**ramipril:** A prodrug and nonsulfhydryl angiotensin converting enzyme (ACE) inhibitor with antihypertensive activity. Ramipril is converted in the liver by de-esterification into its active form ramiprilat, which inhibits ACE, thereby blocking the conversion of angiotensin I to angiotensin II. This abolishes the potent vasoconstrictive actions of angiotensin II and leads to vasodilatation. This agent also causes an increase in bradykinin levels and a decrease in angiotensin II-induced aldosterone secretion by the adrenal cortex, thereby promoting diuresis and natriuresis.

**ramosetron hydrochloride:** The hydrochloride salt of ramosetron, a selective serotonin (5-HT) receptor antagonist with potential antiemetic activity. Upon administration, ramosetron selectively binds to and blocks the activity of 5-HT subtype 3 (5-HT<sub>3</sub>) receptors located in the vagus nerve terminal and in the vomiting center in the central nervous system (CNS), suppressing chemotherapy-induced nausea and vomiting.

**ramucirumab:** A recombinant, fully human monoclonal antibody directed against human vascular endothelial growth factor receptor 2 (VEGFR-2) with antiangiogenesis activity. Ramucirumab specifically binds to and inhibits VEGFR-2, which may result in an inhibition of tumor angiogenesis and a decrease in tumor nutrient supply. VEGFR-2 is a pro-angiogenic growth factor receptor tyrosine kinase expressed by endothelial cells. Check for active clinical trials using this agent. or A drug used with other drugs to treat colorectal cancer and non-small cell lung cancer that have spread to other parts of the body. It is used alone or with another drug to treat cancer of the stomach or gastroesophageal junction (area where the esophagus connects to the stomach) that is advanced or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Ramucirumab binds to receptors for a protein called vascular endothelial growth factor (VEGF), which may be found on some types of cancer cells. This may prevent the growth of new blood vessels that tumors need to grow. Ramucirumab is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called anti-VEGFR-2 fully human monoclonal antibody IMC-1121B, Cyramza, and IMC-1121B.

**RANDOM COPOLYMER:** A random copolymer occurs when one of the two monomers polymerized together to form a polymer is in a random or statistical distribution in the polymer chain.

**Random error:** a result of a measurement minus the mean that would result from an infinite number of measurements of the same measurand carried out under repeatability conditions. OR Random errors are errors that affect the precision of a set of measurements. Random error scatters measurements above and below the mean, with small random errors being more likely than large ones.

**Random-coil conformation:** The disordered, unfolded structure of a denatured macromolecule; many proteins that are not cross-linked lose their native three-dimensional structure as well as their biological function in the presence of unfolding agents such as urea.

**randomization :** When referring to an experiment or clinical trial, the process by which animal or human subjects are assigned by chance to separate groups that compare different treatments or other interventions. Randomization gives each participant an equal chance of being assigned to any of the groups.

**randomized clinical trial :** A study in which the participants are assigned by chance to separate groups that compare different treatments; neither the researchers nor the participants can choose which group. Using chance to assign people to groups means that the groups will be similar and that the treatments they receive can be compared objectively. At the time of the trial, it is not known which treatment is best. It is the patient's choice to be in a randomized trial.

**Ranexa:** (Other name for: ranolazine)

**ranibizumab:** A second-generation, recombinant humanized IgG1 kappa monoclonal antibody fragment directed against human vascular endothelial growth factor (VEGF) alpha. Ranibizumab binds to VEGF alpha and inhibits VEGF alpha binding to its receptors, VEGFR1 and VEGFR2, thereby preventing the growth and maintenance of tumor blood vessels. The molecular weight of this agent (48 kD) is much smaller than the molecular weight of bevacizumab (MW ~149 kD), allowing complete penetration of the retina and the subretinal space following intravitreal injection. In contrast to other anti-VEGF aptamers such as pegaptanib, ranibizumab has a high specificity and affinity for all soluble human isoforms of VEGF.

**ranimustine:** A chloroethylnitrosourea derivative that inhibits proliferation and growth of tumor cells by alkylation and cross-linkage of DNA strands of tumor cells. Check for active clinical trials using this agent.

**ranitidine hydrochloride/bismuth potassium citrate/sucralfate hydrate**

**formulation:** A formulation containing the hydrochloride salt form of the non-imidazole histamine H<sub>2</sub> receptor antagonist ranitidine, bismuth potassium citrate, and the hydrate form of sucralfate, a basic aluminum complex of sulfated sucrose, with potential antacid, radio- and cytoprotective activities. Upon oral administration of the ranitidine hydrochloride/bismuth potassium citrate/sucralfate hydrate formulation, ranitidine binds to and blocks the activity of the histamine H<sub>2</sub> receptors in the parietal cells in the stomach and in the gastrointestinal (GI) tract, thereby decreasing acid secretion. Sucralfate physically binds to the surface of damaged mucosa, thereby forming a protective barrier that shields the GI tract from stomach acid. It also neutralizes stomach acid. Bismuth inhibits peptic activity, increases mucosal secretions and acts as a barrier to prevent damage by acid. Altogether, this protects against ulcer formation and may help to heal existing ulcers.

**ranolazine:** An orally available, piperazine derivative with anti-anginal and potential antineoplastic activities. Ranolazine's mechanism of action for its anti-ischemic effects has yet to be fully elucidated but may involve the alteration of the trans-cellular late sodium current in the ischemic myocyte. By preventing the rise of intracellular sodium levels, ranolazine may affect the transport activity of sodium-dependent calcium channels and prevent the calcium overload during myocardial ischemia, thereby preventing cellular injury. Ranolazine's potential antineoplastic effect may depend on its inhibitory effect on fatty acid oxidation, which may sensitize tumor cells to apoptosis and decrease tumor cell proliferation; fatty acid oxidation provides energy and promotes tumor cell proliferation and survival. Check for active clinical trials using this agent.

**ranpirnase:** A natural homologue of ribonuclease A isolated from the eggs of the frog *Rana pipiens*. Ranpirnase primarily degrades cellular transfer RNA with a substrate specificity for uridine-guanidine base-pair sequences, resulting in inhibition of protein synthesis and cytotoxicity. This agent also activates caspase-9 in mitochondria, resulting in tumor cell apoptosis. orA substance being studied in the treatment of cancer. It is a type of ribonuclease enzyme. Also called Onconase.

**Raoult's Law:** This chemistry law shows that the vapor pressure above a mixture of two liquids is directly related to the amounts of the solute and

solvents in the solution. OR The vapor pressure of a solvent in an ideal solution equals the mole fraction of the solvent times the vapor pressure of the pure solvent.

**Rapaflo:** (Other name for: silodosin)

**Rapamune:** (Other name for: sirolimus) or A drug used to keep the body from rejecting organ and bone marrow transplants. Rapamune blocks certain white blood cells that can reject foreign tissues and organs. It also blocks a protein that is involved in cell division. It is a type of antibiotic, a type of immunosuppressant, and a type of serine/threonine kinase inhibitor. Rapamune was previously called rapamycin. Also called sirolimus.

**rapamycin :** A drug used to keep the body from rejecting organ and bone marrow transplants. Rapamycin blocks certain white blood cells that can reject foreign tissues and organs. It also blocks a protein that is involved in cell division. It is a type of antibiotic, a type of immunosuppressant, and a type of serine/threonine kinase inhibitor. Rapamycin is now called sirolimus.

**rapamycin-polarized Th1/Tc1 autologous T lymphocytes:** A population of T lymphocytes polarized by rapamycin with potential immunomodulating activity. The autologous T cells collected from the patient were co-stimulated with antibodies to the T-cell cell surface proteins CD3 and CD28 and expanded ex vivo in the presence of rapamycin, an immunosuppressive drug, and then infused back into the same patient. Both CD3 and CD28 are required for full T cell activation. These lymphocytes expressed anti-apoptotic bcl-2 family member proteins (reduced Bax, Bak; increased phospho-Bad); maintained mitochondrial membrane potentials; and displayed reduced apoptosis. Adoptive transfer of this type of T cell potentially induces an anti-apoptotic Th1/Tc1 effector phenotype by promoting autophagy.

**rapid eye movement sleep :** One of the five stages of sleep. During rapid eye movement sleep, the eyes move rapidly while closed and dreams occur. Rapid eye movement sleep is the lightest stage of sleep, during which a person may wake easily. During several hours of normal sleep, a person will go through several sleep cycles that include rapid eye movement sleep and the 4 stages of non-rapid eye movement (light to deep sleep). Also called REM sleep.

**rapid hormone cycling :** A procedure in which drugs that block the production of male hormones are alternated with male hormones and/or drugs that promote the production of male hormones. This procedure is being studied in the treatment of prostate cancer.

**Rapid Prototyping:** Fabrication of a physical, three-dimensional part of arbitrary shape directly from a numerical description, typically a CAD model, by a quick, highly automated and totally flexible process.

**rapid-onset opioid :** A substance that acts quickly to treat moderate to severe pain. Opioids are like opiates, such as morphine and codeine, but are not made from opium. Opioids bind to opioid receptors in the central nervous system. A rapid-onset opioid is a type of alkaloid.

**Rapid-start complex:** The complex that RNA polymerase forms at the promoter site just before initiation.

**RAPRA:** RAPRA technology Ltd., (UK,) is a leading rubber and plastics consultancy firm with over 75 years of experience. They offer conduct training courses in Rubber and Plastics.

**rare earth:** An oxide of a rare earth element.

**rare earth element:** A metallic element that belongs to Group 3B or to the lanthanide series.

**rare earths:** the elements from cerium to lutetium; lanthanides.

**ras gene family :** A family of genes that may cause cancer when they are mutated (changed). They make proteins that are involved in cell signaling pathways, cell growth, and apoptosis (cell death). Agents that block the actions of a mutated ras gene or its protein may stop the growth of cancer. Members of the ras gene family include Kras, Hras, and Nras.

**ras peptide :** A short piece of the ras protein, which is made by the ras gene. The ras gene has been found to cause cancer when it is mutated (changed).

**ras peptide cancer vaccine:** A cancer vaccine containing a RAS oncogene-encoded peptide with potential antineoplastic activity. RAS peptide cancer vaccine may stimulate a RAS peptide-specific antitumoral T-cell cytotoxic immune response, resulting in an inhibition of tumor cell proliferation and tumor cell death.

**rasburicase:** A recombinant urate oxidase enzyme isolated from a genetically-modified strain of *Saccharomyces cerevisiae*. Urate oxidase

catalyzes the oxidation of uric acid to the excretable metabolite allantoin, a molecule that is 5-10 times more water-soluble than uric acid. An enzyme that occurs endogenously in most mammals, urate oxidase is not found in humans. or A drug used to treat high blood levels of uric acid in patients with leukemia, lymphoma, and other types of cancer who are receiving certain types of cancer treatment. It is also being studied in the treatment of other medical conditions. Rasburicase is a type of recombinant enzyme and a type of urate-lowering drug. Also called Elitek and recombinant urate oxidase.

**rate:** A measure of the frequency of a phenomenon. An expression of the frequency with which an event occurs in a defined population (from Last, 1988).

**rate constant:** the proportionality constant of a reaction that reflects the concentration of reactants.

**rate constant:** A rate constant is a proportionality constant that appears in a rate law. For example,  $k$  is the rate constant in the rate law  $d[A]/dt = k[A]$ . Rate constants are independent of concentration but depend on other factors, most notably temperature.

**rate difference (RD):** The absolute difference between two rates, for example, the difference in incidence rate between a population group exposed to a causal factor and a population group not exposed to the factor:

**rate equation:** the mathematical formula that relates the rate of a reaction to the concentration of the reactants.

**rate law:** A rate law or rate equation relates reaction rate with the concentrations of reactants, catalysts, and inhibitors. For example, the rate law for the one-step reaction  $A + B \rightarrow C$  is  $d[C]/dt = k[A][B]$ .

**Rate of Diffusion:** This rate measurement is the speed at which molecules or atoms diffuse through a substance.

**rate of reaction:** the speed with which a reaction proceeds.

**rate ratio (RR):** The ratio of two rates. The term is used in epidemiologic research with a precise meaning, i.e., the ratio of the rate in the exposed population to the rate in the unexposed population:

**rate-determining step:** the step in a reaction's mechanism that requires the highest activation energy and is therefore the slowest.

**rate-limiting step:** (1) Generally, the step in an enzymatic reaction with the greatest activation energy or the transition state of highest free energy. (2) The slowest step in a metabolic pathway.

**ratio:** A comparison of two quantities by division.

**ratio:** The relative size of two quantities expressed as the quotient of one divided by the other; the ratio of a to b is written as a:b or a/b.

**Rational Drug Design:** The design of drugs to specifically work for their respective targets.

**rattlesnake root :** An eastern North American perennial herb. A substance obtained from the root of the plant has been used in some cultures to treat a number of medical problems. It is being studied in the treatment of hot flashes and other symptoms of menopause. The scientific name is *Cimicifuga racemosa*. Also called black cohosh, black snakeroot, bugbane, and bugwort.

**rauschpfeffer :** An herb native to islands in the South Pacific. Substances taken from the root have been used in some cultures to relieve stress, anxiety, tension, sleeplessness, and problems of menopause. Rauschpfeffer may increase the effect of alcohol and of certain drugs used to treat anxiety and depression. The U.S. Food and Drug Administration advises users that rauschpfeffer may cause severe liver damage. The scientific name is *Piper methysticum*. Also called intoxicating pepper, kava kava, tonga, and yangona.

**RAV12:** A monoclonal antibody that is being studied in the treatment of some types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to cancer cells. It binds to a carbohydrate (sugar) molecule that is found on gastric, colon, pancreatic, prostate, ovarian, breast, and kidney cancer cells.

**ravuconazole:** A triazole with antifungal activity. Ravuconazole inhibits 14a demethylase, an enzyme involved in sterol synthesis, resulting in lysis of the fungal cell wall and fungal cell death. Or A substance that is being studied in the treatment of infections caused by fungi. It belongs to the family of drugs called antifungal agents.

**Raw Materials:** Ingredients or constituents that are added or mixed together to form or manufacture a finished product. OR Raw materials are the starting materials for an industrial process, obtained from nature.

**ray:** a half-line. Continues forever in one direction. Has one endpoint.

**Rayaldee:** (Other name for: modified-release calcifediol capsule)

**RayGel:** (Other name for: reduced glutathione-L-cysteine-anthocyanins gel)

**Rayon:** The generic term for fibers, staple, and continuous filament yarns composed of regenerated cellulose but also frequently used to describe fibers obtained from cellulose acetate or cellulose triacetate. Rayon fibers are similar in chemical structure to natural cellulose fibers (e.g., cotton) except that the synthetic fiber contains shorter polymer units. Most rayon is made by the viscose process.

**Razadyne:** (Other name for: galantamine hydrobromide)

**razoxane:** An orally bioavailable bis-dioxopiperazine and a derivative of the chelating agent ethylenediaminetetraacetic acid (EDTA) with antineoplastic, antiangiogenic, and antimetastatic activities. Razoxane specifically inhibits the enzyme topoisomerase II without inducing DNA strand breaks, which may result in the inhibition of DNA synthesis and cell division in the premitotic and early mitotic phases of the cell cycle. This agent may also exhibit antiangiogenic and antimetastatic activities although the precise molecular mechanisms of these actions are unknown.

**RBC:** A type of blood cell that is made in the bone marrow and found in the blood. RBCs contain a protein called hemoglobin, which carries oxygen from the lungs to all parts of the body. Checking the number of RBCs in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as anemia, dehydration, malnutrition, and leukemia. Also called erythrocyte and red blood cell.

**Re-186 hydroxyethylidene diphosphonate:** An synthetic compound containing the organic phosphonate hydroxyethylidene diphosphonate (HEDP) labeled with the radioisotope rhenium Re 186. Re-186 hydroxyethylidene diphosphonate binds to hydroxyapatite in bone, delivering a cytotoxic dose of beta radiation to primary and metastatic bone tumors. Re-186 is a beta emitter with a short half-life, a radioisotope profile that provides localized antitumor radiocytotoxicity while sparing extramedullary bone marrow tissues.

**REACH :** REACH is the system for Registration, Evaluation and Assessment of Chemicals being proposed under the EU Chemicals Policy.

**Reactants** : The chemicals that react together to form the new materials. The word reagent is sometimes used instead. OR Substances initially present in a chemical reaction. OR A substance that is consumed during a chemical change. OR a starting material. OR a substance on the left side of a chemical reaction. OR A reactant is a substance we start with before a chemical reaction. OR A starting material in a chemical reaction.

**reaction:** the process of converting reactants into products. OR Any process involving a chemical or nuclear change.

**Reaction cavity:** A hypothetical volume wherein significant molecular motion, hence reaction, can take place within a solid.

**Reaction center:** In a photosynthetic unit, a specialized chlorophyll molecule that collects excitation energy from other chlorophyll molecules and mediates the transformation of light into chemical energy.

**reaction energy:** the difference between the energy of the reactants and that of the products.

**Reaction Injection:** A process that involves the high pressure impingement mixing of two or more reactive liquid components and injecting into a closed mold at low pressure.

**reaction intermediate:** Any chemical species in a reaction pathway that has a finite chemical lifetime.

**reaction mechanism:** A list of all elementary reactions that occur in the course of an overall chemical reaction.

**Reaction order:** The sum of the exponent of the reactants in the kinetics equation for a given reaction.

**reaction quotient:** The product of the concentrations of the products, divided by the product of the concentrations of the reactants, for a chemical reaction which is not necessarily at equilibrium. For example, the reaction quotient for  $A + B = C + D$  is equal to  $(C)(D) / ((A)(B))$ , where the parentheses indicate concentrations. Each concentration is raised to a power equal to its stoichiometric coefficient in the expression. The reaction quotient for  $A + 2B = 3C$  is equal to  $(C)^3 / ((A)(B)^2)$ . For gas phase reactions, partial pressures can be used in the reaction quotient in place of concentrations.

**Reaction rate:** A measure of how fast a chemical reaction occurs OR A reaction rate is the speed at which reactants are converted into products in a

chemical reaction. The reaction rate is given as the instantaneous rate of change for any reactant or product, and is usually written as a derivative (e. g.  $d[A]/dt$ ) with units of concentration per unit time (e. g.  $\text{mol L}^{-1} \text{s}^{-1}$ ).

**reactivate** : To make active again or make something work again. In medicine, an infection or a disease is described as reactivated when it comes back after a period with no signs of disease.

**Reactive** : A substance that is easily able to react. When considering metals, the reactive ones are at the bottom of the periodic table. When considering non-metals, the reactive ones are at the top.

**Reactive Element:** When an element is reactive, it is easily excited. It can combine with other elements very quickly and get involved in many chemical reactions.

**Reactive Inspection:** An inspection to examine the circumstances surrounding an operational problem or event occurring at a nuclear plant.

**reactive oxygen species** : A type of unstable molecule that contains oxygen and that easily reacts with other molecules in a cell. A build up of reactive oxygen species in cells may cause damage to DNA, RNA, and proteins, and may cause cell death. Reactive oxygen species are free radicals. Also called oxygen radical.

**Reactive resins:** Liquid resins which can be cured by catalysts and hardeners to form solid materials.

**reactivity:** The degree to which a substance will respond to a stimulus or interact with another substance. OR A term expressing the departure of a reactor system from criticality. A positive reactivity addition indicates a move toward supercriticality (power increase). A negative reactivity addition indicates a move toward subcriticality (power decrease).

**Reactivity Series:** The Reactivity Series is a list of metals in order of their reactivity. OR A list of metals or non-metals that has the most reactive at the top. Sometimes hydrogen and carbon are included in the metal series. Carbon is included because of the importance of carbon in the reduction of metal oxides. Hydrogen is included because only metals more reactive than it can release hydrogen from an acid.

**Reactor coolant system:** The system used to remove energy from the reactor core and transfer that energy either directly or indirectly to the steam turbine.

**Reactor core:** The central portion of a nuclear reactor, which contains the fuel assemblies, moderator, neutron poisons, control rods, and support structures. The reactor core is where fission takes place.

**Reactor Oversight Process (ROP):** The process by which the NRC monitors and evaluates the performance of commercial nuclear power plants. Designed to focus on those plant activities that are most important to safety, the process uses inspection findings and performance indicators to assess each plant's safety performance. For additional detail, see Reactor Oversight Process (ROP).

**Reactor, nuclear:** The heart of a nuclear power plant or nonpower reactor, in which nuclear fission may be initiated and controlled in a self-sustaining chain reaction to generate energy or produce useful radiation. Although there are many types of nuclear reactors, they all incorporate certain essential features, including the use of fissionable material as fuel, a moderator (such as water) to increase the likelihood of fission (unless reactor operation relies on fast neutrons), a reflector to conserve escaping neutrons, coolant provisions for heat removal, instruments for monitoring and controlling reactor operation, and protective devices (such as control rods and shielding). For additional detail, see Nuclear Reactors.

**Reading frame:** A group of three nonoverlapping nucleotides that is read as a codon during protein synthesis; the reading frame begins with the initiator codon AUG. OR A contiguous and nonoverlapping set of three-nucleotide codons in DNA or RNA.

**reagent:** the chemicals that ordinarily produce reaction products. OR A substance or mixture that is useful in chemical analysis or synthesis. OR a chemical substance used to cause a reaction for the purpose of chemical analysis.

**reagent :** A substance used to carry out a laboratory test. Reagents may be used in a chemical reaction to detect, measure, or make other substances.

**Reagent Resistance:** The ability of a plastic to withstand exposure to chemicals.

**Reagents :** The chemicals that react together to form the new materials. The word reactant is sometimes used instead.

**Real Gas:** A real gas is one that you find in the real world. They have unique properties depending on the temperature and pressure. A perfect gas

would be called an ideal gas.

**realgar-Indigo naturalis formulation:** An orally bioavailable, traditional Chinese medicine (TCM)-based formulation composed of Realgar-Indigo naturalis formula (RIF) with potential antineoplastic activity. The main constituents in RIF are realgar, Indigo naturalis, and Salvia miltiorrhiza, with tetraarsenic tetrasulfide (As<sub>4</sub>S<sub>4</sub>), indirubin and tanshinone IIA as the main active ingredients, respectively, which appear to exert synergistic effects on cancer cells. Tetraarsenic tetrasulfide specifically induces the ubiquitination and degradation of the oncoprotein promyelocytic leukemia retinoic acid receptor alpha (PML-RARalpha). In addition, the active ingredients in the Realgar-Indigo naturalis formulation enhance the expression of myeloid differentiation genes, and induce G(1)/G(0) cell cycle arrest. PML-RARalpha, an acute promyelocytic leukemia (APL)-specific fusion gene, inhibits differentiation and promotes survival of myeloid precursor cells.

**Rearrangement reaction:** A chemical reaction in which covalent bonds are made and broken, but in which the molecular formula remains the same. OR a reaction that causes the skeletal structure of the reactant to undergo change in converting to the product. OR A reaction in which a reactant and product are isomers of each other. Chemical bonds within the reactant are broken and reformed to produce the product.

**Reasonable:** Rational, sensible, or resulting from sound judgment.

**rebamipide:** A quinolinone derivative with anti-ulcer and anti-inflammatory activities. Rebamipide induces cyclooxygenase 2 (COX2) synthesis which results in an increase in endogenous prostaglandin synthesis in the gastric mucosa. This agent also inhibits H. pylori-induced production of tumor necrosis factor (TNF) alpha and subsequent inflammation of the gastric mucosa. In addition, rebamipide scavenges oxygen-derived free radicals that potentially cause mucosal injury, and stimulates prostaglandin EP4 receptor gene expression followed by mucous secretion, thereby enhancing the gastric mucosal defense.

**rebastinib tosylate:** An orally bioavailable small-molecule inhibitor of multiple tyrosine kinases with potential antineoplastic activity. Rebastinib binds to and inhibits the Bcr-Abl fusion oncoprotein by changing the conformation of the folded protein to disallow ligand-dependent and ligand-independent activation; in addition, this agent binds to and inhibits Src

family kinases LYN, HCK and FGR and the receptor tyrosine kinases TIE-2 and VEGFR-2. Rebastinib may exhibit more potent activity against T315I Bcr-Abl gatekeeper mutant kinases than other Bcr-Abl kinase inhibitors. The TIE-2 and VEGFR-2 receptor tyrosine kinases regulate angiogenesis, respectively, while the Src family kinases Abl, LYN, and HCK Src regulate a variety of cellular responses including differentiation, division, adhesion, and the stress response. Check for active clinical trials using this agent.

**Rebate:** A recess cut into a piece of timber so as to fit into another piece to form a joint; a recess in a frame to accommodate a door panel or window. Also spelt 'rabbet'.

**rebeccamycin :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antineoplastic antibiotics.

**rebeccamycin analog :** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called antitumor antibiotics and topoisomerase inhibitors. Also called NSC 655649.

**Rebetol:** (Other name for: ribavirin)

**Rebif:** (Other name for: recombinant interferon beta)

**rebimastat:** A sulfhydryl-based second-generation matrix metalloproteinase (MMP) inhibitor with potential antineoplastic activity. Rebimastat selectively inhibits several MMPs (MMP 1, 2, 8, 9, and 14), thereby inducing extracellular matrix degradation, and inhibiting angiogenesis, tumor growth and invasion, and metastasis.

**Reblend:** The process of “reusing” or reapplying material in the manufacturing process. This is often pursued when a resulting product meets performance requirements and specifications, but may be “off specification”, such as slight variations in color. This product can then be “reblended” into another manufacturing lot or batch, reducing potential waste from the process.

**receding glacier:** a glacier that, although it can move downslope, cannot overtake its rate of uphill recession.

**Recentin :** A substance being studied in the treatment of some types of cancer. Recentin may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of antiangiogenesis agent and a type of vascular endothelial growth factor (VEGF) receptor tyrosine kinase inhibitor. Also called AZD2171 and cediranib maleate.

**receptor:** Protein molecules on the surface of cell membranes used for communication between cells. OR Proteins which ligands can bind to and elicit a biological response. OR A molecule or surface in a cell that recognizes and binds to a specific messenger molecule, leading to a biological response.

**receptor :** A molecule inside or on the surface of a cell that binds to a specific substance and causes a specific effect in the cell.

**Receptor part:** according to the IUPAC definition of chemical sensor one of the two principal components of the chemical sensor, which converts chemical information into a form of energy.

**Receptor tyrosine kinases:** Transmembrane receptor proteins that, when bound to the appropriate signal molecules, display intracellular protein kinase activity, phosphorylating proteins at tyrosine residues.

**Receptor-mediated endocytosis:** A means of importing specific proteins into a cell by their binding to plasma-membrane receptors and their subsequent endocytosis and inclusion into vesicles.

**Recess:** An indentation in the plastic part caused by the impact of the ejector pins.

**recessional moraine:** a moraine that develops at the front of a receding glacier.

**recessive:** the allele overshadowed by the dominant allele.

**recharge:** the period of time during the water-budget cycle when the water in the ground is being replenished. OR the process by which new water is added to the saturated zone, replenishing water that is lost. OR The process by which water is added to a reservoir or zone of saturation, often by runoff or percolation from the soil surface.

**recipient :** In medicine, a person who receives blood, cells, tissue, or an organ from another person, such as in a blood transfusion or an organ transplant.

**RECIPROCATING SCREW:** A combination injection and plasticizing unit in which an extrusion device with a reciprocating screw is used to plasticize the material. Injection of material into a mold can take place by direct extrusion into the mold, or by reciprocating the screw as an injection plunger, or by a combination of the two. When the screw serves as an injection plunger, this unit acts as a holding, measuring, and injection

chamber. OR A helical flighted, metal shaft that rotates within the heating cylinder of a molding machine, shearing, blending, and advancing the plastic material. After rotating, the screw is pushed forward which injects the plastic into the mold. Also, simply referred to as "the screw." OR An extruder system in which the screw when rotating is pushed backwards by the molten polymer which collects in front of the screw. When sufficient material has been collected, the screw moves forward and forces the material through the head and die at a high speed.

**Reciprocating Seal:** Seals used in moving piston and rod situations

**RECIST :** A standard way to measure how well a cancer patient responds to treatment. It is based on whether tumors shrink, stay the same, or get bigger. To use RECIST, there must be at least one tumor that can be measured on x-rays, CT scans, or MRI scans. The types of response a patient can have are a complete response (CR), a partial response (PR), progressive disease (PD), and stable disease (SD). Also called Response Evaluation Criteria In Solid Tumors.

**recombinant :** In genetics, describes DNA, proteins, cells, or organisms that are made by combining genetic material from two different sources. Recombinant substances are made in the laboratory and are being studied in the treatment of cancer and for many other uses.

**recombinant 70-kD heat-shock protein:** A recombinant peptide that is chemically identical to or similar to the endogenous 70-kD heat shock protein (HSP70). HSP70 is a molecular chaperone that prevents physiologic stress-induced cell death by inhibiting both caspase-dependent and caspase-independent apoptosis. Because this peptide is often overexpressed in tumor cells, autologous vaccination with HSP70 derived from tumor cells may stimulate the host immune system to mount a tumoricidal cytotoxic T lymphocyte (CTL) response. Check for active clinical trials using this agent.

**recombinant adenovirus-hIFN-beta:** A recombinant replication-defective adenovirus which encodes the gene for the cytokine human interferon-beta (IFN-beta). Once inserted into and replicating in host tumor cells, recombinant adenovirus-hIFN-beta expresses human IFN-beta, which may stimulate an antiproliferative natural killer (NK) cell response against tumor cells and induce caspase-mediated tumor cell apoptosis.

**recombinant adenovirus-interferon SCH 721015:** A replication-deficient recombinant adenovirus encoding human interferon alpha-2b with potential

antineoplastic activity. Upon intravesical administration, recombinant adenovirus-interferon SCH 721015 infects nearby tumor cells and expresses INF alpha-2b intracellularly which activates the transcription and translation of genes whose products mediate antiviral, antiproliferative, antitumor, and immune-modulating effects.

**recombinant adenovirus-interferon/Syn3:** A non-replicating recombinant adenovirus type 5 (Ad5)-vector encoding the gene for interferon alpha-2b (IFN $\alpha$ 2b) and the gene transfer enhancement agent Syn 3, with potential antineoplastic activity. Upon intravesical administration, recombinant adenovirus-interferon with Syn3 transfects both cancerous and normal bladder cells, and the adenovirus secretes interferon (IFN $\alpha$ 2b) into the bladder. IFN exerts a direct antitumor killing effect and a bystander effect, thereby killing adjacent, non-transfected cancerous bladder cells. Syn 3 enhances the ability of the adenoviral vector to transfect cells.

**recombinant adenovirus-L523S vaccine:** A replication-defective adenovirus containing a gene that encodes the human protein L523S with potential antineoplastic activity. Upon administration, recombinant adenovirus-L523S vaccine expresses L523S, which may stimulate antibody and cytotoxic T lymphocyte (CTL) responses against tumor cells expressing L523S. L523S is an RNA-binding protein that belongs to the KOC (K homology domain containing protein over-expressed in cancer) family of proteins. As an oncofetal protein, L523S is normally expressed in early embryonic tissues and certain normal adult tissues such as colon, fallopian tube, gall bladder, and ovary tissues but may be overexpressed in squamous cell cancers of the lung. Check for active clinical trials using this agent.

**recombinant adenovirus-p53 :** A substance that has been studied in the treatment of some types of cancer. Recombinant adenovirus-p53 is a weakened adenovirus that carries the p53 gene into tumor cells, causing them to die. It is a type of gene therapy. Also called ACN53, rAd/p53, and SCH-58500.

**recombinant adenovirus-p53 SCH-58500:** A genetically-engineered adenovirus that contains the gene that encodes the human tumor-suppressor protein p53 with potential antineoplastic activity. Recombinant adenovirus-p53 SCH-58500 delivers p53 into tumor cells, which may result in p53-mediated cell cycle arrest and apoptosis.

**recombinant attenuated Salmonella typhimurium expressing IL-2:** An orally available, genetically engineered Salmonella typhimurium strain expressing a truncated form of the human cytokine interleukin-2 (IL-2) gene, with antitumor activity. Upon administration of recombinant attenuated S. typhimurium expressing IL-2 (SalpIL2), this Salmonella strain may selectively accumulate and divide in a variety of tumor types, and express IL-2. In turn, IL-2 may induce natural killer (NK) cell proliferation thereby enhancing their activity. This may inhibit the growth of tumor cells.

**recombinant B. pertussis adenylate cyclase toxin-tyrosinase A2 epitope vaccine:** A recombinant vaccine containing a genetically detoxified adenylate cyclase toxin (CyaA) of Bordetella pertussis coupled, through its catalytic site, to the melanoma tyrosinase A2 epitope YMDGTMSQV, with potential antineoplastic activity. Via the toxin moiety, the recombinant B. pertussis adenylate cyclase toxin-tyrosinase A2 epitope specifically binds to the alphaMbeta2 integrin (CD11b/CD18) located on CD11b-positive antigen-presenting cells (APC). Upon processing and presentation of the melanoma-specific epitope by MHC class I molecules to the surface of these APCs, a specific cytotoxic T-cell (CTL) response against tumor cells expressing tyrosinase may be initiated, resulting in decreased tumor growth and cell lysis. Check for active clinical trials using this agent.

**recombinant bispecific single-chain antibody rM28:** A recombinant, bispecific, single chain antibody directed against both the T-cell surface-associated costimulatory molecule CD28 and a melanoma-associated proteoglycan (MAPG) with potential antitumor activity. By targeting both CD28 and MAPG, recombinant bispecific single-chain antibody rM28 enhances cytotoxic T-cell recognition of melanoma cells, which may result in immune effector cell-mediated tumor cell death and a decrease in distant metastases. This agent appears to have a long serum half-life secondary to the formation of dimers. When activated, CD28 facilitates interactions between T-cells and other immune effector cells resulting in cytotoxic T-lymphocyte responses; MAPG is a surface antigen expressed on the majority of melanomas, including primary cutaneous, ocular and metastatic melanomas.

**recombinant CD40-ligand:** A recombinant therapeutic agent which is chemically identical to or similar to CD40-ligand. CD40-ligand, also known as CD40L/TRAP and CD154, is a type II membrane protein which binds to

CD40, a cell surface receptor that belongs to the tumor necrosis factor receptor family; CD40 is expressed on B lymphocytes, monocytes, dendritic cells (DC), hematopoietic progenitors, endothelial cells and epithelial cells. Recombinant CD40-ligand may be used to activate DC ex vivo via CD40 binding; CD40-ligand-activated DC may provide or augment a protective antitumor immunity when administered in dendritic cell cancer vaccines.

**recombinant cell-surface anchored sialidase DAS181:** A recombinant sialidase fusion protein composed of a sialidase catalytic domain derived from *Actinomyces viscosus*, a constituent of the normal oral and gastrointestinal flora in humans, fused to a cell surface-anchoring domain, with potential anti-viral activity. Following administration by oral inhalation, DAS181 proteolytically removes sialic acid from the airway epithelium, which inhibits viral binding to and internalization by cells of the respiratory epithelium and prevents viral replication. The cell surface anchoring-domain of this agent may increase retention time and drug potency. Sialic acids in the respiratory tract are used by influenza and parainfluenza viruses to invade airway epithelial cells.

**recombinant dHER2 vaccine:** A cancer vaccine consisting of a truncated recombinant HER2 peptide (dHER2) with potential antineoplastic activity. Upon administration, recombinant dHER2 vaccine may stimulate the host immune response to mount a cytotoxic T-lymphocyte response against tumor cells that overexpress the HER2 protein, resulting in tumor cell lysis. The HER2 protein is a tumor-associated antigen (TAA) that is overexpressed in a variety of cancers. dHER2 includes the extracellular domain (ECD) and a part of the intracellular domain (ICD) of the HER2 protein.

**recombinant DNA:** DNA molecules that have been altered in some way during the process of genetic engineering or biotechnology. OR DNA formed by the joining of genes into new combinations.

**Recombinant DNA technology:** An array of techniques used to analyze and manipulate DNA; these methods include the specific modification of genes as well as the construction of new ones, gene cloning and amplification, and the expression of new and modified genes to yield protein products. OR An enzyme that catalyzes the exchange of genetic material when two DNA molecules recombine. OR The transfer to offspring

of genes not found together in either of the parents. OR The formation of new arrangements of genes or gene sequences by movement of DNA.

**recombinant DNA-L523S vaccine:** A plasmid DNA encoding human L523S, an RNA-binding protein that belongs to the KOC (K homology domain containing protein overexpressed in cancer) family, with potential antineoplastic activity. Vaccination with L523S DNA may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells that express the L523S protein. As an oncofetal protein, L523S is normally expressed in early embryonic tissue, but is overexpressed in certain cancer cell types.

**recombinant EphB4-HSA fusion protein:** A recombinant fusion protein composed of the full-length extracellular domain (soluble) of human receptor tyrosine kinase ephrin type-B receptor 4 (sEphB4) and fused, at its C-terminus, to full-length human serum albumin (HSA), with potential antineoplastic and anti-angiogenic activities. sEphB4-HSA functions as a decoy receptor for the membrane-bound ligand Ephrin-B2 (Efnb2) and interferes with the binding of Efnb2 to its native receptors, including EphB4 and EphA3. This may result in a reduction of angiogenesis and a reduction in cell growth of Efnb2 and/or EphB4 over-expressing tumor cells. In addition, this agent also prevents the angiogenic effects of numerous growth factors due to interactions between Efnb2 and EphB4. Efnb2 and EphB4 are overexpressed in a variety of tumor cell types; the bi-directional signaling of Efnb2-EphB4 plays an important role in angiogenesis and tumor cell migration, invasion, and proliferation. Albumin reduces this agent's degradation, improves circulation time and may thus improve efficacy. Check for active clinical trials using this agent.

**recombinant flt3 ligand:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine Flt3. Flt3 ligand binds to the Flt3 tyrosine kinase receptor and, synergistically with other growth factors, stimulates the proliferation and mobilization of certain bone marrow precursor cells, including CD34+ cells, and dendritic cells. When proteolytically cleaved, the transmembrane isoform of Flt3 ligand generates the soluble form soluble Flt3 ligand, which is also biologically active. Check for active clinical trials using this agent.

**recombinant fowlpox GM-CSF vaccine adjuvant:** A cancer vaccine adjuvant consisting of a recombinant fowlpox virus encoding human granulocyte-macrophage colony-stimulating factor (GM-CSF). GM-CSF

binds to specific cell surface receptors on various immuno-hematopoietic cell types, enhancing their proliferation and differentiation and stimulating macrophage and dendritic cell functions in antigen presentation and antitumor cell-mediated immunity. Administration of recombinant fowlpox GM-CSF vaccine adjuvant may induce an immune response against tumor cells. Fowlpox virus is an attractive vector because its genome is easy to manipulate and it is replication incompetent in mammalian cells.

**recombinant fowlpox-B7.1 vaccine:** A cancer vaccine comprised of a recombinant fowlpox virus vector encoding the stimulatory molecule transgene B7-1. Recombinant fowlpox-B7.1 (rF-B7.1) vaccine may enhance antigen presentation and activate antitumoral cytotoxic T-cells.

**recombinant fowlpox-CEA-MUC-1-TRICOM vaccine :** A cancer vaccine made with a form of a chicken virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called falimarev.

**recombinant fowlpox-CEA(6D)/TRICOM vaccine:** A cancer vaccine comprised of a recombinant fowlpox virus vector encoding the carcinoembryonic antigen (CEA) and a TRIad of COstimulatory Molecules (B7-1, ICAM-1 and LFA-3) (TRICOM). This agent may enhance CEA presentation to antigen presenting cells (APC) and activate cytotoxic T-cells against CEA-expressing tumors.

**recombinant fowlpox-prostate specific antigen vaccine:** A cancer vaccine consisting of a recombinant fowlpox virus encoding human prostate-specific antigen (PSA). Administration of this agent may stimulate a cytotoxic T cell response against PSA-expressing tumor cells. Fowlpox virus is an attractive vector because its genome is easy to manipulate and it is replication incompetent in mammalian cells.

**recombinant fowlpox-PSA(L-155)TRICOM vaccine:** A cancer vaccine consisting of a recombinant fowlpox virus encoding fragment of human prostate-specific antigen (PSA), PSA:154-163 (155L), and a TRIad of COstimulatory Molecules (B7-1, ICAM-1 and LFA-3) (TRICOM). Administration of this agent may induce a cytotoxic T cell response against PSA-expressing tumor cells. Dendritic cells infected with TRICOM vectors greatly enhance naive T-cell activation and peptide-specific T-cell

stimulation. Fowlpox virus is an attractive vector because its genome is easy to manipulate and it is replication incompetent in mammalian cells.

**recombinant fowlpox-TRICOM vaccine:** A cancer vaccine comprised of a recombinant fowlpox virus vector encoding TRICOM. TRICOM is comprised of three co-stimulatory molecule transgenes (B7-1, ICAM-1 and LFA-3) that may enhance antigen presentation and activate cytotoxic T-cells. Fowlpox virus is an attractive vector because its genome is easy to manipulate and it is replication incompetent in mammalian cells.

**recombinant fowlpox-TRICOM vaccine :** A cancer vaccine made with a form of a chicken virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called rF-TRICOM.

**recombinant fowlpox-tyrosinase vaccine:** A recombinant fowlpox virus vaccine with potential antineoplastic activity. Binding to the melanoma antigen tyrosinase, recombinant fowlpox-tyrosinase vaccine generates cellular immune responses against melanoma cells expressing the tyrosinase antigen; this effect is enhanced by the co-administration of interleukin 2 (IL-2). Fowlpox virus is an attractive vector because its genome is easy to manipulate and it is replication incompetent in mammalian cells.

**recombinant hsp110-gp100 chaperone complex vaccine:** A recombinant chaperone-peptide complex-based vaccine composed of a complex between heat shock protein hsp110 and the human melanoma-associated antigen gp100, with potential antineoplastic activity. Upon vaccination, recombinant hsp110-gp100 chaperone complex activates the immune system to exert a cytotoxic T cell immune response and antigen-specific interferon-gamma production against gp100-overexpressing cancer cells. Gp100, is overexpressed in a variety of cancer cell types. Hsp110, binds to and chaperones full-length proteins during heat shock; as an immunoadjuvant it is able to enhance an immune response against antigen(s) and stimulate T-lymphocyte activation.

**recombinant human 6Ckine:** A therapeutic recombinant analogue of a member of the endogenous CC chemokines with potential antineoplastic activity. Expressed by various lymphoid tissues, endogenous 6Ckine is chemotactic for B and T lymphocytes and dendritic cells.

**recombinant human adenovirus type 5 H101:** A replication selective, recombinant, E1B and partial E3 gene deleted form of human adenovirus type 5, with potential antineoplastic activity. Upon intratumoral injection of recombinant human adenovirus type 5, the adenovirus selectively replicates in cancer cells while preventing viral replication in normal, healthy cells. This induces a selective adenovirus-mediated cytotoxicity in cancer cells, which leads to cancer cell lysis. In addition, viral spread to adjacent cells, following lysis of infected cells, may activate the immune system to kill the infected tumor cells. The E1B protein causes p53 inactivation, which promotes viral replication; deletion of E1B allows for p53 activation in normal cells, which prevents viral replication in normal, healthy cells. The mutation and subsequent inactivation of p53 in cancer cells enables the E1B-deleted adenovirus to selectively replicate in cancer cells. Partial deletion of E3, encoding the adenovirus death protein, enhances the safety profile of the administered adenovirus. Check for active clinical trials using this agent.

**recombinant human albumin-human granulocyte colony-stimulating factor:** A long-acting recombinant fusion protein incorporating human serum albumin (HSA)-derived and human granulocyte colony stimulating factor (G-CSF)-derived moieties with potential granulopoietic activity. G-CSF, a naturally occurring cytokine, stimulates the production of granulocytes and stem cells in the bone marrow and their release into the blood; it also stimulates the differentiation, function, and survival of neutrophil precursors and mature neutrophils. Albumin fusion may promote an increased serum half-life and bioavailability of the G-CSF moiety of this fusion protein. Check for active clinical trials using this agent.

**recombinant human angiotensin converting enzyme 2 APN01:** A recombinant, soluble glycosylated form of human angiotensin converting enzyme 2 (rhACE2) with antihypertensive and potential antineoplastic activities. Recombinant human angiotensin converting enzyme 2 APN01 may normalize ACE2 levels, cleaving angiotensin II to create angiotensin-(1-7) and restoring the function of the renin-angiotensin system (RAS). ACE2, a homolog of ACE1, appears to function as a negative regulator of the RAS system by converting angiotensin II to angiotensin-(1-7), a peptide with actions that counteract the cardiovascular actions of angiotensin II. In addition, angiotensin-(1-7) may inhibit cyclooxygenase 2 (COX-2) and the production of proinflammatory prostaglandins and may activate the

angiotensin-(1-7) G protein-coupled receptor Mas, resulting in diminished tumor cell proliferation. ACE2 levels may be reduced in malignancy and diabetes and in liver, cardiovascular and lung diseases.

**recombinant human chorionic gonadotropin:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous glycoprotein hormone human chorionic gonadotropin (HCG). HCG binds to cells of the corpus luteum, thereby stimulating progesterone production and helping to maintain a secretory endometrium.

**recombinant human EGF-rP64K/Montanide ISA 51 vaccine:** A peptide vaccine preparation, containing recombinant human epidermal growth factor (rEGF) linked to the Neisseria meningitidis-derived recombinant immunogenic carrier protein P64k (rP64k) and mixed with the immunoadjuvant Montanide ISA 51, with potential active immunotherapy activity. Recombinant human EGF-rP64K/Montanide ISA 51 vaccine may trigger a humoral immune response against vaccine rEGF and rP64K and, so, against endogenous EGF. Antibody-mediated inhibition of endogenous EGF binding to its receptor, epithelial growth factor receptor (EGFR), may result in the inhibition of tumor cell proliferation.

**recombinant human endostatin:** A recombinant human proteolytic fragment of the C-terminal end of type XVIII collagen. Endostatin induces microvascular endothelial cell apoptosis and inhibits endothelial proliferation and angiogenesis, which may result in a reduction in tumor burden. This agent also may decrease hepatic metastasis by inhibiting proinflammatory cytokines and vascular cell adhesion molecule (VCAM)-dependent cell attachment to the hepatic microvasculature.

**recombinant human epidermal growth factor:** A recombinant form of the naturally-occurring polypeptide human epidermal growth factor with potential epithelial regenerative and cytoprotective activities. Upon topical application, recombinant human epidermal growth factor (rhEGF) may stimulate epithelial proliferation, differentiation and migration, which may result in the acceleration of epithelial regeneration and wound healing. In addition, rhEGF may attenuate epithelial cytotoxicities related to chemotherapy and/or radiotherapy. Check for active clinical trials using this agent.

**recombinant human fusion protein L19TNFalpha:** An immunocytokine consisting of human pro-inflammatory cytokine tumor necrosis factor alpha

(TNF $\alpha$ ) fused to a human single-chain variable fragment (scFv) directed against the extra-domain B (ED-B) of fibronectin (L19), with potential immunopotentiating and antineoplastic activities. The L19 moiety of recombinant human fusion protein L19TNF $\alpha$  binds to the ED-B domain of fibronectin on tumor cells in the tumor neovasculature. In turn, the TNF $\alpha$  moiety may locally induce an immune response against ED-B fibronectin-expressing tumor cells and may specifically decrease the proliferation of ED-B-expressing tumor cells. ED-B is predominantly expressed during angiogenesis and tumor growth.

**recombinant human granulocyte colony-stimulating factor:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine granulocyte colony-stimulating factor (G-CSF). Secreted by monocytes, macrophages and neutrophils and other cells after activation, G-CSF stimulates the proliferation and differentiation of hematopoietic progenitor cells committed to the neutrophil/ granulocyte lineage.

**recombinant human hyaluronidase:** A human recombinant form of the naturally occurring human enzyme hyaluronidase with potential chemoadjuvant activity. Upon local administration, recombinant human hyaluronidase hydrolyzes hyaluronic acid, a glucosaminoglycan responsible for the viscosity of the interstitial barrier. The digestion of hyaluronic acid lowers the viscosity in the interstitial space, thereby increasing permeability and facilitating local penetration of chemotherapeutic agents into cancer cells.

**recombinant human interleukin-11 :** A drug used to increase the number of blood cells, especially platelets, in some cancer patients receiving chemotherapy. Recombinant human interleukin-11 is a form of interleukin-11 (a cytokine normally made by support cells in the bone marrow) that is made in the laboratory. It is a type of biological response modifier. Also called Neumega, oprelvekin, and rhIL-11.

**recombinant human interleukin-15:** A recombinant agent that is chemically identical or similar to the endogenous cytokine interleukin-15 (IL-15) with immunomodulating activity. IL-15, secreted by mononuclear phagocytes (and some other cell types) following viral infection, regulates T and natural killer cell activation and proliferation. This cytokine induces activation of transcription activators STAT3, STAT5, and STAT6 via JAK

kinase signal transduction pathways in mast cells, T cells, and dendritic epidermal T cells. IL-15 and interleukin-2 (IL-2) are structurally similar and share many biological activities; both may bind to common hematopoietin receptor subunits, negatively regulating each other's activity. CD8<sup>+</sup> memory T cell number has been shown to be regulated by a balance between IL-15 and IL-2.

**recombinant human interleukin-2 :** A drug used to treat some types of cancer. It is a form of interleukin-2, a cytokine made by leukocytes (white blood cells), that is made in the laboratory. Recombinant human interleukin-2 increases the activity and growth of white blood cells called T lymphocytes and B lymphocytes. It is a type of biological response modifier. Also called aldesleukin and Proleukin.

**recombinant human mannose-binding lectin:** A recombinant protein similar or identical to human mannan-binding lectin (MBL) with opsonin activity. MBL, a soluble pattern recognition receptor (PRR) collectin in the C-type lectin superfamily, is a plasma protein that plays an important role in innate immunity; MBL contains a carbohydrate recognition domain at one end and a collagen-like stalk domain at the other. Upon MBL binding to mannose residues on mannose-containing polysaccharides (mannans) on the surfaces of a microorganisms, activation of the complement system results in the deposition of complement components (opsonization) and the clearance of the opsonized microorganisms by phagocytic cells. MBL is part of the mannan-binding lectin pathway (also known as the Ali/Krueger pathway), which has similarities to the classical complement pathway in that activation of C4 and C2 produce activated complement proteins further down the complement cascade. However, unlike the classical complement pathway, activation of this pathway is not antibody dependent.

**recombinant human methionyl stem cell factor :** A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. It is being studied in the treatment of myelodysplasia. Recombinant human methionyl stem cell factor is a type of recombinant stem cell growth factor. Also called ancestim, r-metHuSCF, and Stemgen.

**recombinant human papillomavirus bivalent vaccine :** A vaccine used to prevent cervical cancer caused by human papillomavirus (HPV) types 16

and 18. Recombinant human papillomavirus bivalent vaccine is approved for use in females aged 9 to 25 years. It is a type of bivalent vaccine (a vaccine that works against two different viruses or other microorganisms). Also called Cervarix.

**recombinant human papillomavirus nonavalent vaccine:** A non-infectious, recombinant, nonavalent vaccine prepared from highly purified virus-like particles (VLPs) comprised of the major capsid (L1) proteins from human papillomavirus (HPV) types 6, 11, 16, 18, 31, 33, 45, 52, and 58, with active immunizing activity. Upon administration, the recombinant HPV nonavalent vaccine activates the immune system to produce antibodies against the 9 HPV types. This protects against HPV infection and HPV-related cancers. Altogether, HPV types 6, 11, 16, 18, 31, 33, 45, 52, and 58 account for the majority of the HPV types that cause cervical, vulvar, vaginal and anal cancers. Check for active clinical trials using this agent.

**recombinant human papillomavirus nonavalent vaccine :** A vaccine used to prevent anal, cervical, vulvar, and vaginal cancer caused by human papillomavirus (HPV) types 16, 18, 31, 33, 45, 52 and 58 and genital warts caused by HPV types 6 and 11. Recombinant human papillomavirus nonavalent vaccine is approved for use in males aged 9 to 15 years and females aged 9 to 26 years. It is a type of nonavalent vaccine (a vaccine that works against nine different viruses or other microorganisms). Also called Gardasil 9.

**recombinant human papillomavirus quadrivalent vaccine :** A vaccine used to prevent anal, cervical, vulvar, and vaginal cancer caused by human papillomavirus (HPV) types 16 and 18 and genital warts caused by HPV types 6 and 11. Recombinant human papillomavirus quadrivalent vaccine is approved for use in males and females aged 9 to 26 years. It is a type of quadrivalent vaccine (a vaccine that works against four different viruses or other microorganisms). Also called Gardasil.

**recombinant human serum amyloid P/pentraxin 2:** A fully recombinant form of the human pentraxin 2 (PTX2) protein with potential antifibrotic activity. Upon intravenous administration, recombinant human serum amyloid P/pentraxin 2 (PRM-151) may inhibit myofibroblast generation by preventing the differentiation of circulating monocytes into fibrocytes and profibrotic macrophages. PTX2 is a circulating plasma protein that belongs

to the class of pattern recognition receptors (PRR) of the innate immune system.

**recombinant human stem cell factor:** A therapeutic glycoprotein cytokine chemically identical to or similar to endogenous human stem cell factor with hematopoietic activity. Recombinant human stem cell factor (rhSCF) binds to the receptor tyrosine kinase c-kit, which may stimulate the growth of peripheral blood progenitor cells (PBPCs). This agent works synergistically with other hematopoietic growth factors. rhSCF may promote bone marrow recovery after myeloablative therapies and procedures.

**recombinant interferon:** One of a group of recombinant therapeutic glycoprotein cytokines with antiviral, anti-proliferative, and immunomodulating activities. Interferons bind to specific cell-surface receptors, leading to the transcription and translation of genes with interferon-specific response elements (ISREs). The resultant proteins mediate many complex effects, ultimately leading to inhibition of viral protein synthesis and cellular growth, alteration of cellular differentiation, interference with oncogene expression, activation of natural killer cells, alteration of cell surface antigen expression, and augmentation of lymphocyte and macrophage cytotoxicity. The production of endogenous interferons is induced in response to foreign agents such as bacteria, viruses and parasites and to tumor cells.

**recombinant interferon alfa:** A class of naturally-isolated or recombinant therapeutic peptides used as antiviral and anti-tumor agents. Alpha interferons are cytokines produced by nucleated cells (predominantly natural killer (NK) leukocytes) upon exposure to live or inactivated virus, double-stranded RNA or bacterial products. These agents bind to specific cell-surface receptors, resulting in the transcription and translation of genes containing an interferon-specific response element. The proteins so produced mediate many complex effects, including antiviral effects (viral protein synthesis); antiproliferative effects (cellular growth inhibition and alteration of cellular differentiation); anticancer effects (interference with oncogene expression); and immune-modulating effects (natural killer cell activation, alteration of cell surface antigen expression, and augmentation of lymphocyte and macrophage cytotoxicity).

**recombinant interferon alfa-2b:** A non-glycosylated recombinant interferon with antiviral and antineoplastic activities. Alfa interferons bind to specific cell-surface receptors, resulting in the transcription and translation of genes whose protein products mediate antiviral, antiproliferative, anticancer, and immune-modulating effects. or A drug used to treat AIDS-related Kaposi sarcoma in certain patients, hairy cell leukemia, and melanoma that has been removed by surgery. It is also used with other anticancer drugs to treat a certain type of non-Hodgkin lymphoma. Recombinant interferon alfa-2b is also used to treat some infections caused by viruses, such as the hepatitis C virus. It is being studied in the treatment of other types of cancer and other conditions. Recombinant interferon alfa-2b is a form of interferon alfa (a substance normally made by cells in the immune system) and is made in the laboratory. It is a type of cytokine and a type of biological response modifier. Also called IFN alpha-2B, interferon alfa-2b, and Intron A.

**recombinant interferon Alpha 2b-like protein:** A proprietary recombinant protein highly resembling human interferon alpha 2b (IFN-a2b), with potential anti-tumor, anti-inflammatory, immunomodulating and antiviral activities. Upon injection, recombinant IFN alpha 2b-like protein binds to specific IFN alpha cell surface receptors. This activates interferon-mediated signal transduction pathways and induces the transcription and translation of genes with interferon-specific response elements (ISREs). This may activate the immune system, including the activation of natural killer cells (NKs) and may result in an inhibition of tumor cell proliferation, tumor angiogenesis, metastasis and an induction of apoptosis. Compared to human IFN-a2b (HuINF-a2b), this agent exhibits enhanced antiviral and antiproliferative activities. In addition, this agent exhibits antiviral activity against a variety of viruses, including hepatitis B and C viruses, human immunodeficiency virus (HIV) and Avian Influenza.

**recombinant interferon alpha-1b:** The non-glycosylated recombinant interferon alpha, subtype 1b, with immunostimulatory and antineoplastic activities. Alpha interferon-1b binds to specific cell-surface receptors, resulting in the transcription and translation of genes whose protein products mediate antiviral, antiproliferative, anticancer, and immune-modulating effects.

**recombinant interferon alpha-2a:** A non-glycosylated recombinant human alpha interferon, subtype 2a, produced in the bacterium *E. coli*. Interferon alpha-2a binds to its specific cell-surface receptor, resulting in the transcription and translation of genes whose protein products have antiviral, antiproliferative, anticancer, and immune modulating effects. Check for active clinical trials using this agent.

**recombinant interferon beta:** A recombinant protein which is chemically identical to or similar to endogenous interferon beta with antiviral and anti-tumor activities. Endogenous interferons beta are cytokines produced by nucleated cells (predominantly natural killer cells) upon exposure to live or inactivated virus, double-stranded RNA or bacterial products. These agents bind to specific cell-surface receptors, resulting in the transcription and translation of genes with an interferon-specific response element. The proteins so produced mediate many complex effects, including antiviral (the most important being inhibition of viral protein synthesis), antiproliferative and immune modulating effects. The recombinant therapeutic forms of interferon beta are interferon beta 1-a and interferon beta 1-b.

**recombinant interferon gamma:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous lymphokine interferon gamma (IFN-gamma) with antineoplastic, immunoregulatory, and antiviral activities. Therapeutic IFN-gamma binds to and activates the cell-surface IFN-gamma receptor, stimulating antibody-dependent cytotoxicity and enhances natural killer cell attachment to tumor cells. This agent also activates caspases, thereby inducing apoptosis in malignant cells.

**recombinant interleukin-1-alpha:** A recombinant agent which is chemically identical to or similar to the endogenous protein cytokine interleukin-1 (IL-1). The IL-1 precursor is produced by monocytes, activated macrophages, and other cell types; mature IL-1 is generated by proteolytic cleavage by proteases such as IL-1-beta converting enzyme (ICE). This agent enhances T cell proliferation and B cell growth and differentiation and induces the expression of proinflammatory cytokines.

**recombinant interleukin-1-beta:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous protein cytokine interleukin 1 (IL-1)-beta. Produced by monocytes and activated macrophages, endogenous mature IL-1 is generated through proteolytic cleavage by proteases such as IL-1-beta converting enzyme (ICE). This

agent promotes angiogenesis, fibroblast proliferation, and neutrophil chemotaxis; it also regulates the functions of lymphocytes and epithelial cells and is involved in the 'acute phase response' to infection.

**recombinant interleukin-12:** A recombinant form of the endogenous heterodimeric cytokine interleukin-12 with potential antineoplastic activity. Recombinant interleukin-12 binds to and activates its cell-surface receptor, stimulating the production of interferon-gamma (IFN) which, in turn, induces IFN-gamma-inducible protein-10 (IP-10) and so inhibits tumor angiogenesis.

**recombinant interleukin-18:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine interleukin-18 (IL-18). Produced primarily by macrophages, IL-18 induces the production of interferon-gamma (IFN-gamma), and enhances the activity of natural killer (NK) and cytotoxic T lymphocytes (CTL). As a potential immunotherapeutic agent, IL-18 displays antitumor effects in vitro and in animal models.

**recombinant interleukin-3:** A recombinant form of interleukin-3, a cytokine produced by activated T-cells and mast cells involved in intercellular communication, hematopoiesis, and inflammation. IL-3 binds and activates specific receptors on hematopoietic cells and in the nervous system, triggering expression of specific genes via the Ras signaling pathway and through Jak2 activation. This agent stimulates the proliferation of pluripotent hematopoietic progenitor cells.

**recombinant interleukin-4:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine interleukin-4 (IL-4). Produced primarily by activated T-cells, IL-4 binds to and activates its cell-surface receptor, stimulating the proliferation and differentiation of activated B-cells and enhancing their ability to present antigens to T-cells. As a potential immunotherapeutic agent, recombinant IL-4 also augments the effects of other cytokines on dendritic cells (DC), cytotoxic T lymphocytes (CTL), and tumor-infiltrating lymphocytes (TIL).

**recombinant interleukin-6:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine interleukin-6 (IL-6) with antiapoptotic, proinflammatory, antiinflammatory, proliferative and proangiogenic activities. IL-6 binds to its receptor (IL-6R), activating a receptor-CD130 receptor complex; the CD130 portion of

the complex is a signal transduction protein that activates JAK kinases and ras-mediated signaling pathways, which in turn activate downstream signaling pathways, resulting in the activation of various transcription factors (STAT, ELK-1, NF-IL-6, etc.) and gene transcription. The physiological effects of IL-6 are complex and varied and include hematopoietic, pyrogenic and thermogenic, proinflammatory, antiinflammatory, proliferative (anti-apoptotic), and angiogenic effects. Check for active clinical trials using this agent.

**recombinant interleukin-7:** A recombinant protein which is chemically identical to or similar to endogenous interleukin-7 (IL-7) with hematopoietic and immunopotentiating properties. Produced by bone marrow, thymic stromal, and spleen cells, the cytokine interleukin-7 is a hematopoietic growth factor for progenitor B cells and T cells and stimulates proliferation and differentiation of mature T-cells and natural killer cells. Check for active clinical trials using this agent.

**recombinant leukocyte interleukin:** A cocktail preparation of synthetic interleukin (IL) -1, IL-2, IL-6, tumor necrosis factor (TNF)-alpha, interferon gamma and other cytokines that are chemically identical to or similar to signaling molecules secreted by leukocyte cells. Leukocyte interleukins are essential in many immune responses, such as antibodies production, modulating secretion of other cytokines, and activation of bone marrow stem cells. Check for active clinical trials using this agent.

**recombinant macrophage colony-stimulating factor:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous protein cytokine macrophage colony-stimulating factor (M-CSF). Synthesized endogenously by mesenchymal cells, M-CSF stimulates the survival, proliferation, and differentiation of hematopoietic cells of the monocyte-macrophage series and can reverse treatment-related neutropenias. Recombinant M-CSF may also enhance antigen presentation and activate antitumoral cytotoxic T-cells.

**recombinant MAGE-3.1 antigen:** A recombinant tumor-specific melanoma antigen. Vaccination with recombinant MAGE-3.1 antigen may induce a host immune response against MAGE-expressing cells, resulting in antitumoral T cell-mediated cytotoxicity. MAGE-expressing cells are found in melanoma, non-small-cell lung carcinoma (NSCLC), head and

neck squamous cell carcinoma, transitional cell carcinoma of the bladder, and esophageal carcinoma.

**recombinant MIP1-alpha variant ECI301:** A recombinant form of a human macrophage inflammatory protein-1 alpha (MIP1-alpha) with a substitution of aspartate to alanine at position 26, with potential immunomodulating and radiotherapy potentiating activity. Intravenous administration of recombinant MIP1-alpha variant ECI301 after local tumor irradiation enhances the anti-tumor effect of ionizing radiation at the irradiated site as well as the antitumor effect at non-irradiated tumor sites (known as the abscopal effect). The abscopal effect appears to be attributed to this agent's ability to recruit and activate leukocytes, such as monocytes, dendritic cells, natural killer cells and T lymphocytes, thereby initiating an anti-tumor immune response against cancer cells. MIP1-alpha, also known as chemokine (C-C motif) ligand 3, is a ligand for the chemokine receptors CCR1, CCR4 and CCR5 that are involved in immune and inflammatory responses.

**recombinant modified vaccinia Ankara-5T4 vaccine:** A cancer vaccine comprised of a recombinant modified vaccinia Ankara (MVA) viral vector encoding the 5T4 fetal oncoprotein (MVA-h5T4). Vaccination with recombinant modified vaccinia Ankara-5T4 vaccine may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) response against tumor cells expressing 5T4 fetal oncoprotein antigen, resulting in tumor cell lysis. The MVA viral vector, derived from the replication-competent strain Ankara, is a highly attenuated, replication-defective vaccinia strain incapable of virion assembly.

**recombinant nematode anticoagulant protein c2:** An 85-amino acid recombinant peptide derived from protein c2 of the hemophagocytic hookworm *Ancylostoma caninum* (a common canine parasite) with anticoagulant activity. Recombinant nematode anticoagulant protein c2 (rNAPc2) binds to circulating activated factor X (FXa) or zymogen factor X (FX) to form a binary complex which subsequently binds to and inhibits membrane-bound activated factor VII/tissue factor complex (FVIIa/TF). When administered prophylactically, this agent may reduce the incidence of deep venous thrombosis without hemostatic compromise. Because rNAPc2 inhibits the formation of the FVIIa/TF protease complex, which may play a

role in the cellular signaling of both metastatic and angiogenic processes, it may impede tumor progression.

**recombinant oncolytic poliovirus PVS-RIPO:** A recombinant, live attenuated, nonpathogenic oncolytic virus containing the oral poliovirus Sabin type 1 in which the internal ribosomal entry site (IRES) is replaced with the IRES from human rhinovirus type 2 (HRV2), with potential antineoplastic activity. Upon intratumoral administration of recombinant oncolytic poliovirus PVS-RIPO, the poliovirus is selectively taken up by and replicates in tumor cells expressing CD155 (poliovirus receptor, PVR or NECL5) eventually causing tumor cell lysis. CD155, an oncofetal cell adhesion molecule and tumor antigen, is ectopically expressed in certain cancers, such as glioblastoma multiforme (GBM), and plays an important role in tumor cell migration, invasion, and metastasis. Due to the heterologous HRV2 IRES in this recombinant virus, PVS-RIPO only propagates in susceptible, nonneuronal cells (e.g., GBM). Check for active clinical trials using this agent.

**recombinant oxytocin:** A synthetic cyclic peptide form of the naturally occurring posterior pituitary hormone oxytocin. Oxytocin binds to oxytocin receptors in the uterine myometrium, which triggers the G-protein coupled receptor signal transduction cascade that causes increased intracellular calcium concentrations. Increased calcium concentration levels activate myosin light chain kinase which, in turn, induces the formation of the contractile protein actomyosin. This stimulates uterine smooth muscle contractions. This agent also stimulates smooth muscles in the mammary glands, thereby causing lactation. Check for active clinical trials using this agent.

**recombinant parathyroid hormone:** A recombinant therapeutic agent that is identical or similar to an 84-amino-acid polypeptide produced by the parathyroid gland which functions to maintain a constant concentration of calcium ions ( $\text{Ca}^{2+}$ ) in the extracellular fluid. In target tissues, parathyroid hormone (PTH) binds to and activates the parathyroid hormone receptor (PTHr), a cell surface G protein-coupled receptor; there are two types of receptors, parathyroid hormone receptor 1 (PTH1R) found in bone and the kidney and parathyroid hormone receptor 2 (PTH2R) found primarily in the central nervous system (CNS), pancreas, testis, and placenta. Activation of PTHr results in the activation of adenylyl cyclase and phospholipase C in

target tissue cells, which, depending upon the specific target tissue, results in the enhancement of intestinal Ca<sup>2+</sup> absorption, mobilization of bone Ca<sup>2+</sup>, and renal Ca<sup>2+</sup> reabsorption.

**recombinant platelet factor 4:** A recombinant form of the endogenous chemokine platelet factor 4 with potential antiangiogenesis and antineoplastic activities. As a heparin-binding tetramer, recombinant platelet factor 4 inhibits growth factor-stimulated endothelial cell proliferation, migration, and angiogenesis; it has been shown that this agent inhibits fibroblast growth factor 2 (FGF2) angiogenic activity downstream from the FGF2 receptor. Its activity is antagonized by heparin. Recombinant platelet factor 4 may also directly inhibit the proliferation of some tumor cell types.

**recombinant PRAME protein plus AS15 adjuvant GSK2302025A:** A recombinant form of the human PRAME (Preferentially Expressed Antigen of Melanoma) protein combined with the AS15 adjuvant, with potential immunostimulatory and antineoplastic activities. Upon intramuscular administration, GSK2302025A may stimulate the host immune response to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells that overexpress the PRAME protein, resulting in tumor cell lysis. The tumor-associated antigen PRAME is often overexpressed by a variety of tumor cell types. AS15 is a potent adjuvant liposomal formulation that contains CpG 7909, monophosphoryl lipid, and QS-21.

**recombinant Saccharomyces cerevisia-CEA(610D) vaccine GI-6207:** A whole, heat-killed, recombinant *Saccharomyces cerevisiae* yeast-based vaccine genetically altered to express the carcinoembryonic antigen (CEA) peptide 610D with potential immunostimulating and antineoplastic activities. Upon administration, recombinant *Saccharomyces cerevisia*-CEA(610D) vaccine GI-6207 may stimulate a host cytotoxic T-lymphocyte (CTL) response against CEA-expressing tumor cells, which may result in tumor cell lysis. CEA, a tumor associated antigen, is overexpressed on a wide variety of human cancer cells including colorectal, gastric, lung, breast and pancreatic cancer cells. CEA 610D encodes for 9 amino acids (605-613) in which aspartate is substituted for asparagine at position 610 (610D) in order to strengthen the induction of the CTL response against CEA-expressing tumor cells.

**recombinant soluble human CD4 protein:** A recombinant human soluble CD4 with antiviral activity. Recombinant human soluble CD4 has the amino terminus but not the T-cell binding domain of the endogenous CD4 antigen. This soluble CD4 protein competitively binds to envelope glycoprotein (gp120) of human immunodeficiency virus (HIV) resulting in inhibition of interaction between gp120 and the endogenous CD4 antigen, thereby blocking viral recognition of CD4 and subsequent entry of HIV into CD4 bearing cells.

**recombinant super-compound interferon:** A recombinant form of the naturally-occurring cytokine interferon-alpha (IFN-a) that has a modified spatial configuration, with immunomodulating, antiviral and antineoplastic activities. Upon administration of recombinant super-compound interferon (rSIFN-co), this agent binds to IFN-specific cell surface receptors, resulting in the transcription and translation of genes whose protein products have antiviral, antiproliferative, anticancer, and immune-modulating effects. The 3-dimensional conformational change improves efficacy and causes fewer side effects compared to IFN-a. Check for active clinical trials using this agent.

**recombinant thymosin:** A recombinant form of a polypeptide chemically identical to or similar to the hormone secreted by the thymus gland. Thymosin is generally known to have functions in the preprocessing of T cells and the development of B cells to plasma cells to produce antibodies. In particular, the predominant form of thymosin, beta 4 thymosin, is the principal actin-sequestering protein that plays an important role in functions that involve actin molecules, such as maintenance of cell shape, cytoplasmic organization, cell movement, and cell division.

**recombinant thyroid-stimulating hormone:** A peptide hormone secreted by the anterior pituitary. It promotes the growth of the thyroid gland and stimulates the synthesis of thyroid hormones and the release of thyroxine by the thyroid gland.

**recombinant thyrotropin alfa:** A recombinant form of the human anterior pituitary glycoprotein thyroid stimulating hormone (TSH) with use in the diagnostic setting. With an amino acid sequence identical to that of human TSH, thyrotropin alfa binds to TSH receptors on normal thyroid epithelial cells or well-differentiated thyroid cancer cells, stimulating iodine uptake

and organification, synthesis and secretion of thyroglobulin (Tg), triiodothyronine (T3), and thyroxine (T4).

**recombinant tissue plasminogen activator :** A form of tissue plasminogen activator that is made in the laboratory. It helps dissolve blood clots and is used to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. It is a type of systemic thrombolytic agent. Also called Activase, Alteplase, and r-tPA.

**recombinant transforming growth factor-beta-2:** A recombinant polypeptide chemically identical to or similar to the endogenous cytokine transforming growth factor-beta-2 (TGF-beta-2). TGF-beta-2 modulates cell growth and immune function and may promote or inhibit tumor growth, depending on the tumor cell type. TGF-beta-2 may also suppress host immune system recognition of and/or response to tumor cells.

**recombinant tumor necrosis factor family protein:** A recombinant therapeutic agent which is chemically identical to or similar to one of a number of endogenous tumor necrosis factor (TNF) proteins. TNF family cytokines bind to and activate specific cell-surface receptors, thereby mediating inflammatory processes, cell proliferation, immunity, angiogenesis, and tumor cell cytotoxicity. One primary antitumor effect of TNFs involves stimulation of T cell-mediated antitumor cytotoxicity. Check for active clinical trials using this agent.

**recombinant tyrosinase-related protein-2:** A recombinant therapeutic agent which is chemically identical to or similar to an endogenous non-mutated melanocyte differentiation antigen expressed by both normal and malignant melanocytes. Vaccinations with recombinant tyrosinase-related protein-2 may elicit an antitumoral cytotoxic T-cell response against tumor cells and some normal cells that express tyrosinase-related protein-2.

**recombinant urate oxidase :** A drug used to treat high blood levels of uric acid in patients with leukemia, lymphoma, and other types of cancer who are receiving certain types of cancer treatment. It is also being studied in the treatment of other medical conditions. Recombinant urate oxidase is a type of recombinant enzyme and a type of urate-lowering drug. Also called Elitek and rasburicase.

**recombinant vaccinia prostate-specific antigen vaccine:** A vaccine consisting of recombinant vaccinia virus encoding prostate specific antigen (PSA). Vaccination with recombinant vaccinia prostate-specific antigen

vaccine stimulates the host immune system to mount a cytotoxic T-cell response against tumor cells expressing PSA.

**recombinant vaccinia viral vector RO5217790:** A vaccine consisting of recombinant modified vaccinia Ankara (MVA) viral vector encoding mutated forms of the genes for the viral oncoproteins E6 and E7 derived from the human papillomavirus (HPV) type 16 and the human cytokine interleukin-2 (hIL2), with potential immunomodulating and antineoplastic activities. Upon subcutaneous administration, recombinant vaccinia viral vector RO5217790 may stimulate the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against cells expressing HPV E6 and E7, resulting in tumor cell lysis. Oncoproteins E6 and E7 have been implicated in the tumorigenesis of cervical carcinoma.

**recombinant vaccinia-B7.1 vaccine:** A recombinant vaccinia virus encoding the T-cell co-stimulatory molecule B7-1. Co-administration of recombinant vaccinia-B7.1 and a tumor-associated antigen in a cancer vaccine may enhance tumor-associated antigen-specific T-cell responses.

**recombinant vaccinia-CEA-MUC-1-TRICOM vaccine :** A cancer vaccine made with a form of vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins, including the tumor markers called CEA and MUC-1, that may help immune cells in the body kill tumor cells. Also called inalimarev and PANVAC-V.

**recombinant vaccinia-CEA(6D)-TRICOM vaccine:** A vaccine consisting of recombinant vaccinia virus encoding the tumor-associated antigen carcinoembryonic antigen (CEA) and a TRIad of COstimulatory Molecules (B7-1, ICAM-1, and LFA-3; also called TRICOM). Vaccination with recombinant vaccinia-CEA(6D)-TRICOM vaccine stimulates the host immune system to mount a T-cell response against tumor cells expressing the CEA antigen. The use of TRICOM in the vaccine may elicit a greater antitumor cytotoxic T lymphocyte (CTL) immune response compared to the use of vaccinia-CEA alone.

**recombinant vaccinia-MUC1 vaccine:** A vaccine containing a recombinant vaccinia virus that encodes the gene for human mucin-1, a tumor-associated antigen. Upon administration, recombinant vaccinia-MUC-1 vaccine may elicit a MUC-1-specific cytotoxic T cell response against tumor cells bearing MUC-1.

### **recombinant vaccinia-multiplepeptide melanoma peptides-B7.1-B7.2**

**vaccine:** A cancer vaccine consisting of an inactivated recombinant vaccinia virus encoding epitope peptides derived from melanoma-related HLA-A2-restricted tumor-associated antigens (TAAs), including Melan-A(27-35), gp100(280-288) and tyrosinase(1-9), and two co-stimulatory B7 proteins, B7.1 (CD80) and B7.2 (CD86). Upon administration, recombinant vaccinia-multiplepeptide melanoma peptides-B7.1-B7.2 vaccine may stimulate a cytotoxic T-lymphocyte response against melanoma cells that express TAAs which share epitopes with the epitope peptides expressed by the vaccine viral vector, resulting in tumor cell lysis; vaccine viral vector-expressed co-stimulatory proteins B7.1 and B7.2 may enhance the cytotoxic T-lymphocyte immune response to the TAAs.

**recombinant vaccinia-NY-ESO-1 vaccine:** A cancer vaccine consisting of a recombinant vaccinia viral vector encoding an immunogenic peptide derived from the cancer-testis antigen NY-ESO-1, an antigen found in normal testis and various tumors, including bladder, breast, hepatocellular, melanoma, and prostate cancers. Vaccination with recombinant vaccinia-NY-ESO-1 peptide vaccine may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) response against tumor cells expressing NY-ESO-1 antigen, resulting in tumor cell lysis.

**recombinant vaccinia-TRICOM vaccine:** A vaccine consisting of recombinant vaccinia virus encoding a triad of costimulatory molecules (B7-1, ICAM-1, and LFA-3; also called TRICOM). Vaccination with recombinant vaccinia-TRICOM vaccine stimulates the host immune system to mount a non-specific T-cell response. With the addition of a tumor-associated antigen peptide, this vaccine may enhance a tumor-specific immune response.

**recombinant vaccinia-TRICOM vaccine :** A cancer vaccine made with a form of a vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called rV-TRICOM and vaccinia-TRICOM vaccine.

**recombinant vesicular stomatitis virus-expressing interferon-beta:** A recombinant, replicating oncolytic vesicular stomatitis virus (VSV) carrying the human interferon-beta (IFN- $\beta$ ) gene, with potential immunomodulating and antineoplastic activities. Upon intratumoral administration,

recombinant VSV expressing IFN- $\beta$  replicates in the tumor environment specifically, partially due to defective innate antiviral host defense mechanisms in tumor cells, involving type I IFNs, and exerts its cytolytic activity towards the tumor cells. By expressing human IFN- $\beta$ , an IFN- $\beta$ -mediated antiviral immune response in surrounding normal cells is activated which protects normal cells against virus replication and VSV-mediated cell lysis. However, tumor cells have a defective IFN- $\beta$ -mediated innate antiviral immune response allowing for VSV to replicate in these cells without interference. In addition, the IFN- $\beta$  produced by VSV may activate an immune response in surrounding normal cells and may activate T-lymphocytes, dendritic cells and natural killer cells; thus, inducing an anti-tumor immune response against the tumor cells. VSV, a single-stranded RNA virus belonging to the genus Vesiculovirus of the family Rhabdoviridae, is relatively nonpathogenic to healthy humans.

**Recombination synapse:** The initial stage in the recombination process in which four molecules of recombinase and their associated DNA molecules come together.

**Recombivax HB:** (Other name for: hepatitis B vaccine (recombinant))

**reconstructive surgeon :** A doctor who can surgically reshape or rebuild (reconstruct) a part of the body, such as a woman's breast after surgery for breast cancer.

**reconstructive surgery :** Surgery that is done to reshape or rebuild (reconstruct) a part of the body changed by previous surgery.

**recorder:** a device that makes a graph or other automatic record of the stage, pressure, depth, velocity, or the movement or position of water controlling devices, usually as a function of time.

**Recormon:** (Other name for: epoetin beta)

**recover :** To become well and healthy again.

**Recovery Time:** The length of time for the screw to rotate, create a shot, and return to original position.

**RECP:** Relativistic effective core potential. The core electrons have been replaced by an effective potential that is based upon relativistic quantum calculations of the free atoms. Saves cost because of fewer explicit electrons and also includes some relativistic effects, especially the contraction of core s- and p-orbitals.

**recreational therapy :** A type of therapy that uses activities to help meet the physical and emotional needs of patients with an illness or disability and help them develop skills for daily living. These activities include arts and crafts, music, spending time with animals, sports, and drama. Recreational therapy is being studied as a way to relieve distress in cancer patients who are being treated for pain.

**recrystallization:** a process based on solubility in which a substance is dissolved in a minimum amount of hot solvent, which is then cooled to allow new, purer crystals to form.

**rectal :** By or having to do with the rectum. The rectum is the last several inches of the large intestine closest to the anus.

**rectal cancer :** Cancer that forms in the tissues of the rectum (the last several inches of the large intestine closest to the anus).

**rectal reconstruction :** Surgery to rebuild the rectum (the last several inches of the large intestine before the anus) using a section of the colon. This may be done when the rectum has been removed to treat cancer or other diseases.

**rectangle:** A four-sided closed figure in which the opposite sides are parallel and of equal length. All pairs of adjacent sides of a rectangle meet at right angles. OR a four-sided plane closed figure having opposite sides equal and parallel and four right angles.

**rectangular drainage pattern:** a drainage pattern created in bedrock that is regularly fractured or jointed in 90-degree angles.

**RECTILINEAR PROPAGATION:** is the principle that electromagnetic radiations like light travel in straight lines.

**rectitis :** Inflammation of the mucous membrane that lines the rectum (the last several inches of the large intestine closest to the anus). Also called proctitis.

**Rectoid:** (Other name for: therapeutic hydrocortisone)

**rectum :** The last several inches of the large intestine closest to the anus.

**recumbent fold:** a fold so overturned that its limbs are essentially horizontal and parallel.

**recur :** To come back or to return.

**recurrence :** Cancer that has recurred (come back), usually after a period of time during which the cancer could not be detected. The cancer may come back to the same place as the original (primary) tumor or to another place in the body. Also called recurrent cancer.

**recurrence risk :** In genetics, the likelihood that a hereditary trait or disorder present in one family member will occur again in other family members. This is distinguished from recurrence risk for cancer, which is the chance that a cancer that has been treated will recur.

**recurrent cancer :** Cancer that has recurred (come back), usually after a period of time during which the cancer could not be detected. The cancer may come back to the same place as the original (primary) tumor or to another place in the body. Also called recurrence.

**Recycled Plastic:** A plastic prepared from used articles which have been cleaned and reground, then re-introduced into the manufacturing process. See also Regrind, Rechip or Reprocessed. OR A plastic prepared from used articles which have been cleaned and reground.

**recycling:** To treat or process waste materials so as to make them suitable for reuse. The key to successful recycling of materials contained in refuse lies in the separation of recyclable components from the main bulk of the waste.

**Recycling Markets:** These markets are made up of individuals or businesses that purchase post-consumer plastic and/or post-industrial recyclable materials. Markets specify what kind of recyclables they purchase, what price the material is worth and in what form the material is needed. Recycling markets for plastics fall into two broad categories: (Waste Reduction Strategies for Rural Communities, prepared by the MaCC Group, with support from Tennessee Valley Authority, March 1994). OR The series of activities by which discarded materials are collected, sorted, processed and converted into raw materials and used in the production of new products. OR Metals (and other things like plastics and paper) can be re-used. Think about an aluminium drinks can. Recycling involves the can being melted and re-shaped into another object. This requires some energy. If the same amount of aluminium had to be extracted from its ore, that would require a huge amount more energy. So, recycling aluminium makes economic sense.

**red blood cell :** also known as erythrocytes; cells that contain hemoglobin to transport oxygen. OR A type of blood cell that is made in the bone marrow and found in the blood. Red blood cells contain a protein called hemoglobin, which carries oxygen from the lungs to all parts of the body. Checking the number of red blood cells in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as anemia, dehydration, malnutrition, and leukemia. Also called erythrocyte and RBC.

**red cedar :** A type of evergreen tree with hard fragrant wood that is a member of the cypress family. The oil from the wood is used in soaps, shampoos, bath salts, perfumes, aromatherapy, and to keep insects away. The scientific name is *Juniperus virginiana*. Also called cedarwood and Eastern red cedar.

**red clover :** *Trifolium pratense*. A plant with flowers that has been used in some cultures to treat certain medical problems. It is being studied in the relief of menopausal symptoms and may have anticancer effects. Also called purple clover, *Trifolium pratense*, and wild clover.

**red date :** The fruit of the jujube plant. It has been used in some cultures to treat certain medical problems.

**red elm :** The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, Indian elm, slippery elm, sweet elm, *Ulmus fulva*, and *Ulmus rubra*.

**red giant:** stage of the life cycle of a star in which it expands and cools.

**red shift:** apparent lengthening of starlight as it moves away from you (Doppler).

**red tomato juice:** Tomato juice derived from red tomatoes, with potential antioxidant and chemopreventive activities. Red tomato juice contains higher levels of the trans-isomer of lycopene (trans-LYC) compared to the cis-isomer (cis-LYC). Lycopene, a linear, unsaturated hydrocarbon carotenoid, is the major red pigment in certain fruits such as tomatoes, pink grapefruit, apricots, red oranges, watermelon, rosehips, and guava. As an antioxidant, lycopene scavenges free radicals which may both inhibit cellular oxidation and prevent free radical damage to cells. cis-LYC is better absorbed than its trans form.

**Redemption Center:** A centrally located depot to which consumers bring recyclables that provides payment for delivered materials. (The Blueprint for Plastics Recycling, The Council for Solid Waste Solutions, 1991).

**redox:** refers to a reaction in which simultaneous reduction and oxidation occur.

**redox :** A chemical reaction that takes place between an oxidizing substance and a reducing substance. The oxidizing substance loses electrons in the reaction, and the reducing substance gains electrons. For example, rust forms when there is a redox reaction between oxygen contained in water or moist air (an oxidizing substance) and iron (a reducing substance). Redox reactions also occur when glucose (a type of sugar) and fat are broken down in the body to make energy. Also called oxidation-reduction.

**Redox couple:** An electron donor and its corresponding oxidized form.

**Redox electrode:** a metallic electrode, usually made of platinum, which is used to monitor reversible reduction/oxidation reactions. The potential difference developed between the redox electrode and a reference electrode is a Nernstian function of the ratio of two different oxidation states of a species in solution.

**redox indicator:** An organic molecule that has reduced and oxidized forms with different colors; interconversion of the reduced and oxidized forms of the indicator must be reversible. Ferroin is an example.

**redox pair:** An electron donor and its corresponding oxidized form; for example, NADH and NAD<sup>+</sup>.

**Redox potential:** the potential developed by a metallic electrode when placed in a solution containing a species in two oxidation states in reversible equilibrium. The redox potential is a measure of the tendency for the reduction reaction to occur. Standard redox potentials range from about -3 volts to +3 volts. The more positive the value the more likely it is that reduction will occur. Negative values indicate that oxidation is more likely.

**Redox potential (E):** The relative tendency of a pair of molecules to release or accept an electron. The standard redox potential (E<sup>0</sup>) is the redox potential of a solution containing the oxidant and reductant of the couple at standard concentrations.

**redox reaction:** A reaction that involves transfer of electrons from one substance to another. Redox reactions always involve a change in oxidation

number for at least two elements in the reactants. OR See oxidation-reduction reaction.

**redox titration:** A titration based on a redox reaction. For example, iron in water can be determined by converting dissolved iron to  $\text{Fe}^{2+}$  and titrating the solution with potassium permanganate ( $\text{KMnO}_4$ ), a powerful oxidizing agent.

**reduced glutathione-L-cysteine-anthocyanins gel:** A gel formulation containing reduced glutathione, L-cysteine, and anthocyanins with potential antioxidant, immunostimulating, and chemoprotective activities. Reduced glutathione is the primary cellular antioxidant and plays important roles in the antioxidation of reactive oxygen species and free radicals and, as a thiol-containing co-enzyme, in the detoxification of xenobiotic compounds. In addition, glutathione affects DNA synthesis and repair and exerts immunostimulating activity by increasing the production of interleukin-2 (IL-2), promoting antigen presentation, and stimulating T-suppressor/cytotoxic (CD8 cells) cells. The flavonoid anthocyanins, derived from various blue and purple flowering plants, are potent scavengers of reactive oxygen species.

**Reduced Radius Omni-Grid :** Smallest turn radius available with no center link assembled into the belt.

**reducing:** The gain of electrons by an atom, ion, or molecule.

**reducing agent:** A reducing agent is an element or compound that removes oxygen from a compound (or provides electrons in a reaction). OR A reducing agent is a substance that reduce another substance by supplying electrons to it. Reducing agents cause other substances to be reduced in chemical reactions while they themselves are oxidized. For example, tin(II) is a reducing agent in the following reaction:
$$\text{Sn}^{2+}(\text{aq}) + 2 \text{Fe}^{3+}(\text{aq}) \rightarrow \text{Sn}^{4+}(\text{aq}) + 2 \text{Fe}^{2+}(\text{aq})$$

**reducing agent (reductant):** The electron donor in an oxidation-reduction reaction.

**reducing end:** The end of a polysaccharide having a terminal sugar with a free anomeric carbon; the terminal residue can act as a reducing sugar.

**reducing equivalent:** A general or neutral term for an electron or an electron equivalent in the form of a hydrogen atom or a hydride ion.

**reducing sugar:** A sugar in which the carbonyl (anomeric) carbon is not involved in a glycosidic bond and can therefore undergo oxidation.

**Reducing sugars:** Sugars that convert into a form with a free aldehyde group that is readily oxidized and can thus reduce another compound.

**Reductase:** An enzyme that catalyzes the reduction of a functional group, often using NADPH as an electron donor; a type of oxidoreductase.

**reduction:** The gain of electrons by a compound or ion. OR Reduction is gain of one or more electrons by an atom, molecule, or ion. Reduction is accompanied by a decrease in oxidation number. OR the gaining of electrons by an atom or molecule. In organic compounds, a reduction is an increase in the number of hydrogen atoms in a molecule. OR the gain of electrons by a species. OR Reduction is the removal of oxygen from a compound (or the addition of electrons to an atom or ion). OR A gain of electrons; a decrease in oxidation state. OR chemical reaction in which an atom or molecule gains an electron; decrease in positive valence; addition of hydrogen to a molecule.

**reduction :** A chemical reaction that takes place when a substance comes into contact with hydrogen or another reducing substance.

**Reduction 2 :** The addition of one or more electrons, especially in terms of an electrode reaction during electrolysis. An example would be  $\text{Na}^+$  gaining an electron at the cathode to form Na.

**reduction half reaction:** That part of a redox reaction that involves gain of electrons. In the oxidation half reaction, the oxidation number of one or more atoms within the reactants is reduced.

**reduction reaction:** A reaction in which a substance gains at least one electron.

**reduction treatment:** the opposite of oxidation treatment wherein a reductant is used to lower the valence state of a pollutant to a less toxic form; e.g. the use of  $\text{SO}_2$  to reduce  $\text{Cr}^{6+}$  to  $\text{Cr}^{3+}$  in an acidic solution.

**Reduction1 :** The removal of oxygen from a substance. This is the main process when metals are extracted from their ores.

**Reductive biosynthesis:** Refers to anabolic pathways that require hydride ion donors to reduce carbon atoms in metabolic intermediates; NADPH serves as an electron donor in many such pathways, including the biosynthesis of palmitoyl coa.

**redundancy:** the unnecessary repetition of words, phrases, or ideas in writing.

**redundant internal coordinates:** Internal coordinates that overdetermine the molecular geometry, i.e., are more numerous than  $3N-6$  for non-linear molecules or  $3N-5$  for linear molecules.

**Reed-Sternberg cell :** A type of cell that appears in people with Hodgkin disease. The number of these cells increases as the disease advances.

**reef:** an accumulation of organisms (typically corals and algae) that forms in warm, shallow ocean environments; resistant ridge that rims islands, lagoons, and other shorelines.

**refametinib:** An orally bioavailable selective MEK inhibitor with potential antineoplastic activity. Refametinib specifically inhibits mitogen-activated protein kinase kinase 1 (MAP2K1 or MAPK/ERK kinase 1), resulting in inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK, a dual specificity threonine/tyrosine kinase, is a key component of the RAS/RAF/MEK/ERK signaling pathway that regulates cell growth; constitutive activation of this pathway has been implicated in many cancers. Check for active clinical trials using this agent.

**reference:** As in "single-reference" or "multi-reference," refers to the number of configurations (or really Slater determinants) in the 0th-order description of the wavefunction. Most methods that don't begin with "MR," "MC," or "CAS" are single-reference methods.

**Reference electrode:** the half of an electrode pair which provides a constant potential, regardless of the sample composition. The potential developed by a sensing electrode is measured against this reference to give a signal, which can be converted to the activity of ion under analysis. Single junction reference electrodes have a single chamber generally filled with a potassium chloride solution saturated with silver chloride, which contacts with the sample solution through a single liquid junction by means of a semiporous ceramic plug or fritted disc. Double junction reference electrodes have two chambers with the internal reference system having a liquid junction with an intermediary salt bridge and then a second liquid junction to the external sample. The outer filling solution is chosen to avoid contamination of the sample and minimize the effects of the liquid junction potential.

**Reference internal element:** the part of a reference electrode, which reacts with the filling solution to produce a constant reference potential. The most common element is silver/silver chloride.

**reference interval :** In medicine, a set of values that a doctor uses to interpret a patient's test results. The reference interval for a given test is based on the results that are seen in 95% of the healthy population. Sometimes patients whose test results are outside of the reference interval may be healthy, and some patients whose test results are within the reference interval may have a health problem. The reference interval for a test may be different for different groups of people (for example, men and women). Also called normal range, reference range, and reference values.

**Reference man:** A person with the anatomical and physiological characteristics of an average individual that is used in calculations assessing internal dose (also may be called "standard man").

**reference population:** The standard against which a population that is being studied can be compared (Last, 1988).

**reference range :** In medicine, a set of values that a doctor uses to interpret a patient's test results. The reference range for a given test is based on the results that are seen in 95% of the healthy population. Sometimes patients whose test results are outside of the reference range may be healthy, and some patients whose test results are within the reference range may have a health problem. The reference range for a test may be different for different groups of people (for example, men and women). Also called normal range, reference interval, and reference values.

**reference values :** In medicine, a set of values that a doctor uses to interpret a patient's test results. The reference values for a given test are based on the results that are seen in 95% of the healthy population. Sometimes patients whose test results are outside of the reference values may be healthy, and some patients whose test results are within the reference values may have a health problem. The reference values for a test may be different for different groups of people (for example, men and women). Also called normal range, reference interval, and reference range.

**referral :** In medicine, the act of a doctor in which a patient is sent to another doctor for additional healthcare services.

**REFET (reference field effect transistor):** one of the possible solution of a miniaturized reference electrode based on FET transducer. Up to now

none of the constructions were put into practice mainly because of material and technological problems.

**Refined Products:** Refined products is the term given to the output streams produced by a refinery. These products differ from petrochemical products in that they generally consist of a mixture of chemicals, whose value is based on their combined physical properties rather than their chemistry. Refined products are used as energy sources across all areas of economic activity, with the petrochemical industry accounting for only a small percentage of total demand.

**Refinery Propylene:** Refinery propylene refers to a mixture of propylene and propane (typically 75 percent propylene) that is produced by refineries for sale to petrochemical producers or for use as a feedstock to make gasoline components. Refinery propylene can be upgraded to propylene by distillation in a propylene splitter. Refinery propylene can also be used directly as a feedstock for production of cumene.

**Reflectance :** an operation mode of fiber optic chemical sensors. In this mode the detector measures the changes in spectral properties of the light beam reflected (after interaction) from the optomembrane (chemooptical interface).

**Reflected light:** Used to observe gross properties of particles (cf., transmitted light).

**Reflective goniometry:** A technique by which the interfacial angles of a single crystal can be determined.

**reflectivity:** The ratio of the energy carried by a wave that is reflected from a surface to the energy of a wave incident on the surface.

**Reflector:** A layer of material immediately surrounding a reactor core that scatters back (or reflects) into the core many neutrons that would otherwise escape. The returned neutrons can then cause more fissions and improve the neutron economy of the reactor. Common reflector materials are graphite, beryllium, water, and natural uranium.

**reflex arc:** the simplest unit of nervous activity; involved in the detection of a stimulus in the environment by sensory nerve endings, followed by impulses that travel via the sensory neurons to the spinal cord.

**reflexive (intensive) pronoun:** combines a personal pronoun with -self or -selves in order to reflect nouns or pronouns, or to provide emphasis

**reflexology** : A type of massage in which different amounts of pressure are applied to specific points on the feet or hands. These points are believed to match up with certain other parts of the body. Reflexology is claimed to cause relaxation and healing in those parts of the body, but this has not been proven.

**Refludan:** (Other name for: lepirudin)

**reflux** : The backward flow of liquid from the stomach into the esophagus.

**Reformate:** Reformate is the term given to the side stream produced by refinery reformers. These units are designed to produce higher value gasoline components from highly aromatic naphtha streams. Reformate is produced from naphtha in continuous catalytic reformers and semi-regenerative reformers and is a mixture of aromatic and aliphatic hydrocarbons. Its composition can be controlled within limits by the aromatics producer. It is the major source of aromatics in most of the world.

**Reformulated Plastic:** Recycled plastic that has been upgraded to alter or improve performance capability or to change characteristics through use of plasticizers, fillers, stabilizers, pigments, etc.

**Refractive index:** The ratios of the velocities of light in a medium and in air under the same conditions. Measured by the ratio of the sines of the angles of incidence and refraction. OR The ratio of the speed of radiation (as light) in one medium (as a vacuum) to that in another medium. In optical coating applications, differences in refractive indexes of coatings and substrates can result in birefringence. OR For a particular substance, the speed of light in a vacuum divided by the speed of light in that substance. This gives rise to the bending of light as it travels from one transparent material to another. OR The deviation caused by the material when a light beam passes through a transparent specimen.

**Refractive Index, Sodium D:** The ratio of the velocity and light in a vacuum to its velocity in the material.

**refractory** : In medicine, describes a disease or condition that does not respond to treatment.

**refractory cancer** : Cancer that does not respond to treatment. The cancer may be resistant at the beginning of treatment or it may become resistant during treatment. Also called resistant cancer.

**refrigerant:** A chemical used in refrigeration, to keep substances cool.

**regadenoson:** An adenosine derivative and selective A<sub>2A</sub> adenosine receptor agonist with coronary vasodilating activity. Upon administration, regadenoson selectively binds to and activates the A<sub>2A</sub> adenosine receptor, which induces coronary vasodilation. This leads to an increase in coronary blood flow and enhances myocardial perfusion. Compared to adenosine, regadenoson has a longer half-life and shows higher selectivity towards the A<sub>2A</sub> adenosine receptor. This agent is a very weak agonist for the A<sub>1</sub> adenosine receptor and has negligible affinity for the A<sub>2B</sub> and A<sub>3</sub> adenosine receptors. Check for active clinical trials using this agent.

**REGELATION:** is the process of melting ice by pressure. Inasmuch as water expands upon freezing, pressure will reverse the process, forcing water to melt. Then when the pressure is released, the water re-freezes (re-gells).

**Regenecare :** A substance being studied in the treatment of certain types of skin rash and skin pain in cancer patients. The ingredients of Regenecare are collagen, aloe vera, vitamin E, and lidocaine. It may help stop bleeding, form new blood vessels, keep the skin moist, and relieve pain and itching. It is a type of topical anesthetic and a type of wound repair agent.

**regeneration :** In biology, regrowth of damaged or destroyed tissue or body part.

**regimen :** A treatment plan that specifies the dosage, the schedule, and the duration of treatment.

**regional :** In oncology, describes the body area right around a tumor.

**regional anesthesia :** A temporary loss of feeling or awareness in a part of the body, such as an arm or a leg, caused by special drugs or other substances called anesthetics. The patient stays awake but has no feeling in the part of the body treated with the anesthetic.

**regional cancer :** Refers to cancer that has grown beyond the original (primary) tumor to nearby lymph nodes or organs and tissues.

**regional chemotherapy :** Treatment with anticancer drugs directed to a specific area of the body.

**regional enteritis :** A condition in which the gastrointestinal tract is inflamed over a long period of time. Regional enteritis usually affects the small intestine and colon. Symptoms include fever, diarrhea, stomach cramps, vomiting, and weight loss. Regional enteritis increases the risk of

colorectal cancer and small intestine cancer. It is a type of inflammatory bowel disease (IBD). Also called Crohn disease.

**regional lymph node :** In oncology, a lymph node that drains lymph from the region around a tumor.

**regional lymph node dissection :** A surgical procedure to remove some of the lymph nodes that drain lymph from the area around a tumor. The lymph nodes are then examined under a microscope to see if cancer cells have spread to them.

**regional metamorphism:** metamorphism of rocks typically exposed to tectonic forces and associated high pressures and temperatures. OR Metamorphic rocks that have been formed in areas where heat and pressure combined to create the rock. Mountain areas are locations of regional metamorphism.

**regionally metamorphic:** rock that undergoes intense heat and pressure over large areas.

**registered dietitian :** A health professional with special training in the use of diet and nutrition to keep the body healthy. A registered dietitian may help the medical team improve the nutritional health of a patient.

**Regitine:** (Other name for: phentolamine mesylate)

**Reglan :** A drug that increases the motility (movements and contractions) of the stomach and upper intestine. It is used to treat certain stomach problems and nausea and vomiting caused by chemotherapy. It is a type of antiemetic and a type of motility agent. Also called metoclopramide.

**regolith:** the interface between bedrock and overlying sedimentary material; consists of solid fragments of weathered rock.

**regorafenib:** An orally bioavailable small molecule with potential antiangiogenic and antineoplastic activities. Regorafenib binds to and inhibits vascular endothelial growth factor receptors (VEGFRs) 2 and 3, and Ret, Kit, PDGFR and Raf kinases, which may result in the inhibition of tumor angiogenesis and tumor cell proliferation. VEGFRs are receptor tyrosine kinases that play important roles in tumor angiogenesis; the receptor tyrosine kinases RET, KIT, and PDGFR, and the serine/threonine-specific Raf kinase are involved in tumor cell signaling. or A drug used to treat colorectal cancer that has spread to other parts of the body and has not gotten better with other treatment. It is also used to treat gastrointestinal

stromal tumors (GIST) that cannot be removed by surgery or have spread to other parts of the body and have not gotten better with other anticancer drugs. It is being studied in the treatment of other types of cancer.

Regorafenib blocks the action of certain proteins, which may help keep cancer cells from growing and may kill them. It may also prevent the growth of new blood vessels that tumors need to grow. Regorafenib is a type of kinase inhibitor and a type of antiangiogenesis agent. Also called Stivarga.

**regression :** A decrease in the size of a tumor or in the extent of cancer in the body.

**Regrind:** plastic material that has been gone through one or more melting processes after initial polymerization. All reprocessed plastic material is technically regrind, and can come from a variety of sources. The term regrind most commonly refers to the material that is created when scrap plastic material (rejected or unused parts, runners, sprues, etc) is chopped or ground into small pieces. Note: Each time a polymer molecule goes through a thermal cycle, (solid/molten/solid), the molecular composition (chain length and chemistry) changes. Changes can also occur in the additives. OR Waste material such as sprues, runners, excess parison material and reject parts from injection molding, blow molding and extrusion, which has been reclaimed by shredding or granulating. Regrind is usually mixed with virgin compound at a predetermined percentage for remolding.

**Regrind Waste:** Material from injection molding, blow molding and extrusion operations, which has been reclaimed by shredding or granulating.

**Regrind/Rechip:** Recycled plastic material which has been reclaimed by shredding or granulating from all fabrication processes including plastic extrusion manufacture. Regrind is often mixed with a percentage of virgin compound for re-use.

**Regular Novolin R:** (Other name for: insulin, regular)

**regular polygon:** a polygon in which sides and angles are all equal. For example, a regular pentagon has five equal angles and five equal sides.

**Regulation:** A meeting between the NRC and a reactor licensee to discuss an inspection finding that was preliminarily assessed as greater-than-Green in significance to gather more information before a final decision on significance is made by the agency.

**Regulatory Conference:** A meeting between the NRC and a reactor licensee to discuss an inspection finding that was preliminarily assessed as greater-than-Green in significance to gather more information before a final decision on significance is made by the agency.

**Regulatory enzyme:** An enzyme in which the active site is subject to regulation by factors other than the enzyme substrate. The enzyme frequently contains a nonoverlapping site for binding the regulatory factor that affects the activity of the active site. OR An enzyme having a regulatory function through its capacity to undergo a change in catalytic activity by allosteric mechanisms or by covalent modification.

**Regulatory gene:** A gene whose principal product is a protein designed to regulate the synthesis of other genes. OR A gene that gives rise to a product involved in the regulation of the expression of another gene; for example, a gene coding for a repressor protein.

**Regulatory Information Conference:** An annual NRC conference that brings together NRC staff, regulated utilities, materials users, and other interested stakeholders to discuss nuclear safety topics and significant and timely regulatory activities through informal dialogue to ensure an open regulatory process.

**Regulatory proteins:** Proteins that bind to enzymes and regulate their catalytic activity.

**regulatory sequence:** A DNA sequence involved in regulating the expression of a gene; for example, a promoter or operator.

**regulatory T cell :** A type of immune cell that blocks the actions of some other types of lymphocytes, to keep the immune system from becoming over-active. Regulatory T cells are being studied in the treatment of cancer. A regulatory T cell is a type of white blood cell and a type of lymphocyte. Also called suppressor T cell, T reg, and T-regulatory cell.

**regulon:** A group of genes or operons that are coordinately regulated even though some, or all, may be spatially distant within the chromosome or genome.

**rehabilitation :** In medicine, a process to restore mental and/or physical abilities lost to injury or disease, in order to function in a normal or near-normal way.

**rehabilitation services :** Special healthcare services that help a person regain physical, mental, and/or cognitive (thinking and learning) abilities that have been lost or impaired as a result of disease, injury, or treatment. Rehabilitation services help people return to daily life and live in a normal or near-normal way. These services may include physical therapy, occupational therapy, speech and language therapy, cognitive therapy, and mental health rehabilitation services.

**rehabilitation specialist :** A healthcare professional who helps people recover from an illness or injury and return to daily life. Examples of rehabilitation specialists are physical therapists and occupational therapists.

**Reinforced concrete:** Concrete work in which steel bars (reinforcement) are embedded to impart additional strength. Should not be confused with a load-bearing steel structure, clad or covered with concrete.

**REINFORCED MOLDING COMPOUND:** A material reinforced with special fillers to meet specific requirements (glass, carbon, etc.) OR Compound supplied by raw material produced in the form of ready-to-use materials; as distinguished from premix.

**Reinforced Plastic:** A plastic with high-strength fibers embedded in the polymer matrix, resulting in increased strength properties superior to those of the base resin. The term is used to designate any polymer that is a basic material for plastics. OR These plastic materials consist of base resins to which fibrous reinforcements have been added to increase the strength of the finished plastic products.

**Reinforced resin:** Refers to base resins with fillers added for strength. They are particularly susceptible to warp because the fiber orientation tends to follow flow lines, resulting in asymmetric stresses. These resins are typically harder and stronger but also more brittle (i.e. less tough).

**REINFORCEMENT:** A strong inert material bound into a plastic to improve its strength, stiffness, and impact resistance. Reinforcements are usually long fibers of glass, sisal, cotton, etc. — in woven or nonwoven form. OR a substance added to a polymer to enhance the performance properties of the final parts. These substances form a chemical bond with the base polymer. Typical reinforcements include glass, carbon, and other synthetic fibers, and mineral flakes. OR An inert fibrous or non-fibrous material incorporated in a plastic to improve or modify mechanical or physical properties. OR Material used to reinforce, strengthen or give

dimensional stability to another material; can be chopped, woven or braided. OR An inert fibrous or non-fibrous material incorporated in a plastic to improve or modify mechanical or physical properties.

**Reinforcing Rod :** A rod of any shape (usually round) inserted through the bends of the spirals for the purpose of strengthening the fabric, and which does not join spirals or serve as a connector.

**relapse :** The return of a disease or the signs and symptoms of a disease after a period of improvement. Relapse also refers to returning to the use of an addictive substance or behavior, such as cigarette smoking.

**relapse-free survival :** In cancer, the length of time after primary treatment for a cancer ends that the patient survives without any signs or symptoms of that cancer. In a clinical trial, measuring the relapse-free survival is one way to see how well a new treatment works. Also called DFS, disease-free survival, and RFS.

**relative atomic mass:** The relative atomic mass,  $A_r$ , is the mass of one mole of atoms of an element (taking into account the proportions of each isotope in a naturally occurring sample of the element).

**relative clause:** a clause that begins with a relative pronoun and functions as an adjective.

**Relative Density:** When the absolute density of a gas is compared to the density of air. The comparison of two values makes it relative. Air has a relative density of 1.0.

**relative error:** The uncertainty in a measurement compared to the size of the measurement. For example, if three replicate weights for an object are 2.00 g, 2.05 g, and 1.95 g, the absolute error can be expressed as  $\pm 0.05$  g and the relative error is  $\pm 0.05 \text{ g} / 2.00 \text{ g} = 0.025 = 2.5\%$ .

**relative formula mass:** The relative formula mass is the sum of the relative atomic masses of the elements indicated by a chemical formula. For example, the relative formula mass of  $\text{Na}_2\text{O} = 2 \times A_r(\text{Na}) + 1 \times A_r(\text{O})$ .  
Symbol = Mr.

**relative humidity:** a measure of how much water is in the air compared to how much it can hold, given as a percentage. OR Ratio of the quantity of water vapor present in the air to the quantity which would saturate it at any given temperature.

**relative odds :** A measure of the odds of an event happening in one group compared to the odds of the same event happening in another group. In cancer research, relative odds are most often used in case-control (backward looking) studies to find out if being exposed to a certain substance or other factor increases the risk of cancer. For example, researchers may study a group of individuals with cancer (cases) and another group without cancer (controls) to see how many people in each group were exposed to a certain substance or factor. They calculate the odds of exposure in both groups and then compare the odds. A relative odds of one means that both groups had the same odds of exposure and, therefore, the exposure probably does not increase the risk of cancer. A relative odds of greater than one means that the exposure may increase the risk of cancer, and a relative odds of less than one means that the exposure may reduce the risk of cancer. Also called odds ratio.

**relative pronoun:** (who, whom, which, that) introduce clauses that describe nouns or pronouns.

**relative risk:** (i) The ratio of the risk of disease or death among the exposed to the risk among the unexposed; this usage is synonymous with risk ratio; (ii) alternatively, the ratio of the cumulative incidence rate in the exposed to the cumulative incidence rate in the unexposed, i.e., the cumulative incidence ratio, and (iii) the term "relative risk" has also been used synonymously with "odds ratio" and, in some biostatistical articles, has been used for the ratio of forces of morbidity. The use of the term "relative risk" for several different quantities arises from the fact that for "rare" diseases (e.g., most cancers) all the quantities approximate one another. For common occurrences (e.g., neonatal mortality in infants under 1500g birth weight), the approximations do not hold (Last, 1988).

**relative risk :** A measure of the risk of a certain event happening in one group compared to the risk of the same event happening in another group. In cancer research, relative risk is used in prospective (forward looking) studies, such as cohort studies and clinical trials. A relative risk of one means there is no difference between two groups in terms of their risk of cancer, based on whether or not they were exposed to a certain substance or factor, or how they responded to two treatments being compared. A relative risk of greater than one or of less than one usually means that being exposed to a certain substance or factor either increases (relative risk

greater than one) or decreases (relative risk less than one) the risk of cancer, or that the treatments being compared do not have the same effects. Also called risk ratio.

**relative sea level:** The height of the boundary between sea and air as measured in relationship to a fixed reference point on land.

**relative standard deviation:** The relative standard deviation is a measure of precision, calculated by dividing the standard deviation for a series of measurements by the average measurement.

**relative survival rate :** A way of comparing the survival of people who have a specific disease with those who don't, over a certain period of time. This is usually five years from the date of diagnosis or the start of treatment for those with the disease. It is calculated by dividing the percentage of patients with the disease who are still alive at the end of the period of time by the percentage of people in the general population of the same sex and age who are alive at the end of the same time period. The relative survival rate shows whether the disease shortens life.

**Relative Viscosity:** The relative viscosity of a polymer in solution is the ratio of the absolute viscosities of the solution (of stated concentration) and of the pure solvent at the same temperature.

**RELAXATION:** Whenever polymer melts are subjected to mechanical work they develop stresses which do not become immediately zero when the mechanical influence is removed. The time required for the stresses to relax is referred to as RELAXATION TIME. There is no universally accepted definition of the most characteristic relaxation time for a polymer melt. Some authors use the  $\lambda$  of the Carreau or Cross viscosity models, but this is considered a poor choice by theoreticians. The best choice is perhaps the "longest relaxation time" determined in dynamic measurements as where  $G'$  is the storage modulus,  $h'$  is the dynamic viscosity and  $w$  is the frequency. Polymers with higher molecular weights have long relaxation times. When the polymer solidifies without the stresses having been relaxed, the product includes FROZEN-IN STRESSES which will be released when the plastic part is reheated. The accompanying changes in dimensions, shrinkage or warpage may be significant.

**relaxation technique :** A method used to help reduce muscle tension and stress, lower blood pressure, and control pain. Examples of relaxation techniques include tensing and relaxing muscles throughout the body,

guided imagery (focusing the mind on positive images), meditation (focusing thoughts), and deep breathing exercises.

**relaxation therapy :** A type of therapy that helps reduce muscle tension and stress, lowers blood pressure, and controls pain. It may involve tensing and relaxing muscles throughout the body. It may be used with guided imagery (focusing the mind on positive images) and meditation (focusing thoughts).

**Relaxed DNA:** A circular DNA molecule that has no superhelical turns.

**Relay helix:** A long helix that connects the switch regions of the S1 fragment to the lever arm; the nature of the nucleotide in the S1 fragment (ATP or ADP) allows the relay helix to change position, resulting in a reorientation of the lever arm.

**Release agent:** a lubricant, often wax, used to coat a mold cavity to prevent the molded piece from sticking to it, and thus to facilitate its removal from the mold. OR a lubricant, often wax, used to coat a mold cavity to prevent the molded piece from sticking to it, and thus to facilitate its removal from the mold. OR A substance which prevents a moulding from sticking to the mould surface, thus facilitating its release from the mould after curing. It may be chemical compound or a solid material such as a plastic film. Also know as a Parting agent. OR A compound, which is sprayed on the mold, or as an additive, molded into the part to help facilitate the release of the part.

**Release factor:** One of a set of proteins that recognize stop codons on mRNA at the A site on the ribosome, which leads to the release of the completed protein from the tRNA in the P site of the ribosome. OR See termination factors. OR Hypothalamic hormones that stimulate release of other hormones by the pituitary gland.

**Relenza :** A drug used to prevent and to treat influenza virus infections. It blocks the release of the virus from infected cells. It is a type of antiviral agent. Also called zanamivir.

**Relieved and Reinforced Turned-up Fabric :** A retaining edge similar to a relieved turned-up fabric except that hair-pin reinforcements are inserted in the disconnected spirals.

**Relieved Turned-up Fabric :** A retaining edge similar to a turned-up fabric edge providing flexibility by the omission of connectors or rod

reinforcements in the turned up portion of the mesh at prescribed spacing.

**religion** : A set of beliefs and practices that center on questions about the meaning of life and may involve the worship of a supreme being.

**Relistor** : A drug used to relieve certain side effects caused by treatment with opioids (pain killers similar to morphine), such as constipation (hard, dry stools), itching, and low urine flow. Relistor binds to opioid receptors outside the brain and may block the side effects of opioid drugs without affecting their ability to relieve pain. Relistor is a type of peripheral opioid receptor antagonist. Also called methylnaltrexone bromide.

**REM (Roentgen equivalent man)**: One of the two standard units used to measure the dose equivalent (or effective dose), which combines the amount of energy (from any type of ionizing radiation that is deposited in human tissue), along with the medical effects of the given type of radiation. For beta and gamma radiation, the dose equivalent is the same as the absorbed dose. By contrast, the dose equivalent is larger than the absorbed dose for alpha and neutron radiation, because these types of radiation are more damaging to the human body. Thus, the dose equivalent (in rems) is equal to the absorbed dose (in rads) multiplied by the quality factor of the type of radiation [see Title 10, Section 20.1004, of the Code of Federal Regulations (10 CFR 20.1004), "Units of Radiation Dose"]. The related international system unit is the sievert (Sv), where 100 rem is equivalent to 1 Sv. For additional information, see Doses in Our Daily Lives and Measuring Radiation.

**REM sleep** : One of the five stages of sleep. During REM sleep, the eyes move rapidly while closed and dreams occur. REM sleep is the lightest stage of sleep, during which a person may wake easily. During several hours of normal sleep, a person will go through several sleep cycles that include REM sleep and the 4 stages of non-REM (light to deep sleep). Also called rapid eye movement sleep.

**Remeron**: (Other name for: mirtazapine)

**Remeron** : A drug used to treat depression. Remeron increases the levels of the chemicals serotonin and norepinephrine in the brain, which helps improve mood. It is a type of antidepressant. Also called mirtazapine.

**remestemcel-L**: Human mesenchymal stem cells (MSCs) harvested from bone marrow of healthy adult donors and expanded ex vivo, with potential immunosuppressive activity. Remestemcel-L cells are hypo-immunogenic

due to lack of major histocompatibility II (MHC II) molecule expression, eliciting little, if any, host immune response upon intravenous infusion. Infusion of allogeneic MSCs may result in: a) increased production of anti-inflammatory cytokines, such as interleukin-10, prostaglandin E, and hepatocyte growth factor; b) decreased mononuclear phagocyte expression of indoleamine 2,3,-dioxygenase, which catabolizes L-tryptophan into its pro-inflammatory metabolites; and c) modulated dendritic cell (DC) maturation and disrupted activities of natural killer (NK) cells and CD8+ and CD4+ T cells. In addition, pluripotent MSCs, upon administration, may be recruited to damaged tissue sites, differentiating along specific lineages when stimulated.

**Remicade:** (Other name for: infliximab)

**Remifemin:** (Other name for: black cohosh)

**remifentanil hydrochloride:** The hydrochloride salt form of remifentanil, a synthetic anilidopiperidine derivative and short-acting opiate agonist with analgesic and anesthetic properties. Remifentanil selectively binds to and activates the mu-opioid receptor, thereby producing analgesia, respiratory depression, miosis, reduced gastrointestinal motility, and euphoria. Check for active clinical trials using this agent.

**Reminyl:** (Other name for: galantamine hydrobromide)

**remission :** A decrease in or disappearance of signs and symptoms of cancer. In partial remission, some, but not all, signs and symptoms of cancer have disappeared. In complete remission, all signs and symptoms of cancer have disappeared, although cancer still may be in the body.

**remission induction therapy :** Initial treatment with anticancer drugs to decrease the signs or symptoms of cancer or make them disappear.

**Remitogen:** (Other name for: apolizumab)

**remote brachytherapy :** A type of internal radiation treatment in which the radioactive source is removed between treatments. Also called high-dose-rate remote brachytherapy and high-dose-rate remote radiation therapy.

**REMOVERS:** Substances used to soften old varnish or paint so they may be removed easily.

**renal arteries:** arteries in which blood enters the kidney.

**renal artery :** The main blood vessel that supplies blood to a kidney and its nearby adrenal gland and ureter. There is a renal artery for each kidney.

**renal capsule :** The fibrous connective tissue that surrounds each kidney.

**renal cell adenocarcinoma :** The most common type of kidney cancer. It begins in the lining of the renal tubules in the kidney. The renal tubules filter the blood and produce urine. Also called hypernephroma, renal cell cancer, and renal cell carcinoma.

**renal cell cancer :** The most common type of kidney cancer. It begins in the lining of the renal tubules in the kidney. The renal tubules filter the blood and produce urine. Also called hypernephroma, renal cell adenocarcinoma, and renal cell carcinoma.

**renal cell carcinoma :** The most common type of kidney cancer. It begins in the lining of the renal tubules in the kidney. The renal tubules filter the blood and produce urine. Also called hypernephroma, renal cell adenocarcinoma, and renal cell cancer.

**renal cell carcinoma peptides vaccine IMA901:** A multi-peptide cancer vaccine targeting renal cell carcinoma with potential immunopotentiating activity. Renal cell carcinoma peptides vaccine IMA901 consists of 10 different synthetic tumor-associated peptide (TUMAP) antigens (9 HLA-class I-binding and 1 HLA class II-binding); endogenously, these TUMAPs are expressed by the majority of renal cell carcinomas. Vaccination with this agent may significantly increase host cytotoxic T-lymphocyte (CTL) immune responses against tumor cells expressing these peptide antigens.

**renal cell carcinoma/CD40L RNA-transfected autologous dendritic cell vaccine AGS-003:** A cancer vaccine in which autologous dendritic cells are transfected with patient-specific renal cell carcinoma (RCC) RNA and a synthetic, truncated human CD40 ligand (CD40L) RNA with potential immunostimulatory and antineoplastic activities. Individual RCC-specific RNA, encoding a unique repertoire of tumor-associated antigens (TAAs) (including telomerase reverse transcriptase, G250, and oncofetal antigen) is electroporated into autologous dendritic cells (DCs), transfected with synthetic RNA that encodes a truncated version of the T-cell protein CD40L; the transfected autologous DCs express and process both patient-specific RCC TAAs and the truncated CD40L protein. When reintroduced back to the patient, renal cell carcinoma/CD40L RNA-transfected autologous dendritic cell vaccine AGS-003 may elicit a highly specific

cytotoxic T-cell (CTL) response against RCC cells expressing the patient-specific RCC TAA repertoire. The signal cascade initiated by stimulation of the truncated, ectopically expressed co-stimulatory molecule CD40L results in the secretion of the inflammatory cytokine IL-12 downstream.

**renal collecting tubule :** The last part of a long, twisting tube that collects urine from the nephrons (cellular structures in the kidney that filter blood and form urine) and moves it into the renal pelvis and ureters. Also called collecting duct.

**renal elimination:** Excretion of a substance through the kidneys

**renal failure :** A condition in which the kidneys stop working and are not able to remove waste and extra water from the blood or keep body chemicals in balance. Acute or severe renal failure happens suddenly (for example, after an injury) and may be treated and cured. Chronic renal failure develops over many years, may be caused by conditions like high blood pressure or diabetes, and cannot be cured. Chronic renal failure may lead to total and long-lasting renal failure, called end-stage renal disease (ESRD). A person in ESRD needs dialysis (the process of cleaning the blood by passing it through a membrane or filter) or a kidney transplant. Also called kidney failure.

**renal fascia :** A fibrous envelope of tissue that surrounds the kidney. Also called Gerota's capsule and Gerota's fascia.

**renal function :** A term used to describe how well the kidneys work. The kidneys remove waste and extra water from the blood (as urine) and help keep chemicals (such as sodium, potassium, and calcium) balanced in the body. They also make hormones that help control blood pressure and stimulate bone marrow to make red blood cells. Also called kidney function.

**renal function test :** A test in which blood or urine samples are checked for the amounts of certain substances released by the kidneys. A higher- or lower-than-normal amount of a substance can be a sign that the kidneys are not working the way they should. Also called kidney function test.

**renal glomerulus :** A tiny, round cluster of blood vessels within the kidneys. It filters the blood to reabsorb useful materials and remove waste as urine.

**renal pelvis :** The area at the center of the kidney. Urine collects here and is funneled into the ureter, the tube that connects the kidney to the bladder.

**renal tubular acidosis :** A rare disorder in which structures in the kidney that filter the blood are impaired, producing urine that is more acid than normal.

**renal veins:** veins in which blood exits the kidney.

**Renaturation:** The process of returning a denatured structure to its original native structure, as when two single strands of DNA are reunited to form a regular duplex, or an unfolded polypeptide chain is returned to its normal folded three-dimensional structure. OR Refolding of an unfolded (denatured) globular protein so as to restore native structure and protein function.

**Rencarex:** (Other name for: girentuximab)

**Rendering:** The first rough coat of a plastering system usually composed of lime and/or cement and sand; External 'plastering' on walls and application to all coats in the system -also 'cement rendering'.

**Renewable Materials:** A material is considered to be renewable if it is replaced by nature at the same or faster rate than it is used or consumed by humans.

**renewable resource:** a resource or commodity that can be replenished, such as trees and crops. OR energy sources or other natural resources that are replenished shortly after being used.

**Renewable resources:** Natural, but limited, energy resources that can be replenished, including biomass, hydro, geothermal, solar, and wind. These resources are virtually inexhaustible but limited in the amount of energy that is available per unit of time. In the future, renewable resources could also include the use of ocean thermal, wave, and tidal action technologies. Utility renewable resource applications include bulk electricity generation, onsite electricity generation, distributed electricity generation, nongrid-connected generation, and demand-reduction (energy efficiency) technologies. The Information Digest has included conventional hydroelectric and storage hydroelectric in a separate category from other resources.

**Reniform Habit:** A shape of a large crystal which has the arrangement of several small rounded balls stuck together. Think about some of those

computer generated structures of molecules for this example.

**Renova :** A topical preparation of tretinoin that is used to treat acne. Tretinoin is a form of vitamin A.

**REOLYSIN:** (Other name for: wild-type reovirus)

**repaglinide:** A nonsulfonylurea insulin secretagogue belonging to the melgitinide class with hypoglycemic activity. Repaglinide is rapidly absorbed and has a rapid onset and short duration of action. This agent is metabolized in the liver by CYP2C8 and CYP3A4 and its metabolites are excreted in the bile. Repaglinide has a half-life of one hour. Check for active clinical trials using this agent.

**Repair:** The restoration of the normal structure and sequence of a gene after damage from ultraviolet light or chemical agents.

**Repair synthesis:** DNA synthesis following excision (cutting out) of damaged DNA.

**reparixin:** An orally available inhibitor of CXC chemokine receptor types 1 (CXCR1) and 2 (CXCR2), with potential antineoplastic activity. Upon administration, reparixin allosterically binds to CXCR1 and prevents CXCR1 activation by its ligand interleukin 8 (IL-8 or CXCL8). This may cause cancer stem cell (CSC) apoptosis and may inhibit tumor cell progression and metastasis. CXCR1, overexpressed on CSCs, plays a key role in CSC survival and the ability of CSC to self-renew; it is also linked to tumor resistance to chemotherapy. Inhibition of the IL-8/CXCR1 interaction also potentiates the cytotoxic effect of chemotherapeutic agents. In addition, reparixin inhibits CXCR2 activation and may reduce both neutrophil recruitment and vascular permeability during inflammation or injury. Check for active clinical trials using this agent.

**Repeatability:** Repeatability is closeness of agreement of a tool movement position from one part to another when cutting several copies of the same part.

**Repetitive DNA:** A DNA sequence that is present in many copies per genome.

**Replica plating:** A technique in which an impression of a culture is taken from a master plate and transferred to a fresh plate. The impression can be of bacterial clones or phage plaques.

**replicate :** To make a copy or duplicate of something.

**replicate sampling:** The act of taking several samples concurrently under comparable conditions (WHO, 1979).

**replication:** During the course of an experiment or survey, replication is the determination of a value more than once, so as to obtain a better estimation of the variation. Replication should be distinguished from repetition by the fact that replication of an experiment denotes repeated determinations carried out, as far as possible, at one place and one period of time. The successive determinations, including the first, are called replicates (ISO, 1977).

**replication:** Synthesis of a daughter duplex DNA molecule identical to the parental duplex DNA.

**replication cycle :** In biology, refers to the reproduction cycle of viruses. A replication cycle begins with the infection of a host cell and ends with the release of mature progeny virus particles.

**Replication fork:** The Y-shaped region of DNA at the site of DNA synthesis; also called a growth fork. OR The site of DNA synthesis where the parental strands are separated and daughter strands complementary to each parent are synthesized.

**Replicon:** A genetic element that behaves as an autonomous replicating unit. It can be a plasmid, phage, or bacterial chromosome. OR A segment of DNA that carries its own origin of replication and can replicate autonomously; bacterial plasmids are replicons.

**replisome:** The multiprotein complex that promotes DNA synthesis at the replication fork.

**repressible enzyme:** In bacteria, an enzyme whose synthesis is inhibited when its reaction product is readily available to the cell.

**repression:** A decrease in the expression of a gene in response to a change in the activity of a regulatory protein.

**repressor:** Pur A protein regulator of the pur operon, which encodes genes taking part in purine biosynthesis; the pur repressor binds to operator DNA only when bound to a small molecule (guanine or hypoxanthin) called a corepressor. OR A regulatory protein that inhibits transcription from one or more genes. It can combine with an inducer (resulting in specific enzyme induction) or with an operator element (resulting in repression). OR A protein that binds to an operator sequence and inhibits the transcription of

the structural genes in the operon. OR The protein that binds to the regulatory sequence or operator for a gene, blocking its transcription.

**Reprocessed Plastic:** A thermoplastic prepared from scrap industrial plastic by other than the original processor (see also regrind, recycled plastic).

**Reproducibility:** the closeness of replicate measurements on the same sample, using the same measuring technique, under the same conditions. Reproducibility can be limited by many factors, including instrument or electrode stability, loss of the substance being measured during sample operation and contamination.

**reproductive cell :** An egg or sperm cell. Each mature reproductive cell carries a single set of 23 chromosomes.

**reproductive effects:** The adverse effects of a chemical on any aspects of reproduction in an organism (WHO, 1979).

**reproductive endocrinologist :** A doctor who has special training in the diagnosis and treatment of infertility. A reproductive endocrinologist may use surgery, medicine, or procedures, such as in vitro fertilization (IVF), to treat infertility.

**reproductive medicine :** A branch of medicine that specializes in fertility preservation, diagnosing and treating infertility, and other reproductive problems. Reproductive medicine also deals with issues related to puberty, menopause, contraception (birth control), and certain sexual problems.

**reproductive system :** The organs involved in producing offspring. In women, this system includes the ovaries, the fallopian tubes, the uterus, the cervix, and the vagina. In men, it includes the prostate, the testes, and the penis.

**Requip:** (Other name for: ropinirole hydrochloride)

**rescue transplant :** A method of replacing blood-forming stem cells that were destroyed by treatment with high doses of anticancer drugs or radiation therapy. The stem cells help the bone marrow recover and make healthy blood cells. A rescue transplant may allow more chemotherapy or radiation therapy to be given so that more cancer cells are killed. It is usually done using the patient's own stem cells that were saved before treatment. Also called stem cell rescue.

**Research:** Finding out stuff. Finding out stuff that has never been found out before is the most exciting kind of research. The more stuff you have found out, the more power you have to do good things, and bad things. The country that finds out the most stuff wins. Also, it takes money to find out stuff, especially stuff that has never been found out before.

**research advocate :** A person who serves as a link between patients and scientific researchers. Research advocates help patients understand scientific information and research findings that may help them. They may also bring a patient perspective on research activities to scientific advisory boards and committees. For example, research advocates use their own experiences and the experiences of patients to work with researchers to help develop clinical trials that are safe and meet the needs of patients. They also help teach patients and their families about clinical trials and recruit patients to clinical trials.

**research base :** Refers to the institutions, clinical staff, and patients that can take part in a clinical trial.

**research study :** A scientific study of nature that sometimes includes processes involved in health and disease. For example, clinical trials are research studies that involve people. These studies may be related to new ways to screen, prevent, diagnose, and treat disease. They may also study certain outcomes and certain groups of people by looking at data collected in the past or future.

**resectable :** Able to be removed by surgery.

**resected :** Removed by surgery.

**resection :** Surgery to remove tissue or part or all of an organ.

**Resectisol:** (Other name for: mannitol)

**resectoscope :** A thin, tube-like instrument used to remove tissue from inside the body. A resectoscope has a light and lens for viewing. It also has a tool to remove tissue using an electrical current. It is inserted through the urethra to treat prostate disease in men and through the vagina and cervix to treat abnormal uterine bleeding in women.

**reserves:** that subgroup of a resource that has been discovered and can be extracted at a profit.

**reservoir:** Any natural or artificial holding area used to store, regulate, or control a substance.

**reservoir rock:** a rock with the required permeability and porosity to hold large accumulations of petroleum.

**residence time:** The size of any specific reservoir or pool of mass (e.g., carbon) divided by the total flux of mass into or out of that pool. OR

Residence time is the length of time that the material is held at melt range temperatures in the barrel.

**Resident Inspector:** An NRC inspector assigned to inspect a nuclear plant on a full-time basis. Each site has at least two resident inspectors who have an office on site.

**residual chlorine:** chlorine remaining in water or wastewater at the end of specified contact period as combined or free chlorine.

**residual disease :** Cancer cells that remain after attempts to remove the cancer have been made.

**residual soil:** soil developed from the weathering of the underlying bedrock.

**Residual Stress / Moulded-in Stress:** Residual stress is a term that describes the level and pattern of stress, which is left in the part after it is removed from the machine. It can be due to unbalanced flow, non uniform freezing of melt and over packing.

**residue:** 1. The substances left after an evaporation or distillation. 2. A recognizable molecular fragment embedded in a larger molecule; for example, amino acid "residues" within a protein.

**residue:** A single unit within a polymer; for example, an amino acid within a polypeptide chain. The term reflects the fact that sugars, nucleotides, and amino acids lose a few atoms (generally the elements of water) when incorporated in their respective polymers.

**Resimmune:** (Other name for: anti-CD3 immunotoxin A-dmDT390-bisFv(UCHT1))

**RESIN:** A natural or synthetic material that is the main ingredient of paint and that binds ingredients together. It also aids adhesion to the surface. Thermoforming OR This is a short term for Polyethylene (PE) resin. The three types of PE resins are LDPE, LLDPE and HMW-HDPE (see below). Other plastic resins include vinyl, polypropylene, styrene and nylon. LDPE (Low Density Polyethylene) - This resin was used with older can liner technology. Resin has good clarity but weak film strength. Today

it is used primarily for Food and Utility bags. LLDPE (Linear Low Density Polyethylene) - This is the primary type of resin used in modern can liner manufacturing technology. Bags made from LLDPE film provide excellent combination of film strength, puncture resistance and tear resistance. HMW-HDPE (High Molecular Weight - High Density Polyethylene) Bags made from HMW-HDPE resin provide excellent film strength and puncture resistance, but less tear resistance than LLDPE. Butene - One of three types of LLDPE resin. Butene has weaker film-strength properties than Hexene or Octene. Hexene - One of three types of LLDPE resin. Some manufacturers use a Higher Alpha Olefin (High Grade Hexene) in the manufacturing of can liners. Properties include high film strength and increased tear resistance. Octene - One of three types of LLDPE resin. Used in other applications because of its excellent physical properties. Prime Resin - Refers to the usage of high-quality, "fresh from the reactor", resin. Blended Resin - Refers to the combination of two or more types of resin. Reprocessed Resin - Refers to resin that has been used at least once before. Can be post-industrial (scrap) or post-consumer (recycling). Property of resin is decreased each time it is reused OR A pseudosolid or solid organic material often of high molecular weight. It has a tendency to flow when subjected to stress, usually has a softening or melting range, and usually fractured conchoidally. OR 1) a substance that is polymeric in structure and predominantly amorphous. 2) an alternative term, like polymer, to the predominately used name of plastic. OR A thick substance that comes from plants or can be made in the laboratory from certain chemicals. Resins do not dissolve in water, and are used in plastics, varnishes, printing inks, medicine, and to make fabrics stiff.

**Resin (Synthetic):** The term is used to designate any polymer that is a basic material for plastics.

**Resin Category :** – a term to loosely define the purity of the resin, or the amount of secondary re-processing. Typical categories include prime, wide-spec, off-spec, virgin, regrind, industrial recycle, consumer recycle, etc.

**Resin Pocket:** An apparent accumulation of excess resin in a small, localized section visible on cut edges of molded surfaces.

**Resin transfer moulding (RTM):** A moulding process in which catalysed resin is injected into a closed mould already containing the preformed reinforcement.

**resiniferatoxin:** A naturally occurring capsaicin analog found in the latex of the cactus *Euphorbia resinifera* with analgesic activity. Resiniferatoxin (RTX) binds to and activates the transient receptor potential vanilloid 1 (TRPV1), a non-selective cation channel in the plasma membrane of primary afferent sensory neurons. This increases the permeability to cations, and leads to an influx of calcium and sodium ions. This results in membrane depolarization, causing an irritant effect, followed by desensitization of the sensory neurons thereby inhibiting signal conduction in afferent pain pathways and causing analgesia. TRPV1, a member of the transient receptor potential channel (TRP) superfamily, is a heat- and chemo-sensitive calcium/sodium ion channel that is selectively expressed in a subpopulation of pain-sensing primary afferent neurons.

**resiquimod:** An imidazoquinolinamine Toll-like receptor (TLR) agonist with potential immunostimulatory activity. Resiquimod binds to and activates TLRs 7 and 8, mainly on dendritic cells (DCs), macrophages, and B-lymphocytes, which results in the activation of the TLR signaling pathway and nuclear translocation of the transcription activator NF- $\kappa$ B and other transcription factors; subsequently, the production of cytokines, especially interferon-alpha (INF- $\alpha$ ), increases, enhancing T-helper 1 (Th1) immune responses. In addition, topical application of resiquimod appears to activate Langerhans cells, which may result in enhanced activation of T-lymphocytes. Due to its immunostimulatory activity, this agent may potentially be useful as a vaccine adjuvant.

**resiquimod :** A substance being studied in the treatment of some types of skin cancer. When put on the skin, resiquimod causes some immune cells to make certain chemicals that may help them kill tumor cells. It is also being studied to find out if adding it to a tumor vaccine improves the antitumor immune response. It is a type of imidazoquinoline and a type of immunomodulator.

**resiquimod topical gel:** A topical gel containing the Toll-like receptor (TLR) agonist resiquimod, an imidazoquinolinamine and with potential immunomodulating activity. Resiquimod binds to TLR7 and 8, mainly on dendritic cells, macrophages, and B-lymphocytes, and activates the TLR signaling pathway, resulting in the induction of the nuclear translocation of transcription activator NF- $\kappa$ B and activation of other transcription factors; subsequently, gene expression increases and the production of cytokines

increases, especially interferon-alpha (INF-a), resulting in the enhancement of T-helper 1 (Th1) immune responses. In addition, topical application of resiquimod appears to activate epidermal Langerhans cells, leading to an enhanced activation of T-lymphocytes.

**Resistance:** property of a conductor that opposed the current flow produced by a given difference of potential. The ohm is the practical unit of resistance. OR The ability of a material to resist passage of electrical current either through its bulk or on a surface. The unit of volume resistivity is the ohm-cm., of surface resistivity, the ohm. OR the opposition which a device or material offers to the flow of current; measured in ohms. OR The opposition of a substance to the passage through it of a steady electric current. From Ohm's Law,  $R = E/I$ , the resistance equals the voltage of the cell divided by the current flow.

**Resistance (electrical):** The opposition offered by a coating to the passage of an electric current through it.

**Resistance transfer factor:** A DNA sequence that allows a plasmid carrying genes for drug resistance to be transferred to other bacteria by conjugation.

**resistant cancer :** Cancer that does not respond to treatment. The cancer may be resistant at the beginning of treatment, or it may become resistant during treatment. Also called refractory cancer.

**resistant starch:** A form of dietary fiber that resists degradation in the small intestine by gastrointestinal (GI) enzymes with potential chemopreventive and prebiotic activity. Upon consumption of resistant starch, the fiber is not metabolized or absorbed in the small intestine and enters the colon unaltered. Once in the colon, the starch is fermented by anaerobic colonic bacteria and produces short-chain fatty acids (SCFA), including butyrate, which has anti-inflammatory and immunoregulatory activities. In addition, butyrate appears to exert antitumor effects by inhibiting tumor cell proliferation, inducing tumor cell differentiation and apoptosis in colorectal cancer cells.

**resistor:** a component of an electrical circuit intended to offer resistance to electrical current flow.

**resminostat:** An orally bioavailable inhibitor of histone deacetylases (HDACs) with potential antineoplastic activity. Resminostat binds to and inhibits HDACs leading to an accumulation of highly acetylated histones.

This may result in an induction of chromatin remodeling, inhibition of the transcription of tumor suppressor genes, inhibition of tumor cell division and the induction of tumor cell apoptosis. HDACs, upregulated in many tumor types, are a class of enzymes that deacetylate chromatin histone proteins.

**resolution:** to resolve; the process of separating enantiomers from a racemic mixture. OR The level of printed detail achieved on parts built through additive manufacturing. Processes like stereolithography and direct metal laser sintering allow for extremely fine resolutions with the smallest of features.

**resolvin Rv:** eicosanoid derivatives that have anti-inflammatory actions that lead to the resolution of the inflammatory cycle, hence the derivation of their names as resolvins

**resonance:** the process by which a substituent either removes electrons from or gives electrons to a  $\pi$  bond in a molecule; a delocalization of electrical charge in a molecule.

**resonance:** the process by which a substituent either removes electrons from or gives electrons to a  $\pi$  bond in a molecule; a delocalization of electrical charge in a molecule. OR Description of the ground state of a molecule with delocalized electrons as an average of several Lewis structures. The actual ground state doesn't switch rapidly between the separate structures: it is an average.

**resonance effect:** If electron density at a particular point in a molecule is higher or lower than what you'd expect from a single Lewis structure, and various canonical structures can be drawn to show how electron delocalization will explain the discrepancy, the difference in electron density is called a "resonance effect" or "mesomeric effect".

**resonance energy:** the difference in energy between the calculated energy content of a resonance structure and the actual energy content of the hybrid structure.

**resonance hybrid:** the actual structure of a molecule that shows resonance. A resonance hybrid possesses the characteristics of all possible drawn structures (and consequently cannot be drawn). It is lower in energy than any structure that can be drawn for the molecule and thus more stable than any of them. OR A molecular structure that is a hybrid of two structures that differ in the locations of some of the electrons. For example,

the benzene ring can be drawn in two ways, with double bonds in different positions. The actual structure of benzene is in-between these two equivalent structures.

**resonance structure:** Possible structures of a molecule for which more than one electron-dot structure can be written, which differ in the bond pairs between atoms. OR various intermediate structures of one molecule that differ from each other only in the positions of their electrons. None of the drawn resonance structures is correct, and the best representation is a hybrid of all the drawn structures.

**resonance structures:** various intermediate structures of one molecule that differ only in the location of the electrons. OR Alternative covalent bonding patterns for a molecule that are equally likely or nearly so.

**resorption :** A process in which a substance, such as tissue, is lost by being destroyed and then absorbed by the body.

**resource:** that amount of a geologic commodity that exists in both discovered and undiscovered deposits.

**Respbid:** (Other name for: theophylline)

**Respiration :** All living cells carry out this reaction. Glucose and oxygen are converted to carbon dioxide and water releasing energy. The energy is used to carry out useful reactions in the cell. OR The catabolic process in which electrons are removed from nutrient molecules and passed through a chain of carriers to oxygen. OR A biochemical process by which living organisms take up oxygen from the environment and consume organic matter, releasing both carbon dioxide and heat. In plants, the organic matter in photosynthate produced during daylight hours. OR An ATP-generating process in which an inorganic compound, such as O<sub>2</sub>, serves as the ultimate electron acceptor; the electron donor can be either an organic compound or an inorganic one.

**respirator :** In medicine, a machine used to help a patient breathe. Also called ventilator.

**respiratory acidosis:** abnormal decrease in the pH of the blood (acidosis) due to decreased ventilation of the pulmonary alveoli, leading to elevated arterial carbon dioxide concentration; primarily caused by alveolar hypoventilation

**respiratory alkalosis:** results from increased alveolar respiration (hyperventilation) leading to decreased plasma carbon dioxide concentration which leads to decreased hydrogen ion and freely ionized blood calcium concentrations

**Respiratory chain:** The path that electrons travel in going from NADH or FADH<sub>2</sub> to O<sub>2</sub>; consists of three complexes that pump protons as a result of the electron transport and two mobile electron carriers. Also called the . OR The electron transfer chain; a sequence of electron-carrying proteins that transfer electrons from substrates to molecular oxygen in aerobic cells.

**Respiratory control:** Tight coupling or coordination of the oxidation of reduced cofactors (NADH and FADH<sub>2</sub>) in the electron-transport chain and the phosphorylation of ADP to yield ATP in the mitochondrion; such control ensures that the rate of the citric acid cycle, where reduced cofactors are generated, corresponds to the demand for ATP.

**respiratory disease :** A type of disease that affects the lungs and other parts of the respiratory system. Respiratory diseases may be caused by infection, by smoking tobacco, or by breathing in secondhand tobacco smoke, radon, asbestos, or other forms of air pollution. Respiratory diseases include asthma, chronic obstructive pulmonary disease (COPD), pulmonary fibrosis, pneumonia, and lung cancer. Also called lung disorder and pulmonary disease.

**respiratory syncytial virus :** A virus that causes respiratory infections with cold-like symptoms. Also called RSV.

**respiratory system :** The organs that are involved in breathing. These include the nose, throat, larynx, trachea, bronchi, and lungs. Also called respiratory tract.

**respiratory therapist :** A health professional trained to evaluate and treat people who have breathing problems or other lung disorders.

**respiratory therapy :** Exercises and treatments that help improve or restore lung function.

**respiratory tract :** The organs that are involved in breathing. These include the nose, throat, larynx, trachea, bronchi, and lungs. Also called respiratory system.

**respite care :** Temporary care given to a person who is unable to care for himself or herself so that the usual caregivers can have a break. Respite care

may include in-home care, adult daycare, or nursing home care.

**response:** The proportion of an exposed population with an effect or the proportion of a group of individuals that demonstrate a defined effect in a given time (e.g., death) (WHO, 1979).

**response :** In medicine, an improvement related to treatment.

**Response Evaluation Criteria In Solid Tumors :** A standard way to measure how well a cancer patient responds to treatment. It is based on whether tumors shrink, stay the same, or get bigger. To use Response Evaluation Criteria In Solid Tumors, there must be at least one tumor that can be measured on x-rays, CT scans, or MRI scans. The types of response a patient can have are a complete response (CR), a partial response (PR), progressive disease (PD), and stable disease (SD). Also called RECIST.

**response rate :** The percentage of patients whose cancer shrinks or disappears after treatment.

**Response time:** the length of time necessary to obtain a stable electrode potential when the electrode is removed from one solution and placed into another of different concentration or temperature. Response time depends on the electrode type, the measuring solution, the magnitude and direction of the concentration change, temperature, and the presence of electrode, if any. The response time can be expressed as the time at which the output reaches 63% ( $1/e$ ) or 95% of its final value, in response to a step changes in concentration.

**responsiveness:** the ability of living things to respond to stimuli in the external environment.

**restaging :** A process used to find out the amount or spread of cancer in the body if it comes back or gets worse after treatment. Restaging may also be done to find out how the cancer responded to treatment. If restaging is done and a new stage is assigned, the new stage will be marked with an “r” in front of it to show that it’s different from the original stage. Usually, the original stage stays the same, even if the cancer comes back or gets worse. The same tests that were done to diagnose the cancer are usually done again. Restaging helps doctors plan the best treatment for cancer that has come back or gotten worse.

**Restasis:** (Other name for: cyclosporine ophthalmic emulsion)

**resting :** In biology, refers to a cell that is not dividing.

**resting potential:** the inactive state of a neuron in which the cytoplasm is negatively charged with respect to the outside of the cell.

**restless legs syndrome :** A condition in which a person has a strong urge to move his or her legs in order to stop uncomfortable sensations. These include burning, itching, creeping, tugging, crawling, or pain. These feelings usually happen when a person is lying or sitting down, and are worse at night. They can also occur in other parts of the body. Also called RLS.

**Restricted area:** Any area to which access is controlled for the protection of individuals from exposure to radiation and radioactive materials.

**Restricted Gate:** A very small orifice between runner and cavity in an injection mold. When the part is ejected, this gate readily breaks free of the runner system. Generally, the part drops through one chute and the runner system through another leading to a granulator and scrap reclaim system.

**restriction endonucleases:** Site-specific endodeoxyribonucleases causing cleavage of both strands of DNA at points within or near the specific site recognized by the enzyme; important tools in genetic engineering.

**restriction enzymes:** catalyze the opening of a DNA molecule at a "restriction" point; many leave dangling ends of DNA molecules at the point where the DNA has been opened.

**Restriction enzymes:** Endonuclease enzymes that recognize specific base sequences in double-stranded DNA and cleave both strands of the duplex at specific places.

**restriction fragment:** A segment of double-stranded DNA produced by the action of a restriction endonuclease on a larger DNA.

**restriction fragment length polymorphisms (RFLPs):** Variations, among individuals in a population, in the length of certain restriction fragments within which certain genomic sequences occur. These variations result from rare sequence changes that create or destroy restriction sites in the genome. OR The genetic diversity within a population indicated by mutations within specific sites in DNA; such mutations alter the position of restriction fragments in electrophoretic gel analysis.

**Restriction-modification system:** A pair of enzymes found in most bacteria (but not eukaryotic cells) The restriction enzyme recognizes a certain sequence in duplex DNA and makes one cut in each unmodified

DNA strand at or near the recognition sequence. The modification enzyme methylates (or modifies) the same sequence, thus protecting it from the action of the restriction enzyme. OR A system such that, for each restriction enzyme that a prokaryote produces, the cell also produces a corresponding methylase that marks the host DNA and prevents its degradation.

**Result of measurement:** a value attributed to a measurand, obtained by measurement.

**resveratrol:** A phytoalexin derived from grapes and other food products with antioxidant and potential chemopreventive activities. Resveratrol induces phase II drug-metabolizing enzymes (anti-initiation activity); mediates anti-inflammatory effects and inhibits cyclooxygenase and hydroperoxidase functions (anti-promotion activity); and induces promyelocytic leukemia cell differentiation (anti-progression activity), thereby exhibiting activities in three major steps of carcinogenesis. This agent may inhibit TNF-induced activation of NF-kappaB in a dose- and time-dependent manner.

**resveratrol :** A substance found in the skins of grapes and in certain other plants, fruits, and seeds. It is made by various plants to help defend against invading fungi, stress, injury, infection, and too much sunlight. It is being studied in the prevention of cancer and heart disease. It is a type of antioxidant and a type of polyphenol.

**resveratrol formulation SRT501:** A proprietary formulation of resveratrol, a polyphenolic phytoalexin derived from grapes and other food products with potential antioxidant, anti-obesity, antidiabetic and chemopreventive activities. Resveratrol may activate sirtuin subtype 1 (SIRT-1). SIRT1 activation has been reported to inhibit tumorigenesis and tumor cell proliferation. SIRT-1 is a member of the silent information regulator 2 (SIR2) (or sirtuin) family of enzymes that plays an important role in mitochondrial activity and acts as a protein deacetylase. SIRT1 appears to be involved in the regulation of numerous transcription factors such as Nf-kB and p53.

**RETAINER PLATE:** The plate on which demountable pieces, such as mold cavities, ejector pins, guide pins, and bushings are mounted during molding: usually drilled for water lines. OR A plate onto which the removable parts of the mold are mounted. OR The plate on which

demountable pieces, such as mold cavities, ejector pins, guide pins, and bushings are mounted during molding; usually drilled for steam or water. OR The plate on which demountable pieces, such as mold cavities, ejector pins, guide pins, and bushings are mounted during molding: usually drilled for water lines. OR The plate on which demountable pieces, such as mold cavities, ejector pins, guide pins and bushings are mounted during molding.

**retaspimycin hydrochloride:** The hydrochloride salt of a small-molecule inhibitor of heat shock protein 90 (HSP90) with antiproliferative and antineoplastic activities. Retaspimycin binds to and inhibits the cytosolic chaperone functions of HSP90, which maintains the stability and functional shape of many oncogenic signaling proteins and may be overexpressed or overactive in tumor cells. Retaspimycin-mediated inhibition of HSP90 promotes the proteasomal degradation of oncogenic signaling proteins in susceptible tumor cell populations, which may result in the induction of apoptosis.

**retch :** The action of the stomach and esophagus to try to vomit (eject some or all of the contents of the stomach). Retching that does not cause vomiting is called dry heaves.

**retention:** The amount of substance that is left of the deposited amount after a certain time. If the retention follows a course in relation to time that is a first-order process, it may be described in terms of biological half-life (WHO, 1979).

**reticular dermis :** The thick bottom layer of the dermis (the inner layer of the skin). The reticular dermis has blood vessels and connective tissue that supports the skin. Hair follicles, oil and sweat glands, and other structures are also found in the reticular dermis.

**retiform hemangioendothelioma :** A rare, slow-growing tumor that usually forms on or under the skin of the arms, legs, and trunk. The tumor has blood vessels that branch out like a tree. Retiform hemangioendotheliomas can spread to nearby tissue and often come back after treatment. They usually do not spread to other parts of the body. They occur in young adults and sometimes children. Retiform hemangioendotheliomas are a type of vascular tumor.

**Retin-A:** (Other name for: tretinoin)

**Retin-A :** A topical preparation of tretinoin that is used to treat acne. Tretinoin is a form of vitamin A.

**Retin-A MICRO:** (Other name for: tretinoin)

**Retin-A-Micro :** A topical preparation of tretinoin that is used to treat acne. Tretinoin is a form of vitamin A.

**retina:** a single layer containing nerve cells within the eye. OR The light-sensitive layers of nerve tissue at the back of the eye that receive images and sends them as electric signals through the optic nerve to the brain.

**Retinal:** The prosthetic group of rhodopsin that, upon absorbing light, undergoes an isomerization from 11-cis-retinal to all-trans-retinal, initiating the visual signal transduction pathway.

**retinoblastoma :** Cancer that forms in the tissues of the retina (the light-sensitive layers of nerve tissue at the back of the eye). Retinoblastoma usually occurs in children younger than 5 years. It may be hereditary or nonhereditary (sporadic).

**retinoic acid :** A nutrient that the body needs in small amounts to function and stay healthy. Retinoic acid is made in the body from vitamin A and helps cells to grow and develop, especially in the embryo. A form of retinoic acid made in the laboratory is put on the skin to treat conditions such as acne and is taken by mouth to treat acute promyelocytic leukemia (a fast-growing cancer in which there are too many immature blood-forming cells in the blood and bone marrow). Retinoic acid is being studied in the prevention and treatment of other types of cancer. Also called all-trans retinoic acid, ATRA, tretinoin, and vitamin A acid.

**retinoid :** Vitamin A or a vitamin A-like compound.

**retinoid 9cUAB30:** A synthetic analogue of 9-cis retinoic acid with potential antineoplastic and chemopreventive activities. Retinoid 9cUAB30 binds to and activates retinoid X receptor (RXR) homodimers and/or and retinoic acid receptor (RAR)/RXR heterodimers, which may result in the dissociation of corepressor protein and the recruitment of coactivator protein, followed by transcription of downstream target genes into mRNAs and protein translation. Gene transcription regulated by these transcription factors may result in inhibition of cell proliferation, induction of cell differentiation, and apoptosis of both normal cells and tumor cells.

**retinoid analogue NRX 195183:** An orally bioavailable retinoid acid receptor (RAR) alpha agonist with potential antineoplastic activity. Retinoid analogue NRX 195183 binds to and activates RAR alpha, modulating the

transcription of genes responsible for cell differentiation and proliferation, which may result in cell differentiation, decreased cell proliferation, and the inhibition of tumorigenesis. Encoded by the RARA gene, RAR alpha is a nuclear receptor and a member of the steroid receptor superfamily.

**retinol:** The fat soluble vitamin retinol. Vitamin A binds to and activates retinoid receptors (RARs), thereby inducing cell differentiation and apoptosis of some cancer cell types and inhibiting carcinogenesis. Vitamin A plays an essential role in many physiologic processes, including proper functioning of the retina, growth and differentiation of target tissues, proper functioning of the reproductive organs, and modulation of immune function. Check for active clinical trials using this agent. or A nutrient that the body needs in small amounts to function and stay healthy. Retinol helps in vision, bone growth, reproduction, growth of epithelium (cells that line the internal and external surfaces of the body), and fighting infections. It is fat-soluble (can dissolve in fats and oils). Retinol is found in liver, egg yolks, and whole milk dairy products from animals and in fish oils. It can also be made in the body from a substance found in some fruits and vegetables, such as cantaloupes, carrots, spinach, and sweet potatoes. Retinol is being studied in the prevention and treatment of some types of cancer. Also called vitamin A.

**retinyl acetate:** A naturally-occurring fatty acid ester form of retinol (vitamin A) with potential antineoplastic and chemopreventive activities. Retinyl acetate binds to and activates retinoid receptors, inducing cell differentiation and decreasing cell proliferation. This agent also inhibits carcinogen-induced neoplastic transformation in some cancer cell types and exhibits immunomodulatory properties.

**retinyl palmitate :** A drug that is being studied in the prevention of cancer. It belongs to the family of drugs called retinoids.

**Retractable Cores :** Used when molding parts in cavities not perpendicular to the direction in which the part is ejected from the mold. The cores are automatically pulled from the mold prior to the mold opening and reinserted when the mold closes again and prior to injection.

**Retracted Length:** The length of a coil when it is not in use. (antonym“working length)

**retrograde motion:** the apparent backward movement of a celestial object.

**Retrograde transport:** The cytoplasmic dynein-driven transport of organelles from the periphery to the center of a cell.

**retromolar trigone :** The small area behind the wisdom teeth.

**retroperitoneal :** Having to do with the area outside or behind the peritoneum (the tissue that lines the abdominal wall and covers most of the organs in the abdomen).

**retropubic prostatectomy :** Surgery to remove part or all of the prostate and some of the tissue around it. Nearby lymph nodes may also be removed. A retropubic prostatectomy may be done through an incision (cut) made in the wall of the lower abdomen, or it may be done using a laparoscope. A laparoscope is a thin, tube-like instrument with a light and lens for viewing. Several small incisions (cuts) are made in the wall of the abdomen, and the laparoscope is inserted through one opening to guide the surgery. Surgical instruments are inserted through the other openings to do the surgery.

**retrospective :** Looking back at events that have already taken place.

**retrospective cohort study :** A research study in which the medical records of groups of individuals who are alike in many ways but differ by a certain characteristic (for example, female nurses who smoke and those who do not smoke) are compared for a particular outcome (such as lung cancer). Also called historic cohort study.

**retrospective study:** A research design which is used to test etiologic hypotheses in which inferences about exposure to the putative causal factor(s) are derived from data relating to characteristics of the persons under study or to events or experiences in their past. The essential feature is that some of the persons under study have the disease or other outcome condition of interest, and their characteristics and past experiences are compared with those of other, unaffected persons. Persons who differ in the severity of the disease may also be compared (from Last, 1983).

**retrospective study :** A study that compares two groups of people: those with the disease or condition under study (cases) and a very similar group of people who do not have the disease or condition (controls). Researchers study the medical and lifestyle histories of the people in each group to learn what factors may be associated with the disease or condition. For example, one group may have been exposed to a particular substance that the other was not. Also called case-control study.

**Retrosynthesis:** In synthetic organic chemistry, is a problem-solving technique used to transform a typically more complex target molecule into simpler, commercially available precursor structures.

**retrovector encoding mutant anti-cyclin G1:** A replication-incompetent, pathotropic, tumor matrix (collagen)-targeted, retroviral vector encoding an N-terminal deletion mutant form of the cyclin G1 gene with potential antineoplastic activity. Under the control of a hybrid long-terminal repeat/cytomegalovirus (CMV) promoter, retrovector encoding mutant anti-cyclin G expresses the mutant cyclin G1 construct, resulting in disruption of tumor cell cyclin G1 activity and decreased cellular proliferation and angiogenesis. This agent preferentially targets collagen of the tumor matrix because of the incorporation of the collagen-binding domain of von Willebrand factor (vWF) on the retrovector surface. Exploiting the collagen-targeting mechanism of vWF permits delivery of the retrovector to tumor sites where angiogenesis and collagen matrix exposure occur.

**Retrovir:** (Other name for: zidovudine)

**retroviral vector :** RNA from a virus that is used to insert genetic material into cells.

**Retrovirus:** A virus that contains an RNA genome but that replicates through the intermediacy of double-stranded DNA that is integrated into the host-cell genome. OR An RNA virus containing a reverse transcriptase. OR A type of virus that has RNA instead of DNA as its genetic material. It uses an enzyme called reverse transcriptase to become part of the host cells' DNA. This allows many copies of the virus to be made in the host cells. The virus that causes AIDS, the human immunodeficiency virus (HIV), is a type of retrovirus.

**Return Path :** The path the belt takes in moving from the discharge back to the infeed.

**Reveal:** The interior surfaces of a bay are the reveals; also used to describe a 'return' of a wall into a window or door opening.

**Revelle factor:** The ratio of the instantaneous fractional change in the partial pressure of CO<sub>2</sub> (pCO<sub>2</sub>) exerted by seawater to the fractional change in total CO<sub>2</sub> dissolved in the ocean waters. The buffer factor relates the partial pressure of CO<sub>2</sub> in the ocean to the total ocean CO<sub>2</sub> concentration at constant temperature, alkalinity and salinity. The Revelle factor is a useful parameter for examining the distribution of CO<sub>2</sub> between the atmosphere

and the ocean, and measures in part the amount of CO<sub>2</sub> that can be dissolved in the mixed surface layer.

**reverse dip-slip fault:** a dip-slip fault in which the hanging wall block has moved upward relative to the footwall block.

**reverse fault:** rocks that crack and are thrust upward, forming an overhang; caused by the compression of rocks.

**reverse osmosis:** Solvent molecules flow spontaneously from a dilute solution through a semipermeable membrane to a more concentrated solution (osmosis). In reverse osmosis, pressure is applied to the more concentrated solution to force the flow of solvent to go from more concentrated to more dilute solution. Reverse osmosis is used to produce fresh water from sea water.

**Reverse transcriptase:** An enzyme that synthesizes DNA from an RNA template, using deoxyribonucleotide triphosphates. OR An enzyme that synthesizes DNA by using an RNA template. OR An RNA-directed DNA polymerase in retroviruses; capable of making DNA complementary to an RNA. OR In biology, the process in cells by which an enzyme makes a copy of DNA from RNA. The enzyme that makes the DNA copy is called reverse transcriptase and is found in retroviruses, such as the human immunodeficiency virus (HIV). Reverse transcription can also be carried out in the laboratory.

**reversible:** thermo (A process or reaction that can be reversed by an infinitesimally small change in conditions. For example, ice and water coexist at 1 atm and 0°C; a very slight temperature increase causes the ice to melt; a tiny temperature decrease causes the water to freeze. Melting or freezing under these conditions can be considered reversible. Reversible processes are infinitesimally close to equilibrium. ) reversible process; reversible reaction. Compare with irreversible and irreversible process.

**Reversible change** : A change that can be undone fairly easily. Often called a physical change or a temporary change.

**Reversible reaction** : Some chemical reactions can be undone. An example is the removal of water from copper sulfate crystals. Heating the crystals (blue) loses water and the crystals become a white powder. If the powder is left to cool and then cold water is added, the powder turns blue and gets very hot. The reaction is reversed and the energy change is

reversed too. Reversible reactions in a closed system can set up an equilibrium. This is usually studied in the context of the Haber process.

**reversible reactions:** Reversible reactions are reactions in which reactants form products and the products can also react with each other to re-form the reactants.

**ReVia :** A drug that blocks the action of opiates (drugs used to treat pain). It may be used in the treatment of intravenous opiate addiction or alcohol dependence. ReVia is also being studied in the treatment of breast cancer. It may block the effects of the hormone estrogen, which causes some breast cancer cells to grow, or block the blood flow to tumors. It is a type of opiate antagonist. Also called naltrexone, naltrexone hydrochloride, and Vivitrol.

**Revimmune:** (Other name for: cyclophosphamide)

**Revival:** (Other name for: soy protein isolate)

**Revlimid :** A drug that is similar to thalidomide, and is used to treat multiple myeloma and certain types of anemia. It is also used to treat mantle cell lymphoma that has come back or has not gotten better after other treatment. It is being studied in the treatment of other conditions and types of cancer. Revlimid may help the immune system kill abnormal blood cells or cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called CC-5013 and lenalidomide.

**RevM10 gene:** RevM10 is a dominant-negative mutant of HIV-1 Rev gene, which encodes a RNA-binding protein involving in nuclear trafficking of unspliced viral mRNAs. Due to the fact that Rev is essential for HIV-1 replication makes it an attractive target for antiviral approaches. Based on the notion of intracellular immunization, in vitro studies that introducing RevM10 gene into stem cells have demonstrated its ability to combat HIV-1 infection in human hematopoietic cells. or An antiviral gene that is being studied in the treatment of cancer in patients who have HIV, the virus that causes AIDS.

**REXIN-G:** (Other name for: retrovector encoding mutant anti-cyclin G1)

**rexinoid NRX194204:** An orally bioavailable synthetic retinoid X receptor (RXR) agonist with potential antineoplastic and anti-inflammatory activities. Rexinoid NRX 194204 selectively binds to and activates RXRs. Because RXRs can form heterodimers with several nuclear receptors (NRs),

RXR activation by this agent may result in a broad range of gene expression depending on the effector DNA response elements activated. Rexinoid NRX 194204 may inhibit the tumor-necrosis factor (TNF)-mediated release of nitric oxide (NO) and interleukin 6 (IL6) and may inhibit tumor cell proliferation. This agent appears to be less toxic than RAR-selective ligands.

**Reye syndrome :** A rare disease that damages the brain and liver and causes death if not treated. It occurs most often in children younger than 15 years who have had a fever-causing virus, such as chickenpox or flu. Taking aspirin during a viral illness may increase the risk of Reye syndrome.

**REYNOLDS NUMBER:** A dimensionless quantity defined as which is equivalent to the ratio of INERTIA forces to VISCOUS forces. The flow is turbulent when the Reynolds number is more than 2100 for tubes. Below 2100 the flow is laminar (i.e. streamlines without disturbances). For molten polymer flow, the Reynolds Number is usually in the range  $10^{-4}$  to  $10^{-2}$  (see also CREEPING FLOW).

**Rezulin:** (Other name for: troglitazone)

**RF:** Radio-Frequency

**rF-TRICOM :** A cancer vaccine made with a form of a chicken virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called recombinant fowlpox-TRICOM vaccine.

**RFLP:** restriction fragment length polymorphism; a technique using small bits of DNA fragments linked to various diseases.

**RFS:** In cancer, the length of time after primary treatment for a cancer ends that the patient survives without any signs or symptoms of that cancer. In a clinical trial, measuring the RFS is one way to see how well a new treatment works. Also called DFS, disease-free survival, and relapse-free survival.

**RFT5-dgA immunotoxin:** A recombinant immunotoxin consisting of the anti-CD25 monoclonal antibody RFT5 fused to the deglycosylated ricin A-chain (dgA) with potential antitumor activity. The monoclonal antibody moiety of RFT5-dgA immunotoxin attaches to CD25 (the alpha chain of the IL-2 receptor complex) on the cell membrane; after internalization, the dgA

moiety cleaves the N-glycosidic bond between the ribose and adenine base at position 4324 in 28S ribosomal RNA, resulting in ribosome inactivation, inhibition of protein synthesis, and cell death. CD25 is expressed on activated normal T and B cells and macrophages and is frequently upregulated in many hematologic malignancies. or A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of melanoma that has spread to distant parts of the body. RFT5-dgA immunotoxin is made in the laboratory. It can find and kill certain white blood cells that prevent the immune system from killing cancer cells. Also called IgG-RFT5-dgA.

**RG7204:** A drug used to treat advanced melanoma that has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. RG7204 blocks this mutated protein, which may stop the growth of cancer cells. It is a type of kinase inhibitor and a type of targeted therapy agent. Also called BRAF (V600E) kinase inhibitor RO5185426, PLX4032, vemurafenib, and Zelboraf.

**rhabdoid tumor :** A malignant tumor of either the central nervous system (CNS) or the kidney. Malignant rhabdoid tumors of the CNS often have an abnormality of chromosome 22. These tumors usually occur in children younger than 2 years.

**rhabdomyosarcoma :** Cancer that forms in the soft tissues in a type of muscle called striated muscle. Rhabdomyosarcoma can occur anywhere in the body.

**rhEndostatin:** (Other name for: recombinant human endostatin)

**Rhenium:** Symbol:"Re" Atomic Number:"75" Atomic Mass: 186.21amu. This is one of the transition elements. Rhenium is never found free in nature, always bonded to other elements. This silvery-white metal is used in many alloys, flash photography, and even experiments with superconductivity.

**rhenium Re 188 BMEDA-liposome:** A liposome-based preparation consisting of the beta- and gamma-emitting radionuclide rhenium Re 188 (Re 188) linked to the chelator N,N-bis (2-mercaptoethyl)-N',N'-diethylethylenediamine (BMEDA) and encapsulated in liposomes, with potential tumor imaging and antineoplastic activities. Upon intravenous infusion of rhenium Re 188 BMEDA-labeled liposomes, the liposomes selectively target tumor cells, facilitate the retention of the radioisotope by

those cells, and cause localized antitumor radiocytotoxicity while sparing surrounding normal, healthy cells. In addition, Re 188 BMEDA-labeled liposomes can be used for imaging purposes. Re 188 has a short half-life and a short path length, which further contribute to limiting the radiotoxicity to the tumor cells. Check for active clinical trials using this agent.

**rhodium Re 188 ethiodized oil:** A rhodium (Re) 188 conjugate of ethiodized oil (lipiodol), an iodinated ethyl ester derived from poppy seed oil, with potential antineoplastic activity. Upon hepatic intra-arterial injection rhodium Re 188 ethiodized oil accumulates in hepatocellular carcinoma (HCC) tumor cells, thereby delivering a cytotoxic dose of radiation through Re 188 directly to the tumor cells. This may kill tumor cells while sparing surrounding normal cells and tissues. Compared to iodine I 131, Re 188 has a shorter half-life.

**RHEOLOGY:** The study of the behavior of materials as they are deformed. OR The science of deformation and flow of materials including polymers. Viscosity, elongational viscosity, normal stresses, relaxation time,  $G'$ ,  $G''$ , etc. are rheological properties. OR Study of the deformation and flow of matter in terms of stress, strain and time.

**rheumatism :** A group of disorders marked by inflammation or pain in the connective tissue structures of the body. These structures include bone, cartilage, and fat.

**rheumatoid arthritis :** An autoimmune disease that causes pain, swelling, and stiffness in the joints, and may cause severe joint damage, loss of function, and disability. The disease may last from months to a lifetime, and symptoms may improve and worsen over time.

**Rheumatex :** A drug used to treat some types of cancer, rheumatoid arthritis, and severe skin conditions, such as psoriasis. Rheumatex stops cells from making DNA and may kill cancer cells. It is a type of antimetabolite. Also called amethopterin, methotrexate, and MTX.

**RHF:** Spin-restricted Hartree-Fock. Closed-shell singlet with two electrons in each occupied orbital.

**rhIL-11:** A drug used to increase the number of blood cells, especially platelets, in some cancer patients receiving chemotherapy. rhIL-11 is a form of interleukin-11 (a cytokine normally made by support cells in the bone marrow) that is made in the laboratory. It is a type of biological response

modifier. Also called Neumega, oprelvekin, and recombinant human interleukin-11.

**rhinoscope** : A thin, tube-like instrument used to examine the inside of the nose. A rhinoscope has a light and a lens for viewing and may have a tool to remove tissue. Also called nasoscope.

**rhinoscopy** : Examination of the inside of the nose using a rhinoscope. A rhinoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called nasoscopy.

**rhizoxin**: A macrocyclic lactone. Rhizoxin binds to tubulin and inhibits microtubule assembly, thereby inducing cytotoxicity. This agent also may inhibit endothelial cell-induced angiogenic activity, which may result in decreased tumor cell proliferation.

**rhizoxin** : A substance that is being studied in the treatment of cancer. It comes from a fungus and is similar to vinca alkaloid drugs. It belongs to the family of drugs called antimitotic agents.

**Rho factor**: A protein involved in the termination of transcription of some messenger RNAs.

**Rho protein**: An ATP-dependent bacterial helicase that breaks the RNA-DNA hybrid at the transcription bubble, and thereby terminates transcription.

**Rhodium**: Symbol:"Rh" Atomic Number:"45" Atomic Mass: 102.91amu. Rhodium is one of the transition elements and in the platinum family. Rhodium is often used to harden platinum and found in spark plugs and highly reflective materials.

**rhodopsin**: a light-sensitive pigment of the eye that functions in the detection of light. OR The photoreceptor of rod cells. It is composed of the protein opsin and the prosthetic group 11-cis-retinal.

**Rhodopsin kinase**: An enzyme that phosphorylates activated rhodopsin at multiple serine and threonine residues to provide a binding site for the inhibitory protein arrestin.

**Rhombohedral crystal class**: A subclass of the trigonal crystal class containing a three-fold rotation axis along a diagonal of the unit cell. This class contains 7 space groups and has two restrictions: 1) the lengths of the

three axes are equal, and 2) the three angles are equal, but need not equal  $90^\circ$ .

**rhombus:** a parallelogram with four equal sides.

**rhubarb :** The root of this plant has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. The scientific name is *Rheum palmatum* or *Rheum officinale*. Also called Chinese rhubarb, da-huang, Indian rhubarb, and Turkish rhubarb.

**rhubarb/licorice herbal supplement:** A decoction of rhubarb root (Da Huang) and licorice root (Gan Cao) used in Chinese Herbal Medicine. Upon ingestion, the rhubarb/licorice herbal supplement may help improve appetite. Check for active clinical trials using this agent.

**ribavirin:** A synthetic nucleoside analogue of ribofuranosyl with antiviral activity. Ribavirin incorporates into viral nucleic acid, inhibits viral ribonucleic acid (RNA) synthesis, induces viral genome mutations, and inhibits normal viral replication. Ribavirin shows activity against a variety of RNA viruses, especially hepatitis C virus. Check for active clinical trials using this agent. or A drug used to treat respiratory syncytial virus (RSV) infection in the lungs.

**ribociclib:** An orally available cyclin-dependent kinase (CDK) inhibitor targeting cyclin D1/CDK4 and cyclin D3/CDK6 cell cycle pathway, with potential antineoplastic activity. Ribociclib specifically inhibits CDK4 and 6, thereby inhibiting retinoblastoma (Rb) protein phosphorylation. Inhibition of Rb phosphorylation prevents CDK-mediated G1-S phase transition, thereby arresting the cell cycle in the G1 phase, suppressing DNA synthesis and inhibiting cancer cell growth. Overexpression of CDK4/6, as seen in certain types of cancer, causes cell cycle deregulation.

**Riboflavin:** A vitamin component of the electron-transfer coenzymes FAD, FADH<sub>2</sub>, FMN, and FMNH<sub>2</sub>. Also called vitamin B<sub>2</sub>. OR An essential human nutrient that is a heat-stable and water-soluble flavin belonging to the vitamin B family. Riboflavin is a precursor of the coenzymes flavin mononucleotide (FMN) and flavin adenine dinucleotide (FAD). These coenzymes are of vital importance in normal tissue respiration, pyridoxine activation, tryptophan to niacin conversion, fat, carbohydrate, and protein metabolism, and glutathione reductase mediated detoxification. Riboflavin may also be involved in maintaining erythrocyte integrity. This vitamin is essential for healthy skin, nails, and hair. or A

nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Riboflavin helps make red blood cells, helps some enzymes work properly, and keeps skin, nails, and hair healthy. It is found in milk, eggs, malted barley, organ meats, yeast, and leafy vegetables. Riboflavin is water-soluble (can dissolve in water) and must be taken in every day. Not enough riboflavin can cause anemia (a low number of red blood cells), mouth sores, and skin problems. Amounts of riboflavin may be higher in the blood of patients with some types of cancer. Also called vitamin B2.

**ribonuclease:** A nuclease that catalyzes the hydrolysis of certain internucleotide linkages of RNA.

**ribonuclease QBI-139:** A nuclease of mammalian origin that cleaves the phosphodiester bond between nucleotides of ribonucleic acids with potential antineoplastic activity. Ribonuclease QBI-139 catalyzes the hydrolysis and degradation of RNA leading to the inhibition of protein synthesis and cell death.

**ribonucleic acid :** One of two types of nucleic acid made by cells. Ribonucleic acid contains information that has been copied from DNA (the other type of nucleic acid). Cells make several different forms of ribonucleic acid, and each form has a specific job in the cell. Many forms of ribonucleic acid have functions related to making proteins. Ribonucleic acid is also the genetic material of some viruses instead of DNA. Ribonucleic acid can be made in the laboratory and used in research studies. Also called RNA.

**Ribonucleoproteins:** Macromolecular complexes whose optimal activity depends on the presence of specific rnas and proteins; ribosomes are ribonucleoproteins.

**Ribonucleotide:** A nucleotide that contains a purine or pyrimidine base covalently linked to a ribose, which is in turn linked to one or more phosphate groups. OR A nucleotide containing n-ribose as its pentose component.

**Ribonucleotide reductase:** An enzyme that catalyzes the reduction of all four ribonucleotides to deoxyribonucleotides.

**ribonucleotide reductase inhibitor :** A family of anticancer drugs that interfere with the growth of tumor cells by blocking the formation of deoxyribonucleotides (building blocks of DNA).

**Ribose:** The five-carbon sugar found in RNA. OR A five-carbon monosaccharide (C<sub>5</sub>H<sub>10</sub>O<sub>5</sub>) that constitutes the carbohydrate moiety of ATP, other ribonucleosides and ribonucleotides, and cofactors such as NAD and coenzyme A.

**Ribosomal RNA:** The RNA component of a ribosome, the site of protein synthesis. OR The RNA parts of the ribosome. OR A class of RNA molecules serving as components of ribosomes.

**Ribosome:** A large ribonucleoprotein assembly that catalyzes the formation of peptide bonds; a molecular machine that coordinates protein synthesis. OR organelle bodies that may be bound to the ER that are the sites of protein synthesis in eukaryotic cells; the bodies in which amino acids are bound together to form proteins. OR Small cellular particles made up of ribosomal RNA and protein. They are the site, together with mRNA, of protein synthesis.

**ribosome:** A supramolecular complex of rRNAs and proteins, approximately 18 to 22 nm in diameter; the site of protein synthesis.

**ribosome :** In biology, a structure found inside cells that is involved in making proteins. Ribosomes help link amino acids together to form proteins.

**ribosome-inactivating protein CY503:** A recombinant protein that inactivates the ribosome with potential antineoplastic and immunomodulating activities. Ribosome-inactivating protein CY503 binds to the cell surface sialyltransferase CD75 and is internalized; intracellularly, CY503 cleaves an adenine-specific N-glycosidic bond on the 28S ribosomal subunit, which may result in tumor cell apoptosis. This agent has also been shown to activate natural killer (NK) cells, induce cytokine receptor expression, and stimulate the release of cytokines. CD75 is expressed on mature B-cells and subsets of T-cells and erythrocytes.

**Riboxamide:** (Other name for: tiazofurin)

**Ribs:** A thin support features (usually triangle shape) on a part that are used for strengthening wall sections and bosses. OR A thin, wall-like feature parallel to the mold opening direction, common on plastic parts and used to add support to walls or bosses. OR A reinforcing member of a fabricated or molded part. OR A reinforcing member of a fabricated or molded part.

**rice bran:** The nutrient-rich hard outer layer of the rice cereal grain, with potential chemopreventive, antioxidant, iron chelating, anticholesterol and anti-inflammatory activities. Rice bran is rich in fiber, such as beta-glucan, pectin and gum; it also comprises vitamins and minerals, such as iron, magnesium and phosphorus, and essential fatty acids. In addition, Rice bran contains various bioactive components, including ferulic acid, tricin, beta-sitosterol, gamma-oryzanol, phytic acid, and inositol hexaphosphate (IP6). The potential anticancer activity of rice bran may be due to the synergistic effects of these phytochemicals on their ability to induce apoptosis, inhibit cell proliferation, and alter cell cycle progression in cancer cells. Rice bran's bioactive components also protect against tissue damage by scavenging free radicals and blocking chronic inflammatory responses. In addition, they are able to modulate the gut microflora and carcinogen-metabolizing enzymes, thereby further exerting a chemopreventive effect.

**Richter scale:** a numerical scale that lists earthquake magnitude in logarithmic increments from about 2 to 8.6. OR scale for measuring earthquakes based on energy released.

**Richter syndrome :** A rare condition in which chronic lymphocytic leukemia (CLL) changes into a fast-growing type of lymphoma. Symptoms of Richter syndrome include fever, loss of weight and muscle mass, and other health problems. Also called Richter transformation.

**Richter transformation :** A rare condition in which chronic lymphocytic leukemia (CLL) changes into a fast-growing type of lymphoma. Symptoms of Richter transformation include fever, loss of weight and muscle mass, and other health problems. Also called Richter syndrome.

**Rickets:** A disease caused by the insufficient formation of vitamin D, resulting in the inadequate calcification of cartilage and bone. OR A condition in children in which bones become soft and deformed because they don't have enough calcium and phosphorus. It is caused by not having enough vitamin D in the diet or by not getting enough sunlight. In adults, this condition is called osteomalacia. Also called infantile rickets, juvenile rickets, and rachitis.

**ricolinostat:** An orally bioavailable, specific inhibitor of histone deacetylase 6 (HDAC6) with potential antineoplastic activity. Ricolinostat selectively targets and binds to HDAC6, thereby disrupting the Hsp90 protein chaperone system through hyperacetylation of Hsp90 and

preventing the subsequent aggresomal protein degradation. This leads to an accumulation of unfolded and misfolded ubiquitinated proteins and may eventually induce cancer cell apoptosis, and inhibition of cancer cell growth. HDAC6, a class II HDAC deacetylase located in the cytoplasm, appears to play a key role in the formation and activation of the aggresomes needed for degradation of misfolded proteins. Compared to non-selective HDAC inhibitor, ricolinostat is able to reduce the toxic effects on normal, healthy cells.

**ridaforolimus:** A small molecule and non-prodrug analogue of the lipophilic macrolide antibiotic rapamycin with potential antitumor activity. Ridaforolimus binds to and inhibits the mammalian target of rapamycin (mTOR), which may result in cell cycle arrest and, consequently, the inhibition of tumor cell growth and proliferation. Upregulated in some tumors, mTOR is a serine/threonine kinase involved in regulating cellular proliferation, motility, and survival that is located downstream of the PI3K/Akt signaling pathway. or A substance being studied in the treatment of soft tissue and bone cancers. It is also being studied in the treatment of other solid tumors and hematologic cancer. Ridaforolimus stops cells from dividing and may cause cancer cells to die. It is a type of mTOR inhibitor. Also called AP23573.

**Ridaura:** (Other name for: auranofin)

**ridge-push:** a term that refers to the cooling and sinking of new crust as it moves away from a midoceanic ridge along a deeper lithospheric plane of weakness.

**Rieske center:** An unusual 2Fe-2S center in that one of the iron ions is coordinated by two histidine residues rather than by two cysteine residues.

**Rietveld method:** A computational treatment of diffraction data that creates an effective separation of the overlapping data in a typical powder X-ray diffraction pattern, thereby often allowing an accurate determination of the structure without the need of single-crystal data.

**rifabutin:** A semisynthetic ansamycin antibiotic with potent antimycobacterial properties. Rifabutin inhibits bacterial DNA-dependent RNA polymerase, thereby suppressing the initiation of RNA formation and leading to inhibition of RNA synthesis and transcription. Check for active clinical trials using this agent. or A drug used to prevent the spread of a bacterium called in patients with advanced HIV (the virus that causes

AIDS) infection. It blocks an enzyme that the bacteria need to grow. It is a type of antibiotic. Also called Mycobutin.

**rifampin :** A drug used in the treatment of infections caused by bacteria. It belongs to the family of drugs called antibiotics. OR An orally administered, semi-synthetic, nonsystemic antibiotic derived from rifamycin SV with antibacterial activity. Rifaximin binds to the beta-subunit of bacterial DNA-dependent RNA polymerase, inhibiting bacterial RNA synthesis and bacterial cell growth. As rifaximin is not well absorbed, its antibacterial activity is largely localized to the gastrointestinal tract.

**Rifamycin:** An antibiotic isolated from *Streptomyces* that inhibits the initiation of RNA synthesis by blocking the formation of the first phosphodiester bond.

**rift eruption:** lava flows in long, narrow cracks of the Earth's crust.

**rift valley:** a large crack in the crest of a midoceanic ridge that typically forms a graben-type valley. OR the space between diverging plates.

**right angle:** An angle that measures 90 degrees. OR an angle whose measure is equal to  $90^\circ$ .

**right atrium:** the chamber of the human heart in which oxygen-poor blood enters through a major vein called the vena cava.

**right circular cylinder:** a solid shaped like a can. Base meets side at a right angle.

**right triangle:** A triangle with one right angle. OR a triangle containing a  $90^\circ$  angle.

**right ventricle:** the pumping chamber of the human heart from which blood exits.

**right-lateral strike-slip fault:** a strike-slip fault in which the block across the fault appears to have moved to the right.

**Rigid Plastics:** For purpose of general classification, a plastic that has a modulus of elasticity either in flexure or in tension greater than 100,000 psi at 23 degrees C and 50% relative humidity when tested in accordance with ASTM Methods D 747 or D 790 Test for stiffness of plastics.

**Rigid PVC:** Polyvinyl chloride or a polyvinyl chloride/acetate copolymer characterized by a relatively high degree of hardness; it may be formulated with or without a small percentage of plasticizer.

**Rigid Resin:** Having a modulus high enough to be of practical importance, e.g., 10,000 psi or greater.

**Rigidification:** Drug design technique used to restrict free rotation about rotatable bonds.

**rigosertib sodium:** A synthetic benzyl styryl sulfone analogue with potential antineoplastic activity. Rigosertib sodium inhibits polo-like kinase1 (Plk1), inducing selective G2/M arrest followed by apoptosis in a variety of tumor cells while causing reversible cell arrest at the G1 and G2 stage without apoptosis in normal cells. This agent may exhibit synergistic antitumor activity in combination with other chemotherapeutic agents. Plk1, named after the polo gene of *Drosophila melanogaster*, is a serine/threonine protein kinase involved in regulating mitotic spindle function in a non-ATP competitive manner.

**rilimogene galvacirepvec:** A vaccine formulation consisting of recombinant vaccinia virus encoding prostate specific antigen (PSA) and recombinant vaccinia virus encoding three co-stimulatory molecule transgenes B7.1, ICAM-1, and LFA-3 (TRICOM). Vaccination with PSA in combination with TRICOM may enhance antigen presentation, resulting in the augmentation of a cytotoxic T cell (CTL) immune response against tumor cells expressing PSA.

**rill:** a concentration of sheetwash into a small channel; rills merge to form larger streams.

**rilotumumab:** A fully human IgG2 monoclonal antibody directed against the human hepatocyte growth factor (HGF) with potential antineoplastic activity. Rilotumumab binds to and neutralizes HGF, preventing the binding of HGF to its receptor c-Met and so c-Met activation; inhibition of c-Met-mediated signal transduction may result in the induction of apoptosis in cells expressing c-Met. c-Met (HGF receptor or HGFR), a receptor tyrosine kinase overexpressed or mutated in a variety of epithelial cancer cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**Rilutek :** A drug used to treat a nerve disease called amyotrophic lateral sclerosis (ALS). It is also being studied in the treatment of melanoma (a type of skin cancer). Rilutek blocks the release of a substance that melanoma cells need to grow. It is a type of glutamate release inhibitor. Also called riluzole.

**riluzole:** A benzothiazole derivative with neuroprotective and potential anti-depressant and anxiolytic activities. While the mechanism of action of riluzole is unknown, its pharmacological activities in motor neurons include the following, some of which may be related to its effect: 1) an inhibitory effect on glutamate release, 2) inactivation of voltage-dependent sodium channels, and 3) interference with intracellular events that follow transmitter binding at excitatory amino acid receptors. In animal models, this agent has been shown to exhibit myorelaxant and sedative activities, apparently due to the blockade of glutamatergic neurotransmission. or A drug used to treat a nerve disease called amyotrophic lateral sclerosis (ALS). It is also being studied in the treatment of melanoma (a type of skin cancer). Riluzole blocks the release of a substance that melanoma cells need to grow. It is a type of glutamate release inhibitor. Also called Rilutek.

**rimiducid:** A lipid-permeable tacrolimus analogue with homodimerizing activity. Rimiducid homodimerizes an analogue of human protein FKBP12 (Fv) which contains a single acid substitution (Phe36Val) so that AP1903 binds to wild-type FKBP12 with 1000-fold lower affinity. This agent is used to homodimerize the Fv-containing drug-binding domains of genetically engineered receptors such as the iCD40 receptor of the autologous dendritic cell vaccine BP-GMAX-CD1, resulting in receptor activation. Check for active clinical trials using this agent.

**rindopepimut:** A cancer vaccine consisting of a human epidermal growth factor receptor variant III (EGFRvIII)-specific peptide conjugated to the non-specific immunomodulator keyhole limpet hemocyanin (KLH) with potential antineoplastic activity. Vaccination with rindopepimut may elicit a cytotoxic T-lymphocyte (CTL) immune response against tumor cells expressing EGFRvIII. EGFRvIII, a functional variant of EGFR that is not expressed in normal tissues, was originally discovered in glioblastoma multiforme (GBM) and has also been found in various other cancers such as breast, ovarian, metastatic prostate, colorectal, and head and neck cancers. EGFRvIII contains an 83 amino acid deletion in its extracellular domain and has been shown to transform NIH/3T3 mouse embryonic fibroblast cells in vitro.

**Ring Gate:** Used on some cylindrical shapes. This gate encircles the core to permit the melt to first move around the core before filling the cavity.

**ring structure:** a molecule in which the end atoms have bonded, forming a ring rather than a straight chain. OR a molecule in which the end atoms have bonded, forming a ring rather than a straight chain.

**ring-opening reaction:** a reaction that causes a cyclic structure to form a straight chain.

**rintatolimod:** A synthetic derivative of inosinic acid with antiretroviral and immunomodulatory activities. Rintatolimod acts through a number of pathways to stimulate the antiviral activity of the immune system. This agent stimulates interferon production; activates the oligoadenylate synthase-RNase L pathway; stimulates natural killer cell activity; and acts as a non-mitogenic stimulator of the immune system. Rintatolimod also inhibits replication of the human immunodeficiency virus (HIV) in vitro.

**Riomet:** (Other name for: metformin hydrochloride)

**rip current:** a narrow channel of water that flows straight back out to sea after its waves have broken on the beach.

**rip currents:** strong surface currents that move like small rivers perpendicular to the shoreline, caused by water returning from the beach to the ocean.

**ripple marks:** gentle, repeated ridges, usually in sand or silt, that form perpendicular to the flow of wind or water.

**risedronate :** A substance that is being studied in the prevention and treatment of osteoporosis. It belongs to the family of drugs called bone resorption inhibitors.

**risedronate sodium:** The hemipentahydrate monosodium salt of risedronic acid, a synthetic pyridinyl bisphosphonate. Risedronic acid binds to hydroxyapatite crystals in bone and inhibits osteoclast-dependent bone resorption.

**Riser:** The vertical face of a step or stair.

**risk:** The probability that an event will occur, e.g., that an individual will become ill or die within a stated period of time or age. Also, a nontechnical term encompassing a variety of measures of the probability of a (generally) unfavourable outcome (Last, 1988). Risk should not be confused with the term "hazard". Risk is most correctly applied to predicted or actual frequency of occurrence of an adverse effect of a chemical or other hazard. OR The combined answer to three questions that consider (1) what can go

wrong, (2) how likely it is, and (3) what its consequences might be. These three questions allow the NRC to understand likely outcomes, sensitivities, areas of importance, system interactions, and areas of uncertainty, which can be used to identify risk-significant scenarios. For additional detail, see Risk Assessment in Regulation and the Fact Sheet on Nuclear Reactor Risk.

**risk assessment:** A combination of hazard identification, quantification of risk resulting from a specific use or occurrence of a chemical, taking into account the possible harmful effects on individual people or society of using the chemical in the amount and manner proposed and all the possible routes of exposure. Quantification ideally requires the establishment of dose-effect and dose-response relationships in likely target individuals and populations. Compare "risk evaluation".

**risk assessment :** The quantitative or qualitative assessment of an individual's risk of carrying a certain gene mutation, or developing a particular disorder, or of having a child with a certain disorder; sometimes done by using mathematical or statistical models incorporating such factors as personal health history, family medical history and ethnic background. OR A process used to estimate the risk that a certain event will happen. In medicine, this may include a person's risk of having a child with a certain condition or disease, such as cancer. It may also be used to estimate the risk of carrying a certain gene mutation (change), or of having an adverse event (unexpected medical problem) in response to certain types of drugs or other substances. A risk assessment may be done by collecting information about a person's age, sex, personal and family medical history, ethnic background, lifestyle, and other factors and using statistics tools to calculate risk.

**risk assessment management process:** A global term for the whole activity from hazard identification to risk management (WHO, 1988).

**risk characterization:** The outcome of hazards identification and risk estimation applied to a specific use or occurrence of an environmental health hazard (e.g., a chemical compound). The assessment requires quantitative data on the human exposure in the specific situation. The end product is a quantitative statement about the proportion of affected people in a target population (WHO, 1988).

**risk estimation:** The quantification of dose-effect and dose-response relationships for a given environmental agent, showing the probability and

nature of the health effects of exposure to the agent (WHO, 1988).

**risk evaluation:** Risk evaluation involves the establishment of qualitative or quantitative relationship between risks and benefits, involving the complex process of determining the significance of identified hazards and estimated risks to those organisms or people concerned with or affected by them.

**risk factor :** Something that increases the chance of developing a disease. Some examples of risk factors for cancer are age, a family history of certain cancers, use of tobacco products, being exposed to radiation or certain chemicals, infection with certain viruses or bacteria, and certain genetic changes.

**risk group :** In medicine, risk groups are used to describe people who are alike in important ways. For example, patients with the same type of cancer may be divided into different risk groups that depend on certain aspects of their disease. These risk groups may be based on the patients' chance of being cured (good versus poor) or the chance that their disease will come back (high versus low). Treatment may be based on which risk group a patient falls into. Risk groups can also be used to describe people who share traits and behaviors that affect their chance of developing a disease. For example, people who do not smoke are in a lower risk group for lung cancer than people who smoke.

**risk management:** The managerial, decision-making and control process to deal with those environmental agents for which risk evaluation has indicated that the risk is too high (WHO, 1988).

**risk marker :** An attribute that is associated with an increased probability of occurrence of a disease or other specified outcome and that can be used as an indicator of this increased risk. Not necessarily a causal factor (Last, 1988).

**risk monitoring:** The process of following up decisions and actions within risk management in order to check whether the aims of reduced exposure and risk are achieved (WHO, 1988).

**risk ratio :** A measure of the risk of a certain event happening in one group compared to the risk of the same event happening in another group. In cancer research, risk ratios are used in prospective (forward looking) studies, such as cohort studies and clinical trials. A risk ratio of one means there is no difference between two groups in terms of their risk of cancer,

based on whether or not they were exposed to a certain substance or factor, or how they responded to two treatments being compared. A risk ratio of greater than one or of less than one usually means that being exposed to a certain substance or factor either increases (risk ratio greater than one) or decreases (risk ratio less than one) the risk of cancer, or that the treatments being compared do not have the same effects. Also called relative risk.

**Risk-based decisionmaking:** An approach to regulatory decisionmaking that considers only the results of a probabilistic risk assessment. For additional detail, see Risk Assessment in Regulation and the Fact Sheet on Nuclear Reactor Risk.

**Risk-informed decisionmaking:** An approach to regulatory decisionmaking, in which insights from probabilistic risk assessment are considered with other engineering insights. For additional detail, see Risk Assessment in Regulation and the Fact Sheet on Nuclear Reactor Risk.

**Risk-informed regulation:** An approach to regulation taken by the NRC, which incorporates an assessment of safety significance or relative risk. This approach ensures that the regulatory burden imposed by an individual regulation or process is appropriate to its importance in protecting the health and safety of the public and the environment. For additional detail, see Risk Assessment in Regulation and the Fact Sheet on Nuclear Reactor Risk.

**Risk-significant:** "Risk-significant" can refer to a facility's system, structure, component, or accident sequence that exceeds a predetermined limit for contributing to the risk associated with the facility. The term also describes a level of risk exceeding a predetermined "significance" level. For additional detail, see Risk Assessment in Regulation and the Fact Sheet on Nuclear Reactor Risk.

**Risperdal :** A drug used to treat certain mental disorders, such as schizophrenia and bipolar disease. It may also be used to treat certain behavior problems in children. Risperdal blocks the action of certain chemicals in the brain. It is a type of antipsychotic. Also called risperidone.

**risperidone :** A drug used to treat certain mental disorders, such as schizophrenia and bipolar disease. It may also be used to treat certain behavior problems in children. Risperidone blocks the action of certain chemicals in the brain. It is a type of antipsychotic. Also called Risperdal.

**ristocetin:** an antibiotic isolated from *Amycolasis lurida* that used to be used to treat staphylococcal infections. Ristocetin induces binding of von Willebrand factor to platelet glycoprotein Ib (GPIb)

**Ritalin :** A drug used to treat certain behavior disorders, such as attention deficit hyperactivity disorder (ADHD). It is also being studied as a way to improve brain function in patients treated with anticancer drugs. Ritalin acts on certain parts of the brain. It is a type of central nervous system stimulant. Also called Concerta and methylphenidate hydrochloride.

**ritonavir:** A synthetic aromatic derivative with antiviral properties. Ritonavir is a peptidomimetic agent that inhibits both HIV-1 and HIV-2 proteases, thereby preventing the cleavage of Gag-Pol polyproteins and resulting in the production of noninfectious viral particles. This agent is more active against HIV-1. Because ritonavir targets the HIV replication cycle after translation and before assembly, it is active in chronically infected cells that generally are not affected by nucleoside reverse transcriptase inhibitors. Check for active clinical trials using this agent. or A drug used to treat infection with HIV (the virus that causes AIDS). It is also being studied in the treatment of some types of cancer. Ritonavir blocks the ability of HIV to make copies of itself and may block the growth of cancer cells. It is a type of anti-HIV agent and a type of protease inhibitor. Also called Norvir.

**ritual :** An action or series of actions that is repeated, often in a religious or social setting. In medicine, it may describe a repeated action (such as hand washing) done to relieve feelings of fear, dread, and uneasiness in people who have an obsessive-compulsive disorder.

**Rituxan :** A drug used to treat certain types of B-cell non-Hodgkin lymphoma. It is also used with other drugs to treat chronic lymphocytic leukemia and rheumatoid arthritis. It is being studied in the treatment of other types of cancer and other conditions. Rituxan binds to a protein called CD20, which is found on B-cells, and may kill cancer cells. It is a type of monoclonal antibody. Also called rituximab.

**rituximab:** A recombinant chimeric murine/human antibody directed against the CD20 antigen, a hydrophobic transmembrane protein located on normal pre-B and mature B lymphocytes. Following binding, rituximab triggers a host cytotoxic immune response against CD20-positive cells. or A drug used to treat certain types of B-cell non-Hodgkin lymphoma. It is also

used with other drugs to treat chronic lymphocytic leukemia and rheumatoid arthritis. It is being studied in the treatment of other types of cancer and other conditions. Rituximab binds to a protein called CD20, which is found on B-cells, and may kill cancer cells. It is a type of monoclonal antibody. Also called Rituxan.

**rivaroxaban:** An orally bioavailable oxazolidinone derivative and direct inhibitor of the coagulation factor Xa with anticoagulant activity. Upon oral administration, rivaroxaban selectively binds to both free factor Xa and factor Xa bound in the prothrombinase complex. This interferes with the conversion of prothrombin (factor II) to thrombin and eventually prevents the formation of cross-linked fibrin clots. Rivaroxaban does not affect existing thrombin levels.

**rivastigmine tartrate:** The tartrate salt form of rivastigmine, a phenylcarbamate derivative exhibiting cognitive stimulating property. Although the mechanism of action has not been fully elucidated, rivastigmine tartrate may bind reversibly to cholinesterase, thereby decreasing the breakdown of acetylcholine and enhancing cholinergic function.

**rizatriptan benzoate:** The benzoate salt form of rizatriptan, a member of the triptan class agents with anti-migraine property. Rizatriptan benzoate selectively binds to and activates serotonin (5-HT) 1B receptors expressed in intracranial arteries, and to 5-HT 1D receptors located on peripheral trigeminal sensory nerve terminals in the meninges and central terminals in brain stem sensory nuclei. Receptor binding results in constriction of cranial vessels and inhibition of nociceptive transmission, thereby providing relief of migraine headaches. Rizatriptan benzoate may also relieve migraine headaches by inhibition of pro-inflammatory neuropeptide release.

**RK-0202:** An oral polymer matrix-based rinse formulation that contains N-acetylcysteine, an antioxidant amino acid derivative with antiinflammatory properties. RK-0202 may alleviate symptoms of radiation-induced oral mucositis. Or A substance that is being studied in the prevention of oral mucositis in patients receiving radiation therapy or chemotherapy for head and neck cancer.

**RLS:** A condition in which a person has a strong urge to move his or her legs in order to stop uncomfortable sensations. These include burning, itching, creeping, tugging, crawling, or pain. These feelings usually happen

when a person is lying or sitting down, and are worse at night. They can also occur in other parts of the body. Also called restless legs syndrome.

**RMP-7:** A substance that is being studied for its ability to help other drugs reach the brain. It belongs to the family of drugs called bradykinin agonists. Also called lobradimil.

**RNA:** ribonucleic acid; a nucleic acid produced during transcription that is complementary to a DNA strand; similar to DNA in structure but contains the carbohydrate ribose and the pyrimidine uracil rather than thymine. OR A nucleic acid with D-ribose as the sugar component in its nucleotides. OR One of two types of nucleic acid made by cells. RNA contains information that has been copied from DNA (the other type of nucleic acid). Cells make several different forms of RNA, and each form has a specific job in the cell. Many forms of RNA have functions related to making proteins. RNA is also the genetic material of some viruses instead of DNA. RNA can be made in the laboratory and used in research studies. Also called ribonucleic acid.

**RNA (ribonucleic acid):** A chemical found in cells that serves as an intermediate in the synthesis of proteins OR A polynucleotide in which the sugar is ribose.

**RNA editing:** A change, after transcription, in the information content of RNA by processes other than RNA splicing.

**RNA electroporated CD19CAR-CD3zeta-4-1BB-expressing autologous T lymphocytes:** Autologous, genetically engineered T lymphocytes that have been electroporated with an mRNA encoding for an anti-CD19 chimeric antigen receptor (CAR) consisting of an anti-CD19 single chain variable fragment (scFv) coupled to the co-stimulatory signaling domain of 4-1BB (CD137) and the zeta chain of the T-cell receptor CD3 complex (CD3-zeta), with potential immunomodulating and antineoplastic activities. Upon transfusion, the RNA electroporated CD19CAR-CD3zeta-4-1BB-expressing autologous T-lymphocytes attach to cancer cells expressing CD19. This induces selective toxicity against CD19-expressing tumor cells and causes tumor cell lysis. The 4-1BB co-stimulatory molecule signaling domain enhances T-cell activation and signaling after recognition of CD19. CD19 antigen is a B-cell specific cell surface antigen, which is expressed in all B-cell lineage malignancies.

**RNA enzymes:** RNA molecules that act as enzymes. Also called ribozymes.

**RNA polymerase:** the enzyme that moves along the DNA strand, reads the nucleotides one by one, and synthesizes a complementary mRNA molecule according to the principle of complementary base pairing. OR An enzyme that catalyzes the formation of RNA from ribonucleotide triphosphates, using DNA as a template. OR An enzyme that catalyzes the formation of RNA from ribonucleoside 5'-triphosphates, using a strand of DNA or RNA as a template. OR A class of enzymes that synthesize RNA molecules complementary to a DNA template.

**RNA primers:** Small pieces of RNA that base-pair with the template strand of DNA and serve as primers for primer-dependent DNA synthesis; the RNA is later removed and replaced by DNA.

**RNA processing:** Any alteration of a precursor RNA molecule, such as splicing or polyadenylation, that yields a mature RNA molecule.

**RNA splicing:** The excision of a segment of RNA, followed by a rejoining of the remaining fragments. OR Removal of introns and joining of exons in a primary transcript.

**RNA world:** A theoretical time early in evolution in which RNA molecules served both as the genetic material and as catalysts for biochemical reactions.

**RNR inhibitor COH29:** An orally available, aromatically substituted thiazole and inhibitor of the human ribonucleotide reductase (RNR), with potential antineoplastic activity. Upon oral administration, the RNR inhibitor COH29 binds to the ligand-binding pocket of the RNR M2 subunit (hRRM2) near the C-terminal tail. This blocks the interaction between the hRRM1 and hRRM2 subunits and interferes with the assembly of the active hRRM1/hRRM2 complex of RNR. Inhibition of RNR activity decreases the pool of deoxyribonucleotide triphosphates available for DNA synthesis. The resulting decrease in DNA synthesis causes cell cycle arrest and growth inhibition. In addition, this agent may inhibit the nuclear enzyme poly (ADP-ribose) polymerase (PARP) 1, which prevents the repair of damaged DNA, and causes both the accumulation of single and double strand DNA breaks and the induction of apoptosis. RNR, an enzyme that catalyzes the conversion of ribonucleoside diphosphate to deoxyribonucleoside diphosphate, is essential for de novo DNA synthesis and plays an important

role in cell growth; it is overexpressed in many cancer cell types and is associated with increased drug resistance, cancer cell growth and metastasis.

**Ro 31-7453:** A substance that is being studied in the treatment of cancer. It may prevent cancer cells from dividing. It belongs to the family of drugs called cell cycle inhibitors.

**Ro 50-3821:** A substance that is being studied in the treatment of anemia in patients who are receiving chemotherapy. It is a form of erythropoietin (a substance produced in the kidneys that stimulates the production of red blood cells) that has been changed in the laboratory. Also called methoxypolyethylene glycol epoetin beta.

**RO4929097:** A substance being studied in the treatment of cancer. It blocks certain enzymes that are needed for cell growth. This may slow the growth of cancer cells. It may also decrease the growth of new blood vessels that tumors need to grow. It is a type of gamma-secretase inhibitor and a type of Notch signaling inhibitor.

**robatumumab:** A recombinant, fully human monoclonal antibody directed against the insulin-like growth factor 1 receptor (IGF-1R) with potential antineoplastic activity. Robatumumab binds to membrane-bound IGF-1R, preventing binding of the ligand IGF-1 and the subsequent triggering of the PI3K/Akt signaling pathway; downregulation of this survival pathway may result in the induction of apoptosis and decreased cellular proliferation. The activation of IGF-1R, a tyrosine kinase and a member of the insulin receptor family, stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF-1R signaling has been highly implicated in tumorigenesis and metastasis.

**Robimycin:** (Other name for: erythromycin)

**Robinul:** (Other name for: glycopyrrolate)

**Robot:** Automated devices for removing parts upon ejection from an open mold rather than letting the parts drop. Also see parts picker. Robots also can perform secondary functions, such as inspection, degating, precise placement of parts on a conveyor, etc. OR

**Rocaltrol:** (Other name for: calcitriol)

**Rocephin:** (Other name for: ceftriaxone sodium)

**rociletinib:** An orally available small molecule, irreversible inhibitor of epidermal growth factor receptor (EGFR) with potential antineoplastic activity. Rociletinib binds to and inhibits mutant forms of EGFR, including T790M, thereby leading to cell death of resistant tumor cells. Compared to other EGFR inhibitors, CO-1686 inhibits T790M, a secondary acquired resistance mutation, as well as other mutant EGFRs and may have therapeutic benefits in tumors with T790M-mediated resistance to other EGFR tyrosine kinase inhibitors. This agent shows minimal activity against wild-type EGFR, hence does not cause certain dose-limiting toxicities. Check for active clinical trials using this agent.

**rock:** a solid aggregate of bonded mineral crystals. OR A rock is a group of minerals in a mixture. Volcanic rocks are excellent examples of rocks created by the super-heated mixing of many minerals.

**rock avalanche:** the rapid descent of a mass of variously sized rock fragments.

**rock cycle:** the continuous flow from one type of rock to another. OR the various interrelated ways rock types form from geological processes. OR The interconversion of igneous, metamorphic and sedimentary rocks and all the processes such as weathering, transport and cementation are all part of the rock cycle.

**rock formation:** an occurrence of rock with a set of characteristics that distinguishes it from the rocks above or below it.

**rock slide:** the rapid movement of loose rock along an inclined plane.

**rock-basin lake:** a depression that is scoured out by an advancing glacier and later fills with water.

**rocketsonde:** A rocket-borne instrument for measurement and transmission of upper-air meteorological data in the lower 76,000 meters (250,000 feet) of the atmosphere, especially that portion inaccessible to radiosonde techniques.

**Rockwell:** (Hardness) A measure of the surface hardness of a material. A value derived from the increase in depth of an impression as the load of a steel indenter is increased from a fixed minimum value to a higher value and then returned to the minimum value. The values are quoted with a letter prefix corresponding to a scale relating to a given combination of load and indenter. OR Rockwell hardness is the resistance of a material to

indentation of a defined steel ball. Three scales exist (R, L and M) with different ball diameters and different levels of loading for testing materials of different hardness.

**Rockwell Hardness:** A standard method for measuring the hardness of metals. The hardness is expressed as a number related to the depth of residual penetration of a steel ball or diamond cone after a minor load of 10 kilograms has been applied to hold the penetrator in position, designated by letters varying from "A" to "H" the "B" and "C" scales are most commonly in use. OR A measure of the surface hardness of a material. A value derived from the increasing depth of an impression as the load of a steel indenter is increased from a fixed minimum value to a higher value and then returned to the minimum value. The values are quoted with a letter prefix corresponding to a scale relating to a given combination of load and indenter. OR A test for hardness (resistance to indentation) in which a hardened steel ball or diamond point is pressed into the material under test. OR A durometer measuring scale developed by the Rockwell Corporation. Hardness is measured by testing the resistance that a material has to being punctured. See "durometer" and "shore hardness." OR A measure of the surface hardness of a material. The Rockwell hardness test method consists of indenting the test material with a diamond cone or hardened steel ball indenter. See also Shore Hardness.

**rocuronium bromide:** The bromide salt form of rocuronium, an intermediate-acting quaternary aminosteroid with muscle relaxant property. Rocuronium bromide competitively binds to the nicotinic receptor at the motor end plate, and antagonizes acetylcholine binding, which results in skeletal muscle relaxation and paralysis.

**Rod:** A long, slender photoreceptor cell that functions in dim light but does not perceive color.

**rod cells:** the cells of the eye that permit vision in dim light.

**Rod Lock (Modular Belting) :** Extended rod cap, about 1-1/2 inches (38 mm) long, inserted into the module along both edges of the belt to secure rod position. The rod snaps into a notch in the outermost knuckle of the module.

**Rod Looped Edge :** An edge finish similar to the ladder edge except that reinforcing wires or connectors are extended and knuckled on themselves.

**Rod Reinforced Weave :** Fabric constructed in the same manner as Conventional Weave, and reinforced by insertion of a rod through the hinging point of the spirals.

**rodenticide:** A chemical used to kill rodents (rats).

**Rodex:** (Other name for: warfarin)

**Roentgen (R):** A unit of exposure to ionizing radiation. It is the amount of gamma or x-rays required to produce ions resulting in a charge of 0.000258 coulombs/kilogram of air under standard conditions. Named after Wilhelm Roentgen, the German scientist who discovered x-rays in 1895.

**rofecoxib:** A synthetic, nonsteroidal derivative of phenyl-furanone with antiinflammatory, antipyretic and analgesic properties and potential antineoplastic properties. Rofecoxib binds to and inhibits the enzyme cyclooxygenase-2 (COX-2), resulting in an inhibition of the conversion of arachidonic acid to prostaglandins. COX-related metabolic pathways may represent key regulators of cell proliferation and neo-angiogenesis. Some epithelial tumor cell types overexpress pro-angiogenic COX-2. or A drug that was being used for pain relief and was being studied for its ability to prevent cancer and to prevent the growth of new blood vessels that tumors need to grow. It is a type of nonsteroidal anti-inflammatory drug and a type of antiangiogenesis agent. Rofecoxib was taken off the market in the U.S. because of safety concerns. Also called Vioxx.

**Roferon-A:** (Other name for: recombinant interferon alfa)

**roflumilast:** An orally available, long-acting inhibitor of phosphodiesterase (PDE) type 4 (PDE4), with anti-inflammatory and potential antineoplastic activities. Upon administration, roflumilast and its active metabolite roflumilast N-oxide selectively and competitively bind to and inhibit PDE4, which leads to an increase of both intracellular levels of cyclic-3',5'-adenosine monophosphate (cAMP) and cAMP-mediated signaling. cAMP prevents phosphorylation of spleen tyrosine kinase (SYK) and abrogates activation of the PI3K/AKT/mTOR signaling pathway, which may result in the induction of apoptosis. PDE4, a member of the PDE superfamily that hydrolyses cAMP and 3'5'-cyclic guanosine monophosphate (cGMP) to their inactive 5' monophosphates, is upregulated in a variety of cancers and may contribute to chemoresistance; it also plays a key role in inflammation, especially in inflammatory airway diseases. Check for active clinical trials using this agent.

**ROHF:** Spin-restricted open-shell Hartree-Fock. For open-shell molecules. Except for the odd electron(s), there are two electrons in each occupied orbital. (See UHF.)

**rolapitant hydrochloride:** The hydrochloride salt form of rolapitant, an orally bioavailable, centrally-acting, selective, neurokinin 1 receptor (NK1-receptor) antagonist with potential antiemetic activity. Upon oral administration, rolapitant competitively binds to and blocks the activity of the NK1-receptor in the central nervous system, thereby inhibiting the binding of the endogenous ligand, substance P (SP). This may prevent both SP-induced emesis and chemotherapy-induced nausea and vomiting (CINV). The interaction of SP with the NK1-receptor plays a key role in the induction of nausea and vomiting caused by emetogenic cancer chemotherapy. Compared to other NK1-receptor antagonists, rolapitant has both a more rapid onset of action and a much longer half-life. or A drug used with other drugs to prevent nausea and vomiting caused by chemotherapy. Rolapitant hydrochloride blocks the action of chemicals in the central nervous system (CNS) that may trigger nausea and vomiting. It is a type of antiemetic. Also called Varubi.

**Rolling circle replication:** A mechanism for the replication of circular DNA. A nick in one strand allows the 3' end to be extended, displacing the strand with the 5' end, which is also replicated, to generate a double-stranded tail that can become larger than the unit size of the circular DNA.

**Roman chamomile :** A type of chamomile plant with daisy-like white flowers that is found in Europe, North America, and Argentina. The dried flowers are used in teas to calm and relax, to improve sleep, and to help with stomach problems. Its essential oil (scented liquid taken from plants) is used in perfumes, shampoos, face creams, lotions, and aromatherapy. The scientific names are *Chamaemelum nobile* and *Anthemis nobilis*. Also called English chamomile.

**romidepsin:** A bicyclic depsipeptide antibiotic isolated from the bacterium *Chromobacterium violaceum* with antineoplastic activity. After intracellular activation, romidepsin binds to and inhibits histone deacetylase (HDAC), resulting in alterations in gene expression and the induction of cell differentiation, cell cycle arrest, and apoptosis. This agent also inhibits hypoxia-induced angiogenesis and depletes several heat shock protein 90 (Hsp90)-dependent oncoproteins. or A drug used to treat cutaneous T-cell

lymphoma in patients who have been treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Romidepsin blocks certain enzymes, which may help kill cancer cells. It is a type of depsipeptide and a type of histone deacetylase inhibitor. Also called FR901228 and Istodax.

**romiplostim:** A recombinant protein with megakaryopoiesis stimulating activity. Romiplostim mimics endogenous thrombopoietin (TPO), directly binding to and activating the platelet thrombopoietin receptor (TpoR, Mpl, or CD110 antigen), a cytokine receptor belonging to the hematopoietin receptor superfamily. Activation of TpoR stimulates the proliferation and differentiation of megakaryocytes, resulting in an increase in the production of blood platelets. or A drug used to treat patients with immune thrombocytopenic purpura (ITP) who do not get better with other forms of treatment. In ITP, platelets (cells that cause blood clots to form) are destroyed by the immune system. Romiplostim is being studied as a way to treat low platelet counts caused by chemotherapy. It binds to the thrombopoietin receptor and causes the bone marrow to make more platelets. Romiplostim is also being studied in the treatment of myelodysplastic syndromes (a group of diseases in which the bone marrow does not make enough healthy blood cells). It is a type of thrombopoietin agonist. Also called AMG 531 and Nplate.

**ROMOLD, Inc.:** American mold builders in Western NY, with cutting edge equipment, excellent technical skills, and unique abilities in design and manufacturing of plastic injection molds and die cast tools. ISO 9001:2008 quality management system, ITAR registered.

**Romozin:** (Other name for: troglitazone)

**roniciclib:** An orally bioavailable cyclin dependent kinase (CDK) inhibitor with potential antineoplastic activity. Roniciclib selectively binds to and inhibits the activity of CDK1/Cyclin B, CDK2/Cyclin E, CDK4/Cyclin D1, and CDK9/Cyclin T1, serine/threonine kinases that play key roles in the regulation of the cell cycle progression and cellular proliferation. Inhibition of these kinases leads to cell cycle arrest during the G1/S transition, thereby leading to an induction of apoptosis, and inhibition of tumor cell proliferation. CDKs are often dysregulated in cancerous cells.

**Roof light:** Any form of skylight usually in a pitched roof but also sometimes used as a general term for any window or light in a roof.

**roots:** the structures of vascular plants that anchor them to the ground and take in water and minerals from the soil.

**ropidoxuridine:** An orally available 5-substituted 2-pyrimidinone-2'-deoxyribonucleoside analogue and prodrug of 5-iododeoxyuridine (IUdR), an iodinated analogue of deoxyuridine, with radiosensitizing activity. Upon oral administration, ropidoxuridine (IPdR) is efficiently converted to idoxuridine (IUdR) by a hepatic aldehyde oxidase. In turn, IUdR is incorporated into DNA during replication, thereby sensitizing cells to ionizing radiation by increasing DNA strand breaks. Compared to IUdR, ropidoxuridine is associated with a lower toxicity profile and improved anti-tumor activity.

**Ropiness:** The appearance of a paint film which shows coarse or heavy brush marks. OR Coarse or heavy brush marks are most likely caused either by painting onto a very porous surface, or applying paint in warm conditions. To get rid of the marks, first clean down the surfaces to remove all dirt, grease and surface contaminants. Rub down with Wet ' Dry abrasion, using water or a suitable solvent. Finally, rinse down and allow to dry thoroughly before applying a new coat of paint.

**ropinirole hydrochloride:** The hydrochloride salt form of ropinirole, a non-ergot dopamine agonist with antiparkinsonian property. Acting as a substitute for dopamine, ropinirole hydrochloride binds to and activates dopamine D2 and D3 receptors within the caudate putamen in the brain, thereby improving motor function.

**ropivacaine :** A drug used to control pain and to cause a temporary loss of feeling in one part of the body, during and after surgery. It is also being studied for pain control after cancer surgery. It is a type of local anesthetic. Also called Naropin and ropivacaine hydrochloride.

**ropivacaine hydrochloride:** The hydrochloride salt of ropivacaine, a local anesthetic of the amide type with analgesic activity. Ropivacaine binds to voltage-gated sodium ion channels in the neuronal membrane, thereby preventing the permeability of sodium ions and resulting in a stabilization of the neuronal membrane and inhibition of depolarization; nerve impulse generation and propagation are blocked, resulting in a reversible loss of sensation. or A drug used to control pain and to cause a temporary loss of feeling in one part of the body, during and after surgery. It is also being

studied for pain control after cancer surgery. It is a type of local anesthetic. Also called Naropin and ropivacaine.

**roquinimex:** A quinoline-3-carboxamide with potential antineoplastic activity. Roquinimex inhibits endothelial cell proliferation, migration, and basement membrane invasion; reduces the secretion of the angiogenic factor tumor necrosis factor alpha by tumor-associated macrophages (TAMs); and inhibits angiogenesis. This agent is also an immune modulator that appears to alter cytokine profiles and enhance the activity of T cells, natural killer cells, and macrophages.

**ROR1 CAR-specific autologous T lymphocytes:** A mixture of two T-lymphocyte preparations expressing a chimeric antigen receptor (CAR) consisting of an anti-receptor tyrosine kinase-like orphan receptor 1 (ROR1) single chain variable fragment (scFv) fused to either the co-stimulatory signaling domain cluster of differentiation 28 (CD28), and the zeta chain of the T-cell receptor (TCR)/CD3 complex (CD3-zeta) (ROR1CD28zeta), or the co-stimulatory signaling domain cluster of differentiation 137 (CD137; 4-1BB), and the zeta chain of the T-cell receptor (TCR)/CD3 complex (CD3-zeta) (ROR1CD137zeta), with potential immunomodulating and antineoplastic activities. Upon simultaneous administration of the two T lymphocyte populations ROR1CD28zeta and ROR1CD137zeta, the ROR1 CAR-specific autologous T-lymphocytes are directed to tumor cells expressing ROR1, which may result in a selective toxicity against, and lysis of ROR1-expressing tumor cells. CD28, a T-cell surface-associated co-stimulatory molecule, is required for full T-cell activation, proliferation, and survival. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of ROR1. ROR1, also known as neurotrophic tyrosine kinase, receptor-related 1, is expressed during embryogenesis and by certain leukemias. Check for active clinical trials using this agent.

**ROS1 gene :** A gene that makes a protein called ROS1, which is involved in sending signals in cells and in cell growth. Mutated (changed) forms of the ROS1 gene have been found in some types of cancer, including non-small cell lung cancer (NSCLC), a type of brain cancer called glioblastoma multiforme, and cancers of the bile duct, ovary, stomach, colon, and rectum. ROS1 is a type of receptor tyrosine kinase.

**rosiglitazone** : The active ingredient in a drug that helps control the amount of glucose (sugar) in the blood and is being studied in the prevention and treatment of some types of cancer. Rosiglitazone stops cells from growing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of thiazolidinedione and a type of antiangiogenesis agent.

**rosiglitazone maleate**: The maleate salt of rosiglitazone, an orally-active thiazolidinedione with antidiabetic properties and potential antineoplastic activity. Rosiglitazone activates peroxisome proliferator-activated receptor gamma (PPAR-gamma), a ligand-activated transcription factor, thereby inducing cell differentiation and inhibiting cell growth and angiogenesis. This agent also modulates the transcription of insulin-responsive genes, inhibits macrophage and monocyte activation, and stimulates adipocyte differentiation. Check for active clinical trials using this agent. or A drug that helps control the amount of glucose (sugar) in the blood and is being studied in the prevention and treatment of some types of cancer. Rosiglitazone maleate stops cells from growing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of thiazolidinedione and a type of antiangiogenesis agent. Also called Avandia.

**Rosin**: Rosin, also colophony, hard, brittle, translucent, usually amber-colored resin, that is obtained as the residue in the distillation of turpentine. The rosin prepared from exuded, or gum, turpentine is called gum rosin; that obtained from extracted, or wood, turpentine is called wood rosin. Rosin has a specific gravity of about 1.08. It is soluble in alcohol, ether, and other organic solvents and is insoluble in water. Rosin softens when heated to about 80° C (about 176° F) and melts between 120° and 135° C (248° and 275° F). It is one of the most important resins commercially and is used extensively in making varnishes, paints, and soaps; in the manufacture of linoleum; in sizing paper; as a drier in oils; as a flux for solder; and as an adulterant of more costly resins. It is also used to treat violin bows and dancing slippers. OR The hard resin, amber to black in color, left after the distillation of turpentine.

**Rosita Beati Natta**: Inventor of the nomenclature used to describe the stereochemistry of polymers - atactic, for polymers with no long range order; isotactic, for polymers in which all the side groups are on the same

side of the backbone chain; and syndiotactic, for polymers in which the side groups alternate from one side to another.

**rostaporfin:** A synthetic purpurin with photosensitizing activity.

Rostaporfin preferentially accumulates in tumor cells due to an increased rate of metabolism. Upon exposure to a light source, this agent absorbs light, forming an extended high energy conformational state that produces high quantum yields of singlet oxygen with local cytotoxic effects. Check for active clinical trials using this agent.

**rosuvastatin calcium:** The calcium salt form of rosuvastatin, a statin with antilipidemic activity. Rosuvastatin selectively and competitively binds to and inhibits hepatic hydroxymethyl-glutaryl coenzyme A (HMG-CoA) reductase, the enzyme which catalyzes the conversion of HMG-CoA to mevalonate, a precursor of cholesterol. This leads to a decrease in hepatic cholesterol levels and increase in uptake of LDL cholesterol. Check for active clinical trials using this agent. or A drug used to lower the amount of cholesterol and other harmful substances, such as triglycerides, in the blood. It is also being studied in the prevention and treatment of some types of cancer and other conditions. Rosuvastatin calcium blocks an enzyme that helps make cholesterol in the body and it helps break down cholesterol. It also may cause cancer cells to die and may inhibit the growth of blood vessels that cancer cells need to grow. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called Crestor.

**Roswell Park regimen :** A chemotherapy combination used to treat colorectal cancer. It is also used with radiation therapy to treat esophageal cancer and stomach cancer. It includes the drugs fluorouracil and leucovorin calcium.

**Rotarix:** (Other name for: rotavirus vaccine)

**Rotary Forming:** A thermoforming process consisting of multiple stations on a rotary table.

**Rotary Seal:** Seals for rotating shafts, with the turning shaft protruding through the I.D. (hole) of the O-ring

**rotation:** the ability of carbon atoms attached by single bonds to freely turn, which gives the molecule an infinite number of conformations.

**Rotation axis:** A symmetry element involving an n-fold rotation about an axis.

**Rotational Molding:** A process also known as rotomolding or rotational casting is used for the manufacture of hollow plastics including large storage tanks. It involves placing a thermoplastic powder into a mold, heating the mold in an oven while rotating the mold into perpendicular axes simultaneously. OR A process also known as rotomolding or rotational casting is used for the manufacture of hollow plastics including large storage tanks. It involves placing a thermoplastic powder into a mold, heating the mold in an oven while rotating the mold into perpendicular axes simultaneously.

**rotationplasty :** Surgery used to remove a tumor in or near the knee joint, often in young people who are still growing. The knee and part of the thigh are removed. The part of the leg that remains below the knee is then attached to the part of the leg above the knee, with the foot facing backward and the ankle joint acting as a new knee. The patient is then fitted with an artificial lower leg and foot.

**Rotatory-inversion axis:** A symmetry element involving an n-fold rotation followed by an inversion. Also called a center of symmetry.

**rotavirus vaccine:** A viral vaccine that prevents against rotavirus infection, the leading cause of severe acute gastroenteritis.

**Rotenone:** A plant toxin that inhibits electron transfer in the NADH-Q reductase complex; used as a fish and insect poison.

**Rothmund-Thomson syndrome :** A rare inherited disorder that affects the skin and many other parts of the body, including the bones, eyes, nose, hair, nails, teeth, testes, and ovaries. People with Rothmund-Thomson syndrome have an increased risk of osteosarcoma (bone cancer). Also called RTS.

**Rotten wood:** Simply run a pen knife blade across the grain. This will only make a small indentation on sound timber, but on rotten timber the blade will sink in. The only cure is to cut out all the rotten wood and replace with sound timber.

**Rough cast:** A term often used incorrectly for rough-surfaced rendering; correctly the term applied to a final coating of small stones or chippings mixed with a liquid mixture of mortar or cement and sand, and 'cast' or thrown onto the wall or rendering to produce a rough-textured finish.

**rough endoplasmic reticulum:** ER studded with ribosomes; the site of protein synthesis in eukaryotic cells.

**Round:** Describes a heavy-bodied paint or one having good build and opacity.

**Round coat:** Usually refers to the liberal application of a full coat of paint.

**Round Square:** Particular shape of a container which has sides of equal width with well-rounded corners and shoulders.

**Round Wire Sizes :** Round wire sizes generally referred to are the nearest American Steel and Wire or W & M gauge number with its decimal equivalent and are supplied within the standard wire tolerances of wire manufacturers.

**rounding:** the smoothing of rock fragments during transportation.

**Roundtable for Sustainable Palm Oil (RSPO):** An organization formed in 2004 to help promote sustainable agriculture and address the environmental impact of palm oil. This organization is comprised of many stakeholders, including government agencies, NGO groups, plantation owners and growers, and oil traders.

**rovalpituzumab tesirine:** An antibody-drug conjugate (ADC) containing an antibody (SC16) directed against an as of yet undisclosed protein and conjugated to the cytotoxic agent D6.5, with potential antineoplastic activity. Upon administration, the antibody moiety of rovalpituzumab tesirine selectively binds to the target on tumor cell surfaces. Upon internalization, the D6.5 moiety is released and causes DNA damage, which may result in the inhibition of proliferation of tumor cells that overexpress this target.

**Roving:** Endless glass fibre bundles. A collection of parallel strands (assembled roving) or parallel filaments (direct roving) assembled without intentional twist.

**Rowasa:** (Other name for: mesalamine)

**Roxanol:** (Other name for: morphine sulfate)

**Roxicodone:** (Other name for: oxycodone hydrochloride)

**Rozerem:** (Other name for: ramelteon)

**RP-Mycin:** (Other name for: erythromycin)

**RPI.4610:** A substance being studied in the treatment of cancer. RPI.4610 is a special type of RNA made in the laboratory. It stops a protein called vascular endothelial growth factor receptor (VEGFR) from being made.

This may prevent the growth of new blood vessels that tumors need to grow. It is a type of angiogenesis inhibitor and a type of ribozyme. Also called Angiozyme.

**RPR 109881A:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called taxanes.

**rRNA:** ribosomal RNA; RNA molecules that function to manufacture ribosomes. OR See ribosomal RNA.

**RSJ:** Rolled steel joist.

**RSR13:** A substance being studied in the treatment of brain tumors and some other types of cancer. It increases the amount of oxygen in tumor tissues, which may make the tumor cells easier to kill with radiation therapy. RSR13 is a type of radiosensitizing agent. Also called efaproxiral.

**RSV:** A virus that causes respiratory infections with cold-like symptoms. Also called respiratory syncytial virus.

**RSV fusion inhibitor GS-5806:** An orally available inhibitor of human respiratory syncytial virus (RSV) fusion protein (F protein), with potential antiviral activity. Upon oral administration of GS-5806, this agent specifically binds to F protein on the viral surface, which inhibits RSV F protein-mediated fusion with the host cell membrane and prevents viral entry. This blocks RSV replication, reduces viral load, and decreases the severity of the disease. RSV F protein, a viral surface glycoprotein, plays a key role in RSV fusion with and entry into target cells.

**RTA 744:** A substance being studied in the treatment of adult brain tumors. RTA 744 crosses the blood-brain barrier and blocks an enzyme needed for cancer growth. It is a type of topoisomerase inhibitor. Also called topoisomerase II inhibitor RTA 744.

**RTS:** A rare inherited disorder that affects the skin and many other parts of the body, including the bones, eyes, nose, hair, nails, teeth, testes, and ovaries. People with RTS have an increased risk of osteosarcoma (bone cancer). Also called Rothmund-Thomson syndrome.

**RTV Molding:** A procedure where a part is molded in a silicone mold to reproduce up to twenty urethane parts

**RU 486:** A drug used to end early pregnancies. It is also being studied in the treatment of some types of cancer and other conditions. RU 486 blocks

the action of progesterone, a hormone that helps some cancers grow. It is a type of antiprogesterone. Also called Mifeprex and mifepristone.

**RUBBER:** An elastomer capable of rapid elastic recovery after being stretched to at least twice its length at temperatures from 0 to 150°F at any humidity. OR A common name for both naturally occurring and synthetically made elastomers like liquid silicone rubber OR An elastomer capable of rapid elastic recovery after being stretched to at least twice its length at temperatures from 0 to 150 degrees F, at any humidity.

Specifically, heavy or natural rubber, the standard of comparison for elastomers. OR An elastomer capable of rapid elastic recovery after being stretched to at least twice its length at temperatures from 0 to 150°F at any humidity. OR An amorphous material somewhat above its glass transition temperature and having a rubbery consistency.

**Rubber Synthetic:** Man-made elastomers such as Nitrile, Fluorocarbon, Silicone and liquid Silicone rubber

**Rubber-Natural:** A natural product of the juices of certain tropical plants (latex), improved through heat treating with sulfur (vulcanization)

**Rubbery state:** The state of an amorphous material at a temperature above its glass transition temperature and below the temperature of liquefaction.

**Rubbing down:** Preparation of a surface by use of abrasive materials, e.g. glasspaper to obtain a smooth surface for painting over or to provide a 'key' for subsequent coats.

**Rubblization:** A decommissioning technique involving demolition and burial of formerly operating nuclear facilities. All equipment from buildings is removed and the surfaces are decontaminated. Above-grade structures are demolished into rubble and buried in the structure's foundation below ground. The site surface is then covered, regraded and, landscaped for unrestricted use.

**Rubidium:** Symbol:"Rb" Atomic Number:"37" Atomic Mass: 85.47amu. One of the alkali metal group. This silvery-white, metallic element can be found in many alloys and amalgams.

**Rubinstein-Taybi syndrome :** A rare, genetic disorder marked by being short, having wide big toes and thumbs, certain facial features, and problems in developing and learning. Other problems may include heart and kidney defects, eye and dental problems, and obesity. People with

Rubinstein syndrome have an increased risk of some types of leukemia and brain tumors.

**Rubisco (ribulose 1,5-bisphosphate carboxylase/oxygenase):** An enzyme that catalyzes the reaction of carbon dioxide with ribulose 1,5-bisphosphate to form two molecules of 3-phosphoglycerate.

**rubitecan:** A semisynthetic agent related to camptothecin with potent antitumor and antiviral properties. Rubitecan binds to and inhibits the enzyme topoisomerase I and induces protein-linked DNA single-strand breaks, thereby blocking DNA and RNA synthesis in dividing cells; this agent also prevents repair of reversible single-strand DNA breaks.

**rucaparib:** A tricyclic indole poly(ADP-Ribose) polymerase (PARP1) inhibitor with potential chemosensitizing, radiosensitizing, and antineoplastic activities. Rucaparib selectively binds to PARP1 and inhibits PARP1-mediated DNA repair, thereby enhancing the accumulation of DNA strand breaks and promoting genomic instability and apoptosis. This may enhance the cytotoxicity of DNA-damaging agents and reverse tumor cell resistance to chemotherapy and radiation therapy. PARP1 catalyzes post-translational ADP-ribosylation of nuclear proteins and is activated by single-strand DNA (ssDNA) breaks.

**run-on sentence:** or comma splice is an error in which two independent clauses are joined without the proper punctuation.

**Runner:** Grooves or channels cut into either or both halves of the injection mold to provide a path for the molten plastic material, which is to be carried from the sprue to the gate(s) of the cavity. OR In an injection mold, the feed channel, usually of circular cross section, that connects the sprue with the cavity gate. The term is also used for the plastic piece formed in this channel. OR A channel that resin passes through from the sprue to the gate/s. Typically, runners are parallel to, and contained within, the parting surfaces of the mold. OR In an injection or transfer mold, the channel, usually circular, that connects the spruce with the gate to the cavity. OR In an injection or transfer mold, the channel that connects the sprue with the gate to the cavity. OR In an injection or transfer mold, the channel that connects the sprue with the gate to the cavity.

**Runner Balancing:** Developing a runner system which delivers the required amount of melt to each cavity with the correct pressure to finish filling all the cavities simultaneously at the correct temperature for the part.

**Runner Design :** using the runner as a flow control device (positioning the gate and using the size of the runner to control the filling pattern within the cavity) in addition to getting the melt into the cavity.

**Runner Layout:** It is the channels used to get the melt from the machine nozzle to the gates.

**Runner System :** This term is sometimes used for the entire resin feeding system, including sprues, runners and gates, in injection molding. OR The term usually applied to all the material in the form of sprues, runners and gates which lead material from the nozzle of an injection machine or the pot of a transfer mold to the mold cavity.

**Runnerless Molding:** (also see Hot-Runner Mold or Insulated Runner) A mold in which the runners are insulated from the chilled cavities and are kept hot. Hot-runner molds make parts that have no scrap.

**Runnerless Molding (also known as Hot-Runner Mold or Insulated Runner):** A mold in which the runners are insulated from the chilled cavities and are kept hot. Hot-runner molds make parts that have no scrap.

**Runnerm:** The channel that connects the sprue with the gate for transferring the molten liquid silicone rubber to the cavities

**runoff:** That part of precipitation, snowmelt, or irrigation water that flows from the land to streams or other surface waters.

**Runs:** Narrow dribbles or tears of paint caused by excess flowing out of crevices and quirks or from edges or corners and usually due to insufficient spreading or care during application. OR Blemished film caused by excessive flow of coating.

**Rust :** When iron reacts with water and oxygen, rust is formed. Chemically it could be called hydrated iron oxide. Although other metals may corrode, only iron can be said to rust. The need for water AND oxygen can be demonstrated in an experiment using boiled water to provide water but no oxygen and using a sealed test tube containing anhydrous calcium chloride to provide air with no trace of water. Prevention of rust is an important topic. Techniques include coating the iron (eg paint, oil, grease etc) or using electrical protection (such as sacrificial anode).

**RUST PREVENTATIVE:** A compound or formulated system used for coating metal surfaces to produce a film which protects against rust formation

**RUST PREVENTATIVE PAINT:** The first coat of paint applied directly to iron or steel structures to slow down or prevent rust.

**Rustic brick:** Bricks having a rough-textured surface, often multi-coloured and probably derived from rusticated masonry which is composed of unhewn stones.

**rusting:** Rusting is a reaction between iron (or steel) with oxygen and water resulting in corrosion.

**Ruthenium:** Symbol:"Ru" Atomic Number:"44" Atomic Mass: 101.07amu. Ruthenium is one of the transition elements. One of the members of the platinum group, this white metal can be found in alloys and corrosion resistant metals.

**ruthenium Ru 106:** A radioactive isotope of the rare element ruthenium, a member of the light platinum group. A radioactive plaque containing ruthenium 106 may be inserted into the eye to irradiate ophthalmic tumors.

**ruthenium-based transferrin targeting agent NKP-1339:** A ruthenium-containing cancer agent targeting transferrin with potential antineoplastic activity. Upon intravenous administration, NKP-1339 (Ru<sup>3+</sup>) binds to transferrin (Tf) and is taken up via Tf receptors (TfR), which are overexpressed on cancer cells. Once inside the cell, NKP-1339 is released from Tf and is reduced, within the acidic environment of the endosomes, to its active form NKP-119 (Ru<sup>2+</sup>). In turn, the active form induces a redox reaction, thereby leading to the formation of reactive oxygen species (ROS) which inhibits GRP78 and SOD, endoplasmic reticulum-stress modulating molecules as well as BAG4 and ERK, program cell death regulating molecules. This eventually induces caspase-dependent apoptosis. Check for active clinical trials using this agent.

**Rutherfordium:** Symbol:"Rf" Atomic Number:"104" Atomic Mass: (261)amu One of the postactinide elements. Scientists have created these in labs and may have found only a few atoms of the element. You will not find these in use anywhere.

**ruxolitinib phosphate:** The phosphate salt form of ruxolitinib, an orally bioavailable Janus-associated kinase (JAK) inhibitor with potential antineoplastic and immunomodulating activities. Ruxolitinib specifically binds to and inhibits protein tyrosine kinases JAK 1 and 2, which may lead to a reduction in inflammation and an inhibition of cellular proliferation. The JAK-STAT (signal transducer and activator of transcription) pathway

plays a key role in the signaling of many cytokines and growth factors and is involved in cellular proliferation, growth, hematopoiesis, and the immune response; JAK kinases may be upregulated in inflammatory diseases, myeloproliferative disorders, and various malignancies. Check for active clinical trials using this agent. or A drug used to treat polycythemia vera in patients who cannot be treated with or have not gotten better with hydroxyurea. It is also used to treat certain types of myelofibrosis. It is being studied in the treatment of other blood diseases and some types of cancer. Ruxolitinib phosphate blocks a protein called JAK, which may help keep abnormal blood cells or cancer cells from growing. It is a type of tyrosine kinase inhibitor. Also called Jakafi.

**rV-TRICOM :** A cancer vaccine made with a form of a vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called recombinant vaccinia-TRICOM vaccine and vaccinia-TRICOM vaccine.

**RWH:** Rain water head; the hopper or box at the top of a rainwater pipe into which several gutters or pipes discharge.

**RWP:** Rain water pipe.

**S body wave:** a body wave, only about half as fast as a P wave, that causes rock to vibrate perpendicularly to the direction of wave travel.

**S phase:** the phase within the cell division cycle in which DNA is replicated.

**S-1:** A drug that is being studied for its ability to enhance the effectiveness of fluorouracil and prevent gastrointestinal side effects caused by fluorouracil. It belongs to the family of drugs called antimetabolites.

**S-3304:** An orally-agent agent with potential antineoplastic activity. S-3304 inhibits matrix metalloproteinases (MMPs), thereby inducing extracellular matrix degradation, and inhibiting angiogenesis, tumor growth and invasion, and metastasis.

**S-adenosyl-L-methionine disulfate p-toluene-sulfonate:** The disulfate salt of the stable p-toluene-sulfonate complex of s-adenosyl-L-methionine (SAME) with chemopreventive activity. SAME disulfate p-toluene-sulfonate undergoes hydrolytic conversion to its active compound SAME within cells.

Although the mechanism of action is largely unknown, SAMe attenuates experimental liver damage and prevents experimental hepatocarcinogenesis. In addition, SAMe may reduce mitochondrial cytochrome C release, caspase 3 activation, and poly(ADP-ribose) polymerase cleavage, and attenuate okadaic acid-mediated hepatocyte apoptosis in a dose-dependent manner. SAMe is an essential compound in cellular transmethylation reactions and a precursor of polyamine and glutathione synthesis in the liver; SAMe deficiency is associated with chronic liver disease-associated decreases in the activity of methionine adenosyltransferase 1A (MAT1A), the enzyme that catalyzes the production of SAMe as the first step in methionine catabolism.

**S-adenosylmethionine:** The active sulfonium form of methionine that is formed when methionine reacts with ATP and which acts as a methyl group donor in various transmethylation reactions. Check for active clinical trials using this agent.

**S-adenosylmethionine (adoMet):** An enzymatic cofactor involved in methyl group transfers.

**S-equol:** An orally bioavailable, non-steroidal estrogen naturally produced by the metabolism of the isoflavonoid daidzein by human intestinal microflora, with potential chemoprotective and estrogen receptor (ER) modulating activities. S-equol preferentially binds to and activates the beta isoform of ER in certain target tissues, while having an antagonistic effect in other tissues. This modulates the expression of ER-responsive genes in a tissue-specific manner. This agent may increase bone mineral density, affect vasomotor symptoms, and may decrease the proliferation rate of susceptible cancer cells. In addition, this agent interferes with the activity of enzymes involved in steroid biosynthesis. S-equol inhibits dihydrotestosterone (DHT) production and may inhibit the proliferation of androgen-driven prostate cancer. S-equol is the biologically active enantiomer while R-equol is essentially inactive and has a weak affinity for alpha-ER.

**S-phase fraction :** A measure of the percentage of cells in a tumor that are in the phase of the cell cycle during which DNA is synthesized. The S-phase fraction may be used with the proliferative index to give a more complete understanding of how fast a tumor is growing.

**S-wave shadow zone:** the area on the earth's surface in which S waves from an earthquake cannot be detected.

**S-waves:** secondary waves created by an earthquake; these shearing waves move at right angles to the path of travel and are stronger than P-waves, but only move through solids.

**S1 fragments:** Proteolytic digestion products of myosin that are the force-generating units of the intact myosin molecule; the S1 fragment contains the atpase and actin-binding sites.

**S1 heads:** Proteolytic digestion products of myosin that are the force-generating units of the intact myosin molecule; contain the atpase and actin-binding sites; S1 heads are smaller than heavy meromyosin.

**S100 calcium binding protein A8 :** A protein that is made by many different types of cells and is involved in processes that take place both inside and outside of the cell. It is made in larger amounts in inflammatory diseases such as rheumatoid arthritis, and in some types of cancer. It is being studied as a biomarker for breast cancer. Also called calgranulin A.

**S100 calcium binding protein A9 :** A protein that is made by many different types of cells and is involved in processes that take place both inside and outside of the cell. It is made in larger amounts in inflammatory diseases such as rheumatoid arthritis, and in some types of cancer. It is being studied as a biomarker for breast cancer. Also called calgranulin B.

**S1P receptor agonist KRP203:** The hydrochloride salt form of 2-amino-2 propanediol (KRP-203), a sphingosine 1-phosphate (S1P) receptor agonist, with potential immunosuppressive activity. Upon administration of S1P receptor agonist KRP203, this agent binds to S1P receptors on lymphocytes, which prevents binding of serum S1P to S1P receptors and leads to S1P receptor internalization. This reduces the number of circulating blood leukocytes and accelerates lymphocyte homing into peripheral lymph nodes, thereby preventing their infiltration into peripheral inflammatory sites. This agent also decreases the production of inflammatory cytokines by lymphocytes, such as interferon gamma (IFN-g), interleukin-12 (IL-12), and tumor necrosis factor (TNF). Check for active clinical trials using this agent.

**SAB:** A temporary loss of feeling in the abdomen and/or the lower part of the body. Special drugs called anesthetics are injected into the fluid in the lower part of the spinal column to cause the loss of feeling. The patient stays awake during the procedure. It is a type of regional anesthesia. Also called spinal anesthesia, spinal block, and subarachnoid block.

**sabarubicin:** A disaccharide analogue of the anthracycline antineoplastic antibiotic doxorubicin. Sabarubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent also induces apoptosis through a p53-independent mechanism. Sabarubicin is less cardiotoxic than doxorubicin.

**Saccharide:** A simple saccharide, or sugar, is a molecule that is simply lousy with alcohol groups so that it has the general chemical formula  $C_nO_nH_{2n}$ . There are big chemical differences between them depending on the exact geometry of the hydroxyl groups, so there are a lot more different kinds than you think. We tend to give them trivial names, like 'glucose' and 'galactose', since all their structures look pretty much the same and their systematic names would be too... These 'monosaccharides' can join together to form disaccharides (two sugars joined together) or larger chemical structures.

**saccharin:** A compound,  $C_7H_5NO_3S$ , that is several hundred times sweeter than can sugar and is used as a calorie-free sweetener.

**Saccharomyces boulardii probiotic supplement:** A probiotic containing the non-pathogenic yeast *Saccharomyces boulardii* with antidiarrheal and potential anti-inflammatory, antimicrobial and immunomodulating activities. As a dietary supplement, *S. boulardii* may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal intestinal microflora. During colonization of the GI tract, *S. boulardii* forms a protective barrier that helps maintain the integrity of the epithelial barrier. This prevents attachment of pathogens to the intestinal mucosa. In addition, this probiotic secretes a protease that binds to and degrades toxins A and B produced by *Clostridium difficile*, thereby preventing their harmful effects. Dietary supplementation with this microorganism may reduce the secretion of proinflammatory cytokines and may potentiate natural and acquired immunity.

**sacituzumab govitecan:** An antibody-drug conjugate containing the humanized monoclonal antibody, hRS7, against tumor-associated calcium signal transducer 2 (TACSTD2 or TROP2) and linked to the active metabolite of irinotecan, 7-ethyl-10-hydroxycamptothecin (SN-38), with potential antineoplastic activity. The antibody moiety of sacituzumab govitecan selectively binds to TROP2. After internalization and proteolytic

cleavage, SN-38 selectively stabilizes topoisomerase I-DNA covalent complexes, resulting in DNA breaks that inhibit DNA replication and trigger apoptosis. TROP2, also known as epithelial glycoprotein-1 (EGP-1), is a transmembrane calcium signal transducer that is overexpressed by a variety of human epithelial carcinomas; this antigen is involved in the regulation of cell-cell adhesion and its expression is associated with increased cancer growth, aggressiveness and metastasis.

**Sacrificial anode** : Iron can be protected from rusting by connecting a more reactive metal (such as magnesium) to it. The magnesium reacts in preference to the iron and, if the magnesium is placed in an easily accessible location, it can be replaced more easily than the iron structure.

**sacrificial protection:** Sacrificial protection is the use of a metal more reactive than iron to protect an iron object from rusting.

**sacrum** : The large, triangle-shaped bone in the lower spine that forms part of the pelvis. It is made of 5 fused bones of the spine.

**Safe shutdown earthquake:** Is the maximum earthquake potential for which certain structures, systems, and components, important to safety, are designed to sustain and remain functional.

**Safeguards:** The use of material control and accounting programs to verify that all special nuclear material is properly controlled and accounted for, as well as the physical protection (or physical security) equipment and security forces. As used by the International Atomic Energy Agency, this term also means verifying that the peaceful use commitments made in binding nonproliferation agreements, both bilateral and multilateral, are honored. For additional detail, see Nuclear Security and Safeguards.

**Safeguards information (SGI):** A special category of sensitive unclassified information that must be protected. Safeguards information concerns the physical protection of operating power reactors, spent fuel shipments, strategic special nuclear material, or other radioactive material. For additional detail, see Information Security.

**Safety Conscious Work Environment:** A working environment in which employees are encouraged to report safety concerns without fear of criticism or retaliation from their supervisors because they raised the issue.

**safety factors (in food additives and contaminants):** A factor applied to the no-observed-effect level to derive acceptable daily intake (ADI) (the no-

observed-effect level is divided by the safety factor to calculate the ADI). The value of the safety factor depends on the nature of the toxic effect, the size and type of population to be protected, and the quality of the toxicological information available (WHO, 1987).

**Safety injection:** The rapid insertion of a chemically soluble neutron poison (such as boric acid) into the reactor coolant system to ensure reactor shutdown.

**Safety limit:** A restriction or range placed upon important process variables that are necessary to reasonably protect the integrity of the physical barriers that guard against the uncontrolled release of radioactivity.

**Safety-related:** In the regulatory arena, this term applies to systems, structures, components, procedures, and controls (of a facility or process) that are relied upon to remain functional during and following design-basis events. Their functionality ensures that key regulatory criteria, such as levels of radioactivity released, are met. Examples of safety-related functions include shutting down a nuclear reactor and maintaining it in a safe-shutdown condition.

**Safety-significant:** When used to qualify an object, such as a system, structure, component, or accident sequence, this term identifies that object as having an impact on safety, whether determined through risk analysis or other means, that exceeds a predetermined significance criterion.

**Saffir-Simpson scale:** scale for measuring hurricane intensity, from Category I to Category V.

**safingol:** A saturated derivative of sphingosine. As an inhibitor of protein kinase C (PKC), safingol competitively binds to the regulatory phorbol-binding domain of PKC, a kinase involved in tumorigenesis. This agent has been shown to act synergistically with other chemotherapeutic agents and may potentiate chemotherapy drug-induced apoptosis in vitro and in vivo. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called protein kinase inhibitors. Also called L-threo-dihydro-sphingosine.

**SAFSTOR:** A method of decommissioning in which a nuclear facility is placed and maintained in a condition that allows the facility to be safely stored and subsequently decontaminated (deferred decontamination) to levels that permit release for unrestricted use.

**Sagging (curtaining):** Usually occurs on vertical surfaces where paint has been too thickly and unevenly applied resulting in 'horizontal runs' with a thick lower edge.

**sagopilone:** A fully synthetic low-molecular-weight epothilone with potential antineoplastic activity. Sagopilone binds to tubulin and induces microtubule polymerization while stabilizing microtubules against depolymerization, which may result in the inhibition of cell division, the induction of G2/M arrest, and apoptosis. The agent is not a substrate for the P-glycoprotein (P-gp) efflux pump and so may exhibit activity in multidrug-resistant (MDR) tumors. The epothilone class of metabolites was originally isolated from the myxobacterium *Solangium cellulosum*.

**SAGS:** Excessive flow, causing runs or sagging in paint film during application. Usually caused by applying too heavy a coat of paint or thinning too much.

**Sags and runs on new paintwork:** This is usually caused by uneven paint application on broad, flat surfaces, or by over-applying on mouldings or rough-contoured surfaces. Also, failing to join up 'wet edges' before they have set can cause excessive film thickness, resulting in sagging and running. When the paint film is thoroughly dry rub down the sags/runs using wet and dry abrasive paper (or waterproof silicon carbide) together with warm water and detergent. To prevent sags/runs when painting broad, flat areas, work systematically and cross-brush each section into the next; finally using vertical strokes to gently lay off along the length of the surface.

**SAHA :** A drug that is used to treat cutaneous T-cell lymphoma that does not get better, gets worse, or comes back during or after treatment with other drugs. It is also being studied in the treatment of other types of cancer. SAHA is a type of histone deacetylase inhibitor. Also called suberoylanilide hydroxamic acid, vorinostat, and Zolinza.

**Salagen:** (Other name for: pilocarpine hydrochloride)

**salifiable:** Capable of reacting with an acid to form a salt. Lavoisier classified lime, baryta, alumina, and silica as "salifiable earths".

**saline :** A solution of salt and water.

**salinity:** (1) the relative concentration of salts, usually sodium chloride, in a given water. It is usually expressed in terms of the number of ppm of

chloride. (2) a measure of the concentration of dissolved mineral substances in water. OR amount of dissolved salts in water. OR The degree of salt in water.

**salirasib:** A salicylic acid derivative with potential antineoplastic activity. Salirasib dislodges all Ras isoforms from their membrane-anchoring sites, thereby preventing activation of RAS signaling cascades that mediated cell proliferation, differentiation, and senescence. RAS signaling is believed to be abnormally activated in one-third of human cancers, including cancers of the pancreas, colon, lung and breast.

**saliva :** The watery fluid in the mouth made by the salivary glands. Saliva moistens food to help digestion and it helps protect the mouth against infections.

**salivary gland :** A gland in the mouth that produces saliva. OR the parotid glands, the submaxillary glands, and the sublingual glands that secrete saliva into the mouth.

**salivary gland cancer :** A rare cancer that forms in tissues of a salivary gland (gland in the mouth that makes saliva). Most salivary gland cancers occur in older people.

**salmonella VNP20009:** A genetically stable Salmonella typhimurium strain, attenuated by chromosomal deletion of the purI and msbB genes, with tumor-targeting activity. In rodent models, salmonella VNP20009 has been shown to selectively accumulate and grow in a variety of tumor types, inhibiting the growth of primary and metastatic tumors. This agent may be genetically engineered to contain transgenes that express therapeutic agents or cell surface tumor-associated antigen-specific antibodies, such as CEA-specific antibodies, which may improve its tumor targeting and therapeutic potential.

**salpingo-oophorectomy :** Surgical removal of the fallopian tubes and ovaries.

**salt:** any compound formed by combination of any negative ion (except hydroxide) with any positive ion (except hydrogen or hydronium); the precipitate produced as the result of neutralization of an acid with a base. OR An ionic compound with a positive ion that comes from a base and a negative ion that comes from an acid. OR When you mix an acid and a base, the ionic compounds dissociate. In solution, the H and OH ions combine to form water. The other two ions combine to create a salt. A good

example of a salt is NaCl when it is formed by solutions of NaOH (base) and HCl (acid). OR a solid compound composed of both metallic and nonmetallic elements, often as ions.

**Salt bridge:** a technique for isolating the reference element of a reference electrode from the sample solution by use of an intermediate solution containing noninterfering ions. Formerly a U tube filled with saturated KCl (often gelled with agar) was commonly used. In the double junction reference electrode, the outer filling solution serves as a salt bridge. OR A tube (often filled with ion-laced agar) that allows two solutions to be in electrical contact without mixing in an electrochemical cell.

**salt dome:** a vertical column of rock salt that extends upward through a sedimentary sequence, creating folds and faults that trap petroleum.

**salt flat:** a flat surface area covered by salt that precipitated by evaporation.

**Salt staining on plywood:** Salt staining can appear on wood stained exterior grade plywood, especially on eaves and soffits. Salts are contained in the adhesive used to bond the layers of plywood together. Because wood stains are very permeable, they can bring these salts to the surface of the wood. Rainwater will normally remove these salty deposits, except in sheltered areas such as soffits and eaves. The only way to remove these deposits is to wash them down until they no longer appear. For further guidance, see BS 6150 Section 26.

**SALT THICKENING:** The increase in viscosity of a micellar solution on the addition of an electrolyte, such as sodium chloride. This is a similar effect to that seen with THICKENERS, but by a different mechanism.

**salt water intrusion:** The invasion of fresh, surface, or groundwater by salt water.

**saltation:** of water, the process in which turbulent or eddying currents temporarily lift larger sediment grains into the overlying flow of water. OR of wind, the process in which air currents temporarily lift larger sediment grains into the air.

**Salting in:** The increase in solubility that is displayed by typical globular proteins upon the addition of small amounts of certain salts, such as ammonium sulfate.

**Salting out:** The decrease in protein solubility that occurs when salts such as ammonium sulfate are present at high concentrations. OR A protein purification technique based on the fact that the solubility of most proteins is lowered at higher salt concentrations; consequently, different proteins will precipitate at varying salt concentrations.

**salts:** Ionic compounds that can be formed by replacing one or more of the hydrogen ions of an acid with another positive ion. OR Salts are compounds formed in neutralization reactions. They are ionic compounds, containing positive metal ions (or ammonium ions) bonded to negatively charged ions originating from an acid. Examples include sodium chloride, zinc nitrate, and copper sulfate.

**Salvage pathway:** A family of reactions that permits, for instance, nucleosides as well as purine and pyrimidine bases resulting from the partial breakdown of nucleic acids to be re-utilized in nucleic acid synthesis. OR In general, a pathway that synthesizes the final product from preformed components; nucleotides can be synthesized in a salvage pathway by attaching purine bases to PRPP. OR Synthesis of a biomolecule, such as a nucleotide, from intermediates in the degradative pathway for the biomolecule; a recycling pathway, as distinct from a de novo pathway.

**salvage therapy :** Treatment that is given after the cancer has not responded to other treatments.

**Salvia hispanica seed:** The edible seed of the flowering plant *Salvia hispanica* (chia) used as a nutritional supplement, with potential immunomodulating activity. Upon ingestion, chia seed supplies essential fatty acids, including alpha linolenic acid (an omega-3) and linoleic acid (an omega-6), B vitamins, especially niacin (B3) and thiamine (B1), and several minerals, including calcium, zinc, manganese, magnesium, phosphorus and iron; it also contains high levels of antioxidants and dietary soluble fiber. When used as a dietary supplement, this agent may improve a patient's nutrient intake and may balance their intestinal microbiome.

**Salvia officinalis extract tablet:** An oral tablet containing an extract of the plant *Salvia officinalis* (common sage) with reported antihydrotic, antibiotic, antihypertensive, anti-inflammatory, antioxidant, astringent, antispasmodic, estrogenic, and hypoglycemic properties. The primary biologically active component of common sage appears to be its essential oil which contains mainly cineol, borneol, and alpha- and beta-thujone. In

addition, sage leaf contains numerous other substances including tannic acid; resins with oleic, ursolic, and ursolic acids; bitter substances with coumarin and coumaric acid; fumaric, chlorogenic, caffeic and nicotinic acids; nicotinamide; flavones; flavone glycosides; and estrogenic substances. However, the mechanism(s) of action of common sage in the treatment of various disorders is unclear.

**SAM-e Complete:** (Other name for: S-adenosyl-L-methionine disulfate p-toluene-sulfonate)

**Sam68 modulator CWP232291:** A small molecule and prodrug of CWP232204 targeting Src associated in mitosis, of 68 kDa (Sam68 or KHDRBS1), with potential antineoplastic activity. CWP232291 is converted in serum into its active form CWP232204 which binds to Sam68, thereby resulting in the induction of apoptosis in selective cancer cells. Due to the multimodular structure of Sam68, the apoptosis mediated by CWP232204-Sam68 interaction can be attributed to 1) activation of transcription factor NF- $\kappa$ B induced by tumor necrosis factor alpha signaling, 2) alternative splicing of BCL-2 apoptosis gene, driving the balance towards pro-apoptotic as opposed to anti-apoptotic isoforms, 3) down-regulation of the anti-apoptotic protein survivin via Wnt signaling. Sam68, a KH domain RNA-binding protein belonging to the signal transduction and activation of RNA (STAR) family, plays a key role in various cellular processes including cell cycle progression and apoptosis; it is upregulated in many types of cancer cells and its expression is associated with increased cell proliferation and survival.

**Samarium:** Symbol:"Sm" Atomic Number:"62" Atomic Mass: 150.40amu. This is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. This silvery metal has many uses in metallic alloys. You may find it in nuclear reactors and even audio equipment.

**samarium 153 :** A radioactive substance used in the treatment of bone cancer and bone metastases (cancers that have spread from the original tumor to the bone). Samarium 153 is a radioactive form of the element samarium. It collects in bone, where it releases radiation that may kill cancer cells. It is a type of radioisotope.

**samarium Sm 153 leixidronam pentasodium:** The pentasodium salt of samarium Sm 153 leixidronam, a therapeutic agent consisting of a medium

energy beta- and gamma-emitting radioisotope, samarium Sm 153, and a teraphosphonate chelator, ethylenediaminetetramethylene phosphonic acid (EDTMP). The chelator moiety of samarium Sm 153 lexidronam associates with hydroxyapatite crystals concentrated in areas of bone turnover, thereby selectively delivering samarium Sm 153-mediated cytotoxic radiation to osteoblastic bone metastases. Check for active clinical trials using this agent. or A drug used to treat bone pain caused by bone cancer and other cancers that have spread to the bone. It contains a radioactive substance called samarium SM 153. Samarium Sm 153 lexidronam pentasodium collects in bone and gives off radiation that may kill cancer cells. It is a type of radiopharmaceutical. Also called Quadramet.

**Samcyprone:** (Other name for: diphenacyprone)

**sample:** One or more items taken from a population and intended to provide information on the population, and possibly to serve as a basis for a decision on the population or on the process which had produced it (ISO, 1977).

**sampling:** The procedure used to constitute a sample (ISO, 1977).

**sampling error:** Part of the total estimation error of a parameter due to the random nature of the sample (ISO, 1977).

**SAN:** Styrene-acrylonitrile

**Sancuso:** (Other name for: granisetron transdermal system)

**Sand blasting:** Grit and sand-blasting are processes used in the preparation and cleaning of steel to remove millscale and corrosion products. They are highly specialised processes.

**sand dune:** a heap of loose sand deposited by wind action.

**sand fall:** a mass of sand that dislodges and falls in a submarine canyon.

**Sandimmun:** (Other name for: cyclosporine)

**Sandimmune:** (Other name for: cyclosporine)

**Sanding:** The use of an abrasive to level a surface prior to painting. The more common term used by painters is 'rubbing down'.

**SANDING SURFACES:** A heavily pigmented finishing material used for building the surface to a smooth condition. It is sanded after drying.

**Sandoglobulin:** (Other name for: therapeutic immune globulin)

**Sandostatin:** (Other name for: octreotide acetate)

**Sandostatin Lar Depot:** (Other name for: octreotide acetate)

**Sandostatin pamoate:** (Other name for: octreotide pamoate)

**Sandostatin pamoate LAR:** (Other name for: octreotide pamoate)

**Sandstone** : Grains of sand can be formed into this sedimentary rock by the processes of deposition and cementation.

**SangCya:** (Other name for: cyclosporine)

**Sanger dideoxy method:** A DNA-sequencing technique that employs controlled interruption of enzymatic replication of the molecule to be analyzed. DNA polymerase I is used with a primer, the four deoxynucleoside triphosphates, and a 2',3'-dideoxy analog of one of them. Fragments of various lengths are produced in which the dideoxy analog is at the 3' end. Four sets of chain-terminated fragments (one for each analog) are then displayed by electrophoresis and autoradiography, and the base sequence can be read from the four lanes of the gel.

**Sanger sequencing** : A low-throughput method used to determine a portion of the nucleotide sequence of an individual's genome. This technique uses polymerase chain reaction (PCR) amplification of genetic regions of interest followed by sequencing of PCR products.

**sapacitabine:** An orally bioavailable pyrimidine analogue prodrug with potential antineoplastic activity. Sapacitabine is hydrolyzed by amidases to the deoxycytosine analogue CNDAC (2'-Cyano-2'-deoxyarabino-furanosylcytosine), which is then phosphorylated into the active triphosphate form. As an analogue of deoxycytidine triphosphate, CNDAC triphosphate incorporates into DNA strands during replication, resulting in single-stranded DNA breaks during polymerization due to beta-elimination during the fidelity checkpoint process; cell cycle arrest in the G2 phase and apoptosis ensue. The unmetabolized prodrug may exhibit antineoplastic activity as well.

**sapanisertib:** An orally bioavailable inhibitor of raptor-mTOR (TOR complex 1 or TORC1) and rictor-mTOR (TOR complex 2 or TORC2) with potential antineoplastic activity. Sapanisertib binds to and inhibits both TORC1 and TORC2 complexes of mTOR, which may result in tumor cell apoptosis and a decrease in tumor cell proliferation. TORC1 and 2 are upregulated in some tumors and play an important role in the

PI3K/Akt/mTOR signaling pathway, which is frequently dysregulated in human cancers.

**sapitinib:** An erbB receptor tyrosine kinase inhibitor with potential antineoplastic activity. Sapitinib binds to and inhibits erbB tyrosine receptor kinases, which may result in the inhibition of cellular proliferation and angiogenesis in tumors expressing erbB. The erbB protein family, also called the epidermal growth factor receptor (EGFR) family, plays major roles in tumor cell proliferation and tumor vascularization.

**Saponification:** A saponification reaction is the reverse of the esterification reaction. The term "saponification" is normally only used in the context of the making of soaps from the reaction.

**Saponification:** In the paint trade it refers to the chemical attack of the paint media by alkali usually from the substrate. e.g. the alkali reacts with the oil content of an oil based paint and turns it into a soap, resulting in disintegration of the paint. Oil based paints are very susceptible to saponification whereas emulsion paints generally have good resistance to alkali attack. OR The hydrolysis of esters using hot sodium hydroxide solution to produce the salt of a carboxylic acid. Usually saponification refers to the hydrolysis of esters of fatty acids to manufacture soaps. OR Alkaline hydrolysis of triacylglycerols to yield fatty acids as soaps.

**Saponification of oil-based paints on plaster:** Saponification occurs when oil-based paints are softened and liquefied by the alkali in plaster when moisture is present. Materials containing Portland cement or lime are strongly alkaline; gypsum plasters are usually not, but can become alkaline if gauged with lime or if it is brought forward from the backing during the drying phase. For these reasons, never use oil (solvent) based paints on plaster or masonry surfaces until they are completely dry in depth, then prime the surfaces with Dulux Alkali Resisting Primer. Where saponification has occurred, completely remove the defective coating, wash down the surface and rinse with clean water. Allow to dry then prime with Dulux Alkali Resisting Primer.

**saponin :** A substance found in soybeans and many other plants. Saponins may help lower cholesterol and may have anticancer effects.

**saponin-based immunoadjuvant OBI-821:** A purified, natural saponin isolated from the soapbark tree *Quillaja saponaria* Molina with potential

immunoadjuvant activity. When co-administered with a vaccine, OBI-821 may increase antibody and cytotoxic T-lymphocyte (CTL) responses against the vaccine's targeted antigen(s).

**saponin-cholesterol-phospholipid adjuvant:** An adjuvant comprised of saponin, derived from the bark of *Quillaja saponaria* Molina, cholesterol and phospholipid with antigen-delivery and immunostimulatory activities. This saponin-based adjuvant in combination with various antigens, including those for human papilloma virus (HPV), hepatitis C virus (HCV), and the human cancer antigen NY-ESO-1, may result in potent antibody, CD4+ T-helper-cell, and CD8+ cytotoxic T-cell responses against the targeted antigen. In addition, this agent may reduce the amount of antigen necessary to induce an efficient immune response in the host.

**saposin:** any member of a small glycoprotein family required for the hydrolysis of sphingolipids by specific lysosomal hydrolases; identified as SAP-A, -B, -C, and -D

**saquinavir mesylate:** The mesylate salt form of saquinavir, a synthetic peptidomimetic substrate with antiviral property. Saquinavir selectively binds to and inhibits human immunodeficiency virus type 1 (HIV-1) protease, an aspartic protease that cleaves viral gag and gag-pol polyprotein (precursors for viral proteases, reverse transcriptase, and integrase). Inhibition of HIV-1 protease prevents functional viral proteins to be cleaved from the viral polyprotein precursor and results in the release of immature, noninfectious virions.

**saquinavir mesylate :** A drug that belongs to the family of drugs called protease inhibitors. It interferes with the ability of a virus to make copies of itself.

**saracatinib:** An orally available 5-, 7-substituted anilinoquinazoline with anti-invasive and anti-tumor activities. Saracatinib is a dual-specific inhibitor of Src and Abl, protein tyrosine kinases that are overexpressed in chronic myeloid leukemia cells. This agent binds to and inhibits these tyrosine kinases and their effects on cell motility, cell migration, adhesion, invasion, proliferation, differentiation, and survival. Specifically, saracatinib inhibits Src kinase-mediated osteoclast bone resorption.

**Sarasar:** (Other name for: lonafarnib)

**SarCNU:** An alkylating chloroethylnitrosourea with antineoplastic activity. Selectively accumulating in some tumor cells, SarCNU forms covalent

linkages with nucleophilic centers in DNA, causing depurination, base pair miscoding, strand scission, and DNA-DNA cross-linking, which may result in cytotoxicity. or A substance being studied in the treatment of cancer. It is a type of alkylating agent. Also called sarcosinamide nitrosourea.

**sarcoid** : An inflammatory disease marked by the formation of granulomas (small nodules of immune cells) in the lungs, lymph nodes, and other organs. Sarcoid may be acute and go away by itself, or it may be chronic and progressive. Also called sarcoidosis.

**sarcoidosis** : An inflammatory disease marked by the formation of granulomas (small nodules of immune cells) in the lungs, lymph nodes, and other organs. Sarcoidosis may be acute and go away by itself, or it may be chronic and progressive. Also called sarcoid.

**sarcolemma**: the muscle cell membrane.

**sarcoma** : A type of cancer that begins in bone or in the soft tissues of the body, including cartilage, fat, muscle, blood vessels, fibrous tissue, or other connective or supportive tissue. Different types of sarcoma are based on where the cancer forms. For example, osteosarcoma forms in bone, liposarcoma forms in fat, and rhabdomyosarcoma forms in muscle. Treatment and prognosis depend on the type and grade of the cancer (how abnormal the cancer cells look under a microscope and how quickly the cancer is likely to grow and spread). Sarcoma occurs in both adults and children.

**sarcomatoid carcinoma** : A type of cancer that looks like a mixture of carcinoma (cancer that begins in the skin or in tissues that line or cover internal organs in the body) and sarcoma (cancer of the bone, cartilage, fat, muscle, blood vessels, or other connective or supportive tissue). The sarcoma-like cells are often spindle cells. Under a microscope, spindle cells look long and slender.

**sarcomere**: the functional unit of the muscle that contains thin actin filaments and thick myosin filaments. OR The functional unit of a myofibril; its distinct repeating structure is due to the overlapping of thick protein filaments, composed of myosin, and thin filaments, composed of actin and other proteins, which contract through the use of a sliding-filament method. OR A functional and structural unit of the muscle contractile system.

**Sarcoplasmic reticulum:** An extensive intracellular compartment in muscle cells that sequesters  $\text{Ca}^{2+}$  and releases it in response to a nerve impulse, thereby initiating muscle contraction.

**sarcosinamide nitrosourea :** A substance being studied in the treatment of cancer. It is a type of alkylating agent. Also called sarCNU.

**sargramostim:** A recombinant therapeutic agent which is chemically identical to or similar to endogenous human GM-CSF. Binding to specific cell surface receptors, sargramostim modulates the proliferation and differentiation of a variety of hematopoietic progenitor cells with some specificity towards stimulation of leukocyte production and may reverse treatment-induced neutropenias. This agent also promotes antigen presentation, up-regulates antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated lymphokine-activated killer cell function; it may also augment host antitumoral immunity. Check for active clinical trials using this agent.

**sargramostim :** A substance that helps make more white blood cells, especially granulocytes, macrophages, and cells that become platelets. It is a cytokine that is a type of hematopoietic (blood-forming) agent. Also called GM-CSF and granulocyte-macrophage colony-stimulating factor.

**sargramostim plasmid DNA hepatocellular carcinoma vaccine adjuvant:** A vaccine adjuvant consisting of a plasmid DNA encoding sargramostim (granulocyte-macrophage colony-stimulating factor). Upon administration, expressed sargramostim may stimulate a cytotoxic T cell response enhancing the host immune response to a concomitantly administered hepatocellular carcinoma vaccine.

**sargramostim plasmid DNA melanoma vaccine adjuvant:** A vaccine adjuvant consisting of a plasmid DNA encoding sargramostim (a granulocyte macrophage-colony stimulating factor). Upon administration, expressed sargramostim may stimulate a cytotoxic T cell response enhancing the host immune response to a concomitantly administered melanoma vaccine.

**sargramostim plasmid DNA pancreatic tumor cell vaccine:** A whole cell vaccine comprised of irradiated allogenic pancreatic tumor cells transfected with a plasmid DNA encoding human sargramostim (GM-CSF). Vaccination results in expression of GM-CSF, which induces proliferation and differentiation hematopoietic lineage cells as well as stimulating

macrophage and dendritic cell functions in antigen presentation and antitumor cell-mediated immunity. Furthermore, administration of this pancreatic tumor cell vaccine may elicit a cytotoxic T lymphocyte (CTL) response against similar host tumor cells, resulting in decreased tumor growth. Check for active clinical trials using this agent.

**Sarking:** A bituminous underlay placed beneath tiles or slates.

**Sash window:** A window in which the opening parts slide up and down in the frame.

**Satellite DNA:** A DNA fraction whose base composition differs from that of the main component of DNA, as revealed by the fact that it bands at a different density in a CsCl gradient. Usually repetitive DNA or organelle DNA. OR Highly repeated, nontranslated segments of DNA in eukaryotic chromosomes; most often associated with the centromeric region. Its function is not clear.

**satellite tumor :** A type of skin cancer on or under the skin that has spread from the primary tumor through the lymph system and is not more than 2 centimeters away from the original tumor.

**SATIN FINISH:** See Semi-Gloss

**Sativex:** (Other name for: nabiximols)

**SATP:** Used to describe a substance at standard pressure and a temperature of 25°C (298.15 K).

**satraplatin:** An orally administered third generation platinum compound with potential antineoplastic activity. Satraplatin forms highly reactive, charged, platinum complexes which bind to nucleophilic groups in DNA, inducing intrastrand and interstrand DNA cross-links, as well as DNA-protein cross-links. These cross-links result in cell growth inhibition and apoptosis.

**satraplatin :** A substance being studied in the treatment of prostate and other types of cancer. It contains the metal platinum and may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called BMS-182751 and JM 216.

**Satric:** (Other name for: metronidazole hydrochloride)

**saturated:** (1) in organics, a chemical compound with all carbon bonds satisfied; it does not contain double or triple bonds and thus cannot add elements or compounds. (2) in liquids, a solution that contains enough of a

dissolved solid, liquid, or gas so that no more will dissolve into the solution at a given temperature and pressure. OR A solution in which the maximum amount of solute has been dissolved in the solvent. As you dissolve sugar in a glass of water there will come a point when you can dissolve no more sugar. The solution has become saturated. Steam from a boiling pot of water can also saturate the surrounding air. OR describes a solution that holds as much solute as possible. OR cannot hold any more water, as in groundwater or air (humidity). OR This has many different meanings depending on the context.1. Saturated solutions cannot dissolve any more solute at that temperature.2.Saturated hydrocarbons (alkanes) have only carbon and hydrogen atoms and use only single bonds.

**saturated (saturation) zone:** rock and soil in which all the porosity is filled with water.

**saturated compound:** a compound containing all single bonds.

**saturated fat:** A lipid that contains no carbon-carbon double bonds. Animal fats like butter and lard are composed of saturated fat. Saturated fats tend to be waxy or greasy solids. OR A type of fat with certain chemical properties that is usually solid at room temperature. Most saturated fats come from animal food products, but some plant oils, such as palm and coconut oil, also contain high levels. Eating saturated fat increases the level of cholesterol in the blood and the risk of heart disease.

**saturated fatty acid:** A fatty acid containing a fully saturated alkyl chain.

**saturated solution:** A solution which does not dissolve any more solute. When a saturated solution is placed in contact with additional solute, solute neither dissolves nor is deposited from a saturated solution.

**Saturation:** The concentration of a solution in which a solute is at its equilibrium solubility in the respective solvent. OR the condition of a molecule containing the most atoms possible; a molecule made up of single bonds.

**saw palmetto :** A shrub that is a member of the palm tree family. An extract made from the berries of this shrub has been studied in the treatment of certain urinary and prostate disorders. The scientific name is *Serenoa repens*.

**saw palmetto berry extract supplement:** An herbal supplement used commonly to alleviate symptoms of benign prostatic hyperplasia. In vitro

studies show that it may also have anti-cancer properties specific for prostate cancer. Check for active clinical trials using this agent.

**sawhorse projection:** a line drawing that is centered on two of the carbon atoms in a molecule and that shows, through perspective, the three-dimensional structure about them. Carbon atoms are represented by the intersection of bond lines. The arrangement resembles a carpenter's sawhorse.

**saxagliptin hydrochloride:** The hydrochloride salt form of saxagliptin, an orally bioavailable, potent, selective and competitive, cyanopyrrolidine-based inhibitor of dipeptidyl peptidase 4 (DPP-4), with hypoglycemic activity. Saxagliptin is metabolized into an, although less potent, active mono-hydroxy metabolite.

**SB-715992:** A substance being studied in the treatment of cancer. SB-715992 blocks a protein that tumor cells need to divide. It is a type of mitotic inhibitor. Also called ispinesib.

**SB-743921:** A synthetic small molecule with potential antineoplastic properties. SB-743921 selectively inhibits kinesin spindle protein (KSP), an important protein involved in the early stages of mitosis that is expressed in proliferating cells. Inhibition of KSP results in inhibition of mitotic spindle assembly and interrupts cell division, thereby causing cell cycle arrest and induction of apoptosis.

**SB-AS02B adjuvant:** A proprietary oil-in-water emulsion specifically designed for combining protein preparations used in vaccines. SB-AS02B adjuvant contains monophosphoryl lipid A and QS21, a saponin extracted from the South American tree *Quillaja saponaria* Molina. This agent may be used for formulating cancer-specific vaccine preparations such as those containing MAGE-3 melanoma protein.

**SB-AS15 adjuvant:** A vaccine adjuvant containing CpG 7909, monophosphoryl lipid, and QS-21 with potential antineoplastic and immunostimulatory activities. CpG 7909 is a synthetic 24-mer oligonucleotide containing 3 CpG motifs that selectively targets Toll-like receptor 9 (TLR9), thereby activating dendritic and B cells and stimulating cytotoxic T cell and antibody responses against tumor cells bearing tumor antigens. Monophosphoryl lipid is a detoxified derivative of lipid A, a component of *Salmonella minnesota* lipopolysaccharide (LPS); this agent may enhance humoral and cellular responses to various antigens. QS-21 is a

purified, naturally occurring saponin derived from the South American tree *Quillaja saponaria* Molina and exhibits various immunostimulatory activities. Combinations of monophosphoryl lipid and QS-21 may be synergistic in inducing humoral and cellular immune responses.

**SB939:** A substance being studied in the treatment of several types of cancer. SB939 blocks the action of an enzyme called histone deacetylase (HDAC) and may stop tumor cells from dividing. It is a type of HDAC inhibitor.

**SBR:** Styrene-butadiene (rubber)

**SC-70935:** A substance being studied for its ability to stimulate the production of blood cells during chemotherapy. It is a type of colony-stimulating factor. Also called leridistim.

**SC-PEG E. coli L-asparaginase :** A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the anticancer drug PEG-asparaginase that stays in the body longer. SC-PEG E. coli L-asparaginase is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called EZN-2285 and Oncaspar-IV.

**scalar:** field values that measure magnitude.

**scale:** the precipitate that forms on surfaces in contact with water as the results of a physical or chemical change, often due to the presence of calcium carbonate ( $\text{CaCO}_3$ ) or magnesium carbonate ( $\text{MgCO}_3$ ). OR the proportion of a model in relation to the original.

**Scale inhibitor :** A chemical treatment used to control or prevent scale deposition

**scalene triangle:** a triangle having none of its sides equal (or angles equal). OR A triangle with all three sides of different lengths.

**scaling:** Multiplying calculated results by an empirical fudge factor in the hope of getting a more accurate prediction. Very often done for vibrational frequencies computed at the HF/6-31G\* level, for which the accepted scaling factor is 0.893 (17).

**scalpel :** A small, thin knife used for surgery.

**scan :** A type of test that makes detailed pictures of areas inside the body. A scan may also refer to the picture that gets made during the test. Scans may be used to help diagnose disease, plan treatment, or find out how well

treatment is working. There are many different types of scans, including computed tomography (CT) scans, magnetic resonance imaging (MRI) scans, and nuclear medicine scans (such as bone scans and liver scans). CT scans are done with an x-ray machine linked to a computer. MRI scans are done with radio waves and a powerful magnet linked to a computer. Nuclear medicine scans are done with small amounts of radioactive substances that are injected into the body and a special machine that detects the radioactive substance.

**Scandium:** Symbol:"Sc" Atomic Number:"21" Atomic Mass: 44.96amu. Scandium is one of the transition elements from the fourth period. Scandium can be found in stars, crystals of aquamarine, in other minerals, and has possible uses in spacecrafts of the future.

**scanner :** In medicine, an instrument that takes pictures of the inside of the body.

**Scanning electron microscopy (SEM):** A microscope in which a focused beam of electrons is directed on a sample to produce several interactions of which secondary electrons and backscattered electrons are the basis of the image. Resolution is typically 100 Å and has a large depth of field.

**scapula :** One of a pair of triangular bones at the back of the shoulder. The scapula connects the collarbone with the upper arm bone. Also called shoulder blade.

**Scar:** A characteristic mark on plastic containers which is confined mostly to the bottom. It is caused by the pinch-off operation and is often referred to as the length of the pinch-off.

**scar tissue :** Fibrous tissue that forms when normal tissue is destroyed by disease, injury, or surgery. For example, scar tissue forms when a wound heals after a cut, sore, burn, or other skin condition, or when an incision (cut) is made into the skin during surgery. It may also form inside the body when certain conditions, such as cirrhosis, cause normal tissue to become fibrous tissue.

**scarp:** a steep hillside or cliff that typically results from faulting or mass wasting.

**scatter radiation :** Radiation that spreads out in different directions from a radiation beam when the beam interacts with a substance, such as body tissue. For example, during x-ray mammography, very small amounts of

radiation may be scattered to areas away from the breast, such as the head and neck, sternum, and thyroid gland. The energy of scatter radiation is usually much lower than that of the original radiation beam.

**Scattered radiation:** Radiation that, during its passage through a substance, has been changed in direction. It may also have been modified by a decrease in energy. It is one form of secondary radiation.

**SCF:** Self-consistent field. The orbitals (i.e., the coefficients of the atomic basis functions in each molecular orbital) are adjusted until they are optimal in the mean electric field that they imply. Implicit for Hartree-Fock calculations. Sometimes the term "SCF" is used interchangeably with "HF," but it also applies to most DFT calculations and to all MCSCF calculations. OR A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. SCF is a type of cytokine and a type of growth factor. Also called kit ligand and stem cell factor.

**SCH 54031:** A drug used to treat melanoma and hepatitis C. It is also being studied in the treatment of other types of cancer. It is used under the brand name Sylatron to treat melanoma in patients who have had surgery to remove cancer that has spread to lymph nodes. It is used under the brand name PEG-Intron to treat hepatitis C infections. SCH 54031 is a form of interferon alfa (a substance normally made by cells in the immune system) linked to a substance called PEG, which makes the drug stay in the body longer. SCH 54031 is made in the laboratory. It is a type of cytokine and a type of biological response modifier. Also called peginterferon alfa-2b.

**SCH 66336:** An anticancer drug that belongs to the family of drugs called enzyme inhibitors. Also called lonafarnib.

**SCH-58500:** A substance that has been studied in the treatment of some types of cancer. SCH-58500 is a weakened adenovirus that carries the p53 gene into tumor cells, causing them to die. It is a type of gene therapy. Also called ACN53, rAd/p53, and recombinant adenovirus-p53.

**Schedule :** A system of pipe sizes that provides for standardized outside diameters and wall thicknesses

**Schiff base:** An intermediate formed when an amine reacts with an aldehyde or a ketone from a nitrogen compound analogous to a carbonyl

compound; Schiff bases are intermediates in a number of enzymecatalyzed reactions.

**Schiller test** : A test in which iodine is applied to the cervix. The iodine colors healthy cells brown; abnormal cells remain unstained, usually appearing white or yellow.

**schistosome** : A parasitic worm that can cause diseases of the liver, bladder, and gastrointestinal tract. One type of schistosome has been linked to bladder cancer. Schistosomes are found in Africa, the Middle East, East Asia, the Caribbean, and South America.

**schizophrenia** : A group of severe mental disorders in which a person has trouble telling the difference between real and unreal experiences, thinking logically, having normal emotional responses to others, and behaving normally in social situations. Symptoms include seeing, hearing, feeling things that are not there, having false ideas about what is taking place or who one is, nonsense speech, unusual behavior, lack of emotion, and social withdrawal.

**school liaison** : A person who helps a child return to school after a serious illness, such as cancer, or a long hospital stay. A school liaison may also arrange for education services in the child's home or at the hospital if the child is not able to return to school. School liaisons help parents, teachers, and other students understand special issues that the child may have in returning to the classroom as a result of the illness or its treatment. This may help in planning extra education services and support that the child may need.

**SCHROEDINGER'S WAVE EQUATION**: explains the shapes of the orbitals of the electrons around an atom. They are probability distributions. That is, there is a probability of finding an electron's position in a "cloud" around an atomic nucleus. The electron appears to be "spread out" as it orbits, filling its cloud.

**Schwann cell** : A type of glial cell of the peripheral nervous system that helps separate and insulate nerve cells.

**schwannoma** : A tumor of the peripheral nervous system that arises in the nerve sheath (protective covering). It is almost always benign, but rare malignant schwannomas have been reported.

**SCID :** A rare, inherited disease that is marked by a lack of B lymphocytes (white blood cells that make antibodies and help fight infections) and a lack of T lymphocytes (white blood cells that attack virus-infected cells, foreign cells, and cancer cells). Patients with this disease have a high risk of developing viral, bacterial, and fungal infections. Also called severe combined immunodeficiency disease.

**scientific method:** an orderly process of gaining information about the biological world. OR An inefficient but highly successful method of knowledge construction based on experimental testing of hypotheses.

**scientific notation:** a method of converting very large or very small numbers into a convenient value using exponents. OR A system for reporting very small or very large numbers by writing the number as a decimal number between 1 and 10, multiplied by a power of 10. For example, 602000000000000000000000 is written in scientific notation as  $6.02 \times 10^{23}$ . 0.000323 is written in scientific notation as  $3.23 \times 10^{-4}$ .

**scientific review committee :** A group of doctors, scientists, and other experts that reviews the detailed plan of a clinical trial for scientific quality and correct study design. There is a scientific review committee at every health care facility that does clinical research. Most clinical trials are reviewed by the scientific review committee before they go to the facility's Institutional Review Board (IRB) for approval. Also called scientific review panel.

**scientific review panel :** A group of doctors, scientists, and other experts that reviews the detailed plan of a clinical trial for scientific quality and correct study design. There is a scientific review panel at every health care facility that does clinical research. Most clinical trials are reviewed by the scientific review panel before they go to the facility's Institutional Review Board (IRB) for approval. Also called scientific review committee.

**scientist :** A person who has studied science, especially one who is active in a particular field of investigation.

**scintigraphy :** A procedure that produces pictures (scans) of structures inside the body, including areas where there are cancer cells. Scintigraphy is used to diagnose, stage, and monitor disease. A small amount of a radioactive chemical (radionuclide) is injected into a vein or swallowed. Different radionuclides travel through the blood to different organs. A machine with a special camera moves over the person lying on a table and

detects the type of radiation given off by the radionuclides. A computer forms an image of the areas where the radionuclide builds up. These areas may contain cancer cells. Also called radionuclide scanning.

**Scintillation detector:** The combination of phosphor, photomultiplier tube, and associated electronic circuits for counting light emissions produced in the phosphor by ionizing radiation.

**scintimammography :** A type of breast imaging test that is used to detect cancer cells in the breasts of some women who have had abnormal mammograms, or who have dense breast tissue. It is not used for screening or in place of a mammogram. In this test, a woman receives an injection of a small amount of a radioactive substance called technetium 99, which is taken up by cancer cells, and a gamma camera is used to take pictures of the breasts. Also called Miraluma test and sestamibi breast imaging.

**Scissile bond:** The bond in a substrate molecule that is cleaved by the enzyme.

**sclera :** The white layer of the eye that covers most of the outside of the eyeball.

**scleroderma :** A chronic disorder marked by hardening and thickening of the skin. Scleroderma can be localized or it can affect the entire body (systemic).

**sclerosing adenosis :** A benign condition in which scar-like tissue is found in a gland, such as the breast lobules or the prostate. A biopsy may be needed to tell the difference between the abnormal tissue and cancer. Women with sclerosing adenosis of the breast may have a slightly increased risk of breast cancer.

**Sclerosol Intrapleural Aerosol:** (Other name for: talc)

**scoliosis:** a medical condition in which a person's spine is curved from side to side, shaped like an "S" OR A condition marked by a side-to-side curve of the backbone. The curve is usually shaped like an S or a C. In most cases, the cause of scoliosis is not known. In some cases, scoliosis may be present at birth or it may be caused by muscle spasms, inflammation, tumors, or certain other disorders. It may also occur at some point in time after radiation therapy to the backbone.

**Scram:** The sudden shutting down of a nuclear reactor, usually by rapid insertion of control rods, either automatically or manually by the reactor

operator. Also known as a "reactor trip".

**Scrap:** Any output of a mold that is not usable as the primary product. OR All products of a processing operation which are not present in the primary finished articles. Scrap from operations can usually be reclaimed for reuse in the processor's plant or for sale to a commercial reclaimer. OR Any product of a molding operation that is not part of the primary product. In compression molding, this includes flash, culls, runners, and is not reusable as a molding compound. Injection molding and extrusion scrap (runners, rejected parts, spruces, etc.) can usually be reground and remolded. OR Any waste plastic product that is not useable as the primary product. A certain amount of scrap is usually generated during plastic extrusion manufacture and other plastic manufacturing processes. This scrap can normally be recycled. OR Any output of a mold that is not usable as the primary product.

**Scratch resistance:** A surface's resistance to damage by scratching and abrasion. In the coating industry, usually measured by pencil hardness.

**Screed:** A band of plaster or mortar laid on the surface of the wall as a guide to the thickness or level of the plaster to be applied. Therefore also used for the coat itself and for the levelling coat on flooring.

**SCREEN:** Woven metal screens are installed across the flow of plastic in an extruder. They are located between the tip of the screw and the die. Supported by a breaker plate, the screens strain out contaminants and increase back pressure.

**Screen (pack):** Woven metal screens installed across the flow of plastic in a plastic extruder. Supported by a breaker plate, the screens strain out contaminants and increase back pressure.

**Screen printing):** a printing technique involving the passage of printing medium, such as ink, through a web or fabric, which has been stretched on a frame, to which a refined form of stencil has been applied. The stencil openings determine the form and dimensions of the imprint thus produced.

**screening:** The presumptive identification of unrecognized disease or defect by the application of tests, examinations, or other procedures which can be applied rapidly. A screening test is not intended to be diagnostic. Persons with positive or suspicious findings must be referred to their physicians for diagnosis and necessary treatment.

**screening :** Clinical evaluation of an asymptomatic individual in the general population aimed at identifying abnormalities which might signal the presence of a specific medical condition. The intent is to find diseases at the earliest possible stage in their development in order to improve the chances for cure or reduce morbidity. or Checking for disease when there are no symptoms. Since screening may find diseases at an early stage, there may be a better chance of curing the disease. Examples of cancer screening tests are the mammogram (breast), colonoscopy (colon), and the Pap test and HPV test (cervix). Screening can also include checking for a person's risk of developing an inherited disease by doing a genetic test.

**screening mammogram :** X-rays of the breasts taken to check for breast cancer in the absence of signs or symptoms.

**Screw:** A helically grooved rotating element inside the barrel of a screw extruder. The main purpose of a screw is to melt and feed raw material from the feeder to the die, also homogenizing, compressing and pressurizing the material. OR In extrusion, the shaft provided with helical grooves which conveys the material from the hopper outlet through the barrel and forces it out through the die. OR A device in the barrel that compacts resin pellets to pressurize and melt them prior to injection. OR The plastic extrusion feed screw, which can be single or twin screw, is part of the plastic extrusion machine. It sits in the barrel of the machine forcing the plastic material along the barrel. OR A rotating auger that uses a helical thread and a varying channel depth to convey, melt, mix, and pump resin. Consists of a feed section, transition zone, metering section and in some cases a mixing zone/zones.

**Screw axis:** A symmetry element involving an n-fold rotation followed by translation parallel to the axis of rotation. It may be visualized as a screw.

**Screw diameter:** The diameter developed by the rotating flight land around the screw axis.

**Screw dislocation:** A defect in a crystal having a screw-type appearance as observed with an electron microscope or atomic force microscope.

**Screw Extruder:** A machine comprised of a barrel with a temperature control, housing one or more rotating screws which pass plastic material from the feed aperture and move it in the form of melt under pressure through a die.

**SCREW FLIGHT:** The helical metal thread of a screw in an extruder or injection molding machine.

**SCREW PLASTICATING INJECTION MOLDING:** A technique in which the plastic is converted from pellets to a viscose melt by means of an extruder screw which is an integral part of the molding machine. Machines are either single stage (in which plastication and injection are done in the same cylinder) or double stage in which the material is plasticated in one cylinder and then fed to a second for injection into a mold.

**Screw speed:** The rotating speed of the screw as it augers new material towards the metering zone. It is expressed in rpm (revolutions per minute). OR The rate of revolution (in RPM) of an extruder or injection molding machine screw.

**Screw Travel:** The distance the screw travels forward when filling the mold cavity.

**SCRF:** Self-consistent reaction field. A continuum method for treating solvation. The simplest formulation involves placing the molecule in a spherical hole in a polarizable (dielectric) continuum. The molecule polarizes the solvent, which in turn affects the electron distribution in the molecule; this is iterated to self-consistency.

**scrotum:** a pouch outside the male body that contains the testes. OR In males, the external sac that contains the testicles.

**Scrubber:** An absorption column designed to remove an undesirable component from a gas stream.

**Scumbling:** A technique in painting where by the final coat is patterned or partly removed to expose the undercoat or ground in order to obtain colour variety or movement.

**Scurvy:** A disease caused by a deficiency of ascorbate (vitamin C), which results in the formation of unstable collagen.

**Scutellaria barbata :** An herb that belongs to a group of herbs named the Scutellaria species or scullcap. Both the root and the above-ground part have been used to make herbal medicines. The root has been used in traditional Chinese medicine to treat lung cancer and other medical problems.

**SDCI:** See CISD.

**SDF-1-targeted agent NOX-A12:** A 45-mer L-stereoisomer RNA oligonucleotide linked to a 40 kDa polyethyleneglycol that targets the small chemokine stromal cell-derived factor 1 (SDF-1 or CXCL12) with potential antineoplastic and hematopoietic stem cell-mobilization activities. SDF-1 targeted agent NOX-A12 specifically binds to SDF-1 thereby preventing the binding of SDF-1 to its receptors CXCR4 and CXCR7, and blocking the subsequent receptor activation. This may prevent angiogenesis, tumor cell proliferation, invasion and metastasis and could sensitize tumor cells to chemotherapy. In addition, inhibition of SDF-1/CXCR4 interaction may induce mobilization of hematopoietic cells from the bone marrow into blood. The unique mirror-image configuration of this agent renders it resistant to hydrolysis and does not hybridize with native nucleic acids. Furthermore, this agent does not induce the innate immune response and has shown a favorable immunogenicity profile. Check for active clinical trials using this agent.

**SDR:** The aunts, uncles, grandparents, grandchildren, nieces, nephews, or half-siblings of an individual. Also called second-degree relative. Or An aunt, uncle, grandparent, grandchild, niece, nephew, or half-brother or -sister. Also called second-degree relative.

**SDS:** A rare, inherited disorder in which the pancreas and bone marrow do not work the way they should. Symptoms include problems digesting food, a low number of neutrophils (a type of white blood cell), bone problems, and being short. Infants with the disorder get bacterial infections and are at an increased risk of aplastic anemia, myelodysplastic syndrome, and leukemia. Also called Shwachman syndrome and Shwachman-Diamond syndrome.

**SDS-polyacrylamide gel electrophoresis:** The electrophoresis of proteins in a polyacrylamide medium; the detergent SDS renders the movement of the proteins inversely proportional to molecular weight (see also electrophoresis).

**SDX-102:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antimetabolites. Also called alanosine.

**Se-methyl-seleno-L-cysteine:** A naturally occurring organoselenium compound found in many plants, including garlic, onions, and broccoli, with potential antioxidant and chemopreventive activities. Se-Methyl-seleno-L-cysteine (MSC) is an amino acid analogue of cysteine in which a

methylselenium moiety replaces the sulphur atom of cysteine. This agent acts as an antioxidant when incorporated into glutathione peroxidase and has been shown to exhibit potent chemopreventive activity in animal models. or A substance that contains the element selenium (a nutrient that protects cells against damage) and is found in certain plants such as garlic and broccoli. Se-methyl-seleno-L-cysteine can act as an antioxidant and may help prevent or slow the growth of cancer cells. It is a type of amino acid.

**sea arch:** a stack whose center has been eroded through, producing a bridgelike shape, because the rock is softer or more fractured.

**sea breeze:** local wind that develops during the day along a beach due to uneven heating of land and water; wind moves from water to land.

**sea cave:** a cavity eroded into a sea cliff in the wave zone.

**sea cliff:** a steep slope along a coastline that results from the slope's base being eroded by waves.

**sea floor spreading:** the process by which new basaltic oceanic crust forms at a midoceanic ridge and is slowly pushed away on both sides toward the continents as more new crust is produced.

**sea surface temperature:** The temperature of the layer of seawater (approximately 0.5 m deep) nearest the atmosphere.

**sea surface temperature anomalies:** Temperature of emitted energy from the sea surface. SST anomaly = (SST - SST mean).

**Seaborgium:** Symbol:"Sg" Atomic Number:"106" Atomic Mass: (263)amu. This is one of the postactinide elements. Scientists have created these in labs and may have only found a few atoms of the element. You will not find these in use anywhere.

**Seal:** Any device used to prevent the passage of a fluid, liquid or fine particles

**Seal Initiation Temperature:** Measure of lowest temperature at which the required hot tack and seal strength levels are both achieved.

**Seal Off:** A feature on two liquid silicone mold halves or cavity inserts seal off the cavity with the exception of the silicone injection gate and air venting ports

**Sealed source:** Any radioactive material or byproduct encased in a capsule designed to prevent leakage or escape of the material.

**SEALER:** A thin liquid applied to seal a surface, to prevent previous paint from bleeding through from the surface or to prevent undue absorption of the topcoat into the substrate.

**Sealing bead:** a bead of material that is molded onto the top of the land area completely around the top of the neck finish in order to further enhance the sealing capabilities of the component.

**Sealing Plane:** The plane on the inside of a bottle cap along the sealing surface.

**Sealing surface:** the lip portion of the finish that makes contact with the sealing gasket or liner to form a seal. OR The surface of the finish of the container on which the closure forms the seal.

**seamount:** a conical, usually basaltic volcanic mountain that forms on the ocean floor. OR underwater mountain.

**seasonal variation:** The change in a set of meteorological parameters averaged over three months. Seasonal variation is the largest climatic variation, and temperature is the most frequently observed meteorological parameter. Often, monthly averaged data are grouped into seasons, according to the prescribed definition.

**Seat:** indentations on the base of a bottle that help align bottles on filling and decorating lines so that the bottles are oriented correctly during these processes.

**sebum :** An oily substance produced by certain glands in the skin.

**Secant Modulus:** Measure of film stiffness.

**second:** The second (s) is the base unit of time in the SI system of units, defined as the duration of 9,192,631,770 cycles of the radiation associated with a certain color of light emitted by the cesium atom.

**second ionization energy:** The energy needed to remove an electron from an isolated +1 ion. The third ionization energy would be the energy required to remove an electron from an isolated +2 ion, and so on.

**second law:** The second law states that every spontaneous process causes a net increase in the entropy of the universe. Many alternative statements are possible, including: Heat cannot be converted to work via an isothermal cycle. Heat cannot be converted to work with 100% efficiency. Heat cannot flow from a cold object to a warmer object without doing outside work.

**second law of thermodynamics:** The law stating that in any chemical or physical process, the entropy of the universe tends to increase.

**Second messenger:** A diffusible small molecule, such as cAMP, that is formed at the inner surface of the plasma membrane in response to a hormonal signal. OR A small signal molecule whose concentration changes in response to a primary messenger. OR An effector molecule synthesized within a cell in response to an external signal (first messenger) such as a hormone.

**second opinion :** In medicine, the opinion of a doctor other than the patient's current doctor. The second doctor reviews the patient's medical records and gives an opinion about the patient's health problem and how it should be treated. A second opinion may confirm or question the first doctor's diagnosis and treatment plan, give more information about the patient's disease or condition, and offer other treatment options.

**second order reaction:** A reaction with a rate law that is proportional to either the concentration of a reactant squared, or the product of concentrations of two reactants.

**second primary cancer :** A term used to describe a new primary cancer that occurs in a person who has had cancer in the past. Second primary cancers may occur months or years after the original (primary) cancer was diagnosed and treated. Certain types of cancer treatment, such as chemotherapy and radiation therapy, may increase the risk of a second primary cancer. Having certain inherited gene mutations (changes) and being exposed to certain cancer-causing substances, such as tobacco smoke, may also increase the risk of a second primary cancer.

**SECOND QUANTUM NUMBER, l:** describes sublevels. The sublevels are called, s, p, d, f. s orbitals are spherical in shape. p orbitals are dumbbell shaped.

**second-degree relative :** The aunts, uncles, grandparents, grandchildren, nieces, nephews, or half-siblings of an individual. Also called SDR. Or An aunt, uncle, grandparent, grandchild, niece, nephew, or half-brother or -sister. Also called SDR.

**second-line therapy :** Treatment that is given when initial treatment (first-line therapy) doesn't work, or stops working.

**second-look surgery :** Surgery performed after primary treatment to determine whether tumor cells remain.

**secondary (2°) carbon:** a carbon atom that is directly attached to two other carbon atoms.

**secondary cancer :** A term used to describe cancer that has spread (metastasized) from the place where it first started to another part of the body. Secondary cancers are the same type of cancer as the original (primary) cancer. For example, cancer cells may spread from the breast (primary cancer) to form new tumors in the lung (secondary cancer). The cancer cells in the lung are just like the ones in the breast. Also called secondary tumor.

**secondary carbocation:** a carbocation to which two alkyl groups are bonded.

**secondary metabolism:** Pathways that lead to specialized products not found in every living cell.

**Secondary nucleation:** The occurrence of crystal nuclei brought about by operations such as stirring and impact after the system has undergone primary nucleation.

**Secondary operation:** Any activity performed after the molding process required to produce a finished product suitable for its designed purpose. OR In many applications, additional manufacturing steps will be required after molding thermoplastic parts. Parts made from thermoplastic materials lend themselves to a number of ways of machining, assembly and finishing.

**Secondary radiation:** Radiation originating as the result of absorption of other radiation in matter. It may be either electromagnetic or particulate in nature.

**Secondary structure:** The residue-by-residue conformation of the backbone of a polymer. OR In a protein or a nucleic acid, any repetitive folded pattern that results from the interaction of the corresponding polymeric chains. In proteins, the most common are  $\beta$ -strands (sheets) and  $\alpha$ -helices. OR In a protein, the spatial arrangement of amino acid residues that are relatively close to one another in the linear sequence; the  $\alpha$  helix and the  $\beta$  strand are both elements of primary structure.

**Secondary system:** The steam generator tubes, steam turbine, condenser, and associated pipes, pumps, and heaters used to convert the heat energy of

the reactor coolant system into mechanical energy for electrical generation. Most commonly used in reference to pressurized water reactors.

**Secondary transporter:** A transporter that uses the energy of the downhill (exergonic) flow of one ion or molecule to power the uphill (endergonic) flow of another. Also called cotransporter.

**secondary tumor :** A term used to describe cancer that has spread (metastasized) from the place where it first started to another part of the body. Secondary tumors are the same type of cancer as the original (primary) cancer. For example, cancer cells may spread from the breast (primary cancer) to form new tumors in the lung (secondary tumor). The cancer cells in the lung are just like the ones in the breast. Also called secondary cancer.

**secondhand smoke :** Smoke that comes from the burning of a tobacco product and smoke that is exhaled by smokers. Inhaling secondhand smoke is called involuntary or passive smoking. Also called environmental tobacco smoke and ETS.

**secrete :** To form and release a substance. In the body, cells secrete substances, such as sweat that cools the body or hormones that act in other parts of the body.

**secretin:** a hormone produced by digestive glands that influences digestive processes.

**secretin :** A hormone released into the blood by cells in the inner layer of the small intestine. It is released when partly digested food moves from the stomach into the small intestine. Secretin causes the pancreas, liver, and stomach to release other substances that help digest food. Secretin may also be made in the laboratory.

**secretin human :** A drug used to help diagnose gastrinomas (tumors that cause too much gastric acid to be made) and other problems with the pancreas. It is also used to increase secretions from the pancreas and to help identify a duct called the ampulla of Vater. Secretin human is a form of secretin that is made in the laboratory. Secretin causes the pancreas, liver, and stomach to release substances that help digest food. Also called ChiRhoStim and synthetic human secretin.

**secretin stimulation test :** A test used to measure the ability of the pancreas to respond to a hormone called secretin. Secretin causes the

pancreas, liver, and stomach to release substances that help digest food. During a secretin stimulation test, a tube is inserted through the nose or throat into the stomach and small intestine. Secretin is given to the patient by injection into a vein. After a certain amount of time, samples of fluid are taken from the small intestine through the tube and sent to a lab to test for a response. A secretin stimulation test may be used to help diagnose problems that affect the pancreas, such as pancreatitis, cystic fibrosis, and a type of pancreatic tumor called a gastrinoma. Also called pancreatic function test.

**Section:** Any outline drawing showing the shape of a moulding structure or object as it would appear if cut along a line and viewed at right-angles to the cut; particularly refers to the drawing of a building prepared in this way as opposed to a plan or elevation.

**Sectional Weave :** A fabric consisting of alternating sections of right and left conventional weave usually joined by means of straight or crimped wires.

**secular carbon dioxide trend:** The fairly uniform and accelerating increase of carbon dioxide concentration in the atmosphere, as illustrated by the Mauna Loa record. The secular trend reflects the increase in global atmospheric carbon dioxide concentrations produced by combustion of fossil fuels, kilning of limestone, and possibly a net biospheric release of carbon dioxide resulting from deforestation.

**sedation :** A state of calmness, relaxation, or sleepiness caused by certain drugs. Sedation may be used to help relieve anxiety during medical or surgical procedures or to help cope with very stressful events. Drugs that relieve pain may be used at the same time.

**sedative :** A drug or substance used to calm a person down, relieve anxiety, or help a person sleep.

**sediment:** Material that occurs on the bottom of a water stream and is the result of sedimentation of suspended matter (WHO, 1979). OR The grains of rock or animal remains that are dropped to the bottom of a river, lake or sea.

**sedimentary:** rock formed from the compaction and cementation of fragments from other rocks. OR rock formed from layers of sediment after the grains of sediment have been squashed together and have undergone cementation.

**Sedimentary Rock:** A rock type that has been created by the deposit and compression of sediment. This type of rock is created over millions of years while igneous rock can be created overnight. Sandstone is a good example of a sedimentary rock. The three main types of rock are igneous, sedimentary, and metamorphic. OR a rock that is composed of sediment grains that have been compacted and lithified. OR Sedimentary rock is rock formed from layers of sediment by compaction (pressure) and cementation (by insoluble minerals that bind the particles of sediment together).

**sedimentary structures:** features that were part of sediments when they were deposited and which were preserved when the sediments became lithified.

**sedimentation:** Separation of a dense material (usually a solid) from a less dense material (usually a liquid) by allowing the denser material to settle out of the mixture. OR The effect of gravitational forces resulting in the separation of particles from the fluid in which they are suspended (ISO, 1979) OR the deposition of suspended matter carried by water, wastewater, or other liquids, by gravity. It is usually accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material. Also called settling.

**Sedimentation coefficient:** The velocity at which a macromolecule moves in a centrifugal field divided by the strength of the centrifugal field; usually expressed in Svedberg units.

**sedimentation coefficient:** A physical constant specifying the rate of sedimentation of a particle in a centrifugal field under specified conditions.

**sedimentation rate :** The distance red blood cells travel in one hour in a sample of blood as they settle to the bottom of a test tube. The sedimentation rate is increased in inflammation, infection, cancer, rheumatic diseases, and diseases of the blood and bone marrow. Also called erythrocyte sedimentation rate and ESR.

**Sedimentation-equilibrium centrifugation:** An ultracentrifugation technique that can be used to determine the mass of a protein; centrifugation is at a relatively slow speed so that sedimentation is counterbalanced by diffusion.

**sedoxantrone trihydrochloride:** The trihydrochloride salt of the anthrapyrazole antineoplastic antibiotic sedoxantrone with potential antineoplastic activity. Sedoxantrone intercalates into DNA and interacts

with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis.

**sedoxantrone trihydrochloride** : A substance being studied in the treatment of some types of cancer. Sedoxantrone trihydrochloride binds to DNA and stops cells, including cancer cells, from repairing damage to DNA and from making more DNA, RNA, and protein. It is a type of DNA intercalator. Also called CI-958.

**Seediness**: The appearance of very small particles in the dried paint film.  
OR There's really only one solution to this one: thoroughly clean down the surface to remove all dirt, grease and surface contaminants. Rub down with a suitable abrasive, dust off, and re-paint the affected area.

**Seeding**: The addition of solid particles, usually of the desired phase, to a crystallization process in order to induce crystal nucleation under controlled conditions.

**seedless vascular plants**: the division Pteridophyta that includes the ferns.

**SEEDS**: Small, undesirable particles or granules other than dust found in paint, varnish or lacquer.

**SEGA** : A benign (not cancer), slow-growing tumor that usually forms in the walls of fluid-filled spaces in the brain. The tumors are made up of large, star-shaped cells called astrocytes. SEGAs are common in patients with tuberous sclerosis (an inherited disorder in which benign tumors form in the brain and other parts of the body). Also called subependymal giant cell astrocytoma.

**segmental cystectomy** : Surgery to remove part of the bladder (the organ that holds urine). Also called partial cystectomy.

**Segmental flexibility**: Mobility imparted to IgG antibodies by a flexible polypeptide that joins the Fc and the two Fab units. Such mobility enhances the formation of antibody-antigen complexes.

**segmental mastectomy** : An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the cancer is near it. Also called breast-conserving surgery, breast-sparing surgery, lumpectomy, partial mastectomy, and quadrantectomy.

**segmental resection** : Surgery to remove part of an organ or gland. It may also be used to remove a tumor and normal tissue around it. In lung cancer surgery, segmental resection refers to removing a section of a lobe of the lung. Also called segmentectomy.

**segmentectomy** : Surgery to remove part of an organ or gland. It may also be used to remove a tumor and normal tissue around it. In lung cancer surgery, segmentectomy refers to removing a section of a lobe of the lung. Also called segmental resection.

**segmented:** See "contraction."

**SEGREGATION:** A separation of components in a molded article usually denoted by wavy lines and color striations in thermoplastics. In thermosets, usually meaning segregation of resin and filler on surface.

**segregation analysis** : The process of fitting formal genetic models to data on expressed disease characteristics (phenotype) in biological family members in order to determine the most likely mode of inheritance for the trait or disease under study.

**Seigen:** (Other name for: lactobacillus fermented extract)

**Seismic category I:** Structures, systems, and components that are designed and built to withstand the maximum potential earthquake stresses for the particular region where a nuclear plant is sited.

**seismic gap:** a stretch along an active fault zone that has not produced earthquakes for a significant time.

**seismic reflection:** the return of some of the energy from seismic waves that have penetrated downward from the surface or nearsurface, hit a rock boundary, and bounded back to the surface. OR a change in the direction of travel of a seismic wave as it passes through different mediums; occurs only if the mediums have different densities or strengths, which change the velocity of the seismic wave.

**seismic wave:** a wave of energy that is released by an earthquake.

**seismogram:** paper record graphing earthquake motions, created by a seismograph. OR the series of squiggly lines recorded by a seismograph.

**seismograph:** a device used to record the motion of a seismometer during an earthquake. OR machine that detects earthquakes.

**seismometer:** a suspended pendulumlike device used to detect seismic waves.

**Seizing:** Act of holding or grasping suddenly or forcibly.

**seizure :** Sudden, uncontrolled body movements and changes in behavior that occur because of abnormal electrical activity in the brain. Symptoms include loss of awareness, changes in emotion, loss of muscle control, and shaking. Seizures may be caused by drugs, high fevers, head injuries, and certain diseases, such as epilepsy.

**selatinib ditosilate:** An orally bioavailable ditosilate salt form of selatinib, an analog of the quinazoline lapatinib and dual inhibitor of epidermal growth factor receptor (EGFR) and Human Epidermal Growth Factor Receptor 2 (ErbB-2 or HER-2), with potential antineoplastic activity. Upon administration, selatinib reversibly blocks phosphorylation of both EGFR and ErbB2, thereby suppressing tumor growth in EGFR/ErbB-2-overexpressing tumor cells. The tyrosine kinases EGFR and ErbB2 have been implicated in the growth of various tumor types.

**Selectins:** Carbohydrate-binding proteins that constrain immune-system cells to the site of injury in an inflammatory response.

**selection bias :** An error in choosing the individuals or groups to take part in a study. Ideally, the subjects in a study should be very similar to one another and to the larger population from which they are drawn (for example, all individuals with the same disease or condition). If there are important differences, the results of the study may not be valid.

**selective androgen receptor modulator LY2452473:** An orally bioavailable selective androgen receptor modulator (SARM), with potential tissue-selective androgenic/anti-androgenic activity. Upon oral administration, LY2452473 acts as an agonist in select tissues and organs, including skeletal muscle, bone and the penis, thereby binding to and activating androgen receptor (AR) while acting as an antagonist in the prostate, thereby blocking AR activation and AR-mediated cellular proliferation. This may improve muscle mass and strength, bone formation, and erectile dysfunction while not stimulating growth of the prostate.

**selective estrogen receptor degrader ARN-810:** An orally available, nonsteroidal selective estrogen receptor degrader (SERD), with potential antineoplastic activity. Upon oral administration, SERD ARN-810 binds to the estrogen receptor and induces a conformational change that results in the degradation of the receptor. This may inhibit the growth and survival of ER-expressing cancer cells.

**selective estrogen receptor degrader AZD9496:** An orally available selective estrogen receptor degrader (SERD), with potential antineoplastic activity. Upon administration, SERD AZD9496 binds to the estrogen receptor (ER) and induces a conformational change that results in the degradation of the receptor. This prevents ER-mediated signaling and inhibits the growth and survival of ER-expressing cancer cells.

**selective estrogen receptor degrader SRN-927:** An orally available, nonsteroidal selective estrogen receptor degrader (SERD), with potential antineoplastic activity. Upon oral administration, SERD SRN-927 specifically binds to the estrogen receptor (ER) and induces a conformational change that results in the degradation of the receptor. This prevents ER-mediated signaling and inhibits the growth and survival of ER-expressing cancer cells.

**selective estrogen receptor degrader/modulator RAD1901:** An orally available, selective estrogen receptor degrader (SERD) and selective estrogen receptor modulator (SERM), with potential antineoplastic and estrogen-like activities. Upon oral administration of higher doses of RAD1901, this agent acts as a SERD, which binds to the estrogen receptor (ER) and induces a conformational change that results in the degradation of the receptor. This may inhibit the growth and survival of ER-expressing cancer cells. At lower doses of this agent, RAD1901 acts as a SERM and has estrogen-like effects in certain tissues, which can both reduce hot flashes and protect against bone loss. In addition, RAD1901 is able to cross the blood-brain barrier (BBB).

**selective estrogen receptor degraderLSZ102:** A selective estrogen receptor (ER) degrader (SERD), with potential antineoplastic activity. Upon administration of LSZ102, this agent binds to the ER and induces the degradation of the receptor. This prevents ER activation and ER-mediated signaling, and inhibits the growth and survival of ER-expressing cancer cells. Check for active clinical trials using this agent.

**selective estrogen receptor modulator :** A drug that acts like estrogen on some tissues but blocks the effect of estrogen on other tissues. Tamoxifen and raloxifene are selective estrogen receptor modulators. Also called SERM.

**Selective laser sintering (SLS):** During the SLS process, a CO2 laser draws onto a hot bed of thermoplastic powder, where it lightly sinters

(fuses) the powder into a solid. After each layer, a roller lays a fresh layer of powder on top of the bed and the process repeats. OR This method of rapid prototyping utilizes a laser to soften a powdered material, (typically metal), and binding it together into a form pre-defined by a 3D-model.

**selective serotonin reuptake inhibitor :** A type of drug that is used to treat depression. Selective serotonin reuptake inhibitors slow the process by which serotonin (a substance that nerves use to send messages to one another) is reused by nerve cells that make it. This increases the amount of serotonin available for stimulating other nerves. Also called SSRI.

**Selectivity:** the ability of the device to measure one chemical component in the presence of others in the sample. For example ionselective electrodes are not 100% ionspecific. Most are sensitive to some other ions to some extent. Some ISEs cannot be used in the presence of certain other interfering ions or can only tolerate very low contributions from these ions. Special techniques are available for removing or compensating for interfering ions

**Selectivity coefficient:** an expression of the extent to which an ionselective electrode reacts with an interfering ion in proportion to the measured ion. A selectivity coefficient of 0.1 implies, that the electrode is ten times more responsive to the primary ion than to the interfering ion (i.e. if a solution contains equal concentrations of both ions, the interfering ion will contribute about 10% to the total change in electrode signal produced, when the electrode is immersed in the test solution). The selectivity coefficient is not constant but depends on a number of factors including the total ionic strength of the solution, the concentration of both ions, and the temperature. The performance of an ISE in the presence of an interfering ion is quantified by the selectivity coefficient:  $K_{A,B}$  (where A is the primary ion and B is the interfering ion. The higher the  $K_{A,B}$  the greater the effect of the interference from B. At  $K_{A,B} = 1$  there is an equal response to both ions. A modified form of the Nernst equation (see Nikolski equation) gives the total potential developed.

**Selectivity filter:** A region of ion-channel proteins that determines the specificity of a particular channel.

**selenium:** A nonmetallic chemical element found in trace amounts in human body. Selenium primarily occurs in vivo as selenocompounds, mostly selenoproteins such as glutathione peroxidase and thioredoxin

reductase (enzymes responsible for detoxification). Alone or in combination with Vitamin E, selenocompounds act as antioxidants. These agents scavenge free radicals; prevent blood clots by inhibiting platelet aggregation; strengthen the immune system; and have been shown, in some instances, to inhibit chromosomal damage and mutations. Exhibiting chemopreventive activity, selenocompounds also inhibit the induction of protein kinase C. or A mineral that is needed by the body to stay healthy. It is being studied in the prevention and treatment of some types of cancer. Selenium is a type of antioxidant.

**Selenium:** Symbol:"Se" Atomic Number:"34" Atomic Mass: 78.96amu. It is classified as a non-metal. Selenium is found in many forms. It may have red crystals or a grayish metal color. The element is used in solar cells, photocopiers, and it is a trace element in your diet. Too much selenium is poisonous.

**Self-diagonal plot:** A tool used to search for amino acid sequence repeats within a protein. The protein sequence is displayed on both the vertical and the horizontal axes, running from amino to carboxyl terminis. A dot is placed at each point at which the amino acid along the horizontal axis is the same as that on the vertical axis. Internal repeats are seen as lines parallel to the central diagonal line, which represents the sequence aligned with itself.

**self-esteem :** A feeling of self-worth, self-confidence, and self-respect.

**SELF-EXTINGUISHING:** The term applied to a flammable material that will cease burning when the source of heat is removed. Usually expressed in time elapsed. OR A somewhat loosely-used term describing the ability of a material to cease burning once the source of flame has been removed.

**Self-referential:** Referring to itself; for example. "This sentence no verb", is a good example of a self-referential sentence.

**Self-splicing RNA:** Refers to introns that have the ability to remove themselves from the precursor RNA and assist in the splicing of exons to form mature RNA.

**seliciclib:** An orally bioavailable, small-molecule cyclin-dependent kinase (CDK) inhibitor with potential proapoptotic and antineoplastic activities. Seliciclib primarily inhibits CDK2/E, CDK2/A, CDK7 and CDK9 by competing for their ATP binding sites, leading to a disruption of cell cycle progression. In addition, this agent appears to interfere with CDK-mediated phosphorylation of the carboxy-terminal domain of RNA polymerase II,

inhibiting RNA polymerase II-dependent transcription, which may result in the down-regulation of antiapoptotic proteins such as induced myeloid leukemia cell differentiation protein Mcl-1. CDKs, serine/threonine kinases that play an important role in cell cycle regulation, are overexpressed in various malignancies. Mcl-1 belongs to the Bcl-2 family of antiapoptotic proteins and is a protein crucial to the survival of a range of tumor cell types. Check for active clinical trials using this agent.

**selinexor:** An orally available, small molecule inhibitor of CRM1 (chromosome region maintenance 1 protein, exportin 1 or XPO1), with potential antineoplastic activity. Selinexor modifies the essential CRM1-cargo binding residue cysteine-528, thereby irreversibly inactivating CRM1-mediated nuclear export of cargo proteins such as tumor suppressor proteins (TSPs), including p53, p21, BRCA1/2, pRB, FOXO, and other growth regulatory proteins. As a result, this agent, via the approach of selective inhibition of nuclear export (SINE), restores endogenous tumor suppressing processes to selectively eliminate tumor cells while sparing normal cells. CRM1, the major export factor for proteins from the nucleus to the cytoplasm, is overexpressed in a variety of cancer cell types. Check for active clinical trials using this agent.

**sella turcica :** A depression of the bone at the base of the skull where the pituitary gland is located.

**selumetinib:** An orally active, small molecule with potential antineoplastic activity. Selumetinib is an ATP-independent inhibitor of mitogen-activated protein kinase kinase (MEK or MAPK/ERK kinase) 1 and 2. MEK 1 and 2 are dual-specificity kinases that are essential mediators in the activation of the RAS/RAF/MEK/ERK pathway, are often upregulated in various cancer cells, and are drivers of diverse cellular responses, including proliferation. Inhibition of both MEK1 and 2 by selumetinib prevents the activation of MEK1/2 dependent effector proteins and transcription factors, thereby leading to an inhibition of cellular proliferation in various cancers. or A substance being studied in the treatment of several types of cancer. Selumetinib blocks proteins needed for cell growth and may kill cancer cells. It is a type of protein kinase inhibitor. Also called AZD6244 and MEK inhibitor AZD6244.

**Selzentry:** (Other name for: maraviroc)

**semaxanib:** A quinolone derivative with potential antineoplastic activity. Semaxanib reversibly inhibits ATP binding to the tyrosine kinase domain of vascular endothelial growth factor receptor 2 (VEGFR2), which may inhibit VEGF-stimulated endothelial cell migration and proliferation and reduce the tumor microvasculature. This agent also inhibits the phosphorylation of the stem cell factor receptor tyrosine kinase c-kit, often expressed in acute myelogenous leukemia cells. or A substance that has been studied in the treatment of cancer. It belongs to the families of drugs called angiogenesis inhibitors and tyrosine kinase inhibitors. Also called SU5416.

**semen:** a fluid secretion containing sperm and secretions from the prostate gland, seminal vesicles, and Cowper's glands. OR The fluid that is released through the penis during orgasm. Semen is made up of sperm from the testicles and fluid from the prostate and other sex glands.

**SEMI-AUTOMATIC MOLDING MACHINE:** A molding machine in which only part of the operation is controlled by the direct action of a human. The automatic part of the operation is controlled by the machine according to a predetermined program.

**Semi-automatic operation:** The term used to define the mode in which a molding machine is operating when there is a need for an operator to start each cycle.

**semi-empirical:** An approximate version of Hartree-Fock theory in which the more computationally expensive integrals are replaced by adjustable parameters, which are determined by fitting experimental atomic and molecular data. Different choices of parameterization lead to different specific theories (e.g., MNDO, AM1, PM3). Semiempirical calculations are much faster than ab initio calculations.

**Semi-gloss:** An intermediate level of gloss between a 'full gloss' and an 'eggshell' finish. OR Having a luster between full and flat.

**Semi-gloss Finish:** Finish that has a low luster sheen. Semi-gloss paints are formulated to give this result (usually 35-70 degrees on a 60-degree meter).

**SEMI-TRANSPARENT:** A degree of hiding greater than transparent but less than opaque.

**semicolon:** punctuation device used to join independent clauses between items in a series.

**Semiconservative replication:** Duplication of DNA in which the daughter duplex carries one old strand and one new strand. OR In the duplication of DNA, one of the strands of each daughter molecule is newly synthesized, whereas the other is unchanged from the parental DNA double helix.

**semilunar valves:** two valves found in the pulmonary artery and the aorta.

**Semimicro hygostat:** A small chamber in which a sample is suspended over a saturated-salt solution that provides a determined relative humidity. The chamber can be disassembled with a minimum of exposure of the sample to the atmosphere while weighing to determine the increase or decrease in mass of the sample.

**seminal fluid :** Fluid from the prostate and other sex glands that helps transport sperm out of the man's body during orgasm. Seminal fluid contains sugar as an energy source for sperm.

**seminal vesicle :** A gland that helps produce semen.

**seminal vesicle biopsy :** The removal of fluid or tissue with a needle from the seminal vesicles for examination under a microscope. The seminal vesicles are glands in the male reproductive tract that produce a part of semen.

**seminiferous tubules:** coiled passageways in which sperm production takes place.

**seminoma :** A type of cancer that begins in cells that make sperm or eggs. Seminomas occur most often in the testicles or the ovaries. They may also occur in other organs, such as the brain, chest, or abdomen. This happens when cells that have the ability to form sperm or eggs are found in other parts of the body. Seminomas grow and spread slowly.

**semiparasitic :** In botany, a plant that gets food from a host but also contains chlorophyll and is capable of photosynthesis.

**Semipermeable:** The characteristic of allowing only some molecules, usually smaller or uncharged ones, to pass through.

**semipermeable membrane:** A membrane that allows some but not all of the components in a mixture to pass through it. Semipermeable membranes are used in dialysis.

**Semipositive Mold:** A mold which allows a small amount of excess material to escape when it is closed.

**Semirigid Plastic:** For purpose of general classification, a plastic that has a modulus of elasticity either in flexure or in tension of between 10,000 and 100,000 psi at 23 degrees C and 50% relative humidity when tested in accordance with ASTM Method D747 or D790 Test for Stiffness of Plastics.

**semuloparin:** An ultralow-molecular-weight heparin (ULMWH) (Mw: 2000-3000 daltons) consisting of a polydisperse mixture of oligomeric heparin fragments with potential anticoagulant activity. Semuloparin binds to and activates antithrombin III (ATIII), which may result in the inhibition of activated factor Xa and, to a much lesser extent, factor IIa (thrombin) and so the inhibition of fibrin formation. Compared to low-molecular-weight heparins (LMWHs), AVE5026 exhibits an even higher ratio of anti-Factor Xa to anti-Factor IIa activity (>30:1). Compared to unfractionated heparins, the use of LMWHs is associated with lower incidences of major bleeding, osteoporosis and heparin-induced thrombocytopenia. Like LMWHs, this agent may inhibit tumor growth by regulating angiogenesis and apoptosis. AVE5026 is prepared by partial depolymerization of unfractionated porcine mucosal heparin.

**semustine:** A methylated derivative of carmustine with antineoplastic activity. As an alkylating agent, semustine forms covalent linkages with nucleophilic centers in DNA, causing depurination, base-pair miscoding, strand scission, and DNA-DNA cross-linking, which may result in cytotoxicity. or A substance that has been studied in the treatment of some types of cancer. Semustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea.

**Seneca Valley virus-001:** A native, replication-competent oncolytic picornavirus with potential antineoplastic activity. Administered systemically, Seneca Valley virus-001 (SVV-001) specifically targets and infects tumor cells with neuroendocrine characteristics. Upon infection, this agent replicates intracellularly, resulting in tumor cell lysis and reduced tumor cell proliferation. The selective tropism of virus replication may involve receptor-mediated internalization. or A virus being studied in the treatment of neuroendocrine tumors and other types of cancer. Neuroendocrine tumors form from cells that release hormones in response to a signal from the nervous system. The virus infects and breaks down

these tumor cells but not normal cells. It is a type of oncolytic virus. Also called NTX-010 and SVV-001.

**senega root :** The root of an herb called Polygala senega. It has been used in some cultures to treat certain medical problems, including problems of the respiratory system.

**senile keratosis :** A thick, scaly patch of skin that may become cancer. It usually forms on areas exposed to the sun, such as the face, scalp, back of the hands, or chest. It is most common in people with fair skin. Also called actinic keratosis and solar keratosis.

**senna extract:** An extract made from the dried leaflets on the pods of *Cassia angustifolia* or *Cassia acutifolia* with cathartic activity. Dimeric glycosides in dried senna extract are converted to the active monoanthrones by bacterial action in the colon. Through direct effects on enterocytes, enteric neurons, and muscle, monoanthrones produce giant migrating colonic contractions in addition to water and electrolyte secretion. As do other stimulant laxatives, monoanthrones may induce a limited low-grade inflammation in the colon through activation of prostaglandin/cyclic AMP and nitric oxide/cyclic GMP pathways and perhaps inhibition of Na<sup>+</sup>, K<sup>+</sup>-ATPase.

**senna fruit:** The fruit of *Cassia acutifolia* and *Cassia angustifolia* (*Cassia*) with laxative and purgative activities. The active ingredients in senna fruit include the hydroxyanthracene glycosides sennosides A and B (rhein dianthrones) and sennosides C and D (rhein aloe-emodin heterodianthrones). Sennosides irritate the bowel lining and stimulate the bowel muscular coat, particularly in the colon, resulting in accelerated bowel transit and evacuation.

**sensible heat:** The excess radiative energy that has passed from the Earth's surface to the atmosphere through advection, conduction, and convection processes.

**Sensipar:** (Other name for: cinacalcet hydrochloride)

**Sensitive unclassified nonsafeguards information (SUNSI):** Information that is generally not publicly available and that encompasses a wide variety of categories, such as proprietary information, personal and private information, or information subject to attorney-client privilege. For additional detail, see Information Security.

**Sensitivity:** the slope of the response (calibration) curve expressed as output per unit concentration.

**sensitivity :** The frequency with which a test yields a true positive result among individuals who actually have the disease or the gene mutation in question. A test with high sensitivity has a low false-negative rate and thus does a good job of correctly identifying affected individuals. or In medicine, sensitivity may describe how well a test can detect a specific disease or condition in people who actually have the disease or condition. No test has 100% sensitivity because some people who have the disease or condition will not be identified by the test (false-negative test result). Sensitivity may also refer to the way the body reacts to the environment or to drugs, chemicals, or other substances. For example, a person who is sensitive to the sun may have skin that burns easily or get a rash when exposed to the sun. A person who is sensitive to caffeine may need only small amounts of it to feel its effects.

**sensitivity (in chemical analysis):** For a simple procedure, the slope of the analytical calibration curve, i.e., the differential of the measure (x) with respect to concentration (c) (i.e.,  $dx/dc$ ). The greater the value of this derivative, the greater the sensitivity. Sensitivity should not be confused with limit of detection (IUPAC, 1976).

**sensitivity and specificity (of a screening test):** Sensitivity is the proportion of truly diseased persons in the screened population who are identified as diseased by the screening test. Sensitivity is a measure of the probability of correctly diagnosing a case, or the probability that any given case will be identified by the test (synonym true positive rate).

**sensitization:** This term is applied to the exposure to a substance (allergen) which provokes a response in the immune system such that disease symptoms will ensue on subsequent encounters with the same substance. See hypersensitivity, immune system.

**Sensor:** a device for transducing information about the concentration of a chemical species into a readily accessible signal (usually electrical). The device responds directly to the amount of a given environmental component. Ion selective electrodes are sensors, which respond to the concentration of particular dissolved ions in a solution. pH electrodes respond to hydrogen ions.

**sensor** : A device that responds to a stimulus, such as heat, light, or pressure, and generates a signal that can be measured or interpreted.

**Sensor array** : a set of sensors with different sensitivity and limited selectivity. Sensors array provide multiple data points per sample (vector of data) that carry out additional chemical information to differentiate analytes and discriminates against interferences. The pattern of response (distinct for different compounds) of an array of sensors can be applied to identify the unknown component. Suitable patternrecognition algorithms are used to interpret the results of multielement arrays.

**Sensorcaine** : A drug used to relieve pain by blocking signals at nerve endings. It is being studied in the relief of pain following surgery for cancer. It is a type of local anesthetic. Also called bupivacaine, bupivacaine hydrochloride, and Marcaine.

**Sensorcaine-MPF**: (Other name for: bupivacaine hydrochloride)

**sensory** : Having to do with the senses.

**sensory neurons**: neurons that receive stimuli from the external environment.

**sensory somatic system**: a subdivision of the peripheral nervous system that carries impulses from the external environment and the senses.

**sentence**: a group of words containing a subject and a predicate and expressing a complete thought.

**sentence fragment**: a group of words that is missing a subject, a predicate, or does not express a complete thought.

**sentinel lymph node** : The first lymph node to which cancer is likely to spread from the primary tumor. When cancer spreads, the cancer cells may appear first in the sentinel node before spreading to other lymph nodes.

**sentinel lymph node biopsy** : Removal and examination of the sentinel node(s) (the first lymph node(s) to which cancer cells are likely to spread from a primary tumor). To identify the sentinel lymph node(s), the surgeon injects a radioactive substance, blue dye, or both near the tumor. The surgeon then uses a probe to find the sentinel lymph node(s) containing the radioactive substance or looks for the lymph node(s) stained with dye. The surgeon then removes the sentinel node(s) to check for the presence of cancer cells.

**sentinel lymph node mapping :** The use of dyes and radioactive substances to identify the first lymph node to which cancer is likely to spread from the primary tumor. Cancer cells may appear first in the sentinel node before spreading to other lymph nodes and other places in the body.

**seocalcitol :** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called vitamin D analogs.

**sepals:** modified leaves that enclose and protect a growing bud in flowers.

**sepantronium bromide:** A small-molecule proapoptotic agent with potential antineoplastic activity. Sepantronium bromide selectively inhibits survivin expression in tumor cells, resulting in inhibition of survivin antiapoptotic activity (via the extrinsic or intrinsic apoptotic pathways) and tumor cell apoptosis. Survivin, a member of the inhibitor of apoptosis (IAP) gene family, is expressed during embryonal development and is absent in most normal, terminally differentiated tissues; upregulated in a variety of human cancers, its expression in tumors is associated with a more aggressive phenotype, shorter survival times, and a decreased response to chemotherapy.

**Separating compound:** See Release agent.

**separation technique:** a process by which products are isolated from each other and from impurities.

**sepsis :** The presence of bacteria or their toxins in the blood or tissues.

**septate :** An organ or structure that is divided into compartments.

**septicemia :** Disease caused by the spread of bacteria and their toxins in the bloodstream. Also called blood poisoning and toxemia.

**Septra:** (Other name for: trimethoprim-sulfamethoxazole)

**sequence rules:** the rules for establishing the order of atoms or groups in the Cahn-Ingold-Prelog notational system.

**Sequence templates:** Conserved residues that are structurally and functionally important and are characteristic of particular families of proteins.

**sequential AC/Taxol-Trastuzumab regimen :** An abbreviation for a chemotherapy combination used to treat breast cancer. It includes the drugs doxorubicin hydrochloride (Adriamycin) and cyclophosphamide, followed by treatment with paclitaxel (Taxol) and trastuzumab (Herceptin). Also called AC-T-T, AC-T-T regimen, and AC-TH regimen.

**Sequential displacement reaction:** A reaction having multiple reactants, in which all substrates bind to the enzyme before any product is released. Thus, in a reaction with two substrates, a ternary complex of the enzyme and both substrates forms.

**Sequential model:** A model for explaining allosteric enzymes in which the binding of one substrate influences the substrate affinity of neighboring active sites without necessarily inducing a transition encompassing the entire enzyme.

**sequential treatment :** One treatment after the other.

**seribantumab:** A fully human monoclonal antibody directed against the human epidermal growth factor receptor ErbB3 (Her3) with potential antineoplastic activity. Seribantumab binds to and inhibits ErbB3 activation, which may result in inhibition of ErbB3-dependent PI3K/Akt signaling and so inhibition of cellular proliferation and differentiation. ErbB3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in solid tumors, including breast, lung, and colorectal tumors of epithelial origin; it has no active kinase domain itself but is activated through heterodimerization with other members of the EGFR receptor family that do. Check for active clinical trials using this agent.

**serine protease inhibitor WX-671:** An orally bioavailable, 3-amidinophenylalanine-derived, second generation serine protease inhibitor prodrug targeting the human urokinase plasminogen activator (uPA) system with potential antineoplastic and antimetastatic activities. After oral administration, serine protease inhibitor WX-671 is converted to the active  $N\alpha$ -(2,4,6-triisopropylphenylsulfonyl)-3-amidino-(L)-phenylalanine-4-ethoxycarbonylpiperazide (WX-UK1), which inhibits several serine proteases, particularly uPA; inhibition of uPA may result in the inhibition of tumor growth and metastasis. uPA is a serine protease involved in degradation of the extracellular matrix and tumor cell migration and proliferation.

**Serine proteases:** A class of protein-degrading enzymes whose activity depends on the presence of serine at the active site; chymotrypsin and trypsin are examples.

**serine/threonine kinase inhibitor XL418:** A selective, orally active small molecule, targeting protein kinase B (PKB or AKT) and ribosomal protein

S6 Kinase (p70S6K), with potential antineoplastic activity. XL418 inhibits the activities of PKB and p70S6K, both acting downstream of phosphoinositide-3 kinase (PI3K). These kinases are often upregulated in a variety of cancers. Inhibition of PKB by this agent will induce apoptosis, while inhibition of p70S6K will result in the inhibition of translation within tumor cells.

**serine**: A naturally occurring amino acid with a hydroxyl group on its side chain.

**SERM** : A drug that acts like estrogen on some tissues but blocks the effect of estrogen on other tissues. Tamoxifen and raloxifene are SERMs. Also called selective estrogen receptor modulator.

**seroma** : A mass or lump caused by a buildup of clear fluid in a tissue, organ, or body cavity. It usually goes away on its own but may need to be drained with a needle. It often occurs after breast surgery.

**Seromycin**: (Other name for: D-cycloserine)

**Seromycin** : A drug used to treat tuberculosis. It is also being studied in the treatment of pain and nerve problems (numbness, tingling) caused by chemotherapy and in the treatment of low back pain, autism, certain anxiety disorders, and schizophrenia. Seromycin is a type of antibiotic. Also called D-cycloserine.

**Serophene**: (Other name for: clomiphene citrate)

**serosa** : The outer lining of organs and body cavities of the abdomen and chest, including the stomach. Also called serous membrane.

**serotonin** : A hormone found in the brain, platelets, digestive tract, and pineal gland. It acts both as a neurotransmitter (a substance that nerves use to send messages to one another) and a vasoconstrictor (a substance that causes blood vessels to narrow). A lack of serotonin in the brain is thought to be a cause of depression. Also called 5-hydroxytryptamine.

**serotonin-norepinephrine reuptake inhibitor** : A type of drug that is used to treat depression and certain other disorders. Serotonin-norepinephrine reuptake inhibitors increase the levels of the chemicals serotonin and norepinephrine in the brain. Nerves use these chemicals to send messages to one another. Increasing their levels in the brain helps improve mood. Also called SNRI.

**serous** : Having to do with serum, the clear liquid part of blood.

**serous membrane :** The outer lining of organs and body cavities of the abdomen and chest, including the stomach. Also called serosa.

**Sertoli-Leydig cell tumor of the ovary :** A rare type of ovarian tumor in which the tumor cells secrete a male sex hormone. This may cause virilization (the appearance of male physical characteristics in females). Also called androblastoma and arrhenoblastoma.

**sertraline :** A drug used to treat depression. It is a type of selective serotonin reuptake inhibitor (SSRI). Also called Zoloft.

**sertraline hydrochloride:** The hydrochloride salt of sertraline, a synthetic derivative of naphthalenamine with anti-serotonergic and anti-depressant properties. Sertraline appears to selectively inhibit the neuronal uptake of serotonin, raising serotonin levels in the CNS.

**serum:** plasma from which clotting proteins have been removed.

**serum :** The clear liquid part of the blood that remains after blood cells and clotting proteins have been removed.

**serum albumin :** The main protein in blood plasma. Low levels of serum albumin occur in people with malnutrition, inflammation, and serious liver and kidney disease.

**serum glutamate pyruvate transaminase :** An enzyme found in the liver and other tissues. A high level of serum glutamate pyruvate transaminase released into the blood may be a sign of liver damage, cancer, or other diseases. Also called alanine transferase and SGPT.

**serum glutamic-oxaloacetic transaminase :** An enzyme found in the liver, heart, and other tissues. A high level of serum glutamic-oxaloacetic transaminase released into the blood may be a sign of liver or heart damage, cancer, or other diseases. Also called aspartate transaminase and SGOT.

**serum tumor marker test :** A blood test that measures the amount of substances called tumor markers (or biomarkers). Tumor markers are released into the blood by tumor cells or by other cells in response to tumor cells. A high level of a tumor marker may be a sign of cancer.

**serum-derived bovine immunoglobulin protein isolate:** A nutritional supplement composed of serum-derived bovine protein concentrate containing high levels of immunoglobulins (Ig), particularly IgG, with the potential to improve nutritional status. Upon oral administration of SBI, the Ig promotes gastrointestinal (GI) health by improving the composition of

the GI microflora, enhancing digestive processes, and increasing gut barrier integrity and function. SBI may also improve immune function, maintain immune homeostasis, bind to and neutralize bacterial toxins and antigens, and decrease intestinal inflammation. Altogether, this may enhance the functioning of the GI tract, improve both the digestion and absorption of nutrients, and increase weight gain. Check for active clinical trials using this agent.

**Serzone :** A drug used to treat depression. It belongs to the family of drugs called antidepressant agents. Also called nefazodone.

**Sesquihydrate:** A crystal form containing one and one-half moles of water per mole of compound.

**sesquiterpene lactone :** A substance found in some plants. Sesquiterpene lactones may have anti-inflammatory and anticancer effects. Plants containing sesquiterpene lactones have been used in some cultures to treat certain medical problems.

**sestamibi breast imaging :** A type of breast imaging test that is used to detect cancer cells in the breasts of some women who have had abnormal mammograms, or who have dense breast tissue. It is not used for screening or in place of a mammogram. In this test, a woman receives an injection of a small amount of a radioactive substance called technetium 99, which is taken up by cancer cells, and a gamma camera is used to take pictures of the breasts. Also called Miraluma test and scintimammography.

**sestamibi scan :** An imaging test used to find overactive parathyroid glands (four pea-sized glands found on the thyroid) and breast cancer cells, and to diagnose heart disease. The patient receives an injection of a small amount of a radioactive substance called technetium which is bound to another substance called sestamibi. This substance collects in overactive glands, cancer cells, heart muscle, or other tissues and a picture is taken by a gamma camera (a special camera that detects radioactivity).

**Set:** The condition of a paint coating when it has ceased to flow.

**SET UP:** A film that has dried so that it is firm is said to have “set up”.

**Setting coat:** The final coat in a plastering process usually consisting of about one-eighth of an inch of fine plaster.

**Setting Temperature:** The temperature to which a liquid resin, an adhesive, or products or assemblies involving either is subjected to set the

resin or adhesive.

**Setting Time:** The period of time during which a molded or extruded product, an assembly, etc., is subjected to heat and/or pressure to set the resin or adhesive.

**settleable solids:** particles of debris and fine matter heavy enough to settle out of wastewater.

**Settler:** see decanter

**SETTLING:** Paint separation in which pigments accumulate at the bottom of the container.

**Settling:** The deposition of the solid particles of a paint to the bottom of the container.

**sevacizumab:** A monoclonal antibody directed against the human vascular endothelial growth factor (VEGF), with potential antiangiogenic activity. Upon administration, sevacizumab specifically binds to and inhibits VEGF, thereby preventing its binding to VEGF receptors (VEGFRs). This prevents VEGF/VEGFR-mediated signaling and inhibits the proliferation of vascular endothelial cells and tumor cells. VEGF, overexpressed in a variety of cancer cells, is associated with increased invasiveness and decreased survival.

**Seven-transmembrane-helix (7TM) receptors:** A class of integral membrane proteins typified by transducin in which the intramembrane part consists of seven helical regions; these receptors are always coupled to G proteins.

**seven-transmembrane-helix receptors:** A pile or stack of thylakoid membranes in the chloroplast.

**Severe accident:** A type of accident that may challenge safety systems at a level much higher than expected.

**severe combined immunodeficiency disease :** A rare, inherited disease that is marked by a lack of B lymphocytes (white blood cells that make antibodies and help fight infections) and a lack of T lymphocytes (white blood cells that attack virus-infected cells, foreign cells, and cancer cells). Patients with this disease have a high risk of developing viral, bacterial, and fungal infections. Also called SCID.

**severe myelosuppression :** A severe form of myelosuppression. Myelosuppression is a condition in which bone marrow activity is

decreased, resulting in fewer red blood cells, white blood cells, and platelets. It is a side effect of some cancer treatments. Also called myeloablation.

**severe thunderstorm:** thunderstorm that has winds in excess of 50 mph and can produce large hail.

**sevoflurane:** A fluorinated isopropyl ether with general anesthetic activity. Although the mechanism of action has not been fully elucidated, sevoflurane may interfere with the release and re-uptake of neurotransmitters at post-synaptic terminals, and/or alter ionic conductance following receptor activation by a neurotransmitter. This agent may also interact directly with the lipid matrix of neuronal membranes, thereby affecting gating properties of ion channels. In addition, sevoflurane may activate gamma-aminobutyric acid (GABA) receptors, hyperpolarizing cell membranes and resulting in a general anesthetic effect, a decrease in myocardial contractility and mean arterial pressure, and an increased respiratory rate.

**sewage:** the total of organic waste and wastewater generated by residential and commercial establishments.

**sewage, combined:** a sewage containing both sanitary sewage and surface or storm water with or without industrial wastes.

**sewage, dilute:** sewage containing less than 150 ppm of suspended solids and BOD (weak sewage).

**sewage, industrial:** sewage in which industrial wastes predominate.

**sewage, raw:** sewage prior to receiving any treatment.

**sewage, settled:** sewage from which most of the settleable solids have been removed by sedimentation.

**sewage, storm:** liquid flowing in sewers during or following a period of heavy rainfall.

**sex chromosomes:** one pair among the 23 pairs of human chromosomes; the X and Y chromosomes.

**sex cord tumor :** A rare type of cancer that forms in the tissues that support the ovaries or testes. These tumors may release sex hormones. Sex cord tumors include granulosa cell, Sertoli cell, and Leydig cell tumors. Also called sex cord-gonadal stromal tumor and sex cord-stromal tumor.

**sex cord-gonadal stromal tumor :** A rare type of cancer that forms in the tissues that support the ovaries or testes. These tumors may release sex hormones. Sex cord-gonadal stromal tumors include granulosa cell, Sertoli cell, and Leydig cell tumors. Also called sex cord tumor and sex cord-stromal tumor.

**sex cord-stromal tumor :** A rare type of cancer that forms in the tissues that support the ovaries or testes. These tumors may release sex hormones. Sex cord-stromal tumors include granulosa cell, Sertoli cell, and Leydig cell tumors. Also called sex cord tumor and sex cord-gonadal stromal tumor.

**sex drive :** The need for sex. Also called sexual drive.

**sexual drive :** The need for sex. Also called sex drive.

**sexuality :** A person's behaviors, desires, and attitudes related to sex and physical intimacy with others.

**Sezary syndrome :** A cancer that affects the skin. It is a form of cutaneous T-cell lymphoma.

**SGN-00101:** A substance that is being studied in the prevention of cancer. It belongs to the family of drugs called fusion proteins.

**SGN-30:** A monoclonal antibody that binds to cells that have the CD30 antigen on their surface, including Hodgkin disease cells and cells from anaplastic large cell lymphoma, and cutaneous T-cell lymphoma. SGN-30 is being studied in the treatment of cancer. It is a type of monoclonal antibody.

**SGN-35:** A drug used to treat Hodgkin lymphoma in patients who did not get better with other treatment, cannot be treated with autologous stem cell transplant (ASCT), or have a high risk that the cancer will come back or get worse after ASCT. It is also used to treat systemic anaplastic large cell lymphoma that did not get better with other treatment. It is also being studied in the treatment of other types of lymphoma. SGN-35 is made up of a monoclonal antibody linked to an anticancer drug. It binds to a protein called CD30, which is on the surface of some lymphoma cells, and may kill cancer cells. SGN-35 is a type of antibody-drug conjugate. Also called Adcetris and brentuximab vedotin.

**SGN-40:** A monoclonal antibody that binds to cells that have the CD40 antigen on their surface, including cells from multiple myeloma, non-Hodgkin lymphoma, and chronic lymphocytic leukemia. SGN-40 is being studied in the treatment of cancer. It is a type of monoclonal antibody.

**SGOT:** An enzyme found in the liver, heart, and other tissues. A high level of SGOT released into the blood may be a sign of liver or heart damage, cancer, or other diseases. Also called aspartate transaminase and serum glutamic-oxaloacetic transaminase.

**SGPT:** An enzyme found in the liver and other tissues. A high level of SGPT released into the blood may be a sign of liver damage, cancer, or other diseases. Also called alanine transferase and serum glutamate pyruvate transaminase.

**SH2 domain (Src homology domain):** A domain of approximately 100 amino acids that binds to phosphotyrosine residues.

**SH3 domain (Src homology domain):** A domain that binds proline-rich stretches of polypeptide.

**shadow zone:** area of the Earth shielded from earthquake waves by the outer core (where S-waves are absorbed and P-waves are refracted).

**Shaft work:** All work transferred between a continuous system and its surroundings other than that done by or on the process fluid at the system entrance and exit.

**SHAKE PAINTER:** A rectangular-shaped flat pad with an attached handle that is used to paint shingles, shakes and other special surfaces and areas.

**Shallow-Dose Equivalent (SDE):** The external exposure dose equivalent to the skin or an extremity at a tissue depth of 0.007 centimeters (7 mg/cm<sup>2</sup>) averaged over an area of 1 square centimeter.

**sham therapy :** An inactive treatment or procedure that is intended to mimic as closely as possible a therapy in a clinical trial. Also called placebo therapy.

**Shape memory alloys :** These can be bent into a variety of shapes but will return to their original shape when heated. They can be used for medical applications where even the warmth of the body can cause a row of sutures made of them to pull a wound together.

**shark cartilage:** A nutritional supplement gleaned from the exoskeleton of the shark. Shark cartilage inhibits metalloproteinases (MMPs) and possesses antiangiogenic and antimetastatic properties.

**shark cartilage extract AE-941:** A multifunctional antiangiogenic agent derived from shark cartilage with potential antineoplastic activity. Shark cartilage extract AE-941 competitively inhibits the binding of pro-

angiogenic vascular endothelial growth factor (VEGF) to its cell receptor, thereby inhibiting endothelial cell proliferation. This agent also inhibits matrix metalloproteinases (MMPs), stimulates tissue plasminogen activator (tPA), and activates caspase-mediated apoptotic pathways in endothelial cells.

**Shark Skin:** A surface irregularity of a container in the form of finely-spaced sharp ridges caused by a relaxation effect of the melt at the die exit.

**SHARKSKIN:** A surface irregularity of a blow molded container or film during extrusion. See Melt Fracture.

**SHARKSKIN (also known as SURFACE MATTNESS):** The failure of an extrudate to exhibit smooth and glossy appearance. The surface usually exhibits a repetitious wavy or ridged surface pattern perpendicular to the flow direction.

**Sharp coat:** Strictly speaking it is an application of a white lead/linseed oil paint liberally thinned with white spirit or turpentine. By dint of, this 'sharp' has come to be used for any thin and/or quick drying paint.

**shave biopsy :** A procedure in which a skin abnormality and a thin layer of surrounding skin are removed with a small blade for examination under a microscope. Stitches are not needed with this procedure.

**Shear:** Refers to when plastic enters into the mold and the melt is maintained by friction produced by speed and pressure. Too much shear can cause the plastic material to burn, too little can cause the material to freeze off causing short shot. OR Shear is the product of shear rate and resistance time. It is often used to describe the degree of mixing experienced by a material. OR The force between layers of resin as they slide against each other or the surface of the mold. The resulting friction causes some heating of the resin.

**SHEAR FLOW:** The sliding of imaginary fluid slices parallel to each other, like a deck of cards. Shearing occurs whenever fluids flow through tubes and channels. The velocity is zero right at the wall surface and maximum at the center. So the fluid is being sheared as it flows through a tube or channel.

**shear force:** force that is parallel to the surface of the slope.

**SHEAR HEATING:** Heat generated within the plastic melt as the polymer is sheared. It is caused by viscous dissipation of work. OR Shear heating is

due to friction caused by flow of melt through narrow passages in the mould during filling phase.

**shear plane:** the surface along which shearing occurs.

**SHEAR RATE:** The velocity gradient, i.e., velocity divided by the gap measured in reciprocal seconds, s<sup>-1</sup>. In screw extruder channels, the shear rate can usually reach 100 s<sup>-1</sup> or more. In flow through extrusion dies, it might reach 500 s<sup>-1</sup> or more, and in injection molding more than 5000 s<sup>-1</sup>. OR The overall velocity over the cross section of a channel with which molten polymer layers are gliding along each other or along the wall in laminar flow. OR the rate at which a layer of melt slides over the layer below. Shear rate is velocity-related rather than force-related. OR Shear rate is a way to describe how quickly the velocity of the melt changes from the mould surface to the center of flow for a given cross section. The size of the shear rate gives an indication of the shape of the velocity profile for a given situation.

**shear strength:** an object's resistance to movement that needs to be overcome in order to make it move. OR The maximum load required to shear the specimen in such a manner that the moving portion has completely cleared the stationary portion. Sheet Sheets are distinguished from films in the plastics industry only according to their thickness. In general, sheets have thicknesses greater than .040". OR the shearing force divided by the area. It is always a maximum at the outside of the flow channel. As it is force-related, it depends on the viscosity of the material, which in turn depends on the material and molding conditions. The maximum allowable stress level is usually taken as 1% of the tensile strength of the material. High shear stress is unimportant at gates, and in sprues and runners. OR A tangential force divided by the area (FORCE/AREA) on which it is applied. The shear stress is equal to the viscosity multiplied by the shear rate (measured in units of pressure, i.e., MPa or psi). At the die lips under usual production conditions, the shear stress may reach values of 0.2 MPa (29.0 psi) or more. The usually accepted value for the onset of sharkskin in capillaries is 0.14 MPa (20.3 psi), although higher values are reported in industrial production. With additives the critical shear stress value might be pushed up to 0.5 MPa (72.5 psi).

**shear stress:** stress that results when forces from opposite directions create a shear plane in an area in which the forces run parallel to one another.

**Shear Thinning:** Shear thinning is a the description for the physical effects of orientation and affect the flow behavior of the polymer. Shear thinning causes the melts viscosity to drop when it is made to flow within a certain shear rate range.

**SHEAR THINNING:** The reduction of the viscosity as the shear rate increases, which is exhibited by polymeric liquids. Shear thinning is due to molecular chain alignments in the direction of flow and disentanglements.

**SHEAR VISCOSITY:** The ordinary viscosity that is the ratio of shear stress to the shear rate (see also VISCOSITY).

**Sheariness:** A variation of sheen or gloss in a dried paint coating producing an uneven patchy appearance. OR This variation of sheen or gloss in dried paint is known as 'sheariness' and is often seen in brushed emulsion paints when viewed from a shallow angle. To correct this condition, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. The scrape back all areas of poorly adhering or defective coatings to a firm edge, rub down to "feather" broken edges, dust off and repaint.

**shearing:** the sliding motion that is parallel to and results from compressive forces applied to a rock mass.

**Sheary:** An irregularity in gloss or sheen on a surface.

**shedase inhibitor INCB007839:** An orally bioavailable inhibitor of the ADAM (A Disintegrin And Metalloprotease) family of multifunctional membrane-bound proteins with potential antineoplastic activity. Shedase inhibitor INCB007839 represses the metalloproteinase "shedase" activities of ADAM10 and ADAM17, which may result in the inhibition of tumor cell proliferation. The metalloproteinase domains of ADAMs cleave cell surface proteins at extracellular sites proximal to the cell membrane, releasing or "shedding" soluble protein ectodomains from the cell surface; the disintegrin domains of these multifunctional proteins interact with various components of the extracellular matrix (ECM). ADAM10 processes particular epithelial growth factor receptor (EGFR) ligands and appears to regulate Notch signaling through the cleavage of Notch and its related ligand delta-like ligand-1 (Dll-1). ADAM17 (also known as Tumor necrosis

factor-Converting Enzyme or TACE) is involved in processing tumor necrosis factor (TNF) from its membrane bound precursor to its soluble circulating form and in processing ligands for the epidermal growth factor receptor (EGFR) family.

**Sheen:** The degree in gloss of a low gloss or matt type finish. OR The degree of luster of a dried paint film.

**SHEEN UNIFORMITY:** The even distribution of luster over the entire surface of an applied finish.

**sheep sorrel :** A plant that has been used in some cultures to treat certain medical problems. It may have anticancer effects. The scientific name is *Rumex acetosella*. Also called dock and sorrel.

**Sheet:** Sheets are made of continuous phase plastic in a form in which the thickness is very small in proportion to length and width. The thickness is greater than 0.25 millimeters. OR In the plastics and packaging industries, sheets are usually considered to be a web greater than 10 mils (0.010 inch or 250 microns) thick. Webs smaller than 10 mils are considered films. OR Sheets are made of continuous phase plastic in a form in which the thickness is very small in proportion to length and width. The thickness is greater than 0.25 millimeters.

**Sheet (thermoplastic):** A flat section of a thermoplastic resin with the length considerably greater than the width and 10 mils or greater in thickness.

**sheet joint:** a crack that parallels the outer surface of a rock.

**Sheet Train:** The entire assembly necessary to produce sheet which includes extruder, die, polish rolls, conveyer, draw rolls, cutter and stacker.

**Sheet,  $\beta$ :** A common structural motif in proteins, in which two or more  $\beta$  strands are associated as stacks of chains, stabilized by interchain hydrogen bonds; several  $\beta$  strands running in the same direction form a  $\beta$  pleated sheet, whereas such strands running in opposite directions form an antiparallel pleated sheet.

**Sheeting:** A term often used in the film industry as an abbreviation for single wound sheeting. Actually, a web under 10 mils (.010 inch) thick is usually called a film, whereas a web 10 mils and over in thickness is usually called a sheet. OR Sheets are distinguished from films in the plastics industry only according to the thickness. Plastic sheeting is most commonly

made by sheet extrusion and casting in the plastics industry. Post extrusion processes for plastic sheet is thermoforming and vacuum forming.

**sheetwash:** a thin layer of unchanneled water that flows downhill during very heavy rains.

**Shelf life:** the period of time during which a product can be stored under specified temperature and humidity conditions and remain suitable for use. Shelf life is sometimes called storage life. OR An expression to describe the time a molding compound can be stored without losing any of its original physical or molding properties.

**Shelf life (or storage life):** The time period a product can be stored under specified temperature conditions and still remain usable.

**shell:** a set of electron orbitals with the same principal quantum number. OR A set of electrons with the same principal quantum number. The number of electrons permitted in a shell is equal to  $2n^2$ . A shell contains  $n^2$  orbitals, and  $n$  subshells.

**Shellac:** A coating made from purified lac dissolved in alcohol, often bleached white. OR Derived from a resinous substance called Lac. Used as a sealer and finish for floors, for sealing knots and other purposes. A natural resin, usually in the form of thin flakes.

**shells:** Where the electrons generally are. These shells are composed of 4 types of electron subshells: s, p, d and f subshells. OR A shell is the area around the center of an atom. The atom holds its electrons in these shells. There can be up to seven shells that hold 110 electrons. We're only going to look at the first 3 shells.

**Sheng-Mai San:** A Chinese herbal medicine composed of extracts from the roots of Panax ginseng (ren shen) and Ophiopogon japonicas (mai men dong), and the berries of Schisandra chinensis (wu wei zi) with potential protective activity. Ginseng contains a complex mixture of saponins, ginsenosides and panaxosides; homoisoflavonoids isolated from Ophiopogon show anti-inflammatory properties; Schisandra contains abundant amounts of phytoestrogen lignans with antioxidant activity. Although the mechanism of action maybe inexplicit or complex, these phytochemicals work synergistically and may improve symptoms such as shortness of breath, sweating, cough, thirst, dry mouth, and palpitations as well as have an effect on chemotherapy or radiotherapy-induced fatigue, weakness, and neutropenia.

**Sheng-Yu-Tang:** A traditional Chinese medicine (TCM) containing Radix rehmanniae preparata, Radix paeoniae alba, Radix astragali, Radix ginseng, Radix angelicae sinensis, and Rhizoma chuanxiong, with potential immunomodulating activity. Although the exact mechanism of action through which Sheng-Yu-Tang exerts its effect has yet to be fully elucidated, upon oral administration, this TCM may have a beneficial effect on the immune system.

**Sheridan's Formula :** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in Sheridan's Formula have been tested, and none of them have been shown to be effective in treating any form of cancer. Sheridan's Formula is not available in the United States. Also called 126-F, Cancell, Cantron, Jim's Juice, JS-101, JS-114, and Protocol.

**Shi Pi Yin herbal decoction:** A traditional Chinese medicine (TCM) decoction containing a mixture of Aconiti lateral root, Zingiberis (ginger) root, Fu Ling (Poria), Atractylodis macrocephalae, Chaenomelis fruit (flowering quince fruit), magnolia bark, Aucklandia costus root, Arecae pericarpium, Tsao-Ko (cardamon) fruit, and licorice root, and may also contain Arecae seeds and Ziziphus jujuba fruit (red date), which may be used to treat edema. Although the exact mechanism(s) of action through which Shi Pi Yin decoction exerts its effect has yet to be fully elucidated, upon oral administration, this TCM may reduce edema.

**shield cone:** broad cone of a volcano resulting from smooth lava flows.

**shield volcano:** a broad, cone-shaped hill or mountain made from solidified lava flows.

**shielding:** an effect, in NMR spectroscopy, caused by the movement of  $\sigma$  and  $\pi$  electrons within the molecule. Shielding causes chemical shifts to appear at higher magnetic fields (upfield). OR Any material or obstruction that absorbs radiation and thus tends to protect personnel or materials from the effects of ionizing radiation. OR Electrons in orbitals with high penetration can shield the nucleus from less penetrating electrons. Because they are closer to the nucleus on average, they repel those farther away and lessen the effective nuclear charge for the more distant electrons.

**shiitake mushroom :** A dark oriental mushroom widely used as a food. Several anticancer substances have been found in shiitake mushrooms,

including lentinan, which has been studied in Japan as a treatment for stomach and colorectal cancer. The scientific name is *Lentinus edodes*.

**shinbone :** The larger of two bones between the knee and ankle. Also called tibia.

**Shine-Dalgarno sequence:** In messenger RNA, a purine-rich region about 10 nucleotides on the 5' side of an initiator codon that pairs with the 3' end of 16S RNA in the 30S ribosomal subunit; helps to determine where translation is initiated on an mRNA molecule. OR A sequence in an mRNA required for binding prokaryotic ribosomes.

**Shingle Style Guard Edge :** A retaining edge consisting of overlapping flat plates which have one edge of the plate on the outside of the preceding plate, and the other edge on the inside.

**Sho-saiko-to :** A Japanese formulation of seven Chinese herbs that is being studied as a treatment for cancer.

**Shop priming:** Factory application of primers to wood or metal, etc.

**Shore:** Shore hardness values are measured by using calibrated durometers: Shore A for softest and Shore D for harder materials. The material is penetrated with a steel rod of predefined dimensions – different for Shore A and for Shore D. The values show no correlation with other hardness measurement values.

**Shore :** Shore hardness values are measured by using calibrated durometers: Shore A for softest and Shore D for harder materials. The material is penetrated with a steel rod of predefined dimensions - different for Shore A and for Shore D. The values show no correlation with other hardness measurement values.

**Shore A:** A hardness scale used to measure the hardness of molded silicone rubber. The Shore A scale is most effectively used to measure liquid silicone rubber with a hardness from 10 to 95 Shore A

**Shore Hardness:** A method of determining the hardness of a plastic material using a scleroscope or durometer. The Shore Scleroscope measures hardness in terms of the elasticity of the material. The device consists of a small conical hammer fitted with a diamond point which falls inside a glass tube. The hammer is made to strike the material under test and the degree of rebound is noted on a graduated scale. Generally, the harder the material the greater will be the rebound. See also durometer. OR Two different

durometer measuring scales (Shore A and Shore D) developed by the Shore Instrument Company. The measuring tool utilizes a hammer striking the material and measuring rebound. See “durometer” and “Rockwell hardness.”

**short chain fatty acid HQK-1004:** A short chain fatty acid (SCFA) with potential herpes simplex virus thymidine kinase gene (HSV-TK)-inducing activity. Upon administration, short chain fatty acid HQK-1004 may induce the expression of thymidine kinase (TK) by a silenced HSV-TK, which may activate a co-administered antiviral prodrug such as ganciclovir, resulting in the destruction of virally-infected cancer cells.

**Short oil:** The term used to describe a varnish or paint medium which contains a low proportion of oil in relation to its resin content.

**Short shot:** A condition where there is insufficient liquid silicone rubber is introduced into a LSR mold cavity to completely fill the cavity, resulting in a partially formed part

**Short Shot (also known as Non-Fill):** Failure to completely fill the mold or cavities of the mold. Edges may appear melted.

**short term exposure limit (STEL):** According to American Conference of Government Industrial Hygienists, this is the time-weighted average (TWA) airborne concentration to which workers may be exposed for periods up to 15 minutes, which no more than 4 such excursions per day and at least 60 minutes between them. See time-weighted average.

**short term memory:** Short term memory is a mechanism for storing temporary information, such as where you parked your car or numbers in a simple arithmetic problems.

**short-term side effect :** A problem that is caused by treatment of a disease but usually goes away after treatment ends. Short-term side effects of cancer treatment include nausea, vomiting, diarrhea, hair loss, fatigue, and mouth sores.

**shortwave radiation:** The radiation received from the sun and emitted in the spectral wavelengths less than 4  $\mu$  m. It is also called solar radiation.

**Shot:** A molded part produced when the mold has not been filled completely.

**Shot:** A term given to the total amount of plastic material that is injected (or shot) into a mold in a single cycle. OR The yield from one complete

molding cycle, including scrap. OR One complete cycle of a molding machine. OR The yield from one complete molding cycle, including cull, runner, and flash.

**Shot Capacity:** The maximum weight of material which an accumulator can push out with one forward stroke of the ram. OR The maximum weight of material which a machine can produce from one forward motion of the plunger or screw. OR Generally based on polystyrene, this is the maximum weight of plastic that can be displaced or injected by a single injection stroke. Generally expressed as ounces of polystyrene.

**Shot Composition:** The shot size setting and the switch over point give the machine information about how the melt has to be injected into the mould. The stroke positions correspond to volumes of melt that play a role in different portions of the moulding cycle. While the settings relate to the machine barrel, they correspond with the actual events that happen during the cycle.

**Shot size Setting:** Shot size setting is control setting which limit how far back the screw will travel as it rotates in the cooling phase of the cycle. The shot size setting is measured as a distance from the front of the barrel.

**Shoulder:** the sloped area of a bottle or jar between the neck area and the body of the bottle.

**shoulder blade :** One of a pair of triangular bones at the back of the shoulder. The shoulder blade connects the collarbone with the upper arm bone. Also called scapula.

**Shrink:** The change in part size as it cools during the molding process. This is anticipated based on material manufacturer recommendations and built into the mold design before manufacturing.

**SHRINK FILM:** A term sometimes used for pre-stretched or oriented film used in SHRINK PACKAGING.

**SHRINK FIXTURE:** See COOLING FIXTURE.

**SHRINK PACKAGING:** An item or group of items packaged by wrapping in a film or bag, which when heated fits tightly around the contained article.

**Shrink Rate:** The dimensional differences between a molded part and the actual mold dimensions.

**Shrink Wrapping:** A technique of packaging in which the strains in a plastic film are released by raising the temperature of the film thus causing it to shrink over the package. These shrink characteristics are built into the film during its manufacture by stretching it under controlled temperatures to produce orientation of the molecules. Upon cooling, the film retains its stretched condition, but reverts toward its original dimensions when it is heated. Shrink film gives good protection to the products packaged and has excellent clarity.

**Shrinkage:** It is the deviation of dimensions of the moulded part from the dimensions of cavity when measured on moulded part after certain hours. Compressibility, thermal expansion and pVT characteristics influence the dimensions of moulded part.

**Shrinkage:** Contraction upon cooling of all or areas of the part. Shrinkage occurs less in disorientated material and more across chains of molecules than along their lengths. Lower pack area have lower areas of orientation and shrinkage. OR A measurement of the percent of film shrinkage in the machine direction or transverse direction at a specified temperature and time. OR The percentage of reduction in overall part dimensions. Shrinkage occurs during the cooling phase of the process. OR contraction upon cooling of all or areas of the part. Shrinkage occurs less in disorientated material and more across chains of molecules than along their lengths. Lower pack area have lower areas of orientation and shrinkage.

**Shrinkage Allowance:** The dimensional allowance which must be made in molds to compensate for shrinkage of the plastic compound on cooling.

**Shrivelling:** The overall fine-surface wrinkling of a glossy paint film.

**Shrivelling (or rivelling) on new paintwork:** Known as 'shrivelling' or 'rivelling', this wrinkling effect can occur when paint dries too quickly, forming a surface skin before the paint underneath can dry properly.

Overcoating a previous undercoat or gloss too soon can also cause shrivelling, as can applying oil-based coatings at low temperatures. Before attempting to smooth out the wrinkles, allow the surface to dry and harden, then rub down using wet and dry abrasive paper with warm water and detergent. Rinse thoroughly with clean water and allow to dry before repainting.

**shunt :** In medicine, a passage that is made to allow blood or other fluid to move from one part of the body to another. For example, a surgeon may

implant a tube to drain cerebrospinal fluid from the brain to the abdomen. A surgeon may also change normal blood flow by making a passage that leads from one blood vessel to another.

**Shut-Off Nozzle:** A device attached to the front of the molding machine barrel or hot manifold system. It opens to allow resin flow into the mold cavity. It closes after injection to help prevent drooling.

**Shutdown:** A decrease in the rate of fission (and heat/energy production) in a reactor (usually by the insertion of control rods into the core).

**Shutdown margin:** The instantaneous amount of reactivity by which the reactor is subcritical or would be subcritical from its present condition assuming all full-length rod cluster assemblies (shutdown and control) are fully inserted except for the single rod cluster assembly of highest reactivity worth that is assumed to be fully withdrawn.

**Shutoff:** A feature that forms an internal through-hole in a part by bringing the A-side and B-side in contact, preventing the flow of resin into the through-hole.

**Shutoff land:** A raised area of the mold surface surrounding the cavity image. This area is usually between 0.002 and 0.003 inch high, approximately 1/2 inch wide and is used to focus clamping pressure on the mold. The use of a shutoff land reduces the amount of tonnage required to keep a mold closed against injection pressure.

**Shuttering:** The general term for temporary supporting structures for concrete while it is setting. Also from work.

**shuttle vector:** A recombinant DNA vector that can be replicated in two or more different host species. See also vector.

**Shwachman syndrome :** A rare, inherited disorder in which the pancreas and bone marrow do not work the way they should. Symptoms include problems digesting food, a low number of neutrophils (a type of white blood cell), bone problems, and being short. Infants with the disorder get bacterial infections and are at an increased risk of aplastic anemia, myelodysplastic syndrome, and leukemia. Also called SDS and Shwachman-Diamond syndrome.

**Shwachman-Diamond syndrome :** A rare, inherited disorder in which the pancreas and bone marrow do not work the way they should. Symptoms include problems digesting food, a low number of neutrophils (a type of

white blood cell), bone problems, and being short. Infants with the disorder get bacterial infections and are at an increased risk of aplastic anemia, myelodysplastic syndrome, and leukemia. Also called SDS and Shwachman syndrome.

**SI:** Le Système Internationale (SI) is a system of units introduced to remove barriers to international trade, based on the older metric system. It is now used in science and technical communications worldwide.

**SI System:** International System of Units. A system of measurement used in science. It includes the metric system and other measures. Standard units include the kilogram, liter, meter, and seconds.

**SI Unit:** Stands for Systeme International d'Unites, a international system which established a uniform set of measurement units. OR "Systeme International" units, established in 1960, based partly on the metric system, which was used in Europe for a long time. In SI the six base units are metre (length), kilogram (mass), second (time), ampere (electric current), degree Kelvin (temperature) and candela (luminous intensity). OR The International System of Units (Systems International) is a modernized version of the metric system established by international agreement. It provides a logical and interconnected framework for all measurements in science, industry and commerce. Officially abbreviated SI, the system is built upon a foundation of seven base units.

**sialic acid :** Any of a group of simple sugar molecules.

**sialyl Lewis<sup>a</sup>-keyhole limpet hemocyanin conjugate vaccine:** A vaccine consisting of the oligosaccharide antigen sialyl Lewis<sup>a</sup> (CA19-9) conjugated to the nonspecific immunomodulator keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Upon administration, sialyl Lewis<sup>a</sup>-keyhole limpet hemocyanin conjugate vaccine may induce production of IgG and IgM antibodies as well as trigger an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells expressing the sialyl Lewis<sup>a</sup> antigen. Sialyl Lewis<sup>a</sup> is a blood group antigen and a tumor-associated antigen associated with epithelial cancers such as breast cancer and various digestive cancers. Sialyl Lewis<sup>a</sup> serves as a ligand for the cytokine-inducible cell adhesion molecule (CAM) E-selectin, an endothelial cell-specific type I transmembrane surface protein, thus facilitating hematogenous metastasis by mediating the adhesion of circulating cancer cells to vascular endothelium.

**sialyl Tn-KLH :** A vaccine composed of a substance that enhances immunity plus an antigen found on some tumors of the colon, breast, lung, ovary, pancreas, and stomach.

**sibling :** A person's brother or sister who has the same parents.

**sickle cell anemia :** An inherited disease in which the red blood cells have an abnormal crescent shape, block small blood vessels, and do not last as long as normal red blood cells. Sickle cell anemia is caused by a mutation (change) in one of the genes for hemoglobin (the substance inside red blood cells that binds to oxygen and carries it from the lungs to the tissues). It is most common in people of West and Central African descent. Also called sickle cell disease.

**sickle cell disease :** An inherited disease in which the red blood cells have an abnormal crescent shape, block small blood vessels, and do not last as long as normal red blood cells. Sickle cell disease is caused by a mutation (change) in one of the genes for hemoglobin (the substance inside red blood cells that binds to oxygen and carries it from the lungs to the tissues). It is most common in people of West and Central African descent. Also called sickle cell anemia.

**sickle-cell anemia:** A human disease characterized by defective hemoglobin molecules; caused by a homozygous allele coding for the  $\beta$  chain of hemoglobin.

**sickle-cell trait:** A human condition recognized by the sickling of erythrocytes when exposed to low oxygen tension; occurs in individuals heterozygous for the allele responsible for sickle-cell anemia.

**Sickness Bags:** These bags are intended for use as a vomit receptacle when patients do not have the ability to get to a restroom. The bags are made of durable high-density polyethylene material and are much stronger than the conventional lined paper bags. Adhesive and wire fold-over closures are available.

**Side chain:** The distinctive R group bonded to the  $\alpha$ -carbon atom of an amino acid.

**SIDE CORING OR SIDE DRAW PINS:** Projections used to core a hole in a direction other than the line of closing of a mold, and which must be withdrawn before the part is ejected from the mold.

**Side Draw Pins:** Projections used to core a hole in a direction other than the line of closing of a mold, and which must be withdrawn before the part is ejected from the mold.

**side effect :** A problem that occurs when treatment affects healthy tissues or organs. Some common side effects of cancer treatment are fatigue, pain, nausea, vomiting, decreased blood cell counts, hair loss, and mouth sores.

**Side groups:** All the carbon based polymers you will find mentioned on this site have the structure -C-C-C-C-C-C- etc. Anything hanging off that centre chain that is not a hydrogen atom is a side group.

**Side Travel :** The continuous movement of a belt in a direction either right or left of the centerline of the conveyor. (Also see Waver)

**Side-action:** A portion of the mold that is pushed into place as the mold closes, using a cam-actuated slide. Typically, side-actions are used to resolve an undercut, or sometimes to allow an undrafted outside wall. As the mold opens, the side action pulls away from the part, allowing the part to be ejected. Also called a “cam.”

**Side-Draw Pins :** Projections used to core a hole in a direction other than the line of closing of a mold and which must be withdrawn before the part is ejected from the mold. See also Retractable Cores.

**Side-Gusset Bag:** A bag with gussets on both sides, with a fin-seal running from top to bottom and sealed horizontally at the bottom and the top. Commonly used in the coffee industry.

**side-to-end coloanal anastomosis :** A surgical procedure in which the side of the colon is attached to the anus after the rectum has been removed. A section of the colon about 2 inches long is formed into a mini-pouch in order to replace the function of the rectum and store stool until it can be eliminated. This procedure is similar to the J-pouch coloanal anastomosis but a much smaller pouch is formed.

**sideropenic dysphagia :** A disorder marked by anemia caused by iron deficiency, and a web-like growth of membranes in the throat that makes swallowing difficult. Having sideropenic dysphagia may increase the risk of developing esophageal cancer. Also called Paterson-Kelly syndrome and Plummer-Vinson syndrome.

**sidestream smoke:** The smoke that is given off from the cigarette (pipe, cigar) between puffs and is not directly inhaled by the smoker. OR Smoke

that comes from the lighted end of a burning tobacco product, such as a cigarette, pipe, or cigar. Sidestream smoke can be a form of secondhand smoke. It contains nicotine and many harmful, cancer-causing chemicals. Inhaling sidestream smoke increases the risk of lung cancer and may increase the risk of other types of cancer. Inhaling it also increases the risk of other health problems, such as heart disease and lung disease.

**SIDS :** A disorder marked by the sudden and unexpected death of a healthy child who is younger than one year old, usually during sleep. The cause of SIDS is not known. Also called crib death and sudden infant death syndrome.

**Siemen:** The reciprocal of an ohm, which is a measure of resistance to the flow of electrical charge. OR The SI unit of electrical conductance. A material has a conductance of one siemens if one ampere of electric current can pass through it per volt of electric potential.

**Sievert (Sv):** The international system (SI) unit for dose equivalent equal to 1 Joule/kilogram. 1 sievert = 100 rem. Named for physicist Rolf Sievert.

**Sifter top:** perforated top on a container or fitting designed to dispense contents.

**siG12D LODER:** A proprietary, miniature biodegradable polymeric matrix containing small-interfering RNAs for the mutated KRAS oncogene, KRASG12D, (siG12D), with potential antitumor activity. Upon intratumoral injection, siG12D is released locally, thereby preventing translation of KRAS proteins and potentially inhibiting growth of tumor cells overexpressing KRAS. KRAS, a member of the small GTPase superfamily, is mutated in over 90% of human pancreatic ductal adenocarcinomas (PDAC) and is associated with tumor cell proliferation and reduced survival.

**sigma bond:** In the valence bond theory, a sigma bond is a valence bond that is symmetrical around the imaginary line between the bonded atoms. Most single bonds are sigma bonds. OR A type of covalent bond in which most of the electrons are located in between the nuclei.

**Sigma factor:** A subunit of RNA polymerase that recognizes specific sites on DNA for initiation of RNA synthesis.

**Sigma subunit:** A component of bacterial RNA polymerase that enables the core RNA polymerase to recognize promoter sites.

**Sigma-Bond:** A chemical bond formed by the direct "Head-to-Head" overlap of two atomic orbitals. I don't think I actually want to get into this , but the two bonds in a double bond are not the same; one is a sigma bond and is considerably stronger than the second one, which is a pi-bond formed by the indirect overlap of two atomic orbitals....

**sigmoid colon :** The S-shaped section of the colon that connects to the rectum.

**sigmoidoscope :** A thin, tube-like instrument used to examine the inside of the colon. A sigmoidoscope has a light and a lens for viewing and may have a tool to remove tissue. Or Examination of the lower colon using a sigmoidoscope, inserted into the rectum. A sigmoidoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called proctosigmoidoscopy.

**sign:** In medicine, a sign is something found during a physical exam or from a laboratory test that shows that a person may have a condition or disease. Some examples of signs are fever, swelling, skin rash, high blood pressure, and high blood glucose.

**Signal sequence:** A (usually N-terminal) sequence of a protein that directs its processing or localization within the cell. OR A n amino-terminal sequence that signals the cellular fate or destination of a newly synthesized protein. OR A sequence of amino acid residues ranging in size fr 13 to 36 residues, usually at the amino terminus of the nascent polypeptide chain, that marks the protein for translocation across the rough endoplasmic reticulum.

**signal transduction:** The process by which an extracellular signal (chemical, mechanical, or electrical) is amplified and converted to a cellular response.

**signal transduction :** The process by which a cell responds to substances in its environment. The binding of a substance to a molecule on the surface of a cell causes signals to be passed from one molecule to another inside the cell. These signals can affect many functions of the cell, including cell division and cell death. Cells that have permanent changes in signal transduction molecules may develop into cancer.

**signal transduction inhibitor :** A substance that blocks signals passed from one molecule to another inside a cell. Blocking these signals can affect

many functions of the cell, including cell division and cell death, and may kill cancer cells. Certain signal transduction inhibitors are being studied in the treatment of cancer.

**signal-to-noise ratio:** A quantitative measure of the statistical detectability of a signal, expressed as a ratio of the magnitude of the signal relative to the variability. For first detection of a CO<sub>2</sub>-induced climate change, the model signal is the mean change or anomaly in some climatic variable, usually surface air temperature, attributed by a numerical model to increased concentrations of carbon dioxide. Observed noise is the standard deviation or natural variability computed from observations of that variable and adjusted for sample size, autocorrelation, and time averaging.

**signaling pathway :** Describes a group of molecules in a cell that work together to control one or more cell functions, such as cell division or cell death. After the first molecule in a pathway receives a signal, it activates another molecule. This process is repeated until the last molecule is activated and the cell function is carried out. Abnormal activation of signaling pathways can lead to cancer, and drugs are being developed to block these pathways. These drugs may help block cancer cell growth and kill cancer cells.

**signature molecule :** A biological molecule found in blood, other body fluids, or tissues that is a sign of a normal or abnormal process, or of a condition or disease. A signature molecule may be used to see how well the body responds to a treatment for a disease or condition. Also called biomarker and molecular marker.

**signet ring cell carcinoma :** A highly malignant type of cancer typically found in glandular cells that line the digestive organs. The cells resemble signet rings when examined under a microscope.

**Significance Determination Process:** The process used by the NRC staff to evaluate inspection findings to determine their safety significance. This involves assessing how the inspection findings affect the risk of a nuclear plant accident, either as a cause of the accident or the ability of plant safety systems or personnel to respond to the accident.

**significant :** In statistics, describes a mathematical measure of difference between groups. The difference is said to be significant if it is greater than what might be expected to happen by chance alone. Also called statistically significant.

**SIGNIFICANT DIGITS:** those that can be accurately measured. An answer can have no more significant digits than the least number of them in the data.

**significant figure:** A convention for recording measurements.

Measurements are rounded so that they contain only the digits up to and including the first uncertain digit, when the number is written in scientific notation. OR If you measure one side of a cube with a ruler marked in cm and find it is 26 cm long, then its volume should be 17576 cm<sup>3</sup>, right?

Wrong! You have only put two meaningful digits into your calculation - the cube could be anywhere from about 25.50001 to 26.49999 cm long on a side, and if you say it has a volume of 17576 cm<sup>3</sup> you are claiming accuracy that you don't really have. The correct answer is  $1.8 \times 10^4$ , keeping the same number of meaningful digits in the answer as you started with. The proper name for 'meaningful digit' is 'significant figure'.

**Sigosix:** (Other name for: recombinant interleukin-6)

**SIL:** A general term for the abnormal growth of squamous cells on the surface of the cervix. The changes in the cells are described as low grade or high grade, depending on how much of the cervix is affected and how abnormal the cells appear. Also called squamous intraepithelial lesion.

**silatecan AR-67:** A synthetic, highly lipophilic derivative of camptothecin, with potential antineoplastic and radiosensitizing activities. Silatecan DB-67 binds to and stabilizes the topoisomerase I-DNA covalent complex, inhibiting the religation of topoisomerase I-mediated single-stranded DNA breaks and producing lethal double-stranded DNA breaks when encountered by the DNA replication machinery; inhibition of DNA replication and apoptosis follow. Camptothecin readily undergoes hydrolysis at physiological pH, changing its conformation from the active lactone structure to an inactive carboxylate form. Modifications on the E ring of camptothecin prevent binding of human serum albumin, which prefers the inactive carboxylate form, thereby enhancing the stability of the active lactone structure and resulting in prolonged agent activity. In addition, this agent may radiosensitize tumor cells.

**sildenafil :** A drug used to treat erectile dysfunction. Sildenafil relaxes the smooth muscle of the penis to allow increased blood flow and erection. It is a type of phosphodiesterase inhibitor. Also called Viagra.

**sildenafil citrate:** The citrate salt of a pyrazolopyrimidinone derivative structurally related to zaprinast. Sildenafil selectively inhibits cyclic guanosine monophosphate (cGMP)-specific type 5 phosphodiesterase, resulting in vasodilation in the corpus cavernosum of the penis and penile erection.

**silent mutation:** A mutation in a gene that causes no detectable change in the biological characteristics of the gene product.

**silica:** Silica is the common name for silicon dioxide,  $\text{SiO}_2$ . It exists in nature as crystalline quartz.

**silica tetrahedron:** four oxygen atoms connected to a smaller, central silicon atom.

**silicate:** 1. A negatively charged ion containing silicon and oxygen, usually  $\text{SiO}_3^{2-}$ ,  $\text{Si}_2\text{O}_7^{6-}$ , and  $\text{Si}_3\text{O}_7^{2-}$ . 2. A compound containing positively charged metal ions combined with negatively charged ions made of silicon and oxygen.

**Silicate Mineral:** A mineral that is made up of compounds with a silicon oxide group or silicon atom bonded to a metal. Topaz is a good example of a silicate mineral.

**silicates:** group of minerals with silicon and oxygen as a base.

**Silicon:** Symbol: "Si" Atomic Number: "14" Atomic Mass: 28.09amu.

Silicon is a delicate, non-metallic element. It is delicate because it is brittle. There is more silicon in the Earth's crust than any other element except oxygen. You will also find silicon in glass, pottery, computer chips, and bricks. OR A resin used in the binders of coatings. Also used as an additive to provide specific properties, e.g., defoamer. Paints containing silicone are very slick and resist dirt, graffiti and bacterial growth, and are stable in high heat. OR One of the family of polymeric materials in which the recurring chemical group contains silicon and oxygen atoms as links in the main chain. At present these compounds are derived from silica (sand) and methyl chloride. The various forms obtainable are characterized by their resistance to heat. Silicones are used in the following applications: (a) Greases for lubrication. (b) Rubber-like sheeting for gaskets, etc. (c) Heat stable fluids and compounds for waterproofing, insulating, etc. (d) Thermosetting insulating varnishes and resins for both coating and laminating. OR A plastic with high thermal stability, water resistance, flexibility and low toxicity. Commonly used in medical tubing and cooking

applications. OR Chemical derived from silica used in molding as a release agent and general lubricant.

**silicon phthalocyanine 4:** A synthetic photosensitizer agent containing a large macrocyclic ring chelated with silicon. Silicon phthalocyanine 4 localizes primarily in mitochondrial cytosolic membranes and, after photoexcitation, forms reactive oxygen species that induce apoptosis. Check for active clinical trials using this agent. or A substance being studied in the treatment of cancer. When absorbed by cancer cells and exposed to light, it becomes active and kills the cancer cells. It is a type of photodynamic therapy agent.

**silicone :** A synthetic gel that is used as an outer coating on breast implants and as the inside filling of some implants.

**silicosis:** Damage to the lungs caused by exposure to materials containing crystalline silicon dioxide which is found in three different forms quartz, tridymite and cristobalite.

**Silk or satin finish:** A finish with a low to medium degree of sheen or gloss.

**SILK SCREEN PRINTING:** This printing method, in its basic form, involves laying a pattern of an insoluble material, in outline, on a finely woven fabric, so that when ink is drawn across it. it is able to pass through the screen only in the desired areas. Also called "Screen Process Decorating."

**Sill:** The lowest timber or member in a structure frame or opening. The timber or stone at the bottom of a door or window opening. OR an intrusive body formed from magma that entered country rock parallel to the bedding and is thus concordant with the country rock.

**silmitasertib:** An orally bioavailable small-molecule inhibitor of CK2 with potential antineoplastic activity. Silmitasertib selectively binds to and inhibits the enzyme casein kinase II (CK2), which may lead to an inhibition of cellular proliferation. CK2, a protein kinase often overexpressed in a variety of cancer cell types, appears to be correlated with malignant transformation, tumor growth and survival.

**silodosin:** An orally available, alpha-1 adrenoreceptor (alpha-1a) selective antagonist that can be used to relieve symptoms of benign prostate hyperplasia (BPH). Upon administration, silodosin selectively binds alpha-

1a receptors located in the human prostate and bladder with high affinity and blocks signaling pathways mediated by alpha-1a. Blockade of these receptors causes smooth muscle relaxation, lowers intraurethral pressure, and results in improved urine flow and a reduction in the symptoms of BPH, such as difficulty with urinating, painful urination, urinary frequency and incomplete bladder emptying. In addition, silodosin may be used to improve lower urinary tract symptoms, which can occur after receiving radiation therapy for prostate cancer.

**siltuximab:** A chimeric, human-murine, monoclonal antibody targeting the pro-inflammatory cytokine interleukin 6 (IL-6), with antitumor and anti-inflammatory activities. Upon intravenous administration of siltuximab, this agent targets and binds to IL-6. This inhibits the binding of IL-6 to the IL-6 receptor (IL-6R), which results in the blockade of the IL-6/IL-6R-mediated signal transduction pathway. This inhibits cancer cell growth in tumors overexpressing IL-6. or A drug used to treat a rare condition called Castleman disease in patients who do not have HIV or human herpesvirus 8. It is also being studied in the treatment of multiple myeloma. Siltuximab binds to a protein called interleukin-6 (IL-6), which is made by some white blood cells and other cells in the body. Siltuximab may help reduce inflammation and stop the growth of cancer cells or abnormal blood cells. It is a type of monoclonal antibody. Also called anti-IL-6 chimeric monoclonal antibody, cCLB8, CNTO 328, and Sylvant.

**Silvadene:** (Other name for: silver sulfadiazine)

**Silver:** Symbol:"Ag" Atomic Number:"47" Atomic Mass: 107.87amu. It is one of the transition elements. Silver is one of man's precious metals and has been used for thousands of years. It has the highest thermal and electrical conductivity of any metal. You will find it used in photography, dentistry, electronics, mirrors, and explosives.

**silver nitrate:** An inorganic chemical with antiseptic activity. Silver nitrate can potentially be used as a cauterizing or sclerosing agent.

**silver sulfadiazine:** A sulfonamide-based topical agent with antibacterial and antifungal activity. Silver sulfadiazine may act through a combination of the activity of silver and sulfadiazine. When this agent interacts with sodium chloride-containing body fluids, silver ions are released slowly and sustainably into wounded areas. Ionized silver atoms catalyze the formation of disulfide bonds leading to protein structural changes and inactivating

thiol-containing enzymes; silver ions may also intercalate DNA thereby interfering with replication and transcription of bacteria. As a competitive inhibitor of para-aminobenzoic acid (PABA), sulfadiazine inhibits bacterial dihydropteroate synthase, thereby resulting in disruption of folic acid metabolism and ultimately DNA synthesis.

**silviculture:** Management of forest land for timber.

**Silybin-Phytosome:** (Other name for: phosphatidylcholine-bound silybin)

**Silybum marianum :** A plant that has been used in some cultures to treat certain medical problems, including stomach, liver, and gallbladder disorders. The active extract of Silybum marianum seeds is called silymarin. It is being studied in the prevention of liver damage caused by some cancer treatments. Also called milk thistle.

**silymarin:** A mixture of flavonolignans isolated from the milk thistle plant Silybum marianum. Silymarin may act as an antioxidant, protecting hepatic cells from chemotherapy-related free radical damage. This agent may also promote the growth of new hepatic cells. or A substance obtained from milk thistle seeds that is being studied in the prevention of liver damage caused by certain cancer treatments.

**simethicone:** A mixture of polydimethylsiloxanes with antifoaming and anti-bloating effects. Simethicone reduces the surface tension of gas bubbles causing them to coalesce into larger bubbles that can be passed more easily by belching or flatulence.

**simian virus 40 :** A virus that infects some types of monkeys. It may also infect humans, and was found in some polio vaccines tested in the early 1960s. Although the virus has been shown to cause cancer in laboratory animals, there is no evidence that it causes cancer in people. Also called SV40.

**similar:** having the same shape but not the same size, in proportion.

**similar sequences, often as a product of genetic recombination**

**heteropolysaccharide:** A polysaccharide containing more than one type of sugar.

**simmitecan hydrochloride:** The hydrochloride salt form of simmitecan, an ester prodrug of chimmitecan, a 9-alkyl-substituted camptothecin derivative with potential antineoplastic activity. Upon intravenous administration, simmitecan is hydrolyzed by carboxylesterase and the

activated form, chimmitecan, is produced. Chimmitecan inhibits topoisomerase I, stabilizes covalent topoisomerase I-DNA complexes, and inhibits the religation of topoisomerase I-mediated single-strand DNA breaks. Furthermore, the covalent topoisomerase I-DNA complexes interfere and block the DNA replication machinery, resulting in the production of potentially lethal double-strand DNA breaks. This leads to an inhibition of DNA replication and the induction of apoptosis. The modification at position 9 yields improved cytotoxicity compared to some other camptothecin analogues. Check for active clinical trials using this agent.

**Simmons-Smith reaction:** the formation of a cyclopropane molecule via reaction of an alkene with iodomethylzinc iodide ( $\text{ICH}_2\text{ZnI}$ ), the Simmons-Smith reagent.

**simo decoction:** A traditional Chinese medicine (TCM) containing simo decoction which contains Fructus aurantii, Radix Aucklandiae, Semen arecae and Radix Linderae, that can potentially be used to improve gastrointestinal (GI) function following surgery. Upon oral intake of simo decoction, this TCM may stimulate mainly muscarinic M3 receptors, but also muscarinic M2 receptors, calcium channels and nicotinic receptors triggering a release of nitric oxide (NO), while inhibiting adrenergic receptors. Altogether, this stimulates the contraction of antral circular smooth muscle, thereby abrogating GI hypomotility and enhancing the return of GI function after surgery.

**simple diffusion:** The movement of solute molecules across a membrane to a region of lower concentration, unassisted by a protein transporter.

**Simple Elements:** These are elements in the periodic table that have only one shell that is missing electrons. These simple elements include many of the first 18 elements. Carbon, oxygen, nitrogen are examples of simple elements.

**simple mastectomy :** Surgery to remove the whole breast. Some of the lymph nodes under the arm may also be removed. Also called total mastectomy.

**simple nephrectomy :** Surgery to remove one kidney.

**simple predicate:** a verb or verb phrase.

**simple protein:** A protein yielding only amino acids on hydrolysis.

**simple sentence:** has one independent clause and no subordinate clauses.

**simple subject:** a noun or pronoun.

**simple vulvectomy :** Surgery to remove the entire vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina).

**simplex case :** A single, isolated occurrence of an inherited condition in a family. Simplex cases can result from certain inheritance patterns or be caused by de novo mutations or reduced penetrance within the family. It can also result from nongenetic causes such as adoption or alternate paternity.

**Simplification:** Drug design technique used when the lead compound is structurally complex. The use of simpler analogues eases synthesis.

**simplified:** An algebraic expression is simplified by using the distributive property and combining like terms.

**simulation :** In cancer treatment, a process used to plan radiation therapy so that the target area is precisely located and marked.

**Simulect:** (Other name for: basiliximab)

**simvastatin:** A lipid-lowering agent derived synthetically from a fermentation product of the fungus *Aspergillus terreus*. Hydrolyzed in vivo to an active metabolite, simvastatin competitively inhibits hepatic hydroxymethyl-glutaryl coenzyme A (HMG-CoA) reductase, the enzyme which catalyzes the conversion of HMG-CoA to mevalonate, a key step in cholesterol synthesis. This agent lowers plasma cholesterol and lipoprotein levels, and modulates immune responses by suppressing MHC II (major histocompatibility complex II) on interferon gamma-stimulated, antigen-presenting cells such as human vascular endothelial cells.

**simvastatin :** A drug used to lower the amount of cholesterol and other harmful substances in the blood, such as triglycerides. It is also being studied in the treatment of cancer and other conditions. Simvastatin blocks an enzyme that helps make cholesterol in the body. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called Zocor.

**Sinequan:** (Other name for: doxepin hydrochloride)

**single blind study :** A type of clinical trial in which only the doctor knows whether a patient is taking the standard treatment or the new treatment being tested. This helps prevent bias in treatment studies.

**single bond:** When an electron pair is shared by two atoms.

**Single Cavity Mold:** Produces one part with each cycle. OR A silicone injection mold having only one cavity and producing only one finished part per cycle OR An injection mold having only one cavity in the body of the mold, as opposed to a multiple cavity mold or family mold which have numerous cavities.

**Single crystal:** A crystal consisting of a non-interrupted repetition of the unit cell in three dimensions. The structure of a single crystal can be determined by single-crystal X-ray diffraction.

**single displacement:** single replacement reaction; single displacement reaction; single replacement. Compare with double displacement. A reaction of the form  $A + BC = B + AC$ . For example, zinc displaces hydrogen from hydrochloric acid in the following reaction:  $Zn(s) + 2 HCl(aq) = ZnCl_2(aq) + H_2(g)$ .

**single nucleotide polymorphism :** DNA sequence variations that occur when a single nucleotide (adenine, thymine, cytosine, or guanine) in the genome sequence is altered; usually present in at least 1% of the population. Also called SNP.

**single nucleotide polymorphism :** The most common type of change in DNA (molecules inside cells that carry genetic information). Single nucleotide polymorphisms occur when a single nucleotide (building block of DNA) is replaced with another. These changes may cause disease, and may affect how a person reacts to bacteria, viruses, drugs, and other substances. Also called SNP.

**SINGLE WOUND SHEETING (SWS):** A single layer of plastic film that is wound on a roll.

**Single-copy DNA:** A region of the genome whose sequence is present only once per haploid complement.

**single-photon emission computed tomography :** A special type of computed tomography (CT) scan in which a small amount of a radioactive drug is injected into a vein and a scanner is used to make detailed images of areas inside the body where the radioactive material is taken up by the cells. Single-photon emission computed tomography can give information about blood flow to tissues and chemical reactions (metabolism) in the body. Also called SPECT.

**single-stranded conformation polymorphism analysis :** A laboratory test used to separate single-stranded nucleic acids based on subtle differences in their DNA sequence, often a single base pair, which results in a different secondary structure and a measurable difference in mobility through a gel. Also called SSCP analysis.

**single-stranded conformational polymorphism :** A type of mutation scanning; the identification of abnormally-migrating single-stranded DNA segments on gel electrophoresis. Also called SSCP.

**Singlet oxygen:** An oxygen atom in its singlet excited state. Singlet oxygen usually gives products resulting from cycloaddition.

**Singlet-oxygen sensitizer:** An organic compound (e.g., the dye rose bengal) that converts triplet oxygen to singlet oxygen by transfer of energy.

**Singulair :** A drug used to treat symptoms of asthma, such as trouble breathing, tight chest, wheezing, coughing, and runny nose. Singulair blocks the action of a substance that causes airways in the lungs to narrow and causes other symptoms of asthma. It is a type of leukotriene receptor antagonist and a type of antiasthmatic agent. Also called montelukast sodium.

**Sink:** Dimples or other distortion in the surface of the part as different areas of the part cool at different rates. These are most commonly caused by excessive material thickness. OR A depression on the part surface over a thick wall feature i.e., a rib, boss, thick sprue gate or change in wall section. Caused by the delayed cooling effects of the center of the thick area. When the hot center cools, it shrinks and pulls down the skin on the surface.

**Sink condition:** Conditions during a dissolution or solubility experiment where the concentration in solution is much less than the solubility.

**SINK MARK:** A depression or dimple on the surface of an injection molded part due to collapsing of the surface following local internal shrinkage after the gate seals. May also be caused by a short shot. OR A depression on the surface of moulded part caused by differential shrinkage. OR An indentation on the surface of the part as a result of significant local change in wall section. The mark will occur in the thicker area.

**Sinkage:** Loss of gloss or colour due to the absorption of the medium by the undercoat or surface beneath. OR When the gloss or colour of the coating has been absorbed by the undercoat or the surface beneath the

coating, first thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Then rub down with a suitable abrasive and dust off before priming all over with a suitable primer for the finishing system.

**sinkhole:** a basinlike depression at the surface caused when a portion of a cave system collapses.

**sinter:** a build-up of ledgelike layers, generally of calcite or silica, around a hot spring.

**Sintering:** A process where the temperature of PTFE is raised to the point where PTFE particles soften and form a bond with each other. OR In forming articles from fusible powders, e.g.. nylon, the process of holding the pressed-powder article at a temperature just below its melting point for about 1/2 hour. Particles are fused (sintered) together, but the mass, as a whole, does not melt. OR The partial welding together of powder particles at temperature near the melting point.

**sinus :** A cavity, space, or channel in the body. Examples include hollow spaces in the bones at the front of the skull, and channels for blood and lymph. Sinuses may also be found in the heart, brain, and other organs.

**sinusoidal obstruction syndrome :** A condition in which some of the veins in the liver are blocked. This causes a decrease in blood flow inside the liver and may lead to liver damage. Signs and symptoms include weight gain, yellowing of the skin and whites of the eyes, dark-colored urine, and increased liver size. It may occur at some point in time after radiation therapy to the liver and bile ducts or after high-dose anticancer drugs were given before a stem cell transplant. Also called hepatic veno-occlusive disease.

**siplizumab:** A monoclonal immunoglobulin G1 antibody with potential antineoplastic activity. Siplizumab binds to CD2, a specific receptor found in T cells and NK cells, thereby triggering a host immune response that results in lysis of CD2+ cells, selective suppression of the immune system, and control of activated T cell growth. Check for active clinical trials using this agent. or A substance being studied in the treatment of certain types of T-cell lymphoma. It is also being studied in the prevention of organ or tissue rejection after a kidney and/or bone marrow transplant. Siplizumab binds to a protein called CD2, which is found on some types of immune cells and cancer cells. This may help suppress the body's immune response

and it may help kill cancer cells. Siplizumab is a type of monoclonal antibody. Also called MEDI-507.

**Sipple syndrome :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the parathyroid glands and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. An itchy skin condition may also occur. Sipple syndrome is caused by a mutation (change) in a gene called RET. Also called MEN2A, MEN2A syndrome, multiple endocrine adenomatosis type 2A, and multiple endocrine neoplasia type 2A syndrome.

**sipuleucel-T:** A cell-based vaccine composed of autologous antigen-presenting peripheral blood mononuclear cells (enriched for a dendritic cell fraction) that have been exposed to a recombinant protein consisting of granulocyte-macrophage colony-stimulating factor (GM-CSF) fused to prostatic-acid phosphatase (PAP), a protein expressed by prostate cancer cells. Upon administration, the vaccine may stimulate an antitumor T-cell response against tumor cells expressing PAP. or A drug used to treat prostate cancer that has spread. It is made from immune system cells collected from a patient with prostate cancer. The cells are treated with a protein that is made by combining a protein found on prostate cancer cells with a growth factor. When the cells are injected back into the patient, they may stimulate T cells to kill prostate cancer cells. Sipuleucel-T is a type of vaccine and a type of cellular adoptive immunotherapy. Also called APC8015 and Provenge.

**SIR JJ THOMPSON'S "J":** tube determined the charge to mass ratio of electrons and ions. This led to the discovery of isotopes.

**Sirapite:** A common type of hardwall plaster. It may or may not be mixed with lime.

**siRNA-expressing SV40 vector:** A simian virus 40 (SV40)-based shuttle vector, encoding small interfering RNA (siRNA), with potential antineoplastic activity. The expression of siRNA in target tumor cells transfected with an siRNA-expressing SV40 vector may result in siRNA-mediated silencing of target oncogenes and, so, the inhibition of tumor cell growth and the induction of tumor cell death.

**siRNA-transfected peripheral blood mononuclear cells APN401:**

Autologous peripheral blood mononuclear cells (PBMCs) transfected ex vivo with small-interfering ribonucleic acid (siRNA) directed against the E3 ubiquitin ligase casitas B-lineage lymphoma-b gene (Cbl-b), with potential immunoactivating and antineoplastic activities. The Cbl-b gene is silenced ex vivo through the binding of Cbl-b siRNA to Cbl-b mRNA, which prevents the translation of the Cbl-b protein in T-lymphocytes. Upon infusion, the activated, Cbl-b-silenced T-lymphocytes are able to increase the production of cytokines, proliferate and activate the immune system, which leads to cancer cell eradication. Cbl-b, a negative regulator of the immune system, is mutated in a variety of cancer cell types. Its expression is inversely correlated with activation of T-lymphocytes and tumor cell eradication.

**sirolimus:** A natural macrocyclic lactone produced by the bacterium *Streptomyces hygroscopicus*, with immunosuppressant properties. In cells, sirolimus binds to the immunophilin FK Binding Protein-12 (FKBP-12) to generate an immunosuppressive complex that binds to and inhibits the activation of the mammalian target of rapamycin (mTOR), a key regulatory kinase. This results in inhibition of T lymphocyte activation and proliferation that occurs in response to antigenic and cytokine (IL-2, IL-4, and IL-15) stimulation and inhibition of antibody production. or A drug used to keep the body from rejecting organ and bone marrow transplants. Sirolimus blocks certain white blood cells that can reject foreign tissues and organs. It also blocks a protein that is involved in cell division. It is a type of antibiotic, a type of immunosuppressant, and a type of serine/threonine kinase inhibitor. Sirolimus was previously called rapamycin. Also called Rapamune.

**SIRPa-Fc fusion protein TTI-621:** A soluble recombinant antibody-like fusion protein composed of the N-terminal CD47 binding domain of human signal-regulatory protein alpha (SIRPa) linked to the Fc domain of human immunoglobulin G1 (IgG1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, the SIRPa-Fc fusion protein TTI-621 selectively targets and binds to CD47 expressed on tumor cells and blocks the interaction of CD47 with endogenous SIRPa, a cell surface protein expressed on macrophages. This prevents CD47/SIRPa-mediated signaling and abrogates the CD47/SIRPa-mediated inhibition of macrophage activation and phagocytosis of cancer cells. This induces pro-

phagocytic signaling mediated by the binding of calreticulin (CRT), which is specifically expressed on the surface of tumor cells, to low-density lipoprotein (LDL) receptor-related protein-1 (LRP-1), expressed on macrophages, and results in macrophage activation and the specific phagocytosis of tumor cells. CD47, also called integrin-associated protein (IAP), is a tumor-associated antigen (TAA) expressed on normal, healthy hematopoietic stem cells (HSC) and overexpressed on the surface of a variety of cancer cells. Expression of CD47, and its interaction with SIRP $\alpha$ , leads to the inhibition of macrophage activation and protects cancer cells from phagocytosis, thereby allowing cancer cells to proliferate.

**SIRS:** A serious condition in which there is inflammation throughout the whole body. It may be caused by a severe bacterial infection (sepsis), trauma, or pancreatitis. It is marked by fast heart rate, low blood pressure, low or high body temperature, and low or high white blood cell count. The condition may lead to multiple organ failure and shock. Also called systemic inflammatory response syndrome.

**sirtuin:** human homolog of yeast silent information regulator 2, Sir2

**Site-directed mutagenesis:** An intentional alteration in a DNA sequence that can be genetically inherited. OR A set of methods used to create specific alterations in the sequence of a gene.

**Site-specific Drug Delivery:** Comprises of methods of delivering pharmaceutical agents at higher concentrations to the desired part of the body

**Site-specific mutagenesis:** The use of recombinant DNA technology to create specific deletions, insertions, or substitutions in vitro in a particular gene; this technique allows the production of proteins having any desired amino acid at any position.

**Site-specific recombination:** The exchange of two specific but not always homologous DNA sequences.

**site-specific recombination:** A type of genetic recombination that occurs only at specific ssquences.

**sivifene gel:** The phenylhydrazone 4,4'-dihydroxybenzophenone-2,4-dinitrophenylhydrazone formulated as a topical agent with immunomodulating and potential antineoplastic activities. Applied topically

as a gel, sivifene may stimulate a local immune response against human papillomavirus (HPV)-induced cervical intraepithelial neoplasia (CIN).

**Sixofilan:** (Other name for: sizofiran)

**Size:** A mixture of glue and water. OR A coating applied to glass fibres or filaments during manufacture, to improve handling and protect from abrasion.

**Size distribution:** See particle-size distribution.

**SIZE OF THE ATOM:** can be measured by oil slick experiments or by calculating how many atoms lie along the side of a cube of a known number of moles of atoms.

**SIZE OF THE NUCLEUS:** was measured by Lord Rutherford using the scattering patterns of alpha particles passing through gold foil. It is 10-15 meter.

**size-consistent:** Describes a calculation that gives the same energy for two atoms (or molecular fragments) separated by a large distance as is obtained from summing the energies for the atoms (or molecular fragments) computed separately. So for a size-consistent method, the bond energy in N<sub>2</sub> is  $D_e = 2E(N) - E(N_2)$ . For a method that is not size-consistent, a "supermolecule" calculation with a big distance (e.g., 100  $\text{\AA}$ ) is required:  $D_e = E(N \dots N) - E(N_2)$ .

**Sizing:** The process of applying a material to a surface to fill pores and thus reduce the absorption of the subsequently applied adhesive or coating or to otherwise modify the surface. Also, the surface treatment applied to glass fibers used in reinforced plastics. The material used is sometimes called Size.

**sizofiran:** A soluble beta-D-glucan produced by the Basidiomycetes fungus, *Schizophyllum commune* Fries, with potential immunomodulating and antitumor activities. Although sizofiran's exact mechanism of action has yet to be fully elucidated, this agent appears to stimulate the immune system by increasing cytokine production, activating macrophages and enhancing the activity of polymorphonuclear leukocytes (PML) and natural killer (NK) cells.

**SJG-136:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called DNA cross-linking agents.

**Sjögren syndrome** : An autoimmune disease that affects the tear glands and salivary glands, and may affect glands in the stomach, pancreas, and intestines. The disease causes dry eyes and mouth, and may cause dryness in the nose, throat, air passages, skin, and vagina. It may also cause inflammation in the joints, muscles, and skin; pneumonia; tingling in the fingers and toes; and fatigue. It often occurs with rheumatoid arthritis or other connective tissue diseases.

**SK-Diphenhydramine:** (Other name for: diphenhydramine hydrochloride)

**SK-Furosemide:** (Other name for: furosemide)

**SK-Probenecid:** (Other name for: probenecid)

**SK&F106615:** A substance being studied in the treatment of certain multiple myelomas and other advanced cancers. SK&F106615 may block the growth of tumors and may prevent the growth of new blood vessels that tumors need to grow. SK&F106615 is a type of signal transduction inhibitor and a type of antiangiogenesis agent. Also called atiprimod and azaspirane.

**skeletal** : Having to do with the skeleton (bones of the body).

**skeletal structure:** the carbon backbone of a molecule.

**skeleton** : The framework that supports the soft tissues of vertebrate animals and protects many of their internal organs. The skeletons of vertebrates are made of bone and/or cartilage.

**Skeleton Equation:** A chemical equation that is not balanced, with an unequal number of atoms on each side of the reaction. You may start with a hydrogen molecule on one side of the equation (two atoms) and create a compound that has eight hydrogen atoms. Although the formulas are correct, the equation is not balanced.

**SKIN:** Tough covering that forms on paints if container is not tightly sealed. OR A relatively dense layer at the surface of a cellular material.

**skin cancer** : Cancer that forms in the tissues of the skin. There are several types of skin cancer. Skin cancer that forms in melanocytes (skin cells that make pigment) is called melanoma. Skin cancer that forms in the lower part of the epidermis (the outer layer of the skin) is called basal cell carcinoma. Skin cancer that forms in squamous cells (flat cells that form the surface of the skin) is called squamous cell carcinoma. Skin cancer that forms in neuroendocrine cells (cells that release hormones in response to signals from the nervous system) is called neuroendocrine carcinoma of the skin.

Most skin cancers form in older people on parts of the body exposed to the sun or in people who have weakened immune systems.

**skin conduction** : A change in the heat and electricity passed through the skin by nerves and sweat. Skin conduction increases in certain emotional states and during hot flashes that happen with menopause. Also called electrodermal response and galvanic skin response.

**skin graft** : Skin that is moved from one part of the body to another.

**Skin Pack**: A type of carded packaging where a product (or products) is placed on a piece of paperboard, and a thin sheet of transparent plastic is placed over the product and paperboard.

**skin patch** : A bandage-like patch that releases medicine into the body through the skin. The medicine enters the blood slowly and steadily.

**skin stimulation** : The process of applying pressure, friction, temperature change, or chemical substances to the skin to lessen or block a feeling of pain.

**skin tag** : A small, benign skin growth that may have a stalk (peduncle). Skin tags most commonly appear on the neck, axillary, groin, and inframammary regions. Also called acrochordon.

**skin test** : A test for an immune response to a compound by placing it on or under the skin.

**skin vesicle** : A fluid-filled sac in the outer layer of skin. It can be caused by rubbing, heat, or diseases of the skin. Also called blister.

**skinning vulvectomy** : Surgery to remove the top layer of skin of the vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina). A skin graft may be used to replace the skin that was removed.

**Skirting**: A board or member at the base of a wall, probably a corruption of 'wainscotting'.

**skull** : The bones that form the head. The skull is made up of cranial bones (bones that surround and protect the brain) and facial bones (bones that form the eye sockets, nose, cheeks, jaw, and other parts of the face). An opening at the base of the skull is where the spinal cord connects to the brain. Also called cranium.

**SL-11047**: A substance that is being studied in the treatment of lymphoma. It belongs to the family of drugs called polyamine analogs.

**slab-pull:** a term that refers to the result of the cold edge of a plate subducting at a steep angle through the mantle, its downward motion tending to pull the plate away from the ridge crest.

**slag:** Slag is the solid waste product from the extraction of iron and manufacture of steel.

**Slaked lime** : Calcium hydroxide, it is made by adding a limited amount of water to quicklime (calcium oxide). It can be used as a soil additive to reduce the acidity of soil.

**slang:** conversational or informal language, which should generally be avoided in formal writing.

**SLE:** A chronic, inflammatory, connective tissue disease that can affect many organs including the joints, skin, heart, lungs, kidneys, and nervous system. It is marked by many different symptoms; however, not everyone with SLE has all of the symptoms. Also called lupus and systemic lupus erythematosus.

**sleep apnea** : A sleep disorder that is marked by pauses in breathing of 10 seconds or more during sleep, and causes unrestful sleep. Symptoms include loud or abnormal snoring, daytime sleepiness, irritability, and depression.

**sleep disorder** : A disturbance of normal sleep patterns. There are a number of sleep disorders that range from trouble falling asleep, to nightmares, sleepwalking, and sleep apnea (problems with breathing that cause loud snoring). Poor sleep may also be caused by diseases such as heart disease, lung disease, or nerve disorders.

**sleep stage** : One of 5 parts or stages of the sleep cycle based on the type of brain activity that occurs during the stage. During stages 1 to 4, a person will feel drowsy, fall asleep, and move into a deep, dreamless sleep. Stage 5 is called rapid eye movement (REM) sleep, and it is during this stage that dreams occur. During several hours of normal sleep, a person will go through several sleep cycles that include REM sleep and the 4 stages of non-REM sleep (light to deep sleep).

**Sleepiness:** Condition of a recently-dried glossy paint film which has lost its initial gloss slightly. OR Apply another coat of paint, after first cleaning down the surfaces to remove all dirt, grease and surface contaminants. Then rub down with a suitable abrasive, dust off and repaint.

**Sleepy:** The description of a recently applied gloss paint which has a 'hazy' appearance or lower than normal gloss.

**sleeve lobectomy :** Surgery to remove a lung tumor in a lobe of the lung and a part of the main bronchus (airway). The ends of the bronchus are rejoined and any remaining lobes are reattached to the bronchus. This surgery is done to save part of the lung. Also called sleeve resection.

**sleeve resection :** Surgery to remove a lung tumor in a lobe of the lung and a part of the main bronchus (airway). The ends of the bronchus are rejoined and any remaining lobes are reattached to the bronchus. This surgery is done to save part of the lung. Also called sleeve lobectomy.

**slide:** a mass-wasting movement that moves along a surface parallel to the slope of the surface. OR Projection in the mold used to form the geometry of the part, which is not in the direction of the closing of the mold and must be withdrawn before the part can be ejected. OR A section of the mold that is made to travel at an angle to the normal movement of the mold. It is used for providing undercuts, recesses, etc. OR Area of the custom plastic injection molds that is used for creating undercuts. Required for automatic injection molds

**Slide Action:** A sliding mechanism in the mold designed for the molding of parts with undercuts. The undercut-steel fixture is held in place during the injection process and then slides out of the way prior to ejection.

**Sliding Core:** A pin on a mold that automatically retracts when the mold opens

**sliding plate boundary:** region where plates move next to each other.

**slime molds (cellular):** amoeba-like cells that live independently and unite with other cellular slime molds to form a single, large, flat cell with many nuclei.

**slime molds (true):** single, flat, very large cells with many nuclei.

**sling psychrometer:** a handheld psychrometer that spins around, used to measure dewpoint and relative humidity.

**slip:** a mass-wasting movement in which the mass moves as a single unit along a well-defined surface or plane. OR Slip is an agent most commonly an erucamide or oleamide added to polyethylene resin to make it lower the films coefficient of friction (COF).

**Slip Additive:** A modifier that acts as an internal lubricant which exudes to the surface of the plastic during and immediately after processing. In other words, a non-visible coating blooms to the surface to provide the necessary lubricity to reduce coefficient of friction and thereby improve slip characteristics.

**Slip Agent:** Additive used to provide lubrication during and immediately following processing of plastics. OR An additive that provides surface lubrication during and immediately following processing of the plastic material. It acts as an internal lubricant which will eventually migrate to the surfaces. OR Additive used to provide lubrication during and immediately after the processing of plastics.

**Slip dislocation:** A type of defect in which the crystal planes have slipped relative to each other. A slip dislocation can bring molecules into intermolecular interactions that are not found in the bulk crystal.

**slip face:** the back side of a sand dune. OR the steeper, downwind slope of a sand dune.

**Slip Forming:** Sheet forming technique in which some of the plastic sheet material is allowed to slip through the mechanically operated clamping rings during a stretch-forming operation.

**Slip-plane:** Plane within transparent material visible in reflected light, due to poor welding and shrinkage on cooling.

**SLIP, SLIPPAGE:** When fluids flow it is assumed that the velocity at a surface is zero (or equal to the surface velocity if the surface moves).

Virtually all polymer melts exhibit some slippage on the surface, especially when the shear stress levels are high, e.g., over 0.1 MPa (14.5 psi). Stick-slip phenomena are responsible for the onset of sharkskin whenever polymers are extruded at shear stresses higher than 0.14 MPa (20.3 psi). Some additives and processing aids promote slippage. Slippage is beneficial for delaying the appearance of sharkskin at higher throughput rates.

**slippery elm :** The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, Indian elm, red elm, sweet elm, *Ulmus fulva*, and *Ulmus rubra*.

**slit-lamp biomicroscopy :** An eye exam using an instrument that combines a low-power microscope with a light source that makes a narrow beam of

light. The instrument may be used to examine the retina, optic nerve, and other parts of the eye. Also called slit-lamp eye exam.

**slit-lamp eye exam :** An eye exam using an instrument that combines a low-power microscope with a light source that makes a narrow beam of light. The instrument may be used to examine the retina, optic nerve, and other parts of the eye. Also called slit-lamp biomicroscopy.

**SLL:** An indolent (slow-growing) type of lymphoma in which too many immature lymphocytes (white blood cells) are found mostly in the lymph nodes. This causes the lymph nodes to become larger than normal. Sometimes cancer cells are found in the blood and bone marrow, and the disease is called chronic lymphocytic leukemia. The disease is most often seen in people older than 50 years. SLL is a type of non-Hodgkin Lymphoma. Also called small lymphocytic lymphoma and well-differentiated lymphocytic lymphoma.

**Slo-bid:** (Other name for: theophylline)

**Slo-Phyllin:** (Other name for: theophylline)

**Slope:** the gradient of the line formed by plotting the change in the electrode response against change in activity of the ion measured. Theoretical Nernstian slope at 25°C is 59.16 mV per decade change in activity for a monovalent ion and 29.58 mV per decade change for a divalent ion. Slope values are often stated in % efficiency terms (an ideal slope of 59.16 mV for a monovalent ion 100% slope efficiency). Slope values of less than 90% efficiency may be indicative of electrode contamination. However, many other factors will contribute to a loss of system performance.

**slot canyon:** a vertical-walled canyon where mass-wasting processes have been very limited.

**Slow drying of gloss/varnish on new paintwork:** With solvent-based paints, it's usually surface contamination as the result of a poorly prepared surface. Water-based paints can be slow to dry in damp, cold conditions, or when applied to timbers that are oily by nature, such as teak. Wet solvent-based paint may be removed using cloths soaked in white spirit. If this is unsuccessful, completely remove the coating using a hot air gun or a suitable chemical-based remover. To remove slow-drying water-based paints, simply wash off with warm water and detergent solution.

**sludge:** the solids (and accompanying water and organic matter) which are separated from sewage or industrial wastewater in treatment plant facilities. Sludge separation and disposal is one of the major expenses in wastewater treatment operations.

**sludge conditioning:** a process employed to prepare sludge for final disposal, e.g., thickening, digesting, heat treatment or other procedures.

**Sludge dewatering :** Sludge dewatering is one of the key unit processes in sludge management. Sludge contains usually more than 95 percent of water even after thickening and the goal of sludge dewatering is to separate as much water as possible from the sludge, so that the volume for further treatment or final disposal is minimized. Sludge dewatering takes place usually with equipment like centrifuge, belt filter press, screw press, chamber press or equal. Polymers are often used as dewatering aid to improve water separation.

**sludge digestion:** the process by which organic or volatile matter in sludge is gasified, liquefied, mineralized, or converted into more stable organic matter through the activities of either anaerobic or aerobic organisms.

**sludge disposal:** the final disposal of solid wastes including the use of sewage sludge as fertilizers and soil builders, and fill for low-lying lands.

**Sludge management :** Sludge management refers to variety of means of treatment, which are required to be able to finally dispose the excess sludge from the system. The sludge usually originates from biological (aerobic) waste water treatment, where primary and secondary sludges are collected and treated before disposal. Sludge management can include selected unit processes of: stabilization, thickening, dewatering, drying, composting or digestion or incineration and final disposal.

**sludge thickening:** the increase in solids concentrations of sludge in the sedimentation of digestion tank.

**slump:** a mass-wasting movement along a curved surface where the downward movement of the upper part of the mass leaves a steep scarp and the bottom part is pushed outward along a more horizontal plane. OR rock material that is moved downhill as a block of land is uplifted

**slurry:** a watery mixture or suspension of solids. OR A thin paste produced by mixing some materials, especially Portland cement with water. OR a watery mixture of insoluble matter. OR the medium within which a

substance is dissolved; most commonly applied to liquids used to bring particular solids into solution, e.g., acetone is a solvent for PVC. OR the medium within which a substance is dissolved; most commonly applied to liquids used to bring particular solids into solution, e.g., acetone is a solvent for PVC. a watery mixture of insoluble matter.

**SMA:** Styrene maleic anhydride

**Smac mimetic CUDC-427:** An orally available, monovalent mimetic of second mitochondrial-derived activator of caspases (Smac/DIABLO) and inhibitor of IAPs (Inhibitor of Apoptosis Proteins) with potential antineoplastic activity. Smac mimetic CUDC-427 binds to the Smac binding groove on IAPs, including the direct caspase inhibitor X chromosome-linked IAP (XIAP) and the cellular IAPs 1 and 2. This inhibits the activities of these IAPs and promotes the induction of apoptosis through apoptotic signaling pathways. IAPs are overexpressed by many cancer cell types and suppress apoptosis by binding to and inhibiting active caspases-3, -7 and -9 via their baculoviral IAP repeat (BIR) domains.

**Smac mimetic GDC-0152:** A second mitochondrial activator of caspases (Smac) mimetic inhibitor of IAPs (Inhibitor of Apoptosis Proteins) with potential antineoplastic activity. Smac mimetic GDC-0152 binds to the Smac binding groove on IAPs, including the direct caspase inhibitor X chromosome-linked IAP (XIAP) and the cellular IAPs 1 and 2, which may inhibit their activities and promote the induction of apoptosis through apoptotic signaling pathways. IAPs are overexpressed by many cancer cell types and suppress apoptosis by binding to and inhibiting active caspases-3, -7 and -9 via their baculoviral IAP repeat (BIR) domains. Smac, the endogenous IAP antagonist, relies on its N-terminal four amino-acid motif for binding to IAPs.

**SMAC mimetic LCL161:** An orally bioavailable second mitochondrial-derived activator of caspases (SMAC) mimetic and inhibitor of IAP (Inhibitor of Apoptosis Protein) family of proteins, with potential antineoplastic activity. SMAC mimetic LCL161 binds to IAPs, such as X chromosome-linked IAP (XIAP) and cellular IAPs 1 and 2. Since IAPs shield cancer cells from the apoptosis process, this agent may restore and promote the induction of apoptosis through apoptotic signaling pathways in cancer cells. IAPs are overexpressed by many cancer cell types and suppress apoptosis by binding and inhibiting active caspases-3, -7 and -9,

which play essential roles in apoptosis (programmed cell death), necrosis and inflammation. Check for active clinical trials using this agent.

**small cell lung cancer :** An aggressive (fast-growing) cancer that forms in tissues of the lung and can spread to other parts of the body. The cancer cells look small and oval-shaped when looked at under a microscope.

**Small G protein:** A monomeric guanyl nucleotide binding protein that is active when bound to GTP and inactive when bound to GDP; has inherent gtpase activity.

**small intestine:** the site of chemical digestion; includes the duodenum, jejunum, and ileum.

**small intestine :** A long tube-like organ that connects the stomach and the large intestine. It is about 20 feet long and folds many times to fit inside the abdomen. The small intestine has three parts: the duodenum, jejunum, and ileum. It helps to further digest food coming from the stomach. It absorbs nutrients (vitamins, minerals, carbohydrates, fats, proteins) and water from food so they can be used by the body. The small intestine is part of the digestive system.

**small intestine cancer :** A rare cancer that forms in tissues of the small intestine (the part of the digestive tract between the stomach and the large intestine). The most common type is adenocarcinoma (cancer that begins in cells that make and release mucus and other fluids). Other types of small intestine cancer include sarcoma (cancer that begins in connective or supportive tissue), carcinoid tumor (a slow-growing type of cancer), gastrointestinal stromal tumor (a type of soft tissue sarcoma), and lymphoma (cancer that begins in immune system cells).

**small lymphocytic lymphoma :** An indolent (slow-growing) type of lymphoma in which too many immature lymphocytes (white blood cells) are found mostly in the lymph nodes. This causes the lymph nodes to become larger than normal. Sometimes cancer cells are found in the blood and bone marrow, and the disease is called chronic lymphocytic leukemia. The disease is most often seen in people older than 50 years. Small lymphocytic lymphoma is a type of non-Hodgkin Lymphoma. Also called SLL and well-differentiated lymphocytic lymphoma.

**small nuclear RNA (snRNA):** Any of several small RNA molecules in the nucleus; most have a role in the splicing reactions that remove introns from mRNA, tRNA, and rRNA molecules.

**Small nuclear rnas (snrnas):** A class of small rnas confined to the nucleus; some play a role in splicing.

**Small Radius Omni-Grid (3/4" & 1" ) :** Belt consists of an assembly of rods and links. A center row of heavy duty non-collapsing links forms two product lanes; for 3/4" pitch - standard links on inside and outside belt edges; for 1" pitch - standard collapsing links on inside edge with 1.75" (44.5mm) pitch collapsing links on the outside edge. All belts are double welded.

**small-molecule drug :** A substance that is able to enter cells easily because it has a low molecular weight. Once inside the cells, it can affect other molecules, such as proteins, and may cause cancer cells to die. This is different from drugs that have a large molecular weight, such as monoclonal antibodies, which are not able to get inside cells very easily. Many targeted therapies are small-molecule drugs or small molecule inhibitors.

**SMC:** See Sheet moulding compound.

**Smelting :** The extraction of a metal from its ore.

**SMO antagonist BMS 833923:** An orally bioavailable small-molecule SMO (Smoothened) inhibitor with potential antineoplastic activity. SMO antagonist BMS-833923 inhibits the sonic hedgehog (SHH) pathway protein SMO, which may result in a suppression of the SHH signaling pathway. SMO is a G-protein coupled receptor that lies just downstream of the SHH ligand cell surface receptor Patched-1 in the SHH pathway; in the absence of ligand Patched-1 inhibits SMO and ligand binding to Patched-1 results in increased levels of SMO. The SHH signaling pathway plays an important role in cellular growth, differentiation and repair; constitutive activation of this pathway is associated with uncontrolled cellular proliferation and has been observed in a variety of cancers.

**smog:** A fog containing fumes, or a photochemical haze caused by the action of ultraviolet radiation on hydrocarbons and NOx from automobile exhaust. OR Air pollution associated with oxidants.

**smoke:** Particles suspended in air after incomplete combustion of materials.

**smoked plum:** The fruit of the Prunus mume tree that is used as a traditional Chinese medicine (TCM) called Wu Mei, which may be used to promote hydration and improve bowel function. Although the exact

mechanism(s) of action through which this TCM exerts its effect has yet to be fully elucidated, upon oral administration, this TCM may reduce dehydration and improve peristalsis in the bowel.

**smokeless tobacco:** Tobacco that is not smoked but used in another form such as chewing tobacco or snuff. Or A type of tobacco that is not smoked or burned. It may be used as chewing tobacco or moist snuff, or inhaled through the nose as dry snuff. Smokeless tobacco contains nicotine and many harmful, cancer-causing chemicals. Using it can lead to nicotine addiction and can cause cancers of the mouth, esophagus, and pancreas. It may also cause heart disease, gum disease, and other health problems.

**smoking cessation :** To quit smoking. Smoking cessation lowers the risk of cancer and other serious health problems. Counseling, behavior therapy, medicines, and nicotine-containing products, such as nicotine patches, gum, lozenges, inhalers, and nasal sprays, may be used to help a person quit smoking.

**smoldering myeloma :** A very slow-growing type of myeloma in which abnormal plasma cells (a type of white blood cell) make too much of a single type of monoclonal antibody (a protein). This protein builds up in the blood or is passed in the urine. Patients with smoldering myeloma usually have no symptoms, but need to be checked often for signs of progression to fully developed multiple myeloma.

**smooth endoplasmic reticulum:** ER with no ribosomes attached.

**smooth muscle:** found in the linings of the blood vessels, along the gastrointestinal tract, in the respiratory tract, and in the urinary bladder; contains few actin and myosin filaments; also called involuntary muscle.

**Smoothened antagonist LDE225 topical:** A topical formulation of the small-molecule Smoothened (Smo) antagonist LDE225 with potential antineoplastic activity. Upon topical application, smoothened antagonist LDE225 topically selectively binds to the Hedgehog (Hh)-ligand cell surface receptor Smo, which may result in the suppression of the Hh signaling pathway and, so, the inhibition of tumor cells in which this pathway is abnormally activated. The Hh signaling pathway plays an important role in cellular growth, differentiation and repair. Inappropriate activation of Hh pathway signaling and uncontrolled cellular proliferation, as is observed in a variety of cancers, may be associated with mutations in the Hh-ligand cell surface receptor Smo.

**Smoothened antagonist LEQ506:** An orally bioavailable small-molecule Smoothened (Smo) antagonist with potential antineoplastic activity. Smoothened antagonist LEQ506 selectively binds to the Hedgehog (Hh)-ligand cell surface receptor Smo, which may result in the suppression of the Hh signaling pathway, thereby inhibiting tumor cell growth. The Hh signaling pathway plays an important role in cellular growth, differentiation and repair. Dysregulated activation of Hh pathway signaling and uncontrolled cellular proliferation, as is observed in a variety of cancers, may be associated with mutations in the Hh-ligand cell surface receptor Smo.

**Smudge:** A term used for a mixture of paint with remainders of all types and colours.

**SN-38 liposome :** A form of the anticancer drug irinotecan that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than irinotecan alone. SN-38 liposome is being studied in the treatment of advanced colorectal cancer and other types of cancer. SN-38 liposome blocks the ability of cells to divide and grow. It may stop the growth of tumor cells. It is a type of topoisomerase inhibitor and a type of irinotecan (CPT-11) derivative. Also called liposomal SN-38.

**SN-38-loaded polymeric micelles NK012:** A formulation consisting of polymeric micelles loaded with the irinotecan metabolite SN-38 with potential antineoplastic activity. SN-38-loaded polymeric micelles NK012 is an SN-38-releasing nanodevice constructed by covalently attaching SN-38 to the block copolymer PEG-PGlu, followed by self-assembly of amphiphilic block copolymers in an aqueous milieu. SN-38 (7-ethyl-10-hydroxy-camptothecin), a biological active metabolite of the prodrug irinotecan (CPT-11), binds to and inhibits topoisomerase I by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks, inhibition of DNA replication, and apoptosis. SN-38 has been reported to exhibit up to 1,000-fold more cytotoxic activity against various cancer cells in vitro than irinotecan. This formulation increases the water-solubility of SN-38 and allows the delivery of higher doses of SN-38 than those achievable with SN-38 alone.

**SN1:** N a substitution reaction mechanism in which the slow step is a self ionization of a molecule to form a carbocation. Thus, the rate controlling step is unimolecular.

**SN2:** A substitution reaction mechanism in which the rate controlling step is a simultaneous attack by a nucleophile and a departure of a leaving group from a molecule. Thus, the rate controlling step is bimolecular.

**Snap-back Forming:** Sheet forming technique in which an extended heated plastic sheet is allowed to contract over a male form shaped to the desired contours.

**SNDX-275:** A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor. Also called entinostat and HDAC inhibitor SNDX-275.

**SnET2:** An anticancer drug that is also used in cancer prevention. It belongs to the family of drugs called photosensitizing agents. Also called tin ethyl etiopurpurin.

**snow line:** of a glacier, the irregular boundary between the zone of accumulation and the zone of wastage.

**SNP :** DNA sequence variations that occur when a single nucleotide (adenine, thymine, cytosine, or guanine) in the genome sequence is altered; usually present in at least 1% of the population. Also called single nucleotide polymorphism.

**SNP :** The most common type of change in DNA (molecules inside cells that carry genetic information). SNPs occur when a single nucleotide (building block of DNA) is replaced with another. These changes may cause disease, and may affect how a person reacts to bacteria, viruses, drugs, and other substances. Also called single nucleotide polymorphism.

**SNRI:** A type of drug that is used to treat depression and certain other disorders. SNRIs increase the levels of the chemicals serotonin and norepinephrine in the brain. Nerves use these chemicals to send messages to one another. Increasing their levels in the brain helps improve mood. Also called serotonin-norepinephrine reuptake inhibitor.

**SNS01-T nanoparticles:** A colloidal mixture of nanoparticles consisting of small interfering RNA (siRNA) targeting the native eukaryotic translation initiation factor 5A (eIF5A), plasmids expressing a pro-apoptotic mutant of eIF5A under the control of a B-cell specific promoter (B29), and a synthetic cationic polymer polyethylenimine (PEI) as a delivery vehicle, with potential antineoplastic activity. Upon administration, the siRNA

component of SNS01-T suppresses eIF5A expression, thereby interfering with translation of eIF5A and reducing levels of hypusinated eIF5A in cancer cells. In turn, this inhibits activation of the transcription factor NF- $\kappa$ B and induces apoptosis. In addition, the B-cell specific plasmid component expresses an arginine substituted form of eIF5A, eIF5AK50R, which can not be hypusinated, thus leads to a selective induction of apoptosis in B-cells. The native unhyposinated form of eIF5A is pro-apoptotic and can be modified at the lysine residue, by deoxyhypusine synthase (DHS) and subsequently deoxyhypusine hydroxylase (DHH), to the anti-apoptotic hypusinated form which is associated with tumor cell growth and survival. The delivery vehicle protects the siRNA and plasmid from degradation. Check for active clinical trials using this agent.

**snuff tobacco :** A type of smokeless tobacco that is made of finely ground or shredded tobacco leaves. It may have different scents and flavors and may be moist or dry. Moist snuff tobacco is placed in the mouth, usually between the cheek and gum or behind the upper or lower lip. Dry snuff tobacco is inhaled through the nose. Snuff tobacco contains nicotine and many harmful, cancer-causing chemicals. Using it can lead to nicotine addiction and can cause cancers of the mouth, esophagus, and pancreas. Snuff tobacco use may also cause gum disease, heart disease, stroke, and other health problems. Using snuff tobacco is also called “dipping.”

**SNX 111:** A drug used in the treatment of chronic pain. Also called Prialt and ziconotide.

**SNX-5422:** A substance being studied in the treatment of cancer. SNX-5422 blocks a protein needed for cells to grow and may kill cancer cells. It is a type of heat shock protein 90 inhibitor.

**SNX-5422 mesylate :** A substance being studied in the treatment of cancer. SNX-5422 mesylate blocks a protein needed for cells to grow and may kill cancer cells. It is a type of heat shock protein 90 inhibitor.

**Soap:** A soap is a type of surfactant that is derived from the saponification reaction (hydrolysis) of a vegetable oil. A soap has a carboxylate group on the end which can form a complex with calcium ions in hard water. (This causes soaps to form precipitates giving rise to a "soap scum".) Soaps are often called fatty acid salts. Common soaps are: OR A salt of a fatty acid. For example, sodium stearate is a soap made by neutralizing stearic acid. Commercial soaps are mixtures of fatty acid salts.

**soblidotin:** A dolastatin-10 derivative. Soblidotin inhibits tubulin polymerization, resulting in cell cycle arrest and induction of apoptosis. Or A substance being studied in the treatment of cancer. It is a type of tubulin inhibitor. Also called TZT-1027.

**social service :** A community resource that helps people in need. Services may include help getting to and from medical appointments, home delivery of medication and meals, in-home nursing care, help paying medical costs not covered by insurance, loaning medical equipment, and housekeeping help.

**social support :** A network of family, friends, neighbors, and community members that is available in times of need to give psychological, physical, and financial help.

**social worker :** A professional trained to talk with people and their families about emotional or physical needs, and to find them support services.

**SOD1 inhibitor ATN-224:** An orally bioavailable, second-generation tetrathiomolybdate analog with potential antiangiogenic and antineoplastic activities. SOD1 inhibitor ATN-224 selectively chelates the copper ion in copper-zinc superoxide dismutase 1 (SOD1), inhibiting SOD1 activity; this may result in a decrease in intra-cellular H<sub>2</sub>O<sub>2</sub> levels and, in turn, increased activity of intracellular phosphatases. The ATN-224-mediated increase in phosphatase activity may interfere with the activation of multiple kinase signaling pathways required for cellular proliferation and angiogenesis. This agent has been shown to inhibit VEGF and FGF-2 signaling in endothelial cells, IGF-1, EGF, NF-κB, and integrin signaling in tumor cells, and PDGF signaling in pericytes.

**SOD1 inhibitor ATN-224 :** A substance being studied in the treatment of cancer. It may prevent the growth of new blood vessels that tumors need to grow. SOD1 inhibitor ATN-224 also blocks enzymes that cells need to divide and grow, and it may kill cancer cells. It is a type of antiangiogenesis agent and a type of superoxide dismutase inhibitor. Also called ATN-224.

**soda ash:** a common water treating chemical, sodium carbonate.

**Sodium:** Symbol:"Na" Atomic Number:"11" Atomic Mass: 23.00amu. One of the alkali metal family. Sodium is a light, metallic element. It is very reactive and almost explodes if put in water. You will find sodium in salt, glass making, paper-making, salt, developing photos, and fertilizers.

**sodium :** A mineral needed by the body to keep body fluids in balance. Sodium is found in table salt and in many processed foods. Too much sodium can cause the body to retain water.

**sodium alginate microspheres:** An embolic agent containing microporous hydrospheres of sodium alginate with potential arterial occlusive activity. In transarterial chemoembolization (TACE), the sodium alginate microspheres (KMG) are administered into blood vessels that feed the tumor, occluding tumor blood vessels and inducing ischemic tumor necrosis. In addition, these microspheres may be used to encapsulate various therapeutic agents.

**sodium bicarbonate:** The monosodium salt of carbonic acid with alkalinizing and electrolyte replacement properties. Upon dissociation, sodium bicarbonate forms sodium and bicarbonate ions. Ion formation increases plasma bicarbonate and buffers excess hydrogen ion concentration, resulting in raised blood pH. Check for active clinical trials using this agent.

**sodium bicarbonate solution:** An aqueous oral mouthwash solution containing the monosodium salt of carbonic acid with alkalinizing and antimucositis activities. Upon introduction into the mouth, the sodium bicarbonate dissociates, forming sodium and bicarbonate ions, which buffer excess hydrogen ion and elevates the oral pH. An alkaline oral environment is less prone to colonization with yeast and aciduric bacteria. In addition, this solution may help relieve mucositis and mucositis-induced pain by diluting human saliva, and cleansing and lubricating mucosal tissues of the mouth, tongue and oropharynx.

**sodium bicarbonate/potassium bicarbonate/anhydrous citric acid:** A combination preparation containing sodium bicarbonate, potassium bicarbonate, and anhydrous citric acid, with acid-neutralizing properties. This combination in water principally contains the antacids potassium citrate and sodium citrate, and is used for the relief of acid indigestion and heartburn. This combination does not contain aspirin, and therefore does not exert aspirin's analgesic or anti-inflammatory effects.

**sodium biphosphate/sodium phosphate oral laxative:** An oral hyperosmotic saline laxative containing sodium biphosphate and sodium phosphate. Sodium phosphate/sodium biphosphate oral laxative promotes retention of water in the bowel, thereby increasing stool water content and

volume, which results in increased gastrointestinal motility and stool transit time and evacuation of colonic contents.

**sodium borocaptate:** A boron-carrying compound. After parenteral administration, borocaptate sodium accumulates preferentially in tumor cells. When exposed to neutron irradiation, borocaptate absorbs neutrons and self-destructs releasing short-range alpha radiation and 'recoil' lithium in tumor cells, resulting in alpha radiation-induced tumor cell death. This highly selective, localized radiotargeting of tumor cells, known as boron neutron capture therapy (BNCT), spares adjacent normal tissues. or A substance used in a type of radiation therapy called boron neutron capture therapy. Sodium borocaptate is injected into a vein and becomes concentrated in tumor cells. The patient then receives radiation treatment with atomic particles called neutrons. The neutrons react with the boron in sodium borocaptate and make radioactive particles that kill the tumor cells without harming normal cells. Also called BSH.

**sodium carboxymethylcellulose dressing:** A textile fiber dressing composed of sodium carboxymethylcellulose with potential wound-healing activity. Sodium carboxymethylcellulose dressing protects the wound site from external factors that may cause pain, promote infection, or slow the natural wound healing process. Sodium carboxymethylcellulose is a non-toxic, non-allergenic, anionic water-soluble polymer derived from cellulose.

**Sodium chlorate(NaClO<sub>3</sub>) :** An efficient oxidizer and bleaching chemical.

**sodium citrate:** The sodium salt of citrate with alkalizing activity. Upon absorption, sodium citrate dissociates into sodium cations and citrate anions; organic citrate ions are metabolized to bicarbonate ions, resulting in an increase in the plasma bicarbonate concentration, the buffering of excess hydrogen ion, the raising of blood pH, and potentially the reversal of acidosis. In addition, increases in free sodium load due to sodium citrate administration may increase intravascular blood volume, facilitating the excretion of bicarbonate compounds and an anti-urolithic effect.

**sodium dichloroacetate:** The sodium salt of dichloroacetic acid with potential antineoplastic activity. Dichloroacetate ion inhibits pyruvate dehydrogenase kinase, resulting in the inhibition of glycolysis and a decrease in lactate production. This agent may stimulate apoptosis in cancer cells by restoring normal mitochondrial-induced apoptotic signaling. Check for active clinical trials using this agent.

**Sodium dodecyl sulfate:** Sodium dodecyl sulfate is one of the most common surfactants. It can also be called sodium lauryl sulfate, depending on whether it is made from petrochemicals (dodecyl) or plants (lauryl). But they're the same molecule:

**sodium ferric gluconate :** A form of the mineral iron that is used to treat anemia caused by low amounts of iron in the blood. Anemia is a condition in which the number of red blood cells is below normal. Sodium ferric gluconate is a type of hematinic and a dietary supplement. Also called Ferrlecit.

**sodium ferric gluconate complex in sucrose:** A compound containing elemental iron as the sodium salt of a ferric ion carbohydrate complex in an alkaline aqueous solution with approximately 20% sucrose w/v in water for injection, used to replete the total body content of iron. Iron is critical for normal hemoglobin and myoglobin syntheses to maintain oxygen transport and various enzymatic processes, including the biosynthesis of deoxyribonucleotides catalyzed by ribonucleotide reductase (RNR).

**sodium fluoride:** An inorganic salt of fluoride used topically or in municipal water fluoridation systems to prevent dental caries. Fluoride appears to bind to calcium ions in the hydroxyapatite of surface tooth enamel, preventing corrosion of tooth enamel by acids. This agent may also inhibit acid production by commensal oral bacteria.

**sodium glycididazole:** The sodium salt of glycididazole with potential radiosensitizing activity. Due to its low redox potential, glycididazole is selectively activated via bioreduction in hypoxic tumor cells and may sensitize hypoxic tumor cells to the cytotoxic effects of ionizing radiation.

**sodium hyaluronate topical hydrogel:** A proprietary topical gel formulation containing sodium hyaluronate with wound repair and skin moisturizing properties. Upon application, sodium hyaluronate topical hydrogel adheres to injured tissues, hydrates skin, and provides protection from further chemical or mechanical irritation. Hyaluronate, a non-sulfated glucosaminoglycan, is a chief component of the extracellular matrix in connective, epithelial, and neural tissues and contributes significantly to cell proliferation and migration. Check for active clinical trials using this agent.

**Sodium hydroxide (NaOH) :** Also known as caustic soda. It is used in many industries, mostly as a strong chemical base in the manufacture of, e.g., pulp and paper, textiles, drinking water.

**sodium iodide I-131:** A radiopharmaceutical containing the beta- and gamma-emitting radioisotope I-131. After absorption, the iodide is distributed through the extracellular fluid of the body and accumulates in the thyroid gland, thereby allowing the imaging of the thyroid. Check for active clinical trials using this agent.

**sodium metaarsenite:** A highly soluble, orally available trivalent arsenic-containing telomerase inhibitor with potential antitumor activity. Although the exact mechanism through which sodium metaarsenite exerts its effect has yet to be fully elucidated, this agent appears to target and bind to telomeric sequences, specifically TTAGGG repeats, leading to a shortening of telomeres, and subsequent induction of apoptosis and inhibition of tumor cell growth. In addition, sodium metaarsenite also leads to the translocation of the catalytic subunit of telomerase into the cytoplasm and inhibition of the activity of telomerase. Telomerase is active in most tumor cells and is responsible for the maintenance of telomere length and plays a key role in cellular proliferation, but is quiescent in normal, healthy cells. The susceptibility to sodium metaarsenite seems to be inversely correlated with initial length of telomeres.

**sodium phenylbutyrate:** The sodium salt of phenylbutyrate, a derivative of the short-chain fatty acid butyrate, with potential antineoplastic activity. Phenylbutyrate reversibly inhibits class I and II histone deacetylases (HDACs), which may result in a global increase in gene expression, decreased cellular proliferation, increased cell differentiation, and the induction of apoptosis in susceptible tumor cell populations.

**sodium phosphate:** An inorganic compound used as a laxative, dietary supplement and for electrolyte-replacement purposes. Phosphate, a predominant intracellular anion, plays an important role in energy storage, osteoblastic and osteoclastic activities, regulating serum calcium concentrations, and numerous cellular phosphate-transfer reactions. Sodium phosphate increases fluidity of the intestinal contents by retention of water by osmotic forces, thereby indirectly inducing intestinal smooth muscle constriction. Sodium phosphate is also used in the renal excretion of hydrogen ions while promoting the reabsorption of sodium ions.

**sodium picosulfate/magnesium oxide/citric acid oral laxative:** An oral laxative formulation containing the stimulant cathartic sodium picosulfate as the primary active ingredient. Picosulfate acts on the enteric nerves in

the intestinal wall to increase muscle contractions, thereby stimulating peristaltic action and promoting defecation. Other active ingredients are osmotic agents that increase stool water content.

**sodium salicylate:** The sodium salt of salicylic acid. As a nonsteroidal anti-inflammatory drug (NSAID), sodium salicylate irreversibly acetylates cyclooxygenases I and II, thereby inhibiting prostaglandin synthesis and associated inflammation and pain. This agent may also activate mitogen-activated protein kinase (p38MAPK), thereby inducing apoptosis in cancer cells. Check for active clinical trials using this agent.

**sodium salicylate :** A drug that is a type of nonsteroidal anti-inflammatory drug. Sodium salicylate may be tolerated by people who are sensitive to aspirin.

**sodium selenite:** An inorganic form of the trace element selenium with potential antineoplastic activity. Selenium, administered in the form of sodium selenite, is reduced to hydrogen selenide ( $H_2Se$ ) in the presence of glutathione (GSH) and subsequently generates superoxide radicals upon reaction with oxygen. This may inhibit the expression and activity of the transcription factor Sp1; in turn Sp1 down-regulates androgen receptor (AR) expression and blocks AR signaling. Eventually, selenium may induce apoptosis in prostate cancer cells and inhibit tumor cell proliferation.

**sodium stibogluconate:** Pentavalent antimony (Sb) in differential complex formation with gluconic acid with leishmanicidal and potential antineoplastic activities. The Sb moiety of sodium stibogluconate (SSG) may inhibit protein tyrosine phosphatases (PTPases) by covalently modifying sulfhydryl groups in PTPase cysteine residues, resulting in specific inactivation of SH2 domain-containing tyrosine phosphatases-1 and -2 (SHP-1 and SHP-2), PTPases which negatively regulate interferon (IFN) signaling; enhancement of IFN-induced Stat1 tyrosine phosphorylation; and induction of cellular protein tyrosine phosphorylation. SSG in combination with IFN-alpha may synergize to overcome tumor cell resistance to IFN-alpha-mediated apoptosis.

**sodium stibogluconate :** A substance being studied in the treatment of certain solid tumors, lymphoma, and myeloma. Sodium stibogluconate may block enzymes needed for cancer growth. It is a type of pentavalent antimonial. Also called SSG.

**sodium sulfate/potassium sulfate/magnesium sulfate-based laxative:** An oral preparation containing sodium sulfate, potassium sulfate and magnesium sulfate, with osmotic laxative activity. Upon oral administration of the sodium sulfate/potassium sulfate/magnesium sulfate-based laxative, this osmotic laxative promotes the retention of water in the bowel. This increases the water content of stool, which results in increased gastrointestinal motility and facilitates the evacuation of colonic contents. This results in a complete cleansing of the colon.

**Sodium sulfide (Na<sub>2</sub>S) :** The name used to refer to the chemical compound Na<sub>2</sub>S but more commonly it refers to hydrate Na<sub>2</sub>S.9H<sub>2</sub>O. Both are colorless water-soluble salts that give strongly alkaline solutions. When exposed to moist air, Na<sub>2</sub>S and its hydrates emit hydrogen sulfide.

**sodium sulfite :** A chemical used in photography, paper making, water treatment, and for other purposes.

**sodium thiosulfate:** A water soluble salt and reducing agent that reacts with oxidizing agents. Although its exact mechanism of action is unknown, thiosulfate likely provides an exogenous source of sulfur, thereby hastening the detoxification of cyanide through the enzyme rhodanese (thiosulfate cyanide sulfurtransferase) which converts cyanide to the relatively nontoxic, excretable thiocyanate ion. In addition, this agent neutralizes the reactive alkylating species of nitrogen mustard, thereby decreasing skin toxicity related to nitrogen mustard extravasation.

**sodium thiosulfate :** A substance that is used in medicine as an antidote to cyanide poisoning and to decrease side effects of the anticancer drug cisplatin.

**Sodium-potassium pump:** An enzyme that uses the energy of ATP hydrolysis to pump sodium out of the cell and potassium into the cell. Also called sodium-potassium atpase.

**Sodolithol:** (Other name for: sodium thiosulfate)

**Soffit:** The underside of a staircase or of the head of an opening such as a door window or arch. Hence also used for the underface of a beam or for any small ceiling at a different level to a main ceiling.

**sofosbuvir:** An orally available nucleotide prodrug and a hepatitis C virus (HCV) NS5B polymerase inhibitor with potential HCV inhibiting activity. Upon oral administration, sofosbuvir is metabolized to 2'-deoxy-2'-alpha-

fluoro-beta-C-methyluridine-5'-monophosphate, which is then converted into the active triphosphate nucleotide that inhibits the NS5B polymerase, thereby preventing viral replication. The HCV NS5B protein, an RNA-dependent RNA polymerase, is essential for the replication of the viral HCV RNA genome. Check for active clinical trials using this agent.

**soft diet :** A diet consisting of bland foods that are softened by cooking, mashing, pureeing, or blending.

**Soft Drug:** Drugs that undergo biotransformations in vivo to metabolites that are generally inactive and non-toxic.

**soft palate :** The back, muscular (not bony) part of the roof of the mouth.

**soft tissue :** Refers to muscle, fat, fibrous tissue, blood vessels, or other supporting tissue of the body.

**soft tissue sarcoma :** A cancer that begins in the muscle, fat, fibrous tissue, blood vessels, or other supporting tissue of the body.

**softening:** the removal of hardness—calcium and magnesium—from water.

**Softwood timber:** Timber from trees with needle shaped leaves mostly evergreen e.g. conifer. This term has no relationship to the actual hardness of the wood. This timber is most commonly used in house construction.

**SOIL:** In the surfactant world - any material, solid, liquid or paste contaminant adsorbed onto a substrate. OR layers of weathered, unconsolidated particles of earth material that contain organic material and can support vegetation.

**soil carbon:** A major component of the terrestrial biosphere pool in the carbon cycle. Organic soil carbon estimates, rather than total soil carbon, are generally quoted. The amount of carbon in the soil is a function of historical vegetative cover and productivity, which in turn is dependent upon climatic variables.

**soil horizon:** one of the three layers of mature soil.

**Soil pipe:** A vertical lead or cast iron pipe conveying waste matter from WCs, etc. to the drains. Unlike a rainwater pipe it will have sealed joints and is usually continued above eaves level to form a ventilator.

**sol:** A colloid with solid particles suspended in a liquid. Examples are protoplasm, starch in water, and gels.

**sol:** A liquid colloidal dispersion; a fluid colloidal system in which solid particles are dispersed in a liquid colloidal solution.

**solar constant:** The rate at which solar energy is received just outside the Earth's atmosphere on a surface that is normal to the incident radiation and at the mean distance of the Earth from the sun. The current value is 0.140 watt/cm<sup>2</sup>.

**solar cycle:** The periodic change in sunspot numbers. It is the interval between successive minima and is about 11.1 years.

**solar eclipse:** event in which the view of the Sun is blocked by the Moon during a New Moon phase, when the Moon's shadow reaches the Earth.

**Solar Heat Gain Coefficient (SHGC):** The fraction of incident solar radiation admitted through a window, both admitted through a window, both directly transmitted, and absorbed and subsequently released inward. SHGC is expressed as a number between 0 and 1. The lower a window's solar heat gain coefficient, the less solar heat it transmits.

**solar keratosis :** A thick, scaly patch of skin that may become cancer. It usually forms on areas exposed to the sun, such as the face, scalp, back of the hands, or chest. It is most common in people with fair skin. Also called actinic keratosis and senile keratosis.

**solar noon:** the highest point of the Sun on any day.

**solar prominence:** flame-like arc extending out from the Sun.

**Solaraze:** (Other name for: diclofenac sodium gel)

**Solatene:** (Other name for: beta carotene)

**solder:** an alloy of lead/tin used for making permanent electrical connections between parts and wire.

**Solid:** One characteristic of a solid is that it might be hard. In the same way that a solid holds its shape, the atoms inside of a solid are not allowed to move around. The solid atoms and molecules are trapped in their places. OR a state of matter in which the molecules are touching and possessing rigid shape and is not compressible. OR A solid is a relatively dense, rigid state of matter, with a definite volume and shape. Molecules in solids are often packed close together in regularly repeating patterns, and vibrate around fixed positions.

**Solid form:** A general term used to describe polymorphs, pseudopolymorphs, or amorphous forms; synonymous with solid

modification.

**solid geometry:** the study of shapes and figures in three dimensions: length, width, and thickness.

**Solid solution:** The random distribution of one solid in another.

**solid tumor :** An abnormal mass of tissue that usually does not contain cysts or liquid areas. Solid tumors may be benign (not cancer), or malignant (cancer). Different types of solid tumors are named for the type of cells that form them. Examples of solid tumors are sarcomas, carcinomas, and lymphomas. Leukemias (cancers of the blood) generally do not form solid tumors.

**Solid-gas reaction:** A reaction of a solid with a gas (e.g., the reaction of acid crystals with ammonia) or a reaction producing a gas and a solid as products (e.g., decarboxylation reactions).

**Solid-phase method:** A means of synthesizing discrete peptides in which amino acids are added step-by-step to a growing peptide chain that is anchored to an insoluble matrix.

**Solid-solid reactions:** Reactions between two solids without the involvement of a solvent, generally involving four steps: 1) loosening of the molecules at the reaction site, 2) molecular change, 3) solid solution formation, and 4) separation of the product phase.

**Solid-state hydrolysis:** A solid-state reaction in which water hydrolyzes a compound (e.g., hydrolysis of acetylsalicylic acid to form acetic acid and salicylic acid).

**Solid-state oxidation reactions:** A class of solid-gas reactions involving the reaction of a solid with oxygen.

**Solid-state photochemical reactions:** Reactions that proceed by absorption of light by the molecule and subsequent bond formation or breakage. The products of these reactions differ from those in solution.

**Solid-state thermal reactions:** Solid-state reactions that are heat induced. Solid-state rearrangement reactions are important members of this class.

**Solids:** The part of the coating that remains on a surface after the vehicle has evaporated. The dried paint film. Also called Nonvolatile. Or See Nonvolatile. Or  $v$ The amount, in weight %, of non-volatile material in a solution or formulation. Solids content is a specification in a number of blends and formulations.

**SOLIDS CONVEYING ZONE:** The single screw extrusion process consists of three functional zones the SOLIDS CONVEYING ZONE where the polymer pellets or powder are compacted and transported forward, the MELTING ZONE, where the polymer melts mainly under the action of shear on the barrel wall and the METERING ZONE (PUMPING ZONE) where the polymer is transported forward by DRAG FLOW caused by the rotating action of the screw.

**Solidstate electrode :** a miniaturized version of an electrochemical sensor e.g. potentiometric or amperometric. Solidstate electrode can be constructed using MEMS technology.

**solifluction:** a variety of earthflow in which the flow of watersaturated earth is over an impermeable surface such as permafrost; usually occurs in bitterly cold regions.

**Soliris :** A drug used to prevent red blood cells from being destroyed in patients with a rare red blood cell disorder called paroxysmal nocturnal hemoglobinuria (PNH). It is also used to treat another rare disorder called atypical hemolytic urea syndrome (aHUS), in which blood clots form in small blood vessels. Soliris binds to an immune system protein called C5. This helps keep red blood cells from breaking down and helps keep blood clots from forming. Soliris is a type of monoclonal antibody. Also called eculizumab.

**solitomab:** A recombinant bispecific monoclonal antibody directed against both CD3 and epithelial cell adhesion molecule (EpCAM) with potential immunomodulating and antineoplastic activities. Solitomab attaches to both CD3-expressing T lymphocytes and EpCAM-expressing tumor cells, thereby selectively cross-linking tumor and T lymphocytes; this may result in the recruitment of cytotoxic T lymphocytes (CTL) to T lymphocyte/tumor cell aggregates and the CTL-mediated death of EpCAM-expressing tumor cells. CD3 is an antigen expressed on mature T cells; EpCAM, a cell surface protein, is expressed by a variety of tumor cells and is frequently found in head and neck cancers.

**Solu-Cortef:** (Other name for: hydrocortisone sodium succinate)

**Solu-Medrol:** (Other name for: methylprednisolone)

**solubility:** the upper limit of concentration of a solute. OR A measure of how much solute can be dissolved in a specific solvent. Solubility can change with changes in pressure and temperature. Water has specific

solubility for sugar at room temperature. As water is heated, you may dissolve more sugar in the same amount of water. Its solubility has increased with the increase in temperature. OR The amount of solute dissolved in a unit volume of a solvent at equilibrium at a given temperature and pressure. Each form of a substance has a characteristic solubility. OR The maximum amount of a substance that will dissolve in a given amount of solvent at a given temperature. OR The solubility of a substance is its concentration in a saturated solution. Substances with solubilities much less than 1 g/100 mL of solvent are usually considered insoluble. The solubility is sometimes called "equilibrium solubility" because the rates at which solute dissolves and is deposited out of solution are equal at this concentration.

**solubility product:** the constant obtained by multiplying the ion concentrations in a saturated solution.

**solubility productsp:** The equilibrium constant for a reaction in which a solid ionic compound dissolves to give its constituent ions in solution.

**solubilizing group:** A group or substructure on a molecule that increases the molecule's solubility. Solubilizing groups usually make the molecule they are attached to ionic or polar. For example, hydrocarbon chains can be made water-soluble by attaching a carboxylic acid group to the molecule.

**Soluble:** Soluble is the ability of a substance to dissolve in another substance. Not all solutes are soluble in all solvents. Sugar and salt are compounds that are soluble in water. Or Capable of being dissolved in a solvent (usually water).

**soluble :** Able to be dissolved in a liquid.

**SOLUBLE OIL:** An oil that readily forms a stable emulsion or colloidal suspension in water.

**Soluble protein:** Soluble protein. See globular protein.

**soluble salt:** An ionic compound that dissolves in a solvent (usually water).

**solum:** the O, A, and B soil horizons.

**solute:** The substance (solid, liquid, or gas) dissolved in a solution, for example, the salt in saltwater. Or the substance that is dissolved to form a solution. Or The substance dissolved in a solution; substance present in a lesser amount in a solution. Or A solute is the substance to be dissolved. Sugar would be the solute when you are dissolving sugar in water. or the

substance that is dissolved in a solution. or A substance dissolved in a solvent to make a solution.

**solution:** a liquid (solvent) that contains a dissolved substance (solute). Or Mixture of a solid and a liquid where the solid never settles out, for example, saltwater. Or A homogeneous mixture of two or more substances. Or A sample of matter consisting of more than one pure substance with properties that do not vary within the sample. Also called a homogeneous mixture. or a mixture of two or more in which two or more materials are dissolved in another material. or a homogeneous mixture consisting of a solvent and one or more solutes.

**solution weathering:** the process by which certain minerals are completely dissolved by acidic solutions.

**Solvate:** A crystal form that contains either stoichiometric or nonstoichiometric amounts of solvent. Or a liquid used to dissolve another substance. Or Liquid in which something is dissolved, for example, the water in saltwater. Or The substance present in the largest amount in a solution; often the liquid component. or A solvent is a liquid that dissolves another substance. or A liquid component used in paint to bring it to a suitable consistency for use and which evaporates from the paint after application. Also a liquid which will dissolve dried paint, e.g. cellulose thinners on cellulose; chlorinated rubber paint thinners on chlorinated rubber paint. or Any liquid which can dissolve a resin. Generally refers to the liquid portion of paints and coatings that evaporates as the coating dries. or The volatile part of paint composition that evaporates during drying. or the host substance of dominant abundance in a solution. or The most abundant component in a solution. or Any substance, usually a liquid, which dissolves other substances. OR b) ball indentation hardness (also useable on profiled surfaces because of bigger measuring devices). OR Any substance, usually a liquid, which dissolves other substances. or Any substance (usually a liquid) which dissolves other substances.

**solvent :** A liquid that is able to dissolve a solid.

**Solvent Bonding:** Process in which the surfaces of parts to be joined are treated with a solvent. OR Process for forming thermoplastic articles by dipping a male mold in a solution or dispersion of the resin and drawing off the solvent to leave a layer of plastic film adhering to the mold.

**solvent extraction:** Solvent extraction is a method for separating mixtures by exploiting differences in the solubilities of the components. For example, a coffee machine extracts the soluble components of ground coffee with water, and leaves the insoluble components behind. The sample is shaken or mixed with solvent (or with two immiscible solvents) to effect the separation. The "like dissolves like" is a useful guide for selecting solvents to use in the extraction. Nonpolar substances are usually successfully extracted into nonpolar solvents like hexane or methylene chloride. Polar and ionic substances are often extracted with water.

**somatic :** Having to do with the body.

**Somatic cell:** Any of the body cells except the reproductive (germ) cells. OR Any cell of an organism that cannot contribute its genes to a later generation. Or Any cell of an organism that cannot contribute its genes to a later generation. Or All body cells except the germ-line cells.

**Somatic effects of radiation:** Effects of radiation limited to the exposed individual, as distinguished from genetic effects, that may also affect subsequent unexposed generations.

**Somatic mutation:** Refers to the introduction of a mutation after V-D-J recombination to further increase antibody diversity. OR An alteration in DNA that occurs after conception. Somatic mutations can occur in any of the cells of the body except the germ cells (sperm and egg) and therefore are not passed on to children. These alterations can (but do not always) cause cancer or other diseases.

**somatic variant :** An alteration in DNA that occurs after conception and is not present within the germline. Somatic variants can occur in any of the cells of the body except the germ cells (sperm and egg) and therefore are not passed on to children. Somatic variants can (but do not always) cause cancer or other diseases.

**somatomedin :** A protein made by the body that stimulates the growth of many types of cells. Somatomedin is similar to insulin (a hormone made in the pancreas). There are two forms of somatomedin called IGF-1 and IGF-2. Higher than normal levels of IGF-1 may increase the risk of several types of cancer. Somatomedin is a type of growth factor and a type of cytokine. Also called IGF and insulin-like growth factor.

**somatostatin receptor scintigraphy :** A type of radionuclide scan used to find carcinoid and other types of tumors. Radioactive octreotide, a drug

similar to somatostatin, is injected into a vein and travels through the bloodstream. The radioactive octreotide attaches to tumor cells that have receptors for somatostatin. A radiation-measuring device detects the radioactive octreotide, and makes pictures showing where the tumor cells are in the body. Also called octreotide scan and SRS.

**somatotropin:** A recombinant form of endogenous human growth hormone (GH), a polypeptide produced by the anterior lobe of the human pituitary gland. GH exhibits growth-promoting effects and metabolic effects on carbohydrate, fat, protein and bone metabolism. GH stimulates protein synthesis and the uptake of amino acids into cells, and induces lipolysis in adipose tissues. The secretion of GH increases with sexual maturation and then declines steadily. or A protein made by the pituitary gland that helps control body growth and the use of glucose and fat in the body. Also called growth hormone.

**Somatuline Depot :** A drug used to treat gastroenteropancreatic neuroendocrine tumors that are advanced or have spread to other parts of the body. These tumors form in the stomach, small and large intestines, rectum, and pancreas. Somatuline Depot is used for tumors that cannot be removed by surgery. It is also used to treat some patients with acromegaly (a condition in which the pituitary gland makes too much growth hormone). Somatuline Depot is like somatostatin (a hormone made by the body), and may help stop the body from making extra amounts of certain hormones, including growth hormone, insulin, glucagon, and hormones that affect digestion. It may also help keep certain types of tumor cells from growing. Somatuline Depot is a type of somatostatin analog. Also called lanreotide acetate.

**Somavert:** (Other name for: pegvisomant)

**somnolence syndrome :** Periods of drowsiness, lethargy, loss of appetite, and irritability in children following radiation therapy treatments to the head.

**SOMO:** Singly-occupied molecular orbital (for radicals).

**Somophyllin-CRT:** (Other name for: theophylline)

**Somophyllin-T:** (Other name for: theophylline)

**sonpcizumab:** A humanized monoclonal antibody directed against sphingosine 1-phosphate (S1P) with potential antiangiogenic and

antineoplastic activities. Upon administration, sonopcizumab binds S1P, which may result in the inhibition of tumor angiogenesis. S1P is the extracellular ligand for the G protein-coupled lysophospholipid receptor EDG-1 (endothelial differentiation gene-1).

**sonidegib:** An orally bioavailable small-molecule smoothed (Smo) antagonist with potential antineoplastic activity. Sonidegib selectively binds to the hedgehog (Hh)-ligand cell surface receptor Smo, which may result in the suppression of the Hh signaling pathway and, so, the inhibition of tumor cells in which this pathway is abnormally activated. The Hh signaling pathway plays an important role in cellular growth, differentiation and repair. Inappropriate activation of Hh pathway signaling and uncontrolled cellular proliferation, as is observed in a variety of cancers, may be associated with mutations in the Hh-ligand cell surface receptor Smo. or A drug used to treat locally advanced basal cell carcinoma (BCC) that has come back after surgery or radiation therapy. It is also used in patients who cannot be treated with surgery or radiation therapy. Sonidegib is also being studied in the treatment of other types of cancer. Sonidegib blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of hedgehog signaling pathway antagonist. Also called erismodegib, LDE225, and Odomzo.

**sonogram :** A computer picture of areas inside the body created by high-energy sound waves. The sound waves are bounced off internal tissues or organs and make echoes. The echoes form a picture of the body tissues on a computer screen. A sonogram may be used to help diagnose disease, such as cancer. It may also be used during pregnancy to check the fetus (unborn baby) and during medical procedures, such as biopsies. Also called ultrasonogram.

**sonorous:** A sonorous material makes a 'ringing' sound when struck with a hard object.

**SOP:** Written instructions for doing a specific task in a certain way. In clinical trials, SOPs are set up to store records, collect data, screen and enroll subjects, and submit Institutional Review Board (IRB) applications and renewals. Also called Standard Operating Procedure.

**sorafenib tosylate:** The tosylate salt of sorafenib, a synthetic compound targeting growth signaling and angiogenesis. Sorafenib blocks the enzyme RAF kinase, a critical component of the RAF/MEK/ERK signaling pathway

that controls cell division and proliferation; in addition, sorafenib inhibits the VEGFR-2/PDGFR-beta signaling cascade, thereby blocking tumor angiogenesis.

**sorafenib tosylate :** A drug used to treat advanced kidney cancer and a type of liver cancer that cannot be removed by surgery. It is also used to treat a type of advanced thyroid cancer that did not get better with radioactive iodine treatment. It is being studied in the treatment of other types of cancer. Sorafenib tosylate stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of kinase inhibitor and a type of antiangiogenesis agent. Also called BAY 43-9006 and Nexavar.

**Sorghum bicolor supplement:** An herbal-based nutritional supplement containing the leaf sheaths of the plant *Sorghum bicolor*, with potential antioxidant, anti-inflammatory, chemopreventive and immunomodulating activities. Sorghum bicolor supplement contains various phytochemicals, including phenolic acids and polyphenols such as proanthocyanidins. Sorghum bicolor supplement is particularly rich in 3-deoxyanthocyanins, such as luteolinidin and apigeninidin, and appears to induce apoptosis and inhibit cell proliferation in cancer cells through the stimulation of various apoptosis promoter genes and the downregulation of certain apoptosis inhibitor genes. In addition, due to the strong antioxidant nature of the phytochemicals, these compounds are able to scavenge free radicals and prevent tissue damage. Also, intake of this supplement modulates the immune system by both increasing the activity of natural killer (NK) cells and initiating the activation of macrophages. Check for active clinical trials using this agent.

**Soriatane:** (Other name for: acitretin)

**sorivudine :** An antiviral drug that is being studied as a treatment for herpesvirus. It belongs to the family of drugs called nucleic acid synthesis inhibitors.

**sorption:** Assimilation of molecules of one substance by a material in a different phase. Adsorption (sorption on a surface) and absorption (sorption into bulk material) are two types of sorption phenomena.

**sorrel :** A plant that has been used in some cultures to treat certain medical problems. It may have anticancer effects. The scientific name is *Rumex acetosella*. Also called dock and sheep sorrel.

**sorting:** the process by which large, coarse, angular pieces of sediment are deposited near a source area, while progressively smaller and smoother sediments are carried farther.

**SOS response:** In bacteria, a coordinated induction of a variety of genes as a response to high levels of DNA damage. Or A set of DNA repair enzymes and regulatory proteins that regulate their synthesis so that maximum synthesis occurs when the DNA is damaged. Or A set of DNA repair enzymes and regulatory proteins that regulate their synthesis so that maximum synthesis occurs when the DNA is damaged.

**sotagliflozin:** An orally bioavailable inhibitor of the sodium-glucose co-transporter subtypes 1 (SGLT1) and 2 (SGLT2), with potential antihyperglycemic activity. Upon oral administration, sotagliflozin binds to and blocks both SGLT1 in the gastrointestinal (GI) tract and SGLT2 in the kidneys, thereby suppressing the absorption of glucose from the GI tract and the reabsorption of glucose by the proximal tubule into the bloodstream, respectively. This decreases glucose uptake and enhances the urinary excretion of glucose, which lowers and/or normalizes blood glucose levels. SGLT1 is the primary transporter responsible for glucose absorption from the GI tract. SGLT2, a transport protein exclusively expressed in the proximal renal tubules, mediates approximately 90% of renal glucose reabsorption from tubular fluid.

**sotatercept:** A soluble fusion protein composed of the extracellular domain of the activin receptor type IIA (ActRIIA) linked to the Fc portion of human IgG1 with anabolic bone activity. Sotatercept selectively binds to activin, inhibiting its binding to ActRIIA and ActRIIA signaling, resulting in the stimulation of osteoblast activity and the inhibition of osteoclast activity and so normal bone formation and increased bone mineral density and strength. The Fc moiety of this fusion protein binds to the salvage receptor FcRN, preventing its lysosomal degradation and so extending its half-life in the circulatory system.

**sotrastaurin acetate:** The acetate salt form of sotrastaurin, an orally available pan-protein kinase C (PKC) inhibitor with potential immunosuppressive and antineoplastic activities. Sotrastaurin inhibits both T- and B-cell activations via PKC theta and beta isozymes, respectively. Both PKCs are important in the activation of nuclear factor-kappaB (NF- $\kappa$ B). Inhibition of PKC beta in B-cells results in prevention of NF- $\kappa$ B-

mediated signaling and down regulation of NF-kB target genes. This may eventually lead to an induction of G1 cell cycle arrest and tumor cell apoptosis in susceptible tumor cells. This agent may act synergistically with other chemotherapeutic agents. PKC, a family of serine/threonine protein kinases overexpressed in certain types of cancer cells, is involved in cell differentiation, mitogenesis, inflammation, and the activation and survival of lymphocytes. Check for active clinical trials using this agent.

**Sotret:** (Other name for: isotretinoin)

**sound:** a disturbance that travels through air, land, water that can be heard.

**Sour Crude:** Sour Crude is the term used for crudes with a higher sulphur content. Tightening emissions legislation has meant that refiners need to add considerable desulphurisation capacity in order to process Sour Crude.

**Source material:** Uranium or thorium, or any combination thereof, in any physical or chemical form, or ores that contain, by weight, one-twentieth of one percent (0.05 percent) or more of (1) uranium, (2) thorium, or (3) any combination thereof. Source material does not include special nuclear material. For additional detail, see Source Material.

**Source term:** Types and amounts of radioactive or hazardous material released to the environment following an accident.

**Southern blot:** A DNA hybridization procedure in which one or more specific DNA fragments are detected in a larger population by means of hybridization to a complementary, labeled nucleic acid probe. OR Electrophoresis-based technique used in genetic testing to detect large deletions in DNA that can be missed by PCR-based genetic testing methods.

**Southern blotting:** A method for detecting a specific DNA restriction fragment, developed by Edward Southern. DNA from a gel electrophoresis pattern is blotted onto nitrocellulose paper; then the DNA is denatured and fixed on the paper. Subsequently the pattern of specific sequences in the Southern blot can be determined by hybridization to a suitable probe and autoradiography. A Northern blot is similar, except that RNA is blotted instead onto the nitrocellulose paper. or A technique used to locate and identify a DNA fragment containing a specific sequence; a mixture of fragments is separated by electrophoresis, transferred to a nitrocellulose sheet, hybridized to a radioactively labeled DNA probe complementary to the desired sequence, and visualized by autoradiography. or A method for

detecting a specific DNA restriction fragment, developed by Edward Southern. DNA from a gel electrophoresis pattern is blotted onto nitrocellulose paper; then the DNA is denatured and fixed on the paper. Subsequently the pattern of specific sequences in the Southern blot can be determined by hybridization to a suitable probe and autoradiography. A Northern blot is similar, except that RNA is blotted instead onto the nitrocellulose paper.

**Southern Oscillation:** A large-scale atmospheric and hydrospheric fluctuation centered in the equatorial Pacific Ocean. It exhibits a nearly annual pressure anomaly, alternatively high over the Indian Ocean and high over the South Pacific. Its period is slightly variable, averaging 2.33 years. The variation in pressure is accompanied by variations in wind strengths, ocean currents, sea-surface temperatures, and precipitation in the surrounding areas. El Nino occurrences are associated with the phenomenon.

**Southern Oscillation Index:** An indicator based on the pressure gradient between the quasi-stationary low pressure region and the center of a subtropical high pressure cell. A positive index corresponds to an anomalously high pressure difference between the two centers of action.

**soy :** A product from a plant of Asian origin that produces beans used in many food products. Soy contains isoflavones (estrogen-like substances) that are being studied for the prevention of cancer, hot flashes that occur with menopause, and osteoporosis (loss of bone density). Soy in the diet may lower cholesterol levels and reduce the risk of heart disease. Also called Glycine max, soya, and soybean.

**soy isoflavones:** A dietary supplement isolated from soybeans containing phytoestrogen isoflavones. Although the mechanism of action is unclear, soy isoflavones mimic estrogen action mediated through estrogen receptors. In addition, this agent also modulates estrogen metabolism. As a result, soy isoflavones have been shown to reduce tumor cell proliferation and induce tumor cell apoptosis, as well as to be able to regulate hormone balance and reduce the risks of breast cancer, heart disease, and osteoporosis. Check for active clinical trials using this agent.

**soy lecithin/glycerol dioleate-based oral spray:** An oral spray containing soy phospholipid and glycerol dioleate, with protective, analgesic and anti-mucositic activities. Upon spraying onto the oral mucosal surface and

contact with saliva, the soy lecithin/glycerol dioleate-based oral spray forms a gel and adheres to the mucosal surfaces thereby forming a lipid film. This provides a protective barrier and an analgesic effect within the oral cavity. In addition, the lipid barrier prevents bacterial growth at affected areas thereby decreasing infection risk. Check for active clinical trials using this agent.

**soy protein isolate:** A dietary protein isolated from soybeans that contains isoflavone phytoestrogens. Soy protein isolate has been shown to reduce tumor incidence and growth in some animal studies, possibly by modulating estrogen metabolism, reducing tumor cell proliferation, and inducing tumor cell apoptosis. Soy protein isolate may also inhibit endothelial cell proliferation. Isoflavone phytoestrogens display mild estrogen-like activities which may regulate hormone balance and reduce the risks of breast cancer, heart disease, and osteoporosis.

**soya :** A product from a plant of Asian origin that produces beans used in many food products. Soya contains isoflavones (estrogen-like substances) that are being studied for the prevention of cancer, hot flashes that occur with menopause, and osteoporosis (loss of bone density). Soya in the diet may lower cholesterol levels and reduce the risk of heart disease. Also called Glycine max, soy, and soybean.

**soybean :** A product from a plant of Asian origin that produces beans used in many food products. Soybean contains isoflavones (estrogen-like substances) that are being studied for the prevention of cancer, hot flashes that occur with menopause, and osteoporosis (loss of bone density). Soybean in the diet may lower cholesterol levels and reduce the risk of heart disease. Also called Glycine max, soy, and soya.

**Space group:** One of 230 possible three-dimensional arrangements of molecules in a crystal. A listing of all of the space groups can be found in International Tables for Crystallography, Volume 1.

**Space Saver Omni-Grid (3/4" & 1" ):** Belt consists of an assembly of rods and links. A dual row of heavy duty, non-collapsing links is used on the inside edge, a long pitch expanding link is used on the outside edge.

**Spacing:** The spacing between lattice planes in a crystal. d-spacing is measured by a diffraction experiment and is defined by Bragg's law.

**SPACKLING COMPOUND:** A material used as crack filler for preparing surfaces before painting.

**Span:** The horizontal distance between the supports of an arch roof or beam, etc.

**Spandrel:** The triangular area formed between an arch and the horizontal member it supports, hence "spandrel panel"™ - the shaped panel formed in the spandrel.

**sparfosic acid:** A stable transition state analogue for an aspartate transcarbamylase- catalyzed reaction with antineoplastic activity. Sparfosic acid is a stable transition analogue of the activated complex for the reaction catalyzed by aspartate transcarbamylase, the first step in the pyrimidine biosynthetic pathway. This agent inhibits de novo pyrimidine biosynthesis and increases the extent to which fluorouracil metabolites are incorporated into RNA. Check for active clinical trials using this agent.

**spasm :** A sudden contraction of a muscle or group of muscles, such as a cramp.

**spastic colon :** A disorder of the intestines commonly marked by abdominal pain, bloating, and changes in a person's bowel habits. This may include diarrhea or constipation, or both, with one occurring after the other. Also called IBS, irritable bowel syndrome, irritable colon, and mucus colitis.

**spastic paraparesis:** characterized by spasms associated with weakness in the lower extremities

**SPATTER:** Small particles or drips of liquid paint thrown or expelled when applying paint.

**spatter cone:** a smaller feature usually associated with an already extruded and cooling lava flow from a shield volcano.

**Splattering:** Droplets of paint that spin or mist off the roller as paint is being applied.

**SPC:** (Statistical Process Control) Methods of controlling our processes to prevent defects from being made

**SPE:** Abbreviation for Society of Plastics Engineers.

**Special nuclear material:** Plutonium, uranium-233, or uranium enriched in the isotopes uranium-233 or uranium-235. For additional detail, see Special Nuclear Material.

**Special pair:** In a photosynthetic reaction center, the pair of chlorophyll molecules that collect excitation energy from antenna chlorophyll

molecules and then transfer high-energy electrons to other electron acceptors.

**specialist :** In medicine, a doctor or other health care professional who is trained and licensed in a special area of practice. Examples of medical specialists include oncologists (cancer specialists) and hematologists (blood specialists).

**species:** a group of individuals that share features and are able to interbreed under natural conditions to yield fertile offspring.

**Specific activity:** A measure of the activity of a protein sample relative to the amount of protein present in the sample, usually presented as activity units per milligram of protein; assessed at each step of a protein purification procedure as a measure of the effectiveness of the purification. or The number of micromoles ( $\mu\text{mol}$ ) of a substrate transformed by an enzyme preparation per minute per milligram of protein at  $25^{\circ}\text{C}$ ; a measure of enzyme purity. or a comparison by weight to an equal volume of pure water, at a standard temperature. or The specific gravity is a comparison of the mass of a substance to the mass of water with the same volume. If you fill a cup with mercury, it has a greater mass than the same cup filled with water. Specific gravity is usually used to measure and compare the masses of liquids. Density is usually used to measure and compare the masses of solids. or The ratio of the density of a material to that of a standard material at a specified temperature, usually water at  $4^{\circ}\text{C}$ . or the relative density of a mineral, compared to water. or The mass of a unit volume of a substance relative to the mass of a unit volume of water. Temperature must be specified when reporting specific gravities, since the density of the substance and of water change with temperature. Specific gravities are often reported relative to water at  $4^{\circ}\text{C}$ ; at that temperature, water has a density of  $1.00000\text{ g/mL}$  and the specific gravity of a substance is equal to its density in  $\text{g/mL}$ . or ratio of the mass of a body to the mass of an equal volume of water at  $4^{\circ}\text{C}$ , or some other specified temperature. OR The ratio of the density of a material as compared to the density of water at standard atmospheric pressure (1 ATM) and room temperature (73F). OR SG is the ratio of the density of a material compared to the density of water at standard atmospheric pressure (1 ATM) and room temperature

**specific heat:** The amount of heat it takes for a substance to be raised  $1^{\circ}\text{C}$ . or The amount of heat required to raise one kilogram of a substance 1

degree in temperature. Or The heat required to raise the temperature of 1 g of a substance by 1°C is called the specific heat of the substance. Specific heat is an intensive property with units of J g<sup>-1</sup> K<sup>-1</sup>. or The amount of energy (in joules or calories) needed to raise the temperature of 1 g of a pure substance by 1 °C. or The amount of heat needed to raise one gram of material one 1/2°C in temperature. Equals "heat capacity" or "Cp." OR The amount of heat required to raise a specified mass by one unit of a specified temperature. OR Temperature is measure of heat energy level whereas heat is a measure of total internal energy contained in a body. When the same quantity of heat is given to equal masses of different substances, they do not result in the same rise in temperature. The specific heat is defined as the quantity of heat energy which will rise the temperature of unit mass (1kg) of a substance by 10C. Heat = mass x specific heat x Temperature rise.

**specific heat capacity:** the amount of heat required to raise 1 gram of a substance 1 degree Celsius.

**specific humidity:** ) a measure of how much water is actually in the air.

**specific immune cell :** An immune cell such as a T or B lymphocyte that responds to a single, specific antigen.

**specific rotation:** The rotation, in degrees, of the plane of plane-polarized light (D-line of sodium) by an optically active compound at 25 °C, with a specified concentration and light path.

**Specific surface area:** The characterization of a powder by determining the surface area per unit weight.

**specific volume:** The volume of a unit mass of substance. For example, the specific volume of water at 4°C is 1.00000 mL/g. Specific volume is the reciprocal of density. Or The volume of a unit of weight of a material; the reciprocal of density.

**specificity:** The ability of an enzyme or receptor to discriminate among competing substrates or ligands.

**specificity :** The frequency with which a test yields a true negative result among individuals who do not have the disease or the gene mutation in question. A test with high specificity has a low false-positive rate and thus does a good job of correctly classifying unaffected individuals. or When referring to a medical test, specificity refers to the percentage of people who test negative for a specific disease among a group of people who do not

have the disease. No test is 100% specific because some people who do not have the disease will test positive for it (false positive).

**specificity (in chemical analysis):** The degree to which a given analytical procedure detects a specified component but not other components that may be present in the sample (WHO, 1979).

**SPECT :** A special type of computed tomography (CT) scan in which a small amount of a radioactive drug is injected into a vein and a scanner is used to make detailed images of areas inside the body where the radioactive material is taken up by the cells. SPECT can give information about blood flow to tissues and chemical reactions (metabolism) in the body. Also called single-photon emission computed tomography.

**spectator ion:** A spectator ion is an ion that appears as both a reactant and a product in an ionic equation. For example, in the ionic equation  $\text{Ag}^+(\text{aq}) + \text{NO}_3^-(\text{aq}) + \text{Na}^+(\text{aq}) + \text{Cl}^-(\text{aq}) = \text{AgCl}(\text{s}) + \text{Na}^+(\text{aq}) + \text{NO}_3^-(\text{aq})$  the sodium and nitrate ions are spectator ions.

**spectator ions:** Spectator ions are ions that do not change in a reaction. They do not appear in the ionic equation for the reaction.

**spectrometer:** An instrument for measuring the emission or absorption of light of a particular wavelength.

**spectrophotometer:** An instrument for measuring the amount of light absorbed by a sample. Or An instrument used to measure the intensity of wavelengths in a spectrum of light compared with the intensity of light from a standard source. Or Determination of the concentration of a material in a sample by measurement of the amount of light the sample absorbs.

**spectroscope:** instrument for separating visible light into colors. Or An instrument for measuring the spectrum of light or radiation. Or The science that deals with the use of the spectroscope and with spectrum analysis. A spectroscope is an optical device for producing and observing a spectrum of light or radiation from any source. or is the analysis of the lines of light emitted from excited atoms as the electrons drop back through their orbitals. These lines give the energy and distances of the electronic orbitals. or Spectroscopy is analysis of the interaction between electromagnetic radiation and matter. Different types of radiation interact in characteristic ways with different samples of matter; the interaction is often unique and serves as a diagnostic "fingerprint" for the presence of a particular material

in a sample. Spectroscopy is also a sensitive quantitative technique that can determine trace concentrations of substances.

**spectroscopy :** The study of the amount of light that is taken up, given off, or scattered (reflected) by an object. Spectroscopy breaks down light and measures different wavelengths of visible and non-visible light. In medicine, different types of spectroscopy are being used to study tissues and to help make a diagnosis.

**spectrum:** 1. A sequence of colors produced by passing light through a prism or diffraction grating. 2. A range of wavelengths of electromagnetic radiation. 3. A plot that shows how some intensity-related property of a beam of radiation or particles depends on another property that is related to dispersal of the beam by a prism, a magnet, or some other device. For example, a plot of light absorbance vs. wavelength is an absorption spectrum; a plot of ion abundance vs. mass is a mass spectrum.

**Specular Gloss:** Mirror-like finish (usually 60 degrees on a 60-degree meter).

**Specular Transmittance:** The transmittance value obtained when the measured transmitted flux includes only that transmitted in essentially the same direction as the incident flux.

**speculum :** An instrument used to widen an opening of the body to make it easier to look inside.

**speech pathologist :** A specialist who evaluates and treats people with communication and swallowing problems. Also called speech therapist.

**speech therapist :** A specialist who evaluates and treats people with communication and swallowing problems. Also called speech pathologist.

**Speed profile:** Injection speed set up with respect to stroke positions for the filling phase so that melt front speed remains near constant during filling phase.

**Spent (depleted or used) nuclear fuel:** Nuclear reactor fuel that has been used to the extent that it can no longer effectively sustain a chain reaction. For related information, see Storage of Spent Nuclear Fuel and Transportation of Spent Nuclear Fuel.

**Spent fuel pool:** An underwater storage and cooling facility for spent (depleted) fuel assemblies that have been removed from a reactor. For

related information, see Storage of Spent Nuclear Fuel and Spent Fuel Pools.

**Spent nuclear fuel:** Nuclear reactor fuel that has been used to the extent that it can no longer effectively sustain a chain reaction. For related information, see Storage of Spent Nuclear Fuel and Transportation of Spent Nuclear Fuel.

**sperm :** The male reproductive cell, formed in the testicle. A sperm unites with an egg to form an embryo.

**sperm banking :** The process of freezing sperm and storing it for future use. Samples of semen are collected and checked under a microscope in the laboratory to count sperm cells and find out how healthy they are. The sperm cells are then frozen and stored. Sperm banking is often used for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Sperm banking is a type of fertility preservation. Also called sperm cryopreservation.

**sperm cells:** haploid cells within the male testes.

**sperm count :** A count of the number of sperm in a sample of semen. A sperm count may be used as a measure of fertility.

**sperm cryopreservation :** The process of freezing sperm and storing it for future use. Samples of semen are collected and checked under a microscope in the laboratory to count sperm cells and find out how healthy they are. The sperm cells are then frozen and stored. Sperm cryopreservation is often used for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Sperm cryopreservation is a type of fertility preservation. Also called sperm banking.

**sperm retrieval :** Removal of sperm from a man's testis or epididymis by a doctor using a fine needle or other instrument.

**spermatic cord :** A cord-like structure in the male reproductive system that contains nerves, blood and lymph vessels, and the vas deferens (a coiled tube that carries sperm out of the testicle). It runs from the abdomen to the testicle, and connects to the testicle in the scrotum (external sac). Also called testicular cord.

**spermatogonia:** primitive cells within the seminiferous tubules that undergo a series of changes and then meiosis to yield sperm cells.

**spermicide** : A chemical substance that kills sperm and is used as a type of birth control. It is available over-the-counter (without a doctor's order) and comes in many different forms such as cream, gel, foam, and suppository. Spermicides can be used alone or with another birth control method such as a condom or diaphragm. They do not protect against sexually transmitted diseases (STDs).

**SPF**: A scale for rating the level of sunburn protection in sunscreen products. The higher the SPF, the more sunburn protection it gives. Sunscreens with a value of 2 through 11 give minimal protection against sunburns. Sunscreens with a value of 12 through 29 give moderate protection. SPFs of 30 or higher give high protection against sunburn. Also called sun protection factor.

**sphenoid sinus** : A type of paranasal sinus (a hollow space in the bones around the nose). There are two large sphenoid sinuses in the sphenoid bone, which is behind the nose between the eyes. The sphenoid sinuses are lined with cells that make mucus to keep the nose from drying out.

**spherical weathering**: weathering that occurs when the corners of an angular rock are broken down more quickly than the flat surfaces, forming rounded shapes.

**Spherulites**: Spherical crystalline body of radiating crystal fibers.

**sphincter** : A ring-shaped muscle that relaxes or tightens to open or close a passage or opening in the body. Examples are the anal sphincter (around the opening of the anus) and the pyloric sphincter (at the lower opening of the stomach).

**sphingolipid**: An amphipathic lipid with a sphingosine backbone to which are attached a long-chain fatty acid and a polar alcohol.

**Sphingomyelin**: Common in brain tissue, a sphingolipid in which the terminal hydroxyl group of ceramide has a phosphorylcholine substituent.

**Sphingosine**: An amino alcohol containing a long, unsaturated hydrocarbon chain that is a component of the phospholipid sphingomyelin as well as glycolipids; serves a role analogous to that of glycerol in phosphoglycerides.

**sphingosine kinase-2 inhibitor ABC294640**: An orally available, aryladamantane compound and selective inhibitor of sphingosine kinase-2 (SK2) with potential antineoplastic activity. Upon administration,

ABC294640 competitively binds to and inhibits SK2, thereby preventing the phosphorylation of the pro-apoptotic amino alcohol sphingosine to sphingosine 1-phosphate (S1P), the lipid mediator that is pro-survival and critical for immunomodulation. This may eventually lead to the induction of apoptosis and may result in an inhibition of cell proliferation in cancer cells overexpressing SK2. SK2 and its isoenzyme SK1 are overexpressed in numerous cancer cell types.

**SPI:** Abbreviation for Society of Plastics Industry.

**spiculated mass :** A lump of tissue with spikes or points on the surface.

**Spider:** (1) In a molding press, that part of an injector mechanism which operates the ejector pins. (2) In extrusion, a term used to denote the membranes supporting a mandrel within the head/die assembly.

**SPIDER GATE:** Multi-gating of a part through a system of radial runners from the sprue.

**Spider Lines:** Vertical marks on the parison (container) caused by improper welding of several melt flow fronts formed by the legs with which the torpedo is fixed in the extruder head.

**SPIE:** The International Society for Optical Engineering.

**spin:** The spin of an electron is designated by  $m_s$ , the electron spin quantum number, which can have values of  $+1/2$  and  $-1/2$ . In the presence of an external magnetic field an electron in an orbital can have one of two possible energy states, which depend on whether the magnetic field associated with the electron is aligned with or against the external magnetic field. or Electrons have an intrinsic angular momentum that is similar to what would be observed if they were spinning. Electron spin is sometimes called a "twoness" property because it can have two values, referred to as "spin up" and "spin down". Nuclei can have spins of their own.

**spin density:** The amount of excess alpha (over beta) spin; useful for identifying the location of unpaired electrons in radicals and for interpreting ESR experiments.

**Spin locked:** A technique in NMR in which the magnetization is locked along the y axis by the rf field. A means of effectively preventing chemical shift evolution by using a high-power rf field during an NMR experiment.

**spin pair:** ( ) paired spins; electron pair; paired electrons. Compare with unpaired spin. Two electrons with opposite spins, usually occupying

the same orbital.

**spin quantum number (ms) :** ms the fourth number in Schrödinger's electron wave equation, which tells the direction of spin on an electron.

**SPIN WELDING:** A process of fusing two objects together by forcing them together while one of the pair is spinning, until frictional heat melts the interface. Spinning is then stopped and pressure held until they are frozen together.

**spin-contamination:** See UHF.

**spin-polarized:** See UHF.

**spin-spin splitting:** the splitting of NMR signals caused by the coupling of nuclear spins on neighboring nonequivalent hydrogens.

**spin-unrestricted:** See UHF.

**spinal anesthesia :** A temporary loss of feeling in the abdomen and/or the lower part of the body. Special drugs called anesthetics are injected into the fluid in the lower part of the spinal column to cause the loss of feeling. The patient stays awake during the procedure. It is a type of regional anesthesia. Also called SAB, spinal block, and subarachnoid block.

**spinal block :** A temporary loss of feeling in the abdomen and/or the lower part of the body. Special drugs called anesthetics are injected into the fluid in the lower part of the spinal column to cause the loss of feeling. The patient stays awake during the procedure. It is a type of regional anesthesia. Also called SAB, spinal anesthesia, and subarachnoid block.

**spinal canal :** The narrow, fluid-filled space in the spinal column (the bones, muscles, tendons, and other tissues that reach from the base of the skull to the tailbone). The spinal cord runs through the spinal canal.

**spinal column :** The bones, muscles, tendons, and other tissues that reach from the base of the skull to the tailbone. The spinal column encloses the spinal cord and the fluid surrounding the spinal cord. Also called backbone, spine, and vertebral column.

**spinal cord:** the white cord of tissue passing through the bony tunnel made by the vertebrae.

**spinal cord :** A column of nerve tissue that runs from the base of the skull down the center of the back. It is covered by three thin layers of protective tissue called membranes. The spinal cord and membranes are surrounded by the vertebrae (back bones). The spinal cord and the brain make up the

central nervous system (CNS). Spinal cord nerves carry messages between the brain and the rest of the body.

**spinal cord compression :** Pressure on the spinal cord that may be caused by a tumor, a spinal fracture, or other conditions. Spinal cord compression may cause pain, weakness, loss of feeling, paralysis, incontinence (inability to control urine or stool), or impotence (inability to have an erection of the penis).

**spinal tap :** A procedure in which a thin needle called a spinal needle is put into the lower part of the spinal column to collect cerebrospinal fluid or to give drugs. Also called lumbar puncture.

**spindle cell hemangioma :** A benign (not cancer) blood vessel tumor that forms on or under the skin. Spindle cell hemangiomas have cells called spindle cells that look long and slender under a microscope. These tumors are painful red-brown or bluish lesions that usually appear on the arms or legs. One or more lesions may form, and they can sometimes rupture (break open) and bleed. Spindle cell hemangiomas usually occur in young adults but can sometimes occur in children. They are a type of vascular tumor.

**spindle cell sarcoma :** A type of sarcoma that contains spindle cells. Under a microscope, spindle cells look long and slender. Sarcomas are cancers that begin in muscle, fat, fibrous tissue, or other connective or supportive tissue in the body. Spindle cell sarcomas usually occur in adults.

**spindle cell tumor :** A type of tumor that contains cells called spindle cells, based on their shape. Under a microscope, spindle cells look long and slender. Spindle cell tumors may be sarcomas or carcinomas.

**spine :** The bones, muscles, tendons, and other tissues that reach from the base of the skull to the tailbone. The spine encloses the spinal cord and the fluid surrounding the spinal cord. Also called backbone, spinal column, and vertebral column.

**spine cancer :** Cancer that begins in the spinal column (backbone) or spinal cord. The spinal column is made up of linked bones, called vertebrae. The spinal cord is a column of nerve tissue that runs from the base of the skull down the back. It is surrounded by three protective membranes, and is enclosed within the vertebrae. Many different types of cancer may form in the bones, tissues, fluid, or nerves of the spine.

**Spinneret:** A type of extrusion die, i.e., a metal plate with many tiny holes, through which a plastic melt is forced to make fine fibers and filaments. Filaments may be hardened by cooling in air, water, etc., or by chemical action.

**Spinning:** Process of making fibers by forcing plastic melt through a spinneret.

**spiracles:** a series of openings on the body surface of terrestrial arthropods that open into tiny air tubes that assist in gas exchange.

**spiral CT scan :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The x-ray machine scans the body in a spiral path. This allows more images to be made in a shorter time than with older CT methods. A dye may be injected into a vein or swallowed to help the organs or tissues show up more clearly on the x-ray. Spiral CT scan also creates more detailed pictures and may be better at finding small abnormal areas inside the body. It may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called helical computed tomography.

**Spiral Flow :** Test performed by injection molding a sample into a spiral mold and used to compare the processability of different resins.

**Spiral Flow Test:** A method for determining the flow properties of a thermoplastic resin in which the resin flows along the path of a spiral cavity. The length of the material which flows into the cavity and its weight gives a relative indication of the flow properties of the resin.

**spiral galaxy:** galaxy with bands of stars that rotate around the center.

**Spiral Mold Cooling:** A method of cooling injection molds or similar molds wherein the cooling medium flows through a spiral cavity in the body of the mold. In injection molds, the cooling medium is introduced at the center of the spiral, near the spruce section, as more heat is localized in this section.

**Spiral Twist:** A type of seal failure resulting from a twisting action that strains or ruptures the rubber

**spirilla:** flexible spiral bacteria (singular, spirillum).

**spirituality :** Having to do with deep, often religious, feelings and beliefs, including a person's sense of peace, purpose, connection to others, and beliefs about the meaning of life.

**Spiriva:** (Other name for: tiotropium bromide monohydrate)

**spirochetes:** rigid spiral bacteria.

**spirogermanium:** A synthetic organometallic compound containing the element germanium with possible antineoplastic activity. Spirogermanium exhibits significant toxicity, particularly neurotoxicity.

**spiromustine:** A bifunctional nitrogen alkylating agent with antineoplastic activity and lipophilic properties. Containing a lipophilic hydantoin group that serves as a carrier to cross the blood brain barrier, spiromustine forms covalent linkages with nucleophilic centers in DNA, causing depurination, base-pair miscoding, strand scission, and DNA-DNA cross-linking, which may result in cytotoxicity.

**spironolactone:** A synthetic 17-spironolactone corticosteroid with potassium-sparing diuretic, antihypertensive, and antiandrogen activities. Spironolactone competitively inhibits adrenocortical hormone aldosterone activity in the distal renal tubules, myocardium, and vasculature. This agent may inhibit the pathophysiologic effects of aldosterone produced in excess by various types of malignant and benign tumors. Check for active clinical trials using this agent.

**spiroplatin:** A synthetic derivative of cyclohexane sulfatoplatinum with antineoplastic properties. Spiroplatin induces DNA cross-links, thereby inhibiting DNA replication and RNA and protein synthesis. Similar to other platinum compounds, this agent has been shown to be mutagenic and carcinogenic.

**spit:** a fingerlike ridge of sand that projects into a bay.

**spit tobacco :** A type of smokeless tobacco made from cured tobacco leaves. It may be sweetened and flavored with licorice and other substances. It comes in the form of loose tobacco leaves, pellets or “bits” (leaf tobacco rolled into small pellets), plugs (leaf tobacco pressed and held together with some type of sweetener), or twists (leaf tobacco rolled into rope-like strands and twisted). It is placed in the mouth, usually between the cheek and lower lip, and may be chewed. Spit tobacco contains nicotine and many harmful, cancer-causing chemicals. Using it can lead to nicotine addiction and can cause cancers of the mouth, throat, esophagus, and pancreas. Spit tobacco use may also cause gum disease, heart disease, stroke, and other health problems. Also called chewing tobacco.

**Splay:** A defect in the surface of a molded part that is usually small in size, shiny, and may have the appearance of a lightly tinted or silver streaks. OR Discolored, visible streaks in the part, typically caused by moisture in the resin.

**Splay Marks:** Marks or droplet-type imperfections found on the surface of the finished parts that may be caused by the spraying of the melt through the gates and into the cool cavity OR Lines found in part after molding, usually due to flow of material in mold.

**spleen:** the site where red blood cells are destroyed; a reserve blood supply for the body.

**spleen :** An organ that is part of the lymphatic system. The spleen makes lymphocytes, filters the blood, stores blood cells, and destroys old blood cells. It is located on the left side of the abdomen near the stomach.

**spleen tyrosine kinase inhibitor TAK-659:** An inhibitor of spleen tyrosine kinase (syk), with potential anti-inflammatory, immunomodulating, and antineoplastic activities. Spleen tyrosine kinase inhibitor TAK-659 may inhibit the activity of syk, which abrogates downstream B-cell receptor (BCR) signaling and leads to an inhibition of B-cell activation, chemotaxis, adhesion and proliferation. Syk, a BCR-associated non-receptor tyrosine kinase that mediates diverse cellular responses, including proliferation, differentiation, and phagocytosis, is expressed in hematopoietic tissues and is often overexpressed in hematopoietic malignancies.

**splenectomy :** An operation to remove the spleen.

**splenic :** Having to do with the spleen (an organ in the abdomen that makes immune cells, filters the blood, stores blood cells, and destroys old blood cells).

**splenomegaly :** Enlarged spleen.

**splice-site mutation :** An alteration in the DNA sequence that occurs at the boundary of an exon and an intron (splice site). This change can disrupt RNA splicing resulting in the loss of exons or the inclusion of introns and an altered protein-coding sequence.

**Spliceosome:** An assembly of proteins and small nuclear rnas that splices primary transcripts to form mature mrna.

**Splicing:** The removal of introns and the ligation of exons from precursors of RNA to form mature RNA. or See gene splicing; RNA splicing.

**splicing :** The process by which introns, the noncoding regions of genes, are excised out of the primary messenger RNA transcript, and the exons (i.e., coding regions) are joined together to generate mature messenger RNA. The latter serves as the template for synthesis of a specific protein.

**split infinitives:** breaking up an infinitive with one or more adverbs.

**Split Points:** Split points are locations in the a mould cavity where a melt front will split up and advance in more than one direction at the same time. It is also referred as flow junctions, branch points, or nodes.

**Split-Ring Mold :** A mold in which a split cavity block is assembled in a channel to permit the forming of undercuts in a molded piece. These parts are ejected from the mold and then separated from the piece.

**split-valence:** Refers to a basis set that is more than minimal (see MBS) for the valence orbitals, i.e., at least VDZ. 3-21G is one example of a split-valence basis. 6-311G might be called a triple-split-valence basis.

**spontaneous:** A spontaneous process occurs because of internal forces; no external forces are required to keep the process going, although external forces may be required to get the process started. For example, the burning of wood is spontaneous once the fire is started. The combination of water and carbon dioxide to reform the wood and oxygen is NOT spontaneous!

**spontaneous reaction:** A reaction that will proceed without any outside energy. Or A process that proceeds irreversibly toward equilibrium and is accompanied by an increase in disorder, or entropy.

**sporadic cancer :** This term has two meanings. It is sometimes used to differentiate cancers occurring in people who do not have a germline mutation that confers increased susceptibility to cancer from cancers occurring in people who are known to carry a mutation. Cancer developing in people who do not carry a high-risk mutation is referred to as sporadic cancer. The distinction is not absolute, because genetic background may influence the likelihood of cancer even in the absence of a specific predisposing mutation. Alternatively, sporadic is also sometimes used to describe cancer occurring in individuals without a family history of cancer. or Cancer that occurs in people who do not have a family history of that cancer or an inherited change in their DNA that would increase their risk for that cancer.

**Sporanox:** (Other name for: itraconazole)

**Sporulation:** Formation from vegetative cells of metabolically inactive cells that can resist extreme environmental conditions.

**SPOT PRIMING:** A method of protecting localized spots. The only areas primed are those that require additional protection due to rusting or peeling of the former coat.

**Spot priming:** The priming of localised bare timber surfaces when 'bringing forward' prior to stopping up and/or painting.

**spotted thistle :** A plant whose leaves, stems, and flowers have been used in some cultures to treat certain medical problems. Spotted thistle may have anti-inflammatory and anticancer effects. The scientific name is *Cnicus benedictus*. Also called blessed thistle, cardin, holy thistle, and St. Benedict's thistle.

**Spray coating:** a saran or pvc film, applied to pet, that dramatically improves gas barrier properties and allows for lightweight of containers. OR Usually accomplished on continuous webs by a set of reciprocating spray nozzles traveling laterally across the web as it moves.

**Spray-up:** Covers a number of techniques in which a spray gun is used as the processing tool. In reinforced plastics, for example, fibrous glass and resin can be simultaneously deposited in a mold. In essence, roving is fed through a chopper and ejected into a resin stream which is directed at the mold by either of two spray systems. In foamed plastics, very fast-reacting urethane foams or epoxy foams are used in liquid streams to the gun are sprayed on the surface. On contact, the liquid starts to foam. OR A process for manufacturing FRP parts in which continuous glass roving is fed into a special 'gun' which chops the fibres into short lengths and simultaneously mixes them with a resin (usually polyester) that is then sprayed onto the tool. Manual compaction with rollers is used to compact the lay-up.

**Sprayed Metal Molds:** Mold made by spraying molten metal onto a master until a shell of predetermined thickness is achieved. Shell is then removed and backed up with plaster, cement, casting resin, or other suitable material. Used primarily as a mold in sheet-forming processes.

**SPRAYING:** A method of application in which the coating material is broken up into a fine mist that is directed onto the surface to be coated.

**Spraying:** Application of paint by a spray gun. Two types of spray are available: 'conventional' which is operated by compressed air, and 'airless'

operated by hydraulically compressing the paint.

**Spreader:** A streamline metal block placed in the path of flow of the plastic material in the heating cylinder of extruders and injection molding machines to spread it into thin layers, thus forcing it into intimate contact with the heating areas.

**Spreading:** The action of applying paint by brush in a uniform coat over a surface; colouring bare wood by means of a dye or stain; discolouration of a paint film.

**spreading center:** a divergent boundary (midoceanic ridge) along which new oceanic crust is formed and pushed outward.

**SPREADING RATE:** The area to which paint can be spread; usually expressed as square feet per gallon.

**Spreading rate:** The area which a given quantity of paint will cover, e.g. the spreading rate of a particular paint may be quoted as '15m<sup>2</sup> per litre on smooth surfaces of average porosity'.

**spring tide:** extreme tides during Full and New Moon phases.

**spring tides:** tides that occur at the times of the new and full moons; spring tides exhibit the greatest difference in tidal elevations.

**Sprockets :** Manufacturers supply sprockets for positive drive. These sprockets are generally cast from carbon or stainless steel, and are finished in sizes suitable for application.

**Spruce:** The main feed channel that connects the mold-filling orifice with the runners leading to each gravity gate. Spruce is also the piece of plastic material formed in this channel.

**Spruce Bushing:** A hardened steel insert in an injection mold which contains the tapered spruce hole and has a suitable seat for the nozzle of the injection cylinder. Sometimes called an Adapter.

**Spruce Gate:** The passage through which molten resin flows from the nozzle to the mold cavity.

**Spruce Lock:** In injection molding, a portion of the plastic composition which is held in the cold slug well by an undercut; used to pull the spruce out of the bushing as the mold is opened. The spruce lock itself is pushed out of the mold by an ejector pin. When the undercut occurs on the cavity block retainer plate, this pin is called the Spruce Ejector Pin.

**Sprue:** The first stage in the resin distribution system, where the resin enters the mold. The sprue is perpendicular to the parting faces of the mold and brings resin to the runners, which are typically in the parting surfaces of the mold. OR The primary feed channel that runs from the outer face of a silicone injection mold to the mold runner and gates OR Feed opening provided in the injection or transfer mold; also the slug formed at this hole. OR The opening feed that conveys material from the nozzle to runner system in the mold. OR The plastic material that connects the runner system to the nozzle of the heating cylinder of the molding machine. It is formed by the internal surface of a bushing that joins the mold to the machine's nozzle.

**Sprue Bushing:** A hardened steel insert in the silicone injection mold that accepts the silicone molding machine nozzle and provides an opening for transferring the silicone or molten plastic OR A hardened-steel insert in the mold that accepts the nozzle and provides an opening for transferring the melt. OR A hardened-steel insert in the mold that accepts the nozzle and provides an opening for transferring the melt. OR A hardened bushing that connects the mold to the molding machine nozzle and allows molten plastic to enter the runner system.

**Sprue Gate:** A passageway through which melt flows from the nozzle to the mold cavity.

**Sprue Lock :** The portion of resin retained in the cold-slug well by an undercut. This lock is used to pull the sprue out of the bushing as the mold opens. The sprue lock itself is pushed out of the mold by an ejector pin.

**SPRUE LOCK OR PULLER:** In injection molding, a portion of the plastic composition which is held in the cold slug well by an undercut; used to pull the sprue out of the bushing as the mold is opened. The sprue lock itself is pushed out of the mold by an ejector pin. When the undercut occurs on the cavity block retainer plate, this pin is called the Sprue Ejector Pin.

**SPRUE-BUSHING:** A hardened steel insert in an injection mold which contains the tapered sprue hold and has a suitable seat for the nozzle of the injection cylinder.

**Sprycel :** A drug used to treat certain types of chronic myeloid leukemia and acute lymphoblastic leukemia. Sprycel is also being studied in the treatment of certain other blood diseases and types of cancer. Sprycel binds to and blocks BCR-ABL and other proteins that help cancer cells grow. It is a type of tyrosine kinase inhibitor. Also called BMS-354825 and dasatinib.

**SPS:** Syndiotactic Polystyrene :High heat resistant thermoplastic material with crystalline structure. Generally glass filled. Used in under hood-automotive or other high heat applications i.e. sterilization cassettes and electrical connectors. Casco Bay Molding has extensive experience injection molding and ultrasonically welding SPS.

**sputum :** Mucus and other matter brought up from the lungs by coughing.

**sputum cytology :** Examination under a microscope of cells found in sputum (mucus and other matter brought up from the lungs by coughing). The test checks for abnormal cells, such as lung cancer cells.

**spyrine:** (Other name for: trientine hydrochloride)

**squalamine lactate :** A drug that belongs to the family of drugs called angiogenesis inhibitors. It prevents the growth of new blood vessels into a solid tumor.

**squamous cell :** Flat cell that looks like a fish scale under a microscope. These cells are found in the tissues that form the surface of the skin, the passages of the respiratory and digestive tracts, and the lining of the hollow organs of the body (such as the bladder, kidney, and uterus, including the cervix).

**squamous cell carcinoma :** Cancer that begins in squamous cells. Squamous cells are thin, flat cells that look like fish scales, and are found in the tissue that forms the surface of the skin, the lining of the hollow organs of the body, and the lining of the respiratory and digestive tracts. Most cancers of the anus, cervix, head and neck, and vagina are squamous cell carcinomas. Also called epidermoid carcinoma.

**squamous cell carcinoma of the head and neck :** Cancer of the head and neck that begins in squamous cells (thin, flat cells that form the surface of the skin, eyes, various internal organs, and the lining of hollow organs and ducts of some glands). Squamous cell carcinoma of the head and neck includes cancers of the nasal cavity, sinuses, lips, mouth, salivary glands, throat, and larynx (voice box). Most head and neck cancers are squamous cell carcinomas.

**squamous intraepithelial lesion :** A general term for the abnormal growth of squamous cells on the surface of the cervix. The changes in the cells are described as low grade or high grade, depending on how much of the cervix is affected and how abnormal the cells appear. Also called SIL.

**square:** a four-sided plane closed figure having equal sides and four right angles. Its opposite sides are parallel. Or A square is a special type of rectangle in which all sides are equal in length.

**SR-29142:** A drug that may protect healthy tissue from the toxic effects of anticancer drugs.

**SR-45023A:** An anticancer drug that belongs to the family of drugs called bisphosphonates. It affects cancer cell receptors governing cell growth and cell death.

**SR-T100 gel:** A cutaneous gel preparation containing an extract from *Solanum incanum* with potential antineoplastic activity. SR-T100 gel contains high amounts of the steroidal alkaloid glycoside solamargine. Solamargine is able to upregulate expression of tumor necrosis factor receptors 1 (TNFR1) and 6 (TNFRSF6 or Fas), and their signaling adaptors TNFR1-associated death domain, and Fas-associated death domain. In addition, this agent is able to upregulate expression of apoptosis promoter Bax, and suppress the expression of the anti-apoptotic proteins Bcl-xL and Bcl-2. Altogether, this induces apoptosis in tumor cells and may lead to an inhibition of tumor cell proliferation. Check for active clinical trials using this agent.

**SR31747A:** A synthetic peripheral sigma receptor ligand with immunomodulatory and potential antitumor activities. Although the exact mechanism by which SR31747A exerts its antitumor effects has not been fully established, SR31747A binds to and inhibits the sigma1 receptor (SR31747A-binding protein-1 or SR-BP1), human sterol isomerase (emopamil-binding protein) and the sigma2 receptor, which may result in a reduction in tumor cell proliferation and tumor cell apoptosis. In addition, this agent inhibits the production of pro-inflammatory cytokines while increasing anti-inflammatory cytokines. Upregulated in various cancers, the sigma1 and sigma2 receptors and human sterol isomerase are proteins that are involved in the regulation of cell proliferation and survival. Check for active clinical trials using this agent.

**SR49059:** A substance being studied in the treatment of cancer. It inhibits a hormone growth factor that causes some cancer cells to divide. It is a type of vasopressin receptor antagonist.

**Src kinase inhibitor KX2-391:** An orally bioavailable small molecule Src kinase inhibitor with potential antineoplastic activity. Unlike other Src

kinase inhibitors which bind to the ATP-binding site, Src kinase inhibitor KX2-391 specifically binds to the peptide substrate binding site of Src kinase; inhibition of kinase activity may result in the inhibition of primary tumor growth and the suppression of metastasis. Src tyrosine kinases are upregulated in many tumor cells and play important roles in tumor cell proliferation and metastasis.

**Src kinase inhibitor KX2-391 ointment:** An ointment containing an inhibitor for both Src tyrosine kinase and tubulin polymerization, with potential antineoplastic activity. Unlike other Src kinase inhibitors which bind to the ATP-binding site, Src kinase inhibitor KX2-391 binds to the peptide substrate binding site of Src kinase, upon topical application. This inhibits both downstream signaling and the proliferation of tumor cells overexpressing Src. Src tyrosine kinase, a non-receptor tyrosine kinase upregulated in many tumor cell types, plays an important role in tumor cell proliferation, motility, invasiveness and survival. KX2-391 also binds to tubulin heterodimers and inhibits microtubule polymerization, which disrupts microtubule formation and mitosis, leading to further inhibition of cell proliferation. In addition, KX2-391 inhibits T-cell migration.

**Src/Abl kinase inhibitor AZD0424:** An orally bioavailable small molecule tyrosine kinase inhibitor that targets both Abl and Src kinases with potential antineoplastic activity. Upon oral administration, AZD0424 selectively inhibits both Src and Abl kinase activity which may result in the inhibition of tumor growth in susceptible tumor cells. Src and Abl kinases are upregulated in certain tumor cells and play important roles in tumor cell proliferation and metastasis.

**src/tubulin inhibitor KX02:** A lipophilic, orally available inhibitor of both Src kinase activity and tubulin polymerization, with potential antineoplastic activity. Upon oral administration, src/tubulin inhibitor KX02 binds to and inhibits the activity of Src kinase. This inhibits both downstream signaling and the proliferation of Src kinase-expressing tumor cells. KX02 also binds to tubulin heterodimers and inhibits microtubule polymerization, thereby disrupting microtubule formation, mitosis, and further proliferation. Src, a non-receptor tyrosine kinase, is overexpressed in a variety of tumor cell types and plays a key role in tumor cell proliferation, angiogenesis, migration, and metastasis.

**SRS:** A type of radionuclide scan used to find carcinoid and other types of tumors. Radioactive octreotide, a drug similar to somatostatin, is injected into a vein and travels through the bloodstream. The radioactive octreotide attaches to tumor cells that have receptors for somatostatin. A radiation-measuring device detects the radioactive octreotide, and makes pictures showing where the tumor cells are in the body. Also called octreotide scan and somatostatin receptor scintigraphy.

**SS1(dsFv)-PE38 immunotoxin:** A recombinant immunotoxin consisting of the single chain anti-mesothelin monoclonal antibody SS1(dsFv) linked to Pseudomonas exotoxin PE-38. The monoclonal antibody moiety of the agent binds to cells that express mesothelin, a cell surface glycoprotein which may be overexpressed in ovarian cancer, mesotheliomas, and some squamous cell carcinomas; after internalization, the exotoxin moiety inactivates eukaryotic translation elongation factor 2, thereby disrupting tumor cell protein synthesis.

**SSCP:** A type of mutation scanning; the identification of abnormally-migrating single-stranded DNA segments on gel electrophoresis. Also called single-stranded conformational polymorphism.

**SSCP analysis :** A laboratory test used to separate single-stranded nucleic acids based on subtle differences in their DNA sequence, often a single base pair, which results in a different secondary structure and a measurable difference in mobility through a gel. Also called single-stranded conformation polymorphism analysis.

**SSD:** (Other name for: silver sulfadiazine)

**SSG:** A substance being studied in the treatment of certain solid tumors, lymphoma, and myeloma. SSG may block enzymes needed for cancer growth. It is a type of pentavalent antimonial. Also called sodium stibogluconate.

**SSRI:** A type of drug that is used to treat depression. SSRIs slow the process by which serotonin (a substance that nerves use to send messages to one another) is reused by nerve cells that make it. This increases the amount of serotonin available for stimulating other nerves. Also called selective serotonin reuptake inhibitor.

**St. Benedict's thistle :** A plant whose leaves, stems, and flowers have been used in some cultures to treat certain medical problems. St. Benedict's thistle may have anti-inflammatory and anticancer effects. The scientific

name is *Cnicus benedictus*. Also called blessed thistle, cardin, holy thistle, and spotted thistle.

**St. John's wort:** An herbal extract prepared from the plant *Hypericum perforatum* (St. John's wort) with photodynamic, antineoplastic, and antidepressant activities. Hypericin, one of the active compounds found in *Hypericum perforatum*, is a photosensitizer that, when exposed to a particular wavelength and intensity of light, may induce tumor cell apoptosis. Another compound, hyperforin, induces caspase-dependent apoptosis in certain tumor cell lines. *Hypericum perforatum* preparations may also stimulate the activity of cytochrome P450 enzymes and P-glycoprotein drug transporters, resulting in increased metabolism and decreased efficacy of various chemotherapeutic agents and other drugs. or An herbal product sold as an over-the-counter treatment for depression. It is being studied for its ability to lessen certain side effects of cancer treatment. Also called *Hypericum perforatum*.

**ST1481:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called topoisomerase inhibitors. Also called gimatecan.

**Stability:** A term used to describe the resistance of a solid drug or solution of a drug to reaction. Or the percent of change of the baseline and/or sensitivity in time.

**stability field:** the ranges of temperature and pressure in which a particular mineral is stable.

**stabilized sulphur hexafluoride microbubble-based contrast agent:** An injectable ultrasound contrast media formulation composed of microbubbles of stabilized sulphur hexafluoride (SF<sub>6</sub>) in sodium chloride solution. With stabilized sulphur hexafluoride microbubble-based contrast agent, ultrasound waves are scattered and reflected at the microbubble-blood interface during ultrasound imaging, thereby enhancing blood vessel visualization and the contrast between blood vessels and adjacent tissues.

**stabilizer:** A substance that makes a mixture more stable. Antioxidants and antiozonants are examples of stabilizers; stabilizers are added to paints to prevent the components of the mixture from separating over time. Or An ingredient used in the formulation of some plastics to assist in maintaining the physical and chemical properties of the compounded materials at their initial values throughout the processing and

service life of the material. OR A substance used in the formulation of plastics to help maintaining the properties of the material during processing and service life. OR Ingredient used in the formulation of some polymer plastics to assist in maintaining the physical and chemical properties of the compounded plastic materials. OR A substance used in the formulation of plastics to help maintaining the properties of the material during processing and service life.

**Stabilizers & Surface Modifiers:** Some additives included in this category include antioxidants and antizonants, antistats, biocides and fungicides, heat stabilizers, light, and UV stabilizers and absorbers.

**stable disease :** Cancer that is neither decreasing nor increasing in extent or severity.

**Stable form:** The solid form of a substance having the highest thermodynamic stability (e.g., lowest solubility) among all the forms that might be encountered under the given conditions.

**Stable isotope:** An isotope that does not undergo radioactive decay.

**stack:** an erosional remnant of a sea cliff; a stack is rooted to the wave-cut platform and stands above the surface of the water.

**Stack Molds :** Two or more molds of a similar type that are positioned one behind the other to allow for additional parts to be manufactured during a cycle.

**Stacking energy:** The energy of interaction that favors the face-to-face packing of purine and pyrimidine base pairs.

**stage :** The extent of a cancer in the body. Staging is usually based on the size of the tumor, whether lymph nodes contain cancer, and whether the cancer has spread from the original site to other parts of the body.

**stage 0 anal carcinoma in situ :** Abnormal cells are found in the innermost lining of the anus. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 bladder carcinoma in situ :** Abnormal cells are found in tissue lining the inside of the bladder. These abnormal cells may become cancer and spread into nearby normal tissue. Stage 0 is divided into stage 0a (papillary carcinoma) and stage 0is (carcinoma in situ), depending on the type of tumor. Stage 0a may look like tiny mushrooms growing from the

lining of the bladder. Stage 0 is is a flat tumor on the tissue lining the inside of the bladder.

**stage 0 breast carcinoma in situ :** There are 3 types of stage 0 breast carcinoma in situ: ductal carcinoma in situ (DCIS), lobular carcinoma in situ (LCIS), and Paget disease of the nipple. DCIS is a noninvasive condition in which abnormal cells are found in the lining of a breast duct. The abnormal cells have not spread outside the duct to other tissues in the breast. In some cases, DCIS may become invasive cancer and spread to other tissues. At this time, there is no way to know which lesions could become invasive. LCIS is a condition in which abnormal cells are found in the lobules of the breast. This condition seldom becomes invasive cancer. However, having LCIS in one breast increases the risk of developing breast cancer in either breast. Paget disease of the nipple is a condition in which abnormal cells are found in the nipple only. Also called breast carcinoma in situ.

**stage 0 cervical carcinoma in situ :** Severely abnormal cells are found on the surface of the cervix. Stage 0 cervical carcinoma in situ is usually caused by certain types of human papillomavirus (HPV) and is found when a cervical biopsy is done. If not treated, these abnormal cells may become cancer and spread to nearby normal tissue. Treatment for stage 0 cervical carcinoma in situ may include cryotherapy, laser therapy, loop electrosurgical procedure (LEEP), or cone biopsy to remove or destroy the abnormal tissue. Stage 0 cervical carcinoma in situ is sometimes called high-grade or severe dysplasia. Also called cervical squamous intraepithelial neoplasia 3 and CIN 3.

**stage 0 chronic lymphocytic leukemia :** There are too many lymphocytes in the blood, but there are no other symptoms of leukemia. Stage 0 is indolent (slow-growing).

**stage 0 colorectal carcinoma in situ :** Abnormal cells are found in the mucosa (innermost layer) of the colon and/or rectal wall. These abnormal cells may become cancer.

**stage 0 disease :** A group of abnormal cells that remain in the place where they first formed. They have not spread. These abnormal cells may become cancer and spread into nearby normal tissue. Also called carcinoma in situ.

**stage 0 distal extrahepatic bile duct carcinoma in situ :** Abnormal cells are found in the innermost layer of tissue lining the distal extrahepatic bile

duct (where the bile duct empties into the small intestine). These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 esophageal carcinoma in situ :** Abnormal cells are found in the mucosa or submucosa layer of the esophagus wall. These abnormal cells may become cancer and spread into nearby normal tissue. Stage 0 is also called high-grade dysplasia.

**stage 0 gallbladder carcinoma in situ :** Abnormal cells are found in the inner (mucosal) layer of the gallbladder. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 gastric carcinoma in situ :** Abnormal cells are found in the inside lining of the mucosa (innermost layer) of the stomach wall. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 hypopharyngeal carcinoma in situ :** Abnormal cells are found in the lining of the hypopharynx. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 laryngeal carcinoma in situ :** Abnormal cells are found in the lining of the larynx. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 lip and oral cavity carcinoma in situ :** Abnormal cells are found in the lining of the lips and oral cavity. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 maxillary sinus carcinoma in situ :** Abnormal cells are found in the innermost lining of the maxillary sinus. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 medullary thyroid carcinoma in situ :** No tumor is found in the thyroid but abnormal cells are found by screening tests. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 melanoma :** Abnormal melanocytes (cells that make melanin, the pigment that gives skin its color) are found in the epidermis (outer layer of the skin). These abnormal melanocytes may become cancer and spread into nearby normal tissue. Also called melanoma in situ.

**stage 0 Merkel cell carcinoma in situ :** Abnormal cells are found in the place where they first formed and have not spread. These abnormal cells may become cancer and spread to lymph nodes or distant parts of the body.

**stage 0 nasal cavity and ethmoid sinus carcinoma in situ :** Abnormal cells are found in the innermost lining of the nasal cavity or ethmoid sinus. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 nasopharyngeal carcinoma in situ :** Abnormal cells are found in the lining of the nasopharynx. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 non-small cell lung carcinoma in situ :** Abnormal cells are found in the lining of the airways. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 nonmelanoma skin carcinoma in situ :** Abnormal cells are found in the squamous cell or basal cell layer of the epidermis (topmost layer of the skin). These abnormal cells may become cancer and spread into nearby normal tissue. Also called nonmelanoma carcinoma in situ.

**stage 0 nonmelanoma skin carcinoma in situ on the eyelid :** Abnormal cells are found in the epidermis (topmost layer of the skin). These abnormal cells may become cancer and spread into nearby normal tissue. Also called nonmelanoma skin carcinoma in situ on the eyelid.

**stage 0 oropharyngeal carcinoma in situ :** Abnormal cells are found in the lining of the oropharynx. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 pancreatic carcinoma in situ :** Abnormal cells are found in the lining of the pancreas. These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 penile carcinoma in situ :** Abnormal cells or growths that look like warts are found on the surface of the skin of the penis. These abnormal cells or growths may become cancer and spread into nearby normal tissue.

**stage 0 perihilar extrahepatic bile duct carcinoma in situ :** Abnormal cells are found in the innermost layer of tissue lining the perihilar extrahepatic bile duct (where the bile duct leaves the liver). These abnormal cells may become cancer and spread into nearby normal tissue.

**stage 0 testicular carcinoma in situ :** Abnormal cells are found in the tiny tubules where the sperm cells begin to develop. These abnormal cells may become cancer and spread into nearby normal tissue. All tumor marker

levels are normal. Also called testicular intraepithelial neoplasia and testicular intratubular germ cell neoplasia.

**stage 0 transitional cell carcinoma in situ of the renal pelvis and ureter :** Abnormal cells are found in tissue lining the inside of the renal pelvis or ureter. These abnormal cells may become cancer and spread into nearby normal tissue. Stage 0 is divided into stages 0a (noninvasive papillary carcinoma) and 0is (carcinoma in situ), depending on the type of tumor. Stage 0a may look like tiny mushrooms growing from the tissue lining the inside of the renal pelvis or ureter. Stage 0is is a flat tumor on the tissue lining the inside of the renal pelvis or ureter.

**stage 0 urethral carcinoma in situ :** Abnormal cells are found on the inside lining of the urethra. These abnormal cells may become cancer and spread into nearby normal tissue.

**Stage 1 metabolism:** A stage in which large molecules are broken into smaller units; glycogen, for instance, is converted into glucose.

**stage 1 neuroblastoma :** Tumor is only found in one area; all of the tumor that can be seen is completely removed during surgery.

**Stage 2 metabolism:** A stage in which small molecules are degraded to a few key intermediates, such as acetyl coa, in metabolism.

**stage 2 neuroblastoma :** Stage 2 is divided into stages 2A and 2B. In stage 2A, the tumor is in one area only and not all of the tumor that can be seen can be completely removed during surgery. In stage 2B, the tumor is in one area only and all of the tumor that can be seen may be completely removed during surgery, but cancer cells are found in nearby lymph nodes.

**Stage 3 metabolism:** A stage consisting of the citric acid cycle and oxidative phosphorylation; the final common pathway for the oxidation of fuel molecules.

**stage 3 neuroblastoma :** In stage 3 neuroblastoma, the tumor (1) cannot be completely removed during surgery and has spread from one side of the body to the other side and may also have spread to nearby lymph nodes; or (2) is in one area of one side of the body only, but has spread to lymph nodes on the other side of the body; or (3) is in the middle of the body and has spread to tissues or lymph nodes on both sides of the body, and the tumor cannot be removed by surgery.

**stage 4 neuroblastoma :** Stage 4 neuroblastoma is divided into stages 4 and 4S. In stage 4, the tumor has spread to distant lymph nodes, the skin, and/or other parts of the body. In stage 4S, (1) the child is younger than 1 year; and (2) the cancer has spread to the skin, liver, and/or bone marrow; and (3) the tumor is in one area only and all of the tumor that can be seen may be completely removed during surgery; and/or (4) cancer cells may be found in the lymph nodes near the tumor.

**stage A prostate cancer :** A prostate cancer stage defined by the Jewett staging system. Stage A prostate cancer is cancer that began in the prostate and is found in the prostate only. It is usually found during surgery for other reasons, such as benign prostatic hyperplasia (a condition in which an overgrowth of prostate tissue occurs). Stage A is divided into stages A1 and A2. In stage A1, the cancer cells do not look very different from normal cells. In stage A2, the cancer cells look more abnormal or are in several areas in the prostate.

**stage B prostate cancer :** A prostate cancer stage defined by the Jewett staging system. Stage B prostate cancer is cancer that began in the prostate and is more advanced than stage A, but has not spread outside the prostate. Stage B is divided into stages B0, B1, and B2. In stage B0, the cancer is detected only by increased blood levels of PSA (prostate-specific antigen). In stage B1, cancer is in one area of one lobe of the prostate. In stage B2, there is more cancer in one or both lobes of the prostate.

**stage C prostate cancer :** A prostate cancer stage defined by the Jewett staging system. Stage C prostate cancer is cancer that began in the prostate, has grown beyond the outer layer of the prostate to nearby tissues, and may be found in the seminal vesicles (glands that help produce semen). Stage C is divided into stages C1 and C2. In stage C1, the cancer has grown outside the prostate but has not spread to lymph nodes or other places in the body. In stage C2, the cancer has grown outside the prostate and blocks urine flow from the bladder or through the ureters.

**stage D prostate cancer :** A prostate cancer stage defined by the Jewett staging system. Stage D prostate cancer is cancer that began in the prostate and has spread to lymph nodes near or far from the prostate, or to other parts of the body, often to the bones. Stage D is divided into stages D0, D1, D2, and D3. In stage D0, the level of prostatic acid phosphatase (PAP) is high. In stage D1, the cancer has spread to local lymph nodes only. In stage

D2, the cancer has spread to distant lymph nodes and to bones or internal organs. In stage D3, prostate cancer has come back in patients who had received hormone therapy.

**stage I adrenocortical cancer :** The tumor is 5 centimeters or smaller and is found in the adrenal gland only.

**stage I adult Hodgkin lymphoma :** Stage I is divided into stages I and IE. In stage I, cancer is found in one of the following places in the lymph system: (1) one or more lymph nodes in one lymph node group; (2) Waldeyer's ring; (3) thymus; or (4) spleen. In stage IE, cancer is found outside the lymph system in one organ or area.

**stage I adult non-Hodgkin lymphoma :** Stage I is divided into stages I and IE. In stage I, cancer is found in one lymphatic area (lymph nodes, tonsils, thymus, or spleen). In stage IE, cancer is found in one organ or area outside the lymph nodes.

**stage I adult primary liver cancer :** There is one tumor and it has not spread to nearby blood vessels.

**stage I AIDS-related lymphoma :** Stage I is divided into stages I and IE. In stage I, cancer is found in one lymphatic area (lymph node group, tonsils and nearby tissue, thymus, or spleen). In stage IE, cancer is found in one organ or area outside the lymph nodes.

**stage I anal cancer :** The tumor is no larger than 2 centimeters.

**stage I bladder cancer :** Cancer has spread to the layer of connective tissue next to the inner lining of the bladder.

**stage I breast cancer :** Stage I is divided into stages IA and IB. In stage IA, the tumor is 2 centimeters or smaller. Cancer has not spread outside the breast. In stage IB, small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes and either: (1) no tumor is found in the breast; or (2) the tumor is 2 centimeters or smaller.

**stage I cancer of the uterus :** Cancer found in only the main part of the uterus, not the cervix.

**stage I cervical cancer :** Cancer is found in the cervix only. Stage I is divided into stages IA and IB, based on the amount of cancer that is found. In stage IA, a very small amount of cancer that can only be seen with a microscope is found in the tissues of the cervix. Stage IA is divided into

stages IA1 and IA2, based on the size of the tumor. In stage IA1, the cancer is not more than 3 millimeters deep and not more than 7 millimeters wide. In stage IA2, the cancer is more than 3 but not more than 5 millimeters deep, and not more than 7 millimeters wide. Stage IB is divided into stages IB1 and IB2, based on the size of the tumor. In stage IB1, (1) the cancer can only be seen with a microscope and is more than 5 millimeters deep and more than 7 millimeters wide; or (2) the cancer can be seen without a microscope and is not more than 4 centimeters. In stage IB2, the cancer can be seen without a microscope and is more than 4 centimeters.

**stage I childhood Hodgkin lymphoma :** Stage I is divided into stages I and IE. In stage I, cancer is found in one of the following places in the lymph system: (1) one or more lymph nodes in one lymph node group; (2) Waldeyer's ring; (3) thymus; or (4) spleen. In stage IE, cancer is found outside the lymph system in one organ or area.

**stage I childhood liver cancer :** The tumor was in the liver only and all of the cancer was removed by surgery.

**stage I childhood non-Hodgkin lymphoma :** Cancer is found (1) in one group of lymph nodes; or (2) in one area outside the lymph nodes. No cancer is found in the abdomen or mediastinum (area between the lungs).

**stage I chronic lymphocytic leukemia :** There are too many lymphocytes in the blood and the lymph nodes are larger than normal.

**stage I colorectal cancer :** Cancer has spread from the mucosa (innermost layer) of the colon and/or rectal wall to the submucosa (layer of tissue under the mucosa) of the colon and/or rectal wall. Cancer may have spread to the muscle layer of the colon and/or rectal wall. Also called Dukes A colorectal cancer.

**stage I cutaneous T-cell lymphoma :** May be either of the following: (1) stage IA cancer affecting less than 10% of the skin's surface and appearing as red, dry, scaly patches; (2) stage IB cancer affecting 10% or more of the skin's surface and appearing as red, dry, scaly patches.

**stage I distal extrahepatic bile duct cancer :** Stage I is divided into stages IA and IB. In stage IA, cancer is found in the distal extrahepatic bile duct (where the bile duct empties into the small intestine) only. In stage IB, cancer has spread all the way through the wall of the distal bile duct.

**stage I endometrial cancer :** Cancer is found in the uterus only. Stage I is divided into stages IA and IB, based on how far the cancer has spread. In stage IA, cancer is in the endometrium only or less than halfway through the myometrium (muscle layer of the uterus). In stage IB, cancer has spread halfway or more into the myometrium.

**stage I esophageal adenocarcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IA, cancer has formed in the mucosa or submucosa layer of the esophagus wall. The cancer cells are grade 1 or 2. Grade 1 and 2 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 3 cancer cells. In stage IB, cancer has formed (1) in the mucosa or submucosa layer of the esophagus wall, and the cancer cells are grade 3. Grade 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 and 2 cancer cells; or (2) in the mucosa or submucosa layer and spread into the muscle layer of the esophagus wall, and the cancer cells are grade 1 or 2.

**stage I esophageal squamous cell carcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IA, cancer has formed in the mucosa or submucosa layer of the esophagus wall. The cancer cells are grade 1. Grade 1 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 2 and 3 cancer cells. In stage IB, cancer has formed (1) in the mucosa or submucosa layer of the esophagus wall, and the cancer cells are grade 2 and 3. Grade 2 and 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 cancer cells; or (2) in the mucosa or submucosa layer and spread into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 1. The tumor is in the lower esophagus or it is not known where the tumor is.

**stage I gallbladder cancer :** Cancer has spread beyond the inner (mucosal) layer to a layer of tissue with blood vessels or to the muscle layer.

**stage I gastric cancer :** Cancer has formed in the inside lining of the mucosa (innermost layer) of the stomach wall. Stage I is divided into stages IA and IB, depending on where the cancer has spread. In stage IA, cancer may have spread into the submucosa (layer of tissue next to the mucosa) of

the stomach wall. In stage IB, cancer (1) may have spread into the submucosa (layer of tissue next to the mucosa) of the stomach wall and is found in 1 or 2 lymph nodes near the tumor; or (2) has spread to the muscle layer of the stomach wall.

**stage I gestational trophoblastic neoplasia :** The tumor is in the uterus only.

**stage I hypopharyngeal cancer :** Cancer is found in one area of the hypopharynx only and/or the tumor is 2 centimeters or smaller.

**stage I intraocular melanoma of the ciliary body and choroid :** The tumor is in the choroid only and is size category 1 (not more than 12 millimeters wide and not more than 3 millimeters thick; or not more than 9 millimeters wide and 3.1 to 6 millimeters thick).

**stage I intraocular melanoma of the iris :** The tumor is in the iris only and is not more than one fourth the size of the iris.

**stage I kidney cancer :** The tumor is 7 centimeters or smaller and is found in the kidney only. Also called stage I renal cell cancer.

**stage I laryngeal cancer :** Cancer is found only in the area where it started. Stage I laryngeal cancer depends on where cancer is found in the larynx. If it started in the supraglottis, then cancer is in one area of the supraglottis only and the vocal cords can move normally. If it started in the glottis, then cancer is in one or both vocal cords and the vocal cords can move normally. If it started in the subglottis, then cancer is in the subglottis only.

**stage I lip and oral cavity cancer :** The tumor is 2 centimeters or smaller. Cancer has not spread to lymph nodes.

**stage I malignant mesothelioma :** Stage I is divided into stages IA and IB. In stage IA, cancer is found in one side of the chest in the lining of the chest wall and may also be found in the lining of the chest cavity between the lungs and/or the lining that covers the diaphragm. Cancer has not spread to the lining that covers the lung. In stage IB, cancer is found in one side of the chest in the lining of the chest wall and the lining that covers the lung. Cancer may also be found in the lining of the chest cavity between the lungs and/or the lining that covers the diaphragm.

**stage I maxillary sinus cancer :** Cancer has formed in the mucous membranes of the maxillary sinus.

**stage I melanoma :** Stage I is divided into stages IA and IB. In stage IA, the tumor is not more than 1 millimeter thick, with no ulceration (a break in the skin). In stage IB, (1) the tumor is not more than 1 millimeter thick and it has ulceration; or (2) the tumor is more than 1 but not more than 2 millimeters thick, with no ulceration.

**stage I Merkel cell carcinoma :** Stage I Merkel cell carcinoma is divided into stages IA and IB. In stage IA, the tumor is 2 centimeters or smaller at its widest point and no cancer is found when the lymph nodes are checked under a microscope. In stage IB, the tumor is 2 centimeters or smaller at its widest point and no swollen lymph nodes are found by a physical exam or imaging tests.

**stage I multiple myeloma :** Relatively few cancer cells have spread throughout the body. There may be no symptoms of disease.

**stage I mycosis fungoides :** Stage I is divided into stages IA and IB. In stage IA, less than 10% of the skin surface is covered with patches, papules, and/or plaques. In stage IB, 10% or more of the skin surface is covered with patches, papules, and/or plaques. In stages IA and IB, there may be abnormal lymphocytes in the blood but they are not cancerous.

**stage I nasal cavity and ethmoid sinus cancer :** Cancer is found in only one area (of either the nasal cavity or the ethmoid sinus) and may have spread into bone.

**stage I nasopharyngeal cancer :** Cancer (1) is found in the nasopharynx only; or (2) has spread from the nasopharynx to the oropharynx (the middle part of the throat, including the soft palate, base of the tongue, and tonsils) and/or to the nasal cavity.

**stage I nonmelanoma skin cancer :** The tumor is not larger than 2 centimeters at its widest point and may have one of the following high-risk features: (1) is thicker than 2 millimeters; (2) has spread into the lower layer of the dermis or into the layer of fat below the skin; (3) has grown and spread along nerve pathways; (4) began on an ear or on a lip that has hair on it; or (5) has cells that look very different from normal cells under a microscope.

**stage I nonmelanoma skin cancer on the eyelid :** Stage I is divided into stages IA, IB, and IC. In stage IA, the tumor is 5 millimeters or smaller and has not spread to the connective tissue of the eyelid or to the edge of the eyelid where the lashes are. In stage IB, the tumor is larger than 5

millimeters but not larger than 10 millimeters or has spread to the connective tissue of the eyelid or to the edge of the eyelid where the lashes are. In stage IC, the tumor is larger than 10 millimeters but not larger than 20 millimeters or has spread through the full thickness of the eyelid.

**stage I oropharyngeal cancer :** Cancer is 2 centimeters or smaller and is found in the oropharynx only.

**stage I ovarian epithelial and fallopian tube cancer :** Cancer is found in one or both ovaries or fallopian tubes. Stage I is divided into stages IA, IB, and IC. In stage IA, cancer is found inside a single ovary or fallopian tube. In stage IB, cancer is found inside both ovaries or fallopian tubes. In stage IC, cancer is found inside one or both ovaries or fallopian tubes and one of the following is true: (1) cancer is also found on the outside surface of one or both ovaries or fallopian tubes; or (2) the capsule (outer covering) of the ovary has ruptured (broken open); or (3) cancer cells are found in the fluid of the peritoneal cavity (the body cavity that contains most of the organs in the abdomen) or in washings of the peritoneum (tissue lining the peritoneal cavity).

**stage I ovarian germ cell tumor :** Cancer is found in one or both ovaries. Stage I is divided into stages IA, IB, and IC. In stage IA, cancer is found inside a single ovary. In stage IB, cancer is found inside both ovaries. In stage IC, cancer is found inside one or both ovaries and one of the following is true: (1) cancer is also found on the outside surface of one or both ovaries; or (2) the capsule (outer covering) of the ovary has ruptured (broken open); or (3) cancer cells are found in the fluid of the peritoneal cavity (the body cavity that contains most of the organs in the abdomen) or in washings of the peritoneum (tissue lining the peritoneal cavity).

**stage I ovarian low malignant potential tumor :** The tumor is found in one or both ovaries. Stage I is divided into stages IA, IB, and IC. In stage IA, the tumor is found inside a single ovary. In stage IB, the tumor is found inside both ovaries. In stage IC, the tumor is found inside one or both ovaries and one of the following is true: (1) tumor cells are found on the outside surface of one or both ovaries; or (2) the capsule (outer covering) of the ovary has ruptured (broken open); or (3) tumor cells are found in the fluid of the peritoneal cavity (the body cavity that contains most of the organs in the abdomen) or in washings of the peritoneum (tissue lining the peritoneal cavity).

**stage I pancreatic cancer :** Cancer is found in the pancreas only. Stage I is divided into stage IA and stage IB based on tumor size. In stage IA, the tumor is no larger than 2 centimeters and in stage IB, the tumor is larger than 2 centimeters.

**stage I penile cancer :** Cancer has spread to connective tissue just under the skin of the penis. The tumor cells look a lot like normal cells under a microscope.

**stage I perihilar extrahepatic bile duct cancer :** Cancer has formed in the innermost layer of the wall of the perihilar extrahepatic bile duct (where the bile duct leaves the liver) and has spread into the muscle and fibrous tissue of the wall.

**stage I prostate cancer :** Cancer is found in the prostate only. The cancer (1) is found by needle biopsy or in a small amount of tissue during surgery for other reasons; the prostate-specific antigen (PSA) level is lower than 10 and the Gleason score is 6 or lower; or (2) is found in one-half or less of one lobe of the prostate; the PSA level is lower than 10 and the Gleason score is 6 or lower; or (3) cannot be felt during a digital rectal exam and is not visible by imaging; cancer is found in one-half or less of one lobe of the prostate and the PSA level and Gleason score are not known.

**stage I renal cell cancer :** The tumor is 7 centimeters or smaller and is found in the kidney only. Also called stage I kidney cancer.

**stage I salivary gland cancer :** Cancer that is 2 centimeters or less in diameter and has not spread outside the salivary gland.

**stage I soft tissue sarcoma :** Stage I is divided into stages IA and IB. In stage IA, the tumor is low-grade (likely to grow and spread slowly) and 5 centimeters or smaller. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue). In stage IB, the tumor is low-grade (likely to grow and spread slowly) and larger than 5 centimeters. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage I testicular cancer :** Stage I is divided into stage IA, stage IB, and stage IS, and is determined after a radical inguinal orchiectomy (surgery to remove the testicle) is done. In stage IA, cancer is in the testicle and epididymis and may have spread to the inner layer of the membrane

surrounding the testicle; all tumor marker levels are normal. In stage IB, cancer is in the testicle and the epididymis and has spread to the blood or lymph vessels in the testicle; or has spread to the outer layer of the membrane surrounding the testicle; or is in the spermatic cord or the scrotum and may be in the blood or lymph vessels of the testicle; all tumor marker levels are normal. In stage IS, cancer is found anywhere within the testicle, spermatic cord, or the scrotum, and either all tumor marker levels are slightly above normal or one or more tumor marker levels are moderately above normal or high.

**stage I thymoma :** Cancer is found only within the thymus. All cancer cells are inside the capsule (sac) that surrounds the thymus.

**stage I transitional cell cancer of the renal pelvis and ureter :** Cancer has spread through the lining of the renal pelvis and/or ureter, into the layer of connective tissue.

**stage I uterine sarcoma :** Cancer is found in the uterus only. Stage I is divided into stages IA and IB, based on how far the cancer has spread. In stage IA, cancer is in the endometrium only or less than halfway through the myometrium (muscle layer of the uterus). In stage IB, cancer has spread halfway or more into the myometrium.

**stage I vaginal cancer :** Cancer is found in the vaginal wall only.

**stage I vulvar cancer :** The tumor is found only in the vulva or perineum (area between the rectum and the vagina). Stage I is divided into stages IA and IB. In stage IA, the tumor is 2 centimeters or smaller and has spread 1 millimeter or less into the tissue of the vulva. Cancer has not spread to the lymph nodes. In stage IB, the tumor is larger than 2 centimeters or has spread more than 1 millimeter into the tissue of the vulva. Cancer has not spread to the lymph nodes.

**stage I Wilms tumor :** The tumor was completely removed by surgery and all of the following are true: (1) cancer was found only in the kidney and did not spread to blood vessels of the kidney; (2) the outer layer of the kidney did not break open; (3) the tumor did not break open; (4) a biopsy of the tumor was not done; and (5) no cancer cells were found at the edges of the area where the tumor was removed.

**stage IA breast cancer :** Stage I is divided into stages IA and IB. In stage IA, the tumor is 2 centimeters or smaller. Cancer has not spread outside the breast.

**stage IA esophageal adenocarcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IA, cancer has formed in the mucosa or submucosa layer of the esophagus wall. The cancer cells are grade 1 or 2. Grade 1 and 2 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 3 cancer cells.

**stage IA esophageal squamous cell carcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IA, cancer has formed in the mucosa or submucosa layer of the esophagus wall. The cancer cells are grade 1. Grade 1 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 2 and 3 cancer cells.

**stage IA non-small cell lung cancer :** Stage I non-small cell lung cancer is divided into stages IA and IB. In stage IA, the tumor is in the lung only and is 3 centimeters or smaller.

**stage IA soft tissue sarcoma :** Stage I is divided into stages IA and IB. In stage IA, the tumor is low-grade (likely to grow and spread slowly) and 5 centimeters or smaller. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage IB breast cancer :** Stage I is divided into stages IA and IB. In stage IB, small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes and either: (1) no tumor is found in the breast; or (2) the tumor is 2 centimeters or smaller.

**stage IB esophageal adenocarcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IB, cancer has formed (1) in the mucosa or submucosa layer of the esophagus wall, and the cancer cells are grade 3. Grade 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 and 2 cancer cells; or (2) in the mucosa or submucosa layer and spread into the muscle layer of the esophagus wall, and the cancer cells are grade 1 or 2. Grade 1 and 2 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 3 cancer cells.

**stage IB esophageal squamous cell carcinoma :** Stage I is divided into stages IA and IB, depending on where the cancer is found. In stage IB, cancer has formed (1) in the mucosa or submucosa layer of the esophagus

wall, and the cancer cells are grade 2 and 3. Grade 2 and 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 cancer cells; or (2) in the mucosa or submucosa layer and spread into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 1. Grade 1 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 2 and 3 cancer cells. The tumor is in the lower esophagus or it is not known where the tumor is.

**stage IB non-small cell lung cancer :** Stage I non-small cell lung cancer is divided into stages IA and IB. In stage IB, cancer has not spread to the lymph nodes and one or more of the following is true: (1) the tumor is larger than 3 centimeters but not larger than 5 centimeters; (2) cancer has spread to the main bronchus and is at least 2 centimeters below where the trachea joins the bronchus; (3) cancer has spread to the innermost layer of the membrane that covers the lung; and/or (4) part of the lung has collapsed or become inflamed.

**stage IB soft tissue sarcoma :** Stage I is divided into stages IA and IB. In stage IB, the tumor is low-grade (likely to grow and spread slowly) and larger than 5 centimeters. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage II adrenocortical cancer :** The tumor is larger than 5 centimeters and is found in the adrenal gland only.

**stage II adult Hodgkin lymphoma :** Stage II is divided into stages II and IIE. In stage II, cancer is found in two or more lymph node groups either above or below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIE, cancer is found in one or more lymph node groups either above or below the diaphragm and outside the lymph nodes in a nearby organ or area.

**stage II adult non-Hodgkin lymphoma :** Stage II is divided into stages II and IIE. In stage II, cancer is found in two or more lymph node groups, and both are either above or below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIE, cancer is found in one or more lymph node groups either above or below the diaphragm and outside the lymph nodes in an organ or area on the same side of the diaphragm as the lymph nodes with cancer.

**stage II adult primary liver cancer :** There is either (1) one tumor that has spread to nearby blood vessels; or (2) there is more than one tumor, none of which is larger than 5 centimeters.

**stage II AIDS-related lymphoma :** Stage II is divided into stages IIA and IIE. In stage IIA, cancer is found in two or more lymph node groups either above or below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIE, cancer is found in one or more lymph node groups either above or below the diaphragm. Cancer is also found outside the lymph nodes in one organ or area on the same side of the diaphragm as the affected lymph nodes.

**stage II anal cancer :** The tumor is larger than 2 centimeters.

**stage II bladder cancer :** Cancer has spread to the layers of muscle tissue of the bladder.

**stage II breast cancer :** Stage II is divided into stages IIA and IIB. In stage IIA, (1) no tumor is found in the breast or the tumor is 2 centimeters or smaller. Cancer (larger than 2 millimeters) is found in 1 to 3 axillary lymph nodes or in the lymph nodes near the breastbone (found during a sentinel lymph node biopsy); or (2) the tumor is larger than 2 centimeters but not larger than 5 centimeters. Cancer has not spread to the lymph nodes. In stage IIB, the tumor is (1) larger than 2 centimeters but not larger than 5 centimeters. Small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes; or (2) larger than 2 centimeters but not larger than 5 centimeters. Cancer has spread to 1 to 3 axillary lymph nodes or to the lymph nodes near the breastbone (found during a sentinel lymph node biopsy); or (3) larger than 5 centimeters. Cancer has not spread to the lymph nodes.

**stage II cancer of the uterus :** Cancer that has spread to the cervix.

**stage II cervical cancer :** Cancer has spread beyond the uterus but not onto the pelvic wall (the tissues that line the part of the body between the hips) or to the lower third of the vagina. Stage II is divided into stages IIA and IIB, based on how far the cancer has spread. In stage IIA, cancer has spread beyond the cervix to the upper two thirds of the vagina but not to tissues around the uterus. Stage IIA is divided into stages IIA1 and IIA2, based on the size of the tumor. In stage IIA1, the tumor can be seen without a microscope and is not more than 4 centimeters. In stage IIA2, the tumor can be seen without a microscope and is more than 4 centimeters. In stage

IIB, cancer has spread beyond the cervix to the tissues around the uterus but not onto the pelvic wall.

**stage II childhood Hodgkin lymphoma :** Stage II is divided into stages IIA and IIE. In stage IIA, cancer is found in two or more lymph node groups either above or below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIE, cancer is found in one or more lymph node groups either above or below the diaphragm and outside the lymph nodes in a nearby organ or area.

**stage II childhood liver cancer :** The tumor was in the liver only. After the cancer was removed by surgery, a small amount of cancer remains that can only be seen with a microscope.

**stage II childhood non-Hodgkin lymphoma :** Cancer is found (1) in one area outside the lymph nodes and in nearby lymph nodes; or (2) in two or more areas above or below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen), and may or may not have spread to nearby lymph nodes; or (3) to have started in the stomach or intestines and can be completely removed by surgery. Cancer may or may not have spread to certain nearby lymph nodes.

**stage II chronic lymphocytic leukemia :** There are too many lymphocytes in the blood, the liver or spleen is larger than normal, and the lymph nodes may be larger than normal.

**stage II colorectal cancer :** Stage II colorectal cancer is divided into stage IIA, stage IIB, and stage IIC. In stage IIA, cancer has spread through the muscle layer of the colon and/or rectal wall to the serosa (outermost layer) of the colon and/or rectal wall. In stage IIB, cancer has spread through the serosa of the colon and/or rectal wall but has not spread to nearby organs. In stage IIC, cancer has spread through the serosa of the colon and/or rectal wall to nearby organs. Also called Dukes B colorectal cancer.

**stage II cutaneous T-cell lymphoma :** Stage II cutaneous T-cell lymphoma may be either of the following: (1) stage IIA, in which the skin has red, dry, scaly patches but no tumors, and lymph nodes are enlarged but do not contain cancer cells; (2) stage IIB, in which tumors are found on the skin, and lymph nodes are enlarged but do not contain cancer cells.

**stage II distal extrahepatic bile duct cancer :** Stage II is divided into stages IIA and IIB. In stage IIA, cancer has spread from the distal extrahepatic bile duct (where the bile duct empties into the small intestine)

to the gallbladder, pancreas, small intestine, or other nearby organs. In stage IIB, cancer has spread from the distal extrahepatic bile duct to nearby lymph nodes. Cancer may have spread through the wall of the distal extrahepatic bile duct or to the gallbladder, pancreas, small intestine, or other nearby organs.

**stage II endometrial cancer :** Cancer has spread into connective tissue of the cervix, but has not spread outside the uterus.

**stage II esophageal adenocarcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIA, cancer has spread into the muscle layer of the esophagus wall. The cancer cells are grade 3. Grade 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 and 2 cancer cells. In stage IIB, cancer (1) has spread into the connective tissue layer of the esophagus wall; or (2) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall. Cancer is found in 1 or 2 lymph nodes near the tumor.

**stage II esophageal squamous cell carcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIA, cancer has spread (1) into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 1. Grade 1 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 2 and 3 cancer cells. The tumor is in either the upper or middle esophagus; or (2) into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 2 and 3. Grade 2 and 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 cancer cells. The tumor is in the lower esophagus or it is not known where the tumor is. In stage IIB, cancer (1) has spread into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 2 and 3. The tumor is in either the upper or middle esophagus; or (2) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall. Cancer is found in 1 or 2 lymph nodes near the tumor.

**stage II gallbladder cancer :** Cancer has spread beyond the muscle layer to the connective tissue around the muscle.

**stage II gastric cancer :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIA, cancer (1) has

spread to the subserosa (layer of tissue next to the serosa) of the stomach wall; or (2) has spread to the muscle layer of the stomach wall and is found in 1 or 2 lymph nodes near the tumor; or (3) may have spread to the submucosa (layer of tissue next to the mucosa) of the stomach wall and is found in 3 to 6 lymph nodes near the tumor. In stage IIB, cancer (1) has spread to the serosa (outermost layer) of the stomach wall; or (2) has spread to the subserosa (layer of tissue next to the serosa) of the stomach wall and is found in 1 or 2 lymph nodes near the tumor; or (3) has spread to the muscle layer of the stomach wall and is found in 3 to 6 lymph nodes near the tumor; or (4) may have spread to the submucosa (layer of tissue next to the mucosa) of the stomach wall and is found in 7 or more lymph nodes near the tumor.

**stage II gestational trophoblastic neoplasia :** Cancer has spread outside of the uterus to the ovary, fallopian tube, vagina, and/or the ligaments that support the uterus.

**stage II hypopharyngeal cancer :** The tumor is either (1) larger than 2 centimeters but not larger than 4 centimeters and has not spread to the larynx (voice box); or (2) found in more than one area of the hypopharynx or in nearby tissues.

**stage II intraocular melanoma of the iris :** Stage II is divided into stages IIA and IIB. In stage IIA, the tumor (1) is in the iris only and is more than one fourth the size of the iris; or (2) is in the iris only and has caused glaucoma; or (3) has spread next to and/or into the ciliary body, choroid, or both. The tumor has caused glaucoma. In stage IIB, the tumor has spread next to and/or into the ciliary body, choroid, or both, and has also spread into the sclera. The tumor has caused glaucoma.

**stage II kidney cancer :** The tumor is larger than 7 centimeters and is found in the kidney only. Also called stage II renal cell cancer.

**stage II laryngeal cancer :** Stage II depends on where the cancer started. If it started in the supraglottis, then cancer is in more than one area of the supraglottis or surrounding tissue. If it started in the glottis, then cancer has spread to the supraglottis and/or the subglottis, and/or the vocal cords cannot move normally. If it started in the subglottis, then cancer has spread to one or both vocal cords, which may not move normally.

**stage II lip and oral cavity cancer :** The tumor is larger than 2 centimeters but not larger than 4 centimeters, and cancer has not spread to

lymph nodes.

**stage II malignant mesothelioma :** Cancer is found in one side of the chest in the lining of the chest wall, the lining of the chest cavity between the lungs, the lining that covers the diaphragm, and the lining that covers the lung. Also, cancer has spread into the diaphragm muscle and/or the lung.

**stage II maxillary sinus cancer :** Cancer has spread to bone around the maxillary sinus, including the roof of the mouth and the nose, but not to bone at the back of the maxillary sinus or the base of the skull.

**stage II melanoma :** Stage II is divided into stages IIA, IIB, and IIC. In stage IIA, (1) the tumor is more than 1 but not more than 2 millimeters thick, with ulceration (a break in the skin); or (2) more than 2 but not more than 4 millimeters thick, with no ulceration. In stage IIB, (1) the tumor is either more than 2 but not more than 4 millimeters thick, with ulceration; or (2) more than 4 millimeters thick, with no ulceration. In stage IIC, the tumor is more than 4 millimeters thick, with ulceration.

**stage II Merkel cell carcinoma :** Stage II Merkel cell carcinoma is divided into stages IIA, IIB, and IIC. In stage IIA, the tumor is larger than 2 centimeters and no cancer is found when the lymph nodes are checked under a microscope. In stage IIB, the tumor is larger than 2 centimeters and no swollen lymph nodes are found by a physical exam or imaging tests. In stage IIC, the tumor may be any size and has spread to nearby bone, muscle, connective tissue, or cartilage. It has not spread to lymph nodes or distant parts of the body.

**stage II multiple myeloma :** Cancer in which a moderate number of cancer cells have spread throughout the body.

**stage II mycosis fungoides :** Stage II is divided into stages IIA and IIB. In stage IIA, any amount of the skin surface is covered with patches, papules, and/or plaques. Lymph nodes are enlarged but cancer has not spread to them. In stage IIB, one or more tumors that are 1 centimeter or larger are found on the skin. Lymph nodes may be enlarged but cancer has not spread to them. In stages IIA and IIB, there may be abnormal lymphocytes in the blood but they are not cancerous.

**stage II nasal cavity and ethmoid sinus cancer :** Cancer is found in two areas (of either the nasal cavity or the ethmoid sinus) that are near each

other or has spread to an area next to the sinuses. Cancer may also have spread into bone.

**stage II nasopharyngeal cancer :** Cancer (1) is found in the nasopharynx only or has spread from the nasopharynx to the oropharynx (the middle part of the throat, including the soft palate, base of the tongue, and tonsils) and/or to the nasal cavity. Cancer has spread to one or more lymph nodes on one side of the neck and/or to lymph nodes behind the pharynx, and the affected lymph nodes are 6 centimeters or smaller; or (2) is found in the parapharyngeal space (area near the pharynx, between the base of the skull and the lower jaw). Cancer may have spread to one or more lymph nodes on one side of the neck and/or to lymph nodes behind the pharynx, and the affected lymph nodes are 6 centimeters or smaller.

**stage II nonmelanoma skin cancer :** The tumor is larger than 2 centimeters at its widest point; or the tumor is any size and has two or more of the following high-risk features: (1) is thicker than 2 millimeters; (2) has spread into the lower layer of the dermis or into the layer of fat below the skin; (3) has grown and spread along nerve pathways; (4) began on an ear or on a lip that has hair on it; or (5) has cells that look very different from normal cells under a microscope.

**stage II nonmelanoma skin cancer on the eyelid :** The tumor (1) is larger than 20 millimeters; or (2) has spread to nearby parts of the eye or eye socket; or (3) has spread to spaces around the nerves in the eyelid.

**stage II oropharyngeal cancer :** Cancer is larger than 2 centimeters but not larger than 4 centimeters and is found in the oropharynx only.

**stage II ovarian epithelial, fallopian tube, and primary peritoneal cancer :** Cancer is found in one or both ovaries or fallopian tubes and has spread into other areas of the pelvis, or primary peritoneal cancer is found within the pelvis. Stage II is divided into stages IIA and IIB. In stage IIA, cancer has spread from where it first formed to the uterus and/or the fallopian tubes and/or the ovaries. In stage IIB, cancer has spread from the ovary or fallopian tube to organs in the peritoneal cavity (the body cavity that contains most of the organs in the abdomen).

**stage II ovarian germ cell tumor :** Cancer is found in one or both ovaries and has spread into other areas of the pelvis. Stage II is divided into stages IIA, IIB, and IIC. In stage IIA, cancer has spread to the uterus and/or fallopian tubes (the long slender tubes through which eggs pass from the

ovaries to the uterus). In stage IIB, cancer has spread to other tissue within the pelvis. In stage IIC, cancer is found inside one or both ovaries and has spread to the uterus and/or fallopian tubes, or to other tissue within the pelvis. Also, one of the following is true: (1) cancer is found on the outside surface of one or both ovaries; or (2) the capsule (outer covering) of the ovary has ruptured (broken open); or (3) cancer cells are found in the fluid of the peritoneal cavity (the body cavity that contains most of the organs in the abdomen) or in washings of the peritoneum (tissue lining the peritoneal cavity).

**stage II ovarian low malignant potential tumor :** The tumor is found in one or both ovaries and has spread into other areas of the pelvis. Stage II is divided into stages IIA, IIB, and IIC. In stage IIA, the tumor has spread to the uterus and/or fallopian tubes (the long slender tubes through which eggs pass from the ovaries to the uterus). In stage IIB, the tumor has spread to other tissue within the pelvis. In stage IIC, the tumor is found inside one or both ovaries and has spread to the uterus and/or fallopian tubes, or to other tissue within the pelvis. Also, one of the following is true: (1) tumor cells are found on the outside surface of one or both ovaries; or (2) the capsule (outer covering) of the ovary has ruptured (broken open); or (3) tumor cells are found in the fluid of the peritoneal cavity (the body cavity that contains most of the organs in the abdomen) or in washings of the peritoneum (tissue lining the peritoneal cavity).

**stage II pancreatic cancer :** Stage II is divided into stages IIA and IIB, based on where the cancer has spread. In stage IIA, cancer has spread to nearby tissue and organs but has not spread to nearby lymph nodes. In stage IIB, cancer has spread to nearby lymph nodes and may have spread to nearby tissue and organs.

**stage II penile cancer :** Cancer has spread (1) to connective tissue just under the skin of the penis; cancer has spread to lymph vessels or blood vessels, or the tumor cells may look very different from normal cells under a microscope; or (2) through connective tissue to erectile tissue (spongy tissue that fills with blood to make an erection); or (3) beyond erectile tissue to the urethra.

**stage II perihilar extrahepatic bile duct cancer :** Cancer has spread through the wall of the perihilar extrahepatic bile duct (where the bile duct leaves the liver) to nearby fatty tissue or to the liver.

**stage II prostate cancer :** Stage II is divided into stages IIA and IIB. In stage IIA, cancer is found (1) by needle biopsy or in a small amount of tissue during surgery for other reasons; the prostate-specific antigen (PSA) level is lower than 20 and the Gleason score is 7; or (2) by needle biopsy or in a small amount of tissue during surgery for other reasons; the PSA level is at least 10 but lower than 20 and the Gleason score is 6 or lower; or (3) in one-half or less of one lobe of the prostate; the PSA level is at least 10 but lower than 20 and the Gleason score is 6 or lower; or (4) in one-half or less of one lobe of the prostate; the PSA level is lower than 20 and the Gleason score is 7; or (5) in more than one-half of one lobe of the prostate; the PSA level is lower than 20 and the Gleason score is 7 or lower; or (6) in more than one-half of one lobe of the prostate, and the PSA level and Gleason score are not known. In stage IIB, cancer (1) is found in opposite sides of the prostate; the PSA can be any level and the Gleason score can range from 2 to 10; or (2) cannot be felt during a digital rectal exam and is not visible by imaging, and the tumor has not spread outside the prostate; the PSA level is 20 or higher and the Gleason score can range from 2 to 10; or (3) cannot be felt during a digital rectal exam and is not visible by imaging, and the tumor has not spread outside the prostate; the PSA can be any level and the Gleason score is 8 or higher.

**stage II renal cell cancer :** The tumor is larger than 7 centimeters and is found in the kidney only. Also called stage II kidney cancer.

**stage II salivary gland cancer :** Cancer that is larger than 2 centimeters but not larger than 4 centimeters in diameter and has not spread outside the salivary gland.

**stage II soft tissue sarcoma :** Stage II is divided into stages IIA and IIB. In stage IIA, the tumor is mid-grade (somewhat likely to grow and spread quickly) or high-grade (likely to grow and spread quickly) and 5 centimeters or smaller. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue). In stage IIB, the tumor is mid-grade (somewhat likely to grow and spread quickly) and larger than 5 centimeters. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage II testicular cancer :** Stage II is divided into stage IIA, stage IIB, and stage IIC, and is determined after a radical inguinal orchiectomy (surgery to remove the testicle) is done. In stage IIA, cancer is anywhere within the testicle, spermatic cord, or scrotum; and has spread to up to 5 lymph nodes in the abdomen (none larger than 2 centimeters); all tumor marker levels are normal or slightly above normal. In stage IIB, cancer is anywhere within the testicle, spermatic cord, or scrotum; and has spread to up to 5 lymph nodes in the abdomen (at least one of the lymph nodes is larger than 2 centimeters, but none is larger than 5 centimeters), or has spread to more than 5 lymph nodes (the lymph nodes are not larger than 5 centimeters); all tumor marker levels are normal or slightly above normal. In stage IIC, cancer is anywhere within the testicle, spermatic cord, or scrotum; and has spread to a lymph node in the abdomen that is larger than 5 centimeters; all tumor marker levels are normal or slightly above normal.

**stage II thymoma :** Cancer has spread through the capsule (sac) that surrounds the thymus and into the fat around the thymus or into the lining of the chest cavity.

**stage II transitional cell cancer of the renal pelvis and ureter :** Cancer has spread through the layer of connective tissue to the muscle layer of the renal pelvis and/or ureter.

**stage II uterine sarcoma :** Cancer has spread into connective tissue of the cervix, but has not spread outside the uterus.

**stage II vaginal cancer :** Cancer has spread through the wall of the vagina to the tissue around the vagina. Cancer has not spread to the wall of the pelvis.

**stage II vulvar cancer :** The tumor may be any size and has spread into the lower part of the urethra, the lower part of the vagina, or the anus. Cancer has not spread to the lymph nodes.

**stage II Wilms tumor :** Cancer spread out of the kidney to nearby soft tissue or to blood vessels of the kidney and was completely removed by surgery. No cancer cells were found at the edges of the area where the cancer was removed.

**stage IIA breast cancer :** Stage II is divided into stages IIA and IIB. In stage IIA, (1) no tumor is found in the breast or the tumor is 2 centimeters or smaller. Cancer (larger than 2 millimeters) is found in 1 to 3 axillary lymph nodes or in the lymph nodes near the breastbone (found during a

sentinel lymph node biopsy); or (2) the tumor is larger than 2 centimeters but not larger than 5 centimeters. Cancer has not spread to the lymph nodes.

**stage IIA esophageal adenocarcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIA, cancer has spread into the muscle layer of the esophagus wall. The cancer cells are grade 3. Grade 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 and 2 cancer cells.

**stage IIA esophageal squamous cell carcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIA, cancer has spread (1) into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 1. Grade 1 cancer cells look more like normal cells under a microscope and grow and spread more slowly than grade 2 and 3 cancer cells. The tumor is in either the upper or middle esophagus; or (2) into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 2 and 3. Grade 2 and 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 cancer cells. The tumor is in the lower esophagus or it is not known where the tumor is.

**stage IIA intraocular melanoma of the ciliary body and choroid :** Stage II is divided into stages IIA and IIB. In stage IIA, the tumor (1) has spread to the ciliary body and is size category 1 (not more than 12 millimeters wide and not more than 3 millimeters thick; or not more than 9 millimeters wide and 3.1 to 6 millimeters thick); or (2) may have spread to the ciliary body and is size category 1. The tumor has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick; or (3) is in the choroid only and is size category 2 (12.1 to 18 millimeters wide and not more than 3 millimeters thick; or 9.1 to 15 millimeters wide and 3.1 to 6 millimeters thick; or not more than 12 millimeters wide and 6.1 to 9 millimeters thick).

**stage IIA non-small cell lung cancer :** Stage II non-small cell lung cancer is divided into stages IIA and IIB. In stage IIA, cancer has spread to lymph nodes on the same side of the chest as the tumor. Also, one or more of the following is true: (1) the tumor is not larger than 5 centimeters; (2) cancer has spread to the main bronchus and is at least 2 centimeters below where the trachea joins the bronchus; (3) cancer has spread to the innermost layer of the membrane that covers the lung; and/or (4) part of the lung has

collapsed or become inflamed. OR in stage IIA, cancer has not spread to lymph nodes and one or more of the following is true: (1) the tumor is larger than 5 centimeters but not larger than 7 centimeters; (2) cancer has spread to the main bronchus and is at least 2 centimeters below where the trachea joins the bronchus; (3) cancer has spread to the innermost layer of the membrane that covers the lung; and/or (4) part of the lung has collapsed or become inflamed.

**stage IIA soft tissue sarcoma :** Stage II is divided into stages IIA and IIB. In stage IIA, the tumor is mid-grade (somewhat likely to grow and spread quickly) or high-grade (likely to grow and spread quickly) and 5 centimeters or smaller. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage IIB breast cancer :** Stage II is divided into stages IIA and IIB. In stage IIB, the tumor is (1) larger than 2 centimeters but not larger than 5 centimeters. Small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes; or (2) larger than 2 centimeters but not larger than 5 centimeters. Cancer has spread to 1 to 3 axillary lymph nodes or to the lymph nodes near the breastbone (found during a sentinel lymph node biopsy); or (3) larger than 5 centimeters. Cancer has not spread to the lymph nodes.

**stage IIB esophageal adenocarcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIB, cancer (1) has spread into the connective tissue layer of the esophagus wall; or (2) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall. Cancer is found in 1 or 2 lymph nodes near the tumor.

**stage IIB esophageal squamous cell carcinoma :** Stage II is divided into stages IIA and IIB, depending on where the cancer has spread. In stage IIB, cancer (1) has spread into the muscle layer or the connective tissue layer of the esophagus wall, and the cancer cells are grade 2 and 3. Grade 2 and 3 cancer cells look more abnormal under a microscope and grow and spread more quickly than grade 1 cancer cells. The tumor is in either the upper or middle esophagus; or (2) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall. Cancer is found in 1 or 2 lymph nodes near the tumor.

**stage IIB intraocular melanoma of the ciliary body and choroid :** Stage II is divided into stages IIA and IIB. In stage IIB, the tumor (1) has spread to the ciliary body and is size category 2 (12.1 to 18 millimeters wide and not more than 3 millimeters thick; or 9.1 to 15 millimeters wide and 3.1 to 6 millimeters thick; or not more than 12 millimeters wide and 6.1 to 9 millimeters thick); or (2) is in the choroid only and is size category 3 (15.1 to 18 millimeters wide and 3.1 to 6 millimeters thick; or 12.1 to 18 millimeters wide and 6.1 to 9 millimeters thick; or 3.1 to 18 millimeters wide and 9.1 to 12 millimeters thick; or 9.1 to 15 millimeters wide and 12.1 to 15 millimeters thick).

**stage IIB non-small cell lung cancer :** Stage II non-small cell lung cancer is divided into stages IIA and IIB. In stage IIB, cancer has spread to nearby lymph nodes on the same side of the chest as the tumor. Also, one or more of the following is true: (1) the tumor is larger than 5 centimeters but not larger than 7 centimeters; (2) cancer has spread to the main bronchus and is at least 2 centimeters below where the trachea joins the bronchus (3) cancer has spread to the innermost layer of the membrane that covers the lung; and/or (4) part of the lung has collapsed or become inflamed. OR in stage IIB, cancer has not spread to lymph nodes and one or more of the following is true: (1) the tumor is larger than 7 centimeters; (2) cancer has spread to the main bronchus (and is less than 2 centimeters below where the trachea joins the bronchus), the chest wall, the diaphragm, or the nerve that controls the diaphragm; (3) cancer has spread to the membrane around the heart or lining the chest wall; (4) the whole lung has collapsed or become inflamed; and/or (5) there are one or more separate tumors in the same lobe of the lung.

**stage IIB soft tissue sarcoma :** Stage II is divided into stages IIA and IIB. In stage IIB, the tumor is mid-grade (somewhat likely to grow and spread quickly) and larger than 5 centimeters. It may be either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue).

**stage III adrenocortical cancer :** The tumor can be any size and has spread to fat or lymph nodes near the adrenal gland.

**stage III adult Hodgkin lymphoma :** Stage III is divided into stages III, IIIE, IIIS, and IIIE,S. In stage III, cancer is found in lymph node groups above and below the diaphragm (the thin muscle below the lungs that helps

breathing and separates the chest from the abdomen). In stage IIIE, cancer is found in lymph node groups above and below the diaphragm and outside the lymph nodes in a nearby organ or area. In stage IIIS, cancer is found in lymph node groups above and below the diaphragm, and in the spleen. In stage IIIE,S, cancer is found in lymph node groups above and below the diaphragm, outside the lymph nodes in a nearby organ or area, and in the spleen.

**stage III adult non-Hodgkin lymphoma :** Stage III is divided into stages III, IIIE, IIIS, and IIIE+S. In stage III, cancer is found in one or more lymph node groups above and below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIIE, cancer is found in lymph node groups above and below the diaphragm and outside the lymph nodes in a nearby organ or area. In stage IIIS, cancer is found in lymph node groups above and below the diaphragm and in the spleen. In stage IIIE+S, cancer is found in lymph node groups above and below the diaphragm, outside the lymph nodes in a nearby organ or area, and in the spleen.

**stage III AIDS-related lymphoma :** Stage III is divided into stages III, IIIE, IIIS, and IIIE+S. In stage III, cancer is found in lymph node groups above and below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIIE, cancer is found in lymph node groups above and below the diaphragm and outside the lymph nodes in a nearby organ or area. In stage IIIS, cancer is found in lymph node groups above and below the diaphragm, and in the spleen. In stage IIIE+S, cancer is found in lymph node groups above and below the diaphragm, outside the lymph nodes in a nearby organ or area, and in the spleen.

**stage III anal cancer :** Stage III anal cancer is divided into stages IIIA and IIIB. In stage IIIA, the tumor may be any size and has spread to either (1) lymph nodes near the rectum; or (2) nearby organs, such as the vagina, urethra, and bladder. In stage IIIB, the tumor may be any size and has spread to (1) nearby organs and to lymph nodes near the rectum; or (2) lymph nodes on one side of the pelvis and/or groin, and may have spread to nearby organs; or (3) lymph nodes near the rectum and in the groin, and/or to lymph nodes on both sides of the pelvis and/or groin, and may have spread to nearby organs.

**stage III bladder cancer :** Cancer has spread from the bladder to the layer of fat surrounding it and may have spread to the reproductive organs (prostate, seminal vesicles, uterus, or vagina).

**stage III breast cancer :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, (1) no tumor is found in the breast or the tumor may be any size. Cancer is found in 4 to 9 axillary lymph nodes or in the lymph nodes near the breastbone (found during imaging tests or a physical exam); or (2) the tumor is larger than 5 centimeters. Small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes; or (3) the tumor is larger than 5 centimeters. Cancer has spread to 1 to 3 axillary lymph nodes or to the lymph nodes near the breastbone (found during a sentinel lymph node biopsy). In stage IIIB, the tumor may be any size and cancer has spread to the chest wall and/or to the skin of the breast and caused swelling or an ulcer. Also, cancer may have spread to: (1) up to 9 axillary lymph nodes; or (2) the lymph nodes near the breastbone. Cancer that has spread to the skin of the breast may also be inflammatory breast cancer. In stage IIIC, no tumor is found in the breast or the tumor may be any size. Cancer may have spread to the skin of the breast and caused swelling or an ulcer and/or has spread to the chest wall. Also, cancer has spread to: (1) 10 or more axillary lymph nodes; or (2) lymph nodes above or below the collarbone; or (3) axillary lymph nodes and lymph nodes near the breastbone. Cancer that has spread to the skin of the breast may also be inflammatory breast cancer. For treatment, stage IIIC breast cancer is divided into operable and inoperable stage IIIC.

**stage III cancer of the uterus :** Cancer cells have spread outside the uterus to the vagina and/or lymph nodes in the pelvis but have not spread outside the pelvis.

**stage III cervical cancer :** Cancer has spread to the lower third of the vagina, and/or onto the pelvic wall, and/or has caused kidney problems. Stage III is divided into stages IIIA and IIIB, based on how far the cancer has spread. In stage IIIA, cancer has spread to the lower third of the vagina but not onto the pelvic wall. In stage IIIB, (1) cancer has spread onto the pelvic wall; or (2) the tumor has become large enough to block one or both ureters (tubes that connect the kidneys to the bladder) and has caused one or both kidneys to get bigger or stop working.

**stage III childhood Hodgkin lymphoma :** Stage III is divided into stages III, IIIE, IIIS, and IIIE,S. In stage III, cancer is found in lymph node groups above and below the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen). In stage IIIE, cancer is found in lymph node groups above and below the diaphragm and outside the lymph nodes in a nearby organ or area. In stage IIIS, cancer is found in lymph node groups above and below the diaphragm, and in the spleen. In stage IIIE,S, cancer is found in lymph node groups above and below the diaphragm, outside the lymph nodes in a nearby organ or area, and in the spleen.

**stage III childhood liver cancer :** The tumor cannot be removed by surgery; or cancer that can be seen without a microscope remains after surgery; or the cancer has spread to nearby lymph nodes.

**stage III childhood non-Hodgkin lymphoma :** Cancer is found (1) in at least one area above the diaphragm (the thin muscle below the lungs that helps with breathing and separates the chest from the abdomen) and in at least one area below the diaphragm; or (2) to have started in the chest; or (3) to have started in the abdomen and spread throughout the abdomen, and cannot be completely removed by surgery; or (4) in the area around the spine.

**stage III chronic lymphocytic leukemia :** There are too many lymphocytes in the blood and there are too few red blood cells. The lymph nodes, liver, or spleen may be larger than normal.

**stage III colorectal cancer :** Stage III colorectal cancer is divided into stage IIIA, stage IIIB, and stage IIIC. In stage IIIA, (1) cancer has spread through the mucosa (innermost layer) of the colon and/or rectal wall to the submucosa (layer of tissue under the mucosa) and may have spread to the muscle layer of the colon and/or rectal wall. Cancer has spread to at least one but not more than 3 nearby lymph nodes, or cancer cells have formed in tissues near the lymph nodes; or (2) cancer has spread through the mucosa of the colon and/or rectal wall to the submucosa. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes. In stage IIIB, (1) cancer has spread through the muscle layer of the colon and/or rectal wall to the serosa (outermost layer) of the colon and/or rectal wall or has spread through the serosa but not to nearby organs. Cancer has spread to at least one but not more than 3 nearby lymph nodes, or cancer cells have formed in

tissues near the lymph nodes; or (2) cancer has spread to the muscle layer of the colon and/or rectal wall or to the serosa of the colon and/or rectal wall. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes; or (3) cancer has spread through the mucosa of the colon and/or rectal wall to the submucosa and may have spread to the muscle layer of the colon and/or rectal wall. Cancer has spread to 7 or more nearby lymph nodes. In stage IIIC, (1) cancer has spread through the serosa of the colon and/or rectal wall but has not spread to nearby organs. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes; or (2) cancer has spread through the muscle layer of the colon and/or rectal wall to the serosa of the colon and/or rectal wall or has spread through the serosa but has not spread to nearby organs. Cancer has spread to 7 or more nearby lymph nodes; or (3) cancer has spread through the serosa of the colon and/or rectal wall and has spread to nearby organs. Cancer has spread to one or more nearby lymph nodes, or cancer cells have formed in tissues near the lymph nodes. Also called Dukes C colorectal cancer.

**stage III cutaneous T-cell lymphoma :** Nearly all of the skin is red, dry, and scaly; lymph nodes are either normal or enlarged but do not contain cancer cells.

**stage III distal extrahepatic bile duct cancer :** Cancer has spread to the large vessels that carry blood to the organs in the abdomen. Cancer may have spread to nearby lymph nodes.

**stage III endometrial cancer :** Cancer has spread beyond the uterus and cervix, but has not spread beyond the pelvis. Stage III is divided into stages IIIA, IIIB, and IIIC, based on how far the cancer has spread within the pelvis. In stage IIIA, cancer has spread to the outer layer of the uterus and/or to the fallopian tubes, ovaries, and ligaments of the uterus. In stage IIIB, cancer has spread to the vagina or to the parametrium (connective tissue and fat around the uterus). In stage IIIC, cancer has spread to lymph nodes in the pelvis and/or around the aorta (largest artery in the body, which carries blood away from the heart).

**stage III esophageal adenocarcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIA, cancer (1) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall, and cancer is found in 3 to 6 lymph nodes near the tumor; or (2) has spread into the connective tissue

layer of the esophagus wall, and cancer is found in 1 or 2 lymph nodes near the tumor; or (3) has spread into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart. The cancer can be removed by surgery. In stage IIIB, cancer has spread into the connective tissue layer of the esophagus wall. Cancer is found in 3 to 6 lymph nodes near the tumor. In stage IIIC, cancer has spread (1) into the diaphragm, pleura, or sac around the heart. The cancer can be removed by surgery. Cancer is found in 1 to 6 lymph nodes near the tumor; or (2) into other nearby organs, such as the aorta, trachea, or spine, and the cancer cannot be removed by surgery; or (3) to 7 or more lymph nodes near the tumor.

**stage III esophageal squamous cell carcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIA, cancer (1) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall, and cancer is found in 3 to 6 lymph nodes near the tumor; or (2) has spread into the connective tissue layer of the esophagus wall, and cancer is found in 1 or 2 lymph nodes near the tumor; or (3) has spread into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart. The cancer can be removed by surgery. In stage IIIB, cancer has spread into the connective tissue layer of the esophagus wall. Cancer is found in 3 to 6 lymph nodes near the tumor. In stage IIIC, cancer has spread (1) into the diaphragm, pleura, or sac around the heart. The cancer can be removed by surgery. Cancer is found in 1 to 6 lymph nodes near the tumor; or (2) into other nearby organs, such as the aorta, trachea, or spine, and the cancer cannot be removed by surgery; or (3) to 7 or more lymph nodes near the tumor.

**stage III gallbladder cancer :** Stage III gallbladder cancer is divided into stages IIIA and IIIB. In stage IIIA, cancer has spread through the thin layers of tissue that cover the gallbladder and/or to the liver and/or to one nearby organ (such as the stomach, small intestine, colon, pancreas, or bile ducts outside the liver). In stage IIIB, cancer has spread to nearby lymph nodes and (1) beyond the inner layer of the gallbladder to a layer of tissue with blood vessels or to the muscle layer; or (2) beyond the muscle layer to the connective tissue around the muscle; or (3) through the thin layers of tissue that cover the gallbladder and/or to the liver and/or to one nearby organ

(such as the stomach, small intestine, colon, pancreas, or bile ducts outside the liver).

**stage III gastric cancer :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIA, cancer has spread to (1) the serosa (outermost) layer of the stomach wall and is found in 1 or 2 lymph nodes near the tumor; or (2) the subserosa (layer of tissue next to the serosa) of the stomach wall and is found in 3 to 6 lymph nodes near the tumor; or (3) the muscle layer of the stomach wall and is found in 7 or more lymph nodes near the tumor. In stage IIIB, cancer has spread to (1) nearby organs such as the spleen, transverse colon, liver, diaphragm, pancreas, kidney, adrenal gland, or small intestine, and may be found in 1 or 2 lymph nodes near the tumor; or (2) the serosa (outermost layer) of the stomach wall and is found in 3 to 6 lymph nodes near the tumor; or (3) the subserosa (layer of tissue next to the serosa) of the stomach wall and is found in 7 or more lymph nodes near the tumor. In stage IIIC, cancer has spread to (1) nearby organs such as the spleen, transverse colon, liver, diaphragm, pancreas, kidney, adrenal gland, or small intestine, and may be found in 3 or more lymph nodes near the tumor; or (2) the serosa (outermost layer) of the stomach wall and is found in 7 or more lymph nodes near the tumor.

**stage III gestational trophoblastic neoplasia :** Cancer has spread to the lung.

**stage III hypopharyngeal cancer :** The tumor (1) is larger than 4 centimeters or has spread to the larynx (voice box) or esophagus. Cancer may have spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller; or (2) has spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller and cancer is found (1) in one area of the hypopharynx and/or is 2 centimeters or smaller; or (2) in more than one area of the hypopharynx or in nearby tissues, or is larger than 2 centimeters but not larger than 4 centimeters and has not spread to the larynx.

**stage III intraocular melanoma of the iris :** Stage III is divided into stages IIIA and IIIB. In stage IIIA, the tumor has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick. In stage IIIB, the tumor has spread through

the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is more than 5 millimeters thick.

**stage III kidney cancer :** (1) The tumor is any size and cancer is found only in the kidney and in 1 or more nearby lymph nodes; or (2) cancer is found in the main blood vessels of the kidney or in the layer of fatty tissue around the kidney. Cancer may be found in 1 or more nearby lymph nodes. Also called stage III renal cell cancer.

**stage III laryngeal cancer :** Stage III laryngeal cancer depends on whether cancer has spread from the supraglottis, glottis, or subglottis. In stage III cancer of the supraglottis, (1) cancer is in the larynx only and the vocal cords cannot move, and/or cancer is in tissues next to the larynx; cancer may have spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller; or (2) cancer is in one area of the supraglottis and in one lymph node on the same side of the neck as the original tumor; the lymph node is 3 centimeters or smaller and the vocal cords can move normally; or (3) cancer is in more than one area of the supraglottis or surrounding tissues and in one lymph node on the same side of the neck as the original tumor; the lymph node is 3 centimeters or smaller. In stage III cancer of the glottis, (1) cancer is in the larynx only and the vocal cords cannot move, and/or cancer is in tissues next to the larynx; cancer may have spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller; or (2) cancer is in one or both vocal cords and in one lymph node on the same side of the neck as the original tumor; the lymph node is 3 centimeters or smaller and the vocal cords can move normally; or (3) cancer has spread to the supraglottis and/or the subglottis, and/or the vocal cords cannot move normally; cancer has also spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller. In stage III cancer of the subglottis, (1) cancer is in the larynx and the vocal cords cannot move; cancer may have spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller; or (2) cancer is in the subglottis and in one lymph node on the same side of the neck as the original tumor; the lymph node is 3 centimeters or smaller; or (3) cancer has spread to one or both vocal cords, which may not move normally; cancer has also spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller.

**stage III lip and oral cavity cancer :** The tumor may be any size and has spread to one lymph node that is 3 centimeters or smaller, on the same side of the neck as the tumor; or the tumor is larger than 4 centimeters.

**stage III lymphedema :** A condition in which tissue or a limb becomes very swollen and thick, and changes color. It is caused by a block in the flow of lymph and a buildup of fluid in tissues. Also called lymphostatic elephantiasis.

**stage III malignant mesothelioma :** Cancer (1) is found in one side of the chest in the lining of the chest wall. Cancer may have spread to the lining of the chest cavity between the lungs; the lining that covers the diaphragm; the lining that covers the lung; the diaphragm muscle; or the lung. Cancer has spread to lymph nodes where the lung joins the bronchus, along the trachea and esophagus, between the lung and diaphragm, or below the trachea; or (2) is found in one side of the chest in the lining of the chest wall; the lining of the chest cavity between the lungs; the lining that covers the diaphragm; and the lining that covers the lung. Cancer has spread into one or more of the following: tissue between the ribs and the lining of the chest wall; fat in the cavity between the lungs; soft tissues of the chest wall; and/or sac that covers the heart. Cancer may have spread to lymph nodes where the lung joins the bronchus, along the trachea and esophagus, between the lung and diaphragm, or below the trachea.

**stage III maxillary sinus cancer :** Cancer (1) has spread to any of the following: bone at the back of the maxillary sinus, tissues under the skin, the eye socket, the base of the skull, and/or the ethmoid sinuses; or (2) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is 3 centimeters or smaller. Cancer has also spread to any of the following: the lining of the maxillary sinus, bones around the maxillary sinus (including the roof of the mouth and the nose), tissues under the skin, the eye socket, the base of the skull, and/or the ethmoid sinuses.

**stage III melanoma :** The tumor may be any thickness, with or without ulceration (a break in the skin), and one or more of the following is true: (1) cancer has spread to one or more lymph nodes; (2) lymph nodes may be joined together (matted); (3) cancer may be in a lymph vessel between the primary tumor and nearby lymph nodes; and/or (4) very small tumors may be found on or under the skin, not more than 2 centimeters away from where the cancer first started.

**stage III Merkel cell carcinoma :** Stage III Merkel cell cancer is divided into stages IIIA and IIIB. In stage IIIA, the tumor may be any size and may have spread to nearby bone, muscle, connective tissue, or cartilage. Cancer is found in the lymph nodes when they are checked under a microscope. In stage IIIB, the tumor may be any size and may have spread to nearby bone, muscle, connective tissue, or cartilage. Cancer has spread to the lymph nodes near the tumor and is found by physical exam or imaging test. The lymph nodes are removed and cancer is found in the lymph nodes when they are checked under a microscope. There may also be a second tumor, which is either between the primary tumor and nearby lymph nodes or farther away from the center of the body than the primary tumor is.

**stage III multiple myeloma :** A relatively large number of cancer cells have spread throughout the body. There may be one or more of the following: 1) a decrease in the number of red blood cells, causing anemia; 2) the amount of calcium in the blood is very high, because the bones are being damaged; 3) more than three bone tumors (plasmacytomas) are found; or 4) high levels of M protein are found in the blood or urine.

**stage III mycosis fungoides :** In stage III, nearly all of the skin is reddened and may have patches, papules, plaques, or tumors. Lymph nodes may be enlarged but cancer has not spread to them. There may be abnormal lymphocytes in the blood but they are not cancerous.

**stage III nasal cavity and ethmoid sinus cancer :** Cancer (1) has spread to any of the following: the eye socket, maxillary sinus, roof of the mouth, and/or the bone between the eyes; or (2) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is 3 centimeters or smaller. Cancer has also spread to any of the following: the nasal cavity, ethmoid sinus, eye socket, maxillary sinus, roof of the mouth, and/or the bone between the eyes.

**stage III nasopharyngeal cancer :** Cancer (1) is found in the nasopharynx only or has spread from the nasopharynx to the oropharynx (the middle part of the throat, including the soft palate, base of the tongue, and tonsils) and/or to the nasal cavity. Cancer has spread to one or more lymph nodes on both sides of the neck and the affected lymph nodes are 6 centimeters or smaller; or (2) is found in the parapharyngeal space (area near the pharynx, between the base of the skull and the lower jaw). Cancer has spread to one or more lymph nodes on both sides of the neck and the affected lymph

nodes are 6 centimeters or smaller; or (3) has spread to nearby bones or sinuses. Cancer may have spread to one or more lymph nodes on one or both sides of the neck and/or to lymph nodes behind the pharynx, and the affected lymph nodes are 6 centimeters or smaller.

**stage III nonmelanoma skin cancer :** The tumor has spread to the jaw, eye socket, or side of the skull. Cancer may have spread to one lymph node on the same side of the body as the tumor. The lymph node is not larger than 3 centimeters; or, cancer has spread to one lymph node on the same side of the body as the tumor. The lymph node is not larger than 3 centimeters and one of the following is true: (1) the tumor is not larger than 2 centimeters at its widest point and may have one high-risk feature (is thicker than 2 millimeters, has spread into the lower layer of the dermis or into the layer of fat below the skin, has grown and spread along nerve pathways, began on an ear or on a lip that has hair on it, or has cells that look very different from normal cells under a microscope); or (2) the tumor is larger than 2 centimeters at its widest point; or (3) the tumor is any size and has two or more high-risk features (is thicker than 2 millimeters, has spread into the lower layer of the dermis or into the layer of fat below the skin, has grown and spread along nerve pathways, began on an ear or on a lip that has hair on it, or has cells that look very different from normal cells under a microscope).

**stage III nonmelanoma skin cancer on the eyelid :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, to remove all of the tumor, the whole eye and part of the optic nerve must be removed. The bone, muscles, fat, and connective tissue around the eye may also be removed. In stage IIIB, the tumor may be anywhere in or near the eye and has spread to nearby lymph nodes. In stage IIIC, the tumor has spread to structures around the eye or in the face, or to the brain, and cannot be removed in surgery.

**stage III oropharyngeal cancer :** Cancer is either (1) 4 centimeters or smaller; cancer has spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller; or (2) larger than 4 centimeters or has spread to the epiglottis (the flap that covers the trachea during swallowing). Cancer may have spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller.

**stage III ovarian epithelial, fallopian tube, and primary peritoneal cancer :**

Cancer is found in one or both ovaries or fallopian tubes, or is primary peritoneal cancer, and has spread outside the pelvis to other parts of the abdomen and/or to nearby lymph nodes. Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, one of the following is true: (1) cancer has spread to lymph nodes in the area outside or behind the peritoneum (tissue that lines the abdominal wall and covers organs in the abdomen) only; or (2) cancer cells that can be seen only with a microscope have spread to the surface of the peritoneum outside the pelvis. Cancer may have spread to nearby lymph nodes. In stage IIIB, cancer has spread to the peritoneum outside the pelvis and the cancer in the peritoneum is 2 centimeters or smaller. Cancer may have spread to lymph nodes behind the peritoneum. In stage IIIC, cancer has spread to the peritoneum outside the pelvis and the cancer in the peritoneum is larger than 2 centimeters. Cancer may have spread to lymph nodes behind the peritoneum or to the surface of the liver or spleen.

**stage III ovarian germ cell tumor :** Cancer is found in one or both ovaries and has spread outside the pelvis to other parts of the abdomen and/or nearby lymph nodes. Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, the tumor is found in the pelvis only, but cancer cells that can be seen only with a microscope have spread to the surface of the peritoneum (tissue that lines the abdominal wall and covers most of the organs in the abdomen), the small intestines, or the tissue that connects the small intestines to the wall of the abdomen. In stage IIIB, cancer has spread to the peritoneum and the cancer in the peritoneum is 2 centimeters or smaller. In stage IIIC, cancer has spread to the peritoneum and the cancer in the peritoneum is larger than 2 centimeters and/or has spread to lymph nodes in the abdomen. Cancer that has spread to the surface of the liver is also considered stage III ovarian cancer.

**stage III ovarian low malignant potential tumor :** The tumor is found in one or both ovaries and has spread outside the pelvis to other parts of the abdomen and/or nearby lymph nodes. Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, the tumor is found in the pelvis only, but tumor cells that can be seen only with a microscope have spread to the surface of the peritoneum (tissue that lines the abdominal wall and covers most of the organs in the abdomen), the small intestines, or the tissue that connects the small intestines to the wall of the abdomen. In stage IIIB, the tumor has

spread to the peritoneum and the tumor in the peritoneum is 2 centimeters or smaller. In stage IIIC, the tumor has spread to the peritoneum and the tumor in the peritoneum is larger than 2 centimeters and/or has spread to lymph nodes in the abdomen. The spread of tumor cells to the surface of the liver is also considered stage III disease.

**stage III pancreatic cancer :** Cancer has spread to the major blood vessels near the pancreas, and may have spread to nearby lymph nodes.

**stage III penile cancer :** Stage III penile cancer is divided into stage IIIa and stage IIIb. In stage IIIa, cancer has spread to one lymph node in the groin and (1) to connective tissue just under the skin of the penis; cancer may have spread to lymph vessels or blood vessels, or the tumor cells may look very different from normal cells under a microscope; or (2) through connective tissue to erectile tissue (spongy tissue that fills with blood to make an erection); or (3) beyond erectile tissue to the urethra. In stage IIIb, cancer has spread to more than one lymph node on one side of the groin or to lymph nodes on both sides of the groin, and (1) to connective tissue just under the skin of the penis; cancer may have spread to lymph vessels or blood vessels, or the tumor cells may look very different from normal cells under a microscope; or (2) through connective tissue to erectile tissue (spongy tissue that fills with blood to make an erection); or (3) beyond erectile tissue to the urethra.

**stage III perihilar extrahepatic bile duct cancer :** Stage III is divided into stages IIIA and IIIB. In stage IIIA, the tumor has spread to one branch of the hepatic artery or of the portal vein. In stage IIIB, the tumor has spread to nearby lymph nodes. Cancer has also spread into the wall of the perihilar extrahepatic bile duct (where the bile duct leaves the liver) and may have spread through the wall to nearby fatty tissue, the liver, or to one branch of the hepatic artery or of the portal vein.

**stage III prostate cancer :** Cancer has spread beyond the outer layer of the prostate and may have spread to the seminal vesicles. The prostate-specific antigen (PSA) level can be any level and the Gleason score can range from 2 to 10.

**stage III renal cell cancer :** (1) The tumor is any size and cancer is found only in the kidney and in 1 or more nearby lymph nodes; or (2) cancer is found in the main blood vessels of the kidney or in the layer of fatty tissue

around the kidney. Cancer may be found in 1 or more nearby lymph nodes. Also called stage III kidney cancer.

**stage III salivary gland cancer :** In stage III salivary gland cancer, (1) the tumor is not larger than 4 centimeters and has spread to a single lymph node on the same side of the body as the tumor and the lymph node is 3 centimeters or smaller; or (2) the tumor is larger than 4 centimeters and/or has spread to soft tissue around the affected gland; cancer may have spread to a single lymph node on the same side as the tumor and the lymph node is 3 centimeters or smaller.

**stage III soft tissue sarcoma :** The tumor is either (1) high-grade (likely to grow and spread quickly), larger than 5 centimeters, and either superficial (in subcutaneous tissue with no spread into connective tissue or muscle below) or deep (in the muscle and may be in connective or subcutaneous tissue); or (2) any grade, any size, and has spread to nearby lymph nodes.

**stage III testicular cancer :** Stage III is divided into stage IIIA, stage IIIB, and stage IIIC, and is determined after a radical inguinal orchiectomy (surgery to remove the testicle) is done. In stage IIIA, cancer is anywhere within the testicle, spermatic cord, or scrotum; may have spread to one or more lymph nodes in the abdomen; and has spread to distant lymph nodes or to the lungs; tumor marker levels may range from normal to slightly above normal. In stage IIIB, cancer is anywhere within the testicle, spermatic cord, or scrotum; and may have spread to one or more lymph nodes in the abdomen, to distant lymph nodes or to the lungs; the level of one or more tumor markers is moderately above normal. In stage IIIC, cancer is anywhere within the testicle, spermatic cord, or scrotum; and may have spread to one or more lymph nodes in the abdomen, to distant lymph nodes, or to the lungs; the level of one or more tumor markers is high; OR, cancer is anywhere within the testicle, spermatic cord, or scrotum; and may have spread to one or more lymph nodes in the abdomen; and has not spread to distant lymph nodes or the lung but has spread to other parts of the body; tumor marker levels may range from normal to high.

**stage III thymoma :** Cancer has spread to nearby organs in the chest, including the lung, the sac around the heart, or large blood vessels that carry blood to the heart.

**stage III transitional cell cancer of the renal pelvis and ureter :** Cancer has spread (1) from the renal pelvis to tissue or fat in the kidney; or (2)

from the ureter to fat that surrounds the ureter.

**stage III uterine sarcoma :** Cancer has spread beyond the uterus and cervix, but has not spread beyond the pelvis. Stage III is divided into stages IIIA, IIIB, and IIIC, based on how far the cancer has spread within the pelvis. In stage IIIA, cancer has spread to the outer layer of the uterus and/or to the fallopian tubes, ovaries, and ligaments of the uterus. In stage IIIB, cancer has spread to the vagina or to the parametrium (connective tissue and fat around the uterus). In stage IIIC, cancer has spread to lymph nodes in the pelvis and/or around the aorta (largest artery in the body, which carries blood away from the heart).

**stage III vaginal cancer :** Cancer has spread to the wall of the pelvis.

**stage III vulvar cancer :** The tumor may be any size and may have spread into the lower part of the urethra, the lower part of the vagina, or the anus. Cancer has spread to one or more nearby lymph nodes. Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, cancer is found in 1 or 2 lymph nodes that are smaller than 5 millimeters or in one lymph node that is 5 millimeters or larger. In stage IIIB, cancer is found in 2 or more lymph nodes that are 5 millimeters or larger, or in 3 or more lymph nodes that are smaller than 5 millimeters. In stage IIIC, cancer is found in lymph nodes and has spread to the outside surface of the lymph nodes.

**stage III Wilms tumor :** Cancer remains in the abdomen after surgery and at least one of the following is true: (1) cancer has spread to lymph nodes in the abdomen or pelvis (the part of the body between the hips); (2) cancer has spread to or through the surface of the peritoneum (the layer of tissue that lines the abdominal cavity and covers most organs in the abdomen); (3) a biopsy of the tumor was done during surgery to remove it; (4) the tumor was removed in more than one piece.

**stage IIIA adult primary liver cancer :** Stage III adult primary liver cancer is divided into stages IIIA, IIIB, and IIIC. In stage IIIA there is either (1) more than one tumor larger than 5 centimeters; or (2) one tumor that has spread to a major branch of blood vessels near the liver.

**stage IIIA anal cancer :** Stage III anal cancer is divided into stages IIIA and IIIB. In stage IIIA, the tumor may be any size and has spread to either (1) lymph nodes near the rectum; or (2) nearby organs, such as the vagina, urethra, and bladder.

**stage IIIA breast cancer :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, (1) no tumor is found in the breast or the tumor may be any size. Cancer is found in 4 to 9 axillary lymph nodes or in the lymph nodes near the breastbone (found during imaging tests or a physical exam); or (2) the tumor is larger than 5 centimeters. Small clusters of breast cancer cells (larger than 0.2 millimeter but not larger than 2 millimeters) are found in the lymph nodes; or (3) the tumor is larger than 5 centimeters. Cancer has spread to 1 to 3 axillary lymph nodes or to the lymph nodes near the breastbone (found during a sentinel lymph node biopsy).

**stage IIIA esophageal adenocarcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIA, cancer (1) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall, and cancer is found in 3 to 6 lymph nodes near the tumor; or (2) has spread into the connective tissue layer of the esophagus wall, and cancer is found in 1 or 2 lymph nodes near the tumor; or (3) has spread into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart. The cancer can be removed by surgery.

**stage IIIA esophageal squamous cell carcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIA, cancer (1) is in the mucosa or submucosa layer and may have spread into the muscle layer of the esophagus wall, and cancer is found in 3 to 6 lymph nodes near the tumor; or (2) has spread into the connective tissue layer of the esophagus wall, and cancer is found in 1 or 2 lymph nodes near the tumor; or (3) has spread into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart. The cancer can be removed by surgery.

**stage IIIA intraocular melanoma of the ciliary body and choroid :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIA, the tumor (1) may have spread to the ciliary body and is size category 2 (12.1 to 18 millimeters wide and not more than 3 millimeters thick; or 9.1 to 15 millimeters wide and 3.1 to 6 millimeters thick; or not more than 12 millimeters wide and 6.1 to 9 millimeters thick). The tumor has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick; or (2) has spread to the ciliary body and is size category 3 (15.1 to 18 millimeters wide and 3.1

to 6 millimeters thick; or 12.1 to 18 millimeters wide and 6.1 to 9 millimeters thick; or 3.1 to 18 millimeters wide and 9.1 to 12 millimeters thick; or 9.1 to 15 millimeters wide and 12.1 to 15 millimeters thick); or (3) is size category 3 and has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick. The tumor has not spread to the ciliary body; or (4) is in the choroid only and is size category 4 (more than 18 millimeters wide and may be any thickness; or 15.1 to 18 millimeters wide and more than 12 millimeters thick; or 12.1 to 15 millimeters wide and more than 15 millimeters thick).

**stage IIIA non-small cell lung cancer :** Stage III non-small cell lung cancer is divided into stages IIIA and IIIB. In stage IIIA, cancer has spread to lymph nodes on the same side of the chest as the tumor. Also, (1) the tumor may be any size; (2) part of the lung (where the trachea joins the bronchus) or the whole lung may have collapsed or become inflamed; (3) there may be one or more separate tumors in the same lobe of the lung; and/or (4) cancer may have spread to any of the following: main bronchus (but not the area where the trachea joins the bronchus), chest wall, diaphragm and the nerve that controls it, or membrane around the heart, lung, or lining the chest wall. OR in stage IIIA, cancer has spread to lymph nodes on the same side of the chest as the tumor. Also, (1) the tumor may be any size; (2) the whole lung may have collapsed or become inflamed; (3) there may be one or more separate tumors in any of the lobes of the lung with cancer; and/or (4) cancer may have spread to any of the following: main bronchus (but not the area where the trachea joins the bronchus), chest wall, diaphragm and the nerve that controls it, membrane around the lung or lining the chest wall, heart or the membrane around it, trachea, carina (where the trachea joins the bronchi), esophagus, sternum (chest bone), backbone, major blood vessels that lead to or from the heart, or the nerve that controls the larynx (voice box). OR in stage IIIA, cancer has not spread to the lymph nodes and the tumor may be any size. Cancer has spread to any of the following: trachea, carina, esophagus, sternum, backbone, heart, major blood vessels that lead to or from the heart, or the nerve that controls the larynx.

**stage IIIB adult primary liver cancer :** Stage III adult primary liver cancer is divided into stages IIIA, IIIB, and IIIC. In stage IIIB, there are one or more tumors of any size that have either (1) spread to nearby organs

other than the gallbladder; or (2) broken through the lining of the peritoneal cavity.

**stage IIIB anal cancer :** Stage III anal cancer is divided into stages IIIA and IIIB. In stage IIIB, the tumor may be any size and has spread to (1) nearby organs and to lymph nodes near the rectum; or (2) lymph nodes on one side of the pelvis and/or groin, and may have spread to nearby organs; or (3) lymph nodes near the rectum and in the groin, and/or to lymph nodes on both sides of the pelvis and/or groin, and may have spread to nearby organs.

**stage IIIB breast cancer :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIB, the tumor may be any size and cancer has spread to the chest wall and/or to the skin of the breast and caused swelling or an ulcer. Also, cancer may have spread to (1) up to 9 axillary lymph nodes; or (2) the lymph nodes near the breastbone. Cancer that has spread to the skin of the breast may also be inflammatory breast cancer.

**stage IIIB esophageal adenocarcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIB, cancer has spread into the connective tissue layer of the esophagus wall. Cancer is found in 3 to 6 lymph nodes near the tumor.

**stage IIIB esophageal squamous cell carcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIB, cancer has spread into the connective tissue layer of the esophagus wall. Cancer is found in 3 to 6 lymph nodes near the tumor.

**stage IIIB intraocular melanoma of the ciliary body and choroid :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIB, the tumor (1) has spread to the ciliary body and is size category 3 (15.1 to 18 millimeters wide and 3.1 to 6 millimeters thick; or 12.1 to 18 millimeters wide and 6.1 to 9 millimeters thick; or 3.1 to 18 millimeters wide and 9.1 to 12 millimeters thick; or 9.1 to 15 millimeters wide and 12.1 to 15 millimeters thick). The tumor has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick; or (2) has spread to the ciliary body and is size category 4 (more than 18 millimeters wide and may be any thickness; or 15.1 to 18 millimeters wide and more than 12 millimeters thick; or 12.1 to 15 millimeters wide and more than 15 millimeters thick); or (3) is size category 4 and has spread through the sclera to the outside of the eyeball.

The part of the tumor outside the eyeball is not more than 5 millimeters thick. The tumor has not spread to the ciliary body.

**stage IIIB non-small cell lung cancer :** Stage III non-small cell lung cancer is divided into stages IIIA and IIIB. In stage IIIB, cancer has spread to lymph nodes above the collarbone or in the opposite side of the chest as the tumor. Also, (1) the tumor may be any size; (2) part of the lung (where the trachea joins the bronchus) or the whole lung may have collapsed or become inflamed; (3) there may be one or more separate tumors in any of the lobes of the lung with cancer; and/or (4) cancer may have spread to any of the following: main bronchus, diaphragm and the nerve that controls it, membrane around the lung, chest wall or the membrane that lines it, trachea, carina (where the trachea joins the bronchi), esophagus, sternum (chest bone), backbone, heart or the membrane around it, major blood vessels that lead to or from the heart, or the nerve that controls the larynx (voice box). OR in stage IIIB, cancer has spread to lymph nodes on the same side of the chest as the tumor. Also, (1) the tumor may be any size; (2) there may be separate tumors in different lobes of the same lung; and/or (3) cancer has spread to any of the following: trachea, carina, esophagus, sternum, backbone, major blood vessels that lead to or from the heart, or the nerve that controls the larynx.

**stage IIIC adult primary liver cancer :** Stage III adult primary liver cancer is divided into stages IIIA, IIIB, and IIIC. In stage IIIC, the cancer has spread to nearby lymph nodes.

**stage IIIC breast cancer :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIC, no tumor is found in the breast or the tumor may be any size. Cancer may have spread to the skin of the breast and caused swelling or an ulcer and/or has spread to the chest wall. Also, cancer has spread to: (1) 10 or more axillary lymph nodes; or (2) lymph nodes above or below the collarbone; or (3) axillary lymph nodes and lymph nodes near the breastbone. Cancer that has spread to the skin of the breast may also be inflammatory breast cancer. For treatment, stage IIIC breast cancer is divided into operable and inoperable stage IIIC.

**stage IIIC esophageal adenocarcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIC, cancer has spread (1) into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart.

The cancer can be removed by surgery. Cancer is found in 1 to 6 lymph nodes near the tumor; or (2) into other nearby organs, such as the aorta, trachea, or spine, and the cancer cannot be removed by surgery; or (3) to 7 or more lymph nodes near the tumor.

**stage IIIC esophageal squamous cell carcinoma :** Stage III is divided into stages IIIA, IIIB, and IIIC, depending on where the cancer has spread. In stage IIIC, cancer has spread (1) into the diaphragm, pleura (tissue that covers the lungs and lines the inner wall of the chest cavity), or sac around the heart. The cancer can be removed by surgery. Cancer is found in 1 to 6 lymph nodes near the tumor; or (2) into other nearby organs, such as the aorta, trachea, or spine, and the cancer cannot be removed by surgery; or (3) to 7 or more lymph nodes near the tumor.

**stage IIIC intraocular melanoma of the ciliary body and choroid :** Stage III is divided into stages IIIA, IIIB, and IIIC. In stage IIIC, the tumor (1) has spread to the ciliary body and is size category 4 (more than 18 millimeters wide and may be any thickness; or 15.1 to 18 millimeters wide and more than 12 millimeters thick; or 12.1 to 15 millimeters wide and more than 15 millimeters thick). The tumor has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is not more than 5 millimeters thick; or (2) may be any size and has spread through the sclera to the outside of the eyeball. The part of the tumor outside the eyeball is more than 5 millimeters thick. The tumor has not spread to the ciliary body.

**stage IV adrenocortical cancer :** The tumor can be any size and has spread (1) to fat and lymph nodes near the adrenal gland; or (2) to organs near the adrenal gland and may have spread to nearby lymph nodes; or (3) to other parts of the body, such as the liver or lung.

**stage IV adult Hodgkin lymphoma :** Cancer is found (1) outside the lymph nodes throughout one or more organs, and may be in lymph nodes near those organs; or (2) outside the lymph nodes in one organ and has spread to areas far away from that organ; or (3) in the lung, liver, bone marrow, or cerebrospinal fluid (CSF). The cancer has not spread to the lung, liver, bone marrow, or CSF from nearby areas.

**stage IV adult non-Hodgkin lymphoma :** Cancer is found (1) throughout one or more organs that are not part of a lymphatic area (lymph nodes, tonsils, thymus or spleen) and may be in lymph nodes near those organs; or

(2) in one organ that is not part of a lymphatic area and has spread to organs or lymph nodes far away from that organ; or (3) in the liver, bone marrow, cerebrospinal fluid (CSF), or lungs (other than cancer that has spread to the lungs from nearby areas).

**stage IV adult primary liver cancer :** Cancer has spread beyond the liver to other places in the body, such as the bones or lungs. The tumors may be of any size and may also have spread to nearby blood vessels and/or lymph nodes.

**stage IV AIDS-related lymphoma :** Cancer is found (1) throughout one or more organs that are not part of a lymphatic area (lymph node group, tonsils and nearby tissue, thymus, or spleen) and may be in lymph nodes near those organs; or (2) in one organ that is not part of the lymphatic area and has spread to organs or lymph nodes far away from that organ; or (3) in the liver, bone marrow, cerebrospinal fluid (CSF), or lungs (other than cancer that has spread to the lungs from nearby areas).

**stage IV anal cancer :** The tumor may be any size, and cancer has spread to distant parts of the body. It may also have spread to lymph nodes and nearby organs.

**stage IV bladder cancer :** Cancer has spread (1) from the bladder to the wall of the abdomen or pelvis; and/or (2) to one or more lymph nodes; and/or (3) to other parts of the body, such as the lung, bone, or liver.

**stage IV breast cancer :** Cancer has spread to other organs of the body, most often the bones, lungs, liver, or brain.

**stage IV cancer of the uterus :** Cancer cells have spread to the lining of the bladder or rectum or to distant parts of the body.

**stage IV cervical cancer :** Cancer has spread beyond the pelvis, or can be seen in the lining of the bladder and/or rectum, or has spread to other parts of the body. Stage IV is divided into stages IVA and IVB, based on where the cancer has spread. In stage IVA, cancer has spread to nearby organs, such as the bladder or rectum. In stage IVB, cancer has spread to other parts of the body, such as the liver, lungs, bones, or distant lymph nodes.

**stage IV childhood Hodgkin lymphoma :** Cancer is found (1) outside the lymph nodes throughout one or more organs, and may be in lymph nodes near those organs; or (2) outside the lymph nodes in one organ and has spread to areas far away from that organ; or (3) in the lung, liver, bone

marrow, or cerebrospinal fluid (CSF). The cancer has not spread to the lung, liver, bone marrow, or CSF from nearby areas.

**stage IV childhood liver cancer :** The cancer has spread to other parts of the body, such as the lung or brain.

**stage IV childhood non-Hodgkin lymphoma :** Cancer is found in the bone marrow, brain, or cerebrospinal fluid. Cancer may also be found in other parts of the body.

**stage IV chronic lymphocytic leukemia :** There are too many lymphocytes in the blood and too few platelets. The lymph nodes, liver, or spleen may be larger than normal and there may be too few red blood cells.

**stage IV colorectal cancer :** Stage IV colorectal cancer is divided into stage IVA and stage IVB. In stage IVA, cancer may have spread through the colon and/or rectal wall and may have spread to nearby organs or lymph nodes. Cancer has spread to one organ that is not near the colon and/or rectum, such as the liver, lung, or ovary, or to a distant lymph node. In stage IVB, cancer may have spread through the colon and/or rectal wall and may have spread to nearby organs or lymph nodes. Cancer has spread to more than one organ that is not near the colon and/or rectum or into the lining of the abdominal wall.

**stage IV cutaneous T-cell lymphoma :** Stage IV cutaneous T-cell lymphoma may be either of the following: in stage IVA cancer, the skin is red, dry, and scaly, and the lymph nodes contain cancer cells; in stage IVB cancer, the skin is red, dry and scaly, cancer cells may be found in lymph nodes, and cancer has spread to other organs in the body.

**stage IV distal extrahepatic bile duct cancer :** Cancer has spread to other parts of the body, such as the liver or lungs.

**stage IV endometrial cancer :** Cancer has spread beyond the pelvis. Stage IV is divided into stages IVA and IVB, based on how far the cancer has spread. In stage IVA, cancer has spread to the bladder and/or bowel wall. In stage IVB, cancer has spread to other parts of the body beyond the pelvis, including the abdomen and/or lymph nodes in the groin.

**stage IV esophageal adenocarcinoma :** Cancer has spread to other parts of the body.

**stage IV esophageal squamous cell carcinoma :** Cancer has spread to other parts of the body.

**stage IV gallbladder cancer :** Stage IV gallbladder cancer is divided into stages IVA and IVB. In stage IVA, cancer has spread to a main blood vessel of the liver or to 2 or more nearby organs or areas other than the liver. Cancer may have spread to nearby lymph nodes. In stage IVB, cancer has spread to either (1) lymph nodes along large arteries in the abdomen and/or near the lower part of the backbone; or (2) to organs or areas far away from the gallbladder.

**stage IV gastric cancer :** Cancer has spread to distant parts of the body.

**stage IV gestational trophoblastic neoplasia :** Cancer has spread to distant parts of the body other than the lungs.

**stage IV hypopharyngeal cancer :** Stage IV is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to cartilage around the thyroid or trachea, the bone under the tongue, the thyroid, or nearby soft tissue. Cancer may have spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller; or (2) has spread to one lymph node on the same side of the neck as the tumor (the lymph node is larger than 3 centimeters but not larger than 6 centimeters) or to lymph nodes anywhere in the neck (affected lymph nodes are 6 centimeters or smaller), and one of the following is true: (1) cancer is found in one area of the hypopharynx and/or is 2 centimeters or smaller; or (2) cancer is found in more than one area of the hypopharynx or in nearby tissues, or is larger than 2 centimeters but not larger than 4 centimeters and has not spread to the larynx (voice box); or (3) cancer has spread to the larynx or esophagus and is more than 4 centimeters; or (4) cancer has spread to cartilage around the thyroid or trachea, the bone under the tongue, the thyroid, or nearby soft tissue. In stage IVB, the tumor (1) has spread to muscles around the upper part of the spinal column, the carotid artery, or the lining of the chest cavity and may have spread to lymph nodes, which can be any size; or (2) may be any size and has spread to one or more lymph nodes that are larger than 6 centimeters. In stage IVC, the tumor may be any size and has spread beyond the hypopharynx to other parts of the body.

**stage IV intraocular melanoma of the ciliary body and choroid :** The tumor may be any size and has spread (1) to nearby lymph nodes; or (2) to other parts of the body.

**stage IV intraocular melanoma of the iris :** The tumor may be any size and has spread (1) to nearby lymph nodes; or (2) to other parts of the body.

**stage IV kidney cancer :** Cancer has spread (1) beyond the layer of fatty tissue around the kidney and may be found in the adrenal gland above the kidney with cancer, or in nearby lymph nodes; or (2) to other organs, such as the lungs, liver, bones, or brain, and may have spread to lymph nodes. Also called stage IV renal cell cancer.

**stage IV laryngeal cancer :** Stage IV is divided into stage IVA, stage IVB, and stage IVC. In stage IVA, (1) cancer has spread through the thyroid cartilage and/or has spread to tissues beyond the larynx, such as the neck, trachea, thyroid, or esophagus; cancer may have spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller; or (2) cancer has spread to one lymph node on the same side of the neck as the original tumor and the lymph node is larger than 3 centimeters but not larger than 6 centimeters, or has spread to more than one lymph node anywhere in the neck with none larger than 6 centimeters; cancer may have spread to tissues beyond the larynx, such as the neck, trachea, thyroid, or esophagus. The vocal cords may not move normally. In stage IVB, (1) cancer has spread to the space in front of the spinal column, surrounds the carotid artery, or has spread to parts of the chest; cancer may have spread to one or more lymph nodes anywhere in the neck and the lymph nodes may be any size; or (2) cancer has spread to a lymph node that is larger than 6 centimeters and may have spread as far as the space in front of the spinal column, around the carotid artery, or to parts of the chest. The vocal cords may not move normally. In stage IVC, cancer has spread to other parts of the body, such as the lungs, liver, or bone.

**stage IV lip and oral cavity cancer :** Stage IV is divided into stages IVA, IVB, and IVC. In stage IVA, (1) the tumor has spread through tissue in the lip or oral cavity into nearby tissue and/or bone (jaw, tongue, floor of mouth, maxillary sinus, or skin of chin or nose); cancer may have spread to one lymph node that is 3 centimeters or smaller, on the same side of the neck as the tumor; or (2) the tumor is any size or has spread through tissue in the lip or oral cavity into nearby tissue and/or bone (jaw, tongue, floor of mouth, maxillary sinus, or skin of chin or nose). Cancer has spread to one lymph node on the same side of the neck as the tumor and the lymph node is larger than 3 centimeters but not larger than 6 centimeters, or to more

than one lymph node on the same side of the neck as the tumor and the lymph nodes are not larger than 6 centimeters, or to lymph nodes on the opposite side of the neck as the tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters. In stage IVB, (1) the tumor may be any size and has spread to one or more lymph nodes that are larger than 6 centimeters; or (2) the tumor has spread further into the muscles or bones in the oral cavity, or to the base of the skull and/or the carotid artery. Cancer may have spread to one or more lymph nodes anywhere in the neck. In stage IVC, the tumor has spread beyond the lip or oral cavity to distant parts of the body, such as the lungs. The tumor may be any size and may have spread to lymph nodes.

**stage IV malignant mesothelioma :** Cancer cannot be removed by surgery and is found in one or both sides of the body. Cancer may have spread to lymph nodes anywhere in the chest or above the collarbone. Cancer has spread in one or more of the following ways: (1) through the diaphragm into the peritoneum (the thin layer of tissue that lines the abdomen and covers most of the organs in the abdomen); (2) to the tissue lining the chest on the opposite side of the body as the tumor; (3) to the chest wall and may be found in the rib; (4) into the organs in the center of the chest cavity; (5) into the spine; (6) into the sac around the heart or into the heart muscle; and/or (7) to distant parts of the body such as the brain, spine, thyroid, or prostate.

**stage IV maxillary sinus cancer :** Stage IV maxillary sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is larger than 3 centimeters but not larger than 6 centimeters; or to more than one lymph node on the same side of the neck as the original tumor and the lymph nodes are not larger than 6 centimeters; or to lymph nodes on the opposite side of the neck as the original tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters, and cancer has also spread to any of the following: the lining of the maxillary sinus, bones around the maxillary sinus (including the roof of the mouth and the nose), tissues under the skin, the eye socket, the base of the skull, and/or the ethmoid sinuses; or (2) has spread to any of the following: the front of the eye, skin of the cheek, base of the skull, behind the jaw, the bone between the eyes, and/or the sphenoid or frontal sinuses, and cancer may also have spread to one or more lymph nodes 6 centimeters or smaller,

anywhere in the neck. In stage IVB, cancer (1) has spread to any of the following: the back of the eye, brain, middle parts of the skull, nerves in the head that go to the brain, upper part of the throat behind the nose, and/or the base of the skull, and cancer may be found in one or more lymph nodes of any size, anywhere in the neck; or (2) is found in a lymph node larger than 6 centimeters. Cancer may also be found anywhere in or near the maxillary sinus. In stage IVC, cancer may be anywhere in or near the maxillary sinus, may have spread to lymph nodes, and has spread to organs far away from the maxillary sinus, such as the lungs.

**stage IV melanoma :** Cancer has spread to other places in the body, such as the lung, liver, brain, bone, soft tissue, gastrointestinal (GI) tract, or to places in the skin far away from where the cancer first started.

**stage IV Merkel cell carcinoma :** The tumor may be any size and has spread to distant parts of the body, such as the liver, lung, bone, or brain.

**stage IV mycosis fungoides :** Stage IV is divided into stages IVA and IVB. In stage IVA, most of the skin is reddened and any amount of the skin surface is covered with patches, papules, plaques, or tumors, and either (1) cancer has spread to lymph nodes and there may be cancerous lymphocytes in the blood; or (2) there are cancerous lymphocytes in the blood and lymph nodes may be enlarged, but cancer has not spread to them. In stage IVB, most of the skin is reddened and any amount of the skin surface is covered with patches, papules, plaques, or tumors. Cancer has spread to other organs in the body. Lymph nodes may be enlarged and cancer may have spread to them. There may be cancerous lymphocytes in the blood.

**stage IV nasal cavity and ethmoid sinus cancer :** Stage IV nasal cavity and ethmoid sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is larger than 3 centimeters but not larger than 6 centimeters; or to more than one lymph node on the same side of the neck as the original tumor and the lymph nodes are not larger than 6 centimeters; or to lymph nodes on the opposite side of the neck as the original tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters, and cancer has also spread to any of the following: the nasal cavity, ethmoid sinus, eye socket, maxillary sinus, roof of the mouth, and/or the bone between the eyes; or (2) has spread to any of the following: the front of the eye, skin of the nose or cheek, front parts of

the skull, base of the skull, and/or the sphenoid or frontal sinuses, and cancer may also have spread to one or more lymph nodes 6 centimeters or smaller, anywhere in the neck. In stage IVB, cancer (1) has spread to any of the following: the back of the eye, brain, middle parts of the skull, nerves in the head that go to the brain, upper part of the throat behind the nose, and/or the base of the skull, and cancer may be found in one or more lymph nodes of any size, anywhere in the neck; or (2) is found in a lymph node larger than 6 centimeters. Cancer may also be found anywhere in or near the nasal cavity and ethmoid sinus. In stage IVC, cancer may be found anywhere in or near the nasal cavity and ethmoid sinus, may have spread to lymph nodes, and has spread to organs far away from the nasal cavity and ethmoid sinus, such as the lungs.

**stage IV nasopharyngeal cancer :** Stage IV nasopharyngeal cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer has spread beyond the nasopharynx and may have spread to the cranial nerves, the hypopharynx (bottom part of the throat), areas in and around the side of the skull or jawbone, and/or the bone around the eye. Cancer may have spread to one or more lymph nodes on one or both sides of the neck and/or to lymph nodes behind the pharynx, and the affected lymph nodes are 6 centimeters or smaller. In stage IVB, cancer has spread to lymph nodes between the collarbone and the top of the shoulder and/or the affected lymph nodes are larger than 6 centimeters. In stage IVC, cancer has spread beyond nearby lymph nodes to other parts of the body.

**stage IV non-small cell lung cancer :** The tumor may be any size and cancer may have spread to lymph nodes. One or more of the following is true: (1) there are one or more tumors in both lungs; (2) cancer is found in fluid around the lungs or the heart; and/or (3) cancer has spread to other parts of the body, such as the brain, liver, adrenal glands, kidneys, or bone.

**stage IV nonmelanoma skin cancer :** The tumor is any size and may have spread to the jaw, eye socket, or side of the skull. Cancer has spread to one lymph node on the same side of the body as the tumor and the affected node is larger than 3 centimeters but not larger than 6 centimeters, or cancer has spread to more than one lymph node on one or both sides of the body and the affected nodes are not larger than 6 centimeters; or, the tumor is any size and may have spread to the jaw, eye socket, skull, spine, or ribs. Cancer has spread to one lymph node that is larger than 6 centimeters; or, the tumor is

any size and has spread to the base of the skull, spine, or ribs. Cancer may have spread to the lymph nodes; or, cancer has spread to other parts of the body, such as the lung.

**stage IV nonmelanoma skin cancer on the eyelid :** The tumor has spread to distant parts of the body.

**stage IV oropharyngeal cancer :** Stage IV oropharyngeal cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to the larynx, front part of the roof of the mouth, lower jaw, or muscles that move the tongue or are used for chewing. Cancer may have spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller; or (2) has spread to one lymph node on the same side of the neck as the tumor (the lymph node is larger than 3 centimeters but not larger than 6 centimeters) or to more than one lymph node anywhere in the neck (the lymph nodes are 6 centimeters or smaller), and one of the following is true: (1) tumor in the oropharynx is any size and may have spread to the epiglottis (the flap that covers the trachea during swallowing); or (2) tumor has spread to the larynx, front part of the roof of the mouth, lower jaw, or muscles that move the tongue or are used for chewing. In stage IVB, the tumor (1) surrounds the carotid artery or has spread to the muscle that opens the jaw, the bone attached to the muscles that move the jaw, nasopharynx, or base of the skull. Cancer may have spread to one or more lymph nodes, which can be any size; or (2) may be any size and has spread to one or more lymph nodes that are larger than 6 centimeters. In stage IVC, the tumor may be any size and has spread beyond the oropharynx to other parts of the body, such as the lung, bone, or liver.

**stage IV ovarian epithelial, fallopian tube, and primary peritoneal cancer :** Cancer has spread beyond the abdomen to other parts of the body. Stage IV is divided into stages IVA and IVB. In stage IVA, cancer cells are found in extra fluid that builds up around the lungs. In stage IVB, cancer has spread to organs and tissues outside the abdomen, including lymph nodes in the groin.

**stage IV ovarian germ cell tumor :** Cancer has spread beyond the abdomen to other parts of the body, such as the lungs or tissue inside the liver. Cancer cells in the fluid around the lungs is also considered stage IV ovarian cancer.

**stage IV ovarian low malignant potential tumor :** Tumor cells have spread beyond the abdomen to other parts of the body, such as the lungs or tissue inside the liver. Tumor cells in the fluid around the lungs is also considered stage IV disease. Ovarian low malignant potential tumors almost never reach stage IV.

**stage IV pancreatic cancer :** Cancer may be of any size and has spread to distant organs, such as the liver, lung, and peritoneal cavity (the body cavity that contains most of the organs in the abdomen), and may have also spread to organs and tissues near the pancreas or to lymph nodes.

**stage IV penile cancer :** Cancer has spread (1) to tissues near the penis, such as the prostate, and may have spread to lymph nodes in the groin or pelvis; or (2) to one or more lymph nodes in the pelvis, or from the lymph nodes to the tissues around the lymph nodes; or (3) to distant parts of the body.

**stage IV perihilar extrahepatic bile duct cancer :** Stage IV is divided into stages IVA and IVB. In stage IVA, the tumor may have spread to nearby lymph nodes and has spread to one or more of the following: (1) the main part of the portal vein or both branches of the portal vein; (2) the hepatic artery; (3) the right and left hepatic ducts; (4) the right hepatic duct and the left branch of the hepatic artery or of the portal vein; and/or (5) the left hepatic duct and the right branch of the hepatic artery or of the portal vein. In stage IVB, the tumor has spread to other parts of the body, such as the liver.

**stage IV prostate cancer :** Cancer (1) has spread beyond the seminal vesicles to nearby tissue or organs, such as the rectum, bladder, or pelvic wall; or (2) has spread to nearby lymph nodes and may have spread to the seminal vesicles or to nearby tissue or organs, such as the rectum, bladder, or pelvic wall; or (3) has spread to distant parts of the body, which may include lymph nodes or bones. Also, the prostate-specific antigen (PSA) can be any level and the Gleason score can range from 2 to 10.

**stage IV renal cell cancer :** Cancer has spread (1) beyond the layer of fatty tissue around the kidney and may be found in the adrenal gland above the kidney with cancer, or in nearby lymph nodes; or (2) to other organs, such as the lungs, liver, bones, or brain, and may have spread to lymph nodes. Also called stage IV kidney cancer.

**stage IV salivary gland cancer :** Stage IV salivary gland cancer is divided into stages IVA, IVB, and IVC. In stage IVA, (1) the tumor may be any size and may have spread to soft tissue around the affected gland. Cancer has spread to a single lymph node on the same side as the tumor and the lymph node is larger than 3 centimeters but not larger than 6 centimeters, or has spread to more than one lymph node on either or both sides of the body and the lymph nodes are not larger than 6 centimeters; or (2) cancer has spread to the skin, jawbone, ear canal, and/or facial nerve, and may have spread to one or more lymph nodes on either or both sides of the body; the lymph nodes are not larger than 6 centimeters. In stage IVB, (1) the tumor may be any size and may have spread to soft tissue around the affected gland. Cancer has spread to a lymph node larger than 6 centimeters; or (2) cancer has spread to the base of the skull and/or the carotid artery, and may have spread to one or more lymph nodes of any size on either or both sides of the body. In stage IVC, the tumor may be any size and may have spread to soft tissue around the affected gland, to the skin, jawbone, ear canal, facial nerve, base of the skull, or carotid artery, or to one or more lymph nodes on either or both sides of the body. Cancer has spread to distant parts of the body.

**stage IV Sezary syndrome :** Most of the skin is reddened and covered with patches, papules, plaques, or tumors. There is a high level of cancerous lymphocytes in the blood. Lymph nodes may be enlarged and cancer may have spread to them.

**stage IV soft tissue sarcoma :** The tumor is any grade, any size, and may have spread to nearby lymph nodes. Cancer has spread to distant parts of the body, such as the lungs.

**stage IV thymoma :** Stage IV is divided into stages IVA and IVB, depending on where the cancer has spread. In stage IVA, cancer has spread widely around the lungs and heart. In stage IVB, cancer has spread to the blood or lymph system.

**stage IV transitional cell cancer of the renal pelvis and ureter :** Cancer has spread to at least one of the following: (1) a nearby organ; (2) the layer of fat surrounding the kidney; (3) one or more lymph nodes; and/or (4) distant parts of the body, such as the lung, liver, or bone.

**stage IV uterine sarcoma :** Cancer has spread beyond the pelvis. Stage IV is divided into stages IVA and IVB, based on how far the cancer has spread.

In stage IVA, cancer has spread to the bladder and/or bowel wall. In stage IVB, cancer has spread to other parts of the body beyond the pelvis, including the abdomen and/or lymph nodes in the groin.

**stage IV vaginal cancer :** Stage IV is divided into stages IVA and IVB. In stage IVA, cancer may have spread to one or more of the following areas: (1) the lining of the bladder; (2) the lining of the rectum; and/or (3) beyond the area of the pelvis that has the bladder, uterus, ovaries, and cervix. In stage IVB, cancer has spread to parts of the body that are not near the vagina, such as the lung or bone.

**stage IV vulvar cancer :** The tumor has spread into the upper part of the urethra, the upper part of the vagina, or to other parts of the body. Stage IV is divided into stages IVA and IVB. In stage IVA, (1) cancer has spread into the lining of the upper urethra, the upper vagina, the bladder, or the rectum, or has attached to the pelvic bone; or (2) cancer has spread to nearby lymph nodes and the lymph nodes are not moveable or have formed an ulcer. In stage IVB, cancer has spread to lymph nodes in the pelvis or to other parts of the body.

**stage IV Wilms tumor :** Cancer has spread through the blood to organs such as the lungs, liver, bone, or brain, or to lymph nodes outside of the abdomen and pelvis (the part of the body between the hips).

**stage IVA hypopharyngeal cancer :** Stage IV hypopharyngeal cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to cartilage around the thyroid or trachea, the bone under the tongue, the thyroid, or nearby soft tissue. Cancer may have spread to one lymph node on the same side of the neck as the tumor and the lymph node is 3 centimeters or smaller; or (2) has spread to one lymph node on the same side of the neck as the tumor (the lymph node is larger than 3 centimeters but not larger than 6 centimeters) or to lymph nodes anywhere in the neck (affected lymph nodes are 6 centimeters or smaller), and one of the following is true: (1) cancer is found in one area of the hypopharynx and/or is 2 centimeters or smaller; or (2) cancer is found in more than one area of the hypopharynx or in nearby tissues, or is larger than 2 centimeters but not larger than 4 centimeters and has not spread to the larynx (voice box); or (3) cancer has spread to the larynx or esophagus and is more than 4 centimeters; or (4) cancer has spread to cartilage around the thyroid or trachea, the bone under the tongue, the thyroid, or nearby soft tissue.

**stage IVA laryngeal cancer :** Stage IV is divided into stage IVA, stage IVB, and stage IVC. In stage IVA, (1) cancer has spread through the thyroid cartilage and/or has spread to tissues beyond the larynx, such as the neck, trachea, thyroid, or esophagus; cancer may have spread to one lymph node on the same side of the neck as the original tumor and the lymph node is 3 centimeters or smaller; or (2) cancer has spread to one lymph node on the same side of the neck as the original tumor and the lymph node is larger than 3 centimeters but not larger than 6 centimeters, or has spread to more than one lymph node anywhere in the neck with none larger than 6 centimeters; cancer may have spread to tissues beyond the larynx, such as the neck, trachea, thyroid, or esophagus. The vocal cords may not move normally.

**stage IVA lip and oral cavity cancer :** Stage IV is divided into stages IVA, IVB, and IVC. In stage IVA, (1) the tumor has spread through tissue in the lip or oral cavity into nearby tissue and/or bone (jaw, tongue, floor of mouth, maxillary sinus, or skin of chin or nose); cancer may have spread to one lymph node that is 3 centimeters or smaller, on the same side of the neck as the tumor; or (2) the tumor is any size or has spread through tissue in the lip or oral cavity into nearby tissue and/or bone (jaw, tongue, floor of mouth, maxillary sinus, or skin of chin or nose). Cancer has spread to one lymph node on the same side of the neck as the tumor and the lymph node is larger than 3 centimeters but not larger than 6 centimeters, or to more than one lymph node on the same side of the neck as the tumor and the lymph nodes are not larger than 6 centimeters, or to lymph nodes on the opposite side of the neck as the tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters.

**stage IVA maxillary sinus cancer :** Stage IV maxillary sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is larger than 3 centimeters but not larger than 6 centimeters; or to more than one lymph node on the same side of the neck as the original tumor and the lymph nodes are not larger than 6 centimeters; or to lymph nodes on the opposite side of the neck as the original tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters, and cancer has also spread to any of the following: the lining of the maxillary sinus, bones around the maxillary sinus (including the roof of the mouth and the nose), tissues under the skin, the eye socket, the base of the skull,

and/or the ethmoid sinuses; or (2) has spread to any of the following: the front of the eye, skin of the cheek, base of the skull, behind the jaw, the bone between the eyes, and/or the sphenoid or frontal sinuses, and cancer may also have spread to one or more lymph nodes 6 centimeters or smaller, anywhere in the neck.

**stage IVA nasal cavity and ethmoid sinus cancer :** Stage IV nasal cavity and ethmoid sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVA, cancer (1) has spread to one lymph node on the same side of the neck as the cancer and the lymph node is larger than 3 centimeters but not larger than 6 centimeters; or to more than one lymph node on the same side of the neck as the original tumor and the lymph nodes are not larger than 6 centimeters; or to lymph nodes on the opposite side of the neck as the original tumor or on both sides of the neck, and the lymph nodes are not larger than 6 centimeters, and cancer has also spread to any of the following: the nasal cavity, ethmoid sinus, eye socket, maxillary sinus, roof of the mouth, and/or the bone between the eyes; or (2) has spread to any of the following: the front of the eye, skin of the nose or cheek, front parts of the skull, base of the skull, and/or the sphenoid or frontal sinuses, and cancer may also have spread to one or more lymph nodes 6 centimeters or smaller, anywhere in the neck.

**stage IVA pancreatic cancer :** Cancer has spread to organs that are near the pancreas (such as the stomach, spleen, or colon) but has not spread to distant organs (such as the liver or lungs).

**stage IVB hypopharyngeal cancer :** Stage IV hypopharyngeal cancer is divided into stages IVA, IVB, and IVC. In stage IVB, the tumor (1) has spread to muscles around the upper part of the spinal column, the carotid artery, or the lining of the chest cavity and may have spread to lymph nodes, which can be any size; or (2) may be any size and has spread to one or more lymph nodes that are larger than 6 centimeters.

**stage IVB laryngeal cancer :** Stage IV is divided into stage IVA, stage IVB, and stage IVC. In stage IVB, (1) cancer has spread to the space in front of the spinal column, surrounds the carotid artery, or has spread to parts of the chest; cancer may have spread to one or more lymph nodes anywhere in the neck and the lymph nodes may be any size; or (2) cancer has spread to a lymph node that is larger than 6 centimeters and may have

spread as far as the space in front of the spinal column, around the carotid artery, or to parts of the chest. The vocal cords may not move normally.

**stage IVB lip and oral cavity cancer :** Stage IV is divided into stages IVA, IVB, and IVC. In stage IVB, (1) the tumor may be any size and has spread to one or more lymph nodes that are larger than 6 centimeters; or (2) the tumor has spread further into the muscles or bones in the oral cavity, or to the base of the skull and/or the carotid artery. Cancer may have spread to one or more lymph nodes anywhere in the neck.

**stage IVB maxillary sinus cancer :** Stage IV maxillary sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVB, cancer (1) has spread to any of the following: the back of the eye, brain, middle parts of the skull, nerves in the head that go to the brain, upper part of the throat behind the nose, and/or the base of the skull, and cancer may be found in one or more lymph nodes of any size, anywhere in the neck; or (2) is found in a lymph node larger than 6 centimeters. Cancer may also be found anywhere in or near the maxillary sinus.

**stage IVB nasal cavity and ethmoid sinus cancer :** Stage IV nasal cavity and ethmoid sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVB, cancer (1) has spread to any of the following: the back of the eye, brain, middle parts of the skull, nerves in the head that go to the brain, upper part of the throat behind the nose, and/or the base of the skull, and cancer may be found in one or more lymph nodes of any size, anywhere in the neck; or (2) is found in a lymph node larger than 6 centimeters. Cancer may also be found anywhere in or near the nasal cavity and ethmoid sinus.

**stage IVB pancreatic cancer :** Cancer of the pancreas in which the cancer has spread to distant organs (such as the liver or lungs).

**stage IVC hypopharyngeal cancer :** Stage IV hypopharyngeal cancer is divided into stages IVA, IVB, and IVC. In stage IVC, the tumor may be any size and has spread beyond the hypopharynx to other parts of the body.

**stage IVC laryngeal cancer :** Stage IV is divided into stage IVA, stage IVB, and stage IVC. In stage IVC, cancer has spread to other parts of the body, such as the lungs, liver, or bone.

**stage IVC lip and oral cavity cancer :** Stage IV is divided into stages IVA, IVB, and IVC. In stage IVC, the tumor has spread beyond the lip or oral cavity to distant parts of the body, such as the lungs. The tumor may be any size and may have spread to lymph nodes.

**stage IVC maxillary sinus cancer :** Stage IV maxillary sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVC, cancer may be anywhere in or near the maxillary sinus, may have spread to lymph nodes, and has spread to organs far away from the maxillary sinus, such as the lungs.

**stage IVC nasal cavity and ethmoid sinus cancer :** Stage IV nasal cavity and ethmoid sinus cancer is divided into stages IVA, IVB, and IVC. In stage IVC, cancer may be found anywhere in or near the nasal cavity and ethmoid sinus, may have spread to lymph nodes, and has spread to organs far away from the nasal cavity and ethmoid sinus, such as the lungs.

**stage V Wilms tumor :** Cancer cells are found in both kidneys when the disease is first diagnosed. Each kidney is staged separately as I, II, III, or IV.

**staggered conformation:** one of the possible orientations of atoms or groups around two carbon atoms joined by a single bond. Atoms and groups bonded to the two carbons of a staggered conformer are positioned so there is maximum separation between them and therefore minimum interaction. (Compare with "eclipsed conformation.")

**Staggered Style Guard Edges :** A retaining edge consisting of alternating overlapped inside and outside flat plates.

**staging :** Performing exams and tests to learn the extent of the cancer within the body, especially whether the disease has spread from the original site to other parts of the body. It is important to know the stage of the disease in order to plan the best treatment.

**staging system :** A system that is used to describe the extent of cancer in the body. Staging is usually based on the size of the tumor and whether the cancer has spread from where it started to nearby areas, lymph nodes, or other parts of the body.

**STAIN:** A solution or suspension of coloring matter in a vehicle designed primarily to be applied to create color effects rather than to form a protective coating. A transparent or semi-opaque coating that colors without completely obscuring the grain of the surface.

**Staining/discolouration of paint on masonry:** There are a number of principal causes: Certain types of sand used in the construction or rendering of a building can cause staining, as can certain kinds of brick hollow clay

pots or clinker blocks containing soluble salts. Pieces of ferrous metal or iron stone embedded in the material can rust and discolour when the surface is painted. These problems can be treated by sealing the affected areas with Dulux Alkali Resisting Primer when the surface is completely dry. Rust/Steel reinforcing in concrete may be too close to the surface and cause rusting. The only effective way to resolve this problem is to get back to the metal itself and treat the cause of the rust. staining can occur where old nails are left in the substrate, or a wire brush has been used to prepare the surface. In this case, prime locally with Dulux Metal Primer prior to painting. Steel reinforcing in concrete may be too close to the surface and cause rusting. The only effective way to resolve this problem is to get back to the metal itself and treat the cause of the rust.

**Staining/discolouration of paint on plaster:** Past water leaks or burst water pipes can cause staining. Before repainting, ensure that the leak has stopped and the surface is thoroughly dry, then spot prime the affected area with Dulux Alkali Resisting Primer. 2) Heavy deposits of tar from cigarette smoke and around the chimney breast of open fires are common causes of staining, especially on water-based emulsion paints. To prepare, wash the surface thoroughly with detergent solution and rinse frequently with clean water. Allow to dry, then prime with Dulux Alkali Resisting Primer. If using water-based paints, allow a few days for the oil deposits of the primer to disappear, otherwise cissing may be a problem. 3) Conventional solvent-based finishes such as gloss can discolour with age, particularly in areas sheltered from natural daylight. Prior to repainting, wash the surface with a detergent solution, rinse with clean water and allow to dry. It may be more advisable to use a water-based coating for a low light area.

**Staining/discolouration of paint on wood:** There are different solutions for each of these problems. 1) Staining caused by rust from old nails should be rubbed down to remove the rust, then prime any exposed metal with Dulux Metal Primer or Dulux Q.D. Metal Primer before painting. 2) Resin bleeding from knots in wood should first be removed with white spirit. Then seal the knots with two coats of Dulux White Knotting Solution and repaint. 3) All solvent-based paints such as gloss will discolour or yellow with age. To treat, wash the surface thoroughly with detergent solution, rinse with clean water and allow to dry before repainting. If the wood appears to be dirty, particularly around glazing rebates, it may be affected

by fungal growth. Clean the surface thoroughly and treat with domestic bleach, or apply a coat of Aluminium Primer, before painting.

**stainless steel:** Stainless steel does not rust. It has nickel and chromium added in its manufacture.

**Stakel:** (Other name for: padeliporfin)

**stalactite:** rock icicle forming from the ceiling of a cave. Or rock formation rising up from a cave floor.

**stamen:** the structure of a flower that contains a thin, stemlike filament and an anther.

**stamina :** The energy and strength to endure physical activity, stress, or illness over time.

**Stanchion:** A prop or support to a roof ceiling or beam. Especially refers to cast iron or rolled steel member used as a supporting column.

**standard (or standardized solution):** a solution containing a known, precise concentration of an element or chemical compound, often used to calibrate analytical chemistry measurement devices.

**Standard Conditions:** Conditions used to complete formulas in chemistry. Standard conditions include atmosphere at sea level (760 torr) and the Kelvin value for the freezing point of water (273K).

**standard deviation:** The standard deviation is a statistical measure of precision. The best estimate of the standard deviation  $s$  for small data sets is calculated using 
$$s = \sqrt{\frac{\sum (x_i - \bar{x})^2}{N-1}}$$
 where  $x_i$  is the measurement from the  $i$ -th run,  $\bar{x}$  is the mean of all the measurements, and  $N$  is the number of measurements. For very large data sets, the standard deviation is the root-mean-square deviation from the true mean, and is usually written as  $\sigma$  to distinguish it from the best estimate standard deviation  $s$  used for small data sets.

**standard enthalpy change:** A change in enthalpy associated with a reaction or transformation involving substances in their standard states.

**standard enthalpy of formation  $\Delta H_f^\circ$ :** The change in enthalpy when one mole of compound is formed from its elements in their most stable form and in their standard states.

**standard enthalpy of reaction  $\Delta H_{rxn}^\circ$ :** A change in enthalpy associated with a reaction involving substances in their standard states.

**standard entropy of reaction<sub>rxn</sub>:** A change in entropy associated with a reaction involving substances in their standard states. A superscript circle (<sup>°</sup>) distinguishes standard enthalpy changes from enthalpy changes which involve reactants and products that are not in their standard states.

**Standard free-energy change:** The free-energy change of a reaction, when it takes place under standard conditions, in which each of the reactants is present at a concentration of 1.0 M.

**standard free-energy change ( $\Delta G^\circ$ ):** The free-energy change for a reaction occurring under a set of standard conditions : temperature, 298 K; pressure, 1 atm or 101.3 kPa; and all solutes at 1 M concentration.  $\Delta G^\circ$  denotes the standard free-energy change at pH 7.0.

**standard hydrogen electrode:** A platinum electrode that runs the half reaction  $2 \text{H}^+(\text{aq}, 1\text{M}) + 2 \text{e}^- \rightarrow \text{H}_2(\text{g}, 1 \text{ atm})$ , chosen as a reference for cell voltages. The electrode potential of the standard hydrogen electrode is defined to be zero volts.

**standard medical care :** Treatment that is accepted by medical experts as a proper treatment for a certain type of disease and that is widely used by healthcare professionals. Also called best practice, standard of care, and standard therapy.

**standard molar entropy:** The entropy of one mole of a substance in its standard state.

**standard molar volume:** The volume of 1 mole of an ideal gas at STP, equal to 22.414 liters.

**standard of care :** Treatment that is accepted by medical experts as a proper treatment for a certain type of disease and that is widely used by healthcare professionals. Also called best practice, standard medical care, and standard therapy.

**Standard Operating Procedure :** Written instructions for doing a specific task in a certain way. In clinical trials, Standard Operating Procedures are set up to store records, collect data, screen and enroll subjects, and submit Institutional Review Board (IRB) applications and renewals. Also called SOP.

**Standard Pressure:** The pressure measured at sea level on the Earth. Pressure can change if weather changes but standard pressure is measured as 760 millimeters of mercury on a barometer (torr).

**standard pressure:** Standard pressure is a pressure of 1 bar. Before 1982, the standard pressure was 1 atm (1 atm = 1.01325 bar).

**standard reduction potential:** The voltage associated with a reduction process at standard state. The reduction potential of  $2\text{H}^+(\text{aq}, 1\text{M}) + 2\text{e}^- \rightarrow \text{H}_2(\text{g}, 1\text{ atm})$  is taken as exactly zero volts.

**standard reduction potential ( $E^0$ ):** The electromotive force exhibited at an electrode by 1 M concentrations of a reducing agent and its oxidized form at 25 °C and pH 7.0; a measure of the relative tendency of the reducing agent to lose electrons.

**Standard Review Plan:** A document that provides guidance to the staff for reviewing an application to obtain an NRC license to construct or operate a nuclear facility or to possess or use nuclear materials.

**Standard Solution:** This is a solution for which the scientist knows the concentration of solute and solvent. Or A solution of precisely known concentration.

**standard state:** A set of conditions defined to allow convenient comparison of thermodynamic properties. The standard state for a gas is the the state of the pure substance in the gaseous phase at the standard pressure, with the gas behaving ideally. The standard state for liquids and solids is the state of the most stable form of the substance at the standard pressure. Temperature is not included in the definition of standard state and must be specified, but when not given a temperature of 25°C is usually implied.

**Standard Technical Specifications:** NRC staff guidance on model technical specifications for an operating license. (See also Technical Specifications.)

**standard temperature and pressure:** 0° and 1 atmosphere.

**standard therapy :** Treatment that is accepted by medical experts as a proper treatment for a certain type of disease and that is widely used by healthcare professionals. Also called best practice, standard medical care, and standard of care.

**standardization:** A set of techniques used to remove as far as possible the effects of differences in age or other confounding variables, when comparing two or more populations. The common method uses weighted averaging of rates specific for age, sex, or some other potential confounding

variable(s) according to some specified distribution of these variables. There are two main methods, as follows:

**standardized freeze-dried table grape powder:** A standardized freeze-dried preparation of desiccated table grapes containing polyphenols (including flavanols, anthocyanins, flavonols, and stilbenes such as resveratrol) and other unidentified compounds with antioxidant activity. Standardized freeze-dried table grape powder increases serum antioxidant activity and reduces the macrophage-mediated oxidation and uptake of low-density lipoprotein (LDL). This agent has been shown to inhibit genes linked to the development of sporadic colorectal cancer and may exhibit chemopreventive activity for other human cancers.

**standardized mortality (morbidity) ratio (SMR):** The ratio of the number of events observed in the study group or population to the number of deaths expected if the study population had the same specific rates as the standard population, multiplied by 100 (Last, 1988).

**Stanford V :** An abbreviation for a chemotherapy combination that is used to treat Hodgkin lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs mechlorethamine, doxorubicin hydrochloride, vinblastine sulfate, vincristine sulfate, bleomycin sulfate, etoposide phosphate, and prednisone and was developed at Stanford University. Also called Stanford V regimen.

**Stanford V regimen:** A chemotherapy regimen consisting of mechlorethamine, doxorubicin hydrochloride, vinblastine, vincristine, bleomycin, etoposide and prednisone, administered on a compressed schedule and used in the treatment of Hodgkin lymphoma; it may be followed by consolidative radiation therapy. or An abbreviation for a chemotherapy combination that is used to treat Hodgkin lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs mechlorethamine, doxorubicin hydrochloride, vinblastine sulfate, vincristine sulfate, bleomycin sulfate, etoposide phosphate, and prednisone and was developed at Stanford University. Also called Stanford V.

**staphylococcus aureus protein A:** A protein that resides in the microbial wall of staphylococcus aureus and interferes with opsonization by binding to the Fc portion of immunoglobulin. The protein has a deleterious effect on the epithelial cells that line the respiratory tract, and plays a role in the

induction of pneumonia. Protein A also initiates polymorphonuclear cell migration into airway passages via TNFR1 activation.

**Staple:** Refers to textile fibers of a short length, usually 1/2 to 3", for natural fibers and sometimes larger for synthetics.

**star dune:** an isolated hill of sand formed by variable winds in the Sahara and Arabian deserts; the base of the dune resembles a multipointed star.

**Starch:** A long chain of carbohydrates formed in plants. It is often used as a food supply because it is a poly-saccharide made of glucose units. You will see starches from wheat plants used everyday in pasta. Starch is originally created in plant cells. Or A polysaccharide used by plants to stockpile glucose molecules. The most common forms are amylose and amylopectin. or A homopolysaccharide that is a storage form of glucose in plant chloroplasts; amylopectin, the branched form of starch, has approximately one  $\alpha$ -1,6 linkage per thirty  $\alpha$ -1,4 linkages, whereas amylose is unbranched, composed of glucose residues in  $\alpha$ -1,4 linkage. or Starch is the main source of food energy for most of the world's human population. It can be considered to be a condensation polymer of glucose, like cellulose, although the ether linkages in starch are different to those in cellulose. Starch may be highly branched (amylopectin) or relatively unbranched (amylose).

**starch :** A substance found in plants. It contains sugar molecules joined chemically. It is found in high levels in foods such as potatoes, rice, corn, and wheat. It may be used as a dusting powder, a skin softener, a filler in medicine tablets, and a clothes stiffener.

**Starlix:** (Other name for: nateglinide)

**Start codon:** The first codon to be translated, usually AUG.

**Startup:** An increase in the rate of fission (and heat production) in a reactor (usually by the removal of control rods from the core).

**STARVE FEEDING:** Feeding of an extruder at a rate below the full capacity of the machine. This results in output determined by the feeder and not by the extruder or the process parameters.

**Starved-fed cycle:** In animals, the biochemical changes that take place in the postabsorptive state, a prolonged fast and a refeed state, such as would take place between an evening meal and breakfast.

**STAT inhibitor OPB-111077:** An orally bioavailable inhibitor of one or more signal transducer and activator of transcription (STAT) protein(s), with potential antineoplastic activity. Upon oral administration, OPB-111077 binds to and inhibits the phosphorylation of STATs. This prevents binding of STATs to DNA sequences on a variety of STAT-responsive gene promoters, which may result in the inhibition of both STAT-mediated transcription and tumor cell proliferation. STATs are constitutively activated in a variety of cancers and play a key role in tumor cell proliferation.

**STAT3 antisense oligonucleotide ISIS 481464:** An antisense oligonucleotide targeting signal transducer and activator of transcription 3 (STAT3) with potential antitumor activity. STAT3 antisense oligonucleotide ISIS 481464 binds to STAT3 mRNA, thereby inhibiting translation of the transcript. Suppression of STAT3 expression induces tumor cell apoptosis and decreases tumor cell growth. STAT3, a protein overexpressed in a variety of human cancers, plays a critical role in tumor cell growth and survival.

**STAT3 decoy oligonucleotide:** A double-stranded 15-mer oligonucleotide, corresponding closely to the signal transducer and activator of transcription 3 (STAT3) response element within the c-fos promoter, with potential antineoplastic activity. STAT3 decoy oligonucleotide binds specifically to activated STAT3 and blocks binding of STAT3 to DNA sequences on a variety of STAT3-responsive promoters, which results in the inhibition of STAT3-mediated transcription and, potentially, the inhibition of tumor cell proliferation. STAT3 is constitutively activated in a variety of cancers including squamous cell carcinoma of the head and neck, contributing to the loss of cell growth control and neoplastic transformation.

**STAT3 inhibitor OPB-31121:** An orally bioavailable inhibitor of signal transducer and activator of transcription 3 (STAT3), with potential antineoplastic activity. OPB-31121 inhibits the phosphorylation of STAT3, which prevents binding of STAT3 to DNA sequences on a variety of STAT3-responsive promoters and may result in the inhibition of STAT3-mediated transcription and, potentially, the inhibition of tumor cell proliferation. STAT3 is constitutively activated in a variety of cancers, contributing to the loss of cell growth control and neoplastic transformation.

**STAT3 inhibitor OPB-51602:** An orally bioavailable inhibitor of signal transducer and activator of transcription 3 (STAT3), with potential

antineoplastic activity. STAT3 inhibitor OPB-51602 inhibits the phosphorylation and thus the activation of STAT3 protein, impeding STAT3 protein from translocating from the cytoplasm to the nucleus and thereby blocking STAT3's regulation of gene expression through direct binding to the promoters of responsive genes. STAT3 regulates the cellular functions that lead to the cancer phenotype, and constitutive activation of STAT3 is observed in a wide range of human cancers, inducing uncontrolled proliferation and neoplastic transformation.

**state function:** A property that depends only on the condition or "state" of the system, and not on the path used to obtain the current conditions. Energy, enthalpy, temperature, volume, pressure, and temperature are examples of state functions; heat and work are examples of non-state functions.

**state of matter:** There are three common states of matter: gases, liquids, and solids. States of matter differ in the way the molecules are arranged at the molecular level, but not in the structure of the molecules themselves. Other states (the plasma and Bose-Einstein condensate states) are uncommon on Earth.

**state property:** A state property is a quantity that is independent of how the substance was prepared. Examples of state properties are altitude, pressure, volume, temperature and internal energy.

**states of matter:** solid, liquid, and gas. Or Matter comes in many forms, shapes, and sizes. The big ones you should remember are solids, liquids, gases, and plasmas. Nearly all matter can be found in these four basic forms. Or Solid, liquid, gas and plasma. Plasma is a "soup" of disassociated nuclei and electrons, normally found only in stellar objects.

**Statex SR:** (Other name for: morphine sulfate)

**static correlation:** See "nondynamic correlation."

**Static electricity:** Buildup of stationary electrical charge on a coating powder or a coated surface.

**Static Eliminators:** Mechanical devices frequently used by plastic material manufacturers for removing electrical static charges from plastic articles.

**Static Mixer:** A helix like device that mixes two liquids by redirecting the flow path into each other repeatedly, common with RTV Silicone and some

liquid silicone rubber applications

**Static Seal:** A seal that, except for pulsations caused by cycle pressure, does not move in its environment

**Static-light scattering (SLS):** See Fraunhofer diffraction.

**statin :** Any of a group of drugs that lower the amount of cholesterol and certain fats in the blood. Statins inhibit a key enzyme that helps make cholesterol. Statin drugs are being studied in the prevention and treatment of cancer.

**Statins:** Inhibitors of HMG-coa reductase that are used to lower the plasma cholesterol level of people with atherosclerosis.

**station model:** a diagram on a weather map showing weather data from a specific city at a given time.

**stationary front:** initial boundary between two air masses.

**stationary phase:** A stationary phase is a substance that shows different affinities for different components in a sample mixture in a separation of the mixture by chromatography. The mobile phase (a solution containing the sample) flows over or through the stationary phase to effect the separation.

**STATIONARY PLATEN:** The plate of an injection or compression molding machine to which the front plate of the mold is secured during operation. This platen does not move during normal operation. OR ("a"). The platen at the injection end of the molding machine that does not travel. It contains the "a" half of the mold and locates the mold to the nozzle of the injection unit. The moving platen travels between this platen and stationary platen "b." OR The plate of an injection or compression molding machine to which the front plate of the mold is secured during operation. This platen does not move during normal operation. OR The large front plate of an injection molding press to which the front plate of the mold is secured. This platen does not move during normal operation.

**Statistical Process Control (SPC):** The use of statistical techniques on processes and their output to establish process stability and increase capabilities

**statistical-dynamical models:** Computer programs that calculate simplified climate models based on versions of the conservation equations that have been averaged over longitude, with the effects of the synoptic eddies parameterized statistically in the meridional plane.

**statistically significant :** Describes a mathematical measure of difference between groups. The difference is said to be statistically significant if it is greater than what might be expected to happen by chance alone. Also called significant.

**stature :** The height of a person while standing.

**staurosporine :** A drug that belongs to the family of drugs called alkaloids. It is being studied in the treatment of cancer.

**stavudine:** A synthetic nucleoside, analog of didehydro-3-deoxythymidine with potent antiretroviral activity. In vivo, stavudine is phosphorylated by cellular kinases to the active metabolite stavudine triphosphate; this metabolite inhibits the activity of HIV reverse transcriptase both by competing with the natural substrate deoxythymidine triphosphate and by incorporation into viral DNA causing a termination of DNA chain elongation (due to the lack the essential 3'-OH group). or A drug that belongs to the family of drugs called nucleoside analogs. It is used to treat infection caused by viruses.

**Stavzor :** A drug used to treat epileptic seizures and bipolar disorder and to prevent migraine headaches. It is also being studied in the treatment of several types of cancer. It blocks an enzyme that cells need to grow and may cause cancer cells to die. It also blocks the growth of new blood vessels that tumors need to grow. It is a type of anticonvulsant, histone deacetylase (HDAC) inhibitor, antimaniacal, migraine headache prophylactic, and antiangiogenesis agent. Also called Depakene and valproic acid.

**Stay time:** The period during which personnel may remain in a restricted area in a reactor before accumulating some permissible occupational dose.

**Steady state:** In enzyme-kinetic analysis, the time interval when the rate of reaction is approximately constant with time. The term is also used to describe the state of a living cell where the concentrations of many molecules are approximately constant because of a balancing between their rate of synthesis and breakdown. or In enzyme-kinetic analysis, the time interval when the rate of reaction is approximately constant with time. The term is also used to describe the state of a living cell where the concentrations of many molecules are approximately constant because of a balancing between their rate of synthesis and breakdown. or A

nonequilibrium state of a system through which matter is flowing and in which all components remain at a constant concentration.

**Steam generator:** The heat exchanger used in some reactor designs to transfer heat from the primary (reactor coolant) system to the secondary (steam) system. This design permits heat exchange with little or no contamination of the secondary system equipment.

**Stearamide:** A slip additive used by most plastic product distributors in polyolefins. It is used in process industries as release agents, antistatic agents, and antifoaming agents.

**steatosis:** describing the abnormal retention of lipids within a cell. It reflects an impairment of the normal processes of synthesis and elimination of triglyceride fat

**steel:** Steel is a metal composed mainly of iron, with a little carbon and sometimes other metals, mixed in. or An alloy of iron and carbon. Steel contains anywhere between 0.2% carbon (for soft wire and sheet steel) and 1.5% carbon (for cutting tools), with small amounts of many other elements often present.

**Steel (Metal) Safe:** Part design change will only require to remove metal from mold instead of “weld-add” metal on the mold.

**Steel pins:** A cylindrical pin for formatting high-aspect-ratio, small-diameter holes in a part. A steel pin is strong enough to handle the stress of ejection and its surface is smooth enough to release cleanly from the part without draft.

**Steel safe:** Also known as “metal safe” (which is the preferred term when working with aluminum molds). This refers to a change to the part design that requires only the removal of metal from the mold to produce the desired geometry. Typically most important when a part design is changed after the mold has been manufactured, because then the mold can be modified rather than entirely re-machined. OR Steel Safe Rule: Add Plastic = Removing Steel, Removing Plastic = Adding Steel (welding or inserting). When it comes to mold-making, you can always cut more metal away – making your plastic part larger, walls thicknesses wider, etc. – but adding metal back to the mold – removing walls, thinning features, etc.- can be extremely costly, and often times not possible.

**Stelara:** (Other name for: ustekinumab)

**Stelazine:** (Other name for: trifluoperazine hydrochloride)

**stellate :** Star shaped.

**Stem cell:** A cell from which other cells stem or arise by differentiation. Or A cell from which other cells stem or arise by differentiation. Or The common, self regenerating cells in bone marrow that give rise to differentiated blood cells such as erythrocytes and lymphocytes.

**stem cell :** A cell from which other types of cells develop. For example, blood cells develop from blood-forming stem cells.

**stem cell engraftment :** A process in which transplanted stem cells travel through the blood to the bone marrow, where they begin to make new white blood cells, red blood cells, and platelets. It usually happens within 2 to 4 weeks after a stem cell transplant. The transplanted stem cells may come from a donor or from the patient.

**stem cell factor :** A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. Stem cell factor is a type of cytokine and a type of growth factor. Also called kit ligand and SCF.

**stem cell factor receptor :** A protein found on the surface of many different types of cells. It binds to a substance called stem cell factor (SCF), which causes certain types of blood cells to grow. Stem cell factor receptor may also be found in higher than normal amounts, or in a changed form, on some types of cancer cells, including gastrointestinal stromal tumors and melanoma. Measuring the amount of stem cell factor receptor in tumor tissue may help diagnose cancer and plan treatment. Stem cell factor receptor is a type of receptor tyrosine kinase and a type of tumor marker. Also called c-kit and CD117.

**stem cell mobilization :** A process in which certain drugs are used to cause the movement of stem cells from the bone marrow into the blood. The stem cells can be collected and stored. They may be used later to replace the bone marrow during a stem cell transplant.

**stem cell rescue :** A method of replacing blood-forming stem cells that were destroyed by treatment with high doses of anticancer drugs or radiation therapy. The stem cells help the bone marrow recover and make healthy blood cells. A stem cell rescue may allow more chemotherapy or

radiation therapy to be given so that more cancer cells are killed. It is usually done using the patient's own stem cells that were saved before treatment. Also called rescue transplant.

**stem cell transplant :** A method of replacing immature blood-forming cells in the bone marrow that have been destroyed by drugs, radiation, or disease. Stem cells are injected into the patient and make healthy blood cells. A stem cell transplant may be autologous (using a patient's own stem cells that were saved before treatment), allogeneic (using stem cells donated by someone who is not an identical twin), or syngeneic (using stem cells donated by an identical twin).

**Stem-loop structure:** The simplest and most common structural motif found in single-stranded nucleic acids, formed when two complementary sequences within a single strand come together to yield a double-helical structure with an unpaired loop at the end of the helical region.

**Stemgen :** A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. It is being studied in the treatment of myelodysplasia. Stemgen is a type of recombinant stem cell growth factor. Also called ancestim, r-metHuSCF, and recombinant human methionyl stem cell factor.

**stent :** A device placed in a body structure (such as a blood vessel or the gastrointestinal tract) to keep the structure open.

**STEP:** Stands for "Standard for the Exchange of Product Model Data." It is a common format for exchanging CAD data.

**steradian:** A solid angle with vertex at the center of a sphere of radius  $r$  that encompasses an area of  $r^2$  on the surface of the sphere.

**Stereochemical:** The geometry of molecules, and the arrangement of their constituent atoms in space, is the subject matter of stereochemistry. What does that actually mean? In the nomenclature section, you will have encountered isomers with the same chemical formula but with the atoms arranged in a different order - such as the various forms of pentane. You will also have met cis and trans isomers of alkenes - these are compounds with the atoms in the same order, but with a different geometry and are simple examples of stereoisomers. A good general rule to follow is that any compound with a carbon centre bearing four different substituents can exist in different stereoisomers; such a carbon is called a chiral centre. The

original (and still one of the best) examples of stereoisomerism are the two forms of tartaric acid, discovered by Louis Pasteur. It can be hard to see from a picture, so if you can you should try to make models of the two species below and you will discover that they are not the same at all. or The spatial arrangement of atoms in molecules or compounds and the relation of spatial arrangement to the substance's properties.

**Stereochemistry:** A branch of chemistry that is concerned with the study of the relationship between chemical properties and the spatial arrangement of atoms and molecules in a compound. Or the study of the three-dimensional structure of molecules and how it affects their interactions. Or Stereochemistry is the study of how the properties of a compound are affected by the spatial positions of groups within its molecules. Stereochemistry is also concerned with determining the structure of stereoisomers.

**Stereocilium:** One of a bundle of 20 to 300 hairlike projections that protrude from hair cells; movements of a stereocilia initiate the hearing signal-transduction pathway by altering the polarization of hair cells.

**stereogenic center:** a central atom that has four different atoms or groups bonded to it; also called or .

**stereoisomer:** Molecules with the same atoms and bond structure, but different three dimensional arrangements of atoms. For example, the CH<sub>3</sub> groups in CH<sub>3</sub>CH=CHCH<sub>3</sub> can be placed on the same side of the double bond in one stereoisomer and on opposite sides in another. Or Two or more compounds with the same molecular formula and the same atom-to-atom arrangement, but with different arrangement of atoms in space. stereoisomeric (adjective) or compounds with the same molecular formula but different arrangement of their atoms in three-dimensional space. or Isomers that are nonsuperimposable mirror images of each other. or Isomers that are nonsuperimposable mirror images of each other. or Compounds that have the same composition and the same order of atomic connections, but different molecular arrangements.

**Stereolithography (SL):** SL uses an ultraviolet laser focused to a small point to draw on the surface of a liquid thermoset resin. Where it draws, the liquid turns to solid. This is repeated in thin, two-dimensional cross-sections that are layered to form complex three-dimensional parts.

**Stereolithography (SLA):** This form of 3D-printing utilizes a UV laser to cure photo-reactive liquid resin layer by layer into a solid form pre-defined by a 3D modeling file.

**Stereoscopic packing drawing:** A three-dimensional representation of a crystalline arrangement of molecules using side-by-side views at slightly different angles. These representation may be viewed unaided or by using special viewers.

**stereospecific:** the requirement of a specific stereochemical shape for a reaction to occur.

**stereotactic biopsy :** A biopsy procedure that uses a computer and a 3-dimensional scanning device to find a tumor site and guide the removal of tissue for examination under a microscope.

**stereotactic body radiation therapy :** A type of external radiation therapy that uses special equipment to position a patient and precisely deliver radiation to tumors in the body (except the brain). The total dose of radiation is divided into smaller doses given over several days. This type of radiation therapy helps spare normal tissue.

**stereotactic external-beam radiation therapy :** A type of external radiation therapy that uses special equipment to position the patient and precisely deliver radiation to a tumor. The total dose of radiation is divided into several smaller doses given over several days. Stereotactic external-beam radiation therapy is used to treat brain tumors and other brain disorders. It is also being studied in the treatment of other types of cancer, such as lung cancer. Also called stereotactic radiation therapy and stereotaxic radiation therapy.

**stereotactic injection :** A procedure in which a computer and a 3-dimensional scanning device are used to inject anticancer drugs directly into a tumor.

**stereotactic radiation therapy :** A type of external radiation therapy that uses special equipment to position the patient and precisely deliver radiation to a tumor. The total dose of radiation is divided into several smaller doses given over several days. Stereotactic radiation therapy is used to treat brain tumors and other brain disorders. It is also being studied in the treatment of other types of cancer, such as lung cancer. Also called stereotactic external-beam radiation therapy and stereotaxic radiation therapy.

**stereotactic radiosurgery :** A type of external radiation therapy that uses special equipment to position the patient and precisely give a single large dose of radiation to a tumor. It is used to treat brain tumors and other brain disorders that cannot be treated by regular surgery. It is also being studied in the treatment of other types of cancer. Also called radiation surgery, radiosurgery, and stereotaxic radiosurgery.

**stereotaxic radiation therapy :** A type of external radiation therapy that uses special equipment to position the patient and precisely deliver radiation to a tumor. The total dose of radiation is divided into several smaller doses given over several days. Stereotaxic radiation therapy is used to treat brain tumors and other brain disorders. It is also being studied in the treatment of other types of cancer, such as lung cancer. Also called stereotactic external-beam radiation therapy and stereotactic radiation therapy.

**stereotaxic radiosurgery :** A type of external radiation therapy that uses special equipment to position the patient and precisely give a single large dose of radiation to a tumor. It is used to treat brain tumors and other brain disorders that cannot be treated by regular surgery. It is also being studied in the treatment of other types of cancer. Also called radiation surgery, radiosurgery, and stereotactic radiosurgery.

**stereotaxis :** Use of a computer and scanning devices to create 3-dimensional pictures. This method can be used to direct a biopsy, external radiation, or the insertion of radiation implants.

**Steric:** Any effect that is caused simply by a chemical group physically getting in the way, rather than by any particular properties of that group, is called a steric effect. A good definition to keep in mind (Organic Chemistry, John McMurry , 1988) is that steric strain is the result of trying to force two objects to occupy the same space. Here is an interesting example of a steric effect.

**steric height:** The mean dynamic depth (or height) of the ocean for the month minus the annual mean dynamic depth for the same isobaric reference level.

**steric hindrance:** the ability of bulky groups on carbon atoms to prevent or restrict a reagent from reaching a reaction site. Or the blocking of one side of a molecule by a substituent so that any further bonding must occur

on the opposite side. Steric hindrance causes the formation of trans stereoisomers.

**Steric Shield:** In drug design, steric shields are bulky groups added to metabolically vulnerable parts of the drug in order to slow down metabolism.

**sterile :** Unable to produce children. Also means free from germs.

**Sterile Talc Powder:** (Other name for: talc)

**sterile talc powder :** A mineral, usually used in a powdered form. In cancer treatment, sterile talc powder is used to prevent pleural effusions (an abnormal collection of fluid in the space between the lungs and the chest wall). Sterile talc powder is inserted into the space, causing it to close up, so fluid cannot collect there. Also called talc.

**Sterilise:** The treatment of surfaces to kill off organic growth such as mould or algae prior to painting.

**Steritalc:** (Other name for: talc)

**sternum :** The long flat bone that forms the center front of the chest wall. The sternum is attached to the collarbone and the first seven ribs. Also called breastbone.

**Steroid:** Steroids are lipids that are based on the cholesterol molecule. Steroids have three six-carbon rings, one five-carbon ring, and a side chain of some type. They are often used as hormones in organisms. Some steroids you may know are cholesterol, progesterone, or testosterone.

**steroid :** Any of a group of lipids (fats) that have a certain chemical structure. Steroids occur naturally in plants and animals or they may be made in the laboratory. Examples of steroids include sex hormones, cholesterol, bile acids, and some drugs.

**steroid cream :** A skin cream containing a type of drug that relieves swelling, itching, and inflammation.

**steroid drug :** A type of drug used to relieve swelling and inflammation. Some steroid drugs may also have antitumor effects.

**Steroid hormones:** Hormones, such as androgen and estrogen, derived from cholesterol.

**steroid metabolism gene :** A type of gene that helps the body build up or break down steroids. Steroids may be made by the body (such as hormones

and cholesterol) or made in a laboratory (such as drugs). A steroid metabolism gene called CYP17 is being studied in breast, ovarian, and uterine cancers.

**steroid sulfatase inhibitor BN 83495:** An orally bioavailable tricyclic coumarin-based sulfamate with potential antineoplastic activity. Steroid sulfatase inhibitor BN 83495 selectively binds to and inhibits steroid sulfatase (STS), which may inhibit the production of locally active estrogens and so inhibit estrogen-dependent cell growth in tumor cells, such as those of the breast, ovary, and endometrium. STS is a cytoplasmic enzyme responsible for the conversion of circulating inactive estrone sulfate and estradiol sulfate to biologically active unconjugated estrone and estradiol, respectively.

**steroid therapy :** Treatment with corticosteroid drugs to reduce swelling, pain, and other symptoms of inflammation.

**steroids:** Compounds containing a 17-carbon, four-ring system. Or Compounds that are derivatives of a tetracyclic structure composed of a cyclopentane ring fused to a substituted phenanthrene nucleus. Or Compounds that are derivatives of a tetracyclic structure composed of a cyclopentane ring fused to a substituted phenanthrene nucleus.

**Sterol regulatory element binding protein (SREBP):** A transcription factor that binds to the sterol regulatory element of the HMG-coa reductase gene and other genes in cholesterol metabolism to stimulate their transcription.

**sterols:** A class of lipids containing the steroid nucleus.

**STI571:** A drug used to treat different types of leukemia and other cancers of the blood, gastrointestinal stromal tumors, skin tumors called dermatofibrosarcoma protuberans, and a rare condition called systemic mastocytosis. It is also being studied in the treatment of other types of cancer. STI571 blocks the protein made by the bcr/abl oncogene. It is a type of tyrosine kinase inhibitor. Also called Gleevec and imatinib mesylate.

**Stickiness:** There's only one thing for it. Completely remove all existing material and carefully clean down the surfaces. Allow to dry, then reapply coating.

**Sticking:** A problem during the ejection phase of molding, where a part becomes lodged in one or the other half of the mold, making removal

difficult. This is a common issue when the part is not designed with sufficient draft.

**sticky ends:** Two DNA ends in the same DNA molecule, or in different molecules, with short overhanging single-stranded segments that are complementary to one another, facilitating ligation of the ends; also known as cohesive ends.

**Stiffness:** The capacity of a material to resist elastic displacement under stress. OR The capacity of a material to resist strain where stressed.

**Stilbestrol:** (Other name for: diethylstilbestrol)

**Stilbetin:** (Other name for: diethylstilbestrol)

**Stilboestroform:** (Other name for: diethylstilbestrol)

**Stilboestrol:** (Other name for: diethylstilbestrol)

**Stile:** The vertical part of any framing into which the horizontal rails are fixed by mortices and tenons.

**Stimate:** (Other name for: desmopressin acetate)

**Stimulation :** Oil well stimulation is the general term describing a variety of operations performed on a well to improve its productivity. Its main two types of operations are matrix acidization and hydraulic fracturing.

**Stimuvax:** (Other name for: emepepimut-S)

**STING-activating cyclic dinucleotide agonist ADU-S100:** A synthetic, cyclic dinucleotide (CDN) and agonist of stimulator of interferon genes protein (STING; transmembrane protein 173; TMEM173), with potential immunomodulating and antineoplastic activities. Upon intratumoral administration, the STING agonist MIW815 binds to STING and stimulates STING-mediated pathways. This activates the immune response through the activation of certain immune cells, including dendritic cells (DCs), which induces the expression of cytokines and chemokines, and leads to an antigen-specific T-cell mediated immune response against cancer cells. STING, a transmembrane protein that activates immune cells in the tumor microenvironment, plays a key role in the activation of the innate immune system.

**Stipple:** A method of evening out a coat of paint by dabbing or lightly beating out the surface immediately after application with a special brush (stippler). Hence the texture or appearance of a paint surface so treated.

**Stitch lines:** Also known as “weld lines” or “knit lines,” and when multiple gates are present, “meld lines.” These are imperfections in the part where separated flows of cooling material meet and rejoin, often resulting in incomplete bonds and/or a visible line.

**Stivarga :** A drug used to treat colorectal cancer that has spread to other parts of the body and has not gotten better with other treatment. It is also used to treat gastrointestinal stromal tumors (GIST) that cannot be removed by surgery or have spread to other parts of the body and have not gotten better with other anticancer drugs. It is being studied in the treatment of other types of cancer. Stivarga blocks the action of certain proteins, which may help keep cancer cells from growing and may kill them. It may also prevent the growth of new blood vessels that tumors need to grow. Stivarga is a type of kinase inhibitor and a type of antiangiogenesis agent. Also called regorafenib.

**STL:** Originally stood for “STereoLithography.” It is a common format for transmitting CAD data to rapid prototyping machines and is not suitable for injection molding.

**STO:** Slater-type orbital. Basis function with an exponential radial function, i.e.,  $\exp(-\zeta r)$ . Also used to denote a fit to such a function using other functions, such as gaussians. For example, STO-3G is an MBS that uses 3 gaussians to fit an exponential. Exponentials are probably better basis functions than gaussians, but are so much more difficult computationally that they were abandoned by most people a long time ago.

**STO-3G:** The most popular MBS (see MBS and STO).

**stochastic effect:** Effect for which the probability of occurrence depends on the absorbed dose. Hereditary effects and cancer induced by radiation are considered to be stochastic effects (ICRP, 1977). The term “stochastic” indicates that the occurrence of effects so named would be random. This means that, even for an individual, there is no threshold of dose below which the effect will not appear, but the chance of experiencing the effect increases with increasing dose (WHO, 1979). or Effects that occur by chance, generally occurring without a threshold level of dose, whose probability is proportional to the dose and whose severity is independent of the dose. In the context of radiation protection, the main stochastic effects are cancer and genetic effects.

**stock:** a pluton that occupies less than 100 square kilometers at the earth's surface.

**Stoichiometric:** If you can spell this word, you're a real chemist. To paraphrase the IUPAC definition, stoichiometry is the relationship between the amounts of reactants reacted and the amounts of products produced. An equation that says that "Two moles of X reacts with one mole of Y to make three moles of Z" is a stoichiometric equation. We have rarely known anyone to use this word when they were not showing off. or refers to compounds or reactions in which the components are in fixed, whole-number ratios.

**stoichiometric coefficient:** The coefficients given before substances in a balanced chemical equation. For example, the stoichiometric coefficient of carbon dioxide in the following reaction is 4:

**stoichiometry:** The study of the relationships between amounts of products and reactants. Or The study of the quantitative relationships between reactants and products. Or 1. Ratios of atoms in a compound. 2. Ratios of moles of compounds in a reaction. 3. A branch of chemistry that quantitatively relates amounts of elements and compounds involved in chemical reactions, based on the law of conservation of mass and the law of definite proportions.

**Stokes shift :** the difference in wavelength between the apex of the excitation spectrum (shorter wavelength, higher energy) and the apex of the emission spectrum (longer wavelength, lower energy).

**stoma :** A surgically created opening from an area inside the body to the outside.

**stoma, plant stomata:** A minute pore in the epidermis of plant leaves or stems. Stoma, which are bordered by guard cells that regulate the size of the opening, function in gas exchange between the plant and the external environment. The stomatal apparatus or stomate consists of the stoma plus guard cells.

**stomach :** An organ that is part of the digestive system. The stomach helps digest food by mixing it with digestive juices and churning it into a thin liquid.

**stomach acid stimulation test :** A test used to measure the amount of gastric acid made by the stomach. The patient receives an injection of the

hormone gastrin or insulin. A tube is put through the nose or throat into the stomach and samples are taken from the stomach and sent to a laboratory for testing. Also called gastric acid secretion test and stomach acid test.

**stomach acid test :** A test used to measure the amount of gastric acid made by the stomach. The patient receives an injection of the hormone gastrin or insulin. A tube is put through the nose or throat into the stomach and samples are taken from the stomach and sent to a laboratory for testing. Also called gastric acid secretion test and stomach acid stimulation test.

**stomach cancer :** Cancer that forms in tissues lining the stomach. Also called gastric cancer.

**stomata:** the pores within leaves surrounded by guard cells that regulate the rate of gas exchange, which regulates the rate of photosynthesis. (Singular, stoma.)

**stomatitis :** Inflammation or irritation of the mucous membranes in the mouth.

**stool :** The material in a bowel movement. Stool is made up of undigested food, bacteria, mucus, and cells from the lining of the intestines. Also called feces.

**stool guaiac test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards coated with a chemical substance called guaiac and sent to a doctor or laboratory for testing. A testing solution is put on the cards and the guaiac causes the stool sample to change color. If there is blood in the stool, the color changes very quickly. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called gFOBT, guaiac fecal occult blood test, and guaiac smear test.

**stool test :** A test to check for hidden blood in the bowel movement.

**Stop codons:** A set of codons that are recognized by release factors and mark the end of translation. Or See termination codons.

**Stopping:** The action of filling up joints, deep imperfections or holes in a surface before painting.

**STORAGE MODULUS (denoted as  $G'$ ):** The ratio of shear stress to strain (deformation) when dynamic (sinusoidal) deformation is applied in a cone-and-plate rheometer. It relates to the elasticity of the polymer melt.  $G''$ , the loss modulus, also determined in dynamic (sinusoidal)

measurements relates to the viscous behaviour. So,  $G'$  and  $G''$  together give an idea of the dual nature of the polymer melt (partly elastic solid and partly viscous fluid). Measurements of  $G'$  and  $G''$  provide information on polymer structure and might be related to molecular weight distribution, cross-linking, etc.. Computer software like RHEOMWD can infer the breadth of the molecular weight distribution from  $G'$  and  $G''$  data.

**Storage stability:** The ability of a coating material to maintain uniform physical and chemical properties while in storage over an extended period of time.

**storm surge:** bubble of water carried by a hurricane, causing coastal flooding.

**Stoving:** The process of drying and hardening a paint coating by heating in an oven or other apparatus.

**Stoxil:** (Other name for: idoxuridine)

**STP:** Standard temperature and pressure. This is 0°C and 1 atm. Or Used to describe a substance at standard pressure and a temperature of 0°C (273.15 K).

**strabismus:** a disorder in which the eyes do not line up in the same direction when focusing

**straight angle:** an angle equal to 180°. Often called a line.

**straight colorectal anastomosis :** A surgical procedure in which the colon is attached directly to the remainder of the rectum after most of it has been removed during surgery for rectal cancer. This procedure is different from the J-pouch colorectal anastomosis because a pouch to store stool is not made from the colon before it is attached to the rectum.

**straight line:** often described as the shortest distance between two points. Continues forever in both directions. (Line means straight line.)

**Straight Pull:** No side actions.

**straight-chain alkane:** a saturated hydrocarbon that has no carbon-containing side chains.

**Straight-pull mold:** A mold that uses only two halves to form a cavity that resin is injected into. Generally, this term refers to molds with no side-actions or other special features used to resolve undercuts.

**Straight-sided Round:** A round bottle with straight side walls from shoulder to base.

**strain:** a change in the volume and/or shape of a rock because of stress. Or In tensile testing, the ratio of the elongation to the gage length of the test specimen, that is, the change in length per unit of original length. The term is also used in a broader sense to denote a dimensionless number that characterizes the change in dimensions of an object during a deformation or flow process.

**Strain Relief:** A type of fitting that prevents a kink to form at the point where the fitting and tube or hose meet. Particularly useful in situations where the maximum working length of the tube is frequently met.

**Strand:** An assembly of parallel filaments simultaneously produced and lightly bonded, without intentional twist.

**Strand,  $\beta$ :** An extended polypeptide chain, with an axial distance of 3.5 Å between adjacent amino acids, often found in a  $\beta$  pleated sheet.

**stratification:** The process of or result of separating a sample into several subsamples according to specified criteria such as age groups, socioeconomic status, etc. The effect of confounding variables may be controlled by stratifying the analysis of results. For example, lung cancer is known to be associated with smoking. To examine the possible association between urban atmospheric pollution and lung cancer, controlling for smoking, the population may be divided into strata according to smoking status. The association between air pollution and cancer can then be appraised separately within each stratum. Stratification is used not only to control for confounding effects but also as a way of detecting modifying effects. In this example, stratification makes it possible to examine the effect of smoking on the association between atmospheric pollution and lung cancer (Last, 1988).

**stratified sampling:** Of a population which can be divided into different subpopulations (called strata), sampling carried out in such a way that specific proportions of the sample are drawn from the different strata (ISO, 1977).

**stratigraphic trap:** a naturally occurring change in a sedimentary sequence that traps migrating oil and gas; examples include a lens of sandstone in a larger bed of shale or a porous reef structure in a limestone unit.

**stratopause:** the region between the stratosphere and the mesosphere. Or The layer of the earth's atmosphere that extends from roughly 7 miles (11 km) above the surface to 31 miles (50 km) above the surface. Or the layer of the atmosphere above the troposphere; temperature increases with altitude. or The region of the upper atmosphere extending from the tropopause (8 to 15 km altitude) to about 50 km. The thermal structure is determined by its radiation balance and is generally very stable with low humidity.

**Strattera:** (Other name for: atomoxetine hydrochloride)

**stratus:** layered, sheet-like clouds, usually associated with warm fronts and found at lower altitudes.

**strawberry-blackberry-black raspberry-blueberry berry mixture:** A dietary supplement consisting of a mixture of strawberries, blackberries, black raspberries and blueberries with potential antineoplastic activity. Although the exact mechanism of action through which berries may exert their anti-tumor effect has yet to be elucidated, in vivo studies suggest that the ingestion of a mixture of berries seems to result in a reduction in tumor growth and tumor development. As berries are rich in phytonutrients, such as anthocyanins, flavonols, ellagitannins, galltannins, proanthocyanidins, and phenolic acids, the antineoplastic effects of strawberry-blackberry-black raspberry-blueberry berry mixture on cancer cells may be attributable to phytonutrient antioxidant and apoptotic activities. In addition, phytoestrogens in berries may be protective against estrogen-sensitive tumors.

**streak:** the color of the powder left behind when a mineral is rubbed along an unglazed porcelain tile.

**STREAKING:** The irregular occurrence of lines or streaks of various lengths and colors in an applied film; usually caused by some form of contamination.

**stream base level:** the elevation of a stream's most horizontal flow and lowest velocity.

**stream capacity:** the total load of sediment a stream is capable of carrying.

**stream competence:** a measure of the largest-sized particle a stream can transport.

**stream discharge:** the volume of water that flows past a certain point in a certain amount of time.

**stream gradient:** the downhill slope of a channel; typically measured in feet per mile.

**stream terrace:** a steplike bench that occurs above a stream bed and floodplain and that is cut into bedrock or is a remnant of older river sediments that have since been eroded.

**stream valley:** a topographically low area, typically centered on a stream, that is produced by mass wasting and erosion.

**stream velocity:** the speed at which a stream flows.

**streptavidin:** An extracellular protein that has four high affinity binding sites for biotin. Streptavidin is widely utilized in fluorescence microscopy applications due to the ease with which a conjugate fluorescent moiety can be coupled to the protein. Check for active clinical trials using this agent. OR A small bacterial protein that binds with high affinity to the vitamin biotin. This streptavidin-biotin combination can be used to link molecules such as radioisotopes and monoclonal antibodies together. These bound products have the property of being attracted to, and attaching to, cancer cells, rather than normal cells. The radiolabeled products are more easily removed from the body, thus decreasing their toxicity.

**Streptomycin:** A highly basic trisaccharide antibiotic that causes both the inhibition of translational initiation and the misreading of mRNA in prokaryotes.

**streptonigrin:** An aminoquinone antineoplastic antibiotic isolated from the bacterium *Streptomyces flocculus*. Streptonigrin complexes with DNA and topoisomerase II, resulting in DNA cleavage and inhibition of DNA replication and RNA synthesis. This agent also acts as a reverse transcriptase inhibitor and causes free radical-mediated cellular damage. Check for active clinical trials using this agent.

**streptozocin:** A methyl nitrosourea antineoplastic antibiotic isolated from the bacterium *Streptomyces achromogenes*. Streptozocin alkylates DNA, forming inter-strand DNA cross-links and inhibiting DNA synthesis. Due to its glucose moiety, this agent is readily taken up by pancreatic beta cells, inducing diabetes mellitus at high concentrations. Unlike other nitrosoureas, streptozocin causes little myelosuppression. Check for active clinical

trials using this agent. or An anticancer drug that belongs to the family of drugs called alkylating agents.

**Stress:** In the science called rheology (the study of how materials flow and deform), stress is the force applied to a material and strain is the resulting movement of the material. A simple practical exercise is to measure the length of a rubber band 'at rest', then suspend an object of known weight from it (stress) and measure the change in its length (strain). Try adding bigger and bigger weights, and you may discover something originally discovered by Sir Isaac Newton. or an applied force (usually tectonic) that tends to physically alter a rock mass. or The force producing or tending to produce deformation divided by the area over which the force is applied. As generally defined in tensile testing (engineering stress), stress is the ratio of applied load to the original cross-sectional area. OR Force per original cross section that is applied to a specimen OR The force causing deformation in a plastic material measured by the force applied per unit area. OR A resistance to deformation from an applied force Molded plastic products tend to contain stresses molded in as a result of forces applied during the injection process These stresses may result in fractures, cracks, and breakage if they are released during use of the product.

**stress :** In medicine, the body's response to physical, mental, or emotional pressure. Stress causes chemical changes in the body that can raise blood pressure, heart rate, and blood sugar levels. It may also lead to feelings of frustration, anxiety, anger, or depression. Stress can be caused by normal life activities or by an event, such as trauma or illness. Long-term stress or high levels of stress may lead to mental and physical health problems.

**Stress Corrosion Cracking :** The fracture of a metal in a corrosive environment. Austenitic stainless steel belts are susceptible to a phenomenon known as "Stress Corrosion Cracking" under certain conditions.

**Stress Crack:** A crack, either external or internal, in a plastic caused by tensile stresses less than its short-time mechanical strength. Or External or internal cracks in a plastic caused by tensile stresses less than that of its short-time mechanical strength. Note The development of such cracks is frequently accelerated by the environment to which the plastic is exposed.

**Stress Cracking :** There are three types of stress cracking 1. Thermal stress cracking is caused by prolonged exposure of the part to elevated

temperatures or sunlight. 2. Physical stress cracking occurs between crystalline and amorphous portions of the part when the part is under an internally or externally induced strain. 3. Chemical stress cracking occurs when a liquid or gas permeates the part's surface. All of these types of stress cracking have the same end result the splitting or fracturing of the molding. OR A crack, either external / internal, in a plastic part caused by tensile stress less than its short time mechanical strength. The moulded-in stress left in the moulded part - due to unbalanced filling, over packing or non uniform freezing - can fail in service condition. The service environment can have objectionable temperature or contact with aggressive chemicals causing the plastic part to fail. Avoiding or minimising moulded-in stress in plastic part can increase the performance of part even under adverse condition.

**stress protein :** One of a group of proteins that help protect cells from stresses such as heat, cold, and low amounts of oxygen or glucose (sugar). Stress proteins help other proteins function in normal cells and may be present at high levels in cancer cells. Blocking the activity of a stress protein called HSP90 is being studied in the treatment of cancer. Other stress proteins including HSP70 and gp96 are being studied in vaccines to treat cancer. Also called heat-shock protein and HSP.

**Stress Relaxation:** The decay of stress at a constant strain. OR Decreasing stress with constant strain over a given time interval or viscoelastic response

**Stress-Strain Curve :** The curve plotting the applied stress on a test specimen versus the corresponding strain. Stress can be applied through shear, compression, flexure, or tension.

**Stretch Forming:** A plastic sheet forming technique in which the heated thermoplastic sheet is stretched over a mold and subsequently cooled.

**Stretcher:** A stone or brick laid so that its length is in the line of the face of the wall. Opposite to 'header'.

**striated muscle:** skeletal muscle fiber that appears to be banded due to the presence of overlapping actin and myosin filaments; also called voluntary muscle.

**striations:** parallel scratches on the Earth's surface caused by rocks dragged by a glacier; the scratches point in the direction of the glacial movement. Or A separation of colors resulting in a linear effect of color

variation. OR Rippling of thick parisons, caused by a local orientation effect in the melt by the spider legs. OR A separation of colors resulting in a linear effect of color variation. OR Marks evident on the molded-part surfaces that indicate melt flow directions or impingement.

**strike:** the compass bearing of the line formed by the intersection of a tilted bedding plane with the horizontal plane.

**Strike Plate:** A kind of cutting board for thermoforming plastics. What the cutter strikes against.

**strike-slip fault:** a fault in which the blocks on either side of the fault move horizontally in relation to each other, parallel to the strike of the fault. Or a fault where rock plates move horizontally to each other.

**String course:** A projecting course of stone or brick continued horizontally along the face of a wall.

**Stringent response:** In bacteria, a decrease in the rate of ribosomal and transfer RNA synthesis in response to a scarcity of amino acids.

**Stringing:** The supporting board of a staircase farthest from the wall.

**Strings:** Strings of material due to poor gate cut off. See pulled gate.

**STRIP:** Removal of old finishes with paint removers.

**Strip Sizes :** Strip sizes for flat wire and Omniflex are generally supplied in dimensions within the accepted tolerances of flat wire manufacturers. Strip sizes also designates the height and thickness of a flat wire strip.

**Stripper Plate:** A plate that strips a molded piece from core pins or force plugs. The stripper plate is set into operation by the opening of the mold. OR A plate that strips a molded plastic or liquid silicone rubber part from core pins

**Stripping:** A process in which a liquid containing a dissolved gas flows down a column and a gas (stripping gas) flows up the column at conditions such that the dissolved gas comes out of solution and is carried off with the stripping gas. Or The removal of old paint or paper. or Stripping is a technique for removing volatile components in a mixture by bubbling a stream of an chemically unreactive gas (like nitrogen) through the sample, and then 'scrubbing' the nitrogen through a solution or solid adsorbent that can recover the volatile materials.

**stroke :** In medicine, a loss of blood flow to part of the brain, which damages brain tissue. Strokes are caused by blood clots and broken blood

vessels in the brain. Symptoms include dizziness, numbness, weakness on one side of the body, and problems with talking, writing, or understanding language. The risk of stroke is increased by high blood pressure, older age, smoking, diabetes, high cholesterol, heart disease, atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries), and a family history of stroke. Also called cerebrovascular accident and CVA.

**Stroma:** The matrix of the chloroplast; contains thylakoids as well as soluble enzymes and is enclosed by the inner membrane of the chloroplast. Or The space and aqueous solution enclosed within the inner membrane of a chloroplast, not including the contents within the thylakoid membranes.

**Stromagen :** A product that is made of special stem cells taken from a patient's bone marrow and grown in the laboratory. After a patient's bone marrow is destroyed by treatment with whole body irradiation or chemotherapy, these cells are injected back into the patient to help rebuild bone marrow. Stromagen has been studied in the prevention of graft-versus-host disease during stem cell transplant in patients receiving treatment for cancer. Stromagen is used in cellular therapy. Also called autologous expanded mesenchymal stem cells OTI-010.

**stromal cell :** A type of cell that makes up certain types of connective tissue (supporting tissue that surrounds other tissues and organs).

**stromal tumor :** A tumor that arises in the supporting connective tissue of an organ.

**strong acid:** A strong acid is an acid that completely dissociates into hydrogen ions and anions in solution. Strong acids are strong electrolytes. There are only six common strong acids: HCl (hydrochloric acid), HBr (hydrobromic acid), HI (hydroiodic acid), H<sub>2</sub>SO<sub>4</sub> (sulfuric acid), HClO<sub>4</sub>(perchloric acid), and HNO<sub>3</sub> (nitric acid).

**strong base:** A strong base is an base that completely dissociates into ions in solution. Strong bases are strong electrolytes. The most common strong bases are alkali metal and alkaline earth metal hydroxides.

**Strong Electrolyte:** A strong electrolyte is compound that ionizes one hundred percent in solution. Strong acids, bases, and salts are all strong electrolytes. Or an acid, base, or salt that dissociates almost completely to ions in aqueous solution. Or A strong electrolyte is a solute that completely dissociates into ions in solution. Solutions of strong electrolytes conduct electricity. Most soluble ionic compounds are strong electrolytes.

**strong ligand:** A ligand that causes a large crystal field splitting which results in a low-spin complex.

**Strontium:** Symbol:"Sr" Atomic Number:"38" Atomic Mass: 87.62amu. This element is a member of the alkaline metals family. Strontium is grouped with other barium-like minerals. It is reactive and oxidizes quickly, becoming a yellowish color. You may find it in magnets, TV tubes, and nuclear reactors.

**strontium :** A metal often used in a radioactive form for imaging tests and in the treatment of cancer.

**strontium chloride Sr 89:** The chloride salt of a radioactive isotope of strontium. Strontium chloride Sr 89 is taken up and incorporated preferentially in metastatic lesions in bone where it emits cytotoxic beta radiation, resulting in an inhibition and/or reduction of tumor growth and so tumor-related bone pain. or A salt form of the radioactive metal strontium-89 that is absorbed by a part of growing bone. It is being studied in the treatment of bone pain caused by cancer that has spread to the bone.

**strontium ranelate :** A substance that is being studied in the treatment of osteoporosis in postmenopausal women. Strontium ranelate helps new bone tissue to grow and decreases bone loss. This lowers the risk of bone fractures.

**strontium-89 :** A radioactive form of the metal strontium that is taken up by a part of growing bone. It is being studied in the treatment of bone pain caused by some types of cancer.

**structural basin:** a variation of a syncline in which all the beds dip inward toward the center of the basin.

**Structural biology:** A branch of biology dedicated to the study of the three-dimensional structures of proteins and other molecules to help understand the function of these molecules in the cell

**Structural domain:** An element of protein tertiary structure that forms an independent folding unit. Or An element of protein tertiary structure that forms an independent folding unit.

**structural dome:** a variety of anticline, a feature of which is that the central area has been warped and uplifted and all the surrounding rock units dip away from the center.

**Structural Foam:** The process of molding thermoplastics articles with a cellular core and integral solid skins in a single operation.

**Structural Foam Molding :** The process of molding thermoplastics articles with a cellular core and integral solid skins in a single operation.

**structural formula:** depicts the bonding of atoms in a molecule. Or a chemical formula that shows not only the number and kind of atoms in a molecule but also their arrangement. Or A structural formula is a diagram that shows how the atoms in a molecule are bonded together. Atoms are represented by their element symbols and covalent bonds are represented by lines. The symbol for carbon is often not drawn. Most structural formulas don't show the actual shape of the molecule (they're like floor plans that show the layout but not the 3D shape of a house).

**Structural formula** : This is sometimes called a displayed formula. It shows the arrangement of the atoms within a molecule. When drawing the structural formula for a hydrocarbon, remember that all carbon atoms must have four bonds and every hydrogen atom has only one bond.

**Structural gene:** A gene encoding the amino acid sequence of a polypeptide chain. Or A gene encoding the amino acid sequence of a polypeptide chain. Or A gene coding for a protein or RNA molecule; as distinct from a regulatory gene.

**structural geology:** the study of the processes that result in the formation of geologic structures.

**structural isomer:** also known as a constitutional isomer, structural isomers have the same molecular formula but different bonding arrangements among their atoms. For example, C<sub>4</sub>H<sub>10</sub> can be butane or 2-methylpropane, and C<sub>4</sub>H<sub>8</sub> can be 1-butene or 2-butene.

**Structural protein:** A protein that serves a structural function.

**structural trap:** a structure such as a fault between reservoir rocks and impermeable rocks, a thrust fault, or a fold such as an anticline that traps migrating petroleum.

**Structure factor:** The intensity and phase of a diffracted X-ray by a unit cell denoted by F or F(hkl).

**Structure-Activity Relationships (SAR):** SAR studies explore the relationship between a molecule's biological activity and the three dimensional structure of the molecule.

**Structured Light 3-D Scanner:** A 3D scanning device for measuring the three-dimensional shape of an object using projected light patterns and a camera system.

**Stucco:** A smooth-surfaced cement or rendering applied to external walls, especially if it resembles stone.

**study agent :** A medicine, vitamin, mineral, food supplement, or a combination of them that is being tested in a clinical trial.

**Sturge-Weber syndrome :** A rare, congenital disorder that affects the brain, skin, and eyes. Abnormal blood vessel growth occurs in the trigeminal nerve in the face and the meninges (covering) of the brain. This abnormal growth causes red or purple skin discoloration (sometimes called a port wine stain), usually on one side of the face, and can also cause seizures, learning disabilities, and glaucoma. Also called SWS.

**Styrene:** Styrene (also known as vinyl benzene, ethenylbenzene) is a colourless liquid in the Aromatics family. Styrene is a chemical intermediate made from the dehydration of ethyl benzene and a vinyl group on styrene molecule can readily undergo polymerization. Styrene is a monomer used in the production of variety of polymer and rubbers including: polystyrene, ABS, SBR, SBL, and unsaturated polyesters. or One of the most common monomers used to make chain-growth polymers. It also seems to be the one that everyone studies lots: 'If it works for styrene it must be true for all monomers...' (famous trap). or Styrene is the key building block for styrenic polymers. This includes materials such as Polystyrene, ABS, EPS or Expandable polystyrene, to name but a few. Plastic manufacturers use styrene-based resins to produce a wide variety of everyday goods ranging from cups and utensils to furniture, bathroom, and kitchen appliances, hospital and school supplies, boats, sports and recreational equipment, consumer electronics, automobile parts, and durable lightweight packaging of all kinds. OR An unsaturated monomer, widely used with polyester resins.

**Styrene-Acrylonitril (SAN):** A styrene derivative that offers the clarity and rigidity of polystyrene in an engineering grade plastic. SAN has superior barrier properties, as well as improved chemical resistance when compared to polystyrene.

**Styrenics family:** The Styrenics chain includes the chemical products and polymers that can be produced from the styrene monomer. Ethylbenzene,

the immediate precursor used in the production of styrene is also included in this grouping.

**SU006668:** A substance being studied in the treatment of cancer. SU006668 blocks proteins involved in the growth and spread of cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called orantinib and SU6668.

**SU011248:** A drug used to treat certain types of pancreatic cancer. It is also used to treat gastrointestinal stromal tumors (GIST) in some patients and to treat advanced kidney cancer. It is being studied in the treatment of other types of cancer. SU011248 stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called SU11248, sunitinib, sunitinib malate, and Sutent.

**SU014813:** An orally-active, tyrosine kinase receptor inhibitor with potential antitumor activity. SU014813 binds to and inhibits the phosphorylation of vascular endothelial growth factor receptor 2 (VEGFR2), platelet-derived growth factor receptor (PDGFR) alpha and beta, c-Kit and Fms-related tyrosine kinase 3 (Flt-3). This leads to an inhibition of cellular proliferation and angiogenesis and an induction of apoptosis.

**SU101:** An anticancer drug that works by inhibiting a cancer cell growth factor. Also called leflunomide.

**SU11248:** A drug used to treat certain types of pancreatic cancer. It is also used to treat gastrointestinal stromal tumors (GIST) in some patients and to treat advanced kidney cancer. It is being studied in the treatment of other types of cancer. SU11248 stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called SU011248, sunitinib, sunitinib malate, and Sutent.

**SU5416:** A substance that has been studied in the treatment of cancer. It belongs to the families of drugs called angiogenesis inhibitors and tyrosine kinase inhibitors. Also called semaxanib.

**SU6668:** A substance being studied in the treatment of cancer. SU6668 blocks proteins involved in the growth and spread of cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is

a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called orantinib and SU006668.

**subacute toxicity test:** An animal experiment serving to study the effects produced by the test material when administered in repeated doses (or continuously in food, drinking water) over a period of up to about 90 days (WHO, 1979).

**subarachnoid block :** A temporary loss of feeling in the abdomen and/or the lower part of the body. Special drugs called anesthetics are injected into the fluid in the lower part of the spinal column to cause the loss of feeling. The patient stays awake during the procedure. It is a type of regional anesthesia. Also called SAB, spinal anesthesia, and spinal block.

**subatomic particles:** a component of an atom; either a proton, neutron, or electron.

**subbituminous coal:** weakly metamorphosed, black, soft, sooty coal.

**Subcritical mass:** An amount of fissionable material insufficient in quantity or of improper geometrical configuration to sustain a fission chain reaction.

**Subcriticality:** The condition of a nuclear reactor system, in which nuclear fuel no longer sustains a fission chain reaction (that is, the reaction fails to initiate its own repetition, as it would in a reactor's normal operating condition). A reactor becomes subcritical when its fission events fail to release a sufficient number of neutrons to sustain an ongoing series of reactions, possibly as a result of increased neutron leakage or poisons.

**subcutaneous :** Beneath the skin.

**subcutaneous port :** A tube surgically placed into a blood vessel and attached to a disk placed under the skin. It is used for the administration of intravenous fluids and drugs; it can also be used to obtain blood samples.

**subducting plate:** crustal plate which collides with another plate and moves under it.

**subduction:** the process by which oceanic crust is pushed against, and finally underneath, continental or oceanic crust.

**subduction boundary:** a convergent boundary marked by the oceanic crust of one plate that is being pushed downward beneath the continental or oceanic crust of another plate.

**subduction zone:** the gently dipping zone along which subduction occurs.

**subependymal** : Describes the layer of cells just under the ependyma (the thin membrane that lines the fluid-filled spaces in the brain and spinal cord).

**subependymal giant cell astrocytoma** : A benign (not cancer), slow-growing tumor that usually forms in the walls of fluid-filled spaces in the brain. The tumors are made up of large, star-shaped cells called astrocytes. Subependymal giant cell astrocytomas are common in patients with tuberous sclerosis (an inherited disorder in which benign tumors form in the brain and other parts of the body). Also called SEGA.

**suberoylanilide hydroxamic acid** : A drug that is used to treat cutaneous T-cell lymphoma that does not get better, gets worse, or comes back during or after treatment with other drugs. It is also being studied in the treatment of other types of cancer. Suberoylanilide hydroxamic acid is a type of histone deacetylase inhibitor. Also called SAHA, vorinostat, and Zolinza.

**Subgate**: Entrance to the part from the runner located below the parting line. On ejection the part breaks away from the subgate. OR The direct conversion of a substance from solid state to vapor or gas state

**subglottis** : The lowest part of the larynx; the area from just below the vocal cords down to the top of the trachea.

**Subgroup**: These are columns of transition and inner transition elements. They have electron similarities for the outer two or three electron orbitals.

**subject**: part of a sentence that tells what or whom the sentence is about.

**subject-predicate agreement**: a predicate must agree in person and in number with its subject, regardless of other elements in a sentence.

**subjective (nominative) case**: when a noun or pronoun is the subject of a verb.

**subjective environment** : The environment as it is perceived by persons living in it, e.g., eye irritation caused by air pollution, or pleasure arising from good housing conditions (WHO, 1979).

**subjective improvement** : An improvement that is reported by the patient, but cannot be measured by the healthcare provider (for example, "I feel better").

**subjunctive**: refers to the mood of the verb used in sentences that are contrary-to-fact or hypothetical.

**sublimation:** The direct conversion of a solid to a gas. Or A change in state from a solid to a gas and then back to a solid. Sublimation can be used to purify a solid and also may be involved in solid-state reactions and phase transformations. Or the transformation of a solid directly to a gas without an intervening liquid state. or the rare process of a substance changing states from solid directly to a gas. or the changing of a gas directly to a solid. or Conversion of a solid directly into a gas, without first melting into a liquid.

**Sublimaze:** (Other name for: fentanyl citrate)

**submarine canyon:** a V-shaped erosion feature that cuts a continental shelf and slope.

**SUBMARINE GATE:** A type of edge gate where the opening from the runner into the mold is located below the parting line or mold surface as opposed to conventional edge gating where the opening is machined into the surface of the mold. With submarine gates, the part is broken from the runner system on ejection from the mold. OR Tunnel gate, a type of edge gate where the opening from the runner into the mold is located below the mold parting line

**Submolding:** Break up of a full molding into component areas.

**submucosa :** The layer of tissue under the mucosa (inner lining of some organs and body cavities that makes mucus).

**subordinate (dependant) clause:** a clause that does not express a complete thought and is not a sentence; it depends upon something else to express a complete thought.

**subordinating conjunctions:** join subordinate clauses to independent clauses.

**subserosa :** The layer of tissue under the serosa (outer lining of some organs and body cavities).

**subset analysis :** In a clinical study, the evaluation of results for some but not all of the patients who participated. The selected patients have one or more characteristics in common, such as the same stage of disease or the same hormone receptor status.

**subshell:** One part of a level, each of which can hold different numbers of electrons. Or a set of electron orbitals with the same principal and second quantum number; for example, 2p, 3s, and so on. Or A set of electrons with

the same azimuthal quantum number. The number of electrons permitted in a subshell is equal to  $2l + 1$ .

**subsidence:** land sinks into the sea; opposite of uplifting.

**subsoil:** the layer of soil that underlies the topsoil.

**substance abuse :** The use of illegal drugs or the use of prescription or over-the-counter drugs or alcohol for purposes other than those for which they are meant to be used, or in excessive amounts. Substance abuse may lead to social, physical, emotional, and job-related problems.

**substance P-saporin:** An agent composed of substance P (SP) conjugated to the ribosome-inactivating protein and neurotoxin saporin (SAP), isolated from the seeds of the plant *Saponaria officinalis* (SP-SAP), with potential analgesic activity. Upon administration, SP-SAP targets the SP receptor, neurokinin-1 receptor (NK-1R), located on neurons. When SP-SAP binds NK-1R and the receptor/conjugate complex internalizes, the saporin moiety inactivates ribosomes and prevents protein synthesis, which causes cell death, destroys NK-1R-expressing nerves and decreases pain perception. Check for active clinical trials using this agent.

**substituent:** An atom or group that replaces another atom or group in a molecule.

**substituent group:** any atom or group that replaces a hydrogen atom on a hydrocarbon.

**substitution:** the replacement of an atom or group bonded to a carbon atom with a second atom or group. Or A reaction in which an atom or fragment within a molecule is replaced with another.

**Substitution matrix:** A tool for determining evolutionary relationships between amino acid sequences. When two sequences are compared, each substitution is assigned a score based on the matrix. A large positive score corresponds to a substitution that occurs frequently, whereas a negative score corresponds to a substitution that occurs only rarely.

**substitution method:** A method for solving a system of two equations. One of the equations needs to be solved for one of the variables. That expression is then substituted into the other equation for the variable. The resulting equation has only one unknown. Or A mutation caused by the replacement of one base by another.

**substitution reaction:** a reaction in which one group replaces another on a molecule.

**substrate:** A substance that is acted upon by an enzyme during a biochemical reaction. Or A molecule that is acted upon, and chemically changed, by an enzyme. Or The specific compound acted upon by an enzyme.

**substrate:** A substrate is a reactant molecule in an enzyme-catalysed reaction. Or Any surface to which a coating is applied. Or The surface or composition of the structure which is to be painted. Or the substance changed or acted on by an enzyme. Or A molecule acted upon by an enzyme or A molecule that is acted upon, and chemically changed, by an enzyme. or A reactant in a chemical reaction. An enzyme catalyzes a single chemical reaction or set of closely related reactions, and the components of those reactions are called substrates.

**Substrate:** Substrate.

**Substrate channeling:** A property of multienzyme complexes in which the product of one reaction is routed directly to the active site of the next enzyme in the complex, for which it is a substrate; substrate channeling enhances catalytic rate by preventing the loss of intermediates in the overall reaction.

**Substrate cycle:** A pair of thermodynamically irreversible biochemical reactions that simultaneously produce and consume a pair of metabolic intermediates; these paired pathways may amplify metabolic signals and in some cases can also generate heat for the maintenance of temperature in tissues. Also called futile cycle.

**Substrate-level phosphorylation:** The formation of ATP from ADP in which the phosphate donor is a substrate with high phosphoryl transfer potential. Or Phosphorylation of ADP or some other nucleoside 5'-diphosphate coupled to the dehydrogenation of an organic substrate; independent of the electron transfer chain.

**subtenon :** Used to describe injections through the membrane covering the muscles and nerves at the back of the eyeball.

**subtotal hysterectomy :** Surgery to remove the uterus, but not the cervix. Also called partial hysterectomy.

**subtraction keywords:** Words that indicate subtraction.

**Subunit:** Individual polypeptide chains in a protein. Or Any of the polypeptide chains in a protein that contains more than one of such chains. Or Individual polypeptide chains in a protein.

**Subunit, 30S:** The small subunit of the bacterial 70S ribosome; composed of 21 different proteins and a 16S RNA molecule.

**Subunit, 50S:** The large subunit of the bacterial 70S ribosome; the site of peptide-bond synthesis, it contains 34 different proteins, a 5S RNA species, and a 23S RNA species.

**Succinate-Q reductase:** An integral membrane protein complex of the inner mitochondrial membrane that transfers electrons from FADH<sub>2</sub> formed in the citric acid cycle to coenzyme Q. Also called Complex II.

**Suck-back :** When the pressure on the sprue is not held long enough for the melt to cool before the screw returns. Some of the melt in the cavities or runner system may expand back into the nozzle and cause sinks marks on the finished part. OR A method of decompressing a molds runner system by retracting the screw on a plastic or silicone injection molding machine

**sucralfate :** A drug used to treat ulcers. It adheres to proteins at the ulcer site and forms a protective coating over the ulcer. Sucralfate is also used to treat mucositis.

**Sucrose:** A disaccharide of glucose and fructose (commonly known as table sugar) that is readily transportable and stored in many plant cells.

**suction aspiration :** A surgical procedure in which the cervix is dilated (opened) and vacuum is used to remove tissue from the uterus. Also called suction evacuation and vacuum aspiration.

**suction evacuation :** A surgical procedure in which the cervix is dilated (opened) and vacuum is used to remove tissue from the uterus. Also called suction aspiration and vacuum aspiration.

**sudden infant death syndrome :** A disorder marked by the sudden and unexpected death of a healthy child who is younger than one year old, usually during sleep. The cause of sudden infant death syndrome is not known. Also called crib death and SIDS.

**Suess effect:** The relative change in the <sup>14</sup>C/<sup>12</sup>C or <sup>13</sup>C/<sup>12</sup>C ratio of any carbon pool or reservoir caused by the addition of fossil- fuel CO<sub>2</sub> to the atmosphere. Fossil fuels are devoid of <sup>14</sup>C because of the radioactive decay of <sup>14</sup>C to <sup>14</sup>N during long underground storage and are depleted in <sup>13</sup>C

because of isotopic fractionation eons ago during photosynthesis by the plants that were the precursors of the fossil fuels. Carbon dioxide produced by the combustion of fossil fuels is thus virtually free of  $^{14}\text{C}$  and depleted in  $^{13}\text{C}$ . The term Suess effect originally referred to the dilution of the  $^{14}\text{C}/\text{C}$  ratio in atmospheric  $\text{CO}_2$  by the admixture of fossil-fuel produced  $\text{CO}_2$ , but the definition has been extended to both the  $^{14}\text{C}$  and  $^{13}\text{C}$  ratios in any pool or reservoir of the carbon cycle resulting from human disturbances.

**Sufenta:** (Other name for: sufentanil citrate)

**sufentanil citrate:** The citrate salt form of sufentanil, a synthetic congener of fentanyl and related to the phenylpiperidines, with analgesic property. Sufentanil citrate binds to and activates the mu-opioid receptor, thereby producing analgesia, respiratory depression, miosis, reduced gastrointestinal motility, and euphoria. In addition, this agent has a more rapid onset of action and shorter duration of action compared to fentanyl. Check for active clinical trials using this agent.

**sufentanil transdermal system:** A transdermal matrix patch formulation containing the synthetic opioid sufentanil with analgesic activity. Sufentanil binds to and activates the mu-opioid receptors in the central nervous system (CNS), thereby mimicking the effects of the endogenous opioids. Binding of sufentanil to opioid receptors stimulates exchange of GTP for GDP, inhibits adenylate cyclase, and decreases intracellular cAMP. This inhibits the release of various nociceptive neurotransmitters, such as substance P, gamma-aminobutyric acid (GABA), dopamine, acetylcholine, noradrenaline, vasopressin, and somatostatin. In addition, sufentanil closes N-type voltage-gated calcium channels and opens calcium-dependent inwardly rectifying potassium channels, which results in hyperpolarization of neuronal membranes and a reduction in neuronal excitability, and, subsequently, analgesia and sedation. Check for active clinical trials using this agent.

**Sufortan:** (Other name for: penicillamine)

**sugammadex sodium:** The sodium salt form of the biologically inert, selective relaxant binding agent (SRBA) sugammadex, a modified, anionic gamma cyclodextrin derivative containing a hydrophilic exterior and a hydrophobic core, with neuromuscular blocking drug (NMBD) reversal activity. Upon administration, the negatively charged carboxyl-thio-ether

groups of sugammadex selectively and reversibly bind to the positively charged quaternary nitrogen of a steroidal NMBD, which was administered at an earlier time for anesthetic purposes. The encapsulation of the NMBD by sugammadex blocks its ability to bind to nicotinic receptors in the neuromuscular junction and thereby reverses the NMBD-induced neuromuscular blockade. Sugammadex binds rocuronium, vecuronium, and to a lesser extent pancuronium.

**sugar:** A carbohydrate with a characteristically sweet taste. Sugars are classified as monosaccharides, disaccharides, or trisaccharides.

**suicide :** The act of taking one's own life on purpose.

**Suicide (mechanism-based) inhibition:** Inhibition that results when an enzyme converts a pseudosubstrate into a reactive inhibitor that immediately inactivates its catalytic activity.

**suicide inhibitor:** A relatively inert molecule that is transformed by an enzyme, at its active site, into a reactive substance that irreversibly inactivates the enzyme.

**sulfa drug :** A type of antibiotic used to treat infection. Also called sulfonamide.

**Sulfamethoprim:** (Other name for: trimethoprim-sulfamethoxazole)

**sulfasalazine:** A synthetic salicylic acid derivative with affinity for connective tissues containing elastin and formulated as a prodrug, antiinflammatory sulfasalazine acts locally in the intestine through its active metabolites, sulfamide 5-aminosalicylic acid and salicylic acid, by a mechanism that is not clear. It appears inhibit cyclooxygenase and prostaglandin production and is used in the management of inflammatory bowel diseases. Check for active clinical trials using this agent.

**Sulfate Mineral:** A mineral that is made up of compounds with a sulfate group bonded to a metal. Copper sulfate is a good example of a sulfate mineral. It is also known as chalcantite.

**sulfate<sup>2-</sup>:** 1. The  $\text{SO}_4^{2-}$  ion, formed by reaction of sulfuric acid with a base. 2. A compound containing the  $\text{SO}_4^{2-}$  ion.

**sulfatinib:** An orally bioavailable, small molecule inhibitor of vascular endothelial growth factor receptors (VEGFR) 1, 2, and 3, and the fibroblast growth factor receptor type 1 (FGFR1), with potential antineoplastic and anti-angiogenic activities. Upon oral administration, sulfatinib binds to and

inhibits VEGFRs and FGFR1 thereby inhibiting VEGFR- and FGFR1-mediated signal transduction pathways. This leads to a reduction of angiogenesis and tumor cell proliferation in VEGFR/FGFR1-overexpressing tumor cells. Expression of VEGFRs and FGFR1 may be upregulated in a variety of tumor cell types.

**SULFATION:** The process by which an alcohol, such as lauryl alcohol, is reacted with sulfur trioxide (or chlorosulfonic acid) to give an alkyl sulfuric acid.

**Sulfatrim:** (Other name for: trimethoprim-sulfamethoxazole)

**Sulfide Mineral:** A mineral that is made of compounds with a sulfur atom bonded to a metal. Iron pyrite is a good example of a sulfide mineral with one iron atom bonded to two sulfur atoms.

**sulfite<sup>32-</sup>:** 1. The  $\text{SO}_3^{2-}$  ion, formed by reaction of sulfurous acid with a base. 2. A compound containing the  $\text{SO}_3^{2-}$  ion.

**sulfonamide :** A type of antibiotic used to treat infection. Also called sulfa drug.

**Sulfonation:** The replacement of a hydrogen atom of an organic compound with a sulfonic acid. This often occurs as a chemical reaction at high temperatures. Or The process by which a material such as an alkylate is reacted with sulfur trioxide to give a sulfonic acid.

**sulforaphane:** A naturally-occurring phytochemical belonging to the class of isothiocyanates. As the aglycone metabolite of glucosinolate glucoraphanin (sulforaphane glucosinolate), sulforaphane acts as an antioxidant and potent stimulator of endogenous detoxifying enzymes. This agent displays anticarcinogenic properties due to its ability to induce phase II detoxification enzymes, such as glutathione S-transferase and quinone reductase, thereby providing protection against certain carcinogens and toxic, reactive oxygen species. Broccoli sprouts contain large amounts of sulforaphane, which is also found in other cruciferous vegetables including cabbage and kale. Check for active clinical trials using this agent.

**sulforaphane-cyclodextrin complex:** An orally available, stable formulation comprised of sulforaphane, a naturally-occurring phytochemical belonging to the class of isothiocyanates, and encapsulated within alpha-cyclodextrin, with cancer preventive activity. Upon administration, sulforaphane acts as an antioxidant and potent stimulator of

endogenous detoxifying enzymes. This agent is able to induce phase II detoxification enzymes, such as glutathione S-transferase and quinone reductase, thereby providing protection against certain carcinogens and toxins. Broccoli sprouts contain large amounts of sulforaphane, which is also found in other cruciferous vegetables including cabbage and kale. Cyclodextrin is able to prevent sulforaphane's rapid breakdown, which improves its stability and half-life. Check for active clinical trials using this agent.

**Sulfur:** Symbol:"S" Atomic Number:"16" Atomic Mass: 32.06amu. Sulfur is a non-reactive element and is classified as a non-metal. It is found in large amounts all over the Earth and is usually yellow. It is also spelled "sulphur." You'll also find sulfur in fertilizers, medicine, fireworks, and matches. There are also many minerals called sulfides and sulfates in which sulfur appears.

**Sulfur (S) :** The chemical element that has the atomic number 16. It is an abundant, multivalent non-metal. Sulfur, in its native form, is a yellow crystalline solid. In nature, it can be found as the pure element and as sulfide and sulfate minerals. It is an essential element for life and one of the most common elements in various types of chemicals.

**Sulfur compounds** : They are present in crude oil and so find their way into petrol and diesel. When they are burned, sulfur dioxide is released.

**Sulfur dioxide:** This gas is a major contributor to acid rain. It is formed by the combustion of sulfur and sulfur compounds. It is an irritant too.

**Sulfur dioxide (SO<sub>2</sub>) :** A gaseous chemical compound. It is produced by volcanoes and in various industrial processes. Since coal and petroleum often contain sulfur compounds, their combustion generates sulfur dioxide. A reducing agent.

**sulfur hexafluoride:** A contrast agent composed of an inorganic fluorinated inert gas comprised of six fluoride atoms bound to one sulfur atom, with potential diagnostic activity upon imaging. Upon inhalation of sulfur hexafluoride (SF<sub>6</sub>), the gas is distributed throughout the lungs. Upon subsequent ultrasound imaging, the lung vasculature can be imaged and pulmonary perfusion can be assessed.

**Sulfuric Acid:** H<sub>2</sub>SO<sub>4</sub> A strong acid - in water, it decomposes completely to H<sup>+</sup> and HSO<sub>4</sub><sup>-</sup> ions; with a little more prompting, HSO<sub>4</sub><sup>-</sup> can be persuaded to give H<sup>+</sup> and SO<sub>4</sub><sup>2-</sup>. When I was young, I had quite a bitter

disagreement with a friend of mine about whether the element from which its name arises ought to be spelled "sulfur" or "sulphur" (IUPAC comes down firmly on the side of "sulfur"). We eventually reached a compromise, and for many years I stuck to a spelling of "sulfhur" which miraculously passed uncorrected through several years of laboratory practical reports.

**sulfuric acid** : A strong acid that, when concentrated, is extremely corrosive to the skin and mucous membranes. It is used in making fertilizers, dyes, electroplating, and industrial explosives.

**Sulfuric acid (H<sub>2</sub>SO<sub>4</sub>)** : A strong mineral acid. Sulfuric acid has many applications, and is one of the top products of the chemical industry. Principal uses include ore processing, oil refining, wastewater processing, and chemical synthesis.

**sulfuric acid<sup>24</sup>**: An oily, corrosive liquid that acts as a strong acid when dissolved in water. Sulfuric acid has so many industrial uses that sulfuric acid production was once used as an index of industrial productivity. Salts of sulfuric acids are called sulfates.

**sulfurous acid<sup>23</sup>**: A colorless liquid that acts as a weak acid when dissolved in water, sometimes used as a bleach. Salts of sulfurous acid are called sulfites.

**sulindac**: A sulfinylindene derivative prodrug with potential antineoplastic activity. Converted in vivo to an active metabolite, sulindac, a nonsteroidal anti-inflammatory drug (NSAID), blocks cyclic guanosine monophosphate-phosphodiesterase (cGMP-PDE), an enzyme that inhibits the normal apoptosis signal pathway; this inhibition permits the apoptotic signal pathway to proceed unopposed, resulting in apoptotic cell death. Check for active clinical trials using this agent.

**sulindac** : A nonsteroidal anti-inflammatory drug (NSAID) that is being studied as a treatment for cancer.

**Sulmeprim**: (Other name for: trimethoprim-sulfamethoxazole)

**sulofenur**: A diarylsulfonylurea with potential antineoplastic activity. Sulofenur's antineoplastic mechanism of action is unknown.

**sumac/black cumin powder**: An Iranian traditional herbal medicine composed of powder derived from sumac and *Bunium persicum* (black cumin, black zira), with potential anti-emetic activity. Upon oral administration, sumac/black cumin powder may inhibit chemotherapy-

induced nausea and vomiting (CINV). The powder may also have some anti-oxidant activities. Check for active clinical trials using this agent.

**sumatriptan succinate:** The succinate salt form of sumatriptan, a member of the triptan class of compounds with anti-migraine property. Sumatriptan succinate selectively binds to and activates serotonin 5-HT<sub>1</sub> receptors. This results in constriction of meningeal, dural, cerebral or pial blood vessels via stimulation of the 5-HT<sub>1B</sub> receptors, thereby reducing the vascular pulsation and may provide relief in migraine headaches. Furthermore, agonistic action of this agent through presynaptic stimulation of 5-HT<sub>1D</sub> and/or 5-HT<sub>1F</sub> receptors prevents release of vasoactive and pro-inflammatory neuropeptide (calcitonin gene-related peptide), thereby may also relieve migraine headaches. In addition, central inhibition of pain transmission via the inhibition of trigeminal neurons in the brain stems and upper spinal cord mediated by 5-HT<sub>1B</sub>, 5-HT<sub>1D</sub> or 5-HT<sub>1F</sub> receptors also aides in the alleviation of migraine pain.

**sumLOD score :** The summation of all positive pedigree LOD scores (statistical estimates of whether two genetic loci are physically near enough to each other on a particular chromosome that they are likely to be inherited together) at each point in the genome. Also called summary logarithm of the odds score.

**summary logarithm of the odds score :** The summation of all positive pedigree LOD scores (statistical estimates of whether two genetic loci are physically near enough to each other on a particular chromosome that they are likely to be inherited together) at each point in the genome. Also called sumLOD score.

**summation problems:** A word problem with a total.

**summer solstice:** June 21, when the vertical ray of the Sun is at the Tropic of Cancer (23.5° N latitude), and is the longest day of the year in the Northern Hemisphere.

**Summicort:** (Other name for: methylprednisolone)

**sun protection factor :** A scale for rating the level of sunburn protection in sunscreen products. The higher the sun protection factor, the more sunburn protection it gives. Sunscreens with a value of 2 through 11 give minimal protection against sunburns. Sunscreens with a value of 12 through 29 give moderate protection. Sun protection factors of 30 or higher give high protection against sunburn. Also called SPF.

**Sun's Soup :** A mixture of vegetables and other edible plants that has been studied in the treatment of cancer. The vegetables include soybean, shiitake mushroom, mung bean, red date, scallion, garlic, leek, lentil, Hawthorn fruit, onion, ginseng, Angelica root, licorice, dandelion root, senega root, ginger, olive, sesame seed, and parsley. Sun's Soup is available in the United States as a dietary supplement.

**sunitinib :** A drug used to treat certain types of pancreatic cancer. It is also used to treat gastrointestinal stromal tumors (GIST) in some patients and to treat advanced kidney cancer. It is being studied in the treatment of other types of cancer. Sunitinib stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called SU011248, SU11248, sunitinib malate, and Sutent.

**sunitinib malate:** The orally bioavailable malate salt of an indolinone-based tyrosine kinase inhibitor with potential antineoplastic activity. Sunitinib blocks the tyrosine kinase activities of vascular endothelial growth factor receptor 2 (VEGFR2), platelet-derived growth factor receptor b (PDGFRb), and c-kit, thereby inhibiting angiogenesis and cell proliferation. This agent also inhibits the phosphorylation of Fms-related tyrosine kinase 3 (FLT3), another receptor tyrosine kinase expressed by some leukemic cells. or A drug used to treat certain types of pancreatic cancer. It is also used to treat gastrointestinal stromal tumors (GIST) in some patients and to treat advanced kidney cancer. It is being studied in the treatment of other types of cancer. Sunitinib malate stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called SU011248, SU11248, sunitinib, and Sutent.

**sunscreen:** A substance that helps protect the skin from the sun's harmful rays. Sunscreens reflect, absorb, and scatter both ultraviolet A and B radiation to provide protection against both types of radiation. Using lotions, creams, or gels that contain sunscreens can help protect the skin from premature aging and damage that may lead to skin cancer.

**sunspot:** cooler area on the surface of the Sun. or A relatively dark, sharply defined region on the solar disk, marked by an umbra approximately 2000K cooler than the effective photospheric temperature, surrounded by a less dark but also sharply bounded penumbra. The average

spot diameter is about 3700 km, but can range up to 245,000 km. Most sunspots are found in groups of two or more, but they can occur singly. Sunspots are cyclic, with a period of approximately 11 years. The quantitative description of sunspot activity is called the Wolf sunspot number, denoted R. The Wolf sunspot number is also referred to as Wolfer sunspot number, Zurich relative sunspot number, or relative sunspot number.

**Supect:** (Other name for: radotinib hydrochloride)

**superagonist interleukin-15:interleukin-15 receptor alphaSu/Fc fusion complex ALT-803:** A fusion protein complex composed of a mutated form of the cytokine interleukin (IL)-15 (IL-15N72D) and a soluble, dimeric IL-15 receptor alpha (IL-15Ra) Fc fusion protein (IL-15Ra-Fc) (IL-15N72D/IL-15Ra-Fc), with potential antineoplastic activity. Upon administration, superagonist interleukin-15:interleukin-15 receptor alphaSu/Fc fusion complex ALT-803 binds to the IL-2/IL-15 receptor beta-common gamma chain (IL-2Rbetagamma) receptor on natural killer (NK) and CD8<sup>+</sup> T lymphocytes, which activates and increases the levels of NK cells and memory CD8<sup>+</sup>(CD44<sup>high</sup>) T-cells. The memory T-cells enhance the secretion of the cytokine interferon-gamma (IFN-g), which further potentiates the immune response against tumor cells. This may increase tumor cell killing and decrease tumor cell proliferation. IL-15 regulates CD8<sup>+</sup> T and NK cell development, activation and proliferation. By coupling IL-15 to IL15Ra-Fc, this agent has a prolonged drug half-life and shows an increased ability to bind IL-2Rbetagamma, which enhances its immune stimulatory activity as compared to IL-15 alone. Check for active clinical trials using this agent.

**supercell:** thunderstorm with strong updrafts that exist for hours and can spawn tornadoes.

**Supercoil:** A structure formed by closed, circular DNA in which the DNA is more compact than the relaxed circular DNA; the circular DNA helix twists upon itself to form a superhelix.

**Supercoiled DNA:** Supertwisted, covalently-closed duplex DNA. Or Supertwisted, covalently-closed duplex DNA.

**Supercoiling:** Refers to the ability of closed, circular DNA to coil upon itself.

**superconductivity:** A state in which the electrical resistance of a material is so low that it cannot be measured and appears to be zero. The superconducting state is also characterized by unusual magnetic properties. Or The ability of certain materials to carry an electric current with zero electrical resistance.

**supercooling:** Liquids at temperatures below their normal freezing points are said to be "supercooled".

**supercritical:** Above the critical point; above critical temperature or pressure.

**supercritical fluid:** A fluid state that occurs when the pressure and temperature exceed the substance's critical pressure and critical temperature. Supercritical fluids fill their containers like gases but dissolve substances like liquids, which makes them very useful as solvents. Their density and other properties are intermediate between gases and liquids.

**Supercritical reactor:** A reactor in which the power level is increasing with time.

**Supercriticality:** The condition for increasing the level of operation of a reactor. The rate of fission neutron production exceeds all neutron losses, and the overall neutron population increases.

**superficial :** Affecting cells on the surface. Not invasive.

**superfractionated radiation therapy :** Radiation treatment in which the total dose of radiation is divided into small doses and treatments are given more than once a day. Superfractionated radiation therapy is given over the same period of time (days or weeks) as standard radiation therapy. Also called hyperfractionated radiation therapy.

**supergene deposit:** a high-grade metal deposit enriched through the processes of weathering.

**Superheating:** The heating of a vapor, particularly steam, to a temperature much higher than the boiling point at the existing pressure. This is done in some power plants to improve efficiency and to reduce water damage to the turbine.

**Superhelix:** The coil of a double-stranded DNA that forms when it is twisted so as to cross over its own axis.

**superior vena cava :** The large vein that carries blood from the head, neck, arms, and chest to the heart.

**superior vena cava syndrome :** A condition in which a tumor presses against the superior vena cava (the large vein that carries blood from the head, neck, arms, and chest to the heart). This pressure blocks blood flow to the heart and may cause coughing, difficulty in breathing, and swelling of the face, neck, and upper arms.

**superlative degree:** used with adjectives and adverbs to compare more than two things, people, or actions.

**supermolecule:** A system composed of two or more atoms or molecules separated by large distances. See "size-consistent."

**supernova:** the explosion of a star.

**superoxide:** A binary compound containing oxygen in the  $-1/2$  oxidation state. For example,  $KO_2$  is potassium superoxide, an ionic compound containing the superoxide ion,  $O_2^-$ .

**Superoxide dismutase:** An enzyme that scavenges superoxide radicals by catalyzing the conversion of two of these radicals into hydrogen peroxide and molecular oxygen; protects against damage by reactive oxygen species.

**Supersaturated:** A solution that has more solute dissolved than is possible under normal circumstances. If you heat a glass of water that is saturated you can add more sugar to the solution. When that solution cools to the original temperature, it is considered super-saturated. or A solution that temporarily contains more solute than the saturated amount at some temperature.

**supersaturated calcium phosphate rinse:** An aqueous oral rinse composed of an electrolyte solution supersaturated with phosphate and calcium ions with antimucositis and analgesic activities. This solution may help relieve mucositis and mucositis-induced pain by restoring the natural electrolyte and pH balance of human saliva and lubricating mucosal tissues of the mouth, tongue and oropharynx.

**supersaturated solution:** A supersaturated solution has concentration of solute that is higher than its solubility. A crystal of solute dropped into a supersaturated solution grows; excess solute is deposited out of the solution until the concentration falls to the equilibrium solubility.

**Supersaturation:** A solution that contains a concentration of solute greater than the equilibrium solubility value.

**supinoxin:** (Other name for: P-p68 inhibitor RX-5902)

**supplemental nutrition :** A substance or product that is added to a person's diet to make sure they get all the nutrients they need. It may include vitamins, minerals, protein, or fat, and may be given by mouth, by tube feeding, or into a vein.

**supplemental oxygen therapy :** Treatment in which a storage tank of oxygen or a machine called a compressor is used to give oxygen to people with breathing problems. It may be given through a nose tube, a mask, or a tent. The extra oxygen is breathed in along with normal air. Also called oxygen therapy.

**supplementary angles:** two angles the sum of which measures  $180^\circ$ .

**supplementation :** Adding nutrients to the diet.

**support group :** A group of people with similar disease or concerns who help each other cope by sharing experiences and information.

**Support pillar:** A circular rod mold component (post) used to support the ejector half of the mold. It is required because of the tremendous amount of pressure exerted against the "b" plate by the injection phase of the molding process.

**supportive care :** Care given to improve the quality of life of patients who have a serious or life-threatening disease. The goal of supportive care is to prevent or treat as early as possible the symptoms of a disease, side effects caused by treatment of a disease, and psychological, social, and spiritual problems related to a disease or its treatment. Also called comfort care, palliative care, and symptom management.

**suppository :** A form of medicine contained in a small piece of solid material, such as cocoa butter or glycerin, that melts at body temperature. A suppository is inserted into the rectum, vagina, or urethra and the medicine is absorbed into the bloodstream.

**Supprelin:** (Other name for: histrelin acetate)

**Suppressor gene:** A gene that can reverse the phenotype of a mutation in another gene. Or A gene that can reverse the phenotype of a mutation in another gene.

**Suppressor mutation:** A mutation that restores a function lost by an initial mutation and that is located at a site different from the initial mutation.

**Suppressor mutation:** Suppressor mutation. A mutation that restores a function lost by an initial mutation and that is located at a site different from

the initial mutation.

**suppressor T cell :** A type of immune cell that blocks the actions of some other types of lymphocytes, to keep the immune system from becoming over-active. Suppressor T cells are being studied in the treatment of cancer. A suppressor T cell is a type of white blood cell and a type of lymphocyte. Also called regulatory T cell, T reg, and T-regulatory cell.

**supraclavicular lymph node :** A lymph node located above the clavicle (collarbone).

**supraglottic laryngectomy :** An operation to remove the supraglottis, which is part of the larynx (voice box) above the vocal cords.

**supraglottis :** The upper part of the larynx (voice box), including the epiglottis; the area above the vocal cords.

**Suprane:** (Other name for: desflurane)

**suprarenal gland :** A small gland that makes steroid hormones, adrenaline, and noradrenaline. These hormones help control heart rate, blood pressure, and other important body functions. There are two suprarenal glands, one on top of each kidney. Also called adrenal gland.

**supratentorium :** The upper part of the brain that contains the cerebrum, ventricles (fluid-filled spaces), choroid plexus, hypothalamus, pineal gland, pituitary gland, and optic nerve. Examples of tumors that form in the supratentorium are glioblastomas, pineal region tumors, and ependymomas.

**Suprax:** (Other name for: cefixime)

**Suprep®:** (Other name for: sodium sulfate/potassium sulfate/magnesium sulfate-based laxative)

**suramin:** A polysulphonated naphthylurea with potential antineoplastic activity. Suramin blocks the binding of various growth factors, including insulin-like growth factor I (IGF-I), epidermal growth factor (EGF), platelet-derived growth factor (PDGF), and tumor growth factor-beta (TGF-beta), to their receptors, thereby inhibiting endothelial cell proliferation and migration. This agent also inhibits vascular endothelial growth factor (VEGF)- and basic fibroblast growth factor (bFGF)-induced angiogenesis; retroviral reverse transcriptase; uncoupling of G-proteins from receptors; topoisomerases; cellular folate transport; and steroidogenesis. or A drug that is used to treat infections caused by parasites. It is also being studied in

the treatment of cancer. It belongs to the families of drugs called antiprotozoals and anthelmintics.

**surf:** the zone where waves break against a shoreline.

**surface air temperature:** The temperature of the air near the surface of the Earth, usually determined by a thermometer in an instrument shelter about 2 m above the ground. The true daily mean, obtained from a thermograph, is approximated by the mean of 24 hourly readings and may differ by 1.0 degrees C from the average based on minimum and maximum readings. The global average surface air temperature is 15 degrees C.

**surface albedo:** The fraction of solar radiation incident on the Earth's surface that is reflected by it. Reflectivity varies with ground cover, and during the winter months it varies greatly with the amount of snow cover (depth and areal extent). Roughness of terrain, moisture content, solar angle, and angular and spectral distribution of ground-level irradiations are other factors affecting surface albedo.

**Surface appearance:** The smoothness, gloss and presence or lack of surface defects in a coating. Or Distressed melt flow due to welding, melding, splay, etc. will appear as surface imperfections.

**Surface area:** A measurement of the exposed surface of an object. Or the total surface of all sides of a solid, or the total area of faces.

**surface electrode :** A small device that is attached to the skin to measure or cause electrical activity in the tissue under it. Surface electrodes may be used to look for problems with muscles and nerves.

**SURFACE FINISH:** Finish of molded product.

**Surface Resistivity:** The ratio of the potential gradient parallel to the current along its surface to the current per unit width of the surface. OR The electrical resistance between opposite edges of a unit square of insulating material. It is commonly expressed in ohms. (Also covered in ASTM D257-54T.) OR the resistance of a material between two opposite sides of a unit square of its surface.

**surface tension:** the property, due to molecular forces in the surface film, that tends to contract the liquid into a form having the least surface/volume ratio. Or The energy required to disrupt the surface of a liquid. Or The force acting on the surface of a liquid, tending to minimize the area of that surface. (see RFF 705.10.03 - SURFACE TENSION). or The property of a

coating that makes it tend to shrink when applied. or The work required to expand the surface of a liquid by unit area. or A fluid in contact with a surface exhibits phenomena, due to molecular attractions, which appears to arise from a tension in the surface of the fluid. It may be expressed as dynes per cm or as ergs per sq.cm.

**Surface treating:** any method of treating a plastic so as to alter the surface and render it receptive to inks, lacquers and adhesives, such as chemical, flame or electronic treating. Or Conditioning the substrate before coating through grit blast, phosphate, etc. May include the removal of a coating (See Burn-off).

**surface water:** All water naturally open to the atmosphere. Or the slowest of the seismic waves; surface waves travel outward on the earth's surface from the epicenter much as ripples do from a stone thrown into the water.

**surfactant:** a surface-active substance, such as a detergent or soap, that lowers the surface tension of a solvent (usually water). Or The descriptor for any substance that lowers the surface tension. Or An ingredient contained in detergents and other products that provides and enables the cleaning function and capability in the product, such as the removal of stains. or A material which possesses the ability to radically alter the free energy of a liquid surface or interface when present in the system at low concentrations. The word surfactant is a contraction of the term surface active agent. (see RFF 750.10.01 - SURFACTANTS) or From SURFace ACTive AgeNT. A substance which prefers to exist at the boundary between two other substances - for example, detergents have one end highly soluble in greasy, non-polar substances and one end soluble in water. Sodium dodecyl sulfate is a common surfactant. See also emulsifier. or A material that spreads along a surface, changing the properties of the surface. For example, soap spreads over a water surface and lowers its surface tension. or A compound that affects interfacial tensions between two liquids. It usually reduces surface tension. OR The use of these chemicals allows the formation of an emulsion or intimate mixture of otherwise incompatible substances by modifying the surface properties and influencing the wetting and flowing properties of liquids. or A surface active agent. Lowers the surface tension of a liquid, improves wetting of a solid substance in water, lowers the interfacial tension between two liquids

thus improving their compatibility to each other and generates or prevents foaming.

**Surge :** This term is applied to describe a loping or jerky operation of the belt due to too much overdrive, varying coefficients of friction of belt supports and drive problems.

**surgeon :** A doctor who removes or repairs a part of the body by operating on the patient.

**Surgeon General :** The chief medical doctor and health educator for the United States. The mission of the U.S. Surgeon General is to give the public the best scientific information available on how to improve health and lower the risk of illness and injury. The U.S. Surgeon General oversees the U.S. Public Health Service and is chosen by the U.S. President. Each state public health agency and branch of the U.S. military also has its own Surgeon General. The office of the U.S. Surgeon General is part of the Department of Health and Human Services (DHHS).

**surgery :** A procedure to remove or repair a part of the body or to find out whether disease is present. An operation.

**surgical biopsy :** The removal of tissue by a surgeon for examination by a pathologist. The pathologist may study the tissue under a microscope.

**surgical castration :** Surgical removal of the testicles (orchiectomy) or ovaries (oophorectomy) to stop the production of sex hormones. Decreasing the levels of hormones may stop the growth of certain cancers.

**surgical menopause :** Describes a stop in a woman's menstrual periods that is caused by surgery to remove her ovaries. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility.

**surgical oncologist :** A surgeon who has special training in performing biopsies and other surgical procedures in cancer patients.

**SURGING:** In extrusion, an unstable pressure buildup leading to variable output and waviness of the surface of the extrudate. In extreme cases, the flow of extrudate may even cease momentarily at intervals. OR An instability of melt pressure and flow rate in an extruder, which can be detected by a pressure gage at the tip of the screw (or at the die adapter), or by dimensional product variations.

**surplus:** the period of time when the precipitation exceeds the needs for an area and the ground is saturated; runoff occurs, causing flooding conditions.

**surrogate endpoint :** In clinical trials, an indicator or sign used in place of another to tell if a treatment works. Surrogate endpoints include a shrinking tumor or lower biomarker levels. They may be used instead of stronger indicators, such as longer survival or improved quality of life, because the results of the trial can be measured sooner. The use of surrogate endpoints in clinical trials may allow earlier approval of new drugs to treat serious or life-threatening diseases, such as cancer. Surrogate endpoints are not always true indicators or signs of how well a treatment works.

**surroundings:** In thermodynamics, the surroundings refer to the universe outside the system.

**surveillance:** Ongoing scrutiny, generally using methods distinguished by their practicability, uniformity, and frequently their rapidity, rather than by complete accuracy. Its main purpose is to detect changes in trend or distribution in order to initiate investigative or control measures (Last, 1988).

**surveillance :** Periodic clinical evaluation of an individual who is at increased risk of developing a condition (compared with the general population) aimed at detecting new or recurrent disease. In public health, surveillance may also refer to the systematic collection of information regarding the incidence, prevalence, and mortality related to various medical conditions or health-related events. or In medicine, closely watching a patient's condition but not treating it unless there are changes in test results. Surveillance is also used to find early signs that a disease has come back. It may also be used for a person who has an increased risk of a disease, such as cancer. During surveillance, certain exams and tests are done on a regular schedule. In public health, surveillance may also refer to the ongoing collection of information about a disease, such as cancer, in a certain group of people. The information collected may include where the disease occurs in a population and whether it affects people of a certain gender, age, or ethnic group.

**Survey meter:** Any portable radiation detection instrument especially adapted for inspecting an area or individual to establish the existence and amount of radioactive material present.

**survival of the fittest:** the concept of natural selection that states that the fittest survive and spread their traits through a population.

**survival rate :** The percentage of people in a study or treatment group who are still alive for a certain period of time after they were diagnosed with or started treatment for a disease, such as cancer. The survival rate is often stated as a five-year survival rate, which is the percentage of people in a study or treatment group who are alive five years after their diagnosis or the start of treatment. Also called overall survival rate.

**survivin antigen:** A tumor-associated antigen. Vaccination with survivin antigen may result in a cytotoxic T-cell response against survivin antigen-expressing tumor cells, resulting in decreased tumor cell proliferation and tumor cell death. Overexpressed in many tumors, endogenous survivin inhibits tumor cell apoptosis.

**survivin antigen vaccine DPX-Survivac:** A lipid depot-based therapeutic cancer vaccine composed of survivin epitopes, a universal T Helper peptide and a polynucleotide adjuvant encapsulated in liposomes and then formulated in the hydrophobic carrier Montanide ISA51 VG, with potential immunopotentiating and antineoplastic activities. Upon injection of the survivin antigen vaccine DPX-Survivac, a depot is created at the injection site from which the antigens and adjuvant are released. This vaccine may elicit a long lasting cellular response against survivin-expressing cancers, resulting in a decrease in tumor cell proliferation and an induction of tumor cell death. Survivin, a member of the inhibitor of apoptosis (IAP) family expressed during embryonic development, is upregulated in a variety of human cancers while absent in most normal adult cells; its expression in tumors is associated with a more aggressive phenotype, decreased survival, and increased resistance to chemotherapy.

**survivin mRNA antagonist EZN-3042:** A locked nucleic acid (LNA) antisense oligonucleotide targeting survivin mRNA, with potential antineoplastic activity. EZN-3042 hybridizes to survivin mRNA, thereby blocking translation of survivin protein and inhibiting survivin-induced anti-apoptotic activity and promoting tumor cell apoptosis in survivin-overexpressing tumor cells. Survivin, a member of the inhibitor of apoptosis (IAP) family expressed during embryonic development, is upregulated in a variety of human cancers while absent in most normal adult cells; its expression in tumors is associated with a more aggressive

phenotype, decreased survival, and increased resistance to chemotherapy. LNAs contain a methylene bridge linking 2'-oxygen and 4'-carbon of ribose sugar rings, thereby increasing their stability and decreasing degradation.

**survivin Sur1M2 peptide vaccine:** A modified recombinant nonapeptide (LMLGEFLKL) derived from the anti-apoptosis protein survivin with potential immunopotentiating and antineoplastic activities. Upon administration, survivin Sur1M2 peptide vaccine may elicit humoral and cellular immune responses against survivin-expressing cancers, resulting in decreased tumor cell proliferation and tumor cell death. The survivin protein inhibits caspase activation and apoptosis; it is undetectable in normal adult tissues but is expressed by several human cancers including lung, colon, breast, pancreas, and prostate cancer as well as hematopoietic malignancies and skin cancers.

**survivin/p53/HER2 antigen-loaded autologous dendritic cell vaccine:** An autologous dendritic cell (DC) vaccine loaded with tumor-associated antigens (TAAs) derived from survivin, p53 and human epidermal growth factor receptor 2 (HER2 or ERBB2), with immunostimulating and antineoplastic activities. Upon administration, this DC vaccine may elicit a potent cytotoxic T-cell (CTL) response against tumor cells expressing these TAAs, resulting in tumor cell death. Survivin, p53 and HER2 are essential in neoplastic growth, and are considered to be universal tumor antigens.

**survivor :** One who remains alive and continues to function during and after overcoming a serious hardship or life-threatening disease. In cancer, a person is considered to be a survivor from the time of diagnosis until the end of life.

**survivorship :** In cancer, survivorship focuses on the health and life of a person with cancer post treatment until the end of life. It covers the physical, psychosocial, and economic issues of cancer, beyond the diagnosis and treatment phases. Survivorship includes issues related to the ability to get health care and follow-up treatment, late effects of treatment, second cancers, and quality of life. Family members, friends, and caregivers are also considered part of the survivorship experience.

**survivorship care plan :** A detailed plan for a patient's follow-up care after treatment for a disease ends. In cancer, the plan is based on the type of cancer and the treatment the patient received. A survivorship care plan may include schedules for physical exams and medical tests to see if the cancer

has come back or spread to other parts of the body. Follow-up care also checks for health problems that may occur months or years after treatment ends, including other types of cancer. A survivorship care plan may also include information to help meet the emotional, social, legal, and financial needs of the patient. It may include referrals to specialists and recommendations for a healthy lifestyle, such as changes in diet and exercise and quitting smoking. Also called follow-up care plan.

**susceptibility gene :** A germline mutation that increases an individual's susceptibility or predisposition to a certain disease or disorder. When such a mutation is inherited, development of symptoms is more likely, but not certain. Also called predisposing mutation.

**suspect terrane:** a terrane that does not fit the regional pattern or has conflicting age dates.

**suspended load:** of a stream, the fine-grained sediment that remains in the water in a stream during transportation. Or of wind, the fine-grained clay and silt that is carried long distances.

**suspended matter:** (1) solids in suspension in water, wastewater or effluent. (2) solids in suspension that can be removed readily by standard filtering procedures in a laboratory.

**suspended solids:** (1) solids that either float on the surface of, or are in suspension in, water, wastewater, or other liquids, and which are largely removable by laboratory filtering. (2) the quantity of material removed from wastewater in a laboratory test, as prescribed in "Standard Methods" and referred to as nonfilterable residue.

**suspension:** A suspension is a mixture between a liquid (usually water) and fine particles of insoluble solid spread throughout the liquid. Or A liquid that contains undissolved solid distributed evenly throughout the mixture. Or A mixture of two substances where small pieces of a solid are suspended in a liquid - for example, milk (blobs of fat and protein floating in water) and orange juice (chunks of plant floating in water). or similar to a solution, but the particles within the suspension can be seen by the naked eye. or A heterogenous mixture in which droplets or particles are suspended in a liquid. or A mixture of fine particles of any solid with a liquid or gas. The particles are called the disperse phase, the suspending medium is called the continuous phase.

**Sustainability:** The care and maintenance of valuable resources to ensure their presence and longevity for future generations.

**sustained-release mitomycin C hydrogel formulation:** A sustained-release (SR) hydrogel polymer-based formulation containing the antineoplastic antibiotic mitomycin C (MMC), with potential antineoplastic activity. Upon local administration of the SR MMC hydrogel formulation to the upper urinary tract via a ureteral catheter, the gel solidifies and deposits MMC locally to prevent the excretion of this chemotherapeutic agent via urinary flow. In turn, MMC alkylates DNA, and produces interstrand DNA cross-links, thereby inhibiting DNA synthesis. Due to its reverse thermal-gelation properties, this gel is able to stay in a liquid state at cold temperatures and solidifies at body temperature. This allows for increased accumulation of MMC locally in the upper urinary tract which leads to increased efficacy compared to standard intravesical delivery of MMC for upper tract urothelial carcinoma (UTUC). Check for active clinical trials using this agent.

**Sustiva :** A drug used with other drugs to treat infection with the human immunodeficiency virus (HIV). It blocks HIV from making copies of itself. It is a type of non-nucleoside reverse transcriptase inhibitor and a type of antiviral agent. Also called efavirenz.

**Sutent :** A drug used to treat certain types of pancreatic cancer. It is also used to treat gastrointestinal stromal tumors (GIST) in some patients and to treat advanced kidney cancer. It is being studied in the treatment of other types of cancer. Sutent stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called SU011248, SU11248, sunitinib, and sunitinib malate.

**suture zone:** the line of collision at a convergent boundary, typically continent-to-continent.

**sutures:** the immovable joints where bones come together within the skull.

**SV40:** Simian virus 40. A virus that infects some types of monkeys. It may also infect humans, and was found in some polio vaccines tested in the early 1960s. Although the virus has been shown to cause cancer in laboratory animals, there is no evidence that it causes cancer in people. Also called simian virus 40.

**Svedberg (S):** A unit of measure of the rate at which a particle sediments in a centrifugal field.

**Svedberg unit:** A unit for measuring the sedimentation of a macromolecule; 1 Svedberg unit (S) is equal to 10-13 seconds.

**Svedberg unit (S):** The unit used to express the sedimentation constant (S = 10-13 sec)The sedimentation constant S is proportional to the rate of sedimentation of a molecule in a given centrifugal field and is related to the size and shape of the molecule.

**SVN53-67/M57-KLH peptide vaccine:** A peptide vaccine containing a 15-mer peptide (DLAQMFFCFKELEGW), with C to M alteration at amino acid position 57, derived from the anti-apoptosis protein survivin, and conjugated with keyhole limpet hemocyanin (KLH), with potential immunopotentiating and antineoplastic activities. Upon subcutaneous administration of SVN53-67/M57-KLH peptide vaccine, this peptide is able to bind both HMC class I and II molecules and may activate the immune system to mount a cytotoxic T-lymphocyte (CTL) as well as a T-helper cell response against survivin-expressing cancer cells. This may result in decreased tumor cell proliferation and ultimately tumor cell death. Survivin, a member of the inhibitor of apoptosis (IAP) family, expressed during embryonic development while absent in most normal adult cells, is upregulated in a variety of human cancers; its expression in tumors is associated with a more aggressive phenotype, decreased survival, and increased resistance to chemotherapy. KLH may enhance immune recognition and may promote an enhanced response. As SVN53-67 is weakly immunogenic in humans, the M57 alteration may lead to greater affinity towards HLA-A\*0201 and thus an enhanced antitumor immune response.

**SVV-001:** A virus being studied in the treatment of neuroendocrine tumors and other types of cancer. Neuroendocrine tumors form from cells that release hormones in response to a signal from the nervous system. The virus infects and breaks down these tumor cells but not normal cells. It is a type of oncolytic virus. Also called NTX-010 and Seneca Valley virus-001.

**SVWN:** Slater exchange functional, Vosko-Wilk-Nusair correlation functional. A local DFT method.

**swamp:** A type of wetland that is dominated by woody vegetation and does not accumulate appreciable peat deposits; it may be fresh- or saltwater, and

tidal or nontidal.

**swash:** the still-turbulent sheet of water that sweeps up the slope of a beach.

**Sweating:** Exudation of small drops of liquid, usually a plasticizer or softener, on the surface of a plastic part.

**Sweet Crude:** Sweet Crude is the term used for crudes with a low sulphur content. Continued tightening of emissions legislation has increased the value of low sulphur crude in recent years.

**sweet elm :** The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, Indian elm, red elm, slippery elm, *Ulmus fulva*, and *Ulmus rubra*.

**Swing Wide :** A term denoting the occasional tendency of the belt to swing outward in an area, prior to, or on leaving a turn, or the drum.

**Switch over point fill to pack:** The point on injection stroke at which filling phase with speed profile ends and pack or pressure phase with pressure profile starts.

**SWS:** A rare, congenital disorder that affects the brain, skin, and eyes. Abnormal blood vessel growth occurs in the trigeminal nerve in the face and the meninges (covering) of the brain. This abnormal growth causes red or purple skin discoloration (sometimes called a port wine stain), usually on one side of the face, and can also cause seizures, learning disabilities, and glaucoma. Also called Sturge-Weber syndrome.

**Syk inhibitor HMPL-523:** An orally available inhibitor of spleen tyrosine kinase (Syk), with potential immunomodulating and antineoplastic activities. Upon oral administration of Syk inhibitor HMPL-523, this agent binds to and inhibits the activity of Syk. This inhibits B-cell receptor (BCR) signaling, which leads to the inhibition of B-cell activation, and prevents tumor cell activation, migration, adhesion and proliferation. Syk, a non-receptor cytoplasmic, BCR-associated tyrosine kinase, is expressed in hematopoietic tissues and is often overexpressed in hematopoietic malignancies; it plays a key role in B-cell receptor signaling.

**Syk kinase inhibitor R-935788 :** A substance being studied in the treatment of cancer and certain other diseases, such as rheumatoid arthritis. It may block tumor cell signaling and growth. It is a type of tyrosine kinase inhibitor. Also called fostamatinib disodium and R788 sodium.

**Syk-JAK inhibitor PRT062070:** An orally bioavailable dual inhibitor of spleen tyrosine kinase (Syk) and Janus-associated kinases (JAK), with potential anti-inflammatory and antineoplastic activity. Upon oral administration, Syk-JAK inhibitor PRT062070 specifically binds to and inhibits the activity of Syk, JAK1, and JAK3 with preferential inhibition of JAK1 and JAK3-dependent cytokine-mediated signaling and functional responses. This negatively affects the downstream JAK-STAT (signal transducer and activator of transcription) pathway, and leads to both reduced inflammation in various animal models and enhanced antiproliferative activity towards non-Hodgkin's lymphoma (NHL) cell lines. Syk is a non-receptor cytoplasmic tyrosine kinase involved in signal transduction in cells of hematopoietic origin including B cells, macrophages, basophils and neutrophils. Abnormal function of Syk has been implicated in several hematopoietic malignancies including NHL and chronic lymphocytic leukemia (CLL). The JAK-STAT pathway plays a key role in the signaling of many cytokines and growth factors and is involved in cellular proliferation, growth, hematopoiesis, and the immune response; JAK kinases may be upregulated in inflammatory diseases, myeloproliferative disorders, and various malignancies.

**Sylatron :** A drug used to treat melanoma in patients who have had surgery to remove cancer that has spread to lymph nodes. It is also being studied in the treatment of other types of cancer. Sylatron is a brand name for peginterferon alfa-2b. It is a type of cytokine and a type of biological response modifier.

**Sylvant :** A drug used to treat a rare condition called Castleman disease in patients who do not have HIV or human herpesvirus 8. It is also being studied in the treatment of multiple myeloma. Sylvant binds to a protein called interleukin-6 (IL-6), which is made by some white blood cells and other cells in the body. Sylvant may help reduce inflammation and stop the growth of cancer cells or abnormal blood cells. It is a type of monoclonal antibody. Also called anti-IL-6 chimeric monoclonal antibody, cCLB8, CNTO 328, and siltuximab.

**Symadine:** (Other name for: amantadine hydrochloride)

**Symbicort:** (Other name for: budesonide/formoterol fumarate dihydrate inhalation aerosol)

**symbionts:** Two or more organisms that are mutually interdependent; usually living in physical association.

**symbiosis:** the relationship between two populations that live together in a close, permanent, and mutually beneficial association.

**symbol:** an abbreviation for the name of an element; for example, C for carbon.

**Symbol (chemical symbol) :** This may be one, two (or even three) letters. The first letter is always a capital. The others are lower case. The three letter symbols are for elements that have not yet been assigned a name (eg ununquadium which is atomic number 114 and has the symbol Uuq).

**Symbol equation :** If a chemical equation is done using symbols it MUST be balanced. There must be the same number of each kind of atom on each side of the equation.

**Symmetrel:** (Other name for: amantadine hydrochloride)

**Symmetry element:** The various formal spatial relationships that govern the orderly three-dimensional propagation of an object in space (i.e., in crystal growth, the molecules of the compound). (See Table 1.1).

**Symmetry operation:** An operation that returns the contents of the unit cell unchanged. Symmetry operations include n-fold rotations, rotary inversions, point inversions, mirror planes, glide planes, and screw axes.

**sympathetic nervous system:** a subdivision of the autonomic nervous system that prepares the body for an emergency.

**sympathetic nervous system :** The part of the nervous system that increases heart rate, blood pressure, breathing rate, and pupil size. It also causes blood vessels to narrow and decreases digestive juices.

**symport:** Cotransport of solutes across a membrane in the same direction.

**Symporter:** A transport system in which a molecule is carried across a membrane in the same direction as an ion, which in turn is pumped back across the membrane through active transport linked to ATP consumption.

**Sympt-X:** (Other name for: glutamine)

**Sympt-X G.I.:** (Other name for: glutamine)

**symptom :** A physical or mental problem that a person experiences that may indicate a disease or condition. Symptoms cannot be seen and do not

show up on medical tests. Some examples of symptoms are headache, fatigue, nausea, and pain.

**symptom management :** Care given to improve the quality of life of patients who have a serious or life-threatening disease. The goal of symptom management is to prevent or treat as early as possible the symptoms of a disease, side effects caused by treatment of a disease, and psychological, social, and spiritual problems related to a disease or its treatment. Also called comfort care, palliative care, and supportive care.

**symptomatic :** Having to do with symptoms, which are signs of a condition or disease.

**synapse:** the fluid-filled space separating the end of the axon from the dendrite of the next neuron or from a muscle cell. Or The chemical connection for communication between two nerve cells or between a nerve cell and a target cell such as a muscle cell. Or The pairing of homologous chromosomes, seen during the first meiotic prophase.

**synapse :** The space between the end of a nerve cell and another cell. Nerve impulses are usually carried to the neighboring cell by chemicals called neurotransmitters, which are released by the nerve cell and are taken up by another cell on the other side of the synapse. The neighboring cell may be another nerve cell, a muscle cell, or a gland cell.

**synbiotic supplement:** A nutritional supplement comprised of prebiotic and probiotic ingredients, with potential immunomodulating and gastrointestinal (GI) flora-restoring activity. Upon ingestion of the synbiotic supplement, the prebiotics and probiotics work synergistically in the GI tract, thereby modulating the GI flora ecosystem and may improve the functions of the intestinal barrier. In addition, synbiotics may have a beneficial effect on the immune system.

**syncline:** a fold that arches downward to form a trough. Or parallel rock layers folded downward in a valley-like formation.

**syncytium :** A large cell-like structure formed by the joining together of two or more cells. The plural is syncytia.

**syndactyly:** fusion of the fingers and/or toes, results in webbing of the digits, occurs with a frequency of 1 in 2,000 to 1 in 3,000 live births making it the most common congenital malformation of the limbs

**Syndiotactic:** Having a stereochemical regularity where the molecules can be described in terms of alternation of configurational base units that are mirror images of one another.

**syndrome :** A set of symptoms or conditions that occur together and suggest the presence of a certain disease or an increased chance of developing the disease.

**synergism:** a type of relationship in which two populations accomplish together what neither could accomplish on its own. OR A phenomenon wherein the effect of a combination of two additives is greater than the effect that could be expected from the known performance of each additive used singly. OR A term used to describe the use of two or more stabilizers in an organic material where the combination of such stabilizers improves the stability to a greater extent than could be expected from the additive effect of each stabilizer.

**synergistic :** In medicine, describes the interaction of two or more drugs when their combined effect is greater than the sum of the effects seen when each drug is given alone.

**synergistic effect:** A synergistic effect is any effect of two chemicals acting together which is greater than a simple sum of their effects when acting alone.

**Synestrin:** (Other name for: diethylstilbestrol)

**syngeneic :** Having to do with individuals or tissues that have identical genes. For example, identical twins and cells and tissues from them are syngeneic.

**syngeneic bone marrow transplantation :** A procedure in which a person receives bone marrow donated by his or her healthy identical twin.

**syngeneic stem cell transplantation :** A procedure in which a patient receives blood-forming stem cells (cells from which all blood cells develop) donated by his or her healthy identical twin.

**synovial membrane :** A layer of connective tissue that lines the cavities of joints, tendon sheaths, and bursae (fluid-filled sacs between tendons and bones). The synovial membrane makes synovial fluid, which has a lubricating function.

**synovial sarcoma :** A malignant tumor that develops in the synovial membrane of the joints.

**Synovir :** A drug used with another drug to treat multiple myeloma in patients who have just been diagnosed. It is also used to treat a painful skin disease related to leprosy. It is being studied in the treatment of other types of cancer. Synovir may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called thalidomide and Thalomid.

**synovitis :** Inflammation (swelling, pain, and warmth) of a synovial membrane, which is a layer of connective tissue that lines a joint, such as the hip, knee, ankle, or shoulder. Synovitis is caused by some types of arthritis and other diseases.

**Synribo:** (Other name for: omacetaxine mepesuccinate)

**Synribo :** A drug used to treat certain types of chronic myelogenous leukemia (CML) that have not gotten better after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Synribo blocks certain proteins involved in cancer cell growth and may kill cancer cells. It is a type of plant alkaloid. Also called homoharringtonine and omacetaxine mepesuccinate.

**Synthase:** An enzyme catalyzing a synthetic reaction in which two units are joined without the direct participation of a nucleotide triphosphate. Or Enzymes that catalyze condensation reactions in which no nucleoside triphosphate is required as an energy source.

**Synthesis:** When you take two elements or compounds and combine them to create a new compound. Or Formation of a complex product from simpler reactants. For example, water can be synthesized from oxygen and hydrogen gas:  $H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l)$ .

**Synthetase:** An enzyme catalyzing a synthetic reaction in which two units are joined with the direct participation of ATP or another nucleoside triphosphate. Or Enzymes that catalyze condensation reactions using ATP or another nucleoside triphosphate as an energy source.

**synthetic:** A substance manufactured by chemical synthesis.

**synthetic :** Having to do with substances that are man-made instead of taken from nature. OR Term loosely applied to paints containing a proportion of, or based entirely upon a synthetic resin. The use of the term should be avoided as it is not sufficiently precise.

**synthetic brain tumor peptides-pulsed autologous dendritic cell**

**vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with synthetic brain tumor peptides with potential immunostimulatory and antineoplastic activities. Upon administration, synthetic brain tumor peptides-pulsed autologous dendritic cell vaccine may stimulate anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against glioma tumor cells, resulting in glioma tumor cell lysis.

**synthetic breast cancer peptides-tetanus toxoid-Montanide ISA-51**

**vaccine:** A cancer vaccine comprised of multiple synthetic breast cancer peptides and the adjuvant tetanus toxoid helper peptide emulsified in the adjuvant Montanide ISA-51 with immunopotential activity. Vaccination with this cancer vaccine may elicit a specific cytotoxic T-lymphocyte response against breast cancer cells. Synthetic breast cancer peptides may stimulate the immune response against cells that produce breast cancer markers such as erbB2 (HER2/neu) while tetanus toxoid helper peptide binds to class II MHC molecules as a nonspecific vaccine helper epitope, resulting in a long-term immunopotential by increasing the helper T-cell response. Montanide ISA-51, also known as incomplete Freund's adjuvant or IFA, is a stabilized water-in-oil emulsion adjuvant containing mineral oil with mannide oleate added as a surfactant that non-specifically stimulates cell-mediated immune responses to antigens.

**synthetic breast cancer peptides-tetanus toxoid-poly ICLC vaccine:**

A cancer vaccine comprised of nine class I major histocompatibility complex (MHC)-restricted breast cancer associated peptides, the tetanus toxoid helper peptide and the Toll-like receptor 3 (TLR3) agonist poly ICLC, with potential immunostimulatory and antineoplastic activities. The nine peptides derived from six cancer associated proteins are epidermal growth factor receptor 2 (HER2/neu), carcinoembryonic antigen (CEA) and four cancer/testis antigens (CTAs: MAGE-A1, -A3, -A10, and NY-ESO-1). Vaccination with this vaccine may elicit a specific cytotoxic T-lymphocyte (CTL) response against cells overexpressing these tumor associated antigens (TAAs). As a nonspecific T-helper epitope, tetanus toxoid helper peptide binds to class II MHC and results in long-term immunopotential by increasing the helper T-cell response. Poly ICLC, the double-stranded RNA molecules of polyinosinic-polycytidylic acid stabilized with poly L-lysine in carboxymethylcellulose, binds to TLR3 and induces the release of cytokines which may help boost the immune response against the TAAs.

**Synthetic chemistry:** A branch of chemistry in which chemists devise ways to make specific molecules of interest and/or develop new chemical reactions for this purpose

**synthetic colorectal tumor-associated peptides vaccine IMA910:** A synthetic tumor-associated peptide (TUMAP)-based cancer vaccine directed against colorectal cancer with potential immunostimulatory and antineoplastic activities. Synthetic colorectal tumor-associated peptides vaccine IMA910 contains 13 different synthetic tumor-associated peptides (TUMAPs), each of which represents a tumor associated antigen (TAA) specific for colorectal cancer. Upon administration, this agent may elicit a cytotoxic T-lymphocyte (CTL) response against colorectal tumors expressing these TAAs, which may result in a reduction in colorectal tumor cell proliferation. Check for active clinical trials using this agent.

**synthetic glioblastoma mutated tumor-specific peptides vaccine therapy APVAC2:** A personalized peptide-based cancer vaccine comprised of one or two de novo synthesized patient-specific tumor-mutated peptides associated with glioblastoma (GB), with potential immunomodulating and antineoplastic activities. Vaccination with synthetic GB mutated tumor-specific peptides vaccine therapy APVAC2 stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the selected mutated tumor-associated peptides, which results in decreased GB growth. These peptides are specifically selected and synthesized based on the expression of the patient's own mutated tumor-associated antigens, which were detected during individual tumor genome sequencing.

**synthetic glioblastoma tumor-associated peptides vaccine therapy APVAC1:** A personalized peptide-based cancer vaccine comprised of five to ten peptides associated with glioblastoma (GB), with potential immunomodulating and antineoplastic activities. Vaccination with synthetic GB tumor-associated peptides vaccine therapy APVAC1 stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the tumor associated peptides, and results in decreased GB growth. The peptides are derived from a glioma actively-personalized vaccine consortium (GAPVAC) warehouse and are specifically selected based on the patient's expression of tumor-associated antigens.

**synthetic hTERT DNA vaccine INO-1400:** A DNA vaccine consisting of a plasmid encoding the full-length sequence of the tumor-associated antigen (TAA) human telomerase reverse transcriptase (hTERT), which is the catalytic subunit of human telomerase and synthesizes telomeric DNA at the chromosome ends, containing two immunogenic mutations, with potential immunostimulating and antineoplastic activities. Upon intradermal vaccination of the hTERT-encoding DNA vaccine INO-1400 in combination with electroporation, hTERT protein is expressed and activates the immune system to mount a cytotoxic T-cell (CTL) response against telomerase-expressing tumor cells, which may result in tumor cell death. Telomerase prolongs the functional lifespan of cells via the restoration and maintenance of telomere length. Abnormally activated in tumorigenesis, telomerase is expressed in the majority of human cancer cells, but its expression is low or non-existent in normal cells.

**synthetic human papillomavirus 16 E6 peptide:** A synthetic peptide sequence of human papillomavirus (HPV) type 16 oncoprotein E6. The E6 oncoprotein is implicated in the tumorigenesis of cervical carcinoma. Vaccination with HPV 16 E6 peptide may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against cells expressing the E6 oncoprotein, resulting in tumor cell lysis.

**synthetic human secretin:** A synthetic human therapeutic agent which is chemically identical or similar to endogenous secretin, a peptide hormone found in the mucosal S-cells of the proximal small intestine. Secretin stimulates the pancreatic acinar cells and ductal epithelial cells to emit bicarbonate rich digestive fluids, thereby increases duodenal bicarbonate level. Bicarbonate neutralizes acidity of the intestines, consequently increasing the pH and facilitating the action of intestinal digestive enzymes. In addition, secretin stimulates the stomach and the liver to produce pepsin and bile, respectively. Both pepsin and bile aid the digestive action of the duodenum, which resulting in the prevention of gastric inflammation. Check for active clinical trials using this agent.

**synthetic human secretin :** A drug used to help diagnose gastrinomas (tumors that cause too much gastric acid to be made) and other problems with the pancreas. It is also used to increase secretions from the pancreas and to help identify a duct called the ampulla of Vater. Synthetic human secretin is a form of secretin that is made in the laboratory. Secretin causes

the pancreas, liver, and stomach to release substances that help digest food. Also called ChiRhoStim and secretin human.

**synthetic hypericin:** A topical ointment formulation containing a synthetic form of hypericin, an anthraquinone derivative that is naturally found in the yellow flower of *Hypericum perforatum* (St. John's wort), with potential antineoplastic and photosensitizing activities. Upon topical administration of the ointment to the tumor site, hypericin becomes activated through the application of visible fluorescent light. During photoactivation, hypericin generates singlet oxygen, which induces DNA damage, necrosis and apoptosis, thereby inhibiting tumor cell growth. The use of visible light for activation avoids the risk of developing secondary malignancies, which are frequently associated with other photodynamic therapies that are dependent on ultraviolet A exposure.

**synthetic long E6/E7 peptides vaccine HPV-01:** A therapeutic peptide vaccine consisting of thirteen synthetic long peptides (SLPs), which are 25-35 amino acids in size, derived from the human papillomavirus (HPV) type 16 oncoproteins E6 and E7, with potential immunostimulating and antitumor activities. Upon administration, synthetic long E6/E7 peptides vaccine HPV-01 is taken up and degraded into small pieces by dendritic cells. The processed viral epitopes are presented by dendritic cells, which may stimulate the host immune system to mount both cytotoxic T-cell lymphocyte (CTL) and helper T cell responses against HPV E6/E7-expressing tumor cells. This results in the destruction of tumor cells and leads to decreased tumor growth. The E6 and E7 oncoproteins are implicated in the tumorigenesis in a variety of cancers. The SLPs allow for optimal presentation by antigen-presenting cells. Check for active clinical trials using this agent.

**synthetic melanoma-associated antigens vaccine:** A cancer vaccine containing synthetic epitope peptides derived from melanoma tumor-associated antigens (TAAs), including melanoma-melanocyte antigen gp100(280-288), melanoma-associated antigen tyrosinase(1-9), and melanoma-associated antigen melan-A(27-35). Upon administration, synthetic melanoma-associated antigens vaccine may stimulate a cytotoxic T-lymphocyte immune response against melanoma cells that express TAAs which share epitopes with the vaccine epitope peptides, resulting in tumor cell lysis.

**synthetic peptide-based erythropoiesis stimulating agent:** A synthetic, non-recombinant, pegylated, peptidic erythropoiesis stimulating agent. Synthetic peptide-based erythropoiesis stimulating agent binds to and activates the erythropoietin (EPO) receptor on erythroid progenitor cells, thereby inducing their proliferation and differentiation into mature erythrocytes. Check for active clinical trials using this agent.

**synthetic peptides E-PRA and E-PSM vaccine:** A cancer vaccine consisting of E-PRA and E-PSM, two synthetic peptide analogs of PRAME (PReferential Antigen MELanoma) and PSMA (Prostate Specific Membrane Antigen), with potential immunostimulating activity. Upon direct administration into lymph nodes, synthetic peptides E-PRA and E-PSM vaccine may stimulate a cytotoxic T-lymphocyte (CTL) response against PRAME- and PSMA-expressing tumor cells. PRAME and PSMA are tumor-associated antigens upregulated and expressed on the cell surfaces of certain tumor cell types.

**synthetic protegrin analog :** A form of a protegrin that is made in the laboratory. Protegrins kill certain bacteria, fungi, and viruses by making holes in their outer membranes and causing them to burst. Synthetic protegrin analogs, such as iseganan, are being studied in the treatment of oral mucositis (painful mouth sores) caused by radiation therapy. It is a type of synthetic antimicrobial peptide.

**synthetic retinoid :** A substance related to vitamin A that is produced in a laboratory.

**Synthetic Rubber:** Any synthetic polymer that mimics the properties of natural rubber. One of the earliest was ABS (Acrylonitrile-Butadiene-Styrene) rubber, a copolymer containing long segments of each of those three monomers.

**Synthoestrin:** (Other name for: diethylstilbestrol)

**Synthroid:** (Other name for: levothyroxine sodium)

**Synthroid:** (Other name for: levothyroxine sodium)

**Syntocinon:** (Other name for: recombinant oxytocin)

**syringe :** A small hollow tube used for injecting or withdrawing liquids. It may be attached to a needle in order to withdraw fluid from the body or inject drugs into the body.

**Syringeability:** The ability of a suspension to pass readily through a syringe and needle. For example, long needle-like crystals in suspension may have poor suspension syringeability.

**system:** In thermodynamics, the system is the part of the universe that is of interest. Or An isolated collection of matter; all other matter in the universe apart from the system is called the surroundings.

**Systematic:** According to some kind of system. It does not have to be particularly logical- for example, consistently naming chemicals you don't like after people you don't like would be an example of systematic, but irrational, nomenclature.

**Systematic absence:** The absence of certain hkl reflections in the X-ray diffraction of a single crystal. Systematic absences are used to determine the space group and symmetry of a crystal.

**Systematic error:** mean that would result from an infinite number of measurements of the same measurand carried out under repeatability conditions minus a true value of the measurand. Or Systematic errors have an identifiable cause and affect the accuracy of results.

**systemic :** Affecting the entire body.

**systemic chemotherapy :** Treatment with anticancer drugs that travel through the blood to cells all over the body.

**systemic disease :** Disease that affects the whole body.

**systemic inflammatory response syndrome :** A serious condition in which there is inflammation throughout the whole body. It may be caused by a severe bacterial infection (sepsis), trauma, or pancreatitis. It is marked by fast heart rate, low blood pressure, low or high body temperature, and low or high white blood cell count. The condition may lead to multiple organ failure and shock. Also called SIRS.

**systemic lupus erythematosus :** A chronic, inflammatory, connective tissue disease that can affect the joints and many organs, including the skin, heart, lungs, kidneys, and nervous system. It can cause many different symptoms; however, not everyone with systemic lupus erythematosus has all of the symptoms. Also called lupus and SLE.

**systemic mastocytosis :** A rare disease in which too many mast cells (a type of immune system cell) are found in the skin, bones, joints, lymph nodes, liver, spleen, and gastrointestinal tract. Mast cells give off chemicals

such as histamine that can cause flushing (a hot, red face), itching, abdominal cramps, muscle pain, nausea, vomiting, diarrhea, low blood pressure, and shock.

**systemic radiation therapy :** A type of radiation therapy in which a radioactive substance, such as radioactive iodine or a radioactively labeled monoclonal antibody, is swallowed or injected into the body and travels through the blood, locating and killing tumor cells.

**systemic scleroderma :** A disease that is marked by hardening and thickening of skin, connective tissue that surrounds other tissues and organs, and blood vessels. Also called systemic sclerosis.

**systemic sclerosis :** A disease that is marked by hardening and thickening of skin, connective tissue that surrounds other tissues and organs, and blood vessels. Also called systemic scleroderma.

**systemic therapy :** Treatment using substances that travel through the bloodstream, reaching and affecting cells all over the body.

**systemic toxicity:** This term is applied when a substance affects a system in the organism other than and often distant from the site of application or exposure.

**systems analysis:** The analysis of an existing or proposed system in order to find optimal solutions for achieving the objectives of the system. The method owes much to the development of computer logic, and computerized methods of data control are used in the systems analysis when necessary (WHO, 1979).

**systems of equations:** More than one equation that are solved simultaneously.

**T cell:** A lymphocyte that has receptors (T cell receptors) that recognize antigens only if bound to MHC proteins; two major types of T cells exist: cytotoxic T lymphocytes (killer T cells) and helper T cells. OR A type of white blood cell. T cells are part of the immune system and develop from stem cells in the bone marrow. They help protect the body from infection and may help fight cancer. Also called T lymphocyte and thymocyte.

**T lymphocyte :** A type of white blood cell. T lymphocytes are part of the immune system and develop from stem cells in the bone marrow. They help protect the body from infection and may help fight cancer. Also called T

cell and thymocyte. OR white blood cells in the lymph nodes that are stimulated by microorganisms or other foreign material in the blood.

**T reg :** A type of immune cell that blocks the actions of some other types of lymphocytes, to keep the immune system from becoming over-active. T regs are being studied in the treatment of cancer. A T reg is a type of white blood cell and a type of lymphocyte. Also called regulatory T cell, suppressor T cell, and T-regulatory cell.

**t test :** A statistical test that is used to find out if there is a real difference between the means (averages) of two different groups. It is sometimes used to see if there is a significant difference in response to treatment between groups in a clinical trial.

**T-3:** A thyroid hormone. Also called triiodothyronine.

**T-cell acute lymphoblastic leukemia :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many T-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. Also called precursor T-lymphoblastic leukemia and T-cell acute lymphocytic leukemia.

**T-cell acute lymphocytic leukemia :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many T-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. Also called precursor T-lymphoblastic leukemia and T-cell acute lymphoblastic leukemia.

**T-cell depletion :** Treatment to destroy T cells, which play an important role in the immune response. Elimination of T cells from a bone marrow graft from a donor may reduce the chance of an immune reaction against the recipient's tissues.

**T-cell large granular lymphocyte leukemia :** A type of leukemia in which large T lymphocytes (a type of white blood cell) that contain granules (small particles) are found in the blood. It is a chronic disease that may last for a long time and get worse. Also called T-LGL leukemia.

**T-cell lymphoma :** A type of cancer that forms in T cells (a type of immune system cell). T-cell lymphomas may be either indolent (slow-growing) or aggressive (fast-growing). Most T-cell lymphomas are non-Hodgkin lymphomas. There are many different types of T-cell non-Hodgkin lymphomas. These include mycosis fungoides, anaplastic large cell

lymphoma, and precursor T-lymphoblastic lymphoma. Prognosis and treatment depend on type and stage of the cancer.

**T-cell receptor:** A receptor that recognizes peptides displayed by MHC proteins on target cells; the receptor consists of two different 43-kd chains joined by a disulfide bond and spanning the plasma membrane; the combination of constant and variable regions among various T-cell receptors allows T cells to recognize a large number of different epitopes.

**T-cell receptor gene rearrangement test :** A laboratory test in which blood or bone marrow cells are checked to see if there is a certain change in the genes that make receptors on T cells (white blood cells that fight infection). Testing for this gene change can tell whether large numbers of T cells with a certain receptor are being made. This may be a sign of cancer.

**T-cell-mediated immunity:** One of the recognition systems of the immune response, in which T cells scan the surfaces of all cells and kill those that exhibit foreign proteins synthesized by intercellular pathogens.

**T-DM1:** A drug used to treat HER2-positive breast cancer that has spread to other parts of the body. It is used in patients who have already been treated with the anticancer drug called trastuzumab and a type of drug called a taxane. It may also be used in patients whose cancer has recurred (come back) after adjuvant therapy with these drugs. It is also being studied in the treatment of other types of cancer. T-DM1 contains a monoclonal antibody called trastuzumab that binds to a protein called HER2, which is found on some breast cancer cells. It also contains an anticancer drug called DM1, which may help kill cancer cells. T-DM1 is a type of antibody-drug conjugate. Also called ado-trastuzumab emtansine and Kadcyla.

**T-LGL leukemia :** A type of leukemia in which large T lymphocytes (a type of white blood cell) that contain granules (small particles) are found in the blood. It is a chronic disease that may last for a long time and get worse. Also called T-cell large granular lymphocyte leukemia.

**T-lymphoblastic lymphoma :** A type of non-Hodgkin lymphoma in which too many T-cell lymphoblasts (immature white blood cells) are found in the lymph nodes and spleen. It is most common in young men. Also called precursor T-lymphoblastic lymphoma.

**T-Phyl:** (Other name for: theophylline)

**T-regulatory cell :** A type of immune cell that blocks the actions of some other types of lymphocytes, to keep the immune system from becoming over-active. T-regulatory cells are being studied in the treatment of cancer. A T-regulatory cell is a type of white blood cell and a type of lymphocyte. Also called regulatory T cell, suppressor T cell, and T reg.

**T-shape:** A molecular shape that results when there are 3 bonds and 2 lone pairs around the central atom in the molecule. The atoms bonded to the central atom lie at the ends of a "T" with 90° angles between them. ICl<sub>3</sub> has a T-shaped molecular geometry

**T-VEC:** A drug used to treat melanoma that has recurred (come back) after surgery. It is used in patients whose cancer is in the skin and lymph nodes and cannot be removed by surgery. It is also being studied in the treatment of other types of cancer. T-VEC is made with a form of the herpesvirus that has been changed in the laboratory to infect and break down cancer cells without harming normal cells. It may also help the immune system kill cancer cells. T-VEC is injected directly into tumors in the skin and lymph nodes. It is a type of oncolytic virus therapy. Also called Imlygic and talimogene laherparepvec.

**T1 diagnostic:** An indication of how far the usual HF orbitals differ from the Brueckner orbitals. It has been used as an indicator of multi-reference character and therefore of the reliability of coupled cluster calculations (18,19), although this usage has been challenged.

**T138067:** An anticancer drug that belongs to the family of drugs called mitotic inhibitors. It inhibits the growth of cancer cells by preventing cell division.

**T1E28z CAR-expressing autologous CD4-positive T lymphocytes:**

Autologous CD4 positive T-lymphocytes engineered to express the chimeric antigen receptor (CAR) T1E28z containing the ErbB ligand, T1E, fused to the hinge region, transmembrane domain and endodomain of CD28 and the CD3zeta endodomain, with potential immunomodulating and antineoplastic activities. T1E, a chimeric polypeptide containing the N-terminus of human transforming growth factor (TGF)-alpha fused to the C-terminus of epidermal growth factor (EGF), binds to ErbB1 homodimers and heterodimers as well as ErbB2/3 heterodimers, but not to ErbB2 or ErbB3 alone. Upon intratumoral administration, the promiscuous ErbB ligand T1E of the T1E28z CAR-expressing autologous CD4-positive T

lymphocytes binds to the specific ErbB homo- and heterodimers on tumor cells. This induces selective toxicity in ErbB-expressing tumor cells resulting in tumor cell lysis. ErbB1, ErbB2 and ErbB3, members of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, are frequently overexpressed in solid tumors and play key roles in tumor cell proliferation and tumor angiogenesis.

**T4:** A hormone that is made by the thyroid gland and contains iodine. T4 increases the rate of chemical reactions in cells and helps control growth and development. T4 can also be made in the laboratory and is used to treat thyroid disorders. Also called L-3,5,5'-tetraiodothyronine, thyroxin, and thyroxine.

**T4N5 liposomal lotion :** A lotion being studied in the treatment of skin cancer and a skin condition called xeroderma pigmentosum. It has an enzyme contained in very tiny, fat-like particles. The enzyme repairs damage caused by ultraviolet radiation. T4N5 liposomal lotion is a type of DNA repair enzyme topical agent. Also called Dimericine.

**T900607:** A pentafluorophenylsulfonamide compound with potential antineoplastic activity. T900607 inhibits tubulin polymerization by binding irreversibly to colchicine binding sites, resulting in cell cycle arrest and apoptosis. Or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called tubulin-binding agents.

**Tab gate:** An opening aligned with the parting line of the mold where resin flows into the cavity. These are also referred to as “edge-gates” and are typically placed on an outside edge of the part. OR A small removable tab about the same thickness as the molded item, but usually perpendicular to the part for easy removal.

**TAB GATED:** A small removable tab of approximately the same thickness as the mold item, usually located perpendicular to the molded part. The tab is used as a site for edge gate location, usually on items with large flat areas.

**tabalumab:** A human IgG4 monoclonal antibody against B-cell activating factor (BAFF), with potential immunomodulating and antineoplastic activities. Tabalumab binds to and inhibits the activity of both soluble and cell surface-bound BAFF. This may reduce the activity, proliferation and survival of B-cells. A dysregulated expression of BAFF, a member of the tumor necrosis factor (TNF) family of proteins, is often seen in certain

autoimmune diseases and certain cancers, and may promote B lymphocyte activation, proliferation and survival.

**Tableting behavior:** A general term for behavior of crystals upon compression into tablets.

**Tabloid :** A drug used to treat acute myeloid leukemia (AML). It is also being studied in the treatment of other types of cancer. Tabloid stops cells from making DNA and RNA and it may kill cancer cells. It is a type of antimetabolite. Also called thioguanine.

**TAC:** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer. It includes the drugs docetaxel (Taxotere), doxorubicin hydrochloride (Adriamycin), and cyclophosphamide. Also called TAC regimen.

**TAC regimen:** An combination chemotherapy regimen consisting of docetaxel (Taxotere), doxorubicin hydrochloride (Adriamycin) and cyclophosphamide used in the adjuvant setting for the treatment of breast cancer. Or An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer. It includes the drugs docetaxel (Taxotere), doxorubicin hydrochloride (Adriamycin), and cyclophosphamide. Also called TAC.

**TAC-101:** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called synthetic retinoids and angiogenesis inhibitors.

**TACE :** A procedure in which the blood supply to a tumor is blocked after anticancer drugs are given in blood vessels near the tumor. Sometimes, the anticancer drugs are attached to small beads that are injected into an artery that feeds the tumor. The beads block blood flow to the tumor as they release the drug. This allows a higher amount of drug to reach the tumor for a longer period of time, which may kill more cancer cells. It also causes fewer side effects because very little of the drug reaches other parts of the body. TACE is used to treat liver cancer. Also called chemoembolization and transarterial chemoembolization.

**tacedinaline:** An orally bioavailable substituted benzamide derivative with potential antineoplastic activity. Tacedinaline inhibits histone deacetylation, which may result in histone hyperacetylation, followed by the induction of differentiation, the inhibition of cell proliferation, and apoptosis in susceptible tumor cell populations.

**TachoSil:** (Other name for: absorbable fibrin sealant patch)

**tachycardia :** Rapid beating of the heart, usually defined as greater than 100 beats per minute.

**tachypnea :** Rapid breathing.

**Tack:** Stickiness of an adhesive, measurable as the force required to separate an adherent from it by viscous or plastic flow of the adhesive.

**Tack rag:** A fabric impregnated with a special oil or resin which remains tacky. Used to remove dust, etc. from a surface immediately prior to painting.

**Tack Weld :** This process prevents picket compression or narrowing associated with high belt tension typically associated with flat wire belts 60" (1524 mm) or greater.

**Tackifiers:** Additives used to enhance the adhesiveness or bonding ability of a material.

**TACKY:** Sticky condition of coating during drying, between wet and dry-to-touch stage.

**tacrolimus:** A macrolide isolated from the fungus *Streptomyces tsukubaensis*. Tacrolimus binds to the FKBP-12 protein and forms a complex with calcium-dependent proteins, thereby inhibiting calcineurin phosphatase activity and resulting in decreased cytokine production. This agent exhibits potent immunosuppressive activity in vivo and prevents the activation of T-lymphocytes in response to antigenic or mitogenic stimulation. Tacrolimus possesses similar immunosuppressive properties to cyclosporine, but is more potent.

**tacrolimus :** A drug used to help reduce the risk of rejection by the body of organ and bone marrow transplants.

**tadalafil:** A carboline-based compound with vasodilatory activity. Tadalafil selectively inhibits the cyclic guanosine monophosphate (cGMP)-specific type 5 phosphodiesterase- (PDE-5)-mediated degradation of cGMP, which is found in the smooth muscle of the corpus cavernosa and corpus spongiosum of the penis. Inhibition of cGMP degradation by tadalafil results in prolonged muscle relaxation, vasodilation, and blood engorgement of the corpus cavernosa, and, so, prolonged penile erection. Check for active clinical trials using this agent.

**tadalafil** : A drug used to treat erectile dysfunction. It is also being studied in the treatment of sexual problems in patients treated with radiation or surgery for prostate cancer. Tadalafil blocks the action of a certain enzyme, which can result in increased blood flow to the penis, causing an erection. It is a type of cGMP phosphodiesterase type 5 (PDE5) inhibitor. Also called Cialis.

**TAE**: A procedure in which the blood supply to a tumor or an abnormal area of tissue is blocked. During TAE, a small incision (cut) is made in the inner thigh and a catheter (thin, flexible tube) is inserted and guided into an artery near the tumor or abnormal tissue. Once the catheter is in place, small particles made of tiny gelatin sponges or beads are injected. This blocks the artery and stops the flow of blood to the tumor or abnormal area of tissue. TAE is used to treat some types of liver cancer, kidney cancer, and neuroendocrine tumors. It may also be used to treat uterine fibroids, aneurysms, and other conditions. Also called arterial embolization and transarterial embolization.

**tafamidis meglumine**: A soft gelatin capsule formulation containing the meglumine salt form of tafamidis, a small molecule and pharmacological chaperone with potential disease-modifying activity. Tafamidis binds to and stabilizes wild-type and variant (V122I) transthyretin (TTR), thereby preventing tetramer dissociation into monomers; this prevents misfolding of the TTR protein and inhibits the formation of TTR amyloid fibrils and the subsequent deposition of these insoluble protein clusters in peripheral nerve tissues and organs. TTR is a 127 amino acid transport protein for thyroxine and retinol and is secreted by the liver.

**Tafinlar** : A drug used alone or with trametinib to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is used in patients with a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Tafinlar blocks this mutated protein, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor and a type of targeted therapy. Also called dabrafenib.

**TAG-72 antigen** : A protein/sugar complex found on the surface of many cancer cells, including breast, colon, and pancreatic cells.

**Tagamet**: (Other name for: cimetidine)

**tagging SNP** : A single nucleotide polymorphism, or SNP, that is used to “tag” a particular haplotype in a region of the genome. As a subset of all of the SNPs in the genome, tagging SNPs can be extremely useful for testing the association of a marker locus with a qualitative or quantitative trait locus in that it may not be necessary to genotype all of the SNPs. Also called tagSNP.

**Tagrisso** : A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of a cell protein called epidermal growth factor receptor and whose disease got worse during or after treatment with an anticancer drug that blocks EGFR. It is also being studied in the treatment of other types of cancer. Tagrisso blocks this mutated protein, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor. Also called osimertinib.

**tagSNP** : A single nucleotide polymorphism, or SNP, that is used to “tag” a particular haplotype in a region of the genome. As a subset of all of the SNPs in the genome, tagSNPs can be extremely useful for testing the association of a marker locus with a qualitative or quantitative trait locus in that it may not be necessary to genotype all of the SNPs. Also called tagging SNP.

**tai chi** : A form of traditional Chinese mind/body exercise and meditation that uses slow sets of body movements and controlled breathing. Tai chi is done to improve balance, flexibility, muscle strength, and overall health.

**tailbone** : The small bone at the bottom of the spine. It is made up of 3-5 fused bones. Also called coccyx.

**tailored intervention** : The use of communication, drugs, or other types of treatments that are specific for an individual or a group to improve health or change behavior.

**Take-up**: An apparatus for reeling extruded material. Or The area of the system where variations in belt length are accommodated or "taken up".

**Take-Up Drive** : A name often given to the system sprocket drive. This drive sets the belt speed and dwell time for the system, and is located just before the take-up.

**Take-Up Tower** : The structure or area where the take-up, take-up drive, limit switches and dancer roll are located in a spiral.

**talabostat :** A substance being studied in the treatment of cancer, including certain types of lung, pancreas, and brain cancer. Talabostat may help the immune system block the growth of cancer cells. It may also increase the growth of new blood cells. It is a type of enzyme inhibitor. Also called PT-100 and talabostat mesylate.

**talabostat mesylate:** The orally bioavailable mesylate salt of an amino boronic dipeptide with antineoplastic and hematopoiesis- stimulating activities. By cleaving N-terminal Xaa-Pro or Xaa-Ala residues, talabostat inhibits dipeptidyl peptidases, such as fibroblast activation protein (FAP), resulting in the stimulation of cytokine and chemokine production and specific T-cell immunity and T-cell- dependent activity. This agent may also stimulate the production of colony stimulating factors, such as granulocyte colony stimulating factor (G-CSF), resulting in the stimulation of hematopoiesis. Dipeptidyl peptidases are involved in the activation of polypeptide hormones and chemokines. or A substance being studied in the treatment of cancer, including certain types of lung, pancreas, and brain cancer. Talabostat mesylate may help the immune system block the growth of cancer cells. It may also increase the growth of new blood cells. It is a type of enzyme inhibitor. Also called PT-100 and talabostat.

**talactoferrin:** An orally bioavailable recombinant human lactoferrin produced in the fungus *Aspergillus niger* with potential antineoplastic and immunomodulating activities. Upon oral administration, talactoferrin is transported into small intestinal Peyer's patches of the gut-associated lymphoreticular tissues (GALT), where it recruits circulating immature dendritic cells (DCs) bearing tumor antigens and induces their maturation. In the GALT, DC maturation in the presence of tumor antigens and lymphoid effector cells may induce systemic innate and adaptive immune responses mediated by anti-tumor natural killer (NK) cells, cytotoxic T lymphocytes, and natural killer T (NKT) cells; activation of tumor-draining lymph nodes, cellular infiltration of distant tumors, and tumor-cell death may follow. Raising the initial immune response in the GALT, distant from the primary tumor, may counter local tumor-mediated immunosuppression. Check for active clinical trials using this agent.

**talactoferrin :** A drug being studied in the treatment of kidney cancer that has spread. It is also being studied in the treatment of other types of cancer and other conditions. Talactoferrin increases the activity of dendritic cells (a

type of immune cell) to help kill cancer cells. It is a form of human lactoferrin (a protein found in milk, tears, mucus, bile, and some white blood cells) that is made in the laboratory. Talactoferrin is a type of recombinant protein and a type of immunomodulatory protein. Also called talactoferrin alfa and TLF.

**talactoferrin alfa :** A drug being studied in the treatment of kidney cancer that has spread. It is also being studied in the treatment of other types of cancer and other conditions. Talactoferrin alfa increases the activity of dendritic cells (a type of immune cell) to help kill cancer cells. It is a form of human lactoferrin (a protein found in milk, tears, mucus, bile, and some white blood cells) that is made in the laboratory. Talactoferrin alfa is a type of recombinant protein and a type of immunomodulatory protein. Also called talactoferrin and TLF.

**taladegib:** An orally bioavailable small molecule antagonist of the Hedgehog (Hh)-ligand cell surface receptor smoothed (Smo) with potential antineoplastic activity. Taladegib inhibits signaling that is mediated by the Hh pathway protein Smo, which may result in a suppression of the Hh signaling pathway and may lead to the inhibition of the proliferation of tumor cells in which this pathway is abnormally activated. The Hh signaling pathway plays an important role in cellular growth, differentiation and repair; constitutive activation of this pathway is associated with uncontrolled cellular proliferation and has been observed in a variety of cancers. Check for active clinical trials using this agent.

**talampanel:** A synthetic derivative of dioxolo-benzodiazepine with anti-seizure activity. Talampanel noncompetitively binds to the AMPA (alpha-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid) subtype of glutamate excitatory amino acid receptors and may inhibit the growth of gliomas by interfering with neurotransmitters involved in brain tumor growth. This agent may also protect against traumatic brain injury. or A substance that is being studied in the treatment of brain tumors and other brain disorders, such as epilepsy and Parkinson disease. It is a type of AMPA receptor antagonist.

**talaporfin sodium:** An agent consisting of chlorin e6, derived from chlorophyll, and L-aspartic acid with photosensitizing activity. After intratumoral activation by light emitting diodes, taporfin sodium forms an extended high energy conformational state that generates singlet oxygen,

resulting in free radical-mediated cell death. or A drug used in photodynamic therapy. When absorbed by cancer cells and exposed to light, the drug becomes active and kills the cancer cells.

**talazoparib:** An orally bioavailable inhibitor of the nuclear enzyme poly(ADP-ribose) polymerase (PARP) with potential antineoplastic activity. Talazoparib selectively binds to PARP and prevents PARP-mediated DNA repair of single strand DNA breaks via the base-excision repair pathway. This enhances the accumulation of DNA strand breaks, promotes genomic instability and eventually leads to apoptosis. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins that signal and recruit other proteins to repair damaged DNA and is activated by single-strand DNA breaks.

**Talc:** Additive composed of hydrous magnesium silicate, used frequently as a filler or antiblock agent. OR A natural hydrous magnesium silicate, used frequently as an additive in plastic compounds. OR Finely-powdered native hydrous magnesium silicate. When administered into the pleural space, talc initiates an inflammatory reaction, resulting in adhesion of the visceral pleura to the parietal pleura and fibrosis, thereby effectively closing the pleural space and preventing further accumulation of fluid. This agent exhibits no intrinsic antineoplastic activity. or A mineral, usually used in a powdered form. In cancer treatment, sterile talc is used to prevent pleural effusions (an abnormal collection of fluid in the space between the lungs and the chest wall). Talc is inserted into the space, causing it to close up, so fluid cannot collect there. Also called sterile talc powder.

**talimogene laherparepvec:** An ICP34.5, ICP47-deleted, oncolytic herpes simplex type-1 virus (HSV-1) based on the JS1 strain, and encoding the immunostimulating factor human cytokine granulocyte-macrophage colony stimulating factor (GM-CSF) with potential immunostimulating and antineoplastic activities. Upon intratumoral injection, talimogene laherparepvec selectively infects and replicates in tumor cells, thereby inducing tumor cell lysis. In addition, GM-CSF attracts dendritic cells (DCs) and may stimulate a cytotoxic T cell response against tumor cells, which results in immune-mediated tumor cell death. Deletion of the gene encoding for ICP34.5 provides tumor selectivity and prevents replication in healthy cells. As ICP47 blocks antigen presentation in HSV-infected cells, deletion of this gene may induce a more potent antitumor immune response

in the tumor cells. Additionally, deletion of ICP47 causes increased expression of the HSV US11 gene and allows US11 to be expressed as an immediate early and not a late gene. This further enhances the degree of viral replication and oncolysis of tumor cells. or A drug used to treat melanoma that has recurred (come back) after surgery. It is used in patients whose cancer is in the skin and lymph nodes and cannot be removed by surgery. It is also being studied in the treatment of other types of cancer. Talimogene laherparepvec is made with a form of the herpesvirus that has been changed in the laboratory to infect and break down cancer cells without harming normal cells. It may also help the immune system kill cancer cells. Talimogene laherparepvec is injected directly into tumors in the skin and lymph nodes. It is a type of oncolytic virus therapy. Also called Imlygic and T-VEC.

**talk therapy :** Treatment of mental, emotional, personality, and behavioral disorders using methods such as discussion, ing, and counseling. Also called psychotherapy.

**talmapimod:** An orally bioavailable, small-molecule, p38 mitogen-activated protein kinase (MAPK) inhibitor with potential immunomodulating, anti-inflammatory, and antineoplastic activities. Talmapimod specifically binds to and inhibits the phosphorylation of p38 MAPK, which may result in the induction of tumor cell apoptosis, the inhibition of tumor cell proliferation, and the inhibition of tumor angiogenesis. This agent may also enhance proteasome inhibitor-induced apoptosis. p38 MAPK is a serine/threonine protein kinase involved in a MAPK signaling cascade that controls cellular responses to various environmental stresses, cytokines, and endotoxins.

**talotrexin :** A substance that is being studied in the treatment of leukemia and some other types of cancer. It belongs to the family of drugs called antifolates.

**talotrexin ammonium:** The ammonium salt of an antimetabolite analogue of aminopterin with potential antineoplastic activity. As a folate antagonist, talotrexin binds to and inhibits the function of dihydrofolate reductase, resulting in the inhibition of folate metabolism, DNA synthesis, and cell division. Hydrosoluble, talotrexin is actively transported into cells by the reduced folate carrier (RFC) and, therefore, is unlikely to be associated with P-glycoprotein-mediated multidrug resistance.

**taltirelin hydrate:** The hydrate of taltirelin, a thyrotropin releasing hormone (TRH) analogue with potential neuroprotective, analgesic and central nervous system-stimulating (CNS)/analeptic activities. Taltirelin mimics the physiological actions of TRH on the CNS while exerting a minimal effect on the release of thyrotrophin (TSH) from the anterior lobe of the pituitary. Like TRH, the mechanism of action of this agent in the CNS has not been fully elucidated mechanism, but may involve various cerebral monoamine pathways. Compared to TRH, taltirelin has a much longer half-life and duration of effects. Check for active clinical trials using this agent.

**talus:** a pile of rocks at the bottom of a hill. Or the accumulation of rock debris at the base of a steep slope.

**Talvesta:** (Other name for: talotrexin ammonium)

**tamibarotene:** An orally active, synthetic retinoid, developed to overcome all-trans retinoic acid (ATRA) resistance, with potential antineoplastic activity. As a specific retinoic acid receptor (RAR) alpha/beta agonist, tamibarotene is approximately ten times more potent than ATRA in inducing cell differentiation and apoptosis in HL-60 (human promyelocytic leukemia) cell lines in vitro. Due to a lower affinity for cellular retinoic acid binding protein (CRABP), tamibarotene may show sustained plasma levels compared to ATRA. In addition, this agent may exhibit a lower toxicity profile than ATRA, in part, due to the lack of affinity for the RAR-gamma receptor, the major retinoic acid receptor in the dermal epithelium. Check for active clinical trials using this agent.

**Tamiflu :** A drug used to prevent and to treat influenza virus infections. It blocks the release of the virus from infected cells. It is a type of antiviral agent. Also called oseltamivir phosphate.

**tamoxifen :** A drug used to treat certain types of breast cancer in women and men. It is also used to prevent breast cancer in women who have had ductal carcinoma in situ (abnormal cells in the ducts of the breast) and in women who are at a high risk of developing breast cancer. Tamoxifen is also being studied in the treatment of other types of cancer. It blocks the effects of the hormone estrogen in the breast. Tamoxifen is a type of antiestrogen. Also called tamoxifen citrate.

**tamoxifen citrate:** The citrate salt of an antineoplastic nonsteroidal selective estrogen receptor modulator (SERM). Tamoxifen competitively

inhibits the binding of estradiol to estrogen receptors, thereby preventing the receptor from binding to the estrogen-response element on DNA. The result is a reduction in DNA synthesis and cellular response to estrogen. In addition, tamoxifen up-regulates the production of transforming growth factor B (TGFb), a factor that inhibits tumor cell growth, and down-regulates insulin-like growth factor 1 (IGF-1), a factor that stimulates breast cancer cell growth. Tamoxifen also down-regulates protein kinase C (PKC) expression in a dose-dependant manner, inhibiting signal transduction and producing an antiproliferative effect in tumors such as malignant glioma and other cancers that overexpress PKC. or A drug used to treat certain types of breast cancer in women and men. It is also used to prevent breast cancer in women who have had ductal carcinoma in situ (abnormal cells in the ducts of the breast) and in women who are at a high risk of developing breast cancer. Tamoxifen citrate is also being studied in the treatment of other types of cancer. It blocks the effects of the hormone estrogen in the breast. Tamoxifen citrate is a type of antiestrogen. Also called tamoxifen.

**Tamper-evident:** Any device which shows visible signs that the container has been opened.

**tamsulosin :** A drug used to treat urinary problems caused by an enlarged prostate. Tamsulosin relaxes the muscles of the prostate and bladder, which helps the flow of urine. It is a type of alpha blocker. Also called Flomax and tamsulosin hydrochloride.

**tamsulosin hydrochloride:** The hydrochloride salt of tamsulosin, a sulfonamide derivative with adrenergic antagonist activity. Tamsulosin selectivity binds to and blocks the activity of alpha1 adrenoreceptors in the human prostate and bladder neck; blockade of these adrenoceptors can cause smooth muscle in the prostate and bladder neck to relax, resulting in an improvement in urinary flow rate. or A drug used to treat urinary problems caused by an enlarged prostate. Tamsulosin hydrochloride relaxes the muscles of the prostate and bladder, which helps the flow of urine. It is a type of alpha blocker. Also called Flomax and tamsulosin.

**Tandem duplication:** A duplication in which the repeated regions are immediately adjacent to one another.

**tandutinib:** A piperazinyl quinazoline receptor tyrosine kinase inhibitor with antineoplastic activity. Tandutinib inhibits the autophosphorylation of FLT3 (FMS-Like Tyrosine kinase-3), c-KIT and PDGF (platelet-derived

growth factor) receptor tyrosine kinases, thereby inhibiting cellular proliferation and inducing apoptosis. or A substance being studied in the treatment of some types of cancer. It may stop cancer cell growth by blocking certain enzymes. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called CT53518 and MLN518.

**tanespimycin:** A benzoquinone antineoplastic antibiotic derived from the antineoplastic antibiotic geldanamycin. Tanespimycin binds to and inhibits the cytosolic chaperone functions of heat shock protein 90 (HSP90). HSP90 maintains the stability and functional shape of many oncogenic signaling proteins; the inhibition of HSP90 promotes the proteasomal degradation of oncogenic signaling proteins that may be overexpressed by tumor cells. or A substance being studied in the treatment of cancer. It is made from an antibiotic called geldanamycin. Tanespimycin helps cause the breakdown of certain proteins in the cell, and may kill cancer cells. It is a type of antineoplastic antibiotic and a type of HSP90 inhibitor. Also called 17-AAG and 17-N-allylamino-17-demethoxygeldanamycin.

**tanezumab:** A humanized monoclonal antibody directed against nerve growth factor (NGF), a modulator of nociceptor function, with potential analgesic activity. Tanezumab binds to NGF and prevents NGF binding to its high affinity, membrane-bound, catalytic receptor tropomyosin-related kinase A (TrkA), which is present on sympathetic and sensory neurons; reduced stimulation of TrkA by NGF inhibits the pain-transmission activities of these neurons. NGF, a neurotrophin, is critical to the growth and maintenance of sympathetic and sensory neurons. In addition, NGF may induce mast cells to release inflammatory proteins and may induce the upregulation of substance P and other pain-related peptides in sympathetic and sensory neurons. Upon neurotrophin binding, TrkA phosphorylates itself and members of the MAPK pathway, mediating the multiple neuronal effects of NGF.

**tangent to a circle:** a line, line segment, or ray that touches a circle at one point (cannot go within the circle).

**tangerine tomato juice:** Tomato juice derived from the tangerine tomato, with potential antioxidant and chemopreventive activities. Tangerine tomato juice contains higher levels of the cis-isomer of lycopene (cis-LYC) compared to the trans-isomer (trans-LYC). Lycopene, a linear, unsaturated

hydrocarbon carotenoid, is the major red pigment in certain fruits such as tomatoes, pink grapefruit, apricots, red oranges, watermelon, rosehips, and guava. As an antioxidant, lycopene scavenges free radicals, which may both inhibit cellular oxidation and prevent free radical damage to cells. cis-LYC is better absorbed than its trans form.

**tanibirumab:** A fully human monoclonal antibody targeting the vascular endothelial growth factor receptor 2 (VEGFR2), with potential antiangiogenic activity. Upon administration, tanibirumab specifically binds to VEGFR2, thereby preventing the binding of its ligand VEGF. This may result in the inhibition of tumor angiogenesis and a decrease in tumor nutrient supply. VEGFR2 is a pro-angiogenic growth factor receptor tyrosine kinase expressed by endothelial cells, while VEGF is overexpressed in many tumors and is correlated to tumor progression.

**Tank:** Large metal container for holding water or other liquid usually completely enclosed and rectangular in shape.

**tannic acid :** A type of chemical found in plants and in certain foods, such as fruits, vegetables, nuts, wine, and tea. Tannic acid has antioxidant properties and may promote good health. It is being studied in the prevention of cancer, heart disease, and other diseases. It is also used in certain medicines, fabrics, leather, and ink. Tannic acid is a type of polyphenol. Also called tannin.

**tannin :** A type of chemical found in plants and in certain foods, such as fruits, vegetables, nuts, wine, and tea. Tannins have antioxidant properties and may promote good health. They are being studied in the prevention of cancer, heart disease, and other diseases. They are also used in certain medicines, fabrics, leather, and ink. A tannin is a type of polyphenol. Also called tannic acid.

**tanomastat:** A biphenyl matrix metalloproteinase (MMP) inhibitor (MMPI) with potential antineoplastic activity. Tanomastat inhibits MMP-2, MMP-3, and MMP-9, inhibiting extracellular matrix degradation and potentially inhibiting angiogenesis, tumor growth and invasion, and metastasis. MMPs consist of at least 18 zinc-containing endo-proteinases that are capable of degrading collagen and proteoglycan.

**Tantalum:** Symbol:"Ta" Atomic Number:"73" Atomic Mass: 180.95amu. Tantalum is one of the transition elements. This very hard, gray metal can

be found in many alloys. It has also been used in surgical equipment, camera lenses, and even electronic capacitors.

**tapentadol hydrochloride :** A drug used to treat moderate to severe pain. It binds to opioid receptors and other molecules in the central nervous system. Tapentadol hydrochloride is a type of opioid and a type of analgesic agent. Also called Nucynta.

**tapentadol hydrochloride ER:** An orally active, extended-release preparation of the hydrochloride salt of tapentadol with analgesic activity. Tapentadol is a synthetic, centrally acting analgesic with a dual mechanism of action involving mu-opioid receptor agonism and norepinephrine reuptake inhibition. This agent may be effective in the management of pain, cancer-related and other.

**Tapered Cylinder:** Refers to a particular shape of a container in which the circular cross section at the top is smaller in diameter than that at the bottom, or vice versa.

**Tarabine PFS:** (Other name for: cytarabine)

**Tarceva:** (Other name for: erlotinib hydrochloride)

**Tarceva :** A drug used to treat certain types of non-small cell lung cancer. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that cannot be removed by surgery or has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Tarceva blocks a protein called epidermal growth factor receptor (EGFR), which may help keep cancer cells from growing. It is a type of EGFR tyrosine kinase inhibitor. Also called CP-358,774, erlotinib hydrochloride, and OSI-774.

**tarenflurbil:** An orally active synthetic enantiomer of flurbiprofen. Tarenflurbil activates c-Jun N terminal kinase, increases AP-1 binding to DNA, and downregulates cyclin D1 expression, resulting in arrest of tumor cells in the G1 phase of the cell cycle and apoptosis. This agent also affects the expression of nuclear factor kappa B, a rapid response transcription factor that stimulates the immune response to tumor cells. Tarenflurbil does not inhibit the enzyme cyclo-oxygenase.

**tarextumab:** A monoclonal antibody directed against the Notch receptor with potential antineoplastic activity. Tarextumab binds to Notch on the cell surface, thereby inhibiting Notch-mediated signaling and gene transcription, which may impede tumor angiogenesis. Notch receptors are important for

cell-cell communication, which involves gene regulation mechanisms that control multiple cell differentiation processes during embryonic and adult life. Dysregulated Notch signaling is implicated in many diseases including T-ALL (T-cell acute lymphoblastic leukemia), CADASIL (cerebral autosomal dominant arteriopathy with sub-cortical infarcts and leukoencephalopathy), MS (multiple sclerosis), and many other disease states.

**target (biological):** Any organism, organ, tissue, or cell that is subject to the action of a pollutant or other chemical, physical, or biological agent (WHO, 1979).

**target (of environmental pollution):** A human being or any organism, organ, tissue, cell, resource, or any constituent of the environment, living or not, that is subject to the activity of a pollutant or other chemical or physical activity or other agent (WHO, 1979).

**target organ(s):** Organ(s) in which the toxic injury manifests itself in terms of dysfunction or overt disease (WHO, 1979).

**target population:** (i) The collection of individuals, items, measurements, etc., about which we want to make inferences. The term is sometimes used to indicate the population from which a sample is drawn and sometimes to denote any "reference" population about which inferences are required; (ii) The group of persons for whom an intervention is planned (Last, 1988).

**targeted therapy :** A type of treatment that uses drugs or other substances to identify and attack specific types of cancer cells with less harm to normal cells. Some targeted therapies block the action of certain enzymes, proteins, or other molecules involved in the growth and spread of cancer cells. Other types of targeted therapies help the immune system kill cancer cells or deliver toxic substances directly to cancer cells and kill them. Targeted therapy may have fewer side effects than other types of cancer treatment. Most targeted therapies are either small molecule drugs or monoclonal antibodies.

**Targocid:** (Other name for: teicoplanin)

**Targretin :** A drug used to treat skin problems caused by cutaneous T-cell lymphoma that have not gotten better after other treatment. It is also being studied in the treatment of other types of cancer. Targretin is a type of retinoid. Also called bexarotene and LGD1069.

**tariquidar:** An anthranilamide derivative with multidrug resistance properties. Tariquidar non-competitively binds to the p-glycoprotein transporter, thereby inhibiting transmembrane transport of anticancer drugs. Inhibition of transmembrane transport may result in increased intracellular concentrations of an anticancer drug, thereby augmenting its cytotoxicity. or A substance that is being studied in the treatment of cancer. It may help tumor cells respond again to drugs they have become resistant (unable to respond) to. Tariquidar is a type of multidrug resistance inhibitor and a type of P-glycoprotein antagonist. Also called XR9576.

**tarnish:** Tarnish is a dulling of a metal's shiny surface as a result of reactions at its surface between the metal and oxygen (and other gases in the air).

**TARP 27-35 peptide vaccine:** A peptide-based cancer vaccine, containing amino acid residues 27 through 35 of T cell receptor gamma alternate reading frame protein (TARP), with potential immunostimulatory and antineoplastic activities. Upon administration, TARP 27-35 peptide vaccine may stimulate a host cytotoxic T-cell (CTL) response against TARP-expressing tumor cells, resulting in tumor cell cytotoxicity. The nuclear protein TARP is commonly expressed on prostate and breast cancer cells and is highly immunogenic.

**TARP 29-37-9V peptide vaccine:** A peptide-based cancer vaccine, consisting of amino acid residues 29 through 37 of T cell receptor gamma alternate reading frame protein (TARP) with a leucine-to-valine substitution at position 9, with potential immunostimulatory and antineoplastic activities. Upon administration, TARP 29-37-9V peptide vaccine may induce a cytotoxic T-lymphocyte (CTL) response against TARP-expressing tumor cells, which may result in decreased tumor cell proliferation. The leucine-to-valine substitution at position 9 of this peptide improves its immunogenicity. The nuclear protein TARP is commonly expressed on prostate and breast cancer cells and is highly immunogenic.

**Tarvacin :** A substance being studied in the treatment of several types of cancer and infections caused by certain viruses. It binds to substances on the surface of tumor cells, certain viruses, and cells infected with a virus. The immune system detects Tarvacin on the cells and the viruses and may destroy them. It is a type of monoclonal antibody and a type of targeted therapy agent. Also called bavituximab.

**TAS-108:** A synthetic, antiestrogenic steroidal compound with potential antitumor activity. TAS-108 binds to and inhibits estrogenic receptor alpha (ERa), mainly expressed in the mammary gland and uterus and upregulated in estrogen-dependent tumors. Blockage of ERa by TAS-108 prevents the binding and effects of estrogen and may lead to an inhibition of estrogen-dependent cancer cell proliferation. TAS-108 also is a partial agonist of the estrogenic receptor beta (ERb), expressed in many tissues including the central nervous system, urogenital tract, bone and cardiovascular system, thereby exerting a positive effect on these tissues. In addition, TAS-108 activates the co-repressor Silencing Mediator for Retinoid and Thyroid hormone receptor (SMRT), a protein that inhibits the activities of the estrogen receptors, which may contribute to the antitumor activity of TAS-108. Check for active clinical trials using this agent.

**taselisib:** An orally bioavailable inhibitor of the class I phosphatidylinositol 3-kinase (PI3K) alpha isoform (PIK3CA), with potential antineoplastic activity. Taselisib selectively inhibits PIK3CA and its mutant forms in the PI3K/Akt/mTOR pathway, which may result in tumor cell apoptosis and growth inhibition in PIK3CA-expressing tumor cells. By specifically targeting class I PI3K alpha, this agent may be more efficacious and less toxic than pan PI3K inhibitors. Dysregulation of the PI3K/Akt/mTOR pathway is frequently found in solid tumors and causes increased tumor cell growth, survival, and resistance to both chemotherapy and radiotherapy. PIK3CA, which encodes the p110-alpha catalytic subunit of the class I PI3K, is mutated in a variety of cancer cell types and plays a key role in cancer cell growth and invasion.

**Tasigna :** A drug used to treat certain types of chronic myelogenous leukemia (CML). It is used in some newly diagnosed patients. It is also used in patients who have not gotten better after treatment with other anticancer drugs or who are not able to take imatinib mesylate. It is also being studied in the treatment of other types of cancer. Tasigna blocks a protein called BCR-ABL, which may help keep cancer cells from growing. It is a type of tyrosine kinase inhibitor. Also called nilotinib.

**tasisulam sodium:** The sodium salt form of tasisulam, an acyl-sulfonamide compound with potential antiproliferative activity. Tasisulam activates, through an as of yet not fully elucidated mechanism, the intrinsic mitochondrial-mediated cell death pathway as manifested by decreased

adenosine triphosphate (ATP), cytochrome C release, activation of caspases, loss of mitochondrial membrane potential, production of reactive oxygen species (ROS) and eventually apoptosis.

**tasquinimod:** A quinoline-3-carboxamide linomide analogue with antiangiogenic and potential antineoplastic activities. Tasquinimod has been shown to decrease blood vessel density but the exact mechanism of action is not known. This agent has also been shown to augment the antineoplastic effects of docetaxel and androgen ablation in a murine model of prostate cancer involving human prostate cancer xenografts. Check for active clinical trials using this agent.

**TATA box:** Found in nearly all eukaryotic genes, a promoter element giving rise to mRNA. The TATA box is centered between 30 and 90 residues downstream of the transcription start site and has the consensus sequence 5'-TATAAAA-3'.

**TATA-box-binding protein associated factor (TAF):** One of a group of proteins, many of which contain bromodomains, that bind to the TATA-box-binding protein to form a complex required for RNA transcription.

**taurolidine:** A synthetic broad-spectrum antibiotic with antibacterial, anticoagulant and potential antiangiogenic activities. Taurolidine, derived from the amino acid taurine, binds to and neutralizes bacterial exotoxins and endotoxins, or lipopolysaccharides (LPS). Taurolidine binding to LPS prevents bacterial adherence to host epithelial cells, thereby preventing bacterial invasion of uninfected host cells. Although the mechanism underlying its antineoplastic activity has not been fully elucidated, it may be related to this agent's anti-adherence property. In addition, taurolidine also promotes apoptosis by inducing various apoptotic factors and suppresses the production of vascular endothelial growth factor (VEGF), a protein that plays an important role in angiogenesis. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called anti-infectives.

**tautomer:** A structure formed by facile motion of a hydrogen from one site to another within the same molecule.

**Tavocept:** (Other name for: dimesna)

**taxane :** A type of drug that blocks cell growth by stopping mitosis (cell division). Taxanes interfere with microtubules (cellular structures that help

move chromosomes during mitosis). They are used to treat cancer. A taxane is a type of mitotic inhibitor and a type of antimicrotubule agent.

**taxoid XRP6258 :** A drug used with prednisone to treat hormone-resistant prostate cancer that has spread and that had been treated with docetaxel. It is also being studied in the treatment of other types of cancer. Taxoid XRP6258 blocks cell growth by stopping cell division and may kill cancer cells. It is a type of antimitotic agent. Also called cabazitaxel and Jevtana.

**taxol:** A naturally occurring compound (extracted from the bark of the Pacific yew tree) that has been approved by the U.S. Food and Drug Administration (FDA) for treating advanced breast or ovarian cancers. Or A chemical isolated from the Pacific yew tree that stabilizes tubulin in microtubules and promotes polymerization; used in chemotherapy to interfere with the proliferation of rapidly dividing cells.

**Taxol :** A drug used to treat breast cancer, ovarian cancer, and AIDS-related Kaposi sarcoma. It is also used together with another drug to treat non-small cell lung cancer. Taxol is also being studied in the treatment of other types of cancer. It blocks cell growth by stopping cell division and may kill cancer cells. It is a type of antimitotic agent. Also called paclitaxel.

**taxol analogue SID 530:** An intravenous formulation containing docetaxel, a semi-synthetic, second-generation taxane derived from a compound found in the European yew tree, *Taxus baccata*, with potential antineoplastic activity. Taxol analogue SID 530 binds to and stabilizes tubulin, inhibiting microtubule disassembly, which results in cell-cycle arrest at the G2/M phase and cell death.

**Taxoprexin:** (Other name for: DHA-paclitaxel)

**Taxotere :** A drug used to treat certain types of cancers of the breast, stomach, lung, prostate, and head and neck. It is being studied in the treatment of other types of cancer. Taxotere kills cancer cells by stopping them from dividing. It is a type of taxane. Also called docetaxel.

**Taxotere injection concentrate:** (Other name for: docetaxel)

**Taxotere-Platinol-fluorouracil :** A chemotherapy combination used to treat certain types of head and neck cancer and stomach cancer. It includes the drugs docetaxel (Taxotere), cisplatin (Platinol), and fluorouracil. Also called DCF, docetaxel-cisplatin-fluorouracil, TPF, and TPF regimen.

**Tay-Sachs disease:** A heritable disorder caused by the accumulation of gangliosides due to the lack of an enzyme ( $\alpha$ -N-acetylhexosaminidase) responsible for their degradation; clinical characteristics include weakness, mental retardation, dementia, blindness, and death by age 3.

**tazarotene :** A drug used on the skin to treat several skin conditions. It is also being studied in the treatment of basal cell skin cancer and basal cell nevus syndrome. Tazarotene is related to vitamin A and is made in the laboratory. It turns on a gene that may help stop the growth of skin cancer cells. Tazarotene is a type of synthetic retinoid. Also called Avage and Tazorac. OR A synthetic, topical retinoid. Tazarotene induces the expression of tazarotene-induced gene 3 (TIG3), a tumor suppressor gene. In psoriasis, tazarotene normalizes abnormal keratinocyte differentiation and reduces their hyperproliferation.

**tazemetostat:** An orally available, small molecule selective and S-adenosyl methionine (SAM) competitive inhibitor of histone methyltransferase EZH2, with potential antineoplastic activity. Upon oral administration, E7438 selectively inhibits the activity of both wild-type and mutated forms of EZH2. Inhibition of EZH2 specifically prevents the methylation of histone H3 lysine 27 (H3K27). This decrease in histone methylation alters gene expression patterns associated with cancer pathways and results in decreased tumor cell proliferation in EZH2 mutated cancer cells. EZH2, which belongs to the class of histone methyltransferases (HMTs), is overexpressed or mutated in a variety of cancer cells and plays a key role in tumor cell proliferation.

**Tazicef:** (Other name for: ceftazidime sodium)

**Tazorac :** A drug used on the skin to treat several skin conditions. It is also being studied in the treatment of basal cell skin cancer and basal cell nevus syndrome. Tazorac is related to vitamin A and is made in the laboratory. It turns on a gene that may help stop the growth of skin cancer cells. Tazorac is a type of synthetic retinoid. Also called Avage and tazarotene.

**TB:** A disease caused by a specific type of bacteria that spreads from one person to another through the air. TB can affect many parts of the body, but most often affects the lungs. A person may not have symptoms of TB for years, but they may appear when the patient becomes ill with a serious condition like diabetes, AIDS, or cancer. TB can usually be treated and cured with antibiotics. Also called tuberculosis.

**Tc 99m sestamibi:** Sestamibi is a large synthetic molecule of the isonitrile family, which can be labeled with Tc99m. It passes through cell membranes passively, collecting in cells with large numbers of mitochondria. It is often used for imaging of the thyroid and parathyroid. Check for active clinical trials using this agent.

**Tc 99m sulfur colloid :** A substance being studied as a way to find cancer in the body. It is also used to find sentinel lymph nodes in breast cancer. It contains a radioactive substance called technetium linked to a substance called sulfur colloid. Sulfur colloid is taken up by special cells in lymph tissue, and in the liver, spleen, and bone marrow after it is injected. A machine or probe that detects radioactivity is used to find where the Tc 99m sulfur colloid is in the body. It is a type of radiopharmaceutical and a type of radioimaging agent. Also called Tc-99m SC and technetium Tc 99m sulfur colloid.

**Tc-99m Dextran :** A substance being studied as a way to find sentinel lymph nodes in some types of skin cancer and breast cancer. It contains a radioactive substance called technetium linked to a substance called dextran. Dextran helps technetium stay in blood and lymph vessels after it is injected. A machine or probe that detects radioactivity shows which lymph nodes near the tumor have Tc-99m Dextran in them. It is a type of radiopharmaceutical and a type of radioimaging agent. Also called 99m-Tc-Dx and technetium Tc 99m dextran.

**Tc-99m SC:** A substance being studied as a way to find cancer in the body. It is also used to find sentinel lymph nodes in breast cancer. It contains a radioactive substance called technetium linked to a substance called sulfur colloid. Sulfur colloid is taken up by special cells in lymph tissue, and in the liver, spleen, and bone marrow after it is injected. A machine or probe that detects radioactivity is used to find where the Tc-99m SC is in the body. It is a type of radiopharmaceutical and a type of radioimaging agent. Also called Tc 99m sulfur colloid and technetium Tc 99m sulfur colloid.

**TCA cycle:** TCA cycle. See tricarboxylic acid cycle.

**TCE:** A device used to look at tissues in the esophagus. It is a tiny capsule with a laser scanner inside and a very thin cord attached to it. The patient swallows the capsule and the thin cord helps keep the capsule in a specific area in the esophagus. The cord is also used to remove the capsule. Pictures are taken by the laser scanner and sent to a computer for viewing. A TCE is

used to find early cancers of the esophagus and other parts of the body. Also called tethered capsule endoscope.

**TCGA:** A project to identify the complete set of DNA changes in many different types of cancer. Studying these changes may help researchers understand how different types of cancer form. This may lead to new ways to prevent, diagnose, and treat cancer. TCGA is led by the National Cancer Institute (NCI) and the National Human Genome Research Institute (NHGRI), which are parts of the National Institutes of Health (NIH). Also called The Cancer Genome Atlas.

**TCM:** A medical system that has been used for thousands of years to prevent, diagnose, and treat disease. It is based on the belief that qi (the body's vital energy) flows along meridians (channels) in the body and keeps a person's spiritual, emotional, mental, and physical health in balance. TCM aims to restore the body's balance and harmony between the natural opposing forces of yin and yang, which can block qi and cause disease. TCM includes acupuncture, diet, herbal therapy, meditation, physical exercise, and massage. Also called Oriental medicine and Traditional Chinese Medicine.

**TCP:** Transmission Control Protocol.

**TDA:** Tamm-Dancoff approximation. Synonymous with CIS.

**tea tree :** A tree that is a member of the myrtle family. Oil from the tea tree is used in shampoos and skin care products and to treat skin infections. It has been used in some cultures to treat other skin conditions, including acne, burns, and insect bites. The scientific name is *Melaleuca alternifolia*.

**TEAR PROPAGATION RESISTANCE:** Resistance of a material to a force acting to propagate an initiated tear in the material.

**Tear Resistance:** Also called tear strength, is the measure of how well a plastic material can withstand the effects of tearing. Natural rubber and polyurethane, for example, have a high tear resistance. Materials with low tear resistance tend to have poor resistance to abrasion and will quickly fail when damaged. or Resistance of a material to a force acting to initiate and then propagate a failure at the edge of a test specimen.

**Tear strength:** 1) force required to initiate or continue a tear in a material under specified conditions. 2) the force acting substantially parallel to the major axis of the test specimen.

**Tear Strip:** A feature added to the mold that will be removed from the part after molding to aid in creating a crisp end on the part. This is often done in conjunction with an overflow to improve the final part quality.

**Tecentriq :** A drug used to treat urothelial cancer (a type of bladder cancer) that has advanced or spread to other parts of the body. It is used in patients whose disease got worse during or after treatment with anticancer drugs that included platinum. It is also being studied in the treatment of other types of cancer. Tecentriq binds to a protein called PD-L1, which is found on some cancer cells. Tecentriq may block this protein and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called atezolizumab.

**Tecfidera:** (Other name for: dimethyl fumarate)

**TechneScan MDP:** (Other name for: technetium Tc 99m methylene diphosphonate)

**Technetium:** Symbol:"Tc" Atomic Number:"43" Atomic Mass: (98)amu. Technetium is one of the transition elements from period five. Technetium is an element that is not found in nature. Man has been able to create it in labs. It is a silvery-gray metal than has been used in steel and super conductors. It is radioactive.

**technetium Tc 94m sestamibi:** A radioconjugate consisting of sestamibi labeled with the positron-emitting isotope Tc 94m. Sestamibi is a synthetic molecule of the isonitrile family that diffuses through cell membranes and may preferentially accumulate within mitochondria. Technetium Tc 94m sestamibi may be used in tumor-imaging studies utilizing positron emission tomography (PET).

**technetium Tc 99 hydrazinonicotinamide-tricine-linked interleukin-2:** A radioconjugate composed of the cytokine interleukin-2 (IL-2) conjugated to the bifunctional chelating agent succinimidyl-6-hydrazinopyridine-3-carboxylate (HYNIC-NHS) and co-ligand tricine and labeled with the radioisotope technetium Tc 99m (99mTc-HYNIC-IL2), that can potentially be used as a diagnostic agent to detect tumor inflammation. Upon intravenous administration, IL-2 selectively binds to the IL-2 receptor (IL-2R) expressed on tumor infiltrating lymphocytes (TILs); upon internalization, the Tc99m moiety can be visualized using radioimaging, which allows the quantification of TILs expressing IL-2R. This agent

detects tumor enlargement due to invasion by TILs and not tumor progression.

**technetium Tc 99m demobesin-4:** A radioconjugate composed of the synthetic bombesin (BB) analog demobesin-4 bound to the radioisotope technetium Tc 99m with receptor ligand and gamma-emitting radioisotope activities. Upon intravenous administration, demobesin-4 selectively binds to the gastrin-releasing peptide receptor (GRPR) expressed on the surfaces of various tumor cell types; upon internalization, tumor cells expressing GRPRs bound to technetium Tc 99m can then be visualized using scintigraphy. GRPR, a bombesin receptor subtype, is frequently overexpressed on the surface of tumor cells such as prostate and breast cancer cells. Demobesin-4 was developed for technetium Tc 99m imaging of GRPR-expressing tumor cells. or A substance being studied as a way to find certain types of cancer. It contains a radioactive substance called technetium linked to another substance called demobesin. Demobesin binds to the receptor for bombesin (a substance that is found at higher-than-normal levels on some types of cancer cells). Technetium Tc 99m demobsin-4 collects in cancer cells and a machine is used to find where the cancer cells are in the body. It is a type of radiopharmaceutical and a type of radioimaging agent.

**technetium Tc 99m dextran :** A substance being studied as a way to find sentinel lymph nodes in some types of skin cancer and breast cancer. It contains a radioactive substance called technetium linked to a substance called dextran. Dextran helps technetium stay in blood and lymph vessels after it is injected. A machine or probe that detects radioactivity shows which lymph nodes near the tumor have technetium Tc 99m dextran in them. It is a type of radiopharmaceutical and a type of radioimaging agent. Also called 99m-Tc-Dx and Tc-99m Dextran.

**technetium Tc 99m DTPA:** A radiopharmaceutical core of chelating agent DTPA (diethylenetriaminepentaacetic acid) complexed with the gamma-emitting radionuclide technetium Tc 99m with radioimaging application. Tc-99m-DTPA has been utilized as a radiotracer, when conjugated to tissue specific molecules, in a wide variety of nuclear imaging studies, including brain, lung, and renal function studies.

**technetium Tc 99m ethylenedicysteine-deoxyglucose:** A radiopharmaceutical consisting of ethylenedicysteine-deoxyglucose (EC-

DG) labeled with the metastable radioisotope technetium Tc-99 ( $^{99m}\text{Tc}$ ). Upon administration, technetium Tc  $^{99m}$  ethylenedicycysteine-deoxyglucose accumulates in cells with increased metabolic activity such as proliferating tumor cells; tumor tissue may then be imaged using gamma scintigraphy.

**technetium Tc  $^{99m}$  galactosyl human serum albumin:** A colloid formulation of human galactosyl serum albumin (GSA) conjugated to the chelating agent diethylene-triaminepentaacetic acid (DTPA) and complexed to the gamma-emitting isotope technetium- $^{99m}$  ( $^{99m}\text{Tc}$ -GSA) with potential diagnostic imaging activity. Upon intravenous administration, the galactosyl moiety of  $^{99m}\text{Tc}$ -GSA binds to asialoglycoprotein receptors (ASGPR) located on hepatic cells. Upon SPECT (Single Photon Emission Computed Tomography) imaging, liver function can be assessed. The expression of ASGPR, which are solely found on the plasma membrane of mammalian hepatocytes, is associated with hepatic function.

**technetium Tc  $^{99m}$  glycopeptide:** A technetium Tc  $^{99m}$  radiopharmaceutical of a glutamate-rich peptide (GP) conjugated, via carbodiimide linker, to the heparin-like polysaccharide chitosan (CH) in a 1:1 ratio, with potential tumor targeting property. Upon administration,  $^{99m}\text{Tc}$ -glycopeptide targets and is taken up by glutamate-specific transporters on tumor cells. Upon internalization, the  $^{99m}\text{Tc}$  moiety can be visualized upon scanning. GP may potentially be used as a drug carrier for antineoplastic drug delivery to tumor cells.

**technetium Tc  $^{99m}$  human serum albumin colloid:** A colloid formulation of human serum albumin (HSA) labeled with Technetium- $^{99m}$  ( $^{99m}\text{Tc}$ ) with diagnostic imaging properties. This HSA radioconjugate contains the gamma-emitting  $^{99m}\text{Tc}$ , a metastable nuclide of molybdenum-99. A potential advantage of the  $^{99m}\text{Tc}$ -HSA suspension is its smaller colloid particle size as compared to formulations containing either sulfur or tin, thereby allowing for enhanced imaging of the lymphatic draining pattern during lymphoscintigraphic or sentinel lymph node mapping procedures.

**technetium Tc  $^{99m}$  hydroxydiphosphonate:** A radioconjugate containing hydroxydiphosphonate (HDP) labeled with the metastable radioisotope technetium Tc ( $^{99m}\text{Tc}$ ), with radioimaging activity. Upon intravenous administration, skeletal uptake of technetium Tc- $^{99m}$  HDP occurs as a function of skeletal blood flow and osteogenic activity. HDP has a specific

affinity for hydroxyapatite crystals in bone where abnormal accumulation of increased osteoid mineralization has occurred. Labeling of HDP with  $^{99m}\text{Tc}$  allows gamma scintigraphic imaging of areas of abnormal osteogenesis associated with malignant bone lesions.

**technetium Tc 99m mebrofenin:** A radioconjugate composed of the iminodiacetic acid derivative mebrofenin bound to an isotope of the synthetic element technetium (Tc). Upon administration and rapid clearance from the circulation, technetium Tc 99m mebrofenin is secreted into the hepatobiliary system, emitting gamma rays that are detectable with planar scintigraphy or single photon emission computer tomography (SPECT). Mebrofenin has no pharmacological effect at the recommended dosage for diagnostic imaging.

**technetium Tc 99m methylene diphosphonate:** A radiopharmaceutical containing methylene diphosphonate (medronate; MDP) complexed with the gamma-emitting radionuclide technetium Tc 99m with radioisotopic activity and hydroxyapatite affinity. Upon intravenous administration, skeletal uptake of technetium Tc 99m methylene diphosphonate occurs as a function of skeletal blood flow and osteogenic activity. The MDP moiety of this agent has affinity for hydroxyapatite crystals in bone with abnormal accumulation at sites with increased osteoid mineralization; labeling of MDP with Tc 99m allows scintigraphic imaging of areas of abnormal osteogenesis associated with malignant bone lesions.

**technetium Tc 99m sulfur colloid:** A gamma-emitting colloid used in scintillation scanning of the reticuloendothelial system (RES). After intravenous administration, technetium Tc 99m sulfur colloid is phagocytized by the reticuloendothelial system and concentrated in the liver, spleen, and bone marrow; detection/localization of phagocytized gamma ray-emitting colloid is performed with a gamma-ray scintillation camera. Scintillation scanning using technetium Tc 99m colloid sulfur helps determine the distribution and function of the RES and the extent to which tumor involves the RES. The RES includes cells types that can phagocytize and sequester inert particles and vital dyes; RES cell types include macrophages or macrophage precursors, specialized endothelial cells lining the sinusoids of the liver, spleen, and bone marrow, and reticular cells of lymphatic tissue and of bone marrow. or A substance being studied as a way to find cancer in the body. It is also used to find sentinel lymph nodes in

breast cancer. It contains a radioactive substance called technetium linked to a substance called sulfur colloid. Sulfur colloid is taken up by special cells in lymph tissue, and in the liver, spleen, and bone marrow after it is injected. A machine or probe that detects radioactivity is used to find where the technetium Tc 99m sulfur colloid is in the body. It is a type of radiopharmaceutical and a type of radioimaging agent. Also called Tc 99m sulfur colloid and Tc-99m SC.

**technetium Tc 99m-3PRGD2:** A radiopharmaceutical agent comprised of a pegylated arginine-glycine-aspartic acid (RGD) dimer (PRGD2) labeled with technetium Tc 99m, with potential alphaVbeta3 integrin imaging activity when used with single photon emission computed tomography (SPECT). After intravenous administration of technetium Tc 99m-3PRGD2, the RGD moiety binds to alphaVbeta3 integrin on the cell membrane via the cyclic RGD motif. Upon PET imaging, alphaVbeta3 integrin-expressing tumor cells can be visualized and expression levels can be quantified. Compared to other radiolabeled RGD-containing peptides, this agent shows an increased affinity for alphaVbeta3 integrin, enhanced tumor uptake as well as improved pharmacokinetics. AlphaVbeta3 integrin, a member of the integrin receptor family, is overexpressed on certain tumor cells and tumor endothelial cells while minimally or not expressed on healthy, normal cells; this receptor plays a key role in angiogenesis, tumor proliferation and survival.

**technetium Tc 99m-labeled albumin microspheres:** An injectable radiopharmaceutical formulation containing human serum albumin (HSA) microspheres labeled with technetium-99m (Tc-99m) with diagnostic imaging activity. Technetium Tc 99m-labeled albumin microspheres contain the gamma-emitting Tc99m, a metastable nuclide of molybdenum-99. Upon injection into the hepatic artery, the radionuclide portion allows for SPECT (single photon emission computed tomography) imaging of distribution patterns of the albumin microspheres. This may possibly predict the distribution of other agents with similar particle sizes within the liver and may give a prediction of the tumor response upon administration of such agents.

**technetium Tc 99m-labeled macroaggregated albumin:** An injectable radiopharmaceutical formulation containing human serum albumin (HSA) labeled with technetium-99m (Tc99m) in macroaggregates (MAA) with

diagnostic imaging activity. Technetium Tc 99m-labeled macroaggregated albumin contains the gamma-emitting Tc99m, a metastable nuclide of molybdenum-99. Upon injection into the hepatic artery and upon SPECT (single photon emission computed tomography) imaging, distribution patterns and possible prediction of expected distribution of agents with similar particle sizes within the liver can be assessed and may give a prediction about the tumor response upon administration of such agents.

**technetium Tc 99m-labeled tilmanocept:** A radiolabeled macromolecule consisting of the chelating agent diethylenetriamine pentaacetic acid (DTPA) and mannose each attached to a dextran backbone and labeled with metastable technetiumTc-99 (Tc-99m), with mannose binding and radioisotopic activities. Upon injection, the mannose moiety of technetium Tc 99m-labeled tilmanocept binds to mannose-binding protein (MBP). As MBPs reside on the surface of dendritic cells and macrophages, this gamma-emitting macromolecule tends to accumulate in lymphatic tissue where it may be imaged using gamma scintigraphy. This agent exhibits rapid clearance from the injection site, rapid uptake and high retention within the first draining lymph node, and low uptake by the remaining lymph nodes. MBP is a C-type lectin that binds mannose or fucose carbohydrate residues, such as those found on the surfaces of many pathogens, and once bound activates the complement system.

**technetium Tc 99m-NC100692:** A synthetic Arg-Gly-Asp (RGD)-containing cyclic peptide radiolabeled with technetium Tc 99m with integrin-binding and radioisotopic activities. Upon administration, technetium Tc 99m-NC100692 binds to alpha5beta3 integrin and to a lesser extent alpha5beta5; subsequently, alpha5beta3-expressing tumor cells can be visualized using scintigraphy and the degree of tumor angiogenesis can be determined. Integrins, membrane-spanning protein receptors, may be upregulated on proliferating endothelial cells; their overexpression has been associated with neovascularization, differentiation, proliferation of tumor cells and poor prognosis.

**technetium TC-99m:** One of the radioactive isotopes of technetium, a gamma/beta-emitter with a half life of 6 hours.

**technetium Tc-99m-labeled rhenium sulfide nanocolloid:** A colloid formulation of rhenium sulfide that is labeled with the gamma-emitting epitope technetium Tc 99m (Tc-99m) with diagnostic imaging activity.

Upon administration, the  $^{99m}\text{Tc}$ -colloidal rhenium sulfide is taken up by the lymph nodes. This allows imaging of the lymphatic drainage pattern during sentinel lymph node mapping, also known as lymphoscintigraphy.

**Technical Specifications:** Part of an NRC license authorizing the operation of a nuclear production or utilization facility. A Technical Specification establishes requirements for items such as safety limits, limiting safety system settings, limiting control settings, limiting conditions for operation, surveillance requirements, design features, and administrative controls. (See also Standard Technical Specifications.)

**technician :** A person trained in the techniques (methods) and skills of a profession. For example, a mammogram technician is trained to perform mammograms.

**tecogalan sodium:** A sulfated polysaccharide isolated from various *Arthrobacter* bacterial species. Possessing potential antiangiogenic and antineoplastic properties, tecogalan binds to basic fibroblast growth factor (bFGF), thereby preventing bFGF from binding to its receptors. Disruption of this receptor binding results in the inhibition of bFGF-stimulated endothelial cell growth, proliferation, and migration.

**Tectin:** (Other name for: tetrodotoxin)

**tectonic plates:** Tectonic plates are huge slabs of rock that make up the lithosphere (the Earth's crust and uppermost part of the mantle). They move at a rate of a few centimetres per year.

**tegafur:** A congener of the antimetabolite fluorouracil with antineoplastic activity. Tegafur is a prodrug that is gradually converted to fluorouracil in the liver by the cytochrome P-450 enzyme. Subsequently, 5-FU is metabolized to two active metabolites, 5-fluoro-2-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP) by both tumor cells and normal cells. FdUMP inhibits DNA synthesis and cell division by inhibiting thymidylate synthase and reducing normal thymidine production, while FUTP inhibits RNA and protein synthesis by competing with uridine triphosphate. or An anticancer drug that belongs to the family of drugs called antimetabolites.

**tegafur-gimeracil-oteracil potassium:** An orally bioavailable fluoropyrimidine antagonist composed of tegafur combined with two modulators of 5-fluorouracil (5-FU) activity, 5-chloro-2,4-dihydropyridine (CDHP) and potassium oxonate, in a molar ratio of 1:0.4:1. Tegafur is a

prodrug of 5-fluorouracil, an antimetabolite that inhibits thymidylate synthase, DNA synthesis and cell division, and competes with uridine triphosphate, thus inhibiting RNA and protein synthesis. CDHP is a reversible inhibitor of dihydropyrimidine dehydrogenase (DPD), the liver enzyme responsible for rapid catabolism of 5-FU into inactive metabolites. Potassium oxonate preferentially localizes in the gut and inhibits the enzyme orotate phosphoribosyl-transferase (OPRT), thereby decreasing activation of 5-FU in the gut and activated 5-FU-related gastrointestinal toxicity.

**tegafur-gimeracil-oteracil potassium-leucovorin calcium oral**

**formulation:** An orally bioavailable granular formulation composed of the fluoropyrimidine antagonist tegafur combined with two modulators of 5-fluorouracil (5-FU) activity, gimeracil and oteracil potassium, and the folic acid derivative leucovorin calcium, with potential antineoplastic activity. Tegafur is a prodrug of 5-fluorouracil (5-FU), an antimetabolite that is further metabolized to 5-fluoro-2'-deoxyuridine monophosphate (FdUMP) and 5-fluorouridine triphosphate (FUTP). FdUMP inhibits thymidylate synthase, DNA synthesis and cell division; FUTP competes with uridine triphosphate (UTP), thus inhibiting RNA and protein synthesis. Gimeracil is a reversible inhibitor of dihydropyrimidine dehydrogenase (DPD), the liver enzyme responsible for rapid catabolism of 5-FU into inactive metabolites. Oteracil potassium preferentially localizes in the gut and inhibits the enzyme orotate phosphoribosyl-transferase (OPRT), which converts tegafur to 5-FU. This decreases the amount of 5-FU in the gut and prevents activated 5-FU-related gastrointestinal (GI) toxicity. Leucovorin calcium, an active metabolite of folic acid, counteracts the toxic effects of 5-FU, thereby 'rescuing' the patient while permitting the antitumor activity of 5-FU. Check for active clinical trials using this agent.

**tegafur-uracil:** A formulated therapeutic oral agent consisting of a combination of the 5-fluorouracil (5-FU) congener prodrug tegafur (tetrahydrofuran-5-fluorouracil) and uracil (1:4). The high concentration of uracil reversibly inhibits the uracil-reducing enzyme dihydropyrimidine dehydrogenase (DPD), thereby inhibiting first-pass DPD-mediated hepatic metabolism of the uracil analogue 5-FU and permitting administration of 5-FU as the orally bioavailable prodrug tegafur. Tegafur is bioactivated to 5-FU by liver microsomal cytochrome P450 enzymes. 5-FU is subsequently converted into its active metabolites 5-fluoro-deoxyuridine-monophosphate

(FdUMP) and 5-fluorouridine-triphosphate (FUTP) intracellularly; these metabolites inhibit the enzyme thymidylate synthase and intercalate into RNA, resulting in decreased thymidine synthesis, reduced DNA synthesis, disrupted RNA function, and tumor cell cytotoxicity. or A substance being studied in the treatment of some types of cancer. It is a combination of tegafur and uracil. The tegafur is taken up by the cancer cells and breaks down into 5-FU, a substance that kills tumor cells. The uracil causes higher amounts of 5-FU to stay inside the cells and kill them. Tegafur-uracil is a type of antimetabolite. Also called Ftorafur and UFT.

**teglarinad chloride:** A water-soluble prodrug of a cyanoguanidine compound with potential antineoplastic activity. In vivo, teglarinad chloride is rapidly converted into active drug through hydrolytic cleavage of a carbonate ester bond. Although the exact mechanism of action has yet to be fully elucidated, the active drug appears to antagonize nuclear factor-kappa B (NF- $\kappa$ B) transcription, resulting in the induction of tumor cell apoptosis.

**Tegretol:** (Other name for: carbamazepine)

**teicoplanin:** A glycopeptide antibiotic complex isolated from the bacterium *Actinoplanes teichomyceticus*. Teicoplanin inhibits peptidoglycan polymerization, resulting in inhibition of bacterial cell wall synthesis and cell death. Or A substance used to treat bacterial infections. It belongs to the family of drugs called antibiotics.

**telangiectasia :** The permanent enlargement of blood vessels, causing redness in the skin or mucous membranes.

**telangiectasias:** small dilated vessels near the surface of the skin

**telaprevir:** An orally available peptidomimetic small molecule with activity against hepatitis C virus (HCV). Telaprevir is a selective protease inhibitor that targets the viral HCV NS3-4A serine protease and disrupts processing of viral proteins and formation of a viral replication complex.

**telapristone acetate:** The acetate form of the 21-substituted-19-nor-progestin telapristone, an orally available selective progesterone receptor modulator (SPRM), with potential anti-progesterone and antineoplastic activities. Upon oral administration, telapristone competitively binds to the progesterone receptor (PR) in progesterone-responsive tissue and inhibits PR-mediated gene expression. This interferes with progesterone activity in the reproductive system. As a result, this agent may suppress ovulation and inhibit proliferation of endometrial tissue. Also, this agent may prevent cell

growth and induce apoptosis in estrogen receptor (ER) and PR-positive breast cancer cells through a reduction in progesterone levels, ER downregulation and a suppression of the expression of cyclin-dependent kinases (CDK) 2 and 4, ultimately leading to G1/S cell cycle arrest. Unlike some other SPRMs, this agent does not exert any estrogenic, androgenic, anti-estrogenic, and anti-androgenic activities.

**telatinib mesylate:** The orally bioavailable mesylate salt of the 17-allylaminogeldanamycin (17-AAG) small-molecule inhibitor of several receptor protein tyrosine kinases with potential antiangiogenic and antineoplastic activities. Telatinib binds to and inhibits the vascular endothelial growth factor receptors (VEGFRs) type 2 and 3, platelet-derived growth factor receptor beta (PDGFRb) and c-Kit, which may result in the inhibition of angiogenesis and cellular proliferation in tumors in which these receptors are upregulated. These telatinib-inhibited receptor protein tyrosine kinases are overexpressed or mutated in many tumor cell types and may play key roles in tumor angiogenesis and tumor cell proliferation. 17-AAG is a synthetic analogue of the benzoquinone ansamycin antibiotic geldanamycin and has also been found to inhibit the molecular chaperone Hsp90.

**telavancin hydrochloride:** The hydrochloride salt form of telavancin, a lipoglycopeptide and a semisynthetic derivative of vancomycin with antibacterial activity against gram-positive bacteria. Like vancomycin, telavancin binds tightly to the D-alanyl-D-alanine residue of cell wall precursors, thereby interfering with bacterial cell wall synthesis. In addition, the lipophilic moiety of telavancin may interact with the lipid bilayer in the bacterial cell membrane, thereby compromising the integrity of cell membrane and causing cell membrane depolarization. This novel mechanism of action may contribute to telavancin's rapid bactericidal activity and its improved activity over vancomycin against some antibiotic resistance gram-positive bacteria.

**telbivudine:** A synthetic thymidine nucleoside analogue with antiviral activity highly specific for the treatment of hepatitis B virus (HBV). Intracellularly, telbivudine is phosphorylated to its active metabolite, telbivudine triphosphate. The dideoxy telbivudine triphosphate competes with thymidine for incorporation into viral DNA, thereby causing DNA chain termination and inhibiting the function of HBV DNA polymerase

(reverse transcriptase). This results in the blockade of HBV DNA replication and viral propagation.

**Telcyta :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called glutathione analogs. Also called TLK286.

**telemedicine :** The delivery of healthcare from a distance using electronic information and technology such as computers, cameras, videoconferencing, the Internet, satellite, and wireless communications.

**Telescoping:** Roll phenomenon characterized by layers of film sliding laterally in the transverse direction, causing the edge of the roll to have a conical shaped appearance resembling that of a telescope.

**Teletherapy:** Treatment in which the source of the therapeutic radiation is at a distance from the body. Because teletherapy is often used to treat malignant tumors deep within the body by bombarding them with a high-energy beam of gamma rays (from a radioisotope such as cobalt-60) projected from outside the body, it is often called “external beam radiotherapy.” For related information, see the Backgrounder on Medical Use of Radioactive Materials.

**Telintra:** (Other name for: ezatiostat hydrochloride)

**Telltale:** A label or tab of some material. Often a patch of cement and sand or plaster placed across a crack to show whether any future movement occurs.

**Tellurium:** Symbol:"Te" Atomic Number:"52" Atomic Mass: 127.60amu. Tellurium is usually found with gold. It is used in many alloys and as a trace element in ceramics.

**Telomelysin:** (Other name for: telomerase-specific type 5 adenovirus OBP-301)

**Telomerase:** A reverse transcriptase that contains its own template; a highly processive enzyme that elongates the 3'-ending strand of a telomere.

**telomerase :** An enzyme in cells that helps keep them alive by adding DNA to telomeres (the ends of chromosomes). Each time a cell divides, the telomeres lose a small amount of DNA and become shorter. Over time, the chromosomes become damaged and the cells die. Telomerase helps keep this from happening. Cancer cells usually have more telomerase than most normal cells.

**telomerase peptide vaccine GV1001:** A synthetic peptide vaccine containing a 16-amino-acid human telomerase reverse transcriptase peptide(hTERT: 611-626) with potential antineoplastic activity. Vaccination with telomerase peptide vaccine GV1001, which binds multiple HLA class II molecules and harbors putative HLA class I epitopes, may activate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against telomerase-expressing tumor cells. Telomerase, a reverse transcriptase normally repressed in healthy cells, is overexpressed in most tumor cell types and plays a key role in cellular proliferation.

**telomerase-specific type 5 adenovirus OBP-301:** A replication-competent oncolytic, telomerase-specific adenovirus serotype 5 (Ad5), with potential antineoplastic activity. OBP-301 contains the human telomerase reverse transcriptase (hTERT) gene promoter sequence that drives the expression of the E1A and E1B genes, and is linked to an internal ribosomal entry site (IRES). Upon administration, OBP-301 selectively infects and replicates in cancer cells that are expressing telomerase, which causes cell lysis. This adenovirus does not infect or replicate in normal, healthy cells. OBP-301 may also potentially be used as a chemosensitizer. hTERT, which encodes for the catalytic protein subunit of telomerase, is overexpressed in a variety of cancer cell types but not in normal, healthy cells. The insertion of an IRES further improves selectivity towards telomerase-expressing cancer cells.

**telomerase: 540-548 peptide vaccine:** A recombinant peptide consisting of the amino acid residues 540 to 548 of the human telomerase reverse transcriptase (hTERT). Telomerase expression has been directly linked to tumor development; its catalytic subunit is expressed in the majority of human cancer cells, but infrequently in normal cells. Vaccination with telomerase:540-548 peptide may stimulate cytotoxic T cells to recognize and kill telomerase-expressing cells. Check for active clinical trials using this agent.

**telomere:** Specialized nucleic acid structure found at the ends of linear eukaryotic chromosomes.

**telomere :** The ends of a chromosome. Each time a cell divides, the telomeres lose a small amount of DNA and become shorter. Over time, the chromosomes become damaged and the cells die. In cancer cells the telomeres do not get shorter, and may become longer, as the cells divide.

**Telomeres:** Ends of chromosomes; the DNA at the telomere consists of hundreds of repeats of a hexanucleotide sequence characteristic of the organism.

**telophase:** a phase during mitosis in which the chromosomes arrive at the opposite poles of the cell.

**telophase I:** the phase during meiosis in which the nucleus reorganizes as the chromosomes become chromatin; cytoplasmic division takes place, resulting in two cells.

**telophase II:** the phase during meiosis II in which the chromosomes gather at the poles of the cells and form a mass of chromatin; the nuclear envelope develops, the nucleoli reappear, and the cells undergo cytokinesis.

**telotristat etiprate:** An orally bioavailable, small-molecule, tryptophan hydroxylase (TPH) inhibitor prodrug, with potential antiserotonergic activity. Upon administration, telotristat etiprate is converted to its active moiety, telotristat (LP-778902), which binds to and blocks the activity of TPH. This may result in a reduction in peripheral serotonin (5-HT) production and improvement of serotonin-mediated gastrointestinal effects such as severe diarrhea. TPH, the rate-limiting enzyme in serotonin biosynthesis, is overexpressed in carcinoid tumor cells.

**teloxantrone hydrochloride:** The hydrochloride salt of an anthrapyrazole antineoplastic antibiotic. Teloxantrone intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair, as well as RNA and protein synthesis. Check for active clinical trials using this agent.

**Temodar :** A drug that is used to treat certain types of brain tumors in adults and is being studied in the treatment of other types of cancer. It belongs to the family of drugs called alkylating agents. Also called temozolomide.

**temoporfin:** A synthetic light-activated chlorin with photodynamic activity. Upon systemic administration, temoporfin distributes throughout the body and is taken up by tumor cells. Upon stimulation of temoporfin by non-thermal laser light (at 652 nm), and in the presence of oxygen, this agent produces highly reactive short-lived singlet oxygen and other reactive oxygen radicals, resulting in local damage to tumor cells. This may kill tumor cells and may reduce the tumor size. or An anticancer drug that is

also used in cancer prevention. It belongs to the family of drugs called photosensitizing agents.

**temozolomide:** A triazene analog of dacarbazine with antineoplastic activity. As a cytotoxic alkylating agent, temozolomide is converted at physiologic pH to the short-lived active compound, monomethyl triazeno imidazole carboxamide (MTIC). The cytotoxicity of MTIC is due primarily to methylation of DNA at the O6 and N7 positions of guanine, resulting in inhibition of DNA replication. Unlike dacarbazine, which is metabolized to MITC only in the liver, temozolomide is metabolized to MITC at all sites. Temozolomide is administered orally and penetrates well into the central nervous system. Check for active clinical trials using this agent. OR A drug that is used to treat certain types of brain tumors in adults and is being studied in the treatment of other types of cancer. It belongs to the family of drugs called alkylating agents. Also called Temodar.

**temperate phage:** A phage whose DNA may be incorporated into the host-cell genome without being expressed; as distinct from a virulent phage, which destroys the host cell.

**temperature:** measure of how warm or cold a substance is. Or A measure of the average kinetic energy of a substance. Determines the direction of heat transfer. Or Temperature is an intensive property associated with the hotness or coldness of an object. It determines the direction of spontaneous heat flow (always from hot to cold).

**Temperature effects:** changes in sensor signal due to changes in temperature.

**Temperature factor (thermal factor):** See Atomic displacement parameter.

**Template:** In DNA or RNA, a sequence that directs the production of a complementary sequence. Or A macromolecular mold or pattern for the synthesis of an informational macromolecule. Or A polynucleotide chain that serves as a surface for the absorption of monomers of a growing polymer and thereby dictates the sequence of the monomers in the growing chain.

**Template strand:** The strand of DNA that is complementary to the RNA transcript.

**Tempol:** (Other name for: topical piperidine nitroxide MTS-01)

**temporary acceptable daily intake:** Used when data are sufficient to conclude that use of the substance is safe over the relatively short period of time required to generate and evaluate further safety data, but are insufficient to conclude that use of the substance is safe over a lifetime. A higher-than-normal safety factor is used when establishing a temporary ADI and an expiration date is established by which time appropriate data to resolve the safety issue should be available (WHO, 1987).

**temporary hardness:** The component of total water hardness that can be removed by boiling the water.  $\text{Ca}(\text{HCO}_3)_2$  and  $\text{Mg}(\text{HCO}_3)_2$  are responsible for temporary hardness.

**temporary maximum residue limit:** A temporary maximum residue limit is a maximum residue limit established for a specified, limited period when (i) only a temporary or conditional acceptable daily intake has been established for the pesticide concerned, or (ii) although an acceptable daily intake has been established, the residue data are inadequate for firm maximum residue recommendations (WHO, 1976).

**Tempostatin:** (Other name for: halofuginone hydrobromide)

**temsirolimus:** An ester analog of rapamycin. Temsirolimus binds to and inhibits the mammalian target of rapamycin (mTOR), resulting in decreased expression of mRNAs necessary for cell cycle progression and arresting cells in the G1 phase of the cell cycle. mTOR is a serine/threonine kinase which plays a role in the PI3K/AKT pathway that is upregulated in some tumors. or A drug used to treat advanced renal cell carcinoma (a type of kidney cancer). It is also being studied in the treatment of other types of cancer. Temsirolimus blocks a protein involved in cell division, and may kill cancer cells. It is a type of rapamycin analog and a type of serine/threonine kinase inhibitor. Also called CCI-779 and Torisel.

**Tenacity (gpd):** The term generally used in yarn manufacture and textile engineering to denote the strength of a yarn or of a filament for its given size. Numerically it is the grams of breaking force per denier unit of yarn or filament size; grams per denier, gpd. The yarn is usually pulled at the rate of 12 in./min. Tenacity equals breaking strength (grams) divided by denier.

**tenase complex:** clotting cascade protein complex

**tendon :** Tough, fibrous, cord-like tissue that connects muscle to bone or another structure, such as an eyeball. Tendons help the bone or structure to move.

**tendons:** the connective tissue by which muscles are attached to bones.

**tenifatecan:** A lipophilic preparation of 7-ethyl-10-hydroxycamptothecin (SN-38) with potential antineoplastic activity. Tenifatecan is an oil-in-water emulsion of tocopherol covalently linked, via a succinate linker, to SN-38, an active metabolite of the camptothecin derivative irinotecan. After the succinate linker is hydrolyzed in vivo, the active moiety SN-38 is released and selectively stabilizes topoisomerase I-DNA covalent complexes, thereby inhibiting religation of topoisomerase I-mediated single-stranded DNA breaks and inducing lethal double-stranded DNA breaks; DNA replication is inhibited and apoptosis is triggered. This agent may provide greater delivery and exposure of SN-38 to the tumor than can be achieved with irinotecan.

**teniposide:** A semisynthetic derivative of podophyllotoxin with antineoplastic activity. Teniposide forms a ternary complex with the enzyme topoisomerase II and DNA, resulting in dose-dependent single- and double-stranded breaks in DNA, DNA: protein cross-links, inhibition of DNA strand religation, and cytotoxicity. This agent acts in the late S or early G phase of the cell cycle.

**teniposide :** An anticancer drug that is a podophyllotoxin derivative and belongs to the family of drugs called mitotic inhibitors.

**tenofovir:** A synthetic antiviral acyclic nucleotide analogue of adenosine 5-monophosphate. Tenofovir is incorporated into human immunodeficiency viral DNA instead of the natural substrate deoxyadenosine 5-triphosphate, thereby inhibiting HIV-1 reverse transcriptase (RT), an RNA-dependent DNA polymerase, and resulting in DNA chain termination and impairment of viral replication and propagation. This agent prevents HIV from reproducing in uninfected cells only. Tenofovir exhibits activity against the hepatitis B virus (HBV).

**tenofovir disoproxil fumarate:** A pro-drug, fumaric acid salt form of tenofovir, a nucleoside reverse transcriptase inhibitor analog of adenosine. Tenofovir disoproxil fumarate is prescribed to treat HIV and chronic hepatitis B virus (HBV) in adults.

**Tenon:** The end of a piece of wood cut in a rectangular form to fit into a cavity of the same shape and size cut in another piece (a mortice).

**TENS :** A procedure in which mild electric currents are applied to some areas of the skin. Also called transcutaneous electrical nerve stimulation.

**tense:** refers to the time in which the action, or state of being of the verb, is taking place.

**Tensile Bar (specimen):** A compression or injection molded specimen of specified dimensions which is used to determine the tensile properties of a material.

**Tensile Modulus :** (Also called modulus of elasticity). The ratio of nominal stress to the corresponding strain below the proportional limit of a material.

**Tensile Modulus (Also called modulus of elasticity):** The ratio of nominal stress to the corresponding strain below the proportional limit of a material.

**Tensile Strength:** the longitudinal stress required to break a prescribed specimen divided by the original cross-sectional area at the point of rupture (usually expressed in lbs. Per square inch), within the gauge boundaries sustained by the specimen during the test. OR The maximum tensile stress sustained by a material before failure in a tension test. Plastic materials have different tensile strengths. OR The amount of force required to elongate the plastic by a defined amount. The higher the value, the stronger the material. Or the maximum stress sustained by a material before failure in tension. When the maximum stress occurs at the yield point, it is called tensile strength at yield. When maximum stress at break: tensile strength at break.

**Tensile Strength:** The pulling stress required to break a given specimen. Area used in computing strength is usually the original, rather than the necked-down area.

**Tensile Strength, Break:** The maximum stress that a material can withstand without breaking when subjected to a stretching load.

**Tensile Strength, Yield:** The maximum stress that a material can withstand without yielding when subjected to a stretching load.

**Tensile Stress :** This can result from the fabrication of the material or applied stresses to the material in operation. This would most commonly be caused from high tension in the system.

**Tension Drive :** Another name for the Take-Up Drive or Auxiliary Drive.

**Tension Switches :** Switches that are installed to sound an alarm or stop the system if the position of the take-up roll goes too high or too low. Limit

switches can detect high tension and prevent some jam-ups.

**tensional stress:** stress that occurs when a rock is subjected to forces that tend to elongate it or pull it apart.

**tephra:** pyroclastic debris that is ejected from a volcano. Or Any rock material produced by a volcano.

**teprotumumab:** A recombinant, fully human monoclonal antibody directed against the insulin-like growth factor-1 receptor (IGF-1R) with potential antineoplastic activity. Teprotumumab binds to membrane-bound IGF-1R, preventing the binding of the natural ligand IGF-1 and the activation of PI3K/AKT signal transduction; downregulation of the PI3K/AKT survival pathway may result in the induction of apoptosis and decreased cellular proliferation. The activation of IGF-1R, a receptor tyrosine kinase of the insulin receptor superfamily, stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF-1R signaling has been implicated in tumorigenesis and metastasis.

**terameprocol:** A synthetic tetra-methylated derivative of nordihydroguaiaretic acid (NDGA) and transcriptional inhibitor with potential antiviral, antiangiogenic, and antineoplastic activities. Terameprocol competes with the transcription factor Sp1 for specific Sp1 DNA binding domains within gene promoter regions during DNA synthesis. In virally-infected cells, blocking of the Sp1 binding site suppresses Sp1-regulated viral promoter activity and gene expression, thereby inhibiting viral transcription and replication. In tumor cells, blockage of Sp1 binding sites by this agent interferes with the transcription of the Sp1-dependant genes cyclin-dependant kinase (Cdc2), survivin, and vascular endothelial growth factor (VEGF), which are overexpressed in a variety of cancers. By suppressing Sp1-regulated transcription of these genes, terameprocol may reduce tumor angiogenesis and tumor cell proliferation and induce tumor cell apoptosis. Check for active clinical trials using this agent.

**teratocarcinoma :** A type of germ cell cancer that usually forms in the testes (testicles).

**teratogen:** A substance that causes fetal abnormalities. Or This is the descriptor applied to any substance that can cause non-heritable birth defects. Or A substance that can cause deformities in embryos. Dioxin is a teratogen.

**teratogenicity:** The property (or potential) to produce structural malformations or defects in an embryo or fetus (WHO, 1987).

**teratoma :** A type of germ cell tumor that may contain several different types of tissue, such as hair, muscle, and bone. Teratomas may be mature or immature, based on how normal the cells look under a microscope. Sometimes teratomas are a mix of mature and immature cells. Teratomas usually occur in the ovaries in women, the testicles in men, and the tailbone in children. They may also occur in the central nervous system (brain or spinal cord), chest, or abdomen. Teratomas may be benign (not cancer) or malignant (cancer).

**terazosin :** A drug used to treat urinary problems caused by an enlarged prostate. It is also used to treat high blood pressure and is being studied in the treatment of other conditions. Terazosin relaxes muscle tissue in blood vessels and in the prostate. It is a type of alpha blocker. Also called Hytrin and terazosin hydrochloride.

**terazosin hydrochloride :** A drug used to treat urinary problems caused by an enlarged prostate. It is also used to treat high blood pressure and is being studied in the treatment of other conditions. Terazosin hydrochloride relaxes muscle tissue in blood vessels and in the prostate. It is a type of alpha blocker. Also called Hytrin and terazosin.

**Terbium:** Symbol:"Tb" Atomic Number:"65" Atomic Mass: 158.93amu. Terbium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element.

**Terebine:** A form of liquid drier for paint, originally a combination of solvent linseed oil and metallic salts. Now tends to be used by the painter for any liquid drying agent.

**terephthalamidine:** A derivative of the phthalanilide compounds. Terephthalamidine belongs to a family of compounds which appear to reversibly bind to the minor groove of the DNA double helix but not intercalate DNA. This agent also has been suggested to form ionic complexes with many biological components in vitro, including nucleic acids, proteins and lipids. Check for active clinical trials using this agent.

**term:** Each compound or element in a chemical equation. Or The addends of an expression.

**terminal:** 1. The end of a polymer molecule. 2. A point at which electrical connections can easily be made or broken.

**terminal alkyne:** an alkyne whose triple bond is located between the first and second carbon atoms of the chain.

**terminal cancer :** Cancer that cannot be cured and leads to death. Also called end-stage cancer.

**terminal carbon:** the carbon atom on the end a carbon chain.

**Terminal glycosylation:** The addition of carbohydrates to proteins and the processing of these carbohydrates that takes place in the Golgi complex.

**terminal moraine:** a moraine created at the end of the advance of a glacier. Or a ridge of till that marks the farthest advance of a glacier before it started to recede.

**terminal reaction:** A reaction that ends a cycle or chain of other chemical reactions.

**terminal transferase:** An enzyme that catalyzes the addition of nucleotide residues of a single kind to the 3' end of DNA chains.

**Termination:** The final state common to all biological polymerization reactions; the polymerization process is halted in response to a set of termination signals specific for the type of biological molecule being synthesized.

**termination codons:** UAA, UAG, and UGA; in protein synthesis, signal the termination of a polypeptide chain. Also known as stop codons.

**Termination factors:** Proteins that are exclusively involved in the termination reactions of protein synthesis on the ribosome. Or Protein factors of the cytosol required in releasing a completed polypeptide chain from a ribosome; also known as release factors.

**termination sequence:** A DNA sequence that appears at the end of a transcriptional unit and signals the end of transcription.

**termination step:** the step in a reaction mechanism that ends the reaction, often a reaction between two free radicals.

**terminus:** The end of a polymer molecule.

**teroxirone:** A triazene triepoxide with antineoplastic activity. Teroxine alkylates and cross-links DNA, thereby inhibiting DNA replication.

**terpene :** A type of strong-smelling chemical substance found in some plants, especially trees that have cones. Terpenes are found in essential oils (scented liquid taken from plants).

**Terpenes:** A diverse group of lipids made from isoprene precursors. Or Organic hydrocarbons or hydrocarbon derivatives constructed from recurring isoprene units. They produce some of the scents and tastes of plant products; for example, the scents of geranium leaves and pine needles.

**terrane:** a region of geologic continuity distinct from neighboring regions. Or large pieces of rock that are moved large distances; can be from another plate.

**terrestrial planets:** those that have densities of  $3\text{g/cm}^3$  or more: Mercury, Venus, Earth, and Mars. Or inner planet (Mercury, Venus, Earth, and Mars) with a rocky surface.

**terrestrial radiation:** The total infrared radiation emitted by the Earth and its atmosphere in the temperature range of approximately 200-300K.

Because the Earth is nearly a perfect radiator, the radiation from its surface varies as the fourth power of the surface's absolute temperature. Terrestrial radiation provides a major part of the potential energy changes necessary to drive the atmospheric wind system and is responsible for maintaining the surface air temperature within limits for livability. or The portion of the natural background radiation that is emitted by naturally occurring radioactive materials, such as uranium, thorium, and radon in the earth.

**terrigenous sediment:** a sea-floor sediment derived from land and usually deposited on the continental shelf, continental rise, and abyssal plain.

**tertiary:** a carbon atom that is directly attached to three other carbon atoms.

**tertiary ( $3^\circ$ ) carbon:** a carbon atom that is directly attached to three other carbon atoms.

**Tertiary Amines:** Amines fall into three different classes dependent upon how many of the hydrogen atoms are replaced. In a Tertiary Amine, all of the hydrogen atoms in an ammonia molecule have been replaced by hydrocarbon groups.

**tertiary carbocation:** a carbocation to which three alkyl groups are bonded.

**Tertiary structure:** In a protein or nucleic acid, the final folded form of the polymer chain. Or In proteins, the spatial arrangement of amino acid residues that are far from each other in the linear sequence, as well as the pattern of disulfide bonds.

**tertiary treatment:** process utilized to remove practically all solids and organic matter from wastewater. Granular activated carbon filtration is a tertiary treatment process. Phosphate removal by chemical coagulation is also regarded as a step in tertiary treatment.

**TESA:** A procedure in which a sample of sperm cells and tissue are removed from the testicle through a syringe attached to a small needle. The sperm is separated from the tissue and looked at under a microscope in the laboratory. It may then be used right away to fertilize eggs or frozen for future infertility treatment. TESA may be useful for men who have fertility problems caused by a blockage that keeps sperm from being ejaculated. This could be caused by previous vasectomy, certain genetic conditions, ejaculation problems, infection, or other conditions. It may also be useful for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. TESA is a type of sperm retrieval method. Also called testicular sperm aspiration.

**TESE:** A procedure in which sperm cells are removed and either used right away to fertilize eggs or frozen for future infertility treatment. Tissue is removed from the testicle through a small incision (cut) and looked at under a microscope in the laboratory to find sperm cells. TESE may be useful for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. TESE is a type of sperm retrieval method. Also called testicular sperm extraction.

**tesetaxel:** A semi-synthetic, orally bioavailable taxane derivative with potential antineoplastic and antiangiogenic properties. Tesetaxel binds to and stabilizes tubulin, promoting microtubule assembly and thereby preventing microtubule depolymerization. This may lead to cell cycle arrest and an inhibition of cell proliferation. This agent may also inhibit pro-angiogenic factors such as vascular endothelial growth factor (VEGF). As it represents poor substrate for P-glycoprotein-related drug resistance mechanisms, this agent may be useful for treating multi-drug resistant tumors.

**tesevatinib:** An orally bioavailable small-molecule receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic activity. Tesevatinib binds to and inhibits several tyrosine receptor kinases that play major roles in tumor cell proliferation and tumor vascularization, including epidermal growth factor receptor (EGFR; ERBB1), epidermal growth factor receptor 2 (HER2; ERBB2), vascular endothelial growth factor receptor (VEGFR), and ephrin B4 (EphB4). This may result in the inhibition of tumor growth and angiogenesis, and tumor regression.

**Teslac:** (Other name for: testolactone)

**testes:** endocrine glands that secrete androgens; the male reproductive organs located in the scrotum.

**testicle :** One of two egg-shaped glands inside the scrotum that produce sperm and male hormones. Also called testis.

**testicular cancer :** Cancer that forms in tissues of one or both testicles. Testicular cancer is most common in young or middle-aged men. Most testicular cancers begin in germ cells (cells that make sperm) and are called testicular germ cell tumors.

**testicular cord :** A cord-like structure in the male reproductive system that contains nerves, blood and lymph vessels, and the vas deferens (a coiled tube that carries sperm out of the testicle). It runs from the abdomen to the testicle, and connects to the testicle in the scrotum (external sac). Also called spermatic cord.

**testicular germ cell tumor :** A type of tumor that forms in a testicle from germ cells (cells that make sperm). Two main types of testicular germ cell tumors are seminomas and nonseminomas. Seminomas grow and spread slowly and are sensitive to radiation therapy. Nonseminomas grow and spread more quickly than seminomas. There are several different types of nonseminomas.

**testicular intraepithelial neoplasia :** Abnormal cells are found in the tiny tubules where the sperm cells begin to develop. These abnormal cells may become cancer and spread into nearby normal tissue. All tumor marker levels are normal. Also called stage 0 testicular carcinoma in situ and testicular intratubular germ cell neoplasia.

**testicular intratubular germ cell neoplasia :** Abnormal cells are found in the tiny tubules where the sperm cells begin to develop. These abnormal

cells may become cancer and spread into nearby normal tissue. All tumor marker levels are normal. Also called stage 0 testicular carcinoma in situ and testicular intraepithelial neoplasia.

**testicular shielding :** A procedure used to help keep a man fertile by preventing damage to the testicles during radiation therapy. A protective shield is placed over the scrotum (the external sac that contains the testicles) during radiation to the pelvic area. Testicular shielding is a type of fertility preservation.

**testicular sperm aspiration :** A procedure in which a sample of sperm cells and tissue are removed from the testicle through a syringe attached to a small needle. The sperm is separated from the tissue and looked at under a microscope in the laboratory. It may then be used right away to fertilize eggs or frozen for future infertility treatment. Testicular sperm aspiration may be useful for men who have fertility problems caused by a blockage that keeps sperm from being ejaculated. This could be caused by previous vasectomy, certain genetic conditions, ejaculation problems, infection, or other conditions. It may also be useful for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Testicular sperm aspiration is a type of sperm retrieval method. Also called TESA.

**testicular sperm extraction :** A procedure in which sperm cells are removed and either used right away to fertilize eggs or frozen for future infertility treatment. Tissue is removed from the testicle through a small incision (cut) and looked at under a microscope in the laboratory to find sperm cells. Testicular sperm extraction may be useful for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Testicular sperm extraction is a type of sperm retrieval method. Also called TESE.

**testicular tissue banking :** A process being developed to freeze testicular tissue from boys who have not gone through puberty, to save for future infertility treatment. Tissue that contains cells that make sperm is removed from the testicles through a small incision (cut). It is then frozen and stored. At a later date, the tissue can be thawed to retrieve sperm. Testicular tissue banking is being studied as a type of fertility preservation. It may be useful for young boys who are going to have treatments that may cause infertility,

such as certain cancer treatments. Also called testicular tissue cryopreservation and testicular tissue freezing.

**testicular tissue cryopreservation :** A process being developed to freeze testicular tissue from boys who have not gone through puberty, to save for future infertility treatment. Tissue that contains cells that make sperm is removed from the testicles through a small incision (cut). It is then frozen and stored. At a later date, the tissue can be thawed to retrieve sperm. Testicular tissue cryopreservation is being studied as a type of fertility preservation. It may be useful for young boys who are going to have treatments that may cause infertility, such as certain cancer treatments. Also called testicular tissue banking and testicular tissue freezing.

**testicular tissue freezing :** A process being developed to freeze testicular tissue from boys who have not gone through puberty, to save for future infertility treatment. Tissue that contains cells that make sperm is removed from the testicles through a small incision (cut). It is then frozen and stored. At a later date, the tissue can be thawed to retrieve sperm. Testicular tissue freezing is being studied as a type of fertility preservation. It may be useful for young boys who are going to have treatments that may cause infertility, such as certain cancer treatments. Also called testicular tissue banking and testicular tissue cryopreservation.

**testimonial :** Information provided by an individual who claims to have been helped or cured by a particular product. The information provided lacks the necessary elements to be evaluated in a rigorous and scientific manner and is not used in the scientific literature.

**testis :** One of two egg-shaped glands inside the scrotum that produce sperm and male hormones. Also called testicle.

**Testoderm:** (Other name for: therapeutic testosterone)

**testolactone:** A progesterone derivative with antineoplastic activity. Testolactone inhibits steroid aromatase, thereby preventing the formation of estrogen from adrenal androstenedione and reducing endogenous estrogen levels.

**Testolin:** (Other name for: therapeutic testosterone)

**testosterone :** A hormone made mainly in the testes (part of the male reproductive system). It is needed to develop and maintain male sex characteristics, such as facial hair, deep voice, and muscle growth.

Testosterone may also be made in the laboratory and is used to treat certain medical conditions.

**testosterone cypionate:** An eight-carbon ester form of testosterone. The number of ester carbon atoms correlate with the half-life of the prodrug. Testosterone inhibits gonadotropin secretion from the pituitary gland and ablates estrogen production in the ovaries, thereby decreasing endogenous estrogen levels. In addition, this agent promotes the maintenance of male sex characteristics and is indicated for testosterone replacement in hypogonadal males.

**testosterone flare :** A temporary increase in testosterone levels in the body caused by certain types of hormone therapy used to treat prostate cancer. A testosterone flare may occur in patients who are taking drugs called gonadotropin-releasing hormone (GnRH) agonists. When first given, these drugs cause the testicles to make more testosterone. This may cause symptoms, such as bone pain and urinary problems, to get worse, but they usually go away after the first few weeks of treatment.

**testosterone gel:** A topical gel preparation of synthetic testosterone. In vivo, testosterone is irreversibly converted to dihydrotestosterone (DHT) in target tissues by the enzyme 5-alpha reductase. Testosterone or DHT ligand-androgen receptor complexes act as transcription factor complexes, stimulating the expression of various responsive genes, resulting in an increase in protein anabolism, a decrease in amino acid catabolism, and retention of nitrogen, potassium, and phosphorus; DHT binds with higher affinity to nuclear androgen receptors than testosterone. In addition, testosterone is irreversibly converted to estradiol by the enzyme complex aromatase, particularly in the liver and adipose tissue. Testosterone and DHT promote the development and maintenance of male sex characteristics related to the internal and external genitalia, skeletal muscle, and hair follicles; estradiol promotes epiphyseal maturation and bone mineralization. Check for active clinical trials using this agent.

**testosterone undecanoate:** The undecanoate ester form of the androgen testosterone, with gonadotropin-secretory inhibiting and hormone replacement activity. As testosterone inhibits the secretion of gonadotropins from the pituitary gland, administration of testosterone decreases the secretion of luteinizing hormone (LH). By inhibiting LH secretion, the growth of Leydig cells, which are normally stimulated by LH to produce

testosterone, may be suppressed. In addition, this agent promotes the maintenance of male sex characteristics and can be used for testosterone replacement in hypogonadal males.

**testosterone vaginal cream:** A topical cream containing a synthetic form of the endogenous androgenic steroid testosterone. Upon vaginal application, testosterone is irreversibly converted to dihydrotestosterone (DHT) in target tissues by the enzyme 5-alpha reductase. Testosterone or DHT ligand-androgen receptor complexes act as transcription factor complexes, stimulating the expression of various responsive genes. DHT binds with higher affinity to androgen receptors than testosterone, activating gene expression more efficiently. In addition, testosterone is irreversibly converted to estradiol by the enzyme complex aromatase, particularly in the liver and adipose tissue. Topical application of testosterone may improve symptoms of vaginal dryness.

**Testostroval:** (Other name for: therapeutic testosterone)

**Testostroval-PA:** (Other name for: therapeutic testosterone)

**Testro AQ:** (Other name for: therapeutic testosterone)

**tetanus peptide melanoma vaccine:** A vaccine consisting of peptides derived from melanoma-associated antigens and a modified T-cell epitope derived from tetanus toxoid. Vaccination with this agent may stimulate a host cytotoxic and helper T-cell response against tumor cells expressing melanoma-associated antigens, resulting in decreased tumor growth.

**tetanus toxoid:** A substance that is derived from the toxin released by the bacterium that causes the disease tetanus. It is used as a vaccine to prevent tetanus or to help boost the immune response to other vaccines. OR A solution of formaldehyde-deactivated toxin isolated from the bacterium *Clostridium tetani*. Tetanus toxoid stimulates the production of antitoxin antibodies. This agent may be used as an adjuvant in cancer vaccines.

**tetanus toxoid helper peptide:** Obtained by genetic engineering from the bacterial *Clostridium tetani* toxoid, tetanus toxoid helper peptide QYIKANSKFIGITEL (amino acids 830-844) binds to class II MHC molecules as a nonspecific vaccine helper epitope (adjuvant) and induces an increased (and long term) immune response by increasing the helper T-cell response. Check for active clinical trials using this agent.

**tetanus-CMV fusion peptide vaccine:** A vaccine containing an inactivated epitope of tetanus toxin fused to a cytomegalovirus (CMV) peptide epitope, with potential anti-viral and immunomodulating activities. Upon administration, tetanus-CMV fusion peptide may stimulate a cytotoxic T-lymphocyte (CTL) response against CMV in the CMV-infected host. Tetanus toxin contains universal T cell helper epitopes.

**tethered capsule endoscope :** A device used to look at tissues in the esophagus. It is a tiny capsule with a laser scanner inside and a very thin cord attached to it. The patient swallows the capsule and the thin cord helps keep the capsule in a specific area in the esophagus. The cord is also used to remove the capsule. Pictures are taken by the laser scanner and sent to a computer for viewing. A tethered capsule endoscope is used to find early cancers of the esophagus and other parts of the body. Also called TCE.

**tetra-O-methyl NDGA :** A substance being studied in the treatment of cancer. It blocks proteins needed for cancer growth. It is a type of transcriptional inhibitor. Also called EM-1421 and tetra-O-methyl nordihydroguaiaretic acid.

**tetra-O-methyl nordihydroguaiaretic acid :** A substance being studied in the treatment of cancer. It blocks proteins needed for cancer growth. It is a type of transcriptional inhibitor. Also called EM-1421 and tetra-O-methyl NDGA.

**Tetracycline:** An antibiotic that binds to the prokaryotic 30S ribosomal subunit and inhibits the binding of aminoacyl-trna molecules to the ribosomal complex.

**tetracycline :** A drug used to treat bacterial infections. It stops the growth of bacteria by keeping them from making proteins. Tetracycline also binds to new bone tissue and is being studied as a way to detect bone growth. Tetracycline is a type of antibiotic and a type of bone-labeling agent.

**tetracycline antibiotic:** Any of a group of broad spectrum naphthacene antibiotics isolated from various species of Streptomyces or produced semisynthetically. In bacteria, tetracycline antibiotics block binding of aminoacyl-tRNA to the mRNA-ribosome complex, thereby inhibiting protein synthesis.

**tetracycline hydrochloride:** The hydrochloride salt of tetracycline, a broad-spectrum naphthacene antibiotic produced semisynthetically from chlortetracycline, an antibiotic isolated from the bacterium Streptomyces

aureofaciens. In bacteria, tetracycline blocks binding of aminoacyl-tRNA to the mRNA-ribosome complex, thereby inhibiting protein synthesis and bacterial cell growth. Because naturally fluorescing tetracycline binds to newly formed bone at the bone/osteoid interface, tetracycline-labeling of bone and fluorescence microscopy may be used to perform bone histomorphometry.

**tetradecanoylphorbol acetate:** A phorbol ester with potential antineoplastic effects. Tetradecanoylphorbol acetate (TPA) induces maturation and differentiation of hematopoietic cell lines, including leukemic cells. This agent may induce gene expression and protein kinase C (PKC) activity. In addition to potential antineoplastic effects, TPA may exhibit tumor promoting activity. OR A substance being studied in the treatment of leukemias and lymphomas. It is also being studied in the treatment of other types of cancer. Tetradecanoylphorbol acetate affects many cell actions and may cause tumor cells to die. It is a type of phorbol ester. Also called 12-O-tetradecanoylphorbol-13-acetate and TPA.

**Tetrafluoroethylene (TFE):** Monomer used as a chemical feedstock in the production of PTFE.

**Tetragonal Crystal:** A crystal that has a basic cube shape but is stretched out. It is almost rectangular when viewed from one side. Think about a candy bar for this one.

**Tetragonal crystal class:** A crystal class containing a four-fold rotation axis or rotatory-inversion axis along c. This class contains 68 space groups and has two restrictions: 1) the lengths of the a and b axes are identical, and 2) all angles are equal to  $90^\circ$ . T<sub>g</sub> See Glass-transition temperature.

**tetrahaloalkane:** an alkane that contains four halogen atoms on the carbon chain. The halogen atoms can be located on vicinal or nonvicinal carbon atoms.

**tetrahedral:** A molecular shape that results when there are four bonds and no lone pairs around the central atom in the molecule. The atoms bonded to the central atom lie at the corners of a tetrahedron with  $109.5^\circ$  angles between them. The ammonium ion ( $\text{NH}_4^+$ ) has a tetrahedral molecular geometry.

**tetrahedral angle:** an angle of  $109^\circ 28''$ , or approximately  $110^\circ$ . All of the bond angles in methane,  $\text{CH}_4$ , are tetrahedral angles.

**tetrahydrobiopterin:** The reduced coenzyme form of biopterin.

**tetrahydrofolate:** The reduced, active coenzyme form of the vitamin folate.

**Tetrahydrofolate (tetrahydropteroylglutamate):** A highly versatile carrier of activated one-carbon units.

**tetrahydrouridine:** A synthetic pyrimidine nucleoside analogue with biomodulating activity. Tetrahydrouridine increases the efficacy of the radiosensitizer cytochlor (5-chloro-2'-deoxycytidine) by inhibiting the enzyme deoxycytidine monophosphate (dCMP) deaminase and preventing the premature deamination of the cytochlor metabolite 5-chloro-2'-deoxycytidine monophosphate (CldCMP) to 5-chloro-2'-deoxyuridine monophosphate (CldUMP); in turn, this increases tumor concentrations of CldUMP which is then further anabolized and incorporated selectively into tumor DNA as CldU (5-chloro-2'-deoxyuridine). Check for active clinical trials using this agent. OR A substance being studied in the treatment of some types of cancer. It may help make cancer cells easier to kill with radiation therapy. Tetrahydrouridine is a type of radiosensitizing agent, a type of multidrug resistance modulator, and a type of cytidine deaminase inhibitor. Also called THU.

**Tetramer:** Structure resulting from the association of four subunits.

**tetraphenyl chlorin disulfonate:** A meso-tetraphenylchlorin substituted by two adjacent sulfonated groups with potential photosensitizing activity. Upon administration, tetraphenyl chlorin disulfonate incorporates into the cell's endosome and lysosome membranes. Subsequently, cytotoxic agents are administered and accumulate in endosomal and lysosomal compartments; upon local activation by light, tetraphenyl chlorin disulfonate produces reactive oxygen species (ROS), such as singlet oxygen, damaging endo/lysosomal membranes and accumulated cytotoxic agents are released into the tumor cell cytosol. This photochemical internalization (PCI) method can enhance the efficacy and selectivity of cytotoxic agents.

**tetravalent RNA-lipoplex cancer vaccine:** A RNA-lipoplex (RNA-LP)-based cancer vaccine containing four naked ribonucleic acid (RNA)-drug products (DPs) RBL001.1, RBL002.2, RBL003.1, and RBL004.1 encoding melanoma-associated antigens (MAAs) encapsulated in liposomes, with potential antineoplastic activity. Upon intravenous administration of the

tetravalent RNA-lipoplex cancer vaccine, the liposomes protect the RNA from degradation in the bloodstream, travel to the spleen and are taken up by antigen-presenting cells (APCs); RNA is translocated to the cytoplasm and translated into the four tumor-associated proteins. The expressed proteins are processed and the human leukocyte antigen (HLA)-peptide complexes are presented to the immune system. This induces antigen-specific CD8<sup>+</sup> and CD4<sup>+</sup> T-cell responses against the four selected MAAs.

**Tetrodotoxin:** A highly potent poison from the fugu (puffer) fish that blocks the conduction of nerve impulses along axons and excitable membranes in nerve fibers, leading to respiratory paralysis.

**tetrodotoxin:** A neurotoxin with potential analgesic activity. Tetrodotoxin binds to the pores of fast voltage-gated fast sodium channels in nerve cell membranes, inhibiting nerve action potentials and blocking nerve transmission. Although found in various species of fish (such as the pufferfish), newts, frogs, flatworms, and crabs, tetrodotoxin, for which there is no known antidote, is actually produced by bacteria such as *Vibrio alginolyticus*, *Pseudoalteromonas tetraodonis*, and other vibrio and pseudomonas bacterial species.

**Tetroses:** Monosaccharides that have four carbon atoms.

**TEXTURE:** The roughness or irregularity of a surface. Or a term describing the sizes and orientations of a rock's mineral or rock fragment components. Or A specific type of surface treatment applied to some or all faces of the part. This treatment can range from a smooth, polished finish to a highly contoured pattern that can obscure surface imperfections and create a better looking or better feeling part.

**TEXTURE PAINT:** Paint that can be manipulated by brush, roller, trowel or other tool to produce various effects.

**tezacitabine:** A synthetic purine nucleoside analogue with potential antineoplastic activity. Phosphorylated by cellular kinases, tezacitabine is converted into its active diphosphate and triphosphate metabolites. Tezacitabine diphosphate binds to and irreversibly inhibits the activity of the enzyme ribonucleotide reductase (RNR), which may result in the inhibition of DNA synthesis in tumor cells and tumor cell apoptosis. Tezacitabine triphosphate acts as a substrate for DNA polymerase, further compromising DNA replication. This agent is relatively resistant to metabolic deactivation by cytidine deaminase. RNR catalyzes the

conversion of ribonucleoside 5'-diphosphates to deoxyribonucleoside 5'-diphosphates necessary for DNA synthesis and is overexpressed in many tumor types.

**TG4010:** A substance that is being studied as an anticancer drug.

**TGF-beta-resistant LMP-specific cytotoxic T-lymphocytes:** A preparation of transforming growth factor-beta (TGF-beta)-resistant cytotoxic T-lymphocytes (CTL) reactive to Epstein-Barr virus (EBV) latent membrane proteins 1 and 2 (LMP 1 and 2) with potential antineoplastic activity. T lymphocytes are transduced with a retroviral vector expressing the dominant-negative mutant type II TGF-beta receptor, which blocks signaling by all three TGF-beta isoforms. These TGF-beta-resistant T-lymphocytes are exposed ex-vivo to dendritic cells (DCs) transfected with a replication-deficient adenovirus encoding EBV LMP; subsequent exposure to LMP1- or LMP2-expressing lymphoblastoid cell lines is used to expand the CTL. Administered to patients with EBV-positive tumors, TGF-beta-resistant LMP-specific CTL target LMP-positive cells, which may result in a specific CTL response, followed by cell lysis and inhibition of tumor cell proliferation. Tumor-expressed TGF-beta inhibits T lymphocyte activation and expansion.

**TGFa-PE38 immunotoxin:** A recombinant, chimeric toxin composed of human transforming growth factor alpha (TGF-alpha) fused to a fragment of Pseudomonas exotoxin (PE38) without its cell-binding domain. The TGF-alpha moiety of the agent attaches to tumor cells expressing the epithelial growth factor receptor (EGFR); the exotoxin induces caspase-mediated apoptosis of tumor cells via a mechanism involving mitochondrial damage; it also catalyzes the transfer of ADP ribose from nicotinamide adenine dinucleotide (NAD) to elongation factor-2 in eukaryotic cells, thereby inactivating elongation factor 2 and inhibiting protein synthesis.

**TGFbDNRII-transduced autologous tumor-infiltrating lymphocytes:** A preparation of tumor infiltrating lymphocytes (TILs) that are transduced with a retroviral vector encoding a gene for a dominant-negative form of the transforming growth factor beta (TGFb) receptor, TGFbDNRII, with potential immunomodulating activity. Upon administration, the TGFbDNRII-transduced autologous TILs recognize and kill tumor cells. The expression of TGFbDNRII allows for the TILs to be resistant to TGFb-mediated inhibition of T cell proliferation and activation, which allows

optimal TIL activity. The immunosuppressant TGF- $\beta$  is produced by tumor cells and plays a key role in the repression of the immune system.

**thalamus:** a portion of the forebrain that integrates sensory impulses.

**thalamus :** An area of the brain that helps process information from the senses and transmit it to other parts of the brain.

**thalassemia:** a term relating to any genetic defect that results in reduced rate of synthesis of one of the globin chains that make up hemoglobin

**Thalassemias:** Genetic disorders characterized by the defective synthesis of one or more hemoglobin chains.

**thalicarpine:** A natural aporphine benzyloisoquinoline vinca alkaloid with antineoplastic activity. Thalicarpine binds to and inhibits p-glycoprotein, the multidrug resistance efflux pump. Thalicarpine also induces single-strand breaks in DNA and arrests cancer cells at the G<sub>2</sub>/M and G<sub>1</sub> phase of the cell cycle.

**thalidomide:** A synthetic derivative of glutamic acid (alpha-phthalimido-glutarimide) with teratogenic, immunomodulatory, anti-inflammatory and anti-angiogenic properties. Thalidomide acts primarily by inhibiting both the production of tumor necrosis factor alpha (TNF-alpha) in stimulated peripheral monocytes and the activities of interleukins and interferons. This agent also inhibits polymorphonuclear chemotaxis and monocyte phagocytosis. In addition, thalidomide inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and basic fibroblast growth factor (bFGF), thereby inhibiting angiogenesis. OR A drug used with another drug to treat multiple myeloma in patients who have just been diagnosed. It is also used to treat a painful skin disease related to leprosy. It is being studied in the treatment of other types of cancer. Thalidomide may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called Synovir and Thalomid.

**Thallium:** Symbol:"Tl" Atomic Number:"81" Atomic Mass: 204.38amu. It is classified as a basic metal. Thallium is a very soft, silver-colored metal. It is very toxic but still has uses in poisons and some photographic equipment.

**Thalomid** : A drug used with another drug to treat multiple myeloma in patients who have just been diagnosed. It is also used to treat a painful skin disease related to leprosy. It is being studied in the treatment of other types of cancer. Thalomid may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called Synovir and thalidomide.

**The Cancer Genome Atlas** : A project to identify the complete set of DNA changes in many different types of cancer. Studying these changes may help researchers understand how different types of cancer form. This may lead to new ways to prevent, diagnose, and treat cancer. The Cancer Genome Atlas is led by the National Cancer Institute (NCI) and the National Human Genome Research Institute (NHGRI), which are parts of the National Institutes of Health (NIH). Also called TCGA.

**THE MOLE**: is the number of atoms in the atomic mass of an element or the number of molecules in the molecular mass of a compound. It =  $6.02 \times 10^{23}$  atoms or molecules.

**theaflavin** : A substance formed when green tea is fermented to make black tea. It is being studied in the treatment of cancer and other conditions, such as high cholesterol. It is a type of antioxidant.

**thearubigin** : A substance formed when green tea is fermented to make black tea. It is being studied in the treatment of cancer and other conditions, such as high cholesterol. It is a type of antioxidant.

**Theo-24**: (Other name for: theophylline)

**Theobid Duracap**: (Other name for: theophylline)

**theobromine** : A substance that is closely related to caffeine and is found in cocoa beans, cola nuts, and tea. It may also be made in the laboratory. Theobromine is used to increase the amount of urine made by the kidneys, to stimulate the heart, and to widen blood vessels. It is a type of alkaloid.

**Theochron**: (Other name for: theophylline)

**theophylline**: A natural alkaloid derivative of xanthine isolated from the plants *Camellia sinensis* and *Coffea arabica*. Theophylline appears to inhibit phosphodiesterase and prostaglandin production, regulate calcium flux and intracellular calcium distribution, and antagonize adenosine.

Physiologically, this agent relaxes bronchial smooth muscle, produces

vasodilation (except in cerebral vessels), stimulates the CNS, stimulates cardiac muscle, induces diuresis, and increases gastric acid secretion; it may also suppress inflammation and improve contractility of the diaphragm.

**theophylline** : A drug used to improve breathing in people who are short of breath. It belongs to the family of drugs called bronchodilators or respiratory smooth muscle relaxants.

**theoretical yield**: The amount of product obtained when all of the limiting reagent reacts.

**Theory**: A principle that explains a body of facts and the laws based on them. OR This is a word that is frequently misunderstood. Let us say we have a collection of observations ('facts') about something - it preferentially absorbs certain wavelengths of light, is composed largely of oxygen, hydrogen, carbon, calcium and phosphorus in certain proportions, and absorbs oxygen from the environment while releasing carbon dioxide. A theory is a way of explaining at these observations that allows us to make additional predictions about the behaviour of the system. If these predictions are right, we have a theory that is good enough for now. If they are not, we have to change our theory or claim that the additional observations were flawed. For example, the something in our example may be a frog; we could try poking it with a stick to see if it undergoes saltatory motion. If it does, we could claim that as a victory for our theory. If it doesn't, we could claim that some frogs will not jump if poked with sticks, or that our measuring equipment was not sensitive enough to pick up the motion of what was undoubtedly a frog. or Theories are well-established explanations for experimental data. To become established, the theory must experimentally tested by many different investigators. Theories usually can not be proven; a single contrary experiment can disprove a theory. Or A scientific explanation. A scientist uses imagination to produce a theory which seems to explain the observations that have been made. An experiment is then performed to try to either confirm or disprove the theory. The theory is then modified as these results are taken into account. The whole process continues. Although it may seem that science is a list of facts, it is continually evolving. Some of the ideas that were considered perfectly acceptable one hundred years ago are now considered too simple or even wrong. It is possible, though, that some of the ideas we believe today might turn out to be mistaken. Somebody reading this website today could be the

scientist who will produce the new theory! Ask your teacher about Bucky Balls. Unless you have a very young teacher, it is most likely that at school they were told that carbon can only be diamond or graphite. Although Bucky Balls have existed for just as long as diamond and graphite, they were only discovered in the last twenty years or so.

**theory of glacial ages:** a theory proposed by Swiss naturalist Louis Agassiz that parts of the earth's surface in the geologic past were covered with larger glaciers than we see today.

**Theraloc :** A substance being studied in the treatment of some types of cancer. Theraloc binds to a protein called epidermal growth factor receptor (EGFR), which is found on some normal cells and some types of cancer cells. Blocking this protein may help keep cancer cells from growing. Theraloc is a type of monoclonal antibody. Also called nimotuzumab.

**therapeutic :** Having to do with treating disease and helping healing take place.

**therapeutic (subthreshold) electrical stimulation :** A procedure in which small electric impulses are used to stimulate muscles that are weak or paralyzed. It helps to increase muscle strength, blood circulation, and range of motion and to lessen muscle spasms. Also called NES, neuromuscular electrical stimulation, and NMES.

**therapeutic allogeneic cytotoxic T lymphocytes:** A population of cytotoxic T-lymphocytes (CTLs) that are therapeutically administered to a recipient individual who is genetically distinct from a donor of the same species. Check for active clinical trials using this agent.

**therapeutic allogeneic lymphocytes:** A population of lymphocytes therapeutically administered to a recipient individual who is genetically distinct from a donor of the same species.

**therapeutic angiotensin-(1-7):** A substance being studied in the treatment of several types of cancer. Therapeutic angiotensin-(1-7) is a hormone that is made in the laboratory, and helps control blood pressure. It may stop the growth of some types of cancer cells and may stop the growth of blood vessels needed by tumors to grow. It is a type of antiproliferative agent. OR A synthetic heptapeptide identical to endogenous angiotensin-(1-7) with vasodilator and antiproliferative activities. Therapeutic angiotensin 1-7 may inhibit cyclooxygenase 2 (COX-2) and the production of proinflammatory prostaglandins and may activate the angiotensin-(1-7) receptor Mas,

resulting in diminished tumor cell proliferation. Activation of the angiotensin-(1-7) receptor Mas, a G-protein coupled, seven transmembrane protein, may down-regulate the phosphorylation and activation of Erk1 and Erk2 in the Erk1/Erk2 Mapk signaling pathway. In the renin-angiotensin system, the vasodilating activity of angiotensin- (1-7), hydrolysed from angiotensin II by the type I transmembrane metalloproteinase and carboxypeptidase angiotensin converting enzyme 2 (ACE2) in vivo, counteracts the vasoconstricting activity of angiotensin II. Check for active clinical trials using this agent.

**therapeutic autologous dendritic cells:** A population of a type of antigen-presenting cell (APC), the dendritic cell (DC), harvested from a patient and grown in vitro in the presence of tumor-associated antigens (TAAs) derived from the patient's tumor (a technique known as 'pulsing') and then injected back into the patient; autologous DCs so manipulated may stimulate a specific cell-mediated antitumoral cytotoxicity. DCs derived from a patient may also be fused with the patient's tumor cells in vitro to combine sustained tumor antigen expression with the antigen-presenting and immunostimulatory capacities of DCs; when injected back into the patient, these autologous DC-tumor cell hybrids (fusion cells) may stimulate an active antitumoral immune response.

**therapeutic autologous lymphocytes:** A population of lymphocytes isolated from an individual, altered in vitro, and returned to the same individual for therapeutic purposes.

**therapeutic breast/ovarian/prostate cancer vaccine DPX-0907:** A lipid-based multi-peptide cancer vaccine targeted against multiple cancers with immunopotentiating activity. Therapeutic breast/ovarian/prostate peptide cancer vaccine DPX-0907 is a lyophilized liposomal proprietary preparation comprised of 7 tumor-specific HLA-A2-restricted epitopes (TAAs): topoisomerase II alpha, B-cell receptor-associated protein 31 (CDM protein), TNF-alpha-converting enzyme (TACE/ADAM17), Abelson homolog 2 (Abl2), gamma catenin (Junction plakoglobin), epithelial discoidin domain receptor 1 (EDDR1) and integrin beta 8 subunit. Upon vaccination, the lyophilized antigen/adjuvant/liposome complex is re-suspended in Montanide 1SA51 VG to create a depot effect, thereby presenting the TAAs to the immune system for a prolonged period of time. This may stimulate a potent cytotoxic T-lymphocyte (CTL) immune

response against cancer cells that express these 7 TAAs and share epitopes with the vaccine epitope peptides, resulting in tumor cell lysis. The 7 TAAs are overexpressed on the surface of breast/ovarian and prostate cancer cells and play an important role in tumor cell growth and survival.

**therapeutic dendritic cells/cytokine-induced killer cells:** A preparation of autologous dendritic cells (DC) mixed with cytokine-induced killer (CIK) cells (DC-CIK), with potential immunopotentiating and antineoplastic activities. DCs were obtained ex vivo by incubation of peripheral blood lymphocytes (PBLs) with granulocyte-macrophage colony-stimulating factor stimulating factor (GM-CSF or CSF2), tumor necrosis factor (TNF), and interleukin (IL)-24 and were sensitized with tumor-associated antigens (TAAs). Cytokine-induced killer (CIK) cells are immune effector cells with both T-cell and natural killer (NK) cell like phenotype. CIKs are non-major histocompatibility complex (MHC)-restricted, NK-like T-lymphocytes, which express both CD3, a T-cell surface marker, and CD56, a natural killer cell surface marker, and have been generated ex vivo by incubation of peripheral blood lymphocytes (PBLs) with anti-CD3 monoclonal antibody, IL-2, IL-1 alpha, and interferon gamma (IFN-gamma) and then expanded. Upon co-culture of DCs and CIKs, and administration of DC-CIK cells into the patient, the DCs are able to stimulate the immune response to exert a specific anti-tumor immune response, while the CIK cells exert direct oncolytic activity.

**therapeutic epinephrine:** The synthetic form of the naturally occurring sympathomimetic amine with vasoconstricting, intraocular pressure-reducing, and bronchodilating activities. By stimulating vascular alpha-adrenergic receptors, epinephrine causes vasoconstriction, thereby increasing vascular resistance and blood pressure. When administered in the conjunctiva, this agent binds to alpha-adrenergic receptors in the iris sphincter muscle, resulting in vasoconstriction, a decrease in the production of aqueous humor, and a lowering of intraocular pressure. Through its beta1 receptor-stimulating actions, epinephrine increases the force and rate of myocardial contraction and relaxes bronchial smooth muscle, resulting in bronchodilation.

**therapeutic estetrol:** A synthetic steroid similar or identical to endogenous estetrol, a short-acting estrogen with both agonistic and antagonistic estrogen receptor activity. Administered orally, therapeutic estetrol binds to

the estrogen receptor and as a selective estrogen receptor modulator (SERM) exhibits estrogen agonism in certain tissues and estrogen antagonism in others. Displaying weak estrogen activity in the uterus, estetrol acts as an estrogen antagonist in breast tissue. Produced solely by the human fetal liver, endogenous estetrol is the primary estrogen metabolite of estrogen biosynthesis in the human fetal liver.

**therapeutic estradiol:** A steroid sex hormone vital to the maintenance of fertility and secondary sexual characteristics in females. Typically esterified, estradiol derivatives are formulated for oral or parenteral administration. As the primary, most potent estrogen hormone produced by the ovaries, estradiol binds to and activates specific nuclear receptors. Estradiol exhibits mild anabolic and metabolic properties, and increases blood coagulability.

**therapeutic gamma delta T lymphocytes:** A subset of therapeutic autologous T-lymphocytes that express a T-cell receptor (TCR) composed of one gamma chain and one delta chain, with potential immunomodulating and antineoplastic activities. Upon administration of the therapeutic gamma delta T-lymphocytes, these cells secrete interferon-gamma (IFN-g), and exert direct killing of tumor cells. In addition, these cells activate the immune system to exert a cytotoxic T-lymphocyte (CTL) response against tumor cells. Gamma delta T-lymphocytes play a key role in the activation of the immune system and do not require major histocompatibility complex (MHC)-mediated antigen presentation to exert their cytotoxic effect. Check for active clinical trials using this agent.

**therapeutic hemin:** A sterile, lyophilized powder of hemin, the Fe<sup>3+</sup> oxidation product of heme (Fe<sup>2+</sup>), derived from processed red blood cells. Therapeutic hemin appears to inhibit delta-aminolevulinic acid (ALA) synthetase, a rate-limiting enzyme in the porphyrin/heme biosynthetic pathway, resulting in inhibition of the hepatic and/or marrow synthesis of porphyrin precursors. The mechanism by which therapeutic hemin produces symptomatic improvement in patients with acute episodes of the hepatic porphyrias has not been determined.

**therapeutic hydrocortisone:** A synthetic or semisynthetic analog of natural hydrocortisone hormone produced by the adrenal glands with primary glucocorticoid and minor mineralocorticoid effects. As a glucocorticoid receptor agonist, hydrocortisone promotes protein

catabolism, gluconeogenesis, capillary wall stability, renal excretion of calcium, and suppresses immune and inflammatory responses.

**therapeutic immune globulin:** A preparation of plasma proteins derived from the pooled plasma of adult donors. Largely comprised of IgG antibodies, therapeutic immune globulin provides passive immunization by increasing the recipient's serum levels of circulating antibodies. IgG antibodies have multiple functions, including binding to and neutralizing bacterial toxins; opsonization of pathogens; activation of complement; and suppression of pathogenic cytokines and phagocytes through binding to CD5, interleukin-1a (IL-1a), interleukin 6 (IL-6), tumor necrosis factor-alpha (TNF-alpha), and T-cell receptors. Therapeutic immune globulin may diminish pathogenic mechanisms in some autoimmune diseases by binding to and inhibiting the activity of autoantibodies.

**therapeutic insulin:** A synthetic or animal-derived form of insulin used in the treatment of diabetes mellitus. Therapeutic insulin is formulated to be short-, intermediate- and long-acting in order to individualize an insulin regimen according to individual differences in glucose and insulin metabolism. Therapeutic insulin may be derived from porcine, bovine or recombinant sources. Endogenous human insulin, a pancreatic hormone composed of two polypeptide chains, is important for the normal metabolism of carbohydrates, proteins and fats and has anabolic effects on many types of tissues.

**therapeutic lotion:** A moisturizing skincare formulation used for various skin conditions including dry skin conditions associated with eczema, psoriasis, chapped or chafed skin.

**therapeutic medical play :** The use of games, toys, books, art, and role playing, sometimes with real or pretend medical equipment, to help children understand and become more comfortable with medical tests, procedures, treatments, and their illness. Therapeutic medical play gives children a way to express their feelings, fears, and anxieties and helps them learn ways to cope with things that may be stressful or upsetting.

**therapeutic melatonin:** A therapeutic chemically synthesized form of the pineal indole melatonin with antioxidant properties. The pineal synthesis and secretion of melatonin, a serotonin-derived neurohormone, is dependent on beta-adrenergic receptor function. Melatonin is involved in numerous

biological functions including circadian rhythm, sleep, the stress response, aging, and immunity.

**therapeutic progesterone:** A synthetic form of the endogenous hormone progesterone. Progesterone binds to the progesterone receptor, resulting in dissociation of heat shock proteins, receptor phosphorylation, and transcription activation through direct or indirect interaction with transcription factors. This agent exerts inhibitory effects on estrogens by decreasing the number of estrogen receptors and increasing its metabolism to inactive metabolites. Progesterone induces secretory changes in the endometrium, decreases uterine contractility during pregnancy, and maintains pregnancy. Check for active clinical trials using this agent.

**therapeutic testosterone:** A synthetic form of the endogenous androgenic steroid testosterone. In vivo, testosterone is irreversibly converted to dihydrotestosterone (DHT) in target tissues by the enzyme 5-alpha reductase. Testosterone or DHT ligand-androgen receptor complexes act as transcription factor complexes, stimulating the expression of various responsive genes. DHT binds with higher affinity to androgen receptors than testosterone, activating gene expression more efficiently. In addition, testosterone is irreversibly converted to estradiol by the enzyme complex aromatase, particularly in the liver and adipose tissue. Testosterone and DHT promote the development and maintenance of male sex characteristics related to the internal and external genitalia, skeletal muscle, and hair follicles; estradiol promotes epiphyseal maturation and bone mineralization. Due to rapid metabolism by the liver, therapeutic testosterone is generally administered as an ester derivative.

**therapeutic touch :** A form of complementary and alternative medicine based on the belief that vital energy flows through the human body. This energy is said to be balanced or made stronger by practitioners who pass their hands over, or gently touch, a patient's body. Therapeutic touch is being studied in patients receiving cancer therapy, to find out if it can improve quality of life, boost the immune system, or reduce side effects. Therapeutic touch is a type of energy therapy. Also called healing touch.

**therapeutic triiodothyronine:** A therapeutic formulation of the primary physiologically active form of endogenous thyroid hormone. In vivo, triiodothyronine enters the nucleus and binds to nuclear thyroid hormone receptors that subsequently bind to thyroid response elements (TREs)

located in target genes. Receptor binding by triiodothyronine in combination with recruited coactivators results in maximal transcriptional activation after binding to TREs; in general, binding of thyroid hormone receptor alone to TREs leads to repression of gene transcription.

**therapeutic tumor infiltrating lymphocytes:** A preparation of cells, consisting of autologous tumor infiltrating lymphocytes, that are manipulated in vitro and, upon administration in vivo, re-infiltrate the tumor to initiate tumor cell lysis. In vitro, therapeutic tumor-infiltrating lymphocytes (TILs) are isolated from tumor tissue and cultured with lymphokines such as interleukin-2; the therapeutic TILs are then infused into the patient, where, after re-infiltration of the tumor, they may induce lysis of tumor cells and tumor regression. The use of therapeutic TILs is considered a form of adoptive immunotherapy.

**therapy :** Treatment.

**TheraSphere:** (Other name for: yttrium Y 90 glass microspheres)

**thermal:** Pertaining to heat.

**thermal ablation :** A procedure using heat to remove tissue or a part of the body, or destroy its function. For example, to remove the lining of the uterus, a catheter is inserted through the cervix into the uterus, a balloon at the end of the catheter is inflated, and fluid inside the balloon is heated to destroy the lining of the uterus.

**Thermal analysis:** One of a group of methods used to characterize solids, thermogravimetric analysis, differential thermal analysis, differential scanning calorimetry.

**Thermal breeder reactor:** A breeder reactor in which the fission chain reaction is sustained by thermal neutrons.

**THERMAL CONDUCTIVITY:** Ability of a material to conduct heat; physical constant for quantity of heat that passes through unit cube of a substance in unit of time when difference in temperature of two faces is  $1^{\circ}$ . Or The rate of heat flow under steady state conditions through unit area per unit temperature gradient in a direction perpendicular to an isothermal surface. OR the ability of a material to conduct heat; physical constant for quantity of heat that passes through volume of a substance in unit of time for unit difference in temperature. OR Ability of a material to conduct heat;

physical constant for quantity of heat that passes through unit cube of a substance in unit of time when difference in temperature of two faces is 1°.

**Thermal conductivity** : One of the properties of metals, it is the ability to pass heat energy. Metal are good thermal conductors.

**Thermal Cracking:** A form of cracking that simply uses heat to break up the molecules. The crude oil is heated to 750 to 900 °C in the absence of oxygen and the molecules break up to give free-radicals, which start falling apart and rearranging themselves. Catalytic cracking can be done at much lower temperatures, but generates different products from the decomposition of the crude oil.

**thermal decomposition:** Thermal decomposition is the breakdown of the compound by heat. Or A chemical reaction where one substance is broken down into more than one substance by the action of heat. A good example is the thermal decomposition of limestone (calcium carbonate).

**Thermal Degradation:** deterioration of the material by heat, characterized by molecular scission.

**thermal energy:** energy an object possesses by virtue of its temperature. For example, 1 g of water at 15°C has 4.184 J more energy than 1 g of water at 14°C.

**THERMAL EXPANSION:** See COEFFICIENT OF THERMAL EXPANSION.

**Thermal Expansion Coefficient:** The fractional change in length (sometimes volume, specified) of a material for a unit change in temperature. Values for plastics range from 0.01 to 0.2 mils/in., degrees C.

**THERMAL MECHANICAL ANALYSIS (TMA):** In this technique, a sample is deformed under a static load as its temperature is being changed. Glass transition and softening points can be measured. The amount of orientation can also be measured by TMA.

**Thermal power:** The total core heat transfer rate to the reactor coolant.

**Thermal reactor:** A reactor in which the fission chain reaction is sustained primarily by thermal neutrons. Most current reactors are thermal reactors.

**Thermal shield:** A layer, or layers, of high-density material located within a reactor pressure vessel or between the vessel and the biological shield to reduce radiation heating in the vessel and the biological shield.

**Thermal Shut-Off:** Material freezes causing blockage.

**Thermal Stability:** It is polymers thermal characteristic. It is the time interval for which polymer remains stable at certain temperature. Beyond that time if the polymer is exposed to longer duration for a given temperature, it degrades. OR Ability of a polymer to maintain its initial physical and chemical properties at elevated temperature.

**THERMAL STRESS CRACKING (TSC):** Crazeing and cracking of some thermoplastic resins which results from over-exposure to elevated temperatures.

**Thermalization:** The process undergone by high-energy (fast) neutrons as they lose energy by collision.

**Thermazene:** (Other name for: silver sulfadiazine)

**Thermionic:** relating to, using, or being the emission of charged particles (as electrons) by an incandescent material.

**THERMIONIC EMISSION:** is the boiling off of electrons from heated metals. It gives a source of electrons for cathode ray tubes.

**thermionic emission:** The emission of electrons or ions by a hot object. For example, the filament in a mass spectrometer spits out energetic electrons that ionize atoms and molecules in the sample.

**thermistor:** a semiconductor whose resistance will vary with temperature. Or A device that senses temperature changes by using a resistor with an electrical resistance that falls when temperature rises.

**thermochemical equation:** An compact equation representing a chemical reaction that describes both the stoichiometry and the energetics of the reaction. For example, the thermochemical equation  $\text{CH}_4(\text{g}) + 2 \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g}) + 2 \text{H}_2\text{O}(\text{g}), \Delta H = -2220 \text{ kJ}$  means "When one mole of gaseous  $\text{CH}_4$  is burned in two moles of oxygen gas, one mole of  $\text{CO}_2$  gas and 2 moles of steam are produced, and 2220 kilojoules of heat are released."

**thermochemistry:** The study of heat absorbed or released during chemical changes.

**Thermochromism:** A compound is thermochromic if, upon exposure to heat, a color change occurs. Often this color change is reversible.

**thermocline:** zone in water where the temperature changes drastically. Or A transition layer of water in the ocean, with a steeper vertical temperature gradient than that found in the layers of ocean above and below. The

permanent thermocline separates the warm mixed surface layer of the ocean from the cold deep ocean water, and is found between 100- and 1000-m depths. The thermocline first appears at the 55 - 60 degree N and S latitudes, where it forms a horizontal separation between temperate and polar waters. The thermocline reaches its maximum depth at mid-latitudes and is shallowest at the equator and at its northern and southern limits. The thermocline is stably stratified, and transfer of water and carbon dioxide across this zone occurs very slowly. Thus, the thermocline acts as a barrier to the downward mixing of carbon dioxide.

**thermocouple:** A device that senses temperature changes by using a pair of joined wires made of dissimilar metals that produces a voltage that changes with temperature. Or A device made of two dissimilar metals that are used to measure the temperature of a heated area such as a barrel or nozzle. It sends a signal to a controller, which then adjusts the temperature of that area. OR Temperature sensor for measurement and control and can also be used to convert a temperature gradient into electricity. These are used on plastic extruder machines.

**ThermoDox:** (Other name for: lyso-thermosensitive liposomal doxorubicin)

**Thermodynamic:** The word 'thermodynamic' comes from roots that mean 'heat' and 'motion'. In a chemical reaction where chemical bonds rearrange to give more stable products, the energy that was stored in the bonds will be released as heat. In many chemical reactions where there are a number of possible products, one will be the most stable (give the greatest release of heat) - this will be the thermodynamic product. This might not be the product that is actually formed, since another possible product might be formed more rapidly - the kinetic product. Try this dodgy example.

**thermodynamic equilibrium:** A system is at thermodynamic equilibrium if the energy it gains from its surroundings is exactly balanced by the energy it loses, no matter how much time is allowed to pass.

**thermodynamically controlled reaction:** a reaction in which conditions permit two or more products to form. The products are in an equilibrium condition, allowing the more stable product to predominate.

**thermodynamically controlled reaction:** a reaction in which conditions permit two or more products to form. The products are in an equilibrium condition, allowing the more stable product to predominate.

**thermodynamics:** The study of temperature, pressure, volume, and energy flow in chemical reactions. Or The study of energy and its transformation. Or The study of energy transfers and transformations.

**Thermoelasticity :** Rubber-like elasticity exhibited by a rigid plastic resulting from an increase in temperature.

**thermoelectron:** An electron emitted by a very hot object.

**Thermoforming:** A manufacturing process where a plastic sheet is heated to a pliable forming temperature, formed to a specific shape in a mold, and trimmed to create a usable product. The sheet, or “film” when referring to thinner gauges and certain material types, is heated in an oven to a high-enough temperature that it can be stretched into or onto a mold and cooled to a finished shape. OR The process of forming a thermoplastic sheet into a three-dimensional shape by clamping the sheet in a frame, heating it to tender it soft and flowable. Then applying differential pressure to make the sheet conform to the shape of a mold or die positioned below the frame.

**Thermogenesis:** The regulated uncoupling of oxidative phosphorylation as a means of generating heat to maintain body temperature.

**Thermogenin:** A mitochondrial membrane protein (an uncoupling protein) that plays a role in thermogenesis by forming a pathway for the flow of protons into the mitochondria, thereby generating heat without synthesizing ATP.

**thermography :** In medicine, a procedure in which a heat-sensing infrared camera is used to record the surface heat produced by different parts of the body. Abnormal tissue growth can cause temperature changes, which may show up on the thermogram. Thermography may be used to diagnose breast cancer and other tumors. OR Treatment of disease using heat.

**THERMOGRAVIMETRIC ANALYSIS (TGA):** This technique is used to measure a variety of polymeric phenomena involving weight changes, such as sorption of gases, desorption of contaminants (monomers, solvents, and additives) and degradation. In TGA, a sample is placed on a balance beam in an oven. From the weight versus temperature curves, kinetic and other studies are carried out.

**Thermogravimetric analysis (TGA):** An analytical technique in which the weight change of the sample is measured during heating.

**thermohaline:** Refers to the combined effects of temperature and salinity that contribute to density variations in the oceans.

**Thermoluminescent dosimeter:** A small device used to measure radiation by measuring the amount of visible light emitted from a crystal in the detector when exposed to ionizing radiation.

**thermometer:** An instrument for measuring temperature.

**thermometry:** The science of temperature measurement.

**Thermomicroscopy:** A technique that involves observation of crystals on a microscope during heating.

**Thermonuclear:** An adjective referring to the process in which very high temperatures are used to bring about the fusion of light nuclei, such as those of the hydrogen isotopes deuterium and tritium, with the accompanying liberation of energy.

**thermoplastic:** A thermoplastic substance softens when subjected to heat and can be remoulded into different shapes. Or A polymer that, when heated ('thermo') becomes soft and deformable ('plastic'). Examples are poly(styrene) and poly(ethylene). Or A polymer that softens or melts on heating, and becomes rigid again on cooling. Thermoplastic polymer chains are not cross-linked. Polystyrene is a thermoplastic. or (a.) Capable of being repeatedly softened by heat and hardened by cooling — (n.) A material that will repeatedly soften when heated and harden when cooled. Typical of the thermoplastic family are the styrene polymers and copolymers, acrylics, cellulose, polyethylenes, polypropylene, vinyls, nylons, and the various fluorocarbon materials. OR Materials that become soft when heated and solid when cooled to room temperature. This softening and setting may be repeated many times. OR Polymers that can be melted by heating and solidified by cooling and may be remelted repeatedly. PE, PP, PVC and all extrudable polymers are thermoplastics. OR Resins capable of undergoing a chemical reaction leading to a relative infusible and insoluble state. OR Resins or plastic compounds in the form of small beads which, in their final state as formed plastic products, are capable of being repeatedly softened by an increase of temperature and hardened by a decrease of temperature.

**Thermoplastic Elastomers :** The family of polymers that resemble elastomers in that they can be repeatedly stretched without distortion of the unstressed part shape, but are true thermoplastics and thus do not require curing. OR TPEs are a family of polymers that can be repeatedly stretched

without permanently deforming the shape of the part. Unlike rubber-like elastomers, they do not require curing or vulcanization, as they are true thermoplastics. TPEs may be processed by conventional thermoplastic techniques such as injection moulding, plastic extrusion and blow moulding. They are used for automotive, building and construction plastic profiles, soft touch grips and handles, caster treads and rollers.

**Thermoplastic resin:** A resin which will melt when heated and solidifies when cooled, and softens when reheated.

**Thermoplastic screw:** The screw in the barrel of the plastic extrusion machine. There are single screw and vented (two-stage/twin) screws. Often screw length is referenced to its diameter as LD ratio. For instance, a 6-inch (150 mm) diameter screw at 241 will be 144 inches (12 ft) long, and at 321 it is 192 inches (16 ft) long. An LD ratio of 241 is common, but some machines go up to 321 for more mixing and more output at the same screw diameter. Two-stage (vented) screws are typically 361 to account for the two extra zones.

**Thermoplastics vs. Thermosets :** A thermoplastic is a polymeric material or plastic which becomes soft and formable when heated and rigid when cooled. This process may be repeated a number of times without chemically altering the material. A thermoset is a polymeric material which undergoes irreversible chemical changes when cured through heat, catalysts or ultraviolet light: cross-linking prevents movement of molecular chains after curing. Once cured, the structure cannot be changed.

**thermoset:** A thermoset plastic is heat resistant because of extensive cross-linking between its molecules by strong covalent bonds. Or A polymer that, when heated ('thermo') does not become soft and deformable. This is usually because it is crosslinked, and the molecules comprising it cannot move past one another unless chemical bonds are actually broken - which leads to the decomposition of the polymer. Phenol-formaldehyde resin is an example. or A plastic which flows and then sets permanently on first heating, as a result of setting up a three-dimensional crosslinked molecular structure, and subsequently will not soften or dissolve. OR A material, which when heated, is pressed or molded into a shape. The heating process changes the structure of these materials, and for this reason they cannot be re-heated. OR A polymer that doesn't melt when heated. Thermoset polymers "set" into a given shape when first made and afterwards do not

flow or melt, but rather decompose upon heating. They are often highly cross-linked polymers, with properties similar to those of network covalent solids, i.e., hard and strong. OR Materials that undergo chemical reaction and can be hardened by application of heat and pressure. They cannot be softened again to make them flowable. Typical plastics in this family are melamine, urea, epoxies and phenolics. OR Resins or plastic compounds, which in their final state are infusible and insoluble. After being fully cured, thermosets cannot be resoftened by heat. OR Resins or plastic compounds which in their final state as finished resin or plastic articles are substantially infusible and insoluble (see also Cross-Linking). OR Materials that may not be reheated and softened again. Once the structural framework is set, these plastics cannot be reformed.

**thermosetting:** A thermosetting plastic is heat resistant because of extensive cross-linking between its molecules by strong covalent bonds. Or A polymer that solidifies on heating and cannot be remelted. The setting action results from crosslinking of the polymer chains at high temperature—a process that is not reversed by cooling and reheating.

**Thermosetting resin (Thermoset):** A resin designed to undergo an irreversible chemical and physical change during a heat-cure schedule, i.e., a plastic resin that crosslinks during cure so that it does not soften when reheated.

**thermosoftening:** A thermosoftening plastic softens when subjected to heat and can be remoulded into different shapes.

**thermosphere:** uppermost layer of the atmosphere; temperatures increase with altitude.

**thesis:** a sentence or group of sentences that make an assertion about the topic; it is usually found in the introduction and may be directly stated or implied.

**thiabendazole:** A benzimidazole derivative with anthelmintic property. Although the mechanism of action has not been fully elucidated, thiabendazole inhibits the helminth-specific mitochondrial enzyme fumarate reductase, thereby inhibiting the citric acid cycle, mitochondrial respiration and subsequent production of ATP, ultimately leading to helminth's death. In addition, it has been suggested that thiabendazole may lead to inhibition of microtubule polymerization by binding to beta-tubulin and has an overt ovicidal effect with regard to some trichostrongylids.

**Thiamine:** The vitamin component of the coenzyme thiamine pyrophosphate. Also called vitamin B1. OR A heat-labile and water-soluble essential vitamin, belonging to the vitamin B family, with antioxidant, erythropoietic, mood modulating, and glucose-regulating activities. Thiamine reacts with adenosine triphosphate (ATP) to form an active coenzyme, thiamine pyrophosphate. Thiamine pyrophosphate is necessary for the actions of pyruvate dehydrogenase and alpha-ketoglutarate in carbohydrate metabolism and for the actions of transketolase, an enzyme that plays an important role in the pentose phosphate pathway. Thiamine plays a key role in intracellular glucose metabolism and may inhibit the action of glucose and insulin on arterial smooth muscle cell proliferation. Thiamine may also protect against lead toxicity by inhibiting lead-induced lipid peroxidation.

**thiamine :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Thiamine helps some enzymes work properly, helps break down sugars in the diet, and keeps nerves and the heart healthy. It is found in pork, organ meats, peas, beans, nuts, and whole grains. Thiamine is water-soluble (can dissolve in water) and must be taken in daily. Not enough thiamine can cause a disease called beriberi (a condition marked by heart, nerve, and digestive disorders). Too much thiamine may help cancer cells grow faster. Also called vitamin B1.

**Thiamine pyrophosphate:** The coenzyme form of thiamine (vitamin B1), composed of a modified thiazole ring linked by a methylene bridge to a substituted pyrimidine; a cofactor in enzymatic reactions in which bonds to carbonyl carbon atoms are cleaved or synthesized. Or The active coenzyme form of vitamin B1; involved in aldehyde transfer reactions.

**thiarabine:** A analog of antimetabolite cytarabine (ara-C), with potential antineoplastic activity. Upon administration, thiarabine (T-araC) is phosphorylated to the triphosphate form T-araCTP and competes with cytidine for incorporation into DNA. This results in an inhibition of DNA replication and RNA synthesis, chain termination and may eventually decrease tumor cell proliferation. Compared to ara-C, T-araC appears to have a longer half-life and has a higher efficacy.

**thiazide diuretic :** A type of drug used to treat high blood pressure, edema (extra fluid in the tissues), and other conditions. Thiazide diuretics cause the

kidneys to make more urine, which allows the body to get rid of extra fluid and salt.

**Thibenzole:** (Other name for: thiabendazole)

**Thick moulding compound (TMC):** Similar to BMC (see separate entry) but continuously produced in sheet form with a thickness of 25 mm or more.

**THICKENER:** A substance, such as Xanthan Gum, which, when added in low concentrations to a fluid, raises the viscosity of that fluid. (see also SALT THICKENING).

**Thickness:** Depth of the material and contributory to pressure requirements; thickening reduces the pressure required to fill the part.

**thiethylperazine :** A drug used to prevent or reduce nausea and vomiting. It belongs to the families of drugs called antiemetics and phenothiazines.

**thin layer chromatography:** A technique for separating components in a mixture on the basis of their differing polarities. A spot of sample is placed on a flat sheet coated with silica and then carried along by a solvent that soaks the sheet. Different components will move different distances over the surface. TLC is a useful screening technique in clinical chemistry; for example, it can be used to detect the presence of drugs in urine.

**Thin Layer Chromatography (TLC):** An analytical, separatory technique based on the differing affinities of the constituents of the mixture for the stationary phase.

**Thin-layer chromatography (TLC):** A chromatographic method of separating compounds eluted with a solvent after applying them to a thin layer of adsorbent adhered to a solid support (e.g., glass, plastic, or aluminum).

**thin-skinned thrusting:** thin, horizontal sheets of rock from the edge of a continent are forced inland.

**Thinner:** The thinner and binder together form the paint's vehicle. Water thinner used in latex paints evaporates as the paint dries, allowing a smooth paint application. Turpentine or spirits are the thinners in oil-based paints.

**THINNERS:** Solvents used to thin coatings.

**thio-:** A prefix that means, "replace an oxygen with sulfur". For example, sulfate ion is  $\text{SO}_4^{2-}$ ; thiosulfate ion is  $\text{S}_2\text{O}_3^{2-}$ . Cyanate ion is  $\text{OCN}^-$ ; thiocyanate ion is  $\text{SCN}^-$ .

**Thioester:** An ester of a carboxylic acid with a thiol or mercaptan.

**Thioester intermediate:** An ester in which the noncarbonyl oxygen atom is replaced by a sulfur atom; thioesters are energy-rich intermediates in a number of biochemical reactions.

**thioguanine:** A drug used to treat acute myeloid leukemia (AML). It is also being studied in the treatment of other types of cancer. Thioguanine stops cells from making DNA and RNA and it may kill cancer cells. It is a type of antimetabolite. Also called Tabloid. OR A synthetic guanosine analogue antimetabolite. Phosphorylated by hypoxanthine-guanine phosphoribosyltransferase, thioguanine incorporates into DNA and RNA, resulting in inhibition of DNA and RNA syntheses and cell death. This agent also inhibits glutamine-5-phosphoribosylpyrophosphate amidotransferase, thereby inhibiting purine synthesis.

**Thiol:** Also called a mercaptan. A carbon compound containing the -SH functional group. Mercaptans are responsible for the distinctive odour of cat urine.

**Thiol proteases:** A class of protein-degrading enzymes whose activity depends on the presence of a cysteine residue at the active site; papain is a thiol protease.

**Thioredoxin:** A protein with exposed cysteines that can be reversibly oxidized and reduced; an important electron carrier in the reduction of ribonucleotides and in photosynthesis.

**thioredoxin-1 inhibitor PX-12:** An orally bioavailable small molecule with potential antineoplastic activity. Thioredoxin-1 inhibitor PX-12 irreversibly binds to thioredoxin-1 (Trx-1) and inhibits its activity, which may result in growth inhibition and the induction of apoptosis.

Overexpressed in many cancer cell types, the low molecular weight redox protein Trx-1 regulates transcription factor activity and inhibits apoptosis, promoting cell growth and survival; it also interacts with growth factors extracellularly to stimulate cell growth.

**thioridazine hydrochloride:** The hydrochloride salt form of thioridazine, a piperidine phenothiazine derivative and a dopamine antagonist with antipsychotic property. Thioridazine hydrochloride binds to mesolimbic postsynaptic dopamine receptor D2, thereby decreasing dopamine activity leading to decreased psychotic effects, such as hallucinations and delusions.

In addition, this agent binds to serotonin 5-HT<sub>2</sub> receptors, resulting in decreased serotonin activity. Check for active clinical trials using this agent.

**thiotepa:** A polyfunctional, organophosphorus alkylating agent and a stable derivative of N,N',N''-triethylenephosphoramidate (TEPA), with antineoplastic activity. Upon administration, thiotepa is converted into highly reactive ethylenimine groups, which covalently bind to nucleophilic groups in DNA and demonstrate a preference for the N7 position of guanine bases. This induces crosslinking of alkylated guanine bases in double-stranded DNA, interferes with both DNA replication and cell division, and results in both the induction of apoptosis and the inhibition of cell growth. or A drug used to treat certain types of bladder cancer, breast cancer, and ovarian cancer. It is also used to treat malignant effusion (a condition in which cancer causes an abnormal amount of fluid to collect in hollow spaces or between tissues of the body). It is also being studied in the treatment of other types of cancer. Thiotepa damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent.

**thioureidobutyronitrile:** A water-soluble, small molecule and activator of the tumor suppressor protein p53, with potential antineoplastic activity. Upon intravenous administration, thioureidobutyronitrile activates p53 which in turn induces the expressions of p21 and PUMA (p53 up-regulated modulator of apoptosis), thereby inhibiting cancer cell growth and causing tumor cell apoptosis. Thioureidobutyronitrile may be effective in drug-resistant cancers with mutated p53. p53 tumor suppressor, a transcription factor regulating the expression of many stress response genes and mediating various anti-proliferative processes, is often mutated in cancer cells.

**third law:** The entropy of a perfect crystal is zero at absolute zero.

**third molar :** The last tooth to come in at the back of each side of the upper and lower jaws. Third molars usually come in between 17 and 23 years of age, but not everyone has them. Also called wisdom tooth.

**third-line therapy :** Treatment that is given when both initial treatment (first-line therapy) and subsequent treatment (second-line therapy) don't work, or stop working.

**Thixotropy:** Also known as 'false body'. Usually refers to gel type paints which in the tin appear to be very thick or even solid. When applied by brush or roller the gel structure breaks down and the paint becomes liquid

thus allowing ease of application. Or The property of a material that causes it to change from a thick, pasty consistency to a fluid consistency upon agitation, brushing or rolling. or The ability of resins to change their viscosity, liquefying on being shaken or stirred.

**THL-P:** A proprietary, oral Chinese medicinal herb preparation with potential antioxidant, immunomodulating, and antineoplastic activities. THL-P (Tien-Hsien Liquid-P) contains fourteen Chinese medicinal herbs including: *Cordyceps sinensis*, *Oldenlandia diffusa*, *Indigo pulverata levis*, *Polyporus umbellatus*, *Radix astragali*, *Panax ginseng*, *Solanum nigrum L.*, *Pogostemon cablin*, *Atractylodis macrocephalae rhizoma*, *Trichosanthes radix*, *Clematis radix*, *Margarite*, *Ligustrum lucidum Ait* and *Glycyrrhiza radix*. Administered as an oral liquid, THL-P may modulate the activity of natural killer (NK) cells, cytotoxic T-lymphocytes (CTLs), macrophages and polymorphonuclear leukocytes, and enhance the secretion of interleukins (ILs) and interferon-gamma (IFN-gamma). This agent may also induce G2/M cell cycle arrest and downregulate several important oncogenic signaling pathways.

**thoracalgia :** Chest pain. Also called thoracodynia.

**thoracentesis :** Removal of fluid from the pleural cavity through a needle inserted between the ribs.

**thoracic :** Having to do with the chest.

**thoracic surgeon :** A surgeon who has special training in operating on organs inside the chest, including the heart and lungs.

**thoracic surgical oncologist :** A surgeon who has special training in operating on tumors found inside the chest.

**thoracodynia :** Chest pain. Also called thoracalgia.

**thoracoscope :** A thin tube-like instrument used to examine the inside of the chest. A thoracoscope has a light and a lens for viewing and may have tool to remove tissue. Or Examination of the inside of the chest, using a thoracoscope. A thoracoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**thoracotomy :** An operation to open the chest.

**Thorazine:** (Other name for: chlorpromazine)

**Thorium:** Symbol:"Th" Atomic Number:"90" Atomic Mass: 231.04amu. This is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. A very radioactive element that is used in reactors and in the process of making certain types of gas. One of the byproducts of the combustion of thorium is radium.

**Thread:** The profile of a container finish which will accommodate specific closures.

**THREAD PLUG OR RING OR CORE:** A part of a mold that shapes a thread and must be unscrewed from the finished piece.

**Threads:** on continuous thread styles, the "spiral" of plastic onto which a c/t closure is twisted. Different c/t closure styles feature different numbers of threads.

**threonine tyrosine kinase inhibitor CFI-402257:** An orally bioavailable, selective inhibitor of the dual specificity protein kinase TTK (monopolar spindle 1 kinase, Mps1), with potential antineoplastic activity. Upon administration, the Mps1 inhibitor CFI-402257 selectively binds to and inhibits the activity of Mps1. This inactivates the spindle assembly checkpoint (SAC) and accelerates mitosis, resulting in chromosomal misalignment and missegregation, and mitotic checkpoint complex destabilization. This induces cell death in Mps1-overexpressing cancer cells. Mps1, a tyrosine and serine/threonine kinase expressed in proliferating normal tissues, is essential for proper SAC functioning and chromosome alignment. Overexpressed in various human tumors, Mps1 plays a key role in uncontrolled tumor cell growth. Check for active clinical trials using this agent.

**threshold limit value (TLV):** This is a guideline value defined by the by the American Conference of Government Industrial Hygienists to establish the airborne concentration of a potentially toxic substance to which it is believed that healthy working adults may be exposed safely through a 40 hour working week and a full working life. This concentration is measured as a time-weighted average concentration. They are developed only as a guidelines to assist in the control of health hazards and are not developed for use as legal standards.

**Threshold temperature:** The temperature at which an arbitrarily defined 2% of the solvent of crystallization is lost from a solvate. It is conveniently

measured by TGA using a 6 °C/min heating rate.

**throat :** The hollow tube inside the neck that starts behind the nose and ends at the top of the trachea (windpipe) and esophagus (the tube that goes to the stomach). The throat is about 5 inches long, depending on body size. Also called pharynx.

**throat cancer :** Cancer that forms in tissues of the pharynx (the hollow tube inside the neck that starts behind the nose and ends at the top of the windpipe and esophagus). Throat cancer includes cancer of the nasopharynx (the upper part of the throat behind the nose), the oropharynx (the middle part of the pharynx), and the hypopharynx (the bottom part of the pharynx). Cancer of the larynx (voice box) may also be included as a type of throat cancer. Most throat cancers are squamous cell carcinomas (cancer that begins in thin, flat cells that look like fish scales). Also called pharyngeal cancer.

**thrombectomy :** Surgery to remove a thrombus (blood clot) from a blood vessel.

**thrombocytopenia:** low platelet count

**thrombocyte :** A tiny piece of cell that is made by breaking off of a large cell in the bone marrow. Thrombocytes are found in the blood and spleen. They help form blood clots to slow or stop bleeding, and to help wounds heal. Also called platelet.

**thrombocytes:** the starting material for blood clotting; also called platelets.

**thrombocytes:** See platelets.

**thrombocytopenia :** A condition in which there is a lower-than-normal number of platelets in the blood. It may result in easy bruising and excessive bleeding from wounds or bleeding in mucous membranes and other tissues.

**thrombohemorrhagic event :** A process that involves either a blood clot or bleeding, such as a heart attack or stroke.

**thrombolysis :** The process of breaking up a thrombus (blood clot) that is blocking blood flow. The blood clot may be dissolved using drugs delivered through a catheter (tube) into the clot.

**thrombomodulin alfa:** A recombinant, soluble form of the human protein thrombomodulin, with potential anticoagulant activity. Upon

administration, thrombomodulin binds to thrombin, which stimulates the activation of protein C. Activated protein C (APC) degrades factor Va and Factor VIIa in the presence of the cofactor protein S, inhibits thrombin formation, and prevents both thrombin-mediated coagulation and further clot formation. Check for active clinical trials using this agent.

**thrombophlebitis** : Inflammation of a vein that occurs when a blood clot forms.

**thrombopoietin** : A substance made by the body that helps make blood cells, especially platelets. A form of thrombopoietin made in the laboratory is called recombinant human thrombopoietin and rHu thrombopoietin. Thrombopoietin is being studied as a way to increase the number of platelets in cancer patients receiving chemotherapy. Also called TPO.

**thrombosis** : The formation or presence of a thrombus (blood clot) inside a blood vessel.

**thromboxanes**: A class of molecules derived from arachidonate and involved in platelet aggregation during blood clotting.

**thrombus** : A blood clot that forms on the wall of a blood vessel or in the heart when blood platelets, proteins, and cells stick together. A thrombus may block the flow of blood.

**throughput** : The quantity of information, people, or materials that is put through a process in a specific period of time. In medicine, it can be used to describe the efficiency of laboratory procedures, such as genetic sequencing, or the number of patients seen in a clinic in a certain period of time.

**thrush** : A condition in which *Candida albicans*, a type of yeast, grows out of control in moist skin areas of the body. It is usually a result of a weakened immune system, but can be a side effect of chemotherapy or treatment with antibiotics. Thrush usually affects the mouth (oral thrush); however, rarely, it spreads throughout the entire body. Also called candidiasis and candidosis.

**thrust fault**: a reverse fault in which the hanging block (upper plate) has overridden the footwall block (lower plate) at a very shallow angle for an extensive distance.

**THU**: A substance being studied in the treatment of some types of cancer. It may help make cancer cells easier to kill with radiation therapy. THU is a

type of radiosensitizing agent, a type of multidrug resistance modulator, and a type of cytidine deaminase inhibitor. Also called tetrahydrouridine.

**Thulium:** Symbol:"Tm" Atomic Number:"69" Atomic Mass: 168.93amu. Thulium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element.

**Thylakoid:** In chloroplasts, a membranous sac, or vesicle, that contains the energy-transducing machinery of photosynthesis, including light-harvesting proteins, reaction centers, electron-transport chains, and ATP synthase. Or Closed cisterna, or disc, formed by the pigment-bearing internal membranes of chloroplasts. or membranes that make up the grana in chloroplasts; the actual site of photosynthesis within chloroplasts.

**Thymectacin:** (Other name for: brivudine phosphoramidate)

**thymic carcinoma :** A rare type of thymus gland cancer. It usually spreads, has a high risk of recurrence, and has a poor survival rate. Thymic carcinoma is divided into subtypes, depending on the types of cells in which the cancer began. Also called type C thymoma.

**Thymidine:** One of the four nucleosides found in DNA. OR A chemical compound found in DNA. Also used as treatment for mucositis. OR A pyrimidine nucleoside that is composed of the pyrimidine base thymine attached to the sugar deoxyribose. As a constituent of DNA, thymidine pairs with adenine in the DNA double helix.

**Thymidylate synthase:** An enzyme that catalyzes the methylation of deoxyuridylate (dUMP) to form thymidylate (TMP).

**thymidylate synthase :** A protein involved in making and repairing DNA (molecules inside cells that carry genetic information and pass it on from parent to child). High levels of thymidylate synthase may be involved in how certain types of cancer form and respond to treatment.

**thymidylate synthase inhibitor :** A drug that blocks DNA synthesis and may prevent tumor cell growth. It is being studied as a treatment for cancer.

**thymidylate synthase inhibitor DFP-11207:** An orally available thymidylate synthase (TS) inhibitor with potential antineoplastic activity. Upon oral administration, DFP-11207 binds to and inhibits TS. This reduces thymine nucleotide synthesis, inhibits DNA synthesis and cell division, causes DNA damage and leads to tumor cell apoptosis. TS

catalyzes the conversion of deoxyuridine monophosphate (dUMP) to deoxythymidine monophosphate (dTMP).

**Thymine:** A pyrimidine base found in DNA. OR A chemical compound that is used to make one of the building blocks of DNA. It is a type of pyrimidine.

**thymine dimer:** See pyrimidine dimer.

**Thymitaq :** A substance that is being studied in the treatment of liver cancer. It belongs to the family of drugs called thymidylate synthase inhibitors. Also called AG337 and nolatrexed.

**thymocyte :** A type of white blood cell. Thymocytes are part of the immune system and develop from stem cells in the bone marrow. They help protect the body from infection and may help fight cancer. Also called T cell and T lymphocyte.

**Thymoglobulin:** (Other name for: anti-thymocyte globulin)

**thymoma :** A tumor of the thymus, an organ that is part of the lymphatic system and is located in the chest, behind the breastbone.

**thymopentin:** A synthetic pentapeptide which is the active site of the naturally occurring hormone thymopoietin with immunomodulating properties. Thymopentin enhances the production of thymic T cells and may help restore immunocompetence in immunosuppressed subjects. This agent also augments the effects of ionizing radiation by arresting cancer cells in the G2/M phase of the cell cycle.

**thymosins:** hormones secreted by the thymus gland that influence the development of the T lymphocytes of the immune system.

**thymus :** An organ that is part of the lymphatic system, in which T lymphocytes grow and multiply. The thymus is in the chest behind the breastbone.

**thymus gland:** an endocrine gland in the neck tissues that secretes thymosins.

**Thyrogen :** (Other name for: recombinant thyrotropin alfa) OR A form of thyroid-stimulating hormone (TSH) that is made in the laboratory. It is used to test for remaining or recurring cancer cells in patients who have been treated for thyroid cancer. Also called thyrotropin alfa.

**thyroglobulin :** The form that thyroid hormone takes when stored in the cells of the thyroid. If the thyroid has been removed, thyroglobulin should

not show up on a blood test. Doctors measure thyroglobulin level in blood to detect thyroid cancer cells that remain in the body after treatment.

**thyroid** : A gland located beneath the larynx (voice box) that makes thyroid hormone and calcitonin. The thyroid helps regulate growth and metabolism. Also called thyroid gland.

**thyroid cancer** : Cancer that forms in the thyroid gland (an organ at the base of the throat that makes hormones that help control heart rate, blood pressure, body temperature, and weight). Four main types of thyroid cancer are papillary, follicular, medullary, and anaplastic thyroid cancer. The four types are based on how the cancer cells look under a microscope.

**thyroid follicular cell** : A type of cell in the thyroid. Thyroid follicular cells make thyroid hormone.

**thyroid gland**: a gland at the base of the neck that produces several hormones, such as thyroxine and calcitonin. OR A gland located beneath the larynx (voice box) that makes thyroid hormone and calcitonin. The thyroid gland helps regulate growth and metabolism. Also called thyroid.

**thyroid hormone** : A hormone that affects heart rate, blood pressure, body temperature, and weight. Thyroid hormone is made by the thyroid gland and can also be made in the laboratory.

**thyroid hormone treatment** : Treatment with thyroid hormone, which is a hormone that affects heart rate, blood pressure, body temperature, and weight.

**thyroid-stimulating hormone** : A hormone produced by the pituitary gland. Thyroid-stimulating hormone stimulates the release of thyroid hormone from thyroglobulin. It also stimulates the growth of thyroid follicular cells. An abnormal thyroid-stimulating hormone level may mean that the thyroid hormonal regulation system is out of control, usually as a result of a benign condition (hyperthyroidism or hypothyroidism). Also called TSH.

**thyroidectomy** : Surgery to remove part or all of the thyroid.

**thyroiditis** : Inflammation of the thyroid gland. Thyroiditis may be an autoimmune disease that affects the thyroid gland over time, causing hypothyroidism (too little thyroid hormone). A temporary form of thyroiditis may also occur after the birth of a baby, or when viral or bacterial infections spread to the thyroid.

**thyroidologist :** A medical doctor who has special training in diagnosing and treating thyroid diseases.

**thyrotropin alfa :** A form of thyroid-stimulating hormone (TSH) that is made in the laboratory. It is used to test for remaining or recurring cancer cells in patients who have been treated for thyroid cancer. Also called Thyrogen.

**thyroxin :** A hormone that is made by the thyroid gland and contains iodine. Thyroxin increases the rate of chemical reactions in cells and helps control growth and development. Thyroxin can also be made in the laboratory and is used to treat thyroid disorders. Also called L-3,5,5'-tetraiodothyronine, T4, and thyroxine.

**thyroxine:** A hormone synthesized and secreted by the thyroid gland containing four iodine atoms and is converted to triiodothyronine (T3) in the body, influencing metabolism and organ function. OR A hormone that is made by the thyroid gland and contains iodine. Thyroxine increases the rate of chemical reactions in cells and helps control growth and development. Thyroxine can also be made in the laboratory and is used to treat thyroid disorders. Also called L-3,5,5'-tetraiodothyronine, T4, and thyroxin.

**Thytropar:** (Other name for: recombinant thyroid-stimulating hormone)

**tiacumicin B :** A substance being studied in the treatment of diarrhea caused by infection with *Clostridium difficile* (a type of bacteria that can grow without oxygen) in cancer patients. Tiacumicin B is a type of antibiotic. Also called OPT-80 and PAR-101.

**tiazofurin:** A synthetic nucleoside analogue with antineoplastic activity. Tiazofurin (TR) is anabolized intracellularly to an analogue of NAD, tiazole-4-carboxamide adenine dinucleotide (TAD), a potent inhibitor of IMP dehydrogenase (IMPDH); IMPDH is the rate-limiting enzyme for de novo purine synthesis. Inhibition of IMPDH results in reduced levels of guanylates, resulting in the inhibition tumor cell growth in vitro and in vivo. OR An anticancer drug being studied to stop cell growth.

**tibia :** The larger of two bones between the knee and ankle. Also called shinbone.

**tibolone:** A synthetic anabolic steroid with estrogenic, androgenic and progestagenic activities. The 3alpha- and 3beta-hydroxy metabolites of tibolone activate estrogenic receptors (ERs) in bone and vaginal tissue

leading to a decrease in bone turnover, and decreased vaginal dryness, respectively; derived from the 3beta-hydroxy metabolite, its delta4-isomer activates androgenic receptors (ARs) in the brain and liver and progestogenic receptors (PRs) in endometrial tissue, affecting sexual function, lipid metabolism, and endometrial function, respectively. In breast and endometrial tissue, tibolone metabolites inhibit sulfatase, preventing the conversion of circulating estrone sulfate and estradiol sulfate to estrone and estradiol, respectively; estrogen-mediated effects in the breast and uterus are thus reduced.

**TICE BCG solution:** (Other name for: BCG solution)

**tidal current:** the horizontal flow of water that accompanies the changing tide and flows in two opposite directions.

**tidal delta:** sediments deposited by the back-and-forth tidal action between barrier islands.

**tidal flat:** a flat, muddy zone of coastline affected by tidal currents.

**tidal marsh:** Low, flat marshlands traversed by channels and tidal hollows and subject to tidal inundation; normally, the only vegetation present are salt-tolerant bushes and grasses.

**tidal wave:** a gigantic wall of water, sometimes as high as 90 meters, caused by a submarine earthquake.

**tide:** the rhythmic rise and fall of sea level along a coastline.

**TIE BARS:** Bars which provide structural rigidity to the clamping mechanism of a press often used to guide platen movement. OR Large diameter rods that connect stationary platen "a" to stationary platen "b." The moving platen contains bushings that are used for sliding over the tie bars, allowing the moving platen to travel between the two stationary platens. OR Bars which provide structural support to the mold in the press. The spacing between the tie bars dictates the size of the mold that can be placed into the injection machine. The mold opens and closes riding on the tie bars. OR Bars which provide structural rigidity to the clamping mechanism often used to guide platen movement.

**Tie-Bar Spacing :** The space between the horizontal tie-bars on an injection molding machine. Basically, this measurement limits the size of molds that can be placed between the tie-bars and into the molding machine.

**Tier:** A 360° element of the spiral, either ascending or descending one level.

**Tier Height :** The vertical distance from one belt level on the drum to the next higher or lower level. This is a measurement of distance.

**Tier Spacing :** Another term for Tier Height.

**tigapotide:** A synthetic 15-mer peptide corresponding to amino acids 31-45 of the 94-amino acid isoform of human prostate secretory protein (PSP-94) with potential anti-metastasis and anti-angiogenesis activities.

Tigapotide may inhibit the secretion of the metastasis-related protein matrix metalloproteinase-9 (MMP-9) and its potential binding to its cell surface receptor CD44; may interfere with the vascular endothelial growth factor (VEGF) signaling pathway, resulting in an anti-angiogenesis effect; and may reduce the levels of parathyroid hormone-related protein (PTHrP), decreasing plasma calcium levels. PSP-94, one of three predominant proteins found in seminal fluid, may be down-regulated in prostate cancer, representing a potential survival mechanism for prostate cancer cells. MMP-9 is implicated in the invasion and metastasis of cancer. PTHrP may be expressed by various tumor cell types, resulting in the hypercalcemia of malignancy.

**tigatuzumab:** A humanized agonistic monoclonal antibody directed against human tumor necrosis factor-related apoptosis-inducing ligand receptor 2 (TRAIL-R2) with potential antitumor activity. Mimicking the natural receptor ligand TRAIL, tigatuzumab binds to TRAIL-R2, activating signal transduction pathways that may result in tumor cell apoptosis and a reduction in tumor growth. A member of the tumor necrosis factor (TNF) receptor family, TRAIL-R2, also known as DR5 (death receptor 5), is expressed on the surfaces of many types of malignant cells.

**tigecycline:** A broad-spectrum glycylcycline antibiotic derived from tetracycline. Tigecycline binds to the 30S ribosomal subunit, thereby interfering with the binding of aminoacyl-tRNA to the mRNA-ribosome complex. This prevents the incorporation of amino acid residues into the elongating peptide chain, inhibiting protein synthesis and eventually bacterial cell growth. Check for active clinical trials using this agent.

**TIL 1383I T cell receptor-transduced autologous T cells:** Autologous peripheral blood lymphocytes-derived T cells transduced with a retroviral encoding TIL 1383I, a T cell receptor (TCR) specific for melanoma antigen

tyrosinase, with potential immunostimulating and antineoplastic activity. After transduction, expansion in culture, and reintroduction into the patient, TIL 1383I TCR-transduced autologous T cells bind to tumor cells expressing tyrosinase, which may induce cytokine expression, activation and proliferation of T-cells, and a specific cytotoxic T-lymphocyte (CTL) response against tyrosinase-expressing tumor cells. TIL 1383I TCR originated from a melanoma patient's CD4+ tumor-infiltrating lymphocytes and is reactive against a class I MHC (HLA-A2)-restricted epitope (368-376) of tyrosinase.

**till:** an unsorted pile of sediment left behind when a glacier melts. Or the unsorted and unlayered rock debris and sediment that is carried or later deposited by a glacier.

**Time scan :** effects of mold and melt temperature and injection time changes on pressure, stress and temperature at the end of flow.

**time to progression :** The length of time from the date of diagnosis or the start of treatment for a disease until the disease starts to get worse or spread to other parts of the body. In a clinical trial, measuring the time to progression is one way to see how well a new treatment works. Also called TTP.

**Time-domain analysis:** A technique used to determine the size of a particle (0.5–3600  $\mu\text{m}$  in diameter) by measuring the time required for a laser beam moving at a fixed velocity to cross a particle.

**time-weighted average (TWA) exposure:** This is a regulatory value defining the concentration of a substance to which a person is exposed in ambient air divided by the total time of observation. For occupational exposure a working shift of eight hours is commonly used as the averaging time.

**timolol maleate gel forming solution:** A gel forming solution containing the maleate salt of timolol, a propanolamine derivative and a non-selective beta-adrenergic antagonist, with intraocular pressure-reducing activity. Although the precise mechanism of action of timolol's ocular hypotensive action is not clearly established at this time, studies suggest that it may be the result of decreased aqueous humor production (possibly by reduction of blood flow to the ciliary processes and cAMP synthesis) as well as a slight increase in outflow facility. Timolol gel-forming solution can potentially be

used topically as well, in the prevention of the neoangiogenesis that may occur following pulsed dye laser treatment of port wine stains.

**timonacic:** A cyclic sulfur amino acid derivative with potential antineoplastic and antioxidant activities. Acting on cellular membranes of malignant cells through an unknown mechanism, timonacic may induce malignant cells to revert back to an untransformed state. This agent may also restore contact inhibition, a phenomenon characterized by the paracrine inhibition of mitosis following the formation of a critical cell mass, presumably the result of cell-to-cell signal transfer. Timonacic may also produce antioxidant effects secondary to its release of cysteine and restoration of glutathione concentrations.

**Timoptic-XE:** (Other name for: timolol maleate gel forming solution)

**Tin:** Symbol:"Sn" Atomic Number:"50" Atomic Mass: 118.69amu. It is classified as a basic metal. Tin is a metal mainly found in the mineral casiterite. It is a silvery metal used in creating alloys to protect metals from corrosion. It is also used in cans and superconductive materials (materials than conduct electricity extremely well).

**Tin Canning:** Roll defect appearing as raised ridges around the circumference of the roll resembling a tin can.

**tin ethyl etiopurpurin :** An anticancer drug that is also used in cancer prevention. It belongs to the family of drugs called photosensitizing agents. Also called SnET2.

**Tindamax:** (Other name for: tinidazole)

**tinidazole:** A 5-nitroimidazole derivative with antiprotozoal property. Although the mechanism of action has not been fully elucidated, it has been suggested that tinidazole is metabolized and yields nitrite anions and metronidazole. Metronidazole's nitro group in turn is reduced via the parasite ferredoxin, thereby generating a series of free nitro radicals including nitro anions. Toxicity is achieved via depletion of sulfhydryl groups and DNA strand breaks with multiple hits having an additive effect and ultimately leading to cell death.

**tinidazole :** A drug used to treat protozoal infections, such as amebiasis, giardiasis, and trichomoniasis. It belongs to a family of drugs called antiprotozoal agents. Tinidazole is also being evaluated in the treatment of *Helicobacter pylori* infections in people with low-grade gastric lymphoma.

**tinnitus :** A disorder in which a person hears noises such as buzzing, ringing, clicking, or the sound of a pulse, when no outside sound is causing them. Tinnitus may have many different causes, and may be a symptom of another disease or condition. It may be caused by certain tumors and anticancer drugs.

**TINT BASE:** The basic paint in a custom color system to which colorants are added.

**Tinter:** Any coloured pigment or paint mixture used to make small adjustments in colour to an already prepared paint.

**tinzaparin :** A drug that is used with another drug, warfarin, to treat blood clots that form deep in the veins and to prevent new blood clots from forming. It is a type of anticoagulant. Also called Innohep and tinzaparin sodium.

**tinzaparin sodium:** A drug that is used with another drug, warfarin, to treat blood clots that form deep in the veins and to prevent new blood clots from forming. It is a type of anticoagulant. Also called Innohep and tinzaparin. OR The sodium salt of a low molecular weight heparin (LMWH) obtained by controlled enzymatic depolymerization of heparin from porcine intestinal mucosa with antithrombotic properties. Tinzaparin is a potent inhibitor of several activated coagulation factors, especially Factors Xa and IIa (thrombin); its primary activity is mediated through the plasma protease inhibitor antithrombin. In addition, this agent may inhibit angiogenesis through: 1) competitive binding of the heparin-binding sites on endothelial cells for the proangiogenic cytokines vascular endothelial growth factor (VEGF) and beta-fibroblast growth factor (beta-FGF) and 2) increasing the release of tissue factor pathway inhibitor (TFPI), a negative regulator of angiogenesis.

**tiomolibdate diammonium:** An ammonium salt with potential antiangiogenic and antitumor activities. ammonium Tiomolibdate diammonium has been found to deplete systemic copper reserves through an unknown mechanism. This agent has been shown to inhibit the activities of cuproenzymes, including superoxide dismutase 1 (SOD1) and cytochrome c oxidase (COX), which may contribute to its antiangiogenic and antitumor effects.

**tiotropium bromide monohydrate:** The monohydrate bromide salt form of tiotropium, a quaternary ammonium derivative of atropine and a long-

acting muscarinic receptor antagonist, with bronchodilating activity. Upon inhalation, tiotropium binds to and blocks mainly muscarinic M3 receptors located on smooth muscle cells, thereby preventing smooth muscle contraction

**Tip link:** A filament that links adjacent stereocilia; in the membrane of stereocilia, tip links are coupled to ion channels that are gated by stress; mechanical movement alters the current flow across a hair-cell membrane, which may initiate or terminate the hearing signal-transduction pathway.

**tipifarnib:** A nonpeptidomimetic quinolinone with potential antineoplastic activity. Tipifarnib binds to and inhibits the enzyme farnesyl protein transferase, an enzyme involved in protein processing (farnesylation) for signal transduction. By inhibiting the farnesylation of proteins, this agent prevents the activation of Ras oncogenes, inhibits cell growth, induces apoptosis, and inhibits angiogenesis. OR A substance that is being studied in the treatment of acute myeloid leukemia (AML) and other types of cancer. It belongs to the family of drugs called farnesyltransferase inhibitors. Also called R115777 and Zarnestra.

**tipranavir sodium :** A drug used with another drug, ritonavir, to treat patients who are infected with HIV (the virus that causes AIDS) and have been treated with other anti-HIV drugs. Tipranavir sodium blocks the HIV virus from making copies of itself. It is a type of anti-HIV agent and a type of protease inhibitor. Also called Aptivus.

**tirapazamine:** A benzotriazine di-N-oxide with potential antineoplastic activity. Tirapazamine is selectively activated by multiple reductases to form free radicals in hypoxic cells, thereby inducing single- and double-strand breaks in DNA, base damage, and cell death. This agent also sensitizes hypoxic cells to ionizing radiation and inhibits the repair of radiation-induced DNA strand breaks via inhibition of topoisomerase II. OR A substance that has been studied in the treatment of some types of cancer. It may cause damage to the DNA in cells that have a low level of oxygen, including cancer cells. This may make the cells easier to kill with radiation therapy and chemotherapy. Tirapazamine is a type of radiosensitizing agent and a type of chemosensitizing agent.

**Tirazone:** (Other name for: tirapazamine)

**TISAB = Total Ionic Strength Adjustment Buffer:** a reagent which is added to standards and samples in Fluoride determinations to optimize the

pH value at 5.5, liberate any fluoride which may be complexed with hydrogen, aluminium, iron or other cations, and equalize the activity coefficient between sample and standards.

**TISSEEL VH:** (Other name for: fibrin sealant)

**tissue :** A group or layer of cells that work together to perform a specific function.

**tissue culture:** Method by which cells derived from multicellular organisms are grown in liquid media.

**Tissue engineering:** A field of study that combines cells, engineering and materials methods, with the goal of improving or replacing biological functions

**tissue flap reconstruction :** A type of breast reconstruction in which a flap of tissue is surgically moved from another area of the body to the chest, and formed into a new breast mound.

**tissue fluid :** Fluid found in the spaces around cells. It comes from substances that leak out of blood capillaries (the smallest type of blood vessel). It helps bring oxygen and nutrients to cells and to remove waste products from them. As new tissue fluid is made, it replaces older fluid, which drains towards lymph vessels. When it enters the lymph vessels, it is called lymph. Also called interstitial fluid.

**tissue plasminogen activator :** An enzyme made in the body that helps dissolve blood clots. A form of this enzyme is made in the laboratory to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. Tissue plasminogen activator is a type of systemic thrombolytic agent. Also called tPA.

**Titanium:** Symbol:"Ti" Atomic Number:"22" Atomic Mass: 47.90amu. This is one of the transition elements from period three. Titanium can be found in meteorites and many minerals from the Earth's crust. Or Titanium is a corrosion-resistant transition metal used in high performance alloys.

**Titanium dioxide:** A highly opaque inert white pigment. It is the white pigment almost exclusively used in the manufacture of all 'white paint' or in colours which require the addition of white. Or A white powder available in two crystalline forms, the anatase and rutile types. or A white powder available in two crystalline forms, the anatase and rutile types. Both are widely used as opacifying pigments in thermosets and thermoplastics. OR

A white pigment available in two crystalline forms, rutile and anatase, the former being the most widely used white and opacifying pigment in thermoplastics, printing inks and paints

**titanium dioxide/zinc oxide sunscreen cream SPF 60:** A sunscreen formulated with titanium dioxide and zinc oxide with broad UV spectrum-blocking properties. Upon topical application, titanium dioxide and zinc oxide reflect and block both UVA and UVB ultraviolet light rays, protecting the skin against UVA and UVB radiation that causes sunburn, premature aging of the skin and skin cancer. SPF30 and SPF60 contain 5% titanium dioxide and zinc oxide, and 7.5% titanium dioxide and zinc, oxide respectively.

**Title 10 of the Code of Federal Regulations (10 CFR):** Four volumes of the Code of Federal Regulations (CFR) address energy-related topics. Parts 1 to 199 contain the regulations (or rules) established by the NRC. These regulations govern the transportation and storage of nuclear materials; use of radioactive materials at nuclear power plants, research and test reactors, uranium recovery facilities, fuel cycle facilities, waste repositories, and other nuclear facilities; and use of nuclear materials for medical, industrial, and academic purposes. To review the regulations, see NRC Regulations - Title 10, Code of Federal Regulations.

**Titrant:** a reagent containing a species that either complexes or liberates the species being determined. An ideal titrant should react instantaneously, completely, and stoichiometrically with the species being determined. The titrant is added in measured increments from a burette and the sample concentration determined from the amount of titrant needed for complete reaction. or The substance that quantitatively reacts with the analyte in a titration. The titrant is usually a standard solution added carefully to the analyte until the reaction is complete. The amount of analyte is calculated from the volume of titrant required for complete reaction.

**titration:** a method of analyzing the composition of a solution by adding known amounts of a standardized solution until a given reaction (color change, precipitation, or conductivity change) is produced. Or The process used to take a solution of unknown concentration with a solution of a known concentration for the purpose of finding out more about the unknown solution.

**Titration:** A procedure for quantitative analysis by carrying out a reaction in solution by measurement of volumes using a reactant of known concentration. Or a quantitative analytical technique for measuring the concentration of a species by incremental addition of a reagent (titrant) containing a species that either complexes or liberates the sample species. or A procedure for determining the amount of some unknown substance (the analyte) by quantitative reaction with a measured volume of a solution of precisely known concentration (the titrant).

**titration curve:** A plot that summarizes data collected in a titration. A linear titration curve plots moles of analyte (or, some quantity proportional to moles of analyte) on the Y axis, and the volume of titrant added on the X axis. Nonlinear plots use the log of the concentration of the analyte instead. Nonlinear titration curves are often used for neutralization titrations (pH vs. mL NaOH solution). Logs are used to exaggerate the rate of change of concentration on the plot, so that the endpoint can be determined from the point of maximal slope. or A plot of the pH versus the equivalents of base added during titration of an acid.

**tivantinib:** An orally bioavailable small molecule inhibitor of c-Met with potential antineoplastic activity. Tivantinib binds to the c-Met protein and disrupts c-Met signal transduction pathways, which may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met protein, the product of the proto-oncogene c-Met, is a receptor tyrosine kinase also known as hepatocyte growth factor receptor (HGFR); this protein is overexpressed or mutated in many tumor cell types and plays key roles in tumor cell proliferation, survival, invasion, and metastasis, and tumor angiogenesis.

**Tivicay:** (Other name for: dolutegravir)

**tivozanib:** An orally bioavailable inhibitor of vascular endothelial growth factor receptors (VEGFRs) 1, 2 and 3 with potential antiangiogenic and antineoplastic activities. Tivozanib binds to and inhibits VEGFRs 1, 2 and 3, which may result in the inhibition of endothelial cell migration and proliferation, inhibition of tumor angiogenesis and tumor cell death. VEGFR tyrosine kinases, frequently overexpressed by a variety of tumor cell types, play a key role in angiogenesis.

**tizanidine hydrochloride:** The hydrochloride salt form of tizanidine, an imidazoline derivative structurally similar to clonidine and an adrenergic

agonist with muscle relaxant property. Tizanidine stimulates alpha-2 adrenergic receptors in the central nervous system, thereby inhibiting presynaptic release of norepinephrine and increasing the inhibitory effect on alpha motor neurons and motor reflexes. Tizanidine exerts some activity at the postsynaptic excitatory amino acid receptors and imidazoline receptors which may contribute to the overall reduction in facilitation of spinal motor neurons. Overall, tizanidine hydrochloride causes muscle relaxation, reduces spasticity and antinociceptive effects. Check for active clinical trials using this agent.

**TLF:** A drug being studied in the treatment of kidney cancer that has spread. It is also being studied in the treatment of other types of cancer and other conditions. TLF increases the activity of dendritic cells (a type of immune cell) to help kill cancer cells. It is a form of human lactoferrin (a protein found in milk, tears, mucus, bile, and some white blood cells) that is made in the laboratory. TLF is a type of recombinant protein and a type of immunomodulatory protein. Also called talactoferrin and talactoferrin alfa.

**TLK286:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called glutathione analogs. Also called Telcyta.

**TLR-directed cationic lipid-DNA complex JVRS-100:** A cationic lipid DNA complex (CLDC) consisting of DOTIM/cholesterol liposomes and plasmid DNA, containing immunostimulatory CpG and non-CpG motifs, with potential immunostimulating and antineoplastic activities. Upon systemic administration, TLR-directed cationic lipid-DNA complex JVRS-100 enters dendritic cells (DCs) and macrophages; immunostimulatory DNA binds to and activates Toll-like receptors (TLRs), which may result in the generation of anti-tumor natural killer (NK) cell and T-cell responses by the innate immune system. In addition, as a vaccine adjuvant, this agent may induce a strong cytotoxic T-lymphocyte (CTL) response to co-administered antigen.

**TLR4 agonist GLA-SE:** A synthetic lipid A derivative and toll-like receptor 4 (TLR4) agonist, in an oil-in-water emulsion, with potential immunoadjuvant activity. Upon administration, GLA-SE binds to and activates TLR4, thereby stimulating dendritic cells (DCs), monocytes and macrophages. This activation results in the production of proinflammatory cytokines, including interferon alpha, tumor necrosis factor-alpha and the

interleukins (IL), IL-1 beta, -6 and -12. This may induce a T helper cell-1 (Th1) immune response and activates a cytotoxic T-lymphocyte (CTL) response against tumor associated antigens (TAAs) upon co-administration of vaccine antigens. TLR4, a member of the TLR family, plays a key role in the activation of innate immunity.

**TLR4 agonist GSK1795091:** A toll-like receptor 4 (TLR4) agonist, with potential immunoadjuvant activity. Upon administration, GSK1795091 binds to and activates TLR4, thereby stimulating dendritic cells (DCs), monocytes and macrophages. This activation results in the production of pro-inflammatory cytokines, including interferon gamma (IFN-g), tumor necrosis factor-alpha (TNF-a) and the interleukins (IL), IL-1 beta, -6 and -12. This may induce a T helper cell-1 (Th1) immune response and, upon co-administration of a vaccine containing tumor-associated antigens (TAAs), activates a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing those TAAs. TLR4, a member of the TLR family, plays a key role in the activation of innate immunity. Check for active clinical trials using this agent.

**TLR7 agonist ANA773 tosylate:** The tosylate salt form of ANA773, a Toll-like Receptor 7 (TLR7) agonist prodrug with potential immunostimulating activity. Upon oral administration, ANA773 is metabolized into its active form that binds to and activates TLR7, thereby stimulating dendritic cells (DCs) and enhancing natural killer cell (NK) cytotoxicity. This activation results in the production of proinflammatory cytokines, including interferon alpha, and enhanced antibody-dependent cellular cytotoxicity (ADCC). TLR7 is a member of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity.

**TLR7/8 agonist MEDI9197:** A toll-like receptor type 7 and 8 (TLR7/8) agonist with potential immunostimulating and antitumor activities. Upon intratumoral administration, TLR7/8 agonist MEDI9197 binds to and activates TLR7 and 8, thereby stimulating antigen-presenting cells (APCs), including dendritic cells (DCs). Activation of DCs results in the production of proinflammatory cytokines, and the activation of cytotoxic T-lymphocyte (CTL) and B-lymphocyte immune responses. This may cause tumor cell lysis. TLR7 and 8, members of the TLR family, play fundamental roles in

the activation of the immune system. Check for active clinical trials using this agent.

**TLR8 agonist VTX-2337:** A small-molecule Toll-like receptor 8 (TLR8) agonist with potential immunostimulating and antineoplastic activities. TLR8 agonist VTX-2337 binds to TLR8, present in cutaneous dendritic cells, monocytes/macrophages, and mast cells, which may result in the activation of the central transcription factor nuclear factor- $\kappa$ B, the secretion of proinflammatory cytokines and other mediators, and a Th1-weighted antitumoral cellular immune response. Primarily localized to endosomal membranes intracellularly, TLR8, like other TLRs, recognizes pathogen-associated molecular patterns (PAMPs) and plays a key role in the innate immune system.

**TLR9 agonist DUK-CPG-001:** A synthetic CpG-rich oligonucleotide with potential immunopotentiating activity. TLR9 agonist DUK-CPG-001 binds to and activates intracellular toll-like receptor 9 (TLR9) in monocytes/macrophages, plasmacytoid dendritic cells (DCs), natural killer (NK) cells and B cells. This initiates immune signaling pathways, activates DCs, NK cells and B cells, and induces both the production of T-helper 1 cells (Th1) and a Th1-mediated immune response. TLR9 is a member of the TLR family, which plays a key role in both pathogen recognition and the activation of innate immunity.

**TLR9 agonist EMD 1201081:** A synthetic oligonucleotide containing phosphorothioate oligodeoxynucleotide with potential immunopotentiating activity. TLR9 agonist EMD 1201081 binds to and activates the intracellular Toll-like receptor (TLR) 9 in monocytes/macrophages, plasmacytoid dendritic cells (DCs) and B cells, initiating immune signaling pathways, activating B cells and inducing T-helper cell cytokine production. TLR9 is a member of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity.

**TLR9 agonist IMO-2055:** A synthetic oligonucleotide containing unmethylated CpG dinucleotides with potential immunopotentiating activity. Mimicking unmethylated CpG sequences in bacterial DNA, TLR9 agonist IMO-2055 binds to and activates intracellular Toll-like receptors (TLR) 9 in monocytes/macrophages, plasmacytoid dendritic cells (DCs) and B cells, initiating immune signaling pathways and activating B cells and DCs and inducing T-helper cell cytokine production. TLR9 is a member

of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity. Check for active clinical trials using this agent.

**TLR9 agonist MGN1703:** A synthetic oligonucleotide based on a proprietary double stem-loop immunomodulator design with potential immunostimulating activity. TLR9 agonist MGN1703 binds to and activates intracellular Toll-like receptor 9 (TLR9) in monocytes/macrophages, plasmacytoid and myeloid dendritic cells (DCs), and natural killer (NK) cells, initiating immune signaling pathways and inducing T-helper 1 cell (Th1) production leading to the production of memory T cells and a Th1-mediated immune response. By activating the immune system, MGN1703 may attack tumor associated antigen (TAAs). TLR9 is a member of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity.

**TLR9 agonist SD-101:** A proprietary oligonucleotide with immunostimulatory activity. Immunostimulatory phosphorothiolate oligodeoxyribonucleotide SD-101 targets Toll-Like Receptor 9 (TLR9) found on a specialized subset of dendritic cells. The interaction of TLR9 with SD-101, in conjunction with an allergen or antigen, induces activation of memory T helper cells 1 (Th1) against a specific pathogen or allergen, thereby leading to long-lasting therapeutic effects. Furthermore, this agent does not cause a generalized activation of the immune system.

**TM:** A mental technique used to promote relaxation, reduce stress, and improve quality of life. TM is the registered trademark of the Maharishi Foundation Ltd. Also called Transcendental Meditation.

**TNF:** A protein made by white blood cells in response to an antigen (substance that causes the immune system to make a specific immune response) or infection. TNF can also be made in the laboratory. It may boost a person's immune response, and also may cause necrosis (cell death) of some types of tumor cells. TNF is being studied in the treatment of some types of cancer. It is a type of cytokine. Also called tumor necrosis factor.

**TNF-bound colloidal gold :** A substance being studied in the treatment of some types of cancer. TNF-bound colloidal gold is made in the laboratory by binding a cancer-killing protein called tumor necrosis factor (TNF) to the surface of very tiny particles of gold. These TNF-gold particles may kill

cancer cells without harming healthy tissue. Also called Aurimmune and colloidal gold-bound tumor necrosis factor.

**TNF-related apoptosis-inducing ligand :** A cell protein that can attach to certain molecules in some cancer cells and may kill the cells. TNF-related apoptosis-inducing ligand is being studied in the treatment of cancer. Also called Apo-2L, TRAIL, and tumor necrosis factor-related apoptosis-inducing ligand.

**TNFerade :** A gene therapy product that is being studied in combination with radiation therapy in the treatment of cancer.

**TNM staging system :** A system to describe the amount and spread of cancer in a patient's body, using TNM. T describes the size of the tumor and any spread of cancer into nearby tissue; N describes spread of cancer to nearby lymph nodes; and M describes metastasis (spread of cancer to other parts of the body). This system was created and is updated by the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC). The TNM staging system is used to describe most types of cancer. Also called AJCC staging system.

**TNP-470:** A synthetic analog of fumagillin, an antibiotic isolated from the fungus *Aspergillus fumigatus fresenius* with antineoplastic activity. TNP-470 binds to and irreversibly inactivates methionine aminopeptidase-2 (MetAP2), resulting in endothelial cell cycle arrest late in the G1 phase and inhibition of tumor angiogenesis. This agent may also induce the p53 pathway, thereby stimulating the production of cyclin-dependent kinase inhibitor p21 and inhibiting angiogenesis. OR A substance being studied in the treatment of cancer. It may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent.

**tobacco :** A plant with leaves that have high levels of the addictive chemical nicotine. After harvesting, tobacco leaves are cured, aged, and processed in various ways. The resulting products may be smoked (in cigarettes, cigars, and pipes), applied to the gums (as dipping and chewing tobacco), or inhaled (as snuff). Cured tobacco leaves and the products made from them contain many cancer-causing chemicals, and tobacco use and exposure to secondhand tobacco smoke have been strongly linked to many types of cancer and other diseases. The scientific name of the most common tobacco plant is *Nicotiana tabacum*.

**tobacco tar :** A chemical substance made when tobacco is burned. Tar contains most of the cancer-causing and other harmful chemicals found in tobacco smoke. When tobacco smoke is inhaled, the tar can form a sticky layer on the inside of the lungs. This damages the lungs and may lead to lung cancer, emphysema, or other lung problems. Cigarettes and other smoked tobacco products may produce different amounts of tar, depending on how they are made. Inhaling tobacco smoke also causes other types of cancer, including cancers of the mouth and throat.

**tobacco-specific nitrosamine :** A type of harmful, cancer-causing chemical found in tobacco and tobacco smoke. Tobacco-specific nitrosamines are formed when tobacco leaves are grown, cured, aged, and processed. Tobacco products can contain different amounts of tobacco-specific nitrosamines, depending on how they are made. Also called TSNA.

**tobramycin sulfate:** The sulfate salt of tobramycin, an aminoglycoside antibiotic derived from the bacterium *Streptomyces tenebrarius* with bactericidal activity. Following active transport into the cell, tobramycin binds irreversibly to a specific aminoglycoside receptor on the bacterial 30S ribosomal subunit and fixes the 30 S-50 S ribosomal complex at the start codon (AUG), interfering with the initiation of protein synthesis. In addition, this agent induces misreading of the mRNA template, which results in 1) detachment of the ribosomal complex and inhibition of protein elongation or 2) incorporation of the incorrect amino acids into the growing polypeptide chain and the production of abnormal or nonfunctional proteins. Altogether, cell permeability is altered and cell death ensues.

**Tobrex:** (Other name for: tobramycin sulfate)

**Toca FC:** (Other name for: extended-release flucytosine)

**tocilizumab:** A recombinant, humanized IgG1 monoclonal antibody directed against the interleukin-6 receptor (IL-6R) with immunosuppressant activity. Tocilizumab targets and binds to both the soluble form of IL-6R (sIL-6R) and the membrane-bound form (mIL-6R), thereby blocking the binding of IL-6 to its receptor. This prevents IL-6-mediated signaling. IL-6, a pro-inflammatory cytokine that plays an important role in the regulation of the immune response, is overproduced in autoimmune disorders and certain types of cancers.

**tocladesine:** An antimetabolite and a chlorine derivative of the intracellular secondary messenger, cyclic adenosine 3,5-monophosphate (cAMP), with

potential antineoplastic activity. Tocladesine appears to be converted to 8-chloro-adenosine by phosphodiesterases and subsequently phosphorylated to 8-chloro-ATP, which functions as a purine analogue and competes with ATP in transcription. In addition, generation of 8-chloro-ATP depletes the endogenous ATP pool that is essential for many biological reactions in intracellular energy transfer. As a result, this agent causes RNA synthesis inhibition, blocks cellular proliferation, and induces apoptosis.

**tocladesine :** A substance that has been studied as an anticancer drug. It is an analog of a substance that occurs naturally in the body (cyclic adenosine monophosphate).

**tocopherols:** Forms of vitamin E.

**tocophersolan:** A water-soluble amphipathic formulation of d-alpha-tocopherol succinate coupled, through a succinate linker, to polyethylene glycol (PEG) 1000. Due to its amphipathic property in which it forms its own micelles, tocophersolan is easily taken up into enterocytes, even in the absence of bile salts; fat soluble d-alpha-tocopherol is then released after hydrolysis. This formulation enhances the absorption of d-alpha-tocopherol compared to the administration of free d-alpha-tocopherol. In addition, tocophersolan may enhance the absorption of water-insoluble agents and other fat-soluble vitamins. Check for active clinical trials using this agent.

**Tocosol Paclitaxel:** (Other name for: paclitaxel vitamin E-based emulsion formulation)

**tocotrienol:** Any of the four forms, alpha, beta, gamma and delta, of a member of the vitamin E family, with potential hypocholesterolemic, antithrombotic, antioxidant, immunomodulating and antineoplastic activities. Tocotrienol inhibits the activity of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, thereby lowering cholesterol levels. In addition, tocotrienol acts through multiple signal transduction pathways to induce cell cycle arrest and caspase-mediated apoptosis, and to decrease tumor cell proliferation. In addition, this agent may inhibit angiogenesis through the blockage of vascular endothelial growth factor receptor (VEGFR) and the subsequent inhibition of tumor cell-induced vessel formation. Also, this agent prevents free radical formation and inhibits lipid peroxidation, thereby preventing DNA cell damage. Tocotrienol farnesyl isoprenoid side chains contain 3 double bonds, which are absent in tocopherols, likely contribute to its anti-cancer activities.

**tocotrienol-rich fraction:** An orally available nutritional supplement containing high amounts of the vitamin E family member tocotrienol with antioxidant, hypolipidemic and potential immunomodulating and antiproliferative activity. Upon oral administration, tocotrienol-rich fraction (TRF) accumulates in tumor cells and induces cell cycle arrest, programmed cell death, and inhibits tumor cell proliferation. In addition, this agent suppresses 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase activity and inhibits angiogenesis. Rice bran oil, palm oil and annatto seed oil are common sources of TRF.

**tofacitinib:** An orally available inhibitor of Janus kinases (JAK), with immunomodulatory and anti-inflammatory activities. Upon administration, tofacitinib binds to JAK and prevents the activation of the JAK-signal transducers and activators of transcription (STAT) signaling pathway. This may decrease the production of pro-inflammatory cytokines, such as interleukin (IL)-6, -7, -15, -21, interferon-alpha and -beta, and may prevent both an inflammatory response and the inflammation-induced damage caused by certain immunological diseases. JAK kinases are intracellular enzymes involved in signaling pathways affecting hematopoiesis, immunity and inflammation.

**Toggle:** A type of clamping mechanism that exerts pressure by applying force on a knee joint. A toggle is used to close and exert pressure on a mold in a press. OR A type of clamping mechanism that exerts pressure by applying force on a knee joint. A toggle is used to close and exert pressure on a mold in a press.

**TOGGLE ACTION:** A mechanism which exerts pressure developed by the application of force on a knee joint. It is used as a method of closing presses and also serves to apply pressure at the same time.

**Toggle clamp:** A term used to describe the use of a mechanical "scissors action" system to open and close the clamp unit of a molding machine. It is operated by a relatively small hydraulic cylinder.

**Tolak :** A drug used to treat cancers of the breast, colon, rectum, stomach, and pancreas. Under the brand names Carac, Tolak, Efudex, and Fluoroplex, it is used as a cream to treat actinic keratosis (a skin condition that may become cancer). It is also used under the brand name Efudex as a cream to treat basal cell skin cancer that is superficial (not invasive) and cannot be removed by surgery. Tolak is being studied in the treatment of

other conditions and types of cancer. It stops cells from making DNA and may kill cancer cells. Tolak is a type of antimetabolite. Also called 5-fluorouracil, 5-FU, Carac, Efudex, Fluoroplex, and fluorouracil.

**tolazamide:** An intermediate-acting, first-generation sulfonylurea with hypoglycemic activity. Tolazamide is converted into five major metabolites that are excreted into the urine. Tolazamide is more potent than tolbutamide and similar in potency to chlorpropamide on a milligram basis. This agent may cause cholestatic jaundice. Check for active clinical trials using this agent.

**tolbutamide:** A first-generation sulfonylurea with hypoglycemic activity. Tolbutamide binds to and blocks adenosine triphosphate (ATP)-sensitive potassium channels on the beta cell membrane of the pancreatic islet tissues. This leads to potassium efflux, which results in depolarization, calcium influx, calcium-calmodulin binding, kinase activation, and release of insulin-containing granules by exocytosis. In addition, tolbutamide may increase the number and affinity of cell surface insulin receptors, thereby enhancing the peripheral response to insulin. Tolbutamide is a CYP2C9 substrate.

**tolerance:** Tolerance is the ability to experience exposure to potentially harmful amounts of a substance without showing an adverse effect. An adaptive state characterized by diminished responses to the same dose of a chemical (WHO, 1979). Or A specified allowance for deviations in weighing, measuring, etc., or for deviations from the standard dimensions or weight.

**tolfenamic acid:** An orally available, benzoic acid derivative and a non-steroidal anti-inflammatory drug (NSAID) with anti-inflammatory, antipyretic, analgesic and potential anti-neoplastic activities. Tolfenamic acid inhibits the activity of the enzymes cyclooxygenase (COX) I and II, resulting in a decreased formation of precursors of prostaglandins and thromboxanes. The decrease in prostaglandin synthesis results in the therapeutic effects of this agent. Tolfenamic acid also inhibits thromboxane A<sub>2</sub> synthesis, by thromboxane synthase, which decreases platelet aggregation. In addition, this agent exerts anti-tumor effects through COX-dependent and independent pathways. Specifically, this agent induces the production of reactive oxygen species, causes DNA damage, increases nuclear factor-kappa B (NF- $\kappa$ B) activation and the expression of activating

transcription factor 3 (ATF3) and NSAID-activated gene-1 (NAG1), and inhibits the expression of specificity proteins (Sp), which reduces the expression of Sp-dependent anti-apoptotic and growth-promoting proteins. Altogether, this enhances tumor cell apoptosis, and reduces tumor cell growth and angiogenesis. Check for active clinical trials using this agent.

**Tolinase:** (Other name for: tolazamide)

**Toll-like receptor 9 agonist IMO-2125:** A proprietary synthetic oligonucleotide-based agonist of toll-like receptor 9 (TLR9), with potential immunostimulating activity. Upon administration, TLR9 agonist IMO-2125 binds to and activates TLR9 expressed by plasmacytoid dendritic cells (pDCs) and B cells. This initiates immune signaling pathways, activates B cells and pDCs, and induces a cytotoxic T-lymphocyte (CTL)-mediated immune response against tumor cells. TLR9 is a member of the TLR family, which plays a fundamental role in pathogen recognition and activation of innate immunity.

**Toluene:** Toluene is one of the "aromatic" compounds along with benzene and xylenes. There is limited chemical consumption of toluene but it may be converted to benzene by hydrodealkylation (THDA) or to benzene and xylenes by disproportionation (TDP) or transalkylation. Chemical applications include solvents and toluene diisocyanate (TDI). or The non-systematic name for methylbenzene, like so:

**toluene :** A strong-smelling, colorless liquid used to make gasoline and other types of fuel, paint, paint thinner, fingernail polish, glue, and rubber. Being exposed to toluene may cause headache, tiredness, confusion, weakness, memory loss, nausea, loss of appetite, hearing and color vision loss, dizziness, loss of consciousness, kidney damage, and death.

**Toluene diisocyanate (TDI):** Toluene diisocyanate (TDI) is an aromatic derivative produced by the nitration of toluene followed by phosgenation. TDI-based polyurethanes are used in flexible foams, coating resins, adhesives, sealants and elastomers.

**Toluene Disproportionation (TDP):** Incremental mixed xylenes can be produced from available toluene through disproportionation. Technologies are available that will permit co-processing C9 aromatics with toluene into mixed xylenes. The analysis presented here gives the costs for a typical TDP unit processing toluene only, valuing the feedstock at its gasoline blending value. Xylenes production from gasoline value toluene, in general,

has a lower cash cost of production than xylenes from reformat. This result is sensitive to co-product credits from benzene and other gasoline based co-products, and the position can be reversed if toluene is valued throughout at its market price.

**tomato-soy juice:** A juice containing tomato extract and soy protein with potential chemopreventive and antiproliferative activities. Tomato-soy juice contains phytochemicals, including flavonoids, such as the soy isoflavone genistein, and carotenoids, including lycopene. These phytochemicals may exhibit antioxidative activity, antitumor activity by modulating certain tumor-associated signal transduction pathways, and apoptosis-inducing activity. Check for active clinical trials using this agent.

**tombolo:** a bar of sediment that connects an island to the mainland, forming a small peninsula.

**tomography :** A series of detailed pictures of areas inside the body. The pictures are created by a computer linked to an x-ray machine. Or A type of therapy in which radiation is aimed at a tumor from many different directions. The patient lays on a table and is moved through a donut-shaped machine. The radiation source in the machine rotates around the patient in a spiral pattern. Before radiation, a 3-dimensional (3-D) image of the tumor is taken. This helps doctors find the highest dose of radiation that can be used to kill tumor cells while causing less damage to nearby tissue. Tomotherapy is a type of intensity-modulated radiation therapy (IMRT). Also called helical tomotherapy.

**Tomudex:** (Other name for: raltitrexed)

**TONER:** Pigmented lacquer sealer that is applied by spray. Toners provide color and make the surface appear more even.

**tonga :** An herb native to islands in the South Pacific. Substances taken from the root have been used in some cultures to relieve stress, anxiety, tension, sleeplessness, and problems of menopause. Tonga may increase the effect of alcohol and of certain drugs used to treat anxiety and depression. The U.S. Food and Drug Administration advises users that tonga may cause severe liver damage. The scientific name is Piper methysticum. Also called intoxicating pepper, kava kava, rauschpfeffer, and yangona.

**tongue cancer :** Cancer that begins in the tongue. When the cancer begins in the front two-thirds of the tongue, it is considered to be a type of oral

cavity cancer; when the cancer begins in the back third of the tongue, it is considered to be a type of oropharyngeal or throat cancer.

**Tonnage:** The measure by which injection molding machines are typically categorized, representing the clamping force of the injection molding machine.

**tonsil :** One of two small masses of lymphoid tissue on either side of the throat.

**Tool:** In injection molding, the term sometimes used to describe the mold.  
OR The measure by which injection molding machines are typically categorized, representing the clamping force of the injection molding machine.

**Top Blow:** A specific type of blow molding machine forms hollow articles by injecting the blowing into the parison at the top of the mold

**Top event:** The events across the top of the event tree, which graphically represent the systems needed to keep the plant in a safe state following an initiating event (i.e., a challenge to plant operation). A top event is the starting point of the fault tree, which identifies all of the pathways that lead to a system failure. For additional information, see Probabilistic Risk Assessment.

**Top load:** the amount of weight bearing on the top of a container. The term is sometimes used to indicate the maximum load the container will bear without becoming distorted.

**Topamax:** (Other name for: topiramate)

**topic:** the general idea or area of an essay; provides the subject of the essay.

**topical :** On the surface of the body.

**topical betulinic acid:** A topical formulation of a pentacyclic lupane-type triterpene derivative of betulin (isolated from the bark of *Betula alba*, the common white birch) with antiinflammatory, anti-HIV and antineoplastic activities. Betulinic acid induces apoptosis through induction of changes in mitochondrial membrane potential, production of reactive oxygen species, and opening of mitochondrial permeability transition pores, resulting in the release of mitochondrial factors involved in apoptosis, activation of caspases, and DNA fragmentation. Although originally thought to exhibit specific cytotoxicity against melanoma cells, this agent has been found to

be cytotoxic against non-melanoma tumor cell types including neuroectodermal and brain tumor cells.

**topical calcitriol:** A topical formulation containing the hormonally active form of vitamin D3, with potential protective activity against chemotherapy-induced alopecia (CIA). Upon topical application to the scalp, calcitriol may prevent keratinocyte apoptosis in anagen hair follicles. Therefore, this agent may protect against the damaging effects of certain chemotherapeutics to the hair follicles.

**topical chemotherapy :** Treatment with anticancer drugs in a lotion or cream applied to the skin.

**topical cocaine hydrochloride:** A topical formulation of the hydrochloride salt of the tropane alkaloid cocaine, with local anesthetic activity. Upon topical application of the cocaine hydrochloride solution to nasal mucous membranes, cocaine reversibly binds to and blocks the voltage-gated sodium channels in the neuronal cell membranes. By stabilizing neuronal membranes, cocaine inhibits the initiation and conduction of nerve impulses and produces a reversible loss of sensation. Check for active clinical trials using this agent.

**topical fluorouracil:** A topical formulation containing the antimetabolite 5-fluorouracil (5-FU), with antineoplastic activity. Upon topical administration, 5-FU is converted into the active metabolite 5-fluorouridylic acid monophosphate (F-UMP), which competes with uracil during RNA synthesis and inhibits RNA processing. Conversion of 5-FU into another active metabolite, 5-fluorouridylic acid-2'-deoxyuridine-5'-O-monophosphate (F-dUMP), inhibits thymidylate synthase; this results in the depletion of thymidine triphosphate (TTP), one of the four nucleotide triphosphates used in DNA synthesis, and thus inhibits DNA synthesis. Altogether, this prevents the proliferation of tumor cells locally.

**topical gemcitabine hydrochloride:** A topical preparation of gemcitabine hydrochloride with antineoplastic activity. Gemcitabine, an analogue of the antimetabolite nucleoside deoxycytidine, is converted intracellularly to the active metabolites difluorodeoxycytidine di- and triphosphate (dFdCDP, dFdCTP). dFdCDP inhibits ribonucleotide reductase, thereby decreasing the deoxynucleotide pool available for DNA synthesis; dFdCTP is incorporated into DNA, resulting in DNA strand termination and apoptosis.

**topical keratin:** A topical formulation containing the naturally-derived biomaterial keratin that has wound repair-promoting, hemostatic, moisturizing and potential radioprotective activities. Upon topical application to an injured site, keratin adheres to the injured tissue, and forms an extracellular matrix that mimics the structure and function of the native tissue. This exogenous extracellular matrix is able to absorb fluid, accelerate thrombus formation through beta1 integrin-mediated platelet adhesion and forms a physical seal on the wound. This facilitates tissue regeneration by promoting cellular proliferation and migration, reducing pro-inflammatory cytokine and chemokine expression and altering the expression of extracellular matrix components and adhesion molecules. Altogether, this promotes wound healing and provides protection from damage due to thermal or radiation exposure. Keratin is an essential component in nails, hair and skin. Check for active clinical trials using this agent.

**topical menthol:** A topical cream containing menthol that both causes a localized cooling sensation and has analgesic activities. Upon topical application, menthol acts on the cold-sensitive transient receptor potential cation channel subfamily M member 8 (TRPM8), which provides a cooling sensation. This treatment also provides an analgesic effect through the activation of the inhibitory group II/III metabotropic glutamate receptors (mGluRs). This may decrease neuropathic pain from chemotherapy. In addition, the topical application of menthol causes vasodilation.

**topical myristyl nicotinate cream:** A topical cream containing the ester prodrug myristyl nicotinate (MN), a lipophilic nicotinic acid derivative with potential chemopreventive activity. Upon topical application, myristyl nicotinate penetrates into the epidermis where the agent is cleaved and is converted into nicotinic acid (niacin); nicotinic acid then diffuses into cells where it is converted to nicotinamide adenine dinucleotide (NAD). NAD may stimulate poly(ADP-ribose) polymerase-1 (PARP-1); enhance skin cell turnover and epidermal differentiation; and strengthen skin barrier function. NAD is a coenzyme that plays a crucial role in many redox reactions; PARP-1 is an enzyme that plays an important role in DNA repair.

**topical phenylephrine solution:** A topical solution containing phenylephrine, a sympathomimetic amine with vasoconstricting activity. Upon topical application to the oral mucosa, phenylephrine may activate

alpha-adrenergic receptors in the mucosa thereby causing vasoconstriction. As a result, this agent may reduce swelling of the mucosal membranes and decrease radiotherapy-induced mucositis.

**topical piperidine nitroxide MTS-01:** A topical gel containing a cell permeable hydrophilic piperidine nitroxide with potential radioprotective and antioxidant activity. As a stable, free radical compound, MTS-01 may be able to protect cells against the damaging effects of reactive oxygen species (ROS), upon exposure to ionizing radiation and oxidative stress. The topically applied MTS-01 may protect normal tissue from radiation-induced toxicity, such as radiation dermatitis, during radiation therapy.

**topical sirolimus:** A topical formulation containing the macrolide sirolimus (rapamycin), which is produced by the organism *Streptomyces hygroscopicus*, with potential anti-proliferative activity. Upon application of topical sirolimus, this agent migrates into the skin and is internalized by the affected cells. In turn, sirolimus binds to the immunophilin FK binding protein-12 (FKBP-12) and forms a sirolimus:FKBP-12 complex. This complex binds to and inhibits the activity of the serine/threonine kinase mammalian target of rapamycin (mTOR). It also decreases the production of vascular endothelial growth factor (VEGF) and results in the suppression of cellular proliferation.

**topical vitamin E:** A topical preparation of the fat-soluble vitamin E with potential antioxidant and cytoprotective activities. As a potent antioxidant and radical scavenger, vitamin E ameliorates free-radical damage to cell membranes, thereby protecting cells from reactive oxygen species and maintaining the integrity of cellular macromolecules. In addition, vitamin E noncompetitively inhibits cyclooxygenase (COX) activity in many tissues, which may decrease inflammation. Vitamin E is a generic name for a group of compounds known as tocopherols and tocotrienols (tocols).

**topical wound spray HP802-247:** A cell-based combination product consisting of a fibrinogen solution and a cell preparation containing allogeneic non-proliferating, living human skin-derived keratinocytes and fibroblasts, suspended in thrombin, with potential topical wound healing enhancing and topical anti-ulcer activity. Upon sequential spray of the two components of HP802-247 topically, a thin fibrin matrix is formed on the wound surface and the cellular components are capable of secreting wound healing cytokines and growth factors, such as vascular endothelial growth

factor (VEGF), basic fibroblast growth factor (bFGF), granulocyte-macrophage colony-stimulating growth factor (GM-CSF) and keratinocyte growth factor. Cell concentration and keratinocyte-to-fibroblast ratio in HP802-247 are essential for optimal growth factor production and thus the efficacy of this agent.

**topiramate:** A sulfamate-substituted monosaccharide with anticonvulsant activity. Although the mechanism of action has not been fully elucidated, topiramate appears to antagonize kainate/AMPA subtype glutamate receptors, which results in stabilization of hyper-excited neural membranes, inhibition of repetitive neuronal firing, and a decrease in propagation of synaptic impulses, thus impeding seizure activity. In addition, this agent enhances chloride channels activated by the inhibitory neurotransmitter GABA. Kainate/AMPA subtype glutamate receptors are ligand-activated cation channels that mediate the fast component of excitatory postsynaptic currents in neurons of the central nervous system.

**Topochemical:** The term used to describe the control of solid-state reactions by selective crystal packing. A reaction is topochemical if the structure of the products can be explained by the crystal packing of the reactant crystal.

**Topochemical postulate:** This postulate states that, because a solid-state reaction may occur within the solid or at the surface of the solid, the outcome of the reaction is for the most part determined by the spatial relationships of the reactants.

**topographic map:** map that shows elevations above sea level.

**Topoisomerase:** An enzyme that changes the extent of supercoiling of a DNA duplex.

**topoisomerase I inhibitor Genz-644282:** A non-camptothecin inhibitor of topoisomerase I with potential antineoplastic activity. Topoisomerase I inhibitor Genz-644282 binds to and inhibits the enzyme topoisomerase I, which may result in the inhibition of repair of single-strand DNA breaks, DNA replication, and tumor cell growth in susceptible tumor cell populations. Check for active clinical trials using this agent.

**topoisomerase I inhibitor LMP400:** An indenoisoquinoline and non-camptothecin inhibitor of topoisomerase I (Top I) with potential antineoplastic activity. Topoisomerase I inhibitor LMP400 binds to the topoisomerase I-DNA covalent cleavage complexes, and inhibits repair of

single-strand DNA breaks, DNA replication, and tumor cell growth in susceptible tumor cell populations. Compared to camptothecins, indenoisoquinolines are chemically stable, produce stable Top I-DNA cleavage complexes, induce unique DNA cleavage sites and appear more resistant to multidrug efflux pumps.

**topoisomerase I inhibitor LMP776:** An indenoisoquinoline and non-camptothecin inhibitor of topoisomerase I (Top I) with potential antineoplastic activity. Topoisomerase I inhibitor LMP776 binds to the topoisomerase I-DNA covalent cleavage complexes, and inhibits repair of single-strand DNA breaks, DNA replication, and tumor cell growth in susceptible tumor cell populations. Compared to camptothecins, indenoisoquinolines are chemically stable, produce stable Top I-DNA cleavage complexes, induce unique DNA cleavage sites and appear more resistant to multidrug efflux pumps.

**topoisomerase I/II inhibitor NEV-801:** A multi-targeted agent with potential antineoplastic activity. Upon administration, NEV-801 appears to selectively inhibit topoisomerase (Topo) I and II, and activates hypoxia-inducible factor 1 (HIF-1) transcription and the expression of vascular endothelial growth factor (VEGF) mRNA. NEV-801 is also able to overcome multidrug resistance (MDR) 1-mediated resistance. Check for active clinical trials using this agent.

**Topoisomerase II (DNA gyrase):** A topoisomerase that catalyzes the ATP-driven introduction of negative supercoils into DNA.

**topoisomerase II inhibitor :** A substance that blocks the activity of the enzyme topoisomerase II, which cuts and repairs tangled strands of DNA. Topoisomerase II is involved in cell division and growth, so blocking activity of this enzyme may kill cancer cells. Some topoisomerase II inhibitors are being used to treat cancer.

**topoisomerase II inhibitor RTA 744 :** A substance being studied in the treatment of adult brain tumors. Topoisomerase II inhibitor RTA 744 crosses the blood-brain barrier and blocks an enzyme needed for cancer growth. It is a type of topoisomerase inhibitor. Also called RTA 744.

**topoisomerase inhibitor :** A substance that blocks topoisomerases (enzymes that break and rejoin DNA strands and are needed for cells to divide and grow). Blocking these enzymes may kill cancer cells. Certain topoisomerase inhibitors are being studied in the treatment of cancer.

**Topoisomerases:** Enzymes that catalyze the interconversion of topoisomers of DNA; can relax supercoiled DNA. Or Enzymes that introduce positive or negative supercoils in closed, circular duplex DNA.

**Topoisomers:** Molecules of DNA that differ from one another only in their linking number. Or Different forms of a covalently closed, circular DNA molecule that differ only in their linking number.

**Topotactic:** See Topotaxy

**Topotactic reaction:** A reaction exhibiting topotaxy.

**Topotaxy:** A term used to describe a solid-state reaction whose products have a preferred orientation relative to a crystallographic direction of the parent crystal.

**topotecan :** A drug used to treat certain types of ovarian cancer, lung cancer, and cervical cancer. Topotecan is a type of topoisomerase inhibitor. Also called Hycamtin and topotecan hydrochloride.

**topotecan hydrochloride:** The hydrochloride salt of a semisynthetic derivative of camptothecin with antineoplastic activity. During the S phase of the cell cycle, topotecan selectively stabilizes topoisomerase I-DNA covalent complexes, inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when complexes are encountered by the DNA replication machinery. Camptothecin is a cytotoxic quinoline-based alkaloid extracted from the Asian tree *Camptotheca acuminata*.

**topotecan hydrochloride :** A drug used to treat certain types of ovarian cancer, lung cancer, and cervical cancer. Topotecan hydrochloride is a type of topoisomerase inhibitor. Also called Hycamtin and topotecan.

**toposalysin:** A targeted prodrug consisting of a recombinant modified form of the *Aeromonas* protoxin proaerolysin (PA), bearing a prostate-specific protease cleavage site, with potential antineoplastic activity. When injected directly into the prostate, topsalysin is hydrolyzed to the active toxin aerolysin by the serine protease prostate specific antigen (PSA), a protein overexpressed by prostate cancers and prostate cells in hyperplastic prostatic tissue. Aerolysin molecules then oligomerize to form ring-like heptamers that are incorporated into the lipid bilayers of cell membranes, forming large membrane channels and resulting in the leakage of cellular

contents and lysis of PSA-expressing prostate cells. Check for active clinical trials using this agent.

**topset bed:** a nearly horizontal layer of sediment deposited by distributaries as they flow toward a delta front.

**topsoil:** the upper part of a section of loam; topsoil has the highest organic content of types of soil and is considered to be the most fertile.

**Toradol:** (Other name for: ketorolac tromethamine)

**TORC1/2 kinase inhibitor DS-3078a:** An orally bioavailable inhibitor of raptor-mTOR protein complex (TORC1) and rictor-mTOR protein complex (TORC2) with potential antineoplastic activity. TORC1/2 inhibitor DS-3078a binds to and inhibits both TORC1 and TORC2, which may result in tumor cell apoptosis and a decrease in tumor cell proliferation. TORC1 and 2 are upregulated in some tumors and play an important role in the PI3K/Akt/mTOR signaling pathway, which is frequently dysregulated in human cancers.

**toremifene:** An anticancer drug that belongs to the family of drugs called antiestrogens. Toremifene blocks the effect of the hormone estrogen in the body. It may help control some cancers from growing, and it may delay or reduce the risk of cancer recurrence. OR A nonsteroidal triphenylethylene antiestrogen. Chemically related to tamoxifen, toremifene is a selective estrogen receptor modulator (SERM). This agent binds competitively to estrogen receptors, thereby interfering with estrogen activity. Toremifene also has intrinsic estrogenic properties, which are manifested according to tissue type or species. Check for active clinical trials using this agent.

**Torisel :** A drug used to treat advanced renal cell carcinoma (a type of kidney cancer). It is also being studied in the treatment of other types of cancer. Torisel blocks a protein involved in cell division, and may kill cancer cells. It is a type of rapamycin analog and a type of serine/threonine kinase inhibitor. Also called CCI-779 and temsirolimus.

**TORKi:** (Other name for: mTOR kinase inhibitor CC-223)

**tornado:** narrow, funnel-shaped column of wind created by a thunderstorm. Or An apparatus at the discharge stage of the screw to finish homogenizing and blending the melt.

**Torque:** twisting force used to either attach or remove the closure. OR Stress caused by twisting a material.

**Torr:** Torr is a measurement of pressure. One millimeter of mercury on a barometer is equal to one torr. Standard pressure is equal to 760 torr. Or A unit of pressure equal to 1 mmHg or 1/760 of an atmosphere. Or A unit of pressure, defined so that 760 Torr is exactly 1 atmosphere. A Torr is equivalent to 1 mm Hg on barometer readings taken at 0°C; at other temperatures, the conversion from mm Hg to Torr is approximately  $p(\text{Torr}) = p(\text{mm Hg}) \times (1 - 1.8 \times 10^{-4}t)$ , where t is in °C.

**TORS:** Surgery in which a robot with arms is used to remove cancer from hard-to-reach areas of the mouth and throat. Cameras attached to the robot give a 3-dimensional (3D) image that a surgeon can see. The surgeon guides tools at the ends of the robot arms to remove the cancer. Also called transoral robotic surgery.

**torsional strain:** strain caused by repulsion between groups in an eclipsed conformation.

**tosedostat:** A proprietary orally bioavailable inhibitor of the M1 family of aminopeptidases with potential antineoplastic activity. Tosedostat is converted intracellularly into a poorly membrane-permeable active metabolite (CHR-79888) which inhibits the M1 family of aminopeptidases, particularly puromycin-sensitive aminopeptidase (PuSA), and leukotriene A4 (LTA4) hydrolase; inhibition of these aminopeptidases in tumor cells may result in amino acid deprivation, inhibition of protein synthesis due to a decrease in the intracellular free amino acid pool, an increase in the level of the proapoptotic protein Noxa, and cell death. Noxa is a member of the BH3 (Bcl-2 homology 3)-only subgroup of the proapoptotic Bcl-2 (B-cell CLL/lymphoma 2) protein family.

**tositumomab:** A murine IgG2 monoclonal antibody directed against the CD20 antigen, found on the surface of B-cells. Tositumomab binds to the CD20 surface membrane antigen, resulting in apoptosis, and may stimulate antitumoral cell-mediated and/or antibody-dependent cytotoxicity. OR A drug used together with another drug to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of cancer. Tositumomab binds to a protein called CD20, which is found on the surface of B cells, and may kill cancer cells. It is a type of monoclonal antibody.

**tositumomab and iodine I 131 tositumomab:** A murine IgG2a lambda monoclonal antibody, both unradiolabeled and radiolabeled with iodine I

131, directed against the human B cell-specific surface antigen CD20. Tositumomab binds to CD20, resulting in complement-dependent cytotoxicity (CDC), antibody-dependent cellular cytotoxicity (ADCC), and apoptosis in B cells expressing CD20; in addition to the antibody-mediated cytotoxicity, iodine I 131 tositumomab delivers cytotoxic ionizing radiation specifically to CD20-expressing B cells. In a two-step therapeutic regimen, a predose of unradiolabeled tositumomab is administered first followed by the administration of a dosimetric dose of iodine I 131 tositumomab; 7-14 days later, a therapeutic dose of iodine I 131 tositumomab is administered. The predose of unradiolabeled tositumomab binds to nontumor B cells, increasing the terminal half-life of radiolabeled antibody while protecting nontumor B cells from radiolabeled antibody-mediated radiocytotoxicity. or A combination of drugs used to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of cancer. Tositumomab and iodine I 131 tositumomab is made up of a monoclonal antibody called tositumomab and a form of tositumomab that is linked to a radioactive substance called iodine I 131. It is a type of radioimmunoconjugate. Also called Bexxar and Bexxar regimen.

**tosyl group:** a p-toluenesulfonate group:

**total androgen blockade :** Treatment used to block androgen (male hormone) activity in the body. This may be done by giving an antiandrogen drug and removing the testicles (orchiectomy) or by giving an antiandrogen drug with a gonadotropin-releasing hormone (GnRH) agonist. Total androgen blockade may stop the growth of cancer cells that need androgens to grow, and is used in the treatment of prostate cancer. Also called combined androgen blockade and complete androgen blockade.

**total diet studies:** Studies undertaken to show the range and amount of various foodstuffs in the typical diet or to estimate the total amount of a specific substance (e.g., pesticide residue, vitamin, or food contaminant) in a typical diet (WHO, 1979).

**total diet study:** A total diet study is a study designed to establish the pattern of pesticide residue intake by a person consuming a defined diet (WHO, 1979).

**Total Effective Dose Equivalent (TEDE):** The sum of the effective dose equivalent (for external exposures) and the committed effective dose equivalent (for internal exposures).

**total estrogen blockade :** Therapy used to eliminate estrogen in the body. This may be done with surgery, radiation therapy, chemotherapy, or a combination of these procedures.

**total hysterectomy :** Surgery to remove the entire uterus, including the cervix. Also called complete hysterectomy.

**total laryngectomy :** An operation to remove all of the larynx (voice box).

**total mastectomy :** Surgery to remove the whole breast. Some of the lymph nodes under the arm may also be removed. Also called simple mastectomy.

**total nodal irradiation :** Radiation therapy to the mantle field, the spleen, the lymph nodes in the upper abdomen, and the lymph nodes in the pelvic area.

**total pancreatectomy :** Surgery to remove the entire pancreas. Part of the stomach, part of the small intestine, the common bile duct, gallbladder, spleen, and nearby lymph nodes are also removed.

**total parenteral nutrition :** A form of nutrition that is delivered into a vein. Total parenteral nutrition does not use the digestive system. It may be given to people who are unable to absorb nutrients through the intestinal tract because of vomiting that won't stop, severe diarrhea, or intestinal disease. It may also be given to those undergoing high-dose chemotherapy or radiation and bone marrow transplantation. It is possible to give all of the protein, calories, vitamins and minerals a person needs using total parenteral nutrition. Also called hyperalimentation, parenteral nutrition, and TPN.

**total PSA :** The total amount of prostate-specific antigen (PSA) in the blood. It includes the amount of free PSA and the amount of PSA attached to other proteins.

**total skin electron beam radiation therapy :** A type of radiation therapy using electrons that is directed at the entire surface of the body. This type of radiation goes into the outer layers of the skin, but does not go deeper into tissues and organs below the skin. Also called TSEB radiation therapy.

**total tumor RNA-loaded dendritic cell vaccine:** A cancer vaccine containing autologous dendritic cells (DCs) that are loaded with total tumor RNA (TTRNA) from a specific tumor, with potential immunostimulatory and antineoplastic activities. Upon administration, TTRNA-loaded DC

vaccine may elicit a highly specific cytotoxic T-cell (CTL) response against the tumor-associated antigens (TAAs) encoded by the TTRNA.

**total-body irradiation** : Radiation therapy to the entire body. It is usually followed by bone marrow or peripheral stem cell transplantation.

**Totect** : (Other name for: dexrazoxane hydrochloride) OR A drug used to treat the toxic effects of an anticancer drug that leaks from a vein into surrounding tissue and causes tissue damage. It is also being studied in the treatment of cancer. Totect contains the active ingredient dexrazoxane. It is a type of chemoprotective agent, a type of cardioprotective agent, and a type of topoisomerase inhibitor.

**totipotent** : Having to do with cells that are able to develop into any type of cell found in the body.

**TOUCH UP**: The ability of a coating film to be spot repaired (usually within a few months of initial painting) without showing color or gloss differences.

**Toughener**: a substance added to a polymer that allows for the absorption of energy in the final parts. Typically they alter other performance properties as well.

**tourniquet** : A device, such as a strip of cloth or a band of rubber, that is wrapped tightly around a leg or an arm to prevent the flow of blood to the leg or the arm for a period of time. A tourniquet may be used when drawing blood or to stop bleeding after an injury.

**Toviaz**: (Other name for: fesoterodine fumarate)

**toxemia** : Disease caused by the spread of bacteria and their toxins in the bloodstream. Also called blood poisoning and septicemia.

**toxic** : Having to do with poison or something harmful to the body. Toxic substances usually cause unwanted side effects.

**toxicant** : A poison that is made by humans or that is put into the environment by human activities. Many pesticides are toxicants.

**toxicity**: The degree to which a substance is poisonous. OR The extent to which something is poisonous or harmful.

**toxicokinetics**: A term with the same meaning as chemobiokinetics for substances not used as drugs (WHO, 1979).

**Toxicology:** The study of the harmful effects of chemicals on living organisms or The study of poisons, including identification, isolation, biological effects, mechanism of action, and development of antidotes. OR The study of poisons, including the source, effect, and treatment of poisoning. It is a branch of pharmacology (the study of drugs).

**toxicometry:** A combination of investigation methods and techniques for making a quantitative assessment of toxicity and hazards of poisons (UNEP/IRPTC, 1982).

**Toxin:** A poisonous substance or Proteins produced by some organisms and toxic to certain other species.

**toxin :** A poison made by certain bacteria, plants, or animals, including insects.

**tozasertib lactate:** The lactate salt of tozasertib, a synthetic, small-molecule Aurora kinase inhibitor with potential antitumor activity. Tozasertib binds to and inhibits Aurora kinases (AKs), thereby inducing apoptosis in tumor cells in which AKs are overexpressed. AKs, a family of serine-threonine kinases, are essential for mitotic progression, spindle formation, centrosome maturation, chromosomal segregation, and cytokinesis.

**TP-38 immunotoxin :** A substance being studied in the treatment of brain tumors. It combines a protein that binds to certain tumor cells with a bacterial toxin that kills tumor cells.

**TPA:** A substance being studied in the treatment of leukemias and lymphomas. It is also being studied in the treatment of other types of cancer. TPA affects many cell actions and may cause tumor cells to die. It is a type of phorbol ester. Also called 12-O-tetradecanoylphorbol-13-acetate and tetradecanoylphorbol acetate.

**tPA:** An enzyme made in the body that helps dissolve blood clots. A form of this enzyme is made in the laboratory to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. tPA is a type of systemic thrombolytic agent. Also called tissue plasminogen activator.

**TPF:** An abbreviation for a chemotherapy combination used to treat certain types of head and neck cancer and stomach cancer. It includes the drugs docetaxel (Taxotere), cisplatin (Platinol), and fluorouracil. Also called DCF,

docetaxel-cisplatin-fluorouracil, Taxotere-Platinol-fluorouracil, and TPF regimen.

**TPF regimen:** A regimen consisting of docetaxel, cisplatin and fluorouracil used for the treatment of squamous cell head and neck cancer and gastric cancer. OR An abbreviation for a chemotherapy combination used to treat certain types of head and neck cancer and stomach cancer. It includes the drugs docetaxel (Taxotere), cisplatin (Platinol), and fluorouracil. Also called DCF, docetaxel-cisplatin-fluorouracil, Taxotere-Platinol-fluorouracil, and TPF.

**TPI 287:** A synthetic, third generation taxane with potential antineoplastic activity. TPI 287 binds to tubulin and stabilizes microtubules, resulting in inhibition of microtubule assembly/disassembly dynamics, cell cycle arrest at the G2/M phase, and apoptosis.

**TPN:** A form of nutrition that is delivered into a vein. TPN does not use the digestive system. It may be given to people who are unable to absorb nutrients through the intestinal tract because of vomiting that won't stop, severe diarrhea, or intestinal disease. It may also be given to those undergoing high-dose chemotherapy or radiation and bone marrow transplantation. It is possible to give all of the protein, calories, vitamins and minerals a person needs using TPN. Also called hyperalimentation, parenteral nutrition, and total parenteral nutrition.

**TPO:** A substance made by the body that helps make blood cells, especially platelets. A form of TPO made in the laboratory is called recombinant human TPO and rHu TPO. TPO is being studied as a way to increase the number of platelets in cancer patients receiving chemotherapy. Also called thrombopoietin.

**TPO receptor agonist ONO-7746:** An orally available small molecule and platelet thrombopoietin (TPO) receptor (TPOR; MPL) agonist with potential megakaryopoiesis stimulating activity. Upon administration, TPOR agonist ONO-7746 binds to and stimulates TPOR, which may lead to the proliferation and differentiation of megakaryocytes. In turn, this may increase the production of blood platelets and may prevent chemotherapy induced thrombocytopenia (CIT). TPOR is a cytokine receptor and member of the hematopoietin receptor superfamily. Check for active clinical trials using this agent.

**trabectedin :** A drug used to treat liposarcoma and leiomyosarcoma (types of soft tissue sarcoma) that cannot be removed by surgery or have spread to other parts of the body. It is used in patients who were treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Trabectedin may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called ecteinascidin 743, ET-743, and Yondelis. OR A tetrahydroisoquinoline alkaloid isolated from the marine tunicate Ecteinascidia turbinata with potential antineoplastic activity. Binding to the minor groove of DNA, trabectedin interferes with the transcription-coupled nucleotide excision repair machinery to induce lethal DNA strand breaks and blocks the cell cycle in the G2 phase.

**trabecular cancer :** A rare type of cancer that forms on or just beneath the skin, usually in parts of the body that have been exposed to the sun. It is most common in older people and in people with weakened immune systems. Also called Merkel cell cancer, Merkel cell carcinoma, and neuroendocrine carcinoma of the skin.

**trabedersen:** A transforming growth factor (TGF)-beta2 specific phosphorothioate antisense oligodeoxynucleotide with the sequence 5'-CGGCATGTCTATTTTGTA-3', with potential antineoplastic activity. Trabedersen binds to TGF-beta2 mRNA causing inhibition of protein translation, thereby decreasing TGF-beta2 protein levels; decreasing intratumoral TGF-beta2 levels may result in the inhibition of tumor cell growth and migration, and tumor angiogenesis. TGF-beta2, a cytokine often over-expressed in various malignancies, may play an important role in promoting the growth, progression, and migration of tumor cells.

**Trace Element:** This is an element of the periodic table that living organisms need to survive. These are not the major ones we need to survive (like oxygen); these elements are only needed in very small amounts. OR A chemical element required by an organism in only trace amounts. OR An element found in very small amounts in a given substance. Organisms need certain trace elements to survive.

**trace fossil:** evidence that life existed in the past, such as footprints and burrows.

**trace gas:** A minor constituent of the atmosphere. The most important trace gases contributing to the greenhouse effect are water vapor, carbon

dioxide, ozone, methane, ammonia, nitric acid, nitrous oxide, ethylene, sulfur dioxide, nitric oxide, dichlorofluoromethane or Freon 12, trichlorofluoromethane or Freon 11, methyl chloride, carbon monoxide, and carbon tetrachloride.

**tracer:** (1) a foreign substance mixed with or attached to a given substance for the determination of the location or distribution of the substance. (2) an element or compound that has been made radioactive so that it can be easily followed (traced) in biological and industrial processes. Radiation emitted by the radioisotope pinpoints its location.

**tracer :** A substance (such as a radioisotope) used in imaging procedures.

**trach tube :** A 2-inch- to 3-inch-long curved metal or plastic tube placed in a surgically created opening (tracheostomy) in the windpipe to keep it open. Also called tracheostomy tube.

**trachea:** the windpipe of mammals. OR The airway that leads from the larynx (voice box) to the bronchi (large airways that lead to the lungs). Also called windpipe. OR the branching network that extends from holes to all parts of an arthropod body to assist in gas exchange.

**tracheal carina :** A ridge at the base of the trachea (windpipe) that separates the openings of the right and left main bronchi (the large air passages that lead from the trachea to the lungs). Also called carina of trachea.

**tracheids:** the main conducting vessels of the xylem in most vascular plants.

**trachelectomy :** Surgery to remove the cervix (the end of the uterus that forms a canal between the uterus and the vagina). The upper part of the vagina and certain pelvic lymph nodes may also be removed. Also called cervicectomy.

**tracheoesophageal puncture :** A small opening made by a surgeon between the esophagus and the trachea. A valve keeps food out of the trachea but lets air into the esophagus for esophageal speech.

**tracheophytes:** vascular plants composed of a xylem and phloem.

**tracheostomy :** Surgery to create an opening (stoma) into the windpipe. The opening itself may also be called a tracheostomy.

**tracheostomy button :** A 0.5-inch- to 1.5-inch-long plastic tube placed in a surgically created opening (tracheostomy) in the windpipe to keep it open.

**tracheostomy tube :** A 2-inch- to 3-inch-long curved metal or plastic tube placed in a surgically created opening (tracheostomy) in the windpipe to keep it open. Also called trach tube.

**Tracking:** A phenomenon wherein a high voltage source current creates a leakage or fault path across the surface of an insulating material by slowly but steadily forming a carbonized path.

**trade winds:** planetary winds between 0° and 30° latitude.

**tradition :** A belief or behavior that is passed from generation to generation in a family, a culture, or a religion.

**traditional acupuncture :** An ancient form of acupuncture based on the principle that there are five universal elements (wood, fire, earth, metal, and water) that affect a person's emotions, personality, health, and response to treatment. Each person is affected by one element more than the others. Also called five element acupuncture.

**Traditional Chinese Medicine :** A medical system that has been used for thousands of years to prevent, diagnose, and treat disease. It is based on the belief that qi (the body's vital energy) flows along meridians (channels) in the body and keeps a person's spiritual, emotional, mental, and physical health in balance. Traditional Chinese medicine aims to restore the body's balance and harmony between the natural opposing forces of yin and yang, which can block qi and cause disease. Traditional Chinese medicine includes acupuncture, diet, herbal therapy, meditation, physical exercise, and massage. Also called Oriental medicine and TCM.

**TRAIL :** A cell protein that can attach to certain molecules in some cancer cells and may kill the cells. TRAIL is being studied in the treatment of cancer. Also called Apo-2L, TNF-related apoptosis-inducing ligand, and tumor necrosis factor-related apoptosis-inducing ligand.

**TRAIL receptor 1 :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of TRAIL receptor 1 on cancer cells may kill more cells. Also called death receptor 4, DR4, TRAIL-R1, and tumor necrosis factor receptor superfamily member 10A.

**TRAIL receptor 2 :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of TRAIL receptor 2 on cancer cells may

kill more cells. Also called death receptor 5, DR5, TRAIL-R2, and tumor necrosis factor receptor superfamily member 10B.

**TRAIL-R1 :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of TRAIL-R1 on cancer cells may kill more cells. Also called death receptor 4, DR4, TRAIL receptor 1, and tumor necrosis factor receptor superfamily member 10A.

**TRAIL-R2 :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of TRAIL-R2 on cancer cells may kill more cells. Also called death receptor 5, DR5, TRAIL receptor 2, and tumor necrosis factor receptor superfamily member 10B.

**TRAM flap :** A type of surgery used to rebuild the shape of the breast after a mastectomy. A muscle in the lower abdomen called the rectus abdominis, along with skin, fat, and blood vessels, is moved from the lower abdomen to the chest. This is usually done by passing the muscle tissue and blood vessels through a tunnel under the skin to the chest. A TRAM flap forms a natural-looking breast, so the patient usually does not need a breast implant. It is a type of breast reconstruction. Also called transverse rectus abdominis myocutaneous flap.

**tramadol hydrochloride :** A drug used to treat moderate to severe pain in adults. It binds to opioid receptors in the central nervous system. Tramadol hydrochloride is a type of analgesic agent and a type of opioid. Also called Ultram.

**trametinib:** An orally bioavailable inhibitor of mitogen-activated protein kinase kinase (MEK MAPK/ERK kinase) with potential antineoplastic activity. Trametinib specifically binds to and inhibits MEK 1 and 2, resulting in an inhibition of growth factor-mediated cell signaling and cellular proliferation in various cancers. MEK 1 and 2, dual specificity threonine/tyrosine kinases often upregulated in various cancer cell types, play a key role in the activation of the RAS/RAF/MEK/ERK signaling pathway that regulates cell growth. or

**tranexamic acid:** A synthetic derivative of the amino acid lysine with antifibrinolytic activity. With strong affinity for the five lysine-binding sites of plasminogen, tranexamic acid competitively inhibits the activation of plasminogen to plasmin, resulting in inhibition of fibrinolysis; at higher

concentrations, this agent noncompetitively inhibits plasmin. This agent has a longer half-life, is approximately ten times more potent, and is less toxic than aminocaproic acid, which possesses similar mechanisms of action.

**tranquilizer** : A drug that calms and soothes, and reduces stress and tension. Tranquilizers are used to treat anxiety and insomnia.

**trans fat** : A type of fat that has certain chemical properties and is usually found in processed foods such as baked goods, snack foods, fried foods, shortening, margarine, and certain vegetable oils. Eating trans fat increases blood cholesterol levels and the risk of heart disease.

**trans isomer**: trans a stereoisomer in which substituents are located on opposite sides of a double bond. (Compare with "cis isomer.")

**trans sodium crocetin**: The sodium salt of the trans-isomer of the carotenoid crocetin with potential antihypoxic and radiosensitizing activities. Trans sodium crocetin (TSC) increases the diffusion rate of oxygen in aqueous solutions such as from plasma to body tissue. The agent has been shown to increase available oxygen during hypoxic and ischemic conditions that may occur in hemorrhage, vascular and neurological disorders, and in the tumor microenvironment.

**transabdominal ultrasound** : A procedure used to examine the organs in the abdomen. An ultrasound transducer (probe) is pressed firmly against the skin of the abdomen. High-energy sound waves from the transducer bounce off tissues and create echoes. The echoes are sent to a computer, which makes a picture called a sonogram. Also called abdominal ultrasound.

**Transaldolase**: An enzyme that transfers a three-carbon dihydroxyacetone unit from a ketose to an aldose acceptor; one of the enzymes in the nonoxidative part of the pentose phosphate pathway.

**transaminase** : A type of enzyme that causes the transfer of a chemical substance called an amino group from one molecule to another. Transaminases are involved in many processes in the body, such as making amino acids. OR See aminotransferases.

**Transamination**: Enzymatic transfer of an amino group from an  $\alpha$ -amino acid to an  $\alpha$ -keto acid. Or The transfer of an  $\alpha$ -amino group from an amino acid to an  $\alpha$ -ketoacid.

**transarterial chemoembolization** : A procedure in which the blood supply to a tumor is blocked after anticancer drugs are given in blood

vessels near the tumor. Sometimes, the anticancer drugs are attached to small beads that are injected into an artery that feeds the tumor. The beads block blood flow to the tumor as they release the drug. This allows a higher amount of drug to reach the tumor for a longer period of time, which may kill more cancer cells. It also causes fewer side effects because very little of the drug reaches other parts of the body. Transarterial chemoembolization is used to treat liver cancer. Also called chemoembolization and TACE.

**transarterial embolization :** A procedure in which the blood supply to a tumor or an abnormal area of tissue is blocked. During transarterial embolization, a small incision (cut) is made in the inner thigh and a catheter (thin, flexible tube) is inserted and guided into an artery near the tumor or abnormal tissue. Once the catheter is in place, small particles made of tiny gelatin sponges or beads are injected. This blocks the artery and stops the flow of blood to the tumor or abnormal area of tissue. Transarterial embolization is used to treat some types of liver cancer, kidney cancer, and neuroendocrine tumors. It may also be used to treat uterine fibroids, aneurysms, and other conditions. Also called arterial embolization and TAE.

**Transcendental Meditation :** A mental technique used to promote relaxation, reduce stress, and improve quality of life. Transcendental Meditation is the registered trademark of the Maharishi Foundation Ltd. Also called TM.

**transcription:** the process in which a complementary strand of mRNA is synthesized according to the nitrogenous base code of DNA.

**Transcription:** RNA synthesis that occurs on a DNA template. Or DNA-directed synthesis of RNA catalyzed by RNA polymerase. Or The enzymatic process whereby the genetic information contained in one strand of DNA is used to specify a complementary sequence of bases in an mRNA chain.

**transcription :** In biology, the process by which a cell makes an RNA copy of a piece of DNA. This RNA copy, called messenger RNA (mRNA), carries the genetic information needed to make proteins in a cell. It carries the information from the DNA in the nucleus of the cell to the cytoplasm, where proteins are made.

**Transcription bubble:** The site of RNA synthesis or transcription; it contains RNA polymerase, a locally melted “bubble” of DNA, and helix

consisting of the template strand and the newly synthesized RNA.

**Transcription factor:** A protein that assists RNA polymerase in the initiation of RNA synthesis; binds to a specific promoter element.

**transcriptional control:** The regulation of a protein's synthesis by regulation of the formation of its mRNA.

**transcriptomics :** The study of all RNA molecules in a cell. RNA is copied from pieces of DNA and contains information to make proteins and perform other important functions in the cell. Transcriptomics is used to learn more about how genes are turned on in different types of cells and how this may help cause certain diseases, such as cancer.

**transcutaneous electrical nerve stimulation :** A procedure in which mild electric currents are applied to some areas of the skin. Also called TENS.

**transdermal :** Absorbed through the unbroken skin.

**transdermal 17beta-estradiol gel BHR-200:** A proprietary, transdermal, hydroalcoholic gel formulation containing 17beta-estradiol, with potential antineoplastic activity. Upon topical administration, 17beta-estradiol exerts its antineoplastic effect(s) through as of yet not fully elucidated mechanism(s) of action(s). This formulation may induce feedback inhibition via the hypothalamic–pituitary–gonadal axis feedback loop, block the secretion of luteinizing hormone (LH) and prevent the release of testosterone from Leydig cells in the testes, thus suppressing testosterone secretion. In addition, 17beta-estradiol inhibits enzymes involved in steroidogenesis, thereby further inhibiting androgen production. Since testosterone is required to sustain prostate tumor growth, reducing testosterone levels may inhibit hormone-dependent prostate cancer cell proliferation. In addition, 17beta-estradiol prevents bone loss, and suppresses andropause symptoms, such as hot flashes, which appear during androgen-deprivation therapy (ADT) where the standard of care is the use of gonadotropin releasing hormone (GnRH) analogs. Compared to oral estrogens, the topical gel formulation lowers the risk of cardiovascular side effects.

**transdermal 4-hydroxytestosterone:** A transdermal formulation containing 4-hydroxytestosterone (4-OHT), a steroidal aromatase inhibitor (AI) and androgen receptor (AR) antagonist, with potential antineoplastic activity. 4-OHT is largely converted into 4-hydroxyandrostenedione (4-OHA) and irreversibly binds to and inhibits aromatase, thereby blocking the

conversion of androstenedione to estrone, and testosterone to estradiol. This may inhibit tumor cell proliferation in estrogen-dependent tumor cells. In addition, 4-OHT binds to the AR and may inhibit AR-mediated tumor cell growth. Aromatase, a cytochrome P-450 enzyme, is overexpressed in a variety of cancer cells; it plays a key role in estrogen biosynthesis. Compared to oral 4-OHT, the transdermal formulation allows for continuous release of 4-OHT into the bloodstream and prevents first pass metabolism by the liver.

**transdermal estrogen:** A transdermal formulation containing the synthetic form of estradiol, the most potent, endogenously produced estrogen. Upon topical administration, estradiol diffuses through the cell membrane and binds to and activates specific intracellular estrogen receptors located on estrogen-responsive tissues, including the reproductive tract, breast, pituitary, hypothalamus, liver, and bone. The activated ligand-receptor complex binds to estrogen response elements on DNA and promotes the transcription of genes involved in the functioning of the female reproductive system and secondary sex characteristics. In addition, estradiol inhibits the pituitary secretion of the gonadotropins luteinizing hormone (LH) and follicle stimulating hormone (FSH) through a negative feedback mechanism.

**Transducer :** a physical part of the sensor (detector), that amplifies the primary signal to usable level. According to the IUPAC definition of chemical sensor one of the two principal components of the chemical sensor. The receptor part converts chemical information into a form of energy acceptable by the transducer and then the analytical signal is generated.

**Transducin:** G protein that is the signal-coupling protein of visual excitation; activated by rhodopsin, it leads to the activation of cGMP phosphodiesterase, which in turn leads to a nerve impulse.

**transduction:** (1) Generally, the conversion of energy or information from one form to another. (2) The transfer of genetic information from one cell to another by means of a viral vector.

**Transduction:** Genetic exchange in bacteria that is mediated via phage.

**Transfection:** An artificial process of infecting cells with naked viral DNA.

**Transfer efficiency:** The ratio of the amount of coating deposited on a substrate compared to the total amount directed at the part to be coated.

**transfer factor :** A substance made by some white blood cells. Transfer factor from one person's white blood cells may be able to cause a specific immune response when injected into the skin of another person.

**Transfer Molding :** A process of forming articles by fusing a plastic material in a chamber then forcing the whole mass into a hot mold to solidify.

**Transfer RNA:** The adaptor molecule in protein synthesis; contains an amino acid recognition site as well as a template-recognition site, or anticodon.

**transfer RNA (tRNA):** A class of RNA molecules (Mr. 25,000 to 30,000), each of which combines covalently with a specific amino acid as the first step in protein synthesis.

**Transfer RNA (tRNA):** Any of a family of low-molecular weight RNAs that transfer amino acids from the cytoplasm to the template for protein synthesis on the ribosome.

**Transfer RNA (tRNA):** Transfer RNA (tRNA). Any of a family of low-molecular weight RNAs that transfer amino acids from the cytoplasm to the template for protein synthesis on the ribosome.

**Transferase:** An enzyme that catalyzes the transfer of a molecular group from one molecule to another. Or An enzyme that catalyzes group transfer, often employing a cofactor.

**transferrin receptor-targeted anti-RRM2 siRNA CALAA-01:** A proprietary transferrin receptor-targeted nanoparticle preparation of a non-chemically modified small-interfering RNA (siRNA) directed against the M2 subunit of ribonucleotide reductase (RRM2) with potential antineoplastic activity. Upon administration, transferrin receptor-targeted anti-RRM2 siRNA CALAA-01 binds to transferrin receptors (TfRs), releasing anti-RRM2 siRNA after endocytosis; anti-RRM2 siRNA silences the expression of RRM2 via the RNAi pathway, impeding the assembly of the holoenzyme ribonucleotide reductase (RR) which catalyzes the production of deoxyribonucleotides. As a result, inhibition of cellular proliferation may occur in cells expressing TfR, a cell surface protein overexpressed on various cancer cell types.

**transferrin receptor-targeted liposomal p53 cDNA:** A cationic liposomal, tumor-targeting p53 (TP53) gene delivery system with potential anti-tumor activity. Transferrin receptor-targeted liposomal p53 cDNA contains plasmid DNA encoding the tumor suppressor protein p53 packaged in membrane-like liposome capsules that are complexed with anti-transferrin receptor single-chain antibody (TfRscFv). Upon systemic administration, the anti-TfRscFv selectively binds to tumor cells expressing transferrin receptors. The p53 plasmid is delivered into the nucleus and as a result, p53 protein is produced in tumor cells that have altered p53 function. This results in the restoration of normal cell growth control mechanisms as well as normal response mechanisms to DNA damage.

**transferrin-CRM107:** A substance being studied in the treatment of brain tumors. Transferrin-CRM107 is made by linking a diphtheria toxin to transferrin, a protein that binds to fast growing cells, such as tumor cells. The diphtheria toxin then kills the tumor cells. Transferrin-CRM107 is a type of immunotoxin. OR A synthetic targeted protein toxin which consists of human transferrin (Tf) conjugated to a diphtheria toxin that contains a point mutation (CRM107). After binding to the transferrin receptor expressed on the tumor cell surface, transferrin-CRM107 is internalized, where the diphtheria toxin moiety exerts its cytotoxic effect intracellularly by inhibiting protein synthesis through ADP-ribosylation of elongation factor. Check for active clinical trials using this agent.

**transform boundary:** a fault boundary marked by plates that slide past one another.

**transform plate boundary:** region where plates move next to each other.

**Transformation:** Genetic exchange in bacteria that is mediated via purified DNA. In somatic cell genetics the term is also used to indicate the conversion of a normal cell to one that grows like a cancer cell. Or The incorporation of intact foreign DNA into a cell. Or Introduction of an exogenous DNA into a cell, causing the cell to acquire a new phenotype.

**transformation :** In medicine, the change that a normal cell undergoes as it becomes malignant.

**transforming growth factor-beta superfamily inhibitor ACE-536:** A soluble, recombinant fusion protein composed of a modified form of the extracellular domain of human activin receptor type IIb (ActRIIb) and linked to the human IgG1 Fc domain, with red blood cell stimulating

activity. Upon subcutaneous administration, ACE-536 inhibits several ligands in the transforming growth factor (TGF)-beta superfamily. This prevents activation of a variety of TGF-beta superfamily members involved in late stage erythropoiesis and results in an increased differentiation and proliferation of erythroid progenitors. ACE-536 acts at a different, later stage than erythropoietin. This agent ultimately enhances red blood cell production and prevents anemia.

**transfusion :** A procedure in which whole blood or parts of blood are put into a patient's bloodstream through a vein. The blood may be donated by another person or it may have been taken from the patient and stored until needed. Also called blood transfusion.

**Transgenic:** Describing an organism that contains transfected DNA in the germ line. Or Describing an organism that has genes from another organism incorporated within its genome as a result of recombinant DNA procedures.

**Transgenic animal:** An animal that harbors and expresses a foreign gene that has been inserted into the germ line; experiments with such animals and their offspring show that a foreign gene under the control of a new promoter can be efficiently integrated, expressed, and transmitted. or animals in which one or more genes have been introduced into the nonreproductive cells.

**transgenic lymphocyte immunization vaccine:** A vaccine consisting of a preparation of allogeneic lymphocytes that encode a gene for telomerase. In transgenic lymphocyte immunization, the transgenic cells are infused into the patient, where they serve as antigen- presenting cells (APCs) with the dual function of antigen synthesis and presentation. Vaccination produces an immune response targeting cancer cells expressing telomerase.

**transgenic mice :** Mice that have had DNA from another source put into their DNA. The foreign DNA is put into the nucleus of a fertilized mouse egg. The new DNA becomes part of every cell and tissue of the mouse. These mice are used in the laboratory to study diseases.

**Transient:** A change in the reactor coolant system temperature, pressure, or both, attributed to a change in the reactor's power output. Transients can be caused by (1) adding or removing neutron poisons, (2) increasing or decreasing electrical load on the turbine generator, or (3) accident conditions.

**transient receptor potential cation channel, subfamily V, member 6 :** A protein found in cell membranes that moves calcium into cells. Levels of transient receptor potential cation channel, subfamily V, member 6 are lower than normal in patients who don't have enough vitamin D. High levels of the protein may be found in breast cancer tissue. It is a type of calcium channel protein. Also called TRPV6.

**transient tracers:** Chemical elements (often radioactive) or compounds that have finite lifetimes. Atmospheric testing of nuclear weapons from the mid-1950s to the early 1960s released large quantities of radionuclides to the atmosphere. Atmosphere-ocean exchange processes have transferred some of these elements to the oceans. Studying the behavior and distribution of these specific isotopes and other chemical tracers in the ocean will provide information on: residence times of the water and its dissolved components in gyres, basins, etc.; the mode and rate of formation and the subsequent spreading rates of specific water types, such as the polar water of the Norwegian and Greenland Seas; deep-ocean circulation and ocean- mixing processes, such as advection and upwelling; and the flux of anthropogenic carbon dioxide into the ocean through its correlation with several different transient tracers.

**Transition:** A mutation that results from the substitution of one pyrimidine for another or one purine for another.

**Transition Element:** Transition elements (also known as transition metals) are found in the middle section of the periodic table. They have two electron shells that are not filled. The shells are usually the outer two shells and are good conductors of electricity. Copper, silver and, and gold are examples of transition elements.

**transition metal:** An element with an incomplete d subshell. Elements which have common cations with incomplete d subshells are also considered transition metals. Elements with incomplete f subshells are sometimes called "inner transition elements". Or One of the metals from the central block of the periodic table. Iron is a good example. Transition metals have all the usual properties of metals but in addition usually have particularly high melting and boiling points, high density and usually form coloured compounds. They are often active as catalysts too. or the three rows of elements in the middle of the periodic table, from scandium to mercury.

**Transition Section:** The flighted portion of the screw between the feed and discharge sections in which the extrusion material becomes a melt.

**Transition state:** The activated form of a molecule that has partly undergone a chemical reaction or the point in a reaction at which the system has the most energy. Or The activated state in which a molecule is best suited to undergoing a chemical reaction. Or A chemical species that has the highest free energy and the lowest concentration of those on the pathway from a substrate to a product.

**Transition State Analogue:** In medicinal chemistry, transition state analogues are compounds that are designed to mimic an enzyme-catalysed reaction's transition state. Can be used to inhibit an enzyme,

**Transition Temperature :** The temperature at which a polymer changes from (or to) a viscous or rubbery condition (or from) a hard and relatively brittle one.

**Transition zone:** That area in the center of the screw (between the feed zone and metering zone) This section has a tapering flight depth condition which compresses the plastic material in preparation for injection.

**Transition-state analog:** A compound resembling the transition state of a catalyzed reaction; such compounds are often potent inhibitors of enzyme-catalyzed reactions.

**transitional care :** Support given to patients when they move from one phase of disease or treatment to another, such as from hospital care to home care. It involves helping patients and families with medical, practical, and emotional needs as they adjust to different levels and goals of care.

**transitional cell :** A cell that varies in shape depending on whether the tissue is being stretched. Transitional cells may be stretched without breaking apart. They line hollow organs such as the bladder.

**transitional cell cancer :** Cancer that begins in cells called urothelial cells that line the urethra, bladder, ureters, renal pelvis, and some other organs. Urothelial cells are also called transitional cells. These cells can change shape and stretch without breaking apart. Also called urothelial cancer.

**transitive verbs:** a verb that takes a direct object; that is, the verb transmits action to an object.

**Transketolase:** An enzyme that transfers an activated aldehyde unit from a ketose to an aldose acceptor; one of the enzymes in the nonoxidative part

of the pentose phosphate pathway.

**translate:** Change a phrase written in English to an algebraic expression, using the correct symbols.

**translation:** the process by which the genetic code is transferred to an amino acid sequence in a protein. Or The process of reading a messenger RNA sequence for the specified amino acid sequence it contains. Or

Cellular protein synthesis, so named because the four-letter alphabet of nucleic acids is translated into the different amino acids that make up proteins. OR In biology, the process by which a cell makes proteins using the genetic information carried in messenger RNA (mRNA). The mRNA is made by copying DNA, and the information it carries tells the cell how to link amino acids together to form proteins. OR The process of synthesizing an amino acid sequence (protein product) from the messenger RNA code.

**translational control:** The regulation of a protein's synthesis by regulation of the rate of its translation on the ribosome.

**Translational repressor:** A mechanism for transcriptional regulation in which a protein encoded by an operon binds to an mRNA near the initiation site for its own synthesis and blocks the synthesis of several proteins encoded by that polygenic message; the synthesis of the 50 or so ribosomal proteins is subject to control by translational repression. or A repressor that binds to an mRNA, blocking translation.

**translational research :** A term used to describe the process by which the results of research done in the laboratory are used to develop new ways to diagnose and treat disease.

**Translocase:** An enzyme that carries a molecule from one cellular compartment to another; the ATPADP translocase facilitates the exchange of ATP and ADP between a mitochondrion and the cytosol. Or (1) An enzyme that catalyzes membrane transport. (2) An enzyme that causes a movement, such as the movement of a ribosome along an mRNA.

**translocation :** A type of chromosomal abnormality in which a chromosome breaks and a portion of it reattaches to a different chromosomal location. OR A genetic change in which a piece of one chromosome breaks off and attaches to another chromosome. Sometimes pieces from two different chromosomes will trade places with each other. Translocations may lead to medical problems such as leukemia, breast cancer, schizophrenia, muscular dystrophy, and Down syndrome.

**Translucent:** permitting the passage of light, but diffusing it so that object beyond cannot be clearly distinguished. OR Descriptive of a material or substance capable of transmitting some light, but not clear enough to be seen through

**TransMID:** (Other name for: transferrin-CRM107)

**Transmitted light:** Used to examine single crystals and their optical properties. (cf. reflected light).

**Transom:** horizontal bar of stone timber or metal across a mullioned window. Also the horizontal member separating a door and fanlight.

**transoral robotic surgery :** Surgery in which a robot with arms is used to remove cancer from hard-to-reach areas of the mouth and throat. Cameras attached to the robot give a 3-dimensional (3D) image that a surgeon can see. The surgeon guides tools at the ends of the robot arms to remove the cancer. Also called TORS.

**Transparent:** Capable of transmitting light so that objects or images can be seen as if there were no intervening material. OR Descriptive of a material or substance capable of a high degree of light transmission e.g., glass. Some polypropylene films and acrylic moldings are outstanding in this respect. OR Descriptive of a material or substance capable of a high degree of light transmission, e.g. glass. Some polypropylene extrusions and acrylic mouldings are outstanding in this respect. or Light can travel through transparent substances. "See-through" is an alternative description (but not as good).

**transperineal biopsy :** A procedure in which a sample of tissue is removed from the prostate for examination under a microscope. The sample is removed with a thin needle that is inserted through the skin between the scrotum and rectum and into the prostate.

**transperineal template-guided prostate mapping biopsy :** A procedure being studied in the diagnosis of prostate cancer and in planning prostate cancer treatment. Ultrasound is used to create a map of the prostate so the whole prostate gland can be seen in three dimensions and divided into 24 areas. Needles are then inserted through a template into each of the 24 areas and tissue is removed to be checked under a microscope. Also called TTMB.

**transpiration:** The process in plants by which water is taken up by the roots and released as water vapor by the leaves. The term can also be applied to the quantity of water thus dissipated. Or Passage of water from the roots of a plant to the atmosphere via the vascular system and the stomata of the leaves.

**transplant surgeon :** A surgeon who has special training in transplantation surgery. The surgeon replaces a patient's organ with an organ from another person.

**transplantation :** A surgical procedure in which tissue or an organ is transferred from one area of a person's body to another area, or from one person (the donor) to another person (the recipient).

**Transport :** Movement of particles of rock. Together with weathering, transport makes up the process of erosion.

**Transport antibiotics:** Antibiotics that exert their effect by rendering the membranes abnormally permeable.

**Transport protein:** A protein whose primary function is to transport a substance from one part of the cell to another, from one cell to another, or from one tissue to another.

**Transport vesicles:** Membrane-bounded compartments that mediate the transfer of proteins between the endoplasmic reticulum and the Golgi complex, and between the Golgi complex and subsequent destinations.

**transported soil:** soil deposited by agents such as ice and water and not derived from the underlying bedrock.

**transporters:** Proteins that span a membrane and transport specific nutrients, metabolites, ions, or proteins across the membrane; sometimes called permeases.

**Transposase:** A nuclease enzyme encoded by an insertion sequence (IS) or transposon; makes staggered cuts in donor and recipient sites, facilitating IS insertion into a bacterial gene.

**Transposition:** The movement of a gene from one chromosome to another or from one location to another on the same chromosome. Or The movement of a gene or set of genes from one site in the genome to another.

**transposon (transposable element):** A segment of DNA that can move from one position in the genome to another.

**Transposons:** Mobile bacterial genetic elements that enable genes to be transferred among nonhomologous sequences.

**transrectal biopsy :** A procedure in which a sample of tissue is removed from the prostate using a thin needle that is inserted through the rectum and into the prostate. Transrectal ultrasound (TRUS) is usually used to guide the needle. The sample is examined under a microscope to see if it contains cancer.

**transrectal ultrasound :** A procedure in which a probe that sends out high-energy sound waves is inserted into the rectum. The sound waves are bounced off internal tissues or organs and make echoes. The echoes form a picture of body tissue called a sonogram. Transrectal ultrasound is used to look for abnormalities in the rectum and nearby structures, including the prostate. Also called endorectal ultrasound, ERUS, and TRUS.

**transsphenoidal surgery :** A type of surgery in which instruments are inserted through the nose and sphenoid sinus (a hollow space in a bone in the nose) to remove tumors that are in or near the pituitary gland. The pituitary gland is a pea-sized organ that lies at the base of the brain above the back of the nose.

**transthyretin antisense oligonucleotide ISIS-TTR Rx:** An antisense oligonucleotide (ASO) targeting transthyretin (TTR), which has potential use in the treatment of TTR amyloidosis (ATTR). Upon subcutaneous administration, TTR ASO ISIS-TTR Rx targets and binds to messenger RNA (mRNA) for both variant and wild-type forms of TTR inside liver cells, thereby inhibiting translation of both mutant and wild-type TTR. Inhibition of TTR protein synthesis lowers TTR blood levels and decreases the amount of and/or prevents TTR amyloid deposits, which accumulate in and cause damage to various body organs and tissues. ATTR is caused by mutations in the TTR gene, which lead to TTR protein misfolding; misfolded wild-type and mutant forms of TTR protein accumulate in tissues as amyloid deposits in most ATTR patients. Check for active clinical trials using this agent.

**Transuranic element:** An artificially made, radioactive element that has an atomic number higher than uranium in the periodic table of elements such as neptunium, plutonium, americium, and others.

**Transuranic waste:** Material contaminated with transuranic elements—artificially made, radioactive elements, such as neptunium, plutonium,

americium, and others—that have atomic numbers higher than uranium in the periodic table of elements. Transuranic waste is primarily produced from recycling spent fuel or using plutonium to fabricate nuclear weapons. For related information, see the Backgrounder on Radioactive Waste.

**transuranium element:** An element with an atomic number higher than 92 (uranium's atomic number). Transuranium elements are unstable and occur in extremely low concentrations (if at all) in nature. Most are made artificially.

**transurethral biopsy :** A procedure in which a sample of tissue is removed from the prostate for examination under a microscope. A thin, lighted tube is inserted through the urethra into the prostate, and a small piece of tissue is removed with a cutting loop.

**transurethral electroevaporation of the prostate :** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the prostate. A ball or special wire loop on the instrument heats the prostate tissue and turns it to vapor. This relieves pressure and improves urine flow. Also called transurethral electrovaporization of the prostate, TUEVAP, and TUVF.

**transurethral electrovaporization of the prostate :** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the prostate. A ball or special wire loop on the instrument heats the prostate tissue and turns it to vapor. This relieves pressure and improves urine flow. Also called transurethral electroevaporation of the prostate, TUEVAP, and TUVF.

**transurethral incision of the prostate :** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra and one or two small cuts are made in the bladder neck and prostate. This relieves pressure and improves urine flow. Also called TUIP.

**transurethral microwave thermotherapy :** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the bladder. A small microwave antenna on the instrument heats nearby prostate tissue and destroys it. This relieves pressure and improves urine flow. Also called TUMT.

**transurethral needle ablation :** A procedure that is used to treat benign prostatic hypertrophy (BPH). An instrument with a small probe that gives off low-level radiofrequency energy is inserted through the urethra into the

prostate. The energy from the probe heats nearby prostate tissue and destroys it. This relieves pressure and improves urine flow. Also called transurethral radiofrequency ablation and TUNA.

**transurethral radiofrequency ablation :** A procedure that is used to treat benign prostatic hypertrophy (BPH). An instrument with a small probe that gives off low-level radiofrequency energy is inserted through the urethra into the prostate. The energy from the probe heats nearby prostate tissue and destroys it. This relieves pressure and improves urine flow. Also called transurethral needle ablation and TUNA.

**transurethral resection :** Surgery performed with a special instrument inserted through the urethra. Also called TUR.

**transurethral resection of the prostate :** Surgery to remove tissue from the prostate using an instrument inserted through the urethra. Also called TURP.

**transvaginal sonography :** A procedure used to examine the vagina, uterus, fallopian tubes, ovaries, and bladder. An instrument is inserted into the vagina that causes sound waves to bounce off organs inside the pelvis. These sound waves create echoes that are sent to a computer, which creates a picture called a sonogram. Also called transvaginal ultrasound and TVS.

**transvaginal ultrasound :** A procedure used to examine the vagina, uterus, fallopian tubes, ovaries, and bladder. An instrument is inserted into the vagina that causes sound waves to bounce off organs inside the pelvis. These sound waves create echoes that are sent to a computer, which creates a picture called a sonogram. Also called transvaginal sonography and TVS.

**transversal:** a line crossing two or more parallel or nonparallel lines in a plane.

**Transverse Direction:** -Cross direction or sideways dimension 90° orientation to the machine direction.

**transverse rectus abdominis myocutaneous flap :** A type of surgery used to rebuild the shape of the breast after a mastectomy. A muscle in the lower abdomen called the rectus abdominis, along with skin, fat, and blood vessels, is moved from the lower abdomen to the chest. This is usually done by passing the muscle tissue and blood vessels through a tunnel under the skin to the chest. A transverse rectus abdominis myocutaneous flap forms a

natural-looking breast, so the patient usually does not need a breast implant. It is a type of breast reconstruction. Also called TRAM flap.

**Transversion:** A mutation in which a purine is replaced by a pyrimidine or vice versa.

**tranylcypromine sulfate:** The sulfate salt form of tranylcypromine, an orally bioavailable, nonselective, irreversible, non-hydrazine inhibitor of both monoamine oxidase (MAO) and lysine-specific demethylase 1 (LSD1/BHC110), with antidepressant and anxiolytic activities, and potential antineoplastic activities. Upon oral administration, tranylcypromine exerts its antidepressant and anxiolytic effects through the inhibition of MAO, an enzyme that catalyzes the breakdown of the monoamine neurotransmitters serotonin, norepinephrine, epinephrine and dopamine. This increases the concentrations and activity of these neurotransmitters. Tranylcypromine exerts its antineoplastic effect through the inhibition of LSD1. Inhibition of LSD1 prevents the transcription of LSD1 target genes. LSD1, a flavin-dependent monoamine oxidoreductase and a histone demethylase, is upregulated in a variety of cancers and plays a key role in tumor cell proliferation, migration, and invasion.

**Trap:** A small door opening in a ceiling giving access to a roof void or in a floor for similar purpose. A bend in a pipe so arranged as to be always full of water and prevent free flow of air or gas through the pipe. Hence S-trap or P-trap indicating the shape of the bend. or a stratigraphic or structural feature of high porosity that traps migrating petroleum.

**trapezoid:** a four-sided plane closed figure with only one pair of parallel sides, called bases.

**TrasGEX:** (Other name for: glycooptimized trastuzumab-GEX)

**trastuzumab:** A recombinant humanized monoclonal antibody directed against the human epidermal growth factor receptor 2 (HER2). After binding to HER2 on the tumor cell surface, trastuzumab induces an antibody-dependent cell-mediated cytotoxicity against tumor cells that overexpress HER2. HER2 is overexpressed by many adenocarcinomas, particularly breast adenocarcinomas.

**trastuzumab :** A drug used to treat breast cancer that is HER2-positive (expresses the human epidermal growth factor receptor 2). It is also used with other drugs to treat HER2-positive stomach cancer that has not already been treated and has spread to other parts of the body. It is being studied in

the treatment of other types of cancer. Trastuzumab binds to HER2 on the surface of HER2-positive cancer cells, and may kill them. It is a type of monoclonal antibody. Also called Herceptin.

**Trastuzumab vc-seco-DUBA:** An antibody-drug conjugate (ADC) composed of the recombinant humanized anti-epidermal growth factor receptor 2 (HER2) monoclonal antibody trastuzumab linked, via a cleavable linker, to the duocarmycin prodrug, seco-duocarmycin-hydroxybenzamide-azaindole (seco-DUBA), with potential antineoplastic activity. Upon administration of trastuzumab vc-seco-DUBA, the trastuzumab moiety binds to HER2 on the tumor cell surface, which triggers the endocytosis of this agent. The linker is then cleaved inside the tumor cell by proteases at the dipeptide valine-citrulline (vc), and releases the active moiety, duocarmycin. Duocarmycin binds to the minor groove of DNA, alkylates adenine at the N3 position, and induces cell death. In addition, trastuzumab induces antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells that overexpress HER2. HER2 is overexpressed by many carcinomas and is associated with a poor prognosis.

**Trasylol:** (Other name for: aprotinin bovine)

**trauma :** Injury to the body, or an event that causes long-lasting mental or emotional damage.

**Traumasept:** (Other name for: povidone-iodine solution)

**Traumeel S:** Diluted extracts isolated from plants and minerals, including belladonna, arnica, St. Johns wort, and Echinacea. As a homeopathic mouth rinse preparation, Traumeel S exhibits antiinflammatory activity; the mechanism of action has not been fully elucidated. This agent may reduce the severity and duration of treatment-related stomatitis. Check for active clinical trials using this agent. or A substance that contains minerals and extracts of 14 plants, including belladonna, arnica, St. John's wort, and Echinacea. It is being studied as a mouth rinse treatment for oral mucositis (painful mouth sores) caused by cancer therapy. It is known as a homeopathic remedy.

**Travasol:** (Other name for: amino acid injection)

**travel-time curve:** a plot of the arrival times of seismic waves relative to distance.

**Travelling Saw:** A saw which travels with the extrudate while cutting it to length.

**trazodone :** A drug used to treat depression. It may also be used to help relieve anxiety and insomnia (trouble sleeping) and to treat certain other disorders. Trazodone increases the level of the chemical serotonin in the brain, which helps improve mood. It is a type of antidepressant. Also called Oleptro.

**Tread:** The horizontal part of a step or stair on which the foot treads.

**Treanda :** A drug used to treat chronic lymphocytic leukemia (CLL). It is also used to treat slow-growing B-cell non-Hodgkin lymphoma (NHL) that has gotten worse within 6 months of treatment with other anticancer drugs. It is being studied in the treatment of other types of cancer. Treanda may damage the DNA in cancer cells and cause them to die. It is a type of alkylating agent and a type of antimetabolite. Also called bendamustine hydrochloride.

**Treat:** Method of raising the surface energy and to some extent etching of films in order to accept adhesives and inks.

**TREATER:** Equipment used for preparing resin-impregnated reinforcements including means for the delivery of a continuous web or strand to a resin tank, controlling the amount of resin pickup, drying and/or partially curing the resin, and rewinding the impregnated reinforcement. Term also used to refer to equipment and process used to render a surface of inert plastics like polyethylene more receptive to inks, adhesives, or coatings. OR Equipment and process generally used by plastic manufacturers used to render a surface of inert plastics, such as polyethylene plastic.

**treatment cycle :** In medicine, a course of treatment that is repeated on a regular schedule with periods of rest in between. For example, treatment given for one week followed by three weeks of rest is one treatment cycle.

**treatment efficiency:** usually refers to the percentage reduction of a specific or group of pollutants by a specific wastewater treatment step or treatment plant.

**treatment field :** In radiation therapy, the place on the body where the radiation beam is aimed.

**treatment plan :** A detailed plan with information about a patient's disease, the goal of treatment, the treatment options for the disease and possible side effects, and the expected length of treatment. A treatment plan may also include information about how much the treatment is likely to cost and about regular follow-up care after treatment ends.

**treatment schedule :** A step-by-step plan of the treatment that a patient is going to receive. A treatment schedule includes the type of treatment that will be given (such as chemotherapy or radiation therapy), how it will be given (such as by mouth or by infusion into a vein), and how often it will be given (such as once a day or once a week). It also includes the amount of time between courses of treatment and the total length of time of treatment.

**treatment summary :** A detailed summary of a patient's disease, the type of treatment the patient received, and any side effects or other problems caused by treatment. It usually includes results of laboratory tests (such as pathology reports and biomarker tests) and imaging tests (such as x-rays, CT scans, and MRIs), and whether a patient took part in a clinical trial. A treatment summary may be used to help plan follow-up care after treatment for a disease, such as cancer.

**trebananib:** An angiopoietin (Ang) 1 and 2 neutralizing peptibody, with potential antiangiogenic activity. Trebananib targets and binds to Ang1 and Ang2, thereby preventing the interaction of the angiopoietins with their target tie2 receptors. This may inhibit angiogenesis and may eventually lead to an inhibition of tumor cell proliferation. Check for active clinical trials using this agent.

**tree rings:** Annual growth increments of trees that indicate, among other factors, the climatic conditions that enhance or limit growth. Tree ring widths and indexes have been used to search for solar-terrestrial relationships and climatic cycles and to reconstruct past climates. See also dendroclimatology and dendrochronology.

**trellis drainage pattern:** a drainage pattern consisting of a main stream with short tributaries on either side; forms in areas of tilted sedimentary rocks that create parallel ridges and valleys.

**Trelstar :** A drug that is used to treat advanced prostate cancer, and is being studied in the treatment of breast cancer. It belongs to the family of hormonal drugs called gonadotropin-releasing hormone analogs. Also called triptorelin.

**Trelstar Depot:** (Other name for: triptorelin pamoate)

**tremelimumab:** A substance being studied in the treatment of some types of cancer. Tremelimumab binds to a protein called CTLA-4, which is found on the surface of T cells (a type of white blood cell). It may block CTLA-4 and help the immune system kill cancer cells. Tremelimumab is a type of monoclonal antibody and a type of immunomodulatory agent. OR A human immunoglobulin (Ig) G2 monoclonal antibody directed against the human T-cell receptor protein cytotoxic T-lymphocyte-associated protein 4 (CTLA4), with potential immune checkpoint inhibitory and antineoplastic activities. Tremelimumab binds to CTLA4 on activated T-lymphocytes and blocks the binding of the antigen-presenting cell ligands B7-1 (CD80) and B7-2 (CD86) to CTLA4, resulting in inhibition of CTLA4-mediated downregulation of T-cell activation. This promotes the interaction of B7-1 and B7-2 with another T-cell surface receptor protein CD28, and results in a B7-CD28-mediated T-cell activation that is unopposed by CTLA4-mediated inhibition. This leads to a cytotoxic T-lymphocyte (CTL)-mediated immune response against cancer cells. CTLA4, an inhibitory receptor and member of the immunoglobulin superfamily, plays a key role in the downregulation of the immune system.

**trench:** a deep canyon in the ocean caused by a plate being subducted under another plate.

**trench-suction:** a term that refers to the subduction of a plate at a steep angle, which pulls the overlying plate and the trench toward the midoceanic ridge.

**Trental:** (Other name for: pentoxifylline)

**treosulfan:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called alkylating agents. OR The prodrug of a bifunctional sulfonate alkylating agent with myeloablative, immunosuppressive, and antineoplastic activities. Under physiological conditions, treosulfan converts nonenzymatically to L-diepoxybutane via a monoepoxide intermediate. The monoepoxide intermediate and L-diepoxybutane alkylate DNA at guanine residues and produce DNA interstrand crosslinks, resulting in DNA fragmentation and apoptosis. In escalated doses, this agent also exhibits myeloablative and immunosuppressive activities.

**trephine** : A surgical tool used to cut out circular pieces of bone or other tissue.

**tretinoin**: A naturally-occurring acid of retinol. Tretinoin binds to and activates retinoic acid receptors (RARs), thereby inducing changes in gene expression that lead to cell differentiation, decreased cell proliferation, and inhibition of tumorigenesis. This agent also inhibits telomerase, resulting in telomere shortening and eventual apoptosis of some tumor cell types. The oral form of tretinoin has teratogenic and embryotoxic properties. Check for active clinical trials using this agent. ORA nutrient that the body needs in small amounts to function and stay healthy. Tretinoin is made in the body from vitamin A and helps cells to grow and develop, especially in the embryo. A form of tretinoin made in the laboratory is put on the skin to treat conditions such as acne and is taken by mouth to treat acute promyelocytic leukemia (a fast-growing cancer in which there are too many immature blood-forming cells in the blood and bone marrow). Tretinoin is being studied in the prevention and treatment of other types of cancer. Also called all-trans retinoic acid, ATRA, retinoic acid, and vitamin A acid.

**Trexall**: (Other name for: methotrexate)

**Tri-**: A prefix meaning three

**tri-virus/GD2-specific allogeneic cytotoxic T-lymphocytes**: Allogeneic tri-viral specific, Epstein-Barr virus (EBV), cytomegalovirus (CMV) and adenovirus (Ad), cytotoxic T-lymphocytes (tV-CTLs) expressing a chimeric antigen receptor (CAR) specific for disialoganglioside GD2 with potential antineoplastic activity. Tri-virus/GD2-specific allogeneic CTLs are produced by transducing tV-CTLs with a GD2-specific CAR retroviral vector. Upon administration, after an allogeneic hematopoietic stem cell transplant, these CTLs may be selective towards EBV, CMV, and Ad-infected cells and GD2-expressing tumor cells. The human glycosphingolipid GD2 is a tumor associated antigen overexpressed on the surface of all tumors of neuroectodermal origin.

**TriAb**: (Other name for: monoclonal antibody 11D10 anti-idiotypic vaccine)

**triacetyluridine** : A drug used in the emergency treatment of patients who receive too much fluorouracil or capecitabine (types of anticancer drugs). It is also used in the emergency treatment of heart or central nervous system (CNS) toxicity or other serious side effects that occur within 4 days of

ending treatment with fluorouracil or capecitabine. Triacetyluridine may help protect healthy cells from some of the side effects caused by certain anticancer drugs. It is a type of cytoprotective agent. Also called PN401, uridine triacetate, and Vistogard.

**triacylglycerol:** An ester of glycerol with three molecules of fatty acid; also called a triglyceride or neutral fat.

**Triacylglycerols:** Glycerols that have fatty acyl chains esterified to each of their hydroxyl groups; storage form of fats. Also known as neutral fats or triglycerides.

**triad:** A group of three elements whose chemical and physical properties are somewhat related.

**trial sponsor :** A person, company, institution, group, or organization that oversees or pays for a clinical trial and collects and analyzes the data. Also called clinical trial sponsor.

**triamcinolone:** A synthetic glucocorticoid with anti-inflammatory and immunomodulating properties. Upon cell entry, triamcinolone binds to and activates the glucocorticoid receptor, which leads to translocation of the ligand-receptor complex to the nucleus and induces expression of glucocorticoid-responsive genes such as lipocortins. Lipocortins inhibit phospholipase A2, thereby blocking the release of arachidonic acid from membrane phospholipids and preventing the synthesis of prostaglandins and leukotrienes, both mediators of inflammation. In addition, pro-inflammatory cytokine production, including interleukin (IL)-1 and IL-6, and the activation of cytotoxic T-lymphocytes is also inhibited. T-cells are prevented from making IL-2 and proliferating. This agent also decreases the number of circulating lymphocytes, induces cell differentiation, and stimulates apoptosis through increasing I $\kappa$ B expression and curtailing activation of nuclear factor (NF) $\kappa$ B. OR A substance that is being studied for the prevention of nonmelanoma skin cancer. It is an anti-inflammatory drug that is applied to the skin to relieve irritation, rashes, and infections. It belongs to the family of drugs called topical corticosteroids.

**triamcinolone acetonide:** The acetonide salt of triamcinolone, a synthetic glucocorticosteroid with immunosuppressive and anti-inflammatory activities. Triamcinolone binds to specific cytosolic glucocorticoid receptors, which subsequently interact with the glucocorticoid receptor response element on DNA, gene expression is altered so that the synthesis

of certain anti-inflammatory proteins is induced while the synthesis of certain inflammatory mediators is inhibited. Consequently, chronic inflammatory and autoimmune reactions are reduced.

**triangle:** A three-sided closed figure. Or a three-sided plane closed figure. Contains three angles the sum of whose measures is  $180^\circ$ .

**triapine:** A synthetic heterocyclic carboxaldehyde thiosemicarbazone with potential antineoplastic activity. Triapine inhibits the enzyme ribonucleotide reductase, resulting in the inhibition of the conversion of ribonucleoside diphosphates to deoxyribonucleotides necessary for DNA synthesis. This agent has been shown to inhibit tumor growth in vitro. OR A substance being studied in the treatment of cancer. It is a type of ribonucleotide reductase inhibitor. Also called 3-aminopyridine-2-carboxaldehyde thiosemicarbazone and 3-AP.

**triazinate:** A synthetic dihydrotriazine derivative with antineoplastic properties. As an antifolate agent related to methotrexate (MTX), triazinate inhibits the enzyme dihydrofolate reductase (DHFR), resulting in decreased tetrahydrofolate production and interference with thymidylate synthesis. Unlike MTX, this agent is not converted to polyglutamate forms. Triazinate also inhibits the transport of folates and may be selectively toxic to MTX-resistant tumor cells.

**triazine derivative TriN2755:** A synthetic triazene derivative with antineoplastic activity. Upon metabolic activation via N-demethylation, TriN2755 is converted into highly reactive carbocations that can alkylate DNA and other macromolecules, thereby resulting in DNA cross links, inhibiting DNA replication and repair, and subsequently inducing apoptosis. This agent has high hydrophilicity and photostability and shows a favorable toxicity profile over the other triazenes.

**tributyryn:** A triglyceride prodrug of butyric acid with potential antineoplastic activity. Butyrate, the active metabolite of tributyrin, inhibits histone deacetylase, resulting in increased differentiation, decreased proliferation, cell cycle arrest, and apoptosis in some tumor cell lines.

**tributyryn :** A triglyceride drug that may inhibit cell growth and induce cell differentiation. Differentiating agents may be effective in changing cancer cells back into normal cells.

**Tricarboxylic acid (TCA) cycle:** The cyclical process whereby acetate is completely oxidized to  $\text{CO}_2$  and water, and electrons are transferred to

NAD<sup>+</sup> and flavineThe TCA cycle is localized to the mitochondria in eukaryotic cells and to the plasma membrane in prokaryotic cellsAlso called the Krebs or citric acid cycle.

**tricarboxylic acid cycle:** See citric acid cycle.

**trichilemmoma :** A benign tumor arising from the outer cells of the hair follicle.

**trichothiodystrophy :** A hereditary condition characterized by sparse and brittle hair, short stature, and mental retardation.

**tricyclic phosphate:** The phosphate salt of the synthetic, cell-permeable tricyclic nucleoside tricyclic with potential antineoplastic activity.

Tricyclic inhibits the phosphorylation, activation, and signalling of Akt-1, -2, and -3, which may result in the inhibition of Akt-expressing tumor cell proliferation. Akts are anti-apoptotic serine/threonine-specific protein kinases that phosphorylate and inactivate components of the apoptotic machinery, including Bcl-xL/Bcl-2-associated death promoter (BAD) and caspase 9.

**Triclinic Crystal:** A triclinic crystal has a shape in which the arrangement of facets is random.

**Triclinic crystal class:** A crystal class of containing either no symmetry or a rotatory-inversion axis in any direction. This class contains 2 space groups and has no restrictions on the lengths of the axes or the values of the angles.

**TriCor :** A drug used to treat high levels of cholesterol and triglycerides in the blood. TriCor is being studied in the treatment of advanced cancers in young patients and in the treatment of other conditions. It is a type of antilipidemic agent. Also called fenofibrate and Lofibra.

**tricuspid valve:** a valve that passes blood from the right atrium into the right ventricle.

**tricyclic antidepressant :** A type of drug used to treat depression.

**tried-and-true method:** A method for solving word problems that has been used for many years. Some examples are Polya's four-step process, identifying variables, and estimation.

**trientine hydrochloride:** The hydrochloride salt form of a metal chelating agent with potential anti-angiogenic activity. Trientine chelates excess copper (Cu) ions in the body; the excess copper is subsequently removed

from the body through the kidneys. As Cu is an essential cofactor for cuproenzymes, such as superoxide dismutase 1 (SOD1), depletion of copper may inhibit the activation of signal transduction pathways required for cellular proliferation and angiogenesis. In addition, trientine may inhibit copper-induced secretion of interleukin-8 (IL-8).

**trifluoperazine hydrochloride:** The hydrochloride salt of trifluoperazine, a phenothiazine derivative and a dopamine, alpha-adrenergic, and anticholinergic antagonist with antipsychotic, anxiolytic, and antiemetic activities. Trifluoperazine blocks central dopamine receptors, which may prevent or mitigate delusions and hallucinations caused by an excess of dopamine; dopamine blockade in the chemoreceptor trigger zone (CTZ) may result in an antiemetic effect. This agent binds to central adrenergic receptors, which may result in anxiolytic effects. Trifluoperazine also functions as a calmodulin inhibitor, elevating cytosolic calcium.

**trifluridine:** A fluorinated thymidine analog with potential antineoplastic activity. Trifluridine is incorporated into DNA and inhibits thymidylate synthase, resulting in inhibition of DNA synthesis, inhibition of protein synthesis, and apoptosis. This agent also exhibits antiviral activity.

**trifluridine and tipiracil hydrochloride :** A combination of two drugs used to treat colorectal cancer that has spread to other parts of the body and has already been treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. It is a combination of trifluridine and tipiracil hydrochloride. Trifluridine and tipiracil hydrochloride stops cells from making DNA, which may help keep cancer cells from growing and may kill them. Also called Lonsurf.

**trifluridine/tipiracil hydrochloride:** An orally bioavailable combination agent composed of the cytotoxic pyrimidine analog trifluridine (5-trifluoro-2'-deoxythymidine or TFT) and a thymidine phosphorylase inhibitor (TPI) tipiracil hydrochloride, in a molar ratio of 1.0:0.5 (TFT:TPI), with potential antineoplastic activity. After oral administration of trifluridine/tipiracil, TFT is phosphorylated to the active monophosphate form TF-TMP, which binds covalently to the active site of thymidylate synthase, thereby reducing the nucleotide pool levels required for DNA replication. Furthermore, the triphosphate form TF-TTP can be incorporated into DNA, which induces DNA fragmentation and leads to the inhibition of tumor growth. TPI exhibits a dual effect: 1) an anti-angiogenic effect mediated through the

inhibition of thymidine phosphorylase, which plays an important role in nucleotide metabolism and a variety of development processes, including angiogenesis, 2) increased bioavailability of the normally short-lived antimetabolite TFT by preventing its degradation into the inactive form trifluorothymine (TF-Thy). The synergistic effect of the components in TAS-10 may demonstrate antitumor activity in 5-FU-resistant cancer cells. Check for active clinical trials using this agent.

**Trifolium pratense :** A plant whose flowers have been used in some cultures to treat certain medical problems. It is being studied in the relief of menopausal symptoms and may have anticancer effects. Also called purple clover, red clover, and wild clover.

**trigeminal nerve :** The main sensory nerve of the head and face, and the motor nerve of the muscles used in chewing. Also called fifth cranial nerve.

**trigger :** In medicine, a specific event that starts a process or that causes a particular outcome. For example, chemotherapy, painful treatments, or the smells, sounds, and sights that go with them may trigger anxiety and fear in a patient who has cancer. In allergies, exposure to mold, pollen or dust may trigger sneezing, watery eyes, and coughing.

**Trigger Lock :** Flexible clip molded into the ends of plastic modules to secure rod position.

**trigger point acupuncture :** Use of acupuncture to treat pain by inserting needles into trigger points on the body. Trigger points are places on the body where injury has occurred, but the pain has been sent along nerves and is felt in another place in the body.

**triglyceride:** A triglyceride is an ester of glycerol and three fatty acids. Most animal fats are composed primarily of triglycerides. In the structures below, the fatty acids attached to the glycerol are represented by 'R'. The fatty acids can be the same or different.

**trigonal bipyramidal:** A molecular shape that results when there are five bonds and no lone pairs on the central atom in the molecule. Three of the bonds are arranged along the atom's equator, with  $120^\circ$  angles between them; the other two are placed at the atom's axis. Axial bonds are at right angles to the equatorial bonds. The  $\text{PCl}_5$  molecule has a trigonal bipyramidal molecular geometry.

**Trigonal Crystal:** A trigonal crystal has a shape that has three sides and no specific length. It looks like an elongated triangle.

**Trigonal crystal class:** A crystal class containing a three-fold rotation axis along the diagonal of the unit cell. This class is divided into two subclasses. One subclass, designated with hexagonal axes, contains 18 space groups and has three restrictions: 1) the lengths of the a and b axes are identical, 2) the a and b angles are equal to  $90^\circ$ , and 3) c is equal to  $120^\circ$ . For a description of the other subclass, see Rhombohedral crystal class.

**trigonal planar:** the shape of a molecule with an  $sp^2$  hybrid orbital. In this arrangement, the  $\sigma$  bonds are located in a single plane separated by  $60^\circ$  angles. Or A molecular shape that results when there are three bonds and no lone pairs around the central atom in the molecule. The pairs are arranged along the central atom's equator, with  $120^\circ$  angles between them. The carbonate ion ( $CO_3^{2-}$ ) has a trigonal planar geometry.

**trigonal pyramidal:** A molecular shape that results when there are three bonds and one lone pair on the central atom in the molecule.  $NH_3$  is a trigonal pyramidal molecule.

**triiodothyronine :** A thyroid hormone. Also called T-3.

**Trileptal:** (Other name for: oxcarbazepine)

**Trilisate:** (Other name for: choline magnesium trisalicylate)

**Trilisate :** A substance used to treat arthritis and relieve pain, inflammation, and fever. It is also being studied in the treatment of acute myeloid leukemia (AML). Trilisate blocks the action of a substance that sends a pain message to the brain. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called choline magnesium trisalicylate.

**trilostane:** A synthetic derivative of androstane with adrenocortical suppressive properties. Trilostane reversibly inhibits 3 beta-hydroxysteroid dehydrogenase delta 5-4 isomerase in the adrenal cortex, resulting in the decreased synthesis of mineralocorticoids and glucocorticoids and the decreased conversion of pregnenolone to progesterone. Check for active clinical trials using this agent.

**Trimethoprim:** A competitive inhibitor of dihydrofolate reductase, like methotrexate but specific for bacterial and protozoan enzymes.

**trimethoprim-sulfamethoxazole:** A synthetic combination of two antibacterial agents, trimethoprim and sulfamethoxazole. This synergistic

combination, also known as co-trimoxazole, inhibits two sequential steps in the bacterial metabolism of folic acid. Trimethoprim is a pyrimidine inhibitor of dihydrofolate reductase; sulfamethoxazole is a sulfamide inhibitor of bacterial dihydrofolate synthetase.

**trimethoprim-sulfamethoxazole :** An antibiotic drug used to treat infection and prevent pneumocystis carinii pneumonia.

**trimethylcolchicinic acid:** A colchicine analog with potential antineoplastic activity. Trimethylcolchicinic acid binds to tubulin, inhibiting its polymerization into microtubules and preventing cell division.

**trimetrexate glucuronate:** A lipid soluble methotrexate derivative with potential antineoplastic activity. Trimetrexate glucuronate inhibits the enzyme dihydrofolate reductase, thereby preventing the synthesis of purine nucleotides and thymidylate, with subsequent inhibition of DNA and RNA synthesis. Trimetrexate glucuronate also exhibits antiviral activity.

**trimetrexate glucuronate :** A drug that belongs to the family of drugs called antimetabolites. It is used in the treatment of pneumocystis carinii pneumonia and is being studied in the treatment of cancer.

**Trimox:** (Other name for: amoxicillin)

**trinucleotide repeat :** Sequences of 3 nucleotides repeated in tandem on the same contiguous section of chromosome. A certain amount of normal (polymorphic) variation in repeat number with no clinical significance commonly occurs between individuals; however, repeat numbers over a certain threshold can, in some cases, lead to adverse effects on the function of the gene, resulting in genetic disease.

**Trinucleotide repeats:** Stretches of DNA in which a trinucleotide sequence is repeated many times; these segments of DNA can expand in the course of DNA replication, causing such genetic diseases as Huntington disease.

**Triolein:** Triolein is the principal component of olive oil. Triolein is a triglyceride -- it consists of glycerol with three ester linkages. It may be hydrolysed (breaking the ester linkages) to form oleate ions in a saponification reaction.

**triose:** A simple sugar with a backbone containing three carbon atoms.

**Trioses:** Monosaccharides that have three carbon atoms.

**Triostat :** A drug that is used to treat certain thyroid (a gland located near the voice box) conditions. It is also being studied in the treatment of thyroid cancer. Triostat is made in the laboratory and is a form of the thyroid hormone triiodothyronine (T3). Also called Cytomel and liothyronine sodium.

**Trip, reactor:** A term that is used by pressurized water reactors for a reactor scram (see Scram).

**Tripedia:** (Other name for: diphtheria toxoid/tetanus toxoid/acellular pertussis vaccine adsorbed)

**triple bond:** a multiple bond composed of one  $\sigma$  bond and two  $\pi$  bonds. Rotation is not possible around a triple bond. Hydrocarbons that contain triple bonds are called alkynes.

**triple bond:** A covalent bond that involves 3 bonding pairs. In the valence bond theory, one of the bonds in a triple bond is a sigma bond and the other two are pi bonds. For example, the central bond in acetylene is a triple bond: H-CC-H.

**triple junction (point):** the junction of three major faults, thought to be in response to an underlying mantle plume, that signals the onset of rifting.

**Triple Point:** A temperature point at which a substance can be either a solid, liquid, or gas. Many compounds have triple points at very specific temperatures and pressures. Or a point in a phase diagram where the three states of matter are in equilibrium.

**triple point:** The temperature and pressure at which the solid, liquid, and gaseous forms of a substance are at equilibrium.

**triple-negative breast cancer :** Triple-negative breast cancer is defined by a lack of expression of estrogen receptor (ER), progesterone receptor (PR), and human epidermal growth factor receptor 2 (HER2/neu). Also called ER-negative PR-negative HER2/neu-negative breast cancer. OR Describes breast cancer cells that do not have estrogen receptors, progesterone receptors, or large amounts of HER2/neu protein. Also called ER-negative PR-negative HER2/neu-negative breast cancer.

**triptolide analogue:** A water soluble analogue of the diterpenoid triepoxide triptolide isolated from the Chinese herb *Tripterygium wilfordii* Hook F with potential antineoplastic activity. Upon intravenous administration, the triptolide analogue inhibits heat shock protein 70

(HSP70) and prevents HSP70-mediated inhibition of apoptosis. This leads to both the induction of apoptosis and a reduction of cancer cell growth. HSP70, a molecular chaperone upregulated in various cancer cells, plays a key role in the inhibition of caspase-dependent and -independent apoptosis.

**triptorelin:** A synthetic decapeptide agonist analog of luteinizing hormone releasing hormone (LHRH). Possessing greater potency than endogenous LHRH, triptorelin reversibly represses gonadotropin secretion. After chronic, continuous administration, this agent effects sustained decreases in LH and FSH production and testicular and ovarian steroidogenesis. Serum testosterone concentrations may fall to levels typically observed in surgically castrated men. OR A drug that is used to treat advanced prostate cancer, and is being studied in the treatment of breast cancer. It belongs to the family of hormonal drugs called gonadotropin-releasing hormone analogs. Also called Trelstar.

**triptorelin pamoate:** The pamoate salt of triptorelin, a synthetic decapeptide agonist analog of luteinizing hormone releasing hormone (LHRH). Possessing greater potency than endogenous LHRH, triptorelin reversibly represses gonadotropin secretion after prolonged administration. After chronic, continuous administration, a sustained decrease in LH, FSH and testicular and ovarian steroidogenesis is observed. The serum testosterone concentration may fall to levels typically seen in surgically castrated men.

**tris-acryl gelatin microspheres:** An embolic particle composed of water-soluble, compressible, nonabsorbable tris-acryl gelatin microspheres, with potential use for embolization. Upon administration, the tris-acryl gelatin microspheres (TAGM) serve as an embolic agent before surgery for highly vascularized areas, such as those seen in certain tumors, by penetrating into the vascular system and blocking blood flow. These microspheres may be used to encapsulate various therapeutic agents; drug-loaded microspheres can then be used as drug delivery vehicles during embolization of tumor vasculature.

**Trisenox :** A drug used to treat acute promyelocytic leukemia (APL) that has not gotten better or that has come back after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Also called arsenic trioxide.

**trisomy :** The presence of an extra chromosome, resulting in a total of three copies of that chromosome instead of the normal 2 copies (e.g., trisomy 21, or Down syndrome).

**trisomy 18 :** A genetic disorder caused by having an extra chromosome 18 in some or all of the body's cells. Trisomy 18 is marked by a low birth weight and certain abnormal features. These include a small, abnormally shaped head; a small jaw and mouth; clenched fists with overlapping fingers; and heart, lung, kidney, intestine, and stomach defects. Many babies with trisomy 18 die before birth or within the first month of life, but some children live for several years. Having trisomy 18 increases the risk of certain types of cancer, such as hepatoblastoma (a type of liver cancer) and Wilms tumor (a type of kidney cancer). Also called Edwards syndrome.

**Tritium:** A rare isotope of hydrogen with one proton and two neutrons. Or A radioactive isotope of hydrogen. Because it is chemically identical to natural hydrogen, tritium can easily be taken into the body by any ingestion path. It decays by emitting beta particles and has a half-life of about 12.5 years. For related information, see the Fact Sheet on Tritium, Radiation Protection Limits, and Drinking Water Standards. or A radioisotope of hydrogen with two neutrons and one proton in its nucleus

**Trituration:** A process involving grinding a solid with a liquid

**trivalent influenza vaccine:** A synthetic vaccine consisting of three inactivated influenza viruses, two different influenza type A strains and one influenza type B strain. Trivalent influenza vaccine is formulated annually, based on influenza strains projected to be prevalent in the upcoming flu season. This agent may be formulated for injection or intranasal administration.

**trivalent live-attenuated influenza vaccine:** A weakened live virus vaccine containing three seasonal influenza reassortants with prophylactic activity against influenza subtypes A and B. The trivalent live-attenuated influenza vaccine (LAIV) contains 2 strains of the influenza subtype A, one for H1N1 and one for H3N2, and one strain of subtype B. Upon intranasal administration by sprayer of the trivalent LAIV, the live viruses replicate in the upper respiratory tract and induce an immune response leading to active immunization against influenza subtypes A and B.

**Trk inhibitor LOXO-101:** An orally available, tropomyosin receptor kinase (Trk) inhibitor, with potential antineoplastic activity. Upon

administration, LOXO-101 binds to Trk, thereby preventing neurotrophin-Trk interaction and Trk activation, which results in both the induction of cellular apoptosis and the inhibition of cell growth in tumors that overexpress Trk. Trk, a receptor tyrosine kinase activated by neurotrophins, is mutated in a variety of cancer cell types and plays an important role in tumor cell growth and survival.

**tRNA:** transfer RNA; RNA molecules in the cytoplasm of a cell that carry amino acids to the ribosomes for protein synthesis.

**trodusquemine:** A naturally-occurring cholestane and non-competitive, allosteric inhibitor of protein tyrosine phosphatase 1B (PTP1B), with potential hypoglycemic, anti-diabetic, anti-obesity, and antineoplastic activities. Upon administration, trodusquemine selectively targets and inhibits PTP1B, thereby preventing PTP1B-mediated signaling. This prevents the dephosphorylation of the insulin receptor, which improves insulin signaling and insulin sensitivity, and decreases blood glucose levels. In susceptible cancer cells, inhibition of PTP1B causes a reduction of tumor cell proliferation. In addition, as trodusquemine can cross the blood-brain barrier (BBB), it centrally suppresses appetite and causes weight loss. PTP1B, a tyrosine phosphatase, is elevated in certain cancer cells; it is specifically upregulated in human epidermal growth factor receptor 2 (HER2)-driven cancers where it promotes cell growth, and is correlated with a poor prognosis and increased metastatic potential. In diabetes, PTP1B upregulation plays a major role in insulin resistance. Check for active clinical trials using this agent.

**trofosfamide:** An orally bioavailable oxazaphosphorine prodrug with antineoplastic activity. Trofosfamide (TFF) is metabolized predominantly to the cyclophosphamide analogue ifosfamide (IFO), which is then metabolized by liver cytochrome P450s to the active isophosphoramidate mustard (IPM). IPM alkylates DNA to form DNA-DNA cross-links, which may result in inhibition of DNA, RNA and protein synthesis, and tumor cell apoptosis.

**troglitazone:** An orally-active thiazolidinedione with antidiabetic and hepatotoxic properties and potential antineoplastic activity. Troglitazone activates peroxisome proliferator-activated receptor gamma (PPAR-gamma), a ligand-activated transcription factor, thereby inducing cell differentiation and inhibiting cell growth and angiogenesis. This agent also

modulates the transcription of insulin-responsive genes, inhibits macrophage and monocyte activation, and stimulates adipocyte differentiation.

**trophic level:** The amount of energy, in terms of food, that an organism needs. Organisms capable of utilizing inorganic chemicals, e.g., plants, or food of low energy content are said to be on a low trophic level whereas, for example, predator species needing food of high energy content are said to be on a high trophic level. The trophic level, thus, indicates the level of the organism in the food chain (WHO, 1979). or A segment of the food chain in which all organisms obtain food and energy in, basically, the same manner (e.g., photosynthesis, herbivory, or carnivory) and in which all organisms are the same number of links from the photosynthetic segment.

**trophoblast:** a layer of cells that forms after fertilization; projections from the trophoblast form vessels, which merge with maternal blood vessels to form the placenta. OR A thin layer of cells that helps a developing embryo attach to the wall of the uterus, protects the embryo, and forms a part of the placenta.

**tropic hormone (tropin):** A peptide hormone that stimulates a specific target gland to secrete its hormone; for example, thyrotropin produced by the pituitary stimulates secretion of thyroxine by the thyroid.

**tropical depression:** strong low-pressure system formed in low latitudes.

**tropical storm:** low-pressure system with sustained winds from 39 to 73 mph.

**tropisetron:** An indole derivative with antiemetic activity. As a selective serotonin receptor antagonist, tropisetron competitively blocks the action of serotonin at 5HT<sub>3</sub> receptors, resulting in suppression of chemotherapy- and radiotherapy-induced nausea and vomiting. Check for active clinical trials using this agent.

**tropisetron :** A drug used to prevent nausea and vomiting caused by cancer treatment. It is also used to prevent nausea and vomiting after surgery. Tropisetron blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. It is not available in the United States.

**tropisetron hydrochloride:** The hydrochloride salt form of tropisetron, a selective, competitive serotonin 5-hydroxytryptamine type 3 (5-HT<sub>3</sub>) receptor antagonist, with antinauseant and antiemetic activities. Tropisetron competitively binds to and blocks the action of serotonin at 5HT<sub>3</sub> receptors peripherally on vagus nerve terminals located in the gastrointestinal (GI) tract as well as centrally in the chemoreceptor trigger zone (CTZ) of the area postrema of the central nervous system (CNS). This results in the suppression of chemotherapy- and radiotherapy-induced nausea and vomiting.

**tropism:** the bending or turning response of a plant caused by external stimuli.

**Tropomyosin:** Located in the thin filaments of a sarcomere, a protein that plays a role in the regulation of muscle contraction by blocking the interaction of myosin with actin at low Ca<sup>2+</sup> concentrations; regulated by troponin.

**tropomyosin receptor kinase inhibitor AZD7451:** A tropomyosin receptor kinase (TRK) inhibitor with potential antineoplastic activity. AZD7451 binds to TRK, thereby preventing the neurotrophin-TRK interaction and subsequent TRK activation. This may eventually result in an inhibition of tumor cell proliferation in TRK-expressing tumor cells. TRK, a receptor tyrosine kinase activated by neurotrophins, is mutated in a variety of cancer cell types and plays an important role in tumor cell growth, invasion and survival. Check for active clinical trials using this agent.

**Troponin complex:** Located in the thin filaments of the sarcomeres, that regulate muscle contraction through allosteric interactions with tropomyosin in response to changes in Ca<sup>2+</sup> concentrations.

**tropopause:** region between the troposphere and the stratosphere. Or The boundary between the troposphere and the stratosphere (about 8 km in polar regions and about 15 km in tropical regions), usually characterized by an abrupt change of lapse rate. The regions above the troposphere have increased atmospheric stability than those below. The tropopause marks the vertical limit of most clouds and storms.

**troposphere:** The lowest part of the earth's atmosphere, extending from the surface of the planet to the bottom of the stratosphere. Or lowest level of the atmosphere, where weather occurs; temperature decreases with altitude. Or The inner layer of the atmosphere below about 15 km, within which

there is normally a steady decrease of temperature with increasing altitude. Nearly all clouds form and weather conditions manifest themselves within this region, and its thermal structure is caused primarily by the heating of the Earth's surface by solar radiation, followed by heat transfer by turbulent mixing and convection.

**TROUTON RATIO:** The ratio of elongational (extensional) viscosity to (shear) viscosity for Newtonian fluids is 3. Polymers do not obey this relation. Ratios can range up to 100 for melts and up to perhaps 10,000 for solutions.

**TroVax:** (Other name for: recombinant modified vaccinia Ankara-5T4 vaccine)

**troxacitabine:** A dioxolane derivative and a novel L-configuration deoxycytidine analogue with potent antineoplastic activity. When incorporated into growing chain during DNA replication, troxacitabine stops DNA polymerization due to its unnatural L-configuration, in contrast to the normal nucleotides with D-configuration. As a result, this agent terminates DNA synthesis upon incorporated into DNA molecules, and consequently interrupts tumor cell proliferation. or A drug being studied for use as an anticancer agent.

**Troxatyl:** (Other name for: troxacitabine)

**TRP (transient receptor potential) channels:** A family of ion channels whose properties are altered in response to motion.

**TRP2 mRNA-electroporated autologous langerhans-type dendritic cell vaccine:** A cancer cell vaccine composed of autologous human Langerhans-type dendritic cells (also known as Langerhans cells or LCs) that are electroporated with mRNA encoding full-length murine tyrosinase-related peptide 2 (TRP2), with potential antineoplastic and immunomodulating activities. Upon vaccination, the TRP2 mRNA-electroporated autologous Langerhans-type dendritic cell vaccine may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against TRP2-expressing tumor cells. TRP2, a tautomerase involved in the synthesis of melanin, is only expressed in melanomas, melanocytes, and the retina. The LCs are differentiated from CD34 positive hematopoietic progenitor cells.

**TRPV6:** A protein found in cell membranes that moves calcium into cells. Levels of TRPV6 are lower than normal in patients who don't have enough

vitamin D. High levels of the protein may be found in breast cancer tissue. It is a type of calcium channel protein. Also called transient receptor potential cation channel, subfamily V, member 6.

**TRPV6 calcium channel inhibitor SOR-C13:** An inhibitor of transient receptor potential cation channel vanilloid family member 6 (TRPV6, CaT1 or CATL) with potential antineoplastic activity. TRPV6 calcium channel inhibitor SOR-C13 binds to TRPV6 and prevents the influx of calcium ions into TRPV6-expressing tumor cells. This inhibits the activation of nuclear factor of activated T-cell (NFAT) transcription complex which may result in an inhibition of calcium-dependent cancer cell proliferation and an induction of apoptosis in tumor cells overexpressing TRPV6. The TRPV6 ion channel plays a key role in calcium homeostasis and is highly selective for calcium compared to other cations; it is overexpressed in a variety of tumors and initiates tumor cell growth, proliferation and metastases.

**True Formula:** This formula tells you the number of atoms in a molecule for each element. Water has two hydrogen atoms and one oxygen atom when you look at the true formula.

**true histiocytic lymphoma :** A rare, very aggressive (fast-growing) type of non-Hodgkin lymphoma (cancer that begins in the cells of the immune system). It is marked by large abnormal lymphoid cells that do not look like T cells or B cells.

**true lavender :** A plant with aromatic leaves and flowers that is a member of the mint family. Oil from the flowers has been used in some cultures to treat certain medical problems, to keep insects away, and to wash in. It is also used in aromatherapy. Perillyl alcohol, a substance found in true lavender, is being studied in cancer prevention and treatment. The scientific name is *Lavandula angustifolia*. Also called English lavender and lavender.

**True North:** geographic North Pole, latitude 90° N.

**Truer Tracking :** The unique profile off the TruSeat Lehr provides the most accurate seating possible and thus provides optimal belt tracking.

**truncated spurs:** topographic spurs along a valley that have been truncated by glacial erosion in the valley.

**Trunking:** Description commonly used for ventilating and other ducting usually, but not always, of metal. Or An extruded PVC-U channel used to contain and protect pipes or cables.

**Truphylline:** (Other name for: aminophylline)

**TRUS:** A procedure in which a probe that sends out high-energy sound waves is inserted into the rectum. The sound waves are bounced off internal tissues or organs and make echoes. The echoes form a picture of body tissue called a sonogram. TRUS is used to look for abnormalities in the rectum and nearby structures, including the prostate. Also called endorectal ultrasound, ERUS, and transrectal ultrasound.

**TruSeat Mesh :** A balanced weave wire mesh fabric consisting of alternating right and left hand flattened spirals fully seated into specially formed crimped connector rods - commonly used in baking or glass processing systems.

**Truss:** A combination of timber or metalwork so arranged as to make a rigid frame. Especially used to denote roof framing, hence 'roof truss', examples of which can be readily seen in industrial buildings.

**trust :** A legal document in which a person states what is to be done with his or her property after death. There are many types of trusts, and a trust may take the place of a will.

**Trypsin:** A proteolytic enzyme that cleaves (cuts) peptide chains next to the basic amino acids arginine and lysine.

**Tryptic peptide mapping:** The technique of generating a chromatographic profile characteristic of the fragments resulting from trypsin enzyme cleavage of the protein.

**Tryptic peptide mapping:** Tryptic peptide mapping. The technique of generating a chromatographic profile characteristic of the fragments resulting from trypsin enzyme cleavage of the protein.

**Tryptophan:** Any enthusiastic admirer of the Slovenian guitarist Wenceslas Trypto. Actually, it is an amino acid with the useful property of absorbing ultraviolet light, helping to make proteins visible to detectors in chromatographs. Some vitamin suppliers call it "the natural alternative to Prozac". Tryptophan's biochemical symbol is T and it looks like this:

**tryptophanase:** Encoded by human TDO2 Gene, 406-aa 48-kDa  
Tryptophanase is a homotetramer that may bind protoheme IV involved in tryptophan catabolism with broad specificity towards tryptamine and derivatives including tryptophan, 5-hydroxytryptophan, and serotonin.

**TS-1:** (Other name for: tegafur-gimeracil-oteracil potassium)

**TS-ONE:** (Other name for: tegafur-gimeracil-oteracil potassium)

**TSEB radiation therapy :** A type of radiation therapy using electrons that is directed at the entire surface of the body. This type of radiation goes into the outer layers of the skin, but does not go deeper into tissues and organs below the skin. Also called total skin electron beam radiation therapy.

**TSH:** A hormone produced by the pituitary gland. TSH stimulates the release of thyroid hormone from thyroglobulin. It also stimulates the growth of thyroid follicular cells. An abnormal TSH level may mean that the thyroid hormonal regulation system is out of control, usually as a result of a benign condition (hyperthyroidism or hypothyroidism). Also called thyroid-stimulating hormone.

**TSNA:** A type of harmful, cancer-causing chemical found in tobacco and tobacco smoke. TSNAs are formed when tobacco leaves are grown, cured, aged, and processed. Tobacco products can contain different amounts of TSNAs, depending on how they are made. Also called tobacco-specific nitrosamine.

**TSP-1 mimetic fusion protein CVX-045:** A fusion protein containing two thrombospondin (TSP-1)-derived nonamer peptides covalently attached, via a proprietary diketone linker, to a proprietary humanized catalytic monoclonal aldolase monoclonal antibody with potential antiangiogenic and antineoplastic activities. The TSP-1 mimetic peptide moieties of TSP-1 mimetic fusion protein CVX-045 bind to TSP-1 receptors, such as CD36, and inhibit tumor angiogenesis, which may result in the inhibition of tumor cell proliferation. The proprietary humanized catalytic monoclonal aldolase monoclonal antibody contains reactive lysine residues in its binding sites, which react covalently with compounds having a diketone function; the TSP-1 mimetic peptide moieties are then covalently attached to the diketone linkers via a proprietary spacer.

**tsunami:** a large wave created by an underwater earthquake or landslide.

**TTI-237:** A small synthetic molecule of triazolopyrimidine derivative with potential antitumor activity. With a novel mechanism of action distinct from the action of other vinca alkaloid compounds, TTI-237 specifically binds to tubulin at the vinca site, and promotes the polymerization of tubulin into microtubules. TTI-237 stabilizes tubulin and inhibits microtubule disassembly. This results in cell cycle arrest at the G2/M phase, and leading

to cell death. OR A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called mitotic inhibitors.

**TTMB:** A procedure being studied in the diagnosis of prostate cancer and in planning prostate cancer treatment. Ultrasound is used to create a map of the prostate so the whole prostate gland can be seen in three dimensions and divided into 24 areas. Needles are then inserted through a template into each of the 24 areas and tissue is removed to be checked under a microscope. Also called transperineal template-guided prostate mapping biopsy.

**TTP:** The length of time from the date of diagnosis or the start of treatment for a disease until the disease starts to get worse or spread to other parts of the body. In a clinical trial, measuring the TTP is one way to see how well a new treatment works. Also called time to progression.

**tubal ligation :** An operation to tie the fallopian tubes closed. This procedure prevents pregnancy by blocking the passage of eggs from the ovaries to the uterus.

**tubefeeding :** A way of giving medicines and liquids, including liquid foods, through a small tube placed through the nose or mouth into the stomach or small intestine. Sometimes the tube is placed into the stomach or small intestine through an incision (cut) made on the outside of the abdomen. Tubefeeding may be added to what a person is able to eat and drink, or it may be the only source of nutrition. It is a type of enteral nutrition. Also called gavage.

**tubercidin:** An antibiotic and adenosine analog isolated from the bacterium *Streptomyces tubercidicus* with potential antineoplastic activity. Tubercidin is incorporated into DNA and inhibits polymerases, thereby inhibiting DNA replication and RNA and protein synthesis. This agent also exhibits antifungal and antiviral activities.

**tuberculosis :** A disease caused by a specific type of bacteria that spreads from one person to another through the air. Tuberculosis can affect many parts of the body, but most often affects the lungs. A person may not have symptoms of tuberculosis for years, but they may appear when the patient becomes ill with a serious condition like diabetes, AIDS, or cancer. Tuberculosis can usually be treated and cured with antibiotics. Also called TB.

**tuberin:** protein encoded by the tuberous sclerosis 2 (TSC2) gene

**tuberous sclerosis :** A genetic disorder in which benign (not cancer) tumors form in the kidneys, brain, eyes, heart, lungs, and skin. This disease can cause seizures, mental disabilities, and different types of skin lesions.

**Tubing:** Blown film is extruded through a circular die which creates a tube of film. When the tube of film is collapsed and rolled onto a core, the finished product is called tubing. OR A flexible, non-reinforced, extruded cylinder of any length.

**Tubulin:** The major microtubule protein component that exists in two forms,  $\alpha$ - and  $\beta$ -tubulin; tubulins display gtpase activity that is vital for the assembly and disassembly of microtubules.

**tubulin :** One of a group of proteins found in high levels in the cell cytoplasm (fluid inside a cell but outside the cell's nucleus). Tubulins are the building blocks of microtubules (narrow, hollow tubes inside a cell), which are involved in cell division and cell movement. Certain anticancer drugs bind to and block the formation or function of tubulins, which may block cell division.

**tubulin inhibitor ALB 109564(a):** A semi-synthetic derivative of the vinka alkaloid vinblastine with potential antineoplastic activity. Tubulin inhibitor ALB 109564(a) binds to tubulin monomers and inhibits microtubule formation, resulting in disruption of mitotic spindle assembly and arrest of tumor cells in the G2/M phase of the cell cycle.

**tubulin polymerization inhibitor CKD-516:** A benzophenone derivative and water soluble valine prodrug of the tubulin binding agent S516, with potential tubulin-inhibiting, vascular-disrupting and antineoplastic activity. Upon administration, tubulin polymerization inhibitor CKD-516 is converted into its active metabolite S-516, which binds to tubulin and prevents its polymerization in tumor blood vessel endothelial cells and tumor cells. This blocks the formation of the mitotic spindle and leads to cell cycle arrest at the G2/M phase. As a result, this agent disrupts the tumor vasculature and tumor blood flow, deprives tumor cells of nutrients and induces tumor cell apoptosis. In addition, this agent has a direct cytotoxic effect on tumor cells by inhibiting tubulin polymerization. Check for active clinical trials using this agent.

**tubulin-binding agent SSR97225:** An antimetabolic tubulin-binding agent with potential antineoplastic activity. Tubulin-binding agent SSR97225

binds to tubulin, arresting the cell cycle at the G2/M checkpoint and preventing mitosis.

**tubulovillous adenoma :** A type of polyp that grows in the colon and other places in the gastrointestinal tract and sometimes in other parts of the body. These adenomas may become malignant (cancer).

**tucotuzumab celmoleukin:** A recombinant fusion protein comprised of a human monoclonal antibody directed against the epithelial cell adhesion molecule (EpCAM or KS) linked to an active interleukin-2 (IL2) molecule with potential antineoplastic activity. The humanized monoclonal antibody moiety of tucotuzumab celmoleukin recognizes and binds to EpCAM, a cell surface epithelial protein that is expressed on a wide variety of cancer cells, thereby concentrating IL2 in EpCAM-expressing tumor tissue.

Subsequently, the localized IL2 moiety of this fusion protein may stimulate a cytotoxic T-cell antitumor immune response.

**TUEVAP:** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the prostate. A ball or special wire loop on the instrument heats the prostate tissue and turns it to vapor. This relieves pressure and improves urine flow. Also called transurethral electroevaporation of the prostate, transurethral electrovaporization of the prostate, and TUVF.

**tuff:** a volcanic rock consisting of small particles such as ash and dust.

**tuff breccia:** a volcanic rock that contains angular, coarse rock fragments in a matrix of finer-grained ash and dust.

**tufted angioma :** A rare, benign (not cancer) blood vessel tumor that usually forms on the skin of the arms and legs, but may also form in deeper tissues, such as muscle and bone. Tufted angiomas grow slowly and can spread to nearby tissue. Signs and symptoms may include firm, painful areas of skin that look bruised; purple or brownish-red areas on the skin; easy bruising; anemia; and abnormal bleeding. Tufted angiomas are most common in infants and young children. They are a type of vascular tumor.

**tui na :** Chinese massage that uses kneading, pressing, rolling, shaking, and stretching of the body. Tui na is thought to regulate qi (vital energy) and blood flow, and improve the function of tendons, bones, and joints.

**TUIP:** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra and one or two small cuts are

made in the bladder neck and prostate. This relieves pressure and improves urine flow. Also called transurethral incision of the prostate.

**Tumbling:** Finishing operation for small plastic articles by which gates, flash, and fins are removed and/or surfaces are polished by rotating them in a barrel together with wooden pegs, sawdust, and polishing compounds.

**tumescent mastectomy :** A type of surgery to remove the breast. The breast is injected with a liquid mixture of salts and small amounts of two drugs. These drugs are lidocaine, to numb the area, and epinephrine, to narrow blood vessels and reduce bleeding. Tumescent mastectomy is usually used to treat breast cancer in elderly patients.

**tumor :** An abnormal mass of tissue that results when cells divide more than they should or do not die when they should. Tumors may be benign (not cancer), or malignant (cancer). Also called neoplasm.

**tumor antigen vaccine :** A vaccine made of cancer cells, parts of cancer cells, or pure tumor antigens (substances isolated from tumor cells). A tumor antigen vaccine may stimulate the body's immune system to find and kill cancer cells.

**tumor board review :** A treatment planning approach in which a number of doctors who are experts in different specialties (disciplines) review and discuss the medical condition and treatment options of a patient. In cancer treatment, a tumor board review may include that of a medical oncologist (who provides cancer treatment with drugs), a surgical oncologist (who provides cancer treatment with surgery), and a radiation oncologist (who provides cancer treatment with radiation). Also called multidisciplinary opinion.

**tumor burden :** Refers to the number of cancer cells, the size of a tumor, or the amount of cancer in the body. Also called tumor load.

**tumor cell-derived DRibbles vaccine:** An autophagosome-enriched cancer vaccine composed of short-lived proteins (SLiPs) and defective ribosomal products (DRiPs) derived from tumor cells, with potential immunostimulating and antineoplastic activities. The Dribbles are DriPs- and SLiPs-filled autophagosomes that are made by treating cancer cells with both a proteasome inhibitor, to prevent protein degradation, and an autophagy inducer, which causes the accumulation of DriPs, SLiPs, and their immunogenic fragments. Upon administration of a Dribbles vaccine, the proteins or antigen fragments in Dribbles may stimulate the immune

system to mount cytotoxic T-lymphocyte (CTL) and helper T-lymphocyte responses against the cancer-associated antigens (TAAs).

**tumor debulking :** Surgical removal of as much of a tumor as possible. Tumor debulking may increase the chance that chemotherapy or radiation therapy will kill all the tumor cells. It may also be done to relieve symptoms or help the patient live longer. Also called debulking.

**tumor grade :** A description of a tumor based on how abnormal the cancer cells and tissue look under a microscope and how quickly the cancer cells are likely to grow and spread. Low-grade cancer cells look more like normal cells and tend to grow and spread more slowly than high-grade cancer cells. Grading systems are different for each type of cancer. They are used to help plan treatment and determine prognosis. Also called grade and histologic grade.

**tumor infiltrating lymphocyte :** A white blood cell that has left the bloodstream and migrated into a tumor.

**tumor initiation :** A process in which normal cells are changed so that they are able to form tumors. Substances that cause cancer can be tumor initiators.

**tumor load :** Refers to the number of cancer cells, the size of a tumor, or the amount of cancer in the body. Also called tumor burden.

**tumor lysis syndrome :** A condition that can occur after treatment of a fast-growing cancer, especially certain leukemias and lymphomas (cancers of the blood). As tumor cells die, they break apart and release their contents into the blood. This causes a change in certain chemicals in the blood, which may cause damage to organs, including the kidneys, heart, and liver.

**tumor marker :** A substance found in tissue, blood, or other body fluids that may be a sign of cancer or certain benign (noncancerous) conditions. Most tumor markers are made by both normal cells and cancer cells, but they are made in larger amounts by cancer cells. A tumor marker may help to diagnose cancer, plan treatment, or find out how well treatment is working or if cancer has come back. Examples of tumor markers include CA-125 (in ovarian cancer), CA 15-3 (in breast cancer), CEA (in colon cancer), and PSA (in prostate cancer).

**tumor marker test :** A test that measures the amount of substances called tumor markers in tissue, blood, urine, or other body fluids. Most tumor

markers are made by both normal cells and cancer cells, but they are made in higher amounts by cancer cells. A high level of a tumor marker may be a sign of cancer or certain benign (noncancerous) conditions. A tumor marker test is usually done with other tests, such as biopsies, to help diagnose some types of cancer. It may also be used to help plan treatment or find out how well treatment is working or if cancer has come back.

**tumor microenvironment :** The normal cells, molecules, and blood vessels that surround and feed a tumor cell. A tumor can change its microenvironment, and the microenvironment can affect how a tumor grows and spreads.

**tumor model :** Cells, tissues, or animals used to study the development and progression of cancer, and to test new treatments before they are given to humans. Animals with transplanted human tumors or other tissues are called xenograft models.

**tumor necrosis factor :** A protein made by white blood cells in response to an antigen (substance that causes the immune system to make a specific immune response) or infection. Tumor necrosis factor can also be made in the laboratory. It may boost a person's immune response, and also may cause necrosis (cell death) of some types of tumor cells. Tumor necrosis factor is being studied in the treatment of some types of cancer. It is a type of cytokine. Also called TNF.

**tumor necrosis factor receptor superfamily member 10A :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of tumor necrosis factor receptor superfamily member 10A on cancer cells may kill more cells. Also called death receptor 4, DR4, TRAIL receptor 1, and TRAIL-R1.

**tumor necrosis factor receptor superfamily member 10B :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of tumor necrosis factor receptor superfamily member 10B on cancer cells may kill more cells. Also called death receptor 5, DR5, TRAIL receptor 2, and TRAIL-R2.

**tumor necrosis factor-related apoptosis-inducing ligand :** A cell protein that can attach to certain molecules in some cancer cells and may kill the cells. Tumor necrosis factor-related apoptosis-inducing ligand is being

studied in the treatment of cancer. Also called Apo-2L, TNF-related apoptosis-inducing ligand, and TRAIL.

**tumor peptide-loaded myeloid dendritic cells:** A cell-based cancer vaccine composed of myeloid dendritic cells (myDCs) pulsed with tumor peptides with potential immunostimulatory and antineoplastic activities. Upon administration, the tumor peptide-loaded myDCs stimulate a specific cytotoxic T-lymphocyte (CTL) response against the tumor cells, resulting in tumor cell lysis. Check for active clinical trials using this agent.

**Tumor promoters:** Chemicals that promote the proliferation of carcinogenic cells; phorbol esters are tumor promoters.

**tumor promotion :** A process in which existing tumors are stimulated to grow. Tumor promoters are not able to cause tumors to form.

**tumor sequencing :** Sequencing of somatic tissue, such as tumors, refers to looking for variants in DNA that typically occur after conception. Somatic mutations can occur in any of the cells of the body except the germ cells (sperm and egg) and therefore are not passed on to children. These variants can (but do not always) cause cancer or other diseases.

**tumor suppressor gene :** A type of gene that makes a protein called a tumor suppressor protein that helps control cell growth. Mutations (changes in DNA) in tumor suppressor genes may lead to cancer. Also called antioncogene.

**tumor suppressor gene :** A type of gene that regulates cell growth. When a tumor suppressor gene is mutated, uncontrolled cell growth may occur. This may contribute to the development of cancer. Also called antioncogene.

**tumor vasculature-targeted tumor necrosis factor alpha :** A substance being studied in the treatment of cancer. It is made by linking tumor necrosis factor (TNF) to a peptide. The peptide binds to tumor blood vessels, and TNF damages them. It is a type of biological response modifier. Also called NGR-TNF.

**tumor volume :** The size of a cancer measured by the amount of space taken up by the tumor. For example, the tumor volume of prostate cancer is the percentage of the prostate taken up by the tumor.

**tumor-cells apoptosis factor hormone-peptide:** A synthetic 14-amino acid peptide derived from a novel human peptide hormone, Tumor-Cells

Apoptosis Factor (TCApF), with potential antineoplastic activity. Upon intravenous administration, tumor-cells apoptosis factor hormone-peptide binds to the T1/ST2 receptor (IL1RL1) and activates both caspase 8 and Bcl-2 mediated apoptosis, in addition to the activation of p38 MAPK and JNK signaling cascades in tumor cells. Furthermore, this agent inhibits angiogenesis by suppressing the expressions of vascular endothelial growth factor A (VEGFA) and fms-related tyrosine kinase 1 (VEGFR1). Tumor-cells apoptosis factor hormone-peptide also modulates immune system responses via increasing the expressions of interleukin-10 and anti-angiogenic interleukin. T1/ST2 receptor, a member of the toll/interleukin-1 receptor superfamily, is overexpressed in certain cancer cells.

**tumor-derived :** Taken from an individual's own tumor tissue; may be used in the development of a vaccine that enhances the body's ability to build an immune response to the tumor.

**tumor-homing peptide iRGD:** A 9-amino-acid-based cyclic, tumor specific homing, arginine-glycine-aspartic acid (RGD)-based peptide (CRGDKRGPDC), with tumor penetrating activity. The iRGD contains the RGD motif as well as the C-terminal end binding (CendR) motif that increases internalization. Upon administration, the RGD motif of the iRGD peptide is able to specifically target tumors by binding to  $\alpha$ v $\beta$ 3/ $\alpha$ v $\beta$ 5 integrins on tumor endothelium. In turn, iRGD is cleaved by specific tumor proteases, which exposes the positively charged CendR motif. This motif binds to neuropilin-1 (NRP-1), a receptor overexpressed on certain tumor cells. This increases vascular permeability of tumor blood vessels and promotes tumor penetration. Compared to other RGD peptides, this agent is able to both improve delivery and increase the accumulation of co-administered or conjugated chemotherapeutic agents in the tumor.

**tumor-specific antigen :** A protein or other molecule that is unique to cancer cells or is much more abundant in them. These molecules are usually found in the plasma (outer) membrane, and they are thought to be potential targets for immunotherapy or other types of anticancer treatment.

**Tumorigenesis:** The mechanism of tumor formation.

**tumour:** (neoplasm) This term describes any growth of tissue forming an abnormal mass. Cells of a benign tumour will not spread and will not cause

cancer. Cells of a malignant tumour can spread through the body and cause cancer.

**TUMT:** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the bladder. A small microwave antenna on the instrument heats nearby prostate tissue and destroys it. This relieves pressure and improves urine flow. Also called transurethral microwave thermotherapy.

**TUNA:** A procedure that is used to treat benign prostatic hypertrophy (BPH). An instrument with a small probe that gives off low-level radiofrequency energy is inserted through the urethra into the prostate. The energy from the probe heats nearby prostate tissue and destroys it. This relieves pressure and improves urine flow. Also called transurethral needle ablation and transurethral radiofrequency ablation.

**tundra:** A type of ecosystem dominated by lichens, mosses, grasses, and woody plants. It is found at high latitudes (arctic tundra) and high altitudes (alpine tundra). Arctic tundra is underlain by permafrost and usually very wet.

**Tungsten:** Symbol:"W" Atomic Number:"74" Atomic Mass: 183.85amu. This is one of the transition elements from period six. Tungsten used to be called wolfram (thus the W). It is a light-gray metal found in many minerals. You may find it in electric components, power tools, paints, and even fluorescent lights.

**Tungsten Mesh :** Conventional weave wire mesh fabric consisting of only left hand spirals, wound one into the next so as to form a continuous fabric. Special material allows for use in temperature up to 3632°F (2000°C).

**Tungstic:** Tungstic acid comes in two forms - ortho tungstic acid, which is  $H_2WO_4$ , and meta tungstic acid, which is  $H_2W_4O_{13} \cdot 9H_2O$ . The tungstate anion is  $WO_4^{2-}$ .

**Tunicamycin:** An antibiotic inhibitor of N-glycosylation that is a hydrophobic analog of UDP-Nacetylglucosamine; blocks the first step in core oligosaccharide synthesis.

**Tunnel gate:** A gate that is cut through the body of one side of the mold to create a gate that does not leave a mark on the exterior face of the part.

**TUR:** Surgery performed with a special instrument inserted through the urethra. Also called transurethral resection.

**turbidimeter:** an instrument for measurement of turbidity in which a standard suspension is used for reference.

**turbidites:** sediments that are deposited by turbidity currents and that typically show graded bedding.

**turbidity:** (1) a condition in water or wastewater caused by the presence of suspended matter, resulting in the scattering and absorption of light rays. (2) a measure of fine suspended matter in liquids. (3) an analytical quantity usually reported in turbidity units (NTU/FNU, FTU, JTU) determined by measurements of light diffraction.

**turbidity current:** a large volume of dense, sediment-laden water that results when sand and mud on a continental slope are dislodged by landslides or earthquakes and become suspended in the water.

**Turbine:** A rotary engine made with a series of curved vanes on a rotating shaft, usually turned by water or steam. Turbines are considered the most economical means to turn large electrical generators.

**Turbine generator (TG):** A steam (or water) turbine directly coupled to an electrical generator. The two devices are often referred to as one unit.

**Turcot syndrome :** A rare, inherited disorder in which polyps (abnormal growths of tissue) form on the inside walls of the colon and rectum, and tumors form in the brain. There are two types of Turcot syndrome, which are caused by mutations (changes) in different genes. People with Turcot syndrome have a higher-than-normal risk of colorectal cancer and brain cancer, especially glioblastoma and medulloblastoma.

**turgor pressure:** the pressure exerted on a plant's guard cells to open.

**Turkish rhubarb :** The root of this plant has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. The scientific name is *Rheum palmatum* or *Rheum officinale*. Also called Chinese rhubarb, da-huang, Indian rhubarb, and rhubarb.

**turmeric :** An East Indian plant that is a member of the ginger family and is used as a spice and food color. The underground stems are used in some cultures to treat certain stomach problems. The substance in turmeric that gives it a yellow color (curcumin) is being studied in the treatment of cancer, Alzheimer disease, cystic fibrosis, and psoriasis. The scientific name is *Curcuma longa*. Also called Indian saffron and jiang huang.

**Turn Ratio :** The ratio of inside turn radius to the belt width.

**Turn-up Guard Edge:** A retaining edge formed by extending individual connectors or rod reinforcements, and turning them up at prescribed angles and spacings.

**Turn,  $\beta$ :** In proteins, a structural element composed of four amino acids, in which the CO and NH groups of residue 1 are hydrogen bonded to the NH and CO groups of residue 4, respectively; such a structure forms a hairpin turn, allowing polypeptide chains to reverse their direction.

**turnaround words:** Words that indicate a change in order from left to right. The expressions are turned around, and the second English phrase becomes the first algebraic expression (and visa versa). The basic turnaround words are, TO (including INTO), FROM, and THAN.

**Turned-up Fabric :** A retaining edge formed by turning up a portion of the belt at a prescribed angle to the carrying surface.

**Turning:** During the turning process, rod stock is rotated in a lathe machine while a tool is held against the stock to remove material and create a cylindrical part.

**Turning Radius :** The radius around which a belt may be flexed. It is commonly referred to as inside turning radius and is established by the nesting of links or pickets at the inside edge of the turn and by the belt width.

**Turnover number:** The maximum number of molecules of substrate that can be converted to product per active site per unit time. Or The number of substrate molecules converted into product by an enzyme molecule in a unit time when the enzyme is fully saturated with substrate; equal to the kinetic constant  $k_2$  (see Michaelis constant). or The number of times an enzyme molecule transforms a substrate molecule per unit time, under conditions giving maximal activity at substrate concentrations that are saturating.

**turnover rate:** The fraction of the total amount of mass (e.g., carbon) in a given pool or reservoir that is released from or that enters the pool in a given length of time. The turnover rate of carbon is often expressed as GtC/year.

**TURP :** Surgery to remove tissue from the prostate using an instrument inserted through the urethra. Also called transurethral resection of the prostate.

**TURPENTINE:** A colorless liquid, which is used as a thinner for oil paints and varnishes, distilled from the products of the pine tree.

**TUVP:** A procedure used to treat benign prostatic hypertrophy (BPH). An instrument is inserted through the urethra into the prostate. A ball or special wire loop on the instrument heats the prostate tissue and turns it to vapor. This relieves pressure and improves urine flow. Also called transurethral electroevaporation of the prostate, transurethral electrovaporization of the prostate, and TUEVAP.

**TVS:** A procedure used to examine the vagina, uterus, fallopian tubes, ovaries, and bladder. An instrument is inserted into the vagina that causes sound waves to bounce off organs inside the pelvis. These sound waves create echoes that are sent to a computer, which creates a picture called a sonogram. Also called transvaginal sonography and transvaginal ultrasound.

**twelve-step program :** A program to help people recover from substance abuse, emotional disorders, or addictions. The twelve steps come from an organization called Alcoholics Anonymous (AA) and are changed for each specific condition.

**Twin Screw Extruder:** Twin screw extrusion used in plastic extrusion manufacturing offers several advantages over single screw extrusion. It has better feeding and more positive conveying characteristics which allow the extruder to process hard-to-feed materials. In addition a better mixing and larger heat transfer area allows good control of stock temperatures, which are key elements in the extrusion of thermally sensitive materials. OR An extruder with a pair of screws working together in a common barrel. OR A screw extruder designed so that the pressure of the extrusion material drops substantially part way along the screw.

**Two-dimensional gel electrophoresis:** A means of analyzing a protein sample in which the sample is initially fractionated in one dimension by isoelectric focusing and is subsequently fractionated in a second dimension, perpendicular to the first, by SDS-polyacrylamide gel electrophoresis.

**Two-stage Screw:** A screw for use in a two stage extruder comprised of a decompression section which is before the final metering section.

**Twofold rotation axis:** A symmetry axis in which a rotation of  $180^\circ$  produces no change.

**Tygacil:** (Other name for: tigecycline)

**Tykerb :** A drug used with another anticancer drug to treat breast cancer that is HER2 positive and has advanced or metastasized (spread to other parts of the body) after treatment with other drugs. Tykerb is also being studied in the treatment of other types of cancer. It is a type of ErbB-2 and EGFR dual tyrosine kinase inhibitor. Also called GW572016, lapatinib, and lapatinib ditosylate.

**Tylenol:** (Other name for: acetaminophen)

**tympanites :** Swelling of the abdomen caused by gas in the intestines or peritoneal cavity. Also called meteorism.

**Tyndall Effect:** The effect of light scattering on particles in colloid systems, such as suspensions or emulsions.

**type 3 serotonin receptor antagonist :** A type of drug used to treat certain types of irritable bowel syndrome and relieve nausea and vomiting. It is a type of antiemetic. Also called 5-HT<sub>3</sub> receptor antagonist and 5-hydroxytryptamine 3 receptor antagonist.

**type C thymoma :** A rare type of thymus gland cancer. It usually spreads, has a high risk of recurrence, and has a poor survival rate. Thymic carcinoma is divided into subtypes, depending on the types of cells in which the cancer began. Also called thymic carcinoma.

**type-1 polarized dendritic cell-induced antigen-specific autologous cytotoxic T lymphocytes:** A preparation of autologous cytotoxic T lymphocytes (CTL), specifically reactive to melanoma-associated antigen 3 (MAGE-3), MAGE-4, survivin, human epidermal growth factor receptor 2 (HER2; ERBB2) and cyclooxygenase-2 (COX-2), with potential immunomodulating activity. Peripheral blood mononuclear cells (PBMCs) are collected from the patient. Subsequently, autologous dendritic cells (DCs) are separated, treated with a certain combination of cytokines to produce polarized type-1 DCs (DC1), and then are loaded with MAGE-3/MAGE-4/survivin/HER2/COX-2 CTL epitope peptides. In turn, autologous CTLs are collected, exposed ex vivo to the antigen-loaded DC1s and subsequently expanded in vitro. Upon re-infusion of the DC1-induced MAGE-3/MAGE-4/survivin/HER2/COX-2-specific autologous CTLs, the CTLs target and lyse tumor cells expressing the tumor-associated antigens (TAAs). Exposure to DC1s generates more potent CTLs and thus induces a more potent CTL response against TAA-expressing tumor cells. The

targeted TAAs play key roles in cellular proliferation and are overexpressed by a variety of cancer cell types. Check for active clinical trials using this agent.

**typhoid vaccine:** A bacterial vaccine used to prevent typhoid fever, which is caused by *Salmonella typhi* bacteria.

**tyrosyleptide:** A tripeptide consisting of tyrosine, serine, and leucine with potential antineoplastic activity. Although the mechanism of its antitumor activity has yet to be fully elucidated, tyrosyleptide appears to inhibit the expression of ICAM-1 (CD54), a cell adhesion factor of the immunoglobulin (Ig) superfamily that plays an important role in the invasion, adhesion, and metastasis of tumor cells. In addition, this agent may influence the Ca<sup>2+</sup>/calmodulin pathway, inhibiting phosphatidylinositol 3 kinase (PI3K); PI3K is upregulated in tumor cells and is involved in cellular proliferation.

**tyrosinase peptide:** One of a number of recombinant peptides consisting of amino acid residues of the enzyme tyrosinase, a protein frequently expressed by melanoma cells. Vaccination with tyrosinase peptide may stimulate cytotoxic T lymphocyte response against tyrosinase-expressing tumor cells, resulting in decreased tumor growth. OR A protein that is made from tumor cells and is used in a vaccine against melanoma. A tyrosinase peptide vaccine may stimulate the body's immune system to find and kill melanoma cells.

**tyrosinase-related protein-1:** A recombinant peptide of the tyrosinase-related protein 1 (TRP1) used in vaccine therapy. Expressed by cells of melanocyte origin, TRP1 is an enzyme involved in the process that converts tyrosinase to melanin pigments. Vaccination with TRP1 may stimulate cytotoxic T cell responses to melanoma cells.

**tyrosine kinase inhibitor :** A substance that blocks the action of enzymes called tyrosine kinases. Tyrosine kinases are a part of many cell functions, including cell signaling, growth, and division. These enzymes may be too active or found at high levels in some types of cancer cells, and blocking them may help keep cancer cells from growing. Some tyrosine kinase inhibitors are used to treat cancer. They are a type of targeted therapy.

**tyrosine kinase inhibitor BIBF 1120 :** A substance being studied in the treatment of some types of cancer. Tyrosine kinase inhibitor BIBF 1120 blocks enzymes needed for cells to grow, and may prevent the growth of

new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called BIBF 1120.

**tyrosine kinase inhibitor OSI-930:** A selective thiophene-derived tyrosine kinase inhibitor with potential antineoplastic activity. Tyrosine kinase inhibitor OSI-930 inhibits stem cell factor receptor (c-Kit) and the vascular endothelial growth factor receptor 2 (VEGFR2), which may result in the inhibition of both tumor cell proliferation and tumor angiogenesis. Both c-Kit and VEGFR2 are overexpressed in a variety of cancers.

**tyrosine kinase inhibitor XL228:** A synthetic molecule that targets multiple tyrosine kinases with potential antineoplastic activity. Tyrosine kinase inhibitor XL228 binds to and inhibits the activities of multiple tyrosine kinases, such as the insulin-like growth factor 1 receptor (IGF1R), Src tyrosine kinase, and Bcr-Abl tyrosine kinase. Blockade of these kinases may result in the inhibition of tumor angiogenesis, cell proliferation, and metastasis. In addition, this agent may be a potent inhibitor of the T315I mutant form of the Abl protein, which is associated with the resistance of chronic myelogenous leukemia (CML) to other tyrosine kinase inhibitors. IGF1R and Src tyrosine kinases are upregulated in many tumor cells and play important roles in tumor cell proliferation and metastasis. Bcr-Abl translocation leads to constitutive activation of ABL kinase and is commonly associated with Philadelphia-positive acute lymphocytic leukemia (ALL).

**tyrosinemia :** A rare, inherited disorder marked by high blood levels of a protein building block called tyrosine. This can cause a harmful buildup of tyrosine and other substances in the body's tissues and organs, especially in the liver, kidney, and nervous system. This can lead to serious medical problems and may increase the risk of liver cancer. Tyrosinemia is caused by mutations (changes) in certain genes that make enzymes needed to break down tyrosine.

**Tysabri:** (Other name for: natalizumab)

**Tyzeka:** (Other name for: telbivudine)

**TZ:** Triple-zeta. See "DZ."

**TZ2P:** Triple-zeta with two sets of polarization functions. See "DZP."

**TZP:** Triple-zeta with polarization. See "DZP."

**TZT-1027:** A substance being studied in the treatment of cancer. It is a type of tubulin inhibitor. Also called soblidotin.

**u-plasminogen activator :** An enzyme that is made in the kidney and found in the urine. A form of this enzyme is made in the laboratory and used to dissolve blood clots or to prevent them from forming. Also called uPA, urokinase, and urokinase-plasminogen activator.

**U.V. Inhibitor:** a chemical added to a plastic resin, which absorbs uv light and helps prevent damage to and prolongs the life of the plastic. Tinuvin compounds (hindered amine light stabilizers from ciba-geigy) are an example. (see uv stabilizer).

**U.V. Stabilizer (ultraviolet):** any chemical compound which, when admixed with a thermoplastic resin, selectively absorbs uv rays and minimizes chemical and/or physical changes that may be caused. (see uv inhibitor).

**UAE inhibitor MLN7243:** A small molecule inhibitor of ubiquitin-activating enzyme (UAE), with potential antineoplastic activity. UAE inhibitor MLN7243 binds to and inhibits UAE, which prevents both protein ubiquitination and subsequent protein degradation by the proteasome. This results in an excess of proteins in the cells and may lead to endoplasmic reticulum (ER) stress-mediated apoptosis. This inhibits tumor cell proliferation and survival. UAE, also called ubiquitin E1 enzyme (UBA1; E1), is more active in cancer cells than in normal, healthy cells.

**ubiquinone :** A nutrient that the body needs in small amounts to function and stay healthy. Ubiquinone helps mitochondria (small structures in the cell) make energy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Ubiquinone is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, beef, soybeans, peanuts, and spinach. It is being studied in the prevention and treatment of some types of cancer and heart disease and in the relief of side effects caused by some cancer treatments. Also called coenzyme Q10, CoQ10, Q10, and vitamin Q10.

**Ubiquitin:** Present in all eukaryotes, a small, highly conserved protein that, when attached to another protein, targets it for proteolytic destruction.

**ublituximab:** A chimeric recombinant IgG1 monoclonal antibody directed against human CD20 with potential antineoplastic activity. Ublituximab specifically binds to the B cell-specific cell surface antigen CD20, thereby

potentially inducing a B cell-directed complement dependent cytotoxicity (CDC) and antibody-dependent cell-mediated cytotoxicity (ADCC) against CD20-expressing B cells, leading to B cell apoptosis. CD20 is a non-glycosylated cell surface phosphoprotein that is exclusively expressed on B cells during most stages of B cell development and is often overexpressed in B-cell malignancies. Ublituximab has a specific glycosylation profile, with a low fucose content, that may enhance its ADCC response against malignant B cells.

**UCN-01:** An anticancer drug that belongs to the family of drugs called staurosporine analogs.

**ildenafil:** A benzenesulfonamide derivative with vasodilatory activity. Sildenafil selectively inhibits phosphodiesterase type 5 (PDE5), thus inhibiting the degradation of cyclic guanosine monophosphate (cGMP) found in the smooth muscle of the corpus cavernosa and corpus spongiosum of the penis; inhibition of cGMP degradation results in prolonged muscle relaxation, vasodilation, and blood engorgement of the corpus cavernosa, and, so, prolonged penile erection. This agent does not significantly inhibit the PDE11 isozyme; PDE11 inhibition may be associated with significant myalgia. Check for active clinical trials using this agent.

**UFT:** A substance being studied in the treatment of some types of cancer. It is a combination of tegafur and uracil. The tegafur is taken up by the cancer cells and breaks down into 5-FU, a substance that kills tumor cells. The uracil causes higher amounts of 5-FU to stay inside the cells and kill them. UFT is a type of antimetabolite. Also called Ftorafur and tegafur-uracil.

**UGT1A1:** A substance that is being studied as a treatment for cancer. It is an enzyme produced by the liver and intestine.

**UHF:** Spin-unrestricted Hartree-Fock. For open-shell molecules. There are separate orbitals for spin-up (alpha) and for spin-down (beta) electrons. UHF wavefunctions are usually not eigenfunctions of spin, and are often contaminated by states of higher spin multiplicity (which usually raises the energy; see PUHF).

**UL Temperature Index :** The maximum temperature below which a material maintains its electrical and mechanical integrity over a reasonable period.

**ulcer :** A break on the skin, in the lining of an organ, or on the surface of a tissue. An ulcer forms when the surface cells become inflamed, die, and are

shed. Ulcers may be linked to cancer and other diseases.

**ulceration** : The formation of a break on the skin or on the surface of an organ. An ulcer forms when the surface cells die and are cast off. Ulcers may be associated with cancer and other diseases.

**ulcerative colitis** : Chronic inflammation of the colon that produces ulcers in its lining. This condition is marked by abdominal pain, cramps, and loose discharges of pus, blood, and mucus from the bowel.

**ULDPE / VLDPE**: Specialized form of linear low-density polyethylene having density between .86 and .90 grams/cc.

**ulimorelin hydrochloride**: The hydrochloride salt form of ulimorelin, a macrocyclic ghrelin peptidomimetic, with potential gastrointestinal (GI) prokinetic activity. Upon intravenous administration, ulimorelin binds to the ghrelin receptor in the GI tract and may stimulate GI motility. Ghrelin is a natural ligand for growth hormone secretagogue receptors and is normally localized in the proximal GI tract. The ghrelin receptor signaling pathway mediates multiple GI functions, including motility and gastric emptying. Check for active clinical trials using this agent.

**ulinastatin**: A multivalent Kunitz-type serine protease inhibitor derived from human urine, with potential protective, anti-fibrinolytic and anticoagulant activities. Upon administration, ulinastatin (or urinary trypsinogen inhibitor) inhibits the activities of a variety of enzymes, including trypsin, chymotrypsin, thrombin, kallikrein, plasmin, elastase, cathepsin, lipase, hyaluronidase, factors IXa, Xa, XIa, and XIIa, and polymorphonuclear leukocyte elastase. In addition, ulinastatin inhibits the excessive release of proinflammatory mediators, such as tumor necrosis factor-alpha, interleukin-6 and -8, and chemokines. Altogether, this agent may improve the microcirculation, perfusion and function of tissues and may protect organ injury.

**ulipristal acetate**: An orally bioavailable, acetate ester of ulipristal, a selective progesterone receptor modulator with anti-progesterone activity. Ulipristal binds to the progesterone receptor (PR), thereby inhibiting PR-mediated gene expression, and interfering with progesterone activity in the reproductive system. As a result, this agent may suppress the growth of uterine leiomyomatosis. Furthermore, by inhibiting or delaying ovulation and effecting endometrial tissue, ulipristal can be used as an emergency contraception. Check for active clinical trials using this agent.

**Ulmus fulva :** The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, Indian elm, red elm, slippery elm, sweet elm, and *Ulmus rubra*.

**Ulmus rubra :** The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, Indian elm, red elm, slippery elm, sweet elm, and *Ulmus fulva*.

**ulocuplumab:** An orally bioavailable monoclonal antibody against CXC chemokine receptor 4 (CXCR4) with potential antineoplastic activity. Ulocuplumab binds to the chemokine receptor CXCR4, preventing the binding of stromal derived factor-1 (SDF-1) to the CXCR4 receptor and subsequent receptor activation, which may result in decreased tumor cell proliferation and migration. CXCR4, a chemokine receptor belonging to the G protein-coupled receptor family, plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types.

**Uloric:** (Other name for: febuxostat)

**Ultandren:** (Other name for: fluoxymesterone)

**Ultane:** (Other name for: sevoflurane)

**Ultimate Elongation:** In a tensile test the elongation at rupture.

**Ultimate Strength:** Term used to describe the maximum unit stress a material will withstand when subjected to an applied load in a compression, tension, flexural, or shear test. OR The maximum stress developed in a tensile/compression specimen. OR Term used to describe the maximum unit stress a material will withstand when subjected to an applied load in a compression, tension, or shear test.

**Ultiva:** (Other name for: remifentanil hydrochloride)

**ultra light cigarette :** A type of cigarette that is claimed to give off less tobacco tar than a regular or light (“low-tar”) cigarette when smoked. Ultra light cigarettes have been shown to be no safer than regular cigarettes, and smoking them does not lower the risk of cancer or other diseases. A person smoking an ultra light cigarette can inhale the same amount of tobacco tar, nicotine, and harmful, cancer-causing chemicals as in a regular cigarette, depending on how the cigarette is smoked. Cigarettes are no longer allowed to be labeled or advertised as ultra light cigarettes.

**Ultracentrifugation:** High-speed centrifugation used to separate biomolecules and determine their masses.

**Ultracentrifuge:** A high-speed centrifuge that can attain speeds up to 60,000 rpm and centrifugal fields of 500,000 times gravity Useful for characterizing and/or separating macromolecules.

**Ultradine:** (Other name for: povidone-iodine solution)

**Ultram :** A drug used to treat moderate to severe pain in adults. It binds to opioid receptors in the central nervous system. Ultram is a type of analgesic agent and a type of opioid. Also called tramadol hydrochloride.

**ultramafic rock:** rock consisting almost entirely of ferromagnesian minerals and having no feldspars or quartz.

**ULTRASONIC INSERTION:** The inserting of a metal insert into a thermoplastic part by the application of vibratory mechanical pressure at ultrasonic frequencies.

**Ultrasonic Sealing:** A film sealing method in which sealing is accomplished through the application of vibratory mechanical pressure at ultrasonic frequencies (20 to 40 KC.). Electrical energy is converted to ultrasonic vibrations through the use of either a magnetostrictive or piezoelectric transducer. The vibratory pressures at the film interface in the sealing area develop localized heat losses which melt the plastic surfaces effecting the seal.

**ULTRASONIC SEALING OR BONDING:** A sealing method in which sealing is accomplished through the application of vibratory mechanical pressure at ultrasonic frequencies (20 to 40 kc.). Electrical energy is converted to ultrasonic vibrations through the use of either a magnetostrictive or piezoelectric transducer. The vibratory pressures at the interface in the sealing area develop localized heat losses which melt the plastic surfaces affecting the seal.

**Ultrasonic Welding:** An industrial technique whereby high-frequency ultrasonic acoustic vibrations are locally applied to work pieces being held together under pressure to create a solid-state weld. In ultrasonic welding, there are no connective bolts, nails, soldering materials, or adhesives necessary to bind the materials together. OR An industrial technique whereby high-frequency ultrasonic acoustic vibrations are locally applied to workpieces being held together under pressure to create a solid-state weld.

It is commonly used for plastics, and especially for joining dissimilar materials.

**ultrasonogram :** A computer picture of areas inside the body created by high-energy sound waves. The sound waves are bounced off internal tissues or organs and make echoes. The echoes form a picture of the body tissues on a computer screen. An ultrasonogram may be used to help diagnose disease, such as cancer. It may also be used during pregnancy to check the fetus (unborn baby) and during medical procedures, such as biopsies. Also called sonogram.

**ultrasonography :** A procedure that uses high-energy sound waves to look at tissues and organs inside the body. The sound waves make echoes that form pictures of the tissues and organs on a computer screen (sonogram). Ultrasonography may be used to help diagnose diseases, such as cancer. It may also be used during pregnancy to check the fetus (unborn baby) and during medical procedures, such as biopsies. Also called ultrasound.

**ultrasound :** A procedure that uses high-energy sound waves to look at tissues and organs inside the body. The sound waves make echoes that form pictures of the tissues and organs on a computer screen (sonogram). Ultrasound may be used to help diagnose diseases, such as cancer. It may also be used during pregnancy to check the fetus (unborn baby) and during medical procedures, such as biopsies. Also called ultrasonography.

**ultrasound biomicroscopy :** A type of ultrasound eye exam that makes a more detailed image than regular ultrasound. High-energy sound waves are bounced off the inside of the eye and the echo patterns are shown on the screen of an ultrasound machine. This makes a picture called a sonogram.

**ultrasound energy :** A form of therapy being studied as an anticancer treatment. Intensified ultrasound energy can be directed at cancer cells to heat them and kill them.

**ultrasound transducer :** A device that produces sound waves that bounce off body tissues and make echoes. The transducer also receives the echoes and sends them to a computer that uses them to create a picture called a sonogram. Transducers (probes) come in different shapes and sizes for use in making pictures of different parts of the body. The transducer may be passed over the surface of the body or inserted into an opening such as the rectum or vagina.

**ultrasound-guided biopsy :** A biopsy procedure that uses an ultrasound imaging device to find an abnormal area of tissue and guide its removal for examination under a microscope.

**Ultraviolet:** Electromagnetic radiation of a wavelength between the shortest visible violet and low energy x-rays. Or Zone of invisible radiation beyond the violet end of the spectrum of visible radiation. Since UV wavelengths are shorter than the visible, their photons have more energy, enough to initiate some chemical reactions and to degrade most plastics.

**ultraviolet (UV) radiation:** Electromagnetic radiation in the region of 200 to 400 nm.

**ULTRAVIOLET (UV) STABILIZER:** Chemical agents which absorb or screen out radiation beyond the violet end of the spectrum of electromagnetic radiation. Such radiation has sufficient energy to initiate reactions leading to the degradation of many plastics. These agents are often combined with other additives, e.g., heat stabilizers and antioxidants, with which they act in synergistic fashion. UV stabilizers can be UV absorbers or radical scavengers.

**ultraviolet A radiation :** Invisible rays that are part of the energy that comes from the sun. Ultraviolet A radiation also comes from sun lamps and tanning beds. Ultraviolet A radiation may cause premature aging of the skin and skin cancer. It may also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from ultraviolet radiation. In medicine, ultraviolet A radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called UVA radiation.

**ultraviolet B radiation :** Invisible rays that are part of the energy that comes from the sun. Ultraviolet B radiation causes sunburn, darkening and thickening of the outer layer of the skin, and melanoma and other types of skin cancer. It may also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from ultraviolet radiation. In medicine, ultraviolet B radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called UVB radiation.

**ultraviolet C radiation :** Invisible rays that are part of the energy that comes from the sun. Most ultraviolet C radiation from the sun is blocked from the Earth's surface by the ozone layer. In medicine, ultraviolet C radiation may also come from special lamps or a laser and is used to kill germs or to help heal wounds. It is also used to treat certain skin conditions such as psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma. Also called UVC radiation.

**Ultraviolet Inhibitor:** Retards the degrading effect of sunlight on polyethylene.

**ultraviolet light:** Electromagnetic radiation with wavelength longer than that of x-rays but shorter than that of visible light. Ultraviolet light can break some chemical bonds and cause cell damage.

**ultraviolet radiation :** Invisible rays that are part of the energy that comes from the sun. Ultraviolet radiation that reaches the Earth's surface is made up of two types of rays, called UVA and UVB. Ultraviolet radiation also comes from sun lamps and tanning beds. It can cause skin damage, premature aging, melanoma, and other types of skin cancer. It can also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from both kinds of ultraviolet radiation. In medicine, ultraviolet radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called UV radiation.

**ultraviolet radiation therapy :** A form of radiation used in the treatment of cancer.

**Ultraviolet spectroscopy:** An analytical spectroscopic technique used to study the electronic excitation of a substance. Application of this technique usually requires dissolution of the sample. Or a spectroscopy that measures how much energy a molecule absorbs in the ultraviolet region of the spectrum.

**Ultraviolet-visible Spectroscopy (UV-Vis):** An absorption spectroscopy technique that uses the ultraviolet-visible regions of the electromagnetic spectrum.

**Ultravist:** (Other name for: iopromide)

**Ultresa:** (Other name for: pancrelipase)

**ULvWF multimer-targeting agent ARC1779:** An optimized, second-generation, PEGylated aptamer with antithrombotic property. ULvWF multimer-targeting agent ARC1779 blocks the binding of von Willebrand factor (vWF), via the A1 domain, and ultra-large vWF multimers to platelets, as well as interfering with the binding of platelet receptor glycoprotein Ib, thus reducing platelet adhesion, aggregation and thrombus growth in arterial beds. Unlike other antiplatelet agents, this aptamer can be readily reversed by binding to a complementary sequence of oligonucleotides, and may therefore offer potential therapeutic benefit in surgery.

**umbilical cord:** the source of attachment of the fetus to the maternal blood supply.

**umbilical cord blood :** Blood from the umbilical cord of a newborn baby. This blood contains high concentrations of stem cells (cells from which all blood cells develop).

**umbilical cord blood transplantation :** The injection of umbilical cord blood to restore an individual's own blood production system suppressed by anticancer drugs, radiation therapy, or both. It is being studied in the treatment of cancer and severe blood disorders such as aplastic anemia. Cord blood contains high concentrations of stem cells (cells from which all blood cells develop).

**umbilical cord blood-derived hematopoietic CD34-positive progenitor cells:** A population of cryopreserved, ex vivo expanded and nicotinamide (NAM)-treated, CD34-positive hematopoietic progenitor cells (HPCs) derived from allogeneic, CD34+ cells isolated from human umbilical cord blood (UCB) that can be used during transplantation. CD34+ HPCs are isolated from human UCB mononuclear cells, and expanded ex vivo. Upon transplantation with the UCB-derived CD34+ HPCs, these cells can differentiate into a variety of cell types including fibroblasts, osteoblasts, chondrocytes, myocytes, adipocytes, and endothelial cells. Compared to bone marrow transplants, these HPCs are associated with decreased risk of causing graft-versus host disease (GvHD), increased survival, and enhanced transplant and engraftment potential for any given patient as there is no need for a matched donor. Compared to untreated HPCs, treating the cells ex vivo with NAM increases the number of HPCs from UCB, enhances migration, bone marrow (BM) homing, engraftment and increases

neutrophil and platelet recovery. Check for active clinical trials using this agent.

**umbilical cord blood-derived mesenchymal stem cells:** Multipotent stem cells of mesenchymal origin isolated from umbilical cord blood. Umbilical cord blood-derived mesenchymal stem cells can differentiate into a variety of cell types including fibroblasts, osteoblasts, chondrocytes, myocytes, adipocytes, and endothelial cells.

**umbilical cord blood-derived natural killer cells:** A population of allogeneic, cytokine-differentiated, highly lytic natural killer (NK) cells derived from CD34+ cells isolated from human umbilical cord blood (UCB) with potential cytotoxic activity. CD34+ hematopoietic stem cells (HSC) are isolated from human UCB mononuclear cells, differentiated into mature, highly lytic, CD3- CD56+ NK cells, by a specific combination of cytokines that includes stem cell factor (SCF), fms-related tyrosine kinase 3 ligand (Flt3-L), interleukin-15 (IL-15) and insulin-like growth factor-1 (IGF-1), and expanded *ex vivo*. Upon administration, the UCB-derived NK cells may lyse cancer cells.

**umbra:** the darkest part of a shadow.

**UMP2:** MP2 theory using a UHF reference. Likewise UMP3, UMP4, UCCSD, etc.

**unaffected :** An individual who does not manifest symptoms of a condition or disease occurring in his or her family.

**Unasyn:** (Other name for: ampicillin sodium/sulbactam sodium)

**Uncaria tomentosa extract:** An extract of *Uncaria tomentosa* (U. tomentosa), also called Cat's claw, a native Amazonian plant belonging to the Rubiaceae species, with potential anti-inflammatory, immunomodulating, antioxidant and antineoplastic activities. Although the exact mechanism(s) by which U. tomentosa extract exerts its effect(s) has yet to be fully elucidated, this extract may inhibit the proliferation of certain types of cancer cells. This extract may modulate inflammatory and immune responses through the stimulation of T- and B-lymphocytes and certain cytokines, including interleukin (IL)-1, IL-6 and tumor necrosis factor-alpha (TNF-a). Components in U. tomentosa may both induce repair of chemically-induced DNA damage and scavenge free radicals, which may protect against reactive oxygen species (ROS)-mediated cellular damage. In

addition, this extract stimulates myelopoiesis, which may prevent chemotherapy-induced neutropenia.

**Uncertainty (of a measurement):** parameter associated with the results of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand.

**uncertainty principle:** The exact momentum and exact location of a particle cannot be specified. Werner Heisenberg stated that the product of uncertainties in location and momentum measurements can never be smaller than  $h/4$ , where  $h$  is Planck's constant.

**Uncertainty range:** Defines an interval within which a numerical result is expected to lie within a specified level of confidence. The interval often used is the 5-95 percentile of the distribution reporting the uncertainty.

**unclassified variant :** A variation in a genetic sequence whose association with disease risk is unknown. Also called variant of uncertain significance, variant of unknown significance, and VUS.

**unconfined aquifer:** an aquifer that does not have a confining bed that separates the zone of saturation from the unsaturated units above it.

**unconformity:** a break or gap in the rock record where layers of rock have been eroded. Or an erosional contact between two rocks in which the upper unit is usually much younger than the lower unit.

**uncontrolled study :** A clinical study that lacks a comparison (i.e., a control) group.

**unconventional cancer treatments :** Approaches that use substances or methods of treating cancer that have not been shown to be effective by accepted scientific methods, such as carefully designed clinical trials.

**uncoupling agent:** A substance that uncouples phosphorylation of ADP from electron transfer; for example, 2,4-dinitrophenol.

**Uncoupling protein:** A mitochondrial membrane protein that plays a role in thermogenesis by forming a pathway for the flow of protons into the mitochondria, thereby generating heat without synthesizing ATP. Also called thermogenin.

**Under-drawing:** Describes the formation of a false ceiling by covering in roof trusses or beams with a light structure of building board or similar material.

**underactive thyroid :** Too little thyroid hormone. Symptoms include weight gain, constipation, dry skin, and sensitivity to the cold. Also called hypothyroidism.

**Undercoat:** A paint coating applied after the primer and before the finishing coat. In relation to timber an undercoat helps fill the grain to give a good basis for a gloss coat and in all cases the use of the right undercoat is essential to achieve the correct colour of the top coat.

**UNDERCOAT:** A primer or intermediate coating before the finish coating.

**Undercut:** Can be a design flaw that results in an indentation or protrusion that inhibits the ejection of the part from the mold. Other times undercuts are designed into a mold to ensure a part holds onto the correct side of the mold. OR Create larger nesting dimensions within the parts, the undercut design determines the stacking function of the final product. Undercuts also allow for reversed draft angles that provide a good snap fit between thermoformed products and their lids. Undercut features require precise detail, otherwise the snap will be weak and not serve its purpose. OR The dominant flow of two confronting flows, over the other. The lesser flow reverses direction giving poor surface appearance and structural strength. Underflow should be avoided by positioning gates so that the flow fronts meet at the end of filling. OR (a.) Having a protuberance or indentation that impedes withdrawal from a two-piece, rigid mold. Flexible materials can be ejected intact even with slight undercuts. (n.) Any such protuberance or indentation; depends also on design of mold. OR A portion of the part that shadows another portion of the part, creating an interlock between the part and one or both of the mold halves. An example is a hole perpendicular to the mold opening direction bored into the side of a part. An undercut prevents the part from being ejected, or the mold from opening, or both.

**Undersaturation:** The condition when solution concentration is less than the saturation value (i.e., when solute concentration is less than its solubility in the respective solvent).

**undescended testicles :** A condition in which one or both testicles fail to move from the abdomen, where they develop before birth, into the scrotum. Undescended testicles may increase the risk for development of testicular cancer. Also called cryptorchidism.

**undifferentiated :** A term used to describe cells or tissues that do not have specialized ("mature") structures or functions. Undifferentiated cancer cells

often grow and spread quickly.

**ungraded stream:** a stream that is still actively downcutting its course and smoothing out irregularities in its gradient through erosion.

**unguent :** A substance used on the skin to soothe or heal wounds, burns, rashes, scrapes, or other skin problems. Also called ointment.

**Uni-Directional Weave :** A conventional weave fabric in which all spirals are of the same weave - either right or left. Also known as one-directional weave.

**Uniaxial crystal:** An anisotropic crystal in which the velocities of both plane-polarized light components traveling through the crystal are equal; a crystal with only one optical axis. These crystals typically belong to the hexagonal or tetragonal crystal systems.

**Unidirectional Flow Pattern:** Plastic flowing in one direction with a straight flow front throughout filling.

**Unidirectional replication:** Unidirectional replication. See bidirectional replication.

**Uniform Cooling Time:** Cooling time the same throughout the part to avoid warping.

**uniformitarianism:** the principle that the geologic processes we see today were active in the geologic past.

**uniformly-labeled [U-13C] glucose:** A non-radioactive, naturally occurring carbon 13 (<sup>13</sup>C) glucose isotopomer in which all six carbons are <sup>13</sup>C, with potential imaging application. Upon administration of uniformly-labeled [U-13C] glucose, the glucose is taken up and metabolized by tumors and the <sup>13</sup>C-containing metabolites can be imaged by <sup>13</sup>C nuclear magnetic resonance (NMR) spectroscopy. Since tumor cells take up and metabolize glucose in higher amounts and through different pathways than normal cells, this agent may help assess the metabolic phenotype of the tumor. Check for active clinical trials using this agent.

**unilateral :** Having to do with one side of the body.

**unilateral salpingo-oophorectomy :** Surgery to remove the ovary and fallopian tube on one side of the body.

**unimolecular reaction:** A reaction that involves isomerization or decomposition of a single molecule.

**uninformative :** A negative test result in an individual where a clearly deleterious mutation has not been found in any family members. The genetic risk status of such an individual must be interpreted in the context of his or her personal and family history. Also called inconclusive and indeterminate.

**Uniphyl:** (Other name for: theophylline)

**uniport:** A transport system that carries only one solute, as distinct from cotransport.

**unit:** A set magnitude of measurements used to express a certain type of physical quantity such as length, mass, and time. The SI units replaced previous used system of units for scientific purposes. Or A standard for comparison in measurements. For example, the meter is a standard length which may be compared to any object to describe its length.

**Unit cavity:** a mold with only one cavity, usually a pilot for the production set of molds.

**Unit cell:** The smallest three-dimensional volume element from which the crystal can be constructed. Or The simplest arrangement of atoms or molecules that regularly repeats in a crystal structure.

**UNIT MOLD:** Mold designed for quick changing interchangeable cavity parts.

**Unit-cell parameters:** The parameters (a, b, c, a, b, g) that define the crystallographic unit cell.

**United States Preventive Services Task Force :** A volunteer group of health experts who review published research and make recommendations about prevention health care methods such as screening tests, counseling, immunizations, and medicines. Before making a recommendation, the United States Preventive Services Task Force looks at the strength (scientific quality and correctness) of the evidence found in the research and the benefits and harms of each method being reviewed. Recommendations are made to help healthcare providers and patients decide whether a specific method is right for a patient's needs. The recommendations may change as new research studies are published. Also called USPSTF.

**units:** The method of measurement used for the numbers in a word problem. For example: feet, inches, dollars, degrees, and so on.

**units of measurement:** The base units of the SI system are metre (m), kilogram (kg), second (s), ampere (A), kelvin (K), candela (cd), and mole (mol) (BIPM, 1979).

**Unituxin:** (Other name for: dinutuximab)

**Unituxin :** A drug used with granulocyte-macrophage colony-stimulating factor (GM-CSF), aldesleukin (IL-2), and 13-cis-retinoic acid to treat high-risk neuroblastoma. It is used in children whose disease has improved with other anticancer treatment. Unituxin binds to a substance called GD2, which is found on some types of cancer cells. Unituxin may block GD2 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Ch14.18, dinutuximab, MOAB Ch14.18, and monoclonal antibody Ch14.18.

**Universal colourants:** A colourant which can be used for thinning water-thinned and solvent-thinned paints.

**universal indicator:** A universal indicator is an indicator which undergoes several color changes over a wide range of pH. The color is used to "indicate" pH directly. Universal indicators are usually mixtures of several indicators. OR This is a mixture of indicators which shows the strength of an acid or alkali as well as simply showing which it is. By comparison with a colour chart, a pH number can be selected. pH numbers less than 7 show an acid (the smaller the number, the stronger the acid) and pH numbers bigger than 7 show an alkali (the larger the number, the stronger the alkali).

**universal law of gravity:** formula that measures the force of gravity; developed by Isaac Newton.

**Unlined:** A closure with no special sealing features and no liner.

**unloading:** the removal of the overlying weight and pressure through erosion when a rock mass is uplifted to the surface, resulting in the mass's slow expansion.

**Unnecessary regulatory burden:** Regulatory criteria that go beyond the levels that would be reasonably expected to be imposed on licensees given that regulations apply to conditions that incorporate normal operation and design-basis conditions.

**unpaired spin:** A single electron occupying an orbital.

**UNREACTED (OIL):** Unreacted is an organic substance present in small amounts in products generally consisting of sulf(on)ation feedstock, for

example an alkylate or fatty alcohol or reaction by-products, for example, sulfones. (see RFF 705.10.53 - UNREACTED OIL).

**Unreactive** : A substance for which reactions are difficult. Unreactive substances come at the bottom of a reactivity series. A typical unreactive metal is gold. Iodine is a typical unreactive non-metal.

**unresectable** : Unable to be removed with surgery.

**unresectable gallbladder cancer** : Cancer that has spread to the tissues around the gallbladder (such as the liver, stomach, pancreas, intestine, or lymph nodes in the area) and cannot be surgically removed.

**unresected** : Describes an organ, tissue, or cancer that has not been either partly or completely removed by surgery.

**unrestricted:** See UHF.

**Unrestricted area:** The area outside the owner-controlled portion of a nuclear facility (usually the site boundary). An area in which a person could not be exposed to radiation levels in excess of 2 millirems in any one hour from external sources (see 10 CFR 20.1003).

**unsaturated:** any chemical compound with more than one bond between adjacent atoms, usually carbon, and thus reactive toward the addition of other atoms at that point; for example: olefins, diolefins, and unsaturated fatty acids. Or An organic compound with one or more double or triple covalent bonds between carbon atoms in each molecule. or An unsaturated solution has not reached the maximum amount of solute. You can easily dissolve a tablespoon of sugar in a glass of water. Since you can still dissolve more the solution, it is considered to be unsaturated. or An unsaturated hydrocarbon is a substance that contains only carbon atoms and hydrogen atoms and it must contain at least one carbon-carbon double bond. Alkenes are unsaturated hydrocarbons. So are alkynes

**unsaturated compound:** a compound that contains one or more multiple bonds; for example, alkenes and alkynes.

**unsaturated compound:** An organic compound with molecules containing one or more double bonds.

**unsaturated fat:** A lipid containing one or more carbon-carbon double bonds. Unsaturated fats tend to be oily liquids and are obtained from plants.

**unsaturated fatty acid:** A fatty acid containing one or more double bonds.

**unsaturated hydrocarbon:** Unsaturated hydrocarbons are compounds made up of molecules containing carbon and hydrogen atoms only, with one or more double covalent bonds between their carbon atoms.

**Unsaturated polyester resin:** A condensation product made by reacting an unsaturated dicarboxylic acid with a diol.

**unsaturated solution:** A solution in which more solute can be dissolved at a given temperature. Or A solution with a concentration lower than its equilibrium solubility.

**unsaturated zone:** rock and soil in which pore spaces contain both air and water and therefore are not saturated.

**unsaturation:** refers to a molecule containing less than the maximum number of single bonds possible because of the presence of multiple bonds.

**unsealed internal radiation therapy :** Radiation therapy given by injecting a radioactive substance into the bloodstream or a body cavity, or by swallowing it. This substance is not sealed in a container.

**unstable:** See instability.

**Unstable isotope:** A radioactive isotope (see also stable isotope).

**UNSULFATED MATTER:** see - UNREACTED

**Unwanted Radioactive Material (Orphan Sources):** refers to sealed sources of radioactive material contained in a small volume (but not radioactively contaminated soils and bulk metals) in any one or more of the following conditions (taken from the NRC Orphan Source Initiative): 1. In an uncontrolled condition that requires removal to protect public health and safety from a radiological threat; 2. Controlled or uncontrolled, but for which a responsible party cannot be readily identified; 3. Controlled, but the material's continued security cannot be assured. If held by a licensee, the licensee has few or no options for, or is incapable of providing for, the safe disposition of the material; 4. In the possession of a person, not licensed to possess the material, who did not seek to possess the material; or 5. In the possession of a state radiological protection program for the sole purpose of mitigating a radiological threat because of one of the above conditions, and for which the state does not have a means to provide for the material's appropriate disposition

**Unwinding proteins:** Proteins that help to unwind double-stranded DNA during DNA replication.

**Up Cage :** A spiral system where the belt's travel is from bottom to top.

**uPA:** An enzyme that is made in the kidney and found in the urine. A form of this enzyme is made in the laboratory and used to dissolve blood clots or to prevent them from forming. Also called u-plasminogen activator, urokinase, and urokinase-plasminogen activator.

**updraft:** wind current moving upward in a cloud.

**uplifted coast:** a former coast that has been lifted above the present coastline by tectonic activity.

**uplifted marine terrace:** a former marine terrace that has been lifted above the present coastline by tectonic activity.

**upper endoscopy :** Examination of the inside of the stomach using an endoscope, passed through the mouth and esophagus. An endoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called gastroscopy.

**upper extremity :** The part of the body that includes the arm, wrist, and hand.

**upper gastrointestinal series :** A series of x-ray pictures of the esophagus, stomach, and duodenum (the first part of the small intestine). The x-ray pictures are taken after the patient drinks a liquid containing barium sulfate (a form of the silver-white metallic element barium). The barium sulfate coats and outlines the inner walls of the upper gastrointestinal tract so that they can be seen on the x-ray pictures. Also called upper GI series.

**upper GI series :** A series of x-ray pictures of the esophagus, stomach, and duodenum (the first part of the small intestine). The x-ray pictures are taken after the patient drinks a liquid containing barium sulfate (a form of the silver-white metallic element barium). The barium sulfate coats and outlines the inner walls of the upper gastrointestinal tract so that they can be seen on the x-ray pictures. Also called upper gastrointestinal series.

**Uprate:** See Power uprate.

**upstaging :** In cancer, changing the stage used to describe a patient's cancer from a lower stage (less extensive) to a higher stage (more extensive). Upstaging is based on the results of additional staging tests. It is important to know the stage of the disease in order to plan the best treatment.

**uptake :** The entry of a chemical substance into the body, into a cell, or into the body fluids by passage through a membrane or by other means (WHO, 1979).

**UPVC:** Unplasticized polyvinyl chloride is a rigid plastic polymer. UPVC is low maintenance and has strong resistance against chemicals, sunlight, and oxidation from water. Rigid PVC can be used for thermoplastic extrusion and is supplied in a variety of colours and strengths. Unplasticised PVC one of the stiffest polymers at ambient temperatures and is very durable. It is extremely versatile and is used for a wide variety of applications in most industry sectors.

**upwarped mountain:** a mountain that is the result of broad arching of the crust or great vertical displacement along a high-angle fault.

**upwelling:** deep ocean water is pulled to the surface by currents. Or The vertical motion of water in the ocean by which subsurface water of lower temperature and greater density moves toward the surface of the ocean. Upwelling occurs most commonly among the western coastlines of continents, but may occur anywhere in the ocean. Upwelling results when winds blowing nearly parallel to a continental coastline transport the light surface water away from the coast. Subsurface water of greater density and lower temperature replaces the surface water, and exerts a considerable influence on the weather of coastal regions. Carbon dioxide is transferred to the atmosphere in regions of upwelling. This is especially important in the Pacific equatorial regions, where 1 - 2 GtC/year may be released to the atmosphere. Upwelling also results in increased ocean productivity by transporting nutrient-rich waters to the surface layer of the ocean.

**urachus :** A fibrous cord that connects the urinary bladder to the umbilicus (navel). The urachus is formed as the allantoic stalk during fetal development and lasts through life. Also called median umbilical ligament.

**uracil :** A chemical compound that is used to make one of the building blocks of RNA. It is a type of pyrimidine. OROne of the 5 major bases (with adenine, guanine, cytosine, and thymine) which are a component of nucleic acids.

**uracil ointment:** A 0.1% topical formulation of uracil used to potentially lower the incidence of hand-foot syndrome (HFS) (or palmar-plantar erythrodysesthesia) during 5-fluorouracil (5-FU) or 5-FU prodrug capecitabine chemotherapy. Upon local administration of uracil ointment to

the skin, uracil competes with capecitabine or 5-FU as substrates for the activating enzyme thymidine phosphorylase and the metabolizing enzyme dihydropyrimidine dehydrogenase. This may prevent the production of 5-FU as well as the breakdown of 5-FU into the toxic metabolites locally. As the 5-FU metabolites are responsible for the presentation of HFS, inhibiting their formation may prevent this adverse effect. By applying a high concentration of uracil locally, the skin toxicities of 5-FU may be countered while preserving the systemic anti-cancer activity of the 5FU.

**Uranium:** Symbol:"U" Atomic Number:"92" Atomic Mass: 238.03amu. Uranium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. A very radioactive metal that can be found in nuclear facilities, weapons, and submarines. or A radioactive element with the atomic number 92 and, as found in natural ores, an atomic weight of approximately 238. The two principal natural isotopes are uranium-235 (which comprises 0.7 percent of natural uranium), which is fissile, and uranium-238 (99.3 percent of natural uranium), which is fissionable by fast neutrons and is fertile, meaning that it becomes fissile after absorbing one neutron. Natural uranium also includes a minute amount of uranium-234.

**Uranium enrichment:** The process of increasing the percentage of Uranium-235 from 0.7 percent in natural uranium to about 3 to 5 percent for use in fuel for nuclear reactors. Enrichment can be done through gaseous diffusion, gas centrifuges, or laser isotope separation.

**Uranium fuel fabrication facility:** A facility that converts enriched uranium hexafluoride (UF<sub>6</sub>) into fuel for commercial light-water power reactors, research and test reactors, and other nuclear reactors. The UF<sub>6</sub>, in solid form in containers, is heated to a gaseous form and then chemically processed to form uranium dioxide (UO<sub>2</sub>) powder. This powder is then processed into ceramic pellets and loaded into metal tubes, which are subsequently bundled into fuel assemblies. Fabrication also can involve mixed-oxide (MOX) fuel, which contains plutonium oxide mixed with either natural or depleted uranium oxide, in ceramic pellet form. For related information, see Fuel Fabrication.

**Uranium hexafluoride production facility (or uranium conversion facility):** A facility that receives natural uranium in the form of ore concentrate (known as “yellowcake”) and converts it into uranium

hexafluoride (UF<sub>6</sub>), in preparation for fabricating fuel for nuclear reactors. For additional detail, see Uranium Conversion.

**urban heat island effect:** city areas are warmer than suburbs or rural areas due to less vegetation, more land coverage and other infrastructure.

**Urea:** The generic name for urea-formaldehyde-the thermosetting compound that's used to mold light-colored closures.

**Urea:** Urea is an organic compound that occurs naturally as a product of excretion in living organisms, and is produced industrially by reacting ammonia with carbon dioxide. Urea's main use is as a fertilizer in the form of granules, prills or in aqueous solution. Urea is also an important ingredient for the manufacture of melamine, and for urea-formaldehyde resins, which are used as adhesives for wood products, paper and textiles. or a component of urine that results from amino acid breakdown in the liver.

**urea :** A substance formed by the breakdown of protein in the liver. The kidneys filter urea out of the blood and into the urine. Urea can also be made in the laboratory. A topical form of urea is being studied in the treatment of hand-foot syndrome (pain, swelling, numbness, tingling, or redness of the hands or feet that may occur as a side effect of certain anticancer drugs). Also called carbamide.

**Urea cycle:** A metabolic pathway in the liver that leads to the synthesis of urea from amino groups and CO<sub>2</sub>. The function of the pathway is to convert the ammonia resulting from catabolism to a nontoxic form, which is then secreted. Or A cyclic pathway that converts excess ammonia into urea for secretion; the first metabolic pathway to be discovered. or A metabolic pathway in vertebrates, for the synthesis of urea from amino groups and carbon dioxide; occurs in the liver.

**urea nitrogen :** Nitrogen in the blood that comes from urea (a substance formed by the breakdown of protein in the liver). The kidneys filter urea out of the blood and into the urine. A high level of urea nitrogen in the blood may be a sign of a kidney problem. Also called blood urea nitrogen and BUN.

**Urea Plastics:** Plastics based on resins made by the condensation of urea and aldehydes.

**urea/lactic acid-based cream :** A substance being studied in the treatment of hand-foot syndrome (a condition caused by chemotherapy and marked

by tingling, numbness, and red, peeling skin). Urea/lactic acid-based cream is a moisturizer that may help break down the hardened protein in dry, scaly skin and relieve these symptoms.

**urelumab:** A humanized agonistic monoclonal antibody targeting the CD137 receptor with potential immunostimulatory and antineoplastic activities. Urelumab specifically binds to and activates CD137-expressing immune cells, stimulating an immune response, in particular a cytotoxic T cell response, against tumor cells. CD137 is a member of the tumor necrosis factor (TNF)/nerve growth factor (NGF) family of receptors and is expressed by activated T- and B-lymphocytes and monocytes; its ligand has been found to play an important role in the regulation of immune responses.

**Ureotelic:** Refers to organisms in which excess ammonia is converted into urea and then excreted; most terrestrial vertebrates are ureotelic. Or Excreting excess nitrogen in the form of urea.

**ureter :** The tube that carries urine from the kidney to the bladder.

**ureteronephrectomy :** Surgery to remove a kidney and its ureter. Also called nephroureterectomy.

**ureteroscopy :** Examination of the inside of the kidney and ureter, using a ureteroscope. A ureteroscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. The ureteroscope is passed through the urethra into the bladder, ureter, and renal pelvis (part of the kidney that collects, holds, and drains urine).

**ureters:** tubes that carry waste from the kidneys to the urinary bladder for storage or release.

**Urethane:** An important resin in the coatings industry. A true urethane coating is a two-component product that cures when an isocyanate (the catalyst) prompts a chemical reaction that unites the components.

**urethra:** the path in which urine flows from the bladder to the exterior; the tube within the penis that carries the sperm.

**urethra :** The tube through which urine leaves the body. It empties urine from the bladder.

**urethral cancer :** A rare cancer that forms in tissues of the urethra (the tube through which urine empties the bladder and leaves the body). Types of urethral cancer include transitional cell carcinoma (cancer that begins in

cells that can change shape and stretch without breaking apart), squamous cell carcinoma (cancer that begins in flat cells lining the urethra), and adenocarcinoma (cancer that begins in cells that make and release mucus and other fluids).

**uric acid:** a component of urine that results from nucleic acid breakdown.

**uric acid :** A waste product left over from normal chemical processes in the body and found in the urine and blood. Abnormal buildup of uric acid in the body may cause a condition called gout. Increased levels of uric acid in the blood and urine can be a side effect of chemotherapy or radiation therapy.

**Uricotelic:** Refers to organisms in which excess ammonia is converted into the purine uric acid for secretion; birds and terrestrial reptiles are uricotelic. Or Excreting excess nitrogen in the form of urate (uric acid).

**uridine:** A nucleoside consisting of uracil and D-ribose and a component of RNA. Uridine has been studied as a rescue agent to reduce the toxicities associated with 5-fluorouracil (5-FU), thereby allowing the administration of higher doses of 5-FU in chemotherapy regimens.

**Uridine diphosphate glucose (UDP-glucose):** The activated form of glucose used in the synthesis of glycogen; formed from glucose 1-phosphate and UTP.

**uridine triacetate:** An orally bioavailable, lipophilic, triacetate prodrug form of the pyrimidine nucleoside, uridine, that can be used for uridine replacement or as an antidote for 5-fluorouracil (5-FU)-induced toxicity. Upon administration, uridine triacetate is deacetylated by esterases to produce uridine and acetate. In turn, uridine is converted to uridine triphosphate (UTP), which competes with fluorouridine triphosphate (FUTP), one of the toxic metabolites of 5-FU, for incorporation into RNA of normal cells. This prevents disruption of RNA synthesis in normal cells and limits toxicity resulting from overdose of 5-FU and 5-FU prodrugs. The FUTP-mediated damage to RNA is the main cause of 5-FU toxicities.

**uridine triacetate :** A drug used in the emergency treatment of patients who receive too much fluorouracil or capecitabine (types of anticancer drugs). It is also used in the emergency treatment of heart or central nervous system (CNS) toxicity or other serious side effects that occur within 4 days of ending treatment with fluorouracil or capecitabine. Uridine triacetate may help protect healthy cells from some of the side effects caused by

certain anticancer drugs. It is a type of cytoprotective agent. Also called PN401, triacetyluridine, and Vistogard.

**urinalysis** : A test that determines the content of the urine.

**urinary** : Having to do with urine or the organs of the body that produce and get rid of urine.

**urinary bladder**: the site where waste products are shipped from the kidney for storage or for release.

**urinary diversion** : A surgical procedure to make a new way for urine to leave the body. It may involve redirecting urine into the colon, using catheters to drain the bladder, or making an opening in the abdomen and collecting urine in a bag outside the body.

**urinary incontinence** : Inability to hold urine in the bladder.

**urinary tract** : The organs of the body that produce and discharge urine. These include the kidneys, ureters, bladder, and urethra.

**urine**: the product of the kidney; a watery solution of waste products, salts, organic compounds, uric acid, and urea.

**urine** : Fluid containing water and waste products. Urine is made by the kidneys, stored in the bladder, and leaves the body through the urethra.

**urine culture** : A laboratory test to check for bacteria, yeast, or other microorganisms in the urine. Urine cultures can help identify the type of microorganism that is causing an infection. This helps determine the best treatment. They may be used to help diagnose urinary tract infections, such as bladder infections. They may also be done after treatment for a urinary tract infection to make sure the microorganism that caused the infection is gone.

**urine cytology** : Tests performed on cells in urine to detect disease.

**URLC10 peptide/Montanide ISA51 vaccine**: A cancer vaccine containing URLC10 (up-regulated lung cancer 10) epitopes with potential immunostimulatory and antineoplastic activities. Upon administration, URLC10 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-expressing tumor cells. Up-regulated in lung and esophageal cancers, the function of URLC10 is unknown.

**URLC10-TTK-KOC1-VEGFR1-VEGFR2 multi-peptide vaccine**: A cancer vaccine containing five peptide epitopes with potential immunostimulatory and antitumor activity. Peptide epitopes in this vaccine

are derived from: URLC10 (up-regulated lung cancer 10), TTK (TTK protein kinase), KOC1 (IGF II mRNA Binding Protein 3) and VEGFRs (vascular endothelial growth factor receptors) 1 and 2. Upon administration, URLC10-TTK-KOC1-VEGFR1-VEGFR2 multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing URLC10, TTK, KCO1, VEGFR 1 and 2 peptides, resulting in cell lysis and decreased tumor growth.

**urokinase :** An enzyme that is made in the kidney and found in the urine. A form of this enzyme is made in the laboratory and used to dissolve blood clots or to prevent them from forming. Also called u-plasminogen activator, uPA, and urokinase-plasminogen activator.

**urokinase plasminogen activator (uPA)-derived peptide A6 :** A substance being studied in the treatment of cancer. Urokinase plasminogen activator (uPA)-derived peptide A6 is a small piece of a protein called urokinase (an enzyme that dissolves blood clots or prevents them from forming). It is a type of antiangiogenesis agent and a type of antimetastatic agent. Also called A6.

**urokinase-derived peptide A6:** An octapeptide (amino acids 136-143) derived from the proteolytic enzyme urokinase plasminogen activator (uPA), with potential antineoplastic activity. A6 is derived from the nonreceptor-binding domain and connecting region of urokinase. Administration of A6 inhibits the interaction of uPA with its receptor uPAR, and may inhibit endothelial cell motility and tumor cell invasion. uPA and uPAR promote extracellular matrix degradation and growth factor activation and correlate positively with angiogenesis, cancer cell invasion and metastasis.

**urokinase-plasminogen activator :** An enzyme that is made in the kidney and found in the urine. A form of this enzyme is made in the laboratory and used to dissolve blood clots or to prevent them from forming. Also called u-plasminogen activator, uPA, and urokinase.

**Urolene Blue:** (Other name for: methylene blue)

**urolithiasis:** urate kidney stones

**urologic oncologist :** A doctor who has special training in diagnosing and treating cancers of the male and female urinary tract and the male reproductive organs.

**urologist** : A doctor who has special training in diagnosing and treating diseases of the urinary organs in females and the urinary and reproductive organs in males.

**urostomy** : An operation to create an opening from inside the body to the outside, making a new way to pass urine.

**urothelial cancer** : Cancer that begins in cells called urothelial cells that line the urethra, bladder, ureters, renal pelvis, and some other organs. Urothelial cells are also called transitional cells. These cells can change shape and stretch without breaking apart. Also called transitional cell cancer.

**urothelium** : The lining of the urinary tract, including the renal pelvis, ureters, bladder, and urethra.

**Uroxatrol**: (Other name for: alfuzosin hydrochloride)

**URSO**: (Other name for: ursodiol)

**ursodiol**: A synthetically-derived form of ursodiol, a bile acid produced by the liver and secreted and stored in the gallbladder. Also produced by the Chinese black bear liver, ursodiol has been used in the treatment of liver disease for centuries. This agent dissolves or prevents cholesterol gallstones by blocking hepatic cholesterol production and decreasing bile cholesterol. Ursodiol also reduces the absorption of cholesterol from the intestinal tract. OR A drug that is used to dissolve gallstones in people who can't have surgery to remove them. It is also being studied in the prevention of colorectal cancer. Ursodiol belongs to the family of drugs called anticholelithics.

**urticaria** : Itchy, raised red areas on the skin. Urticaria are caused by a reaction to certain foods, drugs, infections, or emotional stress. Also called hives.

**US Department of Energy (DOE)**: The Federal agency established by Congress to advance the national, economic, and energy security of the United States, among other missions.

**US Department of Homeland Security (DHS)**: The Federal agency responsible for leading the unified national effort to secure the U.S. against those who seek to disrupt the American way of life. DHS is also responsible for preparing for and responding to all hazards and disasters and includes

the formerly separate Federal Emergency Management Agency, the Coast Guard, and the Secret Service.

**US Environmental Protection Agency (EPA):** The Federal agency responsible for protecting human health and safeguarding the environment. The EPA leads the Nation's environmental science, research, education, and assessment efforts to ensure that efforts to reduce environmental risk are based on the best available scientific information. The EPA also ensures that environmental protection is an integral consideration in U.S. policies.

**usage:** time in the water budget for an area when water is being used faster than it is being replenished.

**Useful life:** The period of time during which the paint film is still satisfactorily protecting and/or maintaining its decorative appearance.

**USP14/UCHL5 inhibitor VLX1570:** An inhibitor of the 19S proteasome-specific deubiquitylating enzymes (DUBs) USP14 and UCHL5, with apoptosis-inducing and antineoplastic activities. Upon administration, VLX1570 specifically binds to both USP14 and UCHL5, thereby blocking their deubiquitylating activity. This blocks the ubiquitin proteasome degradation pathway, prevents the degradation of defective proteins, and leads to an accumulation of poly-ubiquitylated proteins. This induces the unfolded protein response (UPR) and results in both the induction of tumor cell apoptosis and the inhibition of tumor cell growth. USP14 and UCHL5, overexpressed in various tumor cell types, play a key role in the correct folding and deubiquitination of proteins.

**USPSTF:** A volunteer group of health experts who review published research and make recommendations about prevention health care methods such as screening tests, counseling, immunizations, and medicines. Before making a recommendation, the USPSTF looks at the strength (scientific quality and correctness) of the evidence found in the research and the benefits and harms of each method being reviewed. Recommendations are made to help healthcare providers and patients decide whether a specific method is right for a patient's needs. The recommendations may change as new research studies are published. Also called United States Preventive Services Task Force.

**ustekinumab:** An orally available, human, IgG1kappa, monoclonal antibody directed against the p40 protein subunit of both interleukin-12 (IL-12) and IL-23, with immunomodulating activity. Upon administration,

ustekinumab binds to the p40 subunit of IL-12 and IL-23, blocking the binding of IL-12 and IL-23 to their interleukin receptors. This inhibits IL-12- and IL-23-mediated signaling and inhibits differentiation of CD4-positive T cells into Th1 and Th17 cells. This prevents Th1- and Th17-mediated responses and cytokine production. This may prevent graft versus host disease (GVHD). IL-12 and IL-23, cytokines that play a key role in the regulation of the immune system, are upregulated in immune-mediated inflammatory disorders. Both Th1 and Th17 cells play a crucial role in GVHD. Check for active clinical trials using this agent.

**usw:** This stands for "und so weiter" which is German for 'et cetera'. It is pronounced "Oont Zoh Vyter" and lends a nice air of Teutonic gravity to any statement about polymers.

**uterine cancer :** Cancer that forms in tissues of the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops). Two types of uterine cancer are endometrial cancer (cancer that begins in cells lining the uterus) and uterine sarcoma (a rare cancer that begins in muscle or other tissues in the uterus).

**uterine sarcoma :** A rare type of uterine cancer that forms in muscle or other tissues of the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops). It usually occurs after menopause. The two main types are leiomyosarcoma (cancer that begins in smooth muscle cells) and endometrial stromal sarcoma (cancer that begins in connective tissue cells).

**uterus:** a muscular organ in the pelvic cavity of female mammals; also called the womb. OR The hollow, pear-shaped organ in a woman's pelvis. The uterus is where a fetus (unborn baby) develops and grows. Also called womb.

**Utimax:** (Other name for: amoxicillin)

**UV absorber:** An additive which protects materials by absorbing UV radiation.

**UV irradiation:** Electromagnetic radiation with a wavelength shorter than that of visible light (200-390 nm) Causes damage to DNA (mainly by forming pyrimidine dimers).

**UV radiation :** Invisible rays that are part of the energy that comes from the sun. UV radiation that reaches the Earth's surface is made up of two

types of rays, called UVA and UVB. UV radiation also comes from sun lamps and tanning beds. It can cause skin damage, premature aging, melanoma, and other types of skin cancer. It can also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from both kinds of UV radiation. In medicine, UV radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called ultraviolet radiation.

**UV STABILIZER (ULTRAVIOLET):** Any chemical compound which, when admixed with a thermoplastic resin, selectively absorbs UV rays.

**UV stabiliser:** Additive which stabilises organic materials against UV radiation. OR Any chemical compound which, when mixed with a thermoplastic resin, selectively absorbs UV rays. OR Any chemical compound which, when mixed with a thermoplastic resin, selectively absorbs UV rays. It slows down the degradation through UV rays which occurs in most plastics.

**UV1 telomerase peptide vaccine:** A synthetic, peptide cancer vaccine directed against the human telomerase reverse transcriptase catalytic subunit (hTERT) with potential immunomodulating activity. Vaccination with the UV1 telomerase peptide may stimulate cytotoxic T-cells to recognize and kill telomerase-expressing cells. Telomerase, a reverse transcriptase normally repressed in healthy cells, is overexpressed in most cancer cells and plays a key role in cellular proliferation.

**UVA radiation :** Invisible rays that are part of the energy that comes from the sun. UVA radiation also comes from sun lamps and tanning beds. UVA radiation may cause premature aging of the skin and skin cancer. It may also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from ultraviolet radiation. In medicine, UVA radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called ultraviolet A radiation.

**Uvadex:** (Other name for: methoxsalen)

**UVB radiation :** Invisible rays that are part of the energy that comes from the sun. UVB radiation causes sunburn, darkening and thickening of the outer layer of the skin, and melanoma and other types of skin cancer. It may

also cause problems with the eyes and the immune system. Skin specialists recommend that people use sunscreens that protect the skin from ultraviolet radiation. In medicine, UVB radiation also comes from special lamps or a laser and is used to treat certain skin conditions such as psoriasis, vitiligo, and skin tumors of cutaneous T-cell lymphoma. Also called ultraviolet B radiation.

**UVC radiation :** Invisible rays that are part of the energy that comes from the sun. Most UVC radiation from the sun is blocked from the Earth's surface by the ozone layer. In medicine, UVC radiation may also come from special lamps or a laser and is used to kill germs or to help heal wounds. It is also used to treat certain skin conditions such as psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma Also called ultraviolet C radiation.

**uvea :** The middle layer of the wall of the eye. The uvea has 3 main parts: (1) the choroid (the tissue layer filled with blood vessels); (2) the ciliary body (the ring of muscle tissue that changes the size of the pupil and the shape of the lens); and (3) the iris (the colored part of the eye). Also called uveal tract.

**uveal tract :** The middle layer of the wall of the eye. The uveal tract has 3 main parts: (1) the choroid (the tissue layer filled with blood vessels); (2) the ciliary body (the ring of muscle tissue that changes the size of the pupil and the shape of the lens); and (3) the iris (the colored part of the eye). Also called uvea.

**UVI (acronym):** Ultra Violet Inhibitor. This is an additive used in making plastic sheeting that requires protection from sunlight.

**Uvidem:** (Other name for: autologous dendritic cell-allogeneic melanoma tumor cell lysate vaccine)

**uvula :** The soft flap of tissue that hangs down at the back of the mouth (at the edge of the soft palate). Also called palatine uvula.

**V-D-J recombination:** A means to increase antibody diversity by recombining different variable (V) genes, joining (J) genes, and diversity (D) genes to generate the entire variable regions of antibody chains; the D genes undergo recombination only in antibody heavy chains.

**V930 vaccine:** A novel cancer vaccine designed to treat HER-2- and/or CEA-expressing cancers. Check for active clinical trials using this agent.

**VAC:** An abbreviation for a chemotherapy combination used to treat rhabdomyosarcoma in children. It is also used to treat certain types of ovarian germ cell tumors. VAC includes the drugs vincristine sulfate, dactinomycin (actinomycin-D), and cyclophosphamide. Also called VAC regimen.

**VAC regimen:** A regimen consisting of vincristine, dactinomycin and cyclophosphamide, which is used for the treatment of rhabdomyosarcoma (RMS) and ovarian germ cell tumors. OR An abbreviation for a chemotherapy combination used to treat rhabdomyosarcoma in children. It is also used to treat certain types of ovarian germ cell tumors. VAC regimen includes the drugs vincristine sulfate, dactinomycin (actinomycin-D), and cyclophosphamide. Also called VAC.

**VACB:** A procedure in which a small sample of tissue is removed from the breast. An imaging device is used to guide a hollow probe connected to a vacuum device. The probe is inserted through a tiny cut made in numbed skin on the breast. The tissue sample is removed using gentle vacuum suction and a small rotating knife within the probe. Then the tissue sample is studied under a microscope to check for signs of disease. This procedure causes very little scarring and no stitches are needed. Also called vacuum-assisted biopsy and vacuum-assisted core biopsy.

**vaccinated :** Treated with a vaccine.

**vaccination :** Treatment with a vaccine.

**vaccine :** A substance or group of substances meant to cause the immune system to respond to a tumor or to microorganisms, such as bacteria or viruses. A vaccine can help the body recognize and destroy cancer cells or microorganisms.

**vaccine adjuvant :** A substance added to a vaccine to improve the immune response so that less vaccine is needed.

**vaccine therapy :** A type of treatment that uses a substance or group of substances to stimulate the immune system to destroy a tumor or infectious microorganisms such as bacteria or viruses.

**vaccine-sensitized draining lymph node cells:** Cells isolated from lymph nodes from patients, and activated in vitro to generate tumor-specific effector T cells. Lymph nodes in the lymphatics draining tumors often contain T cells that are immunologically sensitized but functionally

deficient. Vaccine-sensitized draining lymph node cells are prepared by isolating these lymphocytes in vitro and stimulating them with cytokines to differentiate into mature effector cells. Vaccine-draining lymph node cells may also be produced by pharmacological activation of lymph node-derived lymphocytes with drugs such as ionomycin or with bacterial toxin; these activated lymphocytes may be expanded in culture with cytokines such as interleukin-2 prior to infusion into the patient.

**vaccinia CEA vaccine :** A vaccine made by putting the gene for carcinoembryonic antigen (CEA) into the vaccinia virus. The vaccinia virus is related to the virus used to make the smallpox vaccine. CEA is a tumor marker. The vaccinia CEA vaccine may help the immune system recognize and kill cancer cells that make CEA.

**vaccinia virus (vvDD-CDSR):** A highly tumor-selective vaccinia virus (vv) with an engineered double deletion (DD) of the thymidine kinase (tk) and vaccinia growth factor genes and additions of both a cytosine deaminase (CD) gene and a somatostatin receptor (SR) gene with potential oncolytic viral activity. The tk and vaccinia growth factor gene deletions in intratumorally administered vaccinia virus (vvDD-CDSR) help to restrict its replication and cytolytic activity to tumor cells with large nucleotide pools and tumor cells with activation of the EGFR-Ras pathway. Addition of the CD gene to the viral genome allows control of oncolytic viral infection through the administration of the prodrug 5-fluorocytosine (5-FC), converted by CD to the antimetabolite 5-fluorouracil (5-FU) in cells infected with this agent. Addition of the SR gene allows anatomical localization of vaccinia virus (vvDD-CDSR) through the use of octreotide scintigraphy.

**vaccinia-TRICOM vaccine :** A cancer vaccine made with a form of a vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called recombinant vaccinia-TRICOM vaccine and rV-TRICOM.

**vaccinia-tyrosinase vaccine:** A vaccine consisting of recombinant vaccinia virus, based on the modified vaccinia virus Ankara (MVA), that encodes the melanoma-associated antigen tyrosinase. Vaccination with vaccinia-tyrosinase may stimulate the host immune system to mount a

cytotoxic T-cell response against tumor cells expressing tyrosinase. Tyrosinase is a melanoma-specific differentiation agent that catalyzes the synthesis of the melanin precursor L-3,4-dihydroxyphenylalanine (L-DOPA).

**Vaccinium myrtillus/Macleaya cordata/Echinacea angustifolia extract granules:** A proprietary suspension formulation prepared from granules of standardized extracts from the fruits of *Vaccinium myrtillus*, the aerial parts of *Macleaya cordata* and the roots of *Echinacea angustifolia*, with potential anti-mucositis, anti-inflammatory, and analgesic activities. The main active ingredients of this formulation include anthocyanosides and procyanidins, benzophenanthridinic alkaloids, and alkylamides from *V. myrtillus*, *M. cordata* and *E. angustifolia* extracts, respectively. Upon administration in the mucosal cavity, the anthocyanosides scavenge free radicals, form a protective barrier on the mucosa, and protect the integrity of the capillary vessels; the benzophenanthridine alkaloids prevent the production of pro-inflammatory cytokines by inhibiting NF- $\kappa$ B and may halt the growth of microorganisms; the alkylamides inhibit cyclooxygenase and 5-lipoxygenase thereby blocking productions of prostaglandin and leukotriene. Furthermore, alkylamides modulate the expression of tumor necrosis factor alpha and other cytokines involved in inflammation processes through cannabinoid type 2 receptors and as cannabinomimetics they may also exert analgesic activity. Check for active clinical trials using this agent.

**vacuole:** an organelle found in mature plant cells that stores nutrients and toxic waste.

**Vacuum:** A vacuum is a space that has no pressure and no molecules inside. It is truly and empty space. Although space has a very low pressure (almost a vacuum), there are still particles out there. Or A volume which contains no matter. Or A completely empty space. The collapsing can experiment shows the effect of the pressure of gas particles. The gas particles on the inside of the can are removed, leaving a vacuum. The pressure of the particles on the outside squash the can.

**vacuum aspiration :** A surgical procedure in which the cervix is dilated (opened) and vacuum is used to remove tissue from the uterus. Also called suction aspiration and suction evacuation.

**Vacuum forming:** A process whereby a heated plastic sheet is drawn against a mold surface by evacuating the air between it and the mold. OR A simplified version of thermoforming, whereby a sheet of plastic is heated to a forming temperature, stretched onto or into a single-surface mold, and held against the mold by applying vacuum between the mold surface and the sheet. The vacuum forming process can be used to make most custom plastic packaging, speaker casings and even car dashboards. OR A method of forming plastic sheets or films into three-dimensional shapes, in which the plastic sheet is clamped in a frame suspended above a mold, heated until it becomes softened, drawn down into contact with the mold by means of a vacuum, and cooled while in contact with the mold. Often used interchangeably with thermoforming. OR A process whereby a heated plastic sheet is drawn against a mould surface by withdrawing the air between it and the mould. It is a different process to plastic extrusion manufacturing. OR A method of forming plastic sheets or films into three-dimensional shapes, in which the plastic sheet is clamped in a frame suspended above a mold, heated until it becomes softened, drawn down into contact with the mold by means of a vacuum, and cooled while in contact with the mold. Often used interchangeably with thermoforming.

**VACUUM METALIZING:** Process in which surfaces are thinly coated with metal by exposing them to the vapor of metal that has been evaporated under vacuum (one millionth of normal atmospheric pressure.)

**Vacuum moulding (infusion moulding, resin infusion, vacuum infusion):** Reinforcements and resins are laminated under a vacuum bag operation.

**Vacuum Sizing:** A procedure utilizing a sizing die with a vacuum applied to the outer surface of the extrudate.

**Vacuum Tank:** A cooling tank operating under reduced pressure to control the dimensions of the extrudate.

**vacuum-assisted biopsy :** A procedure in which a small sample of tissue is removed from the breast. An imaging device is used to guide a hollow probe connected to a vacuum device. The probe is inserted through a tiny cut made in numbed skin on the breast. The tissue sample is removed using gentle vacuum suction and a small rotating knife within the probe. Then the tissue sample is studied under a microscope to check for signs of disease.

This procedure causes very little scarring and no stitches are needed. Also called VACB and vacuum-assisted core biopsy.

**vacuum-assisted core biopsy :** A procedure in which a small sample of tissue is removed from the breast. An imaging device is used to guide a hollow probe connected to a vacuum device. The probe is inserted through a tiny cut made in numbed skin on the breast. The tissue sample is removed using gentle vacuum suction and a small rotating knife within the probe. Then the tissue sample is studied under a microscope to check for signs of disease. This procedure causes very little scarring and no stitches are needed. Also called VACB and vacuum-assisted biopsy.

**vadastuximab talirine:** An immunoconjugate consisting of a humanized monoclonal antibody that is engineered to contain cysteine residues that are conjugated to the synthetic, DNA cross-linking, pyrrolbenzodiazepine dimer SGD-1882, via the protease-cleavable linker maleimidocaproyl-valine-alanine dipeptide, with potential antineoplastic activity. The monoclonal antibody portion of the vadastuximab talirine specifically binds to the cell surface antigen CD33. This causes the internalization of vadastuximab talirine, and the release of the cytotoxic moiety SGD-1882. SGD-1882 binds to and crosslinks DNA, which results in both cell cycle arrest and the induction of apoptosis in CD33-expressing tumor cells. CD33, a transmembrane receptor, is expressed on myeloid leukemia cells. Check for active clinical trials using this agent.

**vadimezan:** A fused tricyclic analogue of flavone acetic acid with potential antineoplastic activity. Vadimezan induces the cytokines tumor necrosis alpha (TNF-alpha), serotonin and nitric oxide, resulting in hemorrhagic necrosis and a decrease in angiogenesis. This agent also stimulates the anti-tumor activity of tumor-associated macrophages.

**Vagestrol:** (Other name for: diethylstilbestrol)

**Vagifem:** (Other name for: therapeutic estradiol)

**vagina:** a muscular organ in female mammals leading from the cervix to the exterior. OR The muscular canal that goes from the uterus to the outside of the body. During birth, the baby passes through the vagina. Also called birth canal.

**vaginal :** Having to do with the vagina (the birth canal).

**vaginal cancer :** Cancer that forms in the tissues of the vagina (birth canal). The vagina leads from the cervix (the opening of the uterus) to the outside of the body. The most common type of vaginal cancer is squamous cell carcinoma, which starts in the thin, flat cells lining the vagina. Another type of vaginal cancer is adenocarcinoma, cancer that begins in glandular cells in the lining of the vagina.

**vaginal dilation therapy :** A method used to prevent the closing of the vagina (the birth canal) after radiation therapy to the pelvis. The patient puts a dilator (tube-like device) coated with an oily or slippery substance into her vagina.

**vaginal intraepithelial neoplasia :** Abnormal cells are found in tissue lining the vagina (birth canal). These abnormal cells may become cancer and spread into the vaginal wall. Also called VAIN.

**vaginectomy :** Surgery to remove part or all of the vagina (the birth canal).

**VAIN :** Abnormal cells are found in tissue lining the vagina (birth canal). These abnormal cells may become cancer and spread into the vaginal wall. Also called vaginal intraepithelial neoplasia.

**valacyclovir:** The hydrochloride salt of the L-valyl ester of the antiviral drug acyclovir. Orally administered, valacyclovir is rapidly converted to acyclovir which inhibits viral DNA replication after further conversion to the nucleotide analog acyclovir triphosphate by viral thymidine kinase, cellular guanyl cyclase, and a number of other cellular enzymes. Acyclovir triphosphate competitively inhibits viral DNA polymerase; incorporates into and terminates the growing viral DNA chain; and inactivates viral DNA polymerase. The greater antiviral activity of acyclovir against herpes simplex virus (HSV) compared with varicella-zoster virus (VZV) is due to its more efficient phosphorylation by HSV thymidine kinase.

**valacyclovir :** A substance that is being studied in the prevention of fungal, bacterial, and viral infections in patients undergoing donor stem cell transplantation with cells that are infected with cytomegalovirus. It belongs to the family of drugs called antivirals.

**Valcanisation:** A process by which a network of cross linking is introduced in to an elastomer to strengthen it.

**Valchlor:** (Other name for: mechlorethamine hydrochloride gel)

**Valcyte:** (Other name for: valganciclovir)

**valdecoxib:** A sulfonamide derivative and non-steroidal anti-inflammatory drug (NSAID) with anti-inflammatory, analgesic, and antipyretic activities. Valdecoxib selectively binds to and inhibits cyclooxygenase (COX)-2, thereby preventing the conversion of arachidonic acid into prostaglandins, which are involved in the regulation of pain, inflammation, and fever. This NSAID does not inhibit COX-1 at therapeutic concentrations and therefore does not interfere with blood coagulation.

**valdecoxib :** A substance that is being studied as a treatment for pain and other side effects of cancer therapy. It belongs to the family of drugs called COX-2 inhibitors.

**valence:** the relative ability of a biological substance to react or combine; a positive number that characterizes the combining power of an element for other elements, as measured by the number of bonds to other atoms which one atom of the given element forms upon chemical combination – hydrogen is assigned valence 1, and the valence is the number of hydrogen atoms, or their equivalent, with which an atom of the given element combines. or Valence is a measure of how much an atom wants to form compounds with other elements. You may read of valence mechanism and valence number. or a signed integer describing the combining power of an atom. or The number of hydrogen atoms that typically bond to an atom of an element. For example, in H<sub>2</sub>O, oxygen has a valence of 2; carbon in CH<sub>4</sub> has a valence of four.

**valence bond:** In the valence bond theory, a valence bond is a chemical bond formed by overlap of half-filled atomic orbitals on two different atoms.

**valence bond theory:** A theory that explains the shapes of molecules in terms of overlaps between half-filled atomic orbitals, or half filled "hybridized" orbitals (which are a mixture of atomic orbitals).

**valence electron:** Electrons that can be actively involved in chemical change; usually electrons in the shell with the highest value of n. For example, sodium's ground state electron configuration is 1s<sup>2</sup> 2s<sup>2</sup> 2p<sup>6</sup> 3s<sup>1</sup>; the 3s electron is the only valence electron in the atom. Germanium (Ge) has the ground state electron configuration 1s<sup>2</sup> 2s<sup>2</sup> 2p<sup>6</sup> 3s<sup>2</sup> 3p<sup>6</sup> 3d<sup>10</sup> 4s<sup>2</sup> 4p<sup>2</sup>; the 4s and 4p electrons are the valence electrons. or The electrons in the outermost shell of an atom.

**valence electrons:** the outermost shell of electrons in an atom or ion. Or the outermost electrons of an atom. The valence electrons of the carbon

atom occupy the 2s, 2px, and 2py orbitals, for example.

**Valence Mechanism:** This mechanism is the way an atom bonds to other atoms to create stable (full) electron orbitals.

**Valence Number:** The valence is the number of electrons that can form compounds with other atoms. The valence number for the same element can be different. Sulfur has the valence numbers 2, 4, and 6 depending on the type of compound it forms.

**valence shell:** the outermost electron orbit. Or The shell corresponding to the highest value of principal quantum number in the atom. The valence electrons in this shell are on average farther from the nucleus than other electrons; they are often directly involved in chemical reaction.

**valence shell electron pair repulsion theory:** A model that explains the shapes of molecules by assuming that electron pairs arrange themselves around atoms in a way that minimizes electron-electron repulsions.

**valerian :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden valerian, Indian valerian, Mexican valerian, Pacific valerian, *Valeriana officinalis*, and *Valerianae radix*.

**Valeriana officinalis :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden valerian, Indian valerian, Mexican valerian, Pacific valerian, valerian, and *Valerianae radix*.

**Valeriana officinalis extract:** An herbal extract isolated from the root of the plant *Valeriana officinalis* with sedative and anxiolytic activities. *Valeriana officinalis* extract contains four distinct classes of phytochemical constituents: volatile oils; sesquiterpenoids, including valerenic acid and its hydroxyl and acetoxyl derivative; valepotriates; and volatile pyridine alkaloids. Although the exact mechanism of action has not been established, the sesquiterpenoids in *Valeriana officinalis* extract, particularly valerenic acid, appear to account for its sedative and anxiolytic effects. Valerenic acid is both a subtype-selective GABA-A receptor agonist and a 5HT-5A receptor partial agonist. The sedative-hypnotic benzodiazepines are GABA-A receptor agonists.

**Valerianae radix :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden valerian, Indian valerian, Mexican valerian, Pacific valerian, valerian, and *Valeriana officinalis*.

**valganciclovir:** A synthetic prodrug of ganciclovir, a nucleoside analogue of 2'-deoxyguanosine, with antiviral activity. After phosphorylation, valganciclovir is incorporated into DNA, resulting in inhibition of viral DNA polymerase, viral DNA synthesis, and viral replication. Check for active clinical trials using this agent.

**valganciclovir :** An antiviral agent that is being studied as a treatment for AIDS-related cytomegalovirus. It is changed in the body to ganciclovir.

**validity, measurement:** An expression of the degree to which a measurement measures what it purports to measure.

**validity, study:** The degree to which the inference drawn from a study, especially generalizations extending beyond the study sample, are warranted when account is taken of the study methods, the representatives of the study sample, and the nature of the population from which it is drawn. Two varieties of study validity are distinguished:

**Valium :** A drug used to treat mild to moderate anxiety and tension and to relax muscles. It is a type of benzodiazepine. Also called diazepam.

**valley glacier:** a glacier located on top of a mountain, also called an alpine glacier, that moves downhill through the valley. Or a mass of ice restricted to high mountain valleys.

**Valley Printing:** Ink is applied to the high points of an embossing roll and subsequently deposited in what becomes the valleys of the embossed plastic material.

**valley train:** the outwash plain of an alpine glacier.

**Valparin:** (Other name for: divalproex sodium)

**valproic acid:** A synthetic derivative of propylpentanoic acid with antiepileptic properties and potential antineoplastic and antiangiogenesis activities. In epilepsy, valproic acid appears to act by increasing the concentration of gamma-aminobutyric acid (GABA) in the brain. This agent's antitumor and antiangiogenesis activities may be related to the inhibition of histone deacetylases and nitric oxide synthase, which results in

the inhibition of nitric oxide synthesis. or A drug used to treat epileptic seizures and bipolar disorder and to prevent migraine headaches. It is also being studied in the treatment of several types of cancer. It blocks an enzyme that cells need to grow and may cause cancer cells to die. It also blocks the growth of new blood vessels that tumors need to grow. It is a type of anticonvulsant, histone deacetylase (HDAC) inhibitor, antimaniacal, migraine headache prophylactic, and antiangiogenesis agent. Also called Depakene and Stavzor.

**valrubicin:** A semisynthetic derivative of the antineoplastic anthracycline antibiotic doxorubicin. With a mechanism of action that appears to differ from doxorubicin, valrubicin is converted intracytoplasmically into N-trifluoroacetyl Adriamycin, which interacts with topoisomerase II, stabilizing the complex between the enzyme and DNA; consequently, DNA replication and repair and RNA and protein synthesis are inhibited and the cell cycle is arrested in the G2 phase. In addition, this agent accumulates in the cell cytoplasm where it inhibits protein kinase C (PKC). Valrubicin is less cardiotoxic than doxorubicin when administered systemically; applied topically, this agent shows excellent tissue penetration. Structurally, the trifluoro-acetyl moiety on the amino group of the glycoside and the valerate moiety appear to result in a lipophilicity that is greater than of doxorubicin, resulting in increased intracytoplasmic concentrations. or A drug used to treat bladder cancer that does not respond to BCG (Bacillus Calmette Guerin). It is an anthracycline and is a type of antitumor antibiotic. Also called AD 32.

**valsartan:** An orally active nonpeptide triazole-derived antagonist of angiotensin (AT) II with antihypertensive properties. Valsartan selectively and competitively blocks the binding of angiotensin II to the AT1 subtype receptor in vascular smooth muscle and the adrenal gland, preventing AT II-mediated vasoconstriction, aldosterone synthesis and secretion, and renal reabsorption of sodium, and resulting in vasodilation, increased excretion of sodium and water, a reduction in plasma volume, and a reduction in blood pressure.

**valspodar:** An analogue of cyclosporin-A. Valspodar inhibits p-glycoprotein, the multidrug resistance efflux pump, thereby restoring the retention and activity of some drugs in some drug-resistant tumor cells. This agent also induces caspase-mediated apoptosis.

**Valstar:** (Other name for: valrubicin)

**Valtrex:** (Other name for: valacyclovir)

**Value:** the relative lightness of a color as measured on a scale ranging from pure black to pure white. (This attribute basically classifies a color as light or dark.) The value scale applies to chromatic as well as neutral colors. Value is also referred to as Lightness, Brightness, or Intensity. In color space value is most often represented on the vertical axis.

**Value-added Industries:** Digging stuff up and doing something to it so you can sell it for more than stuff you just dig up and sell. What we should be aiming to do more of for Australia's economy.

**Valve Gating :** A type of gate where a pin is held in the gate or channel by spring tension. As the injection stroke moves forward, this gate compresses the plastic in the runner. When this pressure build-up is sufficient to overcome the spring tension, the pin is then pushed back (pulled) and the fast decompression of the melt fills the cavity at extremely high speed.

**VAMP :** An abbreviation for a chemotherapy combination used with radiation therapy to treat low-risk childhood Hodgkin lymphoma. It includes the drugs vincristine sulfate, doxorubicin hydrochloride (Adriamycin), methotrexate, and prednisone. Also called VAMP regimen.

**VAMP Regimen:** A chemotherapy regimen consisting of vincristine, doxorubicin hydrochloride (Adriamycin), methotrexate and prednisone used in combination with radiation therapy for the treatment of low-risk childhood Hodgkin lymphoma. Or An abbreviation for a chemotherapy combination used with radiation therapy to treat low-risk childhood Hodgkin lymphoma. It includes the drugs vincristine sulfate, doxorubicin hydrochloride (Adriamycin), methotrexate, and prednisone. Also called VAMP.

**van der Waals equation:** An equation for non-ideal gasses that accounts for intermolecular attraction and the volumes occupied by the gas molecules. Or A semiempirical equation that describes the relationship between pressure (P), volume (V), temperature (T), and moles of gas (n) for a real gas. The equation is  $(P + n^2a/V^2)(V - nb) = nRT$ , where a and b are constants that include the effects of molecular attractions and molecular volume. a and b are usually fitted to experimental data for a particular gas.

**van der Waals force:** A weak physical force that holds together two molecules or two different parts of the same molecule or A force acting between nonbonded atoms or molecules. Includes dipole-dipole, dipole-induced dipole, and London forces. Or are weak interactions between MOLECULES. (Note: chemical bonds are the forces between ATOMS in a molecule whereas van der waals forces are between MOLECULES). These weak forces are caused by the attraction between protons in one molecule and electrons in an adjacent molecule. Because of the greater distance between the particles in one molecule and another, van der waals forces are only 1/100 as strong as the covalent bond. or Attractive forces acting between uncharged molecules. There are three kinds: (1) Dipole-dipole forces (2) Dipole-induced dipole forces (3) Dispersion Forces. Named after Johannes Diderik van der Waals (1837-1923).

**van der Waals interactions:** Refers to weak intermolecular interactions between transient dipoles usually in hydrophobic regions of molecules.

**van der Waals radius:** One half the distance between two nonbonded atoms, when attractive and repulsive forces between the atoms are balanced.

**van't Hoff rule:** predicts the maximum number of enantiomers that an optically active molecule can have; 2 raised to the nth power, where n equals the number of stereogenic centers. Or A plot of the log of solubility values versus the reciprocal of the temperature. The plot for several forms of a substance reveals transition temperatures for the forms.

**Vanadate Mineral:** A mineral that is made up of compounds with a vanadium oxide group or vanadium atom bonded to a metal. Vanadinite is a good example of a vanadate mineral.

**Vanadium:** Symbol:"V" Atomic Number:"23" Atomic Mass: 50.94amu. Vanadium is one of the transition elements. Vanadium can be found in some meteorites, crude oil, and many minerals.

**Vancenase:** (Other name for: beclomethasone dipropionate)

**Vanceril:** (Other name for: beclomethasone dipropionate)

**vancomycin :** An antibiotic drug used to fight resistant bacterial infections.

**vandetanib:** An orally bioavailable 4-anilinoquinazoline. Vandetanib selectively inhibits the tyrosine kinase activity of vascular endothelial growth factor receptor 2 (VEGFR2), thereby blocking VEGF-stimulated

endothelial cell proliferation and migration and reducing tumor vessel permeability. This agent also blocks the tyrosine kinase activity of epidermal growth factor receptor (EGFR), a receptor tyrosine kinase that mediates tumor cell proliferation and migration and angiogenesis. OR A drug used to treat medullary thyroid cancer that has spread to other parts of the body and cannot be treated by surgery. It is also being studied in the treatment of other types of cancer. Vandetanib prevents the growth of new blood vessels that tumors need to grow. It also blocks enzymes needed for cell growth and may kill cancer cells. It is a type of antiangiogenesis agent and a type of tyrosine kinase inhibitor. Also called Caprelsa and ZD6474.

**Vanicream Sunscreen SPF 60:** (Other name for: titanium dioxide/zinc oxide sunscreen cream SPF 60)

**Vanos:** (Other name for: fluocinonide cream)

**Vantas:** (Other name for: histrelin acetate)

**vantictumab:** A monoclonal antibody directed against the Wnt signaling pathway with potential antineoplastic activity. Vantictumab binds to certain receptors in the Wnt signaling pathway thereby preventing the activation of the Wnt signaling pathway. This may result in an inhibition of cancer stem cell (CSC) activity and a subsequent inhibition of cancer cell proliferation. The Wnt signaling pathway is dysregulated in many cancer cell types and appears to play a major role in CSC regulation and activity; CSC are tumor initiating cells that are able to self-renew and are responsible for tumor growth and resistance. Check for active clinical trials using this agent.

**Vantin:** (Other name for: cefpodoxime proxetil)

**vapor:** Another name for a gas. Or A vapor is closely related to a gas. Scientists define a vapor as "a compound in a gaseous state when its temperature is below the critical temperature." Steam is considered to be a vapor because it is in a gas state but the temperature is still below the critical temperature. Steam is liquid water suspended in a gas state. Helium gas is a true gas at room temperature. You may also see the spelling "vapour." or The gaseous phase of substances that are liquid or solid at atmospheric pressure (e.g., steam). or The gaseous form of substances that are normally in liquid or solid form.

**VAPOR BARRIER:** A layer of material through which water vapor will not pass readily or at all.

**Vapor Pressure:** A property that is unique to each liquid. When the surrounding pressure of a system is below the vapor pressure, the liquid is able to evaporate. Or The pressure at which pure liquid A can coexist with its vapor at a given temperature. In this text, vapor pressures can be determined from tabulated data, the antoine equation or the cox chart or The pressure of vapor above a liquid or solid surface which is in equilibrium with that liquid or solid. or The partial pressure of a gas in equilibrium with a condensed form (solid or liquid) of the same substance.

**vapor pressure lowering:** A colligative property of solutions. The vapor pressure of a solution is always lower than the vapor pressure of the pure solvent; the ratio of solution to pure solvent vapor pressures is approximately equal to the mole fraction of solvent in the solution.

**vaporization:** the process of boiling.

**vapreotide :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called somatostatin analogs.

**Vaqta:** (Other name for: hepatitis A vaccine)

**vardenafil hydrochloride:** The hydrochloride salt form of vardenafil, a benzenesulfonamide derivative and phosphodiesterase type 5 (PDE5) inhibitor with vasodilatory activity. Vardenafil selectively inhibits PDE5, thus inhibiting the degradation of cyclic guanosine monophosphate (cGMP) found in the smooth muscle of the corpus cavernosa and corpus spongiosum of the penis. The inhibition of cGMP degradation results in prolonged muscle relaxation, vasodilation, and blood engorgement of the corpus cavernosa, thereby prolonging penile erection.

**varenicline:** A partial agonist of the nicotinic acetylcholine receptor (nAChR) subtype alpha4beta2. Nicotine stimulation of central alpha4beta2 nAChRs located at presynaptic terminals in the nucleus accumbens causes the release of the neurotransmitter dopamine, which may be associated with the experience of pleasure; nicotine addiction constitutes a physiologic dependence related to this dopaminergic reward system. As an AChR partial agonist, varenicline attenuates the craving and withdrawal symptoms that occur with abstinence from nicotine but is not habit-forming itself.

**varenicline tartrate :** A drug used to help people stop smoking by acting the same way nicotine acts in the brain. It is a type of nicotine receptor partial agonist. Also called Chantix.

**Vargatef:** (Other name for: nintedanib)

**variable:** A symbol used to represent an unknown number, often  $x$  or  $n$ . Or A quantity that can have many possible values. In designing experiments, variables that affect measurements must be identified and controlled. For example, an experiment that measures reaction rates must control temperature, because temperature is a variable that can change the rate of reaction.

**variable expression :** Variation in the manner in which a trait is manifested. When there is variable expressivity, the trait may vary in clinical expression from mild to severe. For example, the condition neurofibromatosis type 1 may be mild, presenting with café-au-lait spots only, or may be severe, presenting with neurofibromas and brain tumors. OR Refers to the difference in the way that signs and symptoms of a genetic condition can show up in individual patients who have that condition. For example, some patients with neurofibromatosis type 1 may have only mild symptoms, such as brown spots and freckling on the skin, and others may have more severe symptoms, such as brain tumors and tumors on the nerves.

**variable omission:** An error that occurs when, in the process of translating a sentence in the word problem into an equation, one of the variables is left out.

**Variable region:** The 108-residue amino acid sequence found at the N-terminal end of both the light and heavy chains of immunoglobulin G; the sequence in this region varies for every antibody type known; parts of these segments (the hypervariable regions) form the antigen-binding site of the immunoglobulin.

**variable reversal:** This error is made if the variables are switched with each other.

**variant of uncertain significance :** A variation in a genetic sequence whose association with disease risk is unknown. Also called unclassified variant, variant of unknown significance, and VUS.

**variant of unknown significance :** A variation in a genetic sequence whose association with disease risk is unknown. Also called unclassified variant, variant of uncertain significance, and VUS.

**varicella vaccine:** A live attenuated virus vaccine used to prevent chickenpox and shingles, which is caused by varicella-zoster virus (VZV).

**varicella zoster virus strain Oka/Merck live antigen:** A sterile, lyophilized preparation of the Oka/Merck strain of the live, attenuated varicella zoster virus (VZV), that can be used to prevent varicella, commonly known as chickenpox, or herpes zoster (HZ), commonly known as shingles. Upon reconstitution and subcutaneous vaccination with the VZV strain Oka/Merck live antigen, this vaccine induces antigen-specific T-cell and B-cell immune responses against the VZV, thereby protecting against VZV infection.

**varicose vein :** A condition in which a vein, most often in the legs, becomes permanently enlarged, twisted, and painful. This may be caused by valves in the vein that don't work properly or by weakness in the vein walls.

**Varivax:** (Other name for: varicella vaccine)

**Varivax:** (Other name for: varicella zoster virus strain Oka/Merck live antigen)

**VariZIG:** (Other name for: human varicella zoster immune globulin)

**VariZIG vaccine:** (Other name for: human varicella zoster immune globulin)

**varlilumab:** A human agonistic monoclonal antibody (MoAb) specific for CD27, with potential immunostimulating and antineoplastic activity. Upon administration of CDX-1127, this MoAb binds to CD27 and may potentiate the immune response by increasing the cytotoxic T-lymphocyte (CTL) response against CD27-expressing tumor cells. This may lead to growth inhibition of CD27-expressing tumor cells. In addition, this agent may increase the proliferation and activation of antigen-specific T lymphocytes upon co-administration of TAA-containing vaccines, such as dendritic cell vaccines. CD27, a co-stimulatory molecule and member of the tumor necrosis factor family overexpressed in certain tumor cell types, is constitutively expressed on mature T-lymphocytes, memory B cells and natural killer cells and plays an important role in NK cell mediated cytolytic activity and T and B lymphocyte proliferation and activation.

**varlitinib:** An orally bioavailable inhibitor of the epidermal growth factor receptor family with potential antineoplastic activity. Varlitinib selectively

and reversibly binds to both EGFR (ErbB-1) and Her-2/neu (ErbB-2) and prevents their phosphorylation and activation, which may result in inhibition of the associated signal transduction pathways, inhibition of cellular proliferation and cell death. EGFR and Her-2 play important roles in cell proliferation and differentiation and are upregulated in various human tumor cell types. Due to the dual inhibition of both EGFR and Her-2, this agent may be therapeutically more effective than agents that inhibit EGFR or Her-2 alone.

**Varnish:** A transparent coating based on drying oils and resins. Or Transparent liquid that dries on exposure to air to give a decorative and protective and protective coating when applied as a thin film.

**VARNISH STAIN:** Varnishes colored with a dye and without the same power of penetrations as the true stains, leaving a colored coating on the surface.

**Varubi :** A drug used with other drugs to prevent nausea and vomiting caused by chemotherapy. Varubi blocks the action of chemicals in the central nervous system (CNS) that may trigger nausea and vomiting. It is a type of antiemetic. Also called rolapitant hydrochloride.

**varve:** alternating layers of sediment showing yearly cycles. Or one light-colored bed and one dark-colored bed of sediment that form at the bottom of a glacial lake and that represent a single year's deposition.

**VAS:** A tool used to help a person rate the intensity of certain sensations and feelings, such as pain. The visual analog scale for pain is a straight line with one end meaning no pain and the other end meaning the worst pain imaginable. A patient marks a point on the line that matches the amount of pain he or she feels. It may be used to help choose the right dose of pain medicine. Also called visual analog scale.

**vas deferens :** A coiled tube that carries the sperm out of the testes.

**vascular bundles:** arrangements of the xylem and phloem in vascular plants.

**vascular disrupting agent BNC105P:** A benzofuran-based vascular disrupting agent (VDA) prodrug with potential anti-vascular and antineoplastic activities. Upon administration vascular disrupting agent BNC105P, the disodium phosphate ester of BNC105, is rapidly converted to BNC105; in activated endothelial cells, BNC105 binds to tubulin and

inhibits its polymerization, which may result in a blockage of mitotic spindle formation, cell cycle arrest, and disruption of the tumor vasculature. Hypoxic conditions ensue, depriving tumor cells of nutrients and resulting in tumor cell apoptosis. In addition to its VDA activity, this agent has a direct cytotoxic effect on tumor cells by inhibiting tubulin polymerization. BNC105 is not a substrate for the multidrug-resistance P-glycoprotein (Pgp) transporter.

**vascular endothelial growth factor :** A substance made by cells that stimulates new blood vessel formation. Also called VEGF.

**vascular endothelial growth factor antisense oligonucleotide:** An antisense oligonucleotide with potential antiangiogenesis activity. Vascular endothelial growth factor (VEGF) antisense oligonucleotide binds directly to binds VEGF A/C/D mRNA, leading to mRNA degradation and the inhibition of VEGF A-mediated angiogenesis and VEGF C/D-mediated lymphangiogenesis.

**vascular endothelial growth factor receptor tyrosine kinase inhibitor :** A substance that blocks an enzyme needed to form blood vessels. Also called VEGFR tyrosine kinase inhibitor.

**vascular endothelial growth factor trap :** A drug used with other drugs to treat colorectal cancer that has spread to other parts of the body and has not gotten better with chemotherapy. It is also being studied in the treatment of other types of cancer. Vascular endothelial growth factor trap blocks the action of a protein called vascular endothelial growth factor (VEGF) and may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent. Also called VEGF Trap, Zaltrap, and ziv-aflibercept.

**vascular endothelial growth factor-antisense oligonucleotide :** A substance that has been studied in the treatment of cancer. It binds to the RNA for a protein called vascular endothelial growth factor (VEGF) that stimulates the growth of new blood vessels. Vascular endothelial growth factor-antisense oligonucleotide blocks the cell's ability to make VEGF, which may kill tumors that need new blood vessels to grow. It is a type of antisense oligonucleotide and a type of gene expression inhibitor. Also called VEGF-AS.

**vascular plants:** plants that contain specialized tissues to transport fluids.

**vascular plants with protected seeds:** angiosperms; the most developed and complex vascular plants.

**vascular plants with unprotected seeds:** gymnosperms; vascular plants that contain naked seeds, such as the conifers.

**vascular tumor :** A type of tumor that forms from cells that make blood vessels or lymph vessels. Vascular tumors may be benign (not cancer) or malignant (cancer) and can occur anywhere in the body. They may form on the skin, in the tissues below the skin, and/or in an organ. There are many types of vascular tumors. The most common type of vascular tumor is hemangioma, which is a benign tumor that usually occurs in infants and goes away on its own.

**vascularized autologous bone graft :** Bone tissue that contains blood vessels, taken from one part of the body and used to replace diseased or injured bone in another part of the body of the same person.

**vasectomy :** An operation to cut or tie off the two tubes that carry sperm out of the testicles.

**vasoactive :** Describes something that causes the blood vessels to constrict (get narrower) or dilate (get wider).

**vasoactive intestinal peptide :** A hormone found in the pancreas, intestine, and central nervous system. It has many actions in the body, such as helping to control the secretion of water, salts, enzymes, and gastric acid during digestion. It also causes smooth muscles in the digestive tract, the heart, and the blood vessels to relax. It also has effects on the immune system and the central nervous system. Certain tumors in the pancreas make large amounts of vasoactive intestinal peptide. Also called VIP hormone.

**Vasomax:** (Other name for: phentolamine mesylate)

**vasomotor :** Affecting the narrowing and widening of the blood vessels.

**Vasotec:** (Other name for: enalapril maleate)

**Vasovist:** (Other name for: gadofosveset trisodium)

**vatalanib:** An orally bioavailable anilinophthalazine with potential antineoplastic activity. Vatalanib binds to and inhibits the protein kinase domain of vascular endothelial growth factor receptors 1 and 2; both receptor tyrosine kinases are involved in angiogenesis. This agent also binds to and inhibits related receptor tyrosine kinases, including platelet-derived growth factor (PDGF) receptor, c-Kit, and c-Fms. OR A substance

that is being studied in the treatment of cancer. It belongs to the families of drugs called protein tyrosine kinase inhibitors and VEGF receptor kinase inhibitors. Also called PTK787/ZK 222584.

**Vatican city:** Actually not a member of OPEC. If anyone says it is you will know that they stole their information from us before we added this disclaimer.

**VB4-845:** A substance being studied in the treatment of certain types of head and neck cancer. VB4-845 is made by linking a monoclonal antibody fragment to a toxic protein that may kill cancer cells. It binds to EpCAM (a protein on the surface of epithelial cells and some types of cancer cells). Also called anti-EpCAM-Pseudomonas-exotoxin fusion protein and Proxinium.

**VCL-CB01 vaccine:** A vaccine consisting of two plasmids encoding the human cytomegalovirus (CMV) tegument phosphoprotein 65 (pp65), a major internal matrix protein, and glycoprotein B (gB), an important CMV component responsible for attachment and entry into cells, with immunostimulatory properties. Vaccination with VCL-CB01 may stimulate the host immune system to mount cellular and humoral immune responses against CMV positive cells, resulting in cell lysis.

**VDZ:** Valence double-zeta. A minimal basis is used to describe core electrons, but the valence electrons have twice the minimum number of functions (see "DZ").

**Vectibix :** A human monoclonal antibody that is being used to treat colorectal cancer that has spread to other parts of the body. It is used in patients whose disease has not gotten better during or after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Vectibix binds to the epidermal growth factor receptor (EGFR) and may block tumor cell growth. Also called ABX-EGF and panitumumab.

**vector:** field quantity that measures magnitude and direction. Or A DNA molecule known to replicate autonomously in a host cell, to which a segment of DNA may be spliced to allow its replication; for example, a plasmid or a temperate-phage DNA. Or the carriers of DNA genes to be inserted into cells.

**Vectrin:** (Other name for: minocycline hydrochloride)

**vecuronium bromide:** The bromide salt form of vecuronium, a synthetic steroid derivative of the naturally occurring alkaloids of curare with a muscle relaxant property. Vecuronium bromide competes with acetylcholine for the nicotinic receptors at the neuromuscular junction of skeletal muscles, thereby inhibiting the action of acetylcholine and blocking the neural transmission without depolarizing the postsynaptic membrane. This leads to skeletal muscle relaxation and paralysis.

**vedolizumab:** A recombinant humanized immunoglobulin G1 (IgG1) monoclonal antibody directed against the human lymphocyte Peyer's patch adhesion molecule 1 (LPAM-1;  $\alpha4\beta7$ ;  $\alpha4\beta7$ ), with immunomodulating, anti-inflammatory, and potential antineoplastic activities. Upon administration, vedolizumab selectively binds to integrin  $\alpha4\beta7$  and prevents the binding of  $\alpha4\beta7$ , expressed on the surface of a subset of T lymphocytes, to its natural ligand, mucosal addressin cell adhesion molecule-1 (MAdCAM-1), which is mainly expressed on the surface of gut endothelial cells. This prevents  $\alpha4\beta7$ -mediated signaling, adhesion of lymphocytes to the endothelium and the migration of T lymphocytes across the endothelium into inflamed gastrointestinal (GI) tissue. By preventing this infiltration to the affected area, inflammation is reduced. The human lymphocyte  $\alpha4\beta7$  integrin, plays a key role in gastrointestinal (GI) inflammation; it is overexpressed in certain types of cancer cells. The  $\alpha4\beta7$ /MAdCAM-1 signaling pathway plays a critical role in the homing of T lymphocytes to intestinal tissue.

**vegan :** A person who does not eat any foods that come from animals, including meat, eggs, and dairy products. A vegan diet is being studied in the prevention and treatment of prostate cancer and other medical conditions.

**VEGF:** A substance made by cells that stimulates new blood vessel formation. Also called vascular endothelial growth factor.

**VEGF inhibitor PTC299:** An orally bioavailable, small molecule inhibitor of vascular endothelial growth factor (VEGF) synthesis with potential antiangiogenesis and antineoplastic activities. VEGF inhibitor PTC299 targets post-transcriptionally by selectively binding the 5'- and 3'-untranslated regions (UTR) of VEGF messenger RNA (mRNA), thereby preventing translation of VEGF. This inhibits VEGF protein production and decreases its levels in the tumor and bloodstream. In turn, this may result in

the inhibition of migration, proliferation and survival of endothelial cells, microvessel formation, the inhibition of tumor cell proliferation, and eventually the induction of tumor cell death. VEGFs are upregulated in a variety of tumor cell types and play key roles during angiogenesis. In addition, PTC299 may enhance the antitumor activity of other chemotherapeutic agents.

**VEGF Trap :** A drug used with other drugs to treat colorectal cancer that has spread to other parts of the body and has not gotten better with chemotherapy. It is also being studied in the treatment of other types of cancer. VEGF Trap blocks the action of a protein called vascular endothelial growth factor (VEGF) and may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent. Also called vascular endothelial growth factor trap, Zaltrap, and ziv-aflibercept.

**VEGF-AS:** A substance that has been studied in the treatment of cancer. It binds to the RNA for a protein called vascular endothelial growth factor (VEGF) that stimulates the growth of new blood vessels. VEGF-AS blocks the cell's ability to make VEGF, which may kill tumors that need new blood vessels to grow. It is a type of antisense oligonucleotide and a type of gene expression inhibitor. Also called vascular endothelial growth factor-antisense oligonucleotide.

**VEGF/HGF-targeting DARPIn MP0250:** A designed ankyrin repeat proteins (DARPIn)-based agent targeting vascular endothelial growth factor (VEGF) and hepatocyte growth factor (HGF), with potential antiangiogenic and antineoplastic activities. Compared to antibodies, DARPins are small in size, have favorable pharmacokinetics and allow for both high affinity binding and efficacy. Upon administration, the VEGF/HGF-targeting DARPIn MP0250 binds to and inhibits both HGF and VEGF. This prevents HGF- and VEGF-mediated signaling, and inhibits the growth of HGF/VEGF-overexpressing tumor cells. This agent also prevents osteolysis, due to the inhibitory effect on HGF signaling. HGF and VEGF are overexpressed in a variety of cancer cell types and are associated with increased cell proliferation, migration and adhesion.

**VEGFR inhibitor KRN951:** An orally bioavailable quinoline-urea derivative inhibitor of vascular endothelial growth factor receptors (VEGFRs) 1 and 2 with potential antiangiogenesis and antineoplastic

activities. VEGFR inhibitor KRN951 inhibits VEGF-induced phosphorylation of VEGFRs 1 and 2, which may result in inhibition of migration, proliferation and survival of endothelial cells, microvessel formation, the inhibition of tumor cell proliferation, and tumor cell death. Expression of VEGFRs may be upregulated in a variety of tumor cell types.

**VEGFR tyrosine kinase inhibitor :** A substance that blocks an enzyme needed to form blood vessels. Also called vascular endothelial growth factor receptor tyrosine kinase inhibitor.

**VEGFR-2 DNA vaccine VXM01:** An orally available DNA cancer vaccine containing an attenuated strain of the bacterium *Salmonella typhimurium* encoding murine vascular endothelial growth factor receptor 2 (VEGFR-2) (VXM01), with potential immunomodulating, anti-angiogenic and antineoplastic activity. Upon oral administration and successful transduction, VEGFR-2 DNA vaccine VXM01 expresses VEGFR-2 in addition to inducing the expression of T-cell activation markers, such as CD25, interleukin-2, the early T-cell activation antigen CD69 and the lymphocyte function-associated antigen LFA-2. The immune response targets the fast growing VEGFR-2 expressing endothelial cells found in the tumor vasculature, thereby blocking angiogenesis which may ultimately inhibit tumor cell proliferation. VEGFR-2 is a receptor tyrosine kinase overexpressed on proliferating endothelial cells in the tumor vasculature. Check for active clinical trials using this agent.

**VEGFR-2 inhibitor CT-322 :** A substance being studied in the treatment of cancer. VEGFR-2 inhibitor CT-322 may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of vascular endothelial growth factor receptor-2 (VEGFR-2) inhibitor and a type of antiangiogenesis agent. Also called Angiocept and CT-322.

**VEGFR/FGFR inhibitor ODM-203:** An orally available inhibitor of the human vascular endothelial growth factor receptors (VEGFRs) and fibroblast growth factor receptors (FGFRs), with potential antiangiogenic and antineoplastic activities. VEGFR/FGFR inhibitor ODM-203 inhibits both VEGFRs and FGFRs, which may result in the inhibition of VEGFR- and FGFR-mediated signaling. This leads to an inhibition of angiogenesis and cell proliferation in tumor cells overexpressing VEGFR and/or FGFR. Both VEGFRs and FGFRs belong to the superfamily of receptor tyrosine

kinases and are upregulated in various tumor cell types. Check for active clinical trials using this agent.

**VEGFR/PDGFR dual kinase inhibitor TAK-593:** An oral formulation containing a small-molecule receptor tyrosine kinase inhibitor of both vascular endothelial growth factor receptor (VEGFR) and platelet-derived growth factor receptor (PDGFR) with potential antineoplastic activity. TAK-593 selectively binds to and inhibits VEGFR and PDGFR, which may result in the inhibition of angiogenesis and tumor cell proliferation.

**VEGFR/PDGFR dual kinase inhibitor X-82:** An orally available small molecule dual inhibitor targeting human vascular endothelial growth factor receptors (VEGFRs) and platelet-derived growth factor receptors (PDGFRs) with antiangiogenic and antineoplastic activities. VEGFR/PDGFR dual kinase inhibitor X-82 inhibits all isoforms of VEGFR and PDGFR, which may result in the inhibition of tumor angiogenesis and tumor cell proliferation, and the induction of tumor cell death. Both VEGFRs and PDGFRs are receptor tyrosine kinases that may be upregulated in various tumor cell types. VEGFR/PDGFR dual kinase inhibitor X-82 has been shown to reduce tissue toxicity by 95 percent compared with first-generation kinase inhibitors.

**VEGFR1-1084 peptide vaccine:** A peptide vaccine containing an HLA-A\*2402-restricted epitope of vascular endothelial growth factor receptor 1 (VEGFR1 or Flt-1) with potential immunostimulating, antiangiogenic, and antineoplastic activities. Upon vaccination, VEGFR1-1084 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against VEGFR1-expressing endothelial cells of the tumor microvasculature, which may inhibit tumor angiogenesis and tumor cell proliferation. VEGFR1, a receptor tyrosine kinase, may be overexpressed on endothelial cells of the tumor microvasculature and is associated with tumor cell proliferation, invasion and tumor angiogenesis. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenicity.

**VEGFR2 tyrosine kinase inhibitor PF-00337210:** An orally available ATP-competitive inhibitor of the vascular endothelial growth factor receptor type 2 (VEGFR2), with potential anti-angiogenesis and antineoplastic activities. Upon administration, the VEGFR2 tyrosine kinase

inhibitor PF-00337210 selectively binds to VEGFR2 and prevents its phosphorylation which may result in an inhibition of migration, proliferation and survival of endothelial cells, microvessel formation, the inhibition of tumor cell proliferation, and may eventually cause tumor cell death. VEGFR2, a receptor tyrosine kinase, is frequently overexpressed by a variety of tumor types.

**VEGFR2-169 peptide vaccine:** A peptide vaccine containing an HLA-A\*2402-restricted epitope of vascular endothelial growth factor receptor (VEGFR) 2 with potential immunostimulatory and antineoplastic activities. Upon administration, VEGFR2-169 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against VEGFR2-expressing tumor cells. VEGFR2, a receptor tyrosine kinase, is overexpressed by a variety of tumor types; overexpression is associated with tumor cell proliferation and tumor angiogenesis. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**VEGFR2-targeted contrast agent BR55:** A lipopeptide-based, vascular endothelial growth factor receptor 2 (VEGFR2) -targeted contrast agent with the property of molecular imaging of angiogenesis. BR55 is prepared by incorporation of a biospecific heterodimer peptide into the perfluorobutane-containing lipid-shelled microbubble membrane; the peptide specifically binds to VEGFR2 expressed on tumoral vascular endothelium allowing ultrasound imaging of the sites of active angiogenesis.

**Veglin:** (Other name for: vascular endothelial growth factor antisense oligonucleotide)

**Vehicle:** Portion of a coating that includes all liquids and the binder. The vehicle and the pigment are the two basic components of paint. Or The vehicle and the pigment are the two basic components of paint. The vehicle is made up of thinner and binder. Or The liquid portion of paint composed mainly of solvents, resins or oils.

**vein :** A blood vessel that carries blood to the heart from tissues and organs in the body.

**veins:** channels through which fluid flows toward the heart.

**VeIP:** An abbreviation for a chemotherapy combination used to treat advanced ovarian and testicular germ cell cancers. It includes the drugs vinblastine sulfate (Velban), ifosfamide (Ifex), and cisplatin (Platinol). Also called VeIP regimen.

**VeIP regimen :** An abbreviation for a chemotherapy combination used to treat advanced ovarian and testicular germ cell cancers. It includes the drugs vinblastine sulfate (Velban), ifosfamide (Ifex), and cisplatin (Platinol). Also called VeIP. OR A regimen consisting of vinblastine, ifosfamide and cisplatin used for the treatment of advanced-stage germ cell gonadal cancers.

**velafermin:** A recombinant human fibroblast growth factor-20 (rhFGF-20) protein with pro-proliferative activity. Velafermin stimulates DNA synthesis and cell proliferation, specifically promoting epithelial and mesenchymal cell proliferation, and may prevent radiation or chemotherapy-induced oral mucositis. OR A substance that is being studied in the prevention and treatment of oral mucositis (sores in the mouth) in patients receiving high-dose chemotherapy. Velafermin belongs to the family of drugs called recombinant human fibroblast growth factors (rhFGF).

**Velban :** A drug used to treat several types of cancer, including breast cancer and a type of gestational trophoblastic tumor that have not gotten better with other treatment, lymphoma, testicular cancer, Kaposi sarcoma, and mycosis fungoides. It is also being studied in the treatment of other types of cancer. Velban blocks cell growth by stopping cell division and may kill cancer cells. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called Velsar and vinblastine sulfate.

**VELCADE:** (Other name for: bortezomib)

**velcade :** A drug used to treat multiple myeloma. It is also used to treat mantle cell lymphoma in patients who have already received at least one other type of treatment and is being studied in the treatment of other types of cancer. Velcade blocks several molecular pathways in a cell and may cause cancer cells to die. It is a type of proteasome inhibitor and a type of dipeptidyl boronic acid. Also called bortezomib and PS-341.

**veliparib:** A poly(ADP-ribose) polymerase (PARP) -1 and -2 inhibitor with chemosensitizing and antitumor activities. With no antiproliferative effects as a single agent at therapeutic concentrations, ABT-888 inhibits PARPs, thereby inhibiting DNA repair and potentiating the cytotoxicity of

DNA-damaging agents. PARP nuclear enzymes are activated by DNA single or double strand breaks, resulting in the poly(ADP-ribosyl)ation of other nuclear DNA binding proteins involved in DNA repair; poly(ADP-ribosyl)ation contributes to efficient DNA repair and to survival of proliferating cells exposed to mild genotoxic stresses as induced by oxidants, alkylating agents or ionizing radiation.

**veliparib** : A substance being studied in the treatment of breast cancers caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is also being studied in the treatment of other types of cancer. It blocks an enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Veliparib may cause cancer cells to die. It is a type of poly(ADP-ribose) polymerase inhibitor. Also called ABT-888 and PARP-1 inhibitor ABT-888.

**velocity**: Speed of an object; the change in position over time.

**Velsar** : A drug used to treat several types of cancer, including breast cancer and a type of gestational trophoblastic tumor that have not gotten better with other treatment, lymphoma, testicular cancer, Kaposi sarcoma, and mycosis fungoides. It is also being studied in the treatment of other types of cancer. Velsar blocks cell growth by stopping cell division and may kill cancer cells. It is a type of vinca alkaloid and a type of antimitotic agent. Also called Velban and vinblastine sulfate.

**veltuzumab**: A fully humanized monoclonal antibody directed against the CD20 antigen with potential antineoplastic activity. Following binding, veltuzumab triggers complement-dependent cell lysis (CDCL) and antibody-dependent cell-mediated cytotoxicity (ADCC) in cells that overexpress CD20. CD20 antigen is a hydrophobic transmembrane protein located on pre-B and mature B lymphocytes.

**veltuzumab** : A substance being studied in the treatment of several types of lymphoma. It binds to the protein CD20, which is found on B cells (a type of immune system cell) and some types of lymphoma cells. This causes the immune system to kill the cancer cells. Veltuzumab is a type of monoclonal antibody. Also called hA20, HCD20, and IMMU-106. OR An orally bioavailable, ATP-competitive, small-molecule inhibitor of BRAF(V600E) kinase with potential antineoplastic activity. Vemurafenib selectively binds to the ATP-binding site of BRAF(V600E) kinase and

inhibits its activity, which may result in an inhibition of an over-activated MAPK signaling pathway downstream in BRAF(V600E) kinase-expressing tumor cells and a reduction in tumor cell proliferation. Approximately 90% of BRAF gene mutations involve a valine-to-glutamic acid mutation at residue 600 (V600E); the oncogene protein product, BRAF(V600E) kinase, exhibits a markedly elevated activity that over-activates the MAPK signaling pathway. The BRAF(V600E) gene mutation has been found to occur in approximately 60% of melanomas, and in about 8% of all solid tumors, including melanoma, colorectal, thyroid and other cancers. OR A drug used to treat advanced melanoma that has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Vemurafenib blocks this mutated protein, which may stop the growth of cancer cells. It is a type of kinase inhibitor and a type of targeted therapy agent. Also called BRAF (V600E) kinase inhibitor RO5185426, PLX4032, RG7204, and Zelboraf.

**vena cava:** the major vein in the human heart; pumps oxygen-poor blood into the right atrium.

**Venclexta :** A drug used to treat chronic lymphocytic leukemia (CLL) in patients who have already received other treatment. It is used in patients whose cancer has a change in chromosome 17. It is also being studied in the treatment of other types of cancer. Venclexta binds to a protein called BCL2, which may be found on some types of leukemia cells. Blocking this protein may help kill cancer cells and may make them more sensitive to other anticancer drugs. Venclexta is a type of BCL2 inhibitor. Also called venetoclax.

**venetoclax:** An orally bioavailable, selective small molecule inhibitor of the anti-apoptotic protein Bcl-2, with potential antineoplastic activity. Venetoclax mimics BH3-only proteins, the native ligands of Bcl-2 and apoptosis activators, by binding to the hydrophobic groove of Bcl-2 proteins thereby repressing Bcl-2 activity and restoring apoptotic processes in tumor cells. Bcl-2 protein is overexpressed in some cancers and plays an important role in the regulation of apoptosis; its expression is associated with increased drug resistance and tumor cell survival. Compared to the Bcl-2 inhibitor navitoclax, this agent does not inhibit bcl-XL and does not cause bcl-XL-mediated thrombocytopenia. OR A drug used to treat chronic lymphocytic leukemia (CLL) in patients who have already received other

treatment. It is used in patients whose cancer has a change in chromosome 17. It is also being studied in the treatment of other types of cancer.

Venetoclax binds to a protein called BCL2, which may be found on some types of leukemia cells. Blocking this protein may help kill cancer cells and may make them more sensitive to other anticancer drugs. Venetoclax is a type of BCL2 inhibitor. Also called Venclexta.

**venipuncture :** A procedure in which a needle is used to take blood from a vein, usually for laboratory testing. Venipuncture may also be done to remove extra red blood cells from the blood, to treat certain blood disorders. Also called blood draw and phlebotomy.

**venlafaxine:** A synthetic phenethylamine bicyclic derivative with antidepressant activity. Venlafaxine and its active metabolite, O-desmethylvenlafaxine (ODV), are potent inhibitors of neuronal serotonin and norepinephrine reuptake and weak dopamine reuptake inhibitors. This agent may reduce hormone-related vasomotor symptoms. Check for active clinical trials using this agent. OR A drug used to treat depression and certain anxiety disorders. It may also be used to treat hot flashes in women who are in menopause or are being treated for breast cancer. Venlafaxine increases the levels of the chemicals serotonin and norepinephrine in the brain, which helps improve mood. It is a type of antidepressant and a type of serotonin-norepinephrine reuptake inhibitor. Also called Effexor.

**Venofer:** (Other name for: iron sucrose injection)

**Venoglobulin-I:** (Other name for: therapeutic immune globulin)

**Venoglobulin-S:** (Other name for: therapeutic immune globulin)

**venography :** A procedure in which an x-ray of the veins is taken after a special dye is injected into the bone marrow or veins.

**venous catheter :** A thin, flexible tube that is inserted into a large vein, usually in the arm, chest, or leg. It is used to give intravenous fluids, blood transfusions, and chemotherapy and other drugs, and for taking blood samples. It avoids the need for repeated needle sticks.

**venous sampling :** A procedure in which a sample of blood is taken from a certain vein and checked for specific substances released by nearby organs and tissues. A higher than normal amount of a substance can be a sign of disease in the organ or tissue that makes it.

**Vent:** A shallow groove machined into the parting line surface of a mold to allow air and gases to escape from the cavity, or runner, as the molten plastic is filling the mold. Sometimes also located on ejector and core pins.  
OR In a mold, a shallow channel or minute hole cut in the cavity to allow air to escape as the material enters. OR A very small (0.001 in. to 0.005 in.) opening in the mold cavity, typically at the shutoff surface or via an ejector pin tunnel, that is used to let air escape from a mold while the resin is injected.

**Vent pipe:** Any ventilating shaft; expansion pipe from a hot water system or other sealed tank or circuit.

**Ventavis:** (Other name for: iloprost)

**Vented Barrel :** Special barrel unit with a vent port over the compression section of the screw to permit escape of gases prior to injecting melt into mold. Often used when molding moisture-sensitive resins.

**Vented Extruder -:** A two-stage screw extruder with an opening part way along the barrel for the removal of air and volatile matter from the plastics material.

**ventifact:** a rock that has flattened surfaces formed by windblown sand.

**ventilator :** In medicine, a machine used to help a patient breathe. Also called respirator.

**venting:** Providing an opening for the discharge of gases or the relief of pressure.

**Ventolin:** (Other name for: albuterol sulfate)

**ventricle:** a pumping chamber for blood to exit from the heart.

**ventricle :** A fluid-filled cavity in the heart or brain.

**vepoloxamer:** A purified form of the non-ionic polyoxypropylene-based copolymer poloxamer 188 comprised of a hydrophobic core with hydrophilic side chains, with cytoprotective, hemorrhheologic, anti-inflammatory, anti-thrombotic and fibrinolytic activities. Although the exact mechanism of action is not fully elucidated, upon intravenous administration, the hydrophobic polyoxypropylene core of vepoloxamer reversibly adheres to hydrophobic sites of damaged cell membranes, thereby fully covering the damaged sites. This prevents the attachment of other hydrophobic molecules, cell leakage of contents, such as ions, and restores the integrity of the damaged cell. Binding of vepoloxamer to

damaged cells in the blood vessel walls prevents cell aggregation and improves blood flow. By occupying damaged sites, this agent also prevents inflammatory processes, inhibits thrombosis, and induces fibrinolysis. As the hydrophobic region of the lipid cell membrane is not exposed in healthy cells, vepoloxamer does not adhere to healthy cells. Check for active clinical trials using this agent.

**verapamil:** A phenylalkylamine calcium channel blocking agent. Verapamil inhibits the transmembrane influx of extracellular calcium ions into myocardial and vascular smooth muscle cells, causing dilatation of the main coronary and systemic arteries and decreasing myocardial contractility. This agent also inhibits the drug efflux pump P-glycoprotein which is overexpressed in some multi-drug resistant tumors and may improve the efficacy of some antineoplastic agents.

**Verapamil SR:** (Other name for: verapamil)

**verb:** conveys the action performed by a subject, expresses the state of that subject, or links the subject to a complement.

**verbal:** words derived from verbs but that function differently from a verb (see infinitives, participles, and gerunds).

**Veregen:** (Other name for: kunecatechins ointment)

**Verge:** The edge of the roof covering projected beyond a gable end.

**Vermox:** (Other name for: mebendazole)

**Vernal equinox:** March 21, when the vertical ray of the Sun is at the Equator; the entire Earth has 12 hours of day and 12 hours of night.

**Versed :** A drug used to treat anxiety and tension and to relax muscles. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of benzodiazepine. Also called midazolam and midazolam hydrochloride.

**vertebral column :** The bones, muscles, tendons, and other tissues that reach from the base of the skull to the tailbone. The vertebral column encloses the spinal cord and the fluid surrounding the spinal cord. Also called backbone, spinal column, and spine.

**vertebrates:** animals with backbones.

**vertebroplasty :** A procedure used to repair a bone in the spine that has a break caused by cancer, osteoporosis (a decrease in bone mass and density), or trauma. Bone cement is injected into the broken bone to make it stronger.

**verteporfin:** A synthetic light-activated agent with photodynamic activity. Upon systemic administration, verteporfin accumulates in neovessels in the eye and, once stimulated by nonthermal red light in the presence of oxygen, produces highly reactive short-lived singlet oxygen and other reactive oxygen radicals, resulting in local damage to neovascular endothelium and blood vessel occlusion.

**vertex:** the point at which two rays meet and form an angle, or the point at which two sides meet in a polygon.

**vertical angles:** the opposite angles formed by the intersection of two lines. Vertical angles are equal in measure.

**Vertical Flash Ring:** The clearance between the force plug and the vertical wall of the cavity in a positive or semi-positive mold. Also, the ring of excess melt which escapes from the cavity into this clearance space.

**vertical ionization energy:** The energy required to remove an electron from an atom, molecule, or ion in the gas phase without moving any nuclei. The vertical ionization energy is greater than or equal to the adiabatic ionization energy.

**vertical ray:** radiational energy from the Sun that strikes the Earth at a right angle.

**vertices:** plural of vertex. Or The three endpoints of the line segments that make up a triangle.

**verubulin hydrochloride:** A quinazoline derivative with potential dual antineoplastic activities. Verubulin hydrochloride binds to and inhibits tubulin polymerization and interrupts microtubule formation, resulting in disruption of mitotic spindle assembly, cell cycle arrest in the G<sub>2</sub>/M phase, and cell death. This agent is not a substrate for several subtypes of multidrug resistance ABC transporters, such as P-glycoprotein, multidrug resistance-associated protein 1 (MRP1), and breast cancer resistance protein 1 (BCRP1); therefore, it may be useful for treating multidrug resistant (MDR) tumors that express these transporters. In addition, as a vascular disrupting agent (VDA), MPC-6827 appears to disrupt tumor microvasculature specifically, which may result in acute ischemia and massive tumor cell death.

**verum acupuncture :** Refers to traditional acupuncture, which is the technique of inserting thin needles through the skin to certain depths and at

certain points on the body to control pain and other symptoms. The term verum acupuncture may be used when comparing traditional acupuncture to sham (placebo) acupuncture. In sham acupuncture, needles do not go as deep and are not used at the same points on the body.

**Very high radiation area:** An area accessible to individuals, in which radiation levels exceed 500 rad (5 gray) in one hour at 1 meter from the source or from any surface that the radiation penetrates (see 10 CFR 20.1003).

**Vesanoid :** An oral preparation of tretinoin that is used to treat acute promyelocytic leukemia, usually together with other drugs. It is being studied in the treatment and prevention of other types of cancer. Tretinoin is a form of vitamin A.

**vesicant extravasation :** The leakage of certain drugs called vesicants out of a vein into the tissue around it. Vesicants cause blistering and other tissue injury that may be severe and can lead to tissue necrosis (tissue death).

**vesicle :** A small sac formed by a membrane and filled with liquid. Vesicles inside cells move substances into or out of the cell. Vesicles made in the laboratory can be used to carry drugs to cells in the body.

**vesicular texture:** rock that has gas pockets and air that was trapped during the rock's formation.

**vessels:** the main conducting vessels of the xylem found in the angiosperms.

**Vestige:** After molding, the plastic runner system (or in the case of a hot tip gate, a small dimple of plastic) will remain connected to the part at the location of the gate/s. After the runner is trimmed off (or the hot tip dimple is trimmed), a small imperfection called a “vestige” remains on the part.

**VHL syndrome :** A rare inherited disorder in which blood vessels grow abnormally in the eyes, brain, spinal cord, adrenal glands, or other parts of the body. People with VHL syndrome have a higher risk of developing some types of cancer. Also called von Hippel-Lindau syndrome.

**Viability assessment:** A decisionmaking process used by the U.S. Department of Energy (DOE) to assess the prospects for safe and secure permanent disposal of high-level radioactive waste in an excavated, underground facility, known as a geologic repository. This decisionmaking process is based on (1) specific design work on the critical elements of the

repository and waste package, (2) a total system performance assessment that will describe the probable behavior of the repository, (3) a plan and cost estimate for the work required to complete the license application, and (4) an estimate of the costs to construct and operate the repository.

**Viadur :** A drug used to treat advanced prostate cancer. Under the brand name Lupron, it is also used to treat early puberty in children and certain gynecologic conditions. Viadur is also being studied in the treatment of other types of cancer. It blocks the testicles from making testosterone (a male hormone) and the ovaries from making estrogen and progesterone (female hormones). It may stop the growth of prostate cancer cells that need testosterone to grow. Viadur is a type of gonadotropin-releasing hormone (GnRH) agonist. Also called Eligard, leuprolide acetate, and Lupron.

**viagenpumatulcel-L:** A proprietary, allogeneic tumor cell vaccine expressing a recombinant secretory form of the heat shock protein gp96 fusion (gp96-Ig) with potential antineoplastic activity. Upon administration of viagenpumatulcel-L, the irradiated live tumor cells continuously secrete gp96-Ig along with its chaperoned tumor associated antigens (TAAs) into the blood stream, thereby activating antigen presenting cells, natural killer cells and priming potent cytotoxic T lymphocytes (CTLs) to respond against TAAs on the endogenous tumor cells. Furthermore, this vaccine may induce long-lived memory T cells that could fight recurring cancer cells. gp96-Ig is constructed by replacing the KDEL retention sequence of gp96, normally an endoplasmatic reticulum-resident chaperone peptide, with the Fc portion of mouse and human IgG1.

**Viagmox:** (Other name for: moxifloxacin hydrochloride)

**Viagra :** A drug used to treat erectile dysfunction. Viagra relaxes the smooth muscle of the penis to allow increased blood flow and erection. It is a type of phosphodiesterase inhibitor. Also called sildenafil.

**Vibativ:** (Other name for: telavancin hydrochloride)

**Vibramycin:** (Other name for: doxycycline)

**Vibration** : Solids are made of particles that are vibrating. The particles are fixed in position but can wriggle about.

**vibro-acoustography imaging :** A technique being studied in the diagnosis of breast cancer and other types of cancer. Vibro-acoustography imaging uses ultrasound (high-energy sound waves) to cause tissues to

vibrate. The sound made by the vibrating tissues is picked up by a microphone and is used to make an image of the object on a computer. Cancer tissue can be seen because it is denser and vibrates at a different rate than normal tissue.

**Vicat Softening Point:** The temperature at which a flat ended needle will penetrate a specimen under a specific load using a uniform rate of temperature rise.

**Vicat Softening Temperature Undercut :** Vicat Softening Temperature, is a measure of the temperature at which a plastic starts to soften at specified test conditions according to ISO 306. It is determined with a standard indenter (a flat-ended needle of 1 mm 2 circular cross section) penetrating into the surface of a test specimen under a predefined load. The temperature at 1 mm penetration is quoted as the VST in Co. VST gives an indication of a material's ability to withstand limited short-term contact with a heated object. For material comparisons only.

**vicinal:** a term that describes the location of two identical atoms or groups as being bonded to adjacent carbon atoms; a vicinal dihalide, for example. (Compare with "geminal.")

**Vicodin:** (Other name for: hydrocodone/acetaminophen)

**Victoza:** (Other name for: liraglutide)

**Victrelis:** (Other name for: boceprevir)

**vidarabine:** A nucleoside antibiotic isolated from the bacterium *Streptomyces antibioticus* with antineoplastic activity. Vidarabine inhibits DNA polymerase, resulting in the inhibition of DNA replication in tumor cells.

**Vidaza :** A drug that is used to treat myelodysplastic syndromes and is being studied in the treatment of other types of cancer. It belongs to the family of drugs called antimetabolites. Also called azacitidine and Mylosar.

**Videne:** (Other name for: povidone-iodine solution)

**video-assisted resection :** Surgery that is aided by the use of a video camera that projects and enlarges the image on a television screen. Also called video-assisted surgery.

**video-assisted surgery :** Surgery that is aided by the use of a video camera that projects and enlarges the image on a television screen. Also called video-assisted resection.

**Videx:** (Other name for: didanosine)

**Videx EC:** (Other name for: didanosine)

**Vigil:** (Other name for: bi-shRNA-furin/GMCSF-expressing autologous tumor cell vaccine)

**vildagliptin:** A cyanopyrrolidine-based, orally bioavailable inhibitor of dipeptidyl peptidase 4 (DPP-4), with hypoglycemic activity. Vildagliptin's cyano moiety undergoes hydrolysis and this inactive metabolite is excreted mainly via the urine.

**villous adenoma :** A type of polyp that grows in the colon and other places in the gastrointestinal tract and sometimes in other parts of the body. These adenomas may become malignant (cancer).

**villus :** A tiny hair-like projection, often on the surface of mucous membranes. The plural is villi.

**VIN :** Abnormal cells are found on the surface of the vulvar skin. These abnormal cells may become cancer and spread into nearby tissue. Also called vulvar carcinoma in situ and vulvar intraepithelial neoplasia.

**vinblastine:** A natural alkaloid isolated from the plant *Vinca rosea* Linn. Vinblastine binds to tubulin and inhibits microtubule formation, resulting in disruption of mitotic spindle assembly and arrest of tumor cells in the M phase of the cell cycle. This agent may also interfere with amino acid, cyclic AMP, and glutathione metabolism; calmodulin-dependent  $Ca^{++}$  - transport ATPase activity; cellular respiration; and nucleic acid and lipid biosynthesis.

**vinblastine sulfate:** The sulfate salt of vinblastine, a natural alkaloid isolated from the plant *Catharanthus roseus* (Madagascar periwinkle) with antineoplastic properties. Vinblastine disrupts microtubule formation and function during mitosis and interferes with glutamic acid metabolism. or A drug used to treat several types of cancer, including breast cancer and a type of gestational trophoblastic tumor that have not gotten better with other treatment, lymphoma, testicular cancer, Kaposi sarcoma, and mycosis fungoides. It is also being studied in the treatment of other types of cancer. Vinblastine sulfate blocks cell growth by stopping cell division and may kill cancer cells. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called Velban and Velsar.

**vinca alkaloid :** A type of drug that blocks cell growth by stopping mitosis (cell division). Vinca alkaloids interfere with microtubules (cellular structures that help move chromosomes during mitosis). They are used to treat cancer. A vinca alkaloid is a type of mitotic inhibitor and a type of antimicrotubule agent.

**Vincasar PFS:** (Other name for: vincristine sulfate)

**Vincosid:** (Other name for: vincristine sulfate)

**Vincrex:** (Other name for: vincristine sulfate)

**vincristine :** The active ingredient in a drug used to treat acute leukemia. It is used in combination with other drugs to treat Hodgkin disease, non-Hodgkin lymphoma, rhabdomyosarcoma, neuroblastoma, and Wilms tumor. Vincristine is also being studied in the treatment of other types of cancer. It blocks cell growth by stopping cell division. It is a type of vinca alkaloid and a type of antimitotic agent. or A synthetic derivative of vinblastine, a naturally occurring vinca alkaloid. Vindesine binds to and stabilizes tubulin, thereby interrupting tubulin polymerization and preventing the formation of the mitotic spindle and cell division; treated cells are unable to undergo mitosis and are arrested in metaphase. This agent also disrupts macromolecular synthesis.

**vincristine sulfate:** The sulfate salt of a natural alkaloid isolated from the plant *Vinca rosea* Linn with antimitotic and antineoplastic activities. Vincristine binds irreversibly to microtubules and spindle proteins in S phase of the cell cycle and interferes with the formation of the mitotic spindle, thereby arresting tumor cells in metaphase. This agent also depolymerizes microtubules and may also interfere with amino acid, cyclic AMP, and glutathione metabolism; calmodulin-dependent  $Ca^{++}$  -transport ATPase activity; cellular respiration; and nucleic acid and lipid biosynthesis.

**vincristine sulfate :** A drug used to treat acute leukemia. It is used in combination with other drugs to treat Hodgkin disease, non-Hodgkin lymphoma, rhabdomyosarcoma, neuroblastoma, and Wilms tumor. Vincristine sulfate is also being studied in the treatment of other types of cancer. It blocks cell growth by stopping cell division. It is a type of vinca alkaloid and a type of antimitotic agent. Also called Oncovin.

**vincristine sulfate liposome:** A sphingomyelin/cholesterol liposomal formulation of vincristine sulfate with potential antineoplastic activity.

Vincristine, a vinca alkaloid isolated from the plant *Vinca rosea*, irreversibly binds to and stabilizes tubulin, thereby interrupting microtubule assembly/disassembly dynamics, thereby preventing the formation of the mitotic spindle and leading to cell cycle arrest in metaphase. Liposomal encapsulation prolongs bioavailability of vincristine, increases its delivery to tumor tissues and reduces its toxicity profile. Compared to standard liposomal delivery, sphingosomal drug delivery further increases circulation time of serum drug and enhances drug accumulation at tumor sites, thereby leading to a further increase in efficacy.

**vincristine sulfate liposome :** A form of the anticancer drug vincristine sulfate that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than vincristine. Vincristine sulfate liposome is used to treat adults with acute lymphoblastic leukemia that is Philadelphia chromosome negative and has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called liposomal vincristine sulfate and Marqibo.

**vindesine :** An anticancer drug that belongs to the family of plant drugs called vinca alkaloids.

**Vinetra:** (Other name for: muscadine grape skin extract)

**vinflunine:** A bi-fluorinated derivative of the semi-synthetic vinca alkaloid vinorelbine with antitubulin, antineoplastic, and antiangiogenic activities. Vinflunine inhibits tubulin assembly without any stabilization of assembled microtubules at concentrations comparable to those of other vinca alkaloids such as vincristine, vinblastine and vinorelbine; this effect on microtubule dynamics results in cell cycle arrest in mitosis and apoptosis. Compared to other vinca alkaloids, this agent binds weakly to the vinca-binding site, indicating that vinflunine may exhibit reduced neurotoxicity. or A substance being studied in the treatment of bladder cancer, lung cancer, and other types of cancer. Also called Javlor.

**vinorelbine :** An anticancer drug that belongs to the family of plant drugs called vinca alkaloids.

**vinorelbine tartrate:** The ditartrate salt of a semisynthetic vinca alkaloid derived from the leaves of the periwinkle plant (*Vinca rosea*) with antineoplastic activity. Vinorelbine binds to tubulin, thereby inhibiting tubulin polymerization into microtubules and spindle formation and

resulting in apoptosis of susceptible cancer cells. Inhibition of mitotic microtubules correlates with antitumor activity, whereas inhibition of axonal microtubules seems to correlate with vinorelbine's neurotoxicity. Compared to related vinca alkaloids, vinorelbine is more selective against mitotic than axonal microtubules in vitro, which may account for its decreased neurotoxicity. This agent is also a radiation-sensitizing agent.

**vinorelbine tartrate :** A drug used to treat advanced non-small cell lung cancer. It blocks cell growth by stopping cell division and may cause cancer cells to die. It is a type of vinca alkaloid and a type of antimitotic agent. Also called Navelbine.

**vinorelbine tartrate emulsion:** An emulsion containing the tartrate salt of the semisynthetic vinca alkaloid vinorelbine with antineoplastic activity. Vinorelbine binds to tubulin, inhibiting tubulin polymerization into microtubules; cell division is prevented, the cell cycle is arrested metaphase and cell death ensues. In this formulation vinorelbine is emulsified in a homogeneous suspension of nanoparticles, which protects the venous endothelium from coming into direct contact with the active ingredient, potentially reducing vinorelbine-associated venous toxicity at the venous injection site.

**vinorelbine tartrate oral:** An orally bioavailable tartrate salt of vinorelbine, a semisynthetic vinca alkaloid with potential antineoplastic activity. Vinorelbine binds to tubulin, thereby inhibiting tubulin polymerization into microtubules and spindle formation and resulting in apoptosis of susceptible cancer cells. Inhibition of mitotic microtubules correlates with antitumor activity, whereas inhibition of axonal microtubules seems to correlate with vinorelbine's neurotoxicity. Compared to related vinca alkaloids, vinorelbine is more selective against mitotic than axonal microtubules in vitro, which may account for its decreased neurotoxicity. This agent is also a radiation-sensitizing agent. Check for active clinical trials using this agent.

**vintafolide:** A water-soluble, folate-receptor-targeted conjugate of folate and the vinca alkaloid desacetylvinblastine monohydrazide (DAVLBH) with potential antineoplastic activity. The folate moiety of vintafolide binds to folic acid receptors on the tumor cell surface and the agent is internalized via folate receptor-mediated endocytosis, delivering the tubulin-binding DAVLBH moiety directly into the tumor cell; DAVLBH binding to tubulin

results in the disruption of microtubule assembly-disassembly dynamics, cell cycle arrest, and tumor cell apoptosis. Folic acid receptors are frequently upregulated on the surfaces of many tumor cell types. DAVLBH is a derivative of the natural product vinblastine.

**Vinyl:** See Polyvinyl Chloride or A resin with poor adhesion but good hardness, flexibility and resistance. Used for swimming pools, tank linings and marine equipment. Or A polymer made by linking ethylene ( $\text{CH}_2=\text{CH}_2$ ) or substituted ethylene molecules together. Or A generic term for PVC, one of various compounds of ethylene that are polymerized to form resins and plastics (e.g. polyvinyl or polyethylene plastics).

**Vinyl Acetate:** A common monomer used to make chain-growth polymers. Or A colorless liquid obtained by the reaction of ethylene and acetic anhydride in the presence of a catalyst. It is the monomer for polyvinyl acetate, and a comonomer and intermediate for many members of the vinyl plastics family.

**Vinyl Acetate Monomer (VAM):** Vinyl acetate monomer (VAM) is a highly versatile intermediate used in the production of a variety of polymers, such as polyvinyl acetate (PVAc), polyvinyl alcohol (PVOH), polyvinyl butyral (PVB), polyvinyl formal (PVF) and ethylene vinyl acetate (EVA). The main process used to produce VAM is vapor-phase acetoxylation (reaction of ethylene with acetic acid), except in China where the acetylene process dominates.

**vinyl alcohol:**  $\text{CH}_2=\text{CH}-\text{OH}$  or One of the most common monomers used to make chain-growth polymers. Here is a picture: One of the few legitimate arguments against PVC in a country like Australia is that making it involves shipping this potent carcinogen from place to place in trucks.

**vinyl chloride :** A substance used to make plastics. Exposure to vinyl chloride may increase the risk of developing liver, brain, and lung cancers; lymphoma; and leukemia.

**Vinyl Chloride Monomer (VCM):** Vinyl chloride monomer (VCM) is an intermediate chemical of the vinyls chain, mainly produced by thermal cracking of EDC. Almost all VCM produced is used to manufacture PVC, with other applications consuming very little VCM. VCM is a toxic gas at room temperature, and thus transporting VCM is costly and hazardous. As

such, trade in VCM is usually minimised, in favour of shipping EDC (the precursor to VCM) or PVC.

**Vinyl emulsions:** Emulsions based on PVA or other vinyl compounds.

**Vinyl ester resin:** A reaction product of methacrylic acid and epoxy resin.

**vinyl group:** the  $\text{CH}_2=\text{CH}-$  group.

**Vinyls family:** The Vinyls family contains those chemicals used in the production of PVC resin, namely chlorine, EDC, VCM, and PVC. Although not specifically used for PVC production, caustic soda is often associated with the vinyls chain, as it is a major by-product of chlorine production.

**Viokace:** (Other name for: pancrelipase)

**Vioxx:** (Other name for: rofecoxib)

**Vioxx :** A drug that was being used for pain relief and was being studied for its ability to prevent cancer and to prevent the growth of new blood vessels that tumors need to grow. It is a type of nonsteroidal anti-inflammatory drug and a type of antiangiogenesis agent. Vioxx was taken off the market in the U.S. because of safety concerns. Also called rofecoxib.

**VIP:** An abbreviation for a chemotherapy combination used to treat advanced testicular cancer. It is often used in patients who cannot receive bleomycin. It includes the drugs etoposide (VePesid), ifosfamide, and cisplatin (Platinol). Also called VIP regimen.

**VIP hormone :** A hormone found in the pancreas, intestine, and central nervous system. It has many actions in the body, such as helping to control the secretion of water, salts, enzymes, and gastric acid during digestion. It also causes smooth muscles in the digestive tract, the heart, and the blood vessels to relax. It also has effects on the immune system and the central nervous system. Certain tumors in the pancreas make large amounts of VIP hormone. Also called vasoactive intestinal peptide.

**VIP regimen:** A regimen consisting of etoposide, ifosfamide and cisplatin used for the treatment of advanced-stage germ cell gonadal cancers. Or An abbreviation for a chemotherapy combination used to treat advanced testicular cancer. It is often used in patients who cannot receive bleomycin. It includes the drugs etoposide (VePesid), ifosfamide, and cisplatin (Platinol). Also called VIP.

**Vira-A:** (Other name for: vidarabine)

**Viracept:** (Other name for: nelfinavir mesylate)

**viral :** Having to do with a virus.

**viral oncolysate :** An extract made from cancer cells that are infected with a strain of virus that can lyse (break down) cancer cells. The extract contains both cancer cell proteins and virus proteins. Viral oncolysates are being studied as cancer vaccines.

**viral therapy :** Treatment using a virus that has been changed in the laboratory to find and destroy cancer cells without harming healthy cells. It is a type of targeted therapy. Also called oncolytic virotherapy, oncolytic virus therapy, and virotherapy.

**viral vector:** A viral DNA altered so that it can act as a vector for recombinant DNA. OR A type of virus used in cancer therapy. The virus is changed in the laboratory and cannot cause disease. Viral vectors may produce tumor antigens (proteins found on a tumor cell) to stimulate an antitumor immune response in the body. Viral vectors may also be used to carry genes that can change cancer cells back to normal cells.

**Viramune:** (Other name for: nevirapine)

**Virazid:** (Other name for: ribavirin)

**Virazole:** (Other name for: ribavirin)

**Viread:** (Other name for: tenofovir disoproxil fumarate)

**Virgin:** plastic material that has not been gone through a melting process since polymerization. Virgin material typically has very high uniformity in the composition of the individual polymer molecules.

**Virgin Grade Material:** plastic material that has not undergone any processing other than that required to prepare it for manufacturing parts.

**Virgin Material:** A plastic material that has not been subjected to use or processing other than that required for its initial manufacture. It can be in the form of pellets, granules, powder, floc, or liquid. OR A plastic material in the form of pellets, granules, powder, flock, or liquid that has not been subjected to use or processing other than that required for its initial manufacture.

**Virgin Resin:** This is a term that refers to pure and clean (no recycled material is included) resins.

**Virilization:** An inherited disorder of steroid-hormone synthesis due to abnormally high levels of androgen; clinical characteristics include early

sexual development in males, masculinization of external female genitalia, and persistent loss of Na<sup>+</sup>, leading to dehydration and hypotension.

**Virilon:** (Other name for: testosterone cypionate)

**Virion:** The complete extracellular form of a virus consisting of DNA or RNA surrounded by a coat. Or A virus particle.

**Viroids:** Pathogenic agents, mostly of plants, that consist of short (usually circular) RNA molecules.

**virotherapy :** Treatment using a virus that has been changed in the laboratory to find and destroy cancer cells without harming healthy cells. It is a type of targeted therapy. Also called oncolytic virotherapy, oncolytic virus therapy, and viral therapy.

**virtual:** An unoccupied orbital.

**virtual colonoscopy :** A method to examine the inside of the colon by taking a series of x-rays. A computer is used to make 2-dimensional (2-D) and 3-D pictures of the colon from these x-rays. The pictures can be saved, changed to give better viewing angles, and reviewed after the procedure, even years later. Also called computed tomographic colonography, computed tomography colonography, CT colonography, and CTC.

**virulence :** The ability of a microorganism to cause damage to its host.

**virulent :** Refers to the ability of a virus or a bacterium to cause damage to its host.

**Virulizin:** A natural biological response modifier (BRM) isolated from bovine reticuloendothelial tissue. Viruzlin may enhance cell-mediated immune response to tumor cells by direct macrophage activation.

**Virulizin :** A substance that activates some types of immune system cells, and is being studied as a treatment for cancer. It belongs to the family of drugs called biological therapy agents.

**virus:** fragments of nucleic acid surrounded by a protein coat; may attack cells and replicate within the cells, destroying them. Or A complex of nucleic-acid and protein, that can infect and replicate inside a specific host cell to make more virus particles. or A complex of protein and nucleic acid that can penetrate a cell and replicate itself by co-opting the host's metabolism and employing its own as well as the host's gene products; the smallest organism known. or A self replicating, infectious, nucleic acid-protein complex that requires an intact host cell for its replication; its

genome is either DNA or RNA. OR In medicine, a very simple microorganism that infects cells and may cause disease. Because viruses can multiply only inside infected cells, they are not considered to be alive.

**virus replication cycle :** The reproduction cycle of viruses. A replication cycle begins with the infection of a host cell and ends with the release of mature progeny virus particles.

**virus-like particle :** A small particle that contains certain proteins from the outer coat of a virus. Virus-like particles do not contain any genetic material from the virus and cannot cause an infection. They are used to make vaccines that can help the body's immune system kill microorganisms and certain cancer cells. Virus-like particles were used to make vaccines that prevent cervical cancer caused by human papilloma viruses (HPV). They were also used to make vaccines that prevent liver cancer caused by infection with the hepatitis B virus.

**virus-neutralizing antibody :** An antibody that binds to a virus and interferes with its ability to infect a cell.

**viscera :** The soft internal organs of the body, including the lungs, the heart, and the organs of the digestive, excretory, and reproductive systems.

**visceral :** Having to do with the viscera, which are the soft internal organs of the body, including the lungs, the heart, and the organs of the digestive, excretory, reproductive, and circulatory systems.

**visceral peritoneum :** The layers of tissue that cover the outer surface of most organs in the abdomen, including the intestines.

**visceromegaly:** enlargement of the internal organs in the abdomen, such as liver, spleen, stomach, kidneys, or pancreas

**Visco-ease:** (Other name for: lamellar body mimetic mouth spray LMS-611)

**VISCOELASTICITY:** The dual nature of polymers, partly viscous fluid and partly elastic solid, is referred to as viscoelasticity. In flowing polymers viscoelasticity is responsible for time-dependent properties, such as stress relaxation, normal stresses, very large elongational viscosities, and numerous unusual phenomena such as extrudate swell, entry flow vortices and some flow instabilities. OR This property, possessed by all plastics to some degree, dictates that while plastics have solid-like characteristics such as elasticity, strength and form-stability, they also have liquid-like

characteristics such as flow depending on time, temperature, rate and amount of loading.

**Viscosity:** The property of a fluid whereby it tends to resist relative motion within itself. Or A measurement of the consistency and/or other properties of a paint, i.e. thickness or thinness. Or The thickness of a coating as related to its ability to flow as a liquid. or resistance to flow; a lava with low viscosity spreads quickly, and one with high viscosity flows sluggishly. or The resistance a liquid exhibits to flow. Experimentally, the frictional force between two liquid layers moving past each other is proportional to area of the layers and the difference in flow speed between them. The constant of proportionality is called "viscosity" or "coefficient of viscosity", and is given the symbol  $\eta$ . The time required for a liquid to drain out of a capillary tube is directly proportional to its viscosity. The poise is a non-SI unit frequently used to express viscosities. or The resistance to flow of a fluid (strictly speaking the resistance to shearing). It is defined as the ratio of shear stress (Tangential Force/Area) to shear rate (velocity/gap). The viscosity of a polymer decreases as the shear rate increases. This property is referred to as pseudoplastic behavior or shear thinning. The viscosity of a polymer at (near) zero shear for a polymer like PE might be 5,000 to 10,000 Pa.s while during flow in an extrusion channel it could be much lower (i.e. 500 Pa.s or less). Melt flow index corresponds to just one point on a viscosity curve (actually inverse). High viscosity implies low melt index and high molecular weight. Viscosity is measured in units of Pa.s or poise.  $1 \text{ Pa.s} = 10 \text{ poise}$ . The viscosity of water is  $10^{-3} \text{ Pa.s}$  (1 centipoise) and for a typical polymer melt at least one million times larger (i.e. over 1000 Pa.s or 10,000 poise) OR Internal friction or resistance to flow of a liquid. The constant ratio of shearing stress to rate of shear. In liquids for which this ratio is a function of stress, the term "apparent viscosity" is defined as the ratio. OR The resistance of a material to flow. Fluids that are highly viscous, are thick and "gooey." Water has a low viscosity. OR the resistance offered by a fluid (liquid or gas) to flow. The viscosity is a characteristic property and is a measure of the combined effects of adhesion and cohesion. Or Resistance of a substance to flow. OR The resistance the a liquid (or gaseous) system offers to flow when it is subjected to shear stress. Viscosity is a specification for a number of oils, solutions and blends.

**VISCOSITY INDEX:** The relationship of viscosity to temperature of a fluid. High viscosity index fluids will display less change in viscosity with temperature.

**Viscosity response:** The viscosity response is a way of describing how the viscosity of a particular polymer responds to the changes in temperature and shear rate.

**Viscosity, Inherent:** The logarithmic viscosity number determined by dividing the natural logarithm of the relative viscosity (sometimes called viscosity ratio) by the concentration in grams per 100 mls. of solution.

**Viscosity, MFR, MVI, and MV:** Viscosity is the resistance to steady flow shown within the body of a material. It is internal friction or the measure of a polymer melt's resistance to flow. In testing: the ratio of the shearing stress to the rate of shear of a fluid. Which 'Newtonian viscosity', the ratio of shearing stress to rate of shearing strain is constant. In non-Newtonian behavior – which is the usual case with plastics – the ratio is not constant but varies with the shearing stress. Such a ratio is often called the apparent viscosity at the corresponding shearing stress. It represents one point on the flow curve. MFR, or melt flow rate, is the mass of thermoplastic material extruded in a given time through a defined orifice under specified conditions. Also called "flow rate." The expression MVI, or melt volume index, equals MFR. MV, or melt viscosity, is a measure of a polymer at a given temperature at which the molecular chains can move relative to each other. It is expressed as the quotient of the real shear stress  $\tau$  and the real rate of shear  $\dot{\gamma}$ . Melt viscosity is considerably dependent on the molecular weight: the higher the molecular weight the greater the entanglements and the greater the melt viscosity.

**Viscosity, Relative (or Viscosity Ratio):** Determined by dividing the average efflux time of the solution by the average efflux time of the pure solvent.

**viscotoxin :** A member of a group of small proteins produced by mistletoe plants that are able to kill cells and may stimulate the immune system.

**visible light:** Visible light is electromagnetic radiation with a wavelength between 400 and 750 nm.

**visilizumab:** A humanized, non-Fc receptor (FcR)-binding IgG2 monoclonal antibody (MoAb) directed against CD3 with potential immunosuppressive activity. Visilizumab binds to invariant CD3 epsilon,

one of the non-covalently-associated subunits of T-cell receptors (TCRs) on activated T-cells. Upon binding to the TCR/CD3 complex, visilizumab induces apoptosis, which may result in the selective clonal deletion of activated pathogenic T-cells. This MoAb is engineered with a substitution at amino acid residues 234 and 237 (Val3Ala) within the IgG2 Fc arm, rendering it unable to bind to type II FcRs; accordingly, this agent is less likely to activate type II FcR-expressing resting T-cells. or A substance being studied in the treatment of an immune system reaction called graft-versus-host disease (GVHD), which may occur after a donor stem cell transplant. It is also being studied in the treatment of some autoimmune diseases. Visilizumab binds to a protein called CD3, which is found on some T cells (a type of white blood cell). This may help suppress the body's immune response. Visilizumab is a type of monoclonal antibody.

**Vision Plastics:** Your Plastic Injection Molder, from Concept to Completion.

**Visipaque:** (Other name for: iodixanol)

**vismodegib:** An orally bioavailable small molecule with potential antineoplastic activity. Vismodegib targets the Hedgehog signaling pathway, blocking the activities of the Hedgehog-ligand cell surface receptors PTCH and/or SMO and suppressing Hedgehog signaling. The Hedgehog signaling pathway plays an important role in tissue growth and repair; aberrant constitutive activation of Hedgehog pathway signaling and uncontrolled cellular proliferation may be associated with mutations in the Hedgehog-ligand cell surface receptors PTCH and SMO.

**vismodegib :** A drug used to treat advanced basal cell carcinoma that has spread to other parts of the body or has come back after surgery. It is also used in patients who cannot be treated with surgery or radiation therapy. It is also being studied in the treatment of other types of cancer. Vismodegib blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of Hedgehog signaling pathway antagonist. Also called Erivedge and GDC-0449.

**Vistide:** (Other name for: cidofovir)

**Vistogard:** (Other name for: uridine triacetate)

**Vistogard :** A drug used in the emergency treatment of patients who receive too much fluorouracil or capecitabine (types of anticancer drugs). It is also used in the emergency treatment of heart or central nervous system

(CNS) toxicity or other serious side effects that occur within 4 days of ending treatment with fluorouracil or capecitabine. Vistogard may help protect healthy cells from some of the side effects caused by certain anticancer drugs. It is a type of cytoprotective agent. Also called PN401, triacetyluridine, and uridine triacetate.

**vistusertib:** An orally bioavailable inhibitor of the mammalian target of rapamycin (mTOR) with potential antineoplastic activity. Vistusertib inhibits the activity of mTOR, which may result in the induction of tumor cell apoptosis and a decrease in tumor cell proliferation. mTOR, a serine/threonine kinase that is upregulated in a variety of tumors, plays an important role downstream in the PI3K/Akt/mTOR signaling pathway.

**visual analog scale :** A tool used to help a person rate the intensity of certain sensations and feelings, such as pain. The visual analog scale for pain is a straight line with one end meaning no pain and the other end meaning the worst pain imaginable. A patient marks a point on the line that matches the amount of pain he or she feels. It may be used to help choose the right dose of pain medicine. Also called VAS.

**visual pathway glioma :** A rare, slow-growing tumor that usually forms in the optic nerve, optic chiasm, or optic tract. These are parts of the nervous system that carry messages from the eye to the brain. Also called optic pathway glioma.

**Visudyne:** (Other name for: verteporfin)

**VitaBlue tablet formation:** (Other name for: blueberry powder supplement)

**vital :** Necessary to maintain life. Breathing is a vital function.

**vitality :** A term used to describe a person's ability to live, grow, and develop. Vitality also refers to having energy and being vigorous and active. Being ill or being treated for a disease, such as cancer, may lessen a person's vitality.

**Vitamin:** A trace organic substance required in the diet of some species. Many vitamins are precursors of coenzymes. Or A substance that is critical for proper functioning of a living organism that the organism is unable to produce in sufficient quantities for itself. or An organic substance required in small quantities in the diet of some species; generally functions as a component of a coenzyme.

**vitamin :** A nutrient that the body needs in small amounts to function and stay healthy. Sources of vitamins are plant and animal food products and dietary supplements. Some vitamins are made in the human body from food products. Vitamins are either fat-soluble (can dissolve in fats and oils) or water-soluble (can dissolve in water). Excess fat-soluble vitamins are stored in the body's fatty tissue, but excess water-soluble vitamins are removed in the urine. Examples are vitamin A, vitamin C, and vitamin E. OR organic nutrients essential in trace amounts to the health of animals. Or Organic substances required in trace amounts for a number of essential biochemical reactions.

**Vitamin A:** A fat-soluble vitamin that is the precursor of the light-sensitive pigment retinal and the signal molecule retinoic acid, an activator of certain transcription factors. Also called retinol. OR A nutrient that the body needs in small amounts to function and stay healthy. Vitamin A helps in vision, bone growth, reproduction, growth of epithelium (cells that line the internal and external surfaces of the body), and fighting infections. It is fat-soluble (can dissolve in fats and oils). Vitamin A is found in liver, egg yolks, and whole milk dairy products from animals and in fish oils. It can also be made in the body from a substance found in some fruits and vegetables, such as cantaloupes, carrots, spinach, and sweet potatoes. Vitamin A is being studied in the prevention and treatment of some types of cancer. Also called retinol.

**vitamin A acid :** A nutrient that the body needs in small amounts to function and stay healthy. Vitamin A acid is made in the body from vitamin A and helps cells to grow and develop, especially in the embryo. A form of vitamin A acid made in the laboratory is put on the skin to treat conditions such as acne and is taken by mouth to treat acute promyelocytic leukemia (a fast-growing cancer in which there are too many immature blood-forming cells in the blood and bone marrow). Vitamin A acid is being studied in the prevention and treatment of other types of cancer. Also called all-trans retinoic acid, ATRA, retinoic acid, and tretinoin.

**Vitamin B:** 12 A prosthetic group, consisting of a cobalt atom, a corrin ring, and deoxyadenosine, that plays a role in intramolecular rearrangements, methylations, and reductions of ribonucleotides to deoxyribonucleotides. Also called cobalamin.

**vitamin B complex :** A compound containing several or all of a group of vitamins and nutrients that the body needs in very small amounts to function and stay healthy. The B vitamins in the vitamin B complex include thiamine, riboflavin, niacin (nicotinic acid), niacinamide (nicotinamide), the vitamin B6 group (including pyridoxine, pyridoxal, pyridoxamine), biotin, pantothenic acid, folic acid, and vitamin B12. Aminobenzoic acid, inositol, and choline are sometimes included as part of the vitamin B complex. The vitamin B complex is water-soluble (can dissolve in water) and is found in yeast, seeds, eggs, liver, meat, and vegetables. Members of the vitamin B complex are being studied in the prevention and treatment of some types of cancer.

**vitamin B1 :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B1 helps some enzymes work properly, helps break down sugars in the diet, and keeps nerves and the heart healthy. It is found in pork, organ meats, peas, beans, nuts, and whole grains. Vitamin B1 is water-soluble (can dissolve in water) and must be taken in daily. Not enough vitamin B1 can cause a disease called beriberi (a condition marked by heart, nerve, and digestive disorders). Too much vitamin B1 may help cancer cells grow faster. Also called thiamine.

**vitamin B12:** An essential nutrient and natural water-soluble vitamin of the B-complex family that must combine with an intrinsic factor for absorption by the intestine, Vitamin B12 (cyanocobalamin) is necessary for hematopoiesis, neural metabolism, DNA and RNA production, and carbohydrate, fat, and protein metabolism. B12 improves iron functions in the metabolic cycle and assists folic acid in choline synthesis. B12 metabolism is interconnected with that of folic acid. Vitamin B12 deficiency causes pernicious anemia, megaloblastic anemia, and neurologic lesions. or A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B12 helps make red blood cells, DNA, RNA, energy, and tissues, and keeps nerve cells healthy. It is found in liver, meat, eggs, poultry, shellfish, milk, and milk products. Vitamin B12 is water-soluble (can dissolve in water) and must be taken in every day. Not enough vitamin B12 can cause certain types of anemia (a condition in which the number of red blood cells is below normal) and neurologic disorders. It is being studied with folate in the prevention and

treatment of some types of cancer. Also called cobalamin and cyanocobalamin.

**vitamin B2 :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B2 helps make red blood cells, helps some enzymes work properly, and keeps skin, nails, and hair healthy. It is found in milk, eggs, malted barley, organ meats, yeast, and leafy vegetables. Vitamin B2 is water-soluble (can dissolve in water) and must be taken in every day. Not enough vitamin B2 can cause anemia (a low number of red blood cells), mouth sores, and skin problems. Amounts of vitamin B2 may be higher in the blood of patients with some types of cancer. Also called riboflavin.

**vitamin B3 :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B3 helps some enzymes work properly and helps skin, nerves, and the digestive tract stay healthy. Vitamin B3 is found in many plant and animal products. It is water-soluble (can dissolve in water) and must be taken in every day. Not enough vitamin B3 can cause a disease called pellagra (a condition marked by skin, nerve, and digestive disorders). A form of vitamin B3 is being studied in the prevention of skin and other types of cancer. Vitamin B3 may help to lower blood cholesterol. Also called niacin and nicotinic acid.

**vitamin B5 :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B5 helps some enzymes use foods and make many substances used in the body and protects cells against damage from peroxides. It is found in almost all plant and animal foods. Vitamin B5 is water-soluble (can dissolve in water) and must be taken in every day. Also called pantothenic acid.

**vitamin B6 :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin B6 helps keep nerves and skin healthy, fight infections, keep blood sugar levels normal, produce red blood cells, and some enzymes work properly. Vitamin B6 is a group of related compounds (pyridoxine, pyridoxal, and pyridoxamine) found in cereals, beans, peas, nuts, meat, poultry, fish, eggs, and bananas. It is water-soluble (can dissolve in water). Not enough vitamin B6 can cause mouth and tongue sores and nervous disorders. Vitamin B6 is being studied in the prevention of hand-foot syndrome (a disorder caused by certain anticancer

drugs and marked by pain, swelling, numbness, tingling, or redness of the hands or feet). Also called pyridoxine.

**vitamin C :** A nutrient that the body needs in small amounts to function and stay healthy. Vitamin C helps fight infections, heal wounds, and keep tissues healthy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Vitamin C is found in all fruits and vegetables, especially citrus fruits, strawberries, cantaloupe, green peppers, tomatoes, broccoli, leafy greens, and potatoes. It is water-soluble (can dissolve in water) and must be taken in every day. Vitamin C is being studied in the prevention and treatment of some types of cancer. Also called ascorbic acid.

**Vitamin D:** A fat-soluble vitamin that plays a role in the regulation of calcium and phosphorus metabolism; deficiencies in vitamin D lead to the impairment of bone formation. OR A family of lipo-soluble steroids important to the absorption, metabolism, and function of calcium and phosphorus and the growth and development of bone and tooth enamel. Found naturally in animal tissues, cholecalciferol (vitamin D3) is formed in the skin when ultraviolet light activates cholesterol conversion into vitamin D3. Ultraviolet irradiation of ergosterol (plant vitamin D) forms ergocalciferol (vitamin D2). Check for active clinical trials using this agent. OR A nutrient that the body needs in small amounts to function and stay healthy. Vitamin D helps the body use calcium and phosphorus to make strong bones and teeth. It is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, egg yolks, and dairy products. Skin exposed to sunshine can also make vitamin D. Not enough vitamin D can cause a bone disease called rickets. It is being studied in the prevention and treatment of some types of cancer. Also called cholecalciferol.

**vitamin D2 :** A form of vitamin D that helps the body use calcium and phosphorus to make strong bones and teeth. It is fat-soluble (can dissolve in fats and oils) and is found in plants and yeast. It can be made in the body from another form of vitamin D when the body is exposed to the sun. Vitamin D2 is also made in the laboratory. It is used to prevent and to treat vitamin D deficiency. It is a type of dietary supplement. Also called ergocalciferol.

**Vitamin E:** Protects unsaturated membrane lipids from oxidation. Also called  $\alpha$ -tocopherol. OR A natural fat-soluble antioxidant with potential

chemopreventive activity. Vitamin E ameliorates free-radical damage to biological membranes, protecting polyunsaturated fatty acids (PUFA) within membrane phospholipids and within circulating lipoproteins. Peroxyl radicals react 1000-fold faster with vitamin E than with PUFA. In the case of oxygen free radical-mediated tumorigenesis, vitamin E may be chemopreventive. OR A nutrient that the body needs in small amounts to stay healthy and work the way it should. It is fat-soluble (can dissolve in fats and oils) and is found in seeds, nuts, leafy green vegetables, and vegetable oils. Vitamin E boosts the immune system and helps keep blood clots from forming. It also helps prevent cell damage caused by free radicals (highly reactive chemicals). Vitamin E is being studied in the prevention and treatment of some types of cancer. It is a type of antioxidant. Also called alpha-tocopherol.

**vitamin H :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Vitamin H helps some enzymes break down substances in the body for energy and helps tissues develop. It is found in yeast, whole milk, egg yolks, and organ meats. Vitamin H is water-soluble (can dissolve in water) and must be taken in every day. Not enough vitamin H can cause skin, nerve, and eye disorders. Vitamin H is present in larger amounts in some cancer tissue than in normal tissue. Attaching vitamin H to substances used to treat some types of cancer helps them find cancer cells. Also called biotin.

**Vitamin K:** A fat-soluble vitamin required for blood coagulation. OR A nutrient that the body needs in small amounts to function and stay healthy. Vitamin K helps to form blood clots (a mass that forms when blood platelets, proteins, and cells stick together) and maintain strong bones. It is fat-soluble (can dissolve in fats and oils) and is found in green leafy vegetables, broccoli, liver, and vegetable oils. Vitamin K is also made by bacteria that live in the large intestine. Not enough vitamin K can lead to bleeding and bruising. It is a type of phyloquinone.

**vitamin K1-containing urea skin cream:** A topical cream containing urea and 0.1% vitamin K1 (phytomenadione) with topical epidermal growth factor receptor (EGFR)-activating activity. Upon application of vitamin K1-containing urea skin cream, vitamin K1 may locally activate EGFR, thereby abrogating EGFR inhibition in the skin caused by systemic EGFR inhibiting agents. This may help inhibit the acne-like skin rash induced by

EGFR antagonists. EGFR, a tyrosine kinase, plays a key role in maintaining epidermal integrity. Check for active clinical trials using this agent.

**vitamin Q10 :** A nutrient that the body needs in small amounts to function and stay healthy. Vitamin Q10 helps mitochondria (small structures in the cell) make energy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Vitamin Q10 is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, beef, soybeans, peanuts, and spinach. It is being studied in the prevention and treatment of some types of cancer and heart disease and in the relief of side effects caused by some cancer treatments. Also called coenzyme Q10, CoQ10, Q10, and ubiquinone.

**vitespen:** An autologous cancer vaccine derived from tumor-specific gp96 heat shock proteins. Heat shock proteins chaperone peptides through the endoplasmic reticulum, are key regulators of dendritic cell maturation, migration and antigen processing, and are involved in T-cell activation.

**vitespen :** A vaccine made from a patient's tumor cells that may help the body's immune system kill cancer cells. This vaccine is used to treat kidney cancer, a type of brain cancer called glioma, and metastatic melanoma (a type of skin cancer that has spread). It is also being studied in the treatment of other types of cancer. Also called gp96 heat shock protein-peptide complex vaccine, gp96 HSP-peptide complex, and Oncophage.

**Vitex :** An extract made from the fruit of the chaste tree (*Vitex agnus-castus*) found in parts of Asia and Europe. It is claimed to treat infertility and to lessen symptoms that may occur before or during a woman's menstrual period, such as headaches and irregular bleeding. Vitex may affect levels of reproductive hormones in the blood. It is a type of phytomedicine. Also called chaste tree berry and monk's pepper.

**vitreous humor :** The clear jelly-like substance that fills the inside of the eyeball. As a person ages, the vitreous humor becomes more liquid.

**Vitreous Solid:** A vitreous solid has no specific organization of molecules. Steel is an example of a vitreous solid. Because of its combination of atoms, it does not have a specific melting point. It may become a liquid over a range of temperatures.

**Vivelle:** (Other name for: therapeutic estradiol)

**Vivitrol :** A drug that blocks the action of opiates (drugs used to treat pain). It may be used in the treatment of intravenous opiate addiction or alcohol dependence. Vivitrol is also being studied in the treatment of breast cancer. It may block the effects of the hormone estrogen, which causes some breast cancer cells to grow, or block the blood flow to tumors. It is a type of opiate antagonist. Also called naltrexone, naltrexone hydrochloride, and ReVia.

**Vizamyl:** (Other name for: flutemetamol F-18)

**Vldls (very low density lipoproteins):** Lipoprotein particles, stabilized by apolipoproteins B-100 and E, that transport excess endogenous triacylglycerides and cholesterol from the liver to other tissues.

**VLP-encapsulated TLR9 agonist CMP-001:** An agent composed of an unmethylated CpG motif-rich G10 oligonucleotide, which is an agonist of toll-like receptor 9 (TLR9), encapsulated in noninfectious virus-like particles (VLPs), with potential immunostimulating and antineoplastic activities. Upon administration of CMP-001, the VLPs are specifically taken up by and release the oligonucleotide into antigen-presenting cells (APCs), including dendritic cells (DCs). In turn, the oligonucleotide binds to and activates intracellular TLR9. This stimulates immune signaling pathways, induces the innate immune system and may promote the immune system to attack tumor cells. VLPs stimulate the immune system. TLR9, a member of the TLR family, plays a key role in both pathogen recognition and the activation of innate immunity.

**V<sub>max</sub>:** The maximum velocity of an enzymatic reaction when the binding site is saturated with substrate.

**VNP20009:** A genetically modified Salmonella bacterium that is injected into the tumor. It is being studied for its ability to shrink solid tumors.

**VNP40101M:** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called alkylating agents.

**VOC:** Volatile organic content. Any carbon compound that evaporates under standard test conditions. Essentially all paint solvents except water are VOCs. Federal and state governments are beginning to limit the amount of volatile organics found in paint because of the concerns about possible destructive environmental and health effects.

**vocal cord :** One of two small bands of muscle within the larynx that vibrates to produce the voice.

**vocimagene amiretrorepvec:** A replication competent retroviral vector, derived from the Moloney murine leukemia virus (MoMLV), encoding a modified form of the yeast suicide gene cytosine deaminase (CD) (Toca 511) used as an antineoplastic adjuvant. Upon transcranial injection, vocimagene amiretrorepvec preferentially enters and transfects tumor cells, and expresses cytosine deaminase, an enzyme that catalyzes the intracellular conversion of the prodrug flucytosine (5-FC) into the antineoplastic agent 5-fluorouracil (5-FU). After administration of 5-FC, the tumor can be eradicated upon activation of 5-FU. Check for active clinical trials using this agent.

**voglibose:** A valiolamine derivative and inhibitor of alpha-glucosidase with antihyperglycemic activity. Voglibose binds to and inhibits alpha-glucosidase, an enteric enzyme found in the brush border of the small intestines that hydrolyzes oligosaccharides and disaccharides into glucose and other monosaccharides. This prevents the breakdown of larger carbohydrates into glucose and decreases the rise in postprandial blood glucose levels.

**voice:** refers to the form of a verb indicating whether the subject performs the action (active voice) or receives the action (passive voice).

**voice box :** The area of the throat containing the vocal cords and used for breathing, swallowing, and talking. Also called larynx.

**Void:** In a nuclear power reactor, an area of lower density in a moderating system (such as steam bubbles in water) that allows more neutron leakage than does the more dense material around it. Or An unfilled space in a cellular plastic which is substantially larger than the individual cells. Can also be an empty space in any material or medium. OR A void or bubble occurring in the center of a heavy thermoplastic part. This is generally caused by excessive shrinkage.

**Void coefficient of reactivity:** A rate of change in the reactivity of a water reactor system resulting from a formation of steam bubbles as the power level and temperature increase.

**Void space:** The space within a desolvated crystal that is not occupied by atoms.

**volasertib:** A dihydropteridinone Polo-like kinase 1 (Plk1) inhibitor with potential antineoplastic activity. Volasertib selectively inhibits Plk1, inducing selective G2/M arrest followed by apoptosis in a variety of tumor cells while causing reversible cell arrest at the G1 and G2 stage without apoptosis in normal cells. Plk1, named after the polo gene of *Drosophila melanogaster*, is a serine/threonine protein kinase involved in regulating mitotic spindle function in a non-ATP competitive manner.

**volatile:** A substance which is easily vaporized. Or A volatile compound has a lower boiling point than surrounding compounds. Volatility is a comparison. Alcohol is more volatile than water because it evaporates at a lower temperature. Or A solid or liquid material that easily vaporizes. A material with a significant vapor pressure.

**Volatile content:** The quantity, expressed as a percent weight of a coating, that is lost under specified conditions of temperature and time.

**Volatile Organic Compounds (VOCs):** Volatile organic compounds (VOCs) are any compound that contains carbon and hydrogen, having a vapor pressure that may contribute to atmospheric photochemical reactions. VOCs tend to accumulate and remain in the environment, causing issues such as smog and other emissions. Many VOCs are synthetic chemicals that are used in the manufacturing of paints, pharmaceuticals, and refrigerants.

**volatile solids:** the quantity of solid in water, wastewater or other liquids, lost on ignition of the dry solids at 600 oC.

**Volatiles:** That portion of a substance that is readily vaporized.

**Volatility:** The readiness of a substance to change from a solid or liquid form to a vapor.

**volatize:** To make volatile; to cause to pass off in vapor.

**volcanic arc:** a range of andesitic volcanic mountains that forms on the continental edge above a subduction zone.

**volcanic dome:** a rounded volcanic feature, formed from thick, viscous magma, that creates a plug in the vent of a volcano.

**volcanic mountain:** the result of the accumulation of a large amount of volcanic lavas and pyroclastic material around a volcanic vent.

**volcanic neck:** a rock that formed in the vent or throat of a volcano at the end of its eruptive life and remains standing after the flanks of the volcano have eroded away.

**volcanism:** the venting of liquid magma at the surface of the earth.

**volcano:** a hill or mountain that forms around a volcanic vent and that consists of cooled lava, rock fragments, and dust from the eruptions.

**volitinib:** An orally bioavailable inhibitor of the c-Met receptor tyrosine kinase with potential antineoplastic activity. Volitinib selectively binds to and inhibits the activation of c-Met in an ATP-competitive manner, and disrupts c-Met signal transduction pathways. This may result in cell growth inhibition in tumors that overexpress the c-Met protein. C-Met encodes the hepatocyte growth factor receptor tyrosine kinase and plays an important role in tumor cell proliferation, survival, invasion, and metastasis, and tumor angiogenesis; this protein is overexpressed or mutated in a variety of cancers.

**volociximab:** A chimeric monoclonal antibody with potential antineoplastic activity. Volociximab binds to and inhibits the activity of alpha(5)beta(1) integrin, thereby inhibiting endothelial cell-cell interactions, endothelial cell-matrix interactions, and angiogenesis.

**volociximab :** A monoclonal antibody that is being studied in the treatment of some types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Volociximab binds to a protein that is found on cells that line some tumor blood vessels. It is a type of angiogenesis inhibitor. Also called M200.

**volt:** A unit of electrical potential. Or The SI unit of electrical potential. One volt equals one joule per coulomb.

**voltage:** the electrical pressure (electromotive force) that makes current flow through a conductor. Or A measured electric potential, in volts.

**Voltage-gated channel:** A transmembrane channel that is opened by membrane depolarization; the sodium and potassium channels of axon membranes are good examples.

**voltaic cell:** An electrochemical cell that spontaneously generates electrical energy.

**voltaic pile:** An early battery consisting of disks of dissimilar metals (usually zinc and copper) separated by moist paper or cloth soaked in an electrolyte solution.

**voltammeter:** An instrument for measuring voltages and amperages.

**Voltaren** : A drug that is used to treat the symptoms of rheumatoid arthritis and is being studied in the prevention and treatment of some types of skin cancer. It blocks substances that cause inflammation and pain. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of cyclooxygenase inhibitor, a type of nonsteroidal anti-inflammatory drug (NSAID), and a type of antiangiogenesis agent. Also called diclofenac sodium.

**Voltaren gel** : The gel form of a drug that is used to treat the symptoms of rheumatoid arthritis and is being studied in the prevention and treatment of some types of skin cancer. It blocks substances that cause inflammation and pain. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of cyclooxygenase inhibitor, a type of nonsteroidal anti-inflammatory drug (NSAID), and a type of antiangiogenesis agent. Also called diclofenac sodium gel.

**volume**: the space occupied in three dimensions. Or Measures the size of an object using length measurements in three dimensions. Or The space occupied by a mass. Or capacity to hold, measured in cubic units. Volume of rectangular prism = length x width x height. or 1. The amount of space an object takes up. 2. The amount of space a container can hold. The SI unit of volume is the cubic meter (m<sup>3</sup>); the liter is a popular unit of volume in chemistry. or referred to as "displacement" and also as "capacity." (1) the amount of water displaced by a model of a bottle. Volume is used to estimate its capacity. (2) the amount of product a bottle is designed to hold, i.e., up to the fill point of the bottle. (3) the overflow capacity, i.e. The amount of product a bottle will hold when filled to overflowing.

**Volume percent (% v/v)**: for liquid mixtures, the percentage of total volume occupied by a particular component; for ideal gases, the same as mole percent. for nonideal gases, the volume percent has no meaningful physical significance.

**volume percentage**: Volume percentages express the concentration of a component in a mixture or an element in a compound. For example, 95% ethanol by volume contains 95 mL of ethanol in 100 mL of solution (NOT in 100 mL of water!)

**Volume Resistivity**: The measure of ratio of the potential gradient parallel to the current in the material to the current in density. OR The measure of ratio of the potential gradient parallel to the current in the material to the

current in density. OR resistance between opposite faces of 1 cm cube of material, usually in ohm-cms.

**Volume Solids:** Solid ingredients as a percentage of total ingredients. The volume of pigment plus binder divided by the total volume, expressed as a percent. High-volume solids mean a thicker dry film with improved durability.

**Voluven:** (Other name for: hetastarch)

**vomit :** To eject some or all of the contents of the stomach through the mouth.

**Von Gierke disease:** A disease resulting from defective glucose 6-phosphatase that affects the liver and kidneys; glycogen is normal in structure but present in abnormally large amounts and so there is a massive increase in liver size with resulting damage to liver functions.

**von Hippel-Lindau peptide vaccine:** A cancer vaccine composed of peptides derived from a tumor-associated protein encoded by a mutated Von Hippel-Lindau (VHL) oncogene. VHL peptide vaccine may stimulate a cytotoxic T cell response against tumor cells expressing the VHL tumor-associated protein.

**von Hippel-Lindau syndrome :** A rare inherited disorder in which blood vessels grow abnormally in the eyes, brain, spinal cord, adrenal glands, or other parts of the body. People with von Hippel-Lindau syndrome have a higher risk of developing some types of cancer. Also called VHL syndrome.

**Voraxaze:** (Other name for: glucarpidase)

**Voraxaze :** A drug used to treat toxic levels of methotrexate (an anticancer drug) in the blood of patients with kidney problems. It is a bacterial enzyme that breaks down proteins and other substances, such as methotrexate.

Voraxaze may also help certain drugs kill cancer cells. It is a type of chemoprotective agent and a type of prodrug activator. Also called carboxypeptidase-G2 and glucarpidase.

**voriconazole:** A synthetic triazole with antifungal activity. Voriconazole selectively inhibits 14-alpha-lanosterol demethylation in fungi, preventing the production of ergosterol, an essential constituent of the fungal cell membrane, and resulting in fungal cell lysis.

**voriconazole :** A drug that treats infections caused by fungi.

**vorinostat:** A synthetic hydroxamic acid derivative with antineoplastic activity. Vorinostat, a second generation polar-planar compound, binds to the catalytic domain of the histone deacetylases (HDACs). This allows the hydroxamic moiety to chelate zinc ion located in the catalytic pockets of HDAC, thereby inhibiting deacetylation and leading to an accumulation of both hyperacetylated histones and transcription factors. Hyperacetylation of histone proteins results in the upregulation of the cyclin-dependant kinase p21, followed by G1 arrest. Hyperacetylation of non-histone proteins such as tumor suppressor p53, alpha tubulin, and heat-shock protein 90 produces additional anti-proliferative effects. This agent also induces apoptosis and sensitizes tumor cells to cell death processes. Vorinostat crosses the blood-brain barrier.

**vorinostat :** A drug that is used to treat cutaneous T-cell lymphoma that does not get better, gets worse, or comes back during or after treatment with other drugs. It is also being studied in the treatment of other types of cancer. Vorinostat is a type of histone deacetylase inhibitor. Also called SAHA, suberoylanilide hydroxamic acid, and Zolinza.

**vorozole :** A hormone therapy drug used to decrease the production of estrogen.

**vorsetuzumab-mafodotin:** An antibody-drug conjugate (ADC) consisting of a humanized monoclonal antibody, directed against the extracellular domain of the human CD70 molecule, conjugated to the auristatin analogue monomethyl auristatin phenylalanine (MMAF), with potential antineoplastic activity. The anti-CD70 antibody moiety of anti-CD70 antibody-drug conjugate SGN-75 selectively binds to the extracellular domain of CD70 on tumor cell surfaces. Upon internalization, the MMAF moiety is released, binds to tubulin and inhibits its polymerization, which may result in G2/M phase arrest, tumor cell apoptosis and inhibition of cellular proliferation in tumor cells that overexpress CD70. CD70, the ligand for the costimulatory receptor CD27 and a member of the tumor necrosis factor (TNF) family, is found on the surfaces of various types of cancer cells.

**vortioxetine hydrobromide:** A hydrobromide salt form of vortioxetine, a serotonin (5-HT) modulator and stimulator (SMS), with antidepressant activity. Vortioxetine inhibits the reuptake of serotonin and norepinephrine from the synaptic cleft and acts variably as a serotonin receptor agonist (5-

HT1A), partial agonist (5-HT1B) or antagonist (5-HT3, 5-HT1D and 5-HT7). It is not clear how this agent's purported multimodal mechanism of action contributes to its antidepressant effect; however, it is presumed to increase the synaptic availability of serotonin and norepinephrine.

**vosaroxin:** A small molecule and a naphthyridine analogue with antineoplastic activity. Vosaroxin intercalates into DNA in a site-specific manner and blocks the re-ligation process carried out by topoisomerase II during DNA replication. As a result, inhibition of DNA replication, RNA and protein synthesis occurs, followed by cell cycle arrest at G2 phase and induced p53-independent apoptosis. This agent shows a favorable toxicity profile in several aspects: it does not generate reactive oxygen species, as do anthracyclines, hence reducing the risk of cardiotoxicity; it is not a P-glycoprotein (P-gp) substrate, and thereby evades the common mechanism for multidrug resistance; and it has limited distribution to normal tissues and a more chemically stable molecular structure. Check for active clinical trials using this agent.

**Votrient :** A drug used to treat advanced renal cell carcinoma, which is the most common type of kidney cancer. It is also used to treat advanced soft tissue sarcoma that has been treated with other anticancer drugs. It is being studied in the treatment of other types of cancer. Votrient may prevent the growth of new blood vessels that tumors need to grow. It is a type of protein tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called GW786034 and pazopanib hydrochloride.

**VTZ:** Valence triple-zeta. A minimal basis is used to describe core electrons, but the valence electrons have three times the minimum number of functions (see "DZ").

**vulcanization:** The process for changing rubber from a weak material into a hard, strong material, usually by heating with sulfur. Or A process of combining rubber with sulfur or other substances that causes the polymer chains to crosslink, making them stronger and more elastic.

**vulva :** The external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina.

**vulvar cancer :** Cancer of the vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina).

**vulvar carcinoma in situ :** Abnormal cells are found on the surface of the vulvar skin. These abnormal cells may become cancer and spread into

nearby tissue. Also called VIN and vulvar intraepithelial neoplasia.

**vulvar intraepithelial neoplasia :** Abnormal cells are found on the surface of the vulvar skin. These abnormal cells may become cancer and spread into nearby tissue. Also called VIN and vulvar carcinoma in situ.

**Vumon:** (Other name for: teniposide)

**VUS:** A variation in a genetic sequence whose association with disease risk is unknown. Also called unclassified variant, variant of uncertain significance, and variant of unknown significance.

**VX 853:** A drug being studied to make cancer cells less resistant to the effects of chemotherapy.

**VX-710:** A drug being studied to make cancer cells less resistant to the effects of chemotherapy.

**Vytorin:** (Other name for: ezetimibe/simvastatin)

**Vyvance:** (Other name for: lisdexamfetamine dimesylate)

**WAGR syndrome :** A rare, genetic disorder that is present at birth and has two or more of the following symptoms: Wilms tumor (a type of kidney cancer); little or no iris (the colored part of the eye); defects in the sexual organs and urinary tract (the organs that make urine and pass it from the body); and below average mental ability. This syndrome occurs when part of chromosome 11 is missing. Also called Wilms tumor-aniridia-genitourinary anomalies-mental retardation syndrome.

**Wainscot:** Woodwork lining the walls of a room or passage.

**Waldenström macroglobulinemia :** An indolent (slow-growing) type of non-Hodgkin lymphoma marked by abnormal levels of IgM antibodies in the blood and an enlarged liver, spleen, or lymph nodes. Also called lymphoplasmacytic lymphoma.

**Waldeyer's ring :** A ring of lymphoid tissue found in the throat. The Waldeyer's ring is made up of the tonsils, adenoids, and other lymphoid tissue. It contains lymphocytes (a type of immune cell) that help the body fight infection and disease.

**Walker cell:** A zonal circulation of the atmosphere confined to equatorial regions and driven principally by the oceanic temperature gradient. In the Pacific, air flows westward from the colder, eastern area to the warm, western ocean, where it acquires warmth and moisture and subsequently

rises. A return flow aloft and subsidence over the eastern ocean complete the cell.

**Wall:** the thickness of the bottle, usually measured along the side walls. B&C Plastics Ltd. manufactures some heavy-wall styles of bottles that offer improved strength and stacking. OR A common term for the faces of a hollow part. Consistency in wall thickness is important.

**Wall Thickness:** The thickness of the cross section of the plastic part.

**Wallach's rule:** A rule stating that enantiomeric crystals tend to be more soluble (lower melting) than the corresponding racemic crystals.

**waning:** part of the lunar cycle in which the Moon is getting less full and the "left side is lit up" (left side lit).

**WARF Compound 42:** (Other name for: warfarin)

**warfarin:** A synthetic anticoagulant. Warfarin appears to inhibit the regeneration of vitamin K1 epoxide and so the synthesis of vitamin K dependent clotting factors, which include Factors II, VII, IX and X, and the anticoagulant proteins C and S. This inhibition results in a sequential depression of Factors VII, IX, X and II activities. Vitamin K is an essential cofactor for the post ribosomal synthesis of the vitamin K dependent clotting factors. The vitamin promotes the biosynthesis of gamma-carboxyglutamic acid residues in these proteins which are essential for biological activity.

**warfarin :** A drug that prevents blood from clotting. It belongs to the family of drugs called anticoagulants (blood thinners).

**warm front:** the leading edge of a warm air mass.

**warm ischemia :** In surgery, keeping a tissue, organ, or body part at body temperature after its blood supply has been reduced or cut off.

**warm ischemia time :** In surgery, the time a tissue, organ, or body part remains at body temperature after its blood supply has been reduced or cut off but before it is cooled or reconnected to a blood supply.

**Warning Label:** These are labels on packaging that indicate improper use of the enclosed products and warning of the dangerous results of improper use. This type of label is required by law.

**Warp:** The curving or bending of a part as it cools that results from stresses as different portions of the part cool and shrink at different rates. Parts made using filled resins may also warp due to the way the fillers align

during resin flow. Fillers often shrink at different rates than the matrix resin, and aligned fibers can introduce anisotropic stresses. OR To twist or deform from a desired shape. Often caused by molded in stress or shrinkage.

**Warpage:** Dimensional distortion in a plastic object after molding. OR Uneven bending, Twisting etc on account of differential cooling, differential shrinkage, or non uniform freezing of melt in the mould can cause these conditions in the moulded part. OR Dimensional distortion of a plastic part due to strain resulting from injection molding or other conversion methods.

**wart :** A raised growth on the surface of the skin or other organ.

**Washability:** Ease with which washing will remove dirt from the paint's surface without causing damage to it. Or The ability of a paint to be easily cleaned without wearing away during cleaning.

**washdown:** water resulting from cleaning of equipment, walls, floors, etc., within a plant.

**Washing off:** If you apply a water-based product in cold conditions (i.e. below 10°C), loss of adhesion can occur and the coating may simply wash off when it rains. To rectify, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Scrape back all areas of poorly adhering or defective coatings to a firm edge and rub down to 'feather' broken edges. Dust off and re-apply coating.

**Waste classification (classes of waste):** Classification of low-level radioactive waste (LLW) according to its radiological hazard. The classes include Class A, B, and C, with Class A being the least hazardous and accounting for 96 percent of LLW. As the waste class and hazard increase, the regulations established by the NRC require progressively greater controls to protect the health and safety of the public and the environment. For the specific regulations, see Title 10, Section 61.55, of the Code of Federal Regulations (10 CFR 61.55), "Waste Classification."

**Waste, radioactive:** Radioactive materials at the end of their useful life or in a product that is no longer useful and requires proper disposal. For additional detail, see Radioactive Waste.

**watchful waiting :** Closely watching a patient's condition but not giving treatment unless symptoms appear or change. Watchful waiting is sometimes used in conditions that progress slowly. It is also used when the

risks of treatment are greater than the possible benefits. During watchful waiting, patients may be given certain tests and exams. Watchful waiting is sometimes used in prostate cancer. It is a type of expectant management.

**Water Absorbtion:** The amount of water absorbed by a plastic article when immersed in water for a certain period of time. All plastics will absorb moisture to some extent. Or The ability of a thermoplastic material to absorb water from an environment. Or the percentage by weight of water absorbed by a sample immersed in water. Dependant upon area exposed. Or The ability of a thermoplastic material to absorb water from an environment. or The amount of water absorbed by a plastic article when immersed in water for a stipulated period of time. All plastics will absorb moisture to some extent.

**Water Absorption, 24 hours:** The percentage of water absorbed by a material when immersed in water for 24 hours; water absorbed in a material chiefly affects its electrical properties.

**Water bath:** Used during the extrusion process to cool plastic extrusions.

**Water contact angle:** Tangent angle at the interface between droplet of liquid and a solid surface; measure of the surface energy;  $0^\circ$  for perfectly hydrophilic surface and  $90^\circ$  for perfectly hydrophobic surface. Water contact angle can be affected by several factors, microscopic roughness of the surface tends to give a higher water contact angle.

**water deprivation test :** A test to measure how much urine is made and how concentrated it becomes when no water is given to a patient for a certain amount of time. This test is used to see how well the kidneys work and to help diagnose diabetes insipidus (a condition in which a person is very thirsty and makes large amounts of urine). Also called fluid deprivation test.

**WATER EMULSIONS:** Mixture of pigment and synthetic resin in water with low solvent emission, low fire hazard and toxicity and good durability and chemical resistance.

**Water footprint :** The water footprint is an indicator of water use that looks at both direct and indirect water use of a consumer or producer. The water footprint of an individual, community or business is defined as the total volume of freshwater that is used to produce the goods and services consumed by the individual or community or produced by the business. Water use is measured in terms of water volumes consumed (evaporated)

and/or polluted per unit of time. A water footprint can be calculated for any well-defined group of consumers (e.g., an individual, family, village, city, province, state or nation) or producers (e.g., a public organization, private enterprise or economic sector). The water footprint is a geographically explicit indicator, not only showing volumes of water use and pollution, but also the locations. (source: Water Footprint Network)

**water gas:** A fuel gas used in industrial synthesis of organic chemicals, and in welding, glassmaking, and other high-temperature industrial applications. Water gas made by passing steam over a bed of hot coal or coke. It consists mainly of carbon monoxide (CO) and hydrogen (H<sub>2</sub>), contaminated with small amounts of CO<sub>2</sub>, N<sub>2</sub>, CH<sub>4</sub>, and O<sub>2</sub>.

**Water Hammer:** a phenomenon whereby a pressure shock wave is generated, due to a sudden change in fluid velocity within a piping system. The resulting pressure pulses can be significantly higher than the nominal working pressure of the system.

**Water hardness:** a measure of the ability of water to form insoluble precipitates when boiled or when soap is added. Hardness is caused by the presence of Ca, Mg and Fe cations and to a lesser extent, other divalent cations. It is expressed as ppm of divalent cations. It can be measured with a water hardness electrode, which exhibits almost equal response to all divalent cations. or Hard water is water contaminated with compounds of calcium and magnesium. Dissolved iron, manganese, and strontium compounds can also contribute to the "total hardness" of the water, which is usually expressed as ppm CaCO<sub>3</sub>. Water with a hardness over 80 ppm CaCO<sub>3</sub> is often treated with water softeners, since hard water produces scale in hot water pipes and boilers and lowers the effectiveness of detergents.

**water O-15:** An inert, radiopharmaceutical of oxygen-15 (O-15) labeled water used as a tracer molecule with positron emission tomography (PET). Upon administration, water O-15 is freely diffusible and its distribution, as well as its clearance, are completely dependent on the rate of blood flow. Water O-15 can be imaged using PET to measure tissue or tumor blood flow/perfusion. This cyclotron product has a very short half life of about 2 minutes thereby allowing for multiple, serial measurements.

**water of crystallization:** Water that is stoichiometrically bound in a crystal; for example, the waters in copper sulfate pentahydrate.

**Water paint:** Any paint in which the 'thinning' agent is water, might strictly be classified as a water paint. However the term has come to mean an oil or varnish bound washable distemper in which the binder, on drying, becomes mainly insoluble in water.

**water pipe :** A device used to smoke a special type of tobacco that comes in different flavors. In a water pipe, charcoal is used to heat the tobacco. The smoke from the heated tobacco is cooled by passing it through a water-filled bowl. It is then inhaled through a flexible tube with a mouthpiece. Water pipe tobacco smoke contains nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Water pipe smoking can lead to nicotine addiction and can cause many of the same health problems as cigarette smoking. Water pipe smoking is not safer than cigarette smoking. Also called hookah.

**Water Quality and Quantity Management :** Means reducing water usage, increasing recycling and reuse to ensure efficient process conditions and minimal waste.

**Water Quality Management :** Means optimization of customer process to meet given efficiency requirements.

**water softener:** A material that lowers water hardness when dissolved in water. For example, sodium carbonate ("washing soda") softens water by precipitating  $\text{Ca}^{2+}$  ions as  $\text{CaCO}_3$ . Zeolites soften water by exchanging  $\text{Ca}^{2+}$  ions with  $\text{Na}^{+}$  ions.

**water softening:** Removal of  $\text{Ca}^{2+}$  and  $\text{Mg}^{2+}$  from water to prevent undesirable precipitation reactions from occurring in plumbing, pools, washwater, and boilers.

**WATER SPOTTING:** A paint appearance defect caused by water droplets.

**water stress effect:** The closing of the stomata by a plant in response to excessive water loss through transpiration or in response to drought conditions. The stomatal closing reduces  $\text{CO}_2$  uptake as well as water loss, thus decreasing the photosynthetic rate. However, under conditions of elevated  $\text{CO}_2$  concentration, the  $\text{CO}_2$  gradient between the atmosphere and the leaf is higher than under ambient conditions, and  $\text{CO}_2$  can pass through partially closed stomates at a rate similar to that under conditions of lower  $\text{CO}_2$  and open stomates. The humidity gradient remains the same at higher

CO<sub>2</sub>, and transpiration is impeded. The net result is improved water-use efficiency by some plants.

**water table:** the contact between the saturated and unsaturated zones. Or the surface of the water in the zone of saturation.

**water vapor:** Water present in the atmosphere in gaseous form; the source of all forms of condensation and precipitation. Water vapor, clouds, and carbon dioxide are the main atmospheric components in the exchange of terrestrial radiation in the troposphere, serving as a regulator of planetary temperatures via the greenhouse effect. Approximately 50 percent of the atmosphere's moisture lies within about 1.84 km of the earth's surface, and only a minute fraction of the total occurs above the tropopause.

**water vapor feedback:** A process in which an increase in the amount of water vapor increases the atmosphere's absorption of longwave radiation, thereby contributing to a warming of the atmosphere. Warming, in turn, may result in increased evaporation and an increase in the initial water vapor anomaly. This feedback, along with carbon dioxide, is responsible for the greenhouse effect and operates virtually continuously in the atmosphere.

**WATER VAPOR TRANSMISSION:** The amount of water vapor passing through a given area and thickness of a plastic sheet or film in a given time, when the sheet or film is maintained at a constant temperature and when its faces are exposed to certain different relative humidities. The result is usually expressed as grams per 24 hours per square meter.

**Water vapour** : This is water in the form of a gas. Although there is a technical difference between a vapour and a gas but that does not matter at GCSE. When a kettle is boiling, many people call the white clouds "steam". This is not correct. The true steam is the invisible gas that is right by the mouth of the kettle. The white clouds are actually made of droplets of liquid water that have condensed as the steam met the cooler air. The scalds from steam are much worse than scalds from liquid water because the energy released as the gas turns into liquid is added to the energy released as a hot substance becomes cooler.

**Water White:** A grade of colour which looks like clear water.

**Water-based:** Coatings in which the majority of the liquid content is water.

**water-based vaginal lubricant:** A water-based vaginal lubricant with hydration activity. Upon application to the vagina, the water-based vaginal lubricant provides moisture and may relieve dryness and sexual discomfort.

**water-soluble vitamin :** A vitamin that can dissolve in water. Water-soluble vitamins are carried to the body's tissues but are not stored in the body. They are found in plant and animal foods or dietary supplements and must be taken in daily. Vitamin C and members of the vitamin B complex are water-soluble.

**water-use efficiency:** A measure of the amount of water used by plants per unit of plant material produced. The term can be applied at the leaf, whole-plant, and ecosystem levels. At the leaf level, it is more precisely referred to as the instantaneous transpiration efficiency, the CO<sub>2</sub> assimilation rate (photosynthesis) divided by the transpiration rate (the moles of CO<sub>2</sub> taken up divided by the moles of water lost through transpiration in a unit of time per unit leaf area). At the whole-plant level, it is more precisely referred to as the growth water-use efficiency, the units of dry matter synthesized divided by the units of water lost. At the ecosystem level, it is more precisely referred to as the crop water-use efficiency, the grams of dry weight gained by plants during the growing season per unit land area divided by the millimeters of water lost (including evaporation directly from the soil).

**water<sup>2</sup>:** A colorless, tasteless liquid with some very peculiar properties that stem from the bent H-O-H structure of its molecules.

**watercress :** Parts of the flowering plant have been used in some cultures to treat certain medical problems. It may have anticancer effects. The scientific name is *Nasturtium officinale*. Also called Indian cress.

**Watson-Crick base pairs:** The type of hydrogen-bonded base pairs found in DNA, or comparable base pairs found in RNA. The base pairs are A-T, G-C, and A-U.

**Watson-Crick base pairs:** Watson-Crick base pairs. The type of hydrogen-bonded base pairs found in DNA, or comparable base pairs found in RNA. The base pairs are A-T, G-C, and A-U.

**watt:** the practical unit of electrical power. Or A unit of power (in the international system of units) defined as the consumption or conversion of one joule of energy per second. In electricity, a watt is equal to current (in amperes) multiplied by voltage (in volts).

**Watt-hour:** An unit of energy equal to one watt of power steadily supplied to, or taken from, an electrical circuit for one hour (or exactly  $3.6 \times 10^3 \text{J}$ ).

**wave:** A signal which propagates through space, much like a water wave moves through water. Or An oscillating motion that moves outward from the source of some disturbance (ripples running away from a pebble tossed in a pond). Waves transmit the energy of the disturbance away from its source.

**wave crest:** the top of a wave.

**wave cut platform:** a flat-lying bench of eroded rock left behind by a sea cliff's retreat.

**wave height:** the vertical distance between the top of the wave and the low point of the wave.

**wave refraction:** a process by which breaking waves become more parallel with the shore.

**wave trough:** the low point of a wave.

**wavefunction:** A mathematical function that gives the amplitude of a wave as a function of position (and sometimes, as a function of time and/or electron spin). Wavefunctions are used in chemistry to represent the behavior of electrons bound in atoms or molecules.

**wavelength:** On a periodic curve, the length between two consecutive troughs (low points) or peaks (high points). Or The distance between any two identical points in consecutive cycles of a wave. Often measured from peak to peak or crest to crest. Symbolized by the Greek letter lambda. or the horizontal distance between two crests or two troughs of adjacent waves. or The distance between adjacent peaks (or adjacent troughs) on a wave. Varying the wavelength of light changes its color; varying the wavelength of sound changes its pitch.

**Wavelength of light:** the distance in nanometers between nodes in a wave of light. The wavelength is inversely proportional to the energy of the light.

**wavenumber:** The number of wave crests per unit distance. Wavenumber is the reciprocal of wavelength. Wavenumbers are used extensively in infrared spectroscopy, and usually have units of  $\text{cm}^{-1}$ .

**Waver :** The inherent deviation from a straight line along the fabric edges. (Also see Side Travel)

**waves of oscillation:** waves in the open sea; so named because of the orbital motion of water particles in them.

**waves of translation:** waves that begin to break as they meet the shore.

**Waviness:** Long- or short-term undulation of the surface of a moulding.

**Wax:** Any fatty substance that is a relatively hard, brittle, and non-greasy at room temperature. Most waxes, whether derived from mineral, vegetable, or animal sources, are a mixture of relatively high molecular weight (more than thirty carbons) hydrocarbons, esters, alcohols, and carboxylic acids. or An ester formed from long-chain fatty acids and alcohols that is usually solid at room temperature.

**waxing:** part of the lunar cycle when the Moon is getting more full, and the "right side is lit up."

**WBC:** A type of blood cell that is made in the bone marrow and found in the blood and lymph tissue. WBCs are part of the body's immune system. They help the body fight infection and other diseases. Types of WBCs are granulocytes (neutrophils, eosinophils, and basophils), monocytes, and lymphocytes (T cells and B cells). Checking the number of WBCs in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as infection, inflammation, allergies, and leukemia. Also called leukocyte and white blood cell.

**WBRT:** A type of external radiation therapy used to treat patients who have cancer in the brain. It is often used to treat patients whose cancer has spread to the brain, or who have more than one tumor or tumors that cannot be removed by surgery. Radiation is given to the whole brain over a period of many weeks. Also called whole-brain radiation therapy and whole-brain radiotherapy.

**weak acid:** Substances capable of donating hydrogen but do not completely ionize in solution. Or An acid that only partially dissociates into hydrogen ions and anions in solution. Weak acids are weak electrolytes. Recognize weak acids by learning the six common strong acids; any acid that doesn't appear on the list of strong acids is usually a weak acid.

**weak base:** A base that only partially dissociates into ions in solution. Weak bases are weak electrolytes. Ammonia is an example of a weak base; the reaction  $\text{NH}_3(\text{aq}) + \text{H}_2\text{O}(\text{l}) = \text{NH}_4^+(\text{aq}) + \text{OH}^-(\text{aq})$  is reversible. Or

Substances capable of accepting hydrogen but do not completely ionize in solution.

**Weak Electrolyte:** A weak electrolyte is a compound that does not ionize one hundred percent in solution. The lower the percentage, the weaker the electrolyte. Weak acids and bases are often weak electrolytes. Water is also considered a weak electrolyte. Or an acid, base, or salt that dissociates only slightly to form ions in solution. or A weak electrolyte is a solute that incompletely dissociates into ions in solution. For example, acetic acid partially dissociates into acetate ions and hydrogen ions, so that an acetic acid solution contains both molecules and ions. A solution of a weak electrolyte can conduct electricity, but usually not as well as a strong electrolyte because there are fewer ions to carry the charge from one electrode to the other.

**weak ligand:** A ligand that causes a small crystal field splitting which results in a high-spin complex.

**Wear:** Deterioration by friction (abrasion, spaling, cutting, fretting).

**Wear Edges :** An additional feature extended beyond the edge of the belt to act as a buffer.

**weather:** The instantaneous state of the global atmosphere-ocean-cryosphere system.

**Weather board:** Boards fixed to overlap one another to prevent entry of rain etc.

**Weather Resistance:** ability of plastic to retain its original physical properties and appearance upon prolonged exposure to outdoor weather.

**Weathered:** Rocks that have been worn away are said to have been weathered. This does not have to be because of the weather! The action of roots, people walking etc are all weathering justb as much as the effect of wind-borne grit and acid rain.

**weathering:** Weathering is the breakdown of rock in nature by physical, chemical, and biological means. Or The effect of exposure to weather on paint films. Or the breaking apart of rock at the surface through chemical and physical processes. Or the physical or chemical breaking down of rocks due to exposure to the atmosphere. or The breakdown of rocks. This does not include the deliberate extraction by mining or quarrying.

**Web:** The central part of a girder connecting the two flanges.

**WEB GATE:** See DIAPHRAGM GATE.

**wedge resection :** Surgery to remove a triangle-shaped slice of tissue. It may be used to remove a tumor and a small amount of normal tissue around it.

**wedge-and-dash projection:** a drawing of a molecule in which three types of lines are used to represent the three-dimensional structure of a molecule: 1) solid lines are bonds in the plane of the paper, 2) dashed lines are bonds extending away from the viewer, and 3) wedge-shaped lines are bonds oriented toward the viewer.

**WEE1 inhibitor AZD1775:** A small molecule inhibitor of the tyrosine kinase WEE1 with potential antineoplastic sensitizing activity. AZD1775 selectively targets and inhibits WEE1, a tyrosine kinase that phosphorylates cyclin-dependent kinase 1 (CDK1, CDC2) to inactivate the CDC2/cyclin B complex. Inhibition of WEE1 activity prevents the phosphorylation of CDC2 and impairs the G2 DNA damage checkpoint. This may lead to apoptosis upon treatment with DNA damaging chemotherapeutic agents. Unlike normal cells, most p53 deficient or mutated human cancers lack the G1 checkpoint as p53 is the key regulator of the G1 checkpoint and these cells rely on the G2 checkpoint for DNA repair to damaged cells. Annulment of the G2 checkpoint may therefore make p53 deficient tumor cells more vulnerable to antineoplastic agents and enhance their cytotoxic effect.

**weight:** The measures of the earth's gravitational pull on a object. Or Weight is the force exerted by an object in a gravitational field. The weight of an object ( $W$ ) arises from its mass ( $m$ ):

**Weighting factor (WT):** Multipliers of the equivalent dose to an organ or tissue used for radiation protection purposes to account for different sensitivities of different organs and tissues to the induction of stochastic effects of radiation (see 10 CFR 20.1003 for complete information).

**Weissenberg camera:** A camera consisting of a cylinder of film that, while a crystal is rotated  $180^\circ$ , is moved past a slit in a screen in one direction along the axis of rotation, then back again through another  $180^\circ$ . The result gives a pattern of intensities that is used to determine the space group and unit-cell dimensions of the crystal.

**WEISSENBERG NUMBER:** The product of a characteristic material time and shear rate. It has the same meaning as the Deborah Number under

certain conditions (see DEBORAH NUMBER).

**WEISSENBERG RHEOGONIOMETER:** see CONE AND PLATE INSTRUMENT

**Welchol:** (Other name for: colesevelam hydrochloride)

**Weld Line:** Where melted material flows together during molding to form a visible line or lines on a finished part that may cause weakening or breaking of the component. A mark formed by the union of two or more streams of material flowing together. OR Also called a knit line, the juncture where two flow fronts meet and are unable to join together during the molding process. These lines usually occur around holes or obstructions and cause localized weak areas in the molded part. OR Where melted material flows together during molding to form a visible line or lines on a finished part that may cause weakening or breaking of the component. OR Also known as “stitch lines” or “knit lines,” and when multiple gates are present, “meld lines.” These are imperfections in the part where separated flows of cooling material meet and rejoin, often resulting in incomplete bonds and/or a visible line. OR A mark on a container caused by incomplete fusion of two streams of molten polymer. See Spider Lines. OR Weld lines are locations in the moulded part where two met fronts meet. or Where melted material flows together during molding to form a visible line or lines on a finished part that may cause weakening or breaking of the component.

**Weld Mark:** A mark on a molded plastic piece made by the meeting of two flow fronts during the molding operation.

**Welded Edge :** An edge finish on a woven belt completed by welding only.

**Welded Knuckled Edge :** An edge finish which is knuckled, and the knuckles completely filled by welding or brazing.

**WELDING:** Joining thermoplastic pieces by one of several heat-softening processes: Butt fusion, spin welding, ultrasonic, and hot gas are several methods. OR the joining of two or more pieces of plastic by fusion of the material in the pieces at adjoining or nearby areas either with or without the addition of plastic from another source. OR Joining thermoplastic pieces by one of several heat-softening processes. In hot-gas welding, the material is heated by a jet of hot air or inert gas directed from a welding “torch” onto the area of contact of the surfaces which are being welded. Welding operations to which this method is applied normally require the use of a

filler rod. In Spin-Welding the heat is generated by friction. Welding also includes heat sealing and the terms are synonymous in some foreign countries including Britain.

**WELDLINES (also known as PARTING LINES):** Weldlines are formed because of flow interruptions by obstructions in a melt flow field. Because of the high viscosity, the diffusion of polymer molecules, after they have been separated, is very slow and the weldline remains a line of mechanical weakness and may be visible to the naked eye. Such defects are common in injection molded products and are often encountered in extruded pipes, bottles, and film.

**well-differentiated :** A term used to describe cells and tissue that have mature (specialized) structures and functions. In cancer, well-differentiated cancer cells look more like normal cells under a microscope and tend to grow and spread more slowly than poorly differentiated or undifferentiated cancer cells.

**well-differentiated lymphocytic lymphoma :** An indolent (slow-growing) type of lymphoma in which too many immature lymphocytes (white blood cells) are found mostly in the lymph nodes. This causes the lymph nodes to become larger than normal. Sometimes cancer cells are found in the blood and bone marrow, and the disease is called chronic lymphocytic leukemia. The disease is most often seen in people older than 50 years. Well-differentiated lymphocytic lymphoma is a type of non-Hodgkin Lymphoma. Also called SLL and small lymphocytic lymphoma.

**Well-logging:** All operations involving the lowering and raising of measuring devices or tools that contain licensed nuclear material or are used to detect licensed nuclear materials in wells for the purpose of obtaining information about the well or adjacent formations that may be used in oil, gas, mineral, groundwater, or geological exploration. For related information, see Well Logging and the Well-Logging Licensee Toolkit.

**Wellbutrin :** A drug used to treat depression and certain other disorders. It is also used to help people stop smoking. Wellbutrin increases the levels of the chemicals dopamine, serotonin, and norepinephrine in the brain. This helps improve mood and can lessen cravings for nicotine. It is a type of antidepressant and a type of nicotine receptor antagonist. Also called bupropion hydrochloride and Zyban.

**Wellcovorin :** A drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Wellcovorin is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Wellcovorin is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called calcium levoleucovorin, citrovorum factor, and leucovorin calcium.

**Wermer syndrome :** A rare, inherited disorder that affects the endocrine glands and can cause tumors in the parathyroid and pituitary glands and the pancreas. These tumors are usually benign (not cancer). They cause the glands to secrete high levels of hormones, which can lead to other medical problems, such as kidney stones, fertility problems, and severe ulcers. In some cases, tumors inside the pancreas can become malignant (cancer). Also called MEN1 syndrome, multiple endocrine adenomatosis, and multiple endocrine neoplasia type 1 syndrome. OR An inherited disorder marked by rapid aging that begins in early adolescence. Patients may be shorter than average, and have health problems such as loss and graying of hair, hardening of the arteries, thinning of the bones, diabetes, and thin, hardened skin. They also have an increased risk of cancer, especially osteosarcoma (a type of bone cancer). Werner syndrome is caused by a mutation (change) in a gene involved in cell division. It is a type of autosomal recessive gene disease. Also called adult progeria and WS.

**West Antarctic Ice Sheet:** See ice sheet.

**Western blot:** Similar in principle to a Southern blot, but where the species adsorbed to the nitrocellulose filter is a protein, and the detection makes use of specific antibodies.

**Western blotting:** An immunoassay technique used to detect a specific protein in a cell or in body fluid. A sample undergoes electrophoresis in an SDS-polyacrylamide gel, the resolved proteins are transferred to a polymer sheet, and then an antibody specific for the protein of interest is incubated with the blotted sample; other antibodies or radioactive markers may then be used to help visualize the desired antigen-antibody complex.

**Western medicine :** A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery. Also called

allopathic medicine, biomedicine, conventional medicine, mainstream medicine, and orthodox medicine.

**Wet adhesion:** The ability of dry paint to adhere to the surface, in spite of wet conditions, is particularly important for exterior house paints.

**Wet edge:** Refers to the condition of a paint which has been applied for a short while but has remained in a sufficiently liquid condition to be successfully joined up and to dry without showing the lap. Or Length of time a wall paint can stand and be brushed back in to the next stretch without showing a lap.

**Wet etched:** A technique for studying surface properties of crystals by eroding their surface with exposure to solvent.  $W_g$  The weight of a monolayer of water on a solid.

**Wet Lay-up:** A reinforced plastic manufacturing process where the polymer compound is applied as a liquid as the reinforcement is put into place. Or A reinforced plastic manufacturing process where the polymer compound is applied as a liquid as the reinforcement is put into place.

**Wet Strength:** The strength of paper when saturated with water, especially used in discussions of processes whereby the strength of paper is increased by the addition, in manufacture, of plastic resins. Also, the strength of an adhesive joint determined immediately after removal from a liquid in which it has been immersed under specified conditions of time, temperature, and pressure. or A fiber reinforcement material is coated with a polymer compound as a liquid prior to wrapping on a mandrel in the filament wound manufacturing process.

**wet-bulb depression:** difference between wet-bulb and dry-bulb temperatures, used to find relative humidity and dew point temperatures.

**Wet-out:** Complete wetting/saturation of a fibrous surface with a liquid resin.

**wetlands:** An area that is regularly saturated by surface water or groundwater and subsequently is characterized by a prevalence of vegetation that is adapted for life in saturated-soil conditions.

**WETTING:** The coating of a contact surface with an adherent film of liquid. Or Covering with a surface with thin film of liquid. Liquid beads up on a surface if it cannot wet it.

**Wetting Agent:** Wetting is produced when this surface active agent decreases the cohesion within a liquid. For wetting to occur, the adhesive force between the two phases (solid and liquid) is greater than the cohesive force within the liquid.

**wheatgrass juice:** The juice extracted from the mature sprouts of wheatgrass, *Triticum aestivum*, which is a member of the Poaceae family, with potential anti-inflammatory, immunomodulating and chemopreventive activities. Wheatgrass juice contains many vitamins, including A, B vitamins, C and E, minerals, including selenium, iron, magnesium, calcium, manganese, copper and zinc, amino acids, chlorophyll and a number of antioxidant enzymes, including superoxide dismutase and cytochrome oxidase. Although the exact mechanism(s) of action through which wheatgrass juice exerts its effect(s) has yet to be fully elucidated, the components in the juice may scavenge free radicals, reduce chemotherapy-induced myelotoxicity, neutralize toxins and carcinogens and modulate the levels of certain pro-inflammatory cytokines, such as interleukin (IL)- 6, IL-8, IL-10 and IL-12.

**Wheeling service:** The movement of electricity from one system to another over transmission facilities of intervening systems. Wheeling service contracts can be established between two or more systems.

**whey protein isolate:** A biologically active, cystine-rich, whey-based protein isolate. Whey protein isolate is broken down in the body into cystine and glutamylcystine, which travel safely in the blood stream, upon cell entry, deliver a sustained amount of free cysteine to the cells. The available cysteine allows cells to synthesize glutathione (GSH), a tripeptide containing amino acids glycine, glutamate and cysteine, thereby maintaining and increasing intracellular GSH concentrations. GSH plays a major role as an antioxidant, thereby protecting cells from oxidative damage due to harmful substances such as free radicals and reactive oxygen compounds.

**whey protein powder :** A powdered form of proteins taken from whey, which is the liquid left over when cheese is made from cow's milk. Whey protein powder is used to increase protein in the diet and is being studied for possible health benefits.

**Whipple procedure :** A type of surgery used to treat pancreatic cancer. The head of the pancreas, the duodenum, a portion of the stomach, and

other nearby tissues are removed. Also called pancreatoduodenectomy.

**Whisker:** A single-crystal, short fiber.

**white blood cell :** A type of blood cell that is made in the bone marrow and found in the blood and lymph tissue. White blood cells are part of the body's immune system. They help the body fight infection and other diseases. Types of white blood cells are granulocytes (neutrophils, eosinophils, and basophils), monocytes, and lymphocytes (T cells and B cells). Checking the number of white blood cells in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as infection, inflammation, allergies, and leukemia. Also called leukocyte and WBC.

**white button mushroom extract:** A heat-stable extract of white button mushrooms (*Agaricus bisporus*) with potential chemopreventive and immunomodulating activities. Phytochemicals, such as polysaccharides and especially beta-D-glucans found in the white button mushroom extract, bind to and inhibit the activity of aromatase, an enzyme responsible for the conversion of androgens to estrogens and which is often upregulated in breast cancer cells. The consequent decrease in estrogen production may result in the suppression of estrogen-dependent cellular proliferation. In addition, this extract may promote dendritic cell (DC) maturation, increase interferon gamma (IFN-gamma) and tumor necrosis factor alpha (TNF-alpha) production, and may enhance natural killer (NK) cell activity, thus amplifying both innate and T cell-mediated immune responses against cancer cells.

**white carrot:** A vegetable, also known as Arracacha, with potential chemopreventive, anti-oxidant and protective activities. White carrot contains a variety of nutrients, including minerals and vitamins. Polyacetylenes, including falcarinol, falcarindiol and falcarindiol-3-acetate are mainly responsible for its potential anti-cancer activity.

**white dwarf:** final stage of a star as it collapses onto itself.

**white wine:** An alcoholic beverage made from fermented white grapes with potential orexigenic activity. Although not well understood, the mechanism for white wine's potential orexigenic activity may be due, in part, to its alcohol content and may involve alterations in neurotransmitter and hormone activities related to appetite regulation.

**Whitmore-Jewett staging system :** A staging system for prostate cancer that uses ABCD. “A” and “B” refer to cancer that is confined to the prostate. “C” refers to cancer that has grown out of the prostate but has not spread to lymph nodes or other places in the body. “D” refers to cancer that has spread to lymph nodes or to other places in the body. Also called ABCD rating and Jewett staging system.

**WHO :** A part of the United Nations that deals with major health issues around the world. The WHO sets standards for disease control, health care, and medicines; conducts education and research programs; and publishes scientific papers and reports. A major goal is to improve access to health care for people in developing countries and in groups who do not get good health care. The headquarters are located in Geneva, Switzerland. Also called World Health Organization.

**whole cell vaccine :** Vaccine made from whole tumor cells that have been changed in the laboratory.

**Whole-body counter:** A device used to identify and measure the radioactive material in the body of human beings and animals. It uses heavy shielding to keep out naturally existing background radiation and ultrasensitive radiation detectors and electronic counting equipment.

**Whole-body exposure:** Whole body exposure includes at least the external exposure, head, trunk, arms above the elbow, or legs above the knee. Where a radioisotope is uniformly distributed throughout the body tissues, rather than being concentrated in certain parts, the irradiation can be considered as whole-body exposure (see also 10 CFR 20.1003).

**whole-brain radiation therapy :** A type of external radiation therapy used to treat patients who have cancer in the brain. It is often used to treat patients whose cancer has spread to the brain, or who have more than one tumor or tumors that cannot be removed by surgery. Radiation is given to the whole brain over a period of many weeks. Also called WBRT and whole-brain radiotherapy.

**whole-brain radiotherapy :** A type of external radiation therapy used to treat patients who have cancer in the brain. It is often used to treat patients whose cancer has spread to the brain, or who have more than one tumor or tumors that cannot be removed by surgery. Radiation is given to the whole brain over a period of many weeks. Also called WBRT and whole-brain radiation therapy.

**whole-exome sequencing :** A laboratory process that is used to determine the nucleotide sequence primarily of the exonic (or protein-coding) regions of an individual's genome and related sequences, representing approximately 1% of the complete DNA sequence.

**whole-genome sequencing :** A laboratory process that is used to determine nearly all of the approximately 3 billion nucleotides of an individual's complete DNA sequence, including non-coding sequence.

**whooping cough :** A serious bacterial infection of the lungs and breathing tubes that spreads easily. Whooping cough begins like a cold, but develops into severe coughing and gasping for air. Long spells of coughing may cause vomiting, and broken blood vessels in the eyes and on the skin. Also called pertussis.

**wide local excision :** Surgery to cut out the cancer and some healthy tissue around it.

**Wide mouth:** Containers with a large finish opening or those that have a large finish size in proportion to their capacity.

**wild clover :** *Trifolium pratense*. A plant with flowers that has been used in some cultures to treat certain medical problems. It is being studied in the relief of menopausal symptoms and may have anticancer effects. Also called purple clover, red clover, and *Trifolium pratense*.

**wild type:** The normal (unmutated) phenotype.

**Wild-type gene:** The form of a gene (allele) normally found in nature.

**wild-type reovirus:** A serotype 3 Dearing strain (T3D) of reovirus (Respiratory Enteric Orphan virus) with potential oncolytic activity. Reovirus, a dsRNA virus, is able to replicate specifically in cancer cells bearing an activated Ras pathway. In contrast to normal cells, two-thirds of human cancer cells are Ras-activated. Unlike normal cells, Ras-activated tumor cells are deficient in host cellular protein kinase R (PKR) activity and so are unable to mount an antiviral response. In Ras-activated tumor cells, reovirus freely replicates and induces apoptosis; tumor cell lysis frees progeny viral particles to infect surrounding tumor cells. A cycle of infection, replication and cell death may continue until Ras-activated tumor cells are eradicated. PKR (eukaryotic translation initiation factor 2-alpha kinase 2) is activated by viral synthesis of double-stranded RNA and is an

important component of innate immunity in vertebrates, protecting against viral infection.

**will :** A legal document in which a person states what is to be done with his or her property after death, who is to carry out the terms of the will, and who is to care for any minor children.

**Wilms tumor :** A disease in which malignant (cancer) cells are found in the kidney, and may spread to the lungs, liver, or nearby lymph nodes. Wilms tumor usually occurs in children younger than 5 years old.

**Wilms tumor-aniridia-genitourinary anomalies-mental retardation syndrome :** A rare, genetic disorder that is present at birth and has two or more of the following symptoms: Wilms tumor (a type of kidney cancer); little or no iris (the colored part of the eye); defects in the sexual organs and urinary tract (the organs that make urine and pass it from the body); and below average mental ability. This syndrome occurs when part of chromosome 11 is missing. Also called WAGR syndrome.

**Window stripe:** A see-through vertical stripe on a molded bottle; used primarily to monitor the level of the contents.

**windpipe :** The airway that leads from the larynx (voice box) to the bronchi (large airways that lead to the lungs). Also called trachea.

**windward:** the side facing the wind.

**Winobanin:** (Other name for: danazol)

**WinRho SDF:** (Other name for: therapeutic immune globulin)

**Winter solstice:** December 21, when the vertical ray of the Sun is at the Tropic of Capricorn (23.5° S latitude), the shortest day of the year in the Northern Hemisphere.

**Wipe sample:** A sample made for the purpose of determining the presence of removable radioactive contamination on a surface. It is done by wiping, with slight pressure, a piece of soft filter paper over a representative type of surface area. It is also known as a "swipe" or "smear" sample.

**Wire cut:** A type of brick so called from its method of manufacture in which the clay blocks are cut into shape instead of being moulded or pressed.

**wire gauge:** wire size, measured in diameter.

**wire localization :** A procedure used to mark a small area of abnormal tissue so it can be removed by surgery. An imaging device is used to guide a thin wire with a hook at the end through a hollow needle to place the wire in or around the abnormal area. Once the wire is in the right place, the needle is removed and the wire is left in place so the doctor will know where the abnormal tissue is. The wire is removed when a biopsy is done. Also called needle localization and needle/wire localization.

**Wireframe:** A type of CAD model consisting only of lines and curves, in 2D or 3D. Wireframe models are not suitable for rapid-injection molding. OR It is a geometric model that describes 3D geometry by outlining its edges.

**wireless capsule endoscope :** A device used to look at the inside of the intestines and other parts of the digestive tract. It is a capsule that is about the size of a large pill, with a lens, a light, a camera, a radio transmitter, and a battery inside. The patient swallows the capsule and it takes pictures as it travels through the digestive tract. The pictures are sent to a small recorder that is worn on the patient's waist or shoulder. The pictures are then viewed on a computer by the doctor to check for signs of disease. The wireless capsule endoscope passes out of the body during a bowel movement. Also called capsule endoscope.

**wisdom tooth :** The last tooth to come in at the back of each side of the upper and lower jaws. These teeth usually come in between 17 and 23 years of age, but not everyone has them. Also called third molar.

**Wiskott-Aldrich syndrome :** An inherited immune disorder that occurs in young boys. It causes eczema (a type of skin inflammation), a decrease in the number of platelets (blood cells that help prevent bleeding), and frequent bacterial infections. People with Wiskott-Aldrich syndrome are at increased risk of developing leukemia and lymphoma. Also called Aldrich syndrome.

**Wisps :** Similar to stringing but smaller in size. These also may occur as slight flashing when the mold is over packed or forced open slightly. Mold-parting-line wear or misalignment can also cause wisps.

**withdrawal :** In medicine, symptoms that occur when a person quits smoking or stops using an addictive substance, such as drugs or alcohol. Common withdrawal symptoms after quitting smoking include nicotine

cravings, anger, irritability, anxiety, depression, and weight gain. These symptoms usually get better over time.

**Withdrawal Symptoms:** A group of symptoms associated with sudden decrease of or cessation of intake of drugs.

**WITHERING:** Withering a loss of gloss is sometimes caused by varnishing open-pore woods without filling pores, use of improper undercoating or applying top coat before undercoat has dried.

**Wnt-5a mimic hexapeptide foxy-5:** A formylated, six amino acid, Wnt5a-derived peptide and wnt-5a mimetic with potential anti-metastatic activity. Upon intravenous administration, Wnt-5a mimic hexapeptide foxy-5 binds to and activates the wnt-5a receptors, Frizzled-2 and -5, which activates wnt-5a-mediated signaling. Increased wnt-5a signaling may inhibit endothelial tumor cell migration and invasion. This may decrease metastasis of susceptible tumor cells. However, foxy-5 does not affect tumor cell proliferation or apoptosis. Foxy-5 lacks a heparan sulfate-binding domain and contains a formyl group on its NH<sub>2</sub>-terminal methionine residue which decreases in vivo degradation. Decreased expression of wnt-5a protein is associated with increased motility of certain tumor cell types.

**Wobble:** A proposed explanation for base pairing that is not of the Watson-Crick type and that often occurs between the 3' base in the codon and the 5' base in the anticodon. Or The relatively loose base pairing between the base at the 3' end of a codon and the complementary base at the 5' end of the anticodon.

**Wobble hypothesis:** The notion that steric freedom in the pairing of the third base of an mrna codon with the anticodon of a transfer RNA molecule allows more than one codon to be recognized by a particular trna molecule.

**Wobe-Mugos E :** A mixture made from an extract of the calf thymus gland and enzymes (proteins that speed up chemical reactions in the body) from the papaya plant, the pancreas of cows, and the pancreas of pigs. It has been used in Europe as a treatment for a variety of cancers and for herpes virus infections.

**WOC nurse :** A registered nurse who has additional education and training in how to care for people who have a wound, an ostomy (an opening made by surgery, from an area inside the body to the outside), or problems with

continence (ability to control the flow of urine or the passage of stool). Also called wound, ostomy, and continence nurse.

**womb :** The hollow, pear-shaped organ in a woman's pelvis. The womb is where a fetus (unborn baby) develops and grows. Also called uterus.

**wood alcohol :** A type of alcohol used to make antifreeze, pesticides, windshield wiper fluid, paint thinner, certain types of fuel, and other substances. Wood alcohol catches fire easily and is very poisonous. It is one of many harmful chemicals found in tobacco smoke. Also called methanol and methyl alcohol.

**word equation:** A word equation is a way of describing what we start with and what is formed in a chemical equation, e.g. magnesium + oxygen or A way to record the changes that have taken place in a chemical equation. If a word equation is asked for, be careful to use the correct words (eg do you mean chlorine or chloride, sulphide or sulphate etc). Make sure that you include all the substances. Do not use "=" (which would mean that the substances are the same but rather use an arrow to show that the substances have changed.

**wordy expression:** expressions that say the same thing twice or avoid getting directly to the point.

**work:** Expression of the movement of an object against some force. Or Energy transferred b/w a system and its surroundings as a consequence of motion against a restraining force, electricity or radiation, or any other driving force except a temperature difference. Or Work is the energy required to move an object against an opposing force. Work is usually expressed as a force times a displacement. Dropping a stone from a window involves no work, because there is no force opposing the motion (unless you consider air friction...). Pushing against a stone wall involves no work, unless the stone wall actually moves.

**Work Done:** Work is said to be done if an unbalanced force moves its point of application through a distance measured in the direction of force.  
Work = Force x Distance

**work problems:** Word problems that involve two people or machines working together at different rates to complete one whole job.

**Working Length:** The length of a coil when it is comfortably stretched out to its maximum reach.

**Working Pressure:** The maximum pressure at a given temperature, that tubing can be expected to perform.

**Working up:** The action of an existing and apparently dry coat of paint being removed by the action of brushing the succeeding coat over it.

**World Health Organization :** A part of the United Nations that deals with major health issues around the world. The World Health Organization sets standards for disease control, health care, and medicines; conducts education and research programs; and publishes scientific papers and reports. A major goal is to improve access to health care for people in developing countries and in groups who do not get good health care. The headquarters are located in Geneva, Switzerland. Also called WHO.

**wound :** A break in the skin or other body tissues caused by injury or surgical incision (cut).

**wound, ostomy, and continence nurse :** A registered nurse who has additional education and training in how to care for people who have a wound, an ostomy (an opening made by surgery, from an area inside the body to the outside), or problems with continence (ability to control the flow of urine or the passage of stool). Also called WOC nurse.

**WPC:** Wood/Plastic Composite material made of recycled plastic and wood waste.

**Wrinkle:** An imperfection in plastic films that has the appearance of a crease, fold, or wave. OR An imperfection in reinforced plastics that has the appearance of a wave molded into one or more plies of fabric or other reinforcing material. OR A plastic surface imperfection in plastic films that has the appearance of a crease or wrinkle in plastic material.

**Wrinkling:** The development of wrinkles during drying. Often caused by too thick an application. Or Development of ridges and furrows in a paint film when the paint dries.

**WRITING and BALANCING:** equations should be reviewed in your Big Chem notebook. Try them with the solutions covered, then check your results.

**WS:** An inherited disorder marked by rapid aging that begins in early adolescence. Patients may be shorter than average, and have health problems such as loss and graying of hair, hardening of the arteries, thinning of the bones, diabetes, and thin, hardened skin. They also have an

increased risk of cancer, especially osteosarcoma (a type of bone cancer). WS is caused by a mutation (change) in a gene involved in cell division. It is a type of autosomal recessive gene disease. Also called adult progeria and Werner syndrome.

**WT-1 analogue peptide vaccine:** A peptide vaccine containing a human Wilms tumor 1 (WT-1) protein-derived epitope with potential antineoplastic activity. Vaccination with the WT-1 analogue peptide vaccine may induce a cytotoxic T-lymphocyte (CTL) response against WT-1 expressing cells, resulting in tumor cell lysis and inhibition of tumor cell proliferation. WT-1, a zinc finger transcription factor, is overexpressed in most types of leukemia and in some solid cancers. Check for active clinical trials using this agent.

**WT1 124-138 peptide vaccine:** A synthetic peptide vaccine consisting of a HLA-DR15-restricted human Wilms' Tumor protein-1 (WT1) peptide comprised of amino acids 124 through 138, a HLA class II-restricted WT1 peptide, with potential immunomodulating and antitumor activities. Vaccination with WT1 124-138 peptide may stimulate a CD4-positive helper T-lymphocyte-mediated immune response against WT1 expressing cells. Activated helper T-cells stimulate dendritic cells, and activate the proliferation of other T-lymphocytes and B-lymphocytes. This causes tumor cell lysis and inhibition of cancer cell proliferation in WT1-overexpressing tumor cells. WT1, a zinc finger DNA-binding protein, is overexpressed in most types of leukemia and in a variety of solid cancers.

**WT1 126-134 peptide vaccine:** A synthetic peptide vaccine consisting of the amino acids 126 through 134 of the human Wilms' Tumor protein-1 (WT1) with potential antitumor activity. WT1, a tumor associated antigen, is overexpressed in most types of leukemia and in a variety of solid cancers. Vaccination with WT1 126-134 peptide vaccine may induce a WT1-specific cytotoxic T-lymphocyte (CTL) response against WT1 expressing cells, resulting in cell lysis and inhibition of cancer cell proliferation.

**WT1 235-243 peptide vaccine:** A synthetic peptide vaccine consisting of a HLA-A24-restricted human Wilms' Tumor protein-1 (WT1) peptide comprised of amino acids 235 through 243, a MHC class I-restricted peptide, with potential immunomodulating and antitumor activities. Vaccination with WT1 235-243 peptide may induce a WT1-specific cytotoxic T-lymphocyte (CTL) response against WT1 expressing cells,

resulting in cell lysis and inhibition of cancer cell proliferation. WT1, a zinc finger DNA-binding protein, is overexpressed in most types of leukemia and in a variety of solid cancers.

**WT1 247-261 peptide vaccine:** A synthetic peptide vaccine consisting of a HLA-DRw53-restricted human Wilms' Tumor protein-1 (WT1) peptide comprised of amino acids 247 through 261, a HLA class II-restricted WT1 peptide, with potential immunomodulating and antitumor activities.

Vaccination with WT1 247-261 peptide may stimulate a CD4-positive helper T-lymphocyte-mediated immune response against WT1 expressing cells. Activated helper T-cells stimulate dendritic cells, and activate the proliferation of other T-lymphocytes and B-lymphocytes. This causes tumor cell lysis and inhibition of cancer cell proliferation in WT1-overexpressing tumor cells. WT1, a zinc finger DNA-binding protein, is overexpressed in most types of leukemia and in a variety of solid cancers.

**WT1 mRNA-electroporated autologous dendritic cell vaccine:** A cancer vaccine containing autologous dendritic cells electroporated with full-length mRNA encoding Wilms' tumor 1 (WT1) antigen with potential immunostimulatory and antineoplastic activities. Upon administration, WT1 mRNA-electroporated autologous dendritic cell vaccine may elicit a cytotoxic T-cell (CTL) response against tumor cells expressing WT1. Wt1 is frequently overexpressed in a variety of tumor cell types and often correlates with disease progression and poor prognosis. Check for active clinical trials using this agent.

**WT1 peptide vaccine OCV-501:** A peptide cancer vaccine comprised of a peptide derived from Wilms tumor gene 1 (WT1) protein, with potential immunomodulating and antineoplastic activities. Upon subcutaneous administration, WT1 peptide vaccine OCV-501 may stimulate a CD4-positive helper T-lymphocyte-mediated immune response against WT1 expressing cells. WT1 protein, a zinc finger DNA-binding protein, is overexpressed in leukemic cells and in some solid tumors.

**WT1 peptide vaccine WT2725:** A peptide cancer vaccine comprised of a peptide derived from Wilms tumor gene 1 (WT1) protein, with potential immunomodulating and antineoplastic activities. Upon administration, WT2725 may induce a specific cytotoxic T-lymphocyte (CTL) response against WT1-overexpressing tumor cells. WT1 protein, a zinc finger DNA-

binding protein, is overexpressed in leukemic cells and in a vast number of non-hematological solid tumors.

**WT1 protein-derived peptide vaccine DSP-7888:** A peptide cancer vaccine comprised of peptides derived from the Wilms tumor gene 1 (WT1) protein, with potential immunomodulating and antineoplastic activities. Upon administration, WT1 protein-derived peptide vaccine DSP-7888 may induce a specific cytotoxic T-lymphocyte (CTL) response against WT1-overexpressing tumor cells. In addition, DSP-7888 induces a helper T-lymphocyte-mediated immune response against WT1 expressing tumor cells. WT1 protein, a zinc finger DNA-binding protein and transcription factor, is overexpressed in leukemic cells and in many non-hematological solid tumors.

**WT1-A10/AS01B immunotherapeutic GSK2130579A:** An immunotherapeutic consisting of the recombinant fusion protein WT1-A10 combined with the adjuvant AS01B with potential immunostimulating and antineoplastic activities. Upon administration, WT1-A10/AS01B immunotherapeutic GSK2130579A WT1 may induce a WT1-specific cytotoxic T-lymphocyte (CTL) response against WT1-expressing tumor cells, resulting in cell lysis and the inhibition of cellular proliferation. The tumor-associated antigen WT1 (Wilms tumor protein-1) is overexpressed in most types of leukemia and in a variety of solid cancers. WT1-A10 is a 292 amino acid recombinant fusion protein consisting of a 12-mer truncated tat sequence (leader sequence) and amino acids number 2-281 of the WT1 sequence; AS01B consists of a combination of the adjuvants monophosphoryl lipid A (MPL) and Q21.

**WT1-sensitized T cells:** A population of allogeneic T-cells sensitized with Wilms tumor 1 (WT1) antigen with potential immunostimulatory and antineoplastic activities. Upon administration, WT1-sensitized T cells may bind to and lyse WT1-expressing tumor cells. WT1 antigen, a zinc finger DNA-binding protein acting as a transcriptional activator or repressor depending on the cellular or chromosomal context, is overexpressed in leukemic cells and in a vast number of nonhematological solid tumors.

**WTI Crude Oil:** West Texas Intermediate Crude Oil is a light sweet crude that is particularly suited for the production of gasoline. WTI production is widely utilized as a refinery feed in the United States Mid West and to a

lesser extent on the Gulf Coast. WTI crude usually trades at a premium to the other two benchmark crudes owing to its higher gasoline yield.

**wu-ling-san:** A traditional Chinese medicine (TCM) composed of Polyporus sclerotium (Sclerotium polypori Umbrellati; Zhu Ling), hoelen (Poria; Sclerotium Poriae Cocos; Fu Ling), Alismatis rhizome (Alisma; Rhizoma Alismatis Orientalis; Ze Xie), Cinnamomi cortex (Ramulus Cinnamomi Cassiae; Gui Zhi) and Atractylodis macrocephalae rhizome (Rhizoma Atractylodis Macrocephalae; Bai Zhu) with potential diuresis-inducing and kidney-protective activities. Upon oral administration, wu-ling san may increase the removal of excess fluid, prevent the retention of water, maintain healthy water metabolism by promoting diuresis, and protect kidney function.

**Wurtz reaction:** the coupling of two alkyl halide molecules to form an alkane.

**Wurtz reaction:** the coupling of two alkyl halide molecules to form an alkane.

**WWP:** Abbreviation for 'water waste preventer', or flushing cistern.

**WX-671:** A substance being studied in the treatment of several types of cancer. It blocks the action of certain enzymes, and it may help keep cancer cells from growing and spreading. It is a type of serine protease inhibitor.

**Wymox:** (Other name for: amoxicillin)

**Wytensin:** (Other name for: guanabenz acetate)

**X alpha :** X-alpha. A venerable, local DFT method in which the coefficient alpha is taken as an adjustable parameter, usually 0.7.

**X group:** "X" is often used as the abbreviation for a halogen substituent in the structural formula of an organic molecule. Or "X" is often used as the abbreviation for a halogen substituent in the structural formula of an organic molecule.

**X ray:** Electromagnetic radiation of high frequency and short wavelength (ranging from  $10^{-11}$  to  $10^{-9}$  meters). Or A very high energy form of electromagnetic radiation (though not as high energy as gamma rays). X-rays typically have wavelengths from a few picometers up to 20 nanometers. X-rays easily penetrate soft tissue, which makes them useful in medical imaging and in radiation therapy. or These are released when electrons move between the inner shells. They are used in medicine to study

broken bones. Bone is opaque to X-rays but soft tissue is transparent. The digestive system can be investigated by giving the patient a meal containing an X-ray opaque material (usually a barium compound such as barium sulfate). X-rays are actually harmful and so the operators work behind a lead shield. Patients are given the minimum dose of X-rays that will give the information required. Sensitive areas (the genital areas in particular) are protected by a lead sheet.

**X-linked dominant :** X-linked dominant inheritance refers to genetic conditions associated with mutations in genes on the X chromosome. A single copy of the mutation is enough to cause the disease in both males (who have one X chromosome) and females (who have two X chromosomes). In some conditions, the absence of a functional gene results in the death of affected males.

**X-linked recessive :** X-linked recessive inheritance refers to genetic conditions associated with mutations in genes on the X chromosome. A male carrying such a mutation will be affected, because he carries only one X chromosome. A female carrying a mutation in one gene, with a normal gene on the other X chromosome, is generally unaffected.

**x-ray :** A type of radiation used in the diagnosis and treatment of cancer and other diseases. In low doses, x-rays are used to diagnose diseases by making pictures of the inside of the body. In high doses, x-rays are used to treat cancer.

**X-ray Crystallography:** A scientific tool used to determine the 3D arrangement of atoms in a crystal using the X-rays.

**X-ray crystallography:** A technique for determining the structure of molecules from the X-ray diffraction patterns that are produced by crystalline arrays of the molecules. Or A technique for determining the three-dimensional structure of protein crystals at atomic resolution by examining the diffraction pattern of x-rays striking the crystal. or Determination of three dimensional arrangement of atoms in a crystal by analysis of x-ray diffraction patterns. or The analysis of x-ray diffraction patterns of a crystalline compound, used to determine the molecule's three-dimensional structure.

**X-ray crystallography:** A technique of determining a molecule's three-dimensional structure by analyzing the X-ray diffraction patterns of crystals made up of the molecule in question.

**x-ray diffraction pattern:** Interference patterns created by x-rays as they pass through a solid material. Studying x-ray diffraction patterns gives detailed information on the three-dimensional structure of crystals, surfaces, and atoms.

**X-Ray diffraction pattern (X-Ray powder pattern) (XRPD):** The diffraction pattern produced by the lattice spacings in an ordered solid through exposure to X-rays. This technique can be used to identify a substance, ascertain the polymorph(s) present, and determine the crystallinity of a solid.

**x-ray spectrum:** A set of characteristic x-ray frequencies or wavelengths produced by a substance used as a target in an x-ray tube. Each element has a characteristic x-ray spectrum, and there is a strong correlation between atomic number and the frequencies of certain lines in the x-ray spectrum.

**x-ray therapy :** A type of radiation therapy that uses high-energy radiation from x-rays to kill cancer cells and shrink tumors.

**x-ray tube:** A cathode ray tube that focuses energetic streams of electrons on a metal target, causing the metal to emit x-rays.

**X-RAYS:** are electromagnetic radiations above the Ultra Violet in frequency that are produced when electrons strike a metal target. They are used to determine the atomic number of elements and the structure of crystals. Or Electromagnetic radiation with a wavelength approximating that of interatomic distances, thus allowing the measurement of these distances. or Penetrating electromagnetic radiation (photon) having a wavelength that is much shorter than that of visible light. These rays are usually produced by excitation of the electron field around certain nuclei. In nuclear reactions, it is customary to refer to photons originating in the nucleus as x-rays.

**xaliproden hydrochloride:** The hydrochloride salt of xaliproden, an orally-active, synthetic, non-peptidic 5-hydroxytryptamine (5-HT) 1A receptor agonist with neurotrophic and neuroprotective activities. Although its mechanism of action is not fully understood, xaliproden appears to either mimic the effects of neurotrophins or stimulate their synthesis, thereby stimulating neuronal cell differentiation and proliferation and inhibiting neuronal cell death. The neuroprotective effect of this agent involves the activation of MAP kinase pathways via stimulation of the 5-HT<sub>1A</sub> receptor.

**Xalkori :** A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of the anaplastic lymphoma kinase (ALK) gene or the ROS1 gene. It is also being studied in the treatment of other types of cancer. Xalkori blocks the proteins made by the mutated ALK and ROS1 genes. Blocking these proteins may stop the growth and spread of cancer cells. Xalkori may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called crizotinib, MET tyrosine kinase inhibitor PF-02341066, and PF-02341066.

**Xanax :** A drug used to treat anxiety disorders and panic attacks. It is being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of benzodiazepine. Also called alprazolam.

**xanthohumol:** A prenylated flavonoid derived from the female flowers of the hops plant (*Humulus lupulus* L), with potential chemopreventive and antineoplastic activities. Upon administration, xanthohumol scavenges reactive oxygen species (ROS), thereby preventing DNA damage due to oxidative stress. In addition, xanthohumol is able to increase the expression of phase II cytoprotective enzymes, thereby inactivating carcinogens. This agent exerts anti-inflammatory activity, through the inhibition of inflammation-inducing enzymes, inhibits DNA synthesis, and induces apoptosis of susceptible cancer cells. Xanthohumol also decreases the expression of C-X-C chemokine receptor 4 (CXCR4), thereby preventing cancer cell invasion.

**xanthomas:** fat deposits in the skin and tendons

**Xanthotoxin:** (Other name for: methoxsalen)

**Xarelto:** (Other name for: rivaroxaban)

**XPB1-US/XPB1-SP/CD138/CS1 multipeptide vaccine PVX-410:** A cancer vaccine containing immunogenic, HLA-A2-specific epitopes derived from X-box-binding protein 1-unspliced (XPB1-US), XPB1-spliced (SP), syndecan-1 (CD138), and CS1 (CD2 subset 1, CRACC, SLAMF7, CD319) with potential immunomodulating and antineoplastic activities. Upon subcutaneous administration, XPB1-US/XPB1-SP/CD138/CS1 multipeptide vaccine PVX-410 may stimulate the immune system to induce a cytotoxic T-lymphocyte response against the four myeloma-specific antigens. The tumor associated antigens (TAAs) XPB1-US, XPB1-SP,

CD138 and CS1, are overexpressed on the surface of multiple myeloma (MM) cells.

**Xcytrin:** (Other name for: motexafin gadolinium)

**XELIRI:** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread to other parts of the body. It is also used to treat esophageal cancer and stomach cancer that are advanced or have spread to other parts of the body. It includes the drugs capecitabine (Xeloda) and irinotecan hydrochloride. Also called CAPIRI, CAPIRI regimen, and XELIRI regimen.

**XELIRI regimen :** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread to other parts of the body. It is also used to treat esophageal cancer and stomach cancer that are advanced or have spread to other parts of the body. It includes the drugs capecitabine (Xeloda) and irinotecan hydrochloride. Also called CAPIRI, CAPIRI regimen, and XELIRI.

**Xeloda :** A drug used to treat stage III colon cancer in patients who had surgery to remove the cancer. It is also used to treat metastatic breast cancer that has not improved after treatment with certain other anticancer drugs. Xeloda is being studied in the treatment of other types of cancer. It is taken up by cancer cells and breaks down into 5-fluorouracil, a substance that kills tumor cells. Xeloda is a type of antimetabolite. Also called capecitabine.

**XELOX :** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread. It is also being studied in the treatment of other types of cancer. It includes the drugs capecitabine (Xeloda) and oxaliplatin. Also called XELOX regimen.

**XELOX regimen :** An abbreviation for a chemotherapy combination used to treat colorectal cancer that has spread. It is also being studied in the treatment of other types of cancer. It includes the drugs capecitabine (Xeloda) and oxaliplatin. Also called XELOX.

**Xenobiotic:** A xenobiotic is a chemical which is not natural component of the organism exposed to it. Synonyms drug, foreign substance or compound. Or A compound is said to be xenobiotic if it is foreign to an organism. Or A substance which is not normally found in a living thing.

**xenogeneic tyrosinase DNA vaccine:** A plasmid DNA vaccine, encoding an epitope of mouse tyrosinase, with potential antineoplastic activity. Administered via intramuscular electroporation, vaccination with xenogeneic tyrosinase DNA vaccine may induce both humoral and cytotoxic lymphocyte (CTL) immune responses against melanoma cells that express tyrosinase, resulting in decreased tumor growth. .

**xenograft :** The transplant of an organ, tissue, or cells to an individual of another species.

**xenolith:** a fragment of country rock torn away during the emplacement of magma; generally most abundant near the contact with the country rock.

**xenon:** A colorless, heavy, odorless noble gas element with atomic symbol Xe, atomic number 54, and atomic weight 131.3.

**Xenon:** Symbol:"Xe" Atomic Number:"54" Atomic Mass: 131.29amu. It is one of the noble or inert gases. This non-reactive element has been made into several compounds in the lab. The pure gas is used in lasers, headlights, and in medicine. Or Element 54, a colorless, inert gas used to fill cathode ray tubes.

**Xerecept:** (Other name for: corticorelin acetate)

**Xeroderma pigmentosa:** A rare skin disorder, characterized by sensitivity to ultraviolet light and a propensity for skin cancers, caused by a defect in excinuclease, which plays a role in the removal of pyrimidine dimers.

**xeroderma pigmentosum :** A genetic condition marked by an extreme sensitivity to ultraviolet radiation, including sunlight. People with xeroderma pigmentosum are not able to repair skin damage from the sun and other sources of ultraviolet radiation, and have a very high risk of skin cancer.

**xerogram :** A picture of the body recorded on paper rather than on film. Also called xeroradiograph.

**xeroradiograph :** A picture of the body recorded on paper rather than on film. Also called xerogram.

**xeroradiography :** A type of x-ray in which a picture of the body is recorded on paper rather than on film.

**xerostomia :** Dry mouth. It occurs when the body is not able to make enough saliva.

**Xgeva** : A drug used to prevent or treat certain bone problems. Under the brand name Xgeva, it is used to prevent broken bones and other bone problems caused by solid tumors that have spread to bone. It is also used in certain patients to treat giant cell tumor of the bone that cannot be removed by surgery. Under the brand name Prolia, it is used to treat osteoporosis (a decrease in bone mass and density) in postmenopausal women who have a high risk of breaking bones. Xgeva is also being studied in the treatment of other conditions and types of cancer. It binds to a protein called RANKL, which keeps RANKL from binding to another protein called RANK on the surface of certain bone cells, including bone cancer cells. This may help keep bone from breaking down and cancer cells from growing. Xgeva is a type of monoclonal antibody. Also called AMG 162, denosumab, and Prolia.

**xianling gubao**: An orally bioavailable phytoestrogen-rich Traditional Chinese Medicine (TCM) containing extracts from the six herbs *Herba epimedii*, *Radix dipsaci* (*Dipsacus* root), *Radix salvia miltiorrhiza* (*Salvia* root, Danshen, red sage root), *Rhizoma anemarrhenae* (*zhi Mu*), *Fructus Psoraleae* (fruit of *Psoralea corylifolia* L), and *Radix Rehmanniae* (*Rehmannia* root, *Rehmannia glutinosa*, Sheng Di Huang, *Rehmannia glutinosa* Libosch), with potential anti-osteoporotic and bone-strengthening activities. Xianling gubao (XLGB) contains various phytochemicals, including flavonoids, coumarins, saponins, alkaloids and terpenes. Upon oral administration of XLGB, the active ingredients may strengthen bones and may treat or prevent osteoporosis, osteoarthritis, bone loss and bone fractures.

**XIAP/cIAP1 antagonist ASTX660**: An orally bioavailable, non-peptidomimetic antagonist of both X chromosome-linked inhibitor of apoptosis protein (XIAP) and cellular IAP 1 (cIAP1), with potential antineoplastic and pro-apoptotic activities. Upon administration, XIAP/cIAP1 antagonist ASTX660 selectively binds to and inhibits the activity of XIAP and cIAP1. This restores and promotes the induction of apoptotic signaling pathways in cancer cells, and inactivates the nuclear factor-kappa B (NF- $\kappa$ B)-mediated survival pathway. XIAP and cIAP1 are overexpressed by many cancer cell types and suppress apoptosis by inhibiting the activity of certain caspases; they promote both cancer cell survival and chemotherapy resistance. Check for active clinical trials using this agent.

**Xifaxan:** (Other name for: rifaximin)

**Xilonix:** (Other name for: anti-interleukin-1 alpha monoclonal antibody MABp1)

**Xinlay:** (Other name for: atrasentan hydrochloride)

**XK469R:** A substance that is being studied in the treatment of leukemia. It belongs to the family of drugs called topoisomerase inhibitors.

**XL820:** An orally bioavailable, small molecule receptor tyrosine kinase inhibitor with potential antineoplastic activity. XL820 binds to and inhibits the receptor tyrosine kinases for vascular endothelial growth factor (VEGF), c-kit, and platelet-derived growth factor (PDGF). In tumor models of breast carcinomas, gliomas, and leukemia, this agent exhibits dose-dependent growth inhibition and has been shown to cause tumor regression. Check for active clinical trials using this agent.

**XL844:** A synthetic small-molecule inhibitor of checkpoint kinases 1 and 2 (Chk1 and Chk2) with potential antineoplastic activity. XL844 binds to and inhibits Chks 1 and 2, resulting in inhibition of cell cycle arrest, progressive DNA damage, inhibition of DNA repair, and, ultimately, tumor cell apoptosis. This agent also inhibits vascular endothelial growth factor receptor 1 (VEGFR1) and vascular endothelial growth factor receptor 3 (VEGFR3), important mediators of tumor angiogenesis and lymphogenesis, respectively. In the presence of DNA damage or incomplete DNA replication, eukaryotic cells activate cell cycle checkpoints that temporarily halt the cell cycle to permit DNA repair or completion of DNA replication to take place. In the presence of extensive damage or absence of timely repair, these checkpoint-signaling pathways may also trigger a pathway that effects apoptosis. Normal functions of Chks involve the initiation of cell-cycle arrest and the up-regulation of transcription genes involved with DNA excision repair and dNTP synthesis.

**XL880:** A substance being studied in the treatment of cancer. XL880 blocks enzymes involved in the growth and spread of tumor cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called foretinib and MET/VEGFR-2 inhibitor GSK1363089.

**Xofigo :** A drug used to treat prostate cancer that has spread to the bone and has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Xofigo contains a radioactive substance

called radium 223. Radium 223 collects in bone and gives off radiation that may kill cancer cells. Xofigo is a type of radiopharmaceutical. Also called radium 223 dichloride.

**Xolair:** (Other name for: omalizumab)

**Xolegel:** (Other name for: ketoconazole)

**XPO1 inhibitor KPT-8602:** An orally bioavailable inhibitor of exportin-1 (XPO1; chromosome region maintenance 1 protein homolog; CRM1), with potential antineoplastic activity. Upon administration, XPO1 inhibitor KPT-8602 binds to the XPO1 cargo binding site, which prevents the XPO1-mediated nuclear export of cargo proteins such as tumor suppressor proteins (TSPs), including p53, p73, BRCA1/2, pRB, FOXO, and other growth regulatory proteins and leads to their selective accumulation in the nuclei of tumor cells. As a selective inhibitor of nuclear export (SINE), KPT-8602 restores the nuclear localization and function of tumor suppressing proteins which leads to the induction of apoptosis in tumor cells. XPO1, the major export factor that transports proteins from the nucleus to the cytoplasm, is overexpressed in a variety of cancer cell types while minimally expressed in normal, healthy cells. The export of tumor suppressor proteins into the cytoplasm prevents them from initiating apoptosis and leads to uncontrolled tumor cell proliferation. Check for active clinical trials using this agent.

**XR9576:** A substance that is being studied in the treatment of cancer. It may help tumor cells respond again to drugs they have become resistant (unable to respond) to. XR9576 is a type of multidrug resistance inhibitor and a type of P-glycoprotein antagonist. Also called tariquidar.

**XRP9881:** A substance that is being studied in the treatment of breast cancer. It belongs to the family of drugs called taxane derivatives.

**Xtandi :** A drug used to treat prostate cancer that has spread to other parts of the body and did not get better with other treatment, including docetaxel. Xtandi binds to proteins called androgen receptors, which are found in some prostate cancer cells. These proteins bind to androgens (male hormones) and may cause cancer cells to grow. Blocking these proteins may keep cancer cells from growing. Xtandi is a type of antiandrogen. Also called enzalutamide.

**xylem:** the structure of vascular plants that conducts water and minerals upward from the roots.

**Xylene:** The non-systematic name for dimethylbenzene, like so:

**Xylocaine:** (Other name for: lidocaine)

**Xylocitin:** (Other name for: lidocaine)

**Xyotax :** A form of the anticancer drug paclitaxel combined with a protein called poliglumex that may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of breast cancer, ovarian cancer, lung cancer, and other types of cancer. It belongs to the family of drugs called mitotic inhibitors. Also called CT-2103, paclitaxel poliglumex, and paclitaxel polyglutamate.

**Y 90 ibritumomab tiuxetan :** A drug used with the drug rituximab to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of B-cell tumors. Y 90 ibritumomab tiuxetan contains a monoclonal antibody that binds to a protein called CD20, which is found on B cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Y 90 ibritumomab tiuxetan is a type of radioimmunoconjugate. Also called IDEC-Y2B8, Y 90 Zevalin, and yttrium Y 90 ibritumomab tiuxetan.

**Y 90 Zevalin :** A drug used with the drug rituximab to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of B-cell tumors. Y 90 Zevalin contains a monoclonal antibody that binds to a protein called CD20, which is found on B cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Y 90 Zevalin is a type of radioimmunoconjugate. Also called IDEC-Y2B8, Y 90 ibritumomab tiuxetan, and yttrium Y 90 ibritumomab tiuxetan.

**Y-90 OctreoTher:** (Other name for: yttrium Y 90-edotreotide)

**Y-shape branched pegylated filgrastim:** A long-acting, pegylated variant of filgrastim (recombinant human granulocyte colony-stimulating factor (G-CSF)) with immunomodulating activity. Similar to endogenous G-CSF, this agent binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions. The modification of this version of filgrastim with the addition of a Y-shaped branch of polyethylene glycol at a specific lysine residue (Lys 17) theoretically serves to extend the half-life of the agent.

**yangona** : An herb native to islands in the South Pacific. Substances taken from the root have been used in some cultures to relieve stress, anxiety, tension, sleeplessness, and problems of menopause. Yangona may increase the effect of alcohol and of certain drugs used to treat anxiety and depression. The U.S. Food and Drug Administration advises users that yangona may cause severe liver damage. The scientific name is Piper methysticum. Also called intoxicating pepper, kava kava, rauschpfeffer, and tonga.

**yeast:** Yeast is a fungus whose enzymes aid the breakdown of sugar (glucose) into alcohol (ethanol) and carbon dioxide in the absence of oxygen. It is used in the brewing and baking industries or Any of a number of species of single-celled fungus. Most important are the Saccharomyces spp., which are used in bread making and beer brewing... OR A type of microorganism that is found almost everywhere, including inside the body. There are many different types of yeast. Some types are used to make foods, such as bread, cheese, and alcoholic drinks. Small amounts of a certain type of yeast normally live on the skin and in some parts of the body, such as the mouth, throat, and vagina. Yeast are a type of fungus.

**Yeast artificial chromosome (YAC):** A DNA molecule that can be used to clone DNA inserts ranging from 100 to 1000 kb in length; contains a centromere, an autonomously replicating sequence, a pair of telomeres, selectable marker genes, and an insertion site for the sequence to be cloned.

**yeast infection** : A condition in which too much yeast grows in certain areas of the body and causes symptoms and disease. Small amounts of yeast normally live on the skin and in other parts of the body, such as the mouth, throat, and vagina. Sometimes, too much yeast can grow in these areas and cause infection. Yeast infections may also occur in the blood and spread throughout the body, but this is rare. Certain conditions, such as a weakened immune system, diabetes, pregnancy, hormone changes, and stress, and use of certain medicines may increase the risk of yeast infection.

**yellow:** A color.

**yellow fever** : A disease caused by infection with the yellow fever virus, which is carried by mosquitos. Symptoms include body aches, chills, fever, severe headache, weakness, and a yellow skin color. Bleeding, vomiting, and failure of the liver and other organs may occur in late stages of the disease.

**Yellowcake:** The solid form of mixed uranium oxide, which is produced from uranium ore in the uranium recovery (milling) process. The material is a mixture of uranium oxides, which can vary in proportion and color from yellow to orange to dark green (blackish) depending on the temperature at which the material is dried (which affects the level of hydration and impurities), with higher drying temperatures producing a darker and less soluble material. Yellowcake was commonly referred to as  $U_3O_8$ , because that chemical compound historically comprised the majority of the yellowcake produced by uranium recovery facilities utilizing conventional milling methods. Most modern uranium recovery facilities utilize in situ recovery methods and produce a yellowish compound comprised mostly of uranyl peroxide dihydrate. This material is then transported to a uranium conversion facility, where it is transformed into uranium hexafluoride ( $UF_6$ ), in preparation for fabricating fuel for nuclear reactors.

**Yellowing:** The development of a yellow colour on ageing; most noticeable on white or light coloured paint and clear varnishes. Or Development of a yellow color or cast in white, a pastel, colored or clear finishes.

**Yellowness Index:** A measure of the color on the yellow scale. Or A measure of the tendency of plastics to turn yellow upon long-term exposure to light or heat.

**Yervoy :** A drug used to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is also used as adjuvant therapy to treat melanoma in the skin and lymph nodes in patients who have already had surgery. Yervoy is also being studied in the treatment of other types of cancer. Yervoy binds to a substance called CTLA-4, which is found on T cells (a type of white blood cell). Yervoy may block CTLA-4 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called ipilimumab and MDX-010.

**Yield:** In chemical synthesis, yield refers to the amount of product obtained at the end of a chemical reaction. Or The amount of product actually obtained in a chemical reaction. Or Net weight per 1,000 lineal feet of film.

**Yield point:** the point at which a material will continue to elongate at no substantial increase in load during a short test period. OR In tensile testing, yield point is the first point on the stress-strain curve at which an increase in

strain occurs without an increase in stress. This is the point at which permanent deformation of the stressed specimen begins to take place. OR In tensile testing, yield point is the first point on the stress-strain curve at which an increase in strain occurs without an increase in stress.

**Yield Strength:** The stress at which a material exhibits a specified limiting deviation from the proportionality of stress to strain. Or The stress at the yield point of a specimen, usually expressed in pounds per square inch or megapascals. OR The stress at which a material exhibits a specified limiting deviation from the proportionality of stress to strain. OR the force which must be applied to a plastic to initiate flow.

**YIELD VALUE:** (Yield Strength) The lowest stress at which a material undergoes plastic deformation. Below this stress, the material is elastic; above it, viscous.

**Yield Value/Yield Strength:** The lowest stress at which a material undergoes plastic deformation. Below this stress, the material is elastic; above it, viscous.

**yin and yang :** In Chinese philosophy, yin and yang are opposite forces that form a whole. Everything contains both yin and yang in a balance that is always changing, such as hot and cold, day and night, and health and disease. In traditional Chinese medicine, disease is diagnosed and treated based on the balance of yin and yang.

**YKL-40:** A substance that may be found in higher-than-normal amounts in the blood of patients with certain types of cancer and inflammatory diseases. It is a type of glycoprotein.

**Ylid:** A compound in which adjacent, covalently-bonded atoms, both having an electronic octet, have opposite charges.

**ylide:** a neutral molecule in which two oppositely charged atoms are directly bonded to each other.

**YM598:** A substance that is being studied as a treatment for advanced prostate cancer and for pain caused by prostate cancer that has spread to the bone. It belongs to the family of drugs called endothelin ETA receptor antagonists.

**yoctomole (ymol):**  $10^{-24}$  moles; A single molecule corresponds to  $1/\text{Avogadro's number}$ , or  $1.66 \times 10^{-24}$  moles, or 1.66 ymol.

**yoga :** An ancient system of practices used to balance the mind and body through exercise, meditation (focusing thoughts), and control of breathing and emotions. Yoga is being studied as a way to relieve stress and treat sleep problems in cancer patients.

**yohimbe :** A tree native to West Africa. The bark is used as a supplement for bodybuilding and to enhance male sexual performance. It contains the chemical yohimbine, which is being studied in the treatment of sexual dysfunction. It may interact with certain drugs used to treat depression, high blood pressure, and high blood sugar. The scientific name is *Pausinystalia yohimbe*. Also called johimbe.

**Yondelis :** A drug used to treat liposarcoma and leiomyosarcoma (types of soft tissue sarcoma) that cannot be removed by surgery or have spread to other parts of the body. It is used in patients who were treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Yondelis may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called ecteinascidin 743, ET-743, and trabectedin.

**yoshi-864:** An alkylsulfonate. Yoshi-864 alkylates and crosslinks DNA, thereby inhibiting DNA replication.

**Young's Modulus:** The ratio of tensile stress to tensile strain below the proportional limit. OR The modulus of elasticity in tension. It is concerned with how stiff, flexible, springy or floppy a material is

**Youngs Modulus of Elasticity:** The modulus of elasticity in tension. The ratio of stress in a material subjected to deformation.

**Ytterbium:** Symbol:"Yb" Atomic Number:"70" Atomic Mass: 173.04amu. Ytterbium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. This silvery metal can be found in several minerals. It is never found as a pure element in nature, always in compounds. or Element 70, atomic weight 173.04, a very rare, malleable metal used in special alloys for X-ray sources.

**Yttrium:** Symbol:"Y" Atomic Number:"39" Atomic Mass: 88.91amu. This is one of the transition elements found in period five of the periodic table. One of the rare Earth metals, yttrium is used in TV tubes, alloys, and has even been found on the Moon. Or Element 39, atomic weight 88.90585, a dark gray metal that is used in alloys and nuclear technology for its high

neutron transparency. Yttrium compounds are used in the manufacture of color tv screens, superconducting ceramics, and fireproof bricks.

**yttrium** : A metal of the rare earth group of elements. A radioactive form of yttrium may be attached to a monoclonal antibody or other molecule that can locate and bind to cancer cells and be used to diagnose or treat some types of cancer.

**yttrium Y 90** : A radioactive form of the rare metal yttrium that is used in radiation therapy to treat some types of tumors. Yttrium Y 90 can be linked to a molecule, such as a monoclonal antibody, to help it locate and bind to certain substances in the body, including cancer cells. The radiation may kill the cancer cells.

**yttrium Y 90 anti-CD19 monoclonal antibody BU12**: A radioimmunoconjugate consisting of the murine IgG1 anti-CD19 monoclonal antibody (MoAb) BU12 labeled with the beta-emitting radioisotope yttrium Y 90 with radioisotopic and antibody activities. Yttrium Y 90 anti-CD19 monoclonal antibody BU12 binds to the CD19 molecule, specifically delivering cytotoxic beta radiation to CD19-expressing B cells. CD19 is a membrane antigen that is widely expressed during B-cell development, from pro-B-cell to early plasma cell stages.

**yttrium Y 90 anti-CD45 monoclonal antibody AHN-12**: A radioimmunoconjugate comprised of the monoclonal antibody AHN-12 conjugated to the radioisotope yttrium 90 with potential radioimmunotherapeutic activity. Yttrium Y 90 monoclonal antibody AHN-12 binds to the tyrosine phosphatase CD45, expressed on the surface of normal and malignant hematopoietic cells. After binding and internalization by CD45-expressing tumor cells, this agent may deliver a cytotoxic dose of beta radiation.

**yttrium Y 90 anti-CD45 monoclonal antibody BC8**: A radioimmunoconjugate containing the murine IgG1 anti-CD45 monoclonal antibody (MoAb) BC8 labeled with yttrium 90 (Y90), with potential immunotherapeutic activity. Yttrium Y 90 anti-CD45 monoclonal antibody BC8 binds to CD45 antigen, a receptor protein-tyrosine phosphatase expressed on the surface of both normal and malignant hematopoietic cells. After binding and internalization by CD45-expressing tumor cells, this agent may deliver a cytotoxic dose of beta radiation.

**yttrium Y 90 anti-CD66 monoclonal antibody BW 250/183:** A radioimmunoconjugate consisting of the murine IgG1 monoclonal antibody BW250/183 labeled with yttrium Y 90 with potential radioimmunotherapeutic activity. Yttrium Y 90 anti-CD66 monoclonal antibody BW 250/183 binds to a 95 kD nonspecific cross-reacting antigen (CD66b or NCA-95) on granulocytes, selectively delivering a cytotoxic dose of Y 90 beta radiation to CD66b-expressing cells. CD66b, a member of the carcinoembryonic antigen (CEA) family with an unknown function, appears early in the differentiation of granulopoietic cells and is expressed on the cell surface of almost all human granulocytes and their more mature precursors.

**yttrium Y 90 anti-CDH3 monoclonal antibody FF-21101:** A radioimmunoconjugate consisting of a chimeric monoclonal antibody targeting human cadherin-3 (CDH3) and labeled, via the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA), with the beta-emitting radioisotope yttrium Y 90, with potential antineoplastic activities. Upon administration, the antibody moiety of yttrium Y 90 anti-CDH3 monoclonal antibody FF-21101 binds to CDH3 expressed on tumor cells, thereby specifically delivering cytotoxic beta radiation to CDH3-expressing tumor cells. CDH3, also known as P-cadherin, is a tumor-associated antigen (TAA) and member of the cadherin family; it is overexpressed in a variety of tumors and plays a role in cell adhesion, motility, invasion, and proliferation.

**yttrium Y 90 anti-CEA monoclonal antibody cT84.66:** A radioimmunoconjugate comprised of a chimeric monoclonal antibody against human carcinoembryonic antigen (CEA) conjugated with the radioisotope yttrium 90 (Y-90) via the chelator tetra-azacyclododecanetetraacetic acid (DOTA) with potential antineoplastic activity. The antibody moiety of yttrium Y90 DOTA anti-CEA monoclonal antibody cT84.66 binds to cells expressing the CEA antigen. Upon cellular internalization, this agent selectively delivers a cytotoxic dose of beta radiation. CEA, a tumor associated antigen, is overexpressed in many cancer types, including gastrointestinal, breast, non-small cell lung, and thyroid cancers.

**yttrium Y 90 clivatuzumab tetraxetan :** A substance being studied in the treatment of advanced pancreatic cancer. Yttrium Y 90 clivatuzumab tetraxetan contains a monoclonal antibody that binds to a protein called

MUC-1, which is found on some pancreatic cancer cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 clivatuzumab tetraxetan is a type of radioimmunoconjugate. Also called yttrium Y 90 DOTA monoclonal antibody HuPAM4. OR A radioimmunoconjugate comprised of the humanized monoclonal antibody HuPAM4, directed against the pancreatic cancer antigen MUC1, that is conjugated to the chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and radiolabeled with the beta-emitting radioisotope Yttrium Y90. Yttrium Y 90 clivatuzumab tetraxetan binds to tumor cells expressing MUC1 antigen, selectively delivering a cytotoxic dose of beta radiation.

**yttrium Y 90 colloid:** An injectable, colloidal formulation of the radioisotope yttrium Y 90, with potential antineoplastic activity. When injected into the tumor, the yttrium Y 90 colloid selectively delivers a cytotoxic dose of beta-emitting yttrium Y 90 to the tumor site, which may result in both tumor cell death and tumor regression.

**yttrium Y 90 daclizumab:** A synthetic radioimmunoconjugate comprised of a humanized anti-interleukin-2 (IL-2) antibody linked to the radioisotope Yttrium 90 with potential antineoplastic activity. Daclizumab binds with high affinity to the Tac (also called CD25) subunit of the IL-2 receptor complex and inhibits the binding of IL-2, thereby blocking the IL-2-mediated activation of lymphocytes. As Yttrium Y 90 daclizumab, daclizumab delivers radiation specifically to lymphocytes that express the IL-2 receptor. Check for active clinical trials using this agent.

**yttrium Y 90 DOTA anti-CEA monoclonal antibody M5A:** A radioimmunoconjugate consisting of a monoclonal antibody directed against the human carcinoembryonic antigen (CEA) conjugated with the radioisotope yttrium 90 (Y-90) via the chelator tetra-azacyclododecanetetra-acetic acid (DOTA) with potential antineoplastic activity. The antibody moiety of yttrium Y 90 DOTA anti-CEA monoclonal antibody M5A binds to cells expressing the CEA antigen. Upon cellular internalization, this agent selectively delivers a cytotoxic dose of beta radiation. CEA, a tumor associated antigen, is overexpressed in many cancer types, including gastrointestinal, breast, non-small cell lung, and thyroid cancers.

**yttrium Y 90 DOTA anti-CEA monoclonal antibody M5A :** A substance being studied in the treatment of some types of cancer. M5A is a monoclonal antibody that binds to a protein called CEA on the surface of

some tumor cells. It is linked to a radioisotope called yttrium Y 90, which may help kill the cancer cells. Yttrium Y 90 DOTA anti-CEA monoclonal antibody M5A is a type of radioimmunoconjugate and a type of radiopharmaceutical.

**yttrium Y 90 DOTA monoclonal antibody HuAFP31** : A substance being studied in the treatment of liver cancer. HuAFP31 is a monoclonal antibody that can bind to tumor cells that make a protein called alpha fetoprotein (AFP). It is linked to a radioactive substance called yttrium Y 90, which may help kill the cancer cells. Yttrium Y 90 DOTA monoclonal antibody HuAFP31 is a type of radioimmunoconjugate.

**yttrium Y 90 DOTA monoclonal antibody HuPAM4** : A substance being studied in the treatment of advanced pancreatic cancer. Yttrium Y 90 DOTA monoclonal antibody HuPAM4 contains a monoclonal antibody that binds to a protein called MUC-1, which is found on some pancreatic cancer cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 DOTA monoclonal antibody HuPAM4 is a type of radioimmunoconjugate. Also called yttrium Y 90 clivatuzumab tetraxetan.

**yttrium Y 90 DOTA-biotin** : A radioconjugate of biotin and yttrium Y 90 (Y-90) linked through the bifunctional macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) with radioimmunotherapy property. Biotin is a water-soluble B-complex vitamin, present in minute amounts in every living cell, while its level in cancerous tissue is higher than that of normal tissue. Y 90-DOTA-biotin could be used in 3-step pre-targeting radioimmunotherapy that employs a tumor targeting antibody conjugated with streptavidin, the natural ligand of biotin. OR A compound that contains the radioisotope yttrium Y 90 linked to the chemical biotin. Biotin is a molecule that binds strongly to the chemical streptavidin. Yttrium Y 90 DOTA-biotin will find tumor cells in the body that have been targeted by an antibody linked to streptavidin and kill them. It is being studied together with CC49-streptavidin in the treatment of cancer. Also called 90Y-DOTA-biotin.

**yttrium Y 90 DOTA-tyr3-octreotide** : A substance being studied in the treatment of some types of cancer. Yttrium Y 90 DOTA-tyr3-octreotide contains a molecule that binds to a protein found on certain types of neuroendocrine tumors (tumors that form from cells that release hormones).

It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 DOTA-tyr3-octreotide is a type of radioconjugate. Also called yttrium Y 90 edotreotide and yttrium Y 90 SMT 487.

**yttrium Y 90 edotreotide :** A substance being studied in the treatment of some types of cancer. Yttrium Y 90 edotreotide contains a molecule that binds to a protein found on certain types of neuroendocrine tumors (tumors that form from cells that release hormones). It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 edotreotide is a type of radioconjugate. Also called yttrium Y 90 DOTA-tyr3-octreotide and yttrium Y 90 SMT 487.

**yttrium Y 90 epratuzumab:** A radioimmunoconjugate consisting of the anti-CD22 monoclonal antibody epratuzumab chelated to the radioisotope yttrium-90 (Y 90). Yttrium Y 90 epratuzumab binds to tumor cells expressing CD22, delivering a cytotoxic dose of beta radiation. Epratuzumab is a humanized version of the murine monoclonal antibody LL2; CD22 is a B cell-restricted antigen present on the surfaces of mature B cells.

**yttrium Y 90 epratuzumab tetraxetan :** A substance being studied in the treatment of certain types of B-cell cancer. Epratuzumab is a monoclonal antibody that binds to a protein called CD22, which is found on the surface of B cells. It is linked to a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 epratuzumab tetraxetan is a type of radioimmunoconjugate.

**yttrium Y 90 glass microspheres:** An injectable formulation of yttrium Y 90 consisting of glass microspheres containing the radioisotope yttrium Y 90. When injected into the tumor vascular bed, yttrium Y 90 glass microspheres occlude tumor blood vessels and deliver a cytotoxic dose of beta radiation to the tumor site, thereby reducing the tumor burden.

**yttrium Y 90 ibritumomab tiuxetan:** A drug used with the drug rituximab to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of B-cell tumors. Yttrium Y 90 ibritumomab tiuxetan contains a monoclonal antibody that binds to a protein called CD20, which is found on B cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 ibritumomab tiuxetan is a type of radioimmunoconjugate.

Also called IDEC-Y2B8, Y 90 ibritumomab tiuxetan, and Y 90 Zevalin. OR A radioimmunotherapeutic agent consisting of a murine monoclonal anti-CD20 antibody (ibritumomab) linked by the chelator tiuxetan to the radioisotope yttrium-90 (Y 90). Yttrium Y 90 ibritumomab tiuxetan binds to and specifically delivers beta radiation to CD20-expressing tumor cells, thereby minimizing the systemic effects of radiation. Check for active clinical trials using this agent.

**yttrium Y 90 monoclonal antibody B3:** A radioimmunoconjugate of monoclonal antibody (MoAb) B3 conjugated with isotope yttrium 90. MoAb B3 is a murine MoAb that recognizes a Lewis Y carbohydrate antigen present on the surface of many carcinomas. This radioimmunoconjugate emits beta particles that causes cytotoxicity in tumor cells and has both diagnostic and therapeutic uses.

**yttrium Y 90 monoclonal antibody BrE-3:** A radioimmunotherapeutic agent consisting of a monoclonal antibody (BrE-3) directed against the tumor-associated antigen epithelial glycoprotein mucin chelated to the radioisotope yttrium-90. Yttrium Y 90 monoclonal antibody BrE-3 binds to tumor cells expressing epithelial glycoprotein mucin, selectively delivering a cytotoxic dose of beta radiation.

**yttrium Y 90 monoclonal antibody Hu3S193:** A radioimmunotherapeutic agent consisting of a humanized murine monoclonal antibody (hu3S193) directed against the tumor-associated Lewis Y epithelial antigen chelated to the radioisotope yttrium-90. Yttrium Y 90 monoclonal antibody Hu3S193 binds to Lewis Y epithelial antigen-expressing tumor cells, selectively delivering a cytotoxic dose of beta radiation.

**yttrium Y 90 monoclonal antibody MN-14:** A radioimmunotherapeutic monoclonal antibody (MN-14) directed against tumor-associated carcinoembryonic antigen (CEA) and chelated to the radioisotope yttrium-90 (Y 90). Y 90 monoclonal antibody MN-14 binds to tumor cell expressing CEA, delivering a cytotoxic dose of beta radiation.

**yttrium Y 90 resin microspheres:** An injectable formulation of the radioisotope yttrium Y 90 encapsulated in resin microspheres with potential antineoplastic activity. When injected into arterial vasculature supplying the tumor, yttrium Y 90 resin microspheres occlude tumor blood vessels and selectively deliver a cytotoxic dose of beta emitting yttrium Y 90 to the tumor site, which may result in tumor cell death and tumor regression.

**yttrium Y 90 SMT 487 :** A substance being studied in the treatment of some types of cancer. Yttrium Y 90 SMT 487 contains a molecule that binds to a protein found on certain types of neuroendocrine tumors (tumors that form from cells that release hormones). It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. Yttrium Y 90 SMT 487 is a type of radioconjugate. Also called yttrium Y 90 DOTA-tyr3-octreotide and yttrium Y 90 edotreotide.

**yttrium Y 90 tacatuzumab tetraxetan:** A radioimmunoconjugate comprised of the monoclonal antibody HuAFP31, directed against alpha fetoprotein, that is conjugated to the chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and radiolabeled with the beta-emitting radioisotope Yttrium Y90. Yttrium Y 90 tacatuzumab tetraxetan binds to tumor cells expressing alpha fetoprotein, selectively delivering a cytotoxic dose of beta radiation.

**yttrium Y 90-DOTA-di-HSG peptide IMP-288:** A radiolabeled divalent histamine-succinyl-glycine (HSG) hapten-peptide linked with the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the beta-emitting radionuclide yttrium 90 (Y-90), with radioimmunotherapeutic activity. After pre-treating and targeting tumor cells with a bi-specific monoclonal antibody (BiMoAB) directed against both a tumor-associated antigen (TAA) and the HSG hapten-peptide, the HSG portion of the administered yttrium Y 90-DOTA-di-HSG peptide IMP-288 binds to the anti-HSG sequence on the BiMoAB. In turn, Y-90 delivers a cytotoxic dose of beta radiation to tumor cells expressing the specific TAA.

**yttrium Y 90-DOTA-girentuximab:** A radioimmunoconjugate comprised of girentuximab conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and labeled with the beta-emitting radioisotope yttrium Y 90. The antibody moiety of yttrium Y 90-DOTA-girentuximab binds to renal cell carcinoma cells expressing the G250 antigen, thereby selectively delivering a cytotoxic dose of beta radiation.

**yttrium Y 90-edotreotide:** A radioconjugate consisting of the octreotide derivative edotreotide labeled with yttrium 90 (Y-90) with potential radiotherapeutic uses. Similar to octreotide, yttrium Y 90-edotreotide binds to somatostatin receptors (SSTRs), especially type 2 receptors, present on

the cell membranes of many types of neuroendocrine tumor cells, delivering tissue-specific, beta-emitting nuclide Y-90-mediated cytotoxicity to SSTR-positive cells. Yttrium Y 90-edotreotide is produced by substituting tyrosine for phenylalanine at the 3 position of the somatostatin analogue octreotide and chelating the substituted octreotide to Y-90 via dodecanetetraacetic acid (DOTA).

**yttrium Y 90-labeled anti-FZD10 monoclonal antibody OTSA101:** A radioimmunoconjugate composed of a humanized monoclonal antibody (MoAb) OTSA101 against FZD10 and labeled with yttrium Y 90, with potential antineoplastic activity. The MoAb moiety of yttrium Y 90-labeled anti-FZD10 monoclonal antibody OTSA101 binds to FZD10, thereby delivering a cytotoxic dose of beta radiation to FZD10 positive tumor cells. FZD10 (also called CD350), a member of the Frizzled family of G protein-coupled receptors that is involved in the Wnt/beta-catenin/TCF signaling pathway, is overexpressed in a variety of cancer cell types but undetectable in normal, healthy human tissues except the placenta.

**yttrium Y 90-labeled basiliximab:** A radioimmunoconjugate composed of basiliximab, a chimeric, mouse-human monoclonal antibody directed against the alpha subunit of interleukin-2 receptor (IL-2R alpha, CD25 or Tac antigen), and labeled with yttrium y 90, with potential antineoplastic activity. The basiliximab moiety of yttrium Y 90 basiliximab selectively binds to IL-2R alpha expressed on the surface of activated T-lymphocytes, thereby preventing IL-2 binding and blocking the IL-2-mediated activation of lymphocytes. The yttrium y 90 moiety selectively delivers a cytotoxic dose of beta radiation to lymphocytes that express the IL-2 receptor. This may prevent T cell-mediated activation of the immune system against a certain transplant and may prevent transplant rejection.

**yttrium-90 polycarbonate brachytherapy plaque:** A polycarbonate-based semicylindrical plaque impregnated with yttrium Y 90 with radioisotopic and antineoplastic activities. An yttrium-90 polycarbonate brachytherapy plaque may be applied to a tumor site with a special brachytherapy applicator for a predetermined interval of time, selectively delivering a cytotoxic dose of beta-emitting yttrium Y 90.

**Z form:** A duplex DNA structure in which there is the usual type of hydrogen bonding between the base pairs but in which the helix formed by the two polynucleotide chains is left-handed rather than right-handed.

**Z scheme of photosynthesis:** The pathway of electron flow between photosystem I and II; so called because the redox diagram from P680 to P700+ looks like the letter Z.

**Z-360:** A selective, orally available, 1,5-benzodiazepine-derivative gastrin/cholecystokinin 2 (CCK-2) receptor antagonist with potential antineoplastic activity. Z-360 binds to the gastrin/CCK-2 receptor, thereby preventing receptor activation by gastrin, a peptide hormone frequently associated with the proliferation of gastrointestinal and pancreatic tumor cells. Check for active clinical trials using this agent.

**Z-DNA:** A left-handed double helix in which the backbone phosphates zigzag; can be formed by oligonucleotides with alternating sequences of purines and pyrimidines.

**Z-endoxifen hydrochloride:** The hydrochloride salt and the z (cis-) stereoisomer of endoxifen with potential antineoplastic activity. Endoxifen, the active metabolite of tamoxifen, competitively inhibits the binding of estradiol to estrogen receptors, thereby preventing the receptor from binding to the estrogen-response element on DNA and thus reducing DNA synthesis. Unlike tamoxifen, however, which relies on CYP2D6 activity for its conversion to the active metabolite endoxifen, the direct administration of endoxifen bypasses the CYP2D6 route. As CYP2D6 activity can vary widely among individuals due to genetic CYP2D6 polymorphisms, endoxifen is therefore theoretically more potent and more uniform in its bioavailability across patient populations.

**Z-matrix:** A common format for specifying molecular geometry in terms of internal coordinates.

**Z-score :** A score that indicates how many standard deviations a value is above or below the mean.

**Zadaxin™:** (Other name for: recombinant thymosin)

**zafirlukast :** A drug used to prevent and treat symptoms of asthma. It blocks substances that cause inflammation in the lungs. It is a type of antiasthmatic agent and a leukotriene receptor antagonist. Also called Accolate.

**Zaitsev rule:** states that the major product in the formation of alkenes by elimination reactions will be the more highly substituted alkene, or the alkene with more substituents on the carbon atoms of the double bond.

**zalcitabine:** A synthetic dideoxynucleoside. After intracellular phosphorylation to its active metabolite, zalcitabine preferentially inhibits the gamma form of DNA polymerase present in tumor cell mitochondria, resulting in the inhibition of tumor cell mitochondrial DNA replication and tumor cell death.

**Zaltrap :** A drug used with other drugs to treat colorectal cancer that has spread to other parts of the body and has not gotten better with chemotherapy. It is also being studied in the treatment of other types of cancer. Zaltrap blocks the action of a protein called vascular endothelial growth factor (VEGF) and may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent. Also called vascular endothelial growth factor trap, VEGF Trap, and ziv-aflibercept.

**zalutumumab:** A fully human IgG1 monoclonal antibody directed against the epidermal growth factor receptor (EGFR) with potential antineoplastic activity. Zalutumumab selectively binds to the EGFR receptor and blocks receptor binding of EGF and transforming growth factor-alpha (TGF-a), which results in the disruption of EGFR-mediated cell signaling, cell growth inhibition and apoptosis in EGFR-expressing tumor cells. In addition, this agent triggers antibody dependent cellular cytotoxicity (ADCC) in EGFR-expressing cells. EGFR is a cell surface receptor tyrosine kinase, overexpressed on many cancer cells.

**Zalypsis:** (Other name for: PM00104)

**Zanaflex:** (Other name for: tizanidine hydrochloride)

**zanamivir:** A sialic acid-analogue neuraminidase inhibitor with antiviral activity. Administered into the respiratory tract by aerosol inhalation, zanamivir selectively binds to and inhibits influenza A and B virus neuraminidase-mediated cleavage of sialic acid residues in host cell membrane-bound glycoprotein receptors for influenza viruses, preventing the release of progeny viruses from host cell surfaces and, so, further viral replication. OR A drug used to prevent and to treat influenza virus infections. It blocks the release of the virus from infected cells. It is a type of antiviral agent. Also called Relenza.

**zanolimumab:** A human IgG1k monoclonal antibody against the CD4 receptor on T lymphocytes, with potential antineoplastic and immunosuppressing activities. Zanolimumab targets and binds to the CD4 receptor on certain T cells thereby preventing the interaction between the

CD4 receptor and the major histocompatibility complex class II molecule. This prevents activation of CD4-positive T cells. In addition, zanolimumab is able to induce an antibody-dependent cellular cytotoxicity (ADCC) response against CD4-expressing tumor cells. CD4, a receptor located on a subset of T-lymphocytes, is upregulated in T-cell lymphomas.

**Zanosar:** (Other name for: streptozocin)

**Zarnestra :** A substance that is being studied in the treatment of acute myeloid leukemia (AML) and other types of cancer. It belongs to the family of drugs called farnesyltransferase inhibitors. Also called R115777 and tipifarnib.

**Zarontin:** (Other name for: ethosuximide)

**Zarxio :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. It is also used to treat chronic neutropenia and to prepare the blood for the collection of certain types of blood cells. Zarxio is also used to help prevent damage to the bone marrow in patients who were exposed to very high doses of certain types of radiation. Zarxio helps the body make more white blood cells. It is a type of colony-stimulating factor. Also called filgrastim, G-CSF, granulocyte colony-stimulating factor, and Neupogen.

**ZD0473:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called platinum analogs.

**ZD1839:** A drug that is used to treat certain types of non-small cell lung cancer and is being studied in the treatment of other types of cancer. It is a type of epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor. Also called gefitinib and Iressa.

**ZD4054:** A substance that is being studied in the treatment of prostate cancer. It belongs to the family of drugs called endothelin-receptor antagonists.

**ZD6126:** A water-soluble phosphate prodrug of N-acetylcolchicol with potential antiangiogenesis and antineoplastic activities. ZD6126 is converted in vivo into N-acetylcolchicol. N-acetylcolchicol binds to and destabilizes the tubulin cytoskeleton of endothelial cells in tumor blood vessels, which may result in tumor endothelial cell apoptosis, the selective

occlusion of tumor blood vessels, cessation of tumor blood flow, and tumor necrosis. OR A substance that has been studied in the treatment of several types of cancer. ZD6126 destroys blood vessels in tumors and may prevent the growth of new blood vessels that tumors need to grow. It is a type of vascular targeting agent and a type of antiangiogenesis agent.

**ZD6474:** A drug used to treat medullary thyroid cancer that has spread to other parts of the body and cannot be treated by surgery. It is also being studied in the treatment of other types of cancer. ZD6474 prevents the growth of new blood vessels that tumors need to grow. It also blocks enzymes needed for cell growth and may kill cancer cells. It is a type of antiangiogenesis agent and a type of tyrosine kinase inhibitor. Also called Caprelsa and vandetanib.

**ZDX:** A drug used to treat prostate cancer and to relieve the symptoms of advanced breast cancer. It is also used to treat problems with the endometrium (lining of the uterus). ZDX keeps the body from making the hormones luteinizing hormone-releasing hormone (LHRH) and luteinizing hormone (LH). This causes the testicles to stop making testosterone (a male hormone) in men, and the ovaries to stop making estradiol (a form of the hormone estrogen) in women. ZDX may stop the growth of cancer cells that need testosterone or estrogen to grow. It is a type of LHRH agonist. Also called goserelin acetate and Zoladex.

**Zeeman effect:** The splitting of spectral lines when an external magnetic field is applied.

**Zelboraf :** A drug used to treat advanced melanoma that has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Zelboraf blocks this mutated protein, which may stop the growth of cancer cells. It is a type of kinase inhibitor and a type of targeted therapy agent. Also called BRAF (V600E) kinase inhibitor RO5185426, PLX4032, RG7204, and vemurafenib.

**Zemuron:** (Other name for: rocuronium bromide)

**Zenapax :** A drug used to keep the body from rejecting kidney transplants. It is also being studied in the treatment of some types of cancer and other conditions. Zenapax binds to receptors for a protein called interleukin-2 (IL-2), which are found on some types of immune cells and cancer cells. This may help suppress the body's immune response and it may help kill

cancer cells. Zenapax is a type of monoclonal antibody. Also called dacliximab and daclizumab.

**zenith:** the point directly overhead of an observer.

**Zenpep:** (Other name for: pancrelipase)

**zeolite:** A natural or synthetic hydrated aluminosilicate with an open three-dimensional crystal structure which water molecules are held in cavities in the lattice. They are used to soften water. Or A class of minerals that are 'hydrated aluminosilicates'. An aluminosilicate is where some of the Si atoms in silica (which has the perfectly reasonable chemical formula  $\text{SiO}_4$ ) are replaced with aluminium, giving an excess negative charge. 'hydrated' means that water is strongly associated with these materials by hydrogen bonding. Lastly, a positively charged 'counter-ion' is needed to balance the negative charge on the zeolite. Zeolites are extremely porous materials, with a regular internal structure of cavities of defined size and shape. or Addition compounds of the type  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot n \text{SiO}_2 \cdot m \text{H}_2\text{O}$ , with calcium sometimes replacing or present with the sodium. The sodium in the zeolite exchanges with calcium in water, making zeolites useful for water softening. The porous structure of zeolites also makes them effectivemolecular sieves used as gas adsorbents and drying agents. Artificial zeolites are used as ion exchange resins.

**zeolite process:** an ion-exchange process for softening water. The zeolite exchanges sodium ions for hardness constituents (calcium, magnesium, etc.) in the water.

**Zerit:** (Other name for: stavudine)

**zero order reaction:** A reaction with a reaction rate that does not change when reactant concentrations change.

**zero point energy:** A minimum possible energy for an atom or molecule predicted by quantum mechanics. Electrons stay in motion and bonds continue to vibrate even at absolute zero because of zero point energy.

**Zero potential point:** the solution concentration at which an electrode pair develops a potential of 0 mV. In many instances, it is also the isopotential point

**ZERO SHEAR VISCOSITY:** The asymptotic viscosity value at zero shear rate (i.e., the maximum value). As the shear rate increases, the viscosity decreases due to alignments of molecular chains in the direction of

flow and molecular chain disentanglements. The zero shear viscosity is proportional to the 3.4 power of the weight average molecular weight (i.e.  $\eta_0 = \text{constant} * M_w^{3.4}$  for most common polymers). This means that if we increase the molecular weight of a polymer from 100,000 to 200,000 the viscosity will increase by  $2^{3.4} = 10.55$  times.

**Zero-order kinetics:** A rate equation independent of concentration.

**Zestril :** A drug used to treat high blood pressure and certain heart conditions. It is also being studied in the prevention and treatment of side effects caused by some anticancer drugs. It blocks certain enzymes that cause blood vessels to constrict (narrow). It is a type of angiotensin-converting enzyme (ACE) inhibitor. Also called lisinopril and Prinivil.

**zeta potential:** Electric potential across all phase boundaries between solids and liquids. In colloids, the zeta potential is the potential across the ion layer around a charged colloidal particle. Neutralizing the zeta potential can cause the colloid to precipitate.

**Zetia:** (Other name for: ezetimibe)

**Zevalin :** A monoclonal antibody that is used to treat certain types of B-cell non-Hodgkin lymphoma and is being studied in the treatment and detection of other types of B-cell tumors. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Ibritumomab binds to the protein called CD20, which is found on B cells. It is linked to the compound tiuxetan. This allows certain radioisotopes to be attached before it is given to a patient. It is a type of monoclonal antibody-chelator conjugate. Also called ibritumomab tiuxetan.

**Zeven:** (Other name for: Hsp90 inhibitor debio 0932)

**Zheng :** In traditional Chinese medicine, a way of diagnosing disease based on observing a set of signs and symptoms. A practitioner checks Zheng by looking at the patient; asking questions; feeling the pulse, organs, and tissues; listening to body sounds; and smelling the body.

**zhongyao fufang:** A combination formula consisting of two or more unknown Traditional Chinese Medicine (TCM) ingredients, with potential anti-osteoporotic activity. Upon oral administration, this particular formula of zhongyao fufang may promote increased bone strength and density.

**Ziagen:** (Other name for: abacavir sulfate)

**zibotentan:** An orally available selective antagonist of the endothelin-A (ET-A) receptor with potential antineoplastic activity. Zibotentan binds selectively to the ET-A receptor, thereby inhibiting endothelin-mediated mechanisms that promote tumor cell proliferation. OR A substance being studied in the treatment of some types of cancer. Zibotentan may block cancer cell growth. It is a type of endothelin-A receptor antagonist.

**ziconotide:** A synthetic, nonopioid, twenty-five amino acid polybasic peptide analogue of an omega-conotoxin derived from the marine snail *Conus magus* with analgesic activity. Ziconotide appears to block neuronal N-type voltage-sensitive calcium channels (NCCB), inhibiting transmission from pain-sensing primary nociceptors. This agent may exhibit significant analgesic activity in refractory pain.

**zidovudine:** A synthetic dideoxynucleoside. After intracellular phosphorylation to its active metabolite, zidovudine inhibits DNA polymerase, resulting in the inhibition of DNA replication and cell death. This agent also decreases levels of available pyrimidines.

**zidovudine :** A drug that inhibits the human immunodeficiency virus (HIV) that causes AIDS. It is a type of systemic antiviral. Also called AZT.

**Ziegler-Natta catalyst:** A compound containing a metal-carbon bond that can be used to make highly ordered, high density polymers by a chain-growth mechanism. A typical Ziegler-Natta catalyst is the compound formed in situ between titanium trichloride and diethylaluminium chloride, picture below: These catalysts are named after two famous polymer chemists named, strangely enough, Ziegler and Natta. You can find out much more than you ever wanted to know about them at the Macrogalleria.

**zileuton:** A synthetic derivative of hydroxyurea with antiasthmatic properties. The leukotriene inhibitor zileuton blocks 5-lipoxygenase, which catalyzes the formation of leukotrienes from arachidonic acid; causes bronchodilation; decreases bronchial mucous secretion and edema; and may prevent or decrease the symptoms of asthma. OR A substance that is used to prevent asthma symptoms and that is being studied in the prevention of lung cancer. It belongs to the family of drugs called leukotriene blockers.

**Zinc:** Symbol:"Zn" Atomic Number:"30" Atomic Mass: 65.38amu. Zinc is one of the transition elements found in period four. Zinc is another metal that has been used for thousands of years. This bluish-white metal can be found in many alloys, paint, fluorescent lights, and in the process of making

plastics. or Element 30, atomic weight 65.37, a reactive gray metal that dissolves in acids, used to galvanize metals and in many alloys (e. g. brass and bronze).

**ZINC CHROMATE:** Rust-inhibiting pigment, greenish-yellow in color that is used with a high-hiding pigment.

**Zinc clusters:** Found in pairs in the nuclear receptor superfamily of proteins, a DNA-binding motif in which a zinc ion is coordinated to four cysteine side chains.

**Zinc finger:** A conserved sequence-specific DNA-binding domain, found in members of the nuclear hormone-receptor family, that consists of eight cysteine residues: the first four bind one zinc ion and the second four bind another. Or A specialized protein motif involved in DNA recognition by some DNA-binding proteins; characterized by a single atom of zinc coordinated to four Lys residues or to two His and two Lys residues.

**zinc gluconate:** A nutritional supplement containing the zinc salt form of gluconic acid for the purpose of providing zinc. As an essential trace element, zinc is of key importance in many biological processes, acts as an antioxidant and strengthens the immune system. Although the mechanism of action is not completely known, zinc supplementation may be used to increase immunity against viruses or may interfere with the replication of certain viruses, such as the human papillomavirus (HPV).

**ZINC OXIDE:** Substance used as a white pigment for high-hiding power hardness and gloss. Reduces yellowing, increases drying; provides resistance to sulfur fumes and mildew. Used with linseed oil for self-cleaning exterior paints. Or An amorphous white or yellowish powder, used as a pigment in plastics. It is said to have the greatest ultra-violet light absorbing power of all commercially available pigments.

**zinc oxide :** A compound that may enhance immune function, especially when administered by inhalation.

**zinc oxide/aluminum starch octenylsuccinate/glycyrrhetic**

**phytosome/vitamin E/botanical extracts-based skin protectant paste:** A paste containing multiple skin protectants with anti-oxidant, skin protecting, moisturizing, anti-erythema and anti-inflammatory activities. The paste includes zinc oxide, aluminum starch octenylsuccinate, lanolin, allantoin, chamomile and sweet almond oil, rice bran oil, shea butter, dimethicone (polymerized siloxane), petrolatum, vitamin E, phytosome of glycyrrhetic

acid and botanical extracts derived from *Calendula officinalis*, *Malva sylvestris* and *Tilia tomentosa*. Upon application, this paste provides a physical barrier on the skin and may help protect, soothe and moisturize the skin as well as restore skin softness, integrity and elasticity. When this paste is applied to the perineum area, it may help prevent radiation-induced dermatitis.

**Zinc proteases:** A class of protein-degrading enzymes whose catalytic activity depends on a zinc ion; carboxypeptidase A is a zinc protease.

**ZINC STEARATE:** A white powder used as a lubricant and antioxidant synergist.

**zinc sulfate:** A salt of the essential trace metal zinc. Zinc is involved in tissue repair and is an important constituent of some proteins, including those involved in taste and smell. Zinc sulfate supplementation may prevent radiation-induced aguesia. Check for active clinical trials using this agent.

**zinc sulfate :** A substance required for cell growth and tissue repair. It is being studied as a way to prevent or decrease mucositis caused by radiation therapy.

**zincography:** Process of etching unprotected parts of a zinc plate with strong acids to produce a printing surface.

**Zinecard :** A drug used to reduce heart damage in women given doxorubicin for breast cancer that has spread. It is also being studied in the treatment of cancer. Zinecard contains the active ingredient dexrazoxane. It is a type of cardioprotective agent, a type of chemoprotective agent, and a type of topoisomerase inhibitor.

**zinostatin:** An enediyne antineoplastic antibiotic hybrid containing an aminoglycoside chromophore. Zinostatin is isolated from the bacterium *Streptomyces carzinostaticus*. The aminoglycoside component of zinostatin intercalates into DNA and the benzene diradical intermediate of the enediyne core binds to the minor groove of DNA, resulting in single- and double-strand breaks in DNA and apoptosis.

**Zip or Seal Top Bag Style:** A recloseable or resealable pouch produced with a plastic track in which two plastic components interlock to provide a mechanism that allows for recloseability in a flexible package.

**Zipan:** (Other name for: promethazine hydrochloride)

**Zirconium:** Symbol:"Zr" Atomic Number:"40" Atomic Mass: 91.22amu. This is one of the transition elements found in period five of the table of elements. Zirconium is found in many minerals. This grayish-white metal can be found in nuclear reactors, corrosion resistant alloys, magnets, and some gemstones. or Element 40, atomic weight 91.22, a hard, grayish, highly flammable crystalline metal that dissolves in hot concentrated acids. Used in steel manufacture and in nuclear reactor chambers because of its transparency to neutrons. Its silicate is used to make zircon used as a gemstone.

**zirconium Zr 89 bevacizumab:** A radioimmunoconjugate comprised of the recombinant humanized monoclonal antibody bevacizumab labeled with the radioisotope zirconium Zr 89 (Zr 89) with radioisotopic activity and potential imaging use. The antibody moiety of zirconium Zr 89 bevacizumab targets and binds to the extracellular domain of the vascular endothelial growth factor receptor (VEGFR). Upon binding, the radioisotope moiety may be detected using positron emission tomography (PET), allowing the imaging and quantification of VEGFR-expressing tumor cells. VEGFR, a tyrosine kinase, is overexpressed on the cell surfaces of various tumor cell types.

**zirconium Zr 89 cetuximab:** A radioimmunoconjugate comprised of the recombinant chimeric monoclonal antibody cetuximab labeled with the radioisotope zirconium Z 89 (Zr 89) with radioisotopic activity and potential imaging use. The antibody moiety of zirconium Zr 89 cetuximab binds to the extracellular domain of the epidermal growth factor receptor (EGFR). Upon binding, the radioisotope moiety may be detected using positron emission tomography (PET), allowing the imaging and quantification of EGFR-expressing tumor cells. EGFR is a tyrosine kinase that may be overexpressed on the cell surfaces of various tumor cell types.

**zirconium Zr 89 desferrioxamine B monoclonal antibody huJ591:** A radioimmunoconjugate comprised of the recombinant humanized monoclonal antibody J591 against prostate-specific membrane antigen (PSMA) conjugated to chelator desferrioxamine B (DFO-B) and labeled with the radioisotope zirconium Zr 89 with potential imaging property used in positron emission tomography (PET) imaging. Upon administration of zirconium Zr 89 desferrioxamine B monoclonal antibody huJ591, the antibody moiety binds to the extracellular domain of PSMA, and the

radioisotope moiety may be detected using PET, thereby allowing the imaging and quantification of PSMA-expressing tumor cells. PSMA, or folate hydrolase is a cell surface peptidase highly expressed by malignant prostate epithelial cells and vascular endothelial cells of numerous solid tumor malignancies. In addition, upon PET imaging this agent provides high tumor:background tissue ratios. Check for active clinical trials using this agent.

**zirconium Zr 89 Df-IAB2M:** A radioimmunoconjugate comprised of an antibody fragment (IAB2M) against prostate-specific membrane antigen (PSMA), conjugated to the chelator desferrioxamine (Df) and labeled with the radioisotope zirconium Zr 89, with potential positron emission tomography (PET) imaging activity. Upon administration of zirconium Zr 89 Df-IAB2M, the antibody moiety binds to the extracellular domain of PSMA expressed on cancer cells. This may enable PET detection of the radioisotope moiety, and allows the imaging and quantification of PSMA-expressing tumor cells. PSMA is a cell surface peptidase highly expressed by malignant prostate epithelial cells and vascular endothelial cells in various solid tumor malignancies.

**zirconium Zr 89 trastuzumab:** A radioimmunoconjugate containing the recombinant humanized monoclonal antibody trastuzumab labeled with the radioisotope zirconium Zr 89 with radioisotopic activity and potential use as an imaging agent. The trastuzumab moiety of zirconium Zr 89 trastuzumab binds with high affinity to the extracellular domain of human epidermal growth factor receptor 2 (HER2). Upon binding, the radioisotope moiety may be detected using positron emission tomography (PET), thereby allowing the imaging and quantification of HER2-expressing tumor cells. HER2, a tyrosine kinase client protein of heat shock protein 90 (Hsp90), may be overexpressed on the cell surfaces of various tumor cell types.

**zirconium Zr 89-labeled anti-CA19-9 monoclonal antibody 5B1:** A radioimmunoconjugate comprised of the recombinant human monoclonal antibody against the carbohydrate antigen sialyl-Lewis a (carbohydrate antigen 19-9; CA19-9) conjugated to the chelator desferrioxamine (DFO) and labeled with the radioisotope zirconium Zr 89 (Zr 89), with radioisotopic activity and potential use as an imaging agent in positron emission tomography (PET). The antibody moiety of zirconium Zr 89 anti-

CA19-9 monoclonal antibody 5B1 targets and binds to CA19-9 expressing-tumor cells. Upon binding, internalization and proteolysis, the radioisotope moiety may be detected using PET, thus allowing imaging and quantification of CA19-9-expressing tumor cells. CA19-9, overexpressed on a number of different tumor cell types, plays a key role in tumor cell survival and metastasis.

**zirconium Zr 89-labeled anti-PD-L1 monoclonal antibody**

**MPDL3280A:** A radioimmunoconjugate composed of MPDL3280A, a human, Fc-optimized, monoclonal antibody directed against programmed cell death-1 ligand 1 (PD-L1) and labeled with the radioisotope zirconium Zr 89, with potential use for assessing PD-L1-expressing tumor cells using positron emission tomography (PET). Upon administration of zirconium Zr 89-labeled anti-PD-L1 monoclonal antibody MPDL3280A, the antibody moiety targets and binds to PD-L1 and is internalized. Following tumor cell uptake, the radioisotope moiety can be visualized using PET. This may result in both the quantification of PD-L1-expressing tumor cells and an assessment of the expected response to treatment with MPDL3280A as well as selection of patients that would respond to MPDL3280A. PD-L1 is overexpressed on many human cancer cell types; PD-L1 binding to programmed cell death 1 (PD-1) on T-cells suppresses the immune system and results in increased immune evasion.

**zirconium Zr 89-labeled anti-PIGF monoclonal antibody RO5323441:**

A radioimmunoconjugate comprised of the humanized IgG1 monoclonal antibody directed against placental growth factor (PIGF) and labeled with zirconium Zr 89 (Zr 89), with potential radiotracer activity upon positron emission tomography (PET) imaging. The monoclonal antibody moiety of RO5323441 binds to both PIGF-1 and -2, thereby preventing the binding of PIGF-1 and -2 to the vascular endothelial growth factor receptor-1 (VEGFR-1) and the subsequent activation of VEGFR-1. The radioisotope moiety of RO5323441 may be detected using PET, thereby allowing for visualization of the antibody's distribution and PIGF expression. PIGF, a member of the VEGF sub-family and a key molecule in angiogenesis and vasculogenesis, is upregulated in many cancers. Check for active clinical trials using this agent.

**zirconium Zr 89-labeled monoclonal antibody MMOT0530A:** A radioimmunoconjugate composed of a monoclonal antibody that targets an

antigen overexpressed in pancreatic and ovarian cancer and labeled with the radioisotope zirconium Zr 89, with potential use for assessing tumor antigen expression using positron emission tomography (PET). Upon administration of zirconium Zr 89-labeled monoclonal antibody MMOT0530A, this agent targets an antigen expressed on certain tumor cells and is internalized. Following tumor cell uptake, the radioisotope moiety can be visualized using PET imaging. This may result in both the quantification of tumor antigen expression and an assessment of the response to treatment with therapeutics targeting the antigen.

**zirconium Zr 89-labeled RO5479599:** A radioimmunoconjugate containing a glycoengineered, humanized monoclonal antibody directed against the human epidermal growth factor receptor HER3 (ErbB3) and labeled with the radioisotope zirconium Zr 89, with radioisotopic activity and potential use as an imaging agent as well as potential antineoplastic activity. Upon administration, the RO5479599 moiety of zirconium Zr 89-labeled RO5479599 binds to the extracellular domain of HER3 and inhibits HER3 dimerization, thereby preventing EGFR-dependent signaling. In addition, RO5479599 elicits enhanced antibody-dependent cellular cytotoxicity (ADCC). Upon binding, the radioisotope moiety may be detected using positron emission tomography (PET), thereby allowing the imaging and quantification of HER3-expressing tumor cells. HER3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in tumors; it has no active kinase domain but is activated through heterodimerization with other members of the EGFR receptor family, such as HER2.

**Zithromax:** (Other name for: azithromycin)

**ziv-aflibercept:** A protein comprised of segments of the extracellular domains of human vascular endothelial growth factor receptors 1 (VEGFR1) and 2 (VEGFR2) fused to the constant region (Fc) of human IgG1 with potential antiangiogenic activity. Aflibercept, functioning as a soluble decoy receptor, binds to pro-angiogenic vascular endothelial growth factors (VEGFs), thereby preventing VEGFs from binding to their cell receptors. Disruption of the binding of VEGFs to their cell receptors may result in the inhibition of tumor angiogenesis, metastasis, and ultimately tumor regression.

**ziv-aflibercept** : A drug used with other drugs to treat colorectal cancer that has spread to other parts of the body and has not gotten better with chemotherapy. It is also being studied in the treatment of other types of cancer. Ziv-aflibercept blocks the action of a protein called vascular endothelial growth factor (VEGF) and may prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent. Also called vascular endothelial growth factor trap, VEGF Trap, and Zaltrap.

**Zocor** : A drug used to lower the amount of cholesterol and other harmful substances in the blood, such as triglycerides. It is also being studied in the treatment of cancer and other conditions. Zocor blocks an enzyme that helps make cholesterol in the body. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called simvastatin.

**Zofran** : A drug used to prevent nausea and vomiting caused by chemotherapy and radiation therapy. It is also used to prevent nausea and vomiting after surgery. Zofran blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called ondansetron hydrochloride.

**Zoladex** : A drug used to treat prostate cancer and to relieve the symptoms of advanced breast cancer. It is also used to treat problems with the endometrium (lining of the uterus). Zoladex keeps the body from making the hormones luteinizing hormone-releasing hormone (LHRH) and luteinizing hormone (LH). This causes the testicles to stop making testosterone (a male hormone) in men, and the ovaries to stop making estradiol (a form of the hormone estrogen) in women. Zoladex may stop the growth of cancer cells that need testosterone or estrogen to grow. It is a type of LHRH agonist. Also called goserelin acetate and ZDX.

**zoledronate** : A drug used to treat patients with hypercalcemia (high blood levels of calcium) caused by cancer. It is also used together with other drugs to treat multiple myeloma and to prevent bone fractures and reduce bone pain in people who have cancer that has spread to the bone. It is a type of bisphosphonate. Also called zoledronic acid and Zometa.

**zoledronic acid**: A synthetic imidazole bisphosphonate analog of pyrophosphate with anti-bone-resorption activity. A third-generation

bisphosphonate, zoledronic acid binds to hydroxyapatite crystals in the bone matrix, slowing their dissolution and inhibiting the formation and aggregation of these crystals. This agent also inhibits farnesyl pyrophosphate synthase, an enzyme involved in terpenoid biosynthesis. Inhibition of this enzyme prevents the biosynthesis of isoprenoid lipids, donor substrates of farnesylation and geranylgeranylation during the post-translational modification of small GTPase signalling proteins, which are important in the process of osteoclast turnover. Decreased bone turnover and stabilization of the bone matrix contribute to the analgesic effect of zoledronic acid with respect to painful osteoblastic lesions. The agent also reduces serum calcium concentrations associated with hypercalcemia. OR A drug used to treat patients with hypercalcemia (high blood levels of calcium) caused by cancer. It is also used together with other drugs to treat multiple myeloma and to prevent bone fractures and reduce bone pain in people who have cancer that has spread to the bone. It is a type of bisphosphonate. Also called zoledronate and Zometa.

**Zolinza :** A drug that is used to treat cutaneous T-cell lymphoma that does not get better, gets worse, or comes back during or after treatment with other drugs. It is also being studied in the treatment of other types of cancer. Zolinza is a type of histone deacetylase inhibitor. Also called SAHA, suberoylanilide hydroxamic acid, and vorinostat.

**Zollinger-Ellison syndrome :** A disorder in which tumors of the pancreatic islet cells produce large amounts of gastrin (a hormone), leading to excess acid in the stomach and, possibly, a peptic ulcer (ulcer of the stomach or the upper part of the small intestine).

**zolmitriptan:** A member of the triptan class agents with anti-migraine property. Zolmitriptan selectively binds to and activates serotonin (5-HT) 1B expressed in intracranial arteries and 5-HT 1D receptors located on peripheral trigeminal sensory nerve terminals in the meninges and central terminals in brain stem sensory nuclei. Receptor binding results in constriction of cranial vessels, reduction of the vessel pulsation and inhibition of nociceptive transmission, thereby providing relief of migraine headaches. Zolmitriptan may also relief migraine headaches by inhibition pro-inflammatory neuropeptide release.

**Zoloft :** A drug used to treat depression. It is a type of selective serotonin reuptake inhibitor (SSRI). Also called sertraline.

**zolpidem** : A drug used to treat insomnia (inability to sleep), and anxiety. It is a type of imidazopyridine (sedative hypnotic). Also called Ambien.

**zolpidem tartrate**: The tartrate salt of an imidazopyridine with non-benzodiazepine benzodiazepine-receptor agonist and sedative-hypnotic activities. Zolpidem binds selectively to the alpha 1 subunit of the omega-1 (BZ1) receptor of the gamma-aminobutyric acid type A (GABA-A ) receptor-chloride ionophore complex, thereby opening neuronal chloride channels, hyperpolarizing neuronal cell membranes, and inhibiting neuronal firing. In contrast, benzodiazepines non-selectively bind to and activate all omega receptor subtypes, exhibiting anticonvulsant and myorelaxant activities in addition to a sedative-hypnotic activity.

**Zometa** : A drug used to treat patients with hypercalcemia (high blood levels of calcium) caused by cancer. It is also used together with other drugs to treat multiple myeloma and to prevent bone fractures and reduce bone pain in people who have cancer that has spread to the bone. It is a type of bisphosphonate. Also called zoledronate and zoledronic acid.

**Zomig**: (Other name for: zolmitriptan)

**Zonal centrifugation**: An ultracentrifugation technique in which the sample is centrifuged through a gradient of increasing density and the components are separated on the basis of differing sedimentation coefficients.

**zonally-averaged models**: Statistical-dynamical or energy-balance models in which only the latitudinally averaged quantities are determined and the effects of the longitudinally varying transports are determined parametrically. Abbreviated as ZAM.

**zone of accumulation**: of a glacier, the higher portion that is perennially covered with snow. Or upper level of a glacier where more snow falls than melts.

**zone of aeration**: area underground above the water table where the spaces between rocks contain a mixture of air and water.

**zone of fracture**: the more rigid portion of a glacier near its surface.

**zone of saturation**: area underground where the spaces between rock particles are filled with water.

**zone of wastage**: of a glacier, the lower portion, where the ice is lost

**zone refining:** A method for purifying solids based on the fact that solutes tend to concentrate in the liquid when a solution is frozen. A solid bar is drawn slowly over a heat source and melted in a narrow band; impurities are carried along in the melted band until the end of the bar is reached.

**Zones:** Sections of the barrel which are controlled individually by temperature controllers.

**zooplankton:** That portion of the plankton community comprised of tiny aquatic animals eaten by fish.

**zoptarelin doxorubicin:** A peptide agonist of the gonadotropin releasing hormone-1 receptor (GnRH-1R) that is conjugated to the anthracycline antibiotic doxorubicin with potential antineoplastic activity. Zoptarelin doxorubicin binds to GnRH-1Rs, which may be highly expressed on endometrial and ovarian tumor cell membrane surfaces, and is internalized. Once inside the cell, the doxorubicin moiety of this agent intercalates into DNA and inhibits the topoisomerase II activity, which may result in the inhibition of tumor cell DNA replication and tumor cell proliferation.

**Zortress:** (Other name for: everolimus)

**zorubicin hydrochloride:** A benzoyl-hydrazone derivative of the anthracycline antineoplastic antibiotic daunorubicin. Zorubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. Check for active clinical trials using this agent.

**Zostavax:** (Other name for: varicella zoster virus strain Oka/Merck live antigen)

**zosuquidar trihydrochloride:** A difluorocyclopropyl quinoline. Zosuquidar trihydrochloride binds with high affinity to P-glycoprotein and inhibits P-glycoprotein-mediated multidrug resistance (MDR). P-glycoprotein, encoded by the MDR-1 gene, is a member of the ATP-binding cassette superfamily of transmembrane transporters and prevents the intracellular accumulation of many natural product-derived cytotoxic agents.

**zosuquidar trihydrochloride :** A substance being studied in the treatment of cancer. Zosuquidar trihydrochloride may help kill cancer cells that are resistant to anticancer drugs. Also called LY335979.

**Zovirax:** (Other name for: acyclovir sodium)

**Zurinol:** (Other name for: allopurinol)

**zwitterion:** An ion that has a positive and negative charge on the same group of atoms. It is also called dipolar ion. Or A chemical entity that contains both anionic and cationic groups. Or 'Zwitter' is german for 'hybrid', and zwitterions are chemical species that manage to be both cations and anions at the same time. How can this come about? Consider ammonium acetate ( $\text{NH}_4\text{CH}_3\text{COO}$ ). It is a perfectly ordinary salt, and when dissolved in water splits into its two constituent ions,  $\text{NH}_4^+$  and  $\text{CH}_3\text{COO}^-$ . These ions will be able to approach quite close to each other in solution, but there will be no transfer of charge from one to another because of the 'shell' of water around each one. In fact, there is no reason we can't have a molecule where there is a physical bridge joining these two ions - for example, a  $\text{CH}_2$  group. The resulting species is a zwitterion, the ionised form of the amino acid glycine, and it is in this form that glycine exists when dissolved in water at a neutral pH. or A dipolar ion with spatially-separated positive and negative charges For example, most amino acids are zwitterions, having a positive charge on the  $\alpha$ -amino group and a negative charge on the  $\alpha$ -carboxyl group but no net charge on the overall molecule.

**Zyban:** (Other name for: bupropion hydrochloride)

**Zyban :** A drug used to treat depression and certain other disorders. It is also used to help people stop smoking. Zyban increases the levels of the chemicals dopamine, serotonin, and norepinephrine in the brain. This helps improve mood and can lessen cravings for nicotine. It is a type of antidepressant and a type of nicotine receptor antagonist. Also called bupropion hydrochloride and Wellbutrin.

**ZYBRESTAT:** (Other name for: fosbretabulin disodium)

**Zybrestat:** (Other name for: fosbretabulin tromethamine)

**ZYC300:** A plasmid DNA encoding an inactivated form of the carcinogen activator cytochrome P450 1B1 (CYP1B1) encapsulated in biodegradable poly-DL-lactide-co-glycolide microparticles with potential antineoplastic activity. Vaccination with ZYC300 may stimulate the immune system to elicit a cytotoxic T lymphocyte (CTL) response against the tumor-associated antigen (TAA) CYP1B1, which may result in the lysis of tumor cells expressing CYP1B1. CYP1B1, an extrahepatic monooxygenase of the cytochrome P450 family, is overexpressed in many cancers with only restricted expression in normal tissues.

**Zydelig :** A drug used with rituximab to treat chronic lymphocytic leukemia (CLL) that has come back. It is also used to treat follicular B-cell non-Hodgkin lymphoma (NHL) and small lymphocytic lymphoma (SLL) that have come back after treatment with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Zydelig blocks certain proteins, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor. Also called idelalisib.

**Zyflo:** (Other name for: zileuton)

**Zygote:** A cell that results from the union of haploid male and female sex cells. Zygotes are diploid.

**Zykadia :** A drug used to treat non-small cell lung cancer that has spread to other parts of the body and has a mutated (changed) form of a gene called anaplastic lymphoma kinase (ALK). It is used in patients whose cancer has gotten worse after treatment with or who cannot receive certain anticancer drugs. Zykadia blocks the protein made by the mutated ALK gene. Blocking this protein may stop the growth and spread of cancer cells. Zykadia is a type of tyrosine kinase inhibitor. Also called ceritinib.

**Zyloprim:** (Other name for: allopurinol)

**zymase:** Enzymes present in yeast that catalyze fermentation of sugar into alcohol and carbon dioxide.

**zymogen:** An inactive biomolecule that is a precursor to an enzyme. Or An inactive precursor of an enzyme. For example, trypsin exists in the inactive form trypsinogen before it is converted to its active form, trypsin. Or A catalytically inactive precursor of an enzyme. or A protein that may be converted into an enzyme or An inactive precursor of an enzyme; for example, pepsinogen, the precursor of pepsin

**Zyprexa :** A drug used to treat certain mental disorders. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of antipsychotic and a type of monoamine antagonist. Also called olanzapine and Zyprexa Zydis.

**Zyprexa Zydis :** A drug used to treat certain mental disorders. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of antipsychotic and a type of monoamine antagonist. Also called olanzapine and Zyprexa.

**Zytiga :** A drug used with prednisone to treat prostate cancer that has spread to other parts of the body and has not gotten better with other hormone therapy. It is also being studied in the treatment of other types of cancer. Zytiga lowers the amount of androgens (male hormones), such as testosterone, made by the body. This may stop the growth of cancer cells that need androgens to grow. Zytiga is a type of antiandrogen. Also called abiraterone acetate.

**Zyvox:** (Other name for: linezolid)

**$\alpha$  helix:** A helical conformation of a polypeptide chain, usually right-handed, with maximal intrachain hydrogen bonding; one of the most common secondary structures in proteins.

**B -microglobulin:** 2 An immunoglobulin fold-containing subunit of human class I MHC protein; this 12- kd polypeptide is noncovalently bound to the 44-kd  $\alpha$  chain.

**$\beta$  conformation:** An extended, zigzag arrangement of a polypeptide chain; a common secondary structure in proteins.

**$\beta$  elimination:** a group of reactions that form double or triple bonds through the loss of atoms or groups from adjacent carbon atoms; included are dehydrations, dehydrogenations, dehydrohalogenations, and double dehydrohalogenations.

**$\beta$  oxidation:** Oxidative degradation of fatty acids into acetyl-CoA by successive oxidations at the  $\beta$ -carbon atom.

**B sheet:** A common structural motif in proteins, in which two or more  $\beta$  strands are associated as stacks of chains, stabilized by interchain hydrogen bonds; a number of  $\beta$  strands running in the same direction form a  $\beta$  pleated sheet, whereas such strands running in opposite directions form an antiparallel pleated sheet.

**B-galactosidase:** An essential enzyme in lactose metabolism that hydrolyzes lactose into galactose and glucose.

**B-galactosidase:** In lactose metabolism, an essential enzyme that hydrolyzes lactose into galactose and glucose.

**B-oxidation:** Oxidation of the C-3 carbon atom that is  $\beta$  to a functional group; in the degradation of a fatty acyl coa molecule, the sequence of oxidation, hydration, and oxidation reactions that converts a methylene group at C-3 into a  $\beta$ -keto group.

$\Delta G^\circ$ : See standard free-energy change.

**$\sigma$  (sigma) antibonding molecular orbital:** a  $\sigma$  molecular orbital in which one or more of the electrons are less stable than when localized in the isolated atomic orbitals from which the molecular orbital was formed.

**$\sigma$  (sigma) bonding molecular orbital:** a  $\sigma$  molecular orbital in which the electrons are more stable than when they are localized in the isolated atomic orbitals from which the molecular orbital was formed.

**$\sigma$  bond:** a bond formed by the linear combination of orbitals in such a way that the maximum electron density is along a line joining the two nuclei of the atoms.
