smooth muscle and inhibition of the cellular release of mediators of immediate hypersensitivity, especially from mast cells.

**budget:** of a glacier, the ratio between ice gained and ice lost.

**Buffer:** A solution or liquid whose chemical makeup neutralizes acids or bases without a great change in pH. OR a solution selected or prepared to minimize changes in hydrogen ion concentration which would otherwise occur as a result of a chemical reaction.. OR A solution containing both a weak acid and its conjugate base which resists changes in pH brought on by addition of an acid or base to the solution. (see RFF 705.10.09 - BUFFERS) OR A conjugate acid-base pair that is capable of resisting changes in pH when acid or base is added to the system This tendency will be maximal when the conjugate forms are present in equal amounts. OR A solution that can maintain its pH value with little change when acids or bases are added to it. Buffer solutions are usually prepared as mixtures of a weak acid with its own salt or mixtures of salts of weak acids. For example, a 50:50 mixture of 1 M acetic acid and 1 M sodium acetate buffers pH around 4.7. OR A system capable of resisting changes in pH, consisting of a

conjugate acid-base pair in which the ratio of proton acceptor to proton donor is near unity.

**buffer factor (Revelle factor):** The ratio of the instantaneous fractional change in the partial pressure of CO<sub>2</sub> (pCO<sub>2</sub>) exerted by seawater to the fractional change in total CO<sub>2</sub> dissolved in the ocean waters. The buffer factor relates the partial pressure of CO<sub>2</sub> in the ocean to the total ocean CO<sub>2</sub> concentration at constant temperature, alkalinity and salinity. The Revelle factor is a useful parameter for examining the distribution of CO<sub>2</sub> between the atmosphere and the ocean, and measures in part the amount of CO<sub>2</sub> that can be dissolved in the mixed surface layer.

**buffer solutions:** Solutions that resist changes in their pH, even when small amounts of acid or base are added.

**Buffing:** Process of polishing a cured coating to improve release and low friction.

**buformin hydrochloride:** The hydrochloride salt form of buformin, an agent belonging to the biguanide class of antidiabetics with antihyperglycemic activity. Buformin is not metabolized and is excreted in the urine. This agent has an elevated risk of causing lactic acidosis, and has been withdrawn from the market.

**bugbane :** The inner lining of the cheeks.

**bugwort :** A drug used in the treatment of asthma and rhinitis. It is also being studied in the treatment of cancer. Budesonide belongs to the family of drugs called steroids.

**Build:** The actual or apparent thickness of a dried film of paint.

**BUILD:** Thickness or depth of a paint film.

**Build platform:** The support base on an additive machine where parts are built. The maximum build size of a part is dependent on the size of a machine's build platform. Many times a build platform will house a number of different parts of varying geometries.

**BUILDER:** Binds hardness ions, calcium and magnesium, to remove them from solution either as a soluble complex or as a precipitate.

**Bulk density:** The mass of powder in a unit volume. Note this is not the true density of the substance, which is the mass per unit volume in a single crystal. OR The mass per unit of volume in powder form, including the air trapped between particles. OR ASTM D1182-54 test method describes this

measurement of mass per unit volume of a molding powder (in large volume determinations). OR The mass per unit volume of a molding powder as determined in a reasonably large volume. The recommended test method is ASTM D1182-54. OR The density (mass per unit of volume) of a resin in solid form (granular, nodular, pellet, powder, etc.) expressed in g/cc or lbs/ft<sup>3</sup>. OR Weight of a unit of a material, in powdered or granular form, including voids (air) inherent in the material.

**Bulk Factor:** Ratio of the volume of loose molding powder to the volume of the same weight of resin after molding. OR The ratio of the volume of any given mass of loose plastic material to the volume of the same mass of the material after molding. OR A polyester resin/glass fibre premix, for injection or transfer moulding. Also known as dough moulding compound (DMC).

**bulk-forming agent :** An eastern North American perennial herb. A substance obtained from the root of the plant has been used in some cultures to treat a number of medical problems. It is being studied in the treatment of hot flashes and other symptoms of menopause. The scientific name is *Cimicifuga racemosa*. Also called black cohosh, black snakeroot, bugwort, and rattlesnake root.

**Bulk-molding compounds (BMC):** Bulk-molding compounds are used as a premix in composite manufacturing. A BMC consists of a mixture of resin, reinforcements, inert fillers, and other additives which form a puttylike preformed shape, rope or sheet.

**Bulkamid:** (Other name for: polyacrylamide hydrogel)

**bulking agent:** a fine, solid material which is sometimes added to a wastewater stream to produce clarification or coagulation by adding bulk to the solids.

**Bulking sludge:** Clouds of billowing sludge that occur throughout secondary clarifiers and sludge thickeners when sludge becomes too light and will not settle properly. In the activated sludge process, bulking is usually caused by filamentous bacteria. Alken-Murray can cure this condition by applying Alken Nu-Bind and Clear-Flo 7015 to the system.

**BuMel:** An eastern North American perennial herb. A substance obtained from the root of the plant has been used in some cultures to treat a number of medical problems. It is being studied in the treatment of hot flashes and other symptoms of menopause. The scientific name is *Cimicifuga*

racemosa. Also called black cohosh, black snakeroot, bugbane, and rattlesnake root.

**BuMel regimen :** A substance, such as fiber in food, that adds bulk and water to stools so that they can pass more easily through the intestines (lower part of the digestive tract).

**Bumpoff:** A feature in the mold with an undercut. To eject the part, it must bend or stretch around the undercut.

**BUN:** An abbreviation for a chemotherapy combination used to prepare patients with high-risk neuroblastoma for a stem cell transplant. It is also being studied in the treatment of other types of cancer. BuMel includes the drugs busulfan and melphalan hydrochloride. Also called BuMel regimen.

**Bunsen burner:** Common laboratory burner that uses natural gas or propane, developed by German chemist Robert Wilhelm Bunsen during the 19th century. OR A gas burner with adjustable air intake, commonly used in laboratories.

**buoyant:** describes a property that causes materials to appear to float in or on a fluid.

**buparlisib:** An orally bioavailable specific oral inhibitor of the pan-class I phosphatidylinositol 3-kinase (PI3K) family of lipid kinases with potential antineoplastic activity. Buparlisib specifically inhibits class I PIK3 in the PI3K/AKT kinase (or protein kinase B) signaling pathway in an ATP-competitive manner, thereby inhibiting the production of the secondary messenger phosphatidylinositol-3,4,5-trisphosphate and activation of the PI3K signaling pathway. This may result in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**Buphenyl:** (Other name for: sodium phenylbutyrate)

**bupivacaine :** An abbreviation for a chemotherapy combination used to prepare patients with high-risk neuroblastoma for a stem cell transplant. It is also being studied in the treatment of other types of cancer. BuMel regimen includes the drugs busulfan and melphalan hydrochloride. Also called BuMel.

**bupivacaine hydrochloride:** A long-acting, amide-type local anesthetic. Bupivacaine reversibly binds to specific sodium ion channels in the neuronal membrane, resulting in a decrease in the voltage-dependent membrane permeability to sodium ions and membrane stabilization; inhibition of depolarization and nerve impulse conduction; and a reversible loss of sensation. Check for active clinical trials using this agent.

**bupivacaine hydrochloride :** Nitrogen in the blood that comes from urea (a substance formed by the breakdown of protein in the liver). The kidneys filter urea out of the blood and into the urine. A high level of urea nitrogen in the blood may be a sign of a kidney problem. Also called blood urea nitrogen and urea nitrogen.

**bupivacaine hydrochloride liposome injectable suspension:** A liposome-encapsulated formulation of bupivacaine, which is an amide-type, long-acting local anesthetic. Upon administration, bupivacaine reversibly binds to specific sodium ion channels in the neuronal membrane, resulting in both a decrease in the voltage-dependent membrane permeability to sodium ions and membrane stabilization. This leads to inhibition of both depolarization and nerve impulse conduction, and a reversible loss of sensation. Compared to bupivacaine alone, liposomal delivery increases the duration of local anesthetic action and delays the peak plasma concentration of bupivacaine due to its slow release from the liposome.

**buprenorphine hydrochloride :** A drug used to relieve pain by blocking signals at nerve endings. It is being studied in the relief of pain following surgery for cancer. It is a type of local anesthetic. Also called bupivacaine hydrochloride, Marcaine, and Sensorcaine.

**buprenorphine transdermal matrix patch:** A transdermal matrix patch containing the synthetic opioid buprenorphine with analgesic and sedative activities. Buprenorphine binds to and activates the mu-opioid receptors in the central nervous system (CNS), thereby mimicking the effects of the endogenous opiates. Binding to opioid receptors stimulates exchange of GTP for GDP, inhibits adenylate cyclase, and decreases intracellular cAMP. This inhibits the release of various nociceptive neurotransmitters, such as substance P, gamma-aminobutyric acid (GABA), dopamine, acetylcholine, noradrenaline, vasopressin, and somatostatin. In addition, buprenorphine closes N-type voltage-gated calcium channels and opens calcium-dependent inwardly rectifying potassium channels, resulting in hyperpolarization,

reduced neuronal excitability, analgesia and sedation. Buprenorphine is a partial agonist at the mu-opioid receptor and an antagonist at the kappa-opioid receptor in the CNS.

**bupropion hydrochloride:** The hydrochloride salt of an aminoketone antidepressant. The molecular mechanism of the antidepressant effect of bupropion is unknown. This agent does not inhibit monoamine oxidase and, compared to classical tricyclic antidepressants, is a weak blocker of the neuronal uptake of serotonin and norepinephrine. Bupropion also weakly inhibits the neuronal re-uptake of dopamine. or A drug used to relieve pain by blocking signals at nerve endings. It is being studied in the relief of pain following surgery for cancer. It is a type of local anesthetic. Also called bupivacaine, Marcaine, and Sensorcaine.

**burdock :** A drug used to treat moderate to severe pain. It is also used to treat addiction to heroin and other opiates, such as morphine.

Buprenorphine hydrochloride binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opioid.

**buret:** A cylindrical glass tube closed by a stopcock on one end and open on the other, with volume gradations marked on the barrel of the tube, used to precisely dispense a measured amount of a liquid.

**burixafor:** An orally bioavailable inhibitor of CXC chemokine receptor 4 (CXCR4) with receptor binding and hematopoietic stem cell-mobilization activities. Burixafor binds to the chemokine receptor CXCR4, thereby preventing the binding of stromal derived factor-1 (SDF-1 or CXCL12) to the CXCR4 receptor and subsequent receptor activation; this may induce the mobilization of hematopoietic stem and progenitor cells from the bone marrow into blood. CXCR4, a chemokine receptor belonging to the G protein-coupled receptor (GPCR) gene family, plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types; CXCL12/CXCR4 interaction induces retention of hematopoietic cells in the bone marrow.

**Burkitt leukemia :** A drug used to treat depression and certain other disorders. It is also used to help people stop smoking. Bupropion hydrochloride increases the levels of the chemicals dopamine, serotonin, and norepinephrine in the brain. This helps improve mood and can lessen cravings for nicotine. It is a type of antidepressant and a type of nicotine receptor antagonist. Also called Wellbutrin and Zyban.

**Burkitt lymphoma :** A plant whose seeds and root have been used in some cultures to treat certain medical problems. It may have antioxidant effects. The scientific name is *Arctium lappa*. Also called happy major and lappa.

**BURNED:** Showing evidence of thermal decomposition through some discoloration, distortion, or localized destruction of the surface of the plastic.

**Burned :** Showing evidence of excessive heating during processing or use of a plastic, as evidenced by blistering, discoloration, distortion or destruction of the surface.

**Burning off:** The removal of paint by means of heat applied to the surface by means of a blow-lamp.

**burr hole :** A rare, fast-growing type of leukemia (blood cancer) in which too many white blood cells called B lymphocytes form in the blood and bone marrow. It may start in the lymph nodes as Burkitt lymphoma and then spread to the blood and bone marrow, or it may start in the blood and bone marrow without involvement of the lymph nodes. Both Burkitt leukemia and Burkitt lymphoma have been linked to infection with the Epstein-Barr virus.

**Burrs:** Metal protrusions on metal parts due to dull tooling, improperly punched or cut parts of the belt.

**bursitis :** An aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma that occurs most often in children and young adults. The disease may affect the jaw, central nervous system, bowel, kidneys, ovaries, or other organs. There are three main types of Burkitt lymphoma (sporadic, endemic, and immunodeficiency related). Sporadic Burkitt lymphoma occurs throughout the world, and endemic Burkitt lymphoma occurs in Africa. Immunodeficiency-related Burkitt lymphoma is most often seen in AIDS patients.

**Burst Pressure:** The pressure level that is required to burst a tube.

**Burst strength:** the hydraulic pressure required to cause a pipe, fitting, or vessel to fail. This value is typically dependent on the rate at which the pressure is applied as well as the pressure duration.

**buserelin:** A small opening in the skull made with a surgical drill. OR A synthetic analog of gonadotropin-releasing hormone (GnRH). Buserelin binds to and activates pituitary gonadotropin releasing hormone (GnRH)

receptors. Prolonged administration of buserelin results in sustained inhibition of gonadotropin production, suppression of testicular and ovarian steroidogenesis, and reduced levels of circulating gonadotropin and gonadal steroids. Buserelin is more potent than GnRH.

**Bushing (extrusion):** The outer ring of any type of a circular tubing or pipe die which forms the outer surface of the tube or pipe.

**Buspar:** (Other name for: buspirone hydrochloride)

**buspirone :** Inflammation (swelling, pain, and warmth) of a bursa. A bursa is a flat, fluid-filled sac found between a bone and a tendon or muscle. It forms a cushion to help the tendon or muscle slide smoothly over the bone. Bursitis may be caused by long-term overuse, trauma, rheumatoid arthritis, gout, or infection. It usually affects the shoulder, knee, elbow, hip, or foot.

**buspirone hydrochloride:** The hydrochloride salt of an anxiolytic agent chemically and pharmacologically unrelated to benzodiazepines, barbiturates, or other sedative/hypnotic drugs. Although its exact mechanism of action is unknown, buspirone may exert its anti-anxiety effects via serotonin (5-HT<sub>1A</sub>) and dopamine receptors (D<sub>2</sub>) and may indirectly affect other neurotransmitter systems. Unlike typical benzodiazepine anxiolytics, this agent does not exert anticonvulsant or muscle relaxant effects and lacks prominent sedative effects. Check for active clinical trials using this agent.

**busulfan:** A synthetic derivative of dimethane-sulfonate with antineoplastic and cytotoxic properties. Although its mechanism of action is not fully understood, busulfan appears to act through the alkylation of DNA. Following systemic absorption of busulfan, carbonium ions are formed, resulting in DNA alkylation and DNA breaks and inhibition of DNA replication and RNA transcription. OR An anticancer drug that belongs to the family of drugs called gonadotropin-releasing hormones. In prostate cancer therapy, buserelin blocks the production of testosterone in the testicles.

**busulfan-melphalan regimen:** A chemotherapeutic regimen composed of busulfan and melphalan used as a conditioning regimen for stem cell transplantation (SCT).

**Busulfex :** (Other name for: busulfan) OR A drug that is used to treat certain anxiety disorders. It belongs to the family of drugs called anti-anxiety agents.

**Butadiene:** Butadiene is the first member for the olefin chemical family with two double bonds, consisting of four carbons joined by alternate single and double bonds (1,2 propadiene which has three carbon atoms separated by two double bonds only is not a useful chemical owing to its high self reactivity) The largest use for butadiene is in the production of synthetic rubbers, with the majority produced as a by-product from steam crackers. OR A gas which is chemically combined with styrene to create a resin used in latex binders, styrene-butadiene. OR Common monomer in chain-growth polymerisation; an important constituent of ABS rubber. Here is a picture: OR A gas, insoluble in water but soluble in alcohol and ether, obtained from the cracking of petroleum, from coal tar benzene or from acetylene produced from coke and lime. It is widely used in the formation of copolymers with styrene, acrylonitrile, vinyl chloride and other monomeric substances, where it imparts flexibility to the subsequent moldings.

**Butadiene Styrene Plastics:** A synthetic resin derived from the copolymerization of butadiene gas and styrene liquids.

**Butane:** Butane is a gas in the LPG family of petroleum gases that can be separated from the gas stream that is often associated with crude oil as it leaves an oil well. Butane is a four carbon hydrocarbon that can either be arranged as a straight chain (n-butane) or branched (iso-butane). Butane extracted from associated gas is most usually a mixture of these two isomers. N-Butane is more highly valued as a petrochemical feedstock as it yields more ethylene in a steam cracker, while iso-butane has a higher value in gasoline production.

**butane :** A drug used to treat chronic myelogenous leukemia (CML). It is also used with other drugs to prepare patients with CML for a stem cell transplant. It is also being studied in the treatment of other types of cancer. Busulfan attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called Busulfex and Myleran.

**butanol:** An alcohol containing four carbon atoms. Example: 1-butanol.

**buthionine sulfoximine:** A synthetic amino acid. Buthionine sulfoximine irreversibly inhibits gamma-glutamylcysteine synthetase, thereby depleting cells of glutathione, a metabolite that plays a critical role in protecting cells against oxidative stress, and resulting in free radical-induced apoptosis. Elevated glutathione levels are associated with tumor cell resistance to alkylating agents and platinum compounds. By depleting cells of

glutathione, this agent may enhance the in vitro and in vivo cytotoxicities of various chemotherapeutic agents in drug-resistant tumors. Buthionine sulfoximine may also exhibit antiangiogenesis activity. or A drug used to treat chronic myelogenous leukemia (CML). It is also used with other drugs to prepare patients with CML for a stem cell transplant. It is also being studied in the treatment of other types of cancer. Busulfex attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called busulfan and Myleran.

**Butt:** A joint formed between two squared ends which come together but do not overlap. Also used for 'butt hinge' and refers to the type of hinge commonly used for doors and casements.

**Butt Weld:** A joint in a plastic tube or tether that is created by melting two ends and then joining them together, end-to-end. The result is a bond as strong as the original material.

**butte:** a landform resulting from the erosion of a mesa.

**Butterfly Hinge:** Flexible (i.e., living) hinge used in joining the cover to the main body of a flip top dispensing closure. Superior hinge for impact resistance.

**Buttress Thread:** A type of threading in which the thread sides terminate abruptly in threading gradually tapering down to the neck finish. Designed to withstand maximum force in one direction only. Cross section of thread is triangular. OR A design of thread profile (cross section) which takes the form of a truncated triangle or slight modification of that form. It is usually positioned so the right angle is at the bottom of the thread cross section and adjacent to the neck of the bottle finish. The horizontal leg of the right triangle is the bearing surface for a matching cap thread. It is designed to withstand maximum force in one direction only.

**Butyl Acetate:** Butyl acetate is most commonly prepared by esterification, the reaction of acetic acid with n-butyl alcohol. The major end-use for butyl acetate is as a medium-boiling solvent for lacquers and enamels. It is also used as an active solvent for cellulosic resins, chlorinated rubber, polystyrene and methacrylate resins.

**Butylene Plastics:** Plastics based on resins made by the polymerization of butene or copolymerization by butene with one or more unsaturated compounds, the butene being in greatest amount by weight.

**butylscopolamine bromide:** An orally available bromide salt form of butylscopolamine, a quaternary ammonium derivative of the alkaloid scopolamine, with anticholinergic property. Upon oral administration, hyoscine butylbromide binds to and blocks muscarinic receptors located on postganglionic parasympathetic nerve endings and on smooth muscle cells. This blocks the activity of acetylcholine (ACh) and causes its antispasmodic effect in the gastrointestinal (GI), urinary, uterine, and biliary tracts. This agent may also facilitate radiologic visualization of the GI tract.

**By-product:** Is a secondary or incidental product deriving from a manufacturing process or a chemical reaction and is not the primary product or service being produced. A by-product can be useful and marketable, or it can be considered waste.

**Byetta:** (Other name for: exenatide)

**bypass :** A colorless gas that catches fire easily and is used as fuel. It is found in gasoline, lighter fluid, and some aerosol sprays. Butane is also one of many harmful chemicals found in tobacco smoke.

**Byproduct material:** As defined by NRC regulations includes any radioactive material (except enriched uranium or plutonium) produced by a nuclear reactor. It also includes the tailings or wastes produced by the extraction or concentration of uranium or thorium or the fabrication of fuel for nuclear reactors. Additionally, it is any material that has been made radioactive through the use of a particle accelerator or any discrete source of radium-226 used for a commercial, medical, or research activity. In addition, the NRC, in consultation with the EPA, DOE, DHS and others, can designate as byproduct material any source of naturally-occurring radioactive material, other than source material, that it determines would pose a threat to public health and safety or the common defense and security of the United States. For additional detail, see Byproduct Material.

**C cell :** A drug that may help prevent resistance to some anticancer drugs.

**C horizon:** the lowest soil horizon, which lies directly above the bedrock; composed partly of soil and partly of decomposing bedrock fragments.

**C-11 choline :** A surgical procedure in which the doctor creates a new pathway for the flow of body fluids.

**C-11 choline PET-CT scan :** A type of cell in the thyroid. C cells make calcitonin, a hormone that helps control the calcium level in the blood.

**c-ABL:** In medicine, a group of non-scientist volunteers that serves as a link between a community and clinical trial researchers. A CAB may review and monitor clinical trials and help teach the community about the trials. Also called Community Advisory Board.

**c-erbB-2:** A drug used to treat bacterial infections. It belongs to the family of drugs called antibiotics.

**c-erbB-2 positive :** A type of lipid (fat) found in the membranes of cells and the covers of nerves. Some ceramides are important in signal transduction (the process by which a cell responds to substances in its environment) and may cause some types of cells to die. Ceramides are being studied in the treatment of cancer.

**c-fos antisense oligonucleotide :** A drug used to treat certain types of head and neck cancer, and a certain type of colorectal cancer that has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Cetuximab binds to a protein called epidermal growth factor receptor (EGFR), which is on the surface of some types of cancer cells. This may stop cancer cells from growing. Cetuximab is a type of monoclonal antibody. Also called Erbitux.

**c-kit:** A drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Citrovorum factor is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Citrovorum factor is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called calcium levoleucovorin, leucovorin calcium, and Wellcovorin.

**c-Kit inhibitor PLX9486:** An orally bioavailable protein tyrosine kinase inhibitor of mutated forms of the tumor-associated antigen mast/stem cell factor receptor c-Kit (SCFR), with potential antineoplastic activity. Upon oral administration, c-Kit inhibitor PLX9486 binds to and inhibits specific c-Kit mutants. This may result in an inhibition of tumor cell proliferation in cancer cell types that overexpress these c-Kit mutations. c-Kit, a transmembrane protein and receptor tyrosine kinase, is overexpressed in solid tumors and hematological malignancies; it plays a key role in the regulation of cell differentiation and proliferation. Check for active clinical trials using this agent.

**c-Met inhibitor AMG 208:** A selective small-molecule inhibitor of the proto-oncogene c-Met with potential antineoplastic activity. c-Met inhibitor AMG 208 inhibits the ligand-dependent and ligand-independent activation of c-Met, inhibiting its tyrosine kinase activity, which may result in cell growth inhibition in tumors that overexpress c-Met. C-Met encodes the hepatocyte growth factor receptor tyrosine kinase, plays an important role in epithelial cell proliferation and has been shown to be overexpressed in a variety of cancers. Check for active clinical trials using this agent.

**c-Met inhibitor AMG 337:** An orally bioavailable inhibitor of the proto-oncogene c-Met with potential antineoplastic activity. c-Met inhibitor AMG 337 selectively binds to c-Met, thereby disrupting c-Met signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met protein, the product of the proto-oncogene c-Met, is a receptor tyrosine kinase also known as hepatocyte growth factor receptor (HGFR); this protein is overexpressed or mutated in many tumor cell types and plays key roles in tumor cell proliferation, survival, invasion, and metastasis, and tumor angiogenesis.

**c-Met inhibitor HS-10241:** An orally bioavailable small molecule inhibitor of the oncoprotein c-Met (hepatocyte growth factor receptor; HGFR), with potential antineoplastic activity. Upon oral administration, HS-10241 targets and binds to the c-Met protein, prevents c-Met phosphorylation and disrupts c-Met-dependent signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met protein is overexpressed or mutated in many tumor cell types and plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis. Check for active clinical trials using this agent.

**c-Met inhibitor JNJ-38877605:** An orally available, small molecule inhibitor of the proto-oncogene c-Met (hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. c-Met inhibitor JNJ-38877605 selectively binds to c-Met, thereby inhibiting c-Met phosphorylation and disrupting c-Met signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles

in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis.

**c-Met inhibitor MSC2156119J:** An orally bioavailable inhibitor of the proto-oncogene c-Met (also known as hepatocyte growth factor receptor (HGFR)) with potential antineoplastic activity. c-Met inhibitor MSC2156119J selectively binds to c-Met, which inhibits c-Met phosphorylation and disrupts c-Met-mediated signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis.

**c-myb antisense oligonucleotide G4460:** A 24-base phosphorothiolate antisense oligodeoxynucleotide (ODN) for the proto-oncogene c-myb with potential antineoplastic activity. C-myb antisense oligonucleotide G4460 binds to codon sequences 2 to 9 of c-myb mRNA, inhibiting translation of the transcript. Suppression of c-myb expression with this agent may result in the restoration of normal differentiation pathways, increased antiproliferative effects, and the induction of apoptosis in early progenitor hematopoietic cells and in tumor cells that overexpress c-myb. Tumor-cell overexpression of c-myb blocks differentiation, promotes proliferation, and inhibits apoptosis.

**C-peptide :** A substance that is being studied in the treatment of some types of cancer. It belongs to the family of drugs called biological response modifiers. Also called PF-3512676 and ProMune.

**C-peptide suppression test :** An emergency procedure used to restart a person's heartbeat and breathing after one or both have stopped. It involves giving strong, rapid pushes to the chest to keep blood moving through the body. Usually, it also involves blowing air into the person's mouth to help with breathing and send oxygen to the lungs. Also called cardiopulmonary resuscitation.

**C-stage:** This term describes the final stage of the reaction where the material s relatively insoluble and infusible. OR This term describes the final stage of the reaction where a thermoset material is relativelyinsoluble and infusible.

**C-T closure:** A continuous-thread design that begins near the bottom of the closure skirt and continues upward toward the liner. Closure size designation determines number of turns.

**C-T finish:** A continuous-thread finish that features an uninterrupted protruding helix on the neck of a container to accommodate a screw-type closure.

**C-VISA BikDD: liposome:** A formulation composed of DOTAP:cholesterol liposome nanoparticles complexed with the plasmid C-VISA BiKDD, with potential antineoplastic activity. C-VISA BikDD: liposome consists of a pancreatic-cancer-specific expression vector “VISA” (VP16-GAL4-WPRE integrated systemic amplifier) and a pancreatic-cancer-specific promoter CCKAR (cholecystokinin type A receptor) (CCKAR-VISA or C-VISA) which drives expression of the gene BikDD, a mutant form of the potent proapoptotic gene Bik (Bcl-2 interacting killer). Upon administration and transduction into pancreatic tumor cells, expression of BikDD by C-VISA BikDD:liposome may induce pancreatic tumor cell apoptosis and suppress pancreatic tumor cell proliferation. BikDD binds with greater affinity to anti-apoptotic proteins bcl-2, bcl-x1, bcl-w and Mcl-1 and is more potent than wild-type Bik. DOTAP:cholesterol liposome is composed of cationic lipid dioleoyl-trimethylammonium propane (DOTAP) and cholesterol at molar ratio of 1:1.

**C3 plants:** Plants (e.g., soybean, wheat, and cotton) whose carbon-fixation products have three carbon atoms per molecule. Compared with C4 plants, C3 plants show a greater increase in photosynthesis with a doubling of CO<sub>2</sub> concentration and less decrease in stomatal conductance, which results in an increase in leaf-level water-use efficiency.

**C3-targeted complement inhibitor APL-2:** A pegylated derivative of the cyclic tridecapeptide compstatin and inhibitor of complement component C3 (C3) activation, with potential use as a treatment for various diseases in which excessive complement activation plays a key role, including paroxysmal nocturnal hemoglobinuria (PNH) and age-related macular degeneration (AMD). Upon administration, C3-targeted complement inhibitor APL-2 selectively binds to C3 and blocks the cleavage of C3 into C3a and C3b by C3 convertase. This prevents complement pathway activation, and inhibits complement-mediated inflammation and cell lysis. Pegylation increases compstatin's half-life, and increases its efficacy.

Excessive complement activation plays a key role in various inflammatory and autoimmune diseases, and leads to tissue destruction. C3 is a crucial and central component of the complement system. Check for active clinical trials using this agent.

**C4 plants:** Plants (e.g., maize and sorghum) whose carbon fixation products have four carbon atoms per molecule. Compared with C3 plants, C4 plants show little photosynthetic response to increased CO<sub>2</sub> concentrations above 340 ppm but show a decrease in stomatal conductance, which results in an increase in photosynthetic water-use efficiency.

**CA 15-3:** A radioactive substance being studied in PET imaging to detect certain types of cancer. C-11 choline gets taken up by cells in the body and more of it is taken up by tumor cells than by normal cells. A PET scanner is used to detect which cells in the body have taken up C-11 choline. It is a type of radioimaging agent.

**CA 19-9:** A procedure in which a small amount of C-11 choline (a radioactive form of the vitamin choline) is injected into a vein. A scanner and a computer are used to make detailed pictures of areas inside the body where the C-11 choline collects. Cancer cells take up more C-11 choline than normal cells, so the pictures can be used to find cancer cells in the body. Also called carbon-11 choline PET-CT scan.

**CA 19-9 assay :** A protein found on epithelial cells that is part of a larger protein called MUC 1. CA 15-3 may be found in higher than normal amounts in patients with some types of cancer, including breast cancer. Measuring the amount of CA 15-3 in the blood may be useful in checking how well cancer treatment is working or if cancer has come back. CA 15-3 is a type of tumor marker.

**CA 27.29:** A substance released into the bloodstream by both cancer cells and normal cells. Too much CA 19-9 in the blood can be a sign of pancreatic cancer or other types of cancer or conditions. The amount of CA 19-9 in the blood can be used to help keep track of how well cancer treatments are working or if cancer has come back. It is a type of tumor marker.

**CA-125:** A laboratory test that measures the level of CA 19-9 in the blood. CA 19-9 is a substance released into the blood by both cancer cells and normal cells. Higher than normal amounts of CA 19-9 in the blood can be a

sign of pancreatic or other types of cancer or other conditions. The amount of CA 19-9 in the blood can be used to help keep track of how well cancer treatments are working or if cancer has come back. CA 19-9 is a type of tumor marker.

**CAB:** A protein found on epithelial cells, which line the inside and outside surfaces of the body. It is part of a larger protein called MUC 1. CA 27.29 may be found in higher than normal amounts in patients with some types of cancer, including breast cancer. Measuring the amount of CA 27.29 in the blood may help to find out how well cancer treatment is working or if cancer has come back. CA 27.29 is a type of tumor marker. or A substance that may be found in high amounts in the blood of patients with certain types of cancer, including ovarian cancer. CA-125 levels may also help monitor how well cancer treatments are working or if cancer has come back. Also called cancer antigen 125.

**cabazitaxel:** A semi-synthetic derivative of the natural taxoid 10-deacetylbaaccatin III with potential antineoplastic activity. Cabazitaxel binds to and stabilizes tubulin, resulting in the inhibition of microtubule depolymerization and cell division, cell cycle arrest in the G2/M phase, and the inhibition of tumor cell proliferation. Unlike other taxane compounds, this agent is a poor substrate for the membrane-associated, multidrug resistance (MDR), P-glycoprotein (P-gp) efflux pump and may be useful for treating multidrug-resistant tumors. In addition, cabazitaxel penetrates the blood-brain barrier (BBB). or Surgery in which a healthy blood vessel taken from another part of the body is used to make a new path for blood around a blocked artery leading to the heart. This restores the flow of oxygen and nutrients to the heart. Also called aortocoronary bypass and coronary artery bypass.

**cabergoline:** A synthetic ergoline derivative and a long-acting dopamine receptor agonist with high affinity for the dopamine D2 receptor. Cabergoline exerts an inhibitory effect on prolactin secretion by acting on dopamine receptors present in pituitary lactotrophs. This drug also binds to dopamine D2 receptors in the corpus striatum, thereby mimicking the actions of dopamine on motor control. Cabergoline also possesses antioxidant and neuroprotective properties due to its free radical scavenging activity. Cabergoline is used in the treatment of Parkinson's disease and in the treatment of hyperprolactinemia.

**Cable extrusion:** Process of extruding cables for wire sheathing or coating. Various plastic materials can be used for this process, such as PVC, HDPE, depending on the application of the extruded plastic profile.

**Cabometyx :** (Other name for: cabozantinib-s-malate) OR A drug used with prednisone to treat hormone-resistant prostate cancer that has spread and that had been treated with docetaxel. It is also being studied in the treatment of other types of cancer. Cabazitaxel blocks cell growth by stopping cell division and may kill cancer cells. It is a type of antimetabolic agent. Also called Jevtana and taxoid XRP6258.

**cabozantinib-s-malate:** The s-malate salt form of cabozantinib, an orally bioavailable, small molecule receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic activity. Cabozantinib strongly binds to and inhibits several RTKs, which are often overexpressed in a variety of cancer cell types, including hepatocyte growth factor receptor (MET), RET (rearranged during transfection), vascular endothelial growth factor receptor types 1 (VEGFR-1), 2 (VEGFR-2), and 3 (VEGFR-3), mast/stem cell growth factor (KIT), FMS-like tyrosine kinase 3 (FLT-3), TIE-2 (TEK tyrosine kinase, endothelial), tropomyosin-related kinase B (TRKB) and AXL. This may result in an inhibition of both tumor growth and angiogenesis, and eventually lead to tumor regression. or An enzyme that is involved in many cell processes, such as cell division. The gene for c-ABL is on chromosome 9. In most patients with chronic myelogenous leukemia (CML), the part of chromosome 9 with c-ABL has broken off and traded places with part of chromosome 22 to form the BCR-ABL fusion gene.

**cachexia :** A drug used to treat advanced renal cell carcinoma (a type of kidney cancer) that was treated with antiangiogenesis therapy (a type of anticancer therapy). It is also being studied in the treatment of other types of cancer. Cabometyx blocks certain proteins, which may help keep cancer cells from growing. It may also prevent the growth of new blood vessels that tumors need to grow. Cabometyx contains the active ingredient cabozantinib-s-malate. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor.

**CAD:** A drug used to treat advanced renal cell carcinoma (a type of kidney cancer) that was treated with antiangiogenesis therapy (a type of anticancer therapy). It is used under the brand name Cabometyx to treat this cancer. It is also used under the brand name Cometriq to treat progressive medullary

thyroid cancer that has spread to other parts of the body. Cabozantinib-s-malate is also being studied in the treatment of other types of cancer. It blocks certain proteins, which may help keep cancer cells from growing. It may also prevent the growth of new blood vessels that tumors need to grow. Cabozantinib-s-malate is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor.

**CAD (Computer-aided Design):** The use of computer technology for the design of objects, real or virtual.

**cadazolid:** An oxazolidinone-type antibiotic, with activity against gram-positive bacteria, including *Clostridium difficile*. Although the exact mode of action through which cadazolid exerts its effect has yet to be fully elucidated, upon administration, this agent inhibits bacterial protein synthesis and leads to bacterial cell death.

**Cadmium:** Symbol:"Cd" Atomic Number:"48" Atomic Mass: 112.41amu. Cadmium is one of the transition elements. This bluish metal is actually very soft and can be cut with a knife. You will find it used in nickel-cadmium batteries, nuclear reactors, and as a pigment. It is toxic.

**cadmium :** Loss of body weight and muscle mass, and weakness that may occur in patients with cancer, AIDS, or other chronic diseases.

**CADMIUM PIGMENTS:** Inorganic pigments based on cadmium sulphide and cadmium sulphoselenides used widely in polyethylene. Include cadmium maroon, -orange, -red, and -yellow.

**CADPAC:** Another ab initio package; acronym stands for "Cambridge analytical derivatives package."

**CAF:** A disease in which there is a narrowing or blockage of the coronary arteries (blood vessels that carry blood and oxygen to the heart). CAD is usually caused by atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries). The disease may cause chest pain, shortness of breath during exercise, and heart attacks. The risk of CAD is increased by having a family history of CAD before age 50, older age, smoking tobacco, high blood pressure, high cholesterol, diabetes, lack of exercise, and obesity. Also called coronary artery disease and coronary heart disease.

**CAF regimen:** A chemotherapy regimen consisting of cyclophosphamide, doxorubicin hydrochloride (Adriamycin), and fluorouracil, which may be used in the adjuvant setting for the treatment of nonmetastatic breast cancer

or alone for the treatment of metastatic breast cancer. or A metallic element that occurs naturally in tiny amounts in air, water, soil, and food. It is a byproduct of zinc refining and is used to make batteries, pigments, plastics, alloys, and electroplate. It is also found in tobacco and tobacco smoke. Exposure to high levels of cadmium may cause certain cancers and other health problems.

**caffeine:** An abbreviation for a chemotherapy combination used alone or together with other therapies to treat breast cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, doxorubicin hydrochloride (Adriamycin), and fluorouracil. Also called CAF regimen. OR A naturally occurring xanthine derivative with central nervous system (CNS) stimulating activity. Due to the structural similarity to adenosine, caffeine binds to and blocks adenosine receptors, thereby preventing the inhibitory effects of adenosine on nerve cells. This leads to stimulation of medullary, vagal, vasomotor, and respiratory centers in the brain; and the release of epinephrine. Physiologic responses can include bradycardia, tachycardia, vasoconstriction, CNS excitability, increased respiratory rate, increased blood pressure, increased blood flow to muscles, decreased blood flow to skin and inner organs, and release of glucose by the liver. Due to the interaction between adenosine A<sub>2A</sub> and dopamine D<sub>2</sub> receptors, caffeine can also indirectly increase the levels of dopamine in the brain.

**caffeine<sup>81042</sup>:** A substance found in tea, coffee, and cola that acts as a stimulant. It is extremely soluble in supercritical fluid carbon dioxide and somewhat soluble in water; aqueous solutions of caffeine quickly break down.

**Cage:** Large cylindrical shaped core of a spiral system. The system's main driving component. Also see Drum.

**Cage Bars:** The vertical members that form the driving surface of the cage or drum in a lotension spiral system.

**Cahn-Ingold-Prelog notational system:** a system that labels the three-dimensional arrangement of atoms around a stereogenic center of a molecule by ranking their atomic weights. The letter R indicates a clockwise decline in rank, and S indicates a counterclockwise decline in rank.

**CAIX inhibitor DTP348:** An orally bioavailable, nitroimidazole-based sulfamide, carbonic anhydrase IX (CAIX) inhibitor with potential antineoplastic activity. Upon administration, CAIX inhibitor DTP348 inhibits tumor-associated CAIX, a hypoxia-inducible transmembrane glycoprotein that catalyzes the reversible reaction and rapid interconversion of carbon dioxide and water to carbonic acid, protons, and bicarbonate ions. This prevents the acidification of the tumor's extracellular microenvironment and decreases the intracellular pH. This results in increased cell death in CAIX-expressing, hypoxic tumors. In addition, DTP348, through its nitroimidazole moiety, is able to sensitize hypoxic tumor cells to irradiation. CAIX is overexpressed in various tumors and plays a key role in intra- and extracellular pH regulation, cancer cell progression, survival, migration and invasion.

**cake, sludge:** the material resulting from air drying or dehydrating sludge.

**calaspargase pegol:** An intravenous formulation containing E. coli-derived L-asparaginase II conjugated with succinimidyl carbonate monomethoxypolyethylene glycol (SC-PEG), with potential antineoplastic activity. L-asparaginase hydrolyzes L-asparagine to L-aspartic acid and ammonia, thereby depleting cells of asparagine; asparagine depletion blocks protein synthesis and tumor cell proliferation, especially in the G1 phase of the cell cycle and ultimately induces tumor cell death. Asparagine is critical to protein synthesis in acute lymphoblastic leukemia (ALL) cells which, unlike normal cells, cannot synthesize this amino acid due to the absence of the enzyme asparagine synthase. Pegylation decreases enzyme antigenicity and increases its half life. SC is used as a PEG linker to facilitate attachment to asparaginase and enhances the stability of the formulation. Check for active clinical trials using this agent.

**calbindin :** An abbreviation for a chemotherapy combination used alone or together with other therapies to treat breast cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, doxorubicin hydrochloride (Adriamycin), and fluorouracil. Also called CAF.

**calcification :** A substance found in the leaves and beans of the coffee tree, in tea, yerba mate, guarana berries, and in small amounts in cocoa. It can also be made in the laboratory, and is added to some soft drinks, foods, and medicines. Caffeine increases brain activity, alertness, attention, and energy.

It may also increase blood pressure, heart rate, breathing rate, and the loss of water from the body in urine.

**calcinosis** : A group of proteins that bind calcium and move it into cells. Calbindins are found in many different tissues in the body.

**calcipotriene**: A synthetic vitamin D derivative usually formulated for topical dermatological use, antipsoriatic calcipotriene (calcipotriol) competes equally with active 1,25-hydroxy-2D3 (the natural form of vitamin D) for 1,25-hydroxy-2D3 receptors in regulating cell proliferation and differentiation. It induces differentiation and suppresses proliferation of keratinocytes, reversing abnormal keratinocyte changes in psoriasis, and leads to normalization of epidermal growth. Check for active clinical trials using this agent.

**calcitonin** : Deposits of calcium in the tissues. Calcification in the breast can be seen on a mammogram, but cannot be detected by touch. There are two types of breast calcification, macrocalcification and microcalcification. Macrocalcifications are large deposits and are usually not related to cancer. Microcalcifications are specks of calcium that may be found in an area of rapidly dividing cells. Many microcalcifications clustered together may be a sign of cancer.

**calcitriol**: A condition in which abnormal amounts of calcium salts are found in soft tissue, such as muscle. OR A synthetic physiologically-active analog of vitamin D, specifically the vitamin D3 form. Calcitriol regulates calcium in vivo by promoting absorption in the intestine, reabsorption in the kidneys, and, along with parathyroid hormone, regulation of bone growth. A calcitriol receptor-binding protein appears to exist in the mucosa of human intestine. Calcitriol also induces cell cycle arrest at G0/G1 phase of the cell cycle, cell differentiation, and apoptosis, resulting in inhibition of proliferation of some tumor cell types. This agent may be chemopreventive for colon and prostate cancers. Check for active clinical trials using this agent.

**Calcium**: Symbol:"Ca" Atomic Number:"20" Atomic Mass: 40.06amu. Member of the alkaline earth metals group. Calcium can be found in three percent of the Earth's crust, your bones and cells, and in the shells of ocean creatures.

**calcium** : A hormone formed by the C cells of the thyroid gland. It helps maintain a healthy level of calcium in the blood. When the calcium level is

too high, calcitonin lowers it.

**calcium aluminosilicate anti-diarrheal:** A clay compound consisting of aluminosilicate and calcium ions with potential antidiarrheal activity. Calcium aluminosilicate anti-diarrheal consists of microscopically large flat plates of aluminosilicate separated by calcium ions that may sorb toxic chemotherapeutic drugs and their metabolites and inflammatory proteins such as TNF-alpha, which may help minimize chemotherapy-mediated or radiation therapy-mediated damage to the intestinal epithelium and so therapy-related diarrhea.

**calcium antagonist :** The active form of vitamin D. Calcitriol is formed in the kidneys or made in the laboratory. It is used as a drug to increase calcium levels in the body in order to treat skeletal and tissue-related calcium deficiencies caused by kidney or thyroid disorders.

**Calcium Carbonate:** A chemical compound filler and extender used in thermoplastics, commonly found in rock.

**CALCIUM CARBONATE:** A filler and extender used in thermoplastics. It occurs naturally in the form of minerals such as calcite, chalk, limestone, marble, and whiting.

**calcium carbonate:** A mineral needed for healthy teeth, bones, and other body tissues. It is the most common mineral in the body. A deposit of calcium in body tissues, such as breast tissue, may be a sign of disease. OR The carbonic salt of calcium ( $\text{CaCO}_3$ ). Calcium carbonate is used therapeutically as a phosphate buffer in hemodialysis, as an antacid in gastric hyperacidity for temporary relief of indigestion and heartburn, and as a calcium supplement for preventing and treating osteoporosis.

**Calcium Carbonate:** Mineral based additive used as filler, modifier, and sometimes antiblock agent.

**calcium channel blocker :** A type of drug that keeps calcium from entering the muscle cells of the heart and blood vessels. This causes the blood vessels to relax and widen, which allows the blood to flow more easily and lowers blood pressure. Some calcium antagonists may also slow the heartbeat. Calcium antagonists are used to treat high blood pressure, chest pain (angina), abnormal heartbeat (arrhythmia), and several other conditions. Also called calcium channel blocker.

**calcium chloride:** A crystalline, white substance, soluble in water, calcium chloride is the chloride salt of calcium, a bivalent metallic element with many crucial biological roles. Calcium is a major constituent of the skeleton but plays many roles as an intracellular and plasma ion as well. In medicine, calcium chloride is also used as a 10% solution in injection, for calcium replenishment. Check for active clinical trials using this agent.

**calcium citrate:** The citrate salt of calcium. An element necessary for normal nerve, muscle, and cardiac function, calcium as the citrate salt helps to maintain calcium balance and prevent bone loss when taken orally. This agent may also be chemopreventive for colon and other cancers.

**calcium glucarate:** The orally bioavailable calcium salt of glucaric acid, a natural substance found in many fruits and vegetables, with potential chemopreventive activity. After absorption, glucaric acid is converted to d-glucaro-1,4-lactone which inhibits beta-glucuronidase, an enzyme found in certain bacteria that reside in the human gut. The detoxification of various toxin and sex hormone metabolites depends upon their conjugation to glucuronic acid in the liver and subsequent excretion of glucuronic acid conjugated metabolites in the bile. Bacterial beta-glucuronidase may catalyze the deconjugation of glucuronic acid conjugated metabolites of toxins and sex hormones, thus prolonging exposure to unconjugated and unexcreted toxin and sex hormone metabolites. Accordingly, calcium glucarate supplementation may indirectly inhibit sex hormone-mediated and toxin-mediated tumorigenesis by inhibiting bacterial beta-glucuronidase activity. Elevated bacterial beta-glucuronidase activity may be associated with an increased risk for sex hormone-mediated and toxin-mediated cancers such as breast, prostate, and colon cancers.

**calcium gluconate:** The gluconate salt of calcium. An element or mineral necessary for normal nerve, muscle, and cardiac function, calcium as the gluconate salt helps to maintain calcium balance and prevent bone loss when taken orally. This agent may also be chemopreventive for colon and other cancers. OR A form of the mineral calcium that is used to prevent or treat osteoporosis (a decrease in bone mass and density) and to treat heartburn and upset stomach. It is also being studied in the prevention of bone problems in people with cancer. It is a type of dietary supplement.

**calcium infusion test :** A type of drug that keeps calcium from entering the muscle cells of the heart and blood vessels. This causes the blood

vessels to relax and widen, which allows the blood to flow more easily and lowers blood pressure. Some calcium channel blockers may also slow the heartbeat. Calcium channel blockers are used to treat high blood pressure, chest pain (angina), abnormal heartbeat (arrhythmia), and several other conditions. Also called calcium antagonist.

**calcium levoleucovorin :** The mineral calcium combined with a form of the sugar glucose. It is used to prevent and treat osteoporosis (a decrease in bone mass and density). It is also being studied in the treatment of bone loss and nerve damage caused by chemotherapy. It is a type of dietary supplement.

**Calcium sulfate (CaSO<sub>4</sub>) :** Calcium sulfate or gypsum. The main sources of calcium sulfate are the naturally-occurring gypsum or it is produced as a by-product in a number of industrial processes.

**calcium-41 (41Ca) chloride aqueous solution :** A test used to help diagnose a type of pancreatic islet cell tumor called a gastrinoma. The patient receives a 3-hour infusion of a substance called calcium gluconate and the amount of gastrin in the blood is measured. An increase in the level of gastrin in the blood after the infusion may be a sign of a gastrinoma. OR A drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Calcium levoleucovorin is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Calcium levoleucovorin is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called citrovorum factor, leucovorin calcium, and Wellcovorin. OR An orally bioavailable aqueous solution containing the chloride salt of the radioisotope calcium-46 (46Ca) with phosphate-binding and radioisotopic activities. Upon administration of calcium-46 chloride aqueous solution, calcium-46 is preferentially taken up by osteoblasts, which generate mineralized osteoid containing calcium. Calcium-46 accumulation and turnover in bone can be measured with bone scintigraphy and urinary isotope excretion testing

**calcium-41 chloride aqueous solution:** An orally bioavailable aqueous solution containing the chloride salt of the radioisotope calcium-41 (41Ca) with phosphate-binding and radioisotopic activities. Upon administration of calcium-41 chloride aqueous solution, calcium-41 is preferentially taken up

by osteoblasts, which generate mineralized osteoid containing calcium. Calcium-41 accumulation and turnover in bone can be measured with bone scintigraphy and urinary isotope excretion.

**calcrete:** A surficial gravel and sand conglomerate cemented by calcium carbonate.

**calculi:** stones, such as those found in kidney or gall bladder

**Calculus bovis/Moschus/Olibanum/Myrrha capsule:** An orally available traditional Chinese medicine (TCM)-based capsule formulation containing Calculus bovis, the dried gallstones of cattle, Moschus, also referred to as deer musk, the resin Olibanum and the resin Myrrha, with potential antineoplastic and chemopreventive activities. Although the exact mechanisms of action through which the active ingredients in the Calculus bovis/Moschus/Olibanum/Myrrha capsule elicit their effects have yet to be fully elucidated, they may, upon intake, exert their antineoplastic activity through modulation of the immune system, inhibition of tumor cell proliferation and induction of apoptosis.

**caldera:** a depression larger than a crater, at least a kilometer in diameter, that forms at the top of a volcano when the summit is destroyed during an eruption or when the crater floor collapses into the magma chamber below.  
OR extinct volcano that has a collapsed cone.

**Caldolor:** (Other name for: ibuprofen intravenous)

**Calendaring:** The process of pressing or smoothing material between rollers. OR A process by which a heated rubber plastic product is squeezed between heavy rollers into thin sheet or film. OR Form of extrusion using two or more counter rotating rolls in which film and sheet is produced by squeezing a hot, viscous material between them. OR A form of extrusion using two or more counter rotating rolls in which film and sheet is produced by squeezing a hot, viscous material between them.

**Calendula officinalis/Plantago major/Cochlearia armoracia/**

**Hamamelis virginiana herbal toothpaste:** A phytochemical-based toothpaste containing Calendula officinalis, Plantago major, Cochlearia armoracia, Hamamelis virginiana with potential soothing activity.

Calendula officinalis/Plantago major/Cochlearia armoracia/ Hamamelis virginiana herbal toothpaste may relieve the discomfort associated with radiation-induced mucositis.

**calendula ointment** : A substance used to diagnose and monitor cancer that has spread to the bones. It is also used to study the turnover of bone tissue and to diagnose other conditions that affect the bones, such as osteoporosis. Calcium-41 ( $^{41}\text{Ca}$ ) is a form of calcium that gives off radiation. It is passed from the body in the urine.

**calfactant**: A sterile suspension composed of an extract of bovine pulmonary surfactant with surfactant activity. Calfactant contains phospholipids, neutral lipids, and hydrophobic surfactant-associated proteins B (SP-B) and C (SP-C). Upon intratracheal administration, this agent, mimicking endogenous pulmonary surfactant, lines the alveoli and smallest bronchioles, keeping alveoli open during expiration by lowering surface tension. Resulting improvements in lung compliance and respiratory gas exchange may lead to improvements in ventilation and oxygenation.

**calgranulin A** : A substance used to study the turnover of bone tissue in certain diseases, such as osteoporosis or cancer that has spread to the bone. Calcium-46 ( $^{46}\text{Ca}$ ) is a form of calcium. It is passed from the body in the urine.

**calgranulin B** : A substance made from the flower of the marigold plant *Calendula officinalis*. Calendula-based skin products have been used to treat minor cuts, burns, and skin irritation. The products that are available in the United States may not contain the same amount or mixture of ingredients and may not be effective. Another product, Calendula ointment, is being studied in France in the prevention of dermatitis in patients having radiation therapy for breast cancer. The ointment being studied is not available in the United States.

**Calibration**: a process of normalizing sensor output by measuring a series of two or more known concentration solutions. The ion analyzer then calculates the offset and slope characteristics of the electrode and uses them to compute the concentration of unknown samples. OR The adjustment, as necessary, of a measuring device such that it responds within the required range and accuracy to known values of input. OR Calibration is correcting a measuring instrument by measuring values whose true values are known. Calibration minimizes systematic error. OR the checking, adjusting, or systematic standardizing of the graduations of a quantitative measuring instrument.

**Calibration (of a process variable measurement instrument):** A procedure in which an instrument is used to measure several independently known process variable values, and a calibration curve of known variable values versus the corresponding instrument readings is plotted. Once the instrument has been calibrated, readings obtained with it can be converted to equivalent process variable values directly from the calibration curve.

**Calibration curve:** a plot of electrode potential versus activity in two or more standardizing solutions. Unknown sample activity is determined by converting electrode potential to activity using the curve.

**caliche:** a hardpan formed by the precipitation of salt by evaporation. OR Also called hardpan; an opaque, reddish-brown-to-white calcareous material, which occurs in layers near the surface of stony soils in arid and semiarid areas.

**Californium:** Symbol:"Cf" Atomic Number:"98" Atomic Mass: (251)amu. Californium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a very radioactive element and you might find it used in medicine.

**Calmodulin:** In vertebrates, a ubiquitous protein in vertebrates that, when bound to calcium, stimulates many enzymes and transporters.

**Calmodulin-dependent kinase:** A protein kinase that is activated by the binding of a  $\text{Ca}^{2+}$ -calmodulin complex.

**Calnexin:** Anchored in the endoplasmic reticulum membrane, a chaperone protein that prevents the export of immature or defective glycoproteins by binding glucose residues on the glycoproteins.

**Caloric homeostasis:** Maintenance of a constant body weight by a complex network of hormonal interactions.

**caloric intake :** A protein that is made by many different types of cells and is involved in processes that take place both inside and outside of the cell. It is made in larger amounts in inflammatory diseases such as rheumatoid arthritis, and in some types of cancer. It is being studied as a biomarker for breast cancer. Also called S100 calcium binding protein A8.

**calorie:** the quantity of heat necessary to raise the temperature of 1 gram of water 1 oC at 1 atmosphere pressure. OR The amount of energy needed to raise the temperature of 1 gram of water by 1 degree Celsius. OR A calorie is a unit scientific measure for heat and energy. You have probably heard of

calories in your food. Scientists measure one calorie as the amount of energy needed to raise the temperature of water (one gram of water) one degree Celsius. OR a unit of energy, equal to 4.184 joules. OR The amount of heat required to raise the temperature of 1 gram of water from 14.5°C to 15.5°C.

**calorie :** A protein that is made by many different types of cells and is involved in processes that take place both inside and outside of the cell. It is made in larger amounts in inflammatory diseases such as rheumatoid arthritis, and in some types of cancer. It is being studied as a biomarker for breast cancer. Also called S100 calcium binding protein A9.

**calorimeter:** Any one of a number of devices used for measuring the heat content. OR An insulated vessel for measuring the amount of heat absorbed or released by a chemical or physical change.

**Calorimetry:** Experimental determination of heat changes arising from chemical or physical change. OR Calorimetry is a technique for measuring the heat generated or lost in a chemical reaction. The reaction is carried out in such a way that as much as possible of the heat change is transferred to another material, raising its temperature. The heat generated can then be calculated from the amount of the material heated and its specific heat. OR Experimental determination of heat absorbed or released by a chemical or physical change.

**CALR gene :** Refers to the number of calories (energy content) consumed.

**calusterone:** A 17-alkylated orally active androgenic steroid. Calusterone may alter the metabolism of estradiol and reduce estrogen production.

**calutron:** A device that separates isotopes (e. g.  $^{235}\text{U}$  from  $^{238}\text{U}$ ) by ionizing the sample, accelerating the ions in a strong electric field, and then passing them through a strong magnetic field. The magnetic field bends the trajectories of the ions with high charge-to-mass ratio more, allowing ions to be separated by mass and collected.

**Calvin cycle:** The incorporation of  $\text{CO}_2$  into glucose by enzymatic reactions. OR In plants, a cyclic metabolic pathway in which carbon dioxide is incorporated into ribulose 1,5-bisphosphate to give compounds that can be used for the synthesis of glucose. OR The cyclic pathway used by plants to fix carbon dioxide and produce triose phosphates.

**calving:** the breaking off of large blocks of ice from a glacier.

**Calx** : It was believed to be an ash-like substance which is left when the phlogiston leaves a metal. Although we now believe that metals form metal oxides when they burn, we no longer believe the phlogiston theory.

**Cam:** A portion of the mold that is pushed into place as the mold closes, using a cam-actuated slide. Typically, side actions are used to resolve an undercut, or sometimes to allow an undrafted outside wall. As the mold opens, the side action pulls away from the part, allowing the part to be ejected. Also called a “side-action.”

**CAM :** A measurement of the energy content of food. The body needs calories as to perform its functions, such as breathing, circulating the blood, and physical activity. When a person is sick, their body may need extra calories to fight fever or other problems.

**CAM (Computer-aided Manufacturing):** The use of computer software to control machine tools and related machinery in the manufacturing of workpieces.

**CAM plants (crassulacean acid metabolism):** Plants (e.g, cactus and other succulents) that, unlike the C3 and C4 plants, temporarily separate the processes of carbon dioxide uptake and fixation when grown under arid conditions. They take up gaseous carbon dioxide at night when the stomata are open and water loss is minimal. During the day when the stomata are closed, the stored CO<sub>2</sub> is released and chemically processed. When CAM plants are not under water stress, they then follow C3 photosynthesis.

**cAMP:** 3',5' cyclic adenosine monophosphate The cAMP molecule plays a key role in metabolic regulation.

**cAMP:** See cyclic AMP.

**Campath :** A gene that makes a protein called calreticulin, which is involved in many cell functions. Calreticulin helps control the amount of calcium that is stored in cells. This is thought to play a role in the control of gene activity, cell growth and movement, the attachment of cells to one another, and cell death. Mutated (changed) forms of the CALR gene have been found in some types of blood conditions, including essential thrombocythemia and primary myelofibrosis.

**camphor :** Forms of treatment that are used in addition to (complementary) or instead of (alternative) standard treatments. These practices generally are not considered standard medical approaches.

Standard treatments go through a long and careful research process to prove they are safe and effective, but less is known about most types of CAM. CAM may include dietary supplements, megadose vitamins, herbal preparations, special teas, acupuncture, massage therapy, magnet therapy, spiritual healing, and meditation. Also called complementary and alternative medicine.

**Camptogen:** (Other name for: rubitecan)

**Camptosar :** A drug used to treat B-cell chronic lymphocytic leukemia. It is also being studied in the treatment of other types of cancer. Campath binds to a protein called CD52, which is found on some types of immune cells and cancer cells. This may help the immune system kill cancer cells. Campath is a type of monoclonal antibody. Also called alemtuzumab.

**camptothecin :** A substance that comes from the wood and bark of the camphor tree or is made in the laboratory. It has a very unique smell and taste and is used in commercial products (for example, mothballs). Camphor is used in topical anti-infective and anti-pruritic (anti-itching) agents.

**camptothecin analog :** A drug used alone or with other drugs to treat colon cancer or rectal cancer that has spread to other parts of the body or has come back after treatment with fluorouracil. It is also being studied in the treatment of other types of cancer. Camptosar blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called CPT 11 and irinotecan hydrochloride.

**camptothecin analogue TLC388:** A synthetic analogue of camptothecin with potential antineoplastic and radio-sensitizing activities. Camptothecin analogue TLC388 selectively stabilizes topoisomerase I-DNA covalent complexes during S-phase, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery. Topoisomerase I relaxes negative super-coiled DNA during replication and transcription. This agent has been chemically modified to enhance the potency and stability of camptothecin.

**camptothecin-20(S)-O-propionate hydrate:** The hydrated, crystalline propionate ester (attached in position C-20) prodrug of camptothecin, an alkaloid isolated from the Chinese tree *Camptotheca acuminata*, with

potential antineoplastic activity. Upon entry into cells, camptothecin-20(S)-O-propionate is hydrolyzed by esterases into the active form camptothecin. Camptothecin selectively stabilizes topoisomerase I-DNA covalent complexes, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery, thus inhibiting DNA replication and triggering apoptotic cell death. Camptothecin readily undergoes hydrolysis at physiological pH, changing its conformation from the active, S-configured lactone structure to an inactive carboxylate form. The ester chain in the vicinity of the S-configured lactone moiety, a key determinant for the chemotherapeutic efficacy of the camptothecins, inhibits protein binding, rendering this agent resistant to hydrolysis and prolonging its half-life.

**Can Liner:** Term used for garbage, trash or waste bags. It is used in industrial, institutional and medical applications. Can Liner Standard Colors are clear, black, white, gray, red, blue and yellow.

**CANAL RAY TUBE:** showed that ions are produced by electron bombardment. The simplest positive ion,  $H^{+1}$ , is the PROTON.

**canarypox-hIL-12 melanoma vaccine:** A vaccine consisting of a replication-defective recombinant canarypox virus (ALVAC) that encodes the gene for human interleukin-12 (hIL-12). Produced mainly by B-cells, IL-12 is an endogenous cytokine that activates natural killer (NK) cells, promotes cytotoxic T lymphocyte (CTL) responses, induces the release of interferon-gamma (IFN-gamma), and may exhibit antitumor and anti-angiogenic effects. Vaccination with canarypox-hIL-12 melanoma vaccine may stimulate the host immune system to mount an immune response against tumor cells, thereby inhibiting tumor growth and/or metastasis.

**Cancell :** An anticancer drug that belongs to the family of drugs called topoisomerase inhibitors.

**cancer:** Cancer is a disease which results from the development of a malignant tumour and its spread into the surrounding tissues. See tumour.

**cancer :** An anticancer drug related in structure to camptothecin, a topoisomerase inhibitor. One such drug is aminocamptothecin.

**cancer antigen 125 :** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in Cancell have been tested, and none of them have been shown to be effective

in treating any form of cancer. Cancell is not available in the United States. Also called 126-F, Cantron, Jim's Juice, JS-101, JS-114, Protocol, and Sheridan's Formula.

**cancer cell line** : A term for diseases in which abnormal cells divide without control and can invade nearby tissues. Cancer cells can also spread to other parts of the body through the blood and lymph systems. There are several main types of cancer. Carcinoma is a cancer that begins in the skin or in tissues that line or cover internal organs. Sarcoma is a cancer that begins in bone, cartilage, fat, muscle, blood vessels, or other connective or supportive tissue. Leukemia is a cancer that starts in blood-forming tissue, such as the bone marrow, and causes large numbers of abnormal blood cells to be produced and enter the blood. Lymphoma and multiple myeloma are cancers that begin in the cells of the immune system. Central nervous system cancers are cancers that begin in the tissues of the brain and spinal cord. Also called malignancy.

**cancer cluster** : A substance that may be found in high amounts in the blood of patients with certain types of cancer, including ovarian cancer. Cancer antigen 125 levels may also help monitor how well cancer treatments are working or if cancer has come back. Also called CA-125.

**Cancer Information Service** : Cancer cells that keep dividing and growing over time, under certain conditions in a laboratory. Cancer cell lines are used in research to study the biology of cancer and to test cancer treatments.

**Cancer Intervention and Surveillance Modeling Network** : The occurrence of a larger-than-expected number of cases of cancer within a group of people in a geographic area over a period of time.

**cancer of the adrenal cortex** : The Cancer Information Service is the National Cancer Institute's link to the public, interpreting and explaining research findings in a clear and understandable manner, and providing personalized responses to specific questions about cancer. Access the CIS by calling 1-800-4-CANCER (1-800-422-6237), or by using the LiveHelp instant-messaging service at Also called CIS.

**cancer of unknown primary origin** : A group of researchers supported by the National Cancer Institute (NCI) who use statistical models to help understand how cancer prevention, screening, and treatment programs can affect the number of new cases of cancer diagnosed each year and the

number of deaths from cancer each year. The Cancer Intervention and Surveillance Modeling Network is now studying breast, colorectal, esophageal, lung, and prostate cancers. The models they create help guide future cancer control strategies, research priorities, policies, and decision making. Also called CISNET.

**cancer peptide vaccine S-588410:** A cancer peptide vaccine containing five human leukocyte antigen (HLA)-A\*2402-restricted epitope peptides derived from as of yet not disclosed oncoantigens, with potential immunostimulating and antineoplastic activities. Upon administration of the cancer peptide vaccine S-588410, the peptides may stimulate a cytotoxic T-lymphocyte (CTL) response against cancer cells expressing the antigens. This decreases proliferation of susceptible tumor cells.

**cancer stemness kinase inhibitor BBI503:** An orally available cancer cell stemness kinase inhibitor with potential antineoplastic activity. Although the exact target has not been fully elucidated, BBI503 targets and inhibits one or more pathways involved in cancer stem cell survival. As a result, cancer stem cell (CSC) growth as well as heterogeneous cancer cell growth is inhibited. CSCs, self-replicating cells able to differentiate into heterogeneous cancer cells, appear to be responsible for both tumor relapse and metastasis.

**cancer subtype :** A rare cancer that forms in the outer layer of tissue of the adrenal gland (a small organ on top of each kidney that makes steroid hormones, adrenaline, and noradrenaline to control heart rate, blood pressure, and other body functions). Also called adrenocortical cancer and adrenocortical carcinoma.

**cancer treatment vaccine :** A case in which cancer cells are found in the body, but the place where the cells first started growing (the origin or primary site) cannot be determined. Also called carcinoma of unknown primary and CUP.

**cancer vaccine :** Describes the smaller groups that a type of cancer can be divided into, based on certain characteristics of the cancer cells. These characteristics include how the cancer cells look under a microscope and whether there are certain substances in or on the cells or certain changes to the DNA of the cells. It is important to know the subtype of a cancer in order to plan treatment and determine prognosis.

**cancer-related post-traumatic stress :** A type of vaccine that is usually made from a patient's own tumor cells or from substances taken from tumor cells. A cancer vaccine may help the immune system kill cancer cells. Also called cancer vaccine.

**Candidas:** (Other name for: caspofungin acetate)

**candesartan cilexetil:** A synthetic, benzimidazole-derived angiotensin II receptor antagonist prodrug with antihypertensive activity. After hydrolysis of candesartan cilexetil to candesartan during gastrointestinal absorption, candesartan selectively competes with angiotensin II for the binding of the angiotensin II receptor subtype 1 (AT1) in vascular smooth muscle, blocking angiotensin II-mediated vasoconstriction and inducing vasodilatation. In addition, antagonism of AT1 in the adrenal gland inhibits angiotensin II-stimulated aldosterone synthesis and secretion by the adrenal cortex; sodium and water excretion increase, followed by a reduction in plasma volume and blood pressure.

**candidiasis :** A type of vaccine that is usually made from a patient's own tumor cells or from substances taken from tumor cells. A cancer vaccine may help the immune system kill cancer cells. Also called cancer treatment vaccine.

**candidosis :** A condition that develops in some people who are diagnosed with cancer. Symptoms of cancer-related post-traumatic stress (PTS) include having frightening thoughts or trouble sleeping, being distracted or overexcited, feeling alone, or losing interest in daily activities. Symptoms may also include feelings of shock, fear, helplessness, or horror. Cancer-related PTS can occur anytime after diagnosis, including during or after treatment. Relaxation training, counseling, support groups, and certain medicines may be used to reduce symptoms of PTS.

**canertinib :** A condition in which *Candida albicans*, a type of yeast, grows out of control in moist skin areas of the body. It is usually a result of a weakened immune system, but can be a side effect of chemotherapy or treatment with antibiotics. Candidiasis usually affects the mouth (oral candidiasis); however, rarely, it spreads throughout the entire body. Also called candidosis and thrush.

**canertinib dihydrochloride:** The hydrochloride salt of an orally bio-available quinazoline with potential antineoplastic and radiosensitizing activities. Canertinib binds to the intracellular domains of epidermal growth

factor receptor tyrosine kinases (ErbB family), irreversibly inhibiting their signal transduction functions and resulting in tumor cell apoptosis and suppression of tumor cell proliferation. This agent also acts as a radiosensitizing agent and displays synergistic activity with other chemotherapeutic agents.

**canertinib dihydrochloride :** A condition in which *Candida albicans*, a type of yeast, grows out of control in moist skin areas of the body. It is usually a result of a weakened immune system, but can be a side effect of chemotherapy or treatment with antibiotics. Candidosis usually affects the mouth (oral candidosis); however, rarely, it spreads throughout the entire body. Also called candidiasis and thrush.

**canfosfamide hydrochloride:** The hydrochloride salt of a modified glutathione analogue with potential antineoplastic activity. Canfosfamide is selectively activated by glutathione S-transferase P1-1 into an alkylating metabolite that forms covalent linkages with nucleophilic centers in tumor cell DNA, which may induce a cellular stress response and cytotoxicity, and decrease tumor proliferation. S-transferase P1-1 is an enzyme that is overexpressed in many human malignancies.

**Canister:** See Dry cask storage.

**Cannabics SR:** (Other name for: Cannabis extract oil SR capsule)

**Cannabics SR capsules:** (Other name for: Cannabis extract oil SR capsule)

**cannabidiol:** A phytocannabinoid derived from *Cannabis* species, which is devoid of psychoactive activity, with analgesic, anti-inflammatory, antineoplastic and chemopreventive activities. Upon administration, cannabidiol (CBD) exerts its anti-proliferative, anti-angiogenic and pro-apoptotic activity through various mechanisms, which likely do not involve signaling by cannabinoid receptor 1 (CB1), CB2, or vanilloid receptor 1. CBD stimulates endoplasmic reticulum (ER) stress and inhibits AKT/mTOR signaling, thereby activating autophagy and promoting apoptosis. In addition, CBD enhances the generation of reactive oxygen species (ROS), which further enhances apoptosis. This agent also upregulates the expression of intercellular adhesion molecule 1 (ICAM-1) and tissue inhibitor of matrix metalloproteinases-1 (TIMP1) and decreases the expression of inhibitor of DNA binding 1 (ID-1). This inhibits cancer cell invasiveness and metastasis. CBD may also activate the transient

receptor potential vanilloid type 2 (TRPV2), which may increase the uptake of various cytotoxic agents in cancer cells. The analgesic effect of CBD is mediated through the binding of this agent to and activation of CB1.

**cannabinoid :** A substance being studied in the treatment of some types of cancer. Canertinib blocks the action of proteins called epidermal growth factor receptors, and may cause cancer cells to die. It is a type of tyrosine kinase inhibitor. Also called canertinib dihydrochloride and CI-1033.

**cannabinol:** A cannabinoid isolated from the plant Cannabis that is a metabolite of tetrahydrocannabinol (THC), with potential immunosuppressive and anti-inflammatory activities. Cannabinol preferentially binds to the cannabinoid G-protein coupled receptor CB2, which is mainly expressed on a variety of immune cells, such as T-cells, B-cells, macrophages and dendritic cells. Stimulation of CB2 receptors by cannabinol may both trigger apoptosis in these cells and inhibit the production of a variety of cytokines. Cannabinol exerts minimal affinity for CB1 and has a weak effect on the central nervous system.

**Cannabis :** A substance being studied in the treatment of some types of cancer. Canertinib dihydrochloride blocks the action of proteins called epidermal growth factor receptors, and may cause cancer cells to die. It is a type of tyrosine kinase inhibitor. Also called canertinib and CI-1033.

**Cannabis extract oil SR capsule:** A sustained-release (SR), oil-based oral capsule composed of a cannabis extract, which contains a variety of cannabinoids but is comprised mainly of tetrahydrocannabinol (THC), with potential anti-cachectic and analgesic activities. Upon oral administration, the cannabinoids bind to the cannabinoid G-protein coupled receptor CB1, which is located in both central and peripheral neurons; CB1 receptor activation inhibits adenylyl cyclase, increases various signal transduction pathways, and modulates the activity of various ion channels. This provides an analgesic effect, increases appetite, decreases chemotherapy-induced nausea and vomiting, and improves weight gain. The formulation allows for the immediate release of cannabinoids and quick onset of action, which is followed by a gradual release of cannabinoids. The SR form facilitates longer lasting therapeutic effects and causes fewer psychoactive side effects when compared to non-SR cannabinoid-containing oral formulations.

**canopy:** The branches and leaves of woody plants that are formed some distance above the ground.

**canthosis nigricans:** brown to black, poorly defined, velvety hyperpigmentation of the skin

**Cantilever:** Horizontal structural member with one end attached to the support columns and the other end free, that the belt supports are mounted on.

**Cantron :** A type of chemical in marijuana that causes drug-like effects all through the body, including the central nervous system and the immune system. The main active cannabinoid in marijuana is delta-9-tetrahydrocannabinol (THC). Cannabinoids may help treat the symptoms of cancer or the side effects of cancer treatment.

**cantuzumab ravtansine:** An immunotoxin of a humanized monoclonal antibody C242 (MoAb HuC242) conjugated with a derivative of cytotoxic agent maytansine, DM4, with potential antitumor activity. Cantuzumab ravtansine is generated based on MoAb C242, which is raised against a cell surface superantigen, CA242, found in a variety of human tumor cells. Upon binding and entry, the immunoconjugate releases the maytansinoid agent DM4, which binds to tubulin, thereby affecting microtubule assembly/disassembly dynamics. As a result, this agent prevents cell division and reduces cell growth of cancer cells that express CA242. Check for active clinical trials using this agent.

**Canvas:** A cotton fabric weighing more than four ounces per square yard. (Used as the base material for NEMA grades C, CE and some L grade laminates.)

**Canvaxin:** (Other name for: polyvalent melanoma vaccine)

**CAP:** The catabolite gene activator protein, sometimes incorrectly referred to as the CRP protein. The latter term, in small letters (crp), should be used to refer to the gene but not to the protein. OR The top of any work but especially short term for capital. OR See catabolite gene activator protein.

**CAP-1:** The dried leaves and flowering tops of the Cannabis sativa or Cannabis indica plant. Cannabis contains active chemicals called cannabinoids that cause drug-like effects all through the body, including the central nervous system and the immune system. Cannabis may help treat the symptoms of cancer or the side effects of cancer treatment, such as nausea and vomiting, pain, and cachexia (loss of body weight and muscle mass). Also called marijuana.

**Capability:** The maximum load that a generating unit, generating station, or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress.

**Capacitance:** the property of an electric nonconductor that permits the storage of energy as a result of the separation of charge that occurs when opposite surfaces of the nonconductor are maintained at a difference of potential.

**Capacity:** The amount of electric power that a generating unit can produce. The amount of electric power that a manufacturer rates its generator, turbine transformer, transmission, circuit, or system, is able to produce. OR (1) The amount of space provided inside a container for a given amount of product. (2) The total amount of volume inside the container. The latter is more correctly called the overflow capacity. OR The amount of space inside a container that holds a given amount of product. 1) the amount of space provided inside a container for a given amount of product. 2) the total amount of volume inside the container. The latter is more correctly called the overflow capacity.

**Capacity charge:** One of two elements in a two-part pricing method used in capacity transactions (the other element is the energy charge). The capacity charge, sometimes called the demand charge, is assessed on the capacity (amount of electric power) being purchased. OR The ratio of the available capacity (the amount of electrical power actually produced by a generating unit) to the theoretical capacity (the amount of electrical power that could theoretically have been produced if the generating unit had operated continuously at full power) during a given time period.

**Capacity factor (gross):** The ratio of the gross electricity generated, for the time considered, to the energy that could have been generated at continuous full-power operation during the same period.

**Capacity factor (net):** The ratio of the net electricity generated, for the time considered, to the energy that could have been generated at continuous full-power operation during the same period.

**Capacity utilization:** A percentage representing the extent to which a generating unit fulfilled its capacity in generating electric power over a given time period. This percentage is defined as the margin between the unit's available capacity (the amount of electrical power the unit actually produced) and its theoretical capacity (the amount of electrical power that

could have been produced if the unit had operated continuously at full power) during a certain time period. Capacity utilization is computed by dividing the amount actually produced by the theoretical capacity, and multiplying by 100.

**capecitabine:** A fluoropyrimidine carbamate belonging to the class of antineoplastic agents called antimetabolites. As a prodrug, capecitabine is selectively activated by tumor cells to its cytotoxic moiety, 5-fluorouracil (5-FU); subsequently, 5-FU is metabolized to two active metabolites, 5-fluoro-2-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP) by both tumor cells and normal cells. FdUMP inhibits DNA synthesis and cell division by reducing normal thymidine production, while FUTP inhibits RNA and protein synthesis by competing with uridine triphosphate for incorporation into the RNA strand.

**capecitabine :** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in Cantron have been tested, and none of them have been shown to be effective in treating any form of cancer. Cantron is not available in the United States. Also called 126-F, Cancell, Jim's Juice, JS-101, JS-114, Protocol, and Sheridan's Formula.

**capecitabine rapidly disintegrating tablet:** A rapidly disintegrating film-coated tablet composed of the fluoropyrimidine carbamate antimetabolite capecitabine with antineoplastic activity. As a prodrug, capecitabine is converted to 5'-deoxy-5-fluorocytidine (5'-DFCR) by hepatic carboxylesterase and then to 5'-deoxy-5-fluorouridine (5'-DFUR) by cytidine deaminase and is eventually activated by thymidine phosphorylase to its cytotoxic moiety, 5-fluorouracil (5-FU); subsequently, 5-FU is metabolized to two active metabolites, 5-fluoro-2-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP). FdUMP inhibits DNA synthesis and cell division by reducing normal thymidine triphosphate production, while FUTP inhibits RNA and protein synthesis by competing with uridine triphosphate for incorporation into the RNA strand. Capecitabine rapidly disintegrating tablet (RDT) contains the water insoluble, disintegrating agent crospovidone which very rapidly disperses and swells in water making this RDT easier to swallow than the traditional capecitabine tablet. A rapidly disintegrating film-coated tablet composed of the fluoropyrimidine carbamate antimetabolite capecitabine

with antineoplastic activity. As a prodrug, capecitabine is converted to 5'-deoxy-5-fluorocytidine (5'-DFCR) by hepatic carboxylesterase and then to 5'-deoxy-5-fluorouridine (5'-DFUR) by cytidine deaminase and is eventually activated by thymidine phosphorylase to its cytotoxic moiety, 5-fluorouracil (5-FU); subsequently, 5-FU is metabolized to two active metabolites, 5-fluoro-2-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP). FdUMP inhibits DNA synthesis and cell division by reducing normal thymidine triphosphate production, while FUTP inhibits RNA and protein synthesis by competing with uridine triphosphate for incorporation into the RNA strand. Capecitabine rapidly disintegrating tablet (RDT) contains the water insoluble, disintegrating agent crospovidone which very rapidly disperses and swells in water making this RDT easier to swallow than the traditional capecitabine tablet.

**Capesaris:** (Other name for: estrogen receptor agonist GTx-758)

**Caphosol:** (Other name for: supersaturated calcium phosphate rinse)

**capillaries:** the microscopic blood vessels between the arteries and the veins.

**capillary:** water that works its way upward in the ground through adhesion to rock particles and cohesion to itself.

**capillary :** A small piece of a tumor marker called carcinoembryonic antigen (CEA). CEA may be found in the blood of people who have colon cancer, other types of cancer or diseases, or who smoke tobacco. CAP-1 is used to make a vaccine that may help stimulate the body's immune system to kill cancer cells. Also called carcinoembryonic antigen peptide-1 and CEA peptide-1.

**capillary action:** the process by which surface tension causes water to rise up into unfilled pore spaces.

**capillary fringe:** the lower part of the unsaturated zone that draws water upward from the saturated zone.

**capillary leak syndrome :** A drug used to treat stage III colon cancer in patients who had surgery to remove the cancer. It is also used to treat metastatic breast cancer that has not improved after treatment with certain other anticancer drugs. Capecitabine is being studied in the treatment of other types of cancer. It is taken up by cancer cells and breaks down into 5-

fluorouracil, a substance that kills tumor cells. Capecitabine is a type of antimetabolite. Also called Xeloda.

**CAPILLARY VISCOMETER:** An instrument used to measure polymer melt viscosity. It consists of a heated reservoir used to melt the polymer, which is subsequently pushed by a piston and flows through a 1-mm- to 2-mm-diameter round die. From the force required to move the piston and the corresponding volumetric flow rate, the viscosity can be determined. The Rabinowitsch correction is necessary to account for the shear thinning effects and the Bagley correction to account for the excess pressure drop at the die entrance (see RABINOWITSCH CORRECTION and BAGLEY CORRECTION).

**CAPIRI:** The smallest type of blood vessel. A capillary connects an arteriole (small artery) to a venule (small vein) to form a network of blood vessels in almost all parts of the body. The wall of a capillary is thin and leaky, and capillaries are involved in the exchange of fluids and gases between tissues and the blood.

**CAPIRI regimen :** A condition in which fluid and proteins leak out of tiny blood vessels and flow into surrounding tissues, resulting in dangerously low blood pressure. Capillary leak syndrome may lead to multiple organ failure and shock.

**Capital:** The ornamental mouldings at the top of a column pier or pilaster.

**caplacizumab:** A humanized, bivalent anti-von Willebrand factor (VWF) nanobody, with potential anti-platelet and anti-thrombotic activities. Upon administration, caplacizumab specifically binds, with its two identical monovalent moieties, to the A1 domain of the adhesive glycoprotein VWF, thereby inhibiting and neutralizing VWF activity. This prevents the interaction of ultra-large VWF (ULVWF) with the platelet glycoprotein (GP)Ib-IX-V receptor complex, and prevents ULVWF-mediated platelet adhesion, and aggregation, which reduces thrombus formation. VWF is a glycoprotein and plays a key role in blood coagulation. Increased VWF, which is seen in a number of diseases, is associated with an increased risk in thrombosis; in thrombotic thrombocytopenic purpura (TTP), increased levels of ULVWF and thus increased and abnormal platelet aggregation are seen due to impaired breakdown of ULVWF. The nanobody formulation allows for rapid distribution, onset of action and clearance. The nanobody is based on the smallest functional fragments of the immunoglobulin heavy-

chain variable domains that occur naturally in the Camelidae family. Check for active clinical trials using this agent.

**capmatinib:** An orally bioavailable inhibitor of the proto-oncogene c-Met (hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. Capmatinib selectively binds to c-Met, thereby inhibiting c-Met phosphorylation and disrupting c-Met signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis.

**Capoten:** (Other name for: captopril)

**CAPOX :** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread to other parts of the body. It is also used to treat esophageal cancer and stomach cancer that are advanced or have spread to other parts of the body. It includes the drugs capecitabine (Xeloda) and irinotecan hydrochloride. Also called CAPIRI regimen, XELIRI, and XELIRI regimen.

**CAPOX regimen :** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread to other parts of the body. It is also used to treat esophageal cancer and stomach cancer that are advanced or have spread to other parts of the body. It includes the drugs capecitabine (Xeloda) and irinotecan hydrochloride. Also called CAPIRI, XELIRI, and XELIRI regimen. OR A regimen consisting of capecitabine and oxaliplatin used as a treatment for advanced stage colorectal cancer. This regimen differs from a similar regimen, XELOX, with regards to the dosing schedule for oxaliplatin.

**Capping:** A failure of tablets evidenced by the loss of layers of the tablet during routine handling. OR Covalent modification involving the addition of a modified guanidine group in a 5'-5" linkageIt occurs only in eukaryotes, primarily on mRNA molecules.

**Caprelsa :** An abbreviation for a chemotherapy combination used to treat advanced colorectal cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs capecitabine and oxaliplatin. Also called CAPOX regimen. OR (Other name for: vandetanib)

**Caprolactam:** Caprolactam is a six-carbon one-nitrogen ring that is used to produce nylon 6. The caprolactam ring is opened through hydrolysis and the linear chains are polymerized in a continuous process to produce nylon 6.

**capromab pendetide :** An abbreviation for a chemotherapy combination used to treat advanced colorectal cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs capecitabine and oxaliplatin. Also called CAPOX.

**capsaicin :** A drug used to treat medullary thyroid cancer that has spread to other parts of the body and cannot be treated by surgery. It is also being studied in the treatment of other types of cancer. Caprelsa prevents the growth of new blood vessels that tumors need to grow. It also blocks enzymes needed for cell growth and may kill cancer cells. It is a type of antiangiogenesis agent and a type of tyrosine kinase inhibitor. Also called vandetanib and ZD6474.

**Capsaicin receptors:** Ion channels expressed in nociceptors that open in response to noxious stimuli such as heat, acidity or chemicals such as capsaicin, the chemical responsible for the “hot” taste of spicy food. Also called the vanilloid receptor 1 (VR1).

**Capsid:** The protein coat surrounding viral DNA or RNA. OR The protein coat of a virion or virus particle.

**capsule :** A substance used to detect prostate cancer. It contains a monoclonal antibody that binds to prostate cells, linked to a substance that can bind radioisotopes. Capromab pendetide is combined with indium 111 and injected into the body. A gamma camera (a special camera that detects radioactivity) is used to find prostate cancer cells in the body. Capromab pendetide is a type of immunoconjugate. Also called ProstaScint.

**capsule endoscope :** A component of certain plants, including cayenne and red pepper, used topically for peripheral nerve pain. It is also being studied for controlling mucositis pain after chemotherapy and radiation therapy.

**capsule endoscopy :** In medicine, a sac of tissue and blood vessels that surrounds an organ, joint, or tumor. A capsule is also a form used for medicine that is taken by mouth. It usually has a shell made of gelatin with the medicine inside.

**Captisol-enabled Melphalan IV:** (Other name for: melphalan hydrochloride/sulfobutyl ether beta-cyclodextrin complex)

**captopril:** A sulfhydryl-containing analog of proline with antihypertensive activity and potential antineoplastic activity. Captopril competitively inhibits angiotensin converting enzyme (ACE), thereby decreasing levels of angiotensin II, increasing plasma renin activity, and decreasing aldosterone secretion. This agent may also inhibit tumor angiogenesis by inhibiting endothelial cell matrix metalloproteinases (MMPs) and endothelial cell migration. Captopril may also exhibit antineoplastic activity independent of effects on tumor angiogenesis. or A device used to look at the inside of the intestines and other parts of the digestive tract. It is a capsule that is about the size of a large pill, with a lens, a light, a camera, a radio transmitter, and a battery inside. The patient swallows the capsule and it takes pictures as it travels through the digestive tract. The pictures are sent to a small recorder that is worn on the patient's waist or shoulder. The pictures are then viewed on a computer by the doctor to check for signs of disease. The capsule endoscope passes out of the body during a bowel movement. Also called wireless capsule endoscope.

**CAR T-cell therapy :** A procedure used to look at the inside of the intestines and other parts of the digestive tract. The patient swallows a capsule about the size of a large pill. The capsule contains a tiny wireless camera that travels through the digestive tract. It takes pictures of the inside of the digestive tract and sends them to a small recorder that is worn on the patient's waist or shoulder. The pictures are then viewed on a computer by the doctor to check for signs of disease. The capsule passes out of the body during a bowel movement.

**Carac:** (Other name for: topical fluorouracil) or A drug used to treat high blood pressure that is also being studied in the prevention of side effects caused by radiation therapy used in the treatment of cancer. It belongs to the family of drugs called ACE inhibitors.

**caracemide:** An agent derived from acetohydroxamic acid with potential antineoplastic activity. Caracemide inhibits ribonuclease reductase, resulting in decreased DNA synthesis and tumor growth; it also inhibits acetylcholinesterase. In vivo, caracemide contributes to the formation of the neurotoxin methyl isocyanate; this effect, along with the agent's

acetylcholinesterase activity, may be responsible for the severe central nervous system toxicity observed in clinical trials.

**carbamazepine:** A tricyclic compound chemically related to tricyclic antidepressants (TCA) with anticonvulsant and analgesic properties. Carbamazepine exerts its anticonvulsant activity by reducing polysynaptic responses and blocking post-tetanic potentiation. Its analgesic activity is not understood; however, carbamazepine is commonly used to treat pain associated with trigeminal neuralgia.

**carbamide :** A type of treatment in which a patient's T cells (a type of immune system cell) are changed in the laboratory so they will attack cancer cells. T cells are taken from a patient's blood. Then the gene for a special receptor that binds to a certain protein on the patient's cancer cells is added in the laboratory. The special receptor is called a chimeric antigen receptor (CAR). Large numbers of the CAR T cells are grown in the laboratory and given to the patient by infusion. CAR T-cell therapy is being studied in the treatment of some types of cancer. Also called chimeric antigen receptor T-cell therapy.

**Carbamoyl phosphate synthetase:** An enzyme that begins the urea cycle by catalyzing the synthesis of carbamoyl phosphate from bicarbonate, ammonium ion, and ATP. The enzyme also catalyzes the initial reaction in pyrimidine biosynthesis.

**carbanion:** a carbon atom bearing a negative charge; a carbon anion. OR A negatively charged carbon atom.

**Carbanion:** An anion where the negative charge is localised on a carbon atom is imaginatively called a carbanion. The best way to generate a carbanion is to remove a H<sup>+</sup> ion from a hydrocarbon. Since carbanions are conjugate bases to very very very weak acids indeed, they are fiendishly reactive bases.

**carbendazim :** A drug used to treat cancers of the breast, colon, rectum, stomach, and pancreas. Under the brand names Carac, Tolak, Efudex, and Fluoroplex, it is used as a cream to treat actinic keratosis (a skin condition that may become cancer). It is also used under the brand name Efudex as a cream to treat basal cell skin cancer that is superficial (not invasive) and cannot be removed by surgery. Carac is being studied in the treatment of other conditions and types of cancer. It stops cells from making DNA and

may kill cancer cells. Carac is a type of antimetabolite. Also called 5-fluorouracil, 5-FU, Efudex, Fluoroplex, fluorouracil, and Tolak.

**carbene:** an electrically uncharged molecule that contains a carbon atom with only two single bonds and just six electrons in its valence shell.

**Carbenium:** If a negatively charged hydride (H<sup>-</sup>) ion is removed from a hydrocarbon, what is left is a positively charged carbenium ion, a form of carbocation.

**carbenoid:** a chemical that resembles a carbene in its chemical reactions.

**Carbo-Tax regimen :** A chemotherapy combination used to treat endometrial, ovarian, and head and neck cancers, and non-small cell lung cancer that has spread. It includes the drugs carboplatin and paclitaxel (Taxol). Also called Carbo-Tax regimen, carboplatin-Taxol, CaT regimen, and PC regimen.

**Carbocaine:** (Other name for: mepivacaine hydrochloride)

**Carbocation:** A positively-charged chemical species where the positive charge is localised on a carbon atom. Both carbenium ions (which have three bonds to a positively charged carbon) and carbonium ions (which may have five or more bonds to a positively charged carbon) are examples of carbocations. OR Carbon compound with a positive charge localised on a carbon atom. OR a carbon cation; a carbon atom bearing a positive charge (sometimes referred to as a "carbonium ion"). OR A positively charged carbon atom; also called a carbonium ion.

**carbocyclic:** Being or having an organic ring of carbon atoms.

**carbogen:** An inhalant consisting of hyperoxic gas (95%-98% oxygen and 2%-5% carbon dioxide) with radiosensitizing properties. Inhaled carbogen reduces diffusion-limited tumor hypoxia, increasing tumor radiosensitivity due to the increased availability of molecular oxygen for cytotoxic radiation-induced oxygen free radical production. Check for active clinical trials using this agent. or A substance formed by the breakdown of protein in the liver. The kidneys filter carbamide out of the blood and into the urine. Carbamide can also be made in the laboratory. A topical form of carbamide is being studied in the treatment of hand-foot syndrome (pain, swelling, numbness, tingling, or redness of the hands or feet that may occur as a side effect of certain anticancer drugs). Also called urea.

**carbohydrate:** An organic compound with the general formula  $C_x(H_2O)_y$ . OR A chemical compound made up of a chain or ring of carbon atoms to which hydrogen and oxygen atoms are attached in a defined ratio (2:1); includes simple sugars like glucose and complex sugars like chitin (the exoskeleton of crabs) OR A polyhydroxy aldehyde or ketone. OR A class of organic compounds including sugars and starches. The name comes from the fact that many (but not all) carbohydrates have empirical formula  $CH_2O$ .

**carbohydrate :** An anticancer drug that belongs to the family of drugs called antifungal agents.

**carbohydrate supplement drink:** A nutritional supplement drink containing 12.5% carbohydrates, which may enhance recovery following gastrointestinal (GI) surgery. Oral intake of the carbohydrate drink before surgery may prevent insulin resistance and associated hyperglycemia. It may also maintain adequate protein balance and muscle function. Ultimately, giving carbohydrates immediately before surgery may improve overall recovery time and return of GI function. It may also decrease muscle loss.

**carbohydrates:** Carbohydrates are compounds containing carbon, hydrogen, and oxygen. Many of them have the general formula  $C_x(H_2O)_y$ . They provide energy for the body. We find them in foods such as bread, pasta, rice (which contains starch) and sugary foods. OR the primary energy source for living things; composed of carbon, hydrogen, and oxygen. OR Saccharides, which are aldehyde or ketone compounds with multiple hydroxyl groups. Also defined as organic compounds with the empirical formula  $(CH_2O)_n$ .

**carbolic acid :** An inhaled form of oxygen and carbon dioxide that has more oxygen than air has. It is being studied in the treatment of cancer and other conditions. It may increase the amount of oxygen in cancer cells, which may make them easier to kill with radiation therapy. Carbogen is a type of radiosensitizing agent.

**Carbon:** Symbol:"C" Atomic Number:"6" Atomic Mass: 12.01amu. Carbon is one of the most important elements on Earth. It is classified as a non-metal and found in rocks, plants, and animals. You will find carbon all over the planet including gasoline, charcoal, diamonds, and plastics. OR An element with atomic number 6. Carbon is a nonmetal found in

all organic compounds. Carbon occurs naturally as diamond, graphite, and buckminsterfullerene.

**Carbon Black:** A black pigment produced by the incomplete burning of natural gas or oil. It is widely used as filler, particularly in the rubber industry. Because it possesses useful ultraviolet properties. It is also used in polyethylene compounds intended for such applications as cold water piping and black agricultural sheet. OR A multi-functional pigment used in plastics as a conductor of electricity, a pigment, a filler-extender, and as a UV stabilizer. A black pigment produced by the incomplete burning of natural gas or oil. It is widely used as a filler, particularly in the rubber industry. Because it possesses useful ultraviolet protective properties. It is also much used in molding compounds intended for outside weathering applications. OR A black material used as a filler in rubber. It gives the rubber its black color and the hardness characteristics OR A black pigment produced by the incomplete burning of natural gas or oil. Widely used as a filler, particularly in the rubber industry due to its useful ultraviolet protective properties. It is also much used in molding compounds intended for outside weathering applications.

**carbon budget:** The balance of the exchanges (incomes and losses) of carbon between the carbon reservoirs or between one specific loop (e.g., atmosphere - biosphere) of the carbon cycle. An examination of the carbon budget of a pool or reservoir can provide information about whether the pool or reservoir is functioning as a source or sink for CO<sub>2</sub>.

**carbon C 11 alpha-methyltryptophan:** A radiopharmaceutical containing an analogue of tryptophan, alpha-methyltryptophan (AMT), labeled with carbon 11 (<sup>11</sup>C), used to measure serotonin synthesis in the human brain using positron emission tomography (PET). Upon administration and once it crosses the blood-brain barrier and into the cytoplasm of serotonergic neurons, carbon C 11 alpha-methyltryptophan acts as a substrate for the enzyme tryptophan hydroxylase and undergoes conversion to carbon C 11 alpha-methyl-5-hydroxytryptophan, also known as C 11 alpha-methyl-serotonin (AMS). C 11 AMS accumulates in serotonergic nerve terminals in proportion to the synthesis rate of serotonin because C 11 AMS cannot be broken down by the enzyme monoamine oxidase, and thus the synthesis rate of serotonin can be imaged using PET. C 11 AMT is not incorporated

into proteins, nor are metabolites released into the blood pool, making C 11 AMT an excellent tracer for serotonin synthesis in vivo.

**carbon C 11 choline:** A radiotracer consisting of choline labeled with the positron-emitting isotope carbon C 11 with potential imaging use. Upon administration, carbon C 11 choline incorporates into tumor cells through an active, carrier-mediated transport mechanism for choline and then is phosphorylated intracellularly by choline kinase, an enzyme frequently upregulated in human tumors, yielding phosphoryl C-11 choline. In turn, phosphoryl C-11 choline is integrated into phospholipids in the cell membrane as part of phosphatidylcholine. As the proliferation of cancer cells is much higher than normal cells, tumor cells exhibit an increased rate of carbon C 11 choline uptake and incorporation, allowing tumor imaging with positron emission tomography (PET).

**carbon C 11 erlotinib hydrochloride:** The hydrochloride salt form of the quinazoline derivative erlotinib labeled with the positron-emitting isotope carbon C 11, with potential use in imaging. Competing with adenosine triphosphate, erlotinib reversibly binds to the intracellular catalytic tyrosine kinase domain of the epidermal growth factor receptor (EGFR). Following exposure to this agent, EGFR expression status can be determined and EGFR overexpressing tumor cells can be visualized using positron emission tomography (PET) imaging. This may be useful in determining the tumor cell response to a particular EGFR kinase inhibitor in individual patients. EGFR, a receptor tyrosine kinase, is overexpressed in numerous cancer cell types, and plays a significant role in tumor cell progression.

**carbon C 11 N-desmethyl-loperamide:** A radiopharmaceutical containing N-desmethyl loperamide (dLop) labeled with carbon 11 (<sup>11</sup>C), used to measure the activity of efflux transporter P-glycoprotein (P-gp) in positron emission tomography (PET). Upon administration, carbon C 11 N-desmethyl-loperamide acts as a substrate for the efflux transporter P-gp. Upon uptake by P-gp at the blood-brain barrier (BBB) and subsequent PET imaging, this radioligand may allow for prediction of P-gp function and expression in brain tumor patients. As P-gp activity may influence response to therapy, measuring P-gp activity may be beneficial when choosing chemotherapy. P-gp, encoded by the MDR-1 gene and a member of the ATP-binding cassette (ABC) superfamily of transmembrane transporters, is

overexpressed by some MDR tumors and may contribute to multidrug resistance to chemotherapy. Check for active clinical trials using this agent.

**carbon C 11 PBR-28:** A radioconjugate composed of a ligand for the 18 kDa translocator protein (TSPO) conjugated to the radioisotope carbon C 11, that can be used as a diagnostic imaging agent to detect TSPO-expressing cells using positron emission tomography (PET). Upon administration of carbon C 11 PBR-28, the PBR-28 moiety targets and binds to TSPO-expressing cells. Upon PET, carbon C 11 can be detected and TSPO-expressing cells can be visualized. This can facilitate detection of inflammatory sites and cancer cells. TSPO, also called the peripheral benzodiazepine receptor (PBR), is found on the outer mitochondrial membrane and is overexpressed on a variety of cancer cells and during inflammation.

**carbon C 11 sarcosine:** A radiotracer consisting of sarcosine, the N-methyl derivative of the amino acid glycine, labeled with the positron-emitting isotope carbon C 11, that can be used for tumor imaging upon positron emission tomography/computed tomography (PET/CT). Upon administration, C-11 sarcosine is taken up by and accumulates in tumor cells, thereby allowing tumor imaging with PET/CT. Sarcosine, a non-proteinogenic amino acid and oncometabolite, is elevated in certain tumor cell types. Its expression seems to correlate with increased tumor invasiveness.

**carbon C 11 sepantronium bromide:** A radiotracer composed of the bromide salt form of sepantronium, a small-molecule survivin antagonist and proapoptotic agent, labeled with the radionuclide carbon C 11, with potential positron emission tomography (PET) imaging activity. Upon administration, sepantronium is selectively taken up by tumor cells, binds to the survivin promoter and inhibits the transcription of survivin, which results in decreased survivin expression. Upon PET imaging, the tissue distribution of sepantronium and its tumor uptake can be assessed. Survivin, a member of the inhibitor of apoptosis (IAP) gene family, is overexpressed in a variety of human cancers; its expression in tumors is associated with a more aggressive phenotype, increased cancer cell proliferation, shorter survival times, and a decreased response to chemotherapy.

**carbon C 11 temozolomide:** A radioconjugate composed of temozolomide, a imidazotetrazine analog of dacarbazine, labeled with the

radioisotope carbon C11, with potential positron emission tomography (PET) imaging activity. As a cytotoxic alkylating agent, temozolomide is hydrolyzed at physiologic pH to the pharmacologically active compound, 5-(3-methyl-(triazen-1-yl)-imidazole)-4-carboxamide (MTIC). MTIC is further hydrolyzed to 5-aminoimidazole-4-carboxamide (AIC) and a methyldiazonium cation. The cation is able to methylate DNA, particularly at the O6 and N7 positions of guanine residues, resulting in cell cycle arrest, inhibition of DNA replication and the induction of apoptosis.

Temozolomide is metabolized to MITC at all sites, crosses the blood-brain-barrier and penetrates well into the central nervous system. Upon PET, the biodistribution, uptake in cancer cells and the efficacy of temozolomide can be assessed.

**carbon C 13 acetate:** The non-radioactive, naturally occurring isotope of acetate, carbon C 13 acetate, with potential use for metabolic tumor imaging upon nuclear magnetic resonance (NMR) spectroscopy. Upon infusion, carbon C 13 acetate is taken up by cancer cells and is utilized by metabolic pathways in the tumor cell. Specifically, the tumor cells oxidize acetate, in the form of acetyl coenzyme A (acetyl-CoA), in the citric acid cycle. Upon <sup>13</sup>C-NMR, the metabolic phenotype of a tumor can be assessed. Certain alternative metabolic pathways are activated in tumor cells and use substrates other than glucose, such as acetate, for acetyl-CoA production.

**carbon C 13 dextromethorphan:** A radioconjugate consisting of dextromethorphan, a synthetic, methylated dextrorotatory analogue of levorphanol, conjugated with carbon-13 [<sup>13</sup>C] with radiotracer activity. <sup>13</sup>C-dextromethorphan can be used in a breath-test phenotype assay of CYP2D6 activity, based on the principle that CYP2D6-mediated O-demethylation cleaves a <sup>13</sup>CH<sub>3</sub> that enters the body's carbon pool to be eliminated ultimately as <sup>13</sup>CO<sub>2</sub> in expired air, which can be measured. The <sup>13</sup>C-dextromethorphan breath test may prove useful in identifying poor CYP2D6 metabolizers of such important clinical drugs as tamoxifen.

**carbon C 13 lycopene:** Carbon C 13 labeled lycopene used as a tracer for carotenoid metabolism studies in vivo. After oral administration of carbon C 13 lycopene, in combination with C 13 labeled phytoene and phytofluene, the absorption kinetics, distribution patterns, metabolism and targets of these carotenoids can be measured upon imaging of the non-radioactive C

13. Lycopene, a carotenoid pigment found in high concentrations in tomatoes as well as in other fruits and vegetables, serves as an antioxidant in vivo; its intake has been associated with a reduced risk of certain types of cancer and cardiovascular diseases. Check for active clinical trials using this agent.

**carbon C 13 octanoate:** The sodium salt form of the medium-chain fatty acid octanoate, and labeled with the isotope carbon C13, used in the octanoate breath test (OBT) to assess hepatic mitochondrial function. Upon ingestion of carbon C13 octanoate, this agent is metabolized in the liver via mitochondrial beta-oxidation. Upon determination of the ratio between  $^{13}\text{C}/^{12}\text{C}$  of  $\text{CO}_2$  in exhaled breath, liver function can be accessed.

**carbon C 13 phytoene:** A 40-carbon hydrocarbon precursor of carotenoids radiolabeled to carbon C 13 and potentially used for tracer purposes of phytoene in vivo. Upon administration, phytoene is taken up and accumulates in various tissues. Upon imaging of the radioisotope, the distribution patterns and metabolism of phytoene can be further elucidated which may aid in the understanding of the bioactivity of this agent. Phytoene is a colorless precursor of many carotenoids, including the antioxidant lycopene.

**carbon C 13 phytofluene:** A 40-carbon hydrocarbon precursor of carotenoids radiolabeled to carbon C 13 and potentially used for tracer purposes of phytofluene in vivo. Upon administration, phytofluene is taken up and accumulates in various tissues. Upon imaging of the radioisotope, the distribution patterns and metabolism of phytofluene can be further elucidated which may aid in the understanding of the bioactivity of this agent. Phytofluene is a colorless precursor of many carotenoids, including the antioxidant lycopene. Check for active clinical trials using this agent.

**carbon C 13/nitrogen N 15-labeled valine:** A radioconjugate composed of the essential amino acid valine radiolabeled to carbon C 13 and nitrogen N 15, that can potentially be used as a tracer for protein metabolism in vivo using mass spectrometry (MS). Upon administration of carbon C 13/nitrogen N 15-labeled valine, the exogenous valine is taken up by cells and incorporated into proteins. Upon imaging, protein biomarkers containing radiolabeled valine are secreted by tumor cells and can be identified by MS. This may aid in cancer diagnosis and prognosis.

Compared to normal cells, tumor cells rapidly take up amino acids to use as protein building blocks.

**carbon C 14 anlotinib hydrochloride:** A radioconjugate composed of the orally bioavailable hydrochloride salt form of anlotinib, a receptor tyrosine kinase (RTK) inhibitor, labeled with the radioisotope carbon C 14, with potential use for evaluating the pharmacokinetic profile of anlotinib. Upon administration of carbon C 14 anlotinib hydrochloride, anlotinib targets multiple RTKs, including vascular endothelial growth factor receptor type 2 (VEGFR2) and type 3 (VEGFR3). This agent may both inhibit angiogenesis and halt cell growth in tumor cells that overexpress these RTKs. Labeling of anlotinib with the radioactive tracer carbon C 14 permits the evaluation of this agent's pharmacokinetic profile, including its absorption, distribution, metabolism, and excretion (ADME).

**carbon C 14 dacomitinib:** A radioconjugate consisting of an orally bioavailable small-molecule inhibitor of the epidermal growth factor receptor (erbB or HER) family of tyrosine kinases radiolabeled with carbon-14 with potential antineoplastic and beta-emitting radioisotope activity. Dacomitinib specifically and irreversibly binds to and inhibits human Her-1, Her-2, and Her-4, resulting in the proliferation inhibition and apoptosis of tumor cells that overexpress these receptors. The HER receptor family of tyrosine kinases, often overexpressed by a variety of tumor cell types, may contribute to tumor cell proliferation, differentiation, migration, and survival. Dacomitinib radiolabeled with carbon C-14 may be used as a radiotracer in pharmacological studies of dacomitinib metabolism.

**carbon C 14 eribulin acetate:** A radioconjugate containing the acetate salt of eribulin, labeled with the beta particle-emitting radioisotope carbon C 14, with radioisotopic and potential antineoplastic activities. Upon administration, eribulin binds to the vinca domain of tubulin and inhibits the polymerization of tubulin and the assembly of microtubules, resulting in inhibition of mitotic spindle assembly, induction of cell cycle arrest at G2/M phase, and, potentially, tumor regression. The radioisotope moiety of this agent acts as a radioactive tracer.

**carbon C 14 gilteritinib:** A radioconjugate composed of gilteritinib, an inhibitor of the receptor tyrosine kinases (RTKs) FMS-related tyrosine kinase 3 (FLT3, STK1, or FLK2), AXL (UFO or JTK11) and anaplastic lymphoma kinase (ALK or CD246), labeled with the radioisotope carbon C

14, with potential use for evaluating the pharmacokinetic profile of gilteritinib. Gilteritinib binds to and inhibits both the wild-type and mutated forms of FLT3, AXL and ALK. This may result in an inhibition of FLT3, AXL, and ALK-mediated signal transduction pathways and the reduction of tumor cell proliferation in cancers that overexpress these RTKs. Labeling of gilteritinib with the radioactive tracer carbon C 14 allows for the evaluation of gilteritinib's pharmacokinetic profile, including its absorption, distribution, metabolism, and excretion (ADME).

**carbon C 14 ombrabulin:** A synthetic water-soluble analogue of combretastatin A4, derived from the South African willow bush (*Combretum caffrum*), labeled with carbon C 14 with potential antineoplastic activity. The ombrabulin moiety of carbon C 14 ombrabulin binds to the colchicine binding site of endothelial cell tubulin, thereby inhibiting tubulin polymerization and inducing mitotic arrest and apoptosis in endothelial cells. As apoptotic endothelial cells detach from their substrata, tumor blood vessels collapse; the acute disruption of tumor blood flow may result in tumor necrosis. The radioisotope moiety of this agent acts as a radioactive tracer.

**carbon C 14 oxaliplatin:** A radioconjugate composed of the platinum agent oxaliplatin labeled with the isotope carbon C 14, that can be used to predict the response to oxaliplatin therapy using accelerator mass spectrometry (AMS). Upon intravenous administration of a microdose of carbon C 14 oxaliplatin, the oxaliplatin moiety covalently links to DNA and forms mono- and di-DNA adducts. The platinum-DNA adduct formation can be measured through quantification of C14-labeled drug-DNA adducts by using AMS. By measuring the microdose-induced DNA damage, the response to oxaliplatin-based chemotherapy can be assessed and predicted. Measurements that indicate either low drug-DNA adduct formation or increased DNA repair (C14 removal from DNA) are correlated with increased resistance to platinum-based chemotherapeutics.

**carbon C 14 roniciclib:** An orally bioavailable radioconjugate composed of roniciclib, a cyclin dependent kinase (CDK) inhibitor, radiolabeled with carbon C 14, with potential use for evaluating the pharmacokinetic profile of roniciclib. Roniciclib selectively binds to and inhibits the activity of various CDK subtypes, which leads to cell cycle arrest and an inhibition of tumor cell proliferation. Labeling of roniciclib with the radioactive tracer

carbon C 14 allows for the evaluation of roniciclib's pharmacokinetic profile, including its absorption, distribution, metabolism, and excretion (ADME). CDKs, serine/threonine kinases overexpressed in various tumor cell types, play key roles in the regulation of both cell cycle progression and cellular proliferation.

**carbon C 14 selumetinib:** A radioconjugate containing the orally available selumetinib, an inhibitor of mitogen-activated protein kinase kinase (MEK or MAPK/ERK kinase) types 1 and 2, labeled with the radioisotope carbon C 14. Upon oral administration, selumetinib selectively inhibits MEK1/2, which prevents the activation of MEK1/2 dependent effector proteins and transcription factors. This leads to an inhibition of cellular proliferation in MEK1/2-overexpressing tumor cells. MEK 1 and 2 are dual-specificity kinases that are essential mediators in the activation of the RAS/RAF/MEK/ERK pathway and are often upregulated in various cancer cells. Selumetinib radiolabeled with carbon C-14 may be used as a radiotracer for pharmacokinetic studies of this agent, including its absorption, distribution, metabolism and excretion (ADME).

**carbon C 14 telotristat etiprate:** An orally bioavailable, tryptophan hydroxylase (TPH) inhibitor prodrug labeled with carbon C 14, which could be used to evaluate the pharmacokinetic profile of telotristat etiprate. Upon administration, telotristat etiprate is converted to its active moiety, telotristat (LP-778902), which binds to and blocks the activity of TPH. This may result in a reduction in peripheral serotonin (5-HT) production and improvement of serotonin-mediated gastrointestinal adverse side effects, such as severe diarrhea. TPH, the rate-limiting enzyme in serotonin biosynthesis, is overexpressed in carcinoid tumor cells. Telotristat radiolabeled with carbon C 14 facilitates the evaluation of the pharmacokinetic characteristics of this agent, including its absorption, distribution, metabolism, and excretion (ADME).

**carbon C 14 vemurafenib:** A radioconjugate composed of vemurafenib, an ATP-competitive, small-molecule inhibitor of BRAF(V600E) kinase, labeled with the radioisotope carbon C 14, with potential use for evaluating the pharmacokinetic profile of vemurafenib. Vemurafenib selectively binds to the ATP-binding site of BRAF(V600E) kinase and inhibits its activity, which may result in both an inhibition of an over-activated MAPK signaling pathway in BRAF(V600E) kinase-expressing tumor cells and a

reduction in tumor cell proliferation. Labeling of vemurafenib with the radioactive tracer carbon C 14 allows for the evaluation of vemurafenib's pharmacokinetic profile, including its absorption, distribution, metabolism, and excretion (ADME). The BRAF(V600E) gene mutation in which valine is substituted for glutamic acid at residue 600 (V600E), is found in many cancer cell types and plays a key role in the over-activation of the MAPK signaling pathway.

**carbon C 14-labeled ixazomib:** A radioconjugate comprised of the orally-available, reversible 20S proteasome inhibitor ixazomib that is labeled with the isotope carbon C 14. Upon administration, the ixazomib moiety hydrolyzes and generates its active form, MLN2238, which inhibits the activity of the 20S catalytic core subunit of the proteasome. This blocks the targeted proteolysis normally performed by the proteasome, which results in an accumulation of unwanted or misfolded proteins. The accumulation of protein may disrupt various cell signaling pathways, induce apoptosis, and inhibit tumor growth. In addition, this agent targets tumor suppressor microRNA-33b (miR-33b). Labeling with the radioactive tracer carbon C 14 allows for evaluation of ixazomib's absorption, distribution, metabolism and excretion (ADME).

**carbon C14 lenvatinib mesylate:** A radioconjugate composed of the orally bioavailable mesylate salt form of lenvatinib, a receptor tyrosine kinase (RTK) inhibitor, labeled with the radioisotope carbon C 14, with potential use for evaluating the pharmacokinetic profile of lenvatinib. Upon administration of carbon C14 lenvatinib mesylate, lenvatinib targets and binds strongly to multiple RTKs, including vascular endothelial growth factor receptor 1 (VEGFR1;FLT1), VEGFR2 (KDR), VEGFR3 (FLT4), fibroblast growth factor receptor 1 (FGFR1), FGFR2, FGFR3, and FGFR4, platelet derived growth factor receptor alpha (PDGFR $\alpha$ ), KIT, and RET. This inhibits growth of tumor cells that overexpress these RTKs. Labeling of lenvatinib with the radioactive tracer carbon C 14 permits the evaluation of lenvatinib's pharmacokinetic profile, including its absorption, distribution, metabolism, and excretion (ADME).

**carbon cycle:** All parts (reservoirs) and fluxes of carbon; usually thought of as a series of the four main reservoirs of carbon interconnected by pathways of exchange. The four reservoirs, regions of the Earth in which carbon behaves in a systematic manner, are the atmosphere, terrestrial

biosphere (usually includes fresh water systems), oceans, and sediments (includes fossil fuels). Each of these global reservoirs may be subdivided into smaller pools ranging in size from individual communities or ecosystems to the total of all living organisms (biota). Carbon exchanges from reservoir to reservoir by various chemical, physical, geological, and biological processes.

**carbon density:** The amount of carbon per unit area for a given ecosystem or vegetation type, based on climatic conditions, topography, vegetative-cover type and amount, soils, and maturity of the vegetative stands.

**Carbon dioxide:** A heat-trapping gas (CO<sub>2</sub>) that plays a role in global warming. OR This is a slightly acidic gas that is formed when carbon burns in air (or oxygen). It does not support combustion and so a burning splint will be extinguished by the gas. However, this is NOT the test for carbon dioxide. To test for the gas, bubble it into limewater. A milky white precipitate shows that the gas is carbon dioxide. Carbon dioxide is produced during respiration (this is true whether the respiration is by animals, plants or even anaerobic respiration of yeast during fermentation). OR A colorless, odorless gas produced by respiration and combustion of carbon-containing fuels. OR A colourless, non-poisonous gas that is a normal part of the ambient air. Carbon dioxide is formed in combustion of fossil fuel and carbon-containing materials, in fermentation, and in respiration of animals and human beings and employed by plants in the photosynthesis of carbohydrates.

**carbon dioxide :** A sugar molecule. Carbohydrates can be small and simple (for example, glucose) or they can be large and complex (for example, polysaccharides such as starch, chitin or cellulose).

**carbon dioxide fertilization:** Enhancement of plant growth or of the net primary production by CO<sub>2</sub> enrichment that could occur in natural or agricultural systems as a result of an increase in the atmospheric concentration of CO<sub>2</sub>.

**carbon dioxide reference gas:** A mixture of a known quantity of CO<sub>2</sub>-in-air or CO<sub>2</sub>-in-N<sub>2</sub> used to calibrate carbon dioxide analyzers.

**carbon fixation reactions:** In photosynthetic cells, the light-independent enzymatic reactions involved in the synthesis of glucose from CO<sub>2</sub>, ATP, and NADPH; also known as the dark reactions.

**carbon flux:** The rate of exchange of carbon between pools (reservoirs).

**Carbon Footprint:** The amount of carbon dioxide and other related greenhouse gasses (GHG) emitted into the atmosphere from an organization, manufacturing facility or process. P&G measures and reports on this metric on behalf of all of our manufacturing sites throughout the world once annually as part of our overall Corporate Sustainability strategy and goals.

**carbon isotope ratio:** Ratio of carbon-12 to either of the other, less common, carbon isotopes, carbon- 13 or carbon-14.

**Carbon monoxide:** A poisonous, local air pollutant (CO) produced when fuel such as petroleum does not burn completely OR A colorless, odorless, poisonous gas produced by incomplete combustion. OR This has the formula CO and is a possible product if a fuel burns in a poor supply of air. It is a toxic gas. It can be removed from the exhaust gases of cars by the use of a catalytic converter. You should be able to write a word equation for its formation during a combustion reaction.

**carbon monoxide :** A very poisonous chemical substance made from tar and also found in some plants and essential oils (scented liquid taken from plants). Carboic acid is used to make plastics, nylon, epoxy, medicines, and to kill germs. Also called phenol.

**carbon nanoparticle-based formulation:** A nanoparticle-based formulation containing carbon, with both a mean size of 150 nm, and potential use as a stain for lymph node draining. Upon injection of the carbon nanoparticles at the tumor site, these nanoparticles travel to regional lymph nodes and stain the lymph nodes black due to the presence of the carbon. This may allow for a more precise surgical removal of tumor-draining lymph nodes. Check for active clinical trials using this agent.

**carbon pool:** The reservoir containing carbon as a principal element in the geochemical cycle.

**carbon sink:** A pool (reservoir) that absorbs or takes up released carbon from another part of the carbon cycle. For example, if the net exchange between the biosphere and the atmosphere is toward the atmosphere, the biosphere is the source, and the atmosphere is the sink.

**carbon source:** A pool (reservoir) that releases carbon to another part of the carbon cycle.

**Carbon steels** : Steel can contain up to 1.5% of carbon. This is much less than the 4% found in cast iron.

**carbon-11 acetate:** The acetate salt of the radioisotope carbon-11. Although the mechanism is unclear, carbon-11 acetate preferentially accumulates in tumor tissue, serving as a tracer for imaging tumors with positron emission tomography (PET). Check for active clinical trials using this agent. or A colorless, odorless gas. It is a waste product made by the body. Carbon dioxide travels in the blood from the body's tissues to the lungs. Breathing out clears carbon dioxide from the lungs.

**carbon-11 choline PET-CT scan :** A poisonous gas that has no color or odor. It is given off by burning fuel (as in exhaust from cars or household heaters) and tobacco products. Carbon monoxide prevents red blood cells from carrying enough oxygen for cells and tissues to live.

**carbon-based resources:** The recoverable fossil fuel (coal, gas, crude oils, oil shale, and tar sands) and biomass that can be used in fuel production and consumption.

**carbonate hardness:** Water hardness due to the presence of calcium and magnesium carbonates and bicarbonates. The "noncarbonate hardness" is due mostly to calcium and magnesium sulfates, chlorides, and nitrates.

**Carbonate Mineral:** A mineral that is made up of compounds with a carbonate group bonded to a metal. Calcite is a good example of a carbonate mineral.

**carbonate<sup>32-</sup>:** 1. an inorganic ion with a charge of -2, containing carbon bound directly to three oxygens in a flat triangular arrangement. 2. A compound containing CO<sub>3</sub><sup>2-</sup> ions.

**carbonates:** the family of minerals composed of carbon and oxygen.

**Carbonium:** If there are five or more bonds to a single carbon atoms, it will be short of electrons and have a positive charge - this species is called a carbonium ion, a form of carbocation. The easiest way to make one is to add a hydrogen ion (H<sup>+</sup>).

**Carbonium ion:** A carbon compound that contains a positively charged carbon atom; a carbonium atom is critical for catalysis by lysozyme

**carbonyl:** A divalent group consisting of a carbon atom with a double-bond to oxygen. For example, acetone (CH<sub>3</sub>-(C=O)-CH<sub>3</sub>) is a carbonyl group linking two methyl groups. Also refers to a compound of a metal

with carbon monoxide, such as iron carbonyl,  $\text{Fe}(\text{CO})_5$ . OR organic functional group occurring in aldehydes, ketones, carboxylic acids, esters and their derivatives.

**carboplatin:** A second-generation platinum compound with a broad spectrum of antineoplastic properties. Carboplatin contains a platinum atom complexed with two ammonia groups and a cyclobutane-dicarboxyl residue. This agent is activated intracellularly to form reactive platinum complexes that bind to nucleophilic groups such as GC-rich sites in DNA, thereby inducing intrastrand and interstrand DNA cross-links, as well as DNA-protein cross-links. These carboplatin-induced DNA and protein effects result in apoptosis and cell growth inhibition. This agent possesses tumoricidal activity similar to that of its parent compound, cisplatin, but is more stable and less toxic. or A radioactive form of carbon that is used in positron emission tomography (PET) scanning.

**carboplatin-paclitaxel-bevacizumab regimen :** A procedure in which a small amount of carbon-11 choline (a radioactive form of the vitamin choline) is injected into a vein. A scanner and a computer are used to make detailed pictures of areas inside the body where the carbon-11 choline collects. Cancer cells take up more carbon-11 choline than normal cells, so the pictures can be used to find cancer cells in the body. Also called C-11 choline PET-CT scan.

**carboplatin-Taxol :** A drug that is used to treat advanced ovarian cancer that has never been treated or symptoms of ovarian cancer that has come back after treatment with other anticancer drugs. It is also used with other drugs to treat advanced, metastatic, or recurrent non-small cell lung cancer and is being studied in the treatment of other types of cancer. Carboplatin is a form of the anticancer drug cisplatin and causes fewer side effects in patients. It attaches to DNA in cells and may kill cancer cells. It is a type of platinum compound. Also called Paraplatin.

**carboplatin-Taxol regimen:** A chemotherapy regimen consisting of carboplatin and paclitaxel (Taxol) used for the treatment of endometrial, epithelial ovarian, head and neck, and advanced-stage non-small cell lung cancers. Or A chemotherapy combination used to treat advanced, nonsquamous non-small cell lung cancer. It includes the drugs carboplatin, paclitaxel (Taxol), and bevacizumab. Also called carboplatin-Taxol-bevacizumab regimen.

**carboplatin-Taxol-bevacizumab regimen:** A chemoimmunotherapy regimen consisting of carboplatin, paclitaxel (Taxol) and bevacizumab used for the treatment of advanced-stage, nonsquamous non-small cell lung cancer. Or A chemotherapy combination used to treat endometrial, ovarian, and head and neck cancers, and non-small cell lung cancer that has spread. It includes the drugs carboplatin and paclitaxel (Taxol). Also called Carbo-Tax regimen, carboplatin-Taxol regimen, CaT regimen, and PC regimen.

**carboxyamidotriazole:** An orally-active agent with potential antineoplastic activity. Carboxyamidotriazole binds to and inhibits non-voltage-operated  $\text{Ca}^{2+}$  channels, blocking both  $\text{Ca}^{2+}$  influx into cells and  $\text{Ca}^{2+}$  release from intracellular stores and resulting in the disruption of calcium channel-mediated signal transduction and inhibition of vascular endothelial growth factor (VEGF) signaling, endothelial proliferation, and angiogenesis. This agent may also inhibit tumor cell growth, invasion and metastasis. OR A chemotherapy combination used to treat advanced, nonsquamous non-small cell lung cancer. It includes the drugs carboplatin, paclitaxel (Taxol), and bevacizumab. Also called carboplatin-paclitaxel-bevacizumab regimen.

**carboxyamidotriazole orotate:** The orotate salt form of carboxyamidotriazole (CAI), an orally bioavailable small molecule with potential antiangiogenic and antiproliferative activities. Carboxyamidotriazole binds to and inhibits non-voltage-operated calcium channels, blocking both  $\text{Ca}^{2+}$  influx into cells and  $\text{Ca}^{2+}$  release from intracellular stores, resulting in the disruption of calcium channel-mediated signal transduction. CAI inhibits PI3 activity and vascular endothelial growth factor (VEGF) signaling. This may inhibit endothelial proliferation, tumor cell growth, invasion and metastasis.

**Carboxyl Group:** Carboxyl groups are chemical functional groups with one carbon, one hydrogen, and two oxygen atoms ( $\text{COOH}$ ). You will find these on many of the amino acids. It also makes molecules that are considered weak carboxylic acids. It is also defined as a polyatomic ion.

**carboxyl-terminal residue:** The only amino acid residue in a polypeptide chain with a free  $\alpha$ -carboxyl group; defines the carboxyl terminus of the polypeptide.

**Carboxylase:** An enzyme that catalyzes a carboxyl transfer reaction; biotin is usually required as a coenzyme.

**Carboxylate group:** When a carboxylic (alkanoic) acid is deprotonated (i.e., loses a  $H^+$  ion) what is left is a negatively-charged carboxylate ion.

**carboxylesterase-expressing allogeneic neural stem cells:** A preparation of allogeneic neural stem cells (NSC), derived from a human fetal cell line, that are adenovirally-transduced to express a modified form of the human enzyme carboxylesterase (CE) hCE1m6, with potential adjuvant activity. Upon intracranial administration, NSCs localize to tumor sites, due to their tumor-trophic nature, and transiently express hCE1m6. Intravenous co-administration of the prodrug irinotecan allows for the selective conversion by hCE1m6 to its active metabolite and topoisomerase I inhibitor, SN-38, in the vicinity of tumor sites. This leads to a local anti-neoplastic effect and causes reduced toxicity and increased therapeutic efficacy of irinotecan. Since NSCs freely cross the blood-brain barrier, these cells can also be intravenously administered to target brain tumor cells. hCE1m6 shows increased activity as compared to unmodified human CE.

**carboxylic acids:** The carboxylic acids are a family of organic compounds containing the  $-COOH$  grouping. They are examples of weak acids. OR A carboxylic acid is an organic molecule with a  $-(C=O)-OH$  group. The group is also written as  $-COOH$  and is called a carboxyl group. The hydrogen on the  $-COOH$  group ionizes in water; carboxylic acids are weak acids. The simplest carboxylic acids are formic acid ( $H-COOH$ ) and acetic acid ( $CH_3-COOH$ ). OR Any carbon compound containing the functional group  $-C(O)OH$ . Formic acid ( $HCOOH$ ) gives the distinctive smell of crushed ants, while acetic acid ( $CH_3COOH$ ) gives VB its distinctive odour and taste. OR A molecule containing a carbon atom attached to a hydroxyl group and to an oxygen atom by a double bond.

**carboxypeptidase-G2 :** A chemotherapy combination used to treat endometrial, ovarian, and head and neck cancers, and non-small cell lung cancer that has spread. It includes the drugs carboplatin and paclitaxel (Taxol). Also called carboplatin-Taxol, carboplatin-Taxol regimen, CaT regimen, and PC regimen.

**carboxyphenyl retinamide:** A synthetic phenylretinamide analogue of retinol (vitamin A) with potential antineoplastic and chemopreventive activities. Carboxyphenyl retinamide induces cell differentiation and inhibits tumor cell growth and carcinogenesis. This agent may also induce cell cycle arrest in the G1 phase in some cancer cell types.

**carboy:** A very large bottle. Glass carboys are usually encased in a wire mesh or wooden box for protection.

**carbutamide:** A first-generation sulfonylurea with hypoglycemic activity. Carbutamide was one of the first sulfonylurea compounds used but was withdrawn from the market due to toxic effects on bone marrow. This agent has a long half-life.

**carcinoembryonic antigen :** An anticancer drug that belongs to the family of drugs called angiogenesis inhibitors.

**Carcinoembryonic antigen (CEA):** A membrane glycoprotein of the fetal gastrointestinal cells that is not significantly expressed after birth. High serum levels of CEA are evident in many patients with colorectal cancer.

**carcinoembryonic antigen assay :** A drug used to treat toxic levels of methotrexate (an anticancer drug) in the blood of patients with kidney problems. It is a bacterial enzyme that breaks down proteins and other substances, such as methotrexate. Carboxypeptidase-G2 may also help certain drugs kill cancer cells. It is a type of chemoprotective agent and a type of prodrug activator. Also called glucarpidase and Voraxaze.

**carcinoembryonic antigen peptide 1:** A nine amino acid peptide fragment of carcinoembryonic antigen (CEA), a protein that is overexpressed in several cancer cell types, including gastrointestinal, breast, and non-small cell lung. Autologous vaccination with activated autologous dendritic cells (DC) or peripheral blood mononuclear cells (PBMC) which have been exposed to CEA peptide 1 in vitro may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing CEA, thereby inhibiting tumor growth. Check for active clinical trials using this agent.

**carcinoembryonic antigen peptide 1-6D:** A 9-residue human leukocyte antigen (HLA)-restricted fragment of carcinoembryonic antigen (CEA). CEA:571-579 peptide, which has the amino acid sequence YLSGANLNL, may elicit a cytotoxic T lymphocyte (CTL) immune response against tumors expressing CEA.

**carcinoembryonic antigen peptide 1-6D virus-like replicon particles vaccine:** A cancer vaccine, consisting of alphavirus vector-derived virus-like replicon particles expressing the 9-amino-acid carcinoembryonic antigen peptide (CAP) 1-6D, with potential antineoplastic activity.

Vaccination with this agent may elicit a cytotoxic T lymphocyte (CTL) immune response against CEA-expressing tumor cells.

**carcinoembryonic antigen peptide-1** : A substance that may be found in the blood of people who have colon cancer, other types of cancer or diseases, or who smoke tobacco. Carcinoembryonic antigen levels may help keep track of how well cancer treatments are working or if cancer has come back. It is a type of tumor marker. Also called CEA.

**carcinoembryonic antigen RNA-pulsed DC cancer vaccine**: A vaccine comprising autologous dendritic cells pulsed with mRNA-encoded Carcinoembryonic Antigen (CEA) that targets tumor cells expressing CEA.

**carcinoembryonic antigen-expressing measles virus**: An attenuated oncolytic Edmonston (Ed) strain of measles virus (MV) encoding the soluble extracellular N-terminal domain of human carcinoembryonic antigen (CEA) (MV-CEA) with potential antineoplastic activity. The cellular receptor of MV is human CD46 antigen, a type 1 integral membrane glycoprotein found on nearly all human tissues and overexpressed on many cancer cell types. Mediated through CD46, both haemagglutinin and fusion glycoproteins of MV are required for the attachment to and fusion of host cell membranes, thereby leading to syncytia and cell lysis. The expressed CEA, a tumor associated antigen, can be detected in serum and used as a sensitive marker to monitor viral gene expression in order to easily optimize individual therapy. Compared to wild-type MV, the Ed strain of MV has a lower affinity for the MV receptor signaling lymphocyte-activation molecule (CD150), mainly expressed in B- and T-lymphocytes, but a higher affinity for CD46.

**carcinogen**: A cancer-causing agent. OR An agent, chemical, physical or biological, that can act on living tissue in such a way as to cause a malignant neoplasm (WHO, 1980). OR A substance that has been proven by medical research showing direct correlation to cause cancer in humans OR A chemical that can cause cancer.

**carcinogen** : A laboratory test that measures the level of carcinoembryonic antigen (CEA) in the blood. An increased amount of CEA may be found in the blood of people who have colon cancer or other types of cancer, certain other diseases, or who smoke. The amount of CEA in the blood may also help keep track of how well cancer treatments are working or if cancer has come back. CEA is a type of tumor marker. Also called CEA assay.

**carcinogenesis:** The induction by chemical, physical, or biological agents, of neoplasms that are usually not observed, an earlier induction of neoplasms that are usually observed, and/or the induction of more neoplasms than are usually found although fundamental differences in the mechanisms may be involved (IARC, 1977).

**carcinogenesis :** A small piece of a tumor marker called carcinoembryonic antigen (CEA). CEA may be found in the blood of people who have colon cancer, other types of cancer or diseases, or who smoke tobacco.

Carcinoembryonic antigen peptide-1 is used to make a vaccine that may help stimulate the body's immune system to kill cancer cells. Also called CAP-1 and CEA peptide-1.

**carcinoid syndrome :** Any substance that causes cancer.

**carcinoid tumor :** The process by which normal cells are transformed into cancer cells.

**carcinoma :** A combination of symptoms caused by the release of serotonin and other substances from carcinoid tumors of the gastrointestinal tract. Symptoms may include flushing of the face, flat angiomas (small collections of dilated blood vessels) of the skin, diarrhea, bronchial spasms, rapid pulse, and sudden drops in blood pressure.

**carcinoma in situ :** A slow-growing type of tumor usually found in the gastrointestinal system (most often in the small intestine and rectum), and sometimes in the lungs or other sites. Carcinoid tumors may spread to the liver or other sites in the body, and they may secrete substances such as serotonin or prostaglandins, causing carcinoid syndrome.

**carcinoma of unknown primary :** Cancer that begins in the skin or in tissues that line or cover internal organs.

**carcinomatosis :** A group of abnormal cells that remain in the place where they first formed. They have not spread. These abnormal cells may become cancer and spread into nearby normal tissue. Also called stage 0 disease.

**carcinomatous lymphangitis :** A case in which cancer cells are found in the body, but the place where the cells first started growing (the origin or primary site) cannot be determined. Also called cancer of unknown primary origin and CUP.

**carcinomatous meningitis :** A condition in which cancer is spread widely throughout the body, or, in some cases, to a relatively large region of the

body. Also called carcinosis.

**carcinosisarcoma** : A condition in which cancer cells spread from the original (primary) tumor and invade lymph vessels (thin tubes that carry lymph and white blood cells through the body's lymph system). The invaded lymph vessels then fill up with cancer cells and become blocked. Although carcinomatous lymphangitis can occur anywhere in the body, it commonly happens in the lungs. It can happen in many types of cancer but is most common in breast, lung, colon, stomach, pancreatic, and prostate cancer. Also called lymphangitic carcinomatosis.

**carcinosis** : A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called leptomenigeal carcinoma, leptomenigeal carcinomatosis, leptomenigeal metastasis, menigeal carcinomatosis, menigeal metastasis, and neoplastic meningitis.

**carcinostatic** : A malignant tumor that is a mixture of carcinoma (cancer of epithelial tissue, which is skin and tissue that lines or covers the internal organs) and sarcoma (cancer of connective tissue, such as bone, cartilage, and fat).

**cardiac** : A condition in which cancer is spread widely throughout the body, or, in some cases, to a relatively large region of the body. Also called carcinomatosis.

**cardiac muscle**: the involuntary muscle found in the heart; contains actin and myosin filaments.

**cardiac pacemaker** : Pertaining to slowing or stopping the growth of cancer.

**cardiac sarcoma** : Having to do with the heart.

**cardin** : An electronic device that is implanted in the body to monitor heart rate and rhythm. It gives the heart electrical stimulation when it does not beat normally. It runs on batteries and has long, thin wires that connect it to the heart. Also called artificial pacemaker and pacemaker.

**Cardiolite**: (Other name for: Tc 99m sestamibi)

**cardiologist** : A rare cancer that develops in tissues of the heart. Also called heart cancer.

**cardiology** : A plant whose leaves, stems, and flowers have been used in some cultures to treat certain medical problems. Cardin may have anti-inflammatory and anticancer effects. The scientific name is *Cnicus benedictus*. Also called blessed thistle, holy thistle, spotted thistle, and St. Benedict's thistle.

**cardiopulmonary** : A doctor who has special training to diagnose and treat diseases of the heart and blood vessels.

**cardiopulmonary resuscitation** : A branch of medicine that specializes in diagnosing and treating diseases of the heart, blood vessels, and circulatory system. These diseases include coronary artery disease, heart rhythm problems, and heart failure.

**Cardiotonic steroids**: Compounds derived from cholesterol that inhibit the Na<sup>+</sup>-K<sup>+</sup> pump by blocking the dephosphorylation of the E2 conformation of the pump protein. Inhibition of the pump in cardiac tissue cells leads to a higher level of sodium ion in the cells, which slows the extrusion of calcium ion and enhances cardiac muscle contractility.

**cardiotoxicity** : Having to do with the heart and lungs.

**cardiovascular** : An emergency procedure used to restart a person's heartbeat and breathing after one or both have stopped. It involves giving strong, rapid pushes to the chest to keep blood moving through the body. Usually, it also involves blowing air into the person's mouth to help with breathing and send oxygen to the lungs. Also called CPR.

**cardiovascular disease** : Toxicity that affects the heart.

**Cardizem**: (Other name for: diltiazem hydrochloride)

**Cardura** : (Other name for: doxazosin mesylate) OR Having to do with the heart and blood vessels.

**caregiver** : A type of disease that affects the heart or blood vessels. The risk of certain cardiovascular diseases may be increased by smoking, high blood pressure, high cholesterol, unhealthy diet, lack of exercise, and obesity. The most common cardiovascular disease is coronary artery disease (narrow or blocked coronary arteries), which can lead to chest pain, heart attacks, or stroke. Other cardiovascular diseases include congestive heart

failure, heart rhythm problems, congenital heart disease (heart disease at birth), and endocarditis (inflamed inner layer of the heart). Also called heart disease.

**carfilzomib:** A drug used to treat high blood pressure and urinary problems caused by an enlarged prostate. It relaxes muscle tissue in blood vessels and in the prostate. Cardura is a type of alpha blocker. Also called doxazosin and doxazosin mesylate. OR An epoxomicin derivate with potential antineoplastic activity. Carfilzomib irreversibly binds to and inhibits the chymotrypsin-like activity of the 20S proteasome, an enzyme responsible for degrading a large variety of cellular proteins. Inhibition of proteasome-mediated proteolysis results in an accumulation of polyubiquinated proteins, which may lead to cell cycle arrest, induction of apoptosis, and inhibition of tumor growth. Check for active clinical trials using this agent.

**caricotamide/tretazicar:** A combination therapy consisting of the prodrug tretazicar and the enzyme co-substrate caricotamide with potential antineoplastic activity. In the presence of separately and simultaneously administered caricotamide, tretazicar is converted to the short-lived cytotoxic DNA cross-linking agent dinitrobenzamide by NAD(P)H quinone oxidoreductase 2 (NQO2), resulting in the inhibition of DNA replication and the induction of apoptosis. NQO2 has been found to be elevated in certain cancers such as hepatocellular carcinoma (HCC).

**carina of trachea :** A person who gives care to people who need help taking care of themselves. Examples include children, the elderly, or patients who have chronic illnesses or are disabled. Caregivers may be health professionals, family members, friends, social workers, or members of the clergy. They may give care at home or in a hospital or other health care setting.

**carlumab:** A recombinant monoclonal antibody directed against human CC chemokine ligand 2 (CCL2) with potential antineoplastic activity. Carlumab binds to and inhibits CCL2, which may result in inhibition of angiogenesis and, so, tumor cell proliferation. Endothelium-derived CCL2 (monocyte chemoattractant protein; MCP1) is a member of the beta-chemokine family, can stimulate monocyte/macrophage migration and smooth muscle cell (SMC) proliferation, and plays a role in angiogenesis and tumor cell migration; CCL2 induction of angiogenesis may involve the

upregulation of hypoxia-inducible factor 1 alpha (HIF-1 alpha) gene expression which, in turn, induces vascular endothelial growth factor-A (VEGF-A) gene expression.

**Carmubris:** (Other name for: carmustine)

**carmustine:** An antineoplastic nitrosourea. Carmustine alkylates and cross-links DNA during all phases of the cell cycle, resulting in disruption of DNA function, cell cycle arrest, and apoptosis. This agent also carbamoylates proteins, including DNA repair enzymes, resulting in an enhanced cytotoxic effect. Carmustine is highly lipophilic and crosses the blood-brain barrier readily.

**carmustine :** A drug used alone or with other drugs to treat multiple myeloma that has gotten worse or come back after treatment with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Carfilzomib blocks the action of enzymes called proteasomes, which may help keep cancer cells from growing and may kill them. It is a type of proteasome inhibitor. Also called Kyprolis.

**carmustine implant :** A ridge at the base of the trachea (windpipe) that separates the openings of the right and left main bronchi (the large air passages that lead from the trachea to the lungs). Also called tracheal carina.

**carmustine sustained-release implant wafer:** A sustained release (SR) implant wafer containing the lipophilic nitrosourea carmustine (BCNU) with antineoplastic activity. Upon intracranial administration of the implant wafer and subsequent release of BCNU from the wafer, this agent alkylates and cross-links DNA during all phases of the cell cycle, resulting in the disruption of DNA function, cell cycle arrest, and apoptosis. This wafer contains the biodegradable copolymer PLGA (poly(lactide-co-glycolide) as the major drug delivery vehicle which is slowly degraded into water and carbon dioxide thereby continuously releasing BCNU over approximately 3-4 weeks. Compared to systemic administration of BCNU alone, this local SR formulation is able to maintain higher drug concentrations locally over a longer period of time while minimizing exposure to other tissues.

**Carney complex :** A drug used to treat certain types of brain tumors. It is also used with prednisone to treat multiple myeloma and with other drugs to treat Hodgkin lymphoma and non-Hodgkin lymphoma that have not gotten better with other treatment or have come back. It is also being studied in the

treatment of other types of cancer. Carmustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea. Also called BCNU and BiCNU.

**Carney dyad :** A biodegradable wafer that is used to deliver the anticancer drug carmustine directly into a brain tumor site after the tumor has been removed by surgery. Also called Gliadel Wafer and polifeprosan 20 carmustine implant.

**Carney syndrome :** A rare, inherited disorder marked by dark spots on the skin and tumors in the heart, endocrine glands, skin, and nerves. There are two types of Carney complex, which are caused by mutations (changes) in different genes. Also called Carney syndrome.

**Carney triad :** A rare, inherited disorder marked by tumors of the gastrointestinal tract and tumors that form in embryonic nervous tissue in the head, neck, and torso. Also called Carney-Stratakis dyad and Carney-Stratakis syndrome.

**Carney-Stratakis dyad :** A rare, inherited disorder marked by dark spots on the skin and tumors in the heart, endocrine glands, skin, and nerves. There are two types of Carney syndrome, which are caused by mutations (changes) in different genes. Also called Carney complex.

**Carney-Stratakis syndrome :** A very rare disorder marked by tumors of the gastrointestinal tract (usually the stomach), tumors that form in embryonic nervous tissue in the head, neck, and torso, and tumors that form in cartilage in the lungs. Sometimes tumors also form in the adrenal glands and esophagus. Carney triad is most common in young females.

**Carnitine:** A zwitterionic compound formed from lysine that acts as a carrier of long-chain fatty acids from the cytosol to the mitochondrial matrix.

**carnitine :** A rare, inherited disorder marked by tumors of the gastrointestinal tract and tumors that form in embryonic nervous tissue in the head, neck, and torso. Also called Carney dyad and Carney-Stratakis syndrome.

**Carnitor :** (Other name for: levocarnitine) OR A rare, inherited disorder marked by tumors of the gastrointestinal tract and tumors that form in embryonic nervous tissue in the head, neck, and torso. Also called Carney dyad and Carney-Stratakis dyad.

**carnivores:** animals that eat other animals.

**carotene:** Carotene is an unsaturated hydrocarbon pigment found in many plants. Carotene is the basic building block of vitamin A.

**carotenoid :** A substance made in the muscle and liver tissue and found in certain foods, such as meat, poultry, fish, and some dairy products. It is used by many cells in the body to make energy from fatty acids.

**Carotenoids:** Lipid-soluble pigments that are made from isoprene units. OR Extended polyenes that absorb light between 400 and 500 nm and serve as accessory pigments in photosynthesis by funneling the energy to the photosynthetic reaction center. OR Lipid-soluble photosynthetic pigments made up of isoprene units.

**Carothers:** Wallace Hume Carrothers (1896-1937) carried out the key early experiments that led to commercial polyesters, nylons, and neoprene while working for the DuPont corporation and almost single-handedly created the polymer industry in the United States. His amazing scientific achievements did not bring him happiness, and he tragically committed suicide by taking cyanide.

**carotid artery :** A form of carnitine, which is a substance made in muscle and liver tissue and found in certain foods, such as meat, poultry, fish, and some dairy products. Carnitor is also a drug that is used to treat patients who do not make enough carnitine and is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is a type of dietary supplement. Also called L-carnitine and levocarnitine.

**carrageenan-containing gel:** A water-based, vaginal moisturizing gel containing a mixture of lambda- and kappa- carrageenans, sulfated polysaccharides derived from red seaweed (*Chondrus crispus*), with potential microbicidal activity against various viruses, including human papillomavirus (HPV), human immunodeficiencyvirus (HIV) and human herpes simplex virus (HSV). Upon vaginal insertion via an applicator, carrageenan specifically binds to the viral capsids, which prevents the binding of virions to heparan sulfate proteoglycan (HSPG) receptors or other, as of yet not fully identified, cellular proteins. In addition, the viral binding of carrageenan may also interfere with conformational changes within the virions after cellular attachment. This inhibits viral infection. Certain HPV types cause cervical cancer; therefore, the prevention of HPV

infection by this gel may subsequently prevent the development of cervical cancer.

**CARREAU MODEL:** A mathematical expression describing the shear thinning behavior of polymers. It is more realistic than the power-law model because it fits the data very well at both high and low shear rates.

**Carrier:** The liquid portion of a coating (solvent or water) in which solids are dissolved or suspended. OR an inactive substance (usually another benign polymer) that is used to transmit an additive to a given polymer, and then facilitate its distribution through the base polymer during melt processing.

**carrier :** In classical genetics, an individual who carries one deleterious allele for an autosomal recessive disorder. In clinical discussions, may refer to an individual who carries a deleterious allele that predisposes to disease.

**carrier frequency :** The proportion of individuals in a population who have a single copy of a specific recessive gene mutation; also sometimes applied to the prevalence of mutations in dominantly acting genes such as BRCA1 and BRCA2. Also called carrier rate.

**carrier oil :** A yellow, red, or orange substance found mostly in plants, including carrots, sweet potatoes, dark green leafy vegetables, and many fruits, grains, and oils. Some carotenoids are changed into vitamin A in the body and some are being studied in the prevention of cancer. A carotenoid is a type of antioxidant and a type of provitamin.

**carrier rate :** The proportion of individuals in a population who have a single copy of a specific recessive gene mutation; also sometimes applied to the prevalence of mutations in dominantly acting genes such as BRCA1 and BRCA2. Also called carrier frequency.

**Carrier-linked prodrug:** Prodrugs which contain the active compound linked to a removable carrier group. Removal is generally through hydrolysis.

**carrot/Ji-Lin ginseng/licorice root/tangerine peel soy beverage:** A soy-based powdered nutritional supplement drink containing carrot, Jilin ginseng, licorice root and tangerine peel with potential antioxidant, immunomodulating and protective activities. Besides vitamin C, E and other phytochemicals, carrot/Jilin ginseng/licorice root/tangerine peel/soy

beverage contains a high amount of soy protein. This beverage may have a beneficial effect on overall nutrition and the immune system.

**carrying capacity:** a situation when a population has reached the maximum size that the environment can support.

**cART:** A major artery that carries blood from the heart to the head. There is a carotid artery on each side of the neck, and each one splits into two branches. The interior branch carries blood to the brain and eyes, and the exterior branch carries blood to the face, tongue, and outside parts of the head.

**cartesian coordinates:** The positions in space of the atoms in a molecule listed as triples (x, y, z).

**cartilage :** (Other name for: shark cartilage) OR An oil with little or no scent that is used to dilute or “carry” essential oils (scented liquid taken from plants).

**Cartridge heaters:** Pencil-shaped electrical heater devices sometimes placed in molds to raise the temperature level of the mold. Especially beneficial when molding high-temperature crystalline materials.

**carubicin:** An anthracycline antineoplastic antibiotic isolated from the bacterium *Actinomadura carminata*. Carubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis.

**carvedilol:** A synthetic antihypertensive methoxyphenoxy-2-propanol derivative with no intrinsic sympathomimetic activity, Carvedilol acts as a nonselective beta-adrenoceptor blocking agent (S(-) enantiomer) and as an alpha 1-adrenoceptor blocker (R(+) and S(-) enantiomers). It acts more strongly on beta-receptors than on alpha 1-receptors, reduces peripheral vascular resistance by vasodilation, and prevents reflex tachycardia (beta-blockade) so that heart rate is either unchanged or decreased. Carvedilol also reduces renin release through beta-blockade. Check for active clinical trials using this agent.

**carvedilol phosphate :** Treatment that uses a combination of three or more drugs to treat HIV infection. cART stops the virus from making copies of itself in the body. This may lessen the damage to the immune system caused by HIV and may slow down the development of AIDS. It may also help prevent transmission of HIV to others, including from mother to child

during birth. Also called combination antiretroviral therapy, HAART, and highly active antiretroviral therapy.

**carvedilol phosphate extended-release capsule:** An extended-release capsule formulation containing the phosphate salt of carvedilol, a nonselective beta-adrenergic blocking agent with alpha 1-adrenergic blocking activity. Carvedilol is a racemic mixture; the S(-) enantiomer non-selectively binds to and blocks beta-adrenergic receptors, exerting negative inotropic and chronotropic effects, leading to a reduction in cardiac output. Both R(+) and S(-) enantiomers bind to and block alpha 1-adrenergic receptors with equal potency, causing vasodilation and a reduction in peripheral vascular resistance. This agent has no intrinsic sympathomimetic activity.

**carzelesin :** A tough, flexible tissue that lines joints and gives structure to the nose, ears, larynx, and other parts of the body.

**Cascade, enzymatic:** A sequence of reactions, in which at each step a product stimulates an ensuing reaction, generating an amplification of a relatively small stimulus or signal.

**case:** refers to the way a noun or pronoun is used in a phrase, clause, or sentence; case can be subjective, objective, or possessive. OR The smallest shipping unit for poly bags containing multiple cartons.

**case control study:** A study that starts with the identification of persons with the disease (or other outcome variable) of interest, and a suitable control (comparison, reference) group of persons without the disease. The relationship of an attribute to the disease is examined by comparing the diseased and nondiseased with regard to how frequently the attribute is present or, if quantitative, the levels of the attribute, in each of the groups.

**CASE HARDEN:** To harden surface of a piece of steel to a relatively shallow depth.

**case management nurse :** A drug used to treat high blood pressure and certain heart problems. It is also being studied in the prevention and treatment of side effects caused by some anticancer drugs. Carvedilol phosphate blocks certain receptors on nerve cells and causes blood vessels to dilate (widen). It is a type of antihypertensive agent and a type of antianginal agent. Also called Coreg.

**case report :** An anticancer drug that belongs to the family of drugs called alkylating agents.

**case series :** A registered nurse who has special training in how to plan, manage, and evaluate all aspects of patient care, especially for patients who get treatment over a long time. Also called nurse case manager.

**case-control study :** A detailed report of the diagnosis, treatment, and follow-up of an individual patient. Case reports also contain some demographic information about the patient (for example, age, gender, ethnic origin).

**casein/whey protein/soy protein/pea protein/fat mix/EPA/DHA-based nutritional supplement:** A gluten-free, calorie-rich nutritional supplement containing all essential vitamins, minerals, and trace elements, as well as protein, fat and carbohydrates. The protein contained in this supplement is derived from a variety of sources, including casein, whey, soy and pea; it helps maintain digestive health throughout the gastrointestinal tract and reduces the risk of digestive complications. This supplement contains the essential omega-3 polyunsaturated fatty acids eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA). DHA and EPA are incorporated into cell membranes and affect the production of pro-inflammatory mediators, eliciting an anti-inflammatory effect. Medium chain triglycerides (MCT) in this supplement enhance fat absorption. Upon oral intake of this nutritional supplement, the ingredients may prevent both malnutrition and weight loss.

**caseinate protein isolate:** An isolate comprised of the sodium or calcium salt of the glycoprotein casein, the primary protein found in milk and other dairy products, with anti-catabolic activity.

**Casement:** A window hinged to open along one of its vertical edges.

**Cask:** A heavily shielded container used for the dry storage or shipment (or both) of radioactive materials such as spent nuclear fuel or other high-level radioactive waste. Casks are often made from lead, concrete, or steel. Casks must meet regulatory requirements and are not intended for long-term disposal in a repository. For additional detail, see Dry Cask Storage and Dry Spent Fuel Storage Designs: NRC Approved for General Use.

**Casodex :** (Other name for: bicalutamide) OR A group or series of case reports involving patients who were given similar treatment. Reports of case series usually contain detailed information about the individual patients. This includes demographic information (for example, age, gender,

ethnic origin) and information on diagnosis, treatment, response to treatment, and follow-up after treatment.

**casopitant mesylate:** The mesylate salt of a centrally-acting neurokinin 1 (NK1) receptor antagonist with antidepressant and antiemetic activities. Casopitant competitively binds to and blocks the activity of the NK1 receptor, thereby inhibiting NK1-receptor binding of the endogenous tachykinin neuropeptide substance P (SP), which may result in antiemetic effects. SP is found in neurons of vagal afferent fibers innervating the brain-stem nucleus tractus solitarius and the area postrema, which contains the chemoreceptor trigger zone (CTZ), and may be elevated in response to chemotherapy. The NK1 receptor is a G-protein receptor coupled to the inositol phosphate signal-transduction pathway and is found in both the nucleus tractus solitarius and the area postrema.

**Caspases:** Cysteine proteases that participate in the proteolytic cascade in apoptosis.

**casprofungin acetate:** The acetate salt of an antimycotic echinocandin lipopeptide, semisynthetically derived from a fermentation product of the fungus *Glarea lozoyensis*. Casprofungin inhibits 1,3-beta-glucan synthase, resulting in decreased synthesis of beta(1,3)-D-glucan (an essential component of the fungal cell wall), weakening of the fungal cell wall, and fungal cell wall rupture. This agent is active against *Aspergillus* and *Candida* species. OR A study that compares two groups of people: those with the disease or condition under study (cases) and a very similar group of people who do not have the disease or condition (controls). Researchers study the medical and lifestyle histories of the people in each group to learn what factors may be associated with the disease or condition. For example, one group may have been exposed to a particular substance that the other was not. Also called retrospective study.

**CASPT2:** Complete active space, second-order perturbation theory. This is one formulation of MP2 theory using a CASSCF reference instead of a HF reference. A high-level multireference theory.

**CASSCF:** Complete active space self-consistent field. A type of MCSCF calculation in which the configurations are chosen to be all those obtainable (i.e., full CI) using a specified number of electrons and a specified set of orbitals. The set of orbitals is called the "active space," and

the specified electrons are called "active." In many cases, it requires experience and skill to select the active space correctly.

**cast:** a fossil formed when the organic remains dissolved, leaving an opening (mold) shaped like the organism and later filled with calcite or silica. OR To form a "plastic" object by pouring a fluid monomer-polymer solution into an open mold where it finishes polymerizing. (2) Forming plastic film and sheet by pouring the liquid resin onto a moving belt or by precipitation in a chemical bath. OR To form a "plastic" object by pouring a fluid monomer-polymer solution into an open mold where it finishes polymerizing.

**Cast Film:** A cast film is made by depositing a layer of plastic onto a surface then solidifying and removing the film from that surface. The plastic layer can be in molten form, in a solution, or in dispersion. OR Plastic film produced from synthetic resins (such as polyethylene) by the cast process. In this process, the molten resin is extruded through a slot die onto an internally cooled chill roll. OR A cast film is made by depositing a layer of plastic onto a surface then solidifying and removing the film from that surface. The plastic layer can be in molten form, in a solution, or in a dispersion. OR a resinous product prepared by pouring liquid resins into a mold and heat treating the mass to harden it.

**Cast iron** : This is iron as it comes out of the blast furnace. It contains around 4% carbon and so is brittle. Some of the carbon is removed as the cast iron is converted to steel.

**Casting:** The process of forming objects using fluid plastic poured into a mold. OR The process of forming solid or hollow articles from fluid plastic mixtures or resins by pouring or injecting the fluid into a mold or against a substrate with little or no pressure, followed by solidification and removal of the formed object. OR The process of forming solid or hollow articles from fluid plastic mixtures or resins by pouring or injecting the fluid into a mold or against a substrate with little or no pressure, followed by solidification and removal of the formed object.

**Castleman disease** : A drug used with another drug to treat prostate cancer that has spread to other parts of the body. Casodex binds to proteins called androgen receptors, which are found in some prostate cancer cells. These proteins bind to androgens (male hormones) and may cause cancer cells to

grow. Casodex blocks these proteins and may keep cancer cells from growing. It is a type of antiandrogen. Also called bicalutamide.

**castrate-resistant prostate cancer :** A drug used to prevent or treat infections caused by a fungus (a type of microorganism). It belongs to the family of drugs called antifungal agents.

**castration :** A rare disorder in which benign (not cancer) growths form in lymph node tissue. There are two main ways that Castleman disease occurs: localized (unicentric) and multicentric. Unicentric Castleman disease affects only one group of lymph nodes in one part of the body, usually in the chest or abdomen. It may not cause symptoms. Multicentric Castleman disease affects many groups of lymph nodes and lymphoid tissue all through the body. It can weaken the immune system and cause problems such as infection, fever, weight loss, fatigue, night sweats, nerve damage, and anemia. People with Castleman disease have an increased risk of lymphoma. Also called angiofollicular lymph node hyperplasia and giant lymph node hyperplasia.

**CaT regimen :** Prostate cancer that keeps growing even when the amount of testosterone in the body is reduced to very low levels. Many early-stage prostate cancers need normal levels of testosterone to grow, but castrate-resistant prostate cancers do not. Also called CRPC.

**CAT scan :** Removal or destruction of the testicles or ovaries using radiation, surgery, or drugs. Medical castration refers to the use of drugs to suppress the function of the ovaries or testicles.

**CAT-8015:** A chemotherapy combination used to treat endometrial, ovarian, and head and neck cancers, and non-small cell lung cancer that has spread. It includes the drugs carboplatin and paclitaxel (Taxol). Also called Carbo-Tax regimen, carboplatin-Taxol, carboplatin-Taxol regimen, and PC regimen.

**Catabolic:** A type of reaction or series of reactions in which complex molecules are broken down into simpler ones; the opposite of anabolic

**catabolism:** the breakdown or digestion of large, complex molecules. OR That part of metabolism that is concerned with degradation reactions. OR

The set of metabolic reactions that transform fuels into cellular energy. OR The phase of intermediary metabolism concerned with the energyyielding degradation of nutrient molecules.

**Catabolite activator protein (CAP):** The camp response protein; when bound to camp, CAP binds to an inverted repeated of the lac operon, near position -61 relative to the start site of transcription, to stimulate transcription. OR A specific regulatory protein that controls initiation of transcription of the genes producing the enzymes required for a bacterial cell to use some other nutrient when glucose is lacking.

**Catabolite repression:** The general repression of transcription of genes associated with catabolism that is seen in the presence of glucose. OR The repression by glucose of catabolic enzymes required for the catabolism of carbohydrates other than glucose.

**Catalase:** A ubiquitous heme protein that catalyzes the dismutation of hydrogen peroxide into molecular oxygen and water.

**catalysis:** A process in which a catalyst increases the speed of a chemical reaction.

**Catalysis by approximation:** Enhancing the rate of a reaction by bringing multiple substrates together along a single binding surface of an enzyme.

**Catalyst:** A chemical compound (usually an organic peroxide) which initiates polymerisation of a resin. (Also known as a hardener.) OR the acceleration (or retardation) of a chemical reaction by the presence of a comparatively small amount of a foreign substance called a catalyst. OR A substance that changes the rate of a chemical reaction without itself undergoing a permanent change or becoming part of the molecular composition of the product. OR A substance which markedly speeds up the cure of a compound when added in minor quantity as compared to the amounts of primary reactants. OR A substance that increases the rate of a chemical reaction, without being consumed or produced by the reaction. Catalysts speed both the forward and reverse reactions, without changing the position of equilibrium. Enzymes are catalysts for many biochemical reactions. OR a substance that helps along a chemical reaction or change without being changed itself. OR A substance that speeds up a chemical or biochemical reaction that would have occurred anyway (without help), but at a much slower rate; enzymes are biological catalysts OR a substance that affects the rate of a reaction in which it participates; however, it is not altered or used up in the process. OR a substance that affects the rate of a reaction in which it participates; however, it is not altered or used up in the process. Platinum metal is a catalyst in alkyne hydrogenation, for example.

OR a substance that accelerates a chemical reaction without itself being consumed. OR An ingredient that speeds up a chemical reaction; sometimes used in two component paint systems. OR Compound that accelerates the rate of a chemical reaction, and is not itself consumed in the reaction. OR Substance whose presence increases the rate of a chemical reaction, e.g., acid catalyst added to an epoxy resin system to accelerate drying time. OR A catalyst is a substance that alters (usually speeds up) the rate of a chemical reaction, but remains chemically unchanged itself at the end of the reaction. OR A substance that significantly increases the rate of a chemical reaction, although it is neither a reactant nor a product. OR A substance that alters the velocity of a chemical reaction and may be recovered essentially unaltered in form and amount at the end of the reaction. OR Substance that speeds up a chemical process without actually changing the products of reaction. OR A substance which increases the rate of a chemical reaction, but itself remains unchanged at the end of the reaction. OR A catalyst is a compound or element that can increase the rate of a chemical reaction. Catalysts can lower activation energy of a reaction to help a reaction proceed faster and with less energy.

**Catalytic antibodies:** Antibodies generated by using transition-state analogs of a particular reaction as antigens. Such antibodies often function as catalysts for the reaction. Also called abzymes.

**catalytic converter:** A catalytic converter is a honeycomb structure coated with precious metal catalysts, used in a car's exhaust to reduce air pollution. OR This is a device fitted to the exhaust pipe of a car in order to convert the harmful gases into less harmful ones. The particular gases to be removed are carbon monoxide and the nitrogen oxides. After conversion, these become nitrogen (already 4/5 of the atmosphere) and carbon dioxide (although a pollutant since it is a greenhouse gas, the amount of carbon dioxide released in this way is very small compared to the amount emitted by burning the fuel).

**Catalytic Cracking:** A method of cracking that uses a catalyst to convert hydrocarbons to positively charged carbocations, which then break down into smaller molecules. This can be carried out at much lower temperatures than thermal cracking - still hot, 500-600°C as compared to around 700°C, but that difference adds up to a lot of \$\$\$.

**Catalytic group:** An amino acid or cofactor at an enzymes active site that directly participates in the making or breaking of covalent bonds.

**Catalytic RNA:** One of a class of RNA molecules that display enzymatic activity.

**Catalytic site:** The site of an enzyme involved in the catalytic process.  
OR See active site.

**Catalytic triad:** A constellation of three residues, found in many proteolytic enzymes, in which two of the residues convert the remaining residue, usually a serine or cysteine, into a potent nucleophile.

**catanadromous:** Fish that swim downstream to spawn.

**Catapres :** (Other name for: clonidine hydrochloride) OR A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The pictures are taken from different angles and are used to create 3-dimensional (3-D) views of tissues and organs. A dye may be injected into a vein or swallowed to help the tissues and organs show up more clearly. A CAT scan may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called computed tomography scan, computerized axial tomography scan, computerized tomography, and CT scan.

**cataract :** A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of some types of B-cell cancer. CAT-8015 is made in the laboratory. It binds to CD22, a protein on the surface of normal B cells and B-cell tumors, and kills the cells. Also called anti-CD22 immunotoxin CAT-8015.

**catechin :** A drug used to treat high blood pressure. It is also being studied in the treatment of certain types of cancer pain and as an aid to stop smoking. It blocks the release of chemicals from nerve endings that make blood vessels constrict (get narrower). Catapres is a type of antihypertensive agent and a type of alpha-adrenergic agonist. Also called clonidine hydrochloride.

**catechol :** A condition in which the lens of the eye becomes cloudy. Symptoms include blurred, cloudy, or double vision; sensitivity to light; and difficulty seeing at night. Without treatment, cataracts can cause blindness. There are many different types and causes of cataracts. They may occur in people of all ages, but are most common in the elderly.

**catecholamine :** A substance found in tea that helps protect cells from damage caused by free radicals. Free radicals are unstable molecules that are made during normal cell metabolism (chemical changes that take place in a cell). They can build up in cells and cause damage to other molecules. This damage may increase the risk of cancer and other diseases. Catechins are being studied in the prevention and treatment of cancer. A catechin is a type of antioxidant.

**catecholamines:** Hormones, such as epinephrine, that are amino derivatives of catechol.

**Category of radioactive sources:** The categories for radioactive sources are defined by the IAEA's Code of Conduct to help ensure that radioactive sources are used within an appropriate framework of radiation safety and security. · Category 1 sources, if not safely managed or securely protected, would be likely to cause permanent injury to a person who handled them or was otherwise in contact with them for more than a few minutes. It would probably be fatal to be close to this amount of unshielded material for a period of a few minutes to an hour. These sources are typically used in practices such as radiothermal generators, irradiators, and radiation teletherapy. · Category 2 sources, if not safely managed or securely protected, could cause permanent injury to a person who handled them or was otherwise in contact with them for a short time (minutes to hours). It could possibly be fatal to be close to this amount of unshielded radioactive material for a period of hours to days. These sources are typically used in practices such as industrial gamma radiography, high dose rate brachytherapy and medium dose rate brachytherapy. · Category 3 sources, if not safely managed or securely protected, could cause permanent injury to a person who handled them or was otherwise in contact with them for some hours. It could possibly -- although it is unlikely -- be fatal to be close to this amount of unshielded radioactive material for a period of days to weeks. These sources are typically used in practices such as fixed industrial gauges involving high activity sources (for example, level gauges, dredger gauges, conveyor gauges, and spinning pipe gauges) and well logging.

**Catemer:** A network extending throughout a system; a type of hydrogen bonding arrangement consisting of an infinite chain.

**Catenane:** An interlocked pair of circular structures, such as covalently closed DNA molecules.

**Catenation:** The linking of molecules without any direct covalent bonding between them, as when two circular DNA molecules interlock like the links in a chain.

**Caternary:** A measure of the difference in length of strands in a specified length of roving, as a result of unequal tension.

**cathepsin-activatable Cy5 fluorescent imaging probe LUM015:** A cathepsin-activatable fluorescent probe with imaging activity. The cathepsin-activatable fluorescent probe LUM015 contains the Cy5 fluorophore linked, via a pan-cathepsin protease cleavable peptide, to a fluorescent quencher. Upon injection, the peptide in LUM015 can be cleaved by cathepsins overexpressed by tumor cells, which releases the quencher and activates the fluorophore. Upon imaging, tumor cells expressing cathepsin family proteases can be detected.

**catheter :** A chemical originally isolated from a type of mimosa tree. Catechol is used as an astringent, an antiseptic, and in photography, electroplating, and making other chemicals. It can also be made in the laboratory.

**cathode:** Electrode where electrons are gained (reduction) in redox reactions. OR A negative electrode. It is the electrode from which current leaves an electrolytic cell. OR A cathode is a negative electrode. OR The electrode at which reduction occurs.

**cathode ray:** A negatively charged beam that emanates from the cathode of a discharge tube. Cathode rays are streams of electrons.

**cation:** a positively charged atom or group of atoms, or a radical which moves to the negative pole (cathode) during electrolysis. OR A cation is a positively charged ion. Metals typically form cations. OR A positively charged ion. OR an ion with a positive charge. OR a positively charged ion. OR an atom or molecule with a positive charge. OR A positively charged ion.

**Cation exchange:** The ability of a soil or other solid to exchange cations (positive ions such as calcium) with a liquid.

**cation-exchange resin:** An insoluble polymer with fixed negative charges; used in the chromatographic separation of cationic substances.

**Cationic cation:** A positively charged chemical species, like the ammonium  $\text{NH}_4^+$  and scandium  $\text{Sc}^{4+}$  ions, is called a cation. In an electrochemical cell, a cation will move towards the cathode to gain an electron to remove its excess positive charge.

**cationic liposome-encapsulated paclitaxel:** A cationic liposome preparation of paclitaxel with antineoplastic activity. Paclitaxel, the active ingredient in cationic liposome-encapsulated paclitaxel, binds to tubulin and inhibits the disassembly of microtubules, resulting in the inhibition of mitosis and cellular proliferation, and apoptosis. Cationic liposome encapsulation of paclitaxel allows the delivery of high doses of paclitaxel to target tissues while minimizing systemic toxicity. Tumor endothelial cells may preferentially bind and internalize cationic liposomes.

**Cationic monomer :** A building block in polyacrylamide flocculant polymers. Makes the polymer cationically charged.

**cationic polymerization:** occurs via a cation intermediate and is less efficient than free-radical polymerization.

**Cationic product :** A product carrying positive charge in its structure.

**CATIONIC SURFACTANT:** A surfactant in which the hydrophile is positively charged. Examples; quaternary ammonium salts. (see RFF 750.10.01 - SURFACTANTS).

**catumaxomab:** A trifunctional bispecific monoclonal antibody with potential antineoplastic activity. Catumaxomab has two antigen-recognition sites: one for human CD3, a T cell surface antigen; and one for human epithelial cell adhesion molecule (EpCAM), a cell surface antigen expressed by a variety of epithelial tumor cells. In addition, the modified Fc portion of this antibody binds Fc receptors on antigen presenting cells (APCs) such as macrophages and dendritic cells (DCs). Catumaxomab brings T cells, EpCAM-expressing epithelial tumor cells and APCs together into tricellular complexes, which may result in a potent cytotoxic T-lymphocyte (CTL) response against EpCAM-expressing epithelial tumor cells. Fc-mediated binding of APCs in the tricellular complex potentiates EpCAM antigen presentation to T cells and the activation of anti-tumor cytotoxic T cell functions. Check for active clinical trials using this agent.

**CAULKING COMPOUND:** A semidrying or slow drying plastic material used to seal joints or fill crevices around windows, chimneys.

**cause-specific survival :** A type of neurohormone (a chemical that is made by nerve cells and used to send signals to other cells). Catecholamines are important in stress responses. High levels cause high blood pressure which can lead to headaches, sweating, pounding of the heart, pain in the chest, and anxiety. Examples of catecholamines include dopamine, epinephrine (adrenaline), and norepinephrine (noradrenaline).

**caustic:** capable of destroying or eating away by chemical action; a hydroxide of a light metal. OR Corrosive; able to eat away or destroy by chemical action.

**Caustic Soda:** When used in industrial processes, sodium hydroxide is often known as caustic soda.

**cauterize :** A flexible tube used to deliver fluids into or withdraw fluids from the body.

**Caverject:** (Other name for: alprostadil)

**CAVITY:** Depression in mold, which usually forms the outer surface of the molded part; depending on number of such depressions, molds are designated as a single cavity or multi-cavity. OR The features of a mold which are directly responsible for forming the final shape of a molded part OR The void between the A-side and B-side that is filled to create the injection-molded part. The A-side of the mold is also sometimes called the cavity. OR Depression in mold, which usually forms the outer surface of the molded part; depending on number of such depressions, molds are designated as a single cavity or multi-cavity. OR A depression or female portion of the mold that creates the external plastic part surface. OR A depression or set of depressions in a plastic-forming mold. OR The part of the mold that contains the reverse image of the product being formed. OR Concave in mold, which usually forms the outer surface of the molded part; depending on number of such depressions, molds are designated as a single cavity or multi-cavity. OR Depression in a mold made by casting, machining, hobbing, or a combination of these methods; depending on number of such depressions, molds are designated as Single-Cavity or Multi-Cavity. OR A depression, or a set of matching depressions, in a plastics-forming mold which forms the outer surfaces of the molded articles. OR A depression, or a set of matching depressions, in a plastics-forming mold which forms the outer surfaces of the molded articles. OR

The machined shape within a mold which created the form of the plastic part.

**cavity :** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, to the date of death from the disease. Patients who die from causes unrelated to the disease are not counted in this measurement. In a clinical trial, measuring the cause-specific survival is one way to see how well a new treatment works. Also called CSS.

**Cavity Pressure:** Pressure on the melt inside the space between core and cavity as the melt moves to fill the mould.

**CB10-277:** A synthetic derivative of dimethylphenyl-triazene related to dacarbazine, with antineoplastic properties. Related to the agent dacarbazine, CB10-277 is converted *in vivo* to a monomethyl triazene form that alkylates DNA, resulting in inhibition of DNA replication and repair; in addition, this agent may act as a purine analogue, resulting in inhibition of DNA synthesis, and may interact with protein sulfhydryl groups. Check for active clinical trials using this agent.

**CBC:** To destroy tissue using a hot or cold instrument, an electrical current, or a chemical that burns or dissolves the tissue. This process may be used to kill certain types of small tumors or to seal off blood vessels to stop bleeding.

**CBC with differential :** A hollow area or hole. It may describe a body cavity (such as the space within the abdomen) or a hole in a tooth caused by decay.

**CBE:** A measure of the number of red blood cells, white blood cells, and platelets in the blood. The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A CBC is used to help diagnose and monitor many conditions. Also called blood cell count, complete blood count, and full blood count.

**CBP/beta-catenin antagonist PRI-724:** A potent, specific inhibitor of the canonical Wnt signaling pathway in cancer stem cells with potential antineoplastic activity. Wnt signaling pathway inhibitor PRI-724 specifically inhibits the recruiting of beta-catenin with its coactivator CBP (the binding protein of the cAMP response element-binding protein CREB); together with other transcription factors beta-catenin/CBP binds to WRE (Wnt-responsive element) and activates transcription of a wide range of

target genes of Wnt/beta-catenin signaling. Blocking the interaction of CBP and beta-catenin by this agent prevents gene expression of many proteins necessary for growth, thereby potentially suppressing cancer cell growth. The Wnt/beta-catenin signaling pathway regulates cell morphology, motility, and proliferation; aberrant regulation of this pathway leads to neoplastic proliferation. Check for active clinical trials using this agent.

**CBS:** Complete basis set. Indicates that some method of basis set extrapolation was applied in an attempt to determine the result that would have been obtained using an infinitely large basis set. The two major extrapolation methods are (1) repeating the calculation with increasingly large basis sets and making an empirical extrapolation, and (2) using analytical formulas that are correct to second-order. See the chapters by Martin and by Petersson in this book.

**CBT:** A measure of the number of red blood cells, white blood cells, and platelets in the blood, including the different types of white blood cells (neutrophils, lymphocytes, monocytes, basophils, and eosinophils). The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A CBC with differential is used to help diagnose and monitor many different conditions, including anemia and infection. Also called blood cell count with differential.

**CBT-1:** A physical exam of the breast performed by a health care provider to check for lumps or other changes. Also called clinical breast exam.

**cc :** A type of psychotherapy that helps patients change their behavior by changing the way they think and feel about certain things. It is used to treat mental, emotional, personality, and behavioral disorders. Also called cognitive behavior therapy and cognitive therapy.

**CC-1088:** A substance taken from plants that is being studied in the treatment of cancer. It may help drugs kill tumor cells that have become resistant to drugs. It is a type of multidrug resistance inhibitor and a type of P-glycoprotein antagonist. Also called MDR modulator CBT-1.

**CC-1088:** An analog of thalidomide with potential antineoplastic activity that belongs to the functional class of agents called selective cytokine inhibitory drugs (SelCIDs). SelCIDs inhibit phosphodiesterase-4 (PDE 4), an enzyme involved in tumor necrosis factor alpha (TNF alpha) production.

CC-1088 inhibits production of the cytokines vascular endothelial growth factor (VEGF) (a pro-angiogenic factor) and interleukin-6 (IL-6).

**CC-401:** A second generation ATP-competitive anthrapyrazolone c-Jun N terminal kinase (JNK) inhibitor with potential antineoplastic activity. Based on the chemistry of SP600125, another anthrapyrazolone inhibitor of JNK, CC-401 competitively binds the ATP binding site of JNK, resulting in inhibition of the phosphorylation of the N-terminal activation domain of transcription factor c-Jun; decreased transcription activity of c-Jun; and a variety of cellular effects including decreased cellular proliferation.

**CC-4047:** A measure of volume in the metric system. One thousand ccs equal one liter. Also called cubic centimeter, milliliter, and ml.

**CC-49:** A drug that is being studied in the treatment of cancer. It is similar but not identical to thalidomide. CC-1088 belongs to the family of drugs called angiogenesis inhibitors.

**CC-5013:** A type of monoclonal antibody used in cancer detection or therapy. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells.

**CC-8490:** A benzopyran with potential antineoplastic activity. CC-8490 acts as a selective estrogen receptor modulator (SERM), inhibiting the proliferation of estrogen-sensitive breast cancer cells. This agent also inhibits growth and induces apoptosis of glioblastoma cells via a mechanism independent of estrogen receptor-related mechanisms. OR A substance that is being studied in the treatment of cancer. It is made by combining the monoclonal antibody CC49 with a chemical called streptavidin. It can find tumor cells that have the protein TAG-72 on their surface, including colon, prostate, breast, and ovary cancer cells. After CC49-streptavidin binds to cancer cells, a radioactive compound called yttrium Y 90 DOTA-biotin will find those cells and kill them.

**cc-pV(T+d)Z:** Correlation-consistent polarized valence triple-zeta basis set with an additional tight d function on elements with atomic number greater than 12.

**cc-pV5Z:** Correlation-consistent polarized valence quintuple-zeta basis set. See cc-pVDZ.

**cc-pVDZ:** Correlation-consistent polarized valence double-zeta basis set. The smallest in a series of "correlation consistent" basis sets developed by

Dunning and coworkers for high-level calculations. It has been observed that properties computed using successively larger basis sets of this series appear to converge exponentially, presumably to the corresponding CBS values.

**cc-pVQZ:** Correlation-consistent polarized valence quadruple-zeta basis set. See cc-pVDZ.

**cc-pVTZ:** Correlation-consistent polarized valence triple-zeta basis set. See cc-pVDZ.

**CC49-streptavidin :** A drug that is a form of thalidomide, and is used to treat multiple myeloma that has not gotten better with other anticancer drugs. It is also being studied in the treatment of other types of cancer. CC-4047 may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of immunomodulating agent and a type of antiangiogenesis agent. Also called pomalidomide and Pomalyst.

**CCD:** Coupled-cluster, doubles. A theory of electron correlation that is complete to infinite order but only for a subset of possible excitations (doubles, for CCD). See " CI ."

**CCI-779:** A drug that is similar to thalidomide, and is used to treat multiple myeloma and certain types of anemia. It is also used to treat mantle cell lymphoma that has come back or has not gotten better after other treatment. It is being studied in the treatment of other conditions and types of cancer. CC-5013 may help the immune system kill abnormal blood cells or cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called lenalidomide and Revlimid.

**CCL21-expressing H1944 cell vaccine:** A cancer cell vaccine comprised of the allogeneic human lung adenocarcinoma cell line H1944 that has been transduced ex vivo with adenoviral vector encoding human cytokine chemokine C-C motif ligand 21 (CCL21), with potential immunomodulating and antineoplastic activities. Upon administration, CCL21-expressing H1944 cell vaccine expresses the chemokine CCL21, which may induce an antitumoral cytotoxic T-lymphocyte immune response in the tumor microenvironment. CCL21 has been shown to attract antigen presenting cells (APCs), like leukocytes and DCs, and natural killer (NK) cells and their T-cell effectors to induce a cytotoxic immune response.

H1944 cells contain tumor-associated antigens (TAAs) overexpressed in non-small cell lung cancer (NSCLC). Check for active clinical trials using this agent.

**cCLB8:** A substance that is being studied in the treatment of brain cancer. It belongs to the family of drugs called benzopyrans.

**CCNU:** A drug used to treat advanced renal cell carcinoma (a type of kidney cancer). It is also being studied in the treatment of other types of cancer. CCI-779 blocks a protein involved in cell division, and may kill cancer cells. It is a type of rapamycin analog and a type of serine/threonine kinase inhibitor. Also called temsirolimus and Torisel.

**CCR2 antagonist CCX872-B:** An orally available human C-C chemokine receptor type 2 (CCR2) antagonist, with potential immunomodulating and antineoplastic activities. Upon oral administration, CCR2 antagonist CCX872-B specifically binds to CCR2 and prevents the binding to its cognate endothelium-derived chemokine ligand CCL2 (monocyte chemoattractant protein-1 or MCP1). This may result in the inhibition of both CCR2 activation and CCR2-mediated signal transduction, which may inhibit inflammatory processes, angiogenesis, tumor cell migration, and tumor cell proliferation. The G-protein coupled receptor CCR2 is expressed on the surface of monocytes and macrophages, and stimulates their migration and infiltration; it plays a key role in inflammation. CCR2 is overexpressed in certain cancer cell types, where it is involved in angiogenesis, tumor cell migration and proliferation.

**CCR2 antagonist PF-04136309:** An orally available human chemokine receptor 2 (CCR2) antagonist with potential immunomodulating and antineoplastic activities. Upon oral administration, CCR2 antagonist PF-04136309 specifically binds to CCR2 and prevents binding of the endothelium-derived chemokine ligand CCL2 (monocyte chemoattractant protein-1 or MCP1) to its receptor CCR2, which may result in inhibition of CCR2 activation and signal transduction. This may inhibit inflammatory processes as well as angiogenesis, tumor cell migration, and tumor cell proliferation. The G-protein coupled receptor CCR2 is expressed on the surface of monocytes and macrophages, stimulates the migration and infiltration of these cell types, and plays an important role in inflammation, angiogenesis, and tumor cell migration and proliferation. Check for active clinical trials using this agent.

**CCSD:** Coupled-cluster, singles and doubles. (See CCD.)

**CCSD(T):** Coupled-cluster, singles and doubles with approximate triples. (See CCD.) Triples contributions are determined perturbatively. CCSD(T) is the cheapest of the usual approximations to full CCSDT, but appears to be the best. The most popular high-level (i.e., lots of electron correlation) method. Size-consistent. Very expensive.

**CCSDT:** Coupled-cluster, singles and doubles and triples. (See CCD.) Extra-high level of electron correlation: incredibly expensive, rarely used.

**CCSG:** A drug used to treat a rare condition called Castleman disease in patients who do not have HIV or human herpesvirus 8. It is also being studied in the treatment of multiple myeloma. CCLB8 binds to a protein called interleukin-6 (IL-6), which is made by some white blood cells and other cells in the body. CCLB8 may help reduce inflammation and stop the growth of cancer cells or abnormal blood cells. It is a type of monoclonal antibody. Also called anti-IL-6 chimeric monoclonal antibody, CNTO 328, siltuximab, and Sylvant.

**CD-expressing Bifidobacterium APS001F:** A recombinant anaerobic bacterium, *Bifidobacterium longum*, encoding the cytosine deaminase (CD) gene with potential antineoplastic adjuvant activity. Upon injection, the CD-expressing bifidobacterium preferentially localizes and grows in the hypoxic environment of the tumor and expresses CD, an enzyme that catalyzes the intracellular conversion of the prodrug flucytosine (5-FC) into the antineoplastic agent 5-fluorouracil (5-FU). Upon administration of 5-FC, and subsequent localized conversion into 5-FU and its cytotoxic active metabolites, the tumor is specifically exposed to cytotoxic agents while the exposure to normal tissues is minimal. Check for active clinical trials using this agent.

**CD105/Yb-1/SOX2/CDH3/MDM2 polypeptide plasmid DNA vaccine:**

A plasmid DNA vaccine containing the mammalian expression vector pUMVC3 (pNGVL3) encoding epitopes of CD105 (Endoglin), Y-box binding protein 1 (Yb-1), SRY-box 2 (SOX2), cadherin 3 (CDH3), and murine double minute 2 (MDM2) proteins, with potential immunomodulating and antineoplastic activities. Upon intradermal administration of pUMVC3-CD105/Yb-1/SOX2/CDH3/MDM2-epitopes plasmid DNA vaccine, the plasmid transfects cells and the peptides are expressed. This generates a specific memory Th1 (T-helper) cell immune

response, stimulates secretion of cytokines by the T cells and leads to a cytotoxic T-lymphocyte (CTL) response against CD105/Yb-1/SOX2/CDH3/MDM2-expressing tumor cells. CD105/Yb-1/SOX2/CDH3/MDM2 proteins are highly immunogenic tumor associated antigens that are overexpressed in breast cancer. Additionally, these antigens are associated with breast cancer stem cells and with epithelial to mesenchymal transformation (EMT).

**CD117:** A drug used to treat brain tumors that have already been treated with surgery or radiation therapy. It is also used to treat Hodgkin lymphoma that has not gotten better with other types of treatment or has come back. It is being studied in the treatment of other types of cancer. CCNU damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called Gleostine and lomustine.

**CD133 antigen peptide-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine comprised of autologous dendritic cells (DCs) pulsed with human leukocyte antigen (HLA)-A2-restricted peptides derived from the CD133 antigen, with potential antineoplastic activity. Upon intradermal administration, the CD133 antigen peptide-pulsed autologous DC vaccine may stimulate an anti-tumoral cytotoxic T-lymphocyte (CTL) response against CD133-expressing tumor cells, resulting in tumor cell lysis. CD133, a cancer stem cell marker, is expressed on hematopoietic stem and progenitor cells and overexpressed on many types of cancer cells; it is associated with resistance to chemotherapy and increased cancer survival. HLA-A2 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T-cells. Epitope design that is restricted to those epitopes that bind most efficiently to HLA-A2 may improve antigenic peptide immunogenicity.

**CD134:** Funds awarded to certain U.S. institutions by the National Cancer Institute (NCI) for them to become cancer centers in the United States, based on scientific merit. The funds help the cancer centers improve the way they are run and develop new ways to prevent, diagnose, and treat cancer. To receive the award, one goal of the cancer center must be to turn clinical and basic research into better health care. Also called P30 Cancer Center Support Grant.

**CD138CAR-CD137/TCRzeta-expressing T lymphocytes:** T-lymphocytes transduced with a retroviral vector expressing a chimeric

antigen receptor (CAR) specific for syndecan-1 (CD138) (CART-138 T cells) coupled to the signaling domain of 4-1BB (CD137), and the zeta chain of the T-cell receptor (TCRzeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD138CAR-CD137/TCRzeta -expressing T lymphocytes direct the T-lymphocytes to syndecan-1-expressing tumor cells and induces selective toxicity in those tumor cells. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of syndecan-1. Syndecan-1, a type 1 transmembrane proteoglycan and tumor associated antigen, is overexpressed in a variety of cancer cells. It plays a key role in the regulation of cell growth, differentiation, and adhesion, and its expression is correlated with poor prognosis.

**CD19/CD3 dual-affinity retargeting protein JNJ-64052781:** An anti-CD19/anti-CD3 bispecific, humanized antibody-like protein, with potential immunostimulatory and antineoplastic activities. Anti-CD19/anti-CD3 dual-affinity retargeting (DART) protein JNJ-64052781 possesses two antigen-recognition and binding sites, one for the CD3 complex, a group of T-cell surface glycoproteins that complex with the T-cell receptor (TCR), and one for CD19, a tumor-associated antigen (TAA) overexpressed on the surface of B-cells. Upon administration, JNJ-64052781 binds to CD3-expressing T-cells and CD19-expressing cancer cells, thereby crosslinking CD19-expressing tumor B-cells and cytotoxic T-lymphocytes (CTLs). This may result in a potent CTL-mediated cell lysis of CD19-expressing B-lymphocytes. CD19, a B-cell specific membrane antigen, is expressed during normal B-cell development and on B-cell malignancies.

**CD19CAR-CD28zeta-4-1BB-expressing allogeneic T lymphocytes:** Allogeneic T-lymphocytes transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) coupled to the costimulatory signaling domain CD28, the signaling domain of 4-1BB (CD137), and the zeta chain of the T-cell receptor (TCR), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD19CAR-CD28 zeta-4-1BB-expressing allogeneic T lymphocytes directs the T-lymphocytes to and induces selective toxicity in CD19-expressing tumor cells. CD28, a T-cell surface-associated co-stimulatory molecule, is required for T-cell activation, proliferation, and survival. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19.

Furthermore, inclusion of the 4-1BB signaling domain may increase the antitumor activity compared to the inclusion of the CD28 costimulatory domain and TCR zeta chain alone. CD19 antigen is a B-cell specific cell surface antigen, which is expressed in all B-cell lineage malignancies.

#### **CD19CAR-CD3zeta-4-1BB-CD28-expressing autologous T**

**lymphocytes:** Autologous T-lymphocytes transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) coupled to three co-stimulatory signaling domains derived from CD28, 4-1BB (CD137), and the zeta chain of the T-cell receptor (TCR)/CD3 complex (CD3-zeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, the CD19CAR-CD3zeta-4-1BB-CD28-expressing autologous T-lymphocytes direct the T-lymphocytes to CD19-expressing tumor cells and induce their selective toxicity. CD28, a T-cell surface-associated co-stimulatory molecule, is required for T-cell activation, proliferation, and survival. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19. CD3-zeta is a transmembrane signaling adaptor polypeptide that regulates the assembly of TCR complexes, modulates the expression of the complex on the cell surface and plays a key role in antigen recognition. CD19 antigen, a B-cell specific cell surface antigen, is expressed in all B-cell lineage malignancies.

#### **CD19CAR-CD3zeta-4-1BB-expressing allogeneic T lymphocytes:**

Allogeneic T-lymphocytes transduced with a modified lentiviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) and the zeta chain of the TCR/CD3 complex (CD3-zeta), coupled to the signaling domain of 4-1BB (CD137), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD19CAR-CD3zeta-4-1BB-expressing allogeneic T-lymphocytes direct the T-lymphocytes to CD19-expressing tumor cells, thereby inducing a selective toxicity in CD19-expressing tumor cells. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19 and the inclusion of this signaling domain may increase the antitumor activity compared to the inclusion of the CD3-zeta chain alone. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies.

**CD19CAR-CD3zeta-4-1BB-expressing autologous T lymphocytes:**

Autologous T-lymphocytes transduced with a modified lentiviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) and the zeta chain of the TCR/CD3 complex (CD3-zeta), coupled to the signaling domain of 4-1BB (CD137), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD19CAR-CD3zeta-4-1BB-expressing autologous T-lymphocytes direct the T-lymphocytes to CD19-expressing tumor cells, thereby inducing a selective toxicity in CD19-expressing tumor cells. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19 and the inclusion of this signaling domain may increase the antitumor activity compared to the inclusion of the CD3-zeta chain alone. CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. CD3-zeta (or CD247) is a transmembrane signaling adaptor polypeptide that regulates the assembly of complete TCR complexes and their expression on the cell surface.

**CD19CAR-CD3zeta-expressing autologous T lymphocytes:** Autologous T-lymphocytes transduced with a modified lentiviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) and the zeta chain of the TCR/CD3 complex (CD3-zeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD19CAR-CD3zeta-expressing autologous T-lymphocytes are directed to CD19-expressing tumor cells, thereby inducing a selective toxicity only in these tumor cells. The CD19 antigen is a B-cell specific cell surface antigen expressed in all B-cell lineage malignancies. CD3-zeta (or CD247) is a transmembrane signaling adaptor polypeptide that regulates the assembly of complete T-cell receptor complexes and their expression on the cell surface.

**CD20:** A protein found on the surface of many different types of cells. It binds to a substance called stem cell factor (SCF), which causes certain types of blood cells to grow. CD117 may also be found in higher than normal amounts, or in a changed form, on some types of cancer cells, including gastrointestinal stromal tumors and melanoma. Measuring the amount of CD117 in tumor tissue may help diagnose cancer and plan treatment. CD117 is a type of receptor tyrosine kinase and a type of tumor marker. Also called c-kit and stem cell factor receptor.

**CD20 antigen :** A protein being studied in the treatment of cancer. Substances that attach to CD134 on the surface of T cells (a type of white blood cell) may help the T cells grow and kill more cancer cells. CD134 is a type of tumor necrosis factor (TNF) receptor. Also called OX-40.

**CD20-targeted polypeptide TRU-015:** A proprietary antibody-based single-chain polypeptide with B cell-depleting activity. Significantly smaller than a whole antibody, CD20-targeted polypeptide TRU-015 binds specifically to the B cell-specific cell surface antigen CD20 with full immunoglobulin Fv fragment-type target binding activity and full immunoglobulin Fc fragment-type effector function. This agent transiently depletes CD20-bearing B cells by inducing B cell -directed complement dependent cytotoxicity (CDC) and antibody-dependent cell-mediated cytotoxicity (ADCC) and B cell apoptosis.

**CD24 extracellular domain-IgG1 Fc domain recombinant fusion protein CD24Fc:** A recombinant fusion protein composed of the extracellular domain of the mature human glycoprotein CD24 linked to a human immunoglobulin G1 (IgG1) Fc domain, with potential immune checkpoint inhibitory, anti-inflammatory and antineoplastic activities. Upon administration, the CD24 extracellular domain-IgG1 Fc domain recombinant fusion protein CD24Fc binds to injured cell components, also called DAMPs (Danger-Associated Molecular Patterns), thereby preventing the interaction of DAMPs with toll-like receptors (TLRs) and inhibiting both nuclear factor-kappa B (NFkB) activation and secretion of inflammatory cytokines. In addition, CD24Fc binds to and activates Siglec G/10, a sialic acid-binding immunoglobulin-type lectin, and stimulates SHP-1-mediated inhibitory signaling, preventing NFkB activation and secretion of inflammatory mediators, which further prevents inflammatory responses. DAMPs activate the innate immune system. CD24 binds to both DAMPs and Siglec G/10 to regulate immune responses. CD24/Siglec G/10 interaction plays a key role in a number of immune-mediated diseases including graft-versus-host disease (GvHD), multiple sclerosis and rheumatoid arthritis.

**CD28CAR/CD137CAR-expressing T lymphocytes:** Third generation, chimeric antigen receptor (CAR) cells composed of T-lymphocytes transduced with a lentiviral vector expressing a CAR consisting of an a single chain variable fragment specific for a particular antigen, coupled to

the two co-stimulatory signaling domains Cluster of Differentiation 28 (CD28) and Cluster of Differentiation 137 (CD137; 4-1BB), and the zeta chain of the T-cell receptor (TCR)/CD3 complex (CD3-zeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD28CAR/CD137CAR-expressing T-lymphocytes are directed to, and induce selective toxicity in tumor cells expressing the particular antigen. CD28, a T-cell surface-associated co-stimulatory molecule that is required for T-cell activation, proliferation, and survival. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of the antigen. Furthermore, inclusion of the 4-1BB signaling domain may increase the antitumor activity when compared to the inclusion of the CD28 co-stimulatory domain and CD3-zeta alone.

**CD3/CD28 costimulated vaccine-primed autologous T-cells:** A population of T cells that have been sensitized to vaccine tumor antigen(s) in vivo; collected from the patient; co-stimulated with antibodies to the T-cell cell surface proteins CD3 and CD28 and expanded ex vivo; and then infused into the same patient. CD3, part of the T cell receptor complex, and CD28, a T-cell surface-associated co-stimulatory molecule, are both required for full T-cell activation. Adoptive transfer of CD3/CD28 costimulated vaccine-primed autologous T-cells may induce the production of interferon-gamma (IFN-gamma) and granulocyte-macrophage colony-stimulating factor (GM-CSF) and associated antitumor effects and a graft-versus-tumor (GVT) response. Check for active clinical trials using this agent.

**CD30 CAR-expressing autologous T lymphocytes:** A preparation of autologous T lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) specific for the CD30 antigen, with potential immunostimulating and antineoplastic activities. Upon administration, the CD30 CAR-expressing autologous T lymphocytes specifically recognize and bind to CD30-expressing tumor cells, resulting in tumor cell lysis. CD30, a cell surface receptor and a member of the tumor necrosis factor (TNF) receptor superfamily, is transiently expressed on activated lymphocytes and is constitutively expressed in hematologic malignancies.

**CD33-targeting antibody-drug conjugate IMGN779:** An antibody-drug conjugate (ADC) consisting of the humanized monoclonal antibody

Z4681A conjugated, via a cleavable disulfide linker, to the cytotoxic DNA alkylating agent DGN462, which is an indolino-benzodiazepine dimer containing a mono-imine moiety, with potential antineoplastic activity. The monoclonal antibody portion of anti-CD33 monoclonal antibody-DGN462 conjugate IMG779 specifically binds to the cell surface antigen CD33 expressed on myeloid leukemia cells; upon internalization, the DGN462 moiety is released, and covalently binds to and alkylates DNA, thereby causing cell cycle arrest, apoptosis and inhibition of cell growth in myeloid leukemia cells that express CD33. CD33 is expressed on normal non-pluripotent hematopoietic stem cells and myeloid leukemia cells. Check for active clinical trials using this agent.

**CD33CAR-CD3zeta-4-1BB-expressing autologous T-lymphocytes:**

Autologous T-lymphocytes transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD33 scFv (single chain variable fragment) coupled to the signaling domain of 4-1BB (CD137) and the zeta chain of the T-cell receptor (TCRzeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, CD33-specific CAR retroviral vector-transduced autologous T lymphocytes target CD33-expressing tumor cells and induce selective toxicity in CD33-expressing tumor cells. Following binding to CD33, the 4-1BB co-stimulatory molecule signaling domain enhances both activation and signaling. Inclusion of the 4-1BB signaling domain may also increase the antitumor activity when compared to the inclusion of the CD3-zeta chain alone. CD33 is expressed on normal non-pluripotent hematopoietic stem cells as well as on myeloid leukemia cells.

**CD34 antigen :** A protein found on B cells (a type of white blood cell). It may be found in higher than normal amounts in patients with certain types of B-cell lymphomas and leukemias. Measuring the amount of CD20 on blood cells may help to diagnose cancer or plan cancer treatment. CD20 is a type of tumor marker. Also called CD20 antigen.

**CD34/TK75-transduced donor lymphocytes:** A preparation of donor T-lymphocytes that are transfected with a retroviral vector encoding a chimeric suicide gene consisting of the extracellular and transmembrane domains of human CD34 and mutant 75 of the herpes simplex virus thymidine kinase (HSV-TK75) with potential controllable immunomodulating activity. Donor T cell therapy following allogeneic

hematopoietic stem cell (HSC) transplantation may result in a graft-versus-leukemia (GVL) and help control transplant-related viral infections. In the event that graft-versus-host disease (GVHD) develops due to donor lymphocyte infusion, CD34/TK75-transduced donor lymphocytes may be selectively eliminated by administration of the prodrug antiviral agent ganciclovir GCV. In CD34/T75-transduced donor lymphocytes, GCV is phosphorylated by expressed HSV-TK75 to its monophosphate form and, subsequently, converted into its active triphosphate form, which specifically kills the donor lymphocytes. The expressed CD34 moiety of the chimeric suicide gene serves as a selection marker; mutant 75 of HSV-TK confers increased GCV sensitivity.

**CD4:** A protein present on the surface of helper T cells that, along with the T-cell receptor, binds to class II MHC proteins on antigen-presenting cells. CD4 is the source of the specificity of helper T cells for class II MHC interactions.

**CD4-positive T lymphocyte :** A protein found on the surface of some bone marrow and blood cells.

**CD4+CD25+ regulatory T cells:** Regulatory T cells that express CD4 and CD25 (interleukin 2 receptor) antigens, with immunomodulating activity.. CD4+CD25+ T regulatory cells (Tregs), a subset of CD4+ T cells expressing high levels of CD25 and the transcription factor Foxp3, are essential in maintaining immunologic homeostasis, preventing autoimmunity by suppressing self-reactive T cells; CD4+CD25+ Tregs may induce tolerance to allogeneic organ transplants such as hematopoietic stem cell transplants (HSCTs).

**CD40 agonist monoclonal antibody CP-870,893:** A fully human monoclonal antibody (mAb) agonist of the cell surface receptor CD40 with potential immunostimulatory and antineoplastic activities. Similar to the CD40 ligand (CD40L or CD154), CD40 agonist monoclonal antibody CP-870,893 binds to CD40 on a variety of immune cell types, triggering the cellular proliferation and activation of antigen-presenting cells (APCs), activating B cells and T cells, and enhancing the immune response; in addition, this agent may activate CD40 present on the surfaces of some solid tumor cells, resulting in apoptosis and decreased tumor growth. CD40, a member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells, many B-cell malignancies, and some

solid tumors, mediating both indirect tumor cell killing through the activation of the immune system and direct tumor cell apoptosis. Check for active clinical trials using this agent.

**CD40 agonist monoclonal antibody RO7009789:** A monoclonal antibody agonist of the cell surface receptor CD40, with potential immunostimulatory and antineoplastic activities. Similar to the endogenous CD40 ligand (CD40L or CD154), CD40 agonist monoclonal antibody RO7009789 binds to CD40 on a variety of immune cell types. This triggers the cellular proliferation and activation of antigen-presenting cells (APCs), and activates B cells and T cells, resulting in an enhanced immune response. RO7009789 also binds to and activates CD40 present on the surfaces of some solid tumor cells, leading to apoptosis and decreased tumor growth. CD40, a cell surface receptor and member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells and certain cancer cells; it mediates both indirect tumor cell killing through the activation of the immune system and direct tumor cell apoptosis.

**CD40 agonistic monoclonal antibody APX005M:** A humanized monoclonal antibody agonist of the cell surface receptor CD40, with potential immunostimulatory and antineoplastic activities. Similar to the endogenous CD40 ligand (CD40L or CD154), CD40 agonistic monoclonal antibody APX005M binds to CD40 on a variety of immune cell types. This triggers the cellular proliferation and activation of antigen-presenting cells (APCs), and activates B-cells, and effector and memory T-cells. This results in an enhanced immune response against tumor cells. APX005M also binds to and activates CD40 present on the surfaces of some solid tumor cells, leading to apoptosis and decreased tumor growth. CD40, a cell surface receptor and member of the tumor necrosis factor (TNF) receptor superfamily, is expressed on various immune cells and certain cancer cells; it mediates both indirect tumor cell killing through the activation of the immune system and direct tumor cell apoptosis.

**CD40-ligand :** A protein found on B cells (a type of white blood cell). It may be found in higher than normal amounts in patients with certain types of B-cell lymphomas and leukemias. Measuring the amount of CD20 antigen on blood cells may help to diagnose cancer or plan cancer treatment. CD20 antigen is a type of tumor marker. Also called CD20.

**CD8:** A cell-surface protein expressed by cytotoxic T cells that, in conjunction with the T cell receptor, recognizes class I MHC-peptide complexes. CD8 binds to the MHC protein itself.

**CD80:** A substance that is being studied in the treatment of cancer. It binds to certain immune cells and may suppress cancer growth.

**CD95 ECD/IgG-Fc fusion protein APG101:** A human, soluble fusion protein consisting of the extracellular domain of the CD95 receptor fused to the Fc-domain of the human IgG antibody, with potential antineoplastic activity. CD95 ECD/IgG-Fc fusion protein APG101 binds to the CD95 ligand (CD95L) and blocks the binding of CD95L to the CD95 receptor. In tumor cells, blockage of CD95L-mediated signaling pathways may prevent cell migration and invasive cell growth; in healthy cells, blockage of CD95L-mediated signaling pathways may prevent apoptosis and may protect cell damage. Activation of the CD95 receptor plays an important role in the initiation of apoptosis in healthy cells or the invasive growth of cancer cells. Check for active clinical trials using this agent.

**CDA inhibitor E7727/decitabine combination agent ASTX727:** An orally available combination agent containing the cytidine deaminase (CDA) inhibitor E7727 and the cytidine antimetabolite decitabine, with potential antineoplastic activity. Upon oral administration of ASTX727, the CDA inhibitor E7727 binds to and inhibits CDA, an enzyme primarily found in the gastrointestinal (GI) tract and liver that catalyzes the deamination of cytidine and cytidine analogs. This prevents the breakdown of decitabine, increasing its bioavailability and efficacy while decreasing GI toxicity due to the administration of lower doses of decitabine. Decitabine exerts its antineoplastic activity through the incorporation of its triphosphate form into DNA, which inhibits DNA methyltransferase and results in hypomethylation of DNA. This interferes with DNA replication and decreases tumor cell growth.

**CDC:** A type of immune cell that stimulates killer T cells, macrophages, and B cells to make immune responses. A CD4-positive T lymphocyte is a type of white blood cell and a type of lymphocyte. Also called helper T cell.

**CDC7 inhibitor TAK-931:** An orally bioavailable inhibitor of cell division cycle 7 (cell division cycle 7-related protein kinase; CDC7), with potential antineoplastic activity. Upon administration, TAK-931 binds to and inhibits CDC7; this prevents the initiation of DNA replication during mitosis, which

causes cell cycle arrest and induces apoptosis. This inhibits cell growth in CDC7-overexpressing tumor cells. CDC7, a serine/threonine kinase and cell division cycle protein, is overexpressed in a variety of cancers and plays a key role in the activation of DNA replication and the regulation of cell cycle progression.

**CDC7 kinase inhibitor BMS-863233:** An orally bioavailable cell division cycle 7 homolog (CDC7) kinase inhibitor with potential antineoplastic activity. CDC7 kinase inhibitor BMS-863233 binds to and inhibits the activity of CDC7, which may result in the inhibition of DNA replication and mitosis, the induction of tumor cell apoptosis, and the inhibition of tumor cell proliferation in CDC7-overexpressing tumor cells. CDC7, a serine-threonine kinase overexpressed in a variety of tumor cell types, plays an essential role in the initiation of DNA replication by activating origins of replication.

**CDC7 kinase inhibitor NMS-1116354:** An orally bioavailable cell division cycle 7 homolog (CDC7) kinase inhibitor with potential antineoplastic activity. CDC7 kinase inhibitor NMS-1116354 binds to and inhibits the activity of CDC7, which may result in the inhibition of DNA replication and mitosis, the induction of tumor cell apoptosis, and the inhibition of tumor cell proliferation in CDC7-overexpressing tumor cells. The serine-threonine kinase CDC7 initiates DNA replication by phosphorylating MCM2 (minichromosome maintenance complex component 2) at Ser40 and Ser53.

**CDDO:** A protein found on the surface of some immune system cells, including B cells and monocytes. Cells with CD80 on their surface cause T cells to make substances that help control immune responses. Also called B7-1.

**CDK inhibitor AT7519M :** A U.S. federal government agency whose mission is to protect public health by preventing and controlling disease, injury, and disability. The CDC promotes healthy behaviors and safe, healthy environments. It keeps track of health trends, tries to find the cause of health problems and outbreaks of disease, and responds to new public health threats. The CDC works with state health departments and other organizations throughout the country and the world to help prevent and control disease. The CDC is part of the U.S. Public Health Service of the

Department of Health and Human Services (DHHS). Also called Centers for Disease Control and Prevention.

**CDK inhibitor P276-00:** A flavone and cyclin dependent kinase (CDK) inhibitor with potential antineoplastic activity. P276-00 selectively binds to and inhibits Cdk4/cyclin D1, Cdk1/cyclin B and Cdk9/cyclin T1, serine/threonine kinases that play key roles in the regulation of the cell cycle and cellular proliferation. Inhibition of these kinases leads to cell cycle arrest during the G1/S transition, thereby leading to an induction of apoptosis, and inhibition of tumor cell proliferation.

**CDK inhibitor SCH 727965 :** A substance being studied in the treatment of some types of cancer. CDDO may block enzymes involved in inflammation and cancer growth. It is a type of antineoplastic plant product.

**CDK inhibitor SNS-032:** A 2-aminothiazole-derived, small-molecule cyclin dependent kinase (CDK) inhibitor with potential antineoplastic activity. CDK inhibitor SNS-032 selectively binds to CDKs 2, 7, and 9, preventing their phosphorylation and activation; inhibition of CDK activity may result in cell cycle arrest, the induction of apoptosis and decreased tumor cell proliferation in susceptible tumor cell populations. This agent has been shown to sensitize radioresistant tumor cells to ionizing radiation.

**CDK2/5/9 inhibitor CYC065:** An orally bioavailable inhibitor of cyclin dependent kinases 2, 5 and 9 (CDK2/5/9), with potential antineoplastic and chemoprotective activities. Upon oral administration, CYC065 selectively binds to and inhibits the activity of CDK2, 5 and 9, which leads to inhibition of CDK2, 5 and 9-dependent cellular pathways, downregulation of genes involved in the pro-survival pathway, prevention of the activation of DNA double-strand break repair pathways, and induction of both cell cycle arrest and apoptosis. This inhibits the proliferation of CDK2/5/9-overexpressing tumor cells. In addition, CYC065 protects hematopoietic stem and progenitor cells (HSPCs), prevents myelosuppression, and preserves the function of the bone marrow. CDKs are serine/threonine kinases involved in the regulation of the cell cycle and may be overexpressed in certain cancer cell types; they play key roles in tumor cell proliferation, the regulation of transcription, and DNA damage repair.

**CDK2/TRKA inhibitor PHA-848125 AC:** An orally bioavailable inhibitor of cyclin-dependent kinases (CDKs) and thropomyosin receptor kinase A (TRKA), with potential antineoplastic activity. CDK2/TRKA

inhibitor PHA-848125 AC potently inhibits cyclin-dependent kinase 2 (CDK2) and exhibits activity against other CDKs including CDK1 and CDK4, in addition to TRKA. Inhibition of these kinases may result in cell cycle arrest and apoptosis of tumor cells that express these kinases. CDKs are serine/threonine kinases involved in regulation of the cell cycle and may be overexpressed in some cancer cell types. The neurotrophin receptor TRKA is mutated in a variety of cancer cell types.

**CDK4 inhibitor P1446A-05:** A protein kinase inhibitor specific for the cyclin-dependent kinase 4 (CDK4) with potential antineoplastic activity. CDK4 inhibitor P1446A-05 specifically inhibits CDK4-mediated G1-S phase transition, arresting cell cycling and inhibiting cancer cell growth. The serine/threonine kinase CDK4 is found in a complex with D-type G1 cyclins and is the first kinase to become activated upon mitogenic stimulation, releasing cells from a quiescent stage into the G1/S growth cycling stage; CDK-cyclin complexes have been shown to phosphorylate the retinoblastoma (Rb) transcription factor in early G1, displacing histone deacetylase (HDAC) and blocking transcriptional repression. Check for active clinical trials using this agent.

**CDK4/6 inhibitor SHR6390:** A cyclin-dependent kinase (CDK) inhibitor with potential antineoplastic activity. Upon administration, CDK4/6 inhibitor SHR6390 selectively inhibits cyclin-dependent kinase 4 (CDK4) and 6 (CDK6). This inhibits retinoblastoma (Rb) protein phosphorylation early in the G1 phase, which prevents CDK-mediated G1-S phase transition and leads to cell cycle arrest. This suppresses DNA replication and decreases tumor cell proliferation. CDK4 and 6 are serine/threonine kinases that are upregulated in many tumor cell types and play a key role in the regulation of cell cycle progression.

**CDKI AT7519:** An orally bioavailable small molecule with potential antineoplastic activity. AT7519M selectively binds to and inhibits cyclin dependent kinases (CDKs), which may result in cell cycle arrest, induction of apoptosis, and inhibition of tumor cell proliferation. CDKs are serine/threonine kinases involved in regulation of the cell cycle and may be overexpressed in some types of cancer cells.

**CDKI R547:** An orally bioavailable diaminopyrimidine cyclin-dependent kinase inhibitor (CDKI) with potential antineoplastic activity. CDKI R547 selectively binds to and inhibits CDKs, especially CDK1/cyclin B,

CDK2/cyclin E, and CDK4/cyclin D1. The inhibition of CDKs results in cell cycle arrest, inhibition of tumor cell proliferation, and induction of apoptosis. Through CDK inhibition, this agent also reduces phosphorylation of the retinoblastoma (Rb) protein, thus preventing activation of transcription factor E2F and so further suppressing tumor cell proliferation. CDKs are ATP-dependent serine/threonine kinases that are important regulators of cell cycle progression and are frequently overexpressed in tumor cells.

**CDKs/JAK2/FLT3 inhibitor TG02 citrate:** An orally bioavailable citrate salt form of TG02, a multi-kinase inhibitor for cyclin dependent kinase (CDK) subtypes 1, 2, 7 and 9, Janus-associated kinase 2 (JAK2), FMS-related tyrosine kinase 3 (FLT3, FLK2, STK1), with potential antineoplastic activity. Upon oral administration, CDK/JAK2/FLT3 Inhibitor TG02 binds to and inhibits the CDK subtypes, JAK2, and FLT3. TG02 also inhibits, to a lesser extent, TYK2, TYRO3, STAT5 and P38delta. This may result in both an induction of apoptosis and an inhibition of tumor cell proliferation in cancer cells that overexpress these kinases. JAK2, often upregulated or mutated in a variety of cancer cells, mediates STAT3 activation and plays a key role in tumor cell proliferation and survival. CDKs are serine/threonine kinases that play key roles in the regulation of the cell cycle and cellular proliferation. FLT3, a class III tyrosine kinase receptor, is overexpressed or mutated in most B lineage and acute myeloid leukemias.

**Cdna:** DNA complementary to an mRNA sequence. OR See complementary DNA.

**cDNA:** Complementary DNA, made in vitro from the mRNA by the enzyme reverse transcriptase using deoxyribonucleotide triphosphates. Unlike mRNA, cDNA can be easily propagated and sequenced.

**CDP-alcohol:** Activated form of an alcohol that can be used in the synthesis of phosphoglycerides by combining with diacylglycerol at the free hydroxyl group on glycerol; for instance, CDP-choline can react with diacylglycerol to form the phospholipid phosphatidylcholine.

**CDP-diacylglycerol (cytidine diphosphodiacylglycerol):** Formed from phosphatidate and cytidine triphosphate (CTP); activated diacylglycerol used in the synthesis of phosphoglycerides such as phosphatidyl serine.

**Ce-Vi-Sol:** (Other name for: ascorbic acid)

**CEA:** A substance being studied in the treatment of some types of cancer. CDK inhibitor AT7519M blocks enzymes needed for cells to divide. It is a type of cyclin-dependent kinase inhibitor. Also called AT7519M.

**CEA assay :** A substance being studied in the treatment of advanced melanoma (a type of skin cancer) and other types of cancer. It blocks cell division and may cause cancer cells to die. It is a type of cyclin-dependent kinase inhibitor. Also called dinaciclib.

**CEA peptide-1 :** A substance that may be found in the blood of people who have colon cancer, other types of cancer or diseases, or who smoke tobacco. CEA levels may help keep track of how well cancer treatments are working or if cancer has come back. It is a type of tumor marker. Also called carcinoembryonic antigen.

**CEA-Scan:** (Other name for: arcitumomab)

**CEA/tetanus toxoid T helper epitope fusion protein-expressing DNA plasmid vaccine:** A plasmid vaccine encoding wild type human carcinoembryonic antigen (CEA) fused to a tetanus toxoid T helper epitope, with potential antineoplastic activity. Upon vaccination and subsequent intradermal electroporation, CEA/tetanus toxoid T helper epitope fusion protein-expressing DNA plasmid vaccine may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against CEA-expressing tumor cells. CEA, a tumor associated antigen, is overexpressed in a variety of cancer cell types. The tetanus toxoid helper peptide epitope, obtained from the bacterial *Clostridium tetani* toxoid, binds to class II MHC molecules and increases the helper T-cell response thereby inducing an increased and long-term immune response.

**CeaVac:** (Other name for: monoclonal antibody 3H1 anti-idiotypic vaccine)

**CEBPA-targeting saRNA MTL-CEBPA liposome:** A lipid-based nanoparticle formulation composed of liposomes encapsulating a small oligonucleotide encoding a small activating RNA (saRNA) targeting the CCAAT enhancer binding protein alpha (CEBPA; C/EBP -  $\alpha$ ) gene, with potential antineoplastic activity. Although the exact mechanism of action through which saRNAs exert their effect(s) is still largely being investigated, it appears that, upon administration, the CEBPA-targeting saRNA MTL-CEBPA liposome targets and binds to a specific DNA regulatory target region, most likely the promoter region, for the CEBPA gene. This restores CEBPA gene transcription, and increases both CEBPA

mRNA levels and protein expression. This in turn activates the expression of tumor suppressor genes and may halt proliferation of susceptible tumor cells. Specifically, upregulation of CEBPA in liver cells abrogates liver cancer cell proliferation, prevents liver failure and normalizes liver function. CEBPA, a transcription factor that plays a key role in the regulation of the expression of genes with many functions, including those involved in cellular proliferation, metastasis and normal hepatocyte function, is found in many tissues, including liver cells, adipose tissue and myeloid cells. CEBPA is downregulated in certain types of cancer cells, such as liver cancer cells. saRNA is a short, double-stranded RNA that is structurally related to small interfering RNAs (siRNAs); saRNA is most likely to bind to a target site on the promoter of the CEBPA gene and upregulates its gene expression.

**cebranopadol:** An orally available antagonist of the nociceptin receptor opioid receptor like -1 (ORL-1), with potential analgesic activity. Upon oral administration, cebranopadol binds to ORL-1 and prevents its interaction with nociceptin. This leads to a decrease of nociceptin/ORL-1-mediated signaling and interferes with the sensation of pain, which results in an analgesic effect. Nociceptin is a neuropeptide involved in the regulation of pain.

**Cecon:** (Other name for: ascorbic acid)

**cecum:** a blind sac that is the meeting point of the small and large intestines.

**cecum :** A laboratory test that measures the level of carcinoembryonic antigen (CEA) in the blood. An increased amount of CEA may be found in the blood of people who have colon cancer or other types of cancer, certain other diseases, or who smoke. The amount of CEA in the blood may also help keep track of how well cancer treatments are working or if cancer has come back. CEA is a type of tumor marker. Also called carcinoembryonic antigen assay.

**cedarwood :** A small piece of a tumor marker called carcinoembryonic antigen (CEA). CEA may be found in the blood of people who have colon cancer, other types of cancer or diseases, or who smoke tobacco. CEA peptide-1 is used to make a vaccine that may help stimulate the body's immune system to kill cancer cells. Also called CAP-1 and carcinoembryonic antigen peptide-1.

**cediranib maleate:** The maleate salt of an indole ether quinazoline derivative with antineoplastic activities. Competing with adenosine triphosphate, cediranib binds to and inhibits all three vascular endothelial growth factor receptor (VEGFR-1,-2,-3) tyrosine kinases, thereby blocking VEGF-signaling, angiogenesis, and tumor cell growth.

**cediranib maleate :** A pouch that forms the first part of the large intestine. It connects the small intestine to the colon, which is part of the large intestine.

**cefazolin sodium:** The sodium salt of cefazolin, a beta-lactam antibiotic and first-generation cephalosporin with bactericidal activity. Cefazolin binds to and inactivates penicillin-binding proteins (PBP) located on the inner membrane of the bacterial cell wall. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity, which results in the weakening of the bacterial cell wall and cell lysis.

**cefepime :** A type of evergreen tree with hard fragrant wood that is a member of the cypress family. The oil from the wood is used in soaps, shampoos, bath salts, perfumes, aromatherapy, and to keep insects away. The scientific name is *Juniperus virginiana*. Also called Eastern red cedar and red cedar.

**cefepime hydrochloride:** The hydrochloride salt of a semi-synthetic, beta-lactamase-resistant, fourth-generation cephalosporin antibiotic derived from an *Acremonium* fungal species with broad-spectrum bactericidal activity. Administered parenterally, cefepime inhibits bacterial cell wall synthesis by binding to and inactivating penicillin-binding proteins (PBP) located on the inner membrane of the bacterial cell wall. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity, resulting in a reduction of bacterial cell wall stability and cell lysis. This agent is more active against a variety of Gram-positive pathogens compared to third-generation cephalosporins.

**cefixime:** A broad-spectrum, third-generation cephalosporin antibiotic derived semisynthetically from the marine fungus *Cephalosporium acremonium* with antibacterial activity. As does penicillin, the beta-lactam antibiotic cefixime inhibits bacterial cell wall synthesis by disrupting peptidoglycan synthesis, resulting in a reduction in bacterial cell wall stability and bacterial cell lysis. Stable in the presence of a variety of beta-

lactamases, this agent is more active against gram-negative bacteria and less active against gram-positive bacteria compared to second-generation cephalosporins.

**cefixime** : A substance being studied in the treatment of some types of cancer. Cediranib maleate may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of antiangiogenesis agent and a type of vascular endothelial growth factor (VEGF) receptor tyrosine kinase inhibitor. Also called AZD2171 and Recentin.

**cefmetazole sodium**: The sodium salt of the second-generation, semi-synthetic, beta-lactam cephalosporin cefmetazole with antibacterial activity. Cefmetazole binds to penicillin-binding proteins (PBPs) and prevents the crosslinking of peptidoglycan, which may result in the inhibition of cell wall synthesis, the loss of cell wall integrity, and bacterial cell wall rupture. PBPs are transpeptidases that are responsible for peptidoglycan crosslinking.

**cefotaxime**: A third generation semisynthetic cephalosporin antibiotic with bactericidal activity. Cefotaxime inhibits mucopeptide synthesis by binding to and inactivating penicillin binding proteins thereby interfering with the final transpeptidation step required for cross-linking of peptidoglycan units which are a component of bacterial cell walls. This results in a reduction of cell wall stability and causes cell lysis.

**cefpodoxime proxetil**: A third generation semi-synthetic cephalosporin and a beta-lactam antibiotic with bactericidal activity. Cefpodoxime's effect is dependent on its binding to penicillin-binding proteins (PBPs) located in the bacterial cytoplasmic membrane. Binding results in the inhibition of the transpeptidase enzymes, thereby preventing cross-linking of the pentaglycine bridge with the fourth residue of the pentapeptide and interrupting consequent synthesis of peptidoglycan chains. As a result, cefpodoxime inhibits bacterial septum and cell wall synthesis formation.

**ceftazidime sodium**: The sodium salt of ceftazidime, a third-generation cephalosporin antibiotic with bactericidal activity. Ceftazidime binds to and inactivates penicillin-binding proteins (PBPs), enzymes located on the inner membrane of the bacterial cell wall, resulting in the weakening of the bacterial cell wall and cell lysis. Compared to the second and first generation cephalosporins, ceftazidime is more active against gram-

negative bacteria and less active against gram-positive bacteria. Ceftazidime also crosses the blood-brain barrier and reaches therapeutic concentrations in the central nervous system (CNS). PBPs participate in the terminal stages of assembling the bacterial cell wall, and in reshaping the cell wall during cell division. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity.

**ceftazidime/avibactam sodium:** A combination preparation containing the third-generation cephalosporin ceftazidime and the sodium salt form of avibactam, a non-beta-lactam beta-lactamase inhibitor, with antibiotic and beta-lactamase inhibiting activity, respectively. Upon administration, ceftazidime binds to essential penicillin-binding proteins (PBPs) and inhibits cell wall synthesis in certain bacteria. Avibactam binds to and inactivates beta-lactamases, thereby protecting ceftazidime from degradation and increasing ceftazidime's efficacy. Check for active clinical trials using this agent.

**ceftobiprole medocaril:** A water-soluble prodrug of ceftobiprole, a pyrrolidinone cephalosporin antibiotic, with bactericidal activity. Ceftobiprole binds to and inactivates penicillin-binding proteins (PBPs), enzymes involved in the terminal stages of bacterial cell wall assembly and cell wall reshaping during bacterial growth and division. This agent exhibits a broad spectrum of activity against gram-negative and gram-positive pathogens including methicillin-resistant *S. aureus* (MRSA), vancomycin-intermediate *S. aureus* (VISA) and vancomycin-resistant *S. aureus* (VRSA). Ceftobiprole is refractory to hydrolysis by class A and class C lactamases.

**ceftriaxone :** A drug used to treat infection. It belongs to the family of drugs called cephalosporin antibiotics.

**ceftriaxone sodium:** The sodium salt form of ceftriaxone, a beta-lactam, third-generation cephalosporin antibiotic with bactericidal activity. Ceftriaxone binds to and inactivates penicillin-binding proteins (PBP) located on the inner membrane of the bacterial cell wall. PBPs participate in the terminal stages of assembling the bacterial cell wall, and in reshaping the cell wall during cell division. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity. This results in the weakening of the bacterial cell wall and causes cell lysis. Compared to the second and first generation cephalosporins, ceftriaxone is more active against gram-negative bacteria

and less active against gram-positive bacteria. Ceftriaxone also crosses the blood-brain barrier and reaches therapeutic concentrations in the central nervous system (CNS).

**Ceiling Temperature:** Above a certain temperature, monomers can no longer be persuaded to form polymers by chain polymerisation. This occurs when the loss in entropy arising from joining many molecules into one outweighs the energetic benefit of converting double bonds to single bonds. A chain-growth polymer raised above the ceiling temperature will degrade, or depolymerise.

**ceiling value (CV):** The maximum permissible airborne concentration of a potentially toxic substance and is a concentration that should never be exceeded in the breathing zone.

**Celebrex:** (Other name for: celecoxib)

**celecoxib:** A nonsteroidal anti-inflammatory drug (NSAID) with a diaryl-substituted pyrazole structure. Celecoxib selectively inhibits cyclooxygenase-2 activity (COX-2); COX-2 inhibition may result in apoptosis and a reduction in tumor angiogenesis and metastasis. Check for active clinical trials using this agent. or An antibiotic drug used to treat infection. It belongs to the family of drugs called cephalosporins.

**Celestone:** (Other name for: betamethasone)

**Celexa:** (Other name for: citalopram hydrobromide)

**Celexa :** A drug used to treat infection. It belongs to the family of drugs called cephalosporin antibiotics.

**celiac disease :** A drug that reduces pain. Celecoxib belongs to the family of drugs called nonsteroidal anti-inflammatory agents. It is being studied in the prevention of cancer.

**Celiptium:** (Other name for: elliptinium acetate)

**cell :** A drug used to treat depression. It belongs to the families of drugs called antidepressant agents and selective serotonin reuptake inhibitors (SSRIs). Also called citalopram.

**cell body:** the main portion of the nerve cell.

**Cell commitment:** That stage in a cell's life when it becomes committed to a certain line of development.

**cell culture :** A digestive disease that is caused by an immune response to a protein called gluten, which is found in wheat, rye, barley, and oats. Celiac disease damages the lining of the small intestine and interferes with the absorption of nutrients from food. A person with celiac disease may become malnourished no matter how much food is consumed.

**cell cycle:** many repetitions of cellular growth and reproduction; divided into interphase and mitosis. OR All of those stages that a cell passes through from one cell generation to the next.

**cell cycle :** In biology, the smallest unit that can live on its own and that makes up all living organisms and the tissues of the body. A cell has three main parts: the cell membrane, the nucleus, and the cytoplasm. The cell membrane surrounds the cell and controls the substances that go into and out of the cell. The nucleus is a structure inside the cell that contains the nucleolus and most of the cell's DNA. It is also where most RNA is made. The cytoplasm is the fluid inside the cell. It contains other tiny cell parts that have specific functions, including the Golgi complex, the mitochondria, and the endoplasmic reticulum. The cytoplasm is where most chemical reactions take place and most proteins get made. The human body has more than 30 trillion cells.

**cell cycle checkpoint/DNA repair antagonist IC83:** A proprietary agent with potential antineoplastic activity. Cell cycle checkpoint/DNA repair antagonist IC83 IC83 inhibits cell cycle checkpoint/DNA repair enzymes, which may result in enhanced cytotoxicity of DNA damaging agents and diminished tumor cell resistance to chemotherapy and radiation therapy. Cell cycle checkpoint/DNA repair enzymes are involved in the recognition and repair of damaged DNA and are overexpressed in many types of cancer cells.

**cell cycle inhibitor :** The growth of microorganisms such as bacteria and yeast, or human, plant, or animal cells in the laboratory. Cell cultures may be used to diagnose infections, to test new drugs, and in research.

**cell differentiation :** The process a cell goes through each time it divides. The cell cycle consists of a series of steps during which the chromosomes and other cell material double to make two copies. The cell then divides into two daughter cells, each receiving one copy of the doubled material. The cell cycle is complete when each daughter cell is surrounded by its own outer membrane. Also called mitotic cycle.

**Cell line:** An established clone originally derived from a whole organism through a long process of cultivation.

**Cell lineage:** The pedigree of cells resulting from binary fission.

**cell motility :** A substance used to block the cell division cycle, which is a series of steps a cell goes through each time it divides. There are many different types of cell cycle inhibitors. Some only work at specific steps in the cell cycle. Others work at any point in the cell cycle. Certain drugs that inhibit the cell cycle are being studied in the treatment of cancer.

**cell proliferation :** The process during which young, immature (unspecialized) cells take on individual characteristics and reach their mature (specialized) form and function.

**cell respiration :** The ability of a cell to move.

**Cell type:** Cells within an organism that have the same genetic makeup but have different properties owing to differences in gene expression.

**cell type :** An increase in the number of cells as a result of cell growth and cell division.

**cell wall:** a strong membrane outside the plasma membrane present in certain cells, such as bacteria and plants. OR A tough outer coating found in many plant, fungal, and bacterial cells that accounts for their ability to withstand mechanical stress or abrupt changes in osmotic pressure. Cell walls always contain a carbohydrate component and frequently also a peptide and a lipid component.

**cell-cell signaling :** A chemical process in which oxygen is used to make energy from carbohydrates (sugars). Also called aerobic metabolism, aerobic respiration, and oxidative metabolism.

**cell-cycle regulation :** The transfer of information from one cell to another. Cells signal each other by direct contact with each other or by the release of a substance from one cell that is taken up by another cell. Cell-cell signaling is important for cells to grow and work normally. Cells that lose the ability to respond to signals from other cells may become cancer cells. Also called cell-to-cell signaling and intercellular communication.

**cell-mediated immunity:** the process in which the T lymphocytes interact with the microorganisms cell-to-cell and destroy them.

**cell-to-cell signaling :** A drug used to prevent graft-versus-host disease (GVHD) after organ transplants. It is also being studied in the prevention of

GVHD after stem cell transplants for cancer, and in the treatment of some autoimmune disorders. CellCept is a type of immunosuppressive agent. Also called mycophenolate mofetil.

**CellCept :** Describes the kinds of cells found in normal or cancer tissue. The cell type is usually identified by looking under a microscope. Some examples of cell types are lymphocytes, melanocytes, and squamous cells. In cancer, it is important to know the cell type in order to diagnose the cancer, plan treatment, and determine prognosis.

**cells:** the fundamental units of living things.

**Cellular Manufacturing:** The process of manufacturing which is a subsection of just-in-time manufacturing and lean manufacturing. The goal of cellular manufacturing is to move as quickly as possible, make a wide variety of similar products, while making as little waste as possible.

**cellular adhesion :** Any process that controls the series of events by which a cell goes through the cell cycle. During the cell cycle, a cell makes a copy of its DNA and other contents, and divides in two. When cell cycle regulation doesn't happen correctly, cells may divide in an uncontrolled way, and diseases such as cancer can occur.

**cellular adoptive immunotherapy :** The transfer of information from one cell to another. Cells signal each other by direct contact with each other or by the release of a substance from one cell that is taken up by another cell. Cell-to-cell signaling is important for cells to grow and work normally. Cells that lose the ability to respond to signals from other cells may become cancer cells. Also called cell-cell signaling and intercellular communication.

**Cellular immune response:** A system for cellular recognition of foreign substances that employs cellattached T-cell receptors to eliminate cells infected by a pathogen or to elicit a particular antigenic response by stimulating B-lymphocyte antibody production.

**cellular metabolism :** The close adherence (bonding) to adjoining cell surfaces.

**Cellular Plastic:** Plastics containing numerous small cells, some interconnected others not, distributed throughout the mass. Used for lighter weight plastic extrusions and other PVC products. OR Plastics containing

numerous small cavities (cells), interconnecting or not distributed throughout the mass.

**cellular respiration:** the process by which animals and other organisms obtain the energy available in carbohydrates.

**Cellulase:** No, not a misspelling of cellulose... Cellulase is an enzyme capable of depolymerising cellulose to form glucose. Chemists like these sort of words - see if your teacher can tell you the definitions of 'filtrate' and 'filtrant' without having to think about it for a couple of minutes... And if they get that one right, test them out on 'carbenium' and 'carbonium' ions!

**cellulitis :** A treatment used to help the immune system fight diseases, such as cancer and infections with certain viruses. T cells are collected from a patient and grown in the laboratory. This increases the number of T cells that are able to kill cancer cells or fight infections. These T cells are given back to the patient to help the immune system fight disease. Also called adoptive cellular therapy.

**Celluloid:** A thermoplastics material made by the intimate blending of cellulose nitrate with camphor. Alcohol is normally employed as a volatile solvent to assist plasticization, and is subsequently removed.

**Cellulose:** A polysaccharide (carbohydrate) found in plants. It is a structural carbohydrate that is an important part of the cell walls. It protects and strengthens the plant. It is a long chain of glucose molecules connected by a different type of glycosidic bond than the one found in starches. OR Cellulose is a large component of the biomass of plants and the main source of food energy for the world's termite population. It can be considered to be a condensation polymer of glucose, like starch, but the links between the glucose monomers are slightly different. OR An unbranched homopolysaccharide in plants, composed of glucose residues in  $\alpha$ -1,4 linkage; the major structural polysaccharide in plants. OR ure cellulose. OR inert substance, chemically a carbohydrate, which is the chief component of the solid structure of plants, wood, cotton, linen, etc. OR A polysaccharide made of linked glucose molecules that strengthens the cell walls of most plants. See also: What is cellulose? OR A natural high polymeric carbohydrate found in most plants; the main constituent of dried woods, jute, flax, hemp, ramie, etc. Cotton is almost p

**cellulose :** The sum of all chemical changes that take place in a cell through which energy and basic components are provided for essential processes, including the synthesis of new molecules and the breakdown and removal of others.

**Cellulose Acetate:** a class of resins made from a cellulose base, either cotton linters or purified wood pulp, by the action of acetic anhydride and acetic acid.

**Cellulose paint:** Paint in which the binder consists essentially of nitrocellulose or cellulose acetate dissolved in suitable solvent.

**Cellulose Propionate:** An ester of cellulose made by the action of propionic acid and its anhydride on purified cellulose. It is used as the basis of a thermoplastic molding material.

**Cellulose Triacetate:** A cellulosic material made by reacting purified cellulose with acetic anhydride in the presence of a catalyst. It is used in the form of film and fibers. Films and sheet are cast from clear solutions on to “drums” with highly polished surfaces. The film, which is of excellent clarity, has high tensile strength, and good heat resistance and dimensional stability. Applications include book jackets, magnetic recording tapes, and various types of packaging. Cellulose triacetate sheet has somewhat similar properties to those of the film and is used to make such articles as safety goggles, map wallets and transparent covers of many kinds.

**Celsius:** A common but non-SI unit of temperature, defined by assigning temperatures of 0°C and 100°C to the freezing and boiling points of water, respectively. OR also referred to as Centigrade, is equal to the difference between the temperature in Fahrenheit less 32 and the quantity divisible by 1.8°C = (°F32) ÷ 1.8.

**CEM:** An acute, spreading infection of the deep tissues of the skin and muscle that causes the skin to become warm and tender and may also cause fever, chills, swollen lymph nodes, and blisters.

**CEM regimen:** A regimen containing carboplatin, etoposide and melphalan used for the treatment of childhood neuroblastoma. Or A building block of plant cells and fiber. Cellulose cannot be digested by people, and is used to add bulk to the diet.

**Cement:** a dispersion of “solution” of unvulcanized rubber or a plastic in a volatile solvent. This meaning is peculiar to the plastic and rubber

industries and may or may not be an adhesive composition. OR Limestone is heated to a high temperature with clay and then powdered. It is mixed with sand and water to make mortar.

**cementation:** the step in lithification in which minerals fill some or all of the pore space and adhere to the sediment fragments, thus producing a sedimentary rock. OR This is one of the processes of sedimentary rock formation. The water is squeezed out from the gaps between the grains of sand etc of the wet sediment. This leaves behind the mineral salts which can act as a kind of glue to hold the grains together.

**cenersen:** A phosphorothioate oligonucleotide harboring nucleotide sequences complementary to tumor suppressor p53 mRNA. Cenersen hybridizes with p53 mRNA molecules, and induces Rnase H dependent hydrolysis of p53 transcripts in the double stranded section of the hybrids, thereby resulting in loss of p53 production. Loss of p53 activity leads to sensitization of cancer cells to other therapeutics.

**cenisertib:** An orally bioavailable, synthetic, small-molecule multi-Aurora kinase inhibitor with potential antineoplastic activity. Cenisertib selectively binds to and inhibits multiple Aurora kinases (AKs), which may result in the inhibition of cell division and proliferation, and the induction of apoptosis in tumor cells that overexpress AKs. Overexpressed in certain tumor cell types, AKs, a family of serine-threonine kinases, are important regulators of cell division and proliferation that are involved in controlling chromatid segregation. Check for active clinical trials using this agent.

**Cenolate:** (Other name for: ascorbic acid)

**CENTER FOLD:** A roll of film that has a fold on one side and slit on the other in the machine direction allowing the film to be unfolded to twice its roll width.

**Center Gated mold:** An injection mold wherein the cavity is filled with resin through an orifice interconnecting the nozzle and the center of the cavity area. Normally, this orifice is located at the bottom of the cavity when forming items such as containers, tumblers, bowls, etc. OR An injection or transfer mold wherein the cavity is filled with molding material through a sprue or gate directly into the center of the part.

**Center Link Position:** Distance between inside edge of belt and centerline of center link in small radius belts.

**Centerfold:** Film which is folded on one side and opens on the other.

**Centers for Disease Control and Prevention :** An abbreviation for a chemotherapy combination used to treat high-risk neuroblastoma. It includes the drugs carboplatin, etoposide, and melphalan. Also called CEM regimen.

**centi-:** Prefix used in the SI system meaning "one hundredth of". For example 1 cm means "one hundredth of a meter"; 2.3 cg could also be written " $2.3 \times 10^{-2}$  g" or "0.023 g".

**centimeter :** An abbreviation for a chemotherapy combination used to treat high-risk neuroblastoma. It includes the drugs carboplatin, etoposide, and melphalan. Also called CEM.

**central angle:** an angle whose vertex is the center of the circle. The measure of a central angle is equal to the measure of its arc.

**central atom:** In a Lewis structure, usually the atom that is the least electronegative.

**central dogma:** The organizing principle of molecular biology: genetic information flows from DNA to RNA to protein.

**central nervous system :** A U.S. federal government agency whose mission is to protect public health by preventing and controlling disease, injury, and disability. The Centers for Disease Control and Prevention promotes healthy behaviors and safe, healthy environments. It keeps track of health trends, tries to find the cause of health problems and outbreaks of disease, and responds to new public health threats. The Centers for Disease Control and Prevention works with state health departments and other organizations throughout the country and the world to help prevent and control disease. The Centers for Disease Control and Prevention is part of the U.S. Public Health Service of the Department of Health and Human Services (DHHS). Also called CDC.

**central nervous system depressant :** A measure of length in the metric system. There are 100 centimeters in a meter and  $2\frac{1}{2}$  centimeters in an inch.

**central nervous system metastasis :** The brain and spinal cord. Also called CNS.

**central nervous system primitive neuroectodermal tumor :** A type of drug that slows down brain activity, which causes the muscles to relax and calms and soothes a person. Central nervous system depressants are used to

treat insomnia (trouble sleeping), anxiety, panic attacks, and seizures. They may also be used to relieve anxiety and tension before surgery. Examples of central nervous system depressants are benzodiazepines, barbiturates, and certain sleep medicines. Central nervous system depressants are sometimes called sedatives or tranquilizers. Also called CNS depressant.

**central nervous system prophylaxis :** Cancer that has spread from the original (primary) tumor to the central nervous system (CNS). Also called CNS metastasis.

**central nervous system sanctuary therapy :** A type of cancer that arises from a particular type of cell within the brain or spinal cord. Also called CNS PNET.

**central nervous system stimulant :** Chemotherapy or radiation therapy given to the central nervous system (CNS) as a preventive treatment. It kills cancer cells that may be in the brain and spinal cord, even though no cancer has been detected there. Also called central nervous system sanctuary therapy, CNS prophylaxis, and CNS sanctuary therapy.

**central nervous system tumor :** Chemotherapy or radiation therapy given to the central nervous system (CNS) as a preventive treatment. It kills cancer cells that may be in the brain and spinal cord, even though no cancer has been detected there. Also called central nervous system prophylaxis, CNS prophylaxis, and CNS sanctuary therapy.

**central venous access catheter :** A type of drug that increases the levels of certain chemicals in the brain and increases alertness, attention, energy, and physical activity. Central nervous system stimulants also raise blood pressure and increase heart rate and breathing rate. They are used to treat depression, attention deficit hyperactivity disorder (a disorder in which a person has problems paying attention, controlling actions, and remaining still or quiet), and narcolepsy (a sleep disorder). Also called CNS stimulant.

**Centrifugal Casting:** A method of forming thermoplastic resins in which the granular resin is placed in a rotatable container, heated to molten condition by the transfer of heat through the walls of the container, and rotated so that the centrifugal force induced will force the molten resin to conform to the configuration of the interior surface of the container. Used to fabricate large diameter pipes and similar cylindrical items.

**Centring:** A temporary timber support for an arch during its construction.

**centriole:** a cylinder-like organelle that assists in chromosomal migration during mitosis.

**centromere:** the place of attachment of the two homologous chromatids during prophase in mitosis. OR The attachment site of mitotic spindles in chromosomes. OR A specialized site within a chromosome, serving as the attachment point for the mitotic or meiotic spindle.

**CEOP regimen:** A chemotherapy regimen consisting of cyclophosphamide, epirubicin, Oncovin (vincristine), and prednisone which may be used in the treatment of aggressive non-Hodgkin lymphomas.

**cEOR:** Chemically enhanced oil recovery, one of three primary techniques used in enhanced oil recovery which is a process used to modify reservoir conditions, hydrocarbon characteristics or both to help produce more oil from the reservoir.

**CEP-2563 dihydrochloride :** A tumor of the central nervous system, including brain stem glioma, craniopharyngioma, medulloblastoma, and meningioma. Also called CNS tumor.

**CEP-701:** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. A thin, flexible tube is inserted into a vein, usually below the collarbone. It is guided (threaded) into a large vein above the right side of the heart called the superior vena cava. A needle is inserted into a port outside of the body to draw blood or give fluids. A central venous access catheter may stay in place for weeks or months and helps avoid the need for repeated needle sticks. There are several types of central venous access catheters.

**CEPA:** Coupled electron pair approximation. An approximate coupled-cluster-type method. Pretty high level.

**cephalexin:** A beta-lactam, first-generation cephalosporin antibiotic with bactericidal activity. Cephalexin binds to and inactivates penicillin-binding proteins (PBP) located on the inner membrane of the bacterial cell wall. Inactivation of PBPs interferes with the cross-linking of peptidoglycan chains necessary for bacterial cell wall strength and rigidity. This results in the weakening of the bacterial cell wall and causes cell lysis. Compared to second and third generation cephalosporins, cephalexin is more active against gram-positive and less active against gram-negative organisms.

**cephalexin** : A substance being studied in the treatment of some types of cancer. CEP-2563 dihydrochloride blocks certain proteins involved in the growth of some tumors and may kill cancer cells. It is a type of receptor tyrosine kinase inhibitor.

**cephalosporin** : A drug being studied in the treatment of acute leukemias and some other types of cancer. It binds to a protein that is present on the surface of some types of cancer cells and stops them from dividing. CEP-701 is a type of receptor tyrosine kinase inhibitor and a type of indolocarbazole alkaloid. Also called lestaurtinib.

**Cepheid**: a star that varies in its light output.

**ceramide**: One of a number of a class of sphingolipids, N-acyl derivatives with long chains. Ceramide is the core molecule for the synthesis of sphingomyelin, an essential lipid for myelination and neurotransmission; it may function as a second messenger to stimulate differentiation, inhibit proliferation, and induce apoptosis. Check for active clinical trials using this agent. or An antibiotic drug that belongs to the family of drugs called cephalosporins.

**Ceramide ( N-acyl sphingosine)**: N A sphingosine with a long-chain acyl group attached to the amino group.

**Cerazette**: (Other name for: desogestral)

**cerebellar hemangioblastoma** : A protein involved in normal cell growth. It is found on some types of cancer cells, including breast and ovarian. Cancer cells removed from the body may be tested for the presence of c-erbB-2 to help decide the best type of treatment. c-erbB-2 is a type of receptor tyrosine kinase. Also called HER2/neu, human EGF receptor 2, and human epidermal growth factor receptor 2.

**cerebellar mutism syndrome** : Describes cancer cells that have too much of a protein called HER2 on their surface. In normal cells, HER2 helps to control cell growth. When it is made in larger than normal amounts by cancer cells, the cells may grow more quickly and be more likely to spread to other parts of the body. Checking to see if a cancer is c-erbB-2 positive may help plan treatment, which may include drugs that kill c-erbB-2 positive cancer cells. Cancers that may be c-erbB-2 positive include breast, bladder, pancreatic, ovarian, and stomach cancers. Also called HER2 positive and human epidermal growth factor receptor 2 positive.

**cerebellopontine :** A benign, slow-growing tumor in the cerebellum (part of the brain at the back of the head), made up of abnormal blood vessel growth. People with von Hippel-Landau disease have an increased risk of developing hemangioblastomas.

**cerebellum:** a portion of the hindbrain that serves as a coordinating center for motor activity.

**cerebellum :** A condition that may occur in patients who have had surgery to remove a tumor in certain parts of the brain, including the cerebellum. Cerebellar mutism syndrome usually appears 1 or 2 days after surgery. Symptoms include loss of speech, trouble swallowing and eating, loss of balance, trouble walking, loss of muscle tone, mood swings, and changes in personality. Many of these symptoms go away over time. Also called CMS.

**cerebral hemisphere :** Having to do with two structures of the brain, the cerebellum (located at the lower back of the brain) and the pons (located at the base of the brain in front of the cerebellum) and the area between them.

**Cerebroside:** A sphingolipid in which glucose or galactose is linked to the terminal hydroxyl group of a ceramide. OR Sphingolipid containing one sugar residue as a head group.

**cerebrospinal fluid :** The portion of the brain in the back of the head between the cerebrum and the brain stem. The cerebellum controls balance for walking and standing, and other complex motor functions.

**cerebrospinal fluid diversion :** One half of the cerebrum, the part of the brain that controls muscle functions and also controls speech, thought, emotions, reading, writing, and learning. The right hemisphere controls the muscles on the left side of the body, and the left hemisphere controls the muscles on the right side of the body.

**cerebrovascular accident :** The fluid that flows in and around the hollow spaces of the brain and spinal cord, and between two of the meninges (the thin layers of tissue that cover and protect the brain and spinal cord). Cerebrospinal fluid is made by tissue called the choroid plexus in the ventricles (hollow spaces) in the brain. Also called CSF.

**cerebrum:** the portion of the forebrain that controls higher mental activity, such as learning, memory, logic, creativity, and emotion.

**cerebrum :** A process used to drain fluid that has built up around the brain and spinal cord. A shunt (a long, thin tube) is placed in a ventricle of the

brain and threaded under the skin to another part of the body, usually the abdomen. The shunt carries excess fluid away from the brain so it may be absorbed elsewhere in the body.

**ceremony :** In medicine, a loss of blood flow to part of the brain, which damages brain tissue. Cerebrovascular accidents are caused by blood clots and broken blood vessels in the brain. Symptoms include dizziness, numbness, weakness on one side of the body, and problems with talking, writing, or understanding language. The risk of cerebrovascular accident is increased by high blood pressure, older age, smoking, diabetes, high cholesterol, heart disease, atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries), and a family history of cerebrovascular accident. Also called CVA and stroke.

**Cereport:** (Other name for: loperamide)

**Cerespan:** (Other name for: papaverine)

**ceritinib:** An orally available inhibitor of the receptor tyrosine kinase activity of anaplastic lymphoma kinase (ALK) with antineoplastic activity. Upon administration, ceritinib binds to and inhibits wild-type ALK kinase, ALK fusion proteins and ALK point mutation variants. Inhibition of ALK leads to both the disruption of ALK-mediated signaling and the inhibition of cell growth in ALK-overexpressing tumor cells. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK dysregulation and gene rearrangements are associated with a variety of tumor cell types. OR The largest part of the brain. It is divided into two hemispheres, or halves, called the cerebral hemispheres. Areas within the cerebrum control muscle functions and also control speech, thought, emotions, reading, writing, and learning.

**Cerium:** Symbol:"Ce" Atomic Number:"58" Atomic Mass: 140.12amu. Cerium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. You can find this silvery colored metal in air conditioners, your computer, and even the oven.

**certolizumab:** A Fab fragment of a recombinant, humanized monoclonal antibody directed against the proinflammatory cytokine tumor necrosis factor-alpha (TNF-alpha), with anti-inflammatory activity. Upon administration, certolizumab binds to TNF-alpha, preventing the interaction of this cytokine with endogenous cell surface receptors, thereby rendering TNF-alpha inactive and inhibiting TNF-mediated inflammatory responses.

TNF-alpha is a protein involved in inflammation, cell survival, and apoptosis.

**Cerubidine:** (Other name for: daunorubicin hydrochloride)

**Cerubidine :** A series of acts performed for a special occasion or to mark a rite of passage. Ceremonies can be casual or formal.

**Cervarix:** (Other name for: human papillomavirus 16/18 L1 virus-like particle/AS04 vaccine) or A drug used to treat non-small cell lung cancer that has spread to other parts of the body and has a mutated (changed) form of a gene called anaplastic lymphoma kinase (ALK). It is used in patients whose cancer has gotten worse after treatment with or who cannot receive certain anticancer drugs. Ceritinib blocks the protein made by the mutated ALK gene. Blocking this protein may stop the growth and spread of cancer cells. Ceritinib is a type of tyrosine kinase inhibitor. Also called Zykadia.

**Cervene:** (Other name for: TGFa-PE38 immunotoxin)

**cervical :** A drug used to treat acute leukemias and some other types of cancer. It blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. Cerubidine is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called daunomycin hydrochloride and daunorubicin hydrochloride.

**cervical adenocarcinoma :** A vaccine used to prevent cervical cancer caused by human papillomavirus (HPV) types 16 and 18. Cervarix is approved for use in females aged 9 to 25 years. It is a type of bivalent vaccine (a vaccine that works against two different viruses or other microorganisms). Also called recombinant human papillomavirus bivalent vaccine.

**cervical cancer :** Relating to the neck, or to the neck of any organ or structure. Cervical lymph nodes are located in the neck. Cervical cancer refers to cancer of the uterine cervix, which is the lower, narrow end (the “neck”) of the uterus.

**cervical dysplasia :** A type of cervical cancer that begins in the glandular cells of the cervix. These cells make mucus and are found in tissue that lines the inner part of the cervix and the uterus. Cervical adenocarcinoma is less common than cervical squamous cell carcinoma.

**cervical intraepithelial neoplasia :** Cancer that forms in tissues of the cervix (the organ connecting the uterus and vagina). It is usually a slow-

growing cancer that may not have symptoms but can be found with regular Pap tests (a procedure in which cells are scraped from the cervix and looked at under a microscope). Cervical cancer is almost always caused by human papillomavirus (HPV) infection.

**cervical intraepithelial neoplasia grade 2/3 :** The abnormal growth of cells on the surface of the cervix. Cervical dysplasia is usually caused by certain types of human papillomavirus (HPV) and is found when a Pap test or cervical biopsy is done. It can be mild, moderate, or severe, depending on how abnormal the cells look under a microscope and how much of the cervical tissue is affected. Cervical dysplasia is not cancer, but may become cancer and spread to nearby normal tissue.

**cervical squamous cell carcinoma :** Abnormal cells are found on the surface of the cervix. Cervical intraepithelial neoplasia is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. Cervical intraepithelial neoplasia is not cancer, but may become cancer and spread to nearby normal tissue. It is graded on a scale of 1 to 3, based on how abnormal the cells look under a microscope and how much of the cervical tissue is affected. For example, CIN 1 has slightly abnormal cells and is less likely to become cancer than CIN 2 or CIN 3. Also called CIN.

**cervical squamous intraepithelial neoplasia 1 :** Abnormal cells are found on the surface of the cervix. Cervical intraepithelial neoplasia grade 2/3 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. Cervical intraepithelial neoplasia grade 2/3 has features of CIN 2 and CIN 3. It is not cancer, but may become cancer and spread to nearby normal tissue if not treated. Treatment for cervical intraepithelial neoplasia grade 2/3 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. Also called CIN 2/3.

**cervical squamous intraepithelial neoplasia 2 :** A type of cervical cancer that begins in squamous cells of the cervix. Cervical squamous cells are found in tissue that lines the outer part of the cervix. They are thin, flat cells that look like fish scales under a microscope. Most cervical cancers are squamous cell carcinomas.

**cervical squamous intraepithelial neoplasia 3 :** Slightly abnormal cells are found on the surface of the cervix. Cervical squamous intraepithelial

neoplasia 1 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. Cervical squamous intraepithelial neoplasia 1 is not cancer and usually goes away on its own without treatment. Sometimes it becomes cancer and spreads to nearby normal tissue. Cervical squamous intraepithelial neoplasia 1 is sometimes called low-grade or mild dysplasia. Also called CIN 1.

**cervicectomy :** Moderately abnormal cells are found on the surface of the cervix. Cervical squamous intraepithelial neoplasia 2 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. Cervical squamous intraepithelial neoplasia 2 is not cancer, but may become cancer and spread to nearby normal tissue if not treated. Treatment for cervical squamous intraepithelial neoplasia 2 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. Cervical squamous intraepithelial neoplasia 2 is sometimes called high-grade or moderate dysplasia. Also called CIN 2.

**CerviPrep :** Severely abnormal cells are found on the surface of the cervix. Cervical squamous intraepithelial neoplasia 3 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. If not treated, these abnormal cells may become cancer and spread to nearby normal tissue. Treatment for cervical squamous intraepithelial neoplasia 3 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. Cervical squamous intraepithelial neoplasia 3 is sometimes called high-grade or severe dysplasia. Also called CIN 3 and stage 0 cervical carcinoma in situ.

**cervix:** the opening at the lower end of the uterus.

**cervix :** Surgery to remove the cervix (the end of the uterus that forms a canal between the uterus and the vagina). The upper part of the vagina and certain pelvic lymph nodes may also be removed. Also called trachelectomy.

**Cesamet :** A device used to deliver drugs directly to the cervix (the lower, narrow end of the uterus that forms a canal between the uterus and vagina). The CerviPrep covers the cervix and protects surrounding tissue. Drugs may be injected into the inner part of the cervix through a syringe attached to the device.

**Cesium:** Symbol:"Cs" Atomic Number:"55" Atomic Mass: 132.91amu. One of the alkali metal group. This element can be found in many minerals. When pure it is a silvery-white color and is used in atomic clocks and photoelectric cells. It is one of three metals found in a liquid state at room temperature.

**cesium Cs 131:** An unstable radioisotope of cesium (Cs) with radiocytotoxic application. Cs-131 is a gamma photon-emitting radionuclide with high energy and a relatively short half-life of 9.7 days. When used in prostate brachytherapy, Cs-131 demonstrated advantages over other commonly used isotopes.

**cesium Cs 137:** A radioactive isotope of cesium with an atomic mass of 139 and potential application in radiotherapy. Cesium Cs 137 is prevalent due to its spontaneous production, which occurs as a result of nuclear fission of other radioactive materials, such as uranium and plutonium. This radionuclide has a relatively long half-life, 30 years, and decays by emitting beta particles. Both Cs 137 and its metastable nuclear isomer, barium-137m, emit gamma radiation of moderate energy and so are used in sterilization procedures in the food industry or in hospital environments.

**Cess Pools:** This system is similar to a septic tank. in performance. Sewage water usually seeps through the open bottom and portholes in the sides of the walls. These can also clog up with overuse and the introduction of detergents and other material which slow up the bacterial action.

**Cetacort:** (Other name for: therapeutic hydrocortisone)

**Cetane:** (Other name for: ascorbic acid)

**cetuximab:** The lower, narrow end of the uterus that forms a canal between the uterus and vagina. OR A recombinant, chimeric monoclonal antibody directed against the epidermal growth factor (EGFR) with antineoplastic activity. Cetuximab binds to the extracellular domain of the EGFR, thereby preventing the activation and subsequent dimerization of the receptor; the decrease in receptor activation and dimerization may result in an inhibition in signal transduction and anti-proliferative effects. This agent may inhibit EGFR-dependent primary tumor growth and metastasis. EGFR is overexpressed on the cell surfaces of various solid tumors.

**cetuximab-IR700 conjugate RM-1929:** A chemical conjugate composed of the dye IR700 linked to cetuximab, a monoclonal antibody directed against the epidermal growth factor receptor (EGFR), with potential

antineoplastic activity. Upon injection, the cetuximab moiety targets and binds to EGFR-expressing tumor cells, resulting in the internalization of the conjugate. Upon localized application of near-infrared (NIR) light, the IR700 dye becomes activated, disrupts the cell membrane and selectively kills the EGFR-expressing tumor cells. EGFR, a tyrosine kinase receptor, is overexpressed in a variety of cancers.

**cetuximab-IRDye 800:** An immunoconjugate comprised of the recombinant chimeric monoclonal antibody cetuximab conjugated to the N-hydroxysuccinamide (NHS) ester form of the near-infrared (NIR) fluorescent dye IRDye 800CW (cetuximab-IRDye 800) with potential imaging use. The antibody moiety of cetuximab-IRDye 800 binds to the extracellular domain of the epidermal growth factor receptor (EGFR). Upon binding, IRDye 800 may be detected using NIR imaging, which facilitates the visualization and quantification of EGFR-expressing tumor cells. EGFR is a receptor tyrosine kinase that may be overexpressed on the cell surfaces of various tumor types.

**Cevalin:** (Other name for: ascorbic acid)

**cevimeline hydrochloride:** A cholinergic analogue with glandular secretion stimulatory activity. Cevimeline binds to and activates muscarinic receptors, thereby increasing the secretions in exocrine salivary and sweat glands. This cholinergic agonist also increases the tone of smooth muscle in the gastrointestinal and urinary tracts. Cevimeline is being studied as a treatment for dry mouth caused by radiation therapy to the head and neck. Check for active clinical trials using this agent.

**cevimeline hydrochloride :** A synthetic pill form of an active chemical in marijuana called delta-9-tetrahydrocannabinol (THC). Cesamet is used to treat nausea and vomiting caused by chemotherapy in patients who have not been helped by other therapy. It is a type of cannabinoid. Also called nabilone.

**cFMS tyrosine kinase inhibitor ARRY-382:** A small molecule and orally available inhibitor of colony-stimulating factor-1 receptor (CSF1R; cFMS) with potential antineoplastic activity. cFMS tyrosine kinase inhibitor ARRY-382 binds to and inhibits the activity of cFMS. By preventing colony-stimulating factor-1 (CSF-1)-cFMS signaling, this agent may inhibit tumor cell proliferation in cFMS-overexpressing tumor cells. cFMS, a tyrosine kinase receptor, is overexpressed in certain tumor cell types and

plays an essential role in macrophage differentiation and regulation of cell proliferation. Check for active clinical trials using this agent.

**CFRP:** Carbon fibre reinforced plastic.

**CFS:** A drug used to treat certain disorders of the salivary gland. It is also being studied as a treatment for dry mouth caused by radiation therapy to the head and neck. It increases the amount of saliva and sweat made by saliva and sweat glands. Cevimeline hydrochloride is a type of cholinergic agonist. Also called Evoxac.

**CFU:** Viable micro-organisms (bacteria, yeasts & mould) capable of growth under the prescribed conditions (medium, atmosphere, time and temperature) develop into visible colonies (colony forming units) which are counted. The term colony forming unit (CFU) is used because a colony may result from a single micro-organism or from a clump / cluster of micro-organisms.

**CgA:** A substance that has been studied in the treatment of cancer and is being studied in the treatment of rheumatoid arthritis and certain skin conditions. It blocks the production of a protein called c-fos, which helps control cell growth. This may kill cancer cells that need c-fos to grow. It is a type of antisense oligonucleotide. Also called antisense c-fos.

**Cgmp phosphodiesterase:** An enzyme that hydrolyzes cyclic GMP to GMP; in the visual system, this hydrolysis leads to the generation of an action potential.

**Cgmp-gated calcium channel:** A channel in rod cells that opens in response to cgmp to allow entry of calcium and sodium ions into the cell; closing of the channel in response to cgmp hydrolysis initiates the visual signal-transduction pathway.

**CGP 48664:** A condition that lasts for more than 6 months in which a person feels tired most of the time. They may also have trouble concentrating and carrying out daily activities. Other symptoms include sore throat, fever, muscle weakness, headache, and joint pain. Also called chronic fatigue syndrome.

**cgs:** An older metric system of units that uses centimeters, grams, and seconds as base units.

**cGTO:** Contracted gaussian-type orbital. The usual basis function; it's a linear combination of gaussian functions with the linear coefficients fixed,

then multiplied by an angular function. So one set of p-functions contains three cGTO's (px, py, and pz), i.e, three basis functions. See "primitives."

**Ch14.18:** A protein found inside neuroendocrine cells, which release CgA and certain hormones into the blood. CgA may be found in higher than normal amounts in patients with certain neuroendocrine tumors, small cell lung cancer, prostate cancer, and other conditions. Measuring the amount of CgA in the blood may help to diagnose cancer or other conditions or find out how well treatment is working or if cancer has come back. CgA is a type of tumor marker. Also called chromogranin A.

**Chain Driven Belts:** A belt construction which provides positive traction by incorporating two or more rows of chain attached to cross rods or flatbar. Chains commonly used for this purpose are attachments, pintle and roller, which are connected by means of cross members.

**Chain Reaction:** A really dodgy film starring Keanu Reeves. Also, a mechanism that has no reason to stop, since the product is just as reactive as the reactants. OR a reaction that, once started, produces sufficient energy to keep the reaction running. These reactions proceed by a series of steps, which produce intermediates, energy, and products. OR a reaction that, once started, produces sufficient energy to keep the reaction running. These reactions proceed by a series of steps, which produce intermediates, energy, and products. OR A reaction that initiates its own repetition. In a fission chain reaction, a fissionable nucleus absorbs a neutron and fissions spontaneously, releasing additional neutrons. These, in turn, can be absorbed by other fissionable nuclei, releasing still more neutrons. A fission chain reaction is self-sustaining when the number of neutrons released in a given time equals or exceeds the number of neutrons lost by absorption in nonfissionable material or by escape from the system.

**chair conformation:** a conformation of cyclohexane that resembles a chair and has less energy than a boat conformation.

**Chalking:** A powdery residue on the surface of a material often resulting from degradation. OR Dry chalk-like appearance or deposit on the surface of a plastic. See HAZE and BLOOM.

**Chalking:** Formation of a powder on the surface of a paint film caused by disintegration of the binder during weathering. Can be affected by the choice of pigment or binder. OR The disintegration of paint film into a faded powdery substance. Chalking occurs when the binder cannot

withstand harsh environmental conditions. Re-painting over a chalky surface is difficult unless a paint has the high adhesion provided by acrylic binders.

**Chamberlain procedure :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called S-adenosylmethionine decarboxylase inhibitors.

**Chamfer:** An arris edge or angle that has been slightly pared off or bevelled. OR Also known as a “bevel,” it is a flat truncated corner.

**chamomile:** The flower-heads of either the plant *Anthemis nobilis* or the plant *Matricaria chamomilla*. Chamomile has a warm aromatic odour and a very bitter taste and contains volatile oils which are a mixture of butyl and amyl angelates and valerates. Due to its coumarin constituents, large doses may interfere with coagulation. Check for active clinical trials using this agent. OR A drug used with granulocyte-macrophage colony-stimulating factor (GM-CSF), aldesleukin (IL-2), and 13-cis-retinoic acid to treat high-risk neuroblastoma. It is used in children whose disease has improved with other anticancer treatment. Ch14.18 binds to a substance called GD2, which is found on some types of cancer cells. Ch14.18 may block GD2 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called dinutuximab, MOAB Ch14.18, monoclonal antibody Ch14.18, and Unituxin.

**Change over- Fill/Pack Switch over point fill to pack:** The point on injection stroke at which filling phase with speed profile ends and pack or pressure phase with pressure profile starts.

**Channel:** a pin or wire lead to which you apply or form which you read the analog or digital signal. OR A protein passage that is continuous and that allows ions to flow rapidly through a eukaryotic membrane from a compartment of higher to a compartment of lower concentration. Channels (also known as pores in bacteria) are generally composed of four to six subunits, or domains, and are gated by membrane potential, allosteric effectors, or covalent modification.

**CHANNEL DEPTH RATIO:** In an extruder screw, the ratio of the depth of the first channel at the hopper end to the depth of the last channel in the metering section.

**channeling:** The direct transfer of a reaction product (common intermediate) from the active site of one enzyme to the active site of a

different enzyme catalyzing the next step in a sequential pathway.

**Chantix :** (Other name for: varenicline) OR A procedure in which a tube is inserted into the chest to view the tissues and organs in the area between the lungs and between the breastbone and heart. The tube is inserted through an incision next to the breastbone. This procedure is usually used to get a tissue sample from the lymph nodes on the left side of the chest. Also called anterior mediastinotomy.

**Chaperone proteins:** Slow atpases that bind newly synthesized proteins and assist their proper folding.

**chaplain :** A family of plants with daisy-like flowers. Two types are German chamomile and Roman or English chamomile. These are used in teas to calm and relax, to improve sleep, and to help with stomach problems. The essential oil (scented liquid taken from plants) of chamomile is used in perfumes, shampoos, lotions, and aromatherapy.

**charge:** Describes an object's ability to repel or attract other objects. Protons have positive charges while electrons have negative charges. Like charges repel each other while opposite charges, such as protons and electrons, attract one another. OR The amount of material used to load a mold at one time or during one cycle. The measurement or weight of material necessary to fill a mold during one cycle. OR The amount of material used to load a mold at one time or during one cycle. OR The measurement or weight of material necessary to fill a mold during one cycle.

**Charged particle:** An ion. An elementary particle (part of an element) carrying a positive or negative electric charge.

**charged-particle radiation therapy :** A drug used to help people stop smoking by acting the same way nicotine acts in the brain. It is a type of nicotine receptor partial agonist. Also called varenicline tartrate.

**Charles' Law:** A scientist named Jacques Charles did many experiments involving gas volumes and temperatures. He determined that the volume a gas needs is directly proportional to the temperature of the system (assuming a constant pressure). The formula goes:  $V = Tk$  (where  $k$  is a constant). OR the volume of a gas varies directly with absolute temperature. OR The volume of a gas is directly proportional to its temperature in kelvins, if pressure and amount of gas remain constant. Doubling the kelvin temperature of a gas at constant pressure will double its

volume. If  $V_1$  and  $T_1$  are the initial volume and temperature, the final volume and temperature ratio  $V_2/T_2 = V_1/T_1$  if pressure and moles of gas are unchanged.

**Charpy Impact Test :** A destructive test of impact resistance, consisting of placing a test coupon in a horizontal position between two supports, then applying a blow of known magnitude. If the specimen does not break, a new specimen is put in position and the magnitude is increased until the specimen breaks.

**chaste tree berry :** A member of the clergy in charge of a chapel or who works with the military or with an institution, such as a hospital.

**Check ring:** A ring shaped component that slides back and forth over the tip end of the screw. The check ring eliminates the flow of molten material backwards over the screw during the injection process.

**CHECKING:** A kind of paint failure in which many small cracks appear in the surface of the paint.

**checkpoint kinase inhibitor AZD7762:** A synthetic small molecule inhibitor of checkpoint kinases (Chks) with potential chemosensitizing activity. AZD7762 binds to and inhibits Chks, which may prevent cell cycle arrest and subsequent nucleotide excision repair in DNA-damaged tumor cells, resulting in tumor cell apoptosis. This agent may enhance the cytotoxicity of DNA-damaging agents. Chks are protein kinases that regulate either G1/S or G2/M transitions in the cell cycle. In the presence of DNA damage or incomplete DNA replication, Chks become activated and initiate cell cycle arrest to allow DNA repair or the completion of DNA replication. Check for active clinical trials using this agent.

**Cheesiness:** The character of a paint film which, although dry, is still soft and mechanically weak. OR A paint film that has dried in this condition is mechanically weak and needs to be completely removed. Carefully clean down the surfaces and allow to dry before reapplying paint.

**Chelate:** A molecule that contains more than one binding site and frequently binds to another molecule through more than one binding site at the same time. OR A stable complex of a metal with one or more polydentate ligands. For example, calcium complexes with EDTA to form a chelate.

**chelated:** Combined with a metal to form a chelate ring, in which a metal ion is held by coordinate bonds.

**chelating agent:** A ligand that binds to a metal using more than one atom; a polydentate ligand.

**chelating agent :** A type of external radiation therapy that uses a special machine to make invisible, high-energy particles (protons or helium ions) that kill cancer cells. This type of radiation may cause less damage to nearby healthy tissue than radiation therapy with high-energy x-rays.

**CHELATION:** A process in which a metal ion is coordinatively bound to an organic molecule forming a heterocyclic ring.

**chemabrasion :** An extract made from the fruit of the chaste tree (*Vitex agnus-castus*) found in parts of Asia and Europe. It is claimed to treat infertility and to lessen symptoms that may occur before or during a woman's menstrual period, such as headaches and irregular bleeding. Chaste tree berry may affect levels of reproductive hormones in the blood. It is a type of phytomedicine. Also called monk's pepper and Vitex.

**ChemDraw:** A software package used to draw molecules.

**chemexfoliation :** A chemical compound that binds tightly to metal ions. In medicine, chelating agents are used to remove toxic metals from the body. They are also being studied in the treatment of cancer.

**CHEMFET (Chemically Modified FET or Chemically Sensitive FET):** an electrochemical microsensor involving the deposition of a polymeric ionselective membrane on the surface of the FET (field effect transistor) transducer. The appropriate composition of the ionselective membrane allows designing of CHEMFET with required selectivity. In this case, the introduction of an additional hydrogel layer (polyHEMA), soaked with an internal solution, between the gate oxide of an ISFET and an ionselective membrane is required.

**chemical:** 1 of or pertaining to chemistry. 2. a substance.

**chemical :** A procedure used to improve the way certain skin problems look. These problems include acne scars, wrinkles, or skin changes caused by long-term sun exposure. A chemical solution is put on the skin to dissolve the top layers of skin cells. Also called chemexfoliation and chemical peel.

**chemical analysis:** the use of a standard chemical analytical procedures to determine the concentration of a specific analyte in a sample, or qualitatively or quantitatively measure a specific parameter of a sample.

**Chemical biology:** A field of study that blends chemistry and biology and involves the application of chemical techniques and tools, often compounds produced through synthetic chemistry, to the study and manipulation of biological systems

**chemical bond:** A chemical bond is a strong attraction between two or more atoms. Bonds hold atoms in molecules and crystals together. There are many types of chemical bonds, but all involve electrons which are either shared or transferred between the bonded atoms.

**Chemical bonding:** A method for bonding rubber to secondary parts by applying special adhesives or having a glass element on part prior to liquid silicone molding

**chemical change:** A chemical change is a reaction in which new substances are formed. OR A chemical change is a dissociation, recombination, or rearrangement of atoms.

**chemical changes:** Processes or events that have altered the fundamental structure of something.

**chemical coagulation:** the destabilization and initial aggregation of colloidal and finely divided suspended matter by the addition of a flocculating chemical.

**Chemical Combination:** A chemical reaction in which two elements or compounds are combined to form a more complex compound.

**Chemical Decomposition:** This is the molecular action of the larger process of decomposition. Compounds are broken down into simpler compounds and elements.

**Chemical engineers:** People who carry out chemical reactions in ten-ton reactors instead of test tubes. Real chemists tend to assume that chemical engineers just mix up reactions that other people have developed in big buckets, but I've looked at some of the books they have to read and they're full of hairy maths, so some parts of what they do must be kind of tricky. Their main job is actually to design the buckets, how they're stirred, and how things get in and out of them, so that they don't explode, shower the

surrounding countryside with toxic waste, or otherwise cost the chemical company too much money. See Industrial Chemist.

**chemical equation:** An expression of a fundamental change in the chemical substances. OR a shorthand way of describing a chemical change using symbols of elements and formulas of compounds. OR A compact notation for describing a chemical change. The formulas of the reactants are added together on the left hand side of the equation; the formulas of the products are added together on the right side. Coefficients are inserted before the formulas to ensure that the equation is balanced. The phase in which each substance is found is usually indicated in parentheses after each formula. For example,  $2 \text{H}_2(\text{g}) + \text{O}_2(\text{g}) = 2 \text{H}_2\text{O}(\text{g})$  indicates that 2 moles of hydrogen gas combine with one mole of oxygen gas to produce two moles of steam.

**Chemical equation** : (Don't confuse this with chemical formula) If you are asked for a symbol equation it must be balanced. OR show what reacts with what, what new substances are formed, and their reacting ratios.

**Chemical Forces:** Chemical forces act on the bonds of molecules and atoms. They change the chemical makeup of systems. Physical forces are different from chemical forces in that they do not change the chemical makeup of molecules.

**chemical formula:** a representation of a compound to show its composition using symbols and subscript numbers. OR (Don't confuse this with chemical equation) This is the chemical code for a substance. If the substance forms molecules the formula tells us how many atoms of each element are in the molecule. OR show which elements are present and their ratios.

**Chemical genomics:** The study of gene responses to chemical compounds. The main goal is to rapidly identify new drugs and drug targets

**chemical imbalance** : A procedure used to improve the way certain skin problems look. These problems include acne scars, wrinkles, or skin changes caused by long-term sun exposure. A chemical solution is put on the skin to dissolve the top layers of skin cells. Also called chemabrasion and chemical peel.

**Chemical library:** A collection of chemicals that are stored along with related information such as the chemical structure, purity, quantity, and other characteristics of the substance

**chemical oxygen demand:** the amount of oxygen required for the chemical oxidation of organics in a liquid; a chemical test that determines the oxygen equivalent of the amount of organic matter oxidizable by potassium dichromate in a 50% sulfuric acid solution.

**chemical peel :** A substance made up of elements, such as hydrogen or sodium.

**chemical potential:** The chemical potential is a partial molar Gibbs free energy, defined as  $\mu_i = (G/n_i)_{T,P,n_j}$ . The definition means that the chemical potential is the change in Gibbs free energy when one mole of a substance is added to a very large amount of a sample. Chemical potential is a measure of chemical stability that can be used to predict and interpret phase changes and chemical reactions. Substances with higher chemical potential will react or move from one phase to another to lower the overall Gibbs free energy of the system. For example, consider a mixture of ice and water. If the ice melts, the chemical potential of the water was lower than that of the ice. If the water freezes, the chemical potential of the ice was lower.

**Chemical precipitation:** Precipitation induced by addition of chemicals; the process of softening water by the addition of lime and soda ash as the precipitants. OR (1) the process of utilizing chemicals to produce a separable solid phase within a liquid medium; in analytical chemistry, precipitation is used to separate a solid phase in an aqueous solution. (2) the process of softening water by the addition of lime and soda ash as the precipitants.

**CHEMICAL PROPERTIES:** are such things as reactivity, oxidation states, flammability, and corrosiveness.

**chemical property:** Measurement of a chemical property involves a chemical change. For example, determining the flammability of gasoline involves burning it, producing carbon dioxide and water.

**Chemical recombination:** Following an ionization event, the positively and negatively charged ion pairs may or may not realign themselves to form the same chemical substance they formed before ionization. Thus, chemical recombination could change the chemical composition of the material bombarded by ionizing radiation.

**Chemical Replacement:** A chemical reaction where one element is replaced by another. Copper and sulfuric acid combine to create copper sulfate and hydrogen.

**Chemical Resistance:** the degree to which a given plastic will resist degradation due to contact with certain chemicals. This characteristic will usually vary with chemical concentration and temperature.

**chemical sedimentary rock:** a sedimentary rock resulting from biological or chemical processes, generally underwater, that crystallizes minerals that accumulate on the sea floor.

**Chemical sensor :** a miniaturized analytical device, which can deliver realtime and online information on the presence of specific compounds or ions in the complex samples.

**chemical shift:** a position in an NMR spectrum, relative to TMS, at which a nucleus absorbs.

**CHEMICAL SYMBOLS:** are abbreviations for the elements.

**chemical weathering:** the breaking down of rock material by chemical means, forming a new substance.

**chemical weathering:** the process by which rain, water, and atmospheric gases decompose minerals, destroy chemical and mineralogical bonds, and form new minerals.

**Chemical weathering :** Rocks can be broken down by many effects. Chemical weathering is where this breakdown is caused by chemical action. This is often due to acidic rainfall and is made worse when the rain is made extra acidic by pollution (acid rain).

**chemiluminescence:** A chemical reaction that releases energy as electromagnetic radiation.

**Cheminformatics:** The use of computer and information technologies to study problems in chemistry

**chemiosmosis:** the subdivision of cellular respiration in which the energy given off by electrons is used to pump protons across a membrane and synthesize ATP.

**Chemiosmotic coupling:** Coupling of ATP synthesis to electron transfer via an electrochemical  $H^+$  gradient across a membrane. The coupling of ATP synthesis to an electrochemical potential gradient across a membrane.

**Chemiosmotic hypothesis:** The idea that electron transfer in the respiratory chain is used to pump protons across the inner mitochondrial membrane, establishing a proton gradient; this gradient (the proton-motive force) drives the synthesis of ATP by ATP synthase.

**chemistry:** The science of matter and the changes in matter. OR The study of matter and its transformations. See What is chemistry? for other definitions.

**Chemoattractants:** Substances, such as glucose, that, when present in the form of a gradient, cause bacteria to swim toward the source of the gradient.

**Chemoautotroph:** An organism that obtains its energy from the oxidation of chemical compounds and uses only organic compounds as a source of carbon. Example: nitrifiers.

**chemobiokinetics:** The process of the uptake of chemical substances by the body, the biotransformation they undergo, the distribution of the substances and their metabolites in the tissues, and the elimination of the substances and their metabolites from the body. Both the amounts and the concentrations of the substances and their metabolites are studied. The term has essentially the same meaning as pharmaco-kinetics, but the latter term should be restricted to the study of pharmaceutical substances (WHO, 1979).

**chemoembolization :** Too much or too little of any substance that helps the body work the way it should. A chemical imbalance may be caused by certain tumors and can cause changes in behavior or emotion.

**chemoimmunotherapy :** A procedure used to improve the way certain skin problems look. These problems include acne scars, wrinkles, or skin changes caused by long-term sun exposure. A chemical solution is put on the skin to dissolve the top layers of skin cells. Also called chemabrasion and chemexfoliation.

**Chemooptical interface :** the receptor part (see optomembrane) of a fiber optic chemical sensor containing an immobilized reagent (e.g. indicator, dye or chromoionophore), which converts chemical information on the sample into changes of its spectral properties (absorbance, fluorescence).

**Chemophase:** (Other name for: recombinant human hyaluronidase)

**chemoprevention :** A procedure in which the blood supply to a tumor is blocked after anticancer drugs are given in blood vessels near the tumor. Sometimes, the anticancer drugs are attached to small beads that are injected into an artery that feeds the tumor. The beads block blood flow to the tumor as they release the drug. This allows a higher amount of drug to reach the tumor for a longer period of time, which may kill more cancer

cells. It also causes fewer side effects because very little of the drug reaches other parts of the body. Chemoembolization is used to treat liver cancer. Also called TACE and transarterial chemoembolization.

**chemoprevention study :** Chemotherapy combined with immunotherapy. Chemotherapy uses different drugs to kill or slow the growth of cancer cells; immunotherapy uses treatments to stimulate or restore the ability of the immune system to fight cancer.

**chemoprotective agent :** The use of drugs, vitamins, or other agents to try to reduce the risk of, or delay the development or recurrence of, cancer.

**chemoradiation :** In cancer prevention, a clinical trial that studies whether taking certain medicines, vitamins, minerals, or food supplements can prevent cancer. Also called agent study.

**chemoradiotherapy :** A type of drug that helps protect healthy tissue from some of the side effects caused by certain anticancer drugs. For example, in patients receiving certain anticancer drugs, amifostine helps protect the kidneys, mesna helps protect the bladder, and dexrazoxane (Zinecard) helps reduce heart damage.

**chemoreceptors:** the specialized receptor cells that transmit smell and taste.

**chemoreduction :** Treatment that combines chemotherapy with radiation therapy. Also called chemoradiotherapy.

**Chemorepellants:** Potentially harmful substances, such phenol, that, when present in the form of a gradient, cause bacteria to swim away from the source of the gradient.

**chemosensitivity :** Treatment that combines chemotherapy with radiation therapy. Also called chemoradiation.

**chemosensitivity assay :** Chemotherapy given to shrink a retinoblastoma tumor before treatment with radiation or surgery. It is a type of neoadjuvant therapy.

**chemosensitizer :** The susceptibility of tumor cells to the cell-killing effects of anticancer drugs.

**chemotaxis:** A cell's sensing of and movement toward, or away from, a specific chemical agent.

**chemotherapeutic agent :** A laboratory test that measures the number of tumor cells that are killed by a cancer drug. The test is done after the tumor

cells are removed from the body. A chemosensitivity assay may help in choosing the best drug or drugs for the cancer being treated.

**chemotherapy** : A drug that makes tumor cells more sensitive to the effects of chemotherapy.

**Chemotroph**: An organism that obtains its energy from the oxidation of chemical compounds. OR An organism that obtains energy by metabolizing organic compounds derived from other organisms.

**Chemotrophs**: Organisms that obtain energy by the oxidation of foodstuffs. See also phototrophs.

**Chequer-plate**: A patterned steel plate used for flooring.

**Chernozem (Tchernozem)**: A major group of dark-colored zonal soils with a rich and deep humus horizon occurring in temperate-to-cool, subhumid climates.

**cherry-red spot**: a red circular area surrounded by gray-white retina as seen during an eye examination typical in lysosomal storage diseases such as Tay-Sachs disease

**chest wall** : A drug used to treat cancer.

**chest x-ray** : Treatment that uses drugs to stop the growth of cancer cells, either by killing the cells or by stopping them from dividing. Chemotherapy may be given by mouth, injection, or infusion, or on the skin, depending on the type and stage of the cancer being treated. It may be given alone or with other treatments, such as surgery, radiation therapy, or biologic therapy.

**chewing tobacco** : The muscles, bones, and joints that make up the area of the body between the neck and the abdomen.

**Chey**: A protein in the bacterial chemotaxis signaling pathway that, when phosphorylated, leads to clockwise rotation of the flagellum, causing tumbling, and that, when dephosphorylated, leads to counterclockwise rotation and smooth swimming.

**CHF**: An x-ray of the structures inside the chest. An x-ray is a type of high-energy radiation that can go through the body and onto film, making pictures of areas inside the chest, which can be used to diagnose disease.

**chiasma** : A type of smokeless tobacco made from cured tobacco leaves. It may be sweetened and flavored with licorice and other substances. It comes in the form of loose tobacco leaves, pellets or “bits” (leaf tobacco rolled into small pellets), plugs (leaf tobacco pressed and held together with some

type of sweetener), or twists (leaf tobacco rolled into rope-like strands and twisted). It is placed in the mouth, usually between the cheek and lower lip, and may be chewed. Chewing tobacco contains nicotine and many harmful, cancer-causing chemicals. Using it can lead to nicotine addiction and can cause cancers of the mouth, throat, esophagus, and pancreas. Chewing tobacco use may also cause gum disease, heart disease, stroke, and other health problems. Also called spit tobacco.

**chiauranib:** An orally available, small molecule inhibitor of select serine-threonine kinases, including aurora kinase B (aurora B), vascular endothelial growth factor receptors (VEGFRs), stem cell factor receptor (c-KIT), and platelet-derived growth factor receptors (PDGFRs), with potential antineoplastic activity. Upon oral administration, chiauranib binds to and inhibits the activity of aurora B, VEGFRs, c-kit and PDGFRs, which may result in a decrease in the proliferation of tumor cells that overexpress these kinases. These kinases are overexpressed by a variety of cancer cell types.

**chidamide:** An orally bioavailable benzamide type inhibitor of histone deacetylase (HDAC) isoenzymes 1, 2, 3 and 10, with potential antineoplastic activity. Chidamide selectively binds to and inhibits HDAC leading to an increase of acetylation levels of histone protein H3. This agent also inhibits the expression of signaling kinases in the PI3K/Akt and MAPK/Ras signaling pathways and may result in cell cycle arrest and the induction of tumor cell apoptosis. This may inhibit tumor cell proliferation in susceptible tumor cells. HDACs, a class of enzymes that deacetylate chromatin histone proteins, are upregulated in many tumor types and play key roles in gene expression. Compared to some other benzamide type HDAC inhibitors, chidamide is more stable, more resistant to degradation and has a longer half-life.

**child-life specialist :** A term used to describe cancers that occur between birth and 15 years of age. Childhood cancers are very rare and may differ from adult cancers in the way they grow and spread, how they are treated, and how they respond to treatment. Common types of childhood cancer include leukemia (begins in blood-forming tissue such as bone marrow), lymphoma (begins in the cells of the immune system), neuroblastoma (begins in certain nerve cells), retinoblastoma (begins in the tissues of the

retina), Wilms tumor (a type of kidney cancer), and cancers of the brain, bone, and soft tissue.

**child-life worker :** A group of children with cancer that has been formed based on certain characteristics of the children and their disease. These may include age at diagnosis, stage of cancer, and cancer biology. Risk groups may also be based on the chance of being cured or the chance that the cancer will come back. Childhood cancer risk groups are used to plan treatment and follow-up care for certain types of cancer, such as neuroblastoma and rhabdomyosarcoma. Risk groups may be described as low risk, intermediate risk, or high risk.

**childhood acute lymphoblastic leukemia risk group system :** A condition in which the heart has trouble pumping blood through the body. It may develop over a long period of time. Symptoms include shortness of breath, problems exercising, fatigue, and swelling of the feet, ankles, and abdomen. CHF may be caused by coronary artery disease, a heart attack, or high blood pressure. It usually occurs in people aged 65 years or older. Also called chronic heart failure.

**childhood cancer :** An anatomy term for an X-shaped crossing (for example, of nerves or tendons).

**childhood cancer risk group :** A way of grouping patients that is used to plan treatment for children with acute lymphoblastic leukemia. A risk group is based on the patient's age and white blood cell count at diagnosis. Risk groups are described as either standard (low) risk or high risk. Other factors that affect the risk group include the type of leukemia cells, whether there are certain chromosome changes, and how quickly the leukemia responds to treatment.

**Children's Oncology Group :** A healthcare professional who is trained in the emotional and developmental needs of children. The child-life specialist helps children and their families understand medical issues and gives psychological and emotional support. Also called child-life worker.

**chill zone:** the fine-grained edge of a rock intrusion.

**chimeric :** A healthcare professional who is trained in the emotional and developmental needs of children. The child-life worker helps children and their families understand medical issues and gives psychological and emotional support. Also called child-life specialist.

**chimeric antigen receptor T-cell therapy :** A group of clinical cancer research organizations that get support from the National Cancer Institute to study childhood cancers. The main goal of Children's Oncology Group is to conduct clinical trials of new treatments for childhood and adolescent cancers at cancer centers in the United States, Canada, Europe, and Australia. Also called COG.

**Chimeric DNA:** Recombinant DNA whose components originate from two or more different sources. OR A recombinant DNA molecule containing unrelated genes.

**chimeric fibril-reactive monoclonal antibody 111F4:** A chimeric monoclonal antibody specifically targeting human immunoglobulin light chain (LC)-related fibrils, which may potentially be used in the treatment of light chain-associated (AL) amyloidosis. Upon administration, chimeric fibril-reactive monoclonal antibody 111F4 targets and binds to the amyloid-related, conformational epitope on LC-related fibrils. This inhibits fibrillogenesis, induces an Fc-mediated cellular inflammatory response, increases degradation and elimination of AL amyloidomas, and prevents systemic LC-associated amyloid deposits. In AL amyloidosis the amyloid fibrils are composed of immunoglobulin light chain fragments.

**chimeric humanized anti-CD47 antibody:** A humanized, high-chimeric antibody targeting the human cell surface antigen CD47, with potential phagocytosis-inducing and antineoplastic activities. Upon administration, chimeric humanized anti-CD47 antibody selectively binds to CD47 expressed on tumor cells and blocks the interaction of CD47 with signal regulatory protein alpha (SIRPa), a protein expressed on phagocytic cells. This prevents CD47/SIRPa-mediated signaling and abrogates the CD47/SIRPa-mediated inhibition of phagocytosis. This induces pro-phagocytic signaling mediated by the binding of calreticulin (CRT), which is specifically expressed on the surface of tumor cells, to low-density lipoprotein (LDL) receptor-related protein-1 (LRP-1), expressed on macrophages. This results in macrophage activation and the specific phagocytosis of tumor cells. In addition, blocking CD47 signaling activates both an anti-tumor T-lymphocyte immune response and T cell-mediated killing of CD47-expressing tumor cells. CD47, also called integrin-associated protein (IAP), is a tumor-associated antigen (TAA) expressed on normal, healthy hematopoietic stem cells (HSC) and overexpressed on the

surface of a variety of cancer cells. Expression of CD47, and its interaction with SIRPa, leads to the inhibition of macrophage activation and protects cancer cells from phagocytosis, thereby allowing cancer cells to proliferate. Check for active clinical trials using this agent.

**Chimney breast:** The projection formed in a room by the flue and fireplace.

**Chinese herbal formulation LC09:** A traditional Chinese medicine (TCM) decoction containing Herba Epimedii that can be used for chemotherapy-induced hand-foot syndrome (HFS; Palmar-Plantar Erythrodysesthesia; PPE). Soaking of the affected hands and feet with TCM Formula LC09 may reduce the severity of HFS and may decrease HFS-associated pain. Check for active clinical trials using this agent.

**Chinese herbal formulation PHY906:** An oral traditional Chinese herbal formulation in powder form containing a spray dried aqueous extract from the herbs *Scutellaria baicalensis*, *Glycyrrhiza uralensis*, *Ziziphus jujuba* and *Paeonia lactiflora* with potential immunomodulating and chemoprotective activities. Although the mechanism of actions remain to be fully elucidated, PHY906 possesses a wide range of pharmacological activities such as the enhancement of oral uptake of pharmacologically active agents, inhibition of CYP3A4, modulation of certain cytokines, macrophages and lymphocytes, and inhibition of expression of MMP, NF- $\kappa$ B, beta-glucuronidase, the NK-1 receptor, and the delta-opioid receptor.

**Chinese herbs:** Herbs used in Chinese Herbal Therapy for toxicity attenuation.

**Chinese meridian theory :** Having parts of different origins. In medicine, refers to a person, organ, or tissue that contains cells with different genes than the rest of the person, organ, or tissue. This may happen because of a mutation (genetic change) that occurs during development, or as a result of a transplant of cells, organs, or tissues from another person or from a different species. In the laboratory, a chimeric protein can be made by combining two different genes. For example, a chimeric antibody is made by joining antibody genes from two different species, such as human and mouse.

**Chinese rhubarb :** A type of treatment in which a patient's T cells (a type of immune system cell) are changed in the laboratory so they will attack cancer cells. T cells are taken from a patient's blood. Then the gene for a

special receptor that binds to a certain protein on the patient's cancer cells is added in the laboratory. The special receptor is called a chimeric antigen receptor (CAR). Large numbers of the CAR T cells are grown in the laboratory and given to the patient by infusion. Chimeric antigen receptor T-cell therapy is being studied in the treatment of some types of cancer. Also called CAR T-cell therapy.

**ChiNing decoction:** A decoction of Liang Ge San, a traditional Chinese herbal medicine, with potential anti-inflammatory and anti-stomatitis activities. Although the complete mechanism of action through which the ChiNing decoction works has yet to be fully elucidated, upon oral administration, the active ingredients may inhibit the inflammatory response, possibly by reducing the levels of pro-inflammatory cytokines, such as interleukin 6 (IL-6) and tumor necrosis factor-alpha (TNF $\alpha$ ), in the saliva. This may protect the oral mucosa against these inflammatory mediators, and may reduce and relieve radiation-induced stomatitis and the associated pain.

**Chipboard:** A building board or sheet made from wood chips bonded with resin or plastic.

**Chipping:** The failure of a paint film whereby the film chips away from the under surface, e.g. paint applied over varnish will chip if knocked leaving the varnish on the surface. OR Paint applied over varnish or wood stain can sometimes chip off if knocked. Should this happen, you'll first need to thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Then carefully scrape back poorly adhering or defective paint to a firm edge and rub down to 'feather' broken edges. If chipping is severe, the surface will need to be totally stripped back. Dust off prior to replying paint.

**CHIR-265:** In traditional Chinese medicine, meridians are channels that form a network in the body, through which qi (vital energy) flows. Blocked qi causes pain or illness. The flow of qi is restored by using pressure, needles, suction, or heat at hundreds of specific points along the meridians.

**chiral:** describes a molecule that is not superimposable on its mirror image; like the relationship of a left hand to a right hand. OR Having nonsuperimposable mirror images. For example, a shoe or a glove is chiral. OR Relating to a molecule that cannot be superimposed on its mirror image.

**chiral center:** An atom in a molecule that causes chirality, usually an atom that is bound to four different groups. A molecule can have chirality without having a chiral center, and a molecule may also have more than one chiral centers.

**Chiral compound:** A compound that contains at least one asymmetric atom and is optically active. OR A compound that can exist in two forms that are non-superimposable images of one another. OR A compound that contains an asymmetric center (chiral atom or chiral center) and thus can occur in two nonsuperimposable mirror-image forms (enantiomers).

**chiral molecule:** a molecule that has a chiral center and rotates plane-polarized light.

**Chirality:** The ability of a chemical substance to exist in two mirror-image forms, each of which rotates polarized light in opposite directions

**ChiRhoStim :** (Other name for: synthetic human secretin) OR The root of this plant has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. The scientific name is *Rheum palmatum* or *Rheum officinale*. Also called da-huang, Indian rhubarb, rhubarb, and Turkish rhubarb.

**Chirocaine:** (Other name for: levobupivacaine hydrochloride)

**chiropractic therapy :** A substance being studied in the treatment of melanoma. CHIR-265 may block the growth of tumors and the growth of blood vessels from surrounding tissue to the tumor. It is a type of Raf kinase inhibitor and angiogenesis inhibitor.

**chitin :** A drug used to help diagnose gastrinomas (tumors that cause too much gastric acid to be made) and other problems with the pancreas. It is also used to increase secretions from the pancreas and to help identify a duct called the ampulla of Vater. ChiRhoStim is a form of secretin that is made in the laboratory. Secretin causes the pancreas, liver, and stomach to release substances that help digest food. Also called secretin human and synthetic human secretin.

**Chk1 inhibitor GDC-0425:** An orally bioavailable inhibitor of checkpoint kinase 1 (chk1), with potential antineoplastic and chemosensitization activities. Upon oral administration, chk1 inhibitor GDC-0425 selectively binds to chk1, thereby preventing activity of chk1 and abrogating the repair of damaged DNA. This may lead to an accumulation of damaged DNA,

inhibition of cell cycle arrest, and induction of apoptosis. GDC-0425 may potentiate the cytotoxicity of DNA-damaging agents and reverse tumor cell resistance to chemotherapeutic agents. Chk1, an ATP-dependent serine/threonine kinase, mediates cell cycle checkpoint control, is essential for DNA repair, and plays a key role in resistance to chemotherapeutic agents. Check for active clinical trials using this agent.

**Chk1 inhibitor GDC-0575:** A small molecule inhibitor of cell cycle checkpoint kinase 1 (Chk1), with potential chemosensitization activity. Chk1 inhibitor GDC-0575 specifically binds to and inhibits Chk1; this may result in tumor cells bypassing Chk1-dependent cell cycle arrest in the S and G2/M phases, which permits the cells to undergo DNA repair prior to entry into mitosis. Therefore, Chk1 inhibition may sensitize tumor cells to the DNA damaging effects of certain chemotherapeutic agents. Chk1 is an ATP-dependent serine-threonine kinase that phosphorylates cdc25 phosphatases in response to DNA damage. This results in both inhibitory tyrosine phosphorylation of cyclin-dependent kinase (CDK)-cyclin complexes and cell cycle arrest, which facilitates DNA damage repair.

**chk1 inhibitor PF-477736:** A proprietary compound targeting cell cycle checkpoint kinase 1 (chk1) with potential chemopotential activity. Chk1 inhibitor PF-477736 inhibits chk1, an ATP-dependent serine-threonine kinase that is a key component in the DNA replication-monitoring S/G2 checkpoint system. By overriding the last checkpoint defense against DNA damaging agent-induced lethal damage, chk1 inhibitor PF-477736 may potentiate the antitumor efficacy of various chemotherapeutic agents against tumor cells with intrinsic checkpoint defects.

**Chk1 inhibitor SCH 900776:** An agent targeting cell cycle checkpoint kinase 1 (Chk1) with potential radiosensitization and chemosensitization activities. Chk1 inhibitor SCH 900776 specifically binds to and inhibits Chk1, which may result in tumor cells bypassing Chk1-dependent cell cycle arrest in the S and G2/M phases to undergo DNA repair prior to entry into mitosis; tumor cells may thus be sensitized to the DNA-damaging effects of ionizing radiation and alkylating chemotherapeutic agents. Chk1 is an ATP-dependent serine-threonine kinase that in response to DNA damage phosphorylates cdc25 phosphatases, resulting in inhibitory tyrosine phosphorylation of CDK-cyclin complexes and cell cycle arrest.

**Chlamydophila psittaci** : A type of therapy in which the hands are used to manipulate the spine or other parts of the body. Sometimes, heat and ice, relaxation techniques, exercise, and other treatments are also used.

Chiropractic therapy may be used to treat conditions such as back pain, neck pain, headache, and hand or foot problems, and to improve overall health. It is a type of complementary and alternative medicine (CAM).

**chlorambucil**: An orally-active antineoplastic aromatic nitrogen mustard. Chlorambucil alkylates and cross-links DNA during all phases of the cell cycle, resulting in disruption of DNA function, cell cycle arrest, and apoptosis. OR A type of polysaccharide (sugar molecule) that is made by some plants and animals. The hard outer shell of shrimp, lobsters, and many insects is made of chitin.

**chlorambucil-prednisone** : A type of bacterium that can infect humans and animals. It spreads to humans from infected birds and can cause a lung infection called psittacosis. It may also cause an infection of the conjunctiva (the membrane that lines the eyelids and covers the white part of the eye). This may increase the risk of a type of lymphoma called ocular adnexa MALT lymphoma, which is a type of B-cell lymphoma.

**chlorambucil-prednisone regimen**: A chemotherapy regimen consisting of chlorambucil and prednisone used for the treatment of chronic lymphocytic leukemia.

**chlorambucil-prednisone regimen** : A drug used to treat several types of leukemias and lymphomas. It blocks cell growth by damaging the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called Leukeran.

**Chloramines**: Compounds formed by the reaction of hypochlorous acid (or aqueous chlorine) with ammonia.

**Chloramphenicol**: An antibiotic that inhibits the peptidyl transferase activity of the prokaryotic 50S ribosomal subunit.

**Chloraprep**: (Other name for: chlorhexidine/ethyl alcohol mouthwash)

**chlorhexidine**: A biguanide compound used as an antiseptic agent with topical antibacterial activity. Chlorhexidine is positively charged and reacts with the negatively charged microbial cell surface, thereby destroying the integrity of the cell membrane. Subsequently, chlorhexidine penetrates into the cell and causes leakage of intracellular components leading to cell

death. Since gram positive bacteria are more negatively charged, they are more sensitive to this agent.

**chlorhexidine gluconate:** The gluconate salt form of chlorhexidine, a biguanide compound used as an antiseptic agent with topical antibacterial activity. Chlorhexidine gluconate is positively charged and reacts with the negatively charged microbial cell surface, thereby destroying the integrity of the cell membrane. Subsequently, chlorhexidine gluconate penetrates into the cell and causes leakage of intracellular components leading to cell death. Since gram positive bacteria are more negatively charged, they are more sensitive to this agent. Check for active clinical trials using this agent.

**chlorhexidine/ethyl alcohol mouthwash:** A mouthwash containing the biguanide chlorhexidine and ethyl alcohol, with topical antibacterial activity. Upon rinsing the oral cavity with the chlorhexidine/ethyl alcohol mouthwash, the positively charged chlorhexidine cation exerts its antibacterial activity through binding to the negatively charged microbial cell surface, which destroys the integrity of the cell membrane. This causes leakage of intracellular components leading to cell death. Ethyl alcohol denatures bacterial proteins, and dissolves and disrupts the bacterial lipid membrane, thereby killing the bacteria. This reduces oral colonization with harmful bacteria and may prevent oral mucositis.

**Chlorinated paraffins:** Flame-retardant additives for polyester resins.

**Chlorinated Polyvinyl Chloride Plastics:** Plastics based on chlorinated polyvinyl chloride in which the chlorinated polyvinyl chloride is in the greatest amount of weight.

**Chlorinated rubber:** Superseded in many cases by Acrylated rubber due to the trichloromethane. Natural rubber reacted with chlorine to produce a hard resin-like substance which forms the basis of binder for a range of specialised paints.

**Chlorination:** The application of chlorine to water or wastewater, generally for the purpose of disinfection, but frequently for accomplishing other biological or chemical results. OR the addition of chlorine to water or wastewater, generally for the purpose of disinfecting, but frequently done to achieve other biological or chemical results.

**chlorination break point:** the addition of chlorine to water, sewage, or industrial waste containing free ammonia to the point where free residual chlorine is available.

**chlorination, free residual:** the addition of chlorine to water, sewage or industrial wastes to produce, directly or through the destruction of ammonia or certain organic nitrogenous compounds, a free available chlorine residual.

**Chlorine:** Symbol:"Cl" Atomic Number:"17" Atomic Mass: 35.45amu. Chlorine is a green/yellow gas with a very bad smell. It is very reactive and combines with many elements. It is a member of the halogen group. You can find chlorine in bleaches, papermaking, swimming pools, tap water, and table salt. OR Chlorine is a member of the halogen grouping of elements, noted for their high reactivity. Chlorine is also highly toxic and is therefore rarely transported any distance, being produced and consumed at the same site. Chlorine is produced by the electro-chemical separation from brine (concentrated salt-water), which is a highly power-intensive process that also co-produces caustic soda. OR In its normal state, chlorine is a greenish yellow gas. It is the eleventh most common element in the earth's crust and is widespread in nature. Chlorine is a key building block of modern chemistry and used in three principal ways: direct use (e.g., to disinfect water); as a raw material for chlorine-containing products (e.g., plastics, pharmaceuticals, pesticides) and as an intermediate to manufacture non-chlorinated products. Effective oxidizing agent.

**chlorine :** A chemotherapy combination used to treat chronic lymphocytic leukemia (CLL). It includes the drugs chlorambucil hydrochloride and prednisone. Also called chlorambucil-prednisone regimen, CP, and CP regimen.

**chlorine demand:** the quantity of chlorine absorbed by wastewater (or water) in a given length of time.

**Chlorine dioxide ( ClO<sub>2</sub> ) :** This reddish-yellow gas crystallizes as orange crystals at  $-59\text{ }^{\circ}\text{C}$ . As one of several oxides of chlorine, it is a potent and useful oxidizing agent used in water treatment and in bleaching.

**chlorine, available:** the quantity of chlorine released by a bleaching powder when treated with acid.

**chlorine, combined available residual:** that portion of the total residual chlorine remaining in water, sewage or industrial waste at the end of a specified contact period, which will react chemically and biologically as chloramines or organic chloramines.

**chlorine, total residual:** free residual chlorine plus combined residual chlorine.

**Chlorobenzene:** Chlorobenzene is produced by the chlorination of benzene in the liquid phase. The major use of chlorobenzene is as an intermediate for the production of nitrochlorobenzenes and diphenyl oxide, which are used to produce herbicides, dyes and rubber.

**Chlorofluorocarbon Plastics:** Plastics based on polymers made with monomers composed of chlorine, fluorine, and carbon only.

**chlorofluorocarbons:** Synthetic compounds containing carbon, chlorine, fluorine, and sometimes hydrogen that are used in refrigerants, propellants, the manufacture of foams, and cleaning solvents. OR A family of inert nontoxic and easily liquified chemicals used in refrigeration, air conditioning, packaging, and insulation or as solvents or aerosol propellants. Because they are not destroyed in the lower atmosphere, they drift into the upper atmosphere where their chlorine components destroy ozone.

**chlorogenic acid:** A polyphenol and the ester of caffeic acid and quinic acid that is found in coffee and black tea, with potential antioxidant and chemopreventive activities. Chlorogenic acid scavenges free radicals, which inhibits DNA damage and may protect against the induction of carcinogenesis. In addition, this agent may upregulate the expression of genes involved in the activation of the immune system and enhance activation and proliferation of cytotoxic T-lymphocytes, macrophages, and natural killer cells. Chlorogenic acid also inhibits the activity of matrix metalloproteinases.

**chloroma :** A chemotherapy combination used to treat chronic lymphocytic leukemia (CLL). It includes the drugs chlorambucil hydrochloride and prednisone. Also called chlorambucil-prednisone, CP, and CP regimen.

**chlorophyll:** The catalytic substance in photosynthesis that contains a  $Mg^{2+}$  ion in the center of a specialized ring structure known as a porphyrin. Porphyrins have a central portion containing nitrogen atoms that can attach to a metal ion. OR Chlorophyll is the pigment in plants that absorbs light rays. The organic compound found in plants that captures the energy from the sun and releases the energy to form chemical bonds. The capture of light is the first step of photosynthesis. Chlorophyll is found in

the chloroplasts of plants and there are many different types of the compound. Chlorophyll has many forms and gives plants their green color. The key element in chlorophyll is magnesium (Mg). OR green pigment that makes up a photosystem that absorbs energy from the sun during photosynthesis. OR A green photosynthetic pigment that is made of a magnesium dihydroporphyrin complex. OR A substituted tetrapyrrole that is the principal photoreceptor in plants.

**chlorophylls:** A family of green pigments functioning as receptors of light energy in photosynthesis; magnesium-porphyrin complexes.

**chloroplast:** an organelle within green plants in which photosynthesis occurs. OR An organelle in the cells of green plants. It contains chlorophyll and functions in photosynthesis and protein synthesis. OR A chlorophyll-containing photosynthetic organelle, found in eukaryotic cells, that can harness light energy. OR The plant organelle in which photosynthesis takes place. OR Chlorophyll-containing photosynthetic organelles in some eukaryotic cells.

**chloroquine:** A 4-aminoquinoline with antimalarial, anti-inflammatory, and potential chemosensitization and radiosensitization activities. Although the mechanism is not well understood, chloroquine is shown to inhibit the parasitic enzyme heme polymerase that converts the toxic heme into non-toxic hemazoin, thereby resulting in the accumulation of toxic heme within the parasite. This agent may also interfere with the biosynthesis of nucleic acids. Chloroquine's potential chemosensitizing and radiosensitizing activities in cancer may be related to its inhibition of autophagy, a cellular mechanism involving lysosomal degradation that minimizes the production of reactive oxygen species (ROS) related to tumor reoxygenation and tumor exposure to chemotherapeutic agents and radiation.

**chloroquinoxaline sulfonamide:** A chlorinated heterocyclic sulfanilamide with potential antineoplastic activity and potential immunosuppressive activity. Chloroquinoxaline sulfonamide poisons topoisomerase II alpha and topoisomerase II beta, thereby causing double-stranded breaks in DNA, accumulation of unrepaired DNA, and apoptosis. This agent also exhibits lymphotoxicity by inhibiting lymphocyte activation in a cell cycle-specific manner.

**chloroquinoxaline sulfonamide :** A chemical used in manufacturing, as a bleach, and to kill bacteria and other organisms in water.

**chlorotoxin :** A malignant, green-colored tumor of myeloid cells (a type of immature white blood cell). This tumor is usually associated with myelogenous leukemia. Also called granulocytic sarcoma.

**chlorotoxin-indocyanine green imaging Agent BLZ-100:** A tumor-targeting imaging agent composed of the tumor-specific peptide chlorotoxin (CTX), a 36-amino acid neurotoxin found in the venom of the *Leiurus quinquestriatus* scorpion, linked to the fluorescent dye indocyanine green (ICG), with potential tumor imaging activity using a near-infrared (NIR) imaging system. Upon intravenous administration of BLZ-100, the CTX moiety of BLZ-100 specifically binds to and is internalized by cancer cells of neuroectodermal origin. Using a NIR imaging system, the ICG, which emits light in the NIR range, permits the intraoperative visualization of tumor cells. This leads to the clear distinction of healthy tissues from tumor cells, and facilitates the surgical removal of tumor tissue while sparing normal, healthy cells.

**chlorozotocin:** A glucose-linked chloroethylnitrosourea with potential antineoplastic activity. Chlorozotocin alkylates DNA and proteins, induces the formation of interstrand DNA and DNA-protein crosslinks, and causes DNA strand breakage, thereby damaging DNA and resulting in cell death. This agent has been shown to exhibit antitumor and immunomodulatory effects in cell lines and animal models. Chlorozotocin is a mutagen and is less myelotoxic than other nitrosoureas.

**chlorpromazine:** A phenothiazine and traditional antipsychotic agent with anti-emetic activity. Chlorpromazine exerts its antipsychotic effect by blocking postsynaptic dopamine receptors in cortical and limbic areas of the brain, thereby preventing the excess of dopamine in the brain. This leads to a reduction in psychotic symptoms, such as hallucinations and delusions. Chlorpromazine appears to exert its anti-emetic activity by blocking the dopamine receptors in the chemical trigger zone (CTZ) in the brain, thereby relieving nausea and vomiting.

**chlorpropamide:** A long-acting, first-generation sulfonylurea with hypoglycemic activity. Compared to other sulfonylureas, chlorpropamide has an increased risk of prolonged hypoglycemia because of its long half-life. Check for active clinical trials using this agent.

**chlorzoxazone:** A benzoxazolone derivative with mild sedative and centrally-acting muscle relaxant activities. Although its exact mechanism of

action is unknown, chlorzoxazone (CZ) appears to act at the spinal cord and subcortical levels of the brain to inhibit multisynaptic reflex arcs involved in producing and maintaining muscle spasms. This agent is extensively hydroxylated by cytochrome P450 2E1 (CYP2E1) to 6-hydroxychlorzoxazone (HCZ),<sup>11,12</sup> which is subsequently glucuronidated and eliminated renally. Highly selective for CYP2E1, CZ may be used as a selective probe for phenotyping CYP2E1 in humans; the ratio of HCZ-to-CZ plasma concentrations obtained 2 to 4 hours after oral administration of CZ may be used as a phenotypic measure of CYP2E1 enzymatic activity. Check for active clinical trials using this agent.

**choanal atresia:** blockage in the back of the nasal passage

**cholangiocarcinoma :** A substance being studied in the treatment of cancer. It is a type of topoisomerase inhibitor. Also called CQS.

**cholangiosarcoma :** A substance being studied in the diagnosis and treatment of glioma (a type of brain cancer) and other types of cancer. It binds to cancer cells in the brain and peripheral nervous system and may keep them from spreading. Chlorotoxin comes from the venom of a type of scorpion. A form of chlorotoxin made in the laboratory is called TM-601. Chlorotoxin is a type of neurotoxin. Also called CTX.

**cholecalciferol:** A steroid hormone produced in the skin when exposed to ultraviolet light or obtained from dietary sources. The active form of cholecalciferol, 1,25-dihydroxycholecalciferol (calcitriol) plays an important role in maintaining blood calcium and phosphorus levels and mineralization of bone. The activated form of cholecalciferol binds to vitamin D receptors and modulates gene expression. This leads to an increase in serum calcium concentrations by increasing intestinal absorption of phosphorus and calcium, promoting distal renal tubular reabsorption of calcium and increasing osteoclastic resorption. OR A rare cancer that forms in the bile ducts. A bile duct is a tube that carries bile (fluid made by the liver) between the liver and gallbladder and the small intestine. Intrahepatic cholangiocarcinoma is found inside the liver. Extrahepatic cholangiocarcinoma is found outside the liver. Also called bile duct cancer.

**cholecalciferol/d-alpha tocopherol/L-selenomethionine/green tea extract/saw palmetto berry extract/daidzein/genistein/lycopene prostate health supplement:** A dietary supplement consisting of a blend of 8 natural ingredients with potential antineoplastic and chemopreventive

activities. This dietary supplement contains vitamin D3 (as cholecalciferol), vitamin E (as d-alpha tocopherol), selenium (as L-selenomethionine), epigallocatechin (green tea extract), saw palmetto (berry extract), lycopene, and the isoflavonoids daidzein and genistein. This combination preparation may decrease prostate cell growth and inhibit prostate carcinogenesis.

**cholecalciferol/whey protein isolate/EPA/DHA-based nutritional supplement:** A gluten-free, energy-rich, non-complete nutritional supplement drink composed of juice from the concentrates of apple pear, pomegranate, purple chokeberry and passion fruit, plus fish oil derived from salmon and cod, the minerals potassium, phosphorus and iodine, whey protein isolate derived from cow's milk, tocopherols (vitamin E), and cholecalciferol (vitamin D3) with potential anti-cachexic activity. Upon oral intake of the cholecalciferol/whey protein isolate/EPA/DHA-based nutritional supplement, the protein components maintain digestive health throughout the gastrointestinal (GI) tract and reduce the risk of digestive complications. The essential omega-3 polyunsaturated fatty acids eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) from the fish oil are incorporated into cell membranes and affect the production of pro-inflammatory mediators, which elicits an anti-inflammatory effect. Cholecalciferol plays an important role in maintaining bone mineralization and regulating blood calcium and phosphorus levels. Tocopherols neutralize free radicals, thereby protecting tissues and organs from oxidative damage. In particular, alpha-tocopherol gets incorporated into biological membranes, maintains cell membrane integrity and protects the cell against damage. This nutritional supplement may prevent both malnutrition and weight loss. Check for active clinical trials using this agent.

**cholelith :** A tumor of the connective tissues of the bile ducts.

**Cholera toxin:** A toxin that consists of a catalytic domain and a membrane-penetration domain; the catalytic subunit ADP-ribosylates the G stimulatory protein, persistently activating it, leading to activation of ion pumps and subsequent efflux of large amounts of Na<sup>+</sup> and water into the gut.

**CholestaGel:** (Other name for: colesevelam hydrochloride)

**cholestasis :** A nutrient that the body needs in small amounts to function and stay healthy. Cholecalciferol helps the body use calcium and phosphorus to make strong bones and teeth. It is fat-soluble (can dissolve in

fats and oils) and is found in fatty fish, egg yolks, and dairy products. Skin exposed to sunshine can also make cholecalciferol. Not enough cholecalciferol can cause a bone disease called rickets. It is being studied in the prevention and treatment of some types of cancer. Also called vitamin D.

**Cholesterol:** A lipid unique to animal cells that is used in the construction of cell membranes and as a building block for some hormones

**Cholesterol:** A sterol that is an important constituent of eukaryotic membranes as well as lipoproteins; also a precursor of steroid hormones.

**cholesterol :** Solid material that forms in the gallbladder or common bile duct. Choleliths are made of cholesterol or other substances found in the gallbladder. They may occur as one large stone or as many small ones, and vary from the size of a golf ball to a grain of sand. Also called gallstone.

**Choletec:** (Other name for: technetium Tc 99m mebrofenin)

**choline :** Any condition in which the release of bile from the liver is blocked. The blockage can occur in the liver (intrahepatic cholestasis) or in the bile ducts (extrahepatic cholestasis).

**choline kinase alpha inhibitor TCD-717:** A small-molecule inhibitor of choline kinase alpha (CHKA), with potential antineoplastic activity. TCD-717 targets and binds to CHKA, an enzyme that plays a key role in the synthesis of phosphatidylcholine, the major phospholipid in eukaryotic cell membranes. Blockade of this enzyme induces cells to activate a different route for phospholipid production which causes a toxic effect and eventually leads to cell destruction. CHKA, overexpressed in human cancer cells while only minimally expressed in normal cells, appears to play a significant role in cellular proliferation, evasion of apoptosis, increased cell motility and metastasis.

**choline magnesium trisalicylate:** A nonsteroidal anti-inflammatory drug (NSAID) belonging to the salicylate family. Choline magnesium trisalicylate inhibits inflammation-related prostaglandin synthesis. This agent's analgesic effect is mediated through peripheral and central pathways, resulting in a decrease in pain perception; its antipyretic effect is mediated via the hypothalamic heat regulation center.

**choline magnesium trisalicylate :** A waxy, fat-like substance made in the liver, and found in the blood and in all cells of the body. Cholesterol is

important for good health and is needed for making cell walls, tissues, hormones, vitamin D, and bile acid. Cholesterol also comes from eating foods taken from animals such as egg yolks, meat, and whole-milk dairy products. Too much cholesterol in the blood may build up in blood vessel walls, block blood flow to tissues and organs, and increase the risk of developing heart disease and stroke.

**cholinesterase and pseudocholinesterase inhibitors:** These are substances which inhibit the cholinesterase-enzyme activity and thus enhance and subsequently prevent transmission of nerve impulses from one nerve cell to another or to a muscle.

**chondrocyte :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Choline helps cells make membranes, make a neurotransmitter (a chemical that helps nerve cells communicate with other cells), and remove fat from the liver. It is found in whole milk, beef liver, eggs, soy foods, and peanuts. Choline is water-soluble (can dissolve in water) and must be taken in every day. Not enough choline can cause diseases of the heart and blood vessels and damage to the liver. A form of choline is being studied in the treatment of some types of cancer and to reduce pain and fever. Choline is also being studied together with vitamin B12 in the prevention and treatment of cancer.

**chondroitin sulfate :** A substance used to treat arthritis and relieve pain, inflammation, and fever. It is also being studied in the treatment of acute myeloid leukemia (AML). Choline magnesium trisalicylate blocks the action of a substance that sends a pain message to the brain. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called Trilisate.

**chondrosarcoma :** Cartilage cell. Chondrocytes make the structural components of cartilage.

**CHOP :** The major glycosaminoglycan (a type of sugar molecule) in cartilage.

**CHOP regimen:** A chemotherapy regimen consisting of cyclophosphamide, hydroxydaunorubicin hydrochloride (doxorubicin hydrochloride), vincristine and prednisone used to treat both indolent and aggressive forms of non-Hodgkin lymphoma. OR A type of cancer that forms in bone cartilage. It usually starts in the pelvis (between the hip bones), the shoulder, the ribs, or at the ends of the long bones of the arms and legs. A rare type of chondrosarcoma called extraskeletal

chondrosarcoma does not form in bone cartilage. Instead, it forms in the soft tissues of the upper part of the arms and legs. Chondrosarcoma can occur at any age but is more common in people older than 40 years. It is a type of bone cancer.

**CHOPE** : An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, doxorubicin hydrochloride (hydroxydaunorubicin), vincristine sulfate (Oncovin), and prednisone. Also called CHOP regimen.

**CHOPE regimen** : An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, doxorubicin hydrochloride (hydroxydaunorubicin), vincristine sulfate (Oncovin), and prednisone. Also called CHOP.

**Chopped Strand** : A type of fiber reinforcement consisting of strands of individual glass fibers which have been chopped into short pieces. OR Short strands cut from continuous filament strands of reinforcing fibre, not held together by any means.

**chord**: a line segment joining any two points on a circle.

**chordae tendineae**: tendons that connect the papillary muscles to the tricuspid and mitral valves

**chordates**: animals with rods along their backs, including reptiles, amphibians, birds, and mammals.

**chordoma** : An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma. It includes the drugs cyclophosphamide, doxorubicin hydrochloride (hydroxydaunorubicin), vincristine sulfate (Oncovin), prednisone, and etoposide phosphate. Also called CHOPE regimen.

**choreoathetosis**: occurrence of involuntary movements in combination with chorea which itself refers to irregular, rapid, uncontrolled, and excessive movements

**chorioadenoma destruens** : An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma. It includes the drugs cyclophosphamide, doxorubicin hydrochloride

(hydroxydaunorubicin), vincristine sulfate (Oncovin), prednisone, and etoposide phosphate. Also called CHOPE.

**chorioallantoic membrane :** A type of bone cancer that usually starts in the lower spinal column or at the base of the skull.

**chorioblastoma :** A type of cancer that grows into the muscular wall of the uterus. It is formed after conception (fertilization of an egg by a sperm). It may spread to other parts of the body, such as the vagina, vulva, and lung. Also called invasive hydatidiform mole.

**choriocarcinoma :** The membrane in hens' eggs that helps chicken embryos get enough oxygen and calcium for development. The calcium comes from the egg shell.

**chorioepithelioma :** A malignant, fast-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta). Almost all chorioblastomas form in the uterus after fertilization of an egg by a sperm, but a small number form in a testis or an ovary. Chorioblastomas spread through the blood to other organs, especially the lungs. They are a type of gestational trophoblastic disease. Also called choriocarcinoma, chorioepithelioma, and chorionic carcinoma.

**chorionic carcinoma :** A malignant, fast-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta). Almost all choriocarcinomas form in the uterus after fertilization of an egg by a sperm, but a small number form in a testis or an ovary. Choriocarcinomas spread through the blood to other organs, especially the lungs. They are a type of gestational trophoblastic disease. Also called chorioblastoma, chorioepithelioma, and chorionic carcinoma.

**choroid :** A malignant, fast-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta). Almost all chorioepitheliomas form in the uterus after fertilization of an egg by a sperm, but a small number form in a testis or an ovary. Chorioepitheliomas spread through the blood to other organs, especially the lungs. They are a type of gestational trophoblastic disease. Also called chorioblastoma, choriocarcinoma, and chorionic carcinoma.

**choroid plexus :** A malignant, fast-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta). Almost all chorionic carcinomas form in the uterus after fertilization of an egg by a sperm, but a small number form in a testis or an

ovary. Chorionic carcinomas spread through the blood to other organs, especially the lungs. They are a type of gestational trophoblastic disease. Also called chorioblastoma, choriocarcinoma, and chorioepithelioma.

**choroid plexus tumor :** A thin layer of tissue that is part of the middle layer of the wall of the eye, between the sclera (white outer layer of the eye) and the retina (the inner layer of nerve tissue at the back of the eye). The choroid is filled with blood vessels that bring oxygen and nutrients to the eye.

**CHP-NY-ESO-1 peptide vaccine IMF-001:** A peptide cancer vaccine containing nanoparticles of cholesteryl hydrophobized pullulan (CHP) complexed with the cancer-testis antigen NY-ESO-1 protein, with potential immunostimulating and antineoplastic activities. Upon administration, CHP-NY-ESO-1 peptide vaccine IMF-001 may stimulate the host immune system to mount a humoral and cytotoxic T-cell response against tumor cells expressing NY-ESO-1 antigen, resulting in tumor cell lysis. The self-aggregating CHP, composed of a pullulan backbone and cholesterol branches, forms stable colloidal nanoparticles in water. NY-ESO-1, an antigen found in normal testis, is upregulated in various cancers, including bladder, breast, hepatocellular, melanoma, and prostate cancers.

**CHPP:** A network of blood vessels and cells in the ventricles (fluid-filled spaces) of the brain. The blood vessels are covered by a thin layer of cells that make cerebrospinal fluid.

**Christmas Tree:** Condition caused by over tensioning of the turn curve belts, typically in spiral systems, in which one edge of the belt bows in the direction of, or opposite of belt travel.

**Chroma:** refers to the strength of the color or how far it is from a neutral gray of the same value. Colors of low chroma are often called weak; colors of high chroma are often called highly saturated, strong, or vivid. For example, a pale pink would have low chroma, and a vivid fluorescent yellow would have very high chroma. In color space chroma would increase as you move away from the vertical axis radially.

**chromaffin cell :** A rare tumor that forms in the choroid plexus (a network of blood vessels and cells in the fluid-filled spaces of the brain). These tumors are most common in children younger than 2 years. Choroid plexus tumors may be benign (not cancer) or malignant (cancer).

**chromatid:** homologous chromosomes joined to each other at the centromere; present during the prophase of mitosis.

**chromatin:** compacted DNA and protein. OR The nucleoprotein fibers of eukaryotic chromosomes. OR Nucleoprotein chromosomal material consisting mainly of DNA and histones. OR A filamentous complex of DNA, histones, and other proteins, constituting the eukaryotic chromosome.

**Chromatin immunoprecipitation (chip):** A technique for identifying the binding sites of DNA-binding proteins. The protein is cross-linked to DNA to which it is bound in chromatin, and the DNA is fragmented into small pieces. Antibodies to the bound protein are used to isolate the chromatin fragments with the bound protein. The cross-linking is reversed, and the DNA is isolated and characterized.

**Chromatin remodeling machine:** A complex of proteins that contain domains homologous to helicases and use the energy of ATP hydrolysis to shift the positions of nucleosomes and induce other conformational changes in chromatin.

**chromatography:** Any process for separating materials using two phases, one stationary, and one moving. One example: gas chromatography (gas as moving phase, solid as stationary phase). OR The separation of the components of a mixture by use of differences in their interactions with a stationary medium. OR A procedure for separating chemically similar molecules. Segregation is usually carried out on paper or in glass or metal columns with the help of different solvents. The paper or glass columns contain porous solids with functional groups that have limited affinities for the molecules being separated. OR Chromatography is a method for separating mixtures based on differences in the speed at which they migrate over or through a stationary phase. OR A process in which complex mixtures of molecules are separated by many repeated partitionings between a flowing (mobile) phase and a stationary phase. OR Literally means coloured writing, it is a technique used to separate coloured materials. You can use chromatography to separate the colours of ink (maybe black ink contains red, blue and brown dyes) or food colourings (smarties are good for this). Forensic science uses chromatography to investigate substances found at the scene of a crime and can trace DNA etc. or A procedure that bathes the abdominal cavity in fluid that contains anticancer drugs. This fluid is warmer than body temperature. This

procedure appears to kill cancer cells without harming normal cells. Also called continuous hyperthermic peritoneal perfusion.

**CHROME PIGMENTS:** Pigments based on basic lead chromate. Included are chrome yellow and orange. They have intense colors, good acid resistance, and heat stability.

**Chromium:** Symbol:"Cr" Atomic Number:"24" Atomic Mass: 52.00amu. Chromium is one of the transition elements. You can find chromium in rubies and other minerals, in utensils, and in the process of making chrome parts for cars and motorcycles.

**Chromium Plating:** An electrolytic process that deposits a hard film of chromium metal onto working surfaces of other where resistance to corrosion, abrasion, and/or erosion is needed OR An electrolytic process that deposits a hard film of chromium metal onto working surfaces of other metals where resistance to corrosion, abrasion. and/or erosion is needed. OR An electrolytic process that deposits a hard film of chromium metal onto working surfaces of other metals where resistance to corrosion, abrasion and/or erosion is needed.

**chromodomain:** domain in proteins that binds to methylated histones

**chromogranin A :** A type of cell that makes neurohormones (chemicals that are made by nerve cells and used to send signals to other cells) and releases them into the blood. Chromaffin cells make epinephrine (adrenaline) and norepinephrine (noradrenaline). They are found in the adrenal glands or in groups of nerve cells called ganglia.

**Chromoionophore:** in fiber optic chemical sensors, an appropriate reagent i.e. chromogenic ionophore (chromoionophore or fluoroionophore), that is responsible for the ion recognition process in an optomembrane. The chromoionophore molecules include an ionrecognizing complexing center (ionophoric moiety) coupled with a chromogenic group, which transduces the chemical information into the changes in optical signal. The selectivity of the optomembrane is governed by the selectivity of the ionchromoionophore complex formation.

**chromomycin A3:** A glycosidic antineoplastic antibiotic isolated from the bacterium *Streptomyces griseus*. Chromomycin A3 reversibly binds to guanine-cytosine (G-C) base pairs in the minor groove of DNA, thereby inhibiting RNA synthesis. This agent is used as a fluorescent chromosome dye.

**Chromophore:** A light-absorbing group, such as 11-cis-retinal in rhodopsin. OR A group or substructure on a molecule that is responsible for the absorption of light.

**chromosomal aberration:** Any abnormality of chromosome number or structure may be described as an aberration.

**chromosome:** This is a structure in the nucleus of the cell composed of deoxyribonucleic acid (DNA) and protein; the chromosome forms the basis of heredity and carries genetic information in DNA in the form of sequence of nitrogenous bases. OR A thread-like structure, visible in the cell nucleus during metaphase, that carries the hereditary information. OR A single large DNA molecule and its associated proteins, containing many genes; stores and transmits genetic information.

**chromosome :** Discrete physical structures inside a cell nucleus that consist of proteins and DNA organized into genes. OR A laboratory technique used to separate different substances in a mixture. A gas or a liquid is used to pass the mixture through a column, paper, or special plate that contains absorbing materials. The substances in the mixture are separated based on how far they move through the material. The different substances may be visible to the eye or detected by a special machine.

**chromosome 17 :** A protein found inside neuroendocrine cells, which release chromogranin A and certain hormones into the blood.

Chromogranin A may be found in higher than normal amounts in patients with certain neuroendocrine tumors, small cell lung cancer, prostate cancer, and other conditions. Measuring the amount of chromogranin A in the blood may help to diagnose cancer or other conditions or find out how well treatment is working or if cancer has come back. Chromogranin A is a type of tumor marker. Also called CgA.

**chromosome 3 :** Part of a cell that contains genetic information. Except for sperm and eggs, all human cells contain 46 chromosomes.

**chromosome 7 :** One of a pair of chromosomes that is part of the 46 chromosomes found in the nucleus of most human cells. Specific changes in chromosome 7 may be found in patients with certain genetic conditions and some types of cancer, including bladder cancer, brain cancer, and leukemia. Checking for these changes may help diagnose cancer or find out if cancer has come back. Chromosome 7 is a type of tumor marker.

**Chromosome puff:** A swollen region of a giant chromosome; the swelling reflects a high degree of transcription activity.

**Chromosome walking:** A technique for analyzing long stretches of DNA by sequential subcloning and rescreening of overlapping segments.

**chromosomes:** linear units of DNA.

**chromosphere:** reddish layer of the Sun that is hydrogen burning.

**chronic :** One of a pair of chromosomes that is part of the 46 chromosomes found in the nucleus of most human cells. Specific changes in chromosome 3 may be found in patients with certain genetic conditions or some types of cancer, including bladder cancer. Checking for these changes may help diagnose cancer or find out if cancer has come back. Chromosome 3 is a type of tumor marker.

**chronic bacterial prostatitis :** One of a pair of chromosomes that is part of the 46 chromosomes found in the nucleus of most human cells. Specific changes in chromosome 7 may be found in patients with certain genetic conditions or some types of cancer, including bladder cancer, leukemia, and lymphoma. Checking for these changes may help diagnose cancer or find out if cancer has come back. Chromosome 7 is a type of tumor marker.

**chronic bronchitis :** A disease or condition that persists or progresses over a long period of time.

**chronic cough :** Inflammation of the prostate gland that is caused by a bacterial infection and that continues or gets worse over a long period of time. The infection may seem to go away but keeps coming back. Symptoms include body aches, pain in the lower back and genital area, a burning feeling during urination, and problems with emptying the bladder all the way.

**chronic effects:** Effects that develop slowly and have a long duration. They are often, but not always, irreversible. Some irreversible effects may appear a long time after the chemical substance was present in the sensitive tissue. For such delayed or late effects, the latent period (or the "time to occurrence" of an observable effect) may be very long, particularly if the level of exposure is low (WHO, 1979).

**chronic eosinophilic leukemia :** A lung condition that develops over time in which the bronchi (large air passages that lead to the lungs) become inflamed and scarred. This causes the bronchi to make large amounts of

mucus and can lead to a chronic cough and breathing problems. The most common cause of chronic bronchitis is cigarette smoking. It may also be caused by infection or by breathing in secondhand tobacco smoke, chemical fumes, or other forms of air pollution. Chronic bronchitis usually does not go away completely. It is a type of chronic obstructive pulmonary disease (COPD).

**chronic fatigue syndrome :** A cough that lasts for 8 weeks or longer. It may occur with other symptoms, including a runny or stuffy nose, extra mucus in the back of the throat, wheezing, shortness of breath, or heartburn. A chronic cough may be caused by allergies, sinus infections, asthma, gastroesophageal reflux disease (GERD), or other conditions. It may also be caused by smoking tobacco or by breathing in secondhand tobacco smoke over a long period of time. It usually improves when the problem that caused the cough is treated. For example, a chronic cough may get better when a person quits smoking.

**chronic granulocytic leukemia :** A disease in which too many eosinophils (a type of white blood cell) are found in the bone marrow, blood, and other tissues. Chronic eosinophilic leukemia may stay the same for many years, or it may progress quickly to acute leukemia.

**chronic heart failure :** A condition that lasts for more than 6 months in which a person feels tired most of the time. They may also have trouble concentrating and carrying out daily activities. Other symptoms include sore throat, fever, muscle weakness, headache, and joint pain. Also called CFS.

**chronic idiopathic myelofibrosis :** An indolent (slow-growing) cancer in which too many myeloblasts are found in the blood and bone marrow. Myeloblasts are a type of immature blood cell that makes white blood cells called myeloid cells. Chronic granulocytic leukemia may get worse over time as the number of myeloblasts increases in the blood and bone marrow. This may cause fever, fatigue, easy bleeding, anemia, infection, a swollen spleen, bone pain, or other signs and symptoms. Chronic granulocytic leukemia is usually marked by a chromosome change called the Philadelphia chromosome, in which a piece of chromosome 9 and a piece of chromosome 22 break off and trade places with each other. It usually occurs in older adults and rarely occurs in children. Also called chronic myelogenous leukemia, chronic myeloid leukemia, and CML.

**chronic leukemia** : A condition in which the heart has trouble pumping blood through the body. It may develop over a long period of time. Symptoms include shortness of breath, problems exercising, fatigue, and swelling of the feet, ankles, and abdomen. Chronic heart failure may be caused by coronary artery disease, a heart attack, or high blood pressure. It usually occurs in people aged 65 years or older. Also called CHF.

**chronic lung disease** : A progressive, chronic disease in which the bone marrow is replaced by fibrous tissue and blood is made in organs such as the liver and the spleen, instead of in the bone marrow. This disease is marked by an enlarged spleen and progressive anemia. Also called agnogenic myeloid metaplasia, idiopathic myelofibrosis, myelosclerosis with myeloid metaplasia, and primary myelofibrosis.

**chronic lymphocytic leukemia** : A slowly progressing cancer that starts in blood-forming tissues such as the bone marrow, and causes large numbers of white blood cells to be produced and enter the blood stream.

**chronic lymphocytic leukemia/small lymphocytic lymphoma** : A type of disorder that affects the lungs and other parts of the respiratory system. It usually develops slowly, and may get worse over time. Chronic lung disease may be caused by smoking tobacco or by breathing in secondhand tobacco smoke, chemical fumes, dust, or other forms of air pollution. Types of chronic lung disease include asthma, chronic obstructive pulmonary disease (COPD), pulmonary fibrosis, asbestosis, pneumonitis, and other lung conditions. Also called CLD.

**chronic myelogenous leukemia** : An indolent (slow-growing) cancer in which too many immature lymphocytes (white blood cells) are found mostly in the blood and bone marrow. Sometimes, in later stages of the disease, cancer cells are found in the lymph nodes and the disease is called small lymphocytic lymphoma. Also called CLL.

**chronic myeloid leukemia** : An indolent (slow-growing) cancer in which immature lymphocytes (white blood cells) are found in the blood and bone marrow and/or in the lymph nodes. Chronic lymphocytic leukemia (CLL) and small lymphocytic lymphoma (SLL) are the same disease, but in CLL cancer cells are found mostly in the blood and bone marrow. In SLL cancer cells are found mostly in the lymph nodes. Chronic lymphocytic leukemia/small lymphocytic lymphoma is a type of non-Hodgkin lymphoma. Also called CLL/SLL.

**chronic myelomonocytic leukemia :** An indolent (slow-growing) cancer in which too many myeloblasts are found in the blood and bone marrow. Myeloblasts are a type of immature blood cell that makes white blood cells called myeloid cells. Chronic myelogenous leukemia may get worse over time as the number of myeloblasts increases in the blood and bone marrow. This may cause fever, fatigue, easy bleeding, anemia, infection, a swollen spleen, bone pain, or other signs and symptoms. Chronic myelogenous leukemia is usually marked by a chromosome change called the Philadelphia chromosome, in which a piece of chromosome 9 and a piece of chromosome 22 break off and trade places with each other. It usually occurs in older adults and rarely occurs in children. Also called chronic granulocytic leukemia, chronic myeloid leukemia, and CML.

**chronic myeloproliferative neoplasm :** An indolent (slow-growing) cancer in which too many myeloblasts are found in the blood and bone marrow. Myeloblasts are a type of immature blood cell that makes white blood cells called myeloid cells. Chronic myeloid leukemia may get worse over time as the number of myeloblasts increases in the blood and bone marrow. This may cause fever, fatigue, easy bleeding, anemia, infection, a swollen spleen, bone pain, or other signs and symptoms. Chronic myeloid leukemia is usually marked by a chromosome change called the Philadelphia chromosome, in which a piece of chromosome 9 and a piece of chromosome 22 break off and trade places with each other. It usually occurs in older adults and rarely occurs in children. Also called chronic granulocytic leukemia, chronic myelogenous leukemia, and CML.

**chronic neutrophilic leukemia :** A slowly progressing type of myelodysplastic/myeloproliferative disease in which too many myelomonocytes (a type of white blood cell) are in the bone marrow, crowding out other normal blood cells, such as other white blood cells, red blood cells, and platelets. Also called CMML.

**chronic obstructive pulmonary disease :** A type of disease in which the bone marrow makes too many red blood cells, platelets, or certain white blood cells. Chronic myeloproliferative neoplasms usually get worse over time as the number of extra cells build up in the blood and/or bone marrow. This may cause bleeding problems, anemia, infection, fatigue, or other signs and symptoms. Certain chronic myeloproliferative neoplasms may become acute myeloid leukemia (AML). Chronic myeloproliferative

neoplasms include chronic myelogenous leukemia (CML), polycythemia vera, primary myelofibrosis, essential thrombocythemia, chronic neutrophilic leukemia, and chronic eosinophilic leukemia. Also called myeloproliferative neoplasm.

**chronic pain :** A disease in which too many neutrophils (a type of white blood cell) are found in the blood. The extra neutrophils may cause the spleen and liver to become enlarged. Chronic neutrophilic leukemia may stay the same for many years or it may progress quickly to acute leukemia.

**chronic phase :** A type of lung disease marked by permanent damage to tissues in the lungs, making it hard to breathe. Chronic obstructive pulmonary disease includes chronic bronchitis, in which the bronchi (large air passages) are inflamed and scarred, and emphysema, in which the alveoli (tiny air sacs) are damaged. It develops over many years and is usually caused by cigarette smoking. Also called COPD.

**chronic phase chronic myelogenous leukemia :** Pain that can range from mild to severe, and persists or progresses over a long period of time.

**chronic prostatitis/chronic pelvic pain syndrome :** Refers to the early stages of chronic myelogenous leukemia or chronic lymphocytic leukemia. The number of mature and immature abnormal white blood cells in the bone marrow and blood is higher than normal, but lower than in the accelerated or blast phase.

**chronic toxicity test:** A study in which animals are observed during the whole life span (or the major part of the life span) and in which exposure to the test material takes place over the whole observation time or a substantial part thereof. The term "long-term toxicity study" is sometimes used as a synonym for "chronic toxicity study" and sometimes to signify a study that falls in between subacute (short-term toxicity studies) and chronic toxicity studies (WHO, 1978a).

**chrysotherapy :** A phase of chronic myelogenous leukemia in which fewer than 10% of the cells in the blood and bone marrow are blast cells (immature blood cells). This phase may last from several months to several years, and there may be no symptoms of leukemia.

**CHS 828:** A condition of the prostate gland that continues or gets worse over a long period of time. Symptoms include body aches, pain in the lower back and genital area, a burning feeling during urination, and problems with emptying the bladder all the way. Also called CP/CPPS.

**chyle** : A procedure that uses gold salts (a salt form of the metal element gold) to treat diseases, such as rheumatoid arthritis. The gold salts stop cells from releasing chemicals that can harm tissues. Also called aurotherapy and gold therapy.

**chylomicron**: A plasma lipoprotein consisting of a large droplet of triacylglycerols stabilized by a coat of protein and phospholipid; carries lipids from the intestine to the tissues.

**Chylomicrons**: Lipoprotein particles that transport dietary triacylglycerols from the intestine to other tissues; apolipoprotein B-48 is a protein component of chylomicrons.

**chyme**: a soupy liquid formed in the stomach from the churning of the bolus with gastric juices.

**CI**: Cast Iron; an abbreviation widely used in building. OR Configuration interaction. A theory of electron correlation. A large set of Hartree-Fock-type configurations (Slater determinants) is used as a many-electron basis set. The coefficient of each configuration is determined variationally so as to minimize the total energy of this wavefunction. Recovers the "dynamic" electron correlation important in bonding. Reliability and expense depend upon the size of the CI, e.g., CISD was popular before coupled-cluster methods caught on. Ordinary, truncated CI (CIS, CISD, etc.) is not size-consistent, so determining bond energies requires "supermolecule" calculations.

**CI-1033**: A drug that is being studied in the treatment of solid tumors.

**CI-958**: A milky-white fluid that forms in the small intestine during digestion. It is made of lymph fluid and fats. Special lymph vessels carry chyle from the intestines to the blood.

**CI-980**: A substance being studied in the treatment of some types of cancer. CI-1033 blocks the action of proteins called epidermal growth factor receptors, and may cause cancer cells to die. It is a type of tyrosine kinase inhibitor. Also called canertinib and canertinib dihydrochloride.

**CI-994**: A substance being studied in the treatment of some types of cancer. CI-958 binds to DNA and stops cells, including cancer cells, from repairing damage to DNA and from making more DNA, RNA, and protein. It is a type of DNA intercalator. Also called sedoxantrone trihydrochloride.

**Cialis :** (Other name for: tadalafil) OR An anticancer drug that belongs to the family of drugs called mitotic inhibitors. Also called mivobulin isethionate.

**ciclopirox olamine lotion:** A lotion preparation of the olamine salt of ciclopirox, a synthetic hydroxypyridone derivative with broad-spectrum antifungal and anti-inflammatory activities. Although its mechanism of action is not well understood, ciclopirox may chelate trivalent cations, such as  $Fe^{3+}$  and  $Al^{3+}$ , thereby inhibiting the availability of essential metal co-factors for enzymes, which may result in a loss of enzyme activities that are essential for cellular metabolism, organization of cell wall structure, and other crucial cell functions in a wide variety of fungal species. This agent may also disrupt DNA repair, cell division signals and mitotic spindles as well as some elements of intracellular transport in susceptible fungi. Ciclopirox exhibits anti-inflammatory activity by inhibiting 5-lipoxygenase and cyclooxygenase (COX).

**ciclopirox olamine oral:** An aqueous suspension of the olamine salt form of ciclopirox, a synthetic, broad-spectrum hydroxypyridone antifungal agent with additional antibacterial and anti-inflammatory activities. Although the exact mechanism of action of ciclopirox has yet to be fully elucidated, this agent is able to chelate trivalent cations, such as  $Fe^{3+}$ , thereby inhibiting the availability of essential co-factors for enzymes. This may lead to a loss of activity of enzymes that are essential for cellular metabolism, organization of cell wall structure and other crucial cell functions. In addition, ciclopirox exerts its anti-inflammatory activity by inhibiting 5-lipoxygenase and cyclooxygenase (COX).

**CID:** Configuration interaction, doubles. A CI that only includes those determinants that correspond to double excitations from the reference (which is usually Hartree-Fock).

**Cidan herbal capsule:** A capsule-based formulation containing artificial bezoar, *Strychni pulveratum* (strychnos powder), camphol alcohol (borneol or borneo camphor) and extracts from Zedoary rhizome (*Rhizoma curcumae*), *Pseudobulbus cremastrae seu pleiones* (dried pseudobulb of *Cremastra appendiculata*), Yatantzu (seed of *Brucca javanica*), beehive, *Bombyx mori* (*Bombyx batryticatus* or silkworm), Danshen (dried root of *Salvia miltiorrhiza* or red sage root), *Radix astragali*, and *Angelica*, with potential antineoplastic activity. Upon oral administration of the cidan

herbal capsule, the active ingredients in the plant extracts may induce tumor cell apoptosis and reduce tumor cell proliferation.

**cidofovir:** A synthetic, acyclic, monophosphate nucleotide analog of deoxycytidine with antiviral activity, and mostly used against cytomegalovirus (CMV). After incorporation into the host cell, cidofovir is phosphorylated by pyruvate kinases to its active metabolite cidofovir diphosphate. Cidofovir diphosphate, bearing structural similarity to nucleotides, competes with deoxycytosine-5-triphosphate (dCTP) for viral DNA polymerase and gets incorporated into the growing viral DNA strands. As a result, it prevents further DNA polymerization and disrupts DNA replication of viruses.

**cidofovir :** A substance being studied in the treatment of non-small cell lung cancer. Also called N-acetyldinaline.

**cigar :** A drug used to treat erectile dysfunction. It is also being studied in the treatment of sexual problems in patients treated with radiation or surgery for prostate cancer. Cialis blocks the action of a certain enzyme, which can result in increased blood flow to the penis, causing an erection. It is a type of cGMP phosphodiesterase type 5 (PDE5) inhibitor. Also called tadalafil.

**cigarette :** A drug used in the treatment of infections caused by viruses.

**cilengitide :** A cyclic Arg-Gly-Asp peptide with potential antineoplastic activity. Cilengitide binds to and inhibits the activities of the  $\alpha(v)\beta(3)$  and  $\alpha(v)\beta(5)$  integrins, thereby inhibiting endothelial cell-cell interactions, endothelial cell-matrix interactions, and angiogenesis. OR A tube-shaped tobacco product that is made of tightly rolled, cured tobacco leaves in a tobacco leaf wrapper or a wrapper that contains tobacco. It may also have other ingredients, including substances to add different flavors. A cigar is lit on one end and smoked, but the smoke is usually not inhaled into the lungs. Cigars contain nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Smoking cigars can lead to nicotine addiction and can cause cancers of the mouth, larynx (voice box), esophagus, lung, and pancreas. Heavy cigar smoking can also increase the risk of heart disease and lung diseases, such as emphysema and chronic bronchitis.

**Cilia:** Hairlike organelles made of microtubules that protrude from the surface of the cell and move liquid past the cell surface; responsible for

movement of many single-celled organisms.

**ciliary body** : A tube-shaped tobacco product that is made of finely cut, cured tobacco leaves wrapped in thin paper. It may also have other ingredients, including substances to add different flavors. A cigarette is lit on one end and smoked, and the smoke is usually inhaled into the lungs. Cigarettes contain nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Smoking cigarettes can lead to nicotine addiction and can cause many types of cancer, including cancers of the lung, larynx, mouth, esophagus, throat, kidney, bladder, pancreas, stomach, and cervix, and acute myeloid leukemia. Smoking cigarettes also causes other health problems, including heart disease, stroke, and lung diseases, such as emphysema and chronic bronchitis.

**Ciliates**: A class of protozoans distinguished by short hairs on all or part of their bodies.

**cimetidine**: A substance that is being studied as an anticancer and antiangiogenesis drug. Also called EMD 121974. OR A histamine H(2)-receptor antagonist. Enhancing anti-tumor cell-mediated responses, cimetidine blocks histamine's ability to stimulate suppressor T lymphocyte activity and to inhibit natural killer (NK) cell activity and interleukin-2 production. Cimetidine also may inhibit tumor growth by suppressing histamine's growth-factor activity and blocking histamine-induced stimulation of vascular endothelial growth factor (VEGF), a pro-angiogenic growth factor.

**CIN** : A part of the middle layer of the wall of the eye. The ciliary body includes the ring-shaped muscle that changes the size of the pupil and the shape of the lens when the eye focuses. It also makes the fluid that fills the eye.

**CIN 1** : A drug usually used to treat stomach ulcers and heartburn. It is also commonly used in a regimen to prevent allergic reactions.

**CIN 2** : Abnormal cells are found on the surface of the cervix. CIN is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. CIN is not cancer, but may become cancer and spread to nearby normal tissue. It is graded on a scale of 1 to 3, based on how abnormal the cells look under a microscope and how much of the cervical tissue is affected. For example, CIN 1 has slightly abnormal

cells and is less likely to become cancer than CIN 2 or CIN 3. Also called cervical intraepithelial neoplasia.

**CIN 2/3 :** Slightly abnormal cells are found on the surface of the cervix. CIN 1 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. CIN 1 is not cancer and usually goes away on its own without treatment. Sometimes it becomes cancer and spreads to nearby normal tissue. CIN 1 is sometimes called low-grade or mild dysplasia. Also called cervical squamous intraepithelial neoplasia 1.

**CIN 3 :** Moderately abnormal cells are found on the surface of the cervix. CIN 2 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. CIN 2 is not cancer, but may become cancer and spread to nearby normal tissue if not treated. Treatment for CIN 2 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. CIN 2 is sometimes called high-grade or moderate dysplasia. Also called cervical squamous intraepithelial neoplasia 2.

**cinacalcet hydrochloride:** The orally bioavailable hydrochloride salt of the calcimimetic cinacalcet. Cinacalcet increases the sensitivity of calcium-sensing receptors on chief cells in the parathyroid gland to extracellular calcium, thereby reducing parathyroid hormone (PTH) secretion. A reduction in PTH levels inhibits osteoclast activity, which may result in a decrease in cortical bone turnover and bone fibrosis, and normalization of serum calcium and phosphorus levels. In addition, by reducing PTH levels, cinacalcet may reduce PSA levels; PTH appears to raise PSA levels and may increase prostate cancer cell growth.

**cinder cone:** a feature composed of pyroclastic material (not lavas) ejected from a volcanic vent.

**cinder cone:** steep cone of a volcano formed from ash and loose rock.

**cinobufagin:** A bufadienolide compound extracted from the dried venom secreted by the parotid glands of toads and one of the glycosides in the traditional Chinese medicine ChanSu, with potential antineoplastic activity. Although the mechanism of action of cinobufagin is still under investigation, it has been found to suppress cancer cell proliferation and cause apoptosis in cancer cells via a sequence of apoptotic modulators that include mitochondrial Bax and cytosolic chromosome c, and caspases 3, 8,

and 9. Possible upstream mediators of cinobufagin-induced apoptosis include Fas and p53. Check for active clinical trials using this agent.

**cintredekin besudotox:** A recombinant chimeric protein with potent antitumor activity. Cintredekin besudotox is composed of interleukin-13 (IL13), a pleiotropic immunoregulatory cytokine, linked to a mutated form of pseudomonas exotoxin A; this agent targets and kills tumor cells that express the IL13 receptor (IL13R). The IL13 moiety attaches to the IL13R on the tumor cell membrane, facilitating the entry of the exotoxin. The exotoxin moiety induces caspase-mediated apoptosis of tumor cells via a mechanism involving mitochondrial damage; it also catalyzes the transfer of ADP ribose from nicotinamide adenine dinucleotide (NAD) to elongation factor-2 in eukaryotic cells, thereby inactivating elongation factor 2 and inhibiting protein synthesis.

**Cipro :** (Other name for: ciprofloxacin) OR Abnormal cells are found on the surface of the cervix. CIN 2/3 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. CIN 2/3 has features of CIN 2 and CIN 3. It is not cancer, but may become cancer and spread to nearby normal tissue if not treated. Treatment for CIN 2/3 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. Also called cervical intraepithelial neoplasia grade 2/3.

**ciprofloxacin:** A synthetic broad spectrum fluoroquinolone antibiotic. Ciprofloxacin binds to and inhibits bacterial DNA gyrase, an enzyme essential for DNA replication. This agent is more active against Gram-negative bacteria than Gram-positive bacteria. Check for active clinical trials using this agent.

**ciprofloxacin :** Severely abnormal cells are found on the surface of the cervix. CIN 3 is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. If not treated, these abnormal cells may become cancer and spread to nearby normal tissue. Treatment for CIN 3 may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. CIN 3 is sometimes called high-grade or severe dysplasia. Also called cervical squamous intraepithelial neoplasia 3 and stage 0 cervical carcinoma in situ.

**Circadin:** (Other name for: therapeutic melatonin)

**circle:** in a plane, the set of points all equidistant from a given point.

**circuit:** a path through which an electrical current can flow when the path is complete. OR In filament winding, the winding produced by a single revolution of mandrel or form.

**circulation :** A drug that is used to treat infections caused by bacteria and is being studied in the treatment of bladder cancer. Cipro is a type of fluoroquinolone. Also called ciprofloxacin.

**circulatory system:** the transport system in animals.

**circulatory system :** A drug that is used to treat infections caused by bacteria and is being studied in the treatment of bladder cancer. Ciprofloxacin is a type of fluoroquinolone. Also called Cipro.

**circum-Pacific belt:** an earthquake belt that follows the rim of the Pacific Ocean.

**circumcision :** In the body, the flow of blood through the heart and blood vessels, and the flow of lymph through the lymph vessels.

**circumference:** the distance around a circle; equals  $2 \times \pi \times \text{radius}$  or  $\pi \times \text{diameter}$  ( $C = 2\pi r$  or  $\pi d$ ).

**cirtuzumab:** A humanized monoclonal antibody against the extracellular domain of the human receptor tyrosine kinase-like orphan receptor 1 (ROR1), with potential antineoplastic activity. Upon administration, cirtuzumab binds to ROR1 and blocks ROR1-mediated signaling. This prevents tumor cell proliferation in cancer cells overexpressing ROR1. ROR1, also known as neurotrophic tyrosine kinase, receptor-related 1 (NTRKR1), is normally expressed during embryogenesis. It is overexpressed in certain leukemias and solid tumors, but minimally expressed in healthy cells.

**cirque:** a steep-sided, circular hollow carved in the top of a mountain from an alpine glacier.

**cirrhosis :** The system that contains the heart and the blood vessels and moves blood throughout the body. This system helps tissues get enough oxygen and nutrients, and it helps them get rid of waste products. The lymph system, which connects with the blood system, is often considered part of the circulatory system.

**cirrus:** very high clouds formed by ice crystals; look like feathers; usually associated with fair weather.

**CIS:** Configuration interaction, singles. (See CID.) The simplest method for calculating electronically excited states; limited to singly-excited states. Contains no electron correlation and has no effect on the ground state (Hartree-Fock) energy.

**CIS:** Surgery to remove part or all of the foreskin (loose skin that covers the head of the penis).

**cis and trans isomers:** See geometric isomers.

**Cis dominance:** Property of a sequence or a gene that exerts a dominant effect on a gene to which it is linked.

**cis-urocanic acid:** A derivative of the amino acid histidine, formed in the mammalian skin from trans-urocanic acid upon ultraviolet radiation, and protodynamic agent, with potential anti-inflammatory and antiproliferative activity. Upon intravesical instillation of cis-urocanic acid (cis-UCA), this agent is protonated at the imidazolyl moiety in the mildly acidic extracellular tumor environment and penetrates into the cancer cell. Once inside the cell and due to the slightly alkaline pH inside the tumor cell, cis-UCA is deprotonated, i.e. the imidazolyl proton is released into the cytosol which eventually raises the intracellular acidity. This acidification impairs many cellular processes, such as metabolic activity, and may lead to cell cycle arrest, an induction of cellular apoptosis and necrotic cell death. In addition, cis-UCA enhances ERK and JNK signaling pathways by inhibiting the activity of serine/threonine and tyrosine phosphatases.

**cisatracurium besylate:** A non-depolarizing skeletal muscle relaxant of the benzyliisoquinolinium class. Cisatracurium besylate acts as a competitive acetylcholine antagonist that binds to nicotinic receptors at the neuromuscular junction. Compared to other neuromuscular blocking agents, it is intermediate in its onset and duration of action. Cisatracurium besylate is used to maintain neuromuscular relaxation during major surgical procedures, primarily to facilitate endotracheal intubation. Cisatracurium besylate can cause bronchospasms, hypotension, and bradycardia.

**CISD:** Configuration interaction, singles and doubles. A CI that only includes those determinants that correspond to single or double excitations from the reference (which is usually Hartree-Fock). Declining popularity.

**CISNET:** A type of chronic, progressive liver disease in which liver cells are replaced by scar tissue.

**cisplatin:** An inorganic platinum agent (cis-diamminedichloroplatinum) with antineoplastic activity. Cisplatin forms highly reactive, charged, platinum complexes which bind to nucleophilic groups such as GC-rich sites in DNA, inducing intrastrand and interstrand DNA cross-links, as well as DNA-protein cross-links. These cross-links result in apoptosis and cell growth inhibition. or The CIS is the National Cancer Institute's link to the public, interpreting and explaining research findings in a clear and understandable manner, and providing personalized responses to specific questions about cancer. Access the CIS by calling 1-800-4-CANCER (1-800-422-6237), or by using the LiveHelp instant-messaging service at Also called Cancer Information Service.

**cisplatin-e therapeutic implant:** An injectable gel comprised of a collagen matrix containing the inorganic platinum (Pt) agent cisplatin and the sympathomimetic agent epinephrine with potential antineoplastic activity. After intratumoral injection, cisplatin forms highly reactive, positively charged, platinum complexes, which covalently bind to nucleophilic groups in DNA, preferably at the N7 position of guanine bases. This induces both intra- and inter-strand DNA cross-links. In addition, cisplatin forms DNA-Pt-protein cross-links. Cross-link formation results in both the induction of apoptosis and cell growth inhibition. Epinephrine, a potent vasoconstrictor, is added to the gel to both enhance the penetration of cisplatin into tumor tissue and reduce its dispersion into the surrounding tissues. Intratumoral injection of cisplatin-E therapeutic implant may increase local chemotherapeutic efficacy, as compared to the systemic administration of cisplatin, while reducing its systemic toxicity. Check for active clinical trials using this agent.

**Cissing:** The failure of paint to form a continuous film by forming into "droplets". Usually caused by grease or other contamination on the surface being painted.

**Cissing on new paintwork:** The paint can't adhere to the surface because of contamination by oil, grease, wax or polish. So the paint draws back, leaving unpainted areas, usually in the form of small spots. To remedy the situation, allow the surface to dry and thoroughly harden, then rub it down using wet and dry abrasive paper (or waterproof silicon carbide) and warm water with a bit of detergent. Rinse the surface thoroughly and allow to dry before repainting.

**Cistane:** (Other name for: isotretinoin)

**Cistern:** Reservoir for storing water, nowadays usually ceramic or plastic.

**Cistron:** A genetic unit that encodes a single polypeptide chain. OR A unit of DNA or RNA corresponding to one gene.

**citalopram :** A group of researchers supported by the National Cancer Institute (NCI) who use statistical models to help understand how cancer prevention, screening, and treatment programs can affect the number of new cases of cancer diagnosed each year and the number of deaths from cancer each year. The CISNET is now studying breast, colorectal, esophageal, lung, and prostate cancers. The models they create help guide future cancer control strategies, research priorities, policies, and decision making. Also called Cancer Intervention and Surveillance Modeling Network.

**citalopram hydrobromide:** The orally bioavailable hydrobromide salt of the racemic bicyclic phthalene derivative citalopram with antidepressant activity. As a selective serotonin reuptake inhibitor (SSRI), citalopram selectively inhibits the CNS neuronal reuptake of serotonin, thereby potentiating serotonergic activity in the central nervous system (CNS). This agent has minimal effects on the CNS neuronal reuptake of norepinephrine (NE) and dopamine (DA).

**citatumab bogatox:** A fusion protein immunotoxin consisting of a humanized, single-chain monoclonal antibody Fab fragment specific for the epithelial cell adhesion molecule (EpCAM) conjugated with a modified bouganin cytotoxin with potential antineoplastic activity. Citatumab bogatox binds to EpCAM, delivering modified bouganin cytotoxin directly to EpCam-positive tumor cells, which may result in the inhibition of tumor cell protein synthesis and tumor cell death. EpCAM, a cell surface protein, is expressed by a variety of tumor cells and is frequently found in head and neck cancers. Bouganin is a plant-derived ribosome-inactivating protein (RIP), a toxic plant N-glycosidase that depurinates the universally conserved alpha-sarcin loop of ribosomal rRNA, inactivating the ribosome and preventing protein synthesis. Compared to unmodified bouganins, modified bouganins may have a reduced propensity to activate human T cells. Check for active clinical trials using this agent.

**citicoline:** A nutritional supplement and source of choline and cytidine with potential neuroprotective and nootropic activity. Citicoline, also known as cytidine-5-diphosphocholine or CDP-choline, is hydrolyzed into

cytidine and choline in the intestine. Following absorption, both cytidine and choline are dispersed, utilized in various biosynthesis pathways, and cross the blood-brain barrier for resynthesis into citicoline in the brain, which is the rate-limiting product in the synthesis of phosphatidylcholine. This agent also increases acetylcholine (ACh), norepinephrine (NE) and dopamine levels in the central nervous system (CNS). In addition, citicoline is involved in the preservation of sphingomyelin and cardiolipin and the restoration of Na<sup>+</sup>/K<sup>+</sup>-ATPase activity. Citicoline also increases glutathione synthesis and glutathione reductase activity, and exerts antiapoptotic effects. Check for active clinical trials using this agent.

**Citracal:** (Other name for: calcium citrate)

**Citrate synthase:** An enzyme that catalyzes the condensation of acetyl coa with oxaloacetate to form citrate, initiating the citric acid cycle.

**Citric Acid:** Derived from citrus fruit or by fermentation of crude sugar, also used as antioxidant, sequestrant, dispersing agent. Helps adjust pH. No toxicity in diluted amounts.

**Citric acid cycle:** A cyclic series of metabolic reactions that completely oxidize acetyl units to carbon dioxide. Also known as the tricarboxylic acid cycle (after citrate) or the Krebs cycle, after Hans Krebs, who elucidated the cyclic nature of the pathway. OR A cyclic system of enzymatic reactions for the oxidation of acetyl residues to carbon dioxide, in which formation of citrate is the first step; also known as the Krebs cycle or tricarboxylic acid cycle.

**citric acid/potassium-sodium citrate :** A drug used to treat cancers of the bladder, ovaries, and testicles. It is used in patients whose cancer cannot be treated with or has not gotten better with other anticancer treatment. It is also being studied in the treatment of other types of cancer. Cisplatin contains the metal platinum. It kills cancer cells by damaging their DNA and stopping them from dividing. It is a type of DNA crosslinking agent. Also called Platinol and Platinol-AQ.

**Citroma:** (Other name for: magnesium citrate)

**citrovorum factor :** A drug used to treat depression. It belongs to the families of drugs called antidepressant agents and selective serotonin reuptake inhibitors (SSRIs). Also called Celexa.

**Civacir:** (Other name for: hepatitis C immune globulin intravenous)

**cixutumumab:** A fully human IgG1 monoclonal antibody directed against the human insulin-like growth factor-1 receptor (IGF-1R) with potential antineoplastic activity. Cixutumumab selectively binds to membrane-bound IGF-1R, thereby preventing the binding of the natural ligand IGF-1 and the subsequent activation of PI3K/AKT signaling pathway. Downregulation of the PI3K/AKT survival pathway may result in the induction of cancer cell apoptosis and may decrease cancer cellular proliferation. IGF-1R, a receptor tyrosine kinase of the insulin receptor superfamily overexpressed by many cancer cell types, stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF-1R signaling has been implicated in tumorigenesis and metastasis. OR A drug used in the treatment of metabolic acidosis (a disorder in which the blood is too acidic).

**CK2-targeting synthetic peptide CIGB-300:** A synthetic peptide targeting the substrates of casein kinase 2 (CK2), with potential antineoplastic activity. Upon administration and nucleolar localization, CK2-targeting synthetic peptide CIGB-300 binds to phosphoacceptor sites on the CK2's substrates, in particular the oncoprotein nucleophosmin (B23 or NPM1). This blocks the activation of B23 and induces apoptosis, thereby inhibiting tumor cell growth in susceptible tumor cells. CK2, a protein kinase often overexpressed in a variety of cancer cell types, appears to be correlated with malignant transformation, tumor growth and survival. Overexpression of B23 has been correlated with increased cellular growth and proliferation as well as inhibition of differentiation and apoptosis.

**Cladding:** The term used to describe the surface covering of a building particularly in sheeting or boarding.

**Cladding:** The thin-walled metal tube that forms the outer jacket of a nuclear fuel rod. It prevents corrosion of the fuel by the coolant and the release of fission products into the coolant. Aluminum, stainless steel, and zirconium alloys are common cladding materials. OR Sometimes referred to as "sidings," it is extruded PVC-U boards that are used as outdoor weather-resistant façade panels.

**cladribine:** A purine nucleoside antimetabolite analogue. Cladribine triphosphate, a phosphorylated metabolite of cladribine, incorporates into DNA, resulting in single-strand breaks in DNA, depletion of nicotinamide adenine dinucleotide (NAD) and adenosine triphosphate (ATP), and apoptosis. Because this agent is resistant to adenosine deaminase, an

enzyme that inactivates some antineoplastic agents, it is selectively toxic to lymphocytes and monocytes which exhibit little deoxynucleotide deaminase activity. OR A substance being studied in the treatment of some types of cancer. It is a monoclonal antibody that is made in the laboratory and can bind to substances in the body. Cixutumumab blocks the action of a protein needed for cell growth and may kill cancer cells. It is a type of insulin-like growth factor-1 receptor (IGF-1R) inhibitor. Also called IMC-A12.

**Clafen:** (Other name for: cyclophosphamide)

**Claforan:** (Other name for: cefotaxime)

**Clamp:** The part of an injection molding machine incorporating the platens that provides the force necessary to hold the mold closed during injection of the molten resin and open the mold to eject the molded part. OR A part of the injection molding machine that holds the molds closed during the casting process. OR The mechanism that holds the mold in location during the molding process.

**Clamp force:** The force, in tons, that the clamp unit of a molding machine exerts to keep the mold closed during the injection process. OR The force required to hold the mold shut so resin cannot escape during injection. Measured in tons, as in “we have a 700 ton press” OR It is force applied by the machines clamping unit to the mould during filling, packing and holding phases of moulding cycle. Unit is Tons or kN.

**Clamp unit:** That section of the molding machine containing the clamping mechanism This is used to close the mold and keep it closed against injection pressure created by the injection process The clamp unit also contains the ejection mechanism.

**Clamping Area :** The largest rated molding area an injection press can hold closed under full molding pressure.

**CLAMPING FORCE:** In injection molding and in transfer molding, the pressure which is applied to the mold to keep it closed, in opposition to the fluid pressure of the compressed molding material, within the mold cavity (cavities) and the runner system. OR The force applied to the mold to keep it closed, in opposition to the fluid pressure of the compressed molding material within the mold cavity and the runner system.

**CLAMPING PLATE:** A plate fitted to a mold and used to fasten mold to a molding machine. OR A plate fitted to a mold and used to fasten the mold

to a plate OR A plate fitted to a mold and used to fasten mold to a molding machine.

**Clamping Plate:** A plate fitted to a mold and used to fasten the mold to a platen. OR A plate fitted to a mold and used to fasten the mold to a molding machine.

**Clamping Pressure:** The pressure applied to the mold to keep it closed during the molding cycle. OR In injection molding and in transfer molding, the pressure which is applied to the mold to keep it closed, in opposition to the fluid pressure of the compressed molding material. OR The pressure applied to the mold to keep it closed during a cycle of an silicone injection molding machine

**Clamshells:** Clear plastic packaging that showcases an array of products from retail, food, medical, etc. The word clamshell indicates that the formed plastic package has one or more hinges.

**Claravis:** (Other name for: isotretinoin)

**Clarification:** the composite wastewater treatment process consisting of flash mixing of coagulants, pH adjusting chemicals, and/or polyelectrolytes, flocculation, and sedimentation. OR A process in which suspended material is removed from a wastewater. This may be accomplished by sedimentation, with or without chemicals, or filtration.

**Clarifier:** Settling tank, sedimentation basin. A tank or basin in which wastewater is held for a period of time, during which the heavier solids settle to the bottom and the lighter material will float to the water surface. OR a unit which provides for settling and removal of solids from wastewater. OR An additive that increases the transparency of a material. OR An upflow solids contact tank with a volume of one million gallons. The clarifier removes the suspended solids, organic material, taste, odor and color from the waste water. The clarification is accomplished by feeding coagulant, which forms flocs in the water with the impurities, The flocs with the impurities settle readily to the bottom of the clarifier. A rotating rake located in the bottom of the clarifier collects these impurities toward the center of the clarifier and removes them to waste. OR Additive used in resins to improve transparency or translucency. OR Additives used in resins to improve the transparency or translucency of the finished plastic extrusion profiles and other plastic products.

**Clarinol:** (Other name for: conjugated linoleic acid)

**clarithromycin:** A semisynthetic 14-membered ring macrolide antibiotic. Clarithromycin binds to the 50S ribosomal subunit and inhibits RNA-dependent protein synthesis in susceptible organisms. Clarithromycin has been shown to eradicate gastric MALT (mucosa-associated lymphoid tissue) lymphomas, presumably due to the eradication of tumorigenic *Helicobacter pylori* infection. This agent also acts as a biological response modulator, possibly inhibiting angiogenesis and tumor growth through alterations in growth factor expression. Check for active clinical trials using this agent. or A protein found on the surface of many different types of cells. It binds to a substance called stem cell factor (SCF), which causes certain types of blood cells to grow. C-kit may also be found in higher than normal amounts, or in a changed form, on some types of cancer cells, including gastrointestinal stromal tumors and melanoma. Measuring the amount of c-kit in tumor tissue may help diagnose cancer and plan treatment. C-kit is a type of receptor tyrosine kinase and a type of tumor marker. Also called CD117 and stem cell factor receptor.

**Claritin:** (Other name for: loratadine)

**Clarity:** Freedom of haze or cloudiness in a plastic material.

**Clark level I skin cancer :** An anticancer drug that belongs to the family of drugs called antimetabolites.

**Clark level II skin cancer :** An antibiotic drug used in the treatment of infections. It belongs to the family of drugs called macrolides.

**Clark level III skin cancer :** Skin cancer that is found only in the epidermis (outer layer of skin).

**Clark level IV skin cancer :** Skin cancer that has spread from the epidermis (outer layer of skin) down into the papillary dermis (the thin top layer of the dermis).

**Clark level V skin cancer :** Skin cancer that has spread down through the papillary dermis (the thin top layer of the dermis) but not into the reticular dermis (the thick bottom layer of the dermis).

**Clark levels :** Skin cancer that has spread down into the reticular dermis (the thick bottom layer of the dermis).

**class:** a grouping of similar orders.

**Class 1 PI3K family inhibitor XL147:** An orally bioavailable small molecule, targeting the class I phosphatidylinositol 3 kinase (PI3K) family

of lipid kinases, with potential antineoplastic activity. Class 1 PI3K kinase family inhibitor XL147 reversibly binds to class 1 PI3Ks in an ATP-competitive manner, inhibiting the production of the secondary messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3) and activation of the PI3K signaling pathway; this may result in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents including genotoxic agents and receptor tyrosine kinase inhibitors.

**Class I MHC proteins:** Membrane proteins that tightly bind proteolytic fragments of cellular proteins and present them to the scrutiny of T cells. A foreign protein presented in a class I MHC protein provokes attack by killer T cells that initiate apoptosis in the target cell.

**Class II MHC proteins:** Proteins expressed only in antigen-presenting cells; Class II MHC proteins display peptides derived by the destruction of proteins internalized by endocytosis.

**Class switching:** A step in the differentiation of an antibody-producing cells in which the cells switch from producing igm antibodies to producing one or the other classes of antibodies while maintaining the same antigen specificity.

**classical Hodgkin lymphoma :** Skin cancer that has spread down into the subcutaneous tissue (tissue beneath the skin).

**Classified information:** Information that could be used by an adversary to harm the U.S. or its allies and thus must be protected. The NRC has two types of classified information. The first type, known as national security information, is information that is classified by an Executive Order. Its release would damage national security to some degree. The second type, known as restricted data, is information that is classified by the Atomic Energy Act. It would assist individuals or organizations in designing, manufacturing, or using nuclear weapons. Access to both types of information is restricted to authorized persons who have been properly cleared and have a “need to know” the information for their official duties. For additional detail, see Classified Information.

**clastic:** pieces of rocks.

**clastic sedimentary rock:** a sedimentary rock formed from the consolidation of material such as gravel, sand, or clay (sediment) derived from the weathering and breakdown of preexisting rocks.

**clastogen:** A clastogen is any substance which causes chromosomal breaks.

**Clathrin:** A protein that coats the cytosolic side of coated pits and can form a lattice around the pit, excising it from the membrane to form a coated vesicle.

**claudiximab:** A monoclonal antibody directed against the antigen GC182 with potential immunostimulatory and antineoplastic activities. Upon administration, claudiximab specifically binds to GC128, which may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against GC182-expressing tumor cells, resulting in decreased tumor cell proliferation. The CD20-like antigen GC182, a gastric differentiation protein, is often overexpressed on the cell surfaces of a variety of tumor cells, including gastric, pancreatic, esophageal cancer and non-small cell lung cancer (NSCLC) cells. Check for active clinical trials using this agent.

**Claus model :** A system for describing how deep skin cancer has spread into the skin. Levels I-V describe the layers of skin involved.

**clause:** a group of related words, but unlike a phrase, a clause has a subject and predicate.

**Clausius-Clapeyron equation:** The Clausius-Clapeyron equation predicts the temperature dependence of vapor pressures of pure liquids or solids:  $\ln(P/P^\circ) = -\frac{H}{RT} + \frac{H}{RT^\circ}$  where  $P$  is the vapor pressure,  $P^\circ$  is a vapor pressure at a known temperature  $T^\circ$ ,  $H$  is an enthalpy of vaporization if the substance is a liquid or an enthalpy of sublimation if it's a solid,  $R$  is the ideal gas law constant, and  $T$  is the temperature (in kelvins).

**clavicle :** The most common type of Hodgkin lymphoma, which is a cancer of the immune system. Classical Hodgkin lymphoma is marked by the presence of a type of cell called the Reed-Sternberg cell.

**CLD:** A computer program that uses statistics to predict a person's risk for developing breast cancer based on family history.

**Cleanup system:** A system used for continuously filtering and demineralizing a reactor coolant system to reduce contamination levels and

to minimize corrosion.

**clear cell :** One of a pair of bones at the base of the front of the neck. The clavicles connect the breastbone to the shoulder blades. Also called collarbone.

**clear cell adenocarcinoma :** A type of disorder that affects the lungs and other parts of the respiratory system. It usually develops slowly, and may get worse over time. CLD may be caused by smoking tobacco or by breathing in secondhand tobacco smoke, chemical fumes, dust, or other forms of air pollution. Types of CLD include asthma, chronic obstructive pulmonary disease (COPD), pulmonary fibrosis, asbestosis, pneumonitis, and other lung conditions. Also called chronic lung disease.

**clear cell carcinoma :** A type of cell that looks clear inside when viewed under a microscope.

**clear cell sarcoma of soft tissue :** A rare type of tumor, usually of the female genital tract, in which the insides of the cells look clear when viewed under a microscope. Also called clear cell carcinoma and mesonephroma.

**clear cell sarcoma of the kidney :** A rare type of tumor, usually of the female genital tract, in which the insides of the cells look clear when viewed under a microscope. Also called clear cell adenocarcinoma and mesonephroma.

**Clear Coating:** A transparent protective and/or decorative film; generally the final coat of sealer applied to automotive finishes.

**CLEAR COATING:** A transparent protective and/or decorative film.

**clear cutting:** A forest-management technique that involves harvesting all the trees in one area at one time.

**Clearance:** The space between components in a mechanical system which is present to allow for manufacturing, thermal, and dynamic variations in the size and position of the components.

**Clearcole:** A mixture of glue-size and whiting used as a primer or undercoat beneath size-bound distemper. Also spelt clairolle and clearcolle.

**clearing fractions:** A method of simplifying an equation by multiplying both sides of the equation by the least common denominator before solving it. This method results in an equation with only integers and no fractions.

**Cleatrac Belting (CTB):** Precision balanced weave wire mesh fabric consisting of alternating right and left-hand spirals joined by crimped connecting rods.

**cleavage:** the ability of a mineral to break along preferred directions, usually along the faces of layered crystals. OR the way a mineral splits or breaks along weak bonds in planes.

**cleaved :** A soft tissue tumor that begins in a tendon (tough, cord-like tissue that connects muscle to bone or to another part of the body). Under the microscope, clear cell sarcoma of soft tissue may look a lot like melanoma (a type of skin cancer). Clear cell sarcoma of soft tissue usually occurs in the leg or arm and it often spreads to nearby lymph nodes. It is most common in young adults.

**clergy :** A rare type of kidney cancer, in which the inside of the cells look clear when viewed under a microscope. Clear cell sarcoma can spread from the kidney to other organs, most commonly the bone, but also including the lungs, brain, and soft tissues of the body.

**clevidipine butyrate injectable emulsion:** An injectable phospholipid emulsion containing the butyrate salt of the synthetic, short-acting, dihydropyridine L-type calcium channel antagonist clevidipine with antihypertensive activity. Clevidipine specifically binds to calcium channels in vascular smooth muscle cells, inhibiting the influx of extracellular calcium ions into vascular smooth muscle cells. This results in dilatation of systemic arteries, a decrease in systemic vascular resistance and so a decrease in arterial blood pressure. This agent is metabolized by esterases in the blood and extravascular tissues to an inactive carboxylic acid metabolite.

**Cleviprex:** (Other name for: clevidipine butyrate injectable emulsion)

**clevidine:** A synthetic pyrimidine analogue with activity against hepatitis B virus (HBV). Intracellularly, clevidine is phosphorylated to its active metabolites, clevidine monophosphate and triphosphate. The triphosphate metabolite competes with thymidine for incorporation into viral DNA, thereby causing DNA chain termination and inhibiting the function of HBV DNA polymerase (reverse transcriptase). Clevidine has a long half-life and shows significant reduction of covalently closed circular DNA (cccDNA), therefore the patient is less likely to have a relapse after treatment is discontinued.

**cliché:** trite, overused expressions, many of which rely on figurative language and should be avoided in writing.

**climate:** the overall temperature, precipitation, and weather conditions for an area. OR The statistical collection and representation of the weather conditions for a specified area during a specified time interval, usually decades, together with a description of the state of the external system or boundary conditions. The properties that characterize the climate are thermal (temperatures of the surface air, water, land, and ice), kinetic (wind and ocean currents, together with associated vertical motions and the motions of air masses, aqueous humidity, cloudiness and cloud water content, groundwater, lake lands, and water content of snow on land and sea ice), and static (pressure and density of the atmosphere and ocean, composition of the dry air, salinity of the oceans, and the geometric boundaries and physical constants of the system). These properties are interconnected by the various physical processes such as precipitation, evaporation, infrared radiation, convection, advection, and turbulence.

**climate change:** The long-term fluctuations in temperature, precipitation, wind, and all other aspects of the Earth's climate. External processes, such as solar-irradiance variations, variations of the Earth's orbital parameters (eccentricity, precession, and inclination), lithosphere motions, and volcanic activity, are factors in climatic variation. Internal variations of the climate system also produce fluctuations of sufficient magnitude and variability to explain observed climate change through the feedback processes interrelating the components of the climate system.

**climate sensitivity:** The magnitude of a climatic response to a perturbing influence. In mathematical modeling of the climate, the difference between simulations as a function of change in a given parameter.

**climate signal:** A statistically significant difference between the control and disturbed (see climate sensitivity) simulations of a climate model.

**climate system:** The five physical components (atmosphere, hydrosphere, cryosphere, lithosphere, and biosphere) that are responsible for the climate and its variations.

**climate variation:** The change in one or more climatic variables over a specified time.

**climatic analog:** A past climate situation in which changes similar to the present occurred. Used in making climatic projections.

**climatic anomaly:** The deviation of a particular climatic variable from the mean or normal over a specified time.

**climatic optimum:** The period in history from about 5000 to about 2500 B.C. during which surface air temperatures were warmer than at present in nearly all regions of the world. In the Arctic region, the temperature rose many degrees, and in temperate regions, the increase was 1.0 degrees - 1.7 degrees C. In this period, glaciers and ice sheets receded greatly, and the melt-water raised sea level by about 3 meters.

**clindamycin phosphate:** The phosphate salt form of clindamycin, a semi-synthetic, chlorinated broad spectrum antibiotic produced by chemical modification of lincomycin. Clindamycin phosphate is used in topical preparations.

**clindamycin/hydrocortisone lotion:** A topical lotion, containing clindamycin and hydrocortisone, with antibacterial and anti-inflammatory activities. Clindamycin, a lincomycin antibiotic, binds to the 50S subunit of the bacterial ribosome, thereby inhibiting bacterial protein synthesis. As a glucocorticoid agonist, hydrocortisone promotes protein catabolism, gluconeogenesis, capillary wall stability, renal excretion of calcium, and suppression of immune and inflammatory responses.

**clinical :** Having to do with the appearance of cells when viewed under a microscope. The nucleus of cleaved cells appears divided or segmented.

**clinical breast exam :** Ordained individuals who perform spiritual and/or religious functions.

**clinical practice guidelines :** Having to do with the examination and treatment of patients.

**clinical research :** A physical exam of the breast performed by a health care provider to check for lumps or other changes. Also called CBE.

**clinical researcher :** Guidelines developed to help health care professionals and patients make decisions about screening, prevention, or treatment of a specific health condition.

**clinical resistance :** Research in which people, or data or samples of tissue from people, are studied to understand health and disease. Clinical research helps find new and better ways to detect, diagnose, treat, and prevent disease. Types of clinical research include clinical trials, which test new

treatments for a disease, and natural history studies, which collect health information to understand how a disease develops and progresses over time.

**clinical series :** A health professional who works directly with patients, or uses data from patients, to do research on health and disease and to develop new treatments. Clinical researchers may also do research on how health care practices affect health and disease.

**clinical stage :** The failure of a cancer to shrink after treatment.

**clinical staging :** A case series in which the patients receive treatment in a clinic or other medical facility.

**clinical study :** The stage of cancer (amount or spread of cancer in the body) that is based on tests that are done before surgery. These include physical exams, imaging tests, laboratory tests (such as blood tests), and biopsies.

**Clinical trial:** A scientific study in which physician-researchers study the effects of potential medicines on people; usually conducted in three phases (I, II, and III) that determine safety, whether the treatment works, and if it's better than current therapies, respectively

**clinical trial :** A method used to find out the stage of cancer (amount or spread of cancer in the body) using tests that are done before surgery. These include physical exams, imaging tests, laboratory tests (such as blood tests), and biopsies.

**clinical trial phase :** A type of research study that tests how well new medical approaches work in people. These studies test new methods of screening, prevention, diagnosis, or treatment of a disease. Also called clinical trial.

**clinical trial sponsor :** A type of research study that tests how well new medical approaches work in people. These studies test new methods of screening, prevention, diagnosis, or treatment of a disease. Also called clinical study.

**clinician :** A part of the clinical research process that answers specific questions about whether treatments that are being studied work and are safe. Phase I trials test the best way to give a new treatment and the best dose. Phase II trials test whether a new treatment has an effect on the disease. Phase III trials compare the results of people taking a new treatment with the results of people taking the standard treatment. Phase IV

trials are done using thousands of people after a treatment has been approved and marketed, to check for side effects that were not seen in the phase III trial.

**Clino-San vaginal lubricant:** A vaginal lubricant formulated as a topical gel used to prevent and treat vaginal dryness. With a pH similar to that of normal vaginal discharge, Clino-San vaginal lubricant may reduce dryness, pain and irritation often caused by insufficient vaginal discharge due to atrophy of the vulvovaginal mucosa.

**ClinOleic:** (Other name for: olive oil/soya oil/egg lecithin-based emulsion)

**Clinoril:** (Other name for: sulindac)

**clioquinol:** An orally bioavailable, lipophilic, copper-binding, halogenated 8-hydroxyquinoline with antifungal, antiparasitic and potential antitumor activities. Clioquinol forms a stable chelate with copper (copper (II) ions), which inhibits the chymotrypsin-like activity of the proteasome; consequently, ubiquitinated proteins may accumulate in tumor cells, followed by tumor cell apoptosis and the inhibition of tumor angiogenesis. In addition, the clioquinol-copper complex appears to decrease the expression of androgen receptors (AR) in human copper-enriched prostate cancer cells. Serum levels of copper are often elevated in patients with cancer; copper chelation may inhibit copper-dependent endothelial cell proliferation and tumor secretion of angiogenic factors.

**CLL:** A person, company, institution, group, or organization that oversees or pays for a clinical trial and collects and analyzes the data. Also called trial sponsor.

**CLL/SLL:** A health professional who takes care of patients.

**clobetasol propionate:** The propionate salt form of clobetasol, a topical synthetic corticosteroid with anti-inflammatory, anti-pruritic, and vasoconstrictive properties. Clobetasol propionate exerts its effect by binding to cytoplasmic glucocorticoid receptors and subsequently activates glucocorticoid receptor mediated gene expression. This results in synthesis of certain anti-inflammatory proteins, while inhibiting the synthesis of certain inflammatory mediators. Specifically, clobetasol propionate appears to induce phospholipase A2 inhibitory proteins, thereby controlling the release of the inflammatory precursor arachidonic acid from membrane phospholipids by phospholipase A2.

**clodronate** : An indolent (slow-growing) cancer in which too many immature lymphocytes (white blood cells) are found mostly in the blood and bone marrow. Sometimes, in later stages of the disease, cancer cells are found in the lymph nodes and the disease is called small lymphocytic lymphoma. Also called chronic lymphocytic leukemia.

**clodronate disodium**: The disodium salt of a nitrogen-free bisphosphonate analog of naturally occurring pyrophosphate. Clodronate binds to calcium and inhibits osteoclastic bone resorption and hydroxyapatite crystal formation and dissolution, resulting in a reduction of bone turnover. This agent may control malignancy-associated hypercalcemia, inhibit osteolytic bone metastasis and decrease pain.

**clofarabine**: A second generation purine nucleoside analog with antineoplastic activity. Clofarabine is phosphorylated intracellularly to the cytotoxic active 5'-triphosphate metabolite, which inhibits the enzymatic activities of ribonucleotide reductase and DNA polymerase, resulting in inhibition of DNA repair and synthesis of DNA and RNA. This nucleoside analog also disrupts mitochondrial function and membrane integrity, resulting in the release of pre-apoptotic factors, including cytochrome C and apoptotic-inducing factor, which activate apoptosis.

**clofarabine** : An indolent (slow-growing) cancer in which immature lymphocytes (white blood cells) are found in the blood and bone marrow and/or in the lymph nodes. CLL (chronic lymphocytic leukemia) and SLL (small lymphocytic lymphoma) are the same disease, but in CLL cancer cells are found mostly in the blood and bone marrow. In SLL cancer cells are found mostly in the lymph nodes. CLL/SLL is a type of non-Hodgkin lymphoma. Also called chronic lymphocytic leukemia/small lymphocytic lymphoma.

**Clofarex**: (Other name for: clofarabine)

**clofibrate**: An aryloxyisobutyric acid derivate with antihyperlipidemic activity. Although the exact mechanism of action has not been fully characterized, clofibrate may enhance the conversion of very-low-density lipoprotein (VLDL) to low-density lipoprotein (LDL), decreasing the production of hepatic VLDL, inhibiting cholesterol production, and increasing fecal excretion of neutral sterols.

**Clolar**: (Other name for: clofarabine) A drug used in the treatment of hypercalcemia (abnormally high levels of calcium in the blood) and cancer

that has spread to the bone (bone metastases). It may decrease pain, the risk of fractures, and the development of new bone metastases.

**Clomid:** (Other name for: clomiphene citrate)

**clomiphene citrate:** The citrate salt form of clomiphene, a triphenylethylene nonsteroidal ovulatory stimulant evaluated for antineoplastic activity against breast cancer. Clomiphene has both estrogenic and anti-estrogenic activities that compete with estrogen for binding at estrogen receptor sites in target tissues. This agent causes the release of the pituitary gonadotropins follicle stimulating hormone (FSH) and luteinizing hormone (LH), leading to ovulation. Check for active clinical trials using this agent.

**Clone:** One of a group of genetically identical cells or organisms derived from a common ancestor. OR An identical copy of a DNA sequence or entire gene; one or more cells derived from and identical to a single ancestor cell OR to isolate a gene or specific sequence of DNA.

**clonidine hydrochloride:** The hydrochloride salt form of clonidine, an imidazoline derivative and centrally-acting alpha-adrenergic agonist as well as antagonist with antihypertensive activity. Clonidine hydrochloride binds to and stimulates central alpha-2 adrenergic receptors, thereby decreasing sympathetic outflow to the heart, kidneys, and peripheral vasculature. The reduction in sympathetic outflow, leads to decreased peripheral vascular resistance, decreased blood pressure, and decreased heart rate. or A drug used to treat certain types of acute lymphoblastic leukemia in children. It is also being studied in the treatment of other types of cancer. Clofarabine is a type of nucleoside analog. Also called Clolar.

**Clonidine Lauriad:** (Other name for: clonidine-containing mucoadhesive buccal tablet)

**clonidine-containing mucoadhesive buccal tablet:** An extended release, proprietary mucoadhesive buccal tablet formulation containing the hydrochloride salt form of clonidine, the imidazoline derivative and adrenergic alpha 2 receptor agonist, with anti-inflammatory activity. Upon contact of the tablet with the buccal mucosa, clonidine binds to the adrenergic receptors on macrophages and lymphocytes and may reduce the release of pro-inflammatory mediators such as tumor necrosis factor alpha (TNFalpha). As a result, this agent may prevent chemoradiation therapy-induced mucositis.

**cloning:** The production of large numbers of identical DNA molecules or cells from a single ancestral DNA molecule or cell.

**Cloning vector:** A self-replicating entity to which foreign DNA can be covalently attached for purposes of amplification in host cells.

**clopidogrel bisulfate:** A thienopyridine with antiplatelet activity.

Clopidogrel bisulfate irreversibly alters the platelet receptor for adenosine diphosphate (ADP), thereby blocking the binding of ADP to its receptor, inhibiting ADP-mediated activation of the glycoprotein complex GPIIb/IIIa, and inhibiting fibrinogen binding to platelets and platelet adhesion and aggregation.

**Cloretazine :** (Other name for: larmustine) or A drug used to treat certain types of acute lymphoblastic leukemia in children. It is also being studied in the treatment of other types of cancer. Clolar is a type of nucleoside analog. Also called clofarabine.

**Close-packing theory:** A theory of crystal packing advanced by Kitaigorodskii that states a crystal will contain the closest possible packing of molecules.

**closed system:** A closed system is a system from which the products of reactions taking place within the system cannot escape. OR A system that exchanges neither matter nor energy with the surroundings. See also system.

**Closed-head drum:** A container that is supplied to the customer with the TOP and BOTTOM ends seamed to the body. (Also known as a tight-head drum.)

**Closed-loop Control :** System for monitoring and automatically adjusting injection molding process conditions such as temperature, pressure and time. The automatic changes keep part production within preset tolerances.

**closed-shell electron configuration:** a stable electron configuration in which all of the electrons are located in the lowest energy orbitals available.

**Clostridium butyricum-containing probiotic:** A probiotic containing the anaerobic, butyric acid-forming Gram-positive bacterium *Clostridium butyricum* (*C. butyricum*), with potential immunomodulatory activity. Upon oral administration of *C. butyricum*-containing probiotic, *C. butyricum* modulates the composition of the normal gastrointestinal (GI) microflora and help maintain adequate colonization of the GI tract, thereby improving

digestion and preventing GI disturbances. This bacterium creates an environment unfavorable to pathogens by adhering to human epithelial cells, thereby forming a protective mucosal barrier. This prevents attachment of pathogens and reduces the risk of infection. Dietary supplementation with this bacterium may restore or enhance intestinal immunity.

**Clostridium difficile :** A drug used to treat high blood pressure. It is also being studied in the treatment of certain types of cancer pain and as an aid to stop smoking. It blocks the release of chemicals from nerve endings that make blood vessels constrict (get narrower). Clonidine hydrochloride is a type of antihypertensive agent and a type of alpha-adrenergic agonist. Also called Catapres.

**Clostridium novyi-NT spores:** Spores of Clostridium novyi-NT, an attenuated strain of the obligate anaerobe Clostridium novyi, with potential immunostimulating and oncolytic activities. Upon intravenous administration, Clostridium novyi-NT spores germinate exclusively in hypoxic tissue, such as avascular regions of tumors. Germination results in lysis and destruction of surrounding viable tumor cells. Although C. novyi-NT spores do not proliferate in oxygenated tumor regions, they may stimulate the immune system to mount a cytolytic immune response against tumor cells, both hypoxic and well-oxygenated.

**closure:** A mathematical term which says that if you operated on any two real numbers A and B with +, -, \* or /, you get a real number. OR A device used to seal off the opening of the bottle to prevent the loss of its contents. OR A metal or plastic cap which effects a primary seal when properly applied to the container.

**clotrimazole:** A synthetic, imidazole derivate with broad-spectrum, antifungal activity. Clotrimazole inhibits biosynthesis of sterols, particularly ergosterol, an essential component of the fungal cell membrane, thereby damaging and affecting the permeability of the cell membrane. This results in leakage and loss of essential intracellular compounds, and eventually causes cell lysis.

**cloud:** A visible mass of condensed water vapor particles or ice suspended above the Earth's surface. Clouds may be classified on their visible appearance, height, or form.

**cloud albedo:** Reflectivity that varies from less than 10 to more than 90% of the insolation and depends on drop sizes, liquid water content, water vapor content, thickness of the cloud, and the sun's zenith angle. The smaller the drops and the greater the liquid water content, the greater the cloud albedo, if all other factors are the same.

**cloud feedback:** The coupling between cloudiness and surface air temperature in which a change in surface temperature could lead to a change in clouds, which could then amplify or diminish the initial temperature perturbation. For example, an increase in surface air temperature could increase the evaporation; this in turn might increase the extent of cloud cover. Increased cloud cover would reduce the solar radiation reaching the Earth's surface, thereby lowering the surface temperature. This is an example of negative feedback and does not include the effects of longwave radiation or the advection in the oceans and the atmosphere, which must also be considered in the overall relationship of the climate system.

**CLOUD POINT:** Anionics - the temperature at which a product becomes turbid when it is cooled under specific conditions.

**clove cigarette :** A drug used to treat acute myelogenous leukemia (AML). It is also being studied in the treatment of several other types of cancer. It blocks cell growth by damaging the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called laromustine and Onrigin.

**cluster sampling:** (i) A method of sampling in which the population is divided into aggregates (or clusters) of items bound together in a certain manner. A sample of these clusters is taken at random and all the items which constitute them are included in the sample (ISO, 1977); (ii) a sampling method in which each unit selected is a group of persons (all persons in a city block, a family, etc.) rather than an individual (Last, 1988).

**cMet CAR-mRNA electroporated autologous T lymphocytes:** A preparation of autologous T-lymphocytes that have been electroporated with an mRNA encoding a chimeric antigen receptor (CAR) consisting of an anti-human hepatocyte growth factor receptor (HGFR or cMet) scFv (single chain variable fragment) and the zeta chain of the TCR/CD3 complex (CD3-zeta) coupled to the co-stimulatory molecule 4-1BB (CD137), with potential antineoplastic activities. Upon intratumoral administration, cMet CAR-mRNA electroporated autologous T lymphocytes direct T-cells to

cMet-expressing tumor cells, which induces a selective toxicity in cMet-expressing tumor cells and causes tumor cell lysis. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of cMet. The inclusion of the 4-1BB signaling domain may increase the antitumor activity as compared to the inclusion of the CD3-zeta chain alone. The mRNA CAR is expressed for a limited amount of time, which can prevent serious, unforeseen side effects. cMet, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**CMF:** A type of bacterium found in human and animal waste. *Clostridium difficile* is a common cause of diarrhea that occurs in hospitals. It can also cause diarrhea or other intestinal disorders in patients treated with antibiotics.

**CMF regimen:** A chemotherapy regimen consisting of cyclophosphamide, methotrexate, and fluorouracil, which may be used in the adjuvant setting for the treatment of nonmetastatic breast cancer or alone for the treatment of metastatic breast cancer.

**CMF regimen :** A type of cigarette that is made in Indonesia. It is made using a mixture of tobacco, cloves, and other ingredients. Clove cigarettes contain nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Smoking clove cigarettes can lead to nicotine addiction and can cause lung cancer and other lung conditions. Also called kretek.

**CML:** An abbreviation for a chemotherapy combination used alone or with other therapies to treat breast cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, methotrexate, and fluorouracil. Also called CMF regimen.

**CMML:** An abbreviation for a chemotherapy combination used alone or with other therapies to treat breast cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs cyclophosphamide, methotrexate, and fluorouracil. Also called CMF.

**CMS:** An indolent (slow-growing) cancer in which too many myeloblasts are found in the blood and bone marrow. Myeloblasts are a type of immature blood cell that makes white blood cells called myeloid cells. CML may get worse over time as the number of myeloblasts increases in

the blood and bone marrow. This may cause fever, fatigue, easy bleeding, anemia, infection, a swollen spleen, bone pain, or other signs and symptoms. CML is usually marked by a chromosome change called the Philadelphia chromosome, in which a piece of chromosome 9 and a piece of chromosome 22 break off and trade places with each other. It usually occurs in older adults and rarely occurs in children. Also called chronic granulocytic leukemia, chronic myelogenous leukemia, and chronic myeloid leukemia.

**CMV:** A slowly progressing type of myelodysplastic/myeloproliferative disease in which too many myelomonocytes (a type of white blood cell) are in the bone marrow, crowding out other normal blood cells, such as other white blood cells, red blood cells, and platelets. Also called chronic myelomonocytic leukemia.

**CMV pp65 peptide:** A peptide derived from cytomegalovirus (CMV) internal matrix protein pp65. CMV pp65 peptide antigen is used in recombinant vaccinia virus as an HLA-A-restricted epitope to produce vaccines and specific CD8+ and CD4+ cell responses against CMV infection, a serious complication of allogeneic bone marrow transplantation (BMT). In BMT, CMV infection may be prevented by passive immunization with donor-derived CMV-pp65-specific T-cell clones if provided early post-BMT.

**CMVpp65-A\*0201 peptide vaccine:** A peptide-based cancer vaccine containing a mutated form of the HLA-A\*0201-restricted cytomegaloviral epitope CMVpp65(495-503) with potential immunostimulatory and antitumor activities. Upon subcutaneous administration, CMVpp65-A\*0201 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against CMV-positive cells, resulting in cell lysis. HLA-A\*0201 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*0201 may improve antigenic peptide immunogenicity. CMVpp65, a tegument protein of the herpes virus CMV, is the main viral antigen found in peripheral blood mononuclear cells (PBMCs) after viral infection and may activate cell-mediated immunity.

**CMVpp65/gB plasmid vaccine ASP0113:** A poloxamer-formulated, bivalent DNA vaccine containing two plasmids encoding both the human cytomegaloviral (CMV) tegument phosphoprotein 65 (pp65), a major

internal matrix protein, and glycoprotein B (gB), an important CMV component responsible for attachment and entry into cells, with potential immunostimulatory properties. Upon intramuscular injection of CMVpp65/gB plasmid vaccine ASP0113, the expressed proteins may activate the immune system to mount both cellular and humoral immune responses against CMV-positive cells. This results in cell lysis of CMV-infected cells and prevents both viral replication and the development of CMV disease. This vaccine also provides active immunization and protective immunity against CMV infection in CMV-negative patients exposed to infected donor cells or tissues in transplant recipients. CMV infection can cause serious complications in patients receiving either allogeneic hematopoietic cell transplants (HCT) or solid organ transplants. The poloxamer-based delivery system enhances DNA delivery.

**CNDO:** A semi-empirical method ("complete neglect of differential overlap").

**CNDO-109-activated allogeneic natural killer cells:** A preparation of non-interleukin-2 primed, tumor activated allogeneic natural killer (NK) cells with potential immunostimulating activity. The allogeneic NK cells obtained from a first or second degree relative of the patient are co-incubated with a lysate from the CTV-1 cell line, a minimally differentiated myeloid line derived from an acute myelogenous leukemia patient. Infusion of CNDO-109-activated allogeneic NK cells may be able to lyse and destroy NK-resistant tumor cells and a broad spectrum of tumor cells. Check for active clinical trials using this agent.

**CNGRC peptide-TNF alpha conjugate:** A cytokine-peptide conjugate composed of the cytokine tumor necrosis factor alpha (TNF-alpha) chemically linked to the peptide CNGRC. The peptide moiety CNGRC, a ligand for the membrane-bound metalloprotease CD13, binds to endothelial cells of the angiogenic vasculature that express CD13 (also known as aminopeptidase N); subsequently, the TNF-alpha moiety induces apoptosis in endothelial cells expressing CD13, thereby inhibiting tumor-associated angiogenesis.

**cnicin :** A condition that may occur in patients who have had surgery to remove a tumor in certain parts of the brain, including the cerebellum. CMS usually appears 1 or 2 days after surgery. Symptoms include loss of speech, trouble swallowing and eating, loss of balance, trouble walking, loss of

muscle tone, mood swings, and changes in personality. Many of these symptoms go away over time. Also called cerebellar mutism syndrome.

**CNS:** A virus that may be carried in an inactive state for life by healthy individuals. It is a cause of severe pneumonia in people with a suppressed immune system, such as those undergoing bone marrow transplantation or those with leukemia or lymphoma. Also called cytomegalovirus.

**CNS depressant :** A substance found in certain plants, including blessed thistle. It has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. Cnicin is a type of sesquiterpene lactone.

**CNS metastasis :** The brain and spinal cord. Also called central nervous system.

**CNS PNET :** A type of drug that slows down brain activity, which causes the muscles to relax and calms and soothes a person. CNS depressants are used to treat insomnia (trouble sleeping), anxiety, panic attacks, and seizures. They may also be used to relieve anxiety and tension before surgery. Examples of CNS depressants are benzodiazepines, barbiturates, and certain sleep medicines. CNS depressants are sometimes called sedatives or tranquilizers. Also called central nervous system depressant.

**CNS prophylaxis :** Cancer that has spread from the original (primary) tumor to the central nervous system (CNS). Also called central nervous system metastasis.

**CNS sanctuary therapy :** A type of cancer that arises from a particular type of cell within the brain or spinal cord. Also called central nervous system primitive neuroectodermal tumor.

**CNS stimulant :** Chemotherapy or radiation therapy given to the central nervous system (CNS) as a preventive treatment. It kills cancer cells that may be in the brain and spinal cord, even though no cancer has been detected there. Also called central nervous system prophylaxis, central nervous system sanctuary therapy, and CNS sanctuary therapy.

**CNS tumor :** Chemotherapy or radiation therapy given to the central nervous system (CNS) as a preventive treatment. It kills cancer cells that may be in the brain and spinal cord, even though no cancer has been detected there. Also called central nervous system prophylaxis, central nervous system sanctuary therapy, and CNS prophylaxis.

**CNTO 328:** A type of drug that increases the levels of certain chemicals in the brain and increases alertness, attention, energy, and physical activity. CNS stimulants also raise blood pressure and increase heart rate and breathing rate. They are used to treat depression, attention deficit hyperactivity disorder (a disorder in which a person has problems paying attention, controlling actions, and remaining still or quiet), and narcolepsy (a sleep disorder). Also called central nervous system stimulant.

**CNV:** Refers to the genetic trait involving the number of copies of a particular gene present in the genome of an individual. Genetic variants, including insertions, deletions, and duplications of segments of DNA, are also collectively referred to as CNVs. CNVs account for a significant proportion of the genetic variation between individuals. Also called copy number variant.

**co-culture :** The small bone at the bottom of the spine. It is made up of 3-5 fused bones. Also called tailbone.

**Co-extrusion:** The simultaneous extrusion of two or more different thermoplastic resins into a sandwich-like film with clearly distinguishable individual layers. This involves a process where parts are blow-molded with walls containing two or more layers of different material. Coextrusion offers wide latitude for material selection and also allows the use of recycled materials. A material with good barrier properties, for example, can be used for the inside and outside surfaces of a blow molded bottle, while recycled material can be used for the internal layer. (Modern Plastics Encyclopedia 1995). OR The technique of extruding two or more materials through a single die being fed by separate extruders. OR The process used to form a multilayer structure from two or more polymers. OR The process of combining two or more layers of extrudate to produce a multiple layer product in a single step. OR The process of extruding two or more materials through a single die with two or more orifices arranged so that the extrudates merge and weld together into a laminar structure before chilling. OR involves the extrusion process where two or more layers of different material are extruded together to form the wall of the tubing or item being formed.

**Co-Injection:** Simultaneous or near simultaneous injection of multiple materials.

**Co-Rax:** (Other name for: warfarin)

**co-trimoxazole :** A substance used to make drugs that prevent and treat blood clots in blood vessels and treat certain heart conditions. Coumarin is taken from certain plants and can also be made in the laboratory. It is a type of anticoagulant.

**coactivated T cell :** A tumor of the central nervous system (CNS), including brain stem glioma, craniopharyngioma, medulloblastoma, and meningioma. Also called central nervous system tumor.

**Coactivator:** A molecule that functions together with a protein apoactivator. For example, cAMP is a coactivator of the CAP protein.

**Coagulant :** Coagulation is the first step in separation process, where impurities in the water are collected to larger coagulated particles with the aid of coagulant. The coagulant is a water treatment chemical based on aluminum or iron salts. The coagulation is usually followed by flocculation in which, with the aid of polymers, the coagulated particles are bound together and even larger flocculated particles are formed. The large particles are then separated from the water with suitable separation process like clarification, flotation or filtration. See also "Flocculant."

**Coagulants:** Chemicals which cause very fine particles to clump (floc) together into larger particles. This makes it easier to separate the solids from the water by settling, skimming, draining, or filtering.

**coagulation:** the clumping of particles in order to settle out impurities; often induced by chemicals such as lime or alum. OR

Coagulation and coalescence are both words that are used to describe what happens when small particles in a dispersion combine together to form large ones. One example is what happens to milk (a nice disperse emulsion) if it is left at the back of the fridge too long. Coagulation is used when the particles that are combining are more or less solids, and coalescence is usually restricted to droplets of liquid.

**coal:** a dark-colored sedimentary rock that contains a high percentage of organic plant material.

**Coalesce:** To combine into one body or to grow together.

**COALESCING:** The settling or drying of an emulsion paint as the water evaporates.

**Coarse stuff:** The first coating in plaster work particularly on lathing or rough brickwork.

**coast:** the strip of land near the ocean that includes the beach and the immediate inland area beside it.

**coastal straightening:** the process of the headlands being cut back and the flanking beaches being widened.

**coastal zone:** Lands and waters adjacent to the coast that exert an influence on the uses of the sea and its ecology or whose uses and ecology are affected by the sea.

**Coastdown:** An action that permits the reactor power level to decrease gradually as the fuel in the core is depleted.

**Coat:** Term used generally to describe a single application of any type of paint or varnish.

**Coated pits:** Specialized regions of the plasma membrane containing localized cell-membrane receptors. The cytosolic side of these indentations is coated with the protein clathrin.

**Coating:** A paint, varnish, lacquer or other finish used to create a protective and/or decorative layer. Generally used to refer to paints and coatings applied in an industrial setting as part of the original equipment manufacturer's (OEM) process.

**Coating:** A uniform layer of chemical primers or adhesives applied to a surface to produce a chemical bond between the liquid silicone rubber and substrate. May also refer to 2-component silicone molding or special surface treatments that can be applied to silicone rubber to achieve desired properties OR Plastic that has not been recycled commonly has coating of a substrate by extruding a thin film of molten polymer plastic and pressing it onto the substrate.

**COATING:** paint, varnish, lacquer or other finish used to create a protective and/or decorative layer.

**cobalamin:** See coenzyme B12.

**cobalamin :** A drug used to treat a rare condition called Castleman disease in patients who do not have HIV or human herpesvirus 8. It is also being studied in the treatment of multiple myeloma. CNTO 328 binds to a protein called interleukin-6 (IL-6), which is made by some white blood cells and other cells in the body. CNTO 328 may help reduce inflammation and stop the growth of cancer cells or abnormal blood cells. It is a type of

monoclonal antibody. Also called anti-IL-6 chimeric monoclonal antibody, cCLB8, siltuximab, and Sylvant.

**Cobalamin (vitamin B<sub>12</sub>):** A complex taking part in a number of reactions including the formation of deoxyribonucleosides from ribonucleosides.

**Cobalt:** Symbol:"Co" Atomic Number:"27" Atomic Mass: 58.93amu. Cobalt is one of the transition elements. You can find cobalt in magnets, stainless steel, pottery, and Vitamin B-12.

**cobalt 60 :** A T cell that has been coated with monoclonal antibodies to enhance its ability to kill tumor cells.

**Cobalt accelerator:** Accelerates cure of polyester resins.

**cobimetinib:** An orally bioavailable small-molecule inhibitor of mitogen-activated protein kinase kinase 1 (MAP2K1 or MEK1), with potential antineoplastic activity. Cobimetinib specifically binds to and inhibits the catalytic activity of MEK1, resulting in inhibition of extracellular signal-related kinase 2 (ERK2) phosphorylation and activation and decreased tumor cell proliferation. Preclinical studies have demonstrated that this agent is effective in inhibiting the growth of tumor cells bearing a B-RAF mutation, which has been found to be associated with many tumor types. A threonine-tyrosine kinase and a key component of the RAS/RAF/MEK/ERK signaling pathway that is frequently activated in human tumors, MEK1 is required for the transmission of growth-promoting signals from numerous receptor tyrosine kinases. or A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Cobalamin helps make red blood cells, DNA, RNA, energy, and tissues, and keeps nerve cells healthy. It is found in liver, meat, eggs, poultry, shellfish, milk, and milk products. Cobalamin is water-soluble (can dissolve in water) and must be taken in every day. Not enough cobalamin can cause certain types of anemia (a condition in which the number of red blood cells is below normal) and neurologic disorders. It is being studied with folate in the prevention and treatment of some types of cancer. Also called cyanocobalamin and vitamin B12.

**cocci:** spherical bacteria (singular, coccus).

**Cocculus/nux vomica/tabacum/petroleum extract:** A homeopathic herbal formulation with potential anti-emetic activity. Cocculus/nux vomica/tabacum/petroleum extract contains equal homeopathic units of the following extracts: extract of Cocculus indicus (fish berry), the fruit of the

southeast Asian/Indian climbing plant Anamirta cocculus; extract of the seeds of Strychnos nux vomica (poison nut), an evergreen tree native to southeast Asia; extract of Nicotiana tabacum (tobacco); and petroleum. Although the exact mechanism(s) of action for this formulation has yet to be fully elucidated, alkaloids in these plant extracts have been shown to relieve nausea, vomiting, and, in some cases, dizziness.

**coccyx** : A radioactive form of the metal cobalt, which is used as a source of radiation to treat cancer.

**cochlea**: a snail-like series of coiled tubes within the skull that assist hearing.

**Cockayne syndrome** : A drug used with vemurafenib to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Cobimetinib blocks certain proteins, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor and a type of targeted therapy. Also called Cotellic.

**cocoa extract**: A dietary supplement containing cocoa extract derived from the cacao bean, with potential vasodilating, anti-inflammatory, cardiovascular protective, neuroprotective, cognition enhancing and chemopreventive activities. Cocoa extract contains flavonoids, including high levels of epicatechin, catechin, procyanidins and xanthines, such as theobromine. Upon oral administration, the bioactive ingredients in the cocoa extract inhibit angiotensin-converting enzyme (ACE) and increase the production of nitric oxide (NO) through the activation of endothelial nitric oxide synthase (eNOS). This causes vasodilation, improves blood flow, and decreases blood pressure. The cocoa extract also improves insulin sensitivity, enhances cognition, and decreases the production of pro-inflammatory molecules. In addition, this extract exerts antioxidant effects and is able to scavenge reactive oxygen species (ROS). As a result, healthy cells are protected from oxidative stress and DNA damage.

**Cocrystal**: A mixed crystal or crystal that contains two different molecules.

**COD**: Chemical oxygen demand - the amount of oxygen in mg/l required to oxidize both organic and oxidizable inorganic compounds.

**COD (Chemical Oxygen Demand):** The amount of oxygen required to oxidize the substance chemically. Refers to degradation.

**codeine phosphate:** The phosphate salt of codeine, a naturally occurring phenanthrene alkaloid and opioid agonist with analgesic, antidiarrheal and antitussive activities. Codeine mimics the actions of endogenous opioids by binding to the opioid receptors at many sites within the central nervous system (CNS). Stimulation of mu-subtype opioid receptors results in a decrease in the release of nociceptive neurotransmitters such as substance P, GABA, dopamine, acetylcholine and noradrenaline; in addition, the codeine metabolite morphine induces opening of G-protein-coupled inwardly rectifying potassium (GIRK) channels and blocks the opening of N-type voltage-gated calcium channels, resulting in hyperpolarization and reduced neuronal excitability. Stimulation of gut mu-subtype opioid receptors results in a reduction in intestinal motility and delayed intestinal transit times. Antitussive activity is mediated through codeine's action on the cough center in the medulla.

**codeine phosphate :** A genetic condition characterized by short stature, premature aging, sensitivity to light, and possibly deafness and mental retardation.

**Coding strand:** The strand of DNA that has the same sequence as the RNA transcript except it contains thymine (T) in place of uracil (U).

**Codon:** In a messenger RNA molecule, a sequence of three bases that represents a particular amino acid. OR Nucleotide triplet in mRNA that encodes for a particular amino acid. OR In DNA or RNA, a sequence of 3 consecutive nucleotides that codes for a specific amino acid or signals the termination of gene translation (stop or termination codon).

**coefficient:** The number in front of a variable. For example, 4 is the coefficient in the term  $4x$ .

**Coefficient of Expansion .:** The fractional change in length (sometimes volume, specified) of a material for a unit change in temperature. Values for plastics range from 0.01 to 0.2 mils/in., C OR A number expressing the amount of frictional effect: static or dynamic.

**COEFFICIENT OF FRICTION:** Resistance to movement of-sliding or rolling surfaces of solid bodies in contact with each other. OR A measure of the resistance to sliding of one surface in contact with another. Low values mean easy sliding. The coefficient of friction of a packed bed of

plastic pellets on a polished screw surface is around 0.25, and about 0.4 on the barrel (rougher) surface. Pressure, temperature and surface characteristics affect the value of the coefficient of friction. OR static: the ratio of the limiting friction developed to the corresponding normal pressure, if two surfaces move relative to each other.

**Coefficient of Friction:** The force resisting the relative motion of solid surfaces, fluid layers, and material elements sliding against each other.

**Coefficient of Thermal Expansion:** The unit change in dimension of a material for a unit change in temperature. OR Average expansion per degree over a stated temperature range, expressed as a fraction of initial dimension, linear or volumetric OR OR The change in length of a material for a unit change in temperature, per unit of length.

**Coenzyme:** An organic molecule that associates with enzymes and affects their activity. OR A small organic molecule required for the activity of many enzymes; vitamins are often components of coenzymes. OR An organic cofactor required for the action of certain enzymes; often contains a vitamin as a component.

**coenzyme A:** A pantothenic acid-containing coenzyme serving as an acyl group carrier in certain enzymatic reactions.

**Coenzyme A (coa):** A coenzyme consisting of an adenine nucleotide linked to pantothenate, which is itself linked to mercaptoethylamine; universal carrier of acyl groups, which are bound to the mercaptoethylamine unit.

**coenzyme B12:** An enzymatic cofactor derived from the vitamin cobalamin, involved in certain types of carbon skeletal rearrangements.

**Coenzyme Q:** A mobile electron carrier that is a component of the respiratory chain; it shuttles between the oxidized ubiquinone form to the reduced ubiquinol form through a semiquinone intermediate; accepts electrons from NADH-Q reductase as well as succinate-Q reductase.

**coenzyme Q10:** A naturally occurring benzoquinone important in electron transport in mitochondrial membranes. Coenzyme-Q functions as an endogenous antioxidant; deficiencies of this enzyme have been observed in patients with many different types of cancer and limited studies have suggested that coenzyme-Q may induce tumor regression in patients with

breast cancer. This agent may have immunostimulatory effects. or A mixture of two or more different kinds of cells that are grown together.

**coenzymes:** organic molecules that act as cofactors, such as NAD and FAD.

**Coextrusion:** The process of combining two or more layers of plastic extrusions to produce a multiple layer product in a single step using one tool. A co-extrusion requires compatible PVC materials that will bond together to form a strong finished part. It can be either a dual hardness (rigid/flexible PVC) co-extrusion or a two-colour co-extrusion where two colours are extruded together. OR Coextrusion A process of extruding two materials simultaneously through the same die. For examples, see our extruded tubing page. OR The process of extruding two or more materials through a single die with two or more orifices arranged so that the extrudates merge and weld together into a laminar structure before chilling. OR The process of combining two or more layers of extrudate to produce a multiple layer product in a single step. OR Extrusion of film having multiple, distinct layers of materials using two or more extruders through a common die assembly. Co-extrusion allows resin combinations to be used to produce films having properties not obtainable through blending in a single layer extrusion.

**COF:** The coefficient of friction is a measurement of "slipperiness" of plastic films and laminates. Measurements are usually done film surface to film surface. Measurements can be done to other surfaces as well, but not recommended because COF values can be distorted by variations in surface finishes and contamination on test surface.

**Cofactor:** A helper molecule (either inorganic, such as a metal ion, or organic, such as a vitamin) required by an enzyme OR A small molecule required for enzyme activity It could be organic in nature, like a coenzyme, or inorganic in nature, like a metallic cation. OR An inorganic ion or a coenzyme required for enzyme activity. OR ions or molecules that associate with enzymes and are required for enzymatic reactions to take place.

**CoFactor:** (Other name for: folitixorin)

**coffee dietary supplement:** A dietary supplement containing coffee, with potential gastrointestinal (GI) tract stimulating activity. Following consumption of the dietary supplement, the coffee may both stimulate

peristalsis and increase bowel movement. The supplement may also stimulate the central nervous system, suppress appetite and cause weight loss.

**coffee enema :** A drug used to treat pain, cough, and diarrhea. It is made from opium or morphine and binds to opioid receptors in the central nervous system. Codeine phosphate is a type of opiate, a type of analgesic agent, a type of antitussive agent, and a type of antidiarrheal agent.

**COG :** A nutrient that the body needs in small amounts to function and stay healthy. Coenzyme Q10 helps mitochondria (small structures in the cell) make energy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Coenzyme Q10 is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, beef, soybeans, peanuts, and spinach. It is being studied in the prevention and treatment of some types of cancer and heart disease and in the relief of side effects caused by some cancer treatments. Also called CoQ10, Q10, ubiquinone, and vitamin Q10.

**cognate:** Describing two biomolecules that normally interact; for example, an enzyme and its normal substrate, or a receptor and its normal ligand.

**cognition :** The injection of coffee through the anus into the colon (large intestine). Coffee enemas are being tested in the treatment of pancreatic cancer.

**cognitive behavior therapy :** A group of clinical cancer research organizations that get support from the National Cancer Institute to study childhood cancers. The main goal of COG is to conduct clinical trials of new treatments for childhood and adolescent cancers at cancer centers in the United States, Canada, Europe, and Australia. Also called Children's Oncology Group.

**cognitive therapy :** The mental process of thinking, learning, remembering, being aware of surroundings, and using judgment.

**COGSWELL'S METHOD:** An approximate method for extensional viscosity measurement. It uses the excess pressure drop value in the die entrance (i.e. from the Bagley Correction). Reproducible measurements are usually possible in the elongation (extension, or stretch) rate range of 5 s<sup>-1</sup> to 50 s<sup>-1</sup>.

**Cohesion:** Cohesive forces of attraction happen between molecules of the same type. Two water droplets that are close to each other will combine into one because of cohesive forces. OR A bonding together of a single substance to itself. Internal adhesion. OR Cohesion just means "sticking together" and cohesive forces are the forces that enable something to stick to itself. For example, if you glue two objects together and then break them apart, a cohesive failure is where the glue itself breaks, as opposed to an adhesive failure where the break is at the join between the glue and one of the objects. OR Attraction of molecules within a coating (how it holds together). OR the attraction that holds together the molecules within one substance. OR Attraction between like molecules.

**Cohesive ends:** In double-stranded DNA molecules, complementary single-stranded ends produced by staggered cuts. Specific cohesive ends in DNA can be produced by certain restriction enzymes, such as *ecori*, and can then be used to join unrelated DNA molecules by annealing and joining with DNA ligase.

**cohort :** A type of psychotherapy that helps patients change their behavior by changing the way they think and feel about certain things. It is used to treat mental, emotional, personality, and behavioral disorders. Also called CBT and cognitive therapy.

**cohort study:** The method of epidemiologic study in which subsets of a defined population can be identified who are, have been, or in the future may be exposed or not exposed, or exposed in different degrees, to a factor or factors hypothesized to influence the probability of occurrence of a given disease or other outcome. The alternative terms for a cohort study, i.e., follow-up, longitudinal, and prospective study, describe an essential feature of the method, which is observation of the population for a sufficient number of person-years to generate reliable incidence or mortality rates in the population subsets. This generally implies study of a large population, study for a prolonged period (years), or both (Last, 1988). OR A type of psychotherapy that helps patients change their behavior by changing the way they think and feel about certain things. It is used to treat mental, emotional, personality, and behavioral disorders. Also called CBT and cognitive behavior therapy.

**Coil tubing:** Coil tubing, or coiled tubing is made to withstand kinking and tangling for uses where the hose needs to move.

**Coiled Hose:** Coiled Hose: Coiled hose is a type of coiled tubing that has a reinforcement like a braided thread or other reinforcement.

**cointegrate:** An intermediate in the migration of certain DNA transposons in which the donor DNA and target DNA are covalently attached.

**Coke** : Coal is heated in the absence of air (so not burned) to drive off volatile components and form coke. It is a raw material in the blast furnace as a source of carbon.

**COL-3:** A research study that compares a particular outcome (such as lung cancer) in groups of individuals who are alike in many ways but differ by a certain characteristic (for example, female nurses who smoke compared with those who do not smoke).

**COL18A1:** A group of individuals who share a common trait, such as birth year. In medicine, a cohort is a group that is part of a clinical trial or study and is observed over a period of time.

**Colchicine:** An alkaloid from the autumn crocus that prevents polymerization of tubulin to form microtubules; as a consequence, it inhibits the cell cycle at metaphase.

**colchicine:** An alkaloid isolated from *Colchicum autumnale* with anti-gout and anti-inflammatory activities. The exact mechanism of action by which colchicine exerts its effect has not been completely established. Colchicine binds to tubulin, thereby interfering with the polymerization of tubulin, interrupting microtubule dynamics, and disrupting mitosis. This leads to an inhibition of migration of leukocytes and other inflammatory cells, thereby reducing the inflammatory response to deposited urate crystals. Colchicine may also interrupt the cycle of monosodium urate crystal deposition in joint tissues, thereby also preventing the resultant inflammatory response.

Overall, colchicine decreases leukocyte chemotaxis/migration and phagocytosis to inflamed areas, and inhibits the formation and release of a chemotactic glycoprotein that is produced during phagocytosis of urate crystals. or A substance being studied in the treatment of cancer. COL18A1 is made from a type of collagen (a protein found in cartilage and other connective tissue). It may prevent the growth of new blood vessels that tumors need to grow. COL18A1 is a type of antiangiogenesis agent. Also called endostatin.

**cold contaminant-free iobenguane I 131:** An I 131 radioiodinated synthetic analogue of the neurotransmitter norepinephrine, manufactured

with a proprietary process, with radioisotopic and potential antineoplastic activities. cold contaminant-free iobenguane I 131 (MIBG) localizes to adrenergic tissue and may be used to image or eradicate tumor cells that accumulate and metabolize norepinephrine. This agent is manufactured using a technology that avoids the production of unwanted "cold contaminants" (i.e., carrier molecules), which may cause undesirable side effects and compete with MIBG for binding on target receptor sites.

**Cold Flexibility:** Flexibility following silicone rubber exposure to a specified low temperature for a specified period of time

**Cold Flow:** change in dimensions or shape of some materials when subjected to external weight or pressure at room temperature. OR A term describing the tendency of certain materials to continue to deform or "creep" under constant sealing pressure OR Tendency of plastic materials to migrate slowly under heavy loads and/or over time.

**Cold Flow Lines :** Imperfections within the part wall due to thickening or solidification of resin prior to full cavity fill.

**Cold Flow or Creep:** A time-dependent strain of solids resulting from stress. OR The process of compression molding involving shaping an unheated compound in a mold under pressure then heating the article to cure it.

**cold front:** the leading edge of a cold air mass.

**cold ischemia :** A substance being studied in the treatment of cancer. COL-3 may block the growth of new blood vessels that tumors need to grow. It is a type of matrix metalloproteinase inhibitor and a type of antiangiogenesis agent.

**cold ischemia time :** A drug used to treat gout (inflamed joints caused by a buildup of uric acid). It comes from the crocus plant *Colchicum autumnale*. Colchicine blocks cell division and the movement of certain immune cells to areas that are inflamed. It is a type of alkaloid and a type of mitotic inhibitor.

**cold knife cone biopsy :** In surgery, the cooling of a tissue, organ, or body part after its blood supply has been reduced or cut off. This can occur while the organ is still in the body or after it is removed from the body if the organ is to be used for transplantation.

**cold knife conization :** In surgery, the time between the chilling of a tissue, organ, or body part after its blood supply has been reduced or cut off and the time it is warmed by having its blood supply restored. This can occur while the organ is still in the body or after it is removed from the body if the organ is to be used for transplantation.

**cold nodule :** A procedure in which a cone-shaped piece of abnormal tissue is removed from the cervix using a scalpel or laser knife. Some of the tissue is then checked under a microscope for signs of disease, such as cervical cancer. Cold knife cone biopsy may also be used to treat certain cervical conditions. Also called cold knife conization.

**Cold Runner:** Runner less liquid silicone injection molding system of delivering liquid silicone to heated cavity

**Cold Seal:** This is a term to describe pressure sensitive adhesive coating on plastic films or laminates that will allow the packages to be sealed by application of pressure (with no heat or with minimal heat).

**Cold shutdown:** The term used to define a reactor coolant system at atmospheric pressure and at a temperature below 200 degrees Fahrenheit following a reactor cooldown.

**Cold Slug:** The first bit of material to enter a silicone injection mold; so called because in passing through a sprue orifice it is cured OR A defect characterized by a small non-uniform area on the part caused by an improperly heated piece of plastic becoming attached to the part. OR The first material to enter an injection mold. So called because in passing through the sprue orifice it is cooled below the effective molding temperature.

**Cold Slug Well:** Space provided directly opposite the spruce opening in an injection mold to trap the cold slug. OR A depression (normally circular) in the ejection half of an injection mold, opposite the sprue, designed to receive the first front, or "cold" portion, of molten plastic during the injection process. OR Space provided directly opposite the sprue opening in an injection mold to trap the cold slug.

**Cold Stretch:** Pulling operation, usually on extruded filaments, to improve tensile properties.

**COLD-fX:** (Other name for: North American ginseng extract AFX-2)

**colectomy** : A procedure in which a cone-shaped piece of abnormal tissue is removed from the cervix using a scalpel or laser knife. Some of the tissue is then checked under a microscope for signs of disease, such as cervical cancer. Cold knife conization may also be used to treat certain cervical conditions. Also called cold knife cone biopsy.

**colesevelam hydrochloride**: A hydrochloride salt form of colesevelam, a non-absorbed polymer that binds bile acids in the intestine and lowers serum lipids.

**Coliform bacteria**: Non-pathogenic microbes found in fecal matter that indicate the presence of water pollution; are thereby a guide to the suitability for potable use.

**coliform organisms**: any of a number of organisms whose presence in wastewater is an indicator of pollution and of potentially dangerous bacterial contamination.

**colitis** : When radioactive material is used to examine the thyroid with a scanner, nodules that collect less radioactive material than the surrounding thyroid tissue are considered "cold." A nodule that is cold does not make thyroid hormone. Cold nodules may be benign (not cancer) or malignant (cancer). Cold nodules are sometimes called hypofunctioning nodules.

**collagen** : An operation to remove all or part of the colon. When only part of the colon is removed, it is called a partial colectomy. In an open colectomy, one long incision is made in the wall of the abdomen and doctors can see the colon directly. In a laparoscopic-assisted colectomy, several small incisions are made and a thin, lighted tube attached to a video camera is inserted through one opening to guide the surgery. Surgical instruments are inserted through the other openings to perform the surgery.

**collagen disease** : Inflammation of the colon.

**collagen/aloe vera/vitamin E/lidocaine topical hydrogel**: A topical preparation containing collagen, aloe vera, vitamin E, and lidocaine hydrochloride with wound-healing activity. The four ingredients of collagen/aloe vera/vitamin E/lidocaine topical hydrogel may promote wound repair and new tissue growth in which : collagen, a structural protein in connective tissue, provides a connective tissue matrix for the attachment of various cells involved in wound repair; aloe vera carbohydrate polymers provide a moist wound environment; vitamin E promotes blood vessel formation; and lidocaine acts as a local anesthetic.

**collagenase :** A fibrous protein found in cartilage and other connective tissue.

**collarbone :** A term previously used to describe chronic diseases of the connective tissue (e.g., rheumatoid arthritis, systemic lupus erythematosus, and systemic sclerosis), but now is thought to be more appropriate for diseases associated with defects in collagen, which is a component of the connective tissue.

**collecting duct :** A type of enzyme that breaks down the protein collagen.

**Collective dose:** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), this is the sum of the individual doses received in a given period by a specified population from exposure to a specified source of radiation. For related information, see Doses in Our Daily Lives, Sources of Radiation, and Measuring Radiation.

**collective noun:** a word that stands for a group of things is called a collective noun.

**collective patient perspective :** One of a pair of bones at the base of the front of the neck. The collarbones connect the breastbone to the shoulder blades. Also called clavicle.

**colligative property:** Properties of a solution that depend on the number of solute molecules present, but not on the nature of the solute. Osmotic pressure, vapor pressure, freezing point depression, and boiling point elevation are examples of colligative properties. OR Properties of a solution that depend only on the number of particles dissolved in it, not the properties of the particles themselves. The main colligative properties addressed at this web site are boiling point elevation and freezing point depression. OR Properties of solutions that depend on the number of solute particles per unit volume; for example, freezing-point depression.

**collision boundary:** a convergent boundary that separates two continental plates that are pushed into contact.

**collision frequency:** The average number of collisions that a molecule undergoes each second.

**collision theory:** A theory that explains reaction rates in terms of collisions between reactant molecules.

**colloid:** A substance consisting of particles dispersed throughout another substance. OR A colloid is a finely dispersed mixture of two or more substances that do not dissolve in each other. OR A substance with components of one or two phases, a type of mixture intermediate between homogeneous solution and heterogeneous mixture with properties also intermediate between a solution and a mixture. The size of dispersed phase particles in a colloid range from one nanometer to one micrometer. Behavior in solution surface chemistry and colloid chemistry is dependent on the surface charge and the potential distribution in the surrounding electrical double layer. OR If the size of a particle is of the order 10 nm to 1 micron ( $10^{-8}$  to  $10^{-6}$  metres), then a mixture of these particles with a continuous phase (e. g., tiny particles of dust in air or polymer in water) will have properties that are intermediate between those of a true solution and a mixture of largish particles in a substance. Three key things to remember about colloids are: OR a mixture in which the substance is split into tiny particles and spread within a second substance. Examples include smoke and fog. OR A colloid is a heterogeneous mixture composed of tiny particles suspended in another material. The particles are larger than molecules but less than 1  $\mu\text{m}$  in diameter. Particles this small do not settle out and pass right through filter paper. Milk is an example of a colloid. The particles can be solid, tiny droplets of liquid, or tiny bubbles of gas; the suspending medium can be a solid, liquid, or gas (although gas-gas colloids aren't possible).

**colloidal gold-bound tumor necrosis factor:** The last part of a long, twisting tube that collects urine from the nephrons (cellular structures in the kidney that filter blood and form urine) and moves it into the renal pelvis and ureters. Also called renal collecting tubule. OR A nanoparticle delivery system for recombinant human tumor necrosis factor (TNF) consisting of recombinant TNF bound to pegylated colloidal gold nanoparticles with potential antineoplastic activity. Upon intravenous administration, colloidal gold-bound recombinant human TNF travels through the bloodstream, avoiding immune detection and uptake by the reticuloendothelial system because of nanoparticle pegylation. Due to their size, the colloidal gold nanoparticles exit the circulatory system only at hyperpermeable tumor neovasculature sites; TNF then binds to and activates tumor cell TNF receptors, which may result in an increase in tumor cell apoptosis and a reduction in tumor cell proliferation. Compared to the administration of

unbound TNF, colloidal gold-bound TNF may improve the efficacy and safety of TNF administration by delivering TNF specifically to tumor tissue.

**colloidal oatmeal cream:** A colloidal oatmeal-based skin cream with potential moisturizing and skin protecting activity. Upon application to the skin, colloidal oatmeal cream forms a protective barrier and thereby prevents water loss, provides moisture to the skin and protects the skin from damage. Check for active clinical trials using this agent.

**Colloidal silica:** Molecular formula: SiO<sub>2</sub>. Monodispersed silicon dioxide particles, usually between 0-1000 nanometers in diameter, usually in solution.

**Colloids:** Very small, finely divided solids (particles that do not dissolve) that remain dispersed in a liquid for a long time due to their small size and electrical charge.

**coloanal anastomosis :** An understanding of the disease experiences of many patients and the ability to describe this collective experience separately from a person's own disease experience. In cancer research, a collective patient perspective may help scientific researchers develop clinical trials that help meet the needs of more patients.

**coloanal pull-through :** A substance being studied in the treatment of some types of cancer. Colloidal gold-bound tumor necrosis factor is made in the laboratory by binding a cancer-killing protein called tumor necrosis factor (TNF) to the surface of very tiny particles of gold. These TNF-gold particles may kill cancer cells without harming healthy tissue. Also called Aurimmune and TNF-bound colloidal gold.

**colon:** used primarily when introducing a list, introducing a quotation or formal statement, or introducing a restatement or explanation.

**colon :** A surgical procedure in which the colon is attached to the anus after the rectum has been removed. Also called coloanal pull-through.

**colon cancer :** A surgical procedure in which the colon is attached to the anus after the rectum has been removed. Also called coloanal anastomosis.

**colon crypt :** The longest part of the large intestine, which is a tube-like organ connected to the small intestine at one end and the anus at the other. The colon removes water and some nutrients and electrolytes from partially

digested food. The remaining material, solid waste called stool, moves through the colon to the rectum and leaves the body through the anus.

**colon polyp** : Cancer that forms in the tissues of the colon (the longest part of the large intestine). Most colon cancers are adenocarcinomas (cancers that begin in cells that make and release mucus and other fluids).

**colonoscope** : Tube-like gland found in the lining of the colon and rectum. Colon crypt cells renew the lining of the intestine and make mucus. Also called gland of Lieberkuhn.

**colonoscopy** : An abnormal growth of tissue in the lining of the bowel. Polyps are a risk factor for colon cancer.

**colony-stimulating factor** : A thin, tube-like instrument used to examine the inside of the colon. A colonoscope has a light and a lens for viewing and may have a tool to remove tissue.

**Color:** Color is a measure of reflected wavelengths of light. Colors are also only useful to organisms that can see with the visible spectrum of light. An element like gold may have a yellow color while mercury will be highly reflective and silvery (like silver color). OR an easy test in the identification of minerals, but not always reliable.

**Color Concentrate:** A measured amount of dye or pigment incorporated into a predetermined amount of plastic. This pigmented or colored plastic is then mixed into larger quantities of plastic material used for molding. The "concentrate" is added to the bulk of plastic in measured quantity in order to produce a precise, predetermined color of the molded bottles. OR A plastics compound which contains a high percentage of pigment to be blended into base resins. The term masterbatch is sometimes used for color concentrate as well as for concentration of other additives. OR A plastics compound which contains a high percentage of color pigment blended with a carrier resin.

**Color Concentrate (also know as Colorant, Pigment)** : A plastic compound which contains a high percentage of pigment, to be blended in appropriate amounts with the base resin so that the correct final color is achieved.

**Color dimorphism:** The existence of two crystalline forms of the same compound in which each exists as a different color.

**Color Jet Printing:** This system involves two main components, the core and the binder. It begins with a layer of the core laid out on the building platform, and then the binder is ejected from inkjet printer heads. This effectively bonds and sets the material, while adding the color.

**Color Space:** all of the measurement systems used to quantify color use three independent variables. (This is easy to understand when we think of a light brilliant blue versus a dark dull blue.) These three components thus create a three dimensional color space where every unique color has a unique position. Munsell developed one of the early systems using the variables hue, value, and chroma. Each system may have different names for the three variables.

**Color Tolerance:** a color tolerance is a compromise between the difference in color values that can be perceived (what one can see) and what is acceptable and achievable in multiple samples. In essence it is a distance measurement from target, either in a specific variable direction ( $L^*$ ,  $a^*$ , or  $b^*$ ), or in total distance  $\Delta E$  (which is always a positive number).

**Colorant:** A pigment system usually in pelletized, powder or liquid form which is mixed with resin to produce the desired color.

**COLORANT:** Dyes or pigments which impart color to plastics. The dyes are synthetic or natural compounds of submicroscopic size, soluble in common solutions, yielding transparent colors. Pigments are organic and inorganic substances with larger particle sizes and are usually insoluble in common solvents. OR an agent used to impart color and/or appearance to a material. Colorants include black, white, and color pigments, dyes, metallic particles, fluorescent and pearlescent agents, marbling, and other special effects. OR A pigment system, usually in pelletized form, powder or liquid, which is mixed with resin to produce the desired color. OR Concentrated color that can be added to paints to make a specific color. Proper color of a diamond OR Colourants are, e.g., dyes, pigments or coloured chemicals added to another substance(s) to cause a change in colour or shade.

**Colorant (also know as Color Concentrate, Pigment) :** A plastic compound which contains a highpercentage of pigment, to be blended in appropriate amounts with the base resin so that the correct final color is achieved.

**Colorants & Pigments:** Are additive used to change the color of the plastic. They can be a powder or a resin/color premix.

**colorectal** : Examination of the inside of the colon using a colonoscope, inserted into the rectum. A colonoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**colorectal cancer** : A substance that stimulates the production of blood cells. Colony-stimulating factors include granulocyte colony-stimulating factor (G-CSF), granulocyte-macrophage colony-stimulating factor (GM-CSF), and promegapoeitin.

**COLORIMETER**: An instrument for measuring and matching colors.

**colorimetry**: A method for chemical analysis that relates color intensity to the concentration of analyte.

**colostomy** : Having to do with the colon or the rectum.

**colostomy irrigation** : Cancer that develops in the colon (the longest part of the large intestine) and/or the rectum (the last several inches of the large intestine before the anus).

**Colour change (fillers)**: Fillers are absorbent and have a different porosity than the substrate, which can cause variations in colour. Therefore, fillers should be applied as early as possible in the process to avoid variations in gloss, sheen or colour. Before repainting, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants, then rub down with a suitable abrasive and dust off the whole surface. Prime with one coat Dulux Alkali Resisting Primer thinned with up to one part Dulux Thinner 41 or white spirit to 10 parts paint.

**Colour Concentrate**: Is a compound containing high pigment that is blended into base resin.

**Colour pigment**: Also known as masterbatch. A concentrated blend of pigment, additives, filler, etc., that are added to the base plastic polymer in appropriate amounts to achieve the required colour.

**Colour retention**: The ability of paint to keep its original colour and resist fading.

**Colourant**: A pigment dispersed in a medium which is used for tinting a paint after manufacture.

**colposcope** : An opening into the colon from the outside of the body. A colostomy provides a new path for waste material to leave the body after part of the colon has been removed. Or A procedure in which a patient with

a colostomy flushes the colon with water, using a tube that is inserted into the stoma (a surgically created opening in the body that connects an organ or area inside the body with the outside). This causes the colon to empty and pass stool through the stoma into a bag. The procedure should be done at the same time every day. It may allow colostomy patients to have better control over their bodies.

**Colprosterone:** (Other name for: therapeutic progesterone)

**Column:** Long vertical cylinder or shaft supporting a roof beam or entablature, or alone as a monument. OR pillar of rock formed when a stalactite and stalagmite merge.

**Column :** The structural member that forms the main support for the entire spiral system and is located circumferentially around the system.

**column chromatography:** Column chromatography is a method for separating mixtures. A solution containing the mixture is passed through a narrow tube packed with a stationary phase. Different substances in the mixture have different affinities for the stationary phase, and so move through the tube at different rates. This allows the substances in the mixture to be detected or collected separately as they reach the end of the tube.

**columnar structures:** cooled and contracted flood basalt in vertical, parallel, generally six-sided columns.

**coma :** A lighted magnifying instrument used to check the cervix, vagina, and vulva for signs of disease.

**Combix:** (Other name for: ferumoxtran-10)

**combination antiretroviral therapy :** A procedure in which a lighted, magnifying instrument called a colposcope is used to examine the cervix, vagina, and vulva. During colposcopy, an instrument called a speculum is inserted into the vagina to widen it so that the cervix can be seen more easily. A vinegar solution may be used to make abnormal tissue easier to see with the colposcope. Tissue samples may be taken using a spoon-shaped instrument called a curette and checked under a microscope for signs of disease. Colposcopy may be used to check for cancers of the cervix, vagina, and vulva, and changes that may lead to cancer.

**combination chemotherapy :** A condition in which a patient is in a state of deep sleep and cannot be awakened. A coma may be caused by many things, including trauma, drugs, toxins, or certain diseases.

**Combination electrode:** a combination of a sensing electrode and a reference electrode contained in one unit.

**combination reaction:** A reaction in which two or more substances are chemically bonded together to produce a product. For example,  $2 \text{Na(s)} + \text{Cl}_2\text{(g)} \rightarrow 2 \text{NaCl(s)}$  is a combination reaction.

**combination therapy :** Treatment that uses a combination of three or more drugs to treat HIV infection. Combination antiretroviral therapy stops the virus from making copies of itself in the body. This may lessen the damage to the immune system caused by HIV and may slow down the development of AIDS. It may also help prevent transmission of HIV to others, including from mother to child during birth. Also called cART, HAART, and highly active antiretroviral therapy.

**Combinatorial Chemistry:** Combinatorial chemistry comprises of methods used to generate libraries of compounds with sizes ranging from hundreds to millions, in a single process. OR The random assembly of various chemical units into chemical libraries of new synthetic compounds OR The process of producing large populations of molecules en masse and then selecting for a particular biochemical property.

**Combinatorial control:** A means of controlling gene expression in eukaryotes in which each transcription factor, rather than acting on its own to effect transcription, recruits other proteins to build up large complexes that regulate the transcription machinery.

**Combinatorial Library:** Large collections of synthesised compounds generated through combinatorial chemistry.

**combined androgen blockade :** Treatment using more than one anticancer drug.

**Combined available:** The concentration of chlorine which is combined with ammonia ( $\text{NH}_3$ ) as chloramine or as other chloro derivatives, yet is still available to oxidize organic matter.

**Combined Gas Law:** There came a time when scientists combined the ideas in Boyle's Law and Charles' Law. The result was the combined gas law that worked for pressure, temperature, and volume. The formula goes:  $(P_1V_1)/T_1=(P_2V_2)/T_2$ . From this formula you can determine the values of pressure, volume, or temperature when you know the values of one system and all but one of the values for a second system.

**Combined license (COL):** An NRC-issued license that authorizes a licensee to construct and (with certain specified conditions) operate a nuclear power plant at a specific site, in accordance with established laws and regulations. A COL is valid for 40 years (with the possibility of a 20-year renewal). For additional detail, see Combined License Applications.

**Combined sewer:** A sewer designed to carry both sanitary wastewaters and storm or surface-water runoff.

**combining like terms:** The process of adding or subtracting like terms.

**COMBINING WEIGHT:** The apparent equivalent weight of, for example, a sulfonic acid, where two or more acidic components, in this case the sulfonic acid product and sulfuric acid impurity, are present. (see RFF 705.10.51 - COMBINING WEIGHT).

**Combotox:** (Other name for: deglycosylated ricin A chain-conjugated anti-CD19/anti-CD22 immunotoxins)

**combretastatin A1 diphosphate:** The diphosphate prodrug of the stilbenoid combretastatin A1, originally isolated from the plant *Combretum caffrum*, with vascular-disrupting and antineoplastic activities. Upon administration, combretastatin A1 diphosphate (CA1P) is dephosphorylated to the active metabolite combretastatin A1 (CA1), which promotes rapid microtubule depolymerization; endothelial cell mitotic arrest and apoptosis, destruction of the tumor vasculature, disruption of tumor blood flow and tumor cell necrosis may ensue. In addition, orthoquinone intermediates, metabolized from combretastatin A1 by oxidative enzymes found to be elevated levels in some tumor types, may bind to tumor cell thiol-specific antioxidant proteins and DNA, and stimulate oxidative stress by enhancing superoxide/hydrogen peroxide production. CA1 binds to tubulin at the same site as colchicine but with higher affinity.

**combretastatin A4 phosphate :** Therapy that combines more than one method of treatment. Also called multimodality therapy and multimodality treatment.

**COMBUSTIBLE LIQUID:** A liquid which has a flash point above 100F.

**combustion:** When substances combine with oxygen and release energy. OR Rapid oxidation (burning) accompanied by the release of heat. OR Combustion is the burning of a substance in air or oxygen to produce oxides. OR A chemical reaction between a fuel and an oxidizing agent that

produces heat (and usually, light). For example, the combustion of methane is represented as  $\text{CH}_4(\text{g}) + 2 \text{O}_2(\text{g}) = \text{CO}_2(\text{g}) + 2 \text{H}_2\text{O}()$ . OR This is a scientific word for the burning of a fuel.

**comedo carcinoma :** Treatment used to block androgen (male hormone) activity in the body. This may be done by giving an antiandrogen drug and removing the testicles (orchiectomy) or by giving an antiandrogen drug with a gonadotropin-releasing hormone (GnRH) agonist. Combined androgen blockade may stop the growth of cancer cells that need androgens to grow, and is used in the treatment of prostate cancer. Also called complete androgen blockade and total androgen blockade.

**comet:** a mass of frozen gases, ice, and rock that orbits the Sun.

**Cometriq:** (Other name for: cabozantinib-s-malate)

**Cometriq :** A substance being studied in the treatment of cancer. It decreases the flow of blood to tumors and may kill cancer cells.

Combretastatin A4 phosphate comes from the African bush willow. It is a type of tubulin-binding agent and a type of vascular targeting agent.

**comfort care :** A type of ductal carcinoma in situ (very early-stage breast cancer).

**comma:** the most frequently used internal punctuation in sentences; commas are used after introductory clauses and phrases, with restrictive and nonrestrictive elements, with appositives, between items in a series, between modifiers in a series, to join independent clauses, and to set off interrupting elements.

**Commensalism:** When two organisms coexist, with one organism deriving food or other benefits from another, without causing harm to the other organism. Often this relationship offers two-way benefits. For a more powerful version of this co-operation see synergism. A natural consortium of commensal bacteria residing in saliva and the digestive system of fish, crustaceans and mammals, including humans, are necessary for proper digestion of foods into simple water-soluble compounds that can easily pass through intestinal walls to feed the host's body. A natural consortium of commensal bacteria will take up residence in the skin and coat of mammals, reducing objectionable odors from sweat and excess production of natural oils, meant to lubricate and protect the skin from the environment, when disinfectants are avoided in soaps, shampoos and skin care products. These commensal bacteria will try to protect their natural home by mechanically

preventing invasion by pathogenic (disease-causing fungi and bacteria). Many natural commensal bacteria are exploited by pharmaceutical companies to produce antibiotics, used to cure some of the worst pathogenic organisms, but incorrect use and overuse of antibiotics is leading some pathogenic organisms to develop resistance to the most commonly used antibiotics. Natural commensal bacteria will produce a cocktail of antibiotics or will vary the antibiotics they produce to discourage pathogens they encounter from developing resistance. OR a relationship in which one population receives a benefit from an association while the other is neither benefited nor harmed.

**Commercial match:** Although paints are matched to a standard there is always some "tolerance"™ between batches. It is possible therefore that there may be a variation in shade between different batches although each batch is a good "commercial match"™ to standard.

**Commercial sector (energy users):** Generally, nonmanufacturing business establishments, including hotels, motels, and restaurants; wholesalers and retail stores; and health, social, and educational institutions. However, utilities may categorize commercial service as all consumers whose demand or annual usage exceeds some specified limit that is categorized as residential service.

**Commingling:** Assembly of a reinforcement yarn with a thermoplastic in yarn or thread form, in a predetermined ratio. OR Shredding. A mechanical treatment process which cuts large pieces of waste into smaller pieces so that they won't plug pipes or damage equipment.

**Commit:** (Other name for: nicotine lozenge)

**Committed dose equivalent (CDE):** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), the CDE (HT,50) is the dose to some specific organ or tissue of reference (T) that will be received from an intake of radioactive material by an individual during the 50-year period following the intake.

**Committed effective dose equivalent (CEDE):** As defined in Title 10, Section 20.1003, of the Code of Federal Regulations (10 CFR 20.1003), the CEDE (HE,50) is the sum of the products of the committed dose equivalents for each of the body organs or tissues that are irradiated multiplied by the weighting factors (WT) applicable to each of those organs or tissues ( $HE,50 = \sum WTHT.50$ ).

**Committed step:** The first irreversible step in a metabolic pathway under physiologic conditions; this step is catalyzed by an allosteric enzyme and commits the product to a particular chemical fate.

**COMMODITY RESIN:** High-volume, low-priced resins like polyethylene (PE), polypropylene (PP), styrene (PS, etc), acrylic (PMMA), vinyl (PVC etc.).

**common bile duct :** A drug used to treat progressive medullary thyroid cancer that has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Cometriq blocks certain proteins, which may help keep cancer cells from growing. It may also prevent the growth of new blood vessels that tumors need to grow. Cometriq contains the active ingredient cabozantinib-s-malate. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor.

**common hepatic duct :** Care given to improve the quality of life of patients who have a serious or life-threatening disease. The goal of comfort care is to prevent or treat as early as possible the symptoms of a disease, side effects caused by treatment of a disease, and psychological, social, and spiritual problems related to a disease or its treatment. Also called palliative care, supportive care, and symptom management.

**common intermediate:** A chemical compound common to two chemical reactions, as a product of one and a reactant in the other.

**community:** a situation in which populations of organisms each contain a habitat and a niche.

**Community Advisory Board :** A tube that carries bile from the liver and the gallbladder through the pancreas and into the duodenum (the upper part of the small intestine). It is formed where the ducts from the liver and gallbladder are joined. It is part of the biliary duct system.

**commutative property of addition:** The order of the terms does not change the sum.

**commutativity:** A math property which states:  $A+B=B+A$  and  $A*B=B*A$ .

**Comonomer:** A monomer that is polymerised along with one or more other monomers to make a copolymer. All the different comonomers used in a copolymerisation are incorporated into each chain. OR One of the compounds that constitute a copolymer.

**comorbidity** : A tube that carries bile from the liver. It starts where the right and left hepatic (liver) ducts join outside the liver. It ends where the cystic duct from the gall bladder joins it to form the common bile duct. It is part of the biliary duct system.

**Compact**: A group of two or more States that have formed business alliances to dispose of low-level radioactive waste on a regional basis. For details, see Low-Level Waste Disposal, and for locations, see Low-Level Waste Compacts.

**compaction**: the step in lithification in which the grains of sediment are packed more tightly together.

**comparative anatomy**: comparing the anatomical structures of modern day organisms with fossils to yield clues to the type of organisms that roamed earth long ago. OR In medicine, a group of non-scientist volunteers that serves as a link between a community and clinical trial researchers. A Community Advisory Board may review and monitor clinical trials and help teach the community about the trials. Also called CAB.

**comparative biochemistry**: the comparison of biochemical processes of modern day organisms with fossils and ancient species; modern biochemistry indicates there is a biochemical similarity in all living things.

**comparative degree**: used with adjectives and adverbs to compare two people, things, or actions.

**Comparative Molecular Field Analysis (CoMFA)**: A 3D QSAR software

**Compartmentation**: The location of metabolites, enzymes, or pathways in different membrane-bound organelles in eukaryotic cells.

**compartments**: The body is composed of a large number of organs, tissues, cells, and fluids, any one of which could be referred to as a compartment. In chemobiokinetics, a compartment often refers collectively to the organs, tissues, cells, and fluids for which the rates of uptake and subsequent distribution and elimination are sufficiently similar to preclude kinetic resolution (WHO, 1979).

**Compass**: A compass is a scientific instrument that tells the user the direction of magnetic north. South is directly opposite north, east is to the right, and west is to the left.

**compassionate use trial** : The condition of having two or more diseases at the same time.

**Compatibility:** The capacity of different materials from different sources or of different compositions to be combined and applied so as to yield no visible or mechanically measurable differences in the cured film or application properties. OR Paints which can be mixed together without adversely affecting any of their properties, or the application of one type of paint over a different type without either being adversely affected. OR The ability of two or more substances to mix together without separation

**competing reactions:** two reactions that start with the same reactants but form different products.

**Competitive inhibition:** The reduction in the OR A type of enzyme inhibition reversed by increasing the substrate concentration; a competitive inhibitor generally competes with the normal substrate or ligand for a protein's binding site. rate of enzyme activity observed when the enzyme can bind the substrate or the inhibitor but not both. Many competitive inhibitors resemble the substrate and compete with it for binding to the active site. Relief from inhibition by saturation with substrate is a kinetic hallmark of competitive inhibition.

**complement:** The percentage that would add to 100%. For example, 42% is the complement of 58%.

**complement (predicate nominative or predicate adjective):** an element in a predicate that identifies or describes the subject; a complement can be either a noun (called a predicate noun or predicate nominative), or an adjective (called a predicate adjective).

**complement C5 inhibitor ALXN1210:** A longer-acting antibody directed against terminal complement protein C5, with potential anti-inflammatory activity. Upon administration, complement C5 inhibitor ALXN1210 binds to terminal complement protein C5, thereby blocking C5 cleavage into pro-inflammatory components and preventing the complement-mediated destruction of red blood cells (RBCs) as seen in paroxysmal nocturnal hemoglobinuria (PNH). Compared to other anti-C5 antibodies, ALXN1210 is longer-acting and allows for monthly dosing. C5, a complement pathway protein, is expressed at high levels by the liver.

**complement protein :** The comparison of the structure (anatomy) of one animal or plant with the structure of a different animal or plant.

**Complementarity-determining region (CDR):** In immunoglobulin L and H chains, polypeptide segments that display great sequence variability and

are responsible for antigenic specificity.

**complementary:** Having a molecular surface with chemical groups arranged to interact specifically with chemical groups on another molecule.

**complementary and alternative medicine :** A way to provide an investigational therapy to a patient who is not eligible to receive that therapy in a clinical trial, but who has a serious or life-threatening illness for which other treatments are not available. Compassionate use trials allow patients to receive promising but not yet fully studied or approved cancer therapies when no other treatment option exists. Also called expanded access trial.

**complementary angles:** two angles the sum of whose measures is  $90^\circ$ .

**Complementary base sequence:** For a given sequence of nucleic acids, the nucleic acids that are related to them by the rules of base pairing.

**Complementary colours:** Contrasting or opposite colours which accentuate one another when placed side by side.

**complementary DNA (cDNA):** A DNA used in DNA cloning, usually made by reverse transcriptase; complementary to a given mRNA.

**complementary medicine :** One of a group of about 20 proteins that is found in the blood and is important in fighting infections and other diseases.

**complete androgen blockade :** Forms of treatment that are used in addition to (complementary) or instead of (alternative) standard treatments. These practices generally are not considered standard medical approaches. Standard treatments go through a long and careful research process to prove they are safe and effective, but less is known about most types of complementary and alternative medicine. Complementary and alternative medicine may include dietary supplements, megadose vitamins, herbal preparations, special teas, acupuncture, massage therapy, magnet therapy, spiritual healing, and meditation. Also called CAM.

**complete blood count :** Treatments that are used along with standard treatments, but are not considered standard. Standard treatments are based on the results of scientific research and are currently accepted and widely used. Less research has been done for most types of complementary medicine. Complementary medicine includes acupuncture, dietary supplements, massage therapy, hypnosis, and meditation. For example,

acupuncture may be used with certain drugs to help lessen cancer pain or nausea and vomiting.

**complete combustion:** A combustion reaction that converts all of the fuel's carbon, hydrogen, sulfur, and nitrogen into carbon dioxide, water, sulfur dioxide, and N<sub>2</sub> respectively.

**complete hysterectomy :** Treatment used to block androgen (male hormone) activity in the body. This may be done by giving an antiandrogen drug and removing the testicles (orchiectomy) or by giving an antiandrogen drug with a gonadotropin-releasing hormone (GnRH) agonist. Complete androgen blockade may stop the growth of cancer cells that need androgens to grow, and is used in the treatment of prostate cancer. Also called combined androgen blockade and total androgen blockade.

**complete ionic equation:** A balanced equation that describes a reaction occurring in solution, in which all strong electrolytes are written as dissociated ions.

**complete metastasectomy :** A measure of the number of red blood cells, white blood cells, and platelets in the blood. The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A complete blood count is used to help diagnose and monitor many conditions. Also called blood cell count, CBC, and full blood count.

**complete predicate:** the verb or verb phrase and the words that modify or complete it.

**complete remission :** Surgery to remove the entire uterus, including the cervix. Also called total hysterectomy.

**complete response :** Surgery to remove all metastases (tumors formed from cells that have spread from the primary tumor).

**complete subject:** the noun or pronoun and the words that modify or complete it.

**complex:** an intermediate formed when a cation is attracted to the high electron density of a  $\pi$  bond.

**complex decongestive therapy :** The disappearance of all signs of cancer in response to treatment. This does not always mean the cancer has been cured. Also called complete response.

**complex ion:** An ion formed by combination of simpler ions or molecules; for example,  $\text{Co}^{2+}$  combines with six molecules of water to form the complex ion  $\text{Co}(\text{H}_2\text{O})_6^{2+}$ .

**complex sentence:** contains one independent clause and one or more subordinate clauses.

**complexing:** the use of chelating or sequestering agents to form relatively loose chemical bonding as a means of treating certain pollutants such as nickel, copper, and cobalt.

**Complexing agent:** any species that combines with an ion to form an undissociated species; the resulting complex stays in solution and does not precipitate. Complexing agents are used as titrants and to bind ions that may interfere with direct measurements. OR A ligand that binds to a metal ion to form a complex.

**complexometric titration:** A titration based on a reaction between a ligand and a metal ion to form a complex. For example, free  $\text{Ca}^{2+}$  in milk powder can be determined by titrating a milk powder sample with EDTA solution, which chelates calcium ion. Endpoints in complexometric titrations are often determined using organochromic indicators.

**compliance :** The disappearance of all signs of cancer in response to treatment. This does not always mean the cancer has been cured. Also called complete remission.

**complication :** Treatment to reduce lymphedema (swelling caused by a buildup of lymph fluid in tissue). This therapy uses massage to move the fluid away from areas where lymph vessels are blocked, damaged, or removed by surgery. This helps remove extra fluid. The affected area is then wrapped in a special bandage. Later, a compression garment (tight-fitting, elastic piece of clothing) is worn to keep fluid from building up again.

**component:** 1. A substance whose concentration must be specified to describe the state of a mixture in which reactions are occurring. 2. A substance present in a mixture in which no reactions occur.

**Composite:** 1) a structure or an entity made up of distinct components. 2) a complex material, such as fiberglass, in which two or more distinct, structurally complementary substances, especially glasses and polymers, combine to produce structural or functional properties not present in any

individual components. 3) reinforced laminates (i.e., canvas phenolic, glass epoxy, etc.) OR A composite material is defined as a combination of two or more materials that results in better properties than when the individual components are used alone. Unlike metal alloys, each material retains its separate chemical, physical and mechanical properties. The two constituents are normally a fibre and a matrix. OR A structural non-homogenous material consisting of a combination of materials.

Typically, one of the materials is a strengthening agent, the other being a thermoset or thermoplastic resin. OR 1) A structure or an entity made up of distinct components. 2) A complex material, such as fiberglass, in which two or more distinct, structurally complementary substances, especially glasses and polymers, combine to produce structural or functional properties not present in any individual component. 3) Reinforced laminates (i.e., canvas phenolic, glass epoxy, etc.). OR A structural material consisting of a combination of materials. Typically, one of the materials is a strengthening agent, the other being a thermoset or thermoplastic resin. OR 1) a structure or an entity made up of distinct components. 2) a complex material, such as fiberglass, in which two or more distinct, structurally complementary substances, especially glasses and polymers, combine to produce structural or functional properties not present in any individual component. 3) reinforced laminates (i.e., canvas phenolic, glass epoxy, etc.). OR A structural non-homogenous material consisting of a combination of materials. Typically, one of the materials is a strengthening agent, the other being a thermoset or thermoplastic resin.

**composite hemangioendothelioma :** The act of following a medical regimen or schedule correctly and consistently, including taking medicines or following a diet.

**composite lymphoma :** In medicine, a medical problem that occurs during a disease, or after a procedure or treatment. The complication may be caused by the disease, procedure, or treatment or may be unrelated to them.

**composite volcano:** a volcano consisting of a cone of alternating layers of solidified lava and rock particles. OR a volcano that consists of alternating layers of lava and pyroclastic debris; built up over millions of years, such volcanos are characterized by long periods of dormancy.

**Composition Percentage:** This value tells the percentage of a solution that could be a percentage of mass or percentage by volume. It is determined by

dividing the value for the solute by the value for the solution and then multiplying by 100 to get the percentage. Seven milliliters of HCl divided by 100 milliliters of water creates a 7 percent by volume solution.

**Compostable:** Compostable materials are capable of undergoing biological decomposition in a compost site, to the extent that they are not visually distinguishable and break down to carbon dioxide, water, inorganic compounds, and biomass, at a rate consistent with known compostable materials (e.g. cellulose). See also 'compostable plastic'.

**Compostable plastic:** A polymer is 'compostable' when it is biodegradable under composting conditions. The polymer must meet the following criteria: a) Break down under the action of microorganisms (bacteria, fungi, and algae); b) Total mineralization is obtained (conversion into CO<sub>2</sub>, H<sub>2</sub>O, inorganic compounds and biomass under aerobic conditions); c) The mineralization rate is compatible with the composting process and consistent with known compostable materials (e.g. cellulose).

**composting:** The controlled biological decomposition of organic solid wastes under aerobic (in the presence of oxygen) conditions. Organic materials are transformed into soil enhancers such as humus and mulch. OR The natural biological decomposition of organic material in the presence of air to form a humus-like material. OR The term used to describe the activity of breaking down plant and animal material using microorganisms under aerobic conditions. For successful composting there must be sufficient water and air to allow the microorganisms to break down the material, and the compost should reach and maintain a warm temperature.

**Compound:** A chemical combination of two or more elements combined in a fixed and definite proportion by weight. OR Any plastic material prepared for subsequent manufacturing processes, specifically in extrusion, molding or calendaring. OR These are chemical combinations of materials which include all the materials necessary for the finished product. They include BMC (Bulk Molding Compounds), SMC (Sheet Molding Compounds) and TMC (Thick Molding Compounds). OR A mixture of the resin and all additives. OR a combination of ingredients before being processed or made not a finished product. Sometimes used as a synonym for material, formulation. OR A mixture of a polymer and associated chemical ingredients necessary to produce a finished high consistency rubber material. The term is commonly used when referring to a specific

rubber not liquid silicone rubber which is delivered in closed system OR These are chemical combinations of materials which include all the materials necessary for the finished product. They include BMC (Bulk Molding Compounds), SMC (Sheet Molding Compounds) and TMC (Thick Molding Compounds). OR These are chemical combinations of materials which include all the materials necessary for the finished product. OR A mixture of resin and the ingredients necessary to modify the resin to a form suitable for processing into finished articles. OR A mixture of resin(s) and additives usually formed in a separate machine downstream from the primary reactor. OR A mixture of resin and the ingredients necessary to modify the resin to a form suitable for processing into finished articles. OR A substance containing two or more different kinds of atoms chemically joined together. OR a molecule made up of two or more elements. OR A compound is a material formed from elements chemically combined in definite proportions by mass. For example, water is formed from chemically bound hydrogen and oxygen. Any pure water sample contains 2 g of hydrogen for every 16 g of oxygen. OR a substance made up of two or more elements that are combined chemically. OR two or more elements combined; a substance having different properties than of the elements used. OR Two or more atoms joined together chemically, with covalent or ionic bonds. OR is two or more elements chemically combined. OR A compound is a substance made up of more than one type of atom. OR a substance formed by the chemical combination of two or more elements. OR a collection of molecules.

**compound :** A blood vessel tumor that is made up of different types of cells and has features that are both benign (not cancer) and malignant (cancer). Composite hemangioendotheliomas usually form on or under the skin on the arms or legs. They may also form on the head, neck, or chest. Composite hemangioendotheliomas may spread to nearby lymph nodes, but usually do not spread to other parts of the body. They may come back in the same place after treatment. They are most common in adults. Composite hemangioendotheliomas are a type of vascular tumor.

**Compound 42:** (Other name for: warfarin)

**compound adjectives:** adjectives that are hyphenated when they appear before a noun.

**compound adverbs:** while most compound adverbs are written as two words, those beginning with over or under are spelled as one word.

**Compound Balanced Weave:** A fabric consisting of alternating right and left hand spirals nested together, and joined by three or more crimped connecting rods. In some fabrics straight connecting rods are used.

**compound heterozygosity :** The presence of two different mutated alleles at a particular gene locus.

**compound Kushen injection:** A traditional Chinese medicine (TCM) formulation composed of compound Kushen injection (CKI) containing aqueous extracts from the roots of Kushen (*Radix Sophorae Flavescentis*) and Baituling (*Rhizoma Smilacis Glabrae*), with potential antineoplastic and immunomodulating activities. CKI contains numerous chemicals including alkaloids, such as matrine and oxymatrine, flavonoids, alkylxanthenes, quinones, triterpene glycosides, fatty acids, and essential oils. Although the exact mechanism(s) of action through which CKI exerts its effects has yet to be fully elucidated, CKI is able to interfere with the activation of various signal transduction pathways, such as the Wnt/beta-catenin signaling pathway, inhibit nuclear factor-kappa B (NF- $\kappa$ B) activation, and block the activity of multiple receptor tyrosine kinases, such as epidermal growth factor receptor (EGFR) and vascular endothelial growth factor receptor (VEGFR). CKI induces apoptosis in and inhibits proliferation, migration, invasion and adhesion of tumor cells. CKI also modulates the production of inflammatory mediators.

**compound nevus :** A rare form of lymphoma (cancer that begins in cells of the immune system) in which different types of lymphoma cells occur at the same time. The different lymphoma cells may form in the same tissue or organ or in many different tissues or organs. The composite lymphoma may contain different types of non-Hodgkin lymphoma cells or both Hodgkin and non-Hodgkin lymphoma cells.

**compound preposition:** prepositions made up of more than one word.

**compound sentence:** has two or more independent clauses, joined by coordinating conjunctions, and no subordinate clauses.

**compound sodium lactate solution:** A multiple electrolyte, isotonic, crystalloid solution for intravenous infusion containing sodium chloride, potassium chloride, calcium chloride dihydrate, and sodium lactate, which can restore the electrolyte balance, normalize pH, and provide water for

hydration. Upon intravenous administration, the compound sodium lactate solution will replace any lost body fluids and electrolytes thereby providing hydration as well as normalizing electrolyte concentrations. In addition, conversion of sodium lactate to bicarbonate increases plasma bicarbonate levels, which facilitates the removal of hydrogen ions from the blood stream, raises blood pH and normalizes the acid-base balance.

**compound subjects:** refers to more than one actor in a sentence.

**compound word:** combination of two words can create a spelling problem; a dictionary is your best guide to correct spelling.

**compound-complex sentence:** joins two or more independent clauses with one or more subordinate clauses.

**COMPOUNDING:** The combination of polymers with other materials either by means of mechanical (dry) blending or melt state blending. OR The process of selection of additives and their incorporation into a polymer. Compounding is done to obtain desirable properties for particular uses. Modification of the polymer properties is done by ingredients such as polymeric resins, plasticizers, fillers, reinforcing agents, various stabilizers, lubricants, coloring agents, flame retardants, etc. OR The process required to mix polymer(s) with all of the additives that are necessary to provide the end user with a finished grade with suitable properties. OR The process required to mix the polymer with all of the materials that are necessary to provide the end user with a finished product.

**Compounding:** combining a polymer with various additives during melt processing (while the polymer is in a molten state). The mixed, molten material is then extruded, cut into pellet form, and packaged for use by an end user. When the additive is a colorant, the resulting colored material is termed a fully compounded color. Since the compounding process adds cost, compounding is usually only done when other blending methods are unsuitable.

**comprehensive cancer center :** In science, a substance made from two or more different elements that have been chemically joined. Examples of compounds include water (H<sub>2</sub>O), which is made from the elements hydrogen and oxygen, and table salt (NaCl), which is made from the elements sodium and chloride.

**comprehensive pediatric cancer center :** A pressing or squeezing together. In medicine, it can describe a structure, such as a tumor, that

presses on another part of the body, such as a nerve. It can also describe the flattening of soft tissue, such as the breast, that occurs during a mammogram (x-ray of the breast).

**Compressed Spiral Edges:** An edge finish in which the outer turns of the spirals are compressed to a specified distance.

**compressibility factor:**  $z = PV/nRT$  for a gas. If  $z=1$ , then  $PV=nRT$  (the ideal gas equation of state) and the gas is said to behave ideally.

**compression :** A type of break in a bone caused by pressure and in which the bone collapses. Compression fractures usually occur in the spine (backbone) and in bones made weak by cancer or by osteoporosis (a decrease in bone mass and density).

**compression bandage :** A tight-fitting, elastic garment, such as a sleeve or stocking. Compression garments are used in the treatment of lymphedema (swelling caused by a buildup of lymph fluid in tissue). They are also used to improve blood flow.

**compression fracture :** A machine used to keep blood and lymph flowing by pushing air through bands or sleeves that are placed on the arms or legs.

**compression garment :** An uncontrollable urge to say or do something without an obvious reason. A person may repeat a behavior, such as hand-washing, over and over.

**COMPRESSION MOLD:** A mold which is open when the material is introduced and which shapes the material by heat and by the pressure of closing. OR A technique of thermoset molding in which the molding compound (generally preheated) is placed in the heated open mold cavity, mold is closed, under pressure (usually in a hydraulic press) causing the material to flow and completely fill the cavity, pressure being held until the material has cured. A method of molding in which the molding material, generally preheated, is placed in an open heated mold cavity, the mold is closed with a top force, pressure is applied to force the material into contact with all mold areas. OR The process of molding a material in a confined shape by applying pressure and usually heat.

**Compression Molding:** A traditional molding process in which the uncured high consistency rubber compound is placed directly into the mold cavity, and compressed to its final shape by the closure of the mold. Considered unacceptable for many applications because parts must be

deflash causing debris. OR The name of this molding method says everything. A heated plastic material is placed in a heated mold and is then compressed into shape. The plastic can be in bulk but often comes in sheets. The heating process, called curing, insures the final part will maintain its integrity. This molding method is often used to make large objects such as automobile components. OR The process of molding a material in a confined shape by applying pressure and usually heat. OR A method of molding in which the molding material, generally preheated, is placed in an open heated mold cavity, the mold is closed with a top force, pressure is applied to force the material into contact with all mold areas, and heat and pressure are maintained until the molding material has cured. This process is most often used with thermoses. OR A technique of thermoset molding in which the molding compound (generally preheated) is placed in the heated open mold cavity, mold is closed, under pressure (usually in a hydraulic press) causing the material to flow and completely fill the cavity, pressure being held until the material has cured. OR A method of molding in which the molding material, generally preheated, is placed in an open heated mold cavity, the mold is closed with a top force, pressure is applied to force the material into contact with all mold areas, and heat and pressure are maintained until the molding material has cured. This process is most often used with thermoses. OR A process for manufacturing FRP parts in which a charge of SMC or BMC of predetermined weight is placed between two dies and then heat and pressure are applied. The moulding compound flows to fill the die and cures within a few minutes. (Thermoplastic composites, usually consisting of glass fibre and polypropylene can also be compression moulded.) OR A method of molding in which the molding material, generally preheated, is placed in an open heated mold cavity, the mold is closed with a top force, pressure is applied to force the material into contact with all mold areas.

**compression pump :** A method to examine the inside of the colon by taking a series of x-rays. A computer is used to make 2-dimensional (2-D) and 3-D pictures of the colon from these x-rays. The pictures can be saved, changed to give better viewing angles, and reviewed after the procedure, even years later. Also called computed tomography colonography, CT colonography, CTC, and virtual colonoscopy.

**COMPRESSION RATIO:** In an extruder screw, the ratio of volume available in the first flight at the hopper to the last flight at the end of the

screw. OR In single-screw extruders the channel depth in the solids-conveying zone under the hopper is much larger than in the metering (pumping) zone. The depth ratio, usually in the range of 2.0–4.0, is referred to as the compression ratio. The low bulk density solid polymer bed is compressed as it is forced to go through a gradually decreasing depth and melts as it is sheared against the barrel wall. OR In an extruder screw, the ratio of volume available in the first flight at the hopper to the last flight at the end of the screw. OR In an extruder screw, the ratio of the volume of the channel at the first flight of the screw to the volume at the last flight in the metering section. OR A factor that determines the amount of shear that is imparted to plastic material as it travels through the barrel. It is determined by dividing the depth of the screw flight in the feed section by the depth of the screw flight in the metering section. OR In an extruder screw, the ratio of volume available in the first flight at the hopper to the last flight at the end of the screw.

**Compression Section:** The transition section of a screw channel in which a reduction in the screw channel volume occurs.

**Compression Set:** Permanent deformation experienced by a rubber material when compressed for a period of time. The term is commonly used in reference to a test conducted under specific conditions wherein the permanent deformation is expressed as a percentage and measured after a prescribed period of time. Low compression set is desirable in molded rubber parts such as seals and gaskets, which must retain their dimensions to maintain an effective seal OR unrecoverable deformation (strain) that remains in a material after compressive loading has been removed.

**Compression strength:** The crushing load at failure of a material, divided by cross-sectional area of the specimen.

**COMPRESSION ZONE:** The second zone in an extruder screw. It receives material from the feed zone and delivers it to the metering zone. It is sometimes referred to as the melting zone. OR Also called the transition or melting zone. Zone in the extruder's screw barrel. Most of the plastic compound is melted in this section, and the channel depth gets progressively smaller.

**Compressive Strength:** crushing a load at failure divided by the original sectional area of the specimen. OR Crushing load at the failure of a specimen divided by the original sectional area of the specimen. OR The

ability of a material to sustain a force in a direction opposite of tension. OR The ability of a material to resist a force that tends to crush it. OR The maximum compressive stress carried by a test specimen during a compression test OR For a container, the shape in which various cross sections have a common center. OR Crushing load at the failure of a specimen divided by the original sectional area of the specimen. OR The ability of a material to resist a force that tends to crush it. OR

**compressor:** a device that raises the pressure of a gas.

**compulsion :** A procedure that uses x-rays to create a series of detailed pictures of the blood vessels and blood flow inside the body. The pictures are taken from different angles and are created by a computer linked to an x-ray machine. A dye is injected into a vein to make the blood vessels and blood flow easier to see on the x-ray. Computed tomography angiography may be used to check for aneurysms (a bulge in the blood vessel wall), blockages in the arteries, blood clots, and other blood vessel problems. Also called CT angiography and CTA.

**Computational Chemistry:** A branch of chemistry that specialises in using computers to help solve chemistry problems. OR A branch of chemistry concerned with the prediction or simulation of chemical properties, structures, or processes using numerical techniques.

**computed tomographic colonography :** A method to examine the inside of the colon by taking a series of x-rays. A computer is used to make 2-dimensional (2-D) and 3-D pictures of the colon from these x-rays. The pictures can be saved, changed to give better viewing angles, and reviewed after the procedure, even years later. Also called computed tomographic colonography, CT colonography, CTC, and virtual colonoscopy.

**computed tomography angiography :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The pictures are taken from different angles and are used to create 3-dimensional (3-D) views of tissues and organs. A dye may be injected into a vein or swallowed to help the tissues and organs show up more clearly. A computed tomography scan may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called CAT scan, computerized axial tomography scan, computerized tomography, and CT scan.

**computed tomography colonography :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The pictures are taken from different angles and are used to create 3-dimensional (3-D) views of tissues and organs. A dye may be injected into a vein or swallowed to help the tissues and organs show up more clearly. A computerized axial tomography scan may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called CAT scan, computed tomography scan, computerized tomography, and CT scan.

**computed tomography scan :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The pictures are taken from different angles and are used to create 3-dimensional (3-D) views of tissues and organs. A dye may be injected into a vein or swallowed to help the tissues and organs show up more clearly. A computerized tomography may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called CAT scan, computed tomography scan, computerized axial tomography scan, and CT scan.

**computer-assisted drug design:** Using computational chemistry to discover, enhance, or study drugs and related biologically active molecules.

**computerized axial tomography scan :** In science, the amount of a substance, such as a salt, that is in a certain amount of tissue or liquid, such as blood. A substance becomes more concentrated when less water is present. For example, the salt in urine may become more concentrated when a person doesn't drink enough water.

**computerized tomography :** In biology, the beginning of pregnancy, marked by fertilization of an egg by a sperm.

**conatumumab:** A fully human monoclonal agonist antibody directed against the extracellular domain of human TRAIL (tumor necrosis factor-related apoptosis-inducing ligand) receptor 2 (TR-2) with potential antineoplastic activity. Conatumumab mimics the activity of native TRAIL, binding to and activating TR-2, thereby activating caspase cascades and inducing tumor cell apoptosis. TR-2 is expressed by a variety of solid tumors and cancers of hematopoietic origin.

**concave polygon:** a polygon which contains at least one diagonal outside the figure.

**Concentraid:** (Other name for: desmopressin acetate)

**concentrate:** To increase the amount of substance present in a unit amount of mixture. For example, allowing solvent to evaporate from a solution concentrates the solution.

**concentrated:** being of full strength, or undiluted. OR Having a relatively large amount of substance present in a unit amount of mixture. For example, a 12 M HCl solution is more concentrated than an 0.001 M HCl solution.

**concentrated beet crystals:** A formulation containing concentrated beetroot crystals, with potential antioxidant and protective activities. Concentrated beetroot crystals contain antioxidants, including betacyanin, which scavenge free radicals, and high levels of nitrates and folic acid. Intake of concentrated beetroot crystals leads to the conversion of nitrate to nitric oxide (NO). This may have a beneficial effect on blood flow and blood pressure through the stimulation of NO-mediated vasodilation. Additionally, this agent may decrease fatigue and increase physical performance.

**Concentrated Solution:** A solution (liquid mixture) that has a large amount of solute dissolved. As you add more sugar to a glass of water, the sugar solution becomes more concentrated.

**concentrated, fortified, collagen protein hydrolysate liquid**

**supplement:** A liquid-based nutritional supplement containing enzyme-hydrolyzed concentrated protein derived from collagen, and fortified with L-tryptophan, with potential anti-cachexic and wound-healing activities. The concentrated, fortified, collagen protein hydrolysate liquid supplement contains all essential and non-essential amino acids. Upon oral administration, this supplement may improve both gastric functioning and gastrointestinal (GI) health, thereby reducing vomiting and diarrhea. The hydrolyzed protein helps to alleviate the digestive burden and allows for fast and efficient absorption and utilization of the protein. This may prevent both malnutrition and weight loss.

**concentration:** in solutions, the mass, volume, or number of moles of solute present in proportion to the amount of solvent or total solution. Common measures are: molarity, normality, percent, molality, and by specific gravity scales. OR The amount of substance in a specified space. OR Concentration is the amount of one substance in a system relative to the

amount of other substances. If you have a glass of water, the concentration of water in the glass is 100%. A glass of salt water will have a specific concentration of salt in the water. OR A general term referring to the quantity of a material or substance contained in unit quantity of a given medium. When the term concentration is used without further qualification, it now means amount of substance concentration (WHO, 1979). OR the total mass of an ion or molecule in a given volume of solution (see: activity). When measuring ionic concentration by ionselective electrodes, it is important to note that the concentration used in the calibration graphs and calculated for the samples is the concentration of the free ion in solution, not the concentration of the compound from which this ion is derived. A distinction must also be made between the concentration of the free unbound ions and the total concentration, which may include any ions, bound to complexing agents and any atoms in undissociated molecules. OR the relative abundance of a solute in a solution. OR the amount of a solvent compared to the solute in a solution. OR 1. A measure of the amount of substance present in a unit amount of mixture. The amounts can be expressed as moles, masses, or volumes. 2. The process of increasing the amount of substance in a given amount of mixture.

**concentration :** A drug used to treat certain behavior disorders, such as attention deficit hyperactivity disorder (ADHD). It is also being studied as a way to improve brain function in patients treated with anticancer drugs. Concerta acts on certain parts of the brain. It is a type of central nervous system stimulant. Also called methylphenidate hydrochloride and Ritalin.

**concentric circles:** circles with the same center.

**Concentricity:** The characteristic of circles or circular cylindrical surfaces of different radii having a common center. OR crushing a load at failure divided by the original sectional area of the specimen. OR Relationship of all inside dimensions to all outside dimensions. usually as with diameter expressed in thousandths of an inch T1R (Total Indicator Reading) OR A condition in which two or more features (cylinder, cones, spheres, hexagons, etc..) in any combination, have a common axis OR Relationship of all inside dimensions to all outside dimensions usually as with diameter expressed in thousandths of an inch TIR (Total Indicator Reading)

**conception :** Occurring or existing at the same time as something else. In medicine, it may refer to a condition a person has or a medication a person

is taking that is not being studied in the clinical trial he or she is taking part in.

**Concerta :** (Other name for: methylphenidate hydrochloride) OR A treatment that is given at the same time as another.

**concerted:** taking place at the same time without the formation of an intermediate.

**Concerted mechanism:** A model explaining the kinetics of allosteric enzymes in which the transitions of all of the active sites between the T state and the R state occur simultaneously.

**conclusions:** the final paragraph or paragraphs of an essay, and should give a reader a sense of completion.

**concomitant :** In medicine, a health problem with certain characteristics or symptoms.

**Concrete :** This is formed by mixing cement, sand, stones (or crushed rock) and water. It can be poured into a hole to form a block for building foundations or into a mould to produce a variety of shapes (eg girders and railway sleepers). It can be reinforced by being poured around steel cables or mesh. OR Tangible, easily understood. OR the final paragraph or paragraphs of an essay, and should give a reader a sense of completion. OR A mixture of cement, sand, gravel and water.

**concurrent therapy :** A type of learning in which repeated exposure to something may affect a person's behavior when they encounter an unrelated object, sound, or smell that occurred at the same time as the initial exposure. For example, a patient who always feels sick after receiving chemotherapy in a clinic that smells a certain way may be conditioned to feel sick when smelling the same odor in a different place.

**condensate:** water obtained by evaporation or a product that has changed from a gaseous or vaporous form to a liquid form. OR A condensate is an example of moisture that has condensed. Condensate might be created during the process of distillation. When you boil water and it condenses on the lid of the pot, you have created a condensate. OR Water that has been produced by the cooling of steam in a condenser.

**condensation:** The process of vapor molecules forming a liquid. OR A process in which an entering gas is cooled and/or compressed, causing one or more of the gas components to liquefy. Uncondensed gases and liquid

condensate leave the condenser as separate streams. OR the process of a substance changing states from gas to liquid. OR 1. The conversion of a gas into a liquid is called condensation. Condensation usually occurs when a gas is cooled below its boiling point. 2. A reaction that involves linking of two molecules with the elimination of water (or another small molecule). OR A chemical reaction in which two or more molecules combine with the separation of water or some other simple substance. If a polymer is formed, the condensation process is called Polycondensation. See also Polymerization.

**Condensation Point:** The condensation point is when a gas reaches a temperature to become a liquid. Energy is taken out of the atoms in the gas state and they condense, forming drops of liquid. You can also think of the point in nature when water vapor cools and forms small droplets, such as dew in the morning.

**Condensation Polymerisation:** Also known as Step-Growth Polymerisation. A way of making polymers in which every polymer chain grows continuously through the course of the reaction, remaining quite small until almost all the monomer has reacted.

**condensation reaction:** a reaction in which two molecules join to form a product and release a small molecule such as water. OR a reaction in which two molecules join with the liberation of a small stable molecule.

**condensed formula:** a formula in which the single bonds between the atoms are not shown with lines.

**Condenser:** A large heat exchanger designed to cool exhaust steam from a turbine below the boiling point so that it can be returned to the heat source as water. In a pressurized-water reactor, the water is returned to the steam generator. In a boiling-water reactor, it returns to the reactor core. The heat removed from the steam by the condenser is transferred to a circulating water system and is exhausted to the environment, either through a cooling tower or directly into a body of water.

**condition :** A situation in which one signal, or stimulus, is given just before another signal. After this happens several times, the first signal alone can cause the response that would usually need the second signal.

**conditional acceptable daily intake:** A conditional acceptable daily intake is one that is established for a pesticide in order to limit its use to those situations where no satisfactory substitutes are available. This definition

will be the subject of further discussion. The allocation of conditional ADIs for intentional food additives has been superseded (Vettorazzi, 1980).

**conditionally replicative adenovirus 5/3-delta24:** A replication competent, oncolytic adenovirus serotype 5 (Ad5) with its knob domain of fiber protein substituted by that of the serotype 3 (Ad5/3-delta24), with potential oncolytic activity. Upon administration, oncolytic adenovirus Ad5/3-delta24 binds to specific Ad3 receptors that are highly expressed on certain tumor cells. This results in the replication of oncolytic adenovirus Ad5/3-delta24 in tumor cells and induces tumor cell lysis which may potentially result in the activation of a systemic immune response against tumor-associated antigens. The Ad5/3-delta24 has a 24 base-pair deletion in constant region 2 of the E1A gene which allows for selective replication in cells that are defective in the retinoblastoma gene (Rb) or cyclin-dependent kinase inhibitor-2A (CDKN2A or p16INK4a). As most tumor cells are defective in the Rb/p16 pathway, this virus selectively replicates in these cells. The replacement of the Ad5 fiber knob, which mediates viral-cell receptor binding, allows for a Coxsackie-adenovirus receptor (CAR)-independent infection of tumor cells; CAR expression is often deficient on cancer cells. Check for active clinical trials using this agent.

**conditioned response :** The treatments used to prepare a patient for stem cell transplantation (a procedure in which a person receives blood stem cells, which make any type of blood cell). A conditioning regimen may include chemotherapy, monoclonal antibody therapy, and radiation to the entire body. It helps make room in the patient's bone marrow for new blood stem cells to grow, helps prevent the patient's body from rejecting the transplanted cells, and helps kill any cancer cells that are in the body.

**conditioned stimulus :** A raised growth on the surface of the genitals caused by human papillomavirus (HPV) infection. The HPV in condyloma is very contagious and can be spread by skin-to-skin contact, usually during oral, anal, or genital sex with an infected partner. Also called genital wart.

**Conditioning:** The subjection of a material to a stipulated treatment so that it will respond in a uniform way to subsequent testing or processing. The term is frequently used to refer to the treatment given to specimens before testing. OR Exposing a molded part to a set of conditions (such as hot oil), which impart favorable characteristics to the product See anneal. OR

Subjecting a material to standard environmental and/or a non-standard stress state prior to testing or use.

**conditioning regimen :** A procedure in which a cone-shaped piece of abnormal tissue is removed from the cervix. A scalpel, a laser knife, or a thin wire loop heated by an electric current may be used to remove the tissue. The tissue is then checked under a microscope for signs of disease. Cone biopsy may be used to check for cervical cancer or to treat certain cervical conditions. Types of cone biopsy are LEEP (loop electrosurgical excision procedure) and cold knife conization (cold knife cone biopsy). Also called conization.

**conductance:** a measure of the conducting power of a solution equal to the reciprocal of the resistance. The resistance is expressed in ohms.

**conduction:** transfer of energy through solids by direct contact.

**Conductive Silicone Rubber:** A silicone rubber capable of conducting electricity. Most generally applied to silicone rubber products used to conduct static electricity or as an RF shield

**conductivity:** ability of a material to carry current or heat. OR a measure of the ability of a solution to conduct electricity. It is the reciprocal of resistivity, which relates the resistance of a conductor (in ohms), to its length and cross sectional area. Units of conductivity are Siemens per centimeter (S/cm). Conductivity is measured with a conductivity cell. This contains two platinum electrodes of known area rigidly fixed at 1 cm apart. The electrolytic conductivity of the solution is determined by passing an alternating current between the electrodes. The conductivity is related to the ionic strength of the solution. OR The reciprocal of volume resistivity. It is the conductance of a unit cube of any material. OR the reciprocal of volume resistivity. It is the conductance of a unit cube of any material. OR A wire, or combination of wires not insulated from each other, suitable for carrying electricity.

**Conductor:** Material that can support flow of electric current. Fluoropolymer coatings are normally insulators, but can be modified with certain fillers and pigments to make them conductive.

**Conduit:** A pipe or channel for conveying water; a trough or pipe for containing wires or cables.

**condyloma :** A mental state in which one is not thinking clearly.

**Cone:** A photoreceptor cell that functions in bright light and is responsible for color vision.

**CONE AND PLATE INSTRUMENT (also called the Weissenberg Rheogoniometer):** A device to measure viscosity by determining the torque necessary to rotate a cone over a flat plate with molten polymer in between. The angle is very small so that the rotational flow is nearly parallel. The device can also be used to determine the (first) normal stress difference by measuring the normal force tending to separate the cone from the plate surface (see NORMAL STRESSES).

**cone biopsy :** A condition or trait present at birth. It may be the result of genetic or non-genetic factors.

**cone cells:** cells of the eye that detect color.

**cone of depression:** the area and shape of a drawdown around a well.

**configuration:** the specific arrangement of atoms and groups in three-dimensional space. A configuration is characteristic of a specific stereoisomer.

**Configuration:** The spatial arrangement in which atoms are covalently linked in a molecule.

**configuration:** The spatial arrangement of an organic molecule that is conferred by the presence of either (1) double bonds, about which there is no freedom of rotation, or (2) chiral centers, around which substituent groups are arranged in a specific sequence. Configurational isomers cannot be interconverted without breaking one or more covalent bonds.

**Configurational polymorphism:** A type of polymorphism in which one labile isomer of a compound (e.g., a keto form) is present in one polymorph and another labile isomer (e.g., an enol form) is present in the other polymorph.

**confined aquifer:** an aquifer overlain by a less permeable bed that keeps the water in the aquifer under pressure.

**confining pressure:** see geostatic pressure.

**conformation:** a specific three-dimensional shape of a molecule at any given time. Conformation can change by rotation around a single bond. OR The three-dimensional arrangement adopted by a molecule, usually a complex macromolecule. Molecules with the same configuration can have more than one conformation. OR The spatial arrangement of substituent

groups that are free to assume different positions in space, without breaking any bonds, because of the freedom of bond rotation.

**conformation-sensitive gel electrophoresis** : A type of mutation testing in which a segment of DNA is screened for mismatched pairing between normal and mutated base pairs. Also called CSGE.

**conformation,  $\beta$** : See  $\beta$  conformation.

**Conformational Blocker**: Groups introduced during drug design to prevent a molecule from adopting particular conformations.

**Conformational polymorphism**: A type of polymorphism in which the conformation of the independent molecule in each polymorph is different.

**conformers**: Molecular arrangements that differ only by rotations around single bonds. For example, the "boat" and "chair" forms of cyclohexane are conformers.

**confounding** :1. A situation in which the effects of two processes are not separated. The distortion of the apparent effect of an exposure on risk brought about by the association with other factors that can influence the outcome.2. A relationship between the effects of two or more causal factors as observed in a set of data, such that it is not logically possible to separate the contribution that any single causal factor has made an effect.3. A situation in which a measure of the effect of an exposure on risk is distorted because of the association of exposure with other factor(s) that influence the outcome under study.

**confounding variable** : A variable that can cause or prevent the outcome of interest, is not an intermediate variable, and is not associated with the factor under investigation. Such a variable must be controlled in order to obtain an undistorted estimate of the effect of the study factor on risk (Last, 1988).

**confusion** : A benign (not cancer) blood vessel tumor that is fully formed at birth. Congenital hemangiomas usually form on the skin of the head and neck or arms and legs. They may also form in organs, such as the liver. Congenital hemangiomas may be raised or flat and usually appear as purple-red lesions on the skin. Some congenital hemangiomas go away on their own; others only partly go away or do not go away at all. Congenital hemangiomas are a type of vascular tumor.

**congener:** 1. Elements belonging to the same group on the periodic table. For example, sodium and potassium are congeners. 2. Compounds produced by identical synthesis reactions and procedures.

**congeners:** elements with similar properties, arranged in columns of the periodic table.

**congenital :** A condition or trait present at birth. It may be the result of genetic or non-genetic factors. OR A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with congenital hypoplastic anemia may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–Diamond anemia, congenital pure red cell aplasia, DBA, Diamond-Blackfan anemia, erythropoiesis imperfecta, and inherited erythroblastopenia.

**congenital hemangioma :** A type of kidney tumor that is usually found before birth by ultrasound or within the first 3 months of life. It contains fibroblastic cells (connective tissue cells), and may spread to the other kidney or to nearby tissue. Congenital mesoblastic nephroma is more common in males.

**congenital hypoplastic anemia :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called genetic infantile agranulocytosis, infantile genetic agranulocytosis, Kostmann disease, Kostmann neutropenia, and Kostmann syndrome.

**congenital mesoblastic nephroma :** A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with congenital pure red cell aplasia may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–Diamond anemia, congenital hypoplastic anemia, DBA, Diamond-Blackfan anemia, erythropoiesis imperfecta, and inherited erythroblastopenia.

**congenital neutropenia :** Weakness of the heart muscle that leads to a buildup of fluid in body tissues.

**congenital pure red cell aplasia :** A procedure in which a cone-shaped piece of abnormal tissue is removed from the cervix. A scalpel, a laser knife, or a thin wire loop heated by an electric current may be used to remove the tissue. The tissue is then checked under a microscope for signs of disease. Conization may be used to check for cervical cancer or to treat certain cervical conditions. Types of conization are LEEP (loop electrosurgical excision procedure) and cold knife conization (cold knife cone biopsy). Also called cone biopsy.

**congestive heart failure :** A compound formed by chemically joining two or more different substances. For example, an antibody-drug conjugate is made up of a monoclonal antibody that is chemically linked to a drug. Some conjugates are used to treat cancer.

**congruent:** exactly alike. Identical in shape and size.

**conization :** A membrane that lines the inner surface of the eyelid and also covers the front part of the eye. Conjunctivitis is inflammation of the conjunctiva.

**conjugate:** an acid and base that are related by removing or adding a single hydrogen ion.

**conjunctate :** A condition in which the conjunctiva (membranes lining the eyelids and covering the white part of the eye) become inflamed or infected. Also called pinkeye.

**conjugate acid:** the acid that results when a Brønsted-Lowry base accepts a hydrogen ion.

**conjugate acid:** A substance which can lose a  $H^+$  ion to form a base. OR A conjugate acid is a molecule that is created when you start with a base and add a proton.

**conjugate acid-base pair:** A proton donor and its corresponding deprotonated species; for example, acetic acid (donor) and acetate (acceptor).

**conjugate base:** A conjugate base is a molecule that is created when you start with an acid and remove a proton. OR A substance which can gain a  $H^+$  ion to form an acid.

**conjugate redox pair:** An electron donor and its corresponding electron acceptor form; for example,  $\text{Cu}^+$  (donor) and  $\text{Cu}^{2+}$  (acceptor), or NADH (donor) and  $\text{NAD}^+$  (acceptor).

**conjugated double bonds:** carbon-carbon double bonds that are separated from one another by just one single bond; for example,

**conjugated estrogens:** Purified orally bioavailable female sex hormones isolated from pregnant mare urine or synthetically derived from plant materials and primarily conjugated as sulfate esters. Estrogen binds to and activates specific nuclear receptors, which, in turn, bind to estrogen response elements (EREs) in target genes, resulting in histone acetylation, alteration of chromatin conformation, and initiation of transcription.

**conjugated estrogens/bazedoxifene:** A combination preparation of conjugated estrogens and the selective estrogen receptor modulator (SERM) bazedoxifene that can be used for hormone replacement purposes. The conjugated estrogens increase the diminishing levels of estrogen in menopausal and postmenopausal women by binding to and activating estrogen receptors (ERs), which, in turn, bind to estrogen response elements (EREs) in target genes; this results in the transcription of estrogen-regulated genes. Maintaining adequate estrogen levels decreases symptoms such as hot flashes, night sweats, irregular menstruation, fat redistribution, mood swings, sleep disorders, vaginal dryness and osteoporosis. Bazedoxifene specifically binds to and activates ERs in certain tissues, including liver, bone, breast, and endometrium, and also promotes the transcription of estrogen-regulated genes in these tissues. However, bazedoxifene acts as an estrogen antagonist in uterine and breast tissue, thereby blocking the proliferative effects of estrogen-binding to ER-positive cells in these tissues.

**conjugated linoleic acid:** A slightly altered form of linoleic acid, an omega-6 fatty acid important to human health found in beef and dairy fats.

**conjugated protein:** A protein containing one or more prosthetic groups.

**conjugation:** the overlapping in all directions of a series of p orbitals. This process usually occurs in a molecule with alternating double and single bonds.

**conjunction:** words that join or link elements.

**conjunctiva:** The term applied to the mucous membrane that covers the eyeball and undersurface of the eyelids. OR A substance made by the pancreas. Connecting peptide and insulin are both part of a larger molecule that gets split apart before being released into the blood. Abnormal blood levels of connecting peptide may occur in certain diseases, such as diabetes or cancer. Also called C-peptide.

**conjunctive (sentence) adverbs:** words that look like coordinating conjunctions but are actually adverbs.

**conjunctivitis :** Supporting tissue that surrounds other tissues and organs. Specialized connective tissue includes bone, cartilage, blood, and fat.

**connate water:** water trapped in the original sediments during deposition and lithification.

**connecting peptide :** A level of sedation in which a person is asleep but wakes when spoken to or touched. Conscious sedation is caused by special drugs and is used to help relieve anxiety during certain medical or surgical procedures. Drugs that relieve pain may be given at the same time. Also called moderate sedation.

**connective tissue :** A clinical study that includes all eligible patients identified by the researchers during the study registration period. The patients are treated in the order in which they are identified. This type of study usually does not have a control group.

**Connector Rod:** A wire or rod of any shape (usually round) either straight or crimped, used for joining belt components.

**consanguinity :** Genetic relatedness between individuals who are descendants of at least one common ancestor.

**conscious sedation :** A program of the National Institutes of Health to bring together an independent group of experts to review scientific evidence related to an important public health issue. For a specific issue, a panel of experts (such as doctors and scientists) reviews reports and papers on the subject, s to information presented by other experts in the field, and hears comments from the general public. Based on the evidence presented, the panel writes a report summarizing the findings, which is made available to the public. The report is not intended to be a practice guideline.

**consecutive:** next to each other

**consecutive case series :** A document with important information about a medical procedure or treatment, a clinical trial, or genetic testing. It also includes information on possible risks and benefits. If a person chooses to take part in the treatment, procedure, trial, or testing, he or she signs the form to give official consent.

**consecutive even integers:** Integers that are adjacent in an ordered list of even integers. For example, 4 and 6 are two consecutive even integers.

**consecutive integers:** Integers that are adjacent on a number line. For example, 7, 8, and 9 are three consecutive integers.

**consecutive odd integers:** Integers that are adjacent in an ordered list of odd integers. For example, 1 and 3 are two consecutive odd integers.

**Consensus Development Program :** A process in which patients are given important information, including possible risks and benefits, about a medical procedure or treatment, a clinical trial, or genetic testing. This is to help them decide if they want to be treated, tested, or take part in the trial. Patients are also given any new information that might affect their decision to continue. Also called informed consent.

**Consensus sequence:** Idealized base sequence that represents common features of a promoter site. OR A DNA or amino acid sequence consisting of the residues that occur most commonly at each position within a set of similar sequences. OR In nucleic acids, the "average" sequence that signals a certain type of action by a specific protein. The sequences actually observed usually vary around this average.

**consent form :** Treatment that is given after cancer has disappeared following the initial therapy. Consolidation therapy is used to kill any cancer cells that may be left in the body. It may include radiation therapy, a stem cell transplant, or treatment with drugs that kill cancer cells. Also called intensification therapy and postremission therapy.

**consent process :** A process of information exchange between a clinician and an individual or their legal proxy designed to facilitate autonomous, informed decision making. The informed consent process for genetic testing should include an explanation of the medical and psychosocial risks, benefits, limitations, and potential implications of genetic analysis, a discussion of privacy, confidentiality, the documentation and handling of genetic test results, as well as options for managing the hereditary disease risk. Also called informed consent. OR A condition in which stool becomes

hard, dry, and difficult to pass, and bowel movements don't happen very often. Other symptoms may include painful bowel movements, and feeling bloated, uncomfortable, and sluggish.

**Conservation of Matter:** Name of the concept that explains how mass cannot be created or destroyed during a chemical reaction.

**conservative substitution:** Replacement of an amino acid residue in a polypeptide by another residue with similar properties; for example, substitution of Glu by Asp. OR Mutations that replace one amino acid with another similar in size and chemical properties.

**Consistency:** A term used to describe the thickness of a paint in the can. While paints of thick consistency are usually expected to be difficult to spread, this will not be the case with 'Gel' and 'Thixotropic' paints. Paints can usually be brought to a thinner consistency by thinning. OR The resistance of a paint to flow. A paint with high consistency flows slowly; with low consistency it flows readily.

**CONSISTENCY INDEX:** In the power-law viscosity model , which describes the reduction of viscosity as the shear rate increases (shear thinning),  $m$  is the consistency index (which is a function of temperature). It corresponds to the value of the viscosity for shear rate

**consolidation therapy :** A type of acupuncture based on a form of Oriental medicine in which treatment is based on a person's constitution. According to this type of medicine, the constitution is the specific way a person's organs affect health and how he or she looks, thinks, behaves, and responds to treatment. Also called Korean acupuncture.

**Constant pressure gradient :** pressure drop per unit length. The constant pressure gradient principlesays that the most efficient filling pattern is when the pressure gradient is constant along the flow path.

**Constant region:** The carboxyl-terminal end of an immunoglobulin G (igg) light chain or an igg heavy chain. For many antibodies, these parts of the polypeptide chains have amino acid sequences that are very similar to one another; a light chain has one constant region, whereas a heavy chain has three such regions, each of which specifies a compact domain in the native immunoglobulin molecule.

**Constant-T:** (Other name for: theophylline)

**constellation:** a group of stars that appears to be in a pattern.

**constipation :** The DNA in germ cells (egg and sperm cells that join to form an embryo). Constitutional DNA is the source of DNA for all other cells in the body. Also called germline DNA.

**constitutional acupuncture :** Touching or very close together.

**constitutional DNA :** Constitutional DNA refers to tissue derived from reproductive cells (egg or sperm) that become incorporated into the DNA of every cell in the body of the offspring. A germline mutation may be passed from parent to offspring. Also called germline DNA.

**constitutional DNA :** Lymphoma in which the lymph nodes containing cancer are next to each other.

**constitutive enzymes:** Enzymes required at all times by a cell and present at some constant level; for example, many enzymes of the central metabolic pathways. Sometimes called "housekeeping enzymes." OR Enzymes synthesized in fixed amounts, regardless of growth conditions.

**Constitutive genes:** Genes that are not subject to regulation and are constantly transcribed.

**construct validity:** The extent to which the measurement corresponds to theoretical concepts (constructs) concerning the phenomenon under study. For example, if on theoretical grounds, the phenomenon should change with age, a measurement with construct validity would reflect such a change.

**Construction recapture:** The maximum number of years that could be added to a facility's license expiration date to recapture the period between the date the NRC issued the facility's construction permit to the date it granted an operating license. A licensee must submit an application to request this extension. For further information, see the Staff Requirements Memorandum regarding SECY-98-296, "Agency Policy Regarding Licensee Recapture of Low-Power Testing or Shutdown Time for Nuclear Power Plants."

**constructive interference:** When the peaks and troughs of two interfering waves match, the amplitudes add to give the resultant wave a higher amplitude.

**consultand :** An individual who presents for genetic counseling. Also called counselee.

**consumers:** the organisms within an ecosystem that meet their energy needs by feeding on the producers.

**contact:** the plane of separation between any two different kinds of rocks.

**Contact angle:** A means of quantifying the nonstick properties of a coating by measuring the ability of a liquid to wet its surface.

**contact coagulation:** a water clarification process which involves the addition of a coagulant with appropriate mixing for the purpose of floc formation within a filter media, which will be periodically back-flushed to permit the separation of the resulting solids from the main wastewater stream.

**contact metamorphic deposit:** a hydrothermal deposit that results from hot solutions that leave a cooling intrusion and deposit minerals in cracks in country rock.

**contact metamorphism:** the process by which country rock surrounding a hot magma intrusion is metamorphosed by the high heat flow coming from the intrusion.

**contact metamorphism:** the process of changing rocks into metamorphic rocks by nearby magma.

**Contact Metamorphism:** Metamorphic rocks that have been formed in areas where volcanic activity has occurred. The heat from the lava directly heats the neighboring rocks and causes them to reform. There are more crystals in this type of metamorphic rock.

**Contact stabilization:** Contact stabilization is a modification of the conventional activated sludge process. In contact stabilization, two aeration tanks are used. One tank is for separate reaeration of the return sludge for at least four hours before it is permitted to flow into the other aeration tank to be mixed with the primary effluent requiring treatment.

**Contact time:** A solid-state NMR term referring to the length of the spin-lock period in which the Larmor frequencies of the proton and carbon are matched.

**Containment building:** The air-tight building, which houses a nuclear reactor and its pressurizer, reactor coolant pumps, steam generator, and other equipment or piping that might otherwise release fission products to the atmosphere in the event of an accident. Such buildings are usually made of steel-reinforced concrete.

**Containment structure:** A gas-tight shell or other enclosure around a nuclear reactor to confine fission products that otherwise might be

released to the atmosphere in the event of an accident. Such enclosures are usually dome-shaped and made of steel-reinforced concrete.

**contaminant:** In some contexts (e.g., in relation to gas cleaning equipment), used as a synonym for pollutant (ISO, 1979).

**Contamination:** Undesirable radiological, chemical, or biological material (with a potentially harmful effect) that is either airborne, or deposited in (or on the surface of) structures, objects, soil, water, or living organisms in a concentration that makes the medium unfit for its next intended use. OR a general term signifying the introduction into water of microorganisms, chemicals, wastes or sewage which renders the water unfit for its intended use.

**contamination plume:** the elongate area of contaminated groundwater that is downgradient from the point source of leakage.

**Contego:** (Other name for: autologous tumor infiltrating lymphocytes LN-144)

**content validity:** The extent to which the measurement incorporates the domain of the phenomenon under study. For example, a measurement of functional health status should embrace activities of daily living, occupational, family, and social functioning, etc.

**contiguous :** A pouch formed from a piece of small intestine to hold urine after the bladder has been removed.

**contiguous lymphoma :** In medicine, a treatment plan that gives immediate rewards for desired changes in behavior. It is based on the principle that if a good behavior is rewarded, it is more likely to be repeated. This is often used in the treatment of drug and alcohol abuse, and is being studied as a smoking cessation method.

**continent reservoir :** A procedure that bathes the abdominal cavity in fluid that contains anticancer drugs. This fluid is warmer than body temperature. This procedure appears to kill cancer cells without harming normal cells. Also called CHPP.

**continent-continent convergence:** the result when two continents collide.

**continental crust:** The layer of the Earth that lies under continents and the continental shelves. It ranges in thickness from 35 to 60 km. Its upper layer has a density of 2.7 g/cm<sup>3</sup> and is composed of rocks that are rich in silica and alumina.

**continental divide:** that topographic ridgeline that separates the streams that flow in opposite directions and empty into different oceans.

**continental drift:** the theory that the continents were once joined together and somehow then split and moved apart.

**continental glaciation:** glaciation that affects a broader, flatter part of a continental land mass than does alpine glaciation.

**continental glacier:** a thick sheet of ice covering a mass of land all year round, moving outward from the thickest part; found only in Greenland and Antarctica.

**continental plate:** A thick continental crust.

**continental rise:** a very low-angle ridge of sediment that forms between the lower part of the continental slope and the abyssal plain.

**continental shelf:** a shallow, very gently sloping platform that extends seaward from the edge of a continent. OR ocean bottom along the coasts with a low gradient.

**continental shelves:** Those parts of the continent that are covered by water. They are several to more than 322 km wide and about 122 m deep. At the edges of the shelves, the continental slopes drop rapidly from 100 to 200 m to 3000 to 3700 m.

**continental slope:** an area that extends from the seaward edge of a continental shelf into the deep ocean at an average angle of 4 to 5 degrees.

**continental slope:** ocean bottom that connects the continental shelf to the deep ocean floor.

**continental slopes:** See continental shelves.

**contingency management :** The administration of a fluid into a blood vessel, usually over a prolonged period of time.

**continuous branch:** the type of magmatic differentiation in which minerals form continuously during cooling.

**continuous hyperthermic peritoneal perfusion :** In medicine, describes the delivery of health care over a period of time. In patients with a disease, this covers all phases of illness from diagnosis to the end of life.

**continuous infusion :** The use of drugs, devices, or surgery to prevent pregnancy. There are many different types of contraception. These include barrier methods to keep sperm from fertilizing the egg, hormone methods,

intrauterine devices (IUDs), and surgery to close the fallopian tubes in women or close off the two tubes that carry sperm out of the testicles in men. Also called birth control.

**Continuous Service Temperature:** The highest temperature at which a material can perform reliably in long term application - long term being, however, OR The highest temperature at which a material can perform reliably in long term application - as defined by the manufacturer. Inconsistently defined by the manufacturers.

**continuous spectrum:** A plot of the relative absorbance or intensity of emitted light vs. wavelength or frequency that shows a smooth variation, rather than a series of sharp peaks or bands.

**Continuous Thread (CT) Finish:** An uninterrupted protruding helix on the neck of a bottle to hold a screw type closure.

**continuum of care :** A company hired by another company or research center to take over certain parts of running a clinical trial. The company may design, manage, and monitor the trial, and analyze the results. Also called CRO.

**contour current:** a current that flows parallel to the edge of a continental slope.

**contour farming:** planting crops along contour lines on a hill to help prevent soil erosion.

**contour interval:** the elevation difference between contour lines.

**contour line:** line connecting points of equal elevation.

**Contoured pins:** Ejector pins with the ends shaped to match a sloping surface on the part.

**contraception :** A permanent tightening of the muscles, tendons, skin, and nearby tissues that causes the joints to shorten and become very stiff. This prevents normal movement of a joint or other body part. Contractures may be caused by injury, scarring, and nerve damage, or by not using the muscles. It may also occur at some point in time after a stem cell transplant that caused chronic graft-versus-host disease.

**contract:** to become smaller, closer together

**Contract Research Organization :** A symptom or medical condition that makes a particular treatment or procedure inadvisable because a person is likely to have a bad reaction. For example, having a bleeding disorder is a

contraindication for taking aspirin because treatment with aspirin may cause excess bleeding.

**Contracting area (disc, cylinder, or rectangle) equation:** A kinetics equation used to fit solid-state kinetic data to a two-dimensional advancement of a phase boundary from the outer edges inward across the surface of the solid.

**Contracting volume (cube or sphere) equation:** A kinetics equation used to fit solid-state kinetic data to a three-dimensional advancement of a phase boundary from the surface inward through the solid.

**contraction:** Refers to the particular choice of scheme for generating the linear combinations of gaussian functions that constitute a contracted basis set. (See cGTO.) A "generally-contracted" basis set is one in which each primitive is used in many basis functions. A "segmented" basis set, in contrast, is one in which each primitive is used in only one (or maybe two) contracted function.

**contracture :** Having to do with the opposite side of the body.

**contraindication :** A series of x-ray pictures of the esophagus taken after a patient drinks a liquid containing barium sulfate (a form of the silver-white metallic element barium). The barium sulfate coats and outlines the inner wall of the esophagus so that it can be seen on the x-ray pictures. Also called esophagram.

**contralateral :** A dye or other substance that helps show abnormal areas inside the body. It is given by injection into a vein, by enema, or by mouth. Contrast material may be used with x-rays, CT scans, MRI, or other imaging tests.

**contrast agent CS-1000:** An aqueous colloidal nanoemulsion containing perfluorocarbon (PFC) polymers that can be used as a tracer for cell tracking purposes during fluorine-19 (<sup>19</sup>F) magnetic resonance imaging (MRI). Upon administration of the contrast agent CS-1000 to cells *ex vivo*, this agent freely enters the cells. Upon introduction of these cells into the patient and subsequent <sup>19</sup>F MRI, the amount of fluorine can be detected and cellular persistence, survival and distribution of the treated cells can be assessed. The emulsion allows for fast entry of the fluorinated polymers into cells; the polymers do not degrade and remain in the cells.

**contrast esophagram** : An animal in a study that does not receive the treatment being tested. Comparing the health of control animals with the health of treated animals allows researchers to evaluate the effects of a treatment more accurately.

**contrast material** : In a clinical trial, the group that does not receive the new treatment being studied. This group is compared to the group that receives the new treatment, to see if the new treatment works.

**control animal** : A clinical study that includes a comparison (control) group. The comparison group receives a placebo, another treatment, or no treatment at all.

**control group** : An experiment or clinical trial that includes a comparison (control) group.

**control limit**: A regulatory value applied to the airborne concentration in the workplace of a potentially toxic substance which is judged to be "reasonably practicable" for the whole spectrum of work activities and which must not normally be exceeded.

**Control rod**: A rod, plate, or tube containing a material such as hafnium, boron, etc., used to control the power of a nuclear reactor. By absorbing neutrons, a control rod prevents the neutrons from causing further fissions.

**Control room**: The area in a nuclear power plant from which most of the plant's power production and emergency safety equipment can be operated by remote control.

**Controlled area**: At a nuclear facility, an area outside a restricted area but within the site boundary, to which the licensee can limit access for any reason.

**controlled clinical trial** : A drug or other substance that is tightly controlled by the government because it may be abused or cause addiction. The control applies to the way the substance is made, used, handled, stored, and distributed. Controlled substances include opioids, stimulants, depressants, hallucinogens, and anabolic steroids. Controlled substances with known medical use, such as morphine, Valium, and Ritalin, are available only by prescription from a licensed medical professional. Other controlled substances, such as heroin and LSD, have no known medical use and are illegal in the United States.

**Controlled frictional heating :** runners designed to deliver a higher melt temperature to the cavity. This results in lower stress levels in the part without causing material degradation due to long exposure to elevated temperatures in the barrel.

**controlled study :** A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery. Also called allopathic medicine, biomedicine, mainstream medicine, orthodox medicine, and Western medicine.

**controlled substance :** Treatment that is widely accepted and used by most healthcare professionals. It is different from alternative or complementary therapies, which are not as widely used. Examples of conventional therapy for cancer include chemotherapy, radiation therapy, and surgery. Also called conventional treatment.

**controls matched:** Controls (persons) who are selected so that they are similar to the study group, or cases, in specific characteristics. Some commonly used matching variables are age, sex, race and socio-economic status (Last, 1988).

**convection:** transfer of energy in fluids; can create currents by density differences.

**convection:** Atmospheric or oceanic motions that are predominately vertical and that result in vertical transport and mixing of atmospheric or oceanic properties. Because the most striking meteorological features result if atmospheric convective motion occurs in conjunction with the rising current of air (i.e., updrafts), convection is sometimes used to imply only upward vertical motion.

**convection currents:** currents within a material that are driven mostly by changing temperature gradients.

**convective adjustment:** A numerical procedure applied in many atmospheric models to approximate the vertical nonradiative heat transport. This procedure adjusts the lapse rate whenever necessary so that some prescribed critical lapse rate is never exceeded.

**Conventional kinesin:** A motor protein, built around a P-loop ntpase core, that has several structural features in common with myosin; conventional kinesin moves toward the plus end of microtubules.

**conventional medicine :** Treatment that is widely accepted and used by most healthcare professionals. It is different from alternative or complementary therapies, which are not as widely used. Examples of conventional treatment for cancer include chemotherapy, radiation therapy, and surgery. Also called conventional therapy.

**conventional therapy :** A condition in which muscles contract and relax quickly and cause uncontrolled shaking of the body. Head injuries, high fevers, some medical disorders, and certain drugs can cause convulsions. They may also occur during seizures caused by epilepsy.

**Conventional treatment:** The preliminary treatment, sedimentation, flotation, trickling filter, rotating biological contactor, activated sludge and chlorination of wastewater.

**conventional treatment :** A laboratory test to identify antibodies that can bind to the surface of red blood cells or platelets and destroy them. This test is used to diagnose certain blood disorders in which patients make antibodies to their own red blood cells or platelets. It is also used to determine blood type. Also called antiglobulin test.

**Conventional Weave:** A fabric consisting of a series of either all right or all left hand spirals each turned into the preceding spiral to form a continuous belt. (For basic types, see one directional and sectional weave.)

**convergence:** The quasi-horizontal flow of a fluid toward a common destination from different directions. When waters of different origins come together at a point or along a line (convergence line), the denser water from one side sinks under the lighter water from other side. The ocean convergence lines are the polar, subtropical, tropical, and equatorial. Also see divergence.

**convergent boundary:** a fault boundary marked by plates that come together.

**Convergent Die:** A die in which the internal channels leading to the orifice are converging (only applicable to dies for hollow bodies).

**Convergent evolution:** The process by which different evolutionary pathways arrive at the same solution to a biochemical problem.

**converging plate boundary:** region where plates move toward each other.

**Conversion:** Changing from one substance to another. As food matter is changed to cell growth or to carbon dioxide. OR The term used to indicate

converting plastic bags from a continuous roll to separate bags in a given configuration.

**conversion factor:** A conversion factor is a fraction that relates one unit to another. Multiplying a measurement by a conversion factor changes the units of the measurement. For example, since 1 in = 2.54 cm, to convert 10 inches to centimeters,  $(10 \text{ in}) = 25.4 \text{ cm}$

**Conversion Fahrenheit to Celsius:**  $F = (^{\circ} \text{C} \times 9/5) + 32$  or  $C = (^{\circ} \text{F} - 32) \times 5/9$

**CONVERTOR:** A term used in the packaging industry. Converters buy plastic film or sheeting in the form of roll stock and convert it to useful forms by slitting, die cutting, heat sealing, etc. for resale to packaging firms.

**convex polygon:** a polygon in which all diagonals lie within the figure.

**Conveyor:** A mechanical device to transport material from one point to another, often continuously.

**convulsion :** A type of lung disease marked by permanent damage to tissues in the lungs, making it hard to breathe. COPD includes chronic bronchitis, in which the bronchi (large air passages) are inflamed and scarred, and emphysema, in which the alveoli (tiny air sacs) are damaged. It develops over many years and is usually caused by cigarette smoking. Also called chronic obstructive pulmonary disease.

**Cool colours:** Any of the hues in which blue predominates. Opposite to 'warm colours'.

**Coolant:** A substance circulated through a nuclear reactor to remove or transfer heat. The most commonly used coolant in the United States is water. Other coolants include heavy water, air, carbon dioxide, helium, liquid sodium, and a sodium-potassium alloy.

**Cooldown:** The gradual decrease in reactor fuel rod temperature caused by the removal of heat from the reactor coolant system after the reactor has been shutdown.

**Cooley anemia:** is thalassemia major which refers to thalassemias associated with total loss of  $\beta$ -globin (referred to as  $\beta^0$ -thalassemia) or partial loss (referred to as  $\beta^+$ -thalassemia)

**COOLING CHANNELS:** Channels or passageways located within the body of a mold through which a cooling medium can be circulated to control temperature on the mold surface. May also be used for heating a

mold by circulating steam, hot oil or other heated fluid through channels as in molding of the thermosetting and some thermoplastic materials. OR : It is the channels through which coolant is flown to remove heat from the mould. The channels are to be located thoughtfully in the core and cavity so that the temperature distribution over the mould surface is constant with little acceptable variation. OR Channels located within the body of a plastic injection mold through which a cooling fluid is circulated to control the mold surface temperature OR Channels or passageways located within the body of a mold through which a cooling medium can be circulated to control temperature on the mold surface. May also be used for heating a mold by circulating steam. hot oil or other heated fluid through channels as in molding of the thermosetting and some thermoplastic materials. OR Drilled holes or channels machined into various plates or components of an injection mold providing a flow path for cooling medium (such as water) to control the temperature of the mold. OR Channels or passageways located within the body of a mold through which a cooling medium can be circulated to control temperature on the mold surface. OR Channels located within the body of a mold through which a cooling medium is circulated to control the mold surface temperature.

**COOLING FIXTURE:** Block of metal or wood holding the shape of a molded piece which is used to maintain the proper shape or dimensional accuracy of a molding after it is removed from the mold until it is cool enough to retain its shape without further appreciable distortion. Also called: 'Shrink Fixture. OR Block of metal or wood holding the shape of a molded piece which is used to maintain the proper shape or dimensional accuracy of a molding after it is removed from the mold until it is cool enough to retain its shape without further appreciable distortion. Also called: 'Shrink Fixture'.

**Cooling Fixture:** Block of metal or wood holding the shape of a molded piece which is used to maintain the proper shape or dimensional accuracy of a molding after it is removed from the mold until it is cool enough to retain its shape without further distortion. Also known as Shrink Fixture.

**Cooling Tank:** A tank typically containing water through which extrusion is constantly passed for cooling.

**Cooling time:** the elapsed time required for the melt to reach its Vicat softening temperature. OR The amount of time required for the plastic to

reach its hardened state.

**cooling tower:** a device for cooling water through a combination of sensible and evaporative heat transfer. Water passes over a number of wooden or plastic racks known as “fill”, that act as a heat-transfer surface. OR A heat exchanger designed to aid in the cooling of water that was used to cool exhaust steam exiting the turbines of a power plant. Cooling towers transfer exhaust heat into the air instead of into a body of water.

**Coombs test :** An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat certain types of childhood Hodgkin lymphoma in males. It includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), prednisone, and dacarbazine. Also called COPDAC regimen.

**Cooperative binding:** A situation in which the binding of one ligand to a macromolecule favors the binding of another. For example, DNA cooperatively binds histone molecules, and hemoglobin cooperatively binds oxygen molecules.

**Cooperativity:** A property of many allosteric enzymes in which the binding of substrate to one active site favors the transition of all active sites from the T state to the R state, leading to an increase in enzyme activity.

**Coordinate induction:** The simultaneous expression of two or more genes.

**Coordinate Measuring Machine:** A coordinate measuring machine (CMM) is a device for measuring the physical geometrical characteristics of an object. This machine may be manually controlled by an operator or it may be computer controlled. Measurements are defined by a probe attached to the third moving axis of this machine. Probes may be mechanical, optical, laser, or white light.

**coordinate system:** rectangular grid system for plotting points.

**coordinating conjunction:** (and, but, for, nor, or, so, and yet) join words, phrases, or clauses that are grammatically equal in rank.

**coordination number:** The number of bonds formed by the central atom in a metal-ligand complex.

**Copal:** A group of natural resins which were formerly used in the manufacture of varnish but which have now been superseded by synthetic resins.

**copanlisib:** A phosphoinositide 3-kinase (PI3K) inhibitor with potential antineoplastic activity. Copanlisib inhibits the activation of the PI3K signaling pathway, which may result in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents. Check for active clinical trials using this agent.

**COPD:** An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat certain types of childhood Hodgkin lymphoma in males. It includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), prednisone, and dacarbazine. Also called COPDAC.

**COPDAC:** To adjust to new situations and overcome problems.

**COPDAC regimen :** The methods a person uses to deal with stressful situations. These may help a person face a situation, take action, and be flexible and persistent in solving problems. OR A chemotherapy regimen consisting of cyclophosphamide, vincristine sulfate, prednisone and dacarbazine used for the treatment of male children with classical Hodgkin lymphoma (HL).

**cope :** A molecule made up of two or more different kinds of small molecules called monomers. The monomers are joined together in a repeating pattern.

**Copernicus, Nicholas:** astronomer who developed the heliocentric model.

**coping skills :** An abbreviation for a chemotherapy combination used to treat Hodgkin and non-Hodgkin lymphomas. It includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), procarbazine hydrochloride, and prednisone. Also called COPP regimen.

**Copolymer:** the product of simultaneous polymerization of two or more polymerizable chemicals, commonly known as monomers. OR The chemical reaction of two different monomers with each other, result in a unique new polymer. OR A polymer resulting from the polymerization reaction between two chemically different monomers. OR Two monomers polymerized together to form a polymer. OR A polymer derived from more than one type of monomer. OR a polymer formed through the inter-polymerization of two (or more) chemically different monomers with each other. OR Polymers resulting from the polymerization reaction of two monomers that are chemically altered. OR This term usually, but not

always, denotes a polymer of two chemically distinct monomers. OR The chemical reaction of two different monomers with each other, result in a unique new polymer. OR This term usually, but not always, denotes a polymer of two chemically distinct monomers. OR The chemical reaction of two different monomers with each other, result in a compound. OR The chemical reaction of two different monomers with each other, result in a compound. OR A material whose chemical structure is made of long chains of two differently structured chemical units (Monomers) which repeat a more or less regular pattern in the chain. OR A polymer that is made up of more than one monomer unit. A copolymer has each of its comonomers in every chain. There are a number of different types of copolymer which describe the nature of the arrangement of the comonomers within the polymer chain. For the two monomer units A and B we can have: OR The product obtained when two or more compounds are chemically reacted with each other (co-polymerised) to produce a resinous type material. Copolymers form the basis of many types of paint and plastics. OR A polymer composed of two or more different monomers. The different monomers can be linked randomly, or in repeating sequences, or in blocks, or as side chains off the main chain.

**copolymer :** An abbreviation for a chemotherapy combination used to treat Hodgkin and non-Hodgkin lymphomas. It includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), procarbazine hydrochloride, and prednisone. Also called COPP.

**Copolymerisation:** Incorporation of more than one monomer into a polymer chain.

**COPP :** An abbreviation for a chemotherapy combination used to treat Hodgkin lymphoma in children. It may be used with radiation therapy. COPP-ABV includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), procarbazine hydrochloride, prednisone, doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, and vinblastine sulfate. Also called COPP-ABV regimen.

**COPP regimen :** A derivative of the original MOPP regimen consisting of cyclophosphamide, vincristine, procarbazine and prednisone used as an initial treatment for Hodgkin's lymphoma. Also used for the treatment of non-Hodgkin's lymphoma. OR An abbreviation for a chemotherapy combination used to treat Hodgkin lymphoma in children. It may be used

with radiation therapy. COPP-ABV regimen includes the drugs cyclophosphamide, vincristine sulfate (Oncovin), procarbazine hydrochloride, prednisone, doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, and vinblastine sulfate. Also called COPP-ABV.

**COPP-ABV:** A substance being studied in PET imaging to detect certain types of tumors. Copper Cu 64 is a radioactive substance. It is linked to ATSM, which is taken up by tissues that have low levels of oxygen, such as some tumor tissues. A PET scanner is used to detect which cells in the body have taken up copper Cu 64-ATSM. It is a type of radioimaging agent.

**COPP-ABV regimen :** A regimen consisting of cyclophosphamide, vincristine, prednisone and procarbazine (COPP) alternating with doxorubicin, bleomycin and vinblastine (ABV), used in combination with radiation therapy for the treatment of low-risk, childhood Hodgkin's lymphoma. OR A nutrient that the body needs in small amounts to function and stay healthy. CoQ10 helps mitochondria (small structures in the cell) make energy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). CoQ10 is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, beef, soybeans, peanuts, and spinach. It is being studied in the prevention and treatment of some types of cancer and heart disease and in the relief of side effects caused by some cancer treatments. Also called coenzyme Q10, Q10, ubiquinone, and vitamin Q10.

**Copper:** Symbol:"Cu" Atomic Number:"29" Atomic Mass: 63.55amu. Copper is one of the transition elements. Copper is one of the most well known metals. Humans have used it for thousands of years. It is a reddish color and can be found alone or in many different minerals. You might find copper in pipes, coins, alloys, and electronics.

**Copper Clad Laminate:** laminates (i.e., FR4) having copper foil bonded to one or both surfaces and intended primarily for use in printed circuits.

**copper Cu 62 ethylglyoxal bis(thiosemicarbazone):** A radiopharmaceutical composed of the nonspecific perfusion agent ethylglyoxal bis(thiosemicarbazone) (ETS) linked to the beta-emitting, radioisotope copper Cu 62, with potential tumor imaging activity upon positron emitting tomography (PET). Upon injection, copper Cu 62-ETS distributes to various organs, especially the kidneys and the myocardium. Upon PET imaging, tumor blood flow can be visualized and the efficacy of

antineoplastic and anti-angiogenic chemotherapeutics can be assessed. Cu<sup>62</sup>-ETS has a short half life of 9.74 minutes. ETS has an enhanced hyperemic response compared to other perfusion agents.

**copper Cu 62-ATSM:** A radioconjugate consisting of a lipophilic, neutral, bioreductive copper-bis(thiosemicarbazone) complex, copper-diacetyl-bis(N<sup>4</sup>-methylthiosemicarbazone) (Cu-ATSM), labeled with the beta-emitting radioisotope copper Cu 62, with hypoxia-selective and positron emitting tomography (PET) radioimaging activities. With a high membrane permeability and low reduction potential, copper Cu 62-ATSM easily enters cells. This agent can only be reduced by mitochondria found in hypoxic cells with abnormally high electron concentrations. This chemical reaction traps Cu 62-ATSM in the cell, which allows for the selective accumulation of this agent in hypoxic cells compared to normoxic cells. The extent of copper Cu 62-ATSM retention in tissue is inversely related to the state of tissue oxygenation allowing the quantitation of tissue hypoxia with PET. This provides information about diagnosis, prognosis, treatment options and outcomes for certain cancers. The short half-life of copper Cu 62 (9.7 minutes) reduces the amount of radiation a patient is subjected to and allows for several imaging studies to be performed. Hypoxic tumors are associated with increased malignancy and resistance to radiation and chemotherapy.

**copper Cu 62-PTSM:** A radioconjugate consisting of a lipophilic, bioreductive copper(II)bis(thiosemicarbazone) complex, copper-pyruvaldehyde-bis(N<sup>4</sup>-methylthiosemicarbazone) (Cu-PTSM), linked to the beta-emitting, radioisotope copper Cu 62, with potential perfusion and positron emitting tomography (PET) tumor imaging activities. Upon injection, the distribution of copper Cu 62-PTSM correlates with blood flow. This agent's high membrane permeability allows for rapid diffusion into cells. Once it enters the cell, <sup>62</sup>Cu-PTSM is then reduced by the mitochondria, which prevents diffusion of the agent out of the cell. Upon PET imaging, tumor blood flow can be visualized and tumor perfusion can be assessed. Compared with other copper radionuclides, the short half-life of copper Cu 62 (9.7 minutes) reduces the amount of radiation a patient is subjected to and allows for several imaging studies to be performed. PTSM lacks selectivity for hypoxic cells.

**copper Cu 64 anti-CEA monoclonal antibody M5A:** A radioimmunoconjugate consisting of a humanized monoclonal antibody directed against the human carcinoembryonic antigen, carcinoembryonic antigen-related cell adhesion molecule 5 (CEA or CEACAM5), which is conjugated with the radioisotope copper Cu 64 via the chelator tetra-azacyclododecanetetra-acetic acid (DOTA), with potential use as an imaging agent during positron emission tomography (PET). Upon administration, the antibody moiety of copper Cu 64 anti-CEA monoclonal antibody M5A specifically binds to cells expressing CEA. Upon binding, the radioisotope moiety can be detected using PET, thereby allowing the imaging and quantification of CEA-expressing tumor cells. CEA, a tumor associated antigen and a member of the CEA family of proteins, plays a key role in cell migration, cell invasion, and cell adhesion and is overexpressed by a variety of cancer types.

**copper Cu 64 plerixafor:** A radioconjugate labeled with the positron-emitting radioisotope, copper Cu 64, and also composed of plerixafor, a bicyclam and hematopoietic stem cell-mobilizing agent that targets the chemokine receptor CXCR4, with tumor imaging potential using positron emission tomography (PET)/computed tomography (CT). Upon administration, the plerixafor moiety blocks the binding of stromal cell-derived factor-1alpha (SDF-1alpha or CXCL12) to the cellular receptor CXCR4. In turn, the CXCR4-expressing tumor cells can be visualized using PET/CT and the resulting images could be used to predict a tumor's response to certain treatments. The expression of CXCR4 on cancer cells has been correlated with increased tumor cell survival, tumor progression, and increased metastatic potential.

**copper Cu 64 TP3805:** A peptide analog of pituitary adenylate cyclase-activating peptide (PACAP) radiolabeled with the positron-emitting radioisotope copper Cu 64, with potential diagnostic ability upon positron emission tomography (PET) imaging. The peptide moiety of copper Cu 64 TP3805 is able to bind to vasoactive intestinal peptide/pituitary adenylate cyclase activating peptide receptors 1 (VPAC1). Upon PET imaging, the cancer cells expressing VPAC1 can be visualized and this may allow for early detection. The oncogenic product VPAC1 is overexpressed in a variety of cancer cell types, moreover, it is overexpressed in 100% of breast tumors at the onset of the cancer. Compared to other positron-emitting radioisotopes, Cu 64 has a longer half life.

**copper Cu 64 trastuzumab:** A diagnostic radioimmunoconjugate comprised of the recombinant humanized monoclonal antibody trastuzumab conjugated with the positron-emitting radioisotope copper Cu 64. Copper Cu 64 trastuzumab binds to the extracellular domain of human epidermal growth factor receptor 2 (HER2), allowing the detection of HER2 distribution using positron emission tomography (PET).

**copper Cu 64-ATSM:** An operation on the vocal cords or on the spinal cord. OR A radioconjugate consisting of a lipophilic copper(II)bis(thiosemicarbazone) labeled with the positron- and beta-emitting isotope (<sup>64</sup>Cu) with hypoxia-selective and antineoplastic activities. With a high membrane permeability and redox potential, copper Cu 64-ATSM is preferentially taken up by hypoxic cells compared to normoxic cells; the extent of retention in tissue is inversely related to the state of tissue oxygenation allowing the quantitation of tissue hypoxia by positron emission tomography (PET). In addition, the radioactive copper moiety of this agent may deliver a selective cytotoxic dose of beta radiation to hypoxic tumor cells.

**copper Cu 64-DOTA B-Fab:** A radioimmunoconjugate containing a bivalent monospecific tandem immunoglobulin fragment (B-Fab) derived from the humanized monoclonal antibody DS6 targeting the tumor-associated mucin-1 (MUC1)-sialoglycotope CA6 conjugated with the bifunctional, macrocyclic chelating agent 1,4,7,10-tetra-azacyclododecane-1,4,7,10-tetra-acetic acid (DOTA) and labeled with the radioisotope copper Cu 64 with potential use as an imaging agent for CA6-expressing tumors using positron emission tomography (PET). The B-Fab moiety of copper Cu 64-DOTA B-Fab binds, with high affinity, to the cell surface antigen CA6. Upon binding, the radioisotope moiety may be detected using PET, thereby allowing the imaging and quantification of CA6-expressing tumor cells. This tracer could be used to select patients who could benefit from and to monitor efficacy of CA6-targeted anti-cancer therapies. Compared to DS6, the antibody fragment allows for increased tumor penetration, faster blood clearance, and more rapid renal elimination. The CA6 epitope is found on a variety of solid tumors.

**copper Cu 64-DOTA-AE105:** A radiotracer composed of AE105, a urokinase-type plasminogen activator receptor (uPAR) peptide antagonist, conjugated with DOTA and labeled with the radionuclide copper Cu 64,

with potential imaging activity upon positron emission tomography (PET). Upon administration, the AE105 moiety of copper Cu 64-DOTA-AE105 targets and binds to uPAR-expressing tumor cells. Upon PET imaging, the copper Cu 64 moiety can be visualized, uPAR-expressing tumor cells can be quantified and the degree of tumor aggressiveness can be assessed. uPAR expression is correlated with increased tumor invasiveness and aggressiveness as well as a poor prognosis.

**copper Cu 64-DOTA-anti-HER3 monoclonal antibody U3-1287:** A radioimmunoconjugate of the fully human monoclonal antibody against the third member of the epidermal growth factor receptor (EGFR), HER3 or ERBB3, conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and labeled with radioisotope copper Cu 64, with potential diagnostic properties upon positron emission tomography (PET) imaging and antineoplastic activity. The antibody moiety of copper Cu 64-DOTA-anti-HER3 monoclonal antibody U3-1287 binds to and blocks the activation of HER3, thereby resulting in the inhibition of EGFR-dependent PI3K/AKT signaling and the subsequent inhibition of cellular proliferation and differentiation. The Cu 64 moiety may be detected using positron emission tomography (PET), thereby allowing the imaging and quantification of HER3-expressing tumor cells. HER3, which lacks the kinase domain conveying ligand-binding signaling by forming heterodimers with other EGFR members that have kinase activity, is frequently overexpressed in solid tumors.

**copper Cu 64-DOTA-rituximab:** A radioimmunoconjugate containing rituximab, a recombinant chimeric murine/human antibody directed against the human CD20 antigen, conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and labeled with the radioisotope copper Cu 64 with potential diagnostic properties upon positron emission tomography (PET) imaging. The monoclonal antibody moiety of copper Cu 64-DOTA-Rituximab specifically binds to cell surface antigen CD20. Upon binding, the radioisotope moiety may be detected using PET, thereby allowing the imaging and quantification of CD20-expressing tumor cells. CD20 is a non-glycosylated phosphoprotein that is exclusively expressed on B cells during most stages of B cell development and is often overexpressed in B-cell malignancies. Check for active clinical trials using this agent.

**copper Cu 64-DOTA-trastuzumab:** A radioimmunoconjugate containing the recombinant humanized monoclonal antibody trastuzumab conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and labeled with the radioisotope copper Cu 64 with radioisotopic activity and potential use as an imaging agent. The trastuzumab moiety of copper Cu 64-DOTA-trastuzumab binds with high affinity to the extracellular domain of human epidermal growth factor receptor 2 (HER2). Upon binding, the radioisotope moiety may be detected using positron emission tomography (PET), thereby allowing the imaging and quantification of HER2-expressing tumor cells. HER2, a tyrosine kinase and client protein of heat shock protein 90 (Hsp90), may be overexpressed on the cell surfaces of various tumor cell types.

**copper gluconate:** The orally bioavailable copper salt of D-gluconic acid. In addition to its roles as an enzyme cofactor for cytochrome C oxidase and superoxide dismutase, copper forms complexes with the thiocarbamate disulfiram (DSF) forming DSF-copper complexes, which enhances the DSF-mediated inhibition of the 26S proteasome; proteasome inhibition may result in inhibition of cellular protein degradation, cessation of cell cycle progression, inhibition of cellular proliferation, and the induction of apoptosis in susceptible tumor cell populations.

**copper supplement:** An element with atomic symbol Cu, atomic number 29, and atomic weight 63. Check for active clinical trials using this agent.

**copy number variant :** Refers to the genetic trait involving the number of copies of a particular gene present in the genome of an individual. Genetic variants, including insertions, deletions, and duplications of segments of DNA, are also collectively referred to as copy number variants. Copy number variants account for a significant proportion of the genetic variation between individuals. Also called CNV.

**CoQ10:** A drug used to treat certain types of abnormal heart rhythms that have not gotten better with other drugs. Corderone affects the electrical activity of the heart. It is a type of antiarrhythmic agent. Also called amiodarone hydrochloride.

**Corbel:** A piece of brick, stone or metal projecting from a wall to support a load or a bracket.

**Cordarone:** (Other name for: amiodarone hydrochloride)

**cordectomy** : An anticancer drug that belongs to a family of drugs called antitumor antibiotics.

**Corderone** : The removal of a tissue sample with a wide needle for examination under a microscope. Also called core needle biopsy.

**cordycepin**: The removal of a tissue sample with a wide needle for examination under a microscope. Also called core biopsy. OR A purine nucleoside antimetabolite and antibiotic isolated from the fungus *Cordyceps militaris* with potential antineoplastic activity. Cordycepin is an adenosine analogue, which is readily phosphorylated to its mono-, di-, and triphosphate intracellularly. Triphosphate cordycepin can be incorporated into RNA, and inhibits transcription elongation and RNA synthesis due to the absence of a hydroxyl moiety at the 3' position. Because it can be converted to an inactive metabolite by adenosine deaminase, this agent must be administered with an adenosine deaminase inhibitor in order to be effective. Cordycepin has displayed cytotoxicity against some leukemic cell lines in vitro.

**Core**: The central member of a sandwich construction (can be honeycomb material, foamed plastic, or solid sheet) to which the face of the sandwich are attached; the central member of a plywood assembly. (2) A channel in a mold for circulation of heat-transfer media. (3) Part of a complex mold that molds undercut parts. Cores are usually withdrawn to one side before the main sections of the mold open. Also called Core Pin. OR Rigid cardboard tube onto which film is wound. Typical cores have either 3 inch or 6 inch inside diameters. OR (1) Male element in a die which produces a hole or recess in part. (2) Part of a complex mold that molds undercut parts. Cores are usually withdrawn to one side before the main sections of the mold opens. (Usually called Side Cores). (3) A channel in a mold for circulation of a heat-transfer medium. Also called "Force." OR A portion of the mold that goes inside a cavity to form the interior of a hollow part. Cores are normally found on the B-side of a mold, thus, the B-side is sometimes called the core. OR The mail portion of a liquid silicone rubber injection or plastic mold. OR A protrusion or set of matching protrusions, which form the inner surface of a plastic part. They are often considered they "male" side of the part. OR (1) Male element in a die which produces a hole or recess in part. (2) Part of a complex mold that molds undercut parts. Cores are usually withdrawn to one side before the main sections of the mold

opens. (Usually called Side Cores.) (3) A channel in a mold for circulation of a heat-transfer medium. Also called "Force." OR A protrusion, or set of matching protrusions, in a plastics forming mold which forms the inner surfaces of the molded articles. OR The pressure applied to the mold to keep it closed during a cycle, usually expressed in tons. OR The part of a mold that allows the internal shaping of a product such as the internal threads of a cap. OR . A) an extended or male portion of the mold that creates the internal plastic part surface. B) a pin or protrusion designed to produce a hole or depression in the plastic part. OR the zone of the earth that includes the inner and outer core. OR The central portion of a nuclear reactor, which contains the fuel assemblies, moderator, neutron poisons, control rods, and support structures. The reactor core is where fission takes place.

**Core & Cavity Set:** A sub set of a liquid silicone rubber injection or plastic mold that fits within a mold base. This technique generally lowers silicone or plastic tooling investment

**Core Bar:** A steel bar used to hold machined core in place in the liquid silicone injection mold

**core biopsy :** A drug used to treat high blood pressure and certain heart problems. It is also being studied in the prevention and treatment of side effects caused by some anticancer drugs. Coreg blocks certain receptors on nerve cells and causes blood vessels to dilate (widen). It is a type of antihypertensive agent and a type of antianginal agent. Also called carvedilol phosphate.

**Core damage frequency:** An expression of the likelihood that, given the way a reactor is designed and operated, an accident could cause the fuel in the reactor to be damaged.

**Core Drill:** A device for making cooling channels in a mold.

**core electron:** Electrons occupying completely filled shells under the valence shell.

**Core glycosylation:** The addition of carbohydrates to proteins and the processing of these carbohydrates that takes place in the endoplasmic reticulum.

**Core melt accident:** An event or sequence of events that result in the melting of part of the fuel in the reactor core.

**core needle biopsy :** A substance being studied in the treatment of breast cancer and other types of cancer. Coriolus versicolor is a type of mushroom. Its extract is used with other treatments in some cultures to treat cancer and other conditions. The extract may boost the immune system, slow the growth of some tumor cells, and lessen the side effects of chemotherapy and radiation therapy. It is a type of biological response modifier (BRM) and a type of dietary supplement.

**Core particles:** Particles resulting from micrococcal nuclease digestion of nucleosomes, consisting of 140-bp DNA and the histone octamer of a nucleosome.

**Core pin:** A fixed element in the mold that creates a void in the part. It is often easier to machine a core pin as a separate element and add it to the A-side or B-side as needed. Steel core pins are sometimes used in aluminum molds to create tall, thin cores that might be too fragile if machined out of the bulk aluminum of the mold.

**Core-cavity:** A term used to describe a mold created by mating A-side and B-side mold halves.

**Cored Rolls:** Bags or tubing is rolled on cardboard cylinders (looks similar to a roll of paper towels).

**Coreg:** (Other name for: carvedilol) OR The transparent part of the eye that covers the iris and the pupil and allows light to enter the inside.

**Coreg CR:** (Other name for: carvedilol phosphate extended-release capsule)

**Coreless Rolls:** Bags are rolled with perforations or are interleaved in a roll configuration.

**Corepressor:** A small molecule that binds to a repressor protein; the corepressor-repressor complex then binds to the operator DNA of a particular operon to inhibit transcription.

**Corgard:** (Other name for: nadolol)

**Cori cycle:** A cyclic metabolic pathway in which lactate from active muscle is converted into glucose by the liver, which in turn supplies newly synthesized glucose to muscle and other tissues.

**Cori disease:** A disease in which the structure of liver and muscle glycogen is abnormal and the amount is increased; it is due to an inability to

hydrolyze the  $\alpha$ -1,6-glycosidic bonds in glycogen; liver function is compromised.

**CORING:** (molded part design) — The removal of excess material from the cross section of a molded part to attain a more uniform wall thickness.

**Coriolis effect:** The tendency for an object moving above the Earth to turn to the right in the Northern Hemisphere and to the left in the Southern Hemisphere relative to the Earth's surface. The effect arises because the Earth rotates and is not, therefore, an inertial reference frame.

**Coriolus versicolor extract:** An extract derived from the mushroom *Coriolus versicolor*, containing polysaccharide K (PSK) and polysaccharide-peptide (PSP), with potential immunomodulating and antineoplastic activities. *Coriolus versicolor* extract has been shown to stimulate the production of lymphocytes and cytokines, such as interferons and interleukins, and may exhibit antioxidant activities. However, the precise mechanism of action(s) of this agent is unknown.

**Coriolus versicolor extract :** Surgery in which a healthy blood vessel taken from another part of the body is used to make a new path for blood around a blocked artery leading to the heart. This restores the flow of oxygen and nutrients to the heart. Also called aortocoronary bypass and CAB.

**cork:** a tough tissue that combines with the phloem to become the bark of vascular plants.

**Cork finish:** The bottle opening (finish) that is sealed with a cork.

**cornea :** A disease in which there is a narrowing or blockage of the coronary arteries (blood vessels that carry blood and oxygen to the heart). Coronary artery disease is usually caused by atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries). The disease may cause chest pain, shortness of breath during exercise, and heart attacks. The risk of coronary artery disease is increased by having a family history of coronary artery disease before age 50, older age, smoking tobacco, high blood pressure, high cholesterol, diabetes, lack of exercise, and obesity. Also called CAD and coronary heart disease.

**Cornerstone of Safety:** Nuclear plant activities that are essential for the safe operation of the facility. These cornerstones are grouped under the categories of reactor safety, radiation safety, and safeguards.

**Cornice:** A projecting moulding decorating the top of a building or wall, e.g. the moulding between wall and ceiling.

**corona:** outermost layer surrounding the Sun.

**CORONA DISCHARGE:** A method of rendering the surface of inert plastics such as polyethylene more receptive to inks, adhesives, or coatings by subjecting their surfaces to an electrical discharge. Typical method is to pass film over a grounded metal cylinder above which a high voltage electrode is spaced to leave a small air gap.—The corona discharge oxidizes the film leading to the formation of polar groups. The surface now becomes receptive to the coatings.

**Corona Resistance:** A current passing through a conductor induces a surrounding electrostatic field. When voids exist in the insulation near the conductor, the high voltage electrostatic field may ionize and rapidly accelerate some of the air molecules, ionizing them, and thereby “eating” a hole in the insulation. Resistance to this process is called corona resistance.

**Corona Treat:** The process by which the surface energy of plastic film is increased to allow adhesion of adhesives, inks, and coatings.

**CORONA TREATMENT:** Surface treatment of plastic parts by exposing them to an electrical corona discharge to increase their receptivity to inks, paints and adhesives. OR Impingement of AC power on a component to bombard with free radicals thus improving the ability to bond to a surface.

**coronary arteries:** the arteries that supply the heart muscle with blood.

**coronary artery bypass :** A disease in which there is a narrowing or blockage of the coronary arteries (blood vessels that carry blood and oxygen to the heart). Coronary heart disease is usually caused by atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries). The disease may cause chest pain, shortness of breath during exercise, and heart attacks. The risk of coronary heart disease is increased by having a family history of coronary heart disease before age 50, older age, smoking tobacco, high blood pressure, high cholesterol, diabetes, lack of exercise, and obesity. Also called CAD and coronary artery disease.

**coronary artery disease :** The body of the uterus.

**coronary heart disease :** Any steroid hormone made in the adrenal cortex (the outer part of the adrenal gland). They are also made in the laboratory. Corticosteroids have many different effects in the body, and are used to treat

many different conditions. They may be used as hormone replacement, to suppress the immune system, and to treat some side effects of cancer and its treatment. Corticosteroids are also used to treat certain lymphomas and lymphoid leukemias.

**corpus :** A hormone made in the pituitary gland. Corticotropin acts on the outer part of the adrenal gland to control its release of corticosteroid hormones. More corticotropin is made during times of stress. Also called ACTH and adrenocorticotrophic hormone.

**corpus luteum:** the mass of cells derived from the female follicle that secretes progesterone.

**Corrective Action Program:** The system by which a utility finds and fixes problems at the nuclear plant. It includes a process for evaluating the safety significance of the problems, setting priorities in correcting the problems, and tracking them until they have been corrected.

**correlation effects:** The effect upon the quantity of interest attributable to the inclusion of dynamic electron correlation.

**correlation energy:** The difference between the Hartree-Fock energy and the FCI energy for a given basis set. Most of this energy is attributable to the correlation among the positions of electrons of opposite spin, caused by their coulombic repulsion. See dynamic and non-dynamic correlation.

**correlative conjunction:** conjunctions that come in matched pairs, like not only/but also.

**corresponding:** in the same position. Coinciding.

**Corrosion:** chemical action which causes destruction of the surface of a material by oxidation or chemical combination. Also caused by reduction of the electrical efficiency between a metal and a contiguous substance or to the disintegrating effects of strong electrical currents or ground return currents in electrical systems. The latter is known as electrolytic corrosion.

**corrosion:** Corrosion is a reaction with oxygen, water, or acid that results in the disintegration of the material under attack. OR Process of metal decomposition (oxidation) in which metal ions are united with oxygen to form metal oxides. Fluoropolymer coatings provide excellent barriers against corrosion. OR A destructive attack of metal caused by oxidation, e.g., rust on ferrous metals or white deposit forming on aluminium.

Corrosion destroys the surface of metal and this process is accelerated in

chemical or salt laden atmospheres. OR Corrosion is a reaction that involves action of an oxidizing agent on a metal. The oxidizing agent is often oxygen dissolved in water. See How Iron Rusts for examples. OR chemical action which causes destruction of the surface of a material by oxidation or chemical combination. Also, caused by reduction of the electrical efficiency between metal and the continuous substance or to the disintegrating effects of strong electrical currents or ground return currents in electrical systems. The latter is known as electrolytic corrosion.

**Corrosion inhibition:** Corrosion can be defined as the unwanted production of a salt from a metal. Adding acid or oxygen are good ways to do this. The main ways of slowing corrosion down (inhibition) are by providing an impermeable coating to stop the chemical reaction from occurring in the first place, or by providing a more easily attacked metal which will be consumed first (a 'sacrificial anode')

**Corrosion Inhibitor:** A type of metal paint or primer that prevents rust by preventing moisture from reaching the metal. Zinc phosphate, barium metaborate and strontium chromate (all pigments) are common ingredients in corrosion-inhibitive coatings. These pigments absorb any moisture that enters the paint film.

**CORROSION INHIBITOR:** An additive or a system used for protecting metal surfaces from chemical attack by water or other materials producing sulfides or oxides which result in metal fatigue or degradation.

**Corrosion Resistance:** A broad term applying to the ability of plastics to resist many environments. OR The ability to withstand the effect of oxidation. OR Term that applies to the ability of plastics to resist degradation in many environments. OR A broad term applying to the ability of plastics to resist degradation in many environments, usually due to oxidation.

**corrosive of tissue:** The descriptor applied to any substance which destroys tissues on direct contact.

**Corrugated medium :** Papers used as fluting for the production of corrugated board.

**Cort-Dome:** (Other name for: therapeutic hydrocortisone)

**Cortalone:** (Other name for: prednisolone)

**Cortef:** (Other name for: therapeutic hydrocortisone)

**Cortenema:** (Other name for: therapeutic hydrocortisone)

**cortex:** the outer portion of the adrenal gland.

**corticotropin acetate:** A synthetic therapeutic agent which is chemically identical to or similar to the endogenous human corticotropin-releasing factor (hCRF). Synthesized in the hypothalamus, hCRF stimulates the anterior pituitary gland to secrete adrenocorticotropic hormone (ACTH). In cerebral edema, hCRF acts by impeding the flow of fluid from blood vessels into brain tissue, thereby decreasing edema and stabilizing intracranial pressure. This agent possesses anti-edema properties independent of adrenal gland function.

**corticosteroid :** A hormone made by the adrenal cortex (the outer layer of the adrenal gland). It helps the body use glucose (a sugar), protein, and fats. Cortisol made in the laboratory is called hydrocortisone. It is used to treat many conditions, including inflammation, allergies, and some cancers. Cortisol is a type of glucocorticoid hormone.

**corticosteroids:** the steroids secreted from the adrenal glands. OR Steroid hormones formed by the adrenal cortex.

**corticotropin :** A natural steroid hormone produced in the adrenal gland. It can also be made in the laboratory. Cortisone reduces swelling and can suppress immune responses.

**corticotropin-releasing hormone:** A hormone synthesized in the hypothalamus and regulates the secretion of adrenocorticotropic hormone (ACTH).

**cortisol :** A bacterium that can cause skin disorders. Substances taken from this bacterium can stimulate the immune system and may help kill cancer cells.

**cortisone :** A drug used to treat Ewing sarcoma, gestational trophoblastic tumor, Wilms tumor, and certain types of testicular cancer. It is also used to treat rhabdomyosarcoma in children. It is being studied in the treatment of other types of cancer. Cosmegen comes from the bacterium *Streptomyces parvulus*. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called actinomycin D and dactinomycin.

**Cortispray:** (Other name for: therapeutic hydrocortisone)

**Cortril:** (Other name for: therapeutic hydrocortisone)

**Corynebacterium granulosum :** A rare, genetic disorder marked by developmental problems, being shorter than normal, mental retardation, heart problems, unusual facial features, and extra folds of skin around the neck, hands, and feet. People with Costello syndrome have an increased risk of certain types of cancer, such as rhabdomyosarcoma (a soft tissue tumor) and neuroblastoma (cancer of immature nerve cells).

**Corynebacterium granulosum P40:** An insoluble fraction isolated from the bacterium *Corynebacterium granulosum* with potential cancer immunotherapeutic activity. As a non-specific immunostimulant, *Corynebacterium granulosum* P40 activates the reticulo-endothelial system; induces the production of certain cytokines; enhances macrophage activity; and potentiates a delayed-type hypersensitivity response when co-administered with an antigen.

**cosegregation :** The transmission, together, of 2 or more genes on the same chromosome, as a result of their being in very close physical proximity to one another (i.e., linked).

**Cosmegen :** A drug used with vemurafenib to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Cotellic blocks certain proteins, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor and a type of targeted therapy. Also called cobimetinib.

**Cosmic radiation:** A source of natural background radiation, which originates in outer space and is composed of penetrating ionizing radiation (both particulate and electromagnetic). The sun and stars send a constant stream of cosmic radiation to Earth, much like a steady drizzle of rain. Differences in elevation, atmospheric conditions, and the Earth's magnetic field can change the amount (or dose) of cosmic radiation that we receive. Secondary cosmic rays, formed by interactions in the Earth's atmosphere, account for about 45 to 50 millirem of the 360 millirem of background radiation that an average individual receives in a year. For related information, see Natural Background Sources.

**Cosmid:** A DNA molecule with cos ends from lambda-bacteriophage that can be packaged in vitro into a virus for infection purposes . OR A cloning

vector, used for cloning large DNA fragments; generally contains segments derived from bacteriophages and various plasmids.

**Costello syndrome :** A drug used in the treatment of infections caused by bacteria and protozoa. It is a combination of two anti-infection drugs, sulfamethoxazole and trimethoprim.

**Cot curve:** A curve that indicates the rate of DNA-DNA annealing as a function of DNA concentration and time.

**Cotara:** (Other name for: iodine I 131 monoclonal antibody TNT-1/B)

**Cotellic :** A substance being studied in the treatment of several types of cancer. It comes from the seed of the cotton plant (*Gossypium*). It blocks the growth of cells and may kill cancer cells. Cottonseed meal toxin may also act as a male contraceptive (a type of birth control). Also called gossypol.

**Cotrim:** (Other name for: trimethoprim-sulfamethoxazole)

**cottonseed meal toxin :** An estrogen-like substance (phytoestrogen) made by some plants. Coumestans may have anticancer effects.

**cotyledon:** A leaf or leaves of the embryos of seed plants. They can function in food storage and can become photosynthetic when the seed germinates.

**COUETTE FLOW (also called DRAG FLOW):** The flow between two surfaces caused by the movement of one relative to the other. The fluid is literally dragged by the moving wall. For parallel flat surfaces the resulting velocity profile is linear, varying from zero at the stationary wall to the velocity of the moving surface.

**Coulomb:** An Amp(ere) of current is what you get one one Coulomb worth of electric charge flows past a point in one second - i.e.,  $1 \text{ A} = 1 \text{ C/s}$ .

One mole of electrons has a charge of 96 500 C, which is called a Farad.  
OR The SI unit of electric charge, equal to the amount of charge delivered by a current of 1 ampere running for 1 second. One mole of electrons has a charge of about 96487 C.

**coulombic interactions:** Attractions between opposite charges or repulsions between like charges that grow stronger as the charges become closer to each other.

**Coulter method:** A technique for determination of particle size distribution in which suspended particles pass through an orifice while

changes in the resistance at the gap are recorded.

**Coumadin:** (Other name for: warfarin)

**coumarin:** O hydroxycinnamic acid. Pleasant smelling compound found in many plants and released on wilting. Has anticoagulant activity by competing with Vitamin K.

**coumarin :** A type of coumestan. Coumestans are estrogen-like substances (phytoestrogens) made by some plants. Coumestans may have anticancer effects.

**coumestan :** The process by which a professional counselor helps a person cope with mental or emotional distress, and understand and solve personal problems.

**coumestrol :** A specialist who talks to patients and their families about emotional and personal matters, and can help them make decisions. Also called mental health counselor.

**counselee :** An individual who presents for genetic counseling. Also called consultand.

**counseling :** An inherited disorder marked by the formation of many noncancerous growths called hamartomas. These growths occur in the skin, breast, thyroid, colon, intestines, and inside of the mouth. Patients with Cowden disease are at increased risk of certain types of cancer, including breast and thyroid. Also called Cowden syndrome and multiple hamartoma syndrome.

**counselor :** An inherited disorder marked by the formation of many noncancerous growths called hamartomas. These growths occur in the skin, breast, thyroid, colon, intestines, and inside of the mouth. Patients with Cowden syndrome are at increased risk of certain types of cancer, including breast and thyroid. Also called Cowden disease and multiple hamartoma syndrome.

**count mean diameter:** The mean of the diameters of all particles in the population (IAEA, 1978).

**count median diameter:** The diameter in the population above which there are as many particles with larger diameter as there are particles with smaller diameters (IAEA, 1978).

**Counter:** A general designation applied to radiation detection instruments or survey meters that detect and measure radiation. The signal

that announces an ionization event is called a count. For related information, see Detecting Radiation.

**Counterbore:** A recessed circular area, commonly used to fit the head of an ejector pin (return pin, sucker pin, etc.) in the ejector plate.

**counterpoise:** The most common, but still controversial, correction for BSSE. The BSSE is approximated as the energy difference between (1) an isolated fragment and (2) the fragment accompanied by the basis functions, but not the atoms, of its companion fragment(s).

**country rock:** the surrounding rock that magma invades in the formation of intrusive rocks.

**coupled cluster:** In diagrammatic perturbation theory, an excited configuration that is "coupled" to the reference configuration.

**Coupled reaction:** The pairing of an endergonic reaction with an exergonic reaction, such as the hydrolysis of ATP, so that the pair of reactions will take place under cellular conditions. OR Two chemical reactions that have a common intermediate and thus a means of energy transfer from one to the other.

**couples:** A half-reaction which explicitly shows electron transfer

**Coupling agent:** A substance which promotes or establishes a stronger bond at the resin matrix/reinforcement interface. OR A material that is used to form a chemical bridge between the resin and glass fiber or mineral fiber. By acting as an interface, bonding is enhanced. OR A material that is used to form a chemical bridge between the resin and an additive such as glass fiber or mineral fiber. By acting as an interface, bonding is enhanced.

**coupling constant (J):** the separation in frequency units between multiple peaks in one chemical shift. This separation results from spin-spin coupling.

**Course:** A horizontal layer of bricks or stones in a wall.

**Covalence:** Covalence is the ability of an element to bond with other elements by sharing electrons across a bond. Covalent compounds can be made with single, double, and triple bonds. These bonds are not as easily broken in solution as electrovalent compounds. Two covalent bonds happen between carbon and two oxygen atoms in carbon dioxide.

**covalent bond:** Bonds that hold atoms together by the sharing of electrons. OR A chemical bond where electrons are shared between two atoms. In this type of bond no ions are found. You can find covalent bonds in many

compounds. You will find covalent bonds when carbon bonds to other elements. OR A covalent bond is a bond between atoms of non-metal elements formed by sharing one (or more) pairs of electrons. OR atoms linked together by sharing valence electrons. OR a bond formed by the sharing of electrons between atoms. OR A force that holds together two or more atoms, formed when electrons travel between the atoms' nuclei (and are thus "shared") OR A covalent bond is a very strong attraction between two or more atoms that are sharing their electrons. In structural formulas, covalent bonds are represented by a line drawn between the symbols of the bonded atoms. OR A chemical bond that involves sharing of electron pairs. OR When two atoms share at least one pair of electrons.

**Covalent catalysis:** Catalysis in which the active site contains a reactive group that becomes temporarily covalently modified in the course of catalysis.

**covalent compound:** A compound made of molecules- not ions. The atoms in the compound are bound together by shared electrons. Also called a molecular compound.

**Covalent intermediate:** In a catalytic mechanism, an intermediate comprising a component of the substrate covalently bound to the enzyme.

**Covalent modification:** The attachment to and removal of chemical groups from an enzyme and the consequent change in the catalytic properties of that enzyme. Catalytic properties of many enzymes are altered by the covalent attachment and removal of phosphoryl groups, whereas a smaller number of others undergo reversible attachment of AMP units from ATP.

**covalent radius:** Value assigned to an atom such that the sum of the covalent radii of atoms A and B is (approximately) the A-B bond length.

**Cove:** Any kind of concave moulding usually large.

**Cover fillit:** Any beading small moulding or strip used to cover a joint.

**COVERAGE:** The area over which a given amount of paint will spread and hide the previous surface. (Usually expressed in square feet per gallon).

**Covering power:** This term should not be used as it can be confused between the two qualities of hiding-power or opacity and of spreading power or area covered by a given amount of paint. "opacity"™ and "spreading capacity"™ are better terms to use.

**Cowden disease :** A type of drug that is used to treat inflammation and pain, and is being studied in the prevention and treatment of cancer. COX inhibitors belong to the family of drugs called nonsteroidal anti-inflammatory drugs (NSAIDs). Also called cyclooxygenase inhibitor.

**Cowden syndrome :** An enzyme that speeds up the formation of substances that cause inflammation and pain. It may also cause tumor cells to grow. Some tumors have high levels of COX-2 and blocking its activity may reduce tumor growth. Also called cyclooxygenase-2 and prostaglandin-endoperoxide synthase 2.

**COX inhibitor :** A nonsteroidal anti-inflammatory drug used to relieve pain and inflammation. COX-2 inhibitors are being studied in the prevention of colon polyps, and as anticancer drugs. Also called cyclooxygenase-2 inhibitor.

**COX-2 :** A drug used to treat high blood pressure. Cozaar blocks the action of chemicals that make blood vessels constrict (get narrower). It is a type of angiotensin II receptor antagonist. Also called losartan and losartan potassium.

**COX-2 inhibitor :** A chemotherapy combination used to treat chronic lymphocytic leukemia (CLL). It includes the drugs chlorambucil hydrochloride and prednisone. Also called chlorambucil-prednisone, chlorambucil-prednisone regimen, and CP regimen.

**COX-MERZ RULE:** Frequently, instead of (steady) viscosity measurements by a capillary and/or a cone-and-plate instrument, dynamic measurements are performed (easier) by applying a sinusoidal deformation in the cone-and-plate. The COX-MERZ rule states that the (steady) viscosity versus shear rate curve is virtually identical to the dynamic viscosity versus frequency curve. It is valid for most common polymers. Since it is easier to get the dynamic data over a very wide range of frequencies, it is used extensively in industry.

**coxa valga:** deformity of the hip where the angle formed between the head and neck of the femur and its shaft is increased

**coxsackievirus A21:** A naturally occurring enterovirus with potential antitumor activity. Upon intratumoral administration, coxsackievirus A21 targets and binds to intracellular adhesion molecule 1 (ICAM-1) and decay acceleration factor (DAF), both cell surface molecules that are both overexpressed on certain malignant cells. After entering the cells,

coxsackievirus A21 replicates in these cancer cells, thereby causing cancer cell lysis. This results in a reduction of tumor cell growth.

**Cozaar :** (Other name for: losartan potassium)

**CP:** A condition of the prostate gland that continues or gets worse over a long period of time. Symptoms include body aches, pain in the lower back and genital area, a burning feeling during urination, and problems with emptying the bladder all the way. Also called chronic prostatitis/chronic pelvic pain syndrome.

**CP regimen :** A drug used to treat certain types of non-small cell lung cancer. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that cannot be removed by surgery or has spread to other parts of the body. It is being studied in the treatment of other types of cancer. CP-358,774 blocks a protein called epidermal growth factor receptor (EGFR), which may help keep cancer cells from growing. It is a type of EGFR tyrosine kinase inhibitor. Also called erlotinib hydrochloride, OSI-774, and Tarceva.

**CP-358,774:** A substance that is being studied in the treatment of cancer.

**CP-4055:** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called vascular endothelial growth factor (VEGF) receptor inhibitors and angiogenesis inhibitors.

**CP-547,632:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called ErbB receptor tyrosine kinase inhibitors.

**CP-609,754:** A substance made by the pancreas. C-peptide and insulin are both part of a larger molecule that gets split apart before being released into the blood. Abnormal blood levels of C-peptide may occur in certain diseases, such as diabetes or cancer. Also called connecting peptide.

**CP-724,714:** An orally bioavailable quinazoline with potential antineoplastic activity. CP-724,714 selectively binds to the intracellular domain of HER2, reversibly inhibiting its tyrosine kinase activity and resulting in suppression of tumor cell growth. HER2, a member of the epidermal growth factor receptor (EGFR) family, is overexpressed in many adenocarcinomas, particularly breast cancers. OR A test used to help diagnose a type of pancreatic tumor called an insulinoma. After fasting, the patient receives an injection of insulin and the level of C-peptide (a

substance released with insulin by the pancreas) in the blood is measured. In patients who have an insulinoma, the level of C-peptide is higher than normal.

**CP/PPS:** A drug used to treat advanced acute myeloid leukemia (AML). It is a form of the anticancer drug cytarabine that may work in patients with leukemia that is resistant to cytarabine. CP-4055 blocks cell division and may kill cancer cells. It is a type of antimetabolite. Also called Elacyt and elacytarabine.

**CP4071:** A substance that is being studied in the treatment of cancer.

**CPE:** Chlorinated Polyethylene

**CpG 7909:** A drug used alone or with other drugs to treat colon cancer or rectal cancer that has spread to other parts of the body or has come back after treatment with fluorouracil. It is also being studied in the treatment of other types of cancer. CPT 11 blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called Camptosar and irinotecan hydrochloride.

**Cpg islands:** Regions of DNA rich in the sequence cpg, usually located at the 5' region of genes; the cytosine bases of these islands can be methylated to inhibit transcription of the associated gene.

**CpG oligodeoxynucleotide:** A synthetic oligodeoxynucleotide, containing unmethylated CpG motifs derived from bacterial DNA, with immunostimulatory activities. A CpG oligodeoxynucleotide (CpG ODN) binds to and activates a Toll-like receptor 9 (TLR9) and is taken up into cells by endocytosis; once internalized, it may activate numerous signaling transduction pathways resulting in the release of multiple cytokines. Through activation of TLR9, a CpG ODN can directly stimulate B-lymphocytes, dendritic and NK cells, resulting in an increase in innate immunity and antibody-dependant cell cytotoxicity (ADCC). Additionally, a CpG ODN can indirectly modulate T-cell responses, through the release of cytokines (IL-12 and IFN gamma), to induce a preferential shift to the Th1 (helper) phenotype resulting in enhanced CD8+ cellular cytotoxicity.

**CpG oligodeoxynucleotide GNKG168:** A synthetic, 21-mer, unmethylated CpG motif-based oligodeoxynucleotide (ODN), with immunostimulatory activity. CpG oligodeoxynucleotide GNKG168 binds to and activates Toll-like receptor 9 (TLR9) and is taken up into cells by

endocytosis; once internalized, it may activate numerous signaling transduction pathways resulting in the release of multiple cytokines, such as immunoglobulins (Igs), interferons (IFNs), interleukins (ILs) and tumor necrosis factor (TNF). Through activation of TLR9, this ODN can directly stimulate B-lymphocytes, dendritic and natural killer (NK) cells, resulting in an increase in innate immunity and antibody-dependent cellular cytotoxicity (ADCC). In addition, through the release of IL-12 and IFN, this agent may induce a preferential shift to the T-helper 1(Th1) phenotype resulting in enhanced CD8+ T cell-mediated antitumor cytotoxicity. Check for active clinical trials using this agent.

**CPR:** A substance being studied in the treatment of cancer. It is a type of topoisomerase inhibitor. Also called chloroquinoxaline sulfonamide.

**CPT 11:** A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor.

**CPVC:** Chlorinated Polyvinyl Chloride

**CQS:** A sharp pain that occurs when a muscle suddenly contracts (tightens up). Cramps commonly occur in the abdomen and legs.

**CR:** Child Resistant, indicates that a package will pass a test protocol administered by the U.S. Consumer Product Safety Commission.

**CR2-fH fusion protein TT30:** A recombinant, chimeric human fusion protein consisting of the iC3b/C3d-binding region of human complement receptor type 2 (CR2/CD21) linked to the alternative complement pathway (ACP) inhibitory domain of human factor H (fH) (CR2-fH), with potential complement system inhibiting activity. Via its C3 binding domain, TT30 selectively binds to complement-activated cell surfaces and via its fH binding domain regulates ACP activity. This suppresses excessive complement activity and may result in an inhibition of ACP-mediated hemolysis of paroxysmal nocturnal hemoglobinuria (PNH) red blood cells (RBCs) as well as preventing ACP-induced tissue damage. Factor H is a key regulator in the activation of ACP. Check for active clinical trials using this agent.

**CRA-024781:** A rare, benign (not cancer) brain tumor that usually forms near the pituitary gland and the hypothalamus. Craniopharyngiomas are slow-growing and do not spread to other parts of the brain or to other parts of the body. However, they may grow and press on nearby parts of the

brain, including the pituitary gland, hypothalamus, optic chiasm, optic nerves, and fluid-filled spaces in the brain. This may cause problems with growth, vision, and making certain hormones. Craniopharyngiomas usually occur in children and young adults.

**Crack/Splits/Chips:** A physical separation or tearing of the part.

**Cracking:** Actual separation of moulded material, visible on opposite surfaces of a part and extending through the thickness (fracture). OR Sharp breaks or fissures in silicone rubber surfaces resulting from excessive strain or exposure to adverse environmental factors OR The process in which large molecules found in crude oil are broken down into smaller molecules. See Catalytic Cracking and Thermal Cracking OR The type of paint failure characterized by breaks in irregular lines wide enough to expose the underlying surface.

**Cracking of plaster:** It is quite normal for small cracks to appear in plaster on interior walls and ceilings, either through drying out in new homes or movement of the building in older homes. Simply cut out the cracks, dust off and fill with a suitable interior filler. Allow to dry, then rub down smooth and dust off to create a clean, smooth surface for decorating.

**Cracking on outside paintwork:** This cracking develops as the paint begins to lose flexibility and it no longer expands and contracts with the substrate. The more layers of paint, the worse the problem. Small areas of cracking can be treated by scraping and rubbing down. But large areas will need to be completely removed with a hot air gun or suitable chemical paint remover. Bare surfaces should be primed with an appropriate Dulux Primer before painting.

**Cracking/crazing/crocodiling:** Fine lines or cracks usually occurring when a hard drying material is applied over a soft material e.g. gloss paints applied over bituminous coatings.

**Crackle finish:** The application of a top coating designed to "shrink"™ and crack exposing a different colour underneath.

**cramp :** An operation in which a piece of the skull is removed. A craniotomy may be done so doctors can remove a brain tumor or abnormal brain tissue. It may also be done to remove blood or blood clots from the brain, relieve pressure in the brain after an injury or stroke, repair a brain aneurysm (a bulge in a blood vessel wall) or skull fractures, or treat other

brain conditions. The piece of skull that is removed is usually put back in place after the brain problem has been treated.

**craniopharyngioma :** The bones that form the head. The cranium is made up of cranial bones (bones that surround and protect the brain) and facial bones (bones that form the eye sockets, nose, cheeks, jaw, and other parts of the face). An opening at the base of the cranium is where the spinal cord connects to the brain. Also called skull.

**craniosynostosis:** premature fusion of the cranial sutures

**craniotomy :** A strong, urgent, or abnormal desire for a certain substance or activity. There are different types of cravings, such as food cravings or cravings for addictive substances, including alcohol, drugs, or nicotine. Nicotine cravings are common after a person quits smoking and may come and go over time.

**cranium :** A substance that is made by the body and used to store energy. It is being studied in the treatment of weight loss related to cancer. It is derived from the amino acid arginine.

**Crassulacean acid metabolism:** An adaptation by plants living in arid environment; the C4 pathway concentrates carbon dioxide at night, and vapor exchange with the environment is curtailed during the heat of the day by closure of the stomata.

**crater:** impact mark left on a planet or moon by a collision with a another object.

**craton:** a continental interior that has been structurally inactive for a prolonged time, usually hundreds of millions of years or longer.

**craving :** A compound that is excreted from the body in urine. Creatinine levels are measured to monitor kidney function.

**CRAWLING:** Varnish defect in which poor adhesion of varnish to surface in some spots causes it to gather up in globs.

**Crazing:** fine cracks at or under the surface of a plastic. OR Fine cracks which may extend in a network on or under the surface or through a layer of plastic material. OR Fine cracks which may extend in a network on or under the surface or through a layer of a plastic material. OR Small cracks near or on the surface of plastic materials. OR A small, shallow surface imperfection. OR A defect that causes small cracks often caused by over-stressing the plastic material. OR Fine cracks which may extend in a

network or under the surface of a moulded part. OR Small cracks near or on the surface of plastic materials. OR minute lines appearing in or near the surface of materials such as plastics, usually resulting as a response to environment. Crazeing cannot be felt by running a fingernail across it. (If the fingernail catches, it is a crack.)

**CRAZING:** Fine cracks which may extend in a network on or under the surface or through a layer of plastic material. OR Defect in plastics articles characterized by distinct surface cracks or minute frost-like internal cracks, resulting from stresses within the article which exceed the tensile strength of the plastic.

**Crazeing:** Similar to 'cracking' but usually referring to overall haphazard cracking rather than continuous or straight splitting. 'Checking' is a similar defect but in smaller scale.

**CRAZING:** Small, interlacing cracks on surface of finish.

**creatine :** A drug used to lower the amount of cholesterol and other harmful substances, such as triglycerides, in the blood. It is also being studied in the prevention and treatment of some types of cancer and other conditions. Crestor blocks an enzyme that helps make cholesterol in the body and it helps break down cholesterol. It also may cause cancer cells to die and may inhibit the growth of blood vessels that cancer cells need to grow. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called rosuvastatin calcium.

**creatine monohydrate:** The monohydrate form of creatine similar or identical to endogenous creatine produced in the liver, kidneys, and pancreas. Creatine, in phosphate form, helps supply energy to muscle cells for contraction. After intense effort, when ATP deposits are depleted, creatine phosphate donates phosphate groups toward the fast synthesis of ATP. Dietary supplementation with creatine may improve muscle wasting associated with cancer and other chronic diseases.

**Creatine phosphate (phosphocreatine):** In muscle, a compound with a high phosphoryl transfer potential that is used to regenerate ATP from ADP during the initial seconds of muscle contraction.

**creatinine :** A disorder marked by the sudden and unexpected death of a healthy child who is younger than one year old, usually during sleep. The cause of crib death is not known. Also called SIDS and sudden infant death syndrome.

**Creep:** The progressive relaxation of an elastomeric material under constant sealing pressure (compressive load) OR The “set” that a molded part takes under stress, and does not return to its original shape. Also known as “memory”. OR the dimensional change with time of a material under load. At room temperature it is also called cold flow. OR The dimensional change with time of a material under load, following the initial instantaneous elastic deformation. Creep at room temperature is sometimes called "Cold Flow". OR Due to its viscoelastic nature, a plastic subjected to a load for a period of time tends to deform more than it would from the same load released immediately after application, and the degree of this deformation is dependent of the load duration. OR the unit elongation of a particular dimension under load for a specific time following the initial elastic elongation caused by load application. It is expressed usually in inches per inch per unit of time. OR Creep is the permanent deformation resulting from prolonged application of a stress below the material's yield point. OR The dimensional change with time of a material under load, following the initial instantaneous elastic deformation. Creep at room temperature is sometimes called “Cold Flow”. OR The dimensional change with time of a material under load. At room temperature it is also called cold flow.

**CREEPING FLOW:** Flow at very low Reynolds Number i.e.  $Re \ll 1$ , where the dimensionless Reynolds number is defined as From Fluid Mechanics it is known that when  $Re$  is more than 2100 the flow is turbulent and below 2100 the flow is laminar. Molten polymer flows through channels and process equipment usually occur at  $Re = 10^{-4} - 10^{-2}$ , that is under creeping flow conditions. The creeping flow assumption implies that the fluid inertia is negligible.

**crenolanib:** An orally bioavailable small molecule, targeting the platelet-derived growth factor receptor (PDGFR), with potential antineoplastic activity. Crenolanib binds to and inhibits PDGFR, which may result in the inhibition of PDGFR-related signal transduction pathways, and, so, the inhibition of tumor angiogenesis and tumor cell proliferation. PDGFR, up-regulated in many tumor cell types, is a receptor tyrosine kinase essential to cell migration and the development of the microvasculature.

**crenolanib besylate:** The besylate salt form of crenolanib, an orally bioavailable benzimidazole targeting the platelet-derived growth factor

receptor (PDGFR) subtypes alpha and beta and FMS-related tyrosine kinase 3 (Flt3), with potential antineoplastic activity. Upon oral administration, crenolanib binds to and inhibits both wild-type and mutated forms of PDGFR and Flt3, which may result in the inhibition of PDGFR- and Flt3-related signal transduction pathways. This results in inhibition of tumor angiogenesis and tumor cell proliferation in PDGFR and/or Flt3 overexpressing tumor cells. PDGFR and Flt3, class III receptor tyrosine kinases, are upregulated or mutated in many tumor cell types.

**Creon:** (Other name for: pancrelipase)

**Crestor:** (Other name for: rosuvastatin calcium) or Pierced with small holes as in a sieve. Refers to the appearance of a tumor when viewed under a microscope. The tumor appears to have open spaces or small holes inside.

**crevasse:** a deep crack or fissure in a glacier.

**crib death :** Immediate, short-term counseling (talking with a professional counselor) to stop a critical emotional incident (e.g., attempted suicide or drug overdose) from getting worse. Crisis intervention is not meant to solve the problem that led up to the crisis.

**cribriform :** An anticancer drug that interferes with the DNA in cancer cells.

**cridanimod sodium:** The sodium salt form of cridanimod, a small molecule that can increase progesterone receptor (PR) expression, with potential antineoplastic adjuvant activity. Upon intramuscular administration, cridanimod is able to induce the expression of PR in endometrial cancer. This could increase the sensitivity of endometrial cancer cells to progestin monotherapy. In combination with a progestin, cancer cells could be eradicated through increased PR-mediated signaling, leading to an inhibition of luteinizing hormone (LH) release from the pituitary gland, via a negative feedback mechanism, and, eventually, an inhibition of estrogen release from the ovaries. This leads to an inhibition of cellular growth in estrogen-dependent tumor cells. In addition, this agent is able to increase the production and release of interferon (IFN) alpha and beta. PR is often downregulated in endometrial cancer and makes it resistant to progestin-mediated hormone therapy.

**Crimped Connectors:** Round wire formed into peaks and valleys to house spirals. This crimp design pre-seats and stabilizes spirals, which reduces break-in stretch and prevents lateral spiral movement.

**crisis intervention :** A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of the anaplastic lymphoma kinase (ALK) gene or the ROS1 gene. It is also being studied in the treatment of other types of cancer. Crizotinib blocks the proteins made by the mutated ALK and ROS1 genes. Blocking these proteins may stop the growth and spread of cancer cells. Crizotinib may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called MET tyrosine kinase inhibitor PF-02341066, PF-02341066, and Xalkori.

**crisnatol mesylate :** A company hired by another company or research center to take over certain parts of running a clinical trial. The company may design, manage, and monitor the trial, and analyze the results. Also called Contract Research Organization.

**cristae:** the folds of the inner mitochondrial membrane.

**Cristanaspase:** (Other name for: asparaginase)

**criteria:** Validated sets of data used as a basis for judgement (WHO, 1979).

**criterion validity:** The extent to which the measurement correlates with an external criterion of the phenomenon under study. Two aspects of criterion validity can be distinguished.

**Critical concentration:** The concentration of G-actin monomers above which polymerization occurs and below which depolymerization occurs. The critical concentration is equal to the dissociation constant (Kd) of an actin monomer from a filament.

**critical concentration for a cell:** The concentration at which undesirable (or adverse) functional changes, reversible or irreversible, occur in the cell (Task Group on Metal Toxicity, 1976).

**critical effect:** The first adverse effect that appears when the critical concentration in the critical organ is reached in an individual (or the adverse effect that occurs as a result of the lowest dose in the critical organ) (WHO, 1979).

**critical group:** That part of the target population most in need of protection (WHO, 1979).

**Critical mass:** The smallest mass of fissionable material that will support a self-sustaining chain reaction.

**CRITICAL MICELLE CONCENTRATION:** The solution concentration of a surfactant at which micelles start to form in that solution. (see RFF 705.10.03 - SURFACE TENSION).

**critical molar volumec:** The molar volume at the critical point.

**critical organ:** ()The organ whose damage (by radiation) results in the greatest injury to the individual (or his descendants). The injury may result from inherent radiosensitivity or indispensability of the organ, or from high dose, or from a combination of all three (ICRP, 1965). OR That part of the body that is most susceptible to radiation damage under the specific conditions under consideration.

**critical organ (critical tissue):** ()The particular organ that first attains the critical concentration (of metal) under specified circumstances of exposure and for a given population (Task Group on Metal Toxicology, 1976).

**critical organ concentration (critical tissue concentration):** The mean concentration in the organ (tissue) at the time the most sensitive type of cell reaches the critical concentration (Task Group on Metal Toxicity, 1976).

**critical period:** A period during the development of a human, animal, or vegetable body, which is of particular importance in the life cycle if the normal full development of some anatomical, physiological, metabolic, or psychological structure or function is to be attained (WHO, 1972).

**critical point:** a point in a phase diagram where the liquid and gas states cease to be distinct. OR State at which two phases of a substance first become indistinguishable. For example, at pressures higher than 217.6 atm and temperatures above 374°C, the meniscus between steam and liquid water will vanish; the two phases become indistinguishable and are referred to as a supercritical fluid.

**critical pressure:** The lowest pressure required to transform a gas into a liquid at the critical temperature. OR Pressure needed to force a gas into a liquid state when the gas is at its critical temperature.

**Critical pressure, Pc:** The highest pressure at which distinct vapor and liquid phases can coexist for a species.

**critical pressurec:** The pressure at the critical point.

**Critical Temperature:** A temperature beyond which a gas cannot be turned into a liquid no matter how much pressure is applied. The process of liquefaction cannot occur above the critical temperature.

**critical temperature:** One of three parameters (critical pressure and critical molar volume being the other two) defining the point at which random thermal molecular motion become so violent that attractive forces are unable to bring about condensation even when the molecules are squeezed together; a temperature above which a vapor cannot be turned into a liquid no matter how much pressure is applied.

**Critical temperature,  $T_c$ :** The highest temperature at which distinct vapor and liquid phases can coexist for a species. The critical temperature and pressure, collectively referred to as the critical constants, are listed for various species in table B.1

**critical temperature<sub>ec</sub>:** The temperature at the critical point. A gas above the critical temperature will never condense into a liquid, no matter how much pressure is applied. Most substances have a critical temperature that is about 1.5 to 1.7 times the standard boiling point, in kelvin.

**Criticality:** The normal operating condition of a reactor, in which nuclear fuel sustains a fission chain reaction. A reactor achieves criticality (and is said to be critical) when each fission event releases a sufficient number of neutrons to sustain an ongoing series of reactions.

**Crixivan:** (Other name for: indinavir sulfate)

**crizotinib:** An orally available aminopyridine-based inhibitor of the receptor tyrosine kinase anaplastic lymphoma kinase (ALK) and the c-Met/hepatocyte growth factor receptor (HGFR) with antineoplastic activity. Crizotinib, in an ATP-competitive manner, binds to and inhibits ALK kinase and ALK fusion proteins. In addition, crizotinib inhibits c-Met kinase, and disrupts the c-Met signaling pathway. Altogether, this agent inhibits tumor cell growth. ALK belongs to the insulin receptor superfamily and plays an important role in nervous system development. ALK dysregulation and gene rearrangements are associated with a series of tumors. or A condition in which the gastrointestinal tract is inflamed over a long period of time. Crohn disease usually affects the small intestine and colon. Symptoms include fever, diarrhea, stomach cramps, vomiting, and weight loss. Crohn disease increases the risk of colorectal cancer and small

intestine cancer. It is a type of inflammatory bowel disease (IBD). Also called regional enteritis.

**CRO:** Describes the process inside a cell that occurs when the same signal is shared by two or more signaling pathways. Usually, a signal caused by the binding of a substance to a molecule on or inside a cell is passed from one molecule to another in the same pathway.

**Crohn disease :** Prostate cancer that keeps growing even when the amount of testosterone in the body is reduced to very low levels. Many early-stage prostate cancers need normal levels of testosterone to grow, but CRPCs do not. Also called castrate-resistant prostate cancer.

**Crohn disease-like reaction :** Discrete aggregates of lymphoid white blood cells, some with germinal centers and surrounding fibrosis, commonly found around some colorectal adenocarcinomas in the absence of a clinical or pathological diagnosis of Crohn disease. Also called Crohn-like reaction.

**Crohn-like reaction :** Discrete aggregates of lymphoid white blood cells, some with germinal centers and surrounding fibrosis, commonly found around some colorectal adenocarcinomas in the absence of a clinical or pathological diagnosis of Crohn disease. Also called Crohn disease-like reaction.

**crolibulin:** A small molecule tubulin polymerization inhibitor with potential antineoplastic activity. Crolibulin binds to the colchicine-binding site on beta-tubulin and inhibits the polymerization of tubulin into microtubules, which may result in cell cycle arrest, the induction of apoptosis, and the inhibition of tumor cell proliferation. As a vascular disruption agent (VDA), this agent also disrupts tumor neovascularization, which may result in a reduction in tumor blood flow and tumor hypoxia and ischemic necrosis.

**cromolyn sodium inhalant PA101:** A solution containing a high concentration of cromolyn sodium, with potential mast cell stabilizing, anti-tussive and anti-inflammatory activities. Upon inhalation of PA101 via a nebulizer, cromolyn blocks calcium ion influx into mast cells, thereby preventing the degranulation of mast cells in the lungs. This blocks the release of pro-inflammatory mediators from mast cells, such as histamine and slow-reacting substance of anaphylaxis (SRS-A), and prevents both bronchoconstriction and an inflammatory response. In indolent systemic

mastocytosis (ISM), PA101 may be able to reduce the symptoms associated with this disease.

**crop water-use efficiency:** A measure at the ecosystem level of how well plants use available water in growth. The grams of dry weight gained by plants during the growing season per unit land area are divided by the millimeters of water lost (including evaporation directly from the soil).

**Cross Laminate:** A laminate in which some of the layers of material are oriented approximately at right angles to the remaining layers with respect to the grain or strongest direction in tension.

**Cross Linking:** The forming of chemical bonds between the molecular chains of a plastic during curing, so that it cannot be re-softened and re-moulded, thus becoming a thermoset. OR A process in which bonds are formed joining adjacent molecules. At low density, these bonds add to the elasticity of the polymer and at high density eventually produce rigidity in the polymer.

**CROSS MODEL:** A mathematical expression describing the shear thinning behavior of polymers. It is more realistic than the power-law model because it fits the data very well at both high and low shear rates. where  $h_0$ ,  $l$ ,  $n$  are curve fitting parameters and  $\dot{\gamma}$  is the shear rate. Due to the mathematical complexities it is not possible to obtain analytical solutions with this model, but it is excellent for numerical simulations of flow processes. This model is very popular in injection molding simulations (cavity filling) and in the characterization of the flow behavior of polymers produced with metallocene catalysts.

**Cross Over:** Length of straight running belt between centers of two cages on a two cage one belt system.

**Cross polarization:** A technique which provides enhancement of nuclei with a low magnetic gyro ratio ( $g$ ) by transferring proton magnetization to the observed nucleus via matched spin-locking (Hartmann–Hahn) conditions at both frequencies. Since the sensitivity enhancement occurs on each scan (according to the ratios of the  $g$  values) the experiment can be repeated much faster because of the faster relaxation of the higher  $g$  nuclei.

**Cross Section-Axial:** When the part is flat (relative), the cross section that is at 90 to the linear plane

**Cross Section-Radial:** When the part is flat (relative), the cross section in the linear plane

**cross-bedding:** a sedimentary structure in which the bedding planes of a particular unit are inclined compared to the bedding of the enclosing rocks.

**Cross-cutting Area:** Nuclear plant activity that affects most or all safety cornerstones. These include the problem identification and resolution, human performance, and "safety-conscious work environment."

**Cross-linking:** The formation of chemical links between the molecular chains in polymers. This process can be achieved by chemical reaction, vulcanization, and electron bombardment. OR the setting –up of chemical valence links between molecular chains of polymer molecules, leading to the formation of a three-dimensional network of polymer chains which is infusible and insoluble. This usually reduces the thermoplasticity of the material. OR the setting-up of chemical valence links between the molecular chains of polymer molecules, leading to the formation of a three-dimensional network of polymer chains which is infusible and insoluble. This usually reduces the thermoplasticity of the material. OR The formation of chemical links between the molecular chains in polymers. This process can be achieved by chemical reaction, vulcanization, and electron bombardment. OR Formation of a 3-dimensional network of polymer chains, which completely prevents flow (e.g. vulcanized rubber). or The formation of chemical links between the molecular chains in polymers. This process can be achieved by chemical reaction, vulcanization, and electron bombardment.

**Cross-linking Agents:** A chemical or chemicals that bond the silicone rubber polymer chains of a silicone rubber together during the liquid silicone molding process

**Cross-Sectional Compression:** The deformation placed on a silicone rubber part to affect a seal. It is expressed as a percentage of the seal's original cross-section

**cross-sectional study :** A study that examines the relationship between diseases (or other health-related characteristics) and other variables of interest as they exist in a defined population at one particular time. The presence or absence of disease and the presence or absence of the other variables (or, if they are quantitative, their level) are determined in each member of the study population or in a representative sample at one

particular time. The relationship between a variable and the disease can be examined (1) in terms of the prevalence of disease in different population subgroups defined according to the presence or absence (or level) of the variables (2) in terms of the presence or absence (or level) of the variables in the diseased versus the nondiseased. Note that disease prevalence rather than incidence is normally recorded in a cross-sectional study. The temporal sequence of cause and effect cannot necessarily be determined in a cross-sectional study. See also morbidity survey (Last, 1988).

**cross-talk :** A member of the family of vegetables that includes broccoli, Brussels sprouts, cabbage, cauliflower, collard greens, kale, and turnips. These vegetables contain substances that may protect against cancer. Also called Brassica vegetable.

**CROSSHEAD:** A device for changing the extrudate flow direction, usually by 90°, so that it can be blow molded or coat wire or coat shapes.

**Crosshead (extrusion):** A device generally employed in wire coating which is attached to the discharge end of the extruder cylinder, designed to facilitate extruding material at an angle. Normally, this is a 90 degree angle to the longitudinal axis of the screw.

**Crosshead Die:** An extrusion die which produces an extrudate on an axis which is at an angle to that of the extruder barrel.

**crossing over:** a process during prophase I in which segments of DNA from one chromatid in the tetrad pass to another chromatid in the tetrad.

**Crosslinking:** Quality of thermosetting plastic resins in which polymer chains combine during the curing process. In general, the greater the crosslinking, the tougher and more chemically resistant the coating.

**crotoxin:** A specific complex of toxic proteins from the venom of *Crotalus durissus terrificus* (South American rattlesnake). It can be separated into a phospholipase A and crotapotin fragment; the latter consists of three different amino acid chains, potentiates the enzyme, and is specifically neurotoxic.

**CRPC:** A procedure in which an extremely cold liquid or an instrument called a cryoprobe is used to freeze and destroy abnormal tissue. A cryoprobe is cooled with substances such as liquid nitrogen, liquid nitrous oxide, or compressed argon gas. Cryoablation may be used to treat certain

types of cancer and some conditions that may become cancer. Also called cryosurgery and cryotherapy.

**CRT:** Cell residence time - the amount of time in days that an average "bug" remains in the process. Also termed "sludge age".

**cruciferous vegetable :** The process of cooling and storing cells, tissues, or organs at very low or freezing temperatures to save them for future use. Also called cryopreservation.

**Crud:** A colloquial term for corrosion and wear products (rust particles, etc.) that become radioactive (i.e., activated) when exposed to radiation.

**crude death rate:** See death rate.

**crude oil:** Crude oil is a liquid formed from tiny sea creatures and plants that died millions of years ago. It contains a mixture of hydrocarbons. It is the raw material for many fuels and plastics. OR Crude oil is a naturally occurring liquid that consists of a wide mixture of hydrocarbons created by the high pressure and temperature decomposition of organic materials. Commercially viable crude oil reserves are found in distinct geographic regions, with the Middle East, the North Sea and Venezuela featuring amongst the key sources of supply. The vast majority of transportation fuels and petrochemical feedstocks are derived from the processing of crude oil. OR Tarry goop consisting of mixed carbon compounds with a highly variable composition. Not much to look at, but the basis for the chemical industry, modern transport, and many shopping sprees at Harrods. OR a liquid containing hydrocarbons that forms in organic- or fossil-rich sediments and rocks.

**crust:** the outermost zone of the earth, its exterior layer. OR the thin, outer layer of the solid part of the Earth.

**crustal rebound:** the process by which crustal rocks that were down-warped by a glacier's weight slowly return to normal elevation after the glacier's retreat.

**cryoablation :** The process of cooling and storing cells, tissues, or organs at very low or freezing temperatures to save them for future use. Also called cryobanking.

**cryobanking :** A procedure in which an extremely cold liquid or an instrument called a cryoprobe is used to freeze and destroy abnormal tissue. A cryoprobe is cooled with substances such as liquid nitrogen, liquid

nitrous oxide, or compressed argon gas. Cryosurgery may be used to treat certain types of cancer and some conditions that may become cancer. Also called cryoablation and cryotherapy.

**cryogen:** A gas that has been liquified by lowering temperature, usually to a temperature under about  $-100^{\circ}\text{C}$ .

**Cryogenic Processes:** Reduction of parts to very low temperatures usually associated with liquid nitrogen. Commonly used to create assemblies or to deflash or degate a part.

**cryopreservation :** A procedure in which an extremely cold liquid or an instrument called a cryoprobe is used to freeze and destroy abnormal tissue. A cryoprobe is cooled with substances such as liquid nitrogen, liquid nitrous oxide, or compressed argon gas. Cryotherapy may be used to treat certain types of cancer and some conditions that may become cancer. Also called cryoablation and cryosurgery.

**cryosphere:** The portion of the climate system consisting of the world's ice masses and snow deposits, which includes the continental ice sheets, mountain glaciers, sea ice, surface snow cover, and lake and river ice. Changes in snow cover on the land surfaces are by and large seasonal and closely tied to the mechanics of atmospheric circulation. The glaciers and ice sheets are closely related to the global hydrologic cycle and to variations of sea level and change in volume and extent over periods ranging from hundreds to millions of years.

**cryosurgery :** A condition in which one or both testicles fail to move from the abdomen, where they develop before birth, into the scrotum. Cryptorchidism may increase the risk for development of testicular cancer. Also called undescended testicles.

**cryotherapy :** The fluid that flows in and around the hollow spaces of the brain and spinal cord, and between two of the meninges (the thin layers of tissue that cover and protect the brain and spinal cord). CSF is made by tissue called the choroid plexus in the ventricles (hollow spaces) in the brain. Also called cerebrospinal fluid.

**cryptorchidism :** A type of tumor found in breast or prostate tissue. It is often large and bulky and grows quickly. It may be benign (not cancer) or malignant (cancer) and may spread to other parts of the body. Also called cystosarcoma phyllodes and phyllodes tumor.
