**IU :** A unit used to measure the activity of many vitamins, hormones, enzymes, and drugs. An IU is the amount of a substance that has a certain biological effect. For each substance there is an international agreement on the biological effect that is expected for 1 IU. Also called International Unit.

**IUD:** A small, plastic T-shaped device that is placed inside the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops) to prevent pregnancy. IUDs prevent sperm from fertilizing an egg, and prevent fertilized eggs from implanting in the uterus. The use of IUDs is also being studied in the prevention and treatment of endometrial cancer and other conditions. Also called intrauterine device.

**IUPAC:** Short for International Union of Pure and Applied Chemistry. OR The International Union of Pure and Applied Chemists. IUPAC is involved in setting consistent nomenclature, symbols and names of elements, mathematical variables.... Some people think IUPAC is a bunch of funny old men with nothing better to do than meddle with the perfectly good ways of spelling things chemists have used since Paracelsus was a boy, but we polymer scientists know better. OR International Union of Pure and

Applied Chemistry, an organization which sets international standards for chemical nomenclature, atomic weights, and the names of newly discovered elements.

**IUPAC nomenclature:** a systematic method for naming molecules based on a series of rules developed by the International Union of Pure and Applied Chemistry. IUPAC nomenclature is not the only system in use, but it is the most common.

**IV:** Into or within a vein. IV usually refers to a way of giving a drug or other substance through a needle or tube inserted into a vein. Also called intravenous.

**IVAC mutanome vaccine:** An individualized, poly-neo-epitopic encoding, ribonucleic acid (RNA)-based cancer vaccine that targets a variety of patient-specific, immunogenic mutant epitopes, with potential immunostimulatory and antineoplastic activities. Upon intranodal administration, the RNA in the individualized mutanome vaccine is translated by antigen presenting cells (APCs) and the expressed protein is presented via major histocompatibility complex (MHC) molecules on the surface of the APCs. This leads to an induction of both cytotoxic T-lymphocyte (CTL) and memory T-cell immune responses against the patient-specific neoantigens.

**Iveegam EN:** (Other name for: therapeutic immune globulin)

**IVP:** A procedure in which x-ray images of the kidneys, ureters, and bladder are taken at regular times after a substance that shows up on x-rays is injected into a blood vessel. The substance outlines the kidneys, ureters, and bladder as it flows through the system and collects in the urine. IVP is usually done to look for a block in the flow of urine. Also called intravenous pyelography.

**ixabepilone:** An orally bioavailable semisynthetic analogue of epothilone B with antineoplastic activity. Ixabepilone binds to tubulin and promotes tubulin polymerization and microtubule stabilization, thereby arresting cells in the G2-M phase of the cell cycle and inducing tumor cell apoptosis. This agent demonstrates antineoplastic activity against taxane-resistant cell lines.

**ixabepilone :** A drug used to treat metastatic or locally advanced breast cancer that has not improved after treatment with certain other anticancer drugs. It is also being studied in the treatment of other types of cancer.

Ixabepilone stops the growth of tumor cells by blocking cell division. It is a type of epothilone analog. Also called BMS-247550 and Ixempra.

**ixabepilone (oral):** An enteric-coated formulation of ixabepilone, a semisynthetic analogue of epothilone B and a non-taxane tubulin inhibitor, with antineoplastic activity. Ixabepilone binds to and stabilizes tubulin molecules, thereby interfering with the dynamics of microtubule assembly/disassembly. This results in cell cycle arrest at the G2-M phase and leads to apoptosis within fast growing tumor cells. This agent demonstrates antineoplastic activity against taxane-resistant cell lines. Compared to intravenously administered ixabepilone, the oral formulation provides a more manageable way to administer this agent. Check for active clinical trials using this agent.

**ixazomib citrate:** An orally bioavailable second generation proteasome inhibitor (PI) with potential antineoplastic activity. Ixazomib inhibits the activity of the proteasome, blocking the targeted proteolysis normally performed by the proteasome, which results in an accumulation of unwanted or misfolded proteins; disruption of various cell signaling pathways may follow, resulting in the induction of apoptosis. Compared to first generation PIs, second generation PIs may have an improved pharmacokinetic profile with increased potency and less toxicity. Proteasomes are large protease complexes that degrade unneeded or damaged proteins that have been ubiquitinated. Check for active clinical trials using this agent.

**ixazomib citrate :** A drug used with lenalidomide and dexamethasone to treat multiple myeloma. It is used in patients who received at least one other anticancer treatment. It is also being studied in the treatment of other types of cancer. Ixazomib citrate blocks enzymes called proteasomes, which may help keep cancer cells from growing and may kill them. It is a type of proteasome inhibitor. Also called Ninlaro.

**Ixempra :** A drug used to treat metastatic or locally advanced breast cancer that has not improved after treatment with certain other anticancer drugs. It is also being studied in the treatment of other types of cancer. Ixempra stops the growth of tumor cells by blocking cell division. It is a type of epothilone analog. Also called BMS-247550 and ixabepilone.

**Ixoten:** (Other name for: trofosfamide)

**Izod Impact Strength :** A measure of impact strength determined by the difference in energy of a swinging pendulum before and after it breaks a notched specimen held vertically as a cantilever beam.

**Izod Impact Test:** A test designed to determine the resistance of a plastics material to a shock loading. It involves the notching of a specimen, which is then placed in the jaws of the machine and struck with a weighted pendulum. See also Impact Strength.

**Izod, Notched, LT :** The energy required to break specimens in which there is a v-notch to create an initial stress point but measured at low temperature (minus 40°C).

**Izod, Notched, RT:** The energy required to break specimens in which there is a v-notched to create an initial stress point.

**J SHEET:** Similar to center fold, j-sheet is folded on one edge of the roll and slit in the machine direction on the other side allowing the film to be unfolded. The difference is that the fold is not directly in the center of the film, so the width of the film on either side of the fold is asymmetrical when opened.

**J-107088:** A substance being studied in the treatment of cancer. It is a type of topoisomerase I inhibitor. Also called edotecarin.

**J-cap finish:** (also called hinge-guard) - flexible (i.e., living) hinge used in joining the cover to the main body of a flip top dispensing closure.

Consumers open a j-cap closure by removing a strip of plastic holding the top of the closure to the base of the closure, leaving a hinged, snap-top closure mechanism. This type of closure can also provide tamper evidence.

**J-pouch coloanal anastomosis :** A surgical procedure in which the colon is attached to the anus after the rectum has been removed. A 2-4 inch section of the colon is formed into a J-shaped pouch in order to replace the function of the rectum and store stool until it can be eliminated. This procedure is similar to the side-to-end coloanal anastomosis but a larger pouch is formed.

**Jacket:** A tough sheath made of plastic material used to protect an insulated wire or cable, or to permanently group two or more insulated wires or cables.

**Jacketed Tubing:** Jacketed tubing allows color coding of a variety of tubing, wire or other materials by wrapping tubing in a neat

bundle.

**jackson turbidity unit (JTU):** a measure of the turbidity of water, proportional to the ppm silica, where 100 ppm silica equals 21.5 JTU. This method was the standard for turbidity for many years; it applied the use of a candle, measuring tube, and the human eye for determining the value. This method has since been replaced by the use of a known turbidity standard, Formazin, and the use of analytical instruments that will detect forward-scattered light and light scattered at 90 degrees.

**JAK inhibitor INCB047986:** An orally bioavailable inhibitor of Janus-associated kinases (JAK), with potential antineoplastic activity. Upon oral administration, INCB047986 specifically binds to and inhibits the phosphorylation of JAK, which affects JAK-dependent signaling and may lead to an inhibition of cellular proliferation in JAK-overexpressing tumor cells. The JAK-STAT (signal transducer and activator of transcription) pathway plays a key role in the signaling of many cytokines and growth factors and is involved in cellular proliferation, growth, hematopoiesis, and the immune response; JAK kinases may be upregulated in inflammatory diseases, myeloproliferative disorders, and various malignancies. Check for active clinical trials using this agent.

**JAK1 inhibitor INCB039110:** An orally bioavailable inhibitor of Janus-associated kinase 1 (JAK1) with potential antineoplastic activity. Upon oral administration of JAK1 inhibitor INCB039110, this agent selectively inhibits the phosphorylation and activity of JAK1, which may result in inhibition of JAK1-mediated signaling, induction of apoptosis, and reduction of cell proliferation in JAK1-expressing tumor cells. JAK1 is overexpressed in a variety of tumor cell types and plays a key role in tumor cell proliferation.

**JAK1 inhibitor INCB052793:** An orally bioavailable inhibitor of Janus-associated kinase 1 (JAK1), with potential antineoplastic activity. Upon oral administration, INCB052793 specifically binds to and inhibits the phosphorylation of JAK1, which interferes with JAK-dependent signaling and may lead to an inhibition of cellular proliferation in JAK1-overexpressing tumor cells. The JAK-STAT (signal transducer and activator of transcription) signaling pathway is a major mediator of cytokine activity and is often dysregulated in a variety of tumor cell types.

**JAK2 gene :** A gene that makes a protein called JAK2, which sends signals in cells that promote cell growth. This protein helps control the number of red blood cells, white blood cells, and platelets that are made in the bone marrow. Mutated (changed) forms of the JAK gene have been found in some types of blood conditions, including polycythemia vera, essential thrombocythemia, and primary myelofibrosis. These changes may cause the body to make too many blood cells.

**JAK2 inhibitor AZD1480:** An orally bioavailable inhibitor of Janus-associated kinase 2 (JAK2) with potential antineoplastic activity. JAK2 inhibitor AZD1480 inhibits JAK2 activation, leading to the inhibition of the JAK/STAT (signal transducer and activator of transcription) signaling including activation of STAT3. This may lead to induction of tumor cell apoptosis and a decrease in cellular proliferation. JAK2, often upregulated or mutated in a variety of cancer cells, mediates STAT3 activation and plays a key role in tumor cell proliferation and survival.

**JAK2 inhibitor BMS-911543:** An orally available small molecule targeting a subset of Janus-associated kinase (JAK) with potential antineoplastic activity. JAK2 inhibitor BMS-911543 selectively inhibits JAK2, thereby preventing the JAK/STAT (signal transducer and activator of transcription) signaling cascade, including activation of STAT3. This may lead to an induction of tumor cell apoptosis and a decrease in cellular proliferation. JAK2, often upregulated or mutated in a variety of cancer cells, mediates STAT3 activation and plays a key role in tumor cell proliferation and survival.

**JAK2 inhibitor TG101348:** An orally bioavailable, small-molecule, ATP-competitive inhibitor of Janus-associated kinase 2 (JAK2) with potential antineoplastic activity. JAK2 inhibitor TG101348 competes with JAK2 as well as the mutated form AK2V617F for ATP binding, which may result in inhibition of JAK2 activation, inhibition of the JAK-STAT signaling pathway, and the induction of tumor cell apoptosis. JAK2 is the most common mutated gene in bcr-abl-negative myeloproliferative disorders (MPDs); the mutated form JAK2V617F has a valine-to-phenylalanine modification at position 617 and plays a key role in tumor cell proliferation and survival.

**JAK2 inhibitor WP1066:** An orally bioavailable inhibitor of Janus-associated kinase 2 (JAK2) with potential antineoplastic activity. Upon oral

administration, WP1066 specifically binds to both JAK2 and its mutated form, JAK2 V617F, and inhibits their phosphorylation and activation. In addition, this agent degrades JAK2 protein. This results in the inhibition of the JAK- signal transducer and activator of transcription (STAT) and phosphoinositide-3-kinase (PI3K)/AKT signaling pathways, resulting in the induction of apoptosis in tumor cells overexpressing JAK2. JAK2, a tyrosine kinase, is overexpressed in a variety of tumor cells and is correlated with increased tumor cell proliferation and survival. The mutated form JAK2 V617F has a valine-to-phenylalanine modification at position 617 and plays a key role in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**JAK2 inhibitor XL019:** An orally bioavailable inhibitor of Janus-associated kinase 2 (JAK2) with potential antineoplastic activity. XL019 inhibits the activation of JAK2 as well as the mutated form JAK2V617F, which may result in the inhibition of the JAK-STAT signaling pathway and may induce apoptosis. The JAK2 mutated form JAK2V617F has a valine-to-phenylalanine modification at position 617 and plays a key role in tumor cell proliferation and survival.

**JAK2/Src inhibitor NS-018:** An orally bioavailable, small molecule inhibitor of Janus-associated kinase 2 (JAK2) and Src-family kinases, with potential antineoplastic activity. JAK2/Src inhibitor NS-018 competes with ATP for binding to JAK2 as well as the mutated form JAK2V617F, thereby inhibiting the activation of JAK2 and downstream molecules in the JAK2/STAT3 (signal transducer and activator of transcription 3) signaling pathway that plays an important role in normal development, particularly hematopoiesis. In addition, NS-018 inhibits the Src family tyrosine kinases. This eventually leads to the induction of tumor cell apoptosis. JAK2 is the most common mutated gene in bcr-abl-negative myeloproliferative disorders (MPDs); JAK2V617F is a constitutively activated kinase that activates the JAK/STAT signaling pathway and dysregulates cell growth and function, and its expression transforms hematopoietic cells to cytokine-independent growth.

**Jakafi :** A drug used to treat polycythemia vera in patients who cannot be treated with or have not gotten better with hydroxyurea. It is also used to treat certain types of myelofibrosis. It is being studied in the treatment of other blood diseases and some types of cancer. Jakafi blocks a protein

called JAK, which may help keep abnormal blood cells or cancer cells from growing. It is a type of tyrosine kinase inhibitor. Also called ruxolitinib phosphate.

**Jamb:** The sides or vertical side posts of a door window or other opening.

**Jamshidi needle :** A long, hollow needle with a tapered cutting edge on one end and a handle with a place to attach a syringe on the other end. It is used to remove a sample of tissue from the bone marrow. The needle is inserted through the bone into the bone marrow and the syringe is attached to the top to remove the sample or to deliver drugs or fluid into the bone. A Jamshidi needle is a type of bone marrow needle.

**Jander equation:** A simplified version of the three-dimensional diffusion kinetic equation.

**Japan:** An abbreviation of 'Japanning' which is the process of finishing with a stoving black called Japanners' Black or Black Japan. Hence also Japanners' gold size or Japan gold size.

**jargon:** the specialized language of a field or profession.

**jaundice :** A condition in which the skin and the whites of the eyes become yellow, urine darkens, and the color of stool becomes lighter than normal. Jaundice occurs when the liver is not working properly or when a bile duct is blocked.

**Javior :** A substance being studied in the treatment of bladder cancer, lung cancer, and other types of cancer. Also called vinflunine.

**JEB:** An abbreviation for a chemotherapy combination used to treat childhood ovarian and testicular germ cell cancers that have spread. It includes the drugs carboplatin (JM8), etoposide phosphate, and bleomycin sulfate. Also called JEB regimen.

**JEB regimen:** A chemotherapy regimen consisting of carboplatin (JM8), etoposide and bleomycin used for the treatment of childhood extracranial germ cell tumors. Or An abbreviation for a chemotherapy combination used to treat childhood ovarian and testicular germ cell cancers that have spread. It includes the drugs carboplatin (JM8), etoposide phosphate, and bleomycin sulfate. Also called JEB.

**jejunostomy :** Surgery to create an opening into the jejunum (part of the small intestine) from the outside of the body. A jejunostomy allows a feeding tube to be put into the small intestine.

**jejunum:** the second 10 inches of the small intestine. OR The middle part of the small intestine. It is between the duodenum (first part of the small intestine) and the ileum (last part of the small intestine). The jejunum helps to further digest food coming from the stomach. It absorbs nutrients (vitamins, minerals, carbohydrates, fats, proteins) and water from food so they can be used by the body.

**Jelly:** Sometimes, when thinking about solids, liquids and gases, you come across substances that don't fit one particular category.

**Jet molding:** Processing technique characterized by the fact that most of the heat is applied to the material as it passes through the nozzle or jet, rather than in a heating cylinder as is done in conventional processes.

**jet stream:** band of fast-moving air in the upper troposphere.

**JETTING:** Turbulent flow of resin from an undersized gate or thin section into a thicker mold section, as opposed to laminar flow of material progressing radially from a gate to the extremities of the cavity. OR A turbulent flow of plastic or silicone rubber accelerating the speed of the melt can be caused by undersized gate or bad mold design OR A turbulent flow in the melt caused by an undersized gate or where a thin section rapidly becomes thicker.

**jetty:** a wall that is built on both sides of a harbor and that extends into the ocean to protect the harbor from sedimentation and destructive waves.

**Jevtana :** A drug used with prednisone to treat hormone-resistant prostate cancer that has spread and that had been treated with docetaxel. It is also being studied in the treatment of other types of cancer. Jevtana blocks cell growth by stopping cell division and may kill cancer cells. It is a type of antimitotic agent. Also called cabazitaxel and taxoid XRP6258.

**Jewett staging system :** A staging system for prostate cancer that uses ABCD. "A" and "B" refer to cancer that is confined to the prostate. "C" refers to cancer that has grown out of the prostate but has not spread to lymph nodes or other places in the body. "D" refers to cancer that has spread to lymph nodes or to other places in the body. Also called ABCD rating and Whitmore-Jewett staging system.

**jiang huang :** An East Indian plant that is a member of the ginger family and is used as a spice and food color. The underground stems are used in some cultures to treat certain stomach problems. The substance in jiang

huang that gives it a yellow color (curcumin) is being studied in the treatment of cancer, Alzheimer disease, cystic fibrosis, and psoriasis. The scientific name is *Curcuma longa*. Also called Indian saffron and turmeric.

**Jig:** A tool for holding parts of an assembly during the manufacturing process. OR Means of holding a part and guiding the tool during machining or assembly operation.

**Jim's Juice :** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in Jim's Juice have been tested, and none of them have been shown to be effective in treating any form of cancer. Jim's Juice is not available in the United States. Also called 126-F, Cancell, Cantron, JS-101, JS-114, Protocol, and Sheridan's Formula.

**Jin Fu Kang:** A traditional Chinese herbal medicine derived from the plant *Astragalus membranaceus* with potential immunopotential activity. Jin Fu Kang may stimulate anti-tumor macrophage and natural killer cell activity and may enhance immune recognition of tumor cells by inhibiting the production of T-helper cell type 2 (Th2) cytokines such as interleukin-4 (IL-4) and interleukin-10 (IL-10).

**JM 216:** A substance being studied in the treatment of prostate and other types of cancer. It contains the metal platinum and may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called BMS-182751 and satraplatin.

**JMML:** A rare form of childhood leukemia in which cancer cells often spread into tissues such as the skin, lung, and intestines. Also called juvenile myelomonocytic leukemia.

**johimbe :** A tree native to West Africa. The bark is used as a supplement for bodybuilding and to enhance male sexual performance. It contains the chemical yohimbine, which is being studied in the treatment of sexual dysfunction. It may interact with certain drugs used to treat depression, high blood pressure, and high blood sugar. The scientific name is *Pausinystalia yohimbe*. Also called yohimbe.

**joint:** an opening in a rock along which the rock exhibits no displacement; generally an equilibrium response to cooling or unloading.

**joint :** In medicine, the place where two or more bones are connected. Examples include the shoulder, elbow, knee, and jaw.

**joint set:** a series of roughly parallel joints that occur in one direction.

**Joists:** Horizontal timbers or metal girders to which floors and ceilings are attached.

**joule:** Unit of energy. OR A derived unit of energy, work, or amount of heat in the International System of Units. OR a unit of energy equal to 0.239 calorie. OR The amount of energy needed to apply a 1-newton force over a distance of 1 meter; a kilojoule (kj) is equal to 1000 J, or to 0.239 kcal.

**Jovian planet:** outer planet (Jupiter, Saturn, Uranus, and Neptune) consisting of a gaseous surface. OR those outer planets that have densities of less than 2 g/cm<sup>3</sup>: Saturn, Jupiter, Uranus, Neptune, and Pluto.

**JS-101:** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in JS-101 have been tested, and none of them have been shown to be effective in treating any form of cancer. JS-101 is not available in the United States. Also called 126-F, Cancell, Cantron, Jim's Juice, JS-114, Protocel, and Sheridan's Formula.

**JS-114:** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in JS-114 have been tested, and none of them have been shown to be effective in treating any form of cancer. JS-114 is not available in the United States. Also called 126-F, Cancell, Cantron, Jim's Juice, JS-101, Protocel, and Sheridan's Formula.

**JTU:** see jackson turbidity unit.

**Juice Plus:** (Other name for: fruit and vegetable extracts)

**Junction potential:** the portion of the total observed potential developed between the sensing and reference electrodes that are formed at the liquid/liquid junction between the reference electrode filling solution and the sample solution. For accuracy, the junction potential should be as low and as constant as possible.

**junctional nevus :** A type of nevus (mole) found at the junction (border) between the epidermis (outer) and the dermis (inner) layers of the skin. These moles may be colored and slightly raised.

**JUNOVAN:** (Other name for: mifamurtide)

**Juven:** An orally bioavailable nutritional supplement. Juven contains the amino acids glutamine and arginine in addition to beta-hydroxy-beta-methylbutyrate (HMB). This agent may promote muscle protein synthesis and increase muscle mass. Check for active clinical trials using this agent.

**juvenile myelomonocytic leukemia :** A rare form of childhood leukemia in which cancer cells often spread into tissues such as the skin, lung, and intestines. Also called JMML.

**juvenile nasopharyngeal angiofibroma :** A benign (not cancer) tumor that is made up of blood vessels and fibrous (connective) tissue. Juvenile nasopharyngeal angiofibromas form in the back of the nose and may spread to the upper part of the throat, the sinuses around the nose, the bone around the eyes, and rarely, to the brain. Signs and symptoms may include runny nose, nosebleeds, problems breathing through the nose, hearing loss, and easy bruising. Juvenile nasopharyngeal angiofibromas are most common in young men. They are a type of vascular tumor.

**juvenile pilocytic astrocytoma :** A slow-growing type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord. Juvenile pilocytic astrocytoma usually occurs in children and young adults. It forms in the brain more often than the spinal cord.

**juvenile rickets :** A condition in children in which bones become soft and deformed because they don't have enough calcium and phosphorus. It is caused by not having enough vitamin D in the diet or by not getting enough sunlight. In adults, this condition is called osteomalacia. Also called infantile rickets, rachitis, and rickets.

**K:** Although not part of GCSE, you may see this if you look at data about weak acids. A large value of  $K_a$  means that although the acid is weak (only partly dissociated in water) it is one of the stronger weak acids. OR Potassium !

**K-Factor:** A term sometimes used for thermal insulation value or coefficient of thermal conductivity.

**K-ras gene :** A gene that may cause cancer when it is mutated (changed). The K-ras gene makes the KRAS protein, which is involved in cell signaling pathways, cell growth, and apoptosis (cell death). Agents that block the activity of the mutated K-ras gene or its protein may stop the growth of cancer. Also called Kras gene.

**K-Resin:** By virtue of its sparkling clarity, high gloss, and impact resistance, K-Resin is ideally suited to a wide variety of packaging applications. K-Resin, a styrene derivative, is a relatively expensive material which is processed and produced on polyethylene equipment. This material is similar to polystyrene in clarity and rigidity, but lacks significant barrier properties. K-Resin is suitable for packaging aqueous and dry products but is specifically not compatible with fats and unsaturated oils or solvents. This material is frequently used for display packaging for items such as candy, beef jerky, etc.

**K-VALUE OF PVC:** A measure of the molecular weight of PVC based on measurements of viscosity of a PVC solution. It ranges usually between 35 and 80. Low K-values imply low molecular weight (which is easy to process but has inferior properties) and high K-values imply high molecular weight, (which is difficult to process, but has outstanding properties).

**Kadcyla :** A drug used to treat HER2-positive breast cancer that has spread to other parts of the body. It is used in patients who have already been treated with the anticancer drug called trastuzumab and a type of drug called a taxane. It may also be used in patients whose cancer has recurred (come back) after adjuvant therapy with these drugs. It is also being studied in the treatment of other types of cancer. Kadcyla contains a monoclonal antibody called trastuzumab that binds to a protein called HER2, which is found on some breast cancer cells. It also contains an anticancer drug called DM1, which may help kill cancer cells. Kadcyla is a type of antibody-drug conjugate. Also called ado-trastuzumab emtansine and T-DM1.

**Kadian:** (Other name for: morphine sulfate)

**Kahler disease :** A type of cancer that begins in plasma cells (white blood cells that produce antibodies). Also called multiple myeloma, myelomatosis, and plasma cell myeloma.

**Kaletra :** A combination of the drugs ritonavir and lopinavir. It is used to treat infection with HIV (the virus that causes AIDS). It is also being studied in the treatment of some types of cancer. Kaletra blocks the ability of HIV to make copies of itself and may help other anticancer drugs work better or may block the growth of cancer cells. Ritonavir blocks the breakdown of lopinavir. Kaletra is a type of anti-HIV agent and a type of protease inhibitor. Also called lopinavir/ritonavir.

**kame:** a steep-sided mound of stratified till that was deposited by meltwater in depressions or openings in the ice or as short-lived deltas or fans at the mouths of meltwater streams.

**kanglaite:** An injectable microemulsion of a purified oil extracted from the seeds of the traditional Chinese medicinal herb *Coix lacryma-jobi* (Job's tears), with potential antineoplastic activity. Although the exact mechanism of action is unknown, kanglaite exhibits an antineoplastic effect, potentially via interfering with the cell cycle and halting tumor cells in the G2/M phase, which may eventually inhibit mitosis and proliferation of cancer cells.

**Kaposi sarcoma :** A type of cancer in which lesions (abnormal areas) grow in the skin, lymph nodes, lining of the mouth, nose, and throat, and other tissues of the body. The lesions are usually purple and are made of cancer cells, new blood vessels, and blood cells. They may begin in more than one place in the body at the same time. Kaposi sarcoma is caused by Kaposi sarcoma-associated herpesvirus (KSHV). In the United States, it usually occurs in people who have a weak immune system caused by AIDS or by drugs used in organ transplants. It is also seen in older men of Jewish or Mediterranean descent, or in young men in Africa.

**Kaposi sarcoma-associated herpesvirus :** A type of virus that causes Kaposi sarcoma (a rare cancer in which lesions grow in the skin, lymph nodes, lining of the mouth, nose, and throat, and other tissues of the body). Kaposi sarcoma-associated herpesvirus also causes certain types of lymphoma (cancer that begins in cells of the immune system). Also called HHV8, human herpesvirus 8, and KSHV.

**kaposiform hemangioendothelioma :** A rare blood vessel tumor that usually forms on the skin of the arms and legs, but may also form in deeper tissues, such as muscle and bone. Kaposiform hemangioendotheliomas may sometimes form in the lymph nodes, chest, abdomen, or bones. They are fast growing and can spread to nearby tissue, but usually do not spread to other parts of the body. Signs and symptoms may include firm, painful areas of skin that look bruised; purple or brownish-red areas on the skin; easy bruising; anemia; and abnormal bleeding. Kaposiform hemangioendotheliomas are most common in infants and young children. They are a type of vascular tumor.

**karenitecin:** A synthetic silicon-containing agent related to camptothecin with antineoplastic properties. Cositecan stabilizes the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks and consequently triggering apoptosis. Because it is lipophilic, karenitecin exhibits enhanced tissue penetration and bio-availability compared to water-soluble camptothecins. or A drug being studied in the treatment of cancer. It is a type of topoisomerase inhibitor. It is related to the anticancer drug camptothecin.

**Karl Ziegler:** Nobel prize winning chemist (1898-1973) who did a vast quantity of work on the catalysts allowing high density poly(ethene) and poly(propene) to be produced. Most of his work was done at the Max Planck Institute for Coal Research in Müllheim, Germany, and had nothing to do with coal, showing the economic benefits of pure research. Like Giulio Natta, he was a keen mountain climber. A quote: "My only motivation has always been just to do what was fun." (quoted in "The Chain Straighteners," by F. McMillan)

**Karnofsky Performance Status :** A standard way of measuring the ability of cancer patients to perform ordinary tasks. The Karnofsky Performance Status scores range from 0 to 100. A higher score means the patient is better able to carry out daily activities. Karnofsky Performance Status may be used to determine a patient's prognosis, to measure changes in a patient's ability to function, or to decide if a patient could be included in a clinical trial. Also called KPS.

**karst topography:** an irregular land surface dotted with numerous sinkholes and depressions related to underlying cave systems.

**Kasabach-Merritt syndrome :** A rare condition in which the blood is not able to clot and serious bleeding may occur. It occurs in some patients who have blood vessel tumors called tufted angiomas and kaposiform hemangioendotheliomas. These tumors usually form on the skin but may also form in deeper tissues, such as muscle and bone. The tumors may grow quickly and trap and destroy platelets, which are needed to form clots and stop bleeding. Kasabach-Merritt syndrome is most common in infants and young children.

**Kassebaum Kennedy Act :** A 1996 U.S. law that allows workers and their families to keep their health insurance when they change or lose their jobs. The law also includes standards for setting up secure electronic health

records and to protect the privacy of a person's health information and to keep it from being misused. Also called Health Insurance Portability and Accountability Act and HIPAA.

**kava kava :** An herb native to islands in the South Pacific. Substances taken from the root have been used in some cultures to relieve stress, anxiety, tension, sleeplessness, and problems of menopause. Kava kava may increase the effect of alcohol and of certain drugs used to treat anxiety and depression. The U.S. Food and Drug Administration advises users that kava kava may cause severe liver damage. The scientific name is *Piper methysticum*. Also called intoxicating pepper, rauschpfeffer, tonga, and yangona.

**Kava-based supplement:** A Kava supplement derived from *Piper methysticum*, with potential cancer preventative activity. Upon oral administration, the kava-based supplement may affect the metabolism of certain carcinogens, presumably because of the kavalactones present in this product.

**Keenes cement:** A quick-setting, hard wall plaster, slower in set than plaster of Paris and normally used to produce hard, well-trowelled surfaces.

**Keep alive/keep open:** Refers to the condition of a paint which has been applied for a short while but is still in a sufficiently liquid condition to be successfully joined up and to dry without showing the lap.

**Keflex:** (Other name for: cephalexin)

**Kefzol:** (Other name for: cefazolin sodium)

**Kekulé structure:** the structure for benzene in which there are three alternating double and single bonds in a six-membered ring of carbon atoms.

**keloid :** A thick, irregular scar caused by excessive tissue growth at the site of an incision or wound.

**kelp :** A type of seaweed. The stem-like parts of this plant have been used in some cultures to treat certain medical problems. It may have immunostimulatory and anticancer effects. The scientific name is *Laminaria digitata*.

**Kelvin:** The SI Unit of temperature. It is the temperature in degrees Celsius plus 273.15. OR A unit of measurement for temperature. Uses absolute zero as its null point. OR The SI base unit of temperature, defined by assigning

273.16 K to the temperature at which steam, ice, and water are at equilibrium (called the triple point of water). The freezing point of water is 273.15 K. OR the absolute temperature scale (metric).  $K = ^\circ C + 273$ . OR The Kelvin scale is a thermodynamic temperature scale (metric). OR The temperature scale that begins with absolute zero as 0 K.

**Kemstro** : A drug that is used to treat certain types of muscle spasms and is being studied in the treatment of liver cancer. Kemstro relaxes muscles by blocking certain nerve receptors in the spinal cord. It is a type of antispasmodic. Also called baclofen and Lioresal.

**Kenalog**: (Other name for: triamcinolone acetate)

**Keoxifene hydrochloride**: (Other name for: raloxifene hydrochloride)

**Kepivance** : A form of keratinocyte growth factor (KGF) that is made in the laboratory. KGF stimulates the growth of cells that line the surface of the mouth and intestinal tract. Kepivance is used to prevent and treat oral mucositis (mouth sores) caused by high-dose chemotherapy and radiation therapy in leukemia and lymphoma. It is also being studied in the prevention and treatment of oral mucositis and dysphagia (difficulty swallowing) in other types of cancer. Kepivance is a type of recombinant human keratinocyte growth factor. Also called palifermin.

**Kepler, Johannes**: astronomer who developed three laws of planetary motion: planets move in elliptical orbits; planets sweep out equal area in equal time; the period of revolution is proportional to the distance to the Sun.

**Keppra** : A drug used to treat seizures (involuntary muscle movements) caused by epilepsy (a group of brain disorders). Keppra is being studied in the treatment of seizures in patients with cancer that has spread to the brain. It is a type of anticonvulsant. Also called levetiracetam.

**KeraStat**: (Other name for: topical keratin)

**keratan sulfate** : A glycosaminoglycan (a type of polysaccharide) found in cartilage and in the cornea of the eye.

**keratin** : A type of protein found on epithelial cells, which line the inside and outside surfaces of the body. Keratins help form the tissues of the hair, nails, and the outer layer of the skin. They are also found on cells in the lining of organs, glands, and other parts of the body. Certain keratins may be found in higher than normal amounts in patients with different types of

epithelial cell cancers, including lung, breast, colorectal, bladder, and head and neck cancers. Measuring the amount of specific keratins in the blood may help to plan cancer treatment or find out how well treatment is working or if cancer has come back. A keratin is a type of tumor marker. Also called cytokeratin.

**keratinocyte growth factor :** A natural substance that stimulates the growth of epithelial cells in the skin and in the lining of the mouth, stomach, and intestines. A form of keratinocyte growth factor made in the laboratory is called recombinant human keratinocyte growth factor. Also called KGF.

**keratins:** Insoluble protective or structural proteins consisting of parallel polypeptide chains in  $\alpha$ -helical or  $\beta$  conformations.

**keratoacanthoma :** A rapidly growing, dome-shaped skin tumor that usually occurs on sun-exposed areas of the body, especially around the head and neck. Keratoacanthoma occurs more often in males. Although in most patients it goes away on its own, in a few patients it comes back. Rarely, it may spread to other parts of the body.

**kernicterus:** this is bilirubin encephalopathy which is characterized by yellow discoloration of the basal ganglia in babies with intense jaundice

**Kerosene:** Kerosene was one of the original fuels to be extracted by distillation from crude oil. It is a light to middle distillate and is used in heating, cooking and lighting systems. In its broader definition kerosene includes the fuels used in commercial and military jet engines.

**ketal:** the product formed by the reaction of a ketone with an alcohol. The general structure of a ketal is:

**Ketalar :** A drug used to cause a loss of feeling and awareness and to induce sleep in patients having surgery. It is also being studied in the treatment of nerve pain caused by chemotherapy. Ketalar blocks pathways to the brain that are involved in sensing pain. It is a type of general anesthetic. Also called ketamine and ketamine hydrochloride.

**ketamine :** A drug used to cause a loss of feeling and awareness and to induce sleep in patients having surgery. It is also being studied in the treatment of nerve pain caused by chemotherapy. Ketamine blocks pathways to the brain that are involved in sensing pain. It is a type of general anesthetic. Also called Ketalar and ketamine hydrochloride.

**ketamine hydrochloride:** The hydrochloride salt of a synthetic derivative of cyclohexanone with analgesic and anesthetic activities. Although its mechanism of action is not well understood, ketamine appears to non-competitively block N-methyl-D-aspartate (NMDA) receptors and may interact with opioid mu receptors and sigma receptors, thereby reducing pain perception, inducing sedation, and producing dissociative anesthesia. Check for active clinical trials using this agent. or A drug used to cause a loss of feeling and awareness and to induce sleep in patients having surgery. It is also being studied in the treatment of nerve pain caused by chemotherapy. Ketamine hydrochloride blocks pathways to the brain that are involved in sensing pain. It is a type of general anesthetic. Also called Ketalar and ketamine.

**ketamine/amitriptyline NP-H cream:** A topical preparation containing the antidepressant amitriptyline and the excitatory amino acid antagonist ketamine with potential topical analgesic activity. In addition to activating adenosine A1 receptors and inhibiting the neuronal reuptake of norepinephrine and serotonin, amitriptyline produces antinociceptive effects, which appear to be mediated through the modulation of multiple subtypes of glutamate receptors including the N-methyl D-aspartate (NMDA) receptor. Ketamine inhibits biogenic amine uptake, agonistically binds to mu-opioid receptors, and inhibits NMDA receptors. NMDA receptor antagonists such as amitriptyline and ketamine interfere with the role of NMDA receptors in the process of central sensitization in which NMDA receptors on spinal dorsal horn neurons are activated, resulting in an increase in synaptic efficacy and so an amplification of the response to sensory input.

**keto-enol tautomerization:** the process by which an enol equilibrates with its corresponding aldehyde or ketone.

**ketoconazole:** A synthetic derivative of phenylpiperazine with broad antifungal properties and potential antineoplastic activity. Ketoconazole inhibits sterol 14- $\alpha$ -dimethylase, a microsomal cytochrome P450-dependent enzyme, thereby disrupting synthesis of ergosterol, an important component of the fungal cell wall. or A drug that treats infection caused by a fungus. It is also used as a treatment for prostate cancer because it can block the production of male sex hormones.

**Ketogenic:** Describing amino acids that are metabolized to acetoacetate and acetate.

**Ketogenic amino acids:** Amino acids whose carbon skeletons, entirely or in part, are degraded into acetyl coa or acetoacetyl coa; only leucine and lysine are solely ketogenic. OR Amino acids with carbon skeletons that can serve as precursors of the ketone bodies.

**ketogenic diet :** A diet high in fat and low in carbohydrates (sugars) that causes the body to break down fat into molecules called ketones. Ketones circulate in the blood and become the main source of energy for many cells in the body. A ketogenic diet is used to treat some types of epilepsy and is being studied in the treatment of some types of cancer.

**ketone:** An organic compound that contains a carbonyl group. For example, methyl ethyl ketone is  $\text{CH}_3\text{COCH}_2\text{CH}_3$  is used in some adhesives. OR An organic compound containing a carbonyl group bonded to two carbon atoms. OR An alkanone or ketone is any carbon compound containing the C-C(O)-C group. Acetone is the simplest ketone and is a common solvent found, for example, in fingernail polish remover. OR a compound in which an oxygen atom is bonded to a carbon atom, which is itself bonded to two more carbon atoms. Water addition to nonterminal alkynes forms ketones. OR a compound in which an oxygen atom is bonded via a double bond to a carbon atom, which is itself bonded to two more carbon atoms. OR A functional group of an organic compound in which a carbon atom is double-bonded to an oxygen. Neither of the other substituents attached to the carbon is a hydrogen. Otherwise the group would be called an aldehyde.

**ketone :** A type of chemical substance used in perfumes, paints, solvents, and found in essential oils (scented liquid taken from plants). Ketones are also made by the body when there is not enough insulin.

**ketone bodies:** Acetoacetate, D- $\beta$ hydroxybutyrate, and acetone; watersoluble fuels normally exported by the liver but overproduced during fasting or in untreated diabetes mellitus.

**Ketone bodies:** Refers to acetoacetate, acetone, and  $\beta$ -hydroxybutyrate made from acetyl-CoA in the liver and used for energy in nonhepatic tissue.

**Ketone body:** Refers to acetoacetate,  $\beta$ -hydroxybutyrate, and acetone, produced when acetyl coa is diverted from the citric acid cycle to the

formation of acetoacetyl coa in the liver; subsequent reactions generate the three compounds, known as ketone bodies.

**ketoprofen:** A propionic acid derivate and nonsteroidal anti-inflammatory drug (NSAID) with anti-inflammatory, analgesic and antipyretic effects. Ketoprofen inhibits the activity of the enzymes cyclo-oxygenase I and II, resulting in a decreased formation of precursors of prostaglandins and thromboxanes. The resulting decrease in prostaglandin synthesis, by prostaglandin synthase, is responsible for the therapeutic effects of ibuprofen. Ketoprofen also causes a decrease in the formation of thromboxane A<sub>2</sub> synthesis, by thromboxane synthase, thereby inhibiting platelet aggregation. Check for active clinical trials using this agent. or A drug used to treat mild pain. It is also used to treat menstrual cramps, fever, and symptoms of arthritis, such as pain, tenderness, swelling, and stiffness. Ketoprofen stops the body from making substances that cause pain and inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID).

**ketorolac:** A synthetic pyrrolizine carboxylic acid derivative with anti-inflammatory, analgesic, and antipyretic activities. Ketorolac non-selective inhibits the enzymes cyclooxygenase 1 (COX-1) and COX-2. The inhibition of COX-2, up-regulated at sites of inflammation, prevents conversion of arachidonic acid to pro-inflammatory prostaglandins. The inhibition of COX-1 by this agent prevents the normal steady-state production of prostaglandins that play housekeeping roles in the protection of the gastrointestinal tract, the regulation of renal blood flow, and platelet aggregation. As a result, the inhibition of COX-1 may be associated with gastrointestinal toxicity, nephrotoxicity, and the inhibition of platelet aggregation.

**ketorolac :** A drug that belongs to a family of drugs called nonsteroidal anti-inflammatory agents. It is being studied in cancer prevention.

**ketorolac tromethamine:** The tromethamine salt of ketorolac, a synthetic pyrrolizine carboxylic acid derivative with anti-inflammatory, analgesic and antipyretic properties. Ketorolac tromethamine, a non-selective inhibitor of the cyclooxygenases (COX), inhibits both COX-1 and COX-2 enzymes. This agent exerts its anti-inflammatory effect by preventing conversion of arachidonic acid to prostaglandins at inflammation site mediated through inhibition of COX-2, which is undetectable in most tissues but is up-regulated at the inflammation sites. Since COX-1 is expressed virtually in

all tissues, inhibition of COX-1 enzyme by this agent prevents normal state production of prostaglandins, which plays housekeeping roles in the protection of the gastrointestinal tract, regulating renal blood flow, and functioning in platelet aggregation. As a result, inhibition of COX-1 is usually associated with adverse effects such as gastrointestinal toxicity and nephrotoxicity.

**Ketose:** A monosaccharide that has a ketone group as its most oxidized carbon.

**ketose:** A simple monosaccharide in which the carbonyl group is a ketone.

**ketose:** A simple sugar that has the reactions of a ketone.

**Ketosis:** A condition in which the concentration of ketone bodies in the blood, tissues, and urine is abnormally high. OR A condition in which the concentration of ketone bodies in the blood or urine is unusually high.

**kettle:** a depression in glacial till that results when a buried block of glacial ice melts. OR a steep-sided pond created by a glacier when a block of ice is left behind as the glacier retreats.

**kettle lake:** a body of water occupying a kettle.

**Kevetrin:** (Other name for: thioureidobutyronitrile)

**Kevlar :** This material is manufactured for use in bulletproof vests and many other applications because it is strong.

**Key:** As a paint term this refers to the slight roughness of a surface which enables a coat of paint to achieve good mechanical adhesion to the surface.

**key bed:** a layer in the rock record showing an event that occurred quickly and over a widespread area; is used like an index fossil.

**Key Centre for Polymer Colloids:** The Key Centre for Polymer Colloids (KCPC) is a research centre at the University of Sydney, established and supported under the Australian Research Council's Research Centres Programme. The KCPC is involved in a range of research projects including the use of polymers in rice production and developing a better understanding of paint systems. See our website:

**keyhole limpet hemocyanin:** A natural protein isolated from the marine mollusc keyhole limpet. Keyhole limpet hemocyanin is an immunogenic carrier protein that, in vivo, increases antigenic immune responses to haptens and other weak antigens such as idio-type proteins. Or A substance taken from a marine organism that may be linked to a specific antigen to

boost the immune response to that antigen. Keyhole limpet hemocyanin is being studied as a way to increase the immune response to cancer vaccines. It is a type of immune modulator. Also called KLH.

**Keystone:** The central locking stone in an arch.

**Keytruda :** A drug used to treat squamous cell cancer of the head and neck that has recurred (come back) or spread to other parts of the body. It is used in patients whose disease got worse during or after treatment. It is also used to treat certain types of non-small cell lung cancer that have spread to other parts of the body and got worse during or after treatment. Keytruda is also used to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Keytruda binds to a protein called PD-1, which is found on T cells (a type of white blood cell). Keytruda may block PD-1 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called pembrolizumab.

**keywords:** Words that indicate a mathematical operation.

**KGF:** A natural substance that stimulates the growth of epithelial cells in the skin and in the lining of the mouth, stomach, and intestines. A form of KGF made in the laboratory is called recombinant human keratinocyte growth factor. Also called keratinocyte growth factor.

**kidney :** One of a pair of organs in the abdomen. The kidneys remove waste and extra water from the blood (as urine) and help keep chemicals (such as sodium, potassium, and calcium) balanced in the body. The kidneys also make hormones that help control blood pressure and stimulate bone marrow to make red blood cells.

**kidney cancer :** Cancer that forms in tissues of the kidneys. The most common type of kidney cancer in adults is renal cell carcinoma. It forms in the lining of very small tubes in the kidney that filter the blood and remove waste products. Transitional cell cancer of the renal pelvis is kidney cancer that forms in the center of the kidney where urine collects. Wilms tumor is a type of kidney cancer that usually develops in children under the age of 5.

**kidney failure :** A condition in which the kidneys stop working and are not able to remove waste and extra water from the blood or keep body chemicals in balance. Acute or severe kidney failure happens suddenly (for example, after an injury) and may be treated and cured. Chronic kidney failure develops over many years, may be caused by conditions like high

blood pressure or diabetes, and cannot be cured. Chronic kidney failure may lead to total and long-lasting kidney failure, called end-stage renal disease (ESRD). A person in ESRD needs dialysis (the process of cleaning the blood by passing it through a membrane or filter) or a kidney transplant. Also called renal failure.

**kidney function :** A term used to describe how well the kidneys work. The kidneys remove waste and extra water from the blood (as urine) and help keep chemicals (such as sodium, potassium, and calcium) balanced in the body. They also make hormones that help control blood pressure and stimulate bone marrow to make red blood cells. Also called renal function.

**kidney function test :** A test in which blood or urine samples are checked for the amounts of certain substances released by the kidneys. A higher- or lower-than-normal amount of a substance can be a sign that the kidneys are not working the way they should. Also called renal function test.

**killer T cell :** A type of immune cell that can kill certain cells, including foreign cells, cancer cells, and cells infected with a virus. Killer T cells can be separated from other blood cells, grown in the laboratory, and then given to a patient to kill cancer cells. A killer T cell is a type of white blood cell and a type of lymphocyte. Also called cytotoxic T cell and cytotoxic T lymphocyte.

**Kilo-:** A Greek prefix meaning "tho OR Prefix meaning 1000.usand" in the nomenclature of the metric system. This prefix multiplies a unit by 1000. or Prefix used in the SI system meaning "one thousand of". For example 1 km means "one thousand meters"; 2.8 kg could also be written " $2.8 \times 10^3$  g" or "2800 g".

**Kilobase:** One thousand bases in a DNA molecule. OR A unit of length equal to 1000 base pairs of a double-stranded nucleic acid molecule or to 1000 bases of a single-stranded molecule. OR A unit of length equal to 1000 base pairs of a double-stranded nucleic acid molecule or to 1000 bases of a single-stranded molecule.

**Kilocalorie (kcal):** A unit of energy equal to 1000 calories, or 4.184 joules.

**kilogram:** Base unit for mass in metric system. OR The kilogram (kg) is the base unit of mass in the SI system of units. The standard kilogram is a 1 kg corrosion resistant platinum/iridium cylinder, carefully preserved in the suburbs of Paris (with a backup copy kept in Gaithersburg, Maryland.)

Efforts are underway to replace these artifacts by redefining the kilogram as the mass of a certain number of silicon atoms. OR A measure of weight. A kilogram is equal to 2.2 pounds.

**Kilovolt:** The unit of electrical potential equal to 1000 volts.

**Kilowatt (KW):** A unit of power equivalent to one thousand watts.

**Kinaret :** A substance that is used to treat rheumatoid arthritis, and is being studied in the treatment of cancer. Kinaret blocks the action of interleukin 1 (IL-1). It is a type of interleukin receptor antagonist. Also called anakinra.

**Kinase:** An enzyme that catalyzes the attachment of a phosphoryl group to a substrate by using ATP as a phosphoryl donor. OR An enzyme catalyzing phosphorylation of an acceptor molecule, usually with ATP serving as the phosphate (phosphoryl) donor.

**kinase :** A type of enzyme (a protein that speeds up chemical reactions in the body) that adds chemicals called phosphates to other molecules, such as sugars or proteins. This may cause other molecules in the cell to become either active or inactive. Kinases are a part of many cell processes. Some cancer treatments target certain kinases that are linked to cancer.

**kinase inhibitor :** A substance that blocks a type of enzyme called a kinase. Human cells have many different kinases, and they help control important functions, such as cell signaling, metabolism, division, and survival. Certain kinases are more active in some types of cancer cells and blocking them may help keep the cancer cells from growing. Kinase inhibitors may also block the growth of new blood vessels that tumors need to grow. Some kinase inhibitors are used to treat cancer.

**kinases:** Enzymes that catalyze the phosphorylation of certain molecules by ATP.

**kindred :** An extended family.

**Kineret:** (Other name for: anakinra)

**Kinesin:** A protein with atpase activity that moves cellular organelles along microtubule tracks in anterograde transport.

**Kinetic:** The word 'kinetic' comes from the greek word for 'motion'. In chemistry, kinetics is the study of how fast reactions occur. In many chemical reactions where there are a number of possible products, the first one formed may be the one that is formed most quickly, not necessarily the one that is most stable; if you leave the reaction going, you should

eventually form the product that involves the greatest change in bond energy - the thermodynamic product. Try this dodgy example.

**kinetic control:** reactions that have a major product that forms the fastest are under kinetic control. These reactions follow the lowest activation-energy pathway.

**kinetic energy:** Energy an object has because of its mass and velocity. Objects that not moving have no kinetic energy. (Kinetic Energy= $0.5 \times \text{mass} \times \text{velocity}^2$ ). OR The energy something possesses due to its motion, depending on mass and velocity. OR Kinetic energy is energy in motion. Potential energy is the opposite of kinetic energy. OR The energy that a body possesses by virtue of its mass and velocity. Also called the energy of motion. OR The energy an object possesses by virtue of its motion. An object of mass  $m$  moving at velocity  $v$  has a kinetic energy of  $\frac{1}{2}mv^2$ .

**kinetic-molecular theory:** A theory of the behavior of matter.

**kinetically controlled reaction:** a reaction in which the rate of formation of the competing products accounts for the major product.

**kinetics:** The study of reaction rates.

**kinetochore:** a region of DNA that has remained undivided during prophase of mitosis; binds to the spindle fibers that eventually pull apart the sister chromatids. OR A structure that attaches laterally to the centromere of a chromosome; it is the site of chromosome tubule attachment.

**kingdom:** the largest and broadest category of the classification system.

**KIRKSITE:** An alloy of aluminum and zinc used for the construction of blow molds; it imparts high degree of heat conductivity to the mold.

**Kiss-roll Coating:** This roll arrangement carries a metered film of coating to the web; at the line of web contact, it is split with part remaining on the roll, the remainder of the coating adhering to the web.

**kit ligand :** A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. Kit ligand is a type of cytokine and a type of growth factor. Also called SCF and stem cell factor.

**KIT/PDGFR inhibitor DCC-2618:** An orally bioavailable switch pocket control inhibitor of wild-type and mutated forms of the tumor-associated antigens (TAA) mast/stem cell factor receptor (SCFR) KIT and platelet-

derived growth factor receptor alpha (PDGFR-alpha; PDGFRa), with potential antineoplastic activity. Upon oral administration, DCC-2618 targets and binds to both wild-type and mutant forms of KIT and PDGFRa specifically at their switch pocket binding sites, thereby preventing the switch from inactive to active conformations of these kinases and inactivating their wild-type and mutant forms. This abrogates KIT/PDGFRa-mediated tumor cell signaling and prevents proliferation in KIT/PDGFRa-driven cancers. DCC-2618 also inhibits several other kinases, including vascular endothelial growth factor receptor type 2 (VEGFR2; KDR), angiopoietin-1 receptor (TIE2; TEK), PDGFR-beta and macrophage colony-stimulating factor 1 receptor (FMS; CSF1R), thereby further inhibiting tumor cell growth. KIT and PDGFRa are tyrosine kinase receptors that are upregulated or mutated in a variety of cancer cell types; mutated forms play a key role in the regulation of tumor cell proliferation and resistance to chemotherapy.

**Klatskin tumor :** Cancer that develops in cells that line the bile ducts in the liver, where the right and left ducts meet. It is a type of cholangiocarcinoma.

**Klebsiella :** A bacterium that frequently causes lung, urinary tract, intestinal, and wound infections.

**Klenow fragment:** A proteolytic digestion product of DNA polymerase I that retains the polymerase and 3'- to 5'-exonuclease activity.

**KLETT:** A unit of color density. Measured by the light absorption of a clear solution using a Klett-Summerson photoelectric colorimeter. (see RFF 705.10.52 - COLOR).

**KLH:** A substance taken from a marine organism that may be linked to a specific antigen to boost the immune response to that antigen. KLH is being studied as a way to increase the immune response to cancer vaccines. It is a type of immune modulator. Also called keyhole limpet hemocyanin.

**KLH-FITC:** A conjugate consisting of keyhole-limpet hemocyanin (KLH) and fluorescein isothiocyanate (FITC) with potential immunostimulating activity. Vaccination with KLH-FITC may elicit an immune response against fluorescein and the production of anti-fluorescein IgG antibodies. KLH, a natural protein isolated from the marine mollusk keyhole limpet, is an immunostimulant carrier protein.

**Klinefelter syndrome :** A genetic disorder in males caused by having one or more extra X chromosomes. Males with this disorder may have larger than normal breasts, a lack of facial and body hair, a rounded body type, and small testicles. They may learn to speak much later than other children and may have difficulty learning to read and write. Klinefelter syndrome increases the risk of developing extragonadal germ cell tumors and breast cancer.

**Knit Line:** Place or line where two or more flow fronts come together after going around a flow restriction or post OR Where melted material flows together to form a line or lines that may cause weakening or breaking of the component.

**Knit lines:** Also known as “stitch lines” or “weld lines,” and when multiple gates are present, “meld lines.” These are imperfections in the part where separated flows of cooling material meet and rejoin, often resulting in incomplete bonds and/or a visible line.

**Knock Out (Ejector) Plate:** A plate in a plastic or liquid silicone rubber injection mold connects and drives the ejector pins in the plastic or silicone mold

**Knockout Pin:** A pin that ejects a molded article from the mold. OR A pin that ejects a molded article from the mold. Land Area The area of surfaces of a mold which contact each other when the mold is closed.

**Knottling:** A solution of shellac in methylated spirit used for treating knots and resinous timber to prevent stains from the timber discolouring the paint. It cannot be expected to hold back resinous exudation.

**Known addition:** a method for determining the concentration of an ion by adding a known volume of standard to the sample. The electrode potentials of the sample before and after addition are compared.

**Knuckled and Welded Edge :** An edge finish which is knuckled with ends of the wire forming the knuckle loop, and tack welded or brazed to the spiral to prevent opening of loops.

**Knuckled Edge :** An edge finish which is complete without welding. The edge is finished by bending back the ends of the spirals to form a loop, generally permitting each individual spiral to flex as a single link in the belt.

**komatiite:** a typical ultramafic extrusive rock that is mostly olivine and pyroxene, with lesser feldspar.

**Komed HC:** (Other name for: therapeutic hydrocortisone)

**Koopmans:** His theorem for approximate ionization energies (see HOMO) and poor electron affinities (see LUMO).

**Korean acupuncture :** A type of acupuncture based on a form of Oriental medicine in which treatment is based on a person's constitution. According to this type of medicine, the constitution is the specific way a person's organs affect health and how he or she looks, thinks, behaves, and responds to treatment. Also called constitutional acupuncture.

**KOS-862:** A substance being studied in the treatment of cancer. It is a type of mitotic inhibitor and epothilone. Also called epothilone D.

**KOS-953:** (Other name for: tanespimycin)

**Kostmann disease :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called congenital neutropenia, genetic infantile agranulocytosis, infantile genetic agranulocytosis, Kostmann neutropenia, and Kostmann syndrome.

**Kostmann neutropenia :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called congenital neutropenia, genetic infantile agranulocytosis, infantile genetic agranulocytosis, Kostmann disease, and Kostmann syndrome.

**Kostmann syndrome :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called congenital neutropenia, genetic infantile agranulocytosis, infantile genetic agranulocytosis, Kostmann disease, and Kostmann neutropenia.

**KPS:** A standard way of measuring the ability of cancer patients to perform ordinary tasks. The KPS scores range from 0 to 100. A higher score means the patient is better able to carry out daily activities. KPS may be used to determine a patient's prognosis, to measure changes in a patient's ability to function, or to decide if a patient could be included in a clinical trial. Also called Karnofsky Performance Status.

**KRAFFT POINT:** The temperature at which the solubility of an ionic surfactant becomes equal to the critical micelle concentration. (see RFF 705.10.55 - KRAFFT POINT).

**Kraft Paper:** 1) Relatively heavy, high strength sulfate paper used for electrical insulating material. 2) Paper made from sulfate wood pulp, chiefly pinewood chips by digestion with a mixture of caustic soda.

**Krakatoa (Krakatau):** Active volcano 2667 ft (813 m) high in West Indonesia. It forms an island between Java and Sumatra. Its eruption in 1883, which was one of the most violent in modern times, scattered debris and darkened skies over vast areas. Additional eruptions occurred in late 1927 and in the 1960s.

**Kras gene :** A gene that may cause cancer when it is mutated (changed). The Kras gene makes the KRAS protein, which is involved in cell signaling pathways, cell growth, and apoptosis (cell death). Agents that block the activity of the mutated Kras gene or its protein may stop the growth of cancer. Also called K-ras gene.

**Krebs cycle:** the subdivision of cellular respiration in which pyruvic acid is broken down and the energy in its molecules is used to form high-energy compounds. OR Krebs cycle. See tricarboxylic acid (TCA) cycle. OR See citric acid cycle.

**kretek :** A type of cigarette that is made in Indonesia. It is made using a mixture of tobacco, cloves, and other ingredients. Kreteks contain nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Smoking kreteks can lead to nicotine addiction and can cause lung cancer and other lung conditions. Also called clove cigarette.

**KRN5500:** A semisynthetic derivative of the nucleoside-like antineoplastic antibiotic spicamycin, originally isolated from the bacterium *Streptomyces alanosinicus*. KRN 5500 inhibits protein synthesis by interfering with endoplasmic reticulum and Golgi apparatus functions. This agent also induces cell differentiation and caspase-dependent apoptosis. Check

for active clinical trials using this agent. or An anticancer drug that is a type of antitumor antibiotic. It is an anthracycline.

**KRN7000:** A drug being studied in the treatment of cancer. It is a biological response modifier that is a type of glycosphingolipid or agelasphin.

**Kroll process:** The Kroll process is a method of extracting titanium metal, using magnesium as the reducing agent.

**Krukenberg tumor :** A tumor in the ovary caused by the spread of stomach cancer.

**Krypton:** Symbol:"Kr" Atomic Number:"36" Atomic Mass: 83.80amu. It is one of the noble or inert gases. A non-reactive element, krypton actually makes some compounds. It has been used in flash photography and lasers.

**KSHV:** A type of virus that causes Kaposi sarcoma (a rare cancer in which lesions grow in the skin, lymph nodes, lining of the mouth, nose, and throat, and other tissues of the body). KSHV also causes certain types of lymphoma (cancer that begins in cells of the immune system). Also called HHV8, human herpesvirus 8, and Kaposi sarcoma-associated herpesvirus.

**KSP inhibitor ARRY-520:** A synthetic, small molecule targeting the kinesin spindle protein (KSP) with potential antineoplastic activity. KSP inhibitor ARRY-520 specifically inhibits KSP (kinesin-5 or Eg5), resulting in activation of the spindle assembly checkpoint, induction of cell cycle arrest during the mitotic phase, and consequently cell death in tumor cells that are actively dividing. Because KSP is not involved in postmitotic processes, such as neuronal transport, this agent does not cause the peripheral neuropathy that is often associated with tubulin-targeting agents. KSP is an ATP-dependent microtubule motor protein that is essential for the formation of bipolar spindles and the proper segregation of sister chromatids during mitosis.

**KSP inhibitor AZD4877:** A synthetic kinesin spindle protein (KSP) inhibitor with potential antineoplastic activity. KSP inhibitor AZD4877 selectively inhibits microtubule motor protein KSP (also called kinesin-5 or Eg5), which may result in the inhibition of mitotic spindle assembly; activation of the spindle assembly checkpoint; induction of cell cycle arrest during the mitotic phase; and cell death in tumor cells that are actively dividing. Because KSP is not involved in postmitotic processes, such as neuronal transport, this agent may be less likely to cause the peripheral

neuropathy often associated with the tubulin-targeting agents. Eg5 is essential for the formation of bipolar spindles and the proper segregation of sister chromatids during mitosis.

**KSP/VEGF siRNAs ALN-VSP02:** A lipid nanoparticle formulation containing two small interfering RNAs (siRNAs) for kinesin spindle protein (KSP) and vascular endothelial growth factor (VEGF) with potential antitumor activity. Upon intravenous administration, the siRNAs in KSP/VEGF siRNAs ALN-VSP02ALN bind to both KSP and VEGF messenger RNAs (mRNAs), preventing translation of KSP and VEGF proteins; this may result in growth inhibition of tumor cells that overexpress KSP and VEGF. VEGF and KSP are upregulated in many tumor cells and play an important role in tumor proliferation and survival.

**kunecatechins ointment:** A topical ointment containing a green tea polyphenol mixture (kunecatechins) with potential antiviral, antibacterial, antioxidant, and chemopreventive activities. Kunecatechins is a partially purified fraction of the aqueous extract of green tea leaves from *Camellia sinensis* and contains catechins and other green tea components. Catechins, polyphenolic antioxidant plant metabolites or flavonoids, comprise most of the drug substance in kunecatechins with epigallocatechin gallate (EGCG) present as the primary catechin. Catechins may inhibit basic functions of human papillomavirus (HPV), counteract specific changes in tumor cells, affect cell signaling, and stimulate the immune system. Topical application of kunecatechins ointment has been reported to reduce HPV-induced genital and anal warts through a not yet fully understood mechanism, which may involve anti-oxidative activity.

**KW-2149:** A semisynthetic water-soluble disulfide derivative of the antineoplastic antibiotic mitomycin C. Activated by serum and glutathione, KW-2149 causes interstrand DNA cross-links and DNA-protein cross-links, resulting in single-strand DNA breaks and inhibition of DNA synthesis.

**KW2189:** A semisynthetic anticancer drug that is a type of antitumor antibiotic.

**kwashiorkor:** a form of malnutrition that occurs when there is not enough protein in the diet

**KX2-391:** A substance being studied in the treatment of cancer. KX2-391 blocks an enzyme needed for growth of cells and may kill cancer cells. It is a type of Src kinase inhibitor.

**Kynacyte:** (Other name for: safingol)

**Kynar:** Kynar tubing is an economic alternative to Teflon® tubing when heat resistance is not needed.

**kyphoscoliosis:** an abnormal curvature of the spine in both the coronal and sagittal planes, a term combined from kyphosis and scoliosis

**kyphosis :** A condition marked by a humpback-like rounding or outward curve of the upper backbone. It may be present at birth or it may be caused by growth problems, arthritis, osteoporosis, tumors, or certain other disorders. It may also occur at some point in time after radiation therapy to the backbone.

**Kyprolis:** (Other name for: carfilzomib)

**Kyprolis :** A drug used alone or with other drugs to treat multiple myeloma that has gotten worse or come back after treatment with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Kyprolis blocks the action of enzymes called proteasomes, which may help keep cancer cells from growing and may kill them. It is a type of proteasome inhibitor. Also called carfilzomib.

**Kytril :** A drug used to prevent nausea and vomiting caused by chemotherapy and radiation therapy. It is also used to prevent nausea and vomiting after surgery. Kytril blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called granisetron hydrochloride.

**L-:** Prefix used to designate a levorotatory enantiomer. OR A measure of volume for a liquid, using the metric system. One L is equal to 1,000 cubic centimeters (cc), 1,000 milliliters (ml), or 1.0567 quarts (qt). Also called liter.

**L-3,5,5'-tetraiodothyronine :** A hormone that is made by the thyroid gland and contains iodine. L-3,5,5'-tetraiodothyronine increases the rate of chemical reactions in cells and helps control growth and development. L-3,5,5'-tetraiodothyronine can also be made in the laboratory and is used to treat thyroid disorders. Also called T4, thyroxin, and thyroxine.

**L-377,202:** A prodrug in which a peptide is covalently conjugated with the anthracycline antineoplastic antibiotic doxorubicin. This complex is

hydrolyzed by the enzyme prostate-specific antigen (PSA), resulting in the formation of doxorubicin and leucine-doxorubicin. Selective targeting of these drugs to prostate tumor cells occurs because the hydrolyzing PSA enzyme is localized to the prostate gland. Doxorubicin and leucine-doxorubicin intercalate into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. These agents also produce toxic free-radical intermediates and interact with cell membrane lipids causing lipid peroxidation.

**L-377,202:** A substance that is being studied in the treatment of cancer.

**L-778,123:** An anticancer drug that belongs to the family of drugs called enzyme inhibitors. It may inhibit the transformation of normal cells into cancer cells.

**L-alanosine:** An amino acid analogue and antibiotic derived from the bacterium *Streptomyces alanosinicus* with antimetabolite and potential antineoplastic activities. L-alanosine inhibits adenylosuccinate synthetase, which converts inosine monophosphate (IMP) into adenylosuccinate, an intermediate in purine metabolism. L-alanosine-induced disruption of de novo purine biosynthesis is potentiated by methylthioadenosine phosphorylase (MTAP) deficiency. The clinical use of this agent may be limited by its toxicity profile. MTAP is a key enzyme in the adenine and methionine salvage pathways.

**L-arginine :** One of the twenty common amino acids (building blocks of proteins). L-arginine is being studied as a nutritional supplement in the treatment and prevention of cancer and other conditions. Also called arginine.

**L-arginine/Korean ginseng/ Ginkgo biloba/damiana-based supplement:** An amino acid and herbal supplement with libido-enhancing activity. L-arginine/korean ginseng/Ginkgo biloba/damiana-based supplement contains a blend of the amino acid L-arginine and the herbs Korean ginseng, Ginkgo biloba, and damiana (*Turnera aphrodisiaca*) in addition to 14 other vitamins and minerals. The semi-essential amino acid L-arginine is a precursor for nitric oxide (NO); Korean ginseng may enhance the conversion of L-arginine into NO by NO synthase; and Ginkgo biloba may promote microvascular circulation. This agent may increase NO production, resulting in vasodilatation and an enhanced circulation critical

to sexual function and arousal. The damiana component may exert an anxiolytic effect and stimulate sexual behavior.

**L-Asnase:** (Other name for: asparaginase)

**L-asparaginase :** A drug that is used to treat acute lymphoblastic leukemia (ALL) and is being studied in the treatment of some other types of cancer. It is an enzyme taken from the bacterium *Escherichia coli* (*E. coli*). It breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. Also called asparaginase and Elspar.

**L-Carnipure L-Carnitine L-Tartrate:** (Other name for: L-carnitine L-tartrate)

**L-carnitine :** A form of carnitine, which is a substance made in muscle and liver tissue and found in certain foods, such as meat, poultry, fish, and some dairy products. L-carnitine is also a drug that is used to treat patients who do not make enough carnitine and is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is a type of dietary supplement. Also called Carnitor and levocarnitine.

**L-carnitine L-tartrate:** A dietary supplement containing the levo-enantiomers of carnitine and tartrate with potential chemoprotective and antioxidant activities. L-carnitine L-tartrate increases fatty acid oxidation and reduces purine catabolism and free radical formation, which may prevent exercise fatigue, muscle weakness, chemotherapy-induced peripheral neuropathy, and hyperlipoproteinemia. L-carnitine, the biologically active form of carnitine, is a carrier molecule that transports activated long-chain fatty acids (LCFAs) from the cytosol to mitochondria where fatty acids are oxidized, resulting in ATP production. L-tartrate, a salt of tartaric acid, is a potent antioxidant.

**L-citrulline:** A non-essential amino acid. In hepatocytes, L-citrulline is synthesized in the urea cycle by the addition of carbon dioxide and ammonia to ornithine. L-citrulline is converted into L-arginine by the enzymes argininosuccinate synthetase and argininosuccinate lyase in the presence of L-aspartate and ATP. Subsequently, L-arginine is converted to nitric oxide by nitric oxide synthase and L-citrulline is regenerated as a by-product.

**L-glutamic acid :** One of twenty amino acids (molecules that join together to form proteins). L-glutamic acid may help nerve cells send and receive information from other cells. It is being studied for its ability to decrease or

prevent nerve damage caused by anticancer drugs. Also called glutamic acid.

**L-gossypol:** The levo-enantiomer of an orally bioavailable polyphenolic aldehyde, derived primarily from unrefined cottonseed oil, with potential antineoplastic activity. Mimicking the inhibitory BH3 (Bcl-2 homology 3) domain of endogenous antagonists of Bcl-2, L-gossypol binds to and inhibits various anti-apoptotic Bcl-2 proteins, which may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. This agent has greater affinity for Bcl-2 proteins than racemic gossypol. Check for active clinical trials using this agent.

**L-leucovorin:** The active l-isomer of the racemic mixture of the 5-formyl derivative of tetrahydrofolic acid. Metabolically active, l-leucovorin, also known levoleucovorin, does not require bioactivation by dihydrofolate reductase, an enzyme inhibited by folic acid antagonists. This agent may enhance the effects of fluoropyrimidines by stabilizing their binding to the enzyme thymidylate synthase.

**L-leucyl-L-leucine methyl ester:** A 2-amino acid compound with immunomodulatory activity. L-leucyl-L-leucine methyl ester (LLME) is a lysosomotropic agent entering cells via receptor-mediated endocytosis. LLME undergoes a condensation process catalyzed by dipeptidyl peptidase I (DPPI) in lysosomes. Condensation of LLME leads to lysosomal rupture and DNA fragmentation in DPPI-expressing immune cells such as cytotoxic T-cells and natural killer cells. Therefore, this agent may be able to decrease the incidence of graft versus host disease (GVHD) via cytotoxic T-cell depletion. Furthermore, LLME has the potential for augmenting antibody production when used in pretreatment of peripheral blood mononuclear cells (PBMCs), possibly by interfering with gene expression of inflammatory factors.

**L-lysine:** A nutritional supplement containing the biologically active L-isomer of the essential amino acid lysine, with potential anti-mucositis activity. Upon oral intake, L-lysine promotes healthy tissue function, growth and healing and improves the immune system. L-Lysine promotes calcium uptake, is essential for carnitine production and collagen formation. As collagen is essential for connective tissue maintenance, this agent may also help heal mucosal wounds. This may help decrease and prevent mucositis induced by radiation or chemotherapy.

**L-menthol preparation NPO-11:** A preparation containing L-menthol with potential anti-peristaltic activity. Upon spraying directly onto the gastric mucosa, L-menthol preparation NPO-11 may relax gastrointestinal smooth muscle. This may result in a suppression of gastric peristalsis and may be beneficial during upper GI endoscopic procedures.

**L-methylfolate:** A nutritional supplement containing the biologically active form of the B9 vitamin folate, 5-methyltetrahydrofolate (L-methylfolate), with potential antineoplastic activity. Upon administration, L-methylfolate is able to provide methyl groups allowing an increase in the level of DNA methylation in the promoter regions of certain tumor-promoting genes, thereby reversing the DNA hypomethylation of these genes and inactivating them. This may result in a decrease of both tumor cell proliferation and tumor progression. In addition, administration of L-methylfolate may sensitize tumor cells to the cytotoxic effects of other chemotherapeutic agents. Unlike folic acid, L-methylfolate is able to cross the blood brain barrier and could be beneficial in the treatment of brain tumors. DNA hypomethylation of certain genes leads to chromosome instability and contributes to tumor development.

**L-MTP-PE:** A drug being studied in the treatment of young adults with bone cancer that has gotten worse or come back. L-MTP-PE activates certain types of white blood cells and helps the immune system kill cancer cells. It is a type of immunostimulant. Also called MEPACT, mifamurtide, and muramyl tripeptide phosphatidylethanolamine.

**L-norgestrel :** A form of the hormone progesterone that is made in the laboratory and used to prevent pregnancy. It is being studied in the prevention of ovarian and endometrial cancer, and in the treatment of other conditions. L-norgestrel is a type of oral contraceptive. Also called levonorgestrel and Plan B.

**L-threo-dihydrospingosine :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called protein kinase inhibitors. Also called safinol.

**L-wave:** longitudinal wave created by the P-wave and S-waves of an earthquake at the surface of the Earth; these are the slowest and move outward like ripples on a pond.

**L/D Ratio:** A term used to define an extrusion screw which denotes the ratio of the screw length to the screw diameter. OR The length over

diameter ratio defining a silicone rubber injection or plastic screw

**L/D Ratio Extrusion :** Barrel length divided by the diameter of the barrel

**L19-IL2 monoclonal antibody-cytokine fusion protein:** An immunoconjugate consisting of the recombinant form of the cytokine interleukin-2 (IL-2) fused to a human single-chain Fv (scFv) antibody fragment directed against the extra-domain B (ED-B) of fibronectin (L19), with potential immunopotentiating and antineoplastic activities. The L19 moiety of L19-IL2 monoclonal antibody-cytokine fusion protein binds to the ED-B domain of fibronectin on tumor cells in the tumor neovasculature. In turn, the IL-2 moiety may locally activate natural killer (NK) cells and macrophages, and may induce T cell cytotoxic immune responses against ED-B fibronectin-expressing tumor cells. This may specifically decrease the proliferation of ED-B-expressing tumor cells. ED-B is predominantly expressed during angiogenesis and tumor growth.

**lab-on-a-chip :** An instrument that uses very small amounts of fluid on a microchip to do certain laboratory tests. A lab-on-a-chip may use body fluids or solutions containing cells or cell parts to diagnose diseases. Also called microfluidic device.

**Label panel:** the flat area of the bottle's body where a label can be applied. Some of B&C Plastics Ltd.'s bottles feature indented label panels.

**labetuzumab-SN-38 immunoconjugate IMMU-130:** An antibody-drug conjugate (ADC) containing labetuzumab, a mildly reduced, anti-CEACAM5 humanized monoclonal antibody, conjugated to the potent topoisomerase I inhibitor SN-38, with antineoplastic activity. The monoclonal antibody moiety of antibody-drug conjugate IMMU-130 selectively binds to carcinoembryonic cell adhesion molecule 5 (CEACAM5), which is abundantly expressed on the surface of a majority of solid tumors. Upon internalization and proteolytic cleavage, SN-38, the active metabolite of irinotecan, inhibits the activity of topoisomerase I in the tumor cells, eventually inhibiting both DNA replication and transcription and leading to tumor cell apoptosis.

**labial mucosa :** The inner lining of the lips.

**LaBID:** (Other name for: theophylline)

**laboratory study :** Research done in a laboratory. A laboratory study may use special equipment and cells or animals to find out if a drug, procedure,

or treatment is likely to be useful in humans. It may also be a part of a clinical trial, such as when blood or other samples are collected. These may be used to measure the effect of a drug, procedure, or treatment on the body.

**laboratory test :** A medical procedure that involves testing a sample of blood, urine, or other substance from the body. Laboratory tests can help determine a diagnosis, plan treatment, check to see if treatment is working, or monitor the disease over time.

**laccolith:** an intrusive feature similar to a sill but formed from a more viscous magma that creates a lens-shaped mass between sedimentary layers, arching the overlying strata upward.

**lacosamide:** A functionalized amino acid compound specifically synthesized as an anticonvulsive drug to use as add-on therapy for partial-onset seizures with antinociceptive and neuroprotective activities. Lacosamide selectively enhances slow inactivation of voltage-gated sodium channels without affecting fast inactivation, thereby stabilizing hyperexcitable neuronal membranes. Furthermore, this agent binds to collapsin response mediator protein 2 (CRMP2; DPYSL2), a cytosolic phosphoprotein expressed in most tissues. In the nervous system, CRMP2 acts as a mediator of growth cone collapse and modifies axon number, length, and neuronal polarity.

**Lacquer:** A fast-drying usually clear coating that is highly flammable and dries by solvent evaporation only. Can be reconstituted after drying by adding solvent. OR A term usually applied to coatings that dry entirely by evaporation of the solvent. OR A fast-drying clear pigmented coating that dries by solvent evaporation.

**lacrimal gland :** A gland that secretes tears. The lacrimal glands are found in the upper, outer part of each eye socket.

**lactase :** An enzyme that breaks down lactose, a type of sugar found in milk and milk products.

**lactate dehydrogenase :** One of a group of enzymes found in the blood and other body tissues and involved in energy production in cells. An increased amount of lactate dehydrogenase in the blood may be a sign of tissue damage and some types of cancer or other diseases. Also called lactic acid dehydrogenase and LDH.

**lactic acid :** A substance made from sugars in milk, by the action of certain enzymes. It is used in skin care products to reduce wrinkles and soften the skin. It is also being studied in the treatment of hand-foot syndrome (a condition marked by pain, swelling, numbness, tingling, or redness of the hands or feet) in patients receiving chemotherapy. Lactic acid is also made in muscles in the body and is used in many chemical processes in the body. It is a type of alpha hydroxyl acid.

**lactic acid dehydrogenase :** One of a group of enzymes found in the blood and other body tissues, and involved in energy production in cells. An increased amount in the blood may be a sign of tissue damage and some types of cancer or other diseases. Also called lactate dehydrogenase and LDH.

**Lactic acid fermentation:** The anaerobic metabolism of glucose to yield lactic acid with the concomitant production of ATP.

**lactobacillus :** A type of bacterium that makes lactic acid (a substance that is made from sugars found in milk and is also made in the body). Lactobacilli usually do not cause disease, but may cause tooth decay. They are normally found in the mouth, gastrointestinal tract, and vagina. They are being studied in the prevention of infections in patients having donor stem cell transplants and in other conditions.

**Lactobacillus acidophilus probiotic:** A probiotic containing the bacterium *Lactobacillus acidophilus* with potential antimicrobial and immunomodulatory activities. As a dietary supplement, *Lactobacillus acidophilus* (*L. acidophilus*), a naturally-occurring bacteria, may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal microflora. Because it produces lactic acid and hydrogen peroxide and other substances during fermentation, this bacterium creates an acidic environment unfavorable to pathogens such as *Candida albicans*. In addition, during colonization of the GI tract, *L. acidophilus* may form a protective barrier, preventing attachment of pathogens. Dietary supplementation with this bacterium has been shown to enhance natural and acquired immunity in mice.

**Lactobacillus acidophilus/estriol vaginal tablet:** A vaginal tablet containing a low dose of the estrogen hormone estriol and lyophilized *Lactobacillus acidophilus*, with hormone replacement and vaginal flora restoring activity. Upon vaginal application, estriol may restore estrogen

levels locally and may relieve symptoms caused by estrogen deficiency; the *Lactobacillus acidophilus* may be able to restore the vaginal *Lactobacillus* flora. Check for active clinical trials using this agent.

***Lactobacillus acidophilus*/Streptococcus thermophilus/Bifidobacterium lactis/L. rhamnosus/B. longum/B. bifidum-based probiotic**

**supplement:** A nutritional supplement containing probiotic cultures of *Lactobacillus acidophilus* (*L. acidophilus*), *L. rhamnosus* *Streptococcus thermophilus*, *Bifidobacterium lactis*, (*B. lactis*), *B. longum* and *B. bifidum*, with gastrointestinal (GI) protective and immunomodulating activities. Upon oral administration, the bacteria in this probiotic supplement help maintain adequate colonization of the GI tract and modulate the composition of the normal microflora. Upon colonization of the GI tract, the probiotic bacteria form a protective barrier that helps maintain the integrity of the epithelial barrier. This will interfere with the attachment of pathogenic bacteria and other harmful substances, prevent inflammation and improve GI function. Check for active clinical trials using this agent.

***Lactobacillus brevis* CD2 lozenge:** A lozenge containing an extract from the *Lactobacillus brevis* (*L. brevis*) with potential anti-inflammatory activity. As *L. brevis* CD2 contains high levels of arginine deiminase, which catalyzes the conversion of arginine to citrulline and ammonia, administration of this lozenge leads to hydrolysis of arginine in the oral cavity. The growth of bacteria, which depends on arginine, is halted, polyamine biosynthesis is reduced and the production of nitric oxide (NO) is reduced. The reduction in NO generation may further prevent inflammation in the oral cavity. Therefore, this agent may be able to reduce chemo- and radiotherapy-induced mucositis.

***lactobacillus fermented extract:*** A proprietary dietary supplement. *Lactobacillus* fermented extract is made from soymilk fermented by several strains of *lactobacillus* and yeast via a symbiotic co-culturing technology. The composition of the agent includes amino acids, vitamins, minerals, fatty acids, isoflavones, and saponins. *Lactobacillus* fermented extract may support healthy intestinal function.

***Lactobacillus plantarum* 299v/*Lactobacillus***

***acidophilus*/Bifidobacterium lactis probiotic supplement:** A powder-based, probiotic supplement drink containing the non-pathogenic microorganisms *Lactobacillus plantarum* 299v, *Lactobacillus acidophilus*,

and *Bifidobacterium lactis*, with potential immunomodulating and protective activities. Upon oral ingestion, the naturally-occurring bacterial components in this dietary supplement may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal microflora. During colonization in the GI tract, the bacteria may form a protective intestinal barrier which may prevent damage to the mucosal epithelia caused by toxins and attachment of potential pathogens, thereby protecting against infections. In addition, this agent may reduce the secretion of proinflammatory cytokines and may potentiate natural and acquired immunity. Check for active clinical trials using this agent.

**Lactobacillus plantarum strain 299:** A nutritional supplement containing the probiotic bacterium *Lactobacillus plantarum* 299 (Lp 299) with potential antimicrobial, immune-boosting, and anti-inflammatory activities. Upon oral ingestion, Lp 299 adheres to the intestinal mucosa, modulates the composition of the normal microflora, helps maintain adequate colonization of the gastrointestinal (GI) tract and improves digestion and metabolism. Upon colonization of the GI tract, the probiotic may form a protective barrier, thereby preventing attachment of pathogens, protecting against infections and boosting the immune system. In addition, Lp 299 stimulates the secretion of protective mucin and produces lactic acid and hydrogen peroxide as well as other substances, thereby creating an acidic environment which prevents growth of pathogens.

**Lactobacillus plantarum strain 299v:** A nutritional supplement containing a strain of the probiotic bacterium *Lactobacillus plantarum* 299v (Lp 299v) with potential antimicrobial, immune-boosting, and anti-inflammatory activities. Upon oral ingestion, *L. plantarum* strain 299v adheres to the intestinal mucosa, modulates the composition of the normal microflora, helps maintain adequate colonization of the gastrointestinal (GI) tract and improves digestion and metabolism. Upon colonization of the GI tract, the probiotic may form a protective barrier, thereby preventing attachment of pathogens, protecting against infections and boosting the immune system. In addition, Lp 299v stimulates the secretion of protective mucin and produces lactic acid and hydrogen peroxide as well as other substances, thereby creating an acidic environment which prevents growth of pathogens. Check for active clinical trials using this agent.

**Lactobacillus rhamnosus GG:** A live specific strain of the species, *Lactobacillus rhamnosus* (a subspecies of *Lactobacillus casei*) with probiotic activity. When administered orally, *Lactobacillus rhamnosus* GG adheres to the mucous membrane of the intestine and may help to restore the balance of the GI microflora; promote gut-barrier functions; diminish the production of carcinogenic compounds by other intestinal bacteria; and activate the innate immune response and enhance adaptive immunity, especially during infections. Check for active clinical trials using this agent. or A live form of a bacterium that makes lactic acid (a substance that is made from sugars found in milk and is also made in the body).

*Lactobacillus rhamnosus* GG is given to help with digestion and normal bowel function. It may also help keep the gastrointestinal (GI) tract healthy. It is being studied in the prevention of infections in patients having donor stem cell transplants and in other conditions. Also called Culturelle.

**Lactobacillus rhamnosus/L. jensenii/L. crispatus/L. gasseri oral supplement:** A nutritional supplement containing the probiotic *Lactobacillus* strains *L. rhamnosus*, *L. jensenii*, *L. crispatus* and *L. gasseri* with protective and immunomodulating activities. The bacteria in this probiotic supplement colonize the vaginal tract and help to maintain as well as restore the composition of the normal, healthy vaginal flora. The four *Lactobacillus* species form a protective barrier that helps both to maintain the integrity of the vaginal tract and prevent the attachment of pathogenic bacteria and other harmful substances, thereby protecting against genitourinary infections.

**Lactobacillus-based probiotic capsule:** A capsule containing a strain of the probiotic bacterium *Lactobacillus* with potential antimicrobial and immunomodulatory activities. As a dietary supplement, *Lactobacillus*, a naturally-occurring bacterium, may improve digestion and help maintain adequate colonization of the gastrointestinal (GI) tract by modulating the composition of the normal microflora. Because it produces lactic acid and hydrogen peroxide and other substances during fermentation, this bacterium creates an acidic environment that is unfavorable for pathogens. In addition, during colonization of the GI tract, this bacterium adheres to human epithelial cells and forms a protective barrier, thereby preventing the attachment of pathogens. Dietary supplementation with this bacterium has been shown to enhance innate and acquired immunity.

**lactoferrin** : A protein that is found in milk, tears, mucus, bile, and some white blood cells and is being studied in the treatment and prevention of cancer. It is involved in fighting against infection and inflammation and it acts as an antioxidant.

**lactoferrin-derived lytic peptide LTX-315**: A peptide derived from human lactoferrin, with potential lytic and immunostimulating activities. Upon transdermal injection directly into the tumor, LTX315 may bind to the tumor cell membranes and subsequently lyse tumor cells, thereby inducing tumor cell necrosis. In turn, presentation of the tumor antigens to the immune system may induce systemic innate and adaptive immune responses mediated by anti-tumor natural killer (NK) cells, cytotoxic T lymphocytes, and natural killer T (NKT) cells. This may trigger an immune response against tumor associated antigens on tumors distant from the primary tumor. Human lactoferrin, a 692 amino acid glycoprotein, belongs to the transferrin family of metal-binding proteins.

**lactose** : A type of sugar found in milk and milk products.

**lactose intolerance** : The inability to digest or absorb lactose, a type of sugar found in milk and other dairy products.

**Ladder Edge** : An edge finish formed by extending reinforcing wires or connectors beyond the spiral finish, and creating an edge in the appearance of ladder chain.

**Ladder Edge, Welded** : An edge finish similar to Ladder Edge with loops tack welded or brazed.

**laetrile**: Originally, the name laetrile was the contraction of laevo-mandelonitrile glucoside, a cyanogenic glycoside found naturally in some plants. Over the years the meaning of laetrile has changed. There are now preparations called Laetrile where amygdalin is the major constituent. Laetrile and amygdalin are often used interchangeably, but are different agents. Cyanide and benzaldehyde are metabolites of both laetrile and amygdalin. Both metabolites may possess antineoplastic properties. Laetrile has been used as an anticancer treatment in humans worldwide, but scientific evidence does not support its effectiveness. It is not approved for use in the United States. or A substance found in the pits of many fruits such as apricots and papayas, and in other foods. It has been tried in some countries as a treatment for cancer, but it has not been shown to work in

clinical studies. Laetrile is not approved for use in the United States. Also called amygdalin.

**Lagging:** The process of covering vessels or pipes with a non-conducting material to prevent loss or ingress of heat.

**Lagging strand:** A newly synthesized strand of DNA at the replication fork that is initially synthesized as Okazaki fragments. OR The DNA strand that, during replication, must be synthesized in the direction opposite to that in which the replication fork moves.

**lagoon:** in wastewater treatment, a shallow pond where sunlight, bacterial action, and oxygen interact to restore wastewater to a reasonable state of purity.

**lahar:** a mudflow originating on a volcanic slope.

**Laitance:** A milky type deposit from newly applied concrete.

**LAK cell :** A white blood cell that is stimulated in a laboratory to kill tumor cells. Also called lymphokine-activated killer cell.

**Lambert's law:** The intensity of radiation passing through a material decays exponentially with path length  $b$ .

**lamellar body mimetic mouth spray LMS-611:** A suspension-based oral spray containing multilamellar lipid vesicles in which the lipids mimic the lipidic composition of endogenous extra-alveolar lamellar bodies, with muco-restorative and protective activity against radiotherapy (RT)-induced xerostomia (RIX). Upon sublingual administration of the lamellar body mimetic LMS-611 using a spray, the lipids in this agent mimic the natural secretions of endogenous lamellar bodies. This makes mucus more fluid and may prevent dryness of the mouth. This restores saliva functions and makes it easier to chew, swallow and talk, and also prevents xerostomia-induced infections, tooth decay and tooth enamel decay. RT decreases saliva secretion by causing the destruction of the parotid and submandibular serous salivary glands and lamellar bodies. This results in thicker and more visco-adhesive saliva, which causes various xerostomia-induced symptoms; intact lamellar bodies maintain the fluidity of mucus and lubricate the mouth.

**Lamictal:** (Other name for: lamotrigine)

**lamina propria :** A type of connective tissue found under the thin layer of tissues covering a mucous membrane.

**Laminar Flow:** Laminar flow of thermoplastic resins in a mold is accomplished by solidification of the layer in contact with the mold surface that acts as an insulating shell through which molten material flows to fill the remainder of the cavity. OR Laminar flow of thermoplastic resins in a mold is accompanied by solidification of the layer in contact with the mold surface that acts as an insulating tube through which material flows to fill the remainder of the cavity. This type of flow is essential to duplication of the mold surface.

**Laminate:** 1) (v) – To build up to desired shape or thickness. 2) (n) – A material composed of successive layers of material, usually bonded together under heat and pressure. OR object composed of two or more sheets or shells of material utilized by means of a bonding agent.

**LAMINATED PLASTICS (Synthetic resin-bonded laminate, laminate):** A plastics material consisting of superimposed layers of a synthetic resin-impregnated or -coated filler which have been bonded together, usually by means of heat and pressure, to form a single piece.

**lamivudine:** A synthetic nucleoside analogue with activity against hepatitis B virus (HBV) and HIV. Intracellularly, lamivudine is phosphorylated to its active metabolites, lamiduvine triphosphate (L-TP) and lamiduvine monophosphate (L-MP). In HIV, L-TP inhibits HIV-1 reverse transcriptase (RT) via DNA chain termination after incorporation of the nucleoside analogue into viral DNA. In HBV, incorporation of L-MP into viral DNA by HBV polymerase results in DNA chain termination. L-TP is a weak inhibitor of mammalian DNA polymerases alpha and beta, and mitochondrial DNA polymerase. or A drug used to treat infection caused by viruses.

**lamotrigine:** A synthetic phenyltriazine with antiepileptic and analgesic properties. Lamotrigine enhances the action of gamma-aminobutyric acid, an inhibitory neurotransmitter, which may result in a reduction of pain-related transmission of signals along nerve fibers. This agent may also inhibit voltage-gated sodium channels, suppress glutamate release, and inhibit serotonin reuptake. or A drug that is used to help control some types of seizures. It is being studied in the prevention of peripheral neuropathy caused by some chemotherapy drugs. It belongs to the family of drugs called anticonvulsants.

**Lampbrush chromosome:** Giant diplotene chromosome found in the oocyte nucleus. The loops that are observed are the sites of extensive gene expression.

**LAND:** 1. The bearing surface along the top of the flights of a screw in a screw extruder. 2. The surface of an extrusion die parallel to the direction of melt flow. OR (1) The horizontal bearing surface of a semi positive or flash mold by which excess material escapes. See Cut-off. (2) The bearing surface along the top of the flights of a screw in a screw extruder. (3) The surface of an extrusion die parallel to the direction of melt flow. OR A term used to describe the area in which the gate, or vent, resides. It can also be thought of as the "length" dimension in the "l, w, h" terminology used for describing the dimensions of the gate or vent. See also shutoff land.

**Land (Gate Area):** Gate dimension parallel to the direction of melt flow.

**Land Area:** The area of surfaces of a mold which contact each other when the mold is closed.

**land breeze:** local wind that forms at night along a beach due to uneven cooling rates of land and water, wind moves from land to water.

**landslide:** a destructive, rapid mass-wasting event.

**Lane Dividers :** Detachable plates assembled into the belt's width to create product lanes. Spiral wire lane dividers can also be manufactured.

**Langerhans cell histiocytosis :** A group of rare disorders in which too many Langerhans cells (a type of white blood cell) grow in certain tissues and organs including the bones, skin, and lungs, and damage them. Langerhans cell histiocytosis may also affect the pituitary gland (which makes hormones that control other glands and many body functions, especially growth). Langerhans cell histiocytosis is most common in children and young adults. Also called LCH.

**lanolin :** An oily substance taken from sheep's wool. Lanolin is used in moisturizing creams and lotions to treat dry, itchy skin.

**Lanoxin :** A drug used to treat irregular heartbeat and some types of heart failure. It is also being studied in the treatment of some types of cancer. Lanoxin helps the heart work normally by controlling the amount of calcium that goes into the heart muscle. It also may kill cancer cells and make them more sensitive to anticancer drugs. It is a type of cardiac glycoside. Also called digoxin.

**lanreotide acetate:** The acetate salt of a synthetic cyclic octapeptide analogue of somatostatin. Lanreotide binds to somatostatin receptors (SSTR), specifically SSTR-2 and also to SSTR-5 with a lesser affinity. However, compared to octreotide, this agent is less potent in inhibiting the release of growth hormone from the pituitary gland. Furthermore, lanreotide has an acute effect on decreasing circulating total and free insulin-like growth factor 1 (IGF-I). This agent is usually given as a prolonged-release microparticle or Autogel formulation for the treatment of acromegaly and to relieve the symptoms of neuroendocrine tumors.

**lanreotide acetate :** A drug used to treat gastroenteropancreatic neuroendocrine tumors that are advanced or have spread to other parts of the body. These tumors form in the stomach, small and large intestines, rectum, and pancreas. Lanreotide acetate is used for tumors that cannot be removed by surgery. It is also used to treat some patients with acromegaly (a condition in which the pituitary gland makes too much growth hormone). Lanreotide acetate is like somatostatin (a hormone made by the body), and may help stop the body from making extra amounts of certain hormones, including growth hormone, insulin, glucagon, and hormones that affect digestion. It may also help keep certain types of tumor cells from growing. Lanreotide acetate is a type of somatostatin analog. Also called Somatuline Depot.

**lanreotide acetate copolymer microparticles:** A prolonged-release depot suspension of microparticles containing the acetate salt of lanreotide, a synthetic peptide analog of the naturally occurring somatostatin, and copolymers. Lanreotide inhibits the secretion of growth hormone (GH) by binding to pituitary somatostatin receptors, and may inhibit various other hormones, including thyroid stimulating hormone (TSH) and the gastroenteropancreatic hormones insulin, glucagon and gastrin. This agent has a much longer duration of action than natural somatostatin and is selective towards the inhibition of growth hormone.

**lanreotide long-acting aqueous gel:** A long-acting aqueous gel preparation of lanreotide, a synthetic cyclic octapeptide analogue of somatostatin. Lanreotide inhibits the secretion of growth hormone (GH) by binding to pituitary somatostatin receptors, and may inhibit the release of various other hormones, including thyroid stimulating hormone (TSH) and the gastroenteropancreatic hormones insulin, glucagon and gastrin. This

agent also decreases circulating total and free insulin-like growth factor 1 (IGF-I). Lanreotide exhibits a high binding affinity for somatostatin receptor 2 (SSTR-2) and a lesser binding affinity for SSTR-5. However, compared to octreotide, this agent is less potent in inhibiting the release of growth hormone from the pituitary gland.

**lansoprazole :** A drug that reduces the amount of acid made in the stomach. It is used to treat stomach ulcers, gastroesophageal reflux disease (a condition in which acid from the stomach causes heartburn), and conditions in which the stomach makes too much acid. Lansoprazole is a type of proton pump inhibitor (PPI). Also called Prevacid.

**Lantern light:** A rectangular projection on a flat roof, usually with vertical sides and wholly or partly glazed to admit light and air to the building beneath.

**lanthanide:** Elements 57-70 are called lanthanides. Electrons added during the Aufbau construction of lanthanide atoms go into the 4f subshell.

**lanthanide contraction:** An effect that causes sixth period elements with filled 4f subshells to be smaller than otherwise expected. The intervention of the lanthanides increases the effective nuclear charge, which offsets the size increase expected from filling the  $n=6$  valence shell. As a consequence, sixth period transition metals are about the same size as their fifth period counterparts.

**Lanthanide Series:** The lanthanide series is one of two sets of inner transition elements. Elements 57 through 71 are a part of this series. The elements include cerium, europium, and holmium.

**lanthanides:** the row of elements beneath the periodic table, from cerium to lutetium; also called rare earths.

**Lanthanides:** The series of f-block elements between lanthanum and hafnium.

**Lanthanum:** Symbol:"La" Atomic Number:"57" Atomic Mass: 138.91amu. Lanthanum is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. It is the first element in the lanthanide series. It is a metallic element found in many minerals of the Earth's crust. You may also find it in catalytic converters and special types of glass (like lenses).

**Lantus :** A drug used to control the amount of sugar in the blood of patients with diabetes. It is a form of the hormone insulin that is made in the laboratory. Lantus controls blood sugar longer than insulin does. It is a type of therapeutic insulin. Also called insulin glargine and insulin glargine recombinant.

**Lap:** In painting, the expression 'to lap' refers to the joining up of a section of painting to a previously painted, but still wet, section. Normally it is important for the previously painted edges to be 'kept alive' so that the paint can be well worked into the previously painted section and subsequently dry without the lap showing.

**laparoscope :** A thin, tube-like instrument used to look at tissues and organs inside the abdomen. A laparoscope has a light and a lens for viewing and may have a tool to remove tissue.

**laparoscopic prostatectomy :** Surgery to remove all or part of the prostate with the aid of a laparoscope. A laparoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**laparoscopic surgery :** Surgery done with the aid of a laparoscope. A laparoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called laparoscopic-assisted resection.

**laparoscopic-assisted colectomy :** Surgery done with the aid of a laparoscope to remove all or part of the colon through several small incisions made in the wall of the abdomen. A laparoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. The laparoscope is inserted through one opening to guide the surgery. Surgical instruments are inserted through the other openings to perform the surgery. When only part of the colon is removed, it is called a partial colectomy.

**laparoscopic-assisted resection :** Surgery done with the aid of a laparoscope. A laparoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called laparoscopic surgery.

**laparoscopy :** A procedure that uses a laparoscope, inserted through the abdominal wall, to examine the inside of the abdomen. A laparoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also

have a tool to remove tissue to be checked under a microscope for signs of disease.

**laparotomy** : A surgical incision made in the wall of the abdomen.

**lapatinib** : A drug used with another anticancer drug to treat breast cancer that is HER2 positive and has advanced or metastasized (spread to other parts of the body) after treatment with other drugs. Lapatinib is also being studied in the treatment of other types of cancer. It is a type of ErbB-2 and EGFR dual tyrosine kinase inhibitor. Also called GW572016, lapatinib ditosylate, and Tykerb.

**lapatinib ditosylate**: The ditosylate salt of lapatinib, a synthetic, orally-active quinazoline with potential antineoplastic activity. Lapatinib reversibly blocks phosphorylation of the epidermal growth factor receptor (EGFR), ErbB2, and the Erk-1 and-2 and AKT kinases; it also inhibits cyclin D protein levels in human tumor cell lines and xenografts. EGFR and ErbB2 have been implicated in the growth of various tumor types. or A drug used with another anticancer drug to treat breast cancer that is HER2 positive and has advanced or metastasized (spread to other parts of the body) after treatment with other drugs. Lapatinib ditosylate is also being studied in the treatment of other types of cancer. It is a type of ErbB-2 and EGFR dual tyrosine kinase inhibitor. Also called GW572016, lapatinib, and Tykerb.

**lappa** : A plant whose seeds and root have been used in some cultures to treat certain medical problems. It may have antioxidant effects. The scientific name is *Arctium lappa*. Also called burdock and happy major.

**lapse rate**: The rapidity with which temperature decreases with altitude. The normal lapse rate is defined to be 3.6 degrees F per 1000 feet change in altitude. The dry adiabatic lapse rate is about 5.5 degrees F per 1000 feet, and the wet adiabatic lapse rate varies between 2 and 5 degrees F per 1000 feet.

**lapuleucel-T**: A cell-based vaccine targets tumors expressing the HER2/neu marker. HER-2/neu is a growth factor receptor, and its overexpression has been associated with a number of cancers including breast, ovarian, colon and lung cancers. APC8024 comprise of autologous antigen-presenting peripheral blood mononuclear cells (APCs) that have been exposed to HER2/neu protein and can be administered to the patient.

These cells may stimulate an antitumor T-cell response to cancer cells expressing HER2/neu. Check for active clinical trials using this agent.

**Laradopa:** (Other name for: levodopa)

**large cell carcinoma :** Lung cancer in which the cells are large and look abnormal when viewed under a microscope.

**large granular lymphocyte :** A type of white blood cell that contains granules with enzymes that can kill tumor cells or microbial cells.

**large intestine :** The long, tube-like organ that is connected to the small intestine at one end and the anus at the other. The large intestine has four parts: cecum, colon, rectum, and anal canal. Partly digested food moves through the cecum into the colon, where water and some nutrients and electrolytes are removed. The remaining material, solid waste called stool, moves through the colon, is stored in the rectum, and leaves the body through the anal canal and anus.

**largetrifoliolious bugbane rhizome supplement:** A proprietary tablet formulation containing an extract from Largetrifoliolious Bugbane rhizome (Shengma), the dried root of *Cimicifuga* sp., with potential use for relieving menopausal symptoms. The Largetrifoliolious bugbane rhizome supplement contains total saponins, including phytoestrogens that can modulate estrogen receptor signaling. This supplement is used to reduce disease symptoms, such as sweating, toothache, headache, ulcers, and insomnia. In women, this supplement may be used to reduce symptoms related to menopause.

**Largeware:** A term given to containers that are over one gallon in capacity.

**Larmor frequency:** The frequency of precession of a nucleus in a magnetic field.

**Larodopa:** (Other name for: levodopa)

**laromustine:** A sulfonyl hydrazine prodrug with antineoplastic activity. Laromustine releases the DNA chloroethylating agent 90CE after entering the blood stream; 90CE chloroethylates alkylates the O6 position of guanine, resulting in DNA crosslinking, strand breaks, chromosomal aberrations, and disruption of DNA synthesis. Intracellular metabolism of this agent also releases methyl isocyanate which inhibits O6-alkyl-guanine transferase, an enzyme involved with DNA repair.

**laromustine :** A drug used to treat acute myelogenous leukemia (AML). It is also being studied in the treatment of several other types of cancer. It blocks cell growth by damaging the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called Cloretazine and Onrigin.

**larotaxel:** A semi-synthetic derivative of the taxane 10-deacetylbaccatin III with potential antineoplastic activities. Larotaxel binds to tubulin, promoting microtubule assembly and stabilization and preventing microtubule depolymerization, thereby inhibiting cell proliferation. As it represents poor substrate for P-glycoprotein-related drug resistance mechanisms, this agent may be useful for treating multi-drug resistant tumors. Larotaxel penetrates the blood brain barrier.

**laryngeal :** Having to do with the larynx.

**laryngeal cancer :** Cancer that forms in tissues of the larynx (area of the throat that contains the vocal cords and is used for breathing, swallowing, and talking). Most laryngeal cancers are squamous cell carcinomas (cancer that begins in flat cells lining the larynx).

**laryngectomee :** A person whose larynx (voice box) has been removed.

**laryngectomy :** An operation to remove all or part of the larynx (voice box).

**laryngitis :** Inflammation of the larynx.

**laryngoscope :** A thin, tube-like instrument used to examine the larynx (voice box). A laryngoscope has a light and a lens for viewing and may have a tool to remove tissue.

**laryngoscopy :** Examination of the larynx (voice box) with a mirror (indirect laryngoscopy) or with a laryngoscope (direct laryngoscopy).

**larynx:** the voicebox of mammals, formed from several folds of cartilage at the upper end of the trachea. OR The area of the throat containing the vocal cords and used for breathing, swallowing, and talking. Also called voice box.

**laser:** Acronym for light amplification by stimulated emission of radiation. A laser is an intense source of light with a very narrow range of wavelengths. The intense light is given off when many ions are stimulated and simultaneously emit a photon at the same wavelength.

**laser :** A device that forms light into intense, narrow beams that may be used to cut or destroy tissue, such as cancer tissue. It may also be used to

reduce lymphedema (swelling caused by a buildup of lymph fluid in tissue) after breast cancer surgery. Lasers are used in microsurgery, photodynamic therapy, and many other procedures to diagnose and treat disease.

**laser acupuncture :** The use of a low-level laser beam instead of an acupuncture needle to stimulate an acupuncture point.

**Laser light scattering:** Various particle-size distribution analyses that examine the optical response of a suspended powder to illumination by a laser (cf. Fraunhofer diffraction, time-domain and image analysis).

**laser surgery :** A surgical procedure that uses the cutting power of a laser beam to make bloodless cuts in tissue or to remove a surface lesion such as a tumor.

**laser therapy :** Treatment that uses intense, narrow beams of light to cut and destroy tissue, such as cancer tissue. Laser therapy may also be used to reduce lymphedema (swelling caused by a buildup of lymph fluid in tissue) after breast cancer surgery.

**Lasix:** (Other name for: furosemide)

**lassitude :** A feeling of tiredness, weakness, and lack of interest in daily activities.

**late effect :** A health problem that occurs months or years after a disease is diagnosed or after treatment has ended. Late effects may be caused by cancer or cancer treatment. They may include physical, mental, and social problems and second cancers.

**late or variable onset :** The state in which a genetic trait is expressed later in life or is expressed at no fixed time in a life history.

**late-stage cancer :** A term used to describe cancer that is far along in its growth, and has spread to the lymph nodes or other places in the body.

**latency period :** The time that passes between being exposed to something that can cause disease (such as radiation or a virus) and having symptoms.

**latent :** Describes a condition that is present but not active or causing symptoms.

**Latent cancer fatality (LCF):** Death resulting from cancer that became active after a latent period following exposure to radiation.

**latent heat:** Energy transferred from the earth's surface to the atmosphere through the evaporation and condensation processes. OR Heat that is

absorbed without causing a rise in temperature. For example, "latent heat of vaporization" refers to the amount of heat required to convert a liquid to vapor at a particular temperature.

**latent period :** Delay between exposure to a disease-causing agent and the appearance of manifestations of the disease. After exposure to ionizing radiation, for instance, there is a latent period of five years, on average, before development of leukemia, and more than 20 years before development of certain other malignant conditions. The term "latent period" is often used as synonym with "induction period", that is, the period between exposure to a disease-causing agent and the appearance of manifestations of the disease. It has also been defined as the period from disease initiation to disease detection (Last, 1988).

**Lateral diffusion:** The ability of lipid and protein molecules to move laterally in the membrane rapidly and spontaneously.

**lateral erosion:** erosion that occurs when a stream meanders or braids back and forth across its valley floor or channel, undercutting and eroding its banks.

**lateral moraine:** a moraine consisting of rock debris and sediment that have worked loose from the walls beside a valley glacier and have accumulated in ridges along the sides of the glacier. OR the pile of rocks that accumulate along the edges of a glacier.

**laterite:** a typically bright red, highly leached, residual soil that forms in tropical regions.

**lateritic weathering:** weathering that results in residual deposits that become enriched through the chemical breakdown and removal of more reactive elements of a rock.

**Latex:** A latex (plural latices, or latexes for the Americans!) is a dispersion of water-insoluble polymer in water. The dispersion is usually of particles (not single molecules) that are around 100 nm (10<sup>-4</sup> mm) in size. The particles are kept suspended in the water by thermal convection (which keeps them from settling out) and surfactants (which keep them from sticking together to form bigger and bigger lumps). Another word for latex is polymer colloid.

**LATEX:** A water-thinned paint, such as a polyvinyl acetate, styrene butadiene or acrylic.

**Latex paint:** Water-based paint made with synthetic binders such as 100% acrylic vinyl, acrylic terpolymer or styrene acrylic. Latex paint dries fast, flows smoothly and cleans up easily with water.

**Latex-based Paint:** General term used for water-based emulsion paints made with synthetic binders such as 100% acrylic, vinyl acrylic, terpolymer or styrene acrylic. A stable emulsion of polymers and pigment in water.

**Lath and plaster:** Describes a form of ceiling or wall construction in which narrow strips of wood are fixed to the framing or joists over which plaster coatings are spread.

**Latin America:** The region between Tijuana and Tierra del Fuego containing a few major petroleum producing countries such as Mexico and Venezuela. So-called because the inhabitants speak badly mispronounced and grammatically incorrect provincial Latin.

**Latisse :** The drug bimatoprost used to increase the length, thickness, and darkness of eyelashes. It is being studied as a way to increase the growth of eyelashes and eyebrows in patients given chemotherapy for cancer. A sterile brush is used to apply Latisse on the upper and lower margins of the eyelids once a day.

**latissimus dorsi flap :** A type of surgery used to rebuild the shape of the breast after a mastectomy. A muscle in the back called the latissimus dorsi, along with skin, fat, and blood vessels, is moved from the back to the chest to form a new breast mound or to form a pocket for a breast implant. This is usually done by passing the muscle tissue and blood vessels through a tunnel under the skin to the chest. A latissimus dorsi flap is a type of breast reconstruction.

**latitude:** coordinate lines for locating a position on Earth that run east and west and are parallel to each other, running from 0° to 90° (angle from the equator).

**lattice:** A regular array of ions or atoms. OR A regular arrangement of points in space in 3 dimensions. OR In a crystal, some arrangement of atoms is repeated in a regular way. If we put an imaginary point at the centre of each repeating unit and mentally throw the rest away, the positions of these points will define a crystal lattice. For example, if the points define the corners of a cube, the crystal is a primitive cubic lattice; if they define the corners and a point in the centre of each face (like a die with a one on

every side), the crystal is a face-centred cubic lattice, etc. There are 14 basic types of crystal lattice.

**Lattice Pattern:** In reinforced plastics, a pattern of filament winding with a fixed arrangement of open voids.

**Laudicon:** (Other name for: hydromorphone hydrochloride)

**laughter therapy :** A type of therapy that uses humor to help relieve pain and stress and improve a person's sense of well-being. It may be used to help people cope with a serious disease, such as cancer. Laughter therapy may include laughter exercises, clowns, and comedy movies, books, games, and puzzles. It is a type of complementary therapy. Also called humor therapy.

**Laurasia:** the paleocontinent that once included the present-day landmasses of North America and Eurasia.

**lava:** Lava is molten rock that has erupted from the surface of the Earth. OR liquid rock on the surface of the Earth. OR magma that is extruded at the earth's surface, as from a volcano. OR This is molten rock that is on the surface of the Earth. It flows from volcanoes. Molten rock inside the Earth is called magma.

**lava flood:** nonvolcanic lava that vents from deep cracks in the continental crust.

**lavage :** In medicine, washing out an organ (such as the stomach or colon), a body cavity, or a wound by flushing it with a fluid. Also called irrigation.

**lavender :** A plant with aromatic leaves and flowers that is a member of the mint family. Oil from the flowers has been used in some cultures to treat certain medical problems, to keep insects away, and to wash in. It is also used in aromatherapy. Perillyl alcohol, a substance found in lavender, is being studied in cancer prevention and treatment. The scientific name is *Lavandula angustifolia*. Also called English lavender and true lavender.

**law:** Mathematical statement of a relationship that is always the same. OR Natural laws summarize patterns that recur in a large amount of data. Unlike human laws, natural laws don't forbid or permit; they describe.

**law of combining volumes:** When gases react, they do so in a definite proportion by volume, if the volumes are measured at the same pressure and temperature. For example, in the reaction  $\text{N}_2(\text{g}) + 3 \text{H}_2(\text{g}) = 2 \text{NH}_3(\text{g})$ , 3

liters of hydrogen will react with 1 liter of nitrogen to give 2 liters of ammonia if all volumes are measured at the same temperature and pressure.

**LAW of CONSERVATION of ENERGY:** states that energy cannot be destroyed nor created, but only changed in form. Ex. heat --> electricity --> light, etc.

**law of conservation of mass:** There is no change in total mass during a chemical change. The demonstration of conservation of mass by Antoine Lavoisier in the late 18th century was a milestone in the development of modern chemistry.

**LAW of CONSERVATION of MATTER:** states that matter cannot be created nor destroyed, but only changed in form. For example matter and mass can be interchanged.

**law of definite proportions:** When two pure substances react to form a compound, they do so in a definite proportion by mass. For example, when water is formed from the reaction between hydrogen and oxygen, the 'definite proportion' is 1 g of H for every 8 g of O.

**law of faunal succession:** a law that states that fossil species succeed one another in undisturbed rocks in a definite and recognizable order around the world.

**Law of mass action:** The finding that the rate of a chemical reaction is a function of the product of the concentrations of the reacting species.

**law of mass action:** The law stating that the rate of any given chemical reaction is proportional to the product of the activities (or concentrations) of the reactants.

**LAW of MULTIPLE PROPORTIONS:** shows that some compounds have formulas that are whole number multiples of atoms Ex.  $\text{NO}_2$ ,  $\text{N}_2\text{O}_4$ ;  $\text{H}_2\text{O}$ ,  $\text{H}_2\text{O}_2$ ;  $\text{FeO}$ ,  $\text{Fe}_2\text{O}_3$ .

**law of multiple proportions:** When one element can combine with another to form more than one compound, the mass ratios of the elements in the compounds are simple whole-number ratios of each other. For example, in  $\text{CO}$  and in  $\text{CO}_2$ , the oxygen-to-carbon ratios are 16:12 and 32:12, respectively. Note that the second ratio is exactly twice the first, because there are exactly twice as many oxygens in  $\text{CO}_2$  per carbon as there are in  $\text{CO}$ .

**law of original horizontality:** a law that states that most sedimentary rocks formed as nearly horizontal layers.

**Law of Partition:** A situation that enables a solute to dissolve in solvents based on the solubility of those solvents. If you mix oil in water and add sugar, the sugar will dissolve more readily in the water because there is a higher solubility.

**Law of rational indices:** A rule stating that the major faces on a crystal will generally be related to the principle dimensions of the unit cell and will have Miller indices with low integer values [(100), (101), (210), etc.]

**law of superposition:** a law that states that in an undisturbed sequence of sedimentary rocks or lava flows the overlying rock is younger than the underlying rock.

**Lawrencium:** Symbol:"Lr" Atomic Number:"103" Atomic Mass: (260)amu. Lawrencium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a radioactive and unstable element and you will not find it in use anywhere.

**laxative :** A substance that promotes bowel movements.

**Lay Flat:** Flexible polyethylene tubing which has been pressed flat.

**Lay-up:** A resin-impregnated reinforcement in the mould, prior to polymerisation.

**Layer thickness:** The precise thickness of a single additive layer that can reach as small as microns thin. Often, parts will contain thousands of layers.

**Layflat:** Measurement of the transverse/cross direction of film, also known as film width.

**Laying off:** The final brush strokes on any surface during a painting operation. These strokes are made after the paint has been spread evenly over the surface.

**Laylight:** A window fixed horizontally in a ceiling to admit light (natural or artificial).

**Lazanda:** (Other name for: fentanyl citrate pectin-based nasal spray)

**LBH589:** A drug used with bortezomib and dexamethasone to treat multiple myeloma. It is used in patients who have already been treated with bortezomib and an immunomodulating agent. It is also being studied in the treatment of other types of cancer. LBH589 blocks certain enzymes needed

for cells to grow and divide and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of histone deacetylase inhibitor and a type of antiangiogenesis agent. Also called Farydak and panobinostat.

**LC50:** This abbreviation is used for the exposure concentration of a toxic substance lethal to 50% of a test population. See median lethal concentration.

**LCH:** A group of rare disorders in which too many Langerhans cells (a type of white blood cell) grow in certain tissues and organs including the bones, skin, and lungs, and damage them. LCH may also affect the pituitary gland (which makes hormones that control other glands and many body functions, especially growth). LCH is most common in children and young adults. Also called Langerhans cell histiocytosis.

**LCIS:** A condition in which abnormal cells are found in the lobules of the breast. This condition seldom becomes invasive cancer. However, having LCIS in one breast increases the risk of developing breast cancer in either breast. Also called lobular carcinoma in situ.

**LCP:** Liquid crystal polymer

**LD:** Where alleles (DNA markers) occur together more often than can be accounted for by chance because of their physical proximity on a chromosome. Also called linkage disequilibrium.

**LD50:** This abbreviation is used for the dose of a toxic substance lethal to 50% of a test population. See median lethal dose.

**LDA:** see LSDA.

**LDE225:** A drug used to treat locally advanced basal cell carcinoma (BCC) that has come back after surgery or radiation therapy. It is also used in patients who cannot be treated with surgery or radiation therapy. LDE225 is also being studied in the treatment of other types of cancer. LDE225 blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of hedgehog signaling pathway antagonist. Also called erismodegib, Odomzo, and sonidegib.

**LDH:** One of a group of enzymes found in the blood and other body tissues, and involved in energy production in cells. An increased amount in the blood may be a sign of tissue damage and some types of cancer or other diseases. Also called lactate dehydrogenase and lactic acid dehydrogenase.

**LDPE (Low Density Polyethylene):** This resin was used with older can liner technology. The resin has good clarity but weak film strength. Today it is used primarily for Food and Utility bags. A plastic used predominantly in film applications due to its toughness, flexibility and relative transparency. LDPE has a low melting point, making it popular for use in applications where heat sealing is necessary. Typically, LDPE is used to manufacture flexible films such as those used for plastic retail bags and garment dry cleaning and grocery bags. LDPE is also used to manufacture some flexible lids and bottles, and it is widely used in wire and cable applications for its stable electrical properties and processing characteristics. (Adapted from Modern Plastics Encyclopedia 1995)

**LDPE Tubing:** LDPE Tubing: Low Density Polyethylene Tubing

**Le Chatelier's principle:** a system that in equilibrium is disturbed adjusts so as to minimize the disturbance. OR When an external force is applied to an equilibrium system, the system adjusts to minimize the effect of the force. OR Le Chatelier's principle predicts that when a stress is applied to an equilibrium mixture, the equilibrium will shift to relieve the stress. Stresses include temperature changes, pressure changes, and changes in the concentrations of species in the mixture. For example, increasing the concentration of a reactant drives the reaction forward; increasing the concentration of a product drives it backward.

**Le Chatelier's principle:** States that a system at equilibrium will oppose any change in the equilibrium conditions.

**Leach:** To extract a soluble component from a mixture by the process of percolation.

**leachate:** The solution produced by passing a liquid through a solid, often containing chemicals that have dissolved from the solid to the liquid. As rainwater passes through landfills and associated sediments, various chemical substances may dissolve in the water and penetrate the aquifer and contaminate ground water.

**Lead:** Symbol:"Pb" Atomic Number:"82" Atomic Mass: 207.20amu. It is classified as a basic metal. Lead is a bluish metal found as an element and in many minerals. It has been used in several alloys, radiation shielding, and even insecticides. Lead is toxic to living organisms.

**LEAD CHROME PIGMENTS:** A series of inorganic pigments including yellows, oranges, and greens, used in polyolefins and other plastics.

**Lead Compound:** Compounds that could serve as a starting point for the development of a clinically useful drug.

**lead compound :** In medicine, a chemical compound that shows promise as a treatment for a disease and may lead to the development of a new drug. Thousands of compounds are tested in the laboratory to find a lead (“leading”) compound that may act on specific genes or proteins involved in a disease. Once a lead compound has been found, the chemical structure is used as a starting point to make a drug that has the most benefits and the least harms. Finding a lead compound is the first step in making a new drug to treat a disease.

**Lead Discovery:** The process of discovering and identifying chemical entities that could serve as a starting point for the development of a clinically useful drug.

**Lead Optimisation:** Drug design techniques employed on lead compounds to improve pharmacokinetic and pharmacodynamic profiles.

**Lead paint:** Usually refers to a paint based on white lead or red lead but more widely can mean any paint containing a lead pigment.

**lead Pb 212 TCMC-trastuzumab:** A radioimmunoconjugate containing the recombinant humanized monoclonal antibody trastuzumab conjugated with the bifunctional chelating agent TCMC ((1,4,7,10-Tetra-(2-Carbamoyl Methyl)-Cyclododecane), and radiolabeled with the alpha-emitting isotope lead Pb 212, with potential anti-tumor activity. Upon administration, the antibody moiety of lead Pb 212 TCMC-trastuzumab binds with high affinity to the extracellular domain of human epidermal growth factor receptor 2 (HER2); after internalization, the radioisotope moiety delivers a cytotoxic dose of alpha radiation to the HER2-expressing tumor cells. HER2, a tyrosine kinase receptor, is overexpressed on the cell surface of a variety of cancer cell types.

**leader:** A short sequence near the amino terminus of a protein or the 5' end of an RNA that has a specialized targeting or regulatory function.

**Leader pins:** A group of pins (usually circular) that normally travel in bushings to provide alignment of two unattached components, such as the two halves of an injection mold. Also called guide pins.

**Leader region:** The region of an mRNA between the 5' end and the initiation codon for translation of the first polypeptide chain.

**Leader sequence:** An N-terminal signal sequence that directs secretion and processing of proteins.

**leading keywords:** If the first word in an English phrase indicates an operation, it is a leading keyword; it "leads" the expression.

**Leading strand:** A newly synthesized strand of DNA at the replication fork that is synthesized continuously. See also . OR The DNA strand that, during replication, is synthesized in the same direction in which the replication fork moves.

**Leafing:** Certain metallic pigments such as aluminium in the form of thin, flat flakes (as distinct from the granular form) which float to the surface of a paint coating and slightly overlap each other, forming a 'barrier' to help prevent staining from previous coatings or substrate.

**Leak rate:** the rate at which the outer filling solution of the reference electrode enters the sample solution. Low or irregular leak rates may cause variations in the liquid junction potential, resulting in erroneous or unstable readings. This is not a significant factor in modern gelfilled electrodes.

**LEAKAGE FLOW:** The flow through the clearance between the flight lands and the barrel wall.

**leaky mutant:** A mutant gene that gives rise to a product with a detectable level of biological activity.

**least common denominator:** The least common multiple of all the denominators in the problem.

**least common multiple:** The smallest of the common multiples of more than one number. For example, 12 and 24 are both multiples of 3 and 4. 12 is the least common multiple of 3 and 4.

**leaving group:** the negatively charged group that departs from a molecule, which is undergoing a nucleophilic substitution reaction. OR The departing or displaced molecular group in a unimolecular elimination or a bimolecular substitution reaction.

**Leber's hereditary optic neuropathy:** A maternally inherited form of blindness due to mutations in NADH-Q reductase; one of a number of mitochondrial diseases.

**lectin :** A complex molecule that has both protein and sugars. Lectins are able to bind to the outside of a cell and cause biochemical changes in it. Lectins are made by both animals and plants.

**Lectins:** Agglutinating proteins usually extracted from plants. OR Plant proteins with a high affinity for specific sugar residues; as such, they are important probes of carbohydrate-containing molecules.

**LED :** LightEmitting Diode.

**LED therapy :** Treatment with drugs that become active and may kill cancer cells when exposed to light. LED therapy is a type of photodynamic therapy, which uses a special type of light to activate the drug. Also called light-emitting diode therapy.

**LEEP :** A technique that uses electric current passed through a thin wire loop to remove abnormal tissue. Also called loop electrosurgical excision procedure and loop excision.

**leeward:** the side opposite from the prevailing wind direction.

**leflunomide:** A derivative of isoxazole used for its immunosuppressive and anti-inflammatory properties. As a prodrug, leflunomide is converted to an active metabolite, A77 1726, which blocks dihydroorotate dehydrogenase, a key enzyme of de novo pyrimidine synthesis, thereby preventing the expansion of activated T lymphocytes. This agent also inhibits various protein tyrosine kinases, such as protein kinase C (PKC), thereby inhibiting cell proliferation. or An anticancer drug that works by inhibiting a cancer cell growth factor. Also called SU101.

**left atrium:** the chamber of the human heart that receives oxygen-rich blood via the pulmonary vein.

**left ventricle:** the chamber of the human heart in which oxygen-rich blood enters through the bicuspid valve that leads into the aorta.

**left-lateral strike-slip fault:** a strike-slip fault in which the block across the fault appears to have moved to the left.

**legal aid organization :** A group or agency that gives legal help to people with low incomes. Health legal aid workers help people with issues related to getting good healthcare, and getting insurance to cover certain patients and conditions.

**Legged and braced door:** A door formed of boards fixed to a frame with diagonal bracing pieces.

**Leghemoglobin:** A homolog of hemoglobin found in leguminous plants that also harbor symbiotic nitrogen-fixing bacteria; leghemoglobin binds oxygen, thereby protecting nitrogenase from inactivation.

**legs:** in a right triangle, the two sides forming the 90° angle. In a trapezoid, the nonparallel sides.

**Lehr Mesh :** A balanced weave wire mesh fabric consisting of alternating right and left hand flattened spirals fully seated into specifically formed crimped connector rods - commonly used in glass processing systems.

**leiomyoma :** A benign smooth muscle tumor, usually in the uterus or gastrointestinal tract. Also called fibroid.

**leiomyosarcoma :** A malignant (cancer) tumor of smooth muscle cells that can arise almost anywhere in the body, but is most common in the uterus, abdomen, or pelvis.

**lemon :** A small, yellow citrus fruit that is a source of citric acid and ascorbic acid (vitamin C). The juice is used to flavor food and drink and to prevent scurvy. Lemon oil (scented liquid taken from the peel) is used in aromatherapy. The scientific name of the lemon tree is Citrus limon.

**lenalidomide:** A thalidomide analog with potential antineoplastic activity. Lenalidomide inhibits TNF-alpha production, stimulates T cells, reduces serum levels of the cytokines vascular endothelial growth factor (VEGF) and basic fibroblast growth factor (bFGF), and inhibits angiogenesis. This agent also promotes G1 cell cycle arrest and apoptosis of malignant cells. or A drug that is similar to thalidomide, and is used to treat multiple myeloma and certain types of anemia. It is also used to treat mantle cell lymphoma that has come back or has not gotten better after other treatment. It is being studied in the treatment of other conditions and types of cancer. Lenalidomide may help the immune system kill abnormal blood cells or cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of antiangiogenesis agent and a type of immunomodulating agent. Also called CC-5013 and Revlimid.

**lenapenem:** A broad-spectrum, carbapenem antibiotic with bactericidal activity. Lenapenem binds to penicillin binding proteins (PBPs) located on the bacterial cell wall, thereby inhibiting the final transpeptidation step in the synthesis of peptidoglycan, an essential component of the bacterial cell wall. This inhibition weakens the bacterial cell wall and leads to lytic cell death in a wide range of Gram-positive and Gram-negative aerobic and anaerobic pathogens.

**Length-to-diameter ratio (L/D ratio) -:** Effective screw length divided by the screw diameter and commonly expressed as a ratio to unity.

**lenograstim:** A glycosylated form of a recombinant therapeutic agent which is chemically identical to or similar to an endogenous human granulocyte colony-stimulating factor (G-CSF). Produced endogenously by monocytes, fibroblasts, and endothelial cells, G-CSF binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions.

**lens:** the portion of the eye that focuses the light on the retina. OR A clear disk that focuses light, as in a camera or microscope. In the eye, the lens is a clear, curved structure at the front of the eye behind the pupil. It focuses light rays that enter the eye through the pupil, making an image on the retina (light-sensitive layers of nerve tissue at the back of the eye).

**Lens Dose Equivalent:** The external exposure dose equivalent to the lens of the eye at a tissue depth of 0.3 centimeters (300 mg/cm<sup>2</sup>).

**LENSING:** A term which refers to a film defect that causes undesirable elongated thin voids in an extruded film. Sometimes referred to as windows or air pockets.

**Lenti-D/ABCD1-transduced autologous hematopoietic stem cells:** Autologous CD34<sup>+</sup> hematopoietic stem cells transduced with Lenti-D lentiviral vector encoding the human ATP-binding cassette, sub-family D, member 1 (ABCD1) cDNA, for the potential treatment of childhood cerebral adrenoleukodystrophy (CCALD). Upon administration of the lenti-D/ABCD1-transduced autologous hematopoietic stem cells, the cells proliferate, and some travel to the brain and differentiate into microglial cells. The expressed ABCD1 restores the function of ALD protein (ALDP) and aids in the treatment of CCALD. In CCALD, the ABCD1 gene is mutated, leading to the inability of patients to metabolize very long chain fatty acids in cells of the brain. Check for active clinical trials using this agent.

**LentiGlobin BB305 Drug Product:** (Other name for: autologous beta-A(T87Q)-globin gene-transduced CD34-positive cells)

**lentinan :** A beta-glucan (a type of polysaccharide) from the mushroom *Lentinus edodes* (shiitake mushroom). It has been studied in Japan as a treatment for cancer.

**lentivirus vector CCR5 shRNA/TRIM5alpha/TAR decoy-transduced autologous CD34-positive hematopoietic progenitor cells:** Autologous, CD34-positive hematopoietic progenitor cells (HPCs) transduced with a

lentiviral vector encoding three anti-human immunodeficiency virus (HIV) genes: a short hairpin RNA (shRNA) that targets human chemokine receptor 5 (CCR5), a human/rhesus macaque chimeric tripartite motif-containing protein 5 alpha isoform (TRIM5alpha), and a TAT activation response (TAR) decoy, as well as a pre-selective cell-surface marker, which is a truncated and mutated form of human CD25, used to potentially provide resistance against human immunodeficiency virus (HIV) infection. Human autologous CD34-positive HPCs are isolated and transduced ex vivo with the lentiviral vector. Upon pre-selection, purification using CD25 immunomagnetic separation, and subsequent administration of effectively transduced HPCs, the HPCs display 3 separate mechanisms of action against HIV infection: CCR5 shRNA binds to CCR5 mRNA and inhibits the expression of CCR5, a HIV-1 co-receptor that mediates HIV attachment and host cell entry; TRIM5alpha prevents HIV genome integration upon cell entry; and the TAR decoy binds to the HIV TAT protein and prevents TAT-dependent viral gene transcription, thereby preventing HIV replication. Upon transfer of the lentivirus vector CCR5 shRNA/TRIM5alpha/TAR decoy-transduced autologous CD34-positive HPCs into the patient, the HPCs are resistant to HIV entry and replication and could provide long-term protection against both HIV infection and HIV-associated cancers.

**lentivirus vector rHIV7-shI-TAR-CCR5RZ-transduced hematopoietic progenitor cells:** Autologous, CD34-positive hematopoietic progenitor cells (HPCs) transduced with rHIV7-shI-TAR-CCR5RZ, a lentiviral vector encoding three anti-human immunodeficiency virus (HIV) RNA genes, with potential antineoplastic activity. The 3 RNA products produced by the lentivirus are: a short hairpin RNA (shRNA) targeted to an exon of the HIV-1 genes *tat/rev*, designated as shI; a decoy for the HIV TAT reactive element, designated as TAR; a ribozyme targeting the host cells CCR5 chemokine receptor, designated as CCR5RZ. Upon administration, lentivirus vector rHIV7-shI-TAR-CCR5RZ-transduced hematopoietic progenitor cells expressing the 3 species of RNAs display 3 separate mechanisms of action: the shRNA blocks the transcription of *tat/rev*, the TAR decoy binds to the TAT protein that is essential for HIV replication, and CCR5RZ catalyzes CCR5 which is needed for viral attachment and entry into the host cells. Altogether, infusion of these HPCs may ultimately inhibit HIV replication and suppress HIV infection. Check for active clinical trials using this agent.

**lenvatinib mesylate:** A synthetic, orally available inhibitor of vascular endothelial growth factor receptor 2 (VEGFR2, also known as KDR/FLK-1) tyrosine kinase with potential antineoplastic activity. Lenvatinib mesylate blocks VEGFR2 activation by VEGF, resulting in inhibition of the VEGF receptor signal transduction pathway, decreased vascular endothelial cell migration and proliferation, and vascular endothelial cell apoptosis. or A drug used with everolimus to treat advanced renal cell carcinoma (a type of kidney cancer) that was treated with antiangiogenesis therapy (a type of anticancer therapy). It is also used alone to treat thyroid cancer in certain patients with progressive, recurrent, or metastatic disease that does not respond to treatment with radioactive iodine. It is also being studied in the treatment of other types of cancer. Lenvatinib mesylate blocks certain proteins needed for cells to grow and may kill cancer cells. It is a type of tyrosine kinase inhibitor. Also called Lenvima.

**Lenvima :** A drug used with everolimus to treat advanced renal cell carcinoma (a type of kidney cancer) that was treated with antiangiogenesis therapy (a type of anticancer therapy). It is also used alone to treat thyroid cancer in certain patients with progressive, recurrent, or metastatic disease that does not respond to treatment with radioactive iodine. It is also being studied in the treatment of other types of cancer. Lenvima blocks certain proteins needed for cells to grow and may kill cancer cells. It is a type of tyrosine kinase inhibitor. Also called lenvatinib mesylate.

**lenzilumab:** A recombinant monoclonal antibody against the cytokine granulocyte macrophage colony-stimulating factor (GM-CSF), with potential immunomodulating activity. Upon administration, lenzilumab binds to and neutralizes GM-CSF. This prevents GM-CSF binding to the GM-CSF receptor, which is a heterodimeric protein expressed on myeloid progenitor cells, and prevents GM-CSF-mediated signaling. This may induce apoptosis in and inhibit proliferation of cancer cells that overproduce GM-CSF. GM-CSF plays a key role in the differentiation and proliferation of monocytes, macrophages and granulocytes; elevated levels of GM-CSF are associated with certain autoimmune diseases, inflammatory diseases, and cancers.

**LEP-ETU:** A form of the anticancer drug paclitaxel that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of several types of

cancer. LEP-ETU blocks the ability of cells to divide and may kill cancer cells. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called liposomal paclitaxel, LipoTaxen, paclitaxel liposome, and PNU-93914.

**lepirudin:** A yeast cell-derived recombinant polypeptide related to the naturally occurring, leech-derived anticoagulant hirudin. Lepirudin directly binds to and inactivates thrombin, producing dose-dependent increases in the activated partial thromboplastin time (aPTT) and prothrombin time (PT). The mechanism of action of this agent is independent of antithrombin III and is not inhibited by platelet factor 4. Natural hirudin, a family of highly homologous isopolypeptides, is produced in trace amounts by the leech *Hirudo medicinalis*. or A drug that inhibits blood clotting. It is being studied in cancer treatment.

**Leptin:** A polypeptide hormone, secreted by the adipocytes in direct proportion to fat mass, that generates satiation signals. OR A hormone made by fat cells that helps control the feeling of hunger, the amount of fat stored in the body, and body weight.

**leptomeningeal :** Having to do with the two innermost meninges (thin layers of tissue that cover and protect the brain and spinal cord).

**leptomeningeal carcinoma :** A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinomatosis, leptomeningeal metastasis, meningeal carcinomatosis, meningeal metastasis, and neoplastic meningitis.

**leptomeningeal carcinomatosis :** A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinoma, leptomeningeal metastasis, meningeal carcinomatosis, meningeal metastasis, and neoplastic meningitis.

**leptomeningeal metastasis :** A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinoma, leptomeningeal carcinomatosis, meningeal carcinomatosis, meningeal metastasis, and neoplastic meningitis.

**leridistim:** A recombinant chimeric dual G-CSF and IL-3 receptor agonist. Leridistim binds with high affinity to both the interleukin-3 (IL-3) and granulocyte colony-stimulating factor (G-CSF) receptors, thereby stimulating the production and maturation of neutrophils, platelets, and lymphocytes after chemotherapy. or A substance being studied for its ability to stimulate the production of blood cells during chemotherapy. It is a type of colony-stimulating factor. Also called SC-70935.

**lerisetron:** The hydrochloride salt of a 2-piperazinylbenzimidazole-derivative serotonin type 3 (5-HT<sub>3</sub>) receptor antagonist with antiemetic activity. Lerisetron specifically binds to 5-HT<sub>3</sub> receptors, located peripherally on vagus nerve terminals and centrally in the chemoreceptor trigger zone (CTZ) of the area postrema, which may result in suppression of chemotherapy-induced nausea and vomiting.

**Lesch-Nyhan syndrome:** A disease resulting from the loss of a single enzyme in the salvage pathway for purines; marked by mental retardation, extreme hostility, and self-mutilation.

**Lescol:** (Other name for: fluvastatin sodium)

**lesion :** An area of abnormal tissue. A lesion may be benign (not cancer) or malignant (cancer).

**lestaurtinib:** An orally bioavailable indolocarbazole derivative with antineoplastic properties. Lestaurtinib inhibits autophosphorylation of FMS-like tyrosine kinase 3 (FLT3), resulting in inhibition of FLT3 activity and induction of apoptosis in tumor cells that overexpress FLT3. or A drug being studied in the treatment of acute leukemias and some other types of cancer. It binds to a protein that is present on the surface of some types of cancer cells and stops them from dividing. Lestaurtinib is a type of receptor tyrosine kinase inhibitor and a type of indolocarbazole alkaloid. Also called CEP-701.

**Let down:** To dilute a material usually to improve application properties.

**letermovir:** An orally bioavailable, non-nucleoside, 3,4-dihydroquinazolinyl acetic acid and inhibitor of the pUL56 subunit of the viral terminase complex of cytomegalovirus (CMV), with potential CMV-specific antiviral activity. Upon oral administration, letermovir binds to the pUL56 subunit of the viral terminase complex of CMV and prevents the cleavage of concatemeric DNA into monomeric genome length DNA. As this agent interferes with viral DNA processing and subsequent viral DNA packaging into procapsids, CMV replication is blocked and CMV infection is prevented.

**Lethal dose (LD):** The dose of radiation expected to cause death to 50 percent of an exposed population within 30 days (LD 50/30). Typically, the LD 50/30 is in the range from 400 to 450 rem (4 to 5 sieverts) received over a very short period.

**lethal mutation:** A mutation that inactivates a biological function essential to the life of the cell or organism.

**lethargy :** A condition marked by drowsiness and an unusual lack of energy and mental alertness. It can be caused by many things, including illness, injury, or drugs.

**letrozole:** A nonsteroidal inhibitor of estrogen synthesis with antineoplastic activity. As a third-generation aromatase inhibitor, letrozole selectively and reversibly inhibits aromatase, which may result in growth inhibition of estrogen-dependent breast cancer cells. Aromatase, a cytochrome P-450 enzyme localized to the endoplasmic reticulum of the cell and found in many tissues including those of the premenopausal ovary, liver, and breast, catalyzes the aromatization of androstenedione and testosterone into estrone and estradiol, the final step in estrogen biosynthesis. or A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Letrozole lowers the amount of estrogen made by the body. This may stop the growth of cancer cells that need estrogen to grow. Letrozole is a type of aromatase inhibitor. Also called Femara.

**leucine zipper:** A protein structural motif involved in protein-protein interactions in many eukaryotic regulatory proteins; consists of two interacting  $\alpha$  helices in which Leu residues in every seventh position are a prominent feature of the interacting surfaces.

**leucine-enhanced essential amino acid dietary supplement:** An orally bioavailable leucine enriched essential amino acid dietary supplement with potential anti-cachexia activity. Leucine-enhanced essential amino acid nutritional supplement may stimulate the mammalian target of rapamycin (mTOR) signaling pathway, which may promote protein synthesis in muscle cells. Although the exact mechanism by which leucine and other essential amino acids stimulate mTOR has yet to be fully elucidated, leucine may stimulate mTOR by inhibiting adenosine monophosphate protein kinase (AMPK), which negatively controls mTOR signaling. Check for active clinical trials using this agent.

**leucine**: A naturally occurring aliphatic amino acid with a nonpolar side chain.

**leucovorin** : The active ingredient in a drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Leucovorin is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Leucovorin is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called folinic acid.

**leucovorin calcium:** An active metabolite of folic acid (also called folinic acid and citrovorum factor), which does not require metabolism by dihydrofolate reductase, the molecular target of folate antagonist-type chemotherapeutic drugs. Leucovorin calcium counteracts the toxic effects of these medications, 'rescuing' the patient while permitting the antitumor activity of the folate antagonist. This agent also potentiates the effects of fluorouracil and its derivatives by stabilizing the binding of the drug's metabolite to its target enzyme, thus prolonging drug activity. or A drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Leucovorin calcium is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Leucovorin calcium is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called calcium levoleucovorin, citrovorum factor, and Wellcovorin.

**leukapheresis** : Removal of the blood to collect specific blood cells. The remaining blood is returned to the body.

**leukemia** : Cancer that starts in blood-forming tissue, such as the bone marrow, and causes large numbers of abnormal blood cells to be produced and enter the bloodstream.

**leukemic apoptotic corpse-pulsed autologous dendritic cells**: A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with corpses of apoptotic leukemic cells, with potential immunostimulatory and antineoplastic activities. Upon vaccination, autologous dendritic cells pulsed with leukemic apoptotic corpse may activate the immune system to mount an anti-tumoral cytotoxic T-lymphocyte (CTL) response against leukemic cells expressing leukemia-associated antigens, which may result in leukemic cell lysis and inhibition of tumor cell growth. Apoptotic tumor cell corpses contain an array of tumor associated antigens (TAAs). Check for active clinical trials using this agent.

**leukemic leptomeningitis** : A serious problem that may occur in leukemia. In leukemic leptomeningitis, cancer cells have spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). The cancer may cause the meninges to be inflamed. Also called leukemic meningitis and meningeal leukemia.

**leukemic meningitis** : A serious problem that may occur in leukemia. In leukemic meningitis, cancer cells have spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). The cancer may cause the meninges to be inflamed. Also called leukemic leptomeningitis and meningeal leukemia.

**Leukeran** : A drug used to treat several types of leukemias and lymphomas. It blocks cell growth by damaging the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called chlorambucil.

**Leukine**: (Other name for: sargramostim)

**leukocyte** : A type of blood cell that is made in the bone marrow and found in the blood and lymph tissue. Leukocytes are part of the body's immune system. They help the body fight infection and other diseases. Types of leukocytes are granulocytes (neutrophils, eosinophils, and basophils), monocytes, and lymphocytes (T cells and B cells). Checking the number of leukocytes in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as infection, inflammation, allergies, and leukemia. Also called WBC and white blood cell.

**leukocytes:** the white blood cells produced in the bone marrow that have various functions in the body, such as immune reaction.

**leukopenia:** decreased white blood cell count OR A condition in which there is a lower-than-normal number of leukocytes (white blood cells) in the blood.

**leukoplakia :** An abnormal patch of white tissue that forms on mucous membranes in the mouth and other areas of the body. It may become cancer. Tobacco (smoking and chewing) and alcohol may increase the risk of leukoplakia in the mouth.

**leukotrienes:** A family of molecules derived from arachidonate; muscle contractants that constrict air passages in the lungs and are involved in asthma.

**leuprolide acetate:** The acetate salt of a synthetic nonapeptide analogue of gonadotropin-releasing hormone. Leuprolide binds to and activates gonadotropin-releasing hormone (GnRH) receptors. Continuous, prolonged administration of leuprolide in males results in pituitary GnRH receptor desensitization and inhibition of pituitary secretion of follicle stimulating hormone (FSH) and luteinizing hormone (LH), leading to a significant decline in testosterone production; in females, prolonged administration results in a decrease in estradiol production. This agent reduces testosterone production to castration levels and may inhibit androgen receptor-positive tumor progression. Check for active clinical trials using this agent. or A drug used to treat advanced prostate cancer. Under the brand name Lupron, it is also used to treat early puberty in children and certain gynecologic conditions. Leuprolide acetate is also being studied in the treatment of other types of cancer. It blocks the testicles from making testosterone (a male hormone) and the ovaries from making estrogen and progesterone (female hormones). It may stop the growth of prostate cancer cells that need testosterone to grow. Leuprolide acetate is a type of gonadotropin-releasing hormone (GnRH) agonist. Also called Eligard, Lupron, and Viadur.

**Leustatin:** (Other name for: cladribine)

**leuvectin :** An agent that delivers the gene for interleukin-2 (IL-2) into cells to increase production of IL-2 by the cells.

**levamisole :** An antiparasitic drug that is also being studied in cancer therapy with fluorouracil.

**levamisole hydrochloride:** The orally bioavailable hydrochloride salt of the synthetic imidazothiazole derivative levamisole with anthelmintic and immunostimulating activities. In immunosuppressed states, levamisole may restore immune function by: 1) stimulating antibody formation, 2) stimulating T-cell activation and proliferation, 3) potentiating monocyte and macrophage phagocytosis and chemotaxis and 4) increasing neutrophil mobility, adherence, and chemotaxis.

**Levaquin:** (Other name for: levofloxacin)

**LEVELING:** Ability of a film to flow out free from ripples, pockmarks and brush marks after application. OR The ability of a coating to form a smooth film without brush marks appearing.

**levels of evidence :** A ranking system used to describe the strength of the results measured in a clinical trial or research study. The design of the study (such as a case report for an individual patient or a randomized double-blinded controlled clinical trial) and the endpoints measured (such as survival or quality of life) affect the strength of the evidence.

**Lever arm:** A long helix that protrudes from the S1 fragment of myosin to bind the light chains; amplifies small structural changes at the nucleotide-binding site of myosin to achieve 110-Å movement along an actin filament.

**levetiracetam:** A pyrrolidine with antiepileptic activity. The exact mechanism through which levetiracetam exerts its effects is unknown but does not involve inhibitory and excitatory neurotransmitter activity. Stereoselective binding of levetiracetam was confined to synaptic plasma membranes in the central nervous system with no binding occurring in peripheral tissue. Levetiracetam inhibits burst firing without affecting normal neuronal excitability, which suggests that it may selectively prevent hyper-synchronization of epileptiform burst firing and propagation of seizure activity. or A drug used to treat seizures (involuntary muscle movements) caused by epilepsy (a group of brain disorders). Levetiracetam is being studied in the treatment of seizures in patients with cancer that has spread to the brain. It is a type of anticonvulsant. Also called Keppra.

**Levitra:** (Other name for: vardenafil hydrochloride)

**levobupivacaine hydrochloride:** The hydrochloride salt of levobupivacaine, an amide derivative with anesthetic property. Levobupivacaine reversibly binds voltage-gated sodium channels to modulate ionic flux and prevent the initiation and transmission of nerve

impulses (stabilizing neuronal membrane), thereby resulting in analgesia and anesthesia. In comparison with racemic bupivacaine, levobupivacaine is associated with less vasodilation and has a longer duration of action.

**levocarnitine:** An amino acid derivative. Levocarnitine facilitates long-chain fatty acid entry into mitochondria, delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. Or A form of carnitine, which is a substance made in muscle and liver tissue and found in certain foods, such as meat, poultry, fish, and some dairy products. Levocarnitine is also a drug that is used to treat patients who do not make enough carnitine and is being studied as a way to prevent tissue damage caused by chemotherapy. Carnitine is a type of dietary supplement. Also called Carnitor and L-carnitine.

**levocetirizine dihydrochloride:** The dihydrochloride salt form of the active levorotatory enantiomer of cetirizine, levocetirizine; a third generation, non-sedating, selective histamine H1 receptor antagonist, with antihistamine, anti-inflammatory and potential anti-angiogenic activities. Levocetirizine competes with endogenous histamine for binding at peripheral H1-receptor sites on the effector cell surface. This prevents the negative symptoms associated with histamine release and an allergic reaction. In addition, as histamine plays an important role in angiogenesis during an allergic inflammatory reaction, blocking the action of histamine may modulate the expression of proangiogenic factors and thus may prevent angiogenesis. As a third-generation histamine H1 receptor antagonist, levocetirizine has fewer side effects than most second-generation antihistamines.

**levodopa:** An amino acid precursor of dopamine with antiparkinsonian properties. Levodopa is a prodrug that is converted to dopamine by DOPA decarboxylase and can cross the blood-brain barrier. When in the brain, levodopa is decarboxylated to dopamine and stimulates the dopaminergic receptors, thereby compensating for the depleted supply of endogenous dopamine seen in Parkinson's disease. To assure that adequate concentrations of levodopa reach the central nervous system, it is administered with carbidopa, a decarboxylase inhibitor that does not cross the blood-brain barrier, thereby diminishing the decarboxylation and

inactivation of levodopa in peripheral tissues and increasing the delivery of dopamine to the CNS.

**levofloxacin:** A broad-spectrum, third-generation fluoroquinolone antibiotic and optically active L-isomer of ofloxacin with antibacterial activity. Levofloxacin diffuses through the bacterial cell wall and acts by inhibiting DNA gyrase (bacterial topoisomerase II), an enzyme required for DNA replication, RNA transcription, and repair of bacterial DNA. Inhibition of DNA gyrase activity leads to blockage of bacterial cell growth. Check for active clinical trials using this agent. or A substance used to treat bacterial infections. It belongs to the family of drugs called quinolone antibiotics.

**levoleucovorin calcium:** A levo isoform of leucovorin calcium with antineoplastic activity. Levoleucovorin is an active metabolite of folic acid, which does not require metabolism by dihydrofolate reductase. This agent counteracts the toxic effects of other folic acid derivative agents, rescuing the patient while permitting the antitumor activity of the folate antagonist. This agent also potentiates the effects of fluorouracil and its derivatives by stabilizing the binding of the drug's metabolite to its target enzyme, thus prolonging drug activity.

**levonantradol:** A synthetic cannabinoid analogue of delta (9)-tetrahydrocannabinol (delta(9)-THC) with antiemetic and anti-analgesic properties. Although its precise mechanism of action is unknown, levonantradol appears to bind and activate the cannabinoid receptors CB1 and/or CB2.

**levonorgestrel:** The levorotatory form of norgestrel and synthetic progestogen with progestational and androgenic activity. Levonorgestrel binds to the progesterone receptor in the nucleus of target cells, thereby stimulating the resulting hormone-receptor complex, initiating transcription, and increasing the synthesis of certain proteins. This results in a suppression of luteinizing hormone (LH) activity and an inhibition of ovulation, as well as an alteration in the cervical mucus and endometrium. or A form of the hormone progesterone that is made in the laboratory and used to prevent pregnancy. It is being studied in the prevention of ovarian and endometrial cancer, and in the treatment of other conditions. Levonorgestrel is a type of oral contraceptive. Also called L-norgestrel and Plan B.

**levonorgestrel-releasing intrauterine system:** A long-acting, hormone-releasing, intrauterine device consisting of a small, T-shaped, polyethylene frame and a reservoired synthetic progesterone with progestational and potential antineoplastic activities. After insertion of this system into the uterus, the device slowly and gradually releases the hormone.

Levonorgestrel acts by binding to the progesterone receptor in the nuclei of target cells, resulting in transcription activation and an alteration in protein synthesis. Subsequently, luteinizing hormone (LH) activity and ovulation are suppressed. Levonorgestrel may also exhibit antiproliferative activity in endometrial tissue.

**Levopa:** (Other name for: levodopa)

**levorotatory:** Able to rotate plane-polarized light in a counterclockwise fashion. OR describes the counterclockwise rotation of plane-polarized light (from Latin, levo, "to the left"). A lowercase "l" or "-" is the notation used before an isomer's name to indicate it is levorotatory; for example, l-2-butanol. (Compare with "dextrorotatory.") OR Having the property of rotating plane-polarized light counterclockwise.

**levorotatory isomer:** A stereoisomer that rotates the plane of plane-polarized light counterclockwise.

**levothyroxine sodium:** The sodium salt of levothyroxine, a synthetic levoisomer of thyroxine (T4) that is similar to the endogenous hormone produced by the thyroid gland. In peripheral tissues, levothyroxine is deiodinated by 5'-deiodinase to form triiodothyronine (T3). T3 enters the cell and binds to nuclear thyroid hormone receptors; the activated hormone-receptor complex in turn triggers gene expression and produces proteins required in the regulation of cellular respiration; thermogenesis; cellular growth and differentiation; and the metabolism of proteins, carbohydrates and lipids. T3 also exhibits cardiostimulatory effects. Check for active clinical trials using this agent.

**Levoxyl:** (Other name for: levothyroxine sodium)

**Levulan:** (Other name for: aminolevulinic acid hydrochloride)

**Levulan :** A drug used to treat actinic keratosis (a skin condition that may become cancer). The drug is also being studied in the treatment of squamous cell and basal cell skin cancers and other types of cancer. When Levulan is taken up by cells, including cancer cells, and then exposed to certain types of light, it becomes active and kills the cells. It is a type of

photosensitizing agent. Also called aminolevulinic acid hydrochloride and Levulan Kerastick.

**Levulan Kerastick :** A drug used to treat actinic keratosis (a skin condition that may become cancer). The drug is also being studied in the treatment of squamous cell and basal cell skin cancers and other types of cancer. When Levulan Kerastick is taken up by cells, including cancer cells, and then exposed to certain types of light, it becomes active and kills the cells. It is a type of photosensitizing agent. Also called aminolevulinic acid hydrochloride and Levulan.

**Lewis structure:** A model pioneered by Gilbert N. Lewis and Irving Langmuir that represents the electronic structure of a molecule by writing the valence electrons of atoms as dots. Pairs of dots (or lines) wedged between atoms represent bonds; dots drawn elsewhere represent nonbonding electrons. OR A way of representing molecular structures based on valence electrons.

**Lewis theory of acids and bases:** a Lewis acid is a compound capable of accepting an electron pair, and a Lewis base is capable of donating an electron pair.

**Lexapro :** A drug used to treat depression and certain anxiety disorders. It belongs to the family of drugs called selective serotonin reuptake inhibitors (SSRIs). Also called escitalopram.

**lexatumumab:** A fully human monoclonal agonistic antibody directed against tumor necrosis factor-alpha (TNF-alpha)-related apoptosis-inducing ligand receptor-2 (TRAIL-R2) with potential antitumor activity. Mimicking the natural ligand TRAIL, lexatumumab binds to and activates TRAIL-R2, which may trigger apoptosis in and inhibit the growth of TRAIL-R2-expressing tumor cells. TRAIL-R2, also known as death receptor 5 (DR5), is a member of the TNF receptor family and is expressed on many malignant cell types. or A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL-R2 on the surface of some tumor cells, which may kill the tumor cells. Lexatumumab is a type of monoclonal antibody. Also called anti-TRAIL R2 mAb HGS-ETR2 and HGS-ETR2.

**lexibulin:** An orally bioavailable small-molecule with tubulin-inhibiting, vascular-disrupting, and potential antineoplastic activities. Lexibulin inhibits tubulin polymerization in tumor blood vessel endothelial cells and

tumor cells, blocking the formation of the mitotic spindle and leading to cell cycle arrest at the G2/M phase; this may result in disruption of the tumor vasculature and tumor blood flow, and tumor cell death. Check for active clinical trials using this agent.

**Lexiscan:** (Other name for: regadenoson)

**LGD1069:** A drug used to treat skin problems caused by cutaneous T-cell lymphoma that have not gotten better after other treatment. It is also being studied in the treatment of other types of cancer. LGD1069 is a type of retinoid. Also called bexarotene and Targretin.

**LH:** A hormone made in the pituitary gland. In females, it acts on the ovaries to make follicles release their eggs and to make hormones that get the uterus ready for a fertilized egg to be implanted. In males, it acts on the testes to cause cells to grow and make testosterone. Also called interstitial cell-stimulating hormone, luteinizing hormone, and lutropin.

**LH-RH:** A hormone made by a part of the brain called the hypothalamus. LH-RH causes the pituitary gland in the brain to make and secrete the hormones luteinizing hormone (LH) and follicle-stimulating hormone (FSH). In men, these hormones cause the testicles to make testosterone. In women, they cause the ovaries to make estrogen and progesterone. Also called GnRH, gonadotropin-releasing hormone, LHRH, and luteinizing hormone-releasing hormone.

**LH-RH agonist :** A substance that keeps the testicles and ovaries from making sex hormones by blocking other hormones that are needed to make them. In men, LH-RH agonists cause the testicles to stop making testosterone. In women, they cause the ovaries to stop making estrogen and progesterone. Some LH-RH agonists are used to treat prostate cancer. Also called GnRH agonist, gonadotropin-releasing hormone agonist, and luteinizing hormone-releasing hormone agonist.

**LH-RH antagonist :** A substance that blocks the pituitary gland from making hormones called follicle-stimulating hormone (FSH) and luteinizing hormone (LH). In men, this causes the testicles to stop making testosterone. In women, this causes the ovaries to stop making estrogen and progesterone. Some LH-RH antagonists are used to treat advanced prostate cancer. They are also used to treat certain gynecologic conditions and are being studied in the treatment of hormone-sensitive breast cancer. Also

called GnRH antagonist, gonadotropin-releasing hormone antagonist, and luteinizing hormone-releasing hormone antagonist.

**Lhermitte's sign :** A sensation similar to an electrical shock radiating from the back of the head down the spine as the neck is bent forward.

**LHRH:** A hormone made by a part of the brain called the hypothalamus. LHRH causes the pituitary gland in the brain to make and secrete the hormones luteinizing hormone (LH) and follicle-stimulating hormone (FSH). In men, these hormones cause the testicles to make testosterone. In women, they cause the ovaries to make estrogen and progesterone. Also called GnRH, gonadotropin-releasing hormone, LH-RH, and luteinizing hormone-releasing hormone.

**Li-Fraumeni syndrome :** A rare, inherited predisposition to multiple cancers, caused by an alteration in the p53 tumor suppressor gene.

**Lialda:** (Other name for: mesalamine)

**liarozole :** An anticancer drug that promotes differentiation by increasing the levels of retinoic acid within the tumor.

**liarozole fumarate:** The orally active fumarate salt of the benzimidazole derivative liarozole with potential antineoplastic activity. As a retinoic acid metabolism blocking agent (RAMBA), liarozole inhibits cytochrome P450-dependent all-trans-retinoic acid (ATRA)-4-hydroxylase, resulting in an increase in endogenous ATRA production, inhibition of cell proliferation, and induction of cell differentiation. This agent also inhibits aromatase, the enzyme that catalyzes the final, rate-limiting step in estrogen biosynthesis. Check for active clinical trials using this agent.

**Liazal:** (Other name for: liarozole fumarate)

**libido :** Sexual desire or the mental energy or emotion related to sex.

**licartin:** An immunoradioconjugate containing metuximab, an antibody fragment targeting the hepatocellular cancer (HCC)-associated antigen HAb18G/CD147, that is conjugated to the radioisotope iodine I 131, with potential antineoplastic activity. Upon administration, the metuximab moiety of licartin targets and binds to HAb18G/CD147 on HCC cells; upon internalization, the radioisotope I 131 delivers a cytotoxic dose of gamma radiation, thereby causing selective destruction of HAb18G/CD147-expressing cells. HAb18G/CD147, a member of CD147 family, is

overexpressed in HCC and fibroblasts and its expression is associated with cancer cell progression and increased adhesion, invasion and metastasis.

**Licensed material:** Source material, byproduct material, or special nuclear material that is received, possessed, used, transferred, or disposed of under a general license or specific license issued by the NRC or Agreement States.

**Licensee:** A company, organization, institution, or other entity to which the NRC or an Agreement State has granted a general license or specific license to construct or operate a nuclear facility, or to receive, possess, use, transfer, or dispose of source material, byproduct material, or special nuclear material.

**Licensing basis:** The collection of documents or technical criteria that provides the basis upon which the NRC issues a license to construct or operate a nuclear facility; to conduct operations involving the emission of radiation; or to receive, possess, use, transfer, or dispose of source material, byproduct material, or special nuclear material. For related information, see Licensing.

**lichens:** associations between the cyanobacteria and the fungi.

**licorice root extract:** An herbal extract derived from the root of the plant *Glycyrrhiza glabra* with potential anti-inflammatory, antioxidant, and antineoplastic activities. Licorice root extract contains glycoside glycyrrhizinic acid and numerous flavonoids. Glycyrrhizinic acid in licorice root extract is hydrolyzed to glycyrrhetic acid (GA); GA inhibits 11 beta-hydroxysteroid dehydrogenase, resulting in inhibition of the conversion of cortisol to the inactive steroid cortisone and elevated cortisol levels. In addition, GA inhibits 17,20-lyase and 17 beta-hydroxysteroid dehydrogenase, resulting in decreased conversions of 17-hydroxyprogesterone to androstenedione and androstenedione to testosterone. The primary antioxidant found in licorice root, the flavonoid glabridin, may inactivate or inhibit the activities of some cytochrome P450 enzymes. In tumor cells, beta-hydroxy-DHP, another flavonoid, may induce Bcl-2 phosphorylation, apoptosis, and G2/M cell cycle arrest. or A substance prepared from dried roots of the plant *Glycyrrhiza glabra*. It is used as a flavoring in medicines, drinks, and sweets, and it is being studied in the treatment of cancer. Licorice root extract contains several compounds that reduce inflammation, kill certain bacteria and viruses, act like estrogen

and other hormones, and may cause cancer cells to die. It is a type of antioxidant.

**Lidex:** (Other name for: fluocinonide cream)

**lidocaine:** A synthetic aminoethylamide with local anesthetic and antiarrhythmic properties. Lidocaine stabilizes the neuronal membrane by binding to and inhibiting voltage-gated sodium channels, thereby inhibiting the ionic fluxes required for the initiation and conduction of impulses and effecting local anesthesia.

**lidocaine :** A substance used to relieve pain by blocking signals at the nerve endings in skin. It can also be given intravenously to stop heart arrhythmias. It is a type of local anesthetic and antiarrhythmic.

**lidocaine patch 5%:** A transdermal patch containing a 5 percent aqueous base solution of the synthetic amide-type anesthetic lidocaine with analgesic activity. Upon topical application and transdermal delivery, the active ingredient lidocaine binds to and blocks voltage-gated sodium channels in the neuronal cell membrane; lidocaine-mediated stabilization of neuronal membranes inhibits the initiation and conduction of nerve impulses and produces a reversible local anesthesia.

**Lidoderm:** (Other name for: lidocaine patch 5%)

**Lidothesin:** (Other name for: lidocaine)

**life zone:** A climatically-defined class that can be associated with regions of soil and biota with a high uniformity in species composition and environmental adaptation. See Holdridge life zone.

**Lifetime :** the usable period of the sensor. It must be specified whether "shelf" or "inuse".

**lifetime risk:** A measure of the risk that a certain event will happen during a person's lifetime. In cancer research, it is usually given as the likelihood that a person who is free of a certain type of cancer will develop or die from that type of cancer during his or her lifetime. For example, a woman with no known risk factors for breast cancer has a lifetime risk of developing breast cancer of about 12%. This means one out of every eight women will develop breast cancer during her lifetime.

**Lifting:** The softening and disturbing of an existing coat of paint when a further coat is applied over it and usually causing a wrinkled effect to develop. OR A new coat of paint can sometimes soften the previous coat

and cause wrinkling or 'lifting'. This can be the result of using a different type of new coating over the existing paint, or by applying a second coat before the first coat is fully dried. To solve the problem, thorough clean down the surfaces to remove all dirt, grease and surface contaminants. Scrape back all poorly adhering or defective coatings to a firm edge and rub down to 'feather' broken edges. Dust off an apply new coat. OR The softening and penetration of a previous film by solvents in the paint being applied over it, resulting in raising and wrinkling.

**lifting condensation level:** formula used to find the height at which clouds can form.

**ligaments:** the tough, fibrous tissues that link bones to one another.

**ligand:** A molecule or ion bonded to a central metal atom or ion in a coordination compound. OR In medicinal chemistry, ligands refer to molecules that are able to bind to a binding site. In coordination chemistry, ligands are ions, molecules, or functional groups that bind to a central metal atom, forming a coordination complex. OR A (usually small) molecule that binds to another, such as oxygen when it binds to myoglobin. OR A small molecule that binds to a protein, inducing a specific structural change. For instance, a steroid is a ligand for a steroid-hormone receptor. OR 1. In inorganic chemistry, a molecule or ion that binds to a metal cation to form a complex. 2. In biochemistry, a molecule that binds to a receptor, having a biological effect. OR A small molecule that binds specifically to a larger one; for example, a hormone is the ligand for its specific protein receptor.

**Ligand-gated channel:** A transmembrane channel that is opened by the binding of a one or more molecules to a ligand-binding domain of the channel protein.

**Ligase:** An enzyme that catalyzes the joining of two molecules together. In DNA it joins 5'-OH to 3' phosphates.

**ligation :** The process of tying off blood vessels so that blood cannot flow to a part of the body or to a tumor.

**Ligation reactions:** Reactions that form bonds by using the energy of ATP hydrolysis.

**LIGHT:** has both wave and particle properties. OR Any glazed opening, window, etc. is termed a light. OR visible electromagnetic radiation

**Light (L) chain:** A 25-kd polypeptide that is one of two types of chains found in immunoglobulin G. Each L chain consists of a variable region and a constant region, and each chain is linked by a disulfide bond to a heavy chain.

**light cigarette :** A type of cigarette that is claimed to give off less tobacco tar than a regular cigarette when smoked. Light cigarettes have been shown to be no safer than regular cigarettes, and smoking them does not lower the risk of cancer or other diseases. A person smoking a light cigarette can inhale the same amount of tobacco tar, nicotine, and harmful, cancer-causing chemicals as in a regular cigarette, depending on how the cigarette is smoked. Cigarettes are no longer allowed to be labeled or advertised as light cigarettes. Also called low tar cigarette.

**Light Crude:** Light Crude is a term used to define crude oils with a higher fraction of lower boiling point components and low wax content. Some definitions have Light Crude defined as a crude with an specific gravity index greater than 28 API, although more commonly this range would include Medium and Light crudes.

**Light fastness:** The degree of resistance to colour fading of pigments in paint on exposure to light.

**Light initiator:** A compound which starts a reaction by being activated by light.

**Light meromyosin (LMM):** Along with heavy meromyosin, one of the tryptic digestion products of myosin; forms filaments but has no atpase or actin-binding activity.

**light microscope :** A microscope (device to magnify small objects) in which objects are lit directly by white light.

**Light reactions:** In chloroplasts, the reactions in which light is used to create reducing potential and to generate oxygen. OR The reactions of photosynthesis that require light and cannot occur in the dark; also known as the light-dependent reactions.

**Light resistance:** the ability of a plastic material to withstand exposure to light, usually sunlight or the ultraviolet part of the light spectrum, without change of color or loss of physical and/or chemical properties.

**Light Stability:** ability of a plastic to retain its original color and physical properties upon exposure to sun or artificial light.

**light therapy :** The treatment of disease with certain types of light. Light therapy can use lasers, LED, fluorescent lamps, and ultraviolet or infrared radiation. Also called phototherapy.

**Light Transmission:** the amount of light that a plastic will allow to pass.

**Light water:** Ordinary water as distinguished from heavy water.

**Light water reactor:** A term used to describe reactors using ordinary water as coolant, including boiling water reactors (BWRs) and pressurized water reactors (PWRs), the most common types used in the United States.

**light year:** the distance that light travels in one year, about 9.5 trillion kilometers.

**light-emitting diode therapy :** Treatment with drugs that become active and may kill cancer cells when exposed to light. Light-emitting diode therapy is type of photodynamic therapy which uses a special type of light to activate the drug. Also called LED therapy.

**light-emitting oncolytic vaccinia virus GL-ONC1:** An attenuated oncolytic vaccinia virus encoding the light-emitting fusion protein Renilla luciferase-Aequorea green fluorescent protein (RUC-GFP) with potential bioluminescent and antineoplastic activities. Upon administration, light-emitting oncolytic vaccinia virus GL-ONC1 specifically enters tumor cells due to the permeable nature of the tumor vasculature. Once inside the cell, the virus replicates, resulting in tumor cell lysis and the release of mature viral particles into the tumor microenvironment. Released viral particles may then infect and destroy neighboring tumor cells. In addition, the release of tumor-associated antigens (TAAs) by lysed tumor cells into the bloodstream may activate the immune system to mount a cytotoxic T lymphocyte (CTL) response against the tumor. The expression of RUC-GFP by this agent allows for both detection and monitoring of virally infected tumor cells in vivo and vitro with luciferase-mediated bioluminescence imaging and fluorescence imaging techniques.

**Light-harvesting complex:** A complex of light-absorbing pigments and protein that completely surround the reaction center of photosynthesis; funnels the energy of absorbed light to the reaction center.

**Light-resistance:** The ability of a plastics material to resist fading after exposure to sunlight or ultra-violet light. Nearly all plastics tend to darken

under these conditions. OR The ability of a plastics material to resist fading after exposure to sunlight or ultraviolet light.

**Light, UV Stabilizers:** Additives that increase the ability of the material to withstand the negative effect of light and ultra violet (UV) exposure. This increases the service life of the plastic extrusions and other plastic profiles.

**Light, UV Stabilizers & Absorbers:** These additives increase the ability of the material to withstand the negative effects of light and UV exposure, thus increasing the service life of the material.

**lightning:** electricity generated by a thunderstorm.

**lignan :** A member of a group of substances found in plants that have shown estrogenic and anticancer effects. Lignans have been used in some cultures to treat certain medical problems.

**Lignin:** The cross-linked polymer of linked benzene rings that makes hardwood hard. It is an important structural material for most land plants, and is usually found mixed in with cellulose. Partial digestion of lignin by enzymes (completely different from the ones that break down cellulose) gives complex materials called humic and fulvic acids. These are the substances that give Adelaide water its unique colour and flavour!

**lignite:** a soft, brown coal produced by increasing temperature and pressure on peat.

**like terms:** Terms with the same variables raised to the same powers.

**LIM:** Liquid injection molding is injection molding silicone rubber, Casco Bay Molding's specialty

**limb:** one side of a fold.

**limb perfusion :** A procedure that may be used to deliver anticancer drugs directly to an arm or leg. The flow of blood to and from the limb is temporarily stopped with a tourniquet (a tight band around the limb), and anticancer drugs are put directly into the blood of the limb. This allows the person to receive a high dose of drugs in the area where the cancer occurred. Also called isolated limb perfusion.

**limb-salvage surgery :** Surgery to remove a tumor in a limb (arm or leg) without removing the whole limb. The bone and tissue around the tumor may also be removed, and an implant may be used to replace the part of the limb removed. Limb-salvage surgery is done to help save the use and

appearance of the limb. It is used to treat cancers of the bone and soft tissue. Also called limb-sparing surgery.

**limbic system:** a collection of structures that ring the edge of the brain and apparently function as centers of emotion. OR A network of structures in the brain involved in memory and emotions.

**lime:** any of a family of chemicals consisting essentially of calcium hydroxide made from limestone (calcite) which is composed mostly of calcium carbonate or a mixture of calcium carbonate and magnesium carbonate.

**Limestone** : A form of sedimentary rock. It is made from the compacted bony remains of dead sea creatures. It is mostly calcium carbonate.

**Limewash:** A white or pale coloured coating for brickwork, stucco, cob, walls, etc. which is made from freshly slaked quicklime to which a binding agent such as tallow has been stirred in while still hot. Pale colours are obtained by tinting with lime-fast dry pigment.

**limewater:** Common name for a solution of calcium hydroxide.

**Limewater:** This is known mainly as the test for carbon dioxide gas. Limewater is a clear (not cloudy), colourless (not coloured) solution of calcium hydroxide. If carbon dioxide is present, the limewater forms a white precipitate of calcium carbonate.

**limit of detection:** (i) The smallest amount, or lowest concentration, of a given substance that a given procedure will detect (WHO, 1980); (ii) for a pesticide residue it is the lowest concentration that can be qualitatively detected in a specified commodity (WHO, 1976).

**limit of determination (pesticide residue):** The limit of determination of a method of analysis is the lowest concentration of a pesticide residue that can be quantitatively measured in the specified commodity with an acceptable degree of certainty (WHO, 1976).

**limit of quantitation:** The smallest detectable concentration an analytical instrument can determine at a given confidence level. IUPAC defines the quantitative detection limit as  $C_{ld} = ks/m$ , where  $k$  is 10,  $s$  is the standard deviation of instrument readings taken on a "blank" (a solution with zero concentration of analyte), and  $m$  is the slope of a plot of instrument response vs. concentration, as calculated by linear regression.

**Limit Switches :** Switches that are installed to sound an alarm or stop the system if the position of the take-up roll goes too high or too low. Limit switches can detect high tension and prevent some jam-ups.

**limited-stage small cell lung cancer :** Cancer is found in one lung, the tissues between the lungs, and nearby lymph nodes only.

**Limiting condition for operation:** The section of Technical Specifications that identifies the lowest functional capability or performance level of equipment required for safe operation of the facility.

**Limiting Oxygen Index:** The concentration of oxygen required to maintain burning. See ASTM Procedure D2863-74.

**Limiting Reactant:** A limiting reactant is the limiting factor or element in a chemical reaction. If you have eight million hydrogen atoms and only one oxygen atom, you can only make one molecule of water. Oxygen would be your limiting reactant.

**limiting reactant:** The reactant that limits the amount of product produced in a chemical reaction. For example, mixing one mole of  $H_2(g)$  with one mole of  $O_2$  produces one mole of steam ( $H_2O(g)$ ), with half a mole of  $O_2(g)$  remaining. The hydrogen gas limits the amount of steam produced in this case.

**limiting reagent:** The reactant that will be exhausted first.

**Limiting safety system settings:** Settings for automatic protective devices related to those variables having significant safety functions. Where a limiting safety system setting is specified for a variable on which a safety limit has been placed, the setting will ensure that automatic protective action will correct the abnormal situation before a safety limit is exceeded.

**limnology:** the study of the physical, chemical, meteorological and biological aspects of fresh water.

**limonene:** An oral dietary supplement containing a natural cyclic monoterpene and major component of the oil extracted from citrus peels with potential chemopreventive and antitumor activities. Although the mechanism of action has yet to be fully elucidated, limonene and its metabolites perillic acid, dihydroperillic acid, uroterpenol and limonene 1,2-diol may inhibit tumor growth through inhibition of p21-dependent signaling and may induce apoptosis via the induction of the transforming growth factor beta-signaling pathway. In addition, they inhibit post-

translational modification of signal transduction proteins, resulting in G1 cell cycle arrest as well as differential expression of cell cycle- and apoptosis-related genes.

**LIN:** A condition in which abnormal cells are found in the lobules (glands that make milk) of the breast. This condition rarely becomes cancer. However, having LIN in one breast increases the risk of breast cancer in either breast. Types of LIN include atypical lobular hyperplasia and lobular carcinoma in situ (LCIS). Also called lobular intraepithelial neoplasia and lobular neoplasia.

**linac :** A machine that uses electricity to form a stream of fast-moving subatomic particles. This creates high-energy radiation that may be used to treat cancer. Also called linear accelerator, mega-voltage linear accelerator, and MeV linear accelerator.

**linaclotide acetate:** The acetate salt form of linaclotide, a synthetic, fourteen amino acid peptide and agonist of intestinal guanylate cyclase type C (GC-C), which is structurally related to the guanylin peptide family, with secretagogue, analgesic and laxative activities. Upon oral administration, linaclotide binds to and activates GC-C receptors located on the luminal surface of the intestinal epithelium. This increases the concentration of intracellular cyclic guanosine monophosphate (cGMP), which is derived from guanosine triphosphate (GTP). cGMP activates the cystic fibrosis transmembrane conductance regulator (CFTR) and stimulates the secretion of chloride and bicarbonate into the intestinal lumen. This promotes sodium excretion into the lumen and results in increased intestinal fluid secretion. This ultimately accelerates GI transit of intestinal contents, improves bowel movement and relieves constipation. Increased extracellular cGMP levels may also exert an antinociceptive effect, through an as of yet not fully elucidated mechanism, that may involve modulation of nociceptors found on colonic afferent pain fibers. Linaclotide is minimally absorbed from the GI tract.

**Lindlar catalyst:** a particular poisoned catalyst used in alkyne reactions; it is finely divided palladium coated with quinoline and absorbed on barium sulfate.

**line graph:** points plotted on a coordinate system and connected with a line.

**line segment:** a part of a line; has two endpoints

**line spectra:** Spectra generated by excited substances. Consists of radiation with only specific wavelengths.

**line spectrum:** A emission spectrum that contains very sharp peaks, corresponding to transitions between states in free atoms. For example, the line spectrum of hydrogen contains 4 sharp lines in the visible part of the spectrum.

**line-bond structure:** a representation of a molecule that shows covalent bonds as lines between atoms.

**linear:** the shape of a molecule with sp hybrid orbitals; an alkyne.

**linear accelerator :** A machine that uses electricity to form a stream of fast-moving subatomic particles. This creates high-energy radiation that may be used to treat cancer. Also called linac, mega-voltage linear accelerator, and MeV linear accelerator.

**Linear Alkyl Benzene (LAB):** Linear alkyl benzene (LAB) is the dominant detergent intermediate. It is mainly produced by the dehydrogenation of n-paraffins to internal olefins followed by alkylation with benzene using hydrofluoric acid catalyst. Almost all LAB is converted to linear alkyl sulfonates, a major surfactant in household cleaning products.

**Linear Alpha Olefins (LAO):** Linear alpha olefins (LAO) are produced by two families of processes - full-range and on-purpose. LAOs are produced by the oligomerization of ethylene in full-range processes. On-purpose technologies are used to produce butene-1 (extractive distillation, hydrogenation/fractionation and ethylene dimerization), hexene-1 (fischer-tropsch and ethylene trimerization) and octene-1 (fischer-tropsch). Alpha olefins cover a wide range of products used in diverse applications. The lighter components (butene-1, hexene-1 and octene-1) are used as comonomers in polyethylene production. Decene-1 is principally used to manufacture polyalpha olefins for the production of high performance lubricants. Higher alpha olefins in the C12/C14 range are consumed in the production of detergent alcohols, while those in the C16/C18 range are predominately used in the oilfield chemicals sector and paper industry, and the higher fractions (C20+) are used to manufacture lubricant additives and specialty waxes.

**linear combination of atomic orbitals:** the process of combining atomic orbitals to form new orbitals. Linear combination can occur between

orbitals in a single atom, creating hybrid atomic orbitals, or between the orbitals of two atoms, creating molecular orbitals. In either case, the number of orbitals always remains constant.

**linear equation:** An equation that can be put in the form  $Ax + By + C = 0$ .

**Linear heat generation rate:** The heat generation rate per unit length of fuel rod, commonly expressed in kilowatts per foot (kw/ft) of fuel rod.

**LINEAR LOW DENSITY POLYETHYLENE:** See Linear Polymer. Includes polyethylenes ranging in density from 0.915 to 0.935.

**Linear Low Density Polyethylene (LLDPE):** Linear low density polyethylene (LDPE) is a relatively new polyethylene that shares many of the performance characteristics of LDPE. LLDPE is most commonly used in film applications. It is produced by the low pressure catalysed reaction of ethylene with small quantities of higher alpha-olefin (most commonly butene-1). This low pressure technology provides LLDPE with a cost advantage over LDPE, although this advantage is partly surrendered as it is a more difficult polymer to process than LDPE.

**Linear Low Density Polyethylene (LLDPE):** Polyethylene which has more crystallinity than LDPE. Can be produced with butene, hexene or octene comonomer for a wide variety of properties usually stronger than conventional LDPE.

**Linear Mold Shrinkage:** The difference between the size of the part and the size of the mold cavity. Values given are often the average of a range.

**Linear Molecule:** A long chain molecule as contrasted to one having many side chains or branches.

**LINEAR POLYMER:** A polymer in which the monomeric units are linked together in linear fashion with little or no long chain branching. Examples are linear low density polyethylene and high density polyethylene. OR Polymers can be classified as linear or branched. In linear polymers the monomeric units are linked together, linearly, with little or no long chain branching. In branched polymers, side chains are attached to the backbone of the molecular chain. High density polyethylene (HDPE) is linear while low density polyethylene (LDPE) is branched. Linear LDPE (LLDPE) is "stiffer" than LDPE in shear but "softer" in extension. In extension the LLDPE chains slide by without getting entangled (since the chain branches are very short).

**Linear range:** the range of concentration (or activity) over which the measured sensor signal can be fitted by straight line.

**Linear Thermal Expansion:** The fractional change in length of a material for a unit change in temperature.

**Linerless closure:** A closure that has been engineered to function in specific applications without the use of an additional liner.

**Lineweaver-Burk equation:** An algebraic transform of the Michaelis-Menten equation, allowing determination of  $V_{max}$  and  $K_m$  by extrapolation of  $[S]$  to infinity.

**linezolid:** A synthetic oxazolidinone derivative, linezolid selectively inhibits an early step in bacterial protein synthesis and affects blood pressure through monoamine oxidase inhibition. It is effective against Gram-positive organisms, including methicillin-resistant *Staphylococcus aureus* strains, coagulase-negative *Staphylococci*, vancomycin-resistant *Enterococci*, and penicillin-resistant *Streptococcus pneumoniae* strains.

**Linfolizin:** (Other name for: chlorambucil)

**linifanib:** An orally bioavailable, small-molecule receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic activity. Linifanib inhibits members of the vascular endothelial growth factor (VEGF) and platelet-derived growth factor (PDGF) receptor families; it exhibits much less activity against unrelated RTKs, soluble tyrosine kinases, or serine/threonine kinases. This agent does not have a general antiproliferative effect due to its high dose requirement. However, linifanib may exhibit potent antiproliferative and apoptotic effects on tumor cells whose proliferation is dependent on mutant kinases, such as *fms*-related tyrosine kinase receptor-3 (FLT3).

**Lining paper:** A plain 'wallpaper' for use as a ground for painting or wall hangings. Usually white or creamy white in colour and generally used for high quality work and to disguise surface defects in plaster which cannot be overcome by normal preparation.

**linitis plastica :** A rare type of stomach cancer that begins in the lining of the stomach and spreads to the muscles of the stomach wall. This causes the wall of the stomach to become thick, hard, and rubbery, which leads to trouble digesting food. Also called gastric scirrhous carcinoma.

**Linkage:** The tendency of markers to be inherited together. Linkage of two markers is an indication that they are close to one another in the genome.

**linkage :** The tendency for genes or segments of DNA closely positioned along a chromosome to segregate together at meiosis, and therefore be inherited together.

**linkage analysis :** A gene-hunting technique that traces patterns of disease in high-risk families. It attempts to locate a disease-causing gene by identifying genetic markers of known chromosomal location that are co-inherited with the trait of interest.

**linkage disequilibrium :** Where alleles (DNA markers) occur together more often than can be accounted for by chance because of their physical proximity on a chromosome. Also called LD.

**Linkers:** Short oligonucleotides that can be ligated (connected) to larger DNA fragments, then cleaved (cut) to yield overlapping cohesive (sticky) ends, suitable for ligation to other DNAs that contain comparable cohesive ends.

**Linking number:** A topological property of circular DNA, equal to the number of times a strand of DNA winds around the helix axis.

**Linking number:** The net number of times one polynucleotide chain crosses over another polynucleotide chain. By convention, right-handed crossovers are given a plus designation.

**linking number:** The number of times one closed circular DNA strand is wound about another; the number of topological links holding the circles together.

**linking verb:** verbs that do not convey action but help complete statements about the subject by describing or identifying it.

**linoleyl carbonate-paclitaxel:** A formulation of the 6-omega fatty acid derivative 2'-linoleyl carbonate (LOC) conjugated to paclitaxel, a taxane compound extracted from the Pacific yew tree *Taxus brevifolia*, with potential antineoplastic activity. Paclitaxel binds to and stabilizes tubulin, thereby interfering with the dynamics of microtubule assembly/disassembly and resulting in the inhibition of cell division. LOC enhances the uptake of paclitaxel by tumor cells, thereby concentrating this agent in tumor cells compared to normal cells, and may decrease its toxicity profile; fatty acids

serve as energy sources and biochemical precursors for the fast growing tumor cells.

**Linomide:** (Other name for: roquinimex)

**linseed :** The seed of the flax plant. It is a rich source of omega-3 fatty acid, fiber, and a compound called lignin. It is being studied in the prevention of several types of cancer. Also called flaxseed.

**Linseed oil:** An oil obtained by crushing flax seed. Its drying properties make it suitable as a paint medium but it is now used mainly for modifying synthetic resins.

**linsitinib:** An orally bioavailable small molecule inhibitor of the insulin-like growth factor 1 receptor (IGF-1R) with potential antineoplastic activity. Linsitinib selectively inhibits IGF-1R, which may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis.

Overexpressed in a variety of human cancers, IGF-1 stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis. Check for active clinical trials using this agent.

**lintuzumab:** A humanized recombinant monoclonal antibody directed against CD33, a cell surface antigen found on myeloid leukemia blasts and early hematopoietic progenitor cells. Lintuzumab stimulates antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells expressing CD33, resulting in a decrease in tumor burden. The humanized version of this monoclonal antibody exhibits less immunogenicity and improved binding affinity compared to its murine counterpart. or A substance being studied in the treatment of myelodysplastic syndromes and some types of leukemia. It binds to CD33, a protein on the surface of certain normal blood stem cells and some abnormal blood cells. It causes the immune system to kill these cells. Lintuzumab is a type of monoclonal antibody. Also called MoAb HuM195 and monoclonal antibody HuM195.

**Linzess:** (Other name for: linaclotide acetate)

**Lioresal :** A drug that is used to treat certain types of muscle spasms and is being studied in the treatment of liver cancer. Lioresal relaxes muscles by blocking certain nerve receptors in the spinal cord. It is a type of antispasmodic. Also called baclofen and Kemstro.

**liothyronine sodium:** The sodium salt form of liothyronine, a synthetic form of the levorotatory isomer of the naturally occurring thyroid hormone

triiodothyronine (T3). Liothyronine sodium binds to nuclear thyroid receptors which then bind to thyroid hormone response elements of target genes. As a result, liothyronine sodium induces gene expression that is required for normal growth and development. Liothyronine sodium is more potent and has a more rapid action than thyroxine (T4). or A drug that is used to treat certain thyroid (a gland located near the voice box) conditions. It is also being studied in the treatment of thyroid cancer. Liothyronine sodium is made in the laboratory and is a form of the thyroid hormone triiodothyronine (T3). Also called Cytomel and Triostat.

**lipases:** Enzymes that catalyze the hydrolysis of triacylglycerols.

**lipegfilgrastim:** A long acting glyco-pegylated recombinant form of human granulocyte colony-stimulating factor (G-CSF), with hematopoietic activity. Similar to G-CSF, lipegfilgrastim binds to and activates specific cell surface receptors, and stimulates neutrophil progenitor proliferation and differentiation. Therefore, this agent may prevent the duration and incidence of chemotherapy-induced neutropenia. Compared to filgrastim, lipegfilgrastim has a prolonged plasma half-life.

**lipid:** A fatty, waxy or oily non-polar organic compound that is characteristically insoluble in water but readily soluble in organic solvents. OR an organic molecule used to form cellular and organelle membranes, the sheaths surrounding nerve fibers, and certain hormones; includes fats as an energy source. OR A fatty, waxy, or oily compound that will not dissolve in water; it contains hydrogen, carbon, and oxygen, but proportionally far less oxygen than carbohydrates OR A biological molecule that is soluble in organic solvents Lipids include steroids, fatty acids, prostaglandins, terpenes, and waxes. OR A diverse group of organic molecules that contain long hydrocarbon chains or rings and are hydrophobic. Examples are fats, oils, waxes, and steroids. OR A small water-insoluble biomolecule generally containing fatty acids, sterols, or isoprenoid compounds.

**lipid :** Fat.

**Lipid bilayer:** Model for the structure of the cell membrane based on the interaction between the hydrophobic regions of phospholipids. OR A bimolecular sheet formed by amphipathic molecules in which the hydrophobic moieties are on the inside of the sheet and the hydrophilic ones are on the aqueous outside.

**Lipinski's Rule of Five:** A set of rules that are obeyed by many orally active drugs. Often used as a guide during drug design. Not all orally active drugs obey the rule.

**Lipiodol :** A form of poppy seed oil that contains iodine. Lipiodol is given by injection and builds up in the blood and lymph vessels in tumors. It is used for imaging (taking pictures) of the salivary glands and the lymph system. It is also being studied in the imaging of other organs such as the liver, lung, stomach, and thyroid. It is a type of diagnostic imaging agent. Also called ethiodized oil, Ethiodol, and iodized oil.

**Lipitor :** A drug used to lower the amount of cholesterol in the blood and to prevent stroke, heart attack, and angina (chest pain). It is also being studied in the prevention and treatment of some types of cancer and other conditions. Lipitor blocks an enzyme that helps make cholesterol in the body. It also causes an increase in the breakdown of cholesterol. It is a type of HMG-CoA reductase inhibitor and a type of statin. Also called atorvastatin calcium.

**Lipo-:** A prefix meaning "lipid," or fat

**Lipo-Lutin:** (Other name for: therapeutic progesterone)

**lipoate (lipoic acid):** A vitamin for some microorganisms; an intermediate carrier of hydrogen atoms and acyl groups in  $\alpha$ -keto acid dehydrogenases.

**LipoDox :** A form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than doxorubicin. LipoDox is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other types of cancer. LipoDox is a type of anthracycline antitumor antibiotic. Also called Dox-SL, Doxil, doxorubicin hydrochloride liposome, Evacet, and liposomal doxorubicin hydrochloride.

**Lipoic acid (6, 8-dithiooctanoic acid):** An acyl group carrier that functions as a cofactor in dehydrogenase enzymes; linked covalently to specific lysine residues in enzyme proteins, it can exist as the reduced open-chain form or the closed-ring disulfide form, undergoing interconversion in a catalytic cycle.

**Lipolysis:** The enzymatic hydrolysis of triacylglycerols to free fatty acids and glycerol.

**lipoma :** A benign (not cancer) tumor made of fat cells.

**Lipophilic:** A compound is said to be lipophilic if it has high solubility in fat. OR Refers to a substance's solubility in fat. Lipophilicity can be measured by shaking the substance with a two-phase mixture of water and 1-octanol and observing the final concentrations of the substance in the two layers. Lipophilic substances will move into the 1-octanol layer, while hydrophilic substances stay in the water.

**lipophilic :** Able to dissolve, be dissolved in, or absorb lipids (fats).

**Lipophilic salt:** (see ionic additives).

**Lipopolysaccharide:** Usually refers to a unique glycolipid found in Gram negative bacteria. OR An endotoxin and biologically active component of the Gram-negative bacterial cell wall that is a Toll-like receptor 4 (TLR4) agonist with potential immunostimulatory activity. Upon internalization, lipopolysaccharide (LPS) activates TLR4 which in turn activates the NFkappaB pathway, in addition to mitogen-activated protein kinases signaling pathways. This leads to the release of proinflammatory cytokines and stimulates an innate immune response against vaccine antigens.

**lipoprotein:** A lipid-protein aggregate that serves to carry water-insoluble lipids in the blood. The protein component alone is an apolipoprotein.

**Lipoprotein particles:** Particles, consisting of a core of hydrophobic lipids surrounded by a shell of polar lipids and specific proteins, that play a role in the transport of cholesterol and triacylglycerols.

**liposarcoma :** A rare cancer of the fat cells.

**liposomal :** A drug preparation that contains the active drug inside very tiny, fat-like particles. This form is easier for the body to absorb and allows more drug to get to the target area of the body, such as a tumor. Liposomal drugs may have fewer side effects and work better than other forms of the drug.

**liposomal amphotericin B:** A liposome-encapsulated formulation of the polyene antifungal antibiotic amphotericin B produced by the bacterium *Streptomyces nodosus* with antifungal activity. Amphotericin B binds to ergosterol, an essential component of the fungal cell membrane, and alters cell membrane integrity, resulting in leakage of intracellular components

and cell rupture. This agent may also induce oxidative damage in fungal cells and has been reported to stimulate host immune cells. Compared to amphotericin B alone, liposomal delivery of amphotericin B allows for a greater drug concentration in target tissues while decreasing systemic side effects.

**liposomal annamycin:** A liposome-encapsulated form of the semi-synthetic doxorubicin analogue annamycin with antineoplastic activity. Annamycin intercalates into DNA and inhibits topoisomerase II, resulting in the inhibition of DNA replication and repair and RNA and protein synthesis. This agent circumvents multidrug-resistance (MDR) transporters, including P-glycoprotein (P-gp). Liposomal annamycin is less toxic and shows improved antitumor activity compared to annamycin.

**liposomal belotecan:** A sterically stabilized, pegylated liposomal formulation containing CKD602, a semi-synthetic analogue of camptothecin with potential antitumor activity. CKD602 inhibits the action of topoisomerase I, an enzyme that produces reversible single-strand breaks in DNA during DNA replication. CKD602 stabilizes the topoisomerase I and DNA complex, resulting in the inhibition of religation of DNA breaks, inhibition of DNA replication, and apoptotic cell death. The polyethylene glycol coating of liposomal belotecan allows for greater plasma circulation time, thus enhancing the concentration of CKD602 at the tumor site. Encapsulation of CKD602 preserves the active lactone form, resulting in an increased cytotoxic effect of CKD602.

**liposomal c-raf antisense oligonucleotide:** The liposomal formulation of a c-raf-1 antisense oligonucleotide, with potential antineoplastic activity. Liposomal c-raf antisense oligonucleotide targets the translation initiation site of human c-raf-1 mRNA, thereby blocking the expression and production of Raf-1 protein and thus inhibits tumor cell growth and development. Raf-1 plays a key role in the RAF/MEK/ERK signaling pathway, which regulates mammalian cell proliferation and growth. The liposomal formulation increases the solubility of the c-raf antisense oligonucleotide, thus improving its pharmacodynamic profile. Check for active clinical trials using this agent.

**liposomal cisplatin:** A synthetic formulation in which the antineoplastic agent cisplatin is encapsulated in lipids. Liposomal cisplatin consists of small aggregates of cisplatin covered by a single lipid bilayer. Encasement

in liposomes improves cisplatin's tumor bioavailability and toxicity profile. Liposomal encapsulation does not affect the pharmacological properties of cisplatin directly. Cisplatin forms highly reactive, charged, platinum complexes which bind to nucleophilic groups such as GC-rich sites in DNA, inducing intrastrand and interstrand DNA cross-links, as well as DNA-protein cross-links. These cross-links result in apoptosis and cell growth inhibition.

**liposomal curcumin:** A liposomal formulation containing curcumin, a poorly water-soluble polyphenol pigment isolated from the plant *Curcuma longa*, with potential antineoplastic, chemopreventive, antioxidant, anti-angiogenic and anti-inflammatory activities. Upon intravenous administration of liposomal curcumin, this agent blocks the formation of reactive-oxygen species, neutralizes free radicals, and exhibits anti-inflammatory properties as a result of inhibition of cyclooxygenases (COX) and other enzymes involved in inflammation. In addition, curcumin disrupts various cell signal transduction pathways involved in carcinogenesis, inhibits the activity of nuclear factor-kappa B (NF- $\kappa$ B), SRC, and annexin A2 (ANXA2), and reduces the expression of both matrix metalloproteinase-9 (MMP-9) and vascular endothelial growth factor receptor 2 (VEGFR2). This prevents and/or inhibits tumor cell formation and proliferation. Liposome encapsulation of curcumin improves its efficacy, when compared to the administration of unencapsulated curcumin. Check for active clinical trials using this agent.

**liposomal cytarabine :** A form of the anticancer drug cytarabine that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than cytarabine. It is used to treat lymphoma that has spread to the meninges (three thin layers of tissue that cover and protect the brain and spinal cord). It is also being studied in the treatment of other types of cancer. It is a type of antimetabolite. Also called cytarabine liposome and Depo-Cyt.

**liposomal cytarabine-daunorubicin CPX-351:** A liposomal formulation containing a fixed combination of the antineoplastic agents cytarabine and daunorubicin in a 5:1 molar ratio. Liposomal cytarabine-daunorubicin CPX-351 has been designed to provide optimal delivery of a specific ratio of cytarabine to daunorubicin, one that has been shown to be synergistic in vitro. The antimetabolite cytarabine competes with cytidine for

incorporation into DNA, inhibiting DNA synthesis. This agent also inhibits DNA polymerase, resulting in a decrease in DNA replication and repair. Daunorubicin, an intercalator and a topoisomerase II inhibitor, prevents DNA replication and inhibits protein synthesis. This agent also generates oxygen free radicals, resulting in the cytotoxic lipid peroxidation of cell membrane lipids.

**liposomal daunorubicin citrate:** A liposome-encapsulated form of the citrate salt of the anthracycline antineoplastic antibiotic daunorubicin. Daunorubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. Liposomal delivery of doxorubicin citrate improves drug penetration into tumors and decreases drug clearance, thereby increasing the duration of therapeutic drug effects.

**liposomal docetaxel:** A formulation of the poorly soluble, semi-synthetic, second-generation taxane docetaxel encapsulated within liposomes, with antineoplastic activity. Upon intravenous administration, docetaxel binds to and stabilizes tubulin, thereby inhibiting microtubule disassembly which results in cell-cycle arrest at the G2/M phase and cell death. This liposomal formulation solubilizes docetaxel without the use of toxic solvents such as Tween 80, permitting the administration of larger doses of docetaxel while avoiding solvent-associated toxicity, including hypersensitivity reactions. In addition, liposomal delivery of docetaxel improves drug penetration into tumors and decreases drug clearance, thereby increasing the duration of therapeutic drug effects while lowering the toxicity profile.

**liposomal doxorubicin hydrochloride :** A form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than doxorubicin. Liposomal doxorubicin hydrochloride is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Liposomal doxorubicin hydrochloride is a type of anthracycline antitumor antibiotic. Also called Dox-SL, Doxil, doxorubicin hydrochloride liposome, Evacet, and LipoDox.

**liposomal eribulin mesylate:** A liposome-encapsulated formulation of the mesylate salt form of eribulin, a synthetic, macrocyclic ketone analogue of

halichondrin B, a substance derived from the marine sponge genus *Halichondria*, with potential antineoplastic activity. Eribulin binds to the vinca domain of tubulin and inhibits both the polymerization of tubulin and the assembly of microtubules. This results in the inhibition of mitotic spindle assembly, the induction of cell cycle arrest at G2/M phase, as well as tumor cell apoptosis. Compared to the administration of eribulin alone, liposomal delivery of eribulin allows for a longer half-life, which allows increased drug concentration in target tissues while decreasing systemic toxicity.

**liposomal HPV-16 E6/E7 multi-peptide vaccine PDS0101:** A liposomal nanoparticle-based therapeutic vaccine composed of the cationic lipid R-DOTAP (R-enantiomer of 1,2-dioleoyl-3-trimethylammonium-propane chloride) encapsulating six human papillomavirus 16 (HPV-16) E6 and E7 peptides, with potential immunostimulating activity. Upon subcutaneous administration of the liposomal HPV-16 E6 and E7 multi-peptide vaccine, the nanoparticles are taken up by antigen presenting cells (APCs), specifically dendritic cells (DCs), which may stimulate the immune system to induce a cytotoxic T-lymphocyte response (CTL) against HPV-16 E6 and E7-expressing tumor cells. HPV-16 E6 and E7 are oncoproteins that play a key role in the tumorigenesis of a variety of cancers. Check for active clinical trials using this agent.

**liposomal interleukin-2:** A formulation in which liposomes are loaded with the cytokine interleukin-2 (IL-2). By activating cytotoxic T lymphocytes, such as lymphokine-activated killer cells, and increasing levels of the cytotoxic cytokines interferon-gamma (IFN-gamma) and transforming growth factor-beta (TGF-beta), IL-2 may exhibit antitumoral activity. Liposomal formulations of IL-2 may promote entry of the cytokine into target tumor cells and may be used as an immunoadjuvant in cancer vaccine therapy.

**liposomal lurtotecan:** A liposome-encapsulated formulation of lurtotecan with antineoplastic activity. Lurtotecan, a semisynthetic analogue of camptothecin, selectively stabilizes the topoisomerase I-DNA covalent complex and forms an enzyme-drug-DNA ternary complex during S phase of the cell cycle, thereby inhibiting religation of topoisomerase I-mediated single-stranded DNA breaks. This ultimately results in an inhibition of DNA replication, inducing double-stranded DNA breakages, obstruction of

RNA and protein synthesis and triggering apoptosis. Furthermore, this agent also stimulates degradation of topoisomerase I, likely mediated through ubiquitin-proteasomal pathway. Liposomal delivery of lurtotecan improves its penetration and delivery into tumors while lowering systemic side effects.

**liposomal mitoxantrone hydrochloride:** A formulation composed of the hydrochloride salt form of the anthracenedione antibiotic mitoxantrone encapsulated within liposomes, with potential antineoplastic activity. Upon intravenous administration, mitoxantrone intercalates into and forms crosslinks with DNA, thereby disrupting DNA and RNA replication. This agent also binds to topoisomerase II, which both results in DNA strand breaks and prevents DNA synthesis. This leads to the induction of apoptosis in the rapidly dividing cancer cells. The liposomal delivery of mitoxantrone improves drug penetration into tumors and decreases drug clearance, thereby increasing drug circulation and therapeutic efficacy while lowering the toxic effects.

**liposomal MUC1/PET-lipid A vaccine:** A cancer vaccine comprised of a 43 amino acid epitope from glycoprotein MUC1 (mucin 1) and the synthetic Toll-like receptor 4 (TLR-4) agonist PET lipid A encapsulated in cholesterol/dipalmitoylphosphatidylcholine (DPPC)/dimyristoylphosphatidylglycerol (DMPG) liposomes, with potential immunostimulatory and antineoplastic activities. The MUC1 epitope is composed of two 20 amino glycosylated VNTR (various number tandem repeats) from human MUC1A and including 6 glycosylated sites modified by Tn (alpha-N-acetyl-D-galactosamine). Immunization of liposomal MUC1/PET-lipid A vaccine results in an antibody as well as a cytotoxic T-lymphocyte (CTL) response against hypoglycosylated MUC1 expressing tumor cells. The tumor associated antigen MUC1, a type I transmembrane protein, is overexpressed and aberrantly glycosylated in a variety of tumor cells. As a vaccine adjuvant, PET lipid A, also known as penta erythritol lipid A, stimulates both cellular and humoral responses to the vaccine antigen. Check for active clinical trials using this agent.

**liposomal NDDP:** A synthetic liposomal formulation of bis-neodecanoate diaminocyclohexane platinum (NDDP), a third-generation platinum complex analogue of cisplatin, with potential antineoplastic activity. After displacement of the 2 long-chain aliphatic leaving groups (neodecanoic

acid), platinum diaminocyclohexane (DACH) complexes become highly reactive and alkylate macromolecules, forming both inter- and intra-strand DNA crosslinks and inhibiting DNA synthesis, which results in tumor cell cytotoxicity. Because DNA mismatch-repair (MMR) complexes do not recognize DACH–platinum adducts, DNA repair mechanisms are inhibited, overcoming limitations observed with other platinum-based agents. In addition, the liposomal encapsulation improves the bioavailability of NDDP and reduces its toxicity profile.

**liposomal oxaliplatin:** A liposomal formulation of the prodrug oxaliplatin, an organoplatinum complex in which the platinum atom is complexed with 1,2-diaminocyclohexane (DACH) and with an oxalate ligand as a 'leaving group', with antineoplastic activity. After displacement of the labile oxalate ligand leaving group, the active oxaliplatin derivatives monoquo and diaquo DACH platinum alkylate macromolecules, and form both inter- and intra-strand platinum-DNA crosslinks; inhibition of DNA replication and transcription and cell-cycle nonspecific cytotoxicity ensue. The DACH side chain appears to inhibit alkylating-agent resistance. A leaving group is an atom or a group of atoms that is displaced as a stable species taking with it its bonding electrons.

**liposomal paclitaxel:** A liposome-encapsulated formulation of paclitaxel, a taxoid compound extracted from the Pacific yew tree *Taxus brevifolia*, with antineoplastic property. Paclitaxel binds to tubulin and interferes with the assembly/disassembly dynamics of microtubules, thereby resulting in the inhibition of cell division. This agent also induces apoptosis via inactivation of the apoptosis inhibitor, B-cell Leukemia 2 (Bcl-2) protein. Paclitaxel liposome formulation potentially enhances delivery of higher doses of paclitaxel to the target tissues and exhibits lower systemic toxicity. or A form of the anticancer drug paclitaxel that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of several types of cancer. Liposomal paclitaxel blocks the ability of cells to divide and may kill cancer cells. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called LEP-ETU, LipoTaxen, paclitaxel liposome, and PNU-93914.

**liposomal rhenium Re 186:** A therapeutic preparation consisting of the beta-emitting radioisotope rhenium Re 186 encapsulated in a nanoliposome, with potential antineoplastic activity. Upon intratumoral infusion of

liposomal rhenium Re 186, the radioisotope releases radiation, which directly kills the tumor cells. The nanoliposomes facilitate the retention of the radioisotope by the tumor cells and localize the radiocytotoxicity to the tumor while sparing surrounding normal, healthy cells. Re-186 has a short half-life and a short path length, which contributes further to limiting the radiotoxicity to the tumor cells.

**liposomal SN-38:** The liposomal formulation of SN-38 (7-ethyl-10-hydroxy-camptothecin), a biologically active metabolite of the prodrug irinotecan, with potential antineoplastic activity. SN-38 binds to and inhibits topoisomerase I by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks, inhibition of DNA replication, and apoptosis. SN-38 has been reported to exhibit up to 1,000-fold more cytotoxic activity against various cancer cells in vitro than irinotecan. The liposomal formulation of SN-38 increases the solubility of SN-38, which is a relatively insoluble compound, and improves the pharmacodynamic profile as compared to SN-38 alone. or A form of the anticancer drug irinotecan that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than irinotecan alone. Liposomal SN-38 is being studied in the treatment of advanced colorectal cancer and other types of cancer. Liposomal SN-38 blocks the ability of cells to divide and grow. It may stop the growth of tumor cells. It is a type of topoisomerase inhibitor and a type of irinotecan (CPT-11) derivative. Also called SN-38 liposome.

**liposomal T4N5 lotion:** A topical lotion that contains the enzyme T4-bacteriophage endonuclease V encapsulated within liposomes. With topical liposomal delivery, the DNA repair enzyme T4-bacteriophage endonuclease V is transported into skin cells, where the enzyme enters cell nuclei and binds to and incises pyrimidine dimers, thereby catalyzing the first reaction step of the cellular excision repair pathway for removing DNA replication-inhibiting pyrimidine dimers produced within duplex DNA through exposure to ultraviolet (UV) irradiation. In vitro and in vivo studies indicate that T4N5 liposomes increases repair of DNA damage caused by UV irradiation.

**liposomal topotecan hydrochloride:** The hydrochloride salt of a semisynthetic derivative of camptothecin mixed with sphingomyelin/cholesterol and sonicated to form small unilamellar vesicles

containing topotecan, with potential antineoplastic activity. Liposomal topotecan hydrochloride mediates efficient drug delivery of topotecan into the cytosol from the endosome compartment. During the S phase of the cell cycle, topotecan selectively stabilizes topoisomerase I-DNA covalent complexes, inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when complexes are encountered by the DNA replication machinery. Check for active clinical trials using this agent.

**liposomal tretinoin:** An intravenous formulation of tretinoin (vitamin A acid or all-trans retinoic acid) encased in liposomes. Tretinoin is a naturally occurring retinoic acid agent that binds to and activates retinoic acid receptors (RAR), effecting changes in gene expression that lead to cell differentiation, decreased cell proliferation, and inhibition of carcinogenesis. This agent also inhibits telomerase, leading to telomere shortening and eventual apoptosis of certain tumor cell types. Liposome encapsulation extends the half-life of intravenously administered tretinoin.

**liposomal vincristine sulfate :** A form of the anticancer drug vincristine sulfate that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than vincristine. Liposomal vincristine sulfate is used to treat adults with acute lymphoblastic leukemia that is Philadelphia chromosome negative and has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called Marqibo and vincristine sulfate liposome.

**liposome :** A very tiny, fat-like particle that is made in the laboratory. In medicine, liposomes containing drugs or other substances are used in the treatment of cancer and other diseases. Drugs given in liposomes may have fewer side effects and work better than the same drugs given alone.

**liposome-encapsulated doxorubicin citrate:** A formulation of the citrate salt of the antineoplastic anthracycline antibiotic doxorubicin, encapsulated within liposomes, with antitumor activity. Doxorubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and RNA synthesis. This agent also interacts with cell membrane lipids causing lipid peroxidation. Liposomal delivery of doxorubicin improves drug penetration into tumors and decreases drug

clearance, thereby increasing the duration of therapeutic drug effects while lowering the toxicity profile.

**liposome-encapsulated doxorubicin citrate :** A form of the anticancer drug doxorubicin citrate that is contained inside very tiny, fat-like particles. It is being studied in the treatment of breast cancer that has spread and in the treatment of other types of cancer. Doxorubicin citrate damages DNA and may kill cancer cells. Liposomal-encapsulated doxorubicin citrate may have fewer side effects and may work better than doxorubicin citrate.

**liposome-encapsulated irinotecan hydrochloride PEP02 :** A form of the anticancer drug irinotecan hydrochloride that is contained in very tiny, fat-like particles. Liposome-encapsulated irinotecan hydrochloride PEP02 is used together with fluorouracil and leucovorin to treat a certain type of pancreatic cancer that has spread to other parts of the body and has gotten worse after treatment with gemcitabine anticancer therapy. It is also being studied in the treatment of other types of cancer. Irinotecan hydrochloride blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. Liposome-encapsulated irinotecan hydrochloride PEP02 may have fewer side effects and work better than irinotecan hydrochloride. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called irinotecan hydrochloride liposome, Onivyde, and PEP02.

**liposome-encapsulated miR-34 mimic MRX34:** A liposomal formulation containing a nucleotide that mimics the human tumor suppressor microRNA (miRNA) miR-34, with potential antineoplastic activity. Upon administration, liposome-encapsulated MRX34 mimics miR-34 by inhibiting the expression of a variety of oncogenes including MYC, MET, BCL2, and beta-catenin. This induces cell cycle arrest, senescence and apoptosis in susceptible tumor cells. miR-34 is downregulated in most solid and hematologic malignancies and regulates the expression of a variety of genes. This miRNA plays an important role in the inhibition of cancer cell stemness, metastasis and cancer cell survival. Check for active clinical trials using this agent.

**liposome-encapsulated RB94 plasmid DNA gene therapy agent SGT-94:** A systemic gene therapy anti-cancer agent composed of cationic liposomes, which encapsulates plasmid DNA encoding for the tumor suppressor gene RB94 and is complexed with anti-transferrin receptor single chain antibody fragment (TfRscFv), with potential antineoplastic

activity. Upon systemic administration of liposome-encapsulated RB94 plasmid DNA gene therapy agent SGT-94, the TfRscFv portion of this agent selectively targets the tumor cells expressing transferrin receptors. TfRscFv binding to the transferrin receptor allows receptor-mediated endocytosis and transfection, followed by the expression of RB94 gene. This induces tumor cell apoptosis through an as-of-yet unknown pathway. RB94 is a modified, N-terminal truncated form of the full-length protein retinoblastoma gene RB110, and exerts enhanced antitumor activity. The transferrin receptor (TfR) functions in cellular iron uptake through its interaction with transferrin, and is overexpressed in a variety of tumor types.

**liposome-encapsulated recombinant human enzyme Cu/Zn superoxide-dismutase:** A topical hydrophilic gel containing a recombinant form of the human Cu/Zn superoxide dismutase (SOD1), a cytoplasmic antioxidant enzyme, encapsulated in liposomes with potential anti-inflammatory and adjuvant activities. Upon application of liposome-encapsulated recombinant human Cu/Zn SOD as a thin film on the irradiated area, the recombinant SOD1 is released and scavenges free oxygen radicals, thereby protecting cells from oxidative stress. This may prevent radiation-induced dermatitis as well as other types of skin reactions. Check for active clinical trials using this agent.

**liposome-incorporated Grb2 antisense oligodeoxynucleotide:** A liposomal formulation containing the antisense oligodeoxynucleotide (ODN) growth factor receptor-bound protein 2 (Grb2), with potential antineoplastic activity. Upon administration, liposome-incorporated Grb2 antisense oligodeoxynucleotide binds directly to and blocks Grb2 mRNA, thereby preventing Grb2 protein synthesis, leading to inhibition of cell proliferation of cancer cells overexpressing Grb2. Grb2, an adaptor protein involved in growth signaling pathways, is upregulated in certain tumor cells.

**Liposomes:** Lipid vesicles having an aqueous region enclosed by a lipid bilayer

**LipoTaxen :** A form of the anticancer drug paclitaxel that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of several types of cancer. LipoTaxen blocks the ability of cells to divide and may kill cancer

cells. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called LEP-ETU, liposomal paclitaxel, paclitaxel liposome, and PNU-93914.

**Lipotecan:** (Other name for: camptothecin analogue TLC388)

**lipoxin:** anti-inflammatory eicosanoids synthesized through lipoxygenase interactions, hence the derivation of the name

**Liquamar:** (Other name for: phenprocoumon)

**liquefaction:** of a landslide, an occurrence in which water-saturated soil moves downslope like a liquid.

**Liquefaction:** A process that increases the pressure on a gas until it becomes a liquid. This process happens at room temperature.

**liquid:** The phase of matter in which a substance has a definite volume but no definite shape. OR Liquids are an in-between phase of matter, between solids and gases. One characteristic of a liquid is that it fills the shape of any container. Liquids usually have a flat surface because of gravity pulling down on the molecules. OR a state of matter in which the molecules are touching, fluid, incompressible. OR A state of matter that has a high density and is incompressible compared to a gas. Liquids take the shape of their container but do not expand to fill the container as gases do.

Liquids diffuse much more slowly than gases. OR A state of matter. It has a fixed volume but no fixed shape.

**liquid biopsy :** A test done on a sample of blood to look for cancer cells from a tumor that are circulating in the blood or for pieces of DNA from tumor cells that are in the blood. A liquid biopsy may be used to help find cancer at an early stage. It may also be used to help plan treatment or to find out how well treatment is working or if cancer has come back. Being able to take multiple samples of blood over time may also help doctors understand what kind of molecular changes are taking place in a tumor.

**Liquid Driers:** Solution of soluble driers in organic solvents.

**Liquid Injection:** The process that involves an integrated system for proportioning, mixing, and dispensing two component liquid resin formulations and directly injecting the resultant mix into a mold which is clamped under pressure.

**Liquid Injection Molding (LIM):** The process that involves an integrated system for proportioning, mixing, and dispensing two component liquid

resin formulations and directly injecting the resultant mix into a mold which is clamped under pressure.

**Liquid junction potential:** the potential formed at the interface between any two electrolyte solutions of different compositions. In ISE measurements, the most important liquid junction is that between the reference electrode filling solution and the sample solution. Ideally, this potential should be as low and as constant as possible, despite variations in the external solution. Reference electrode filling solutions are chosen to minimize this potential.

**liquid-based Pap test :** A type of Pap test. A Pap test is a procedure in which cells are scraped from the cervix for examination under a microscope. It is used to detect cancer or changes that may lead to cancer. A Pap test can also show conditions that are not cancer, such as infection or inflammation. In a liquid-based Pap test, the cells are rinsed into a small container of liquid. The cells are then placed onto slides by a special machine and examined under a microscope to see if the cells are abnormal.

**liquie:** a state of matter that has a definite size or volume but not a definite shape.

**liraglutide:** A long-acting, fatty acylated glucagon-like peptide-1 (GLP-1) analog administered subcutaneously, with antihyperglycemic activity. Liraglutide's prolonged action and half-life of 11-15 hours are attributed to the attachment of the fatty acid palmitic acid to GLP-1 that reversibly binds to albumin. Albumin binding protects liraglutide from immediate degradation and elimination and causes GLP-1 to be released from albumin in a slow and consistent manner. This agent may cause thyroid C-cell tumors and increases the risk of acute pancreatitis.

**lirilumab:** A fully humanized monoclonal antibody against killer-cell immunoglobulin-like receptors (KIR), with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, lirilumab binds to KIR, thereby preventing the binding of KIR ligands to KIR on natural killer (NK) cells. By blocking these inhibitory receptors, NK cells become activated and attack cancer cells leading to tumor cell death. KIR, a member of the immunoglobulin superfamily, is expressed on the surface of NK cells.

**lisdexamphetamine dimesylate:** The dimesylate form and prodrug of the d-isomer of amphetamine, a non-catecholamine sympathomimetic amine with

central nervous system (CNS) stimulating activity. Upon administration, lisdexamphetamine is converted to dextroamphetamine through cleavage of the lysine group. Dextroamphetamine acts by facilitating the release of catecholamines, particularly noradrenaline and dopamine, from its storage sites in nerve terminals in the CNS, and inhibits their uptake within the mesocorticolimbic system, a major component of the brain reward system, resulting in measurable behavioral changes such as euphoria, mental alertness and excitement and appetite suppression. As a CNS stimulant, this agent may increase blood pressure.

**lisinopril:** An orally bioavailable, long-acting angiotensin-converting enzyme (ACE) inhibitor with antihypertensive activity. Lisinopril, a synthetic peptide derivative, specifically and competitively inhibits ACE, which results in a decrease in the production of the potent vasoconstrictor angiotensin II and, so, diminished vasopressor activity. In addition, angiotensin II-stimulated aldosterone secretion by the adrenal cortex is decreased which results in a decrease in sodium and water retention and an increase in serum potassium. or A drug used to treat high blood pressure and certain heart conditions. It is also being studied in the prevention and treatment of side effects caused by some anticancer drugs. It blocks certain enzymes that cause blood vessels to constrict (narrow). It is a type of angiotensin-converting enzyme (ACE) inhibitor. Also called Prinivil and Zestril.

**lisofylline :** A drug that may protect healthy cells from chemotherapy and radiation without inhibiting the effects of these therapies on tumor cells.

**listeria monocytogenes-LLO-PSA ADXS31-142:** A cancer vaccine containing a live-attenuated strain of the Gram-positive bacterium *Listeria monocytogenes* (Lm) encoding a fusion protein composed of the tumor-associated antigen (TAA) human prostate-specific antigen (PSA) fused to a fragment of the immunostimulant listeriolysin O (LLO) protein, with potential immunostimulatory and antineoplastic activities. Upon administration of the Lm-LLO-PSA vaccine ADXS31-142, the expressed LLO-PSA is processed by antigen presenting cells (APCs), presented to the immune system by both major histocompatibility complex (MHC) I and II molecules, and activates the immune system to exert both an innate and adaptive immune response involving the recruitment and activation of T-lymphocytes against PSA-expressing tumor cells as well as the inhibition of

tumor-infiltrating T regulatory cells (T regs) and myeloid-derived suppressor cells (MDSCs). This eventually results in tumor cell lysis. Check for active clinical trials using this agent.

**liter:** Unit of volume in the metric system, slightly larger than 1 quart, since 1 liter is 33.2 ounces, or 1 quart is 0.946 liters, to three significant figures. OR A liter is a metric unit of measure for volume. One liter is equal to one thousand milliliters. OR A measure of volume for a liquid, using the metric system. One liter is equal to 1,000 cubic centimeters (cc), 1,000 milliliters (ml), or 1.0567 quarts (qt). Also called L.

**Lithane:** (Other name for: lithium carbonate)

**lithification:** the hardening of sediment into a rock.

**Lithium:** Symbol:"Li" Atomic Number:"3" Atomic Mass: 6.94amu. It is one member of the alkali metal family. Lithium is a very light metal, so light that it can float on water. Lithium can be found in batteries, medicine, mineral water, nuclear reactors, and air conditioning. OR Element 3, atomic weight 6.939. The lightest alkali metal, used in special-purpose metal alloys and other industrial applications.

**lithium :** A soft metal. Lithium salts are used to treat certain mental disorders, especially bipolar (manic depressive) disorder. Lithium salts include lithium carbonate and lithium citrate.

**lithium carbonate:** The carbonate salt of lithium, a soft alkali metal, with antimanic and hematopoietic activities. Lithium interferes with transmembrane sodium exchange in nerve cells by affecting sodium, potassium-stimulated adenosine triphosphatase (Na<sup>+</sup>, K<sup>+</sup>-ATPase); alters the release of neurotransmitters; affects cyclic adenosine monophosphate (cAMP) concentrations; and blocks inositol metabolism resulting in depletion of cellular inositol and inhibition of phospholipase C-mediated signal transduction. The exact mechanism through which lithium exerts its mood-stabilizing effect has not been established. In addition, lithium stimulates granulocytopoiesis and appears to increase the level of pluripotent hematopoietic stem cells by stimulating the release of hematopoietic cytokines and/or directly acting on hematopoietic stem cells.

**Lithobid:** (Other name for: lithium carbonate)

**Lithonate:** (Other name for: lithium carbonate)

**lithosphere:** The lithosphere is the Earth's crust and uppermost part of the mantle. OR the rock layer on the outer edge of the Earth. OR The component of the Earth's surface comprising the rock, soil, and sediments. It is a relatively passive component of the climate system, and its physical characteristics are treated as fixed elements in the determination of climate.

**Lithotabs:** (Other name for: lithium carbonate)

**litmus:** Plant pigment commonly used as an acid base indicator. Litmus is red (or pink) in an acid, and blue in a base. OR an indicator that turns red in acid and blue in alkaline solution. OR A mixture of pigments extracted from certain lichens that turns blue in basic solution and red in acidic solution.

**litmus paper:** Paper impregnated with litmus, usually cut in narrow strips. Dipping red litmus paper into a basic solution turns it blue; dipping blue litmus paper into an acidic solution turns it red.

**litronesib:** An inhibitor of the kinesin-related motor protein Eg5 with potential antineoplastic activity. Litronesib selectively inhibits the activity of Eg5, which may result in mitotic disruption, apoptosis and consequently cell death in tumor cells that are actively dividing. The ATP-dependent Eg5 kinesin-related motor protein (also known as KIF11 or kinesin spindle protein-5) is a plus-end directed kinesin motor protein that plays an essential role during mitosis, particularly in the regulation of spindle dynamics, including assembly and maintenance.

**litter:** Undecomposed plant residues on the soil surface.

**Little Ice Age:** A cold period that lasted from about A.D. 1550 to about A.D. 1850 in Europe, North America, and Asia. This period was marked by rapid expansion of mountain glaciers, especially in the Alps, Norway, Ireland, and Alaska. There were three maxima, beginning about 1650, about 1770, and 1850, each separated by slight warming intervals.

**live attenuated measles virus vaccine:** A live, attenuated measles vaccine with potential antineoplastic activity. Upon subcutaneous administration, live attenuated measles virus vaccine may activate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against measles-positive tumor cells. Measles virus has been shown to be present in some non-small cell lung cancers.

**Live edge:** During the process of painting large areas some edges of the wet paint will have to be left for a period while the remainder of the work is brought level. If these edges are still capable of being joined without a lap showing they are said to be 'live'. The art of the painter is to coat the whole surface keeping any such edges 'alive' so that the finished work shows no joints or laps.

**live freeze-dried lactic acid bacteria probiotic:** A probiotic containing live, cultivated, freeze-dried lactic acid bacteria with gastrointestinal (GI) protective, anti-inflammatory, immunomodulating and potential antitumor properties. Oral administration of probiotic bacteria help maintain adequate colonization of the GI tract and modulate the composition of the normal microflora. Upon colonization of the GI tract, the probiotic bacteria form a protective barrier, interfere with the attachment of pathogenic bacteria and other harmful substances and may bind to and degrade carcinogens. This may prevent inflammation and possibly cancer. In addition, these bacteria produce lactic acid, thereby creating an acidic environment that is unfavorable for pathogens.

**Live tooling:** Mill-like machining actions in a lathe where a rotating tool removes material from stock. This allows for the creation of features like flats, grooves, slots, and axial or radial holes to be created within the lathe.

**live virus vaccine :** A vaccine made from a virus that has been weakened so it does not cause the disease the virus usually causes. A live virus vaccine helps the body's immune system recognize and fight infections caused by the non-weakened form of the virus. Examples of live virus vaccines are the chickenpox vaccine and the measles, mumps, and rubella (MMR) vaccine. It is not safe for pregnant women or people with weak immune systems to receive a live virus vaccine.

**live-attenuated double-deleted Listeria monocytogenes bacteria JNJ-64041809:** A proprietary, live-attenuated, double-deleted (LADD) strain of the Gram-positive bacterium *Listeria monocytogenes* (Lm) encoding multiple, as of yet undisclosed, tumor-associated antigens (TAAs), with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, live-attenuated double-deleted *Listeria monocytogenes* bacteria JNJ-64041809 is taken up by antigen-presenting cells (APCs), including dendritic cells (DCs). The TAAs are subsequently expressed by the APCs and then processed and presented to the immune

system by both major histocompatibility complex (MHC) class I and II molecules. This activates the immune system and leads to the recruitment and activation of cytotoxic T lymphocytes (CTLs) against the TAA-expressing tumor cells, eventually resulting in tumor cell lysis. Two genes contributing to the virulence of Lm have been removed to minimize the risk of infection.

**live-attenuated *Listeria monocytogenes* cancer vaccine ADXS11-001:** A cancer vaccine containing a live-attenuated strain of the bacterium *Listeria monocytogenes* (Lm) encoding human papillomavirus (HPV) type 16 E7 fused to a non-hemolytic listeriolysin O protein with potential immunostimulatory and antineoplastic activities. Upon vaccination, *Listeria* expresses the HPV 16 E7 antigen and activates the immune system to mount a cytotoxic T-lymphocyte (CTL) response against cancer cells expressing HPV 16 E7. This may result in tumor cell lysis. In addition, the *Listeria* vector itself may induce a potent immune response. HPV 16 E7, a cell surface glycoprotein and tumor associated antigen, is overexpressed in the majority of cervical cancer cells.

**live-attenuated *Listeria monocytogenes* encoding EGFRvIII-mesothelin vaccine JNJ-64041757:** A proprietary, live-attenuated, double-deleted (LADD) strain of the Gram-positive bacterium *Listeria monocytogenes* (Lm) encoding the tumor-associated antigens (TAAs) epidermal growth factor receptor mutant form EGFRvIII and human mesothelin, with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, the live-attenuated *Listeria monocytogenes* encoding EGFRvIII-mesothelin vaccine JNJ-64041757 is taken up by antigen-presenting cells (APCs), including dendritic cells (DCs). EGFRvIII and mesothelin are subsequently expressed by the APCs and then processed and presented to the immune system by both major histocompatibility complex (MHC) class I and II molecules. This activates the immune system and leads to the recruitment and activation of cytotoxic T-lymphocytes (CTLs) against EGFRvIII- and mesothelin-expressing tumor cells, eventually resulting in tumor cell lysis. EGFRvIII and mesothelin are overexpressed in many types of cancer. Two genes contributing to the virulence of Lm have been removed to minimize the risk of infection.

**live-attenuated *Listeria monocytogenes* encoding EGFRvIII-NY-ESO-1 vaccine ADU-623:** A live-attenuated, double-deleted strain of the Gram-

positive bacterium *Listeria monocytogenes* (Lm) encoding a mutant form of the tumor-associated antigens, epidermal growth factor receptor (EGFRvIII) and the cancer/testis antigen NY-ESO-1, with potential immunostimulatory and antineoplastic activities. Upon intravenous administration, live-attenuated *Listeria monocytogenes* encoding EGFRvIII-NY-ESO-1 vaccine targets dendritic cells and expresses EGFRvIII and NY-ESO-1. This promotes both a potent innate immune response and an adaptive immune response involving the recruitment and activation of T lymphocytes against EGFRvIII and NY-ESO-1-expressing tumor cells, which results in tumor cell lysis.

**live-attenuated, double-deleted *Listeria monocytogenes* CRS-207:** A recombinant *Listeria*-based cancer vaccine containing a live-attenuated strain of the facultative intracellular bacterium *Listeria monocytogenes* (Lm) expressing human mesothelin with potential immunostimulatory and antineoplastic activities. Upon administration of this vaccine, *Listeria* invade professional phagocytes within the immune system and express mesothelin, which may activate a cytotoxic T-lymphocyte (CTL) response against mesothelin-expressing tumor cells, resulting in tumor cell lysis. In addition, the *Listeria* vector itself may induce a potent innate and adaptive immunity unrelated to mesothelin expression. Mesothelin is a cell surface glycoprotein involved in cell adhesion and is overexpressed in many epithelial-derived cancers, including pancreatic, ovarian and lung cancers, and malignant mesotheliomas.

**liver:** the organ that helps to process the products of human digestion and removes excess glucose from the bloodstream, converting it to a polymer called glycogen for storage.

**liver :** A large organ located in the upper abdomen. The liver cleanses the blood and aids in digestion by secreting bile.

**liver and bile duct cancer :** Primary liver cancer is cancer that forms in the tissues of the liver. The most common type of primary liver cancer is hepatocellular carcinoma, which occurs in the tissue of the liver. When cancer starts in other parts of the body and spreads to the liver, it is called liver metastasis. Bile duct cancer forms in the small ducts (tubes) that carry bile (fluid made by the liver that helps digest fat) between the liver and gallbladder and the intestine. Bile duct cancer is also called

cholangiocarcinoma. Intrahepatic bile duct cancer is found inside the liver. Extrahepatic bile duct cancer is found outside the liver.

**liver cancer :** Primary liver cancer is cancer that forms in the tissues of the liver. Secondary liver cancer is cancer that spreads to the liver from another part of the body.

**liver function test :** A blood test to measure the blood levels of certain substances released by the liver. A high or low level of certain substances can be a sign of liver disease.

**liver metastasis :** Cancer that has spread from the original (primary) tumor to the liver.

**liver X receptor alpha pathway :** Describes a group of proteins in a cell that work together to help control how certain genes are expressed and how cholesterol, lipids (fats), bile acids, and steroid hormones are made in the body. Changes in the liver X receptor alpha pathway may lead to diseases such as heart disease and cancer. Drugs or substances that affect this pathway are being studied in the prevention and treatment of cancer and other diseases. Also called LXR alpha pathway.

**liver-spleen scan :** A procedure used to check for abnormal areas in the liver or spleen. A very small amount of a radioactive substance is injected into a vein and travels through the blood to the liver and spleen. It is detected by a scanner linked to a computer, which forms an image of the areas where the radioactive substance collects. A liver-spleen scan may be used to help find cancer in the liver or spleen, cirrhosis, hepatitis, and other liver or spleen problems.

**Living Hinge:** A thin flexible hinge made from the same material as the two rigid pieces it connects. It is typically thinned to allow the rigid pieces to bend along the line of the hinge to allow them to open and close. They require careful design and gate placement. A typical application would be the top and bottom of a box.

**living will :** A type of legal advance directive in which a person describes specific treatment guidelines that are to be followed by health care providers if he or she becomes terminally ill and cannot communicate. A living will usually has instructions about whether to use aggressive medical treatment to keep a person alive (such as CPR, artificial nutrition, use of a respirator).

**Lixiviant:** A liquid medium used to selectively extract (or leach) uranium from ore bodies where they are normally found underground (in other words, in situ). This liquid medium, which typically contains an oxidant such as oxygen and/or hydrogen peroxide mixed with sodium carbonate or carbon dioxide, is injected through wells into the ore body in a confined aquifer to dissolve the uranium. The resulting solution is then pumped via other wells to the surface, where the uranium is recovered from it in a concentrated form for processing. For additional detail, see In Situ Recovery Facilities.

**LLDPE:** Linear low-density polyethylene

**LLDPE (Linear Low Density Polyethylene):** This is the primary type of resin used in modern can liner manufacturing technology. Bags made from LLDPE film provide excellent combination of film strength, puncture resistance and tear resistance. This is a plastic that is used predominantly in film applications due to its toughness, flexibility and relative transparency. LLDPE is the preferred resin for injection molding because of its superior toughness and is used in items such as grocery bags, garbage bags and landfill liners. (Adapted from Modern Plastics Encyclopedia 1995; Plastic Packaging Opportunities and Challenges, February 1992).

**LLDPE Tubing:** LLDPE Tubing: Linear Low Density Polyethylene Tubing. More durable than LDPE.

**LMB-1 immunotoxin:** A chimeric protein consisting of the Fv portion of a monoclonal antibody attached to a fragment of Pseudomonas exotoxin A without its cell-binding region. LMB-1 immunotoxin targets B3, a Lewis Y-related carbohydrate epitope found on some solid tumors. The antibody attaches to the tumor cell and the exotoxin stops protein synthesis by inactivating elongation factor 2. or A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**LMB-2 immunotoxin:** A fusion protein consisting of the Fv portion of a monoclonal antibody attached to a 38-kDa fragment of the Pseudomonas exotoxin A (with amino acids 365-380 deleted). LMB-2 immunotoxin targets the interleukin 2 receptor (also known as IL-2R or CD25) which is expressed on activated normal T and B cells and macrophages and on the cells of various hematologic malignancies. The antibody attaches to the IL-2R on the cell membrane, facilitating the entry of the exotoxin. The exotoxin moiety induces caspase-mediated apoptosis of tumor cells via a

mechanism involving mitochondrial damage; it also catalyzes the transfer of ADP ribose from nicotinamide adenine dinucleotide (NAD) to elongation factor-2 in eukaryotic cells, thereby inactivating elongation factor 2 and inhibiting protein synthesis. or A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**LMB-7 immunotoxin:** A single chain chimeric protein consisting of a monoclonal antibody fragment attached to a portion of the *Pseudomonas* exotoxin A. LMB-7 immunotoxin attaches to B3, a Lewis Y-related carbohydrate epitope on some solid tumor cells. The antibody attaches to the cell and the exotoxin inhibits protein synthesis by inactivating elongation factor 2. Check for active clinical trials using this agent. or A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**LMB-9 immunotoxin:** A recombinant disulfide stabilized anti-Lewis Y IgG immunotoxin containing a 38 KD toxic element derived from the *Pseudomonas aeruginosa* exotoxin A and a monoclonal antibody fragment, designed to target adenocarcinomas expressing Lewis Y. LMB-9 immunotoxin attaches to tumor cells, facilitating the entry of the exotoxin. The exotoxin moiety induces caspase-mediated apoptosis of tumor cells via a mechanism involving mitochondrial damage; it also catalyzes the transfer of ADP ribose from nicotinamide adenine dinucleotide (NAD) to elongation factor-2 in eukaryotic cells, thereby inactivating elongation factor 2 and inhibiting protein synthesis. or A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**LmddA-LLO-chHER2 fusion protein-secreting live-attenuated *Listeria* cancer vaccine ADXS31-164:** A cancer vaccine containing a live, highly attenuated strain of the Gram-positive bacterium *Listeria monocytogenes* (LmddA) encoding a fusion protein composed of a chimeric peptide comprised of three highly immunogenic epitopes of the human tumor-associated antigen (TAA) HER2/neu (chHER2) fused to a non-hemolytic fragment of the immunostimulant listeriolysin O (LLO) protein, with potential immunostimulatory and antineoplastic activities. Upon administration of the LmddA-LLO-chHER2 vaccine ADXS31-142, the LmddA is taken up by phagocytic cells; then the listeriolysin portion of the expressed LLO-chHER2 can form pores in the phagolysosomes and the fusion protein can escape into the cytosol. In turn, the LLO-chHER2 is

processed and presented to the immune system by the major histocompatibility complex (MHC) I on the phagocytic cells. Antigen presentation activates the immune system to exert an immune response involving the recruitment and activation of T lymphocytes against HER2-expressing tumor cells, and inhibits tumor-infiltrating T regulatory cells (Tregs) and myeloid-derived suppressor cells (MDSCs). This eventually results in tumor cell lysis. HER2/neu, a tyrosine kinase receptor belonging to the epidermal growth factor receptor (EGFR) family, is overexpressed in various tumor cell types.

**LMP-2:340-349 peptide vaccine:** A peptide cancer vaccine containing amino acid residues 340-349 of the Epstein-Barr virus (EBV) latent membrane protein-2 (LMP-2) with potential immunostimulating and antineoplastic activities. Vaccination with LMP-2:340-349 peptide may boost the immune system to mount a specific cytotoxic T-lymphocyte (CTL) response against LMP-2-expressing tumor cells, resulting in cell lysis and inhibition of tumor cell proliferation. LMP-2, an EBV transmembrane protein, is expressed in various malignancies including nasopharyngeal cancer and EBV-positive Hodgkin disease. Check for active clinical trials using this agent.

**LMP-2:419-427 peptide vaccine:** A peptide cancer vaccine containing amino acid residues 419-427 of the latent membrane protein-2 (LMP-2) of the Epstein-Barr virus (EBV) with potential immunostimulating and antineoplastic activities. Vaccination with the LMP-2:49-427 peptide vaccine may boost the immune system to mount a specific cytotoxic T-lymphocyte response against LMP-2-expressing tumor cells, resulting in cell lysis and inhibition of tumor cell proliferation. LMP-2, an EBV transmembrane protein, is expressed in various malignancies including nasopharyngeal cancer and EBV-positive Hodgkin disease. Check for active clinical trials using this agent.

**LMP/BARF1/ EBNA1-specific cytotoxic T lymphocytes:** A preparation of allogeneic cytotoxic T-lymphocytes (CTL) made specifically reactive to three Epstein-Barr virus (EBV) proteins, latent membrane protein (LMP) 1, BamH1-A rightward frame-1 (BARF1) and EBV nuclear antigen 1 (EBNA1), with potential antineoplastic activity. Administration of LMP1/BARF1/ EBNA1-specific CTLs to patients with LMP1/BARF1/EBNA1-positive tumors may result in a specific CTL

response against the tumor cells expressing these antigens, which can result in both cell lysis and the inhibition of tumor cell proliferation. LMP1, BARF1 and EBNA1 are expressed in various, EBV-associated malignancies, including nasopharyngeal cancer and EBV-positive Hodgkin lymphoma.

**LMP2a-specific cytotoxic T-lymphocytes:** A preparation of cytotoxic T-lymphocytes (CTL), specifically reactive to Epstein-Barr virus (EBV) latent membrane protein-2A (LMP2A), with potential antineoplastic activity. T-lymphocytes are exposed *ex vivo* to dendritic cells (DCs) transfected with a replication-deficient adenovirus encoding EBV LMP2A. Subsequently, LMP2A-specific CTLs are exposed to EBV infected cells transfected with adenovirus encoding LMP2A, thereby further stimulating CTLs. Administered to patients with EBV-positive tumors, LMP2A-specific CTLs target LMP2A-positive cells, resulting in cell lysis and inhibition of cancer cell proliferation. EBV LMP2A may be expressed in various malignancies, including nasopharyngeal carcinoma and Hodgkin and non-Hodgkin lymphomas.

**LMP400:** A substance being studied in the treatment of cancer. It blocks certain enzymes that break and rejoin DNA strands. These enzymes are needed for cells to divide and grow. Blocking them may cause cancer cells to die. LMP400 also helps anticancer drugs kill cancers that are resistant to some other drugs. LMP400 is a type of indenoisoquinoline and a type of topoisomerase inhibitor.

**LMP776:** A substance being studied in the treatment of cancer. It blocks certain enzymes that break and rejoin DNA strands. These enzymes are needed for cells to divide and grow. Blocking them may cause cancer cells to die. LMP776 also helps anticancer drugs kill cancers that are resistant to some other drugs. LMP776 is a type of indenoisoquinoline and a type of topoisomerase inhibitor.

**LMW:** Low molecular weight

**LNA-based anti-miR-155 MRG-106:** A locked nucleic acid (LNA)-based oligonucleotide inhibitor of microRNA (miRNA) 155 (miR-155), with potential antineoplastic activity. Upon administration, LNA-based anti-miR-155 MRG-106 targets, binds to and inhibits miR-155. This silences miR-155 and prevents the translation of certain tumor promoting genes, which leads to the induction of cancer cell apoptosis and the inhibition of

tumor cell growth. miR-155, an oncogenic single-stranded, non-coding RNA that is critical to the regulation of gene expression, is overexpressed in certain tumor cell types. Up-regulation of miR-155 plays a key role in increased tumor cell proliferation and survival. The LNA is an RNA analog in which the ribose ring is locked in a particular confirmation that increases stability. Compared to the unmodified oligonucleotide, the LNA-modified oligonucleotide shows increased affinity for its target miR-155.

**loam:** soil that contains about equal amounts of sand, silt, and clay as well as abundant organic matter. OR A type of soil. It is a good mixture of sand, clay and humus. Gardeners try to make their soil a good loam so that their plants grow well.

**lobaplatin:** A third-generation, water-soluble platinum compound with potential antineoplastic activity. Lobaplatin forms highly reactive, charged, platinum complexes that bind to nucleophilic groups such as GC- and AG-rich sites in DNA, inducing intrastrand DNA cross-links. These cross-links will ultimately result in induction of apoptosis and cell growth inhibition. Compared to first and second generation platinum compounds, lobaplatin appears to be more stable, less toxic, have a better therapeutic index and may overcome tumor resistance. or A substance that contains the metal platinum and may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent.

**lobe :** A portion of an organ, such as the liver, lung, breast, thyroid, or brain.

**lobectomy :** Surgery to remove a whole lobe (section) of an organ (such as the lungs, liver, brain, or thyroid gland).

**lobeline :** A substance that comes from a plant known as Indian tobacco, which is different from the tobacco used to make smoking products. It has been studied as a way to help people stop smoking. It is a type of alkaloid.

**lobradimil:** A synthetic analog of bradykinin. Lobradimil is a potent, specific bradykinin B-2 receptor agonist that stimulates B-2 receptors expressed on the surface of brain capillary endothelial cells, thereby reversibly increasing the permeability of the blood-brain barrier (BBB). Compared to bradykinin, this agent possesses enhanced receptor selectivity, greater plasma stability, and a longer half-life. or A substance that is being studied for its ability to help other drugs reach the brain. It belongs to the family of drugs called bradykinin agonists. Also called RMP-7.

**lobular capillary hemangioma :** A benign (not cancer) blood vessel tumor that usually forms on the skin. It may also form on mucous membranes and inside capillaries (small blood vessels) or other places on the body. Lobular capillary hemangiomas usually appear as raised, bright red lesions that may grow quickly and bleed a lot. The lesions are sometimes caused by injury or use of certain medicines and often come back after treatment. They usually occur in older children and young adults but may occur at any age. Lobular capillary hemangiomas are a type of vascular tumor. Also called pyogenic granuloma.

**lobular carcinoma :** Cancer that begins in the lobules (milk glands) of the breast. Lobular carcinoma may be either lobular carcinoma in situ (LCIS) or invasive lobular carcinoma. LCIS is a noninvasive condition in which abnormal cells are found in the lobules of the breast. LCIS rarely becomes invasive cancer, but having LCIS in one breast increases the risk of developing invasive cancer in either breast. In invasive lobular carcinoma, cancer has spread from the lobules to surrounding normal tissue. It can also spread through the blood and lymph systems to other parts of the body.

**lobular carcinoma in situ :** A condition in which abnormal cells are found in the lobules of the breast. This condition seldom becomes invasive cancer. However, having lobular carcinoma in situ in one breast increases the risk of developing breast cancer in either breast. Also called LCIS.

**lobular intraepithelial neoplasia :** A condition in which abnormal cells are found in the lobules (glands that make milk) of the breast. This condition rarely becomes cancer. However, having lobular intraepithelial neoplasia in one breast increases the risk of breast cancer in either breast. Types of lobular intraepithelial neoplasia include atypical lobular hyperplasia and lobular carcinoma in situ (LCIS). Also called LIN and lobular neoplasia.

**lobular neoplasia :** A condition in which abnormal cells are found in the lobules (glands that make milk) of the breast. This condition rarely becomes cancer. However, having lobular neoplasia in one breast increases the risk of breast cancer in either breast. Types of lobular neoplasia include atypical lobular hyperplasia and lobular carcinoma in situ (LCIS). Also called LIN and lobular intraepithelial neoplasia.

**lobule :** A small lobe or a subdivision of a lobe.

**local:** In DFT, a functional that depends only upon the value of the density,  $f[\rho]$ . This is the simplest and least expensive type of functional.

**local anesthesia :** A temporary loss of feeling in one small area of the body caused by special drugs called anesthetics. The patient stays awake but has no feeling in the area of the body treated with the anesthetic. Local anesthetics may be injected or put on the skin to lessen pain during medical, surgical, or dental procedures. Some are available over-the-counter (without a doctor's order) and may help lessen local pain, irritation, and itching caused by conditions such as cold sores, sunburn, poison ivy, and minor cuts.

**local cancer :** An invasive malignant cancer confined entirely to the organ where the cancer began.

**local noon:** occurs when the Sun is at its highest point for the day.

**local therapy :** Treatment that is directed to a specific organ or limited area of the body, such as the breast or an abnormal growth on the skin. Examples of local therapy used in cancer are surgery, radiation therapy, cryotherapy, laser therapy, and topical therapy (medicine in a lotion or cream that is applied to the skin).

**localization :** The process of determining or marking the location or site of a lesion or disease. May also refer to the process of keeping a lesion or disease in a specific location or site.

**localized :** In medicine, describes disease that is limited to a certain part of the body. For example, localized cancer is usually found only in the tissue or organ where it began, and has not spread to nearby lymph nodes or to other parts of the body. Some localized cancers can be completely removed by surgery.

**localized gallbladder cancer :** Cancer found only in the tissues that make up the wall of the gallbladder. Localized gallbladder cancer can be removed completely in an operation.

**locally advanced cancer :** Cancer that has spread from where it started to nearby tissue or lymph nodes.

**locally recurrent cancer :** Cancer that has recurred (come back) at or near the same place as the original (primary) tumor, usually after a period of time during which the cancer could not be detected.

**lock and key model:** A model that explains the role of enzymes in chemical reactions by assuming that the reactants fit into the enzyme like a key fits into a lock.

**Lock rail:** The horizontal member or rail of a door in which the lock or latch is fixed.

**locus :** The physical site or location of a specific gene on a chromosome. Or Specific place where something is located or occurs. It may refer to a specific place on the body (such as an acupuncture point) or the place on a chromosome where a specific gene is found.

**locus heterogeneity :** The same phenotype is caused by mutations in genes at different chromosomal loci.

**LOD score :** A statistical estimate of whether two genetic loci are physically near enough to each other (or "linked") on a particular chromosome that they are likely to be inherited together. A LOD score of 3 or higher is generally understood to mean that two genes are located close to each other on the chromosome. In terms of significance, a LOD score of 3 means the odds are 1,000:1 that the two genes are linked and therefore inherited together. Also called logarithm of the odds score.

**Lodine:** (Other name for: etodolac)

**loess:** silt and clay deposited by wind and weakly cemented by calcite. OR A buff-colored, wind-blown deposit of fine silt, which is frequently exposed in bluffs with steep faces. The thickness can range from 6 to 30 m. The loess of the USA and Europe is thought to be the fine materials first transported and deposited by the waters of melting ice sheets during the glacial period. It was later blown considerable distances with, in some cases, deposition in lakes. The origin of Asiatic loess, however, is apparently wind-blown dust from central Asian deserts.

**Lofibra :** A drug used to treat high levels of cholesterol and triglycerides in the blood. Lofibra is being studied in the treatment of advanced cancers in young patients and in the treatment of other conditions. It is a type of antilipidemic agent. Also called fenofibrate and TriCor.

**logarithm of the odds score :** A statistical estimate of whether two genetic loci are physically near enough to each other (or "linked") on a particular chromosome that they are likely to be inherited together. A logarithm of the odds score of 3 or higher is generally understood to mean that two genes are

located close to each other on the chromosome. In terms of significance, a logarithm of the odds score of 3 means the odds are 1,000:1 that the two genes are linked and therefore inherited together. Also called LOD score.

**LOH:** If there is one normal and one abnormal allele at a particular locus, as might be seen in an inherited autosomal dominant cancer susceptibility disorder, loss of the normal allele produces a locus with no normal function. When the loss of heterozygosity involves the normal allele, it creates a cell that is more likely to show malignant growth if the altered gene is a tumor suppressor gene. Also called loss of heterozygosity.

**lometrexol:** A folate analog antimetabolite with antineoplastic activity. As the 6R diastereomer of 5,10-dideazatetrahydrofolate, lometrexol inhibits glycinamide ribonucleotide formyltransferase (GARFT), the enzyme that catalyzes the first step in the de novo purine biosynthetic pathway, thereby inhibiting DNA synthesis, arresting cells in the S phase of the cell cycle, and inhibiting tumor cell proliferation. The agent has been shown to be active against tumors that are resistant to the folate antagonist methotrexate. or A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called antifolates.

**lomustine:** A nitrosourea with antineoplastic activity. Lomustine alkylates and crosslinks DNA, thereby inhibiting DNA and RNA synthesis. This agent also carbamoylates DNA and proteins, resulting in inhibition of DNA and RNA synthesis and disruption of RNA processing. Lomustine is lipophilic and crosses the blood-brain barrier. Check for active clinical trials using this agent. or A drug used to treat brain tumors that have already been treated with surgery or radiation therapy. It is also used to treat Hodgkin lymphoma that has not gotten better with other types of treatment or has come back. It is being studied in the treatment of other types of cancer. Lomustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called CCNU and Gleostine.

**lonafarnib:** A synthetic tricyclic derivative of carboxamide with antineoplastic properties. Lonafarnib binds to and inhibits farnesyl transferase, an enzyme involved in the post-translational modification and activation of Ras proteins. Ras proteins participate in numerous signalling pathways (proliferation, cytoskeletal organization), and play an important role in oncogenesis. Mutated ras proteins have been found in a wide range

of human cancers. or An anticancer drug that belongs to the family of drugs called enzyme inhibitors. Also called SCH 66336.

**lonaprisan:** An orally bioavailable pentafluoroethyl derivative of a mifepristone-related steroid with antiprogestagenic activity. Lonaprisan is a pure, highly receptor-selective progesterone receptor (PR) antagonist; binding of this agent to PRs inhibits PR activation and the associated proliferative effects. Unlike many other antiprogestins such as mifepristone, this agent does not appear to convert to an agonist in the presence of protein kinase A (PKA) activators and shows high antiprogestagenic activity on both progesterone receptor (PR) isoforms PR-A and PR-B.

**London force:** An intermolecular attractive force that arises from a cooperative oscillation of electron clouds on a collection of molecules at close range.

**lone pair:** Electrons that are not involved in bonding.

**lone-pair electrons:** a nonbonding pair of electrons, which occupy the valence orbitals.

**Long oil:** Term used to denote the properties of oil and resin in a varnish. A long oil varnish should contain not less than 70% drying oil. Terms for other proportions: short oil for 45-50% drying oil; medium oil for 50-70% drying oil.

**long peptide vaccine 7:** A peptide vaccine consisting of a combination of seven synthetic long peptides (SLPs), which are each about 30 amino acids in size, and derived from cancer-testis antigens (CTA) and melanocytic differentiation proteins (MDP), with potential immunostimulating and antitumor activities. Upon administration, long peptide vaccine 7 may stimulate the host immune system to mount a cytotoxic T-cell lymphocyte (CTL) response against tumor cells expressing these peptides. CTA and MDP are overexpressed in a variety of cancer cell types.

**Long terminal repeat:** A sequence that is repeated at either end of a retroviral DNA molecule.

**long-acting granulocyte colony-stimulating factor receptor SPI-2012:** A long-acting, recombinant analog of the endogenous human granulocyte colony-stimulating factor (G-CSF) with hematopoietic activity. Similar to G-CSF, long-acting G-CSF analog SPI-2012 binds to and activates specific cell surface receptors and stimulates neutrophil progenitor proliferation and

differentiation, as well as selected neutrophil functions. Therefore, this agent may decrease the duration and incidence of chemotherapy-induced neutropenia. The long-acting G-CSF analog SPI-2012 extends the half-life of G-CSF, allowing for administration once every 3 weeks.

**long-acting release pasireotide:** A long-acting release (LAR) formulation containing pasireotide, a synthetic long-acting cyclohexapeptide, with somatostatin-like activity. Upon intramuscular administration of the LAR formulation of pasireotide, this somatostatin analog strongly binds to and activates somatostatin receptor (SSTR) subtypes 1, 2, 3, and 5. This leads to an inhibition in the secretion of human growth hormone (hGH) and results in decreased production of insulin-like growth factor (IGF-1), which may inhibit IGF-1-mediated cell signaling pathways. This may lead to an inhibition in tumor cell growth and an increase in apoptosis in IGF-1-overexpressing tumor cells. In addition, this agent causes a reduction in adrenocorticotrophic hormone (ACTH), which leads to an inhibition of cortisol secretion. ACTH-producing tumors cause hypersecretion of cortisol which results in many unwanted symptoms. This agent may also block other key survival pathways such as the phosphatidylinositol 3-kinase (PI3K) and the mitogen-activated protein kinase (MAPK) signaling pathways. Pasireotide also inhibits vascular endothelial growth factor (VEGF) secretion, thereby decreasing angiogenesis and tumor cell growth in VEGF-overexpressing tumor cells. The long-acting form of pasireotide allows for less frequent administration as compared to the original form of this agent. SSTRs are overexpressed by some neuroendocrine and non-neuroendocrine tumor cells.

**long-term side effect :** A problem that is caused by a disease or treatment of a disease and may continue for months or years. Long-term side effects of cancer treatment include heart, lung, kidney, or gastrointestinal tract problems; pain, numbness, tingling, loss of feeling, or heat or cold sensitivity in the hands or feet; fatigue; hearing loss; cataracts; and dry eyes or dry mouth.

**longitude:** coordinate lines for locating position on Earth that run north and south through the poles, are farthest apart at the Equator, run from 0° to 180°, are equal in length, and are measured from the Prime Meridian.

**longitudinal dune:** a large, symmetrical ridge of sand that parallels the wind direction; it can be over 100 meters high and over 100 kilometers

long.

**Longitudinal Stress:** the stress imposed on the long axis of any shape. It can be wither a compressive or tensile stress.

**longshore current:** a strong current resulting from water being pushed parallel to the shore by repeated wave action; primary transporter of sand in the shoreline environment. OR a current moving parallel to the coast.

**longshore drift:** the movement of sediment parallel to the shore by wave action.

**longwave radiation:** The radiation emitted in the spectral wavelength greater than 4 micrometers corresponding to the radiation emitted from the Earth and atmosphere. It is sometimes referred to as terrestrial radiation or infrared radiation, although somewhat imprecisely.

**Lonsurf :** A combination of two drugs used to treat colorectal cancer that has spread to other parts of the body and has already been treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. It is a combination of trifluridine and tipiracil hydrochloride. Lonsurf stops cells from making DNA, which may help keep cancer cells from growing and may kill them. Also called trifluridine and tipiracil hydrochloride.

**Loop:** In a pressurized water reactor, the coolant flow path through piping from the reactor pressure vessel to the steam generator, to the reactor coolant pump, and back to the reactor pressure vessel. Large PWRs may have as many as four separate loops.

**Loop :** One complete turn within a spiral.

**loop electrosurgical excision procedure :** A technique that uses electric current passed through a thin wire loop to remove abnormal tissue. Also called LEEP and loop excision.

**loop excision :** A technique that uses electric current passed through a thin wire loop to remove abnormal tissue. Also called LEEP and loop electrosurgical excision procedure.

**loop of Henle:** the segment of the human kidney after the proximal tubule.

**Looped Edge (Wicket) :** A retaining edge formed by extending pairs of connectors or rod reinforcements, and turning them up at prescribed angles and spacing.

**Loosening:** See Molecular loosening.

**loperamide hydrochloride:** The hydrochloride salt form of loperamide, a synthetic, piperidine derivative and opioid agonist with antidiarrheal activity. Loperamide acts on the mu-receptors in the intestinal mucosa. This leads to a decrease in gastrointestinal motility by decreasing the circular and longitudinal smooth muscle activity of the intestinal wall. This slows intestinal transit and allows for more water and electrolyte absorption from the intestines. Loperamide is not significantly absorbed from the gut and does not cross the blood-brain barrier. Therefore it has no central nervous system effects.

**Lopid:** (Other name for: gemfibrozil)

**lopinavir:** A protease inhibitor used against human immunodeficiency virus (HIV). Lopinavir competitively inhibits the HIV-1 protease, an enzyme that mediates the cleavage of Gag, Gag-Pol and Nef precursor polypeptides into their mature proteins, including protease, reverse transcriptase, and integrase. Inhibition of HIV-1 protease prevents cleavage of the viral polyprotein precursor and results in the release of immature, noninfectious virions. or A drug used with another drug, called ritonavir, to treat infection with HIV (the virus that causes AIDS). It is also being studied in the treatment of some types of cancer. Lopinavir blocks the ability of HIV to make copies of itself and may help some anticancer drugs work better. It is a type of anti-HIV agent and a type of protease inhibitor.

**lopinavir/ritonavir :** A combination of the drugs ritonavir and lopinavir. It is used to treat infection with HIV (the virus that causes AIDS). It is also being studied in the treatment of some types of cancer. Lopinavir/ritonavir blocks the ability of HIV to make copies of itself and may help other anticancer drugs work better or may block the growth of cancer cells. Ritonavir blocks the breakdown of lopinavir. Lopinavir/ritonavir is a type of anti-HIV agent and a type of protease inhibitor. Also called Kaletra.

**Loprox Lotion:** (Other name for: ciclopirox olamine lotion)

**Lopurin:** (Other name for: allopurinol)

**loratadine:** A piperidine histamine H1-receptor antagonist with anti-allergic properties and without sedative effects. Loratadine blocks the H1 histamine receptor and prevents the symptoms that are caused by histamine activity on capillaries, bronchial smooth muscle, and gastrointestinal smooth muscle, including vasodilatation, increased capillary permeability, bronchoconstriction, and spasmodic contraction of gastrointestinal smooth

muscle. Loratadine does not cross the blood-brain barrier and does not cause central nervous system effects. Check for active clinical trials using this agent.

**lorazepam:** A benzodiazepine with anxiolytic, anti-anxiety, anticonvulsant, anti-emetic and sedative properties. Lorazepam enhances the effect of the inhibitory neurotransmitter gamma-aminobutyric acid on the GABA receptors by binding to a site that is distinct from the GABA binding site in the central nervous system. This leads to an increase in chloride channel opening events, a facilitation of chloride ion conductance, membrane hyperpolarization, and eventually inhibition of the transmission of nerve signals, thereby decreasing nervous excitation.

**lorazepam :** A drug that is used to treat anxiety and certain seizure disorders (such as epilepsy), and to prevent nausea and vomiting caused by chemotherapy. It belongs to the families of drugs called antiemetics and benzodiazepines.

**Lorcet:** (Other name for: hydrocodone/acetaminophen)

**lorvotuzumab mertansine:** An immunoconjugate of a humanized murine monoclonal antibody (huN-901) and DMI, a semi-synthetic derivative of the plant-derived ansa macrolide maytansine. The antibody moiety of lorvotuzumab mertansine selectively attaches to CD56 antigen, a neural cell adhesion molecule (NCAM)) expressed on the surface of cells of small cell lung cancer (SCLC) and other neuroendocrine (NE) tumors. Thus, the DMI conjugate is targeted specifically to CD56-expressing tumor cells, where it inhibits tubulin polymerization and assembly, resulting in inhibition of mitosis and cell cycle arrest in the S phase. Check for active clinical trials using this agent.

**losartan :** A drug used to treat high blood pressure. Losartan blocks the action of chemicals that make blood vessels constrict (get narrower). It is a type of angiotensin II receptor antagonist. Also called Cozaar and losartan potassium.

**losartan potassium:** The potassium salt of losartan, a non-peptide angiotensin II receptor antagonist with antihypertensive activity. Losartan selectively and competitively binds to the angiotensin II receptor (type AT1) and blocks the binding of angiotensin II to the receptor, thus promoting vasodilatation and counteracting the effects of aldosterone. Converted from angiotensin I by angiotensin-converting enzyme (ACE),

angiotensin II stimulates the adrenal cortex to synthesize and secrete aldosterone, decreasing sodium excretion and increasing potassium excretion, and acts as a vasoconstrictor in vascular smooth muscle. or A drug used to treat high blood pressure. Losartan potassium blocks the action of chemicals that make blood vessels constrict (get narrower). It is a type of angiotensin II receptor antagonist. Also called Cozaar and losartan.

**losing stream:** a stream whose channel lies above the water table and loses water into the unsaturated zone through which it is flowing.

**losoxantrone :** An anticancer drug that belongs to the family of drugs called antipyrazoles.

**Loss Factor:** The product of the power factor and the dielectric constant of a dielectric material.

**LOSS MODULUS (denoted as G'')**: An indirect measure of polymer viscosity using a cone-and-plate instrument subjected to dynamic (sinusoidal) deformation (see also STORAGE MODULUS).

**Loss of coolant accident (LOCA):** Those postulated accidents that result in a loss of reactor coolant at a rate in excess of the capability of the reactor makeup system from breaks in the reactor coolant pressure boundary, up to and including a break equivalent in size to the double-ended rupture of the largest pipe of thereactor coolant system.

**loss of heterozygosity :** If there is one normal and one abnormal allele at a particular locus, as might be seen in an inherited autosomal dominant cancer susceptibility disorder, loss of the normal allele produces a locus with no normal function. When the loss of heterozygosity involves the normal allele, it creates a cell that is more likely to show malignant growth if the altered gene is a tumor suppressor gene. Also called LOH.

**Lotensin:** (Other name for: benazepril hydrochloride)

**Lotrimin:** (Other name for: clotrimazole)

**Lotus effect:** A self-cleaning effect of superhydrophobic surfaces, whereby water droplets on the coating retain a high water contact angle, that is, stay spherical and bead off the surface. Named after the self-cleaning property of lotus flowers which have a waxy coating.

**Lovastatin:** A competitive inhibitor of HMG-coa reductase, the key regulatory enzyme in cholesterol biosynthesis; used therapeutically to lower cholesterol levels. Also called mevinolin. OR A lactone metabolite isolated

from the fungus *Aspergillus terreus* with cholesterol-lowering and potential antineoplastic activities. Lovastatin is hydrolyzed to the active beta-hydroxyacid form, which competitively inhibits 3-hydroxy-3-methylglutarylcoenzyme A (HMG-CoA) reductase, an enzyme involved in cholesterol biosynthesis. In addition, this agent may induce tumor cell apoptosis and inhibit tumor cell invasiveness, possibly by inhibiting protein farnesylation and protein geranylgeranylation, and may arrest cells in the G1 phase of the cell cycle. The latter effect sensitizes tumor cells to the cytotoxic effects of ionizing radiation. or A drug used to lower the amount of cholesterol in the blood. It is also being studied in the prevention and treatment of some types of cancer. Lovastatin is a type of HMG-CoA reductase inhibitor (statin). Also called Mevacor.

**Lovaxin C:** (Other name for: live-attenuated *Listeria monocytogenes* cancer vaccine ADXS11-001)

**Lovenox:** (Other name for: enoxaparin)

**low birth weight :** A term used to describe an infant born weighing 5.5 pounds (2500 grams) or less. A low birth weight may occur when an infant is born too early (premature). These infants may have an increased risk of serious health problems. Smoking cigarettes, being exposed to secondhand tobacco smoke, drinking alcohol, and taking certain drugs during pregnancy can increase the risk of having an infant with a low birth weight.

**Low boiling point :** A substance with a low boiling point has only weak forces between its particles. It turns into a gas at fairly low temperatures. Remember that its boiling point might be so low that it boils below room temperature.

**Low Density Poly-ethylene (LDPE) - Autoclave:** There are two basic processes used for the manufacture of LDPE, autoclave and tubular. ICI developed the first LDPE technology as a stirred autoclave process in the late 1930s. The autoclave process is adiabatic, in that there is no significant heat removal from the reactor during the process. The modern stirred autoclave reactor may have a volume of 3 000 litres and four to six zones, each running at a different temperature, thus enabling direct control of the mix of molecular species and degree of long chain branching. The high-pressure polymerisation of ethylene is a free radical promoted reaction and the autoclave operators almost always use organic peroxides as initiators.

**Low Density Poly-ethylene (LDPE) - Tubular:** There are two basic processes used for the manufacture of LDPE, autoclave and tubular. The tubular reactor process was originally developed by BASF. In the tubular design, the reactants are cooled along the long jacketed tube reactor. Tubular reactors can have several zones where fresh ethylene and initiator are added. The addition of fresh ethylene both cools the reactants and agitates the mixture so that the molecular weight distribution can be varied.

**LOW DENSITY POLYETHYLENE:** This term is generally considered to include polyethylenes ranging in density from about 0.915 to 0.925. In low density polyethylenes, the ethylene monomeric units are linked in random fashion, with the main chains having long and short side branches. This branching prevents the formation of a closely knit pattern, resulting in material that is relatively soft, flexible, and tough, and which will withstand moderate heat.

**Low Density Polyethylene (LDPE):** Low density polyethylene (LDPE) was the first polyethylene to be produced and is a member of the polyolefin family. LDPE is used in a wide range of applications, the most common being consumer plastic bags. LDPE goods are commonly marked with a 4 following the recycling codes developed by the American Society of the Plastics Industry. LDPE demand is under pressure from more modern and lower cost polymers including its fellow polyethylene LLDPE. LDPE is formed by the high pressure catalysed reaction of ethylene monomers in either tubular or autoclave reactors.

**Low Density Polyethylene (LDPE):** Polyethylene of a density ranging from .915 to .929 grams/cc.

**low grade :** A term used to describe cells and tissue that look almost normal under a microscope. Low-grade cancer cells look more like normal cells and tend to grow and spread more slowly than high-grade cancer cells. Cancer grade may be used to help plan treatment and determine prognosis. Low-grade cancers usually have a better prognosis than high-grade cancers and may not need treatment right away.

**Low melting point :** A substance with a low melting point has only weak forces between its particles. It turns into a liquid at fairly low temperatures. Remember that its melting point might be so low that it melts below room temperature.

**Low population zone (LPZ):** An area of low population density often required around a nuclear installation before it's built. The number and density of residents is of concern in emergency planning so that certain protective measures (such as notification and instructions to residents) can be accomplished in a timely manner.

**Low Pressure Laminates:** Laminates molded and cured in the range of pressures up to 400 psi

**low spin complex:** A metal-ligand complex with fewer unpaired electrons than the uncomplexed metal ion. When a strong ligand complexes the metal ion, the crystal field splitting is large and some electrons pair rather than occupying the higher energy d orbitals

**low tar cigarette :** A type of cigarette that is claimed to give off less tobacco tar than a regular cigarette when smoked. Low tar cigarettes have been shown to be no safer than regular cigarettes, and smoking them does not lower the risk of cancer or other diseases. A person smoking a low tar cigarette can inhale the same amount of tobacco tar, nicotine, and harmful, cancer-causing chemicals as in a regular cigarette, depending on how the cigarette is smoked. Cigarettes are no longer allowed to be labeled or advertised as low tar cigarettes. Also called light cigarette.

**Low Temperature Flexibility:** The ability of a plastic to be bent without fracture at reduced temperatures.

**Low-alloy steel :** Some steels contain only a small amount of other elements (<5%) but it is enough to modify the properties to fit the requirement.

**Low-density lipoprotein (LDL):** The major carrier of cholesterol in the blood; consists of a core of esterified cholesterol molecules surrounded by a shell of phospholipids, unesterified cholesterol, and apoprotein B-100; primary source of cholesterol for cells other than the liver or intestine.

**Low-Density Polyethylene (LDPE):** LDPE is defined by a density range of 0.910–0.940 g/cm<sup>3</sup>. This plastic material is relatively soft, flexible and tough but breakable, and will withstand temperatures of 80 °C continuously and 95 °C for a short time. It is made in translucent or opaque variations. LDPE is widely used for the manufacture of various containers, dispensing bottles, wash bottles, tubing, plastic bags for computer components, and various moulded laboratory equipment. Its most common use is in plastic

bags. Linear low density polyethylene (LLDPE) is a new type of low density polythene.

**low-energy phosphate compound:** A phosphorylated compound with a relatively small standard free energy of hydrolysis.

**low-grade lymphoma :** A type of lymphoma that tends to grow and spread slowly, and has few symptoms. Also called indolent lymphoma.

**low-grade squamous intraepithelial lesion :** Slightly abnormal cells are found on the surface of the cervix. Low-grade squamous intraepithelial lesion is caused by certain types of human papillomavirus (HPV) and is a common abnormal finding on a Pap test. It usually goes away on its own without treatment but sometimes the abnormal cells become cancer and spread to nearby normal tissue. Low-grade squamous intraepithelial lesion is sometimes called mild dysplasia. Also called LSIL.

**Low-level radioactive waste (LLW):** A general term for a wide range of items that have become contaminated with radioactive material or have become radioactive through exposure to neutron radiation. A variety of industries, hospitals and medical institutions, educational and research institutions, private or government laboratories, and nuclear fuel cycle facilities generate LLW as part of their day-to-day use of radioactive materials. Some examples include radioactively contaminated protective shoe covers and clothing; cleaning rags, mops, filters, and reactor water treatment residues; equipment and tools; medical tubes, swabs, and hypodermic syringes; and carcasses and tissues from laboratory animals. The radioactivity in these wastes can range from just above natural background levels to much higher levels, such as seen in parts from inside the reactor vessel in a nuclear power plant. Low-level waste is typically stored onsite by licensees, either until it has decayed away and can be disposed of as ordinary trash, or until the accumulated amount becomes large enough to warrant shipment to a low-level waste disposal site. For further information, see Low-Level Waste.

**Low-level waste:** A general term for a wide range of items that have become contaminated with radioactive material or have become radioactive through exposure to neutron radiation. A variety of industries, hospitals and medical institutions, educational and research institutions, private or government laboratories, and nuclear fuel cycle facilities generate LLW as part of their day-to-day use of radioactive materials. Some examples

include radioactively contaminated protective shoe covers and clothing; cleaning rags, mops, filters, and reactor water treatment residues; equipment and tools; medical tubes, swabs, and hypodermic syringes; and carcasses and tissues from laboratory animals. The radioactivity in these wastes can range from just above natural background levels to much higher levels, such as seen in parts from inside the reactor vessel in a nuclear power plant. Low-level waste is typically stored onsite by licensees, either until it has decayed away and can be disposed of as ordinary trash, or until the accumulated amount becomes large enough to warrant shipment to a low-level waste disposal site. For further information, see Low-Level Waste.

**low-pressure center:** counterclockwise circulation center, formed along a stationary front in the Northern Hemisphere.

**low-risk HPV :** A type of human papilloma virus (HPV) that can cause skin warts, such as skin warts on the hands, feet, and skin around the genitals and anus. It may also cause respiratory papillomatosis, a condition in which warts form on the larynx or other areas of the respiratory tract and cause breathing problems. Low-risk HPV infections do not cause cancer, and many go away on their own without treatment. Also called low-risk human papillomavirus.

**low-risk human papillomavirus :** A type of human papilloma virus (HPV) that can cause skin warts, such as skin warts on the hands, feet, and skin around the genitals and anus. It may also cause respiratory papillomatosis, a condition in which warts form on the larynx or other areas of the respiratory tract and cause breathing problems. Low-risk human papillomavirus infections do not cause cancer, and many go away on their own without treatment. Also called low-risk HPV.

**lower explosive limit (LEL):** The lower limit of flammability of a gas or vapour at normal ambient temperatures expressed as percentage of the gas or vapour in air by volume. This limit is assumed constant for temperatures up to 130°C.

**lower extremity :** The part of the body that includes the leg, ankle, and foot.

**lower GI series :** X-rays of the colon and rectum that are taken after a person is given a barium enema.

**Lozanoc:** (Other name for: itraconazole)

**LPHL:** A rare type of Hodgkin lymphoma (a cancer of the immune system). It is marked by the presence of lymphocyte-predominant cells, which used to be called popcorn cells. These cells are different from the typical Reed-Sternberg cells found in classical Hodgkin lymphoma. LPHL may change into diffuse large B-cell lymphoma. Also called lymphocyte-predominant Hodgkin lymphoma, NLPHL, and nodular lymphocyte-predominant Hodgkin lymphoma.

**LRP-1-targeted peptide-drug conjugate GRN1005:** A peptide-drug conjugate containing the taxane paclitaxel covalently linked to the proprietary 19 amino acid peptide angiopep-2, in a 3:1 ratio, with potential antineoplastic activity. Upon administration, LRP-1-targeted peptide-drug conjugate GRN1005, via angiopep-2 moiety, binds to LRP-1 (low density lipoprotein receptor-related protein 1), which is highly expressed in blood brain barrier (BBB) and glioma cells. This binding allows the transcytosis of the agent across the BBB and the delivery of the cytotoxic agent paclitaxel. Compared to paclitaxel alone, GRN1005 is able to increase the concentration of paclitaxel in the brain and is also able to specifically deliver paclitaxel to LRP-1-overexpressing tumor cells, both in the brain and in the periphery.

**LSD1 inhibitor GSK2879552:** An orally available, irreversible, inhibitor of lysine specific demethylase 1 (LSD1), with potential antineoplastic activity. Upon administration, GSK2879552 binds to and inhibits LSD1, a demethylase that suppresses the expression of target genes by converting the dimethylated form of lysine at position 4 of histone H3 (H3K4) to mono- and unmethylated H3K4. LSD1 inhibition enhances H3K4 methylation and increases the expression of tumor-suppressor genes. This may lead to an inhibition of cell growth in LSD1-overexpressing tumor cells. LSD1, overexpressed in certain tumor cells, plays a key role in tumor cell growth and survival.

**LSDA:** Local spin-density approximation. A DFT method involving only local functionals (i.e., no dependence upon the gradient of the electron density). In the Gaussian programs "LSDA" is equivalent to the "SVWN" keyword.

**LSIL:** Slightly abnormal cells are found on the surface of the cervix. LSIL is caused by certain types of human papillomavirus (HPV) and is a common abnormal finding on a Pap test. It usually goes away on its own without

treatment but sometimes the abnormal cells become cancer and spread to nearby normal tissue. LSIL is sometimes called mild dysplasia. Also called low-grade squamous intraepithelial lesion.

**LSR:** Liquid silicone rubber is generally a platinum cured, two-component, low viscosity, heat-curable silicone rubber system delivered in a closed drums or buckets. Casco Bay Molding's specialty

**LST:** Linear synchronous transit. An interpolative method used to guess a transition state structure given the structures of the products and of the reactants.

**LU 79553:** An anticancer drug that kills cancer cells by affecting DNA synthesis.

**LU-103793:** An anticancer drug that reduces the risk of tumor cell growth and reproduction.

**lubiprostone:** A bicyclic fatty acid derived from prostaglandin E1 and a chloride channel activator with laxative activity. Upon intake, lubiprostone specifically binds to and activates the type 2 chloride channel (ClC-2) in the apical membrane of the gastrointestinal epithelium. This produces an efflux of chloride ions, thereby drawing water into the gastrointestinal lumen. The resulting increased amounts of intestinal fluid soften the stool, increase motility, and improve bowel movements.

**Lubricant:** An oily or slippery substance. OR Internal lubricants, without affecting the fusion properties of a compound, promotes resin flow. External lubricants promote release from metals which aids in the smooth flow of melt over die surfaces. OR Internal lubricants, without affecting the fusion properties of a compound, promotes resin flow. External lubricants promote release from metals which aids in the smooth flow of melt over die surfaces. Values given are often the average of a range.

**Lucanix:** (Other name for: belagenpumatucel-L)

**lucanthone:** An orally available thioxanthone-based DNA intercalator and inhibitor of the DNA repair enzyme apurinic-apyrimidinic endonuclease 1 (APEX1 or APE1), with anti-schistosomal and potential antineoplastic activity. Lucanthone intercalates DNA and interferes with the activity of topoisomerases I and II during replication and transcription, thereby inhibiting the synthesis of macromolecules. In addition, this agent specifically inhibits the endonuclease activity of APE1, without affecting its

redox activity, resulting in unrepaired DNA strand breaks which may induce apoptosis. Therefore, lucanthone may sensitize tumor cells to radiation and chemotherapy. Furthermore, lucanthone inhibits autophagy through the disruption of lysosomal function. The multifunctional nuclease APE1 is a key component for DNA repair; its expression is often correlated with tumor cell resistance to radio- and chemotherapy.

**lucatumumab:** A monoclonal antibody directed against the B-cell surface antigen CD40 with potential antineoplastic activity. Lucatumumab binds to and inhibits CD40, thereby inhibiting CD40 ligand-induced cell proliferation and triggering cell lysis via antibody-dependent cellular cytotoxicity (ADCC) in cells overexpressing CD40. CD40, an integral membrane protein found on the surface of B lymphocytes, is a member of the tumor necrosis factor receptor superfamily and is highly expressed in a number of B-cell malignancies.

**Lucentis:** (Other name for: ranibizumab)

**lucitanib:** A novel dual inhibitor targeting human vascular endothelial growth factor receptors (VEGFRs) and fibroblast growth factor receptors (FGFRs) with antiangiogenic activity. Lucitanib inhibits VEGFR-1, -2, -3 and FGFR-1, -2 kinases in the nM range, which may result in the inhibition of tumor angiogenesis and tumor cell proliferation, and the induction of tumor cell death. Both VEGFRs and FGFRs belong to the family of receptor tyrosine kinases that may be upregulated in various tumor cell types.

**Lucorteum Sol:** (Other name for: therapeutic progesterone)

**Lug closure:** a screw-type closure where the thread is interrupted rather than continuous. The closure is affected by a short camming action. One advantage is that application is very fast, since the closure needs only a few degrees of rotation. In contrast, a normal continuous thread closure might require 360 degrees or more of rotation to affect a seal.

**Lug pail cover:** A type of cover usually used on open end 5 gallon steel pails. The pail cover is lined with a "cushiony" compound that seats on the top rim of the pail. The seal is "activated" by clinching the lugs (an integral part of the cover) to the pail rim.

**Lugol's solution:** A solution composed of iodine and potassium iodide, which can be used as a reagent and antiseptic, with potential use in cancer diagnosis. The iodine in Lugol's solution selectively binds to alpha-1,4

glucans found in polysaccharides, such as glycogen. Lugol's solution reacts with glycogen in normal, healthy non-keratinized, squamous epithelium and the iodine-glucan complex stains the glycogen-containing cells dark brown. Cancer cells are devoid of glycogen, so these cells will stay unstained. The presence of cancer cells can be detected by the degree of staining and the neoplastic cells can be surgically removed. High-grade intraepithelial neoplasia has almost no glycogen-containing epithelium.

**lumbar lordosis:** excessive inward curvature of the lower spine

**lumbar puncture :** A procedure in which a thin needle called a spinal needle is put into the lower part of the spinal column to collect cerebrospinal fluid or to give drugs. Also called spinal tap.

**lumen :** The cavity or channel within a tube or tubular organ such as a blood vessel or the intestine.

**Lumigan :** The drug bimatoprost used to treat glaucoma (a build-up of fluid in the eye). It lowers pressure in the eye by increasing the flow of natural eye fluids out of the eye. One drop of Lumigan is put directly in the eye once a day.

**Luminescent Pigments:** Special pigments available to produce striking effects in the dark. Basically there are two types: one is activated by ultraviolet radiation, producing very strong luminescence and, consequently, very eye-catching effects; the other type, known as phosphorescent pigments, does not require any separate source of radiation.

**luminosity:** actual brightness of a star.

**Luminous paint:** A paint containing a phosphorescent pigment which glows in the dark after exposure to light.

**Luminous Transmittance:** The ratio of the luminous flux transmitted by a body of the flux incident upon it.

**Lumirem:** (Other name for: ferumoxsil oral suspension)

**Lumitene:** (Other name for: beta carotene)

**LUMO:** Lowest unoccupied molecular orbital. The energy of this orbital is sometimes used to approximate the electron affinity of the molecule, but this usually works badly.

**lumpectomy :** An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the

cancer is near it. Also called breast-conserving surgery, breast-sparing surgery, partial mastectomy, quadrantectomy, and segmental mastectomy.

**lunar eclipse:** the Moon goes out of view as it moves into the Earth's shadow; occurs during the Full Moon phase.

**Lunesta:** (Other name for: eszopiclone)

**Lunette:** Properly a small vault in a larger vault, but commonly used to describe a semi-circular panel or light.

**lung :** One of a pair of organs in the chest that supplies the body with oxygen, and removes carbon dioxide from the body.

**lung biopsy :** The removal of a small piece of lung tissue to be checked by a pathologist for cancer or other diseases. The tissue may be removed using a bronchoscope (a thin, lighted, tube-like instrument that is inserted through the trachea and into the lung). It may also be removed using a fine needle inserted through the chest wall, by surgery guided by a video camera inserted through the chest wall, or by an open biopsy. In an open biopsy, a doctor makes an incision between the ribs, removes a sample of lung tissue, and closes the wound with stitches.

**lung cancer :** Cancer that forms in tissues of the lung, usually in the cells lining air passages. The two main types are small cell lung cancer and non-small cell lung cancer. These types are diagnosed based on how the cells look under a microscope.

**lung disorder :** A type of disease that affects the lungs and other parts of the respiratory system. Lung disorders may be caused by infection, by smoking tobacco, or by breathing in secondhand tobacco smoke, radon, asbestos, or other forms of air pollution. Lung disorders include asthma, chronic obstructive pulmonary disease (COPD), pulmonary fibrosis, pneumonia, and lung cancer. Also called pulmonary disease and respiratory disease.

**lung function :** A term used to describe how well the lungs work in helping a person breathe. During breathing, oxygen is taken into the lungs, where it passes into the blood and travels to the body's tissues. Carbon dioxide, a waste product made by the body's tissues, is carried to the lungs, where it is breathed out. There are different tests to measure lung function. Also called pulmonary function.

**lung function test :** A test used to measure how well the lungs work. It measures how much air the lungs can hold and how quickly air is moved into and out of the lungs. It also measures how much oxygen is used and how much carbon dioxide is given off during breathing. A lung function test can be used to diagnose a lung disease and to see how well treatment for the disease is working. Also called PFT and pulmonary function test.

**lung metastasis :** Cancer that has spread from the original (primary) tumor to the lung.

**lung tumor-associated antigen:** A tumor-associated antigen derived from the cell surface antigen of lung cancer cells. Lung tumor-associated antigen could be used as a diagnostic marker or as a form of immunotherapy targeted against lung cancer cells.

**lung-targeted immunomodulator QBKPN:** A proprietary, lung-targeted, site specific immunomodulator (SSI), with potential immunostimulating and antineoplastic activities. Although the exact type and composition of the lung-targeted immunomodulator QBKPN has yet to be fully disclosed, upon subcutaneous administration, this agent is able to activate a local innate immune response in the lung tissue. This results in an increased number of M1 macrophages, which induces a shift from M2 to M1 macrophage dominance in the tumor microenvironment, and stimulates the recruitment of other immune cells. The M1 macrophages exert antitumor activity and eradicate lung cancer cells through phagocytosis. QBKPN does not induce a systemic immune response or affect other organs or tissues. Altogether, this SSI may decrease tumor cell growth in the lungs. SSIs contain specific, inactivated components of pathogens, such as bacteria and/or viruses, which normally cause an acute infection in the specific organ or tissue of interest.

**lungs:** the organ where oxygen diffuses into the blood to join with hemoglobin in the red blood cells.

**Lupron:** (Other name for: leuprolide acetate)

**Lupron :** A drug used to treat advanced prostate cancer. It is also used to treat early puberty in children and certain gynecologic conditions. It is being studied in the treatment of other types of cancer. Lupron blocks the testicles from making testosterone (a male hormone) and the ovaries from making estrogen and progesterone (female hormones). It may stop the growth of prostate cancer cells that need testosterone to grow. Lupron is a

type of gonadotropin-releasing hormone (GnRH) agonist. Also called Eligard, leuprolide acetate, and Viadur.

**Lupron Depot:** (Other name for: leuprolide acetate)

**Lupron Depot-3 Month:** (Other name for: leuprolide acetate)

**Lupron Depot-4 Month:** (Other name for: leuprolide acetate)

**Lupron Depot-Ped:** (Other name for: leuprolide acetate)

**lupus :** A chronic, inflammatory, connective tissue disease that can affect the joints and many organs, including the skin, heart, lungs, kidneys, and nervous system. It can cause many different symptoms; however, not everyone with lupus has all of the symptoms. Also called SLE and systemic lupus erythematosus.

**lurbinectedin:** A synthetic tetrahydropyrrolo [4, 3, 2-de]quinolin-8(1H)-one alkaloid analogue with potential antineoplastic activity. Lurbinectedin covalently binds to residues lying in the minor groove of DNA, which may result in delayed progression through S phase, cell cycle arrest in the G2/M phase and cell death.

**lurtotecan:** A semisynthetic analogue of camptothecin with antineoplastic activity. Lurtotecan selectively stabilizes the topoisomerase I-DNA covalent complex and forms an enzyme-drug-DNA ternary complex. As a consequence of the formation of this complex, both the initial cleavage reaction and religation steps are inhibited and subsequent collision of the replication fork with the cleaved strand of DNA results in inhibition of DNA replication, double strand DNA breakage and triggering of apoptosis. Independent from DNA replication inhibition, lurtotecan also inhibits RNA synthesis, multi-ubiquitination and degradation of topoisomerase I and chromatin reorganization.

**lurtotecan :** An anticancer drug that belongs to the family of drugs called topoisomerase inhibitors.

**luster:** the appearance or quality of light reflected from a mineral's surface. OR the way a mineral shines in reflected light. OR A term used to describe a particular degree of gloss, e.g. an eggshell or low gloss finish.

**luteinizing hormone :** A hormone made in the pituitary gland. In females, it acts on the ovaries to make follicles release their eggs and to make hormones that get the uterus ready for a fertilized egg to be implanted. In

males, it acts on the testes to cause cells to grow and make testosterone. Also called interstitial cell-stimulating hormone, LH, and lutropin.

**luteinizing hormone-releasing hormone :** A hormone made by a part of the brain called the hypothalamus. Luteinizing hormone-releasing hormone causes the pituitary gland in the brain to make and secrete the hormones luteinizing hormone (LH) and follicle-stimulating hormone (FSH). In men, these hormones cause the testicles to make testosterone. In women, they cause the ovaries to make estrogen and progesterone. Also called GnRH, gonadotropin-releasing hormone, LH-RH, and LHRH.

**luteinizing hormone-releasing hormone agonist :** A substance that keeps the testicles and ovaries from making sex hormones by blocking other hormones that are needed to make them. In men, luteinizing hormone-releasing hormone agonists cause the testicles to stop making testosterone. In women, they cause the ovaries to stop making estrogen and progesterone. Some luteinizing hormone-releasing hormone agonists are used to treat prostate cancer. Also called GnRH agonist, gonadotropin-releasing hormone agonist, and LH-RH agonist.

**luteinizing hormone-releasing hormone antagonist :** A substance that blocks the pituitary gland from making hormones called follicle-stimulating hormone (FSH) and luteinizing hormone (LH). In men, this causes the testicles to stop making testosterone. In women, this causes the ovaries to stop making estrogen and progesterone. Some luteinizing hormone-releasing hormone antagonists are used to treat advanced prostate cancer. They are also used to treat certain gynecologic conditions and are being studied in the treatment of hormone-sensitive breast cancer. Also called GnRH antagonist, gonadotropin-releasing hormone antagonist, and LH-RH antagonist.

**Luteohormone:** (Other name for: therapeutic progesterone)

**Lutetium:** Symbol:"Lu" Atomic Number:"71" Atomic Mass: 174.97amu. Lutetium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. You will find this element used in oil refineries.

**lutetium Lu 177 DOTA-biotin:** A radioconjugate of biotin conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and labeled with the beta-emitting isotope lutetium Lu 177 (Lu-177) that can be used for

radioimmunotherapeutic purposes. Lutetium Lu 177 DOTA-biotin could be used in pre-targeting radioimmunotherapy, which pretreats the lesion with oxidized avidin that binds to protein amino groups on cells. As avidin binds to biotin, the radioisotope can be selectively delivered to cancer cells leading to tumor cell eradication.

**lutetium Lu 177 DOTA-JR11:** A radioconjugate consisting of the somatostatin antagonistic peptide JR11 that is linked, via the chelating agent dodecanetetraacetic acid (DOTA), to the beta-emitting radioisotope lutetium Lu 177, with potential antineoplastic activity and imaging activity during positron emission tomography/computed tomography (PET/CT). Upon administration, lutetium Lu 177-DOTA-JR11 binds to somatostatin receptors (SSTRs), with high affinity for SSTR2, present on the cell membranes of many types of neuroendocrine tumor (NET) cells. Upon binding and internalization, this radioconjugate specifically delivers a cytotoxic dose of beta radiation to SSTR-positive cells. SSTRs have been shown to be present in large numbers on NETs and their metastases, while most normal tissues express low levels of SSTRs.

**lutetium Lu 177 DOTA-tetulomab:** A radioimmunoconjugate, which consists of a monoclonal antibody against the cell-surface antigen CD37 covalently linked, via the bifunctional, macrocyclic chelating agent tetraazacyclododecanetetra-acetic acid (DOTA), to the beta-emitting radioisotope lutetium Lu 177, with potential antineoplastic activity. The antibody moiety of lutetium Lu 177 DOTA-tetulomab binds to CD37 on tumor B-cells. Upon internalization, the radioisotope moiety delivers a cytotoxic dose of beta radiation to CD37-expressing tumor cells. CD37, a transmembrane glycoprotein, is overexpressed in B-cell malignancies.

**lutetium Lu 177 monoclonal antibody J591:** A radioimmunoconjugate consisting of a humanized monoclonal antibody directed against the extracellular domain of prostate-specific membrane antigen linked to a beta-emitting radioisotope (lutetium-177). This radioimmunoconjugate binds to tumor cells that express the extracellular domain of prostate-specific membrane antigen, delivering beta particle radiation selectively to tumor cells expressing this antigen and so limiting the exposure of normal tissues to ionizing radiation.

**lutetium Lu 177 PP-F11N:** A radioconjugate composed of PP-F11N, a gastrin analog, conjugated to the beta-emitting radioisotope lutetium Lu

177, with potential antineoplastic activity and potential use as an imaging agent for scintigraphy. Following intravenous administration, the PP-F11N moiety binds to the cholecystinin-2 (CCK-2) receptor. Subsequently, the CCK-2 receptor-expressing tumor cells can be visualized scintigraphically. In addition, the radioisotope moiety delivers a cytotoxic dose of beta radiation to CCK-2 receptor-expressing tumor cells. CCK-2 receptors are expressed on a variety of tumor cell types.

**lutetium Lu 177-capromab:** A radioimmunoconjugate consisting of capromab linked to lutetium Lu 177 via the bifunctional macrocyclic chelator methoxy-tetraazacyclododecane-tetraacetic acid (MeO-DOTA) with potential antineoplastic activity. Lutetium Lu 177-capromab binds to human prostate specific membrane antigen (PSMA) expressed on tumor cell surfaces via its capromab moiety and, upon internalization, delivers cytotoxic beta radiation directly to PSMA-expressing tumor cells. PSMA is a cell surface glycoprotein abundantly expressed by prostate epithelium and is typically overexpressed by prostate cancer cells.

**lutetium Lu 177-DOTA-di-HSG peptide IMP-288:** A radiolabeled divalent histamine-succinyl-glycine (HSG) hapten-peptide linked with the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the radionuclide lutetium (Lu) 177. After pretargeting with a bispecific monoclonal antibody (BiMoAB) directed against both a tumor associated antigen (TAA) and the HSG hapten-peptide, the HSG portion of administered Lu-177-labeled di-HSG-DOTA peptide IMP-288 binds the anti-HSG portion of the BiMoAB; Lu-177 radioisotopic activity localized to tumor cells bearing the TAA can then be visualized scintigraphically. Check for active clinical trials using this agent.

**lutetium Lu 177-DOTA-octreotate:** A radioconjugate consisting of the somatostatin analog octreotate labeled with lutetium Lu 177 with receptor ligand, beta-emitting radioisotope, and potential antineoplastic activities. Lutetium Lu 177-DOTA-octreotate binds to somatostatin receptors (SSTRs), especially type 2 receptors, present on the cell membranes of many types of neuroendocrine tumor cells. Upon binding and internalization, this radioconjugate specifically delivers a cytotoxic dose of beta radiation to SSTR-positive cells. Lutetium Lu 177-DOTA-octreotate is produced by substituting the natural amino acid Thr for the alcohol Thr(ol)

at the C terminus of the somatostatin analog octreotide and chelating the octreotate to Lu 177 via dodecanetetraacetic acid (DOTA).

**lutetium Lu 177-DOTA-TATE:** A radioconjugate consisting of the tyrosine-containing somatostatin analog Tyr3-octreotate (TATE) conjugated with the bifunctional, macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA) and radiolabeled with the beta-emitting radioisotope lutetium Lu 177 with potential antineoplastic activities. Lutetium Lu 177-DOTA-TATE binds to somatostatin receptors (SSTRs), with high affinity to type 2 SSTR, present on the cell membranes of many types of neuroendocrine tumor (NET) cells. Upon binding and internalization, this radioconjugate specifically delivers a cytotoxic dose of beta radiation to SSTR-positive cells. Tyr3-octreotate (TATE) is an octreotide derivative in which phenylalanine at position 3 is substituted by tyrosine and position 8 threoninol is replaced with threonine. SSTRs have been shown to be present in large numbers on NET and their metastases, while most other normal tissues express low levels of SSTRs.

**lutetium LU 177-edotreotide:** A radioconjugate consisting of the somatostatin analogue edotreotide labeled with lutetium Lu 177 with potential antineoplastic activities. Lutetium Lu 177-edotreotide binds to somatostatin receptors (SSTRs), with high affinity to type 2 SSTR, present on the cell membranes of many types of neuroendocrine tumor cells. Upon binding and internalization, this radioconjugate specifically delivers a cytotoxic dose of beta radiation to SSTR-positive cells. Edotreotide is produced by substituting tyrosine for phenylalanine at the 3 position of the somatostatin analogue octreotide (Tyr3-octreotide or TOC) and chelated by the bifunctional, macrocyclic chelating agent dodecanetetraacetic acid (DOTA).

**lutetium Lu-177 girentuximab:** A radioimmunoconjugate consisting of the chimeric monoclonal antibody cG250 linked to the low energy beta-emitting radioisotope Lutetium 177, via the bifunctional macrocyclic chelating agent tetra-azacyclododecanetetra-acetic acid (DOTA), with potential antineoplastic activity. The antibody moiety of lutetium Lu-177 girentuximab binds to renal cell carcinoma (RCC) cells expressing the RCC-associated antigen G250; a cytotoxic dose of beta radiation is selectively delivered to G250-expressing RCC cells upon internalization of the radioimmunoconjugate.

**lutetium texaphyrin** : A substance that is being studied in the treatment of cancer using photodynamic therapy. It belongs to the family of drugs called metallotexaphyrins. Also called motexafin lutetium.

**Lutex:** (Other name for: motexafin lutetium)

**Lutrin:** (Other name for: motexafin lutetium)

**lutropin** : A hormone made in the pituitary gland. In females, it acts on the ovaries to make follicles release their eggs and to make hormones that get the uterus ready for a fertilized egg to be implanted. In males, it acts on the testes to cause cells to grow and make testosterone. Also called interstitial cell-stimulating hormone, LH, and luteinizing hormone.

**Luvox** : A drug used to treat obsessive-compulsive disorder. It is a type of antidepressant agent and selective serotonin reuptake inhibitor (SSRI). Also called fluvoxamine.

**LV.II-2/B7.1-transduced AML blast vaccine:** A whole-cell cancer vaccine, containing human acute myeloid leukemic (AML) blasts that have been genetically engineered to express a B7.1/IL-2 fusion protein encoded by a self-inactivating lentiviral vector (LV), with potential antineoplastic and immunomodulating activities. Upon administration, LV.II-2/B7.1-transduced AML blast vaccine may stimulate a host cytotoxic T lymphocyte (CTL) response against AML cells. The single fusion protein encoded by the LV is postsynthetically cleaved to produce biologically active membrane-anchored B7.1 and secreted IL-2 in AML blasts; combined expression of IL-2 and the co-stimulatory molecule B7.1 by AML blasts may increase stimulation of both allogeneic and autologous cytotoxic T cells.

**LXR alpha pathway** : Describes a group of proteins in a cell that work together to help control how certain genes are expressed and how cholesterol, lipids (fats), bile acids, and steroid hormones are made in the body. Changes in the LXR alpha pathway may lead to diseases such as heart disease and cancer. Drugs or substances that affect this pathway are being studied in the prevention and treatment of cancer and other diseases. Also called liver X receptor alpha pathway.

**LY231514:** A drug used alone or with another drug to treat certain types of non-small cell lung cancer and malignant pleural mesothelioma. It is being studied in the treatment of other types of cancer. LY231514 blocks DNA

synthesis and may kill cancer cells. It is a type of folate antagonist. Also called Alimta and pemetrexed disodium.

**LY293111:** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called leukotriene B4 receptor antagonists.

**LY317615:** A substance being studied in the treatment of certain types of cancer, including non-Hodgkin lymphoma, breast, colon, lung, ovarian, and prostate. LY317615 blocks certain cell signaling pathways, and may prevent the growth of new blood vessels that tumors need to grow. It is a type of serine threonine kinase inhibitor and a type of antiangiogenesis agent. Also called enzastaurin and enzastaurin hydrochloride.

**LY335979:** A substance being studied in the treatment of cancer. LY335979 may help kill cancer cells that are resistant to anticancer drugs. Also called zosuquidar trihydrochloride.

**LY353381 hydrochloride :** A substance being studied in the treatment of osteoporosis and breast cancer. LY353381 hydrochloride is made in the laboratory and binds to estrogen receptors in the body. It is a type of selective estrogen receptor modulator (SERM). Also called arzoxifene hydrochloride.

**LY6K/VEGFR1/VEGFR2 multipeptide vaccine:** A multipeptide vaccine consisting of peptides derived from lymphocyte antigen 6 complex locus K (LY6K) and type I and II vascular endothelial growth factor receptors (VEGFRs) with potential antineoplastic activity. Upon administration, LY6K/VEGFR1/VEGFR2 multipeptide vaccine may elicit an antitumor cytotoxic T-lymphocyte (CTL) immune response against LY6K-expressing tumor cells and/or VEGFR-expressing vascular endothelial cells involved in tumor angiogenesis. LY6K is a tumor-associated antigen (TAA) that occurs singly in glycosylphosphatidyl-inositol (GPI)-linked cell-surface glycoproteins or as three-fold repeated domain in the urokinase-type plasminogen activator receptor; VEGFRs are cell surface receptors that stimulate endothelial cell proliferation, invasion, angiogenesis, and vasculogenesis upon ligand binding and receptor activation. Check for active clinical trials using this agent.

**Lyase:** An enzyme that catalyzes the removal of a group to form a double bond, or the reverse reaction. OR Enzymes that catalyze the removal of a group from a molecule to form a double bond, or the addition of a group to a double bond.

**Lyc-O-Mato:** (Other name for: lycopene)

**lycopene:** A linear, unsaturated hydrocarbon carotenoid, the major red pigment in fruits such as tomatoes, pink grapefruit, apricots, red oranges, watermelon, rosehips, and guava. As a class, carotenoids are pigment compounds found in photosynthetic organisms (plants, algae, and some types of fungus), and are chemically characterized by a large polyene chain containing 35-40 carbon atoms; some carotenoid polyene chains are terminated by two 6-carbon rings. In animals, carotenoids such as lycopene may possess antioxidant properties which may retard ageing and many degenerative diseases. As an essential nutrient, lycopene is required in the animal diet.

**lycopene :** A red pigment found in tomatoes and some fruits. It is an antioxidant and may help prevent some types of cancer.

**lye:** Common name for solution of sodium hydroxide.

**lymph:** a watery fluid derived from plasma that seeps out of the blood system capillaries and mingles with the cells.

**lymph :** The clear fluid that travels through the lymphatic system and carries cells that help fight infections and other diseases. Also called lymphatic fluid.

**lymph gland :** A small bean-shaped structure that is part of the body's immune system. Lymph glands filter substances that travel through the lymphatic fluid, and they contain lymphocytes (white blood cells) that help the body fight infection and disease. There are hundreds of lymph glands found throughout the body. They are connected to one another by lymph vessels. Clusters of lymph glands are found in the neck, axilla (underarm), chest, abdomen, and groin. For example, there are about 20-40 lymph glands in the axilla. Also called lymph node.

**lymph node :** A small bean-shaped structure that is part of the body's immune system. Lymph nodes filter substances that travel through the lymphatic fluid, and they contain lymphocytes (white blood cells) that help the body fight infection and disease. There are hundreds of lymph nodes found throughout the body. They are connected to one another by lymph vessels. Clusters of lymph nodes are found in the neck, axilla (underarm), chest, abdomen, and groin. For example, there are about 20-40 lymph nodes in the axilla. Also called lymph gland.

**lymph node dissection :** A surgical procedure in which the lymph nodes are removed and a sample of tissue is checked under a microscope for signs of cancer. For a regional lymph node dissection, some of the lymph nodes in the tumor area are removed; for a radical lymph node dissection, most or all of the lymph nodes in the tumor area are removed. Also called lymphadenectomy.

**lymph node drainage :** The flow of lymph from an area of tissue into a particular lymph node.

**lymph node mapping :** The use of dyes and radioactive substances to identify lymph nodes that may contain tumor cells. Also called lymphatic mapping.

**lymph nodes:** capsule-like bodies that contain cells that filter the lymph and phagocytize foreign particles.

**lymph vessel :** A thin tube that carries lymph (lymphatic fluid) and white blood cells through the lymphatic system. Also called lymphatic vessel.

**lymphadenectomy :** A surgical procedure in which the lymph nodes are removed and a sample of tissue is checked under a microscope for signs of cancer. For a regional lymphadenectomy, some of the lymph nodes in the tumor area are removed; for a radical lymphadenectomy, most or all of the lymph nodes in the tumor area are removed. Also called lymph node dissection.

**lymphadenopathy :** Disease or swelling of the lymph nodes.

**lymphangiogram :** An x-ray of the lymphatic system. A dye is injected into a lymphatic vessel and travels throughout the lymphatic system. The dye outlines the lymphatic vessels and organs on the x-ray.

**lymphangiography :** An x-ray study of the lymphatic system. A dye is injected into a lymphatic vessel and travels throughout the lymphatic system. The dye outlines the lymphatic vessels and organs on the x-ray.

**lymphangiosarcoma :** A type of cancer that begins in the cells that line lymph vessels.

**lymphangitic carcinomatosis :** A condition in which cancer cells spread from the original (primary) tumor and invade lymph vessels (thin tubes that carry lymph and white blood cells through the body's lymph system). The invaded lymph vessels then fill up with cancer cells and become blocked. Although lymphangitic carcinomatosis can occur anywhere in the body, it

commonly happens in the lungs. It can happen in many types of cancer but is most common in breast, lung, colon, stomach, pancreatic, and prostate cancer. Also called carcinomatous lymphangitis.

**lymphatic basin :** A group of lymph nodes that receives and filters lymph that flows from a certain area of the body. Special dyes may be used to stain and identify the lymphatic basin in the tissues around a tumor, so that lymph nodes that may contain cancer can be removed and checked by a pathologist.

**lymphatic fluid :** The clear fluid that travels through the lymphatic system and carries cells that help fight infections and other diseases. Also called lymph.

**lymphatic mapping :** The use of dyes and radioactive substances to identify lymph nodes that may contain tumor cells. Also called lymph node mapping.

**lymphatic system:** the extension of the circulatory system consisting of capillaries called lymph vessels, a fluid called lymph, and structures called lymph nodes.

**lymphatic system :** The tissues and organs that produce, store, and carry white blood cells that fight infections and other diseases. This system includes the bone marrow, spleen, thymus, lymph nodes, and lymphatic vessels (a network of thin tubes that carry lymph and white blood cells). Lymphatic vessels branch, like blood vessels, into all the tissues of the body.

**lymphatic vessel :** A thin tube that carries lymph (lymphatic fluid) and white blood cells through the lymphatic system. Also called lymph vessel.  
OR a series of vessels that return the lymph fluid to the circulatory system.

**Lymphazurin:** (Other name for: isosulfan blue)

**lymphedema :** A condition in which extra lymph fluid builds up in tissues and causes swelling. It may occur in an arm or leg if lymph vessels are blocked, damaged, or removed by surgery.

**lymphoblast :** A lymphocyte that has gotten larger after being stimulated by an antigen. Lymphoblast also refers to an immature cell that can develop into a mature lymphocyte.

**lymphoblastic :** Refers to lymphoblasts (a type of immature white blood cell).

**lymphoblastic lymphoma :** An aggressive (fast-growing) type of non-Hodgkin lymphoma in which too many lymphoblasts (immature white blood cells) are found in the lymph nodes and the thymus gland. These lymphoblasts may spread to other places in the body. It is most common in teenagers and young adults and affects more males than females. It may be a T or B cell type. Also called precursor lymphoblastic lymphoma.

**LymphoCide:** (Other name for: epratuzumab)

**lymphocyte :** A type of immune cell that is made in the bone marrow and is found in the blood and in lymph tissue. The two main types of lymphocytes are B lymphocytes and T lymphocytes. B lymphocytes make antibodies, and T lymphocytes help kill tumor cells and help control immune responses. A lymphocyte is a type of white blood cell.

**lymphocyte-predominant Hodgkin lymphoma :** A rare type of Hodgkin lymphoma (a cancer of the immune system). It is marked by the presence of lymphocyte-predominant cells, which used to be called popcorn cells. These cells are different from the typical Reed-Sternberg cells found in classical Hodgkin lymphoma. Lymphocyte-predominant Hodgkin lymphoma may change into diffuse large B-cell lymphoma. Also called LPHL, NLPHL, and nodular lymphocyte-predominant Hodgkin lymphoma.

**lymphocytes:** the white blood cells that are essential components of the immune system. OR A subclass of leukocytes involved in the immune response. B lymphocytes synthesize and secrete antibodies; T lymphocytes either play a regulatory role in immunity or kill foreign and virus-infected cells.

**lymphocytic :** Refers to lymphocytes (a type of white blood cell).

**lymphocytic leukemia :** A type of cancer in which the bone marrow makes too many lymphocytes (white blood cells).

**lymphocytic leukopenia :** A condition in which there is a lower-than-normal number of lymphocytes (a type of white blood cell) in the blood. Also called lymphocytopenia and lymphopenia.

**lymphocytopenia :** A condition in which there is a lower-than-normal number of lymphocytes (a type of white blood cell) in the blood. Also called lymphocytic leukopenia and lymphopenia.

**lymphoepithelioma :** A type of cancer that begins in the tissues covering the nasopharynx (the upper part of the throat behind the nose).

**lymphography** : An x-ray study of lymph nodes and lymphatic vessels made visible by the injection of a special dye.

**lymphoid** : Referring to lymphocytes, a type of white blood cell. Also refers to tissue in which lymphocytes develop.

**lymphokine-activated killer cell** : A white blood cell that is stimulated in a laboratory to kill tumor cells. Also called LAK cell.

**lymphokine-activated killer cells**: Killer cell lymphocytes activated in the presence of interleukin-2 (IL-2). Lymphokine-activated killer cells (LAKs) are cytotoxic effector cells with an exceptionally wide target cell spectrum including normal and malignant cells of different origins. LAK cells exhibit a profound heterogeneity with regard to phenotype surface marker expression; it remains to be determined if they represent a unique cell lineage.

**lymphoma** : Cancer that begins in cells of the immune system. There are two basic categories of lymphomas. One kind is Hodgkin lymphoma, which is marked by the presence of a type of cell called the Reed-Sternberg cell. The other category is non-Hodgkin lymphomas, which includes a large, diverse group of cancers of immune system cells. Non-Hodgkin lymphomas can be further divided into cancers that have an indolent (slow-growing) course and those that have an aggressive (fast-growing) course. These subtypes behave and respond to treatment differently. Both Hodgkin and non-Hodgkin lymphomas can occur in children and adults, and prognosis and treatment depend on the stage and the type of cancer.

**lymphoma TAA-specific cytotoxic T lymphocytes**: A population of autologous cytotoxic T lymphocytes (CTLs) with potential immunomodulating and antitumor activities. White blood cells are grown ex-vivo and are exposed to dendritic cells (DCs) loaded with lymphoma tumor associated antigens (TAAs); the TAA-specific CTLs are further expanded ex-vivo before being introduced into the patient. Upon infusion with TAA-specific CTLs, these CTLs may help activate tumor-specific CTL responses in the patient, thereby specifically killing TAA-expressing cancer cells and eventually inhibiting tumor cell proliferation. Check for active clinical trials using this agent.

**lymphomatoid granulomatosis** : Destructive growth of lymph cells, usually involving the lungs, skin, kidneys, and central nervous system.

Grades I and II are not considered cancer, but grade III is considered a lymphoma.

**lymphomatous leptomeningitis** : A serious problem that may occur in lymphoma. In lymphomatous leptomeningitis, cancer cells have spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). The cancer may cause the meninges to be inflamed. Also called lymphomatous meningitis.

**lymphomatous meningitis** : A serious problem that may occur in lymphoma. In lymphomatous meningitis, cancer cells have spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). The cancer may cause the meninges to be inflamed. Also called lymphomatous leptomeningitis.

**lymphopenia** : A condition in which there is a lower-than-normal number of lymphocytes (a type of white blood cell) in the blood. Also called lymphocytic leukopenia and lymphocytopenia.

**lymphoplasmacytic lymphoma** : An indolent (slow-growing) type of non-Hodgkin lymphoma marked by abnormal levels of IgM antibodies in the blood and an enlarged liver, spleen, or lymph nodes. Also called Waldenström macroglobulinemia.

**lymphopoietin-1** : One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Lymphopoietin-1 is made by cells that cover and support organs, glands, and other structures in the body. It causes the growth of T lymphocytes and B lymphocytes. Lymphopoietin-1 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Lymphopoietin-1 is a type of cytokine. Also called IL-7 and interleukin-7.

**lymphoproliferative disorder** : A disease in which cells of the lymphatic system grow excessively. Lymphoproliferative disorders are often treated like cancer.

**lymphosarcoma** : An obsolete term for a malignant tumor of lymphatic tissue.

**lymphoscintigraphy** : A method used to check the lymph system for disease. A radioactive substance that flows through the lymph ducts and can be taken up by lymph nodes is injected into the body. A scanner or probe is used to follow the movement of this substance on a computer screen.

Lymphoscintigraphy is used to find the sentinel lymph node (the first node to receive lymph from a tumor), which may be removed and checked for tumor cells. Lymphoscintigraphy is also used to diagnose certain diseases or conditions, such as lymphoma or lymphedema.

**Lymphoseek:** (Other name for: technetium Tc 99m-labeled tilmanocept)

**LymphoStat-B antibody:** (Other name for: belimumab)

**lymphostatic elephantiasis :** A condition in which tissue or a limb becomes very swollen and thick, and changes color. It is caused by a block in the flow of lymph and a buildup of fluid in tissues. Also called stage III lymphedema.

**Lynch syndrome :** An inherited disorder in which affected individuals have a higher-than-normal chance of developing colorectal cancer and certain other types of cancer, often before the age of 50. Also called hereditary nonpolyposis colon cancer and HNPCC.

**Lynparza :** A drug used to treat advanced ovarian cancer caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is used in patients who have already received other anticancer drugs. It is also being studied in the treatment of other types of cancer. Lynparza blocks an enzyme involved in many cell functions, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Lynparza may cause cancer cells to die. It is a type of targeted therapy agent and a type of poly (ADP-ribose) polymerase inhibitor. Also called AZD2281, olaparib, and PARP inhibitor AZD2281.

**LYOPHILE:** A material having an affinity for, attracting, adsorbing or absorbing oil. The opposite of lyophobic.

**lyophilized black raspberry lozenge:** A lozenge containing lyophilized black raspberry with potential antioxidant, pro-apoptotic and chemopreventive activities. In addition to vitamins, minerals, and phytosterols, black raspberries are rich in flavonols. Of the flavonols present in this agent, the anthocyanins appear to contribute significantly to this agent's chemopreventive effects by inhibiting the activation of several signal transduction pathways, including the mitogen-activated protein kinase-mediated pathways, and certain transcription factors, such as nuclear factor kappa B (NF-kB), activator protein-1 (AP-1) complex, and nuclear factor in activated T-cells (NFAT). This in turn modulates the expression of downstream target genes that are upregulated in a variety of cancer cell

types, including inducible nitric oxide synthase, cyclooxygenase-2, vascular endothelial growth factor and the anti-apoptotic protein survivin.

**lyophilized black raspberry saliva substitute:** A saliva substitute (or artificial saliva) containing lyophilized black raspberry with potential antioxidant, pro-apoptotic and chemopreventive activities. In addition to vitamins, minerals and phytosterols, black raspberries are rich in flavonols of which the anthocyanins appear to contribute significantly to this agent's chemopreventive effects. Anthocyanins inhibit the activation of several signal transduction pathways, including the mitogen-activated protein kinase-mediated pathways, and certain transcription factors, such as nuclear factor kappa B (NF- $\kappa$ B), activator protein-1 (AP-1) complex, and nuclear factor in activated T-cells (NFAT). This in turn modulates the expression of downstream target genes that are upregulated in a variety of cancer cell types, including inducible nitric oxide synthase, cyclooxygenase-2, vascular endothelial growth factor and the anti-apoptotic protein survivin.

**LYOPHOBE:** A material lacking affinity for, repelling, failing to adsorb or absorb oil. The opposite of lyophile.

**Lyrica :** A drug used to treat nerve pain caused by diabetes or herpes zoster infection and certain types of seizures. It is being studied in the prevention and treatment of nerve pain in the hands and feet of cancer patients given chemotherapy. Lyrica is a type of anticonvulsant. Also called pregabalin.

**lysine-specific demethylase 1 inhibitor INCB059872:** An orally available inhibitor of lysine-specific demethylase 1 (LSD1; lysine-specific histone demethylase 1A; KDM1A), with potential antineoplastic activity. Upon administration, INCB059872 binds to and inhibits LSD1, a demethylase that suppresses the expression of target genes by converting the di- and mono-methylated forms of lysine at position 4 of histone H3 (H3K4) to mono- and unmethylated H3K4, respectively, through amine oxidation. LSD1 inhibition enhances H3K4 methylation and increases the expression of tumor-suppressor genes. In addition, LSD1 demethylates mono- or dimethylated H3K9 which increases gene expression of tumor promoting genes; inhibition of LSD1 promotes H3K9 methylation and decreases transcription of these genes. Altogether, this may lead to an inhibition of cell growth in LSD1-overexpressing tumor cells. LSD1, an enzyme belonging to the flavin adenine dinucleotide (FAD)-dependent amine

oxidase family, is overexpressed in certain tumor cells and plays a key role in the regulation of gene expression and in tumor cell growth and survival.

**lysis:** Destruction of a cell's plasma membrane or of a bacterial cell wall, releasing the cellular contents and killing the cell. OR In biology, lysis refers to the breakdown of a cell caused by damage to its plasma (outer) membrane. It can be caused by chemical or physical means (for example, strong detergents or high-energy sound waves) or by infection with a strain virus that can lyse cells.

**lyso-thermosensitive liposomal doxorubicin:** A temperature-sensitive liposomal formulation of the anthracycline antibiotic doxorubicin with potential antineoplastic activity. Upon intravenous administration, circulating thermosensitive liposomes are activated locally by increasing the tumor temperature to 40-41 degrees Celsius using an external heat source. The elevated temperature causes compositional changes in the liposomes, creating openings that allow for the release of encapsulated doxorubicin. Compared to non-thermosensitive liposomes, lyso-thermosensitive liposomes deliver higher concentrations of a cytotoxic agent to a heat-treated tumor site while sparing normal tissues unexposed to heat treatment. Check for active clinical trials using this agent.

**Lysodren:** (Other name for: mitotane)

**Lysogenic bacteriophage:** A phage whose DNA is integrated into the host cell by site-specific recombination and whose expression is repressed.

**Lysogenic bacterium:** A bacterial cell whose chromosome contains a prophage.

**Lysogenic virus:** A virus that can adopt an inactive (lysogenic) state, in which it maintains its genome within a cell instead of entering the lytic cycle. The circumstances that determine whether a lysogenic (temperate) virus will adopt an inactive state or an active lytic state are often subtle and depend upon the physiologic state of the infected cell.

**lysogeny:** One of two outcomes of the infection of a host cell by a temperate phage. It occurs when the phage genome becomes repressed and is replicated as part of the host DNA; infrequently it may be induced, and the phage particles so produced cause the host cell to lyse.

**lysosome:** an organelle within eukaryotic cells; a droplet-like sac filled with enzymes used for digestion within the cell. OR A membrane-bounded

organelle in the cytoplasm of eukaryotic cells; it contains many hydrolytic enzymes and serves as a degrading and recycling center for unneeded components. OR An organelle that contains hydrolytic enzymes designed to break down proteins that are targeted to that organelle. OR A sac-like compartment inside a cell that has enzymes that can break down cellular components that need to be destroyed.

**lytic :** Having to do with lysis. In biology, lysis refers to the disintegration of a cell by disruption of its plasma membrane. Lysis can be caused by chemical or physical means (e.g., high-energy sound waves) or by a virus infection.

**Lytic bacteriophage:** A phage that replicates in its host and then lyses, or destroys, it.

**Lytic infection:** A virus infection that leads to the lysis of the host cell, yielding progeny virus particles.

**lytic lesion :** Destruction of an area of bone due to a disease process, such as cancer.

**M phase:** That period of the cell cycle when mitosis takes place.

**M protein :** An antibody found in unusually large amounts in the blood or urine of people with multiple myeloma and other types of plasma cell tumors. Also called monoclonal protein.

**m-azidopyrimethamine:** An antifolate derived from diaminopyrimidine with cytotoxic properties. With a mechanism of action similar to that of methotrexate (MTX), m-azidopyrimethamine blocks tetrahydrofolate synthesis, resulting in depletion of nucleotide precursors and inhibition of DNA, RNA and protein synthesis. This agent is more lipophilic but less potent than MTX.

**M-EDTA:** A substance being studied in the prevention of bacterial infections that occur in catheters (thin tubes that carry fluids into or out of the body). It is a combination of minocycline, an antibiotic that blocks the growth of bacteria, and EDTA, a substance that keeps blood clots from forming. M-EDTA removes metals that bacteria use to form biofilms (thin layers stuck to surfaces). Also called minocycline-EDTA.

**M/S:** Abbreviation for mild steel.

**M200:** A monoclonal antibody that is being studied in the treatment of some types of cancer. Monoclonal antibodies are made in the laboratory and

can locate and bind to substances in the body, including cancer cells. M200 binds to a protein that is found on cells that line some tumor blood vessels. It is a type of angiogenesis inhibitor. Also called volociximab.

**M87o-transduced CD34+ peripheral blood stem cells:** Peripheral blood stem cells (PBSCs) transduced with the retroviral vector M87o encoding for the HIV-1-entry inhibitor peptide membrane-anchored antiviral peptide C46 (maC46). Expression of C46 by M87o-transduced CD34+ peripheral blood stem cells may prevent the fusion of viral and cellular membranes, thereby inhibiting HIV-1 entry. C46 is a membrane-anchored peptide encoding amino acids 628 to 673 of the HIV-1 entry inhibitory transmembrane glycoprotein gp41.

**ma huang :** A shrub native to China and India. The stems and roots are used in traditional medicine as a diuretic and for asthma, bronchitis, and cough. It has also been promoted as a decongestant, a weight loss aid, and as a supplement to increase energy. Ma huang may cause high blood pressure, increased heart rate, or death if used with certain drugs, and may reduce the effects of certain drugs used to treat cancer and other diseases. The U.S. Food and Drug Administration has banned the sale of dietary supplements that contain ma huang. The scientific name is *Ephedra sinica*. Also called ephedra.

**Maalox suspension:** (Other name for: magnesium hydroxide/aluminum hydroxide/simethicone suspension)

**Machine Direction:** Direction the film is being pulled through a machine.

**Machine Shot Capacity:** Refers to the maximum volume of thermoplastic resin which can be displaced or injected by the injection ram in a single stroke. OR The maximum volume of resin which can be injected in a single stroke.

**Machining :** Any of a number of processes, such as drilling, turning, sanding, etc., which may be performed on a piece of plastic.

**macimorelin:** An orally available synthetic mimetic of the growth hormone (GH) secretagogue ghrelin with potential anti-cachexia activity. Upon oral administration, macimorelin mimics endogenous ghrelin by stimulating appetite and binds to the growth hormone secretagogue receptor GHSR in the central nervous system, thereby mimicking the GH-releasing effects of ghrelin from the pituitary gland. Stimulation of GH secretion increases insulin-like growth factor-I (IGF-I) levels which may further

stimulate protein synthesis. In addition, ghrelin reduces the production of pro-inflammatory cytokines, which may play a direct role in cancer-related loss of appetite.

**macitentan:** An orally available dual endothelin receptor (ETR) antagonist with potential antihypertensive and antineoplastic activity. Upon administration, macitentan and its metabolites block the binding of endothelin isoform 1 (ET-1) to type-A and type-B ETR on both the tumor cells and the endothelial cells in the tumor vasculature. This prevents ET-1 mediated signaling transduction which may decrease tumor cell proliferation, progression, and angiogenesis in tumor tissue. ET-1, a potent vasoconstrictor that plays an important role in inflammation and tissue repair, is, together with its receptors, overexpressed varyingly in many tumor cell types.

**macrocalcification :** A small deposit of calcium in the breast that cannot be felt but can be seen on a mammogram. It is usually caused by aging, an old injury, or inflamed tissue and is usually not related to cancer.

**macrocephaly:** refers to a head circumference greater than two standard deviations above the mean for age, sex, race and gestation

**macroglobulinemia :** A condition in which the blood contains high levels of large proteins and is too thick to flow through small blood vessels. One type is Waldenström macroglobulinemia, which is a type of cancer.

**macroglossia:** enlarged tongue

**macrogol 3350-based oral osmotic laxative:** An isotonic solution containing macrogol 3350 and electrolytes with laxative activity. Macrogol 3350-based oral osmotic laxative promotes the retention of water in the bowel, thereby increasing the water content of stool, which results in increased gastrointestinal motility and stool transit time and evacuation of colonic contents. Macrogol 3350 is also known as polyethylene glycol (PEG) 3350.

**Macromolecule:** Large molecules with relatively high molecular weights typically generated through polymerisation of smaller subunits. OR A molecule having a molecular weight in the range of a few thousand to many millions. OR Name given to a very large, and in most cases biologically important molecule. Molar mass certain to be in the thousands of grams, at least.

**macroorchidism:** large testicles

**macrophage :** A type of white blood cell that surrounds and kills microorganisms, removes dead cells, and stimulates the action of other immune system cells.

**Macroscopic:** Once we had the word 'microscopic', it was only a matter of time before we needed 'macroscopic'; anything big enough to be seen with the naked eye is macroscopic in size.

**macular degeneration :** A condition in which there is a slow breakdown of cells in the center of the retina (the light-sensitive layers of nerve tissue at the back of the eye). This blocks vision in the center of the eye and can cause problems with activities such as reading and driving. Macular degeneration is most often seen in people who are over the age of 50. Also called age-related macular degeneration, AMD, and ARMD.

**mafic:** magma that is iron or magnesium-based, darker in color, and more dense than felsic magma.

**mafic rock:** an igneous rock containing approximately 50 percent silica and relatively high percentages of iron, magnesium, and calcium.

**mafosfamide:** A synthetic oxazaphosphorine derivative with antineoplastic properties. Mafosfamide alkylates DNA, forming DNA cross-links and inhibiting DNA synthesis. Although closely related to cyclophosphamide, mafosfamide, unlike cyclophosphamide, does not require hepatic activation to generate its active metabolite 4-hydroxy-cyclophosphamide; accordingly, mafosfamide is potentially useful in the intrathecal treatment of neoplastic meningitis. A form of cyclophosphamide that can be administered as an intrathecal infusion. Mafosfamide is being studied as an anticancer drug. It belongs to the family of drugs called alkylating agents.

**MAG-Tn3/AS15 vaccine:** A vaccine containing synthetic multiple antigenic glycopeptide (MAG) composed of tri Tn glycotope (MAG-Tn3), which comprises a dendrimeric, nonimmunogenic lysine core linked to a tetravalent peptidic CD4<sup>+</sup> T-cell epitope backbone and each attached to three Tn antigens (tri-Tn cluster), combined with the immunoadjuvant AS15, with potential antineoplastic activity. Upon administration of the MAG-Tn3/AS15 vaccine, MAG-Tn3 induces the production of tumor-specific anti-Tn glycosidic antibodies, which results in antibody-dependent cell cytotoxicity (ADCC) against Tn-expressing tumor cells. The Tn carbohydrate antigen, a tumor-associated antigen (TAA), is overexpressed

in a number of tumor cell types. The tri-Tn clusters mimic carbohydrate structures found on tumor cells. The T-cell epitope stimulates effective T-cell responses. AS15, a potent adjuvant liposomal formulation that contains CpG 7909, monophosphoryl lipid (MPL), and QS-21, increases the immune response against the Tn antigens.

**MAGE-10.A2:** A synthetic nonapeptide derived from a melanoma-associated antigen. Vaccination with MAGE-10.A2 may stimulate a host cytotoxic T-cell response against tumor cells that express the melanoma-associated antigen, resulting in tumor cell lysis.

**MAGE-3 antigen :** A protein found in many types of tumors but not in most normal tissues. Vaccines using pieces of the MAGE-3 protein are being studied for their ability to boost the immune response to cancer cells in patients with cancer.

**MAGE-3.A1 peptide vaccine:** A synthetic peptide cancer vaccine consisting of human leukocyte antigen HLA-A1-restricted peptide derived from human melanoma antigen 3 (MAGE-3) with potential immunostimulating and antineoplastic activities. Upon administration, MAGE-3.A1 peptide vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing MAGE-3, resulting in tumor cell lysis. MAGE-3, a tumor-associated antigen (TAA), is overexpressed by a variety of cancer cell types.

**MAGE-A1, Her-2/neu, FBP peptides ovarian cancer vaccine:** A cancer vaccine containing multiple synthetic antigen peptides derived from MAGE-A1, Her-2/neu, and folate binding protein (FBP) with potential immunostimulating and antineoplastic properties. MAGE-A1, Her-2/neu, FBP peptides cancer vaccine includes the antigen peptides MAGE-A1:161-169, FBP:191-199, Her-2/neu:369-377, MAGE-A1:96-104, and Her-2/neu:754-762. Upon administration, this cancer vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing these antigen peptides, resulting in tumor cell lysis. MAGE-A1, Her-2/neu, and FBP proteins may be over-expressed in various cancer cell types, such as epithelial ovarian cancer cells.

**MAGE-A1, MAGE-A3, NY-ESO-1 peptides vaccine:** A cancer vaccine comprised of synthetic peptides derived from human melanoma antigen A1 (MAGE-A1), human melanoma antigen A3 (MAGE-A3) and cancer-testis antigen NY-ESO-1 with potential immunostimulating and antineoplastic

activities. Upon administration, MAGE-A1/MAGE-A3/NY-ESO-1 peptides vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing MAGE-A1, MAGE-A3 and NY-ESO-1, resulting in tumor cell lysis. The MAGE-A1, MAGE-A3, and NY-ESO-1 tumor-associated antigens (TAAS) are overexpressed by a variety of cancer cell types. Check for active clinical trials using this agent.

**MAGE-A3 peptide vaccine:** A peptide cancer vaccine comprised of a peptide derived from the human melanoma antigen A3 (MAGE-A3), with potential immunostimulating and antineoplastic activities. Upon administration, MAGE-A3 peptide vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing MAGE-A3, resulting in tumor cell lysis. MAGE-A3, a tumor-associated antigen (TAA), is overexpressed by a variety of cancer cell types.

**MAGE-A3 reactive T cell receptor-transduced autologous T cells:**

Human autologous T-lymphocytes transduced with a retroviral vector encoding a T cell receptor (TCR) specific for the human melanoma antigen A3 (MAGE-A3), with potential antineoplastic activity. Upon isolation, transduction, expansion ex vivo, and reintroduction into the patient, the MAGE-A3 reactive TCR-transduced autologous T cells bind to tumor cells expressing MAGE-A3, which may halt the growth of MAGE-A3-expressing cancer cells; the TCR is specific for MAGE-A3:168-176.

**MAGE-A3-expressing adenovirus type 5 vaccine:** An oncolytic adenoviral vaccine composed of a replication-defective, E1- and E3-deleted adenovirus serotype 5 (Ad5) with a transgene encoding the human melanoma antigen A3 (MAGE-A3), with potential antineoplastic activity. Upon administration, MAGE-A3-expressing adenovirus type 5 vaccine selectively replicates in cancer cells and expresses MAGE-A3. This induces an immune response against tumor cells expressing the MAGE-A3 antigen, which leads to tumor cell death. The tumor-associated antigen MAGE-A3 is overexpressed by a variety of cancer cell types.

**MAGE-A3/HPV 16 peptide vaccine:** A multi-epitope "Trojan antigen" ("TA") construct vaccine consisting of human melanoma antigen A3 (MAGE-A3) and human papillomavirus (HPV) 16 peptide epitopes linked by the furin-sensitive linker peptide RVKR (arginine-serine-lysine-arginine) with immunostimulatory and antitumor activities. The TA construct enters

the cytoplasm of antigen-presenting cells (APC) and is processed by the endoplasmic reticulum (ER) and the trans-Golgi network (TGN), where the endopeptidase furin releases the epitopes from the RVKR linker peptide and, together with various exopeptidases, generates MHC class I-binding peptides. Expressed on the cell surfaces of APC, these MHC class I-binding peptides stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells that display the same peptide epitopes on their cell surfaces.

**MAGE-A4-specific TCR gene-transduced T lymphocytes TBI-1201:**

Autologous human T lymphocytes transduced with a retroviral vector encoding a T-cell receptor (TCR) specific for the human melanoma antigen A4 (MAGE-A4), with potential immunostimulatory and antineoplastic activities. Upon isolation, transduction, expansion *ex vivo*, and reintroduction into the patient, MAGE-A4-specific TCR gene-transduced T lymphocytes TBI-1201 binds to tumor cells expressing MAGE-A4. This may result in both an inhibition of growth and increased cell death for MAGE-A4-expressing tumor cells. The tumor-associated antigen MAGE-A4 is overexpressed by a variety of cancer cell types.

**Magic angle:** The angle ( $54^{\circ} 44'$ ) at which solid samples are often spun in solid-state NMR spectroscopy. This spinning removes the effect of the random orientation of the powdered solid with respect to the magnetic field.

**Magic-angle spinning:** A solid-state NMR technique involving spinning the sample at an angle of  $54^{\circ}44'$  to reduce the anisotropic chemical shifts in a solid.

**magma:** liquid rock below the Earth's surface. OR molten rock that forms below the surface of the earth, usually at depths of 100 kilometers or greater. OR Molten rock beneath the surface of the Earth. When magma spills onto the surface of the Earth (maybe from a volcano) it is called lava. OR Magma is the name given to molten rocks beneath the Earth's surface.

**magmatic arc:** a general term for belts of andesitic island arcs or inland andesitic mountain ranges (volcanic arcs) that develop along continental edges.

**magmatic deposit:** of metallic ore, the result when the minerals settle to the bottom of an intrusive body and form thin, high-grade layers.

**magmatic water:** water derived from magmas.

**Magnesium:** Symbol:"Mg" Atomic Number:"12" Atomic Mass: 24.31amu. Magnesium is a member of the alkaline metals family. Magnesium is a very light metallic element. It is also a trace element, needed by both plants and animals. You will also find magnesium in medicines and flash bulbs.

**magnesium :** In medicine, a mineral used by the body to help maintain muscles, nerves, and bones. It is also used in energy metabolism and protein synthesis.

**magnesium citrate:** The citrate salt of the element magnesium with cathartic activity. The cathartic action of magnesium cations appears to result, in part, from osmotically mediated water retention, which subsequently stimulates peristalsis. In addition, magnesium ions may also stimulate the activity of nitric oxide (NO) synthase and increase the biosynthesis of the phospholipid proinflammatory mediator platelet activating factor (PAF) in the gut. NO may stimulate intestinal secretion via prostglandin- and cyclic GMP-dependent mechanisms while PAF produces significant stimulation of colonic secretion and gastrointestinal motility.

**magnesium hydroxide:** A solution of magnesium hydroxide with antacid and laxative properties. Milk of magnesium exerts its antacid activity in low doses such that all hydroxide ions that enter the stomach are used to neutralize stomach acid. This agent exerts its laxative effect in higher doses so that hydroxide ions are able to move from the stomach to the intestines where they attract and retain water, thereby increasing intestinal movement (peristalsis) and inducing the urge to defecate.

**magnesium hydroxide/aluminum hydroxide/simethicone suspension:** An oral suspension containing magnesium hydroxide, aluminum hydroxide and simethicone with antacid activity. Both magnesium hydroxide and aluminum hydroxide react with excess acid in the stomach thereby neutralizing gastric acid. Simethicone, a mixture of polydimethylsiloxane and silica gel, reduces the surface tension of gas bubbles, promoting gas bubble coalescence and so intestinal gas transit and evacuation. Check for active clinical trials using this agent.

**magnesium isoglycyrrhizinate:** The magnesium salt form of the saponin, isoglycyrrhizinate, a derivative of glycyrrhizic acid extracted from the roots of the plant *Glycyrrhiza glabra*, with potential anti-inflammatory, antioxidant and hepatoprotective activities. Although the exact mechanism

of action remains to be fully elucidated, magnesium isoglycyrrhizinate may prevent or reduce hepatotoxicity through the scavenging of free radicals. This agent also modulates the activity of hepatic enzymes such as alanine aminotransferase (ALT), aspartate aminotransferase (AST), superoxide dismutase (SOD) and glutathione peroxidase.

**magnesium L-threonate:** A nutritional supplement containing the L-threonate form of magnesium (Mg) that can be used to normalize Mg levels in the body. Upon administration, Mg is utilized by the body for many biochemical functions and reactions including: bone and muscle function, protein and fatty acid formation, activation of B vitamins, blood clotting, insulin secretion, and ATP formation. Mg also serves as a catalyst for many enzymes throughout the body. In addition, magnesium improves the functioning of the immune system by enhancing the expression of natural killer activating receptor NKG2D in cytotoxic T-lymphocytes and natural killer (NK) cells. This increases their anti-viral and anti-tumor cytotoxic effects.

**magnesium oxide:** A thickening agent for polyester resins. OR The oxide salt of magnesium with antacid, laxative and vascular smooth muscle relaxant activities. Magnesium combines with water to form magnesium hydroxide which reacts chemically to neutralize or buffer existing quantities of stomach acid; stomach-content and intra-esophageal pH rise, resulting in a decrease in pepsin activity. This agent's laxative effect is the result, in part, of osmotically mediated water retention, which subsequently stimulates peristalsis. In addition, magnesium ions may behave as calcium antagonists in vascular smooth muscle.

**magnesium sulfate :** A drug used to treat pre-eclampsia and eclampsia (serious complications of pregnancy). Magnesium sulfate is also being studied for its ability to prevent the toxic side effects of certain drugs used to treat colorectal cancer. It is a type of anticonvulsant agent.

**magnesium valproate:** The magnesium salt of valproic acid (2-propylpentanoic acid) with antiepileptic and potential antineoplastic activities. Magnesium valproate dissociates in the gastrointestinal tract and is absorbed into the circulation as magnesium ions and valproic acid ions; valproic acid may inhibit histone deacetylases, inducing tumor cell differentiation, apoptosis, and growth arrest. In addition, valproic acid exerts an antiepileptic effect, likely by inhibiting enzymes that catabolize

the inhibitory neurotransmitter gamma-aminobutyric acid (GABA) catabolism and so increasing concentrations of GABA in the central nervous system (CNS). The presence of the magnesium in this agent may contribute to its anticonvulsant activity and sedative properties.

**magnetic anomaly:** an area of magnetism that is either higher or lower than the average magnetic field for that region.

**magnetic declination:** the number of degrees that a compass needle is pulled away from True North to point toward Magnetic North.

**magnetic field:** of a planet, a magnetic force that surrounds the planet and probably originates from its metallic core.

**Magnetic North:** the area near Hudson Bay, Canada, where the Earth's magnetic field is strongest in the Northern Hemisphere (location changes over time).

**magnetic pole:** a locality at which magnetic lines of force converge to create the strongest point in the magnetic field.

**magnetic quantum number:** Quantum number that labels different orbitals within a subshell.  $m$  can take on values from  $-l$  to  $+l$ . The number of orbitals in a subshell is the same as the number of possible  $m$  values.

**magnetic quantum number ( $m$ ):**  $m$  the third number in Schrödinger's electron wave equation, which tells the orientation of the orbital in space.

**magnetic resonance angiography :** A procedure that uses radio waves and a powerful magnet linked to a computer to create detailed pictures of the blood vessels and blood flow inside the body. A dye may be injected into a vein to make the blood vessels and blood flow easier to see. Magnetic resonance angiography may be used to check for aneurysms (a bulge in the blood vessel wall), blockages in the arteries, blood clots, and other blood vessel problems. Also called MRA.

**magnetic resonance imaging :** A procedure in which radio waves and a powerful magnet linked to a computer are used to create detailed pictures of areas inside the body. These pictures can show the difference between normal and diseased tissue. Magnetic resonance imaging makes better images of organs and soft tissue than other scanning techniques, such as computed tomography (CT) or x-ray. Magnetic resonance imaging is especially useful for imaging the brain, the spine, the soft tissue of joints,

and the inside of bones. Also called MRI, NMRI, and nuclear magnetic resonance imaging.

**magnetic resonance perfusion imaging** : A special type of magnetic resonance imaging (MRI) that uses an injected dye in order to see blood flow through tissues. Also called perfusion magnetic resonance imaging.

**magnetic resonance spectroscopic imaging** : A noninvasive imaging method that provides information about cellular activity (metabolic information). It is used along with magnetic resonance imaging (MRI) which provides information about the shape and size of the tumor (spatial information). Also called  $^1\text{H}$ -nuclear magnetic resonance spectroscopic imaging, MRSI, and proton magnetic resonance spectroscopic imaging.

**Magnetic stripes** : Tectonic plates move around the Earth. It is believed that the ocean floors are spreading so that the continents are moving further apart. Measurements of magnetic properties along the ocean floor show that the rock has been formed at different times.

**magnetic-targeted carrier** : A tiny bead made from particles of iron and carbon that can be attached to an anticancer drug. A magnet applied from outside the body then can direct the drug to the tumor site. This can keep a larger dose of the drug at the tumor site for a longer period of time, and help protect healthy tissue from the side effects of chemotherapy.

**magnetometer**: a device for measuring the intensity of the magnetic field at the earth's surface. OR Chains of intracellular small particles containing the magnetic ore magnetite ( $\text{Fe}_3\text{O}_4$ ) found in some bacteria that enable the bacteria to detect Earth's magnetic field.

**Magnevist** : A substance used in magnetic resonance imaging (MRI) to help make clear pictures of the brain, spine, heart, soft tissue of joints, and inside bones. Magnevist is being studied in the diagnosis of cancer. It is a type of contrast agent. Also called gadopentetate dimeglumine and Gd-DTPA.

**maidenhair tree** : A tree native to China. Substances taken from the leaves and seeds have been used in some cultures to treat certain medical problems. Maidenhair tree has been studied in the prevention and treatment of Alzheimer disease, dementia, certain blood vessel diseases, and memory loss. It may cause bleeding or high blood pressure when used with certain drugs. Also called ginkgo and ginkgo biloba.

**Main chain:** The regularly repeating part of the primary structure of a polypeptide; each unit of the chain includes the  $\alpha$ -carbon atom as well as the CO and NH groups of an amino acid residue.

**Main Drive :** The motor, reducer, and other power transmission devices that turn the cage or drum of a spiral system. Also known as the cage drive.

**main group elements:** Elements of the s and p blocks.

**Main olfactory epithelium:** A specific region of the nose, containing approximately 1 million sensory neurons, that detects odorants.

**main sequence star:** star that falls into broad band along the H-R diagram.

**mainstream medicine :** A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery. Also called allopathic medicine, biomedicine, conventional medicine, orthodox medicine, and Western medicine.

**mainstream smoke :** Tobacco smoke that is exhaled by smokers. Mainstream smoke can be a form of secondhand smoke. It contains nicotine and many harmful, cancer-causing chemicals. Inhaling mainstream smoke increases the risk of lung cancer and may increase the risk of other types of cancer. Inhaling it also increases the risk of other health problems, such as heart disease and lung disease.

**mainstream smoke (tobacco smoking):** The smoke that is inhaled.

**maintenance therapy :** Treatment that is given to help keep cancer from coming back after it has disappeared following the initial therapy. It may include treatment with drugs, vaccines, or antibodies that kill cancer cells, and it may be given for a long time.

**Maitake mushroom extract:** An extract of the edible mushroom Maitaki, *Grifola frondosa*, rich in glucan polysaccharides, with potential immunostimulating activity. Upon oral ingestion, Maitaki mushroom extract may promote dendritic cell (DC) maturation, increase interferon gamma (IFN-gamma) and tumor necrosis factor alpha (TNF-alpha) production, and may enhance natural killer (NK) cell activity, thereby amplifying both innate and T cell-mediated immune responses against cancer cells. In addition, this extract may stimulate the production of

granulocyte colony stimulating factor (GCSF) and promote hematopoiesis, and may improve the neutrophil count.

**Major groove:** A 12-Å-wide, 8.5-Å-deep groove in B-DNA resulting from the fact that the glycosidic bonds of a base pair are not diametrically opposite each other.

**Major histocompatibility complex (MHC):** Integral membrane proteins that bind and display on a cell's surface peptides derived from the digestion of proteins from the cytosol (class I MHC proteins) or from endosomal compartments (class II MHC proteins). Foreign peptides bound to class I MHC proteins mark them for destruction by killer T cells, whereas those bound to class II MHC proteins provide a signal for helper T cells, which can in turn stimulate B-lymphocyte production.

**major product:** the product that forms in the greatest amount in a reaction.

**Makarol:** (Other name for: diethylstilbestrol)

**Making good:** Carrying out the requisite repairs to a surface to provide a sound surface for painting.

**malabsorption syndrome :** A group of symptoms such as gas, bloating, abdominal pain, and diarrhea resulting from the body's inability to properly absorb nutrients.

**Malate synthase:** An enzyme of the glyoxylate cycle that catalyzes the formation of oxaloacetate from glyoxylate and acetyl coa.

**Malate-aspartate shuttle:** A reversible shuttle, found in the liver and heart, used to transport electrons from cytoplasmic NADH to mitochondrial NAD<sup>+</sup>.

**Malaysian Oleochemicals Manufacturing Group (MOMG):** Formed in January of 1984 to help support the manufacturers in Peninsular Malaysia responsible for the production of basic oleochemicals, including fatty acids, methyl esters, glycerin, and fatty alcohols.

**Maldex:** (Other name for: maltodextrin)

**Maldrin:** (Other name for: maltodextrin)

**male breast cancer :** Cancer that forms in tissues of the breast in men. Most male breast cancer begins in cells lining the ducts. It is very rare and usually affects older men.

**Maleic Anhydride:** Maleic anhydride has traditionally been produced by the oxidation of benzene, but more recently, n-butane has replaced benzene as the main feedstock. Maleic anhydride is a versatile molecule that lends itself to many applications requiring multi-functionality. The main applications for refined Maleic anhydride are unsaturated polyester resins and fine chemicals (alkenyl succinic anhydrides, fumaric acid, polyaspartic acid). OR An unsaturated dicarboxylic acid anhydride used primarily in the formation of unsaturated polyester resins.

**malignancy :** A term for diseases in which abnormal cells divide without control and can invade nearby tissues. Malignant cells can also spread to other parts of the body through the blood and lymph systems. There are several main types of malignancy. Carcinoma is a malignancy that begins in the skin or in tissues that line or cover internal organs. Sarcoma is a malignancy that begins in bone, cartilage, fat, muscle, blood vessels, or other connective or supportive tissue. Leukemia is a malignancy that starts in blood-forming tissue, such as the bone marrow, and causes large numbers of abnormal blood cells to be produced and enter the blood. Lymphoma and multiple myeloma are malignancies that begin in the cells of the immune system. Central nervous system cancers are malignancies that begin in the tissues of the brain and spinal cord. Also called cancer.

**malignant:** Adjective describing cells in a cancerous growth. See tumour.

**malignant :** Cancerous. Malignant cells can invade and destroy nearby tissue and spread to other parts of the body.

**malignant ascites :** A condition in which fluid containing cancer cells collects in the abdomen.

**malignant ectomesenchymoma :** A rare, fast-growing tumor of the nervous system or soft tissue that occurs in children and young adults. Malignant ectomesenchymomas may form in the head and neck, abdomen, perineum, scrotum, or limbs. Also called ectomesenchymoma.

**malignant fibrous cytoma :** A soft tissue sarcoma that usually occurs in the limbs, most commonly the legs, and may also occur in the abdomen. Also called malignant fibrous histiocytoma.

**malignant fibrous histiocytoma :** A soft tissue sarcoma that usually occurs in the limbs, most commonly the legs, and may also occur in the abdomen. Also called malignant fibrous cytoma.

**malignant glioma tumor lysate-pulsed autologous dendritic cell**

**vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with lysates from malignant glioma cells with potential immunostimulatory and antineoplastic activities. Upon administration, malignant glioma tumor lysate-pulsed autologous dendritic cell vaccine exposes the immune system to undefined malignant glioma tumor-associated antigens (TAAs), which may result in anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against glioma cells and glioma cell lysis.

**malignant meningioma :** A rare, fast-growing tumor that forms in one of the inner layers of the meninges (thin layers of tissue that cover and protect the brain and spinal cord). Malignant meningioma often spreads to other areas of the body.

**malignant mesothelioma :** A rare type of cancer in which malignant cells are found in the lining of the chest or abdomen. Exposure to airborne asbestos particles increases one's risk of developing malignant mesothelioma.

**malignant mixed Müllerian tumor :** A rare type of tumor that is a mixture of carcinoma and sarcoma cells. MMMT usually occurs in the uterus. Also called MMMT.

**malignant pericardial effusion :** A condition in which cancer causes extra fluid to collect inside the sac around the heart. The extra fluid causes pressure on the heart, which keeps it from pumping blood normally. Lymph vessels may be blocked, which can cause infection. Malignant pericardial effusions are most often caused by lung cancer, breast cancer, melanoma, lymphoma, and leukemia.

**malignant peripheral nerve sheath tumor :** A type of soft tissue sarcoma that develops in cells that form a protective sheath (covering) around peripheral nerves, which are nerves that are outside of the central nervous system (brain and spinal cord). Also called MPNST.

**malignant peritoneal effusion :** A condition in which cancer causes extra fluid to collect between the thin layers of the peritoneum (tissue that lines the abdomen and covers most of the organs in the abdomen). Signs and symptoms may include pain or swelling in the abdomen, trouble breathing, chest pain, weight gain, nausea, loss of appetite, and fatigue. Malignant

peritoneal effusions are most often caused by cancers of the ovary, uterus, breast, colon, lung, pancreas, and liver.

**malignant pleural effusion :** A condition in which cancer causes an abnormal amount of fluid to collect between the thin layers of tissue (pleura) lining the outside of the lung and the wall of the chest cavity. Lung cancer, breast cancer, lymphoma, and leukemia cause most malignant pleural effusions.

**malleability:** the property of a metal that allows it to be hammered, rolled, pressed or forged.

**malleable:** A malleable material can be hammered into different shapes. OR Capable of being hammered into sheets. Metals are typically malleable materials.

**malnourished :** Describes a condition caused by not getting enough calories or the right amount of key nutrients needed for health. Key nutrients include vitamins and minerals.

**malnutrition :** A condition caused by not getting enough calories or the right amount of key nutrients, such as vitamins and minerals, that are needed for health. Malnutrition may occur when there is a lack of nutrients in the diet or when the body cannot absorb nutrients from food. Cancer and cancer treatment may cause malnutrition.

**malondialdehyde :** A byproduct of lipid (fat) metabolism in the body. It is also found in many foods and can be present in high amounts in rancid food.

**MALT lymphoma :** A type of cancer that arises in cells in mucosal tissue that are involved in antibody production. Also called mucosa-associated lymphoid tissue lymphoma.

**maltodextrin:** An oligosaccharide derived from starch that is used as a food additive and as a carbohydrate supplement. As a supplement, maltodextrin is used to provide and sustain energy levels during endurance-oriented workouts or sports, to help build muscle mass and support weight gain.

**maltose:** A disaccharide consisting of two glucose units linked through an alpha-1,4 glycosidic bond.

**mammaglobin-A DNA vaccine:** A cancer vaccine containing a plasmid encoding the mammaglobin-A gene with potential immunostimulating and

antineoplastic activities. Upon administration, mammaglobin-A DNA vaccine may induce both humoral and cytotoxic T lymphocyte (CTL) immune responses against tumor cells that express mammaglobin-A, which may result in decreased tumor growth. The 10 kiloDalton (kD) glycoprotein mammaglobin-A is expressed in over 80% of human breast cancers.

**mammalian target of rapamycin :** A protein that helps control several cell functions, including cell division and survival, and binds to rapamycin and other drugs. Mammalian target of rapamycin may be more active in some types of cancer cells than it is in normal cells. Blocking mammalian target of rapamycin may cause the cancer cells to die. It is a type of serine/threonine protein kinase. Also called mechanistic target of rapamycin and mTOR.

**mammals:** milk-producing animals.

**MammaPrint :** A test that is used to help predict whether breast cancer has spread to other parts of the body or come back. The test looks at the activity of 70 different genes in breast cancer tissue of women who have early-stage breast cancer that has not spread to the lymph nodes. If there is a high risk that the cancer will spread or come back, it may be used to help plan treatment with anticancer drugs. Also called 70-gene signature.

**mammary :** Having to do with the breast.

**mammary dysplasia :** A group of conditions marked by changes in breast tissue that are benign (not cancer). There are different types of mammary dysplasia, including some types caused by an increase in the number of cells or by the growth of abnormal cells in the breast ducts or lobes. Signs and symptoms of mammary dysplasia include irregular lumps or cysts, breast swelling or discomfort, skin redness or thickening, and nipple discharge. Most benign breast conditions do not increase the risk of breast cancer. Also called benign breast disease.

**mammary gland :** Glandular organ located on the chest. The mammary gland is made up of connective tissue, fat, and tissue that contains the glands that can make milk. Also called breast.

**mammogram :** An x-ray of the breast.

**mammography :** The use of film or a computer to create a picture of the breast.

**MammoSite :** A system used to deliver internal radiation therapy to breast cancer patients after surgery to remove their cancer. MammoSite targets only the part of the breast where the cancer was found. After a patient has had a lumpectomy to remove the cancer, a small balloon on the end of a catheter (thin tube) is inserted into the empty space left by the surgery. The balloon is then filled with liquid and left in place. Using the catheter, radioactive seeds are put into the balloon twice a day for five days and removed each time. Once treatment has ended, the catheter and balloon are removed. MammoSite is a type of intracavitary brachytherapy and partial breast irradiation therapy (PBRT). Also called balloon catheter radiation.

**MAMMOTOME :** A device that uses a computer-guided probe to perform breast biopsies. A biopsy procedure using the MAMMOTOME device can be done on an outpatient basis with a local anesthetic, removes only a small amount of healthy tissue, and doesn't require sutures (stitches) because the incision is very small. MAMMOTOME is a registered trademark of Devicor Medical Products, Inc.

**MANDREL:** 1. Core around which fiberglass impregnated with plastic resin is wound, as in filament winding. 2. The portion of an extrusion die that forms the hollow center in an extruded tube.

**mangafodipir trisodium:** The trisodium salt of mangafodipir with potential antioxidant and chemoprotective activities. Consisting of manganese (II) ions chelated to fodipir (dipyridoxyl diphosphate or DPDP), mangafodipir scavenges oxygen free radicals such as superoxide anion, hydrogen peroxide, and hydroxyl radical, potentially preventing oxygen free radical damage to macromolecules such as DNA and minimizing oxygen free radical-related chemotoxicity in normal tissues. However, this agent may potentiate the chemotherapy-induced generation of oxygen free radicals in tumor cells, resulting in the potentiation of chemotherapy-induced cytotoxicity; tumor cells, with higher levels of reactive oxygen species than normal cells, possess a lower threshold for oxygen free radical-mediated cytotoxicity. Mangafodipir is traditionally used as an imaging agent in magnetic resonance imaging (MRI).

**Manganese:** Symbol:"Mn" Atomic Number:"25" Atomic Mass: 54.94amu. This element is one of the transition elements. Manganese can be found in many minerals and small round nodules at the bottom of the ocean. It is also used in many alloys and the creation of some types of glass.

**Manganese center:** The site of oxygen generation in photosynthesis in green plants. The center is a complex, which includes four manganese ions, that donates electrons to positively charged P680. After donating four electrons, the manganese center oxidizes two molecules of water to replenish its electrons and thus forms a single molecule of molecular oxygen and four protons.

**Manifold:** A term used mainly with reference to blow molding and sometimes with injection molding equipment. It refers to the distribution or piping system which takes the single channel flow output of the extruder or injection cylinder and divides it to feed several blow molding heads or injection nozzles.

**MANIFOLD:** See HOT RUNNER.

**manipulative and body-based practice :** A type of therapy in which the therapist moves or manipulates one or more parts of the patient's body. It may be used to treat pain, stress, anxiety, and depression, and for general well-being. Examples include chiropractic treatments, physical therapy, and massage therapy. Also called manual healing and physical touch methods.

**mannitol:** A naturally occurring alcohol found in fruits and vegetables and used as an osmotic diuretic. Mannitol is freely filtered by the glomerulus and poorly reabsorbed from the renal tubule, thereby causing an increase in osmolarity of the glomerular filtrate. An increase in osmolarity limits tubular reabsorption of water and inhibits the renal tubular reabsorption of sodium, chloride, and other solutes, thereby promoting diuresis. In addition, mannitol elevates blood plasma osmolarity, resulting in enhanced flow of water from tissues into interstitial fluid and plasma. or A drug used to decrease swelling of the brain and to treat kidney failure. Mannitol can also be used to open the blood-brain barrier, which allows anticancer medicines to enter the brain and treat brain tumors.

**manometer:** an instrument for measuring pressure liquids and gasses. It usually consists of a U-shaped tube containing a liquid, the surface of which is in one end of the tube; moves proportionally with changes in pressure on the liquid in the other end. Also, a tube type differential pressure gauge. OR Device used for measuring small pressures. OR An instrument for measuring gas pressures. A mercury or oil manometer measures gas pressure as the height of a fluid column the gas sample is able to support. Open manometers measure gas pressure relative to atmospheric pressure.

**mantle:** The mantle is the region inside the Earth that lies between the outer crust and the core. OR the layer below the crust; about 2,900 km thick; contains rocks rich in iron, magnesium, and silicon. OR the middle zone of the earth, between the core and the crust. OR The layer of the Earth immediately below the crust. Beneath the mantle is the core.

**mantle cell lymphoma :** An aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma that usually occurs in middle-aged or older adults. It is marked by small- to medium-size cancer cells that may be in the lymph nodes, spleen, bone marrow, blood, and gastrointestinal system.

**mantle field :** The area of the neck, chest, and lymph nodes in the armpit that are exposed to radiation.

**mantle plume:** a "hot spot" in the crust where hot mantle material has ascended along deep penetrating cracks in the crust.

**manual healing :** A type of therapy in which the therapist moves or manipulates one or more parts of the patient's body. It may be used to treat pain, stress, anxiety, and depression, and for general well-being. Examples include chiropractic treatments, physical therapy, and massage therapy. Also called manipulative and body-based practice and physical touch methods.

**Manual operation:** The term used to define the mode in which a molding machine is operating when there is a need for an operator to start and finish each phase of the total cycle.

**Manuka honey:** A monofloral honey with potential wound repair and antibacterial activities. Manuka honey is produced by bees fed on the flowers of the New Zealand Manuka bush (*Leptospermum scoparium*). Manuka honey contains a significant higher concentration of the 1,2-dicarbonyl compound methylglyoxal, which may account for its antibacterial activity; this agent may release small amounts of hydrogen peroxide which may also contribute to its antibacterial activity. Manuka honey has been reported to stimulate the formation of new blood capillaries and the growth of fibroblasts and epithelial cells when applied topically to wounds.

**MAO inhibitor :** A type of drug used to treat depression. It stops the breakdown of certain chemicals in the brain that help improve a person's mood. A MAO inhibitor is a type of antidepressant. Also called monoamine oxidase inhibitor.

**mapatumumab:** A fully human agonistic monoclonal antibody to tumor necrosis factor-related apoptosis-inducing ligand receptor-1 (TRAIL-R1) with apoptosis promoting and potential antitumor activities. TRAIL-R1 is a cell surface receptor expressed on many malignant cell types.

Mapatumumab selectively binds to and activates the TRAIL cell receptor, thereby inducing apoptosis and reducing tumor growth. or A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL R1 on the surface of some tumor cells. This may kill the tumor cells. Mapatumumab is a type of monoclonal antibody. Also called anti-TRAIL R1-mAb and HGS-ETR1.

**Maple syrup disease:** A disease resulting from the inability to oxidatively decarboxylate branch-chain amino acids, characterized by mental and physical retardation and urine that smells like maple syrup.

**Mar Resistance:** The resistance of glossy plastic surfaces to abrasive action.

**maraviroc:** A C-C chemokine receptor type 5 (CCR5) antagonist with activity against human immunodeficiency virus (HIV). Maraviroc inhibits HIV-1 entry via CCR5 coreceptor interaction.

**Marcaine :** A drug used to relieve pain by blocking signals at nerve endings. It is being studied in the relief of pain following surgery for cancer. It is a type of local anesthetic. Also called bupivacaine, bupivacaine hydrochloride, and Sensorcaine.

**marcellomycin:** An antineoplastic oligosaccharide anthracycline antineoplastic antibiotic isolated from the bacterium *Actinosporangium bohemicum*. Marcellomycin intercalates into DNA and induces DNA crosslinks, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent also induces differentiation in HL-60 promyelocytic leukemia cells by interfering with glycoprotein synthesis.

**margetuximab:** A Fc-domain optimized IgG monoclonal antibody directed against the human epidermal growth factor receptor 2 (HER2) with potential immunomodulating and antineoplastic activities. After binding to HER2 on the tumor cell surface, margetuximab may induce an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells overexpressing HER2. HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types. Compared to other anti-HER2 monoclonal antibodies, the Fc domain of MGAH22 is optimized with increased binding

to the activating Fcγ receptor IIIA (CD16A), expressed on cells such as natural killer (NK) cells and macrophages, thereby mediating an enhanced ADCC; the Fc domain also shows decreased binding to the inhibitory Fcγ receptor IIB (CD32B).

**margin :** The edge or border of the tissue removed in cancer surgery. The margin is described as negative or clean when the pathologist finds no cancer cells at the edge of the tissue, suggesting that all of the cancer has been removed. The margin is described as positive or involved when the pathologist finds cancer cells at the edge of the tissue, suggesting that all of the cancer has not been removed.

**marginal zone B-cell lymphoma :** An indolent (slow-growing) type of B-cell non-Hodgkin lymphoma that begins forming in certain areas (the marginal zones) of lymph tissue. There are three types based on whether it forms in the spleen, lymph nodes, or other lymphoid tissue that contains a lot of B cells (a type of white blood cell). Also called marginal zone lymphoma and MZL.

**marginal zone lymphoma :** An indolent (slow-growing) type of B-cell non-Hodgkin lymphoma that begins forming in certain areas (the marginal zones) of lymph tissue. There are three types based on whether it forms in the spleen, lymph nodes, or other lymphoid tissue that contains a lot of B cells (a type of white blood cell). Also called marginal zone B-cell lymphoma and MZL.

**maria:** large, flat areas on the Moon.

**Marianas Trench:** deepest trench in the world; lies off the coast of Japan.

**maribavir :** A substance that blocks the ability of viruses to make new viruses and infect cells. It is being studied in the prevention of cytomegalovirus infection in cancer patients who have had a donor stem cell transplant. It is a type of antiviral agent.

**marijuana:** Any part of, or extract from, the female hemp plant *Cannabis sativa*. Marijuana contains cannabinoids, substances with hallucinogenic, psychoactive, and addictive properties. This agent has potential use for treating cancer pain and cachexia. Check for active clinical trials using this agent. or The dried leaves and flowering tops of the *Cannabis sativa* or *Cannabis indica* plant. Marijuana contains active chemicals called cannabinoids that cause drug-like effects all through the body, including the central nervous system and the immune system. Marijuana may help treat

the symptoms of cancer or the side effects of cancer treatment, such as nausea and vomiting, pain, and cachexia (loss of body weight and muscle mass). Also called Cannabis.

**marimastat** : An anticancer drug that belongs to the family of drugs called angiogenesis inhibitors. Marimastat is a matrix metalloproteinase inhibitor. or An orally-active synthetic hydroxamate with potential antineoplastic activity. Marimastat covalently binds to the zinc(II) ion in the active site of matrix metalloproteinases (MMPs), thereby inhibiting the action of MMPs, inducing extracellular matrix degradation, and inhibiting angiogenesis, tumor growth and invasion, and metastasis. This agent may also inhibit tumor necrosis factor-alpha converting enzyme (TACE), an enzyme involved in tumor necrosis factor alpha (TNF-alpha) production that may play a role in some malignancies as well as in the development of arthritis and sepsis.

**Marine Paint:** Coating specially designed for immersion in water and exposure to marine atmosphere (See also Anti-fouling Paint).

**marine terrace:** a broad, gently sloping platform offshore from a beach face.

**MARINE VARNISH:** Varnish specially designed for immersion in water and exposure to marine atmosphere.

**Marinol:** (Other name for: dronabinol)

**marizomib:** A naturally-occurring salinosporamide, isolated from the marine actinomycete *Salinospora tropica*, with potential antineoplastic activity. Marizomib irreversibly binds to and inhibits the 20S catalytic core subunit of the proteasome by covalently modifying its active site threonine residues; inhibition of ubiquitin-proteasome mediated proteolysis results in an accumulation of poly-ubiquitinated proteins, which may result in the disruption of cellular processes, cell cycle arrest, the induction of apoptosis, and the inhibition of tumor growth and angiogenesis. This agent may be more potent and selective than the proteasome inhibitor bortezomib.

**Marker:** A "landmark" that can be localized to a specific region of the genome.

**marker** : A diagnostic indication that disease may develop.

**marker beds:** those distinctive layers in a sedimentary sequence that allow exposures in different areas to be definitely correlated, or linked.

**Marketing:** Getting people to give you money for goods or services. The relative importance of marketing and research to the wellbeing of society can be measured by the amounts of money spent on each activity.

**Markovnikov rule:** states that the positive part of a reagent (a hydrogen atom, for example) adds to the carbon of the double bond that already has more hydrogen atoms attached to it. The negative part adds to the other carbon of the double bond. Such an arrangement leads to the formation of the more stable carbocation over other less-stable intermediates.

**Marqibo:** (Other name for: vincristine sulfate liposome)

**Marqibo :** A form of the anticancer drug vincristine sulfate that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than vincristine. Marqibo is used to treat adults with acute lymphoblastic leukemia that is Philadelphia chromosome negative and has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. It is a type of vinca alkaloid and a type of antimitotic agent. Also called liposomal vincristine sulfate and vincristine sulfate liposome.

**marsh:** A type of wetland that does not accumulate appreciable peat deposits and is dominated by herbaceous vegetation. Marshes may be fresh- or saltwater, tidal or nontidal.

**marsupials:** the mammals whose embryos develop within the mother's uterus for a short period of time before birth.

**MART-1 antigen:** A tumor-associated melanocytic differentiation antigen. Vaccination with MART-1 antigen may stimulate a host cytotoxic T-cell response against tumor cells expressing the melanocytic differentiation antigen, resulting in tumor cell lysis. Or A protein found on normal melanocytes (cells that make the pigment melanin) in the skin and in the retina. It is also found on most melanomas (cancers that begin in melanocytes). Vaccines using pieces of the MART-1 antigen are being studied for their ability to boost the immune response to cancer cells in patients with melanoma. Also called Melan-A protein and Melanoma Antigen Recognized by T cells 1.

**MART-1 reactive CD8+ lymphocytes:** Human CD8-positive T-lymphocytes that are engineered to recognize melanoma tumor-associated antigen MART-1 (Melanoma Antigen Recognized by T cells, also called Melan-A) in a human leukocyte antigen (HLA)-A2-restricted manner, with

potential antineoplastic activity. Human peripheral blood lymphocytes (PBLs) are isolated from a melanoma patient, exposed to the MART-1:27-35(27L) peptide and MART-1 specific T-lymphocytes are isolated and expanded. Upon infusion, these lymphocytes recognize and exert a cytotoxic T-cell-mediated immune response against MART-1-expressing melanoma cells. The synthetic MART-1:27-35 HLA-A2-restricted peptide has an amino acid substitution, leucine to alanine at position 27, to increase its immunogenicity. Check for active clinical trials using this agent.

**MART-1:26-35(27L) peptide vaccine:** A peptide-based cancer vaccine consisting of amino acid residues 26 through 35 of MART-1 (melanoma antigen recognized by T-cells-1) with a leucine substitution at amino acid position 27 to improve immunogenicity. Upon administration, MART-1:26-35(27L) peptide vaccine may induce a cytotoxic T-lymphocyte (CTL) response against MART-1-expressing tumor cells, resulting in decreased tumor growth. The tumor-associated antigen (TAA) MART-1 may be overexpressed on melanoma cancer cells. Check for active clinical trials using this agent.

**MART-1:27-35 peptide vaccine:** A natural or synthetic peptide cancer vaccine consisting of amino acid residues 27 through 35 of the melanoma-associated antigen MART-1 with potential antineoplastic activity. Vaccination with MART-1:27-35 peptide may induce cytotoxic host immune responses against melanoma cells that express this peptide.

**MART-1/gp100/Tyrosinase/MAGE-A3 peptides-loaded irradiated allogeneic plasmacytoid dendritic cells:** Irradiated allogeneic, HLA-A\*0201 positive, plasmacytoid dendritic cells (pDCs) loaded with 4 melanoma peptides derived from the tumor-associated antigens (TAAs) MelA/MART-1, gp100/pmell17, tyrosinase, and MAGE-A3, with potential immunostimulating and antineoplastic activities. Upon subcutaneous administration, the irradiated allogeneic pDCs may trigger functional multi-specific T cells from peripheral blood mononuclear cells and tumor-infiltrating lymphocytes, and activate the immune system to mount a cytotoxic T-lymphocyte response against HLA-A\*0201-positive melanoma cancer cells expressing the TAAs MelA/MART-1, gp100/pmell17, tyrosinase, and MAGE-A3. These TAAs are upregulated in a variety of tumor cells. The pDCs are derived from a distinct subset of dendritic cells (DCs) with a plasma cell-like morphology and express a characteristic set

of surface markers and may increase the anti-tumor immune responses. Check for active clinical trials using this agent.

**masitinib mesylate:** The orally bioavailable mesylate salt of masitinib, a multi-targeted protein tyrosine kinase inhibitor with potential antineoplastic activity. Masitinib selectively binds to and inhibits both the wild-type and mutated forms of the stem cell factor receptor (c-Kit; SCFR); platelet-derived growth factor receptor (PDGFR); fibroblast growth factor receptor 3 (FGFR3); and, to a lesser extent, focal adhesion kinase (FAK). As a consequence, tumor cell proliferation may be inhibited in cancer cell types that overexpress these receptor tyrosine kinases (RTKs).

**MASKING:** Temporary covering of areas not to be painted.

**MASKING TAPE:** A strip of paper or cloth similar to adhesive tape, which can be easily removed, used to temporarily cover areas that are not to be painted.

**masoprocol:** A naturally occurring antioxidant dicatechol originally derived from the creosote bush *Larrea divaricata* with antipromoter, anti-inflammatory, and antineoplastic activities. Masoprocol directly inhibits activation of two receptor tyrosine kinases (RTKs), the insulin-like growth factor receptor (IGF-1R) and the c-erbB2/HER2/neu receptor, resulting in decreased proliferation of susceptible tumor cell populations. This agent may induce apoptosis in susceptible tumor cell populations as a result of disruption of the actin cytoskeleton in association with the activation of stress activated protein kinases (SAPKs). In addition, NDGA inhibits arachidonic acid 5-lipoxygenase (5LOX), resulting in diminished synthesis of inflammatory mediators such as prostaglandins and leukotrienes; it may prevent leukocyte infiltration into tissues and the release of reactive oxygen species and, at higher concentrations, may also inhibit cyclooxygenase. or A drug put on the skin to treat growths caused by sun exposure. A form of masoprocol that is taken by mouth is being studied in the treatment of prostate cancer. Masoprocol is an antioxidant, and it may block certain enzymes needed for tumor growth. Also called Actinex, NDGA, and nordihydroguaiaretic acid.

**mass:** the quantity of matter in a body as measured by its resistance to a change in acceleration; different but proportional to weight. OR Mass is a measure of the tendency of an object to resist acceleration. It's harder to roll a tractor trailer than a roller skate; the tractor trailer has a far greater mass.

**mass :** In medicine, a lump in the body. It may be caused by the abnormal growth of cells, a cyst, hormonal changes, or an immune reaction. A mass may be benign (not cancer) or malignant (cancer).

**mass balance:** The application of the principle of the conservation of matter. For example, the mass of a glacier is not destroyed or created; the mass of a glacier and all its constitutive components remains the same despite alterations in their physical states. The mass balance of a glacier is calculated with the input/output relationships of ice, firn, and snow, usually measured in water equivalent. Output includes all ablative processes of surface melting, basal melting, evaporation, wind deflation, calving, and internal melting. Input includes direct precipitation, avalanching, and the growth of superimposed ice.

**mass mean diameter:** The diameter of a particle with a mass equal to the mean mass of all the particles in the population (IAEA, 1978).

**mass median diameter:** The diameter of a particle with the median mass (IAEA, 1978).

**mass number:** the total number of protons and neutrons in an atomic nucleus. OR The number of protons and neutrons in an atom. OR is the relative mass of the isotopes compared to that of Carbon-12 whose mass is 12.0000 g/mol. It is not shown on the periodic chart. It is also equal to the sum of protons + neutrons inasmuch as protons and neutrons each have an atomic mass of 1 g/mol (amu - atomic mass unit). OR The mass number is the number of protons plus neutrons in the nucleus of an atom. OR the total number of protons and neutrons in an atom. OR The number of nucleons (neutrons and protons) in the nucleus of an atom. Also known as the atomic weight. OR The total number of protons and neutrons in an atom or ion. In nuclide symbols the mass number is given as a leading superscript. In isotope names (e. g. carbon-14, sodium-23) the mass number is the number following the element name.

**MASS OF AN ELECTRON:** and ions were determined by using the charge/mass ratio and the actual charge (Millikan). The electron's mass is  $10^{-31}$ kg.

**mass percentage:** Mass percentages express the concentration of a component in a mixture or an element in a compound. For example, household bleach is 5.25% NaOCl by mass, meaning that every 100 g of bleach contains 5.25 g of NaOCl. Mass percentage can be calculated as

100% times the mass of a component divided by the mass of the mixture containing the component.

**mass spectrometry:** (of elements) A method for experimentally determining isotopic masses and isotopic abundances. A sample of an element is converted into a stream of ions and passed through an electromagnetic field. Ions with different charge-to-mass ratios are deflected by different amounts, and strike different spots on a film plate or other detector. From the position of the spots, the mass of the ions can be determined; from the intensity of the spot, the relative number of ions (the isotopic abundance) can be determined. OR A technique used to determine the composition and abundance of the atoms in a molecular substance, starting with a very small amount of sample OR An instrument that measures the masses and relative abundances of a sample that has been vaporized and ionized. OR is a refined Sir JJ Tube in which the masses of particles, ions, and isotopes are measured. It separates isotopes according to charge and mass.

**mass spectrum:** A plot showing the results of a mass spectrometry experiment, which shows the presence of particles with different masses as a series of sharp, separate peaks. The position of the peaks on the x-axis indicates the mass of the particles; the peak heights indicate the relative abundance of the particles.

**mass wasting:** the process of erosion whereby rock, soil, and other earth materials move down a slope because of gravitational forces.

**Mass-energy equation:** The equation developed by Albert Einstein, which is usually given as  $E = mc^2$ , showing that, when the energy of a body changes by an amount  $E$  (no matter what form the energy takes), the mass ( $m$ ) of the body will change by an amount equal to  $E/c^2$ . The factor  $c$  squared, the speed of light in a vacuum ( $3 \times 10$  to the eighth power), may be regarded as the conversion factor relating units of mass and energy. The equation predicted the possibility of releasing enormous amounts of energy by the conversion of mass to energy. It is also called the Einstein equation.

**massage therapy :** A treatment in which the soft tissues of the body are kneaded, rubbed, tapped, and stroked. Massage therapy may help people relax, relieve stress and pain, lower blood pressure, and improve circulation. It is being studied in the treatment of cancer symptoms such as lack of energy, pain, swelling, and depression.

**Massive Habit:** This is a large crystal with no definite shape. Sulfur is often found in this form.

**massively parallel sequencing :** A high-throughput method used to determine a portion of the nucleotide sequence of an individual's genome. This technique utilizes DNA sequencing technologies that are capable of processing multiple DNA sequences in parallel. Also called next-generation sequencing and NGS.

**mast cell :** A type of white blood cell.

**mast cell stabilizer TF002:** A small molecule with mast cell stabilizing activity. Mast cell stabilizer TF002 inhibits the formation of lipid rafts of mast cell membranes that contain the signaling machinery which triggers the release of mast cell allergic and inflammatory mediators. Inhibition of lipid raft assembly by this agent results in mast cell stabilization, preventing mast cell degranulation and the release of the inflammatory mediators involved in type I allergic reactions (histamine, leukotrienes, prostaglandins, and cytokines). The assembly of the signaling machinery in mast cell lipid rafts, specialized membrane microdomains rich in cholesterol and sphingolipids, is initiated by IgE binding to its receptor on the mast cell surface; subsequently, allergens crosslink with the IgE/receptor complex and other proteins and lipids are recruited into the signaling machinery.

**mast cell tumor :** A growth or lump of mast cells (a type of white blood cell). Mast cell tumors can involve the skin, subcutaneous tissue, and muscle tissue. Also called mastocytoma.

**mastectomy :** Surgery to remove part or all of the breast. There are different types of mastectomy that differ in the amount of tissue and lymph nodes removed.

**Masterbatch:** A concentration of a substance (an additive, pigment, filler, etc.) in a base polymer. OR A compounded resin or additive already optimally dispersed in concentration and is compatible with the main resin in the process flow. OR A concentrated blend of pigment, additives, filler, etc. in a base polymer. Masterbatch is added in similar amounts to large volumes of material (the same as or compatible with the base polymer) to produce the desired formulation.

**mastitis :** A condition in which breast tissue is inflamed. It is usually caused by an infection and is most often seen in nursing mothers.

**mastocytoma :** A growth or lump of mast cells (a type of white blood cell). Mast cell tumors can involve the skin, subcutaneous tissue, and muscle tissue. Also called mast cell tumor.

**Mat:** 1) A randomly distributed felt of fibers, usually glass, used in reinforced plastics. 2) A nonwoven fabric of fibrous material used as a plastic reinforcement.

**Match boarding:** Boards jointed at their sides with a tongued and grooved joint.

**Material Database:** The file of the information on each material acceptably tested for use in MOLDFLOW analyses.

**Material Safety Data Sheets:** Documentation regarding the toxicity or hazards associated with contact with some substances. Polymer manufacturers have to provide these data sheets.

**maternal :** Having to do with the mother, coming from the mother, or related through the mother.

**mathematical model:** an equation representing an idea.

**Matricaria recutita gel:** A gel-based formulation containing an extract of the herb *Matricaria chamomilla* (*M. recutita* or German chamomile), which is native to eastern and southern Europe, belongs to the Asteraceae family and is high in flavonoids, with potential anti-inflammatory, skin protective, moisturizing, anti-bacterial, anti-oxidant and calming activities. *M. recutita* extract contains flavonoids, including apigenin, luteolin and quercetin, as well as coumarins, herniarin, umbelliferone, anthemide acid, anthemidine, tannin and matricarin. Upon topical application of the *Matricaria recutita* gel, the active ingredients in the chamomile may exert anti-inflammatory, calming and anti-oxidant effects on the skin and may protect the skin against radiotherapy-induced dermatitis. Check for active clinical trials using this agent.

**Matricaria recutita topical infusion:** A gel-based formulation containing an extract of the herb *Matricaria chamomilla* (*M. recutita* or German chamomile), which is native to eastern and southern Europe, belongs to the Asteraceae family and is high in flavonoids, with potential anti-inflammatory, skin protective, moisturizing, anti-bacterial, anti-oxidant and calming activities. *M. recutita* extract contains flavonoids, including apigenin, luteolin and quercetin, as well as coumarins, herniarin,

umbelliferone, anthemic acid, anthemidine, tannin and matricarin. Upon topical application of the *Matricaria recutita* infusion, the active ingredients in the chamomile may exert anti-inflammatory, calming and anti-oxidant effects on the skin and may protect the skin against radiotherapy-induced dermatitis. Check for active clinical trials using this agent.

**matrix:** The aqueous contents of a cell or organelle (the mitochondrion, for example) with dissolved solutes.

**Matrix coating:** One in which some ingredients, such as the lubricant (PTFE), which is soft, are enveloped in others (the matrix, such as harder, more wear-resistant binders). Also referred to as "resin bonded coating."

**matrix metalloproteinase :** A member of a group of enzymes that can break down proteins, such as collagen, that are normally found in the spaces between cells in tissues (i.e., extracellular matrix proteins). Because these enzymes need zinc or calcium atoms to work properly, they are called metalloproteinases. Matrix metalloproteinases are involved in wound healing, angiogenesis, and tumor cell metastasis.

**Matrix-assisted laser desorption-ionization time of flight spectrometry (MALDI-TOF):** A technique for determining a protein's mass. A protein sample is embedded in a matrix and ionized by the application of a laser beam. An electric field accelerates the ions through a flight tube toward a detector, with the lightest ions arriving first.

**Matt finish:** A flat finish with little or no sheen. OR A type of dull non-reflective finish. See SURFACE FINISH. OR A type of dull, non-reflective finish. See Surface Finish. Mold Flow Analysis: Moldflow has two core products: Moldflow Adviser providing manufacturability guidance and directional feedback for standard part and mold design and Moldflow Insight which provides definitive results for flow, cooling, and warpage along with support for specialized molding processes. In addition, Autodesk produces Moldflow Design, Moldflow CAD Doctor, Moldflow Magics STL Expert, and Moldflow Structural Alliance that serve as connectivity tools for other CAD and CAE software.

**matter:** Anything that has mass and takes up space. OR anything that has mass and takes up space. OR Matter is anything that has mass. Air, water, coffee, fire, human beings, and stars are matter. Light, X-rays, photons, gravitons, information, and love aren't matter.

**Matting:** The process of rendering a polished surface uniformly dull.

**Matulane :** A drug that is used to treat advanced Hodgkin lymphoma and is being studied in the treatment of other types of cancer. Matulane blocks cells from making proteins and damages DNA. It may kill cancer cells. It is a type of antineoplastic agent and a type of alkylating agent. Also called procarbazine hydrochloride.

**mature T-cell lymphoma :** One of a group of aggressive (fast-growing) non-Hodgkin lymphomas that begin in mature T lymphocytes (T cells that have matured in the thymus gland and gone to other lymphatic sites in the body, including lymph nodes, bone marrow, and spleen.) Also called peripheral T-cell lymphoma.

**mature teratoma :** A type of benign (not cancer) germ cell tumor (type of tumor that begins in the cells that give rise to sperm or eggs) that often contains several different types of tissue such as hair, muscle, and bone. Also called dermoid cyst.

**matuzumab:** A humanized monoclonal antibody with antineoplastic activity. Matuzumab binds the epidermal growth factor receptor (EGFR) with high affinity, competitively blocking natural ligand binding and blocking receptor-mediated downstream signalling, resulting in impaired tumor cell proliferation.

**Mauna Loa:** An intermittently active volcano 13,680 ft (4,170 m) high in Hawaii. Last eruption was in 1984. Also see Mauna Loa record.

**Mauna Loa record:** The record of measurements of atmospheric carbon dioxide concentrations taken at the Mauna Loa Observatory, Mauna Loa, Hawaii, since March 1958. The Mauna Loa record is the longest reliable daily record of atmospheric carbon dioxide measurements in the world.

**Maunder minimum:** The period from 1654 to 1714 when it was believed that there were no sunspots. It is now thought that there were some sunspots during that time but less than the numbers counted after 1800.

**Maxalt:** (Other name for: rizatriptan benzoate)

**Maxamine :** A substance being studied in the treatment of some types of cancer and other conditions. When used together with interleukin-2, Maxamine may help some immune cells find and kill tumor cells. It is a type of biological response modifier. Also called histamine dihydrochloride.

**maxillary sinus :** A type of paranasal sinus (a hollow space in the bones around the nose). There are two large maxillary sinuses, one in each of the

maxillary bones, which are in the cheek area next to the nose. The maxillary sinuses are lined with cells that make mucus to keep the nose from drying out.

**Maximal velocity:** The highest rate of an enzyme-catalyzed reaction, under conditions of constant enzyme concentration and saturating amounts of substrate.

**maximum allowable concentration (MAC):** Exposure concentration not to be exceeded under any circumstances.

**Maximum dependable capacity (gross):** The maximum amount of electricity that the main generating unit of a nuclear power reactor can reliably produce during the summer or winter (usually summer, but whichever represents the most restrictive seasonal conditions, with the least electrical output). The dependable capacity varies during the year because temperature variations in cooling water affect the unit's efficiency. Thus, this is the gross electrical output as measured (in watts unless otherwise noted) at the output terminals of the turbine generator.

**Maximum dependable capacity (net):** The gross maximum dependable capacity of the main generating unit in a nuclear power reactor, minus the amount used to operate the station. Net maximum dependable capacity is measured in watts unless otherwise noted.

**maximum inspiratory pressure test :** A test that measures the strength of the muscles used in breathing. A person inhales and exhales through a device called a manometer, and the pressures are recorded by a computer. Also called MIP test.

**maximum residue limit:** The maximum concentration of a pesticide residue resulting from the use of a pesticide according to good agricultural practice directly or indirectly for the production and/or protection of the commodity for which the limit is recommended. The maximum residue limit should be legally recognized. It is expressed in milligrams of the residue per kilogram of the commodity (WHO, 1976).

**Maximum Shot Capacity of Machine:** In machine specification it is given in terms of weight for PS. For other polymers the density of polymers at moulding temperature should be multiplied to the maximum swept volume of the machine barrel to get the weight for the given polymer.

**maximum tolerated dose :** The highest dose of a drug or treatment that does not cause unacceptable side effects. The maximum tolerated dose is determined in clinical trials by testing increasing doses on different groups of people until the highest dose with acceptable side effects is found. Also called MTD.

**Maxipime:** (Other name for: cefepime hydrochloride)

**Mayo Clinic regimen :** A chemotherapy combination used to treat colorectal cancer. It is also used with radiation therapy to treat esophageal cancer and stomach cancer. It includes the drugs fluorouracil and leucovorin calcium.

**maytansine:** An ansamycin antibiotic originally isolated from the Ethiopian shrub *Maytenus serrata*. Maytansine binds to tubulin at the rhizoxin binding site, thereby inhibiting microtubule assembly, inducing microtubule disassembly, and disrupting mitosis. Maytansine exhibits cytotoxicity against many tumor cell lines and may inhibit tumor growth in vivo. Check for active clinical trials using this agent.

**maytansinoid DM4-conjugated humanized monoclonal antibody huC242 :** A substance being studied in the treatment of some types of cancer. It is made by linking the monoclonal antibody huC242 to a toxic substance called maytansinoid DM4. The monoclonal antibody binds to the surfaces of cancer cells and the maytansinoid DM4 enters the cells and blocks their growth. It is a type of immunotoxin. Also called huC242-DM4.

**MBL:** A condition in which a higher-than-normal number of identical B cells are found in the blood. People with MBL may develop other B-cell diseases, such as chronic lymphocytic leukemia (CLL). Also called monoclonal B-cell lymphocytosis.

**MBPT:** Many-body perturbation theory. Synonymous with MP (Moller-Plesset) perturbation theory.

**MBS:** Methacrylate-butadiene-styrene

**MBS:** Minimal basis set. Only enough basis functions are supplied to put all the electrons somewhere; the number of basis functions is equal to the number of orbitals. The most common of these is "STO-3G". Qualitative results at best.

**MC-Glucan:** (Other name for: sizofiran)

**MC1R:** A protein found in skin and eye cells that make melanin (a pigment that gives color to the skin and helps protect it from damage by ultraviolet light). People with certain changes in the gene for MC1R have a higher risk of developing melanoma (skin cancer that begins in melanocytes). Also called melanocortin 1 receptor and melanotropin receptor.

**MC5-A scrambler therapy :** A type of treatment for nerve pain that uses electrodes placed on the skin. Electricity is carried from the electrodes through the skin and blocks the pain. The pain may be caused by physical injury, infection, toxic substances, and certain diseases or drugs, including anticancer drugs.

**Mcardle disease:** A disease caused by a lack of muscle glycogen phosphorylase; the glycogen is present in increased amounts but normal structure; clinical characteristics include an inability to perform strenuous exercise.

**MCL-1 Inhibitor AMG 176:** An inhibitor of induced myeloid leukemia cell differentiation protein MCL-1 (myeloid cell leukemia-1), with potential pro-apoptotic and antineoplastic activities. Upon administration, AMG 176 binds to and inhibits the activity of MCL-1. This disrupts the formation of MCL-1/Bcl-2-like protein 11 (BCL2L11; BIM) complexes and induces apoptosis in tumor cells. MCL-1, an anti-apoptotic protein belonging to the Bcl-2 family of proteins, is upregulated in cancer cells and promotes tumor cell survival. Check for active clinical trials using this agent.

**MCPF:** Modified coupled-pair functional. Pretty high-level theory.

**MCPyV TAg-specific polyclonal autologous CD8-positive T cell vaccine:** A preparation of polyclonal autologous CD8 positive T-lymphocytes specific for the Merkel cell polyomavirus (MCPyV) T antigen (TAg) with potential antineoplastic activity. Peripheral blood lymphocytes from a Merkel cell carcinoma (MCC) patient were obtained and antigen-specific CD8<sup>+</sup> T cells targeting a specific MCPyV TAg epitope were derived and expanded *ex vivo*. Upon infusion of the MCPyV TAg-specific polyclonal autologous CD8-positive T cell vaccine, the T cells recognize the MCPyV antigen and exert a cytotoxic T-lymphocyte response against the MCPyV TAg-expressing MCC cells. MCPyV is expressed in about 80% of MCC and is not expressed in normal, human tissue; the MCPyV TAg oncoprotein plays a key role in MCC survival and tumor cell proliferation.

**MCSCF:** Multi-configuration self-consistent field. More than one configuration (Hartree-Fock-type determinant) is used to describe the wavefunction. Both the coefficients of the configurations and the orbital coefficients are optimized. This is a limited type of CI (configuration interaction), with the added feature of orbital optimization. See CASSCF.

**MCT/LCT lipid emulsion:** A nutritional lipid emulsion consisting of both coconut oil-derived medium chain triglycerides (MCTs) and soybean oil-derived long chain triglycerides (LCTs). The LCTs in the MCT/LCT lipid emulsion supply the body with essential omega-6 fatty acids, which are needed as components of phospholipids in cell membranes and as precursors of eicosanoids. The MCTs mainly provide calories for energy. In addition to LCTs and MCTs, this lipid emulsion contains egg yolk lecithin, glycerol, and the antioxidant alpha-tocopherol (vitamin E).

**MCT/LCT/fish oil omega-3 fatty triglyceride lipid emulsion:** A nutritional lipid emulsion consisting of coconut oil-derived medium chain triglycerides (MCTs), soybean oil-derived long chain triglycerides (LCT), and the fish oil-derived polyunsaturated omega-3 fatty acids. This lipid emulsion supplies essential fatty acids and calories for energy. Omega-3 fatty acids may decrease the production of certain pro-inflammatory cytokines, including interleukin 1 (IL-1), IL-6 and tumor necrosis factor (TNF). The MCTs mainly provide calories for energy. In addition to LCTs, MCTs, and omega-3 fatty acids, this lipid emulsion contains egg yolk lecithin, glycerol, and the antioxidant alpha-tocopherol (vitamin E).

**MDL 101,731:** A drug that belongs to a family of drugs called ribonucleotide reductase inhibitors.

**MDM2 antagonist RO5045337:** An MDM2 (human homolog of double minutes-2; HDM2) antagonist with potential antineoplastic activity. RO5045337 binds to MDM2, thereby preventing the binding of the MDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this MDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited and the transcriptional activity of p53 is restored, which may result in the restoration of p53 signaling and thus the p53-mediated induction of tumor cell apoptosis. MDM2, a zinc finger protein, is a negative regulator of the p53 pathway; often overexpressed in cancer cells, it has been implicated in cancer cell proliferation and survival.

**MDM2 antagonist RO6839921:** An MDM2 (human homolog of murine double minute-2; HDM2) antagonist with potential antineoplastic activity. Upon intravenous administration, RO6839921 binds to MDM2 and prevents the binding of the MDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing MDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited and the transcriptional activity of p53 is restored. This may result in the restoration of p53 signaling, followed by p53-mediated induction of tumor cell apoptosis. MDM2, a zinc finger protein, is a negative regulator of the p53 pathway and is often overexpressed in cancer cells; p53 inhibition has been implicated in cancer cell proliferation and survival.

**MDM2 inhibitor AMG 232:** An orally available, piperidinone inhibitor of MDM2 (murine double minute 2), with potential antineoplastic activity. Upon oral administration, MDM2 inhibitor AMG-232 binds to MDM2 protein and prevents its binding to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this MDM2-p53 interaction, the transcriptional activity of p53 is restored. This leads to p53-mediated induction of tumor cell apoptosis. MDM2, a zinc finger protein and a negative regulator of the p53 pathway, is overexpressed in cancer cells; it plays a key role in cancer cell proliferation and survival.

**MDM2 inhibitor DS-3032b:** An orally available MDM2 (murine double minute 2) antagonist with potential antineoplastic activity. Upon oral administration, MDM2 inhibitor DS-3032b binds to, and prevents the binding of MDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this MDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited and the transcriptional activity of p53 is restored. This results in the restoration of p53 signaling and leads to the p53-mediated induction of tumor cell apoptosis. MDM2, a zinc finger protein and a negative regulator of the p53 pathway, is overexpressed in cancer cells; it has been implicated in cancer cell proliferation and survival.

**MDM2/MDMX inhibitor ALRN-6924:** An orally available inhibitor of both murine double minute 2 (MDM2) and murine double minute X (MDMX), with potential antineoplastic activity. Upon oral administration, ALRN-6924 binds to both MDM2 and MDMX and interferes with their interaction with the transcriptional activation domain of the tumor

suppressor protein p53. By preventing MDM2-p53 and MDMX-p53 interactions, p53 activity is restored, which leads to p53-mediated induction of tumor cell apoptosis. MDM2 and MDMX, negative regulators of p53 function, are often overexpressed in cancer cells.

**MDPE:** Medium-density polyethylene

**MDR modulator CBT-1:** A naturally-occurring, orally bioavailable bisbenzylisoquinoline plant alkaloid with potential chemosensitization activity. MDR modulator CBT-1 binds to and inhibits the MDR efflux pump P-glycoprotein (P-gp), which may inhibit the efflux of various chemotherapeutic agents from tumor cells and reverse P-gp-mediated tumor cell MDR. P-gp is a transmembrane ATP-binding cassette (ABC) transporter and is overexpressed by some multidrug resistant tumors. or A substance taken from plants that is being studied in the treatment of cancer. It may help drugs kill tumor cells that have become resistant to drugs. It is a type of multidrug resistance inhibitor and a type of P-glycoprotein antagonist. Also called CBT-1.

**MDS:** A type of cancer in which the bone marrow does not make enough healthy blood cells (white blood cells, red blood cells, and platelets) and there are abnormal cells in the blood and/or bone marrow. When there are fewer healthy blood cells, infection, anemia, or bleeding may occur. Sometimes, MDS becomes acute myeloid leukemia (AML). Also called myelodysplastic syndrome.

**MDX-010:** A drug used to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is also used as adjuvant therapy to treat melanoma in the skin and lymph nodes in patients who have already had surgery. MDX-010 is also being studied in the treatment of other types of cancer. MDX-010 binds to a substance called CTLA-4, which is found on T cells (a type of white blood cell). MDX-010 may block CTLA-4 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called ipilimumab and Yervoy.

**MDX-060:** A monoclonal antibody that is being studied in the treatment of some lymphomas. Monoclonal antibodies are produced in the laboratory and can locate and bind to cancer cells.

**Me-too Drugs:** Drugs that are structurally related to existing drugs. Me-too drugs are often developed by rival pharmaceutical companies in order to

gain a foothold in the same area of the market.

**mean :** A statistics term. The average value in a set of measurements. The mean is the sum of a set of numbers divided by how many numbers are in the set.

**mean life (mean time, turnover time):** The average lifetime of an atomic or nuclear system in a specified state. For an exponentially decaying system, it is the average time for the number of atoms or nuclei in a specified state to decrease by a factor of  $e$  (ISO, 1972).

**mean sea level:** The average height of the sea surface, based upon hourly observation of the tide height on the open coast or in adjacent waters that have free access to the sea. In the United States, it is defined as the average height of the sea surface for all stages of the tide over a nineteen year period. Mean sea level, commonly abbreviated as MSL and referred to simply as sea level, serves as the reference surface for all altitudes in upper atmospheric studies.

**mean survival :** The average length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, that patients diagnosed with the disease are still alive. In a clinical trial, measuring mean survival is one way to see how well a new treatment works.

**meander:** a hairpinlike feature of a stream caused by erosion on the outside of a curve and deposition on the inside.

**measles virus :** The virus that causes measles (a highly contagious disease marked by fever, cough, and raised red spots on the skin). The measles virus usually affects children, and is spread by coughing or contact with fluid from the nose or mouth of someone who has been infected.

**measles/mumps/rubella vaccine:** A trivalent vaccine containing live attenuated viruses that can cause measles, mumps and rubella. It is an injection administered subcutaneously in two separate doses. Check for active clinical trials using this agent.

**measurable disease :** A tumor that can be accurately measured in size. This information can be used to judge response to treatment.

**Measurand :** particular quantity subject to measurement.

**Measurement:** set of operations having the object of determining the value of a quantity. OR Measurement is the collection of quantitative data. Measurement involves comparison of the quantity of interest with a

standard called a unit. The comparison is never perfect. As a result, measurements always include error. You must consider the reliability of the measurement when using it to make decisions or estimate other quantities.

**Measurin:** (Other name for: acetylsalicylic acid)

**mebendazole:** A synthetic benzimidazole derivative and anthelmintic agent. Mebendazole interferes with the reproduction and survival of helminths by inhibiting the formation of their cytoplasmic microtubules, thereby selectively and irreversibly blocking glucose uptake. This results in a depletion of glycogen stores and leads to reduced formation of ATP required for survival and reproduction of the helminth. This eventually causes the helminths death. Check for active clinical trials using this agent.

**Mechanical Bond:** A method of physically bonding liquid silicone rubber to inserts through the use of holes, depressions or projections in the insert

**Mechanical forming:** Uses matching positive and negative molds that are brought together against the heated plastic sheet, forcing it to assume the shape of the custom plastic packaging. In the pure mechanical forming method, air pressure (positive or negative) is not used at all.

**mechanical model:** a physical model with moving parts.

**Mechanical Properties:** Things you can measure while you push, twist, bend, tear, fold, spindle, or mutilate something - the simplest example is probably putting a known force (stress) on a piece of something and measuring how far it stretches (strain). Millions of pages have been written about stress-strain curves. OR Properties of plastics which are classified as mechanical include abrasion resistance, creep, ductility, friction resistance, elasticity hardness, impact resistance, stiffness and strength.

**mechanical weathering:** the physical breaking down of rock, changing only its size (smaller); examples are ice wedging, plant action, and pressure unloading. OR the process by which rocks are physically broken down into smaller pieces by external conditions, such as the freezing and thawing of water in cracks in the rock.

**mechanism:** the series of steps that reactants go through during their conversion into products.

**mechanistic target of rapamycin :** A protein that helps control several cell functions, including cell division and survival, and binds to rapamycin and other drugs. Mechanic target of rapamycin may be more active in some

types of cancer cells than it is in normal cells. Blocking mechanistic target of rapamycin may cause the cancer cells to die. It is a type of serine/threonine protein kinase. Also called mammalian target of rapamycin and mTOR.

**mechlorethamine hydrochloride:** The hydrochloride salt of mechlorethamine, a nitrogen mustard and an analogue of sulfur mustard, with antineoplastic and immunosuppressive activities. Mechlorethamine is metabolized to an unstable, highly reactive ethyleniminium intermediate that alkylates DNA, particularly the 7 nitrogen of guanine residues, resulting in DNA base pair mismatching, DNA interstrand crosslinking, the inhibition of DNA repair and synthesis, cell-cycle arrest, and apoptosis. This agent also exhibits lympholytic properties.

**mechlorethamine hydrochloride :** A drug used to treat non-Hodgkin lymphoma, advanced Hodgkin lymphoma, chronic leukemia, mycosis fungoides, and a type of lung cancer called bronchogenic carcinoma. It is also being studied in the treatment of other types of cancer. Mechlorethamine hydrochloride damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called Mustargen and mustine.

**mechlorethamine hydrochloride gel:** A gel formulation composed of the hydrochloride salt form of mechlorethamine, which is a nitrogen mustard alkylating agent and an analog of sulfur mustard, with antineoplastic and immunosuppressive activities. Upon topical application, mechlorethamine is metabolized to an unstable, highly reactive ethyleniminium intermediate that binds to and alkylates DNA, with a high affinity to the N7 nitrogen of guanine residues. This results in DNA base pair mismatching, DNA interstrand crosslinking, the inhibition of DNA repair and synthesis, cell-cycle arrest, and apoptosis.

**Meclan:** (Other name for: meclocycline sulfosalicylate)

**meclocycline sulfosalicylate:** The sulfosalicylate salt form of meclocycline, a tetracycline antibiotic with broad-spectrum antibacterial and antiprotozoal activity. Meclocycline sulfosalicylate is bacteriostatic and inhibits bacterial protein synthesis by binding to the 30S ribosomal subunit, thereby preventing the addition of amino acids to the growing peptide chain. This tetracycline is active against a wide range of gram-positive and gram-negative bacteria.

**meclofenamate sodium:** The sodium salt form of meclufenamate, an anthranilic acid and non-steroidal anti-inflammatory drug (NSAID) with anti-inflammatory, antipyretic and analgesic activities. Meclofenamate sodium inhibits the activity of the enzymes cyclo-oxygenase I and II, resulting in decreased formation of precursors of prostaglandins and thromboxanes. The resulting decrease in prostaglandin synthesis, by prostaglandin synthase, is responsible for the therapeutic effects of meclufenamate sodium. Meclofenamate sodium also causes a decrease in the formation of thromboxane A<sub>2</sub> synthesis, by thromboxane synthase, thereby inhibiting platelet aggregation.

**Meclomen:** (Other name for: meclufenamate sodium)

**MEDI-507:** A substance being studied in the treatment of certain types of T-cell lymphoma. It is also being studied in the prevention of organ or tissue rejection after a kidney and/or bone marrow transplant. MEDI-507 binds to a protein called CD2, which is found on some types of immune cells and cancer cells. This may help suppress the body's immune response and it may help kill cancer cells. MEDI-507 is a type of monoclonal antibody. Also called siplizumab.

**MEDI-522:** A substance being studied in the treatment of some types of cancer and other conditions. MEDI-522 binds to a protein on the surface of blood vessels and may prevent the growth of new blood vessels that tumors need to grow. It may also prevent the spread of cancer. It is a type of antiangiogenesis agent, a type of metastasis inhibitor, and a type of monoclonal antibody. Also called Abegrin, etaracizumab, and humanized monoclonal antibody MEDI-522.

**medial moraine:** a long ridge of till that results when lateral moraines join as two tributary glaciers merge to form a single glacier. OR the moraine created when two glaciers meet and their lateral moraines merge.

**medial supraclavicular lymph node :** A lymph node located above the collar bone and between the center of the body and a line drawn through the nipple to the shoulder.

**median:** in a trapezoid, a line segment parallel to the bases and bisecting the legs. OR in a triangle, a line segment drawn from a vertex to the midpoint of the opposite side.

**median :** A statistics term. The middle value in a set of measurements.

**median lethal concentration:** Statistically derived concentration of a chemical in water solution that can be expected to cause death in 50% of given population of organism under defined set of experimental conditions.

**median lethal dose:** Statistically derived single dose of a chemical that can be expected to cause death in 50% of given population of organism under defined set of experimental conditions (for example oral administration, rat).

**median overall survival :** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, that half of the patients in a group of patients diagnosed with the disease are still alive. In a clinical trial, measuring the median overall survival is one way to see how well a new treatment works. Also called median survival.

**median survival :** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, that half of the patients in a group of patients diagnosed with the disease are still alive. In a clinical trial, measuring the median survival is one way to see how well a new treatment works. Also called median overall survival.

**median umbilical ligament :** A fibrous cord that connects the urinary bladder to the umbilicus (navel). The median umbilical ligament is formed as the allantoic stalk during fetal development and lasts through life. Also called urachus.

**mediastinal pleura :** The thin membrane that lines the chest cavity in the area between the lungs.

**mediastinoscope :** A thin, tube-like instrument used to examine the tissues and lymph nodes in the area between the lungs. These tissues include the heart and its large blood vessels, trachea, esophagus, and bronchi. The mediastinoscope has a light and a lens for viewing and may also have a tool to remove tissue. It is inserted into the chest through a cut above the breastbone.

**mediastinoscopy :** A procedure in which a mediastinoscope is used to examine the organs in the area between the lungs and nearby lymph nodes. A mediastinoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. The mediastinoscope is inserted into the chest through an incision above the breastbone. This procedure is usually

done to get a tissue sample from the lymph nodes on the right side of the chest.

**mediastinum :** The area between the lungs. The organs in this area include the heart and its large blood vessels, the trachea, the esophagus, the thymus, and lymph nodes but not the lungs.

**Medicaid :** A health insurance program for people who cannot afford regular medical care. The program is run by U.S. federal, state, and local governments. People who receive Medicaid may have to pay a small amount for the services they get.

**medical castration :** Refers to the use of drugs to suppress the function of the ovaries or testicles.

**medical device :** An instrument, tool, machine, test kit, or implant that is used to prevent, diagnose, or treat disease or other conditions. Medical devices range from tongue depressors to heart pacemakers and medical imaging equipment.

**Medical grade:** Resin that may be suitable for use in certain medical applications.

**medical history :** A record of information about a person's health. A personal medical history may include information about allergies, illnesses, surgeries, immunizations, and results of physical exams and tests. It may also include information about medicines taken and health habits, such as diet and exercise. A family medical history includes health information about a person's close family members (parents, grandparents, children, brothers, and sisters). This includes their current and past illnesses. A family medical history may show a pattern of certain diseases in a family.

**medical nutrition therapy :** Treatment based on nutrition. It includes checking a person's nutrition status, and giving the right foods or nutrients to treat conditions such as those caused by diabetes, heart disease, and cancer. It may involve simple changes in a person's diet, or intravenous or tube feeding. Medical nutrition therapy may help patients recover more quickly and spend less time in the hospital. Also called nutrition therapy.

**medical oncologist :** A doctor who has special training in diagnosing and treating cancer using chemotherapy, hormonal therapy, biological therapy, and targeted therapy. A medical oncologist often is the main health care

provider for someone who has cancer. A medical oncologist also gives supportive care and may coordinate treatment given by other specialists.

**Medicare :** A U.S. federal health insurance program for people aged 65 years or older and people with certain disabilities. Medicare pays for hospital stays, medical services, and some prescription drugs but people who receive Medicare must pay part of their healthcare costs.

**medicated urethral system for erection :** A method used to treat impotence (inability to have an erection). A suppository, in the form of a very small pellet, is inserted through the tip of the penis into the urethra. The suppository contains the drug alprostadil, which increases the flow of blood to the penis and causes an erection. Also called MUSE.

**medication :** A legal drug that is used to prevent, treat, or relieve symptoms of a disease or abnormal condition.

**Medicinal Chemistry:** A branch of chemistry that incorporates aspects of organic chemistry, physical chemistry, computational chemistry, analytical chemistry, pharmacology, and the biological sciences to design, develop, and synthesise drugs. OR An area of study involved with designing, making and developing medicines for use in humans and animals OR A branch of chemistry concerned with the discovery, design, synthesis, and investigation of biologically active compounds and reactions that these compounds undergo in living things.

**medicine :** Refers to the practices and procedures used for the prevention, treatment, or relief of symptoms of a diseases or abnormal conditions. This term may also refer to a legal drug used for the same purpose.

**Medihoney™:** (Other name for: Manuka honey)

**meditation :** A mind-body practice in which a person focuses his or her attention on something, such as an object, word, phrase, or breathing, in order to minimize distracting or stressful thoughts or feelings. Meditation may help relax the body and mind and improve overall health and well-being. It may be used to help relieve stress, pain, anxiety, and depression and to help with symptoms related to disease, such as cancer and AIDS. It is a type of complementary and alternative medicine (CAM).

**Mediterranean-Himalayan belt:** a zone that runs through the Mediterranean region eastward through Asia and to the East Indies marked by frequent earthquake and volcanic activity.

**Medium:** A liquid component of paint in which pigments are dispersed and which forms part of the dry paint film.

**Medium Crude:** Medium Crude is a term used to define a crude oil part way between Light Crude and Heavy crude.

**Medium Density Polyethylene (MDPE):** Polyethylene having a density ranging from .929 to .940 grams/cc.

**Medlone 21:** (Other name for: methylprednisolone)

**Medrol:** (Other name for: methylprednisolone)

**medroxyprogesterone:** A synthetic derivative of progesterone administered as an acetate salt (medroxyprogesterone acetate) with antiestrogenic activity. As a do all progestins, medroxyprogesterone binds to and activates nuclear receptors which subsequently bind to and activate target genes for transcription. As an antiestrogen, this agent may inhibit the growth-stimulating effects of estrogen on estrogen-sensitive tumor cells.

**medroxyprogesterone :** A hormonal anticancer drug that is also used in cancer prevention. It belongs to the family of drugs called progestins.

**medroxyprogesterone acetate :** A drug used to prevent endometrial cancer. It is also used to treat menstrual disorders and as a form of birth control. It is a form of the female hormone progesterone and belongs to the family of drugs called progestins.

**medulla:** the inner portion of the adrenal glands; a swelling at the tip of the hindbrain that serves as the passageway for nerves extending to and from the brain.

**medullary breast carcinoma :** A rare type of breast cancer that often can be treated successfully. It is marked by lymphocytes (a type of white blood cell) in and around the tumor that can be seen when viewed under a microscope.

**medullary thyroid cancer :** Cancer that develops in C cells of the thyroid. The C cells make a hormone (calcitonin) that helps maintain a healthy level of calcium in the blood.

**medulloblastoma :** A malignant brain tumor that begins in the lower part of the brain and that can spread to the spine or to other parts of the body. Medulloblastomas are a type of primitive neuroectodermal tumor (PNET).

**mefloquine:** A quinolinemethanol derivative with antimalarial, anti-inflammatory, and potential chemosensitization and radiosensitization

activities. Although the exact mechanism remains to be elucidated, mefloquine, a weak base, preferentially accumulates in lysosomes and disrupts lysosomal function and integrity, thereby leading to host cell death. Similar to chloroquine, the chemosensitizing and radiosensitizing activities of this agent may be related to its inhibition of autophagocytosis, a cellular mechanism involving lysosomal degradation that minimizes the production of reactive oxygen species (ROS) related to tumor reoxygenation and tumor exposure to chemotherapeutic agents and radiation. Compared to chloroquine, mefloquine has better blood-brain-barrier (BBB) penetration.

**Mega-**: A prefix that multiplies a basic unit by 1,000,000 (10 to the sixth power). OR SI prefix meaning "multiply by 10<sup>6</sup>". For example, 3.2 MJ is 3200000 J.

**mega-voltage linear accelerator** : A machine that uses electricity to form a stream of fast-moving subatomic particles. This creates high-energy radiation that may be used to treat cancer. Also called linac, linear accelerator, and MeV linear accelerator.

**Megacurie**: One million curies.

**Megasynthases**: A class of large, multifunctional enzymes, including fatty acid synthase, that participate in step-by-step synthetic pathways.

**Megawatt (MW)**: A unit of power equivalent to one million watts.

**Megawatthour (MWh)**: One million watthours.

**megestrol acetate**: The acetate salt of megestrol, a synthetic derivative of the naturally occurring female sex hormone progesterone, with progestogenic, antiestrogenic, and antineoplastic activities. Mimicking the action of progesterone, megestrol binds to and activates nuclear progesterone receptors (PRs) in the reproductive system and pituitary; ligand-receptor complexes are translocated to the nucleus where they bind to progesterone response elements (PREs) located on target genes.

Megestrol's antineoplastic activity against estrogen-responsive tumors may be due, in part, to the suppression of pituitary gonadotrophin production and the resultant decrease in ovarian estrogen secretion; interference with the estrogen receptor complex in its interaction with genes and; as part of the progesterone receptor complex, direct interaction with the genome and downregulation of specific estrogen-responsive genes. This agent may also directly kill tumor cells.

**megestrol acetate** : A drug used to treat advanced breast and endometrial cancer. It is also being studied in the treatment of anorexia and cachexia in patients with cancer and in other types of cancer or other conditions.

Megestrol acetate blocks the effects of the hormone estrogen in the body, which may help keep some cancer cells from growing. It may also improve appetite. Megestrol acetate is a type of progestin.

**meiosis**: the process by which the chromosome number is halved during gamete formation. OR Process in which diploid cells undergo division to form haploid sex cells. OR A type of cell division in which diploid cells give rise to haploid cells destined to become gametes. OR A special form of cell division in which each daughter cell receives half the amount of DNA as the parent cell. Meiosis occurs during formation of egg and sperm cells in mammals.

**Meitnerium**: Symbol:"Mt" Atomic Number:"109" Atomic Mass: (266)amu. Meitnerium is one of the postactinide elements. Scientists have created these in labs and may have found only a few atoms of the element. You will not find these in use anywhere.

**MEK 1/2 inhibitor AS703988/MSK2015103B**: An orally bioavailable small-molecule inhibitor of mitogen-activated protein kinase kinase (MAP2K, MAPK/ERK kinase, or MEK) 1 and 2 with potential antineoplastic activity. MEK 1/2 inhibitor AS703988/MSK2015103B selectively binds to and inhibits the activity of MEK1/2, preventing the activation of MEK1/2-dependent effector proteins and transcription factors, which may result in the inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK1 and MEK2 are dual-specificity threonine/tyrosine kinases that play key roles in the activation of the RAS/RAF/MEK/ERK pathway that regulates cell growth and are often upregulated in a variety of tumor cell types.

**MEK inhibitor AZD6244** : A substance being studied in the treatment of several types of cancer. MEK inhibitor AZD6244 blocks proteins needed for cell growth and may kill cancer cells. It is a type of protein kinase inhibitor. Also called AZD6244 and selumetinib.

**MEK inhibitor AZD8330**: An orally active, selective MEK inhibitor with potential antineoplastic activity. MEK inhibitor AZD8330 specifically inhibits mitogen-activated protein kinase kinase 1 (MEK or MAP/ERK kinase1), resulting in inhibition of growth factor-mediated cell signaling

and tumor cell proliferation. MEK is a key component of the RAS/RAF/MEK/ERK signaling pathway that regulates cell growth; constitutive activation of this pathway has been implicated in many cancers.

**MEK inhibitor GDC-0623:** An orally active, selective MEK inhibitor with potential antineoplastic activity. MEK inhibitor GDC-0623 specifically inhibits mitogen-activated protein kinase kinase (MEK or MAP/ERK kinase), resulting in inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK is a key component of the RAS/RAF/MEK/ERK signaling pathway that regulates cell growth; constitutive activation of this pathway has been implicated in many cancers.

**MEK inhibitor RO4987655:** An orally active small molecule, targeting mitogen-activated protein kinase kinase 1 (MAP2K1 or MEK1), with potential antineoplastic activity. MEK inhibitor RO4987655 binds to and inhibits MEK, which may result in the inhibition of MEK-dependent cell signaling and the inhibition of tumor cell proliferation. MEK, a dual specificity threonine/tyrosine kinase, is a key component of the RAS/RAF/MEK/ERK signaling pathway that regulates cell growth; constitutive activation of this pathway has been implicated in many cancers. Check for active clinical trials using this agent.

**MEK inhibitor TAK-733:** An orally bioavailable small-molecule inhibitor of MEK1 and MEK2 (MEK1/2) with potential antineoplastic activity. MEK inhibitor TAK-733 selectively binds to and inhibits the activity of MEK1/2, preventing the activation of MEK1/2-dependent effector proteins and transcription factors, which may result in the inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK1/2 (MAP2K1/K2) are dual-specificity threonine/tyrosine kinases that play key roles in the activation of the RAS/RAF/MEK/ERK pathway and are often upregulated in a variety of tumor cell types.

**MEK inhibitor WX-554:** An orally available small molecule mitogen-activated protein kinase kinase (MAP2K, MAPK/ERK kinase, or MEK) inhibitor, with potential antineoplastic activity. MEK inhibitor WX-554 selectively binds to and inhibits the activity of MEK, thereby preventing the activation of MEK-dependent effector proteins including some transcription factors, which may result in the inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK, a dual-specificity threonine/tyrosine kinase that plays a key role in the activation of the

RAS/RAF/MEK/ERK signaling pathway, is frequently upregulated in a variety of tumor cell types.

**MEK-1/MEKK-1 inhibitor E6201:** A synthetic, fungal metabolite analogue inhibitor of mitogen-activated protein kinase kinase 1 (MEK-1) and mitogen-activated protein kinase kinase kinase 1 (MEKK-1) with potential antipsoriatic and antineoplastic activities. MEK-1/MEKK-1 inhibitor E6201 specifically binds to and inhibits the activities of MEK-1 and MEKK-1, which may result in the inhibition of tumor cell proliferation. MEK-1 and MEKK-1 are key components in the RAS/RAF/MEK/MAPK signaling pathway, which regulates cell proliferation and is frequently activated in human cancers.

**MEK/Aurora kinase dual inhibitor BI 847325:** An orally available dual inhibitor of mitogen-activated protein kinase kinase (MEK) and Aurora kinases, with potential antineoplastic activity. Upon oral administration, MEK/Aurora kinase inhibitor BI 847325 selectively binds to and inhibits the activity of MEK, which both prevents the activation of MEK-dependent effector proteins and inhibits growth factor-mediated cell signaling. BI 847325 also binds to and inhibits the activity of the Aurora kinases A, B and C which may disrupt the assembly of the mitotic spindle apparatus, prevent chromosome segregation, and inhibit both cellular division and proliferation in Aurora kinase-overexpressing tumor cells. Altogether, this leads to the inhibition of cell proliferation and tumor growth as well as the induction of tumor regression. MEK, a dual-specificity threonine/tyrosine kinase that plays a key role in the activation of the RAS/RAF/MEK/ERK signaling pathway, is frequently upregulated in a variety of tumor cell types. Aurora kinases are serine-threonine kinases that play essential roles in mitotic checkpoint control and are overexpressed by a wide variety of cancer cell types.

**Mekinist:** (Other name for: trametinib)

**Mekinist :** A drug used alone or with dabrafenib to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is used in patients with a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Mekinist blocks certain proteins, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor and a type of targeted therapy. Also called trametinib.

**Melamine:** Melamine is a white crystalline solid produced by the reaction of ammonia and urea over a catalyst. It is typically shipped in bags and is used mainly as a raw material in the production of melamine formaldehyde resins. These resins are used to produce wood laminates, in textile and paper treatment and as leather tanning agents. Melamine itself also finds applications in flame retardants, speciality fertilizers, ion exchange resins and as a concrete additive.

**Melamine Plastics:** Thermosetting plastics made from melamine and formaldehyde resins.

**Melan-A protein :** A protein found on normal melanocytes (cells that make the pigment melanin) in the skin and in the retina. It is also found on most melanomas (cancers that begin in melanocytes). Vaccines using pieces of the Melan-A protein are being studied for their ability to boost the immune response to cancer cells in patients with melanoma. Also called MART-1 antigen and Melanoma Antigen Recognized by T cells 1.

**Melan-A VLP vaccine:** A vaccine consisting of the melanocyte differentiation antigen Melan A (also called MART-1) encapsulated in noninfectious virus-like particles (VLPs) with potential immunostimulating and antineoplastic activities. Upon administration, Melan-A VLP vaccine may stimulate the immune system to exert a specific cytotoxic T lymphocyte (CTL) response against tumor cells expressing the Melan A antigen, resulting in tumor cell lysis. Melan A is upregulated in most melanomas. VLPs stimulate the immune system and promotes the CTL response.

**Melan-A/MAGE-3.DP4 peptide vaccine:** A cancer vaccine consisting of a peptide derived from the melanocyte differentiation antigen Melan-A (or MART-1) and the human leukocyte antigen HLA-DP4-restricted human melanoma antigen 3 (MAGE-3.DP4), with potential immunostimulating and antineoplastic activities. Upon administration, Melan-A/MAGE-3.DP4 peptide vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing Melan-A and MAGE-3, resulting in tumor cell lysis. The tumor associated antigens Melan-A and MAGE-3 are overexpressed in a variety of cancer cell types. Check for active clinical trials using this agent.

**melanin :** A pigment that gives color to skin and eyes and helps protect it from damage by ultraviolet light.

**melanocortin 1 receptor :** A protein found in skin and eye cells that make melanin (a pigment that gives color to the skin and helps protect it from damage by ultraviolet light). People with certain changes in the gene for melanocortin 1 receptor have a higher risk of developing melanoma (skin cancer that begins in melanocytes). Also called MC1R and melanotropin receptor.

**melanocyte :** A cell in the skin and eyes that produces and contains the pigment called melanin.

**melanoma :** A form of cancer that begins in melanocytes (cells that make the pigment melanin). It may begin in a mole (skin melanoma), but can also begin in other pigmented tissues, such as in the eye or in the intestines.

**Melanoma Antigen Recognized by T cells 1 :** A protein found on normal melanocytes (cells that make the pigment melanin) in the skin and in the retina. It is also found on most melanomas (cancers that begin in melanocytes). Vaccines using pieces of the Melanoma Antigen Recognized by T cells 1 are being studied for their ability to boost the immune response to cancer cells in patients with melanoma. Also called MART-1 antigen and Melan-A protein.

**melanoma helper peptide vaccine:** A multivalent vaccine consisting of peptides derived from melanoma-associated antigens and an adjuvant peptide derived from tetanus toxoid. Vaccination with this agent may stimulate a host cytotoxic T-cell response against tumor cells expressing melanoma-associated antigens, resulting in tumor cell lysis.

**melanoma in situ :** Abnormal melanocytes (cells that make melanin, the pigment that gives skin its color) are found in the epidermis (outer layer of the skin). These abnormal melanocytes may become cancer and spread into nearby normal tissue. Also called stage 0 melanoma.

**melanoma TRP2 CTL epitope vaccine SCIB1:** A proprietary DNA-based cancer vaccine that encodes a melanoma antigen tyrosinase-related protein 2 (TRP2) cytotoxic T-lymphocyte (CTL) epitope and a modified monoclonal antibody, a chimera of human IgG1/murine IgG2a with T cell mimotopes expressed within the complementarity-determining regions (CDR) of the antibodies, with potential immunostimulating and antineoplastic activities. Upon intramuscular injection and electroporation, melanoma TRP2 CTL epitope vaccine SCIB1 expresses the modified antibody. Subsequently, the Fc component of the engineered antibody

targets and binds to the CD64 receptor on the dendritic cells (DCs); upon processing by DCs, the cellular immune system may be activated to induce helper T-cell and CTL immune responses against tumor cells expressing the TRP2 antigen.

**melanoma vaccine :** A cancer vaccine prepared from human melanoma cancer cells. It can be used alone or with other therapy in treating melanoma.

**melanotropin receptor :** A protein found in skin and eye cells that make melanin (a pigment that gives color to the skin and helps protect it from damage by ultraviolet light). People with certain changes in the gene for melanotropin receptor have a higher risk of developing melanoma (skin cancer that begins in melanocytes). Also called MC1R and melanocortin 1 receptor.

**melatonin :** A hormone made by the pineal gland (tiny organ near the center of the brain). Melatonin helps control the body's sleep cycle, and is an antioxidant. It is also made in the laboratory and sold as a supplement.

**Meld lines:** Occurs when multiple gates are present. These are imperfections in the part where separated flows of cooling material meet and rejoin, often resulting in incomplete bonds and/or a visible line.

**MELITAC 12.1 peptide vaccine:** A peptide cancer vaccine consisting of an emulsion of a mixture of 12 class I MHC-restricted melanoma peptides and a class II MHC-restricted tetanus toxoid helper peptide, with potential immunostimulating and antineoplastic activities. Upon administration, the MELITAC 12.1 peptide vaccine may stimulate the host immune system to mount a cytotoxic T-cell response against tumor cells expressing the melanoma peptide antigens, resulting in tumor cell lysis. The melanoma peptides contained in the vaccine are upregulated in melanoma cancer cells.

**MELK inhibitor OTS167:** An orally available inhibitor of maternal embryonic leucine zipper kinase (MELK) with potential antineoplastic activity. Upon administration, OTS167 binds to MELK, which prevents both MELK phosphorylation and activation; thus inhibiting the phosphorylation of downstream MELK substrates. This may lead to an inhibition of both cell proliferation and survival in MELK-expressing tumor cells. MELK, a serine/threonine kinase, is involved in cancer cell survival, invasiveness and cancer-stem cell formation and maintenance; it is highly

upregulated in various types of cancer cells and absent in normal, healthy cells.

**Mellaril:** (Other name for: thioridazine hydrochloride)

**meloxicam:** An oxicam derivative and a non-steroidal anti-inflammatory drug (NSAID) with anti-inflammatory, antipyretic and analgesic activities. Unlike traditional nonselective NSAIDs, meloxicam preferentially inhibits the activity of cyclo-oxygenase II (COX-II), resulting in a decreased conversion of arachidonic acid into prostaglandin precursors. The resulting decrease in prostaglandin synthesis is responsible for the therapeutic effects of meloxicam. or A phenylalanine derivative of nitrogen mustard with antineoplastic activity. Melphalan alkylates DNA at the N7 position of guanine and induces DNA inter-strand cross-linkages, resulting in the inhibition of DNA and RNA synthesis and cytotoxicity against both dividing and non-dividing tumor cells.

**melphalan :** A drug used to treat multiple myeloma. It is also used to treat ovarian epithelial cancer that cannot be removed by surgery. It is also being studied in the treatment of other types of cancer. Melphalan may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called Alkeran Tablets.

**melphalan hydrochloride:** A bifunctional alkylating agent and phenylalanine derivative of nitrogen mustard. Melphalan hydrochloride is converted into highly reactive ethylenimmonium intermediates that induce covalent guanine N7-N7 intra- and inter-crosslinks and alkylation of adenine N3 of DNA. This agent also alkylates RNA and protein structures. As a result RNA transcription and protein synthesis are inhibited, ultimately leading to cell growth arrest and/or death. or A drug used to treat multiple myeloma in patients who cannot take melphalan by mouth. It is also being studied in the treatment of other types of cancer. Melphalan hydrochloride may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called Alkeran for Injection and Evomela.

**melphalan hydrochloride/sulfobutyl ether beta-cyclodextrin complex:** A propylene glycol-free intravenous formulation containing the hydrochloride salt of the nitrogen mustard phenylalanine derivative melphalan complexed with polyanionic sulfobutyl ether beta-cyclodextrin (SBE-CD) with potential antineoplastic activity. Upon administration,

melphalan is converted into highly reactive ethylenimmonium intermediates that induce covalent guanine N7-N7 intra- and inter-crosslinks and alkylation of adenine N3 of DNA; RNA and proteins may also be alkylated. Subsequently, RNA transcription and protein synthesis are inhibited, resulting in cell growth arrest. The addition of sulfobutyl ether beta-cyclodextrin to the formulation improves the solubility, stability and ease of use of melphalan; cyclodextrins are cyclic dextrans derived from starch.

**melphalan-flufenamide prodrug:** A melphalan prodrug in which the alkylating agent melphalan is bound to flufenamide, with potential antineoplastic and anti-angiogenic activities. Upon administration, the dipeptide bond in the melphalan-flufenamide compound is hydrolyzed by peptidases, which are overexpressed by certain cancer cells. This results in the specific release and accumulation of the active metabolite melphalan in cancer cells. Melphalan alkylates DNA at the N7 position of guanine residues and induces DNA intra- and inter-strand cross-linkages. This results in the inhibition of DNA and RNA synthesis and the induction of apoptosis, thereby inhibiting tumor cell proliferation. The administration of the melphalan-flufenamide prodrug allows for enhanced efficacy and reduced toxicity compared to melphalan alone.

**Melt:** A term given to describe the physical condition of molten plastic prior to injection into a mold. A proper melt has the consistency of warm honey.

**Melt Accumulator :** Also referred to as a plunger. A large capacity holding area for molten resin. The area of a structural foam molding machine that determines the shot size.

**MELT BLOCKAGE:** The sudden drop of output rate of an extruder due to insufficient forward transport of the solid packed bed in the feeding zone of the machine.

**Melt Conveying:** Also called Metering zone. This zone, in which channel depth is the same throughout the zone, melts the last plastic resin particles and mixes to a uniform temperature and composition.

**Melt expansion:** During the injection stroke melt is compressed by about 5 to 15%. After melt enters the mould it gets the chance to relax and expand.

**Melt Flow:** Rate of extrusion of molten resin through a die of specified length and diameter. The conditions of the test (e.g. temperature and load)

should be given. Frequently, however, the manufacturer's data lists only the value, not the condition as well. OR Rate of extrusion of molten resin through a die of specified length and diameter.

**Melt Flow :** Rate of extrusion of molten resin through a die of specified length and diameter. The conditions of the test (e.g. temperature and load) should be given. Frequently, however, the manufacturer's data lists only the value, not the condition as well.

**Melt Flow Index:** Measure of viscosity or the amount of polymer which exits the die in ten minutes and is measured in grams.

**MELT FLOW INDEX (also called MELT INDEX or MELT FLOW RATE):** The number of grams of polymer that can be pushed out of a capillary die of standard dimensions (Diameter 2.095 mm, Length 8.0 mm) under the action of standard weight (2.16 kg for PE, at 190°C). in 10 minutes (ASTM Standard 1238). The usual melt index range is from less than 1.0 (called fractional) to more than 25 (up to 100 for injection molding). For PP it is usually called MELT FLOW RATE and the standard temperature is 230°C.

**Melt Flow Rate :** A measure of the molten viscosity of a polymer determined by the weight of polymer extruded through an orifice under specified conditions of pressure and temperature. Particular conditions are dependent upon the type of polymer being tested.

**MELT FRACTURE:** At higher throughput rates, extrudates usually become highly distorted and the head pressure shows significant fluctuations. This phenomenon is known as gross MELT FRACTURE. It is possible with some polymers to obtain grossly melt fractured extrudates without sharkskin, i.e. the surface remains smooth and glossy but overall the extrudate is distorted (see also SHARKSKIN). OR A phenomenon of melt extrudate in which the surface appears rough or wavy upon exit from the die. Melt fracture may appear uniformly or in certain sections only. OR Is a phenomenon of melt extrudate in which the surface of plastic appears rough or wavy upon exit from the die. Melt fracture may appear uniformly or only in certain sections of plastic material.

**Melt Fracture:** An instability in the melt flow through a die starting at the entry to the die. It leads to surface irregularities on the finished article like a regular helix or irregularly-spaced ripples. OR Extrudate or film having a

surface that appears rough and wavy. Melt fracture may be evenly distributed throughout the film or concentrated in some areas only.

**Melt Front:** As the mould is filling, the melt at the leading edge of flow is called the melt front or stream.

**Melt Front Velocity:** It is not same as injection piston (screw velocity) velocity. As melt enters mould it spreads in all direction depending on the resistance to flow in each direction. Melt front velocity is determined by the area of flow, which does not remain constant with time.

**Melt Index:** The amount, in grams, of a thermoplastic resin which can be forced through a 0.0825 inch orifice when subjected to 2160 grams. forced in 10 minutes at 190 degrees C. OR The amount of a thermoplastic resin, measured in grams, which can be forced through a specified orifice within ten minutes when subjected to a specified force. (ASTM D-1238) OR Grams of a thermoplastic resin which can be forced through a 0.0825 inch orifice by 2160 grams of force in 10 minutes at 190°C.

**MELT INSTABILITY:** An instability in the melt flow through a die that causes irregularities in the finished part.

**Melt point:** The temperature at which a polymer particle will begin to melt and flow.

**MELT STRENGTH:** A measure of the extensional viscosity of polymer melts. It represents the maximum tension that can be applied to the melt without rupture or tearing. Usually a capillary viscometer is used to extrude a polymer strand and the strand is pulled till rupture by a pair of rollers. OR The strength of the plastic while in a molten state. This is an important factor in the process of plastic extrusion, blow moulding and drawing molten plastic resin from the die.

**Melt Temperature :** The melt temperature or  $T_m$  is the temperature, measured under specified conditions, at which crystallinity disappears in a semi-crystalline polymer. Semi-crystalline materials have a clearly defined melt temperature. Amorphous materials soften over a wide temperature range above their glass transition temperature. They do not have a specific  $T_m$ , but a melting range. Melt temperature should be measured from a purge shot having the same residence time as in the production process. OR Melt temperature is the actual temperature of the melt during processing. The melt temperature is constantly changing. It varies with time and will not be the same at different locations in the mould.

**Melt-back:** A phenomena that occurs during lyophilization (freeze drying) where the solid melts to form a crust.

**MELTING AND BOILING TEMPERATURES:** are caused by the van der waals interaction. Solids melt and liquids evaporate when the van der waals forces between molecules are broken.

**Melting Behavior:** Phenomena accompanying the softening of a material under the influence of heat: can be shrinking, dripping and burning of molten material. Melt drip: falling droplets of molten material, either burning or not.

**Melting Point:** The melting point is the temperature at which a substance changes state from solid to liquid. Ice has its melting point at zero degrees Celsius. The solid melts.

**Melting Point:** The temperature at which a solid turns into a liquid. As temperature is a measure of the kinetic energy of molecules (how much they are moving around), this means that the molecules are moving too much to stay in one place anymore. OR the temperature at which a solid changes to a liquid. OR the temperature at which a substance changes from a solid to a liquid. OR The temperature at which the structure of a crystalline polymer is destroyed to yield a liquid. For HDPE it is about 135°C, for LDPE it is about 110°C. It is not scientifically correct to talk about the melting point of an amorphous polymer like PS, because it has no crystalline structure. However, in extrusion practice it is often practical to use the glass transition temperature plus 50°C to define an equivalent melting point of such amorphous polymers. For PS this would be 100°C + 50°C = 150°C (see GLASS TRANSITION). OR The temperature at which a solid turns into a liquid.

**Melting temperature:** The temperature at which secondary or higher structures of a biological molecule are lost; for a nucleic acid, the melting temperature is defined as the temperature at which half the helical structure is lost.

**Melting zone:** Also called the transition or compression zone. Most of the plastic resin is melted in this section, and the channel depth gets progressively smaller.

**memantine hydrochloride:** The hydrochloride salt of memantine, a low-affinity, voltage-dependent, noncompetitive N-methyl-D-aspartate (NMDA) receptor antagonist. Memantine binds to and inhibits cation channels of

glutamanergic NMDA receptors located in the central nervous system (CNS), preventing the prolonged influx of calcium ions and the associated neuronal excitotoxicity, and thereby potentially enhancing cognitive function. Memantine is also a 5-hydroxytryptamine type 3 (5HT3) receptor and nicotinic receptor antagonist. Check for active clinical trials using this agent. or A drug used to treat dementia caused by Alzheimer disease. It is also being studied in the treatment of side effects from whole-brain radiation therapy for cancer and other conditions. Memantine hydrochloride blocks the uptake of calcium by certain brain cells and decreases their activity. It is a type of N-methyl-D-aspartate (NMDA) receptor antagonist. Also called Namenda.

**member:** a distinctive rock layer that is part of a larger rock formation.

**Membrane:** a thin or liquid film through which one or more species in a process stream can permeate. OR a continuous layer covering a structure or separating two electrolytic solutions. The membrane of an ISE is responsible for the potential response and the selectivity of the electrode. OR A sheet-like composite of protein and lipid that is the boundary of cells and organelles.

**membrane :** A very thin layer of tissue that covers a surface.

**Membrane asymmetry:** Refers to the fact that the two phases of biologically important membranes differ from each other.

**membrane cell:** A membrane cell is an electrolytic cell in which brine is electrolysed producing chlorine, hydrogen and forming sodium hydroxide solution (an alkali).

**Membrane protein:** A protein that is associated with a membrane, rather than found free in the cell. A membrane protein may be integral (embedded or buried) in the membrane, or peripheral (attached more loosely, by interactions with either lipid or integral membrane proteins).

**Membrane transport:** The facilitated transport of a molecule across a membrane. OR Movement of a polar solute across a membrane via a specific membrane protein (a transporter).

**membrane-disrupting peptide EP-100:** A water-soluble, positively charged fusion protein consisting of a luteinizing hormone releasing hormone (LHRH) receptor-targeting ligand conjugated to the membrane-disrupting peptide CLIP 71 with membrane-disrupting and potential

antineoplastic activities. The LHRH ligand moiety of membrane-disrupting peptide EP-100 specifically binds to LHRH receptors, which are upregulated on a variety of human cancer cell types. Subsequently, the positively charged CLIP 71 moiety of this agent interacts with the negatively charged membrane on the cancer cell surface, which may result in cell membrane disruption and cell lysis.

**Membranes:** Sheetlike structures composed of lipids and proteins, usually only a few molecules thick, that form closed boundaries between different compartments; membranes separate aqueous environments

**Memory:** MemoryThe tendency a particular plastic has to go back to its original shape after being stretched or bent.Polyurethane tubing is described as having excellent memory.

**MEN syndrome :** An inherited condition that may result in the development of cancers of the endocrine system. There are several types of MEN syndrome, and patients with each type may develop different types of cancer. The altered genes that cause each type can be detected with a blood test. Also called multiple endocrine neoplasia syndrome.

**MEN-10755:** An anticancer drug that belongs to the family of drugs called antitumor antibiotics.

**MEN1 syndrome :** A rare, inherited disorder that affects the endocrine glands and can cause tumors in the parathyroid and pituitary glands and the pancreas. These tumors are usually benign (not cancer). They cause the glands to secrete high levels of hormones, which can lead to other medical problems, such as kidney stones, fertility problems, and severe ulcers. In some cases, tumors inside the pancreas can become malignant (cancer). Also called multiple endocrine adenomatosis, multiple endocrine neoplasia type 1 syndrome, and Wermer syndrome.

**MEN2:** A rare, genetic disorder that affects the endocrine glands and can cause tumors in the thyroid gland, parathyroid glands, and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. MEN2 is caused by a mutation (change) in a gene called RET, and is divided into three subtypes (MEN2A, MEN2B, and FMTC). People with all subtypes of MEN2 have an increased risk of medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. Also called MEN2

syndrome, multiple endocrine adenomatosis type 2, and multiple endocrine neoplasia type 2 syndrome.

**MEN2 syndrome :** A rare, genetic disorder that affects the endocrine glands and can cause tumors in the thyroid gland, parathyroid glands, and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. MEN2 syndrome is caused by a mutation (change) in a gene called RET, and is divided into three subtypes (MEN2A, MEN2B, and FMTC). People with all subtypes of MEN2 syndrome have an increased risk of medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. Also called MEN2, multiple endocrine adenomatosis type 2, and multiple endocrine neoplasia type 2 syndrome.

**MEN2A:** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the parathyroid glands and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. An itchy skin condition may also occur. MEN2A is caused by a mutation (change) in a gene called RET. Also called MEN2A syndrome, multiple endocrine adenomatosis type 2A, multiple endocrine neoplasia type 2A syndrome, and Sipple syndrome.

**MEN2A syndrome :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the parathyroid glands and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. An itchy skin condition may also occur. MEN2A syndrome is caused by a mutation (change) in a gene called RET. Also called MEN2A, multiple endocrine adenomatosis type 2A, multiple endocrine neoplasia type 2A syndrome, and Sipple syndrome.

**MEN2B:** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the adrenal glands and growths around the nerves

in the lips, tongue, lining of the mouth, and eyelids. Gastrointestinal symptoms and trouble with the spine or bones in the feet and thighs may also occur. MEN2B is caused by a mutation (change) in a gene called RET. Also called MEN2B syndrome, multiple endocrine adenomatosis type 2B, and multiple endocrine neoplasia type 2B syndrome.

**MEN2B syndrome :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the adrenal glands and growths around the nerves in the lips, tongue, lining of the mouth, and eyelids. Gastrointestinal symptoms and trouble with the spine or bones in the feet and thighs may also occur. MEN2B syndrome is caused by a mutation (change) in a gene called RET. Also called MEN2B, multiple endocrine adenomatosis type 2B, and multiple endocrine neoplasia type 2B syndrome.

**menadione topical lotion:** A topical lotion containing the small organic molecule protein tyrosine phosphatase (PTP) inhibitor menadione (vitamin K3) with potential EGFR- and ErbB2/HER2-activating activities. Upon topical administration, menadione binds to and inhibits the activity of PTPs that dephosphorylate and inactivate EGFR and ErbB2 in human keratinocytes; local reversal of EGFR and ErbB2 inhibition associated with the systemic administration of EGFR inhibitors may help alleviate EGFR inhibitor-mediated skin toxicity. EGFR (epidermal growth factor receptor) and ErbB2/HER2 (erythroblastic leukemia viral oncogene homolog 2/human epidermal growth factor receptor 2) are cell surface receptors that are upregulated in a number of cancer cells types and play important roles in the growth and maintenance of normal epithelial tissues.

**menatetrenone:** A menaquinone compound and form of vitamin K2 with potential antineoplastic activity. Menatetrenone may act by modulating the signalling of certain tyrosine kinases, thereby affecting several transcription factors including c-myc and c-fos. This agent inhibits tumor cell growth by inducing apoptosis and cell cycle arrest.

**Mendelevium:** Symbol:"Md" Atomic Number:"101" Atomic Mass: (258)amu. This is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element.

**Ménétrier disease :** A condition marked by inflammation and ulcers (breaks on the skin or on the surface of an organ) of the mucosa (inner

lining) of the stomach and by overgrowth of the cells that make up the mucosa. Symptoms include vomiting, diarrhea, and weight loss. Patients with Ménétrier disease may be at a higher risk of stomach cancer. Also called gastric mucosal hypertrophy and giant hypertrophic gastritis.

**meningeal** : Having to do with the meninges (three thin layers of tissue that cover and protect the brain and spinal cord).

**meningeal carcinomatosis** : A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinoma, leptomeningeal carcinomatosis, leptomeningeal metastasis, meningeal metastasis, and neoplastic meningitis.

**meningeal leukemia** : A serious problem that may occur in leukemia. In meningeal leukemia, cancer cells have spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). The cancer may cause the meninges to be inflamed. Also called leukemic leptomeningitis and leukemic meningitis.

**meningeal metastasis** : A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinoma, leptomeningeal carcinomatosis, leptomeningeal metastasis, meningeal carcinomatosis, and neoplastic meningitis.

**meningeal syndrome** : A condition marked by headache, fever, and a stiff neck, which is caused when the meninges (three thin layers of tissue that cover and protect the brain and spinal cord) become irritated. Meningeal syndrome may be caused by blood, cancer cells, or substances from the breakdown of cancer cells that get into the cerebrospinal fluid (CSF). It may also be caused by infection with a bacterium, virus, or fungus.

**meninges** : The three thin layers of tissue that cover and protect the brain and spinal cord.

**meningioma** : A type of slow-growing tumor that forms in the meninges (thin layers of tissue that cover and protect the brain and spinal cord). Meningiomas usually occur in adults.

**meningitis** : Inflammation of the meninges (three thin layers of tissue that cover and protect the brain and spinal cord). Meningitis is usually caused by a bacterial or viral infection, but sometimes is caused by cancer, drug allergies, or inflammatory diseases.

**meniscus**: the curved upper surface of a non-turbulent liquid in a container; it is concave (curves upward) if it wets the container walls, and convex (curves downward) if it does not. For accurate measurements, readings should be taken at the flat center of the meniscus. OR Curved surface of a liquid in a container. OR A phase boundary that is curved because of surface tension. OR The free surface of a liquid in a container, for example, water in contact with air confined in a capillary tube.

**menogaril**: A semisynthetic derivative of the anthracycline antineoplastic antibiotic nogalamycin. Menogaril intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent is less cardiotoxic than doxorubicin.

**Menogarol**: (Other name for: menogaril)

**menopause** : The time of life when a woman's ovaries stop producing hormones and menstrual periods stop. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility.

**menorrhagia**: an abnormally heavy and prolonged menstrual period at regular intervals OR Abnormally heavy menstrual bleeding.

**menstrual cycle** : The monthly cycle of hormonal changes from the beginning of one menstrual period to the beginning of the next.

**menstrual period** : The periodic discharge of blood and tissue from the uterus. From puberty until menopause, menstruation occurs about every 28 days, but does not occur during pregnancy.

**menstruation**: the process by which the endometrium is released in females. OR Periodic discharge of blood and tissue from the uterus. From

puberty until menopause, menstruation occurs about every 28 days when a woman is not pregnant.

**mental health :** A person's overall psychological and emotional condition. Good mental health is a state of well-being in which a person is able to cope with everyday events, think clearly, be responsible, meet challenges, and have good relationships with others.

**mental health counselor :** A specialist who talks to patients and their families about emotional and personal matters, and can help them make decisions. Also called counselor.

**mental model:** an idea or model that exists in your mind.

**menthol :** A substance that comes from mint oils or is made in the laboratory. It is used to relieve itching and to treat problems in the upper respiratory tract. Menthol causes a cooling sensation when eaten or put on the skin and it acts as a mild pain killer. It is found in nasal sprays, cough drops, inhalers, creams, and lotions. It is also used as a flavor in many food and oral hygiene products.

**MEPACT:** A drug being studied in the treatment of young adults with bone cancer that has gotten worse or come back. MEPACT activates certain types of white blood cells and helps the immune system kill cancer cells. It is a type of immunostimulant. Also called L-MTP-PE, mifamurtide, and muramyl tripeptide phosphatidylethanolamine.

**meperidine hydrochloride:** The hydrochloride salt of a synthetic piperidine ester with opioid analgesic activity. Meperidine mimics the actions of endogenous neuropeptides via opioid receptors such as the mu-opioid receptor, thereby producing characteristic morphine-like effects including analgesia, euphoria, sedation, respiratory depression, miosis, bradycardia and physical dependence. or A drug used to treat moderate to severe pain. It binds to opioid receptors in the central nervous system. Meperidine hydrochloride is a type of analgesic agent and a type of opioid. Also called Demerol.

**mepivacaine hydrochloride:** The hydrochloride salt form of mepivacaine, an amide-type local anesthetic agent. At the injection site, mepivacaine binds to specific voltage-gated sodium ion channels in neuronal cell membranes, which inhibits both sodium influx and membrane depolarization. This leads to a blockage of nerve impulse initiation and conduction and results in a reversible loss of sensation. Compared to other

local anesthetics, this agent has a more rapid onset and moderate duration of action.

**Meprolone:** (Other name for: methylprednisolone)

**Mer:** The repeating structural unit in any high polymer.

**Mercalli Scale:** scale for measuring earthquakes based on observations.

**mercaptopurine:** A thiopurine-derivative antimetabolite with antineoplastic and immunosuppressive activities. Produced through the metabolism of mercaptopurine by hypoxanthine-guanine phosphoribosyltransferase (HGPRT), mercaptopurine metabolites 6-thioguanosine-5'-phosphate (6-thioGMP) and 6-thioinosine (T-IMP) inhibit nucleotide interconversions and de novo purine synthesis, thereby blocking the formation of purine nucleotides and inhibiting DNA synthesis. This agent is also incorporated into DNA in the form of deoxythioguanosine, which results in the disruption of DNA replication. In addition, mercaptopurine is converted to 6-methylmercaptopurine ribonucleoside (MMPR) by 6-thiopurine methyltransferase; MMPRs are also potent inhibitors of de novo purine synthesis.

**mercaptopurine :** A drug used to treat acute lymphoblastic leukemia. It may also be used to treat certain other conditions, such as Crohn disease and ulcerative colitis. Mercaptopurine stops cells from dividing and may kill cancer cells. It is a type of antimetabolite. Also called Purinethol and Purixan.

**mercaptopurine oral suspension:** An oral suspension containing the thiopurine-derivative antimetabolite 6-mercaptopurine, with potential antineoplastic activity. Upon oral administration, mercaptopurine is metabolized by hypoxanthine-guanine phosphoribosyltransferase (HGPRTase) to its active metabolite 6-thioinosine monophosphate (TIMP); TIMP inhibits nucleotide interconversions and de novo purine ribonucleotide synthesis, which both blocks the formation of purine nucleotides and inhibits DNA synthesis. This agent is also incorporated into DNA in the form of deoxythioguanosine, which results in the disruption of DNA replication. By blocking DNA synthesis and replication, cancer cells are unable to proliferate. Compared to the tablet formulation, the liquid is easier to swallow and offers more flexibility and accuracy in dosing, which is beneficial for use in pediatric patients.

**mercaptopurine tablet:** The anhydrous form of mercaptopurine, a thiopurine-derivative antimetabolite with antineoplastic and immunosuppressive activities. Produced through the metabolism of mercaptopurine by hypoxanthine-guanine phosphoribosyltransferase (HGPRT), mercaptopurine metabolites 6-thioguanosine-5'-phosphate (6-thioGMP) and 6-thioinosine monophosphate (T-IMP) inhibit nucleotide interconversions and de novo purine synthesis, thereby blocking the formation of purine nucleotides and inhibiting DNA synthesis. This agent is also incorporated into DNA in the form of deoxythioguanosine, which results in the disruption of DNA replication. In addition, mercaptopurine is converted to 6-methylmercaptopurine ribonucleoside (MMPR) by 6-thiopurine methyltransferase; MMPRs are also potent inhibitors of de novo purine synthesis.

**Mercury:** Symbol:"Hg" Atomic Number:"80" Atomic Mass: 200.59amu. Mercury is one of many transition elements. Mercury is one of the few elements that exist as a liquid at room temperature. This silvery metal is very toxic but still has many uses in alloys (amalgams). You will find it used in pesticides, lamps, electronics, explosives, and even dentistry. OR A silver-white, poisonous metal that is a liquid at ordinary temperatures. It is commonly used in thermometers and amalgams, and has been used as an ingredient in some homeopathic medicines and in very small amounts as a preservative in viral vaccines.

**mercy killing :** An easy or painless death, or the intentional ending of the life of a person suffering from an incurable or painful disease at his or her request. Also called euthanasia.

**merestinib:** An orally available, small molecule inhibitor of the proto-oncogene c-Met (hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. Merestinib selectively binds to c-Met, thereby inhibiting c-Met phosphorylation and disrupting c-Met signal transduction pathways. This may induce cell death in tumor cells overexpressing c-Met protein or expressing constitutively activated c-Met protein. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis.

**meridian:** line of longitude. OR In traditional Chinese medicine, one of 20 channels that form a network through which qi (the body's vital energy)

flows and that connect the body's acupuncture sites.

**meristematic tissue:** the growth tissue; the location of most cell division of vascular plants.

**Merkel cell :** A special type of cell found right below the epidermis (top layer of skin). These cells are very close to the nerve endings that receive the sensation of touch and may be involved in touch. The cells also contain substances that may act as hormones.

**Merkel cell cancer :** A rare type of cancer that forms on or just beneath the skin, usually in parts of the body that have been exposed to the sun. It is most common in older people and in people with weakened immune systems. Also called Merkel cell carcinoma, neuroendocrine carcinoma of the skin, and trabecular cancer.

**Merkel cell carcinoma :** A rare type of cancer that forms on or just beneath the skin, usually in parts of the body that have been exposed to the sun. It is most common in older people and in people with weakened immune systems. Also called Merkel cell cancer, neuroendocrine carcinoma of the skin, and trabecular cancer.

**Merodiploid:** An organism that is diploid for some but not all of its genes.

**meropenem:** A broad-spectrum carbapenem with antibacterial properties, synthetic Meropenem inhibits cell wall synthesis in gram-positive and gram-negative bacteria. It penetrates cell walls and binds to penicillin-binding protein targets. Meropenem acts against aerobes and anaerobes including Klebsiella, E. coli, Enterococcus, Clostridium sp..

**Merrem I.V.:** (Other name for: meropenem)

**mesa:** a remnant flat-topped tower or column resulting from the weathering and erosion of a plateau's slopes.

**mesalamine:** An agent derived from sulfasalazine, an antiinflammatory agent. Mesalamine may reduce inflammation through inhibition of cyclooxygenase and prostaglandin production. Following rectal or oral administration, only a small amount of mesalamine is absorbed; the remainder, acting topically, reduces bowel inflammation, diarrhea, rectal bleeding and stomach pain. Check for active clinical trials using this agent.

**mesenchymal :** Refers to cells that develop into connective tissue, blood vessels, and lymphatic tissue.

**mesenteric membrane :** The peritoneal membrane that attaches the intestines to the abdominal wall near the back.

**Mesh :** Woven wire surface on which the product rests.

**Mesh Designation (Flat Wire) :** Flat wire belts are constructed in specific mesh designations or opening sizes such as 1x1, 1/2x1, 1/2x1/2, with other modifications which may vary according to belt width.

**Mesh Designation (Woven) :** Woven mesh is designated with a letter (B,C,U) and 3 numbers to describe mesh construction.

**mesic environment:** A habitat with a moderate amount of water.

**mesna:** A sulfhydryl compound that is used to reduce the incidence of hemorrhagic cystitis associated with certain chemotherapeutic agents. Mesna is converted to a free thiol compound in the kidney, where it binds to and inactivates acrolein and other urotoxic metabolites of ifosfamide and cyclophosphamide, thereby reducing their toxic effects on the urinary tract during urinary excretion. or A drug that helps protect the kidneys and bladder from the toxic effects of anticancer drugs such as ifosfamide and cyclophosphamide.

**Mesnex:** (Other name for: mesna)

**meso compound:** meso a compound that has a stereogenic center but is optically inactive because it also has a plane of symmetry.

**mesoderm:** one of three germ layers that develops to become the muscles and other internal organs.

**mesonephroma :** A rare type of tumor, usually of the female genital tract, in which the insides of the cells look clear when viewed under a microscope. Also called clear cell adenocarcinoma and clear cell carcinoma.

**mesopause:** region between the mesosphere and the thermosphere.

**mesoscale eddies (mode eddies):** In the ocean, dense and irregularly-oval high- and low- pressure centers about 400 km in diameter. The intensities of currents in these centers are about 10 times greater than the local means.

**Mesosome:** An invagination of the bacterial cell membrane.

**mesosphere:** part of the atmosphere between the stratosphere and the thermosphere; temperatures decrease with altitude.

**mesothelin :** A protein found on the surface of certain types of normal cells and cancer cells. Mesothelin may help these cells stick together and send signals. A higher-than-normal amount of mesothelin is found on some cancer cells, including mesothelioma, pancreatic cancer, and ovarian cancer.

**mesothelin-specific chimeric antigen receptor-engineered peripheral blood lymphocytes:** A preparation of peripheral blood lymphocytes (PBLs) transduced with a retroviral vector encoding a T cell chimeric antigen receptor (CAR) specific for mesothelin with potential immunostimulatory and antineoplastic activities. After transduction, expansion in culture, and reintroduction into the patient, the mesothelin-specific chimeric antigen receptor-engineered PBLs bind to tumor cells expressing mesothelin. This may stimulate the secretion of cytokines and result in cell lysis of mesothelin-expressing cancer cells. Mesothelin, a cell surface glycoprotein involved in cell adhesion, is overexpressed in many epithelial-derived cancers.

**mesothelioma:** Malignant spreading tumour in mesothelium of pleura, pericardium or peritoneum arising as a result of the presence of asbestos fibres, after exposure to asbestos. OR A benign (not cancer) or malignant (cancer) tumor affecting the lining of the chest or abdomen. Exposure to asbestos particles in the air increases the risk of developing malignant mesothelioma.

**mesothelioma tumor lysate-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine consisting of autologous dendritic cells (DCs) pulsed with mesothelioma tumor lysate with potential immunostimulating and antineoplastic activities. Upon administration, mesothelioma tumor lysate-pulsed autologous dendritic cell vaccine may stimulate the host immune system to mount a specific cytotoxic T lymphocyte (CTL) response against mesothelioma tumor cells, resulting in tumor cell lysis.

**messenger RNA :** A type of RNA found in cells. Messenger RNA molecules carry the genetic information needed to make proteins. They carry the information from the DNA in the nucleus of the cell to the cytoplasm where the proteins are made. Also called mRNA.

**Messenger RNA (mRNA):** The template RNA carrying the message for protein synthesis. OR A class of RNA molecules, each of which is complementary to one strand of DNA; carries the genetic message from the

chromosome to the ribosomes. OR Template for protein synthesis; the base sequence of mrna is complementary to that of a gene in DNA.

**MET receptor tyrosine kinase inhibitor SGX523:** An orally bioavailable small molecule, belonging to the class of c-Met/hepatocyte growth factor receptor (HGFR) tyrosine kinase inhibitors, with potential antineoplastic activity. MET receptor tyrosine kinase inhibitor SGX523 specifically binds to c-Met protein, or hepatocyte growth factor receptor (HGFR), preventing binding of hepatocyte growth factor (HGF) and disrupting the MET signaling pathway; this agent may induce cell death in tumor cells expressing c-Met. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays an important role in tumor cell proliferation, survival, invasion, and metastasis, and in tumor angiogenesis.

**Met tyrosine kinase inhibitor BMS-777607:** An inhibitor of MET tyrosine kinase with potential antineoplastic activity. MET tyrosine kinase inhibitor BMS-777607 binds to c-Met protein, or hepatocyte growth factor receptor (HGFR), preventing binding of hepatocyte growth factor (HGF) and disrupting the MET signaling pathway; this agent may induce cell death in tumor cells expressing c-Met. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays an important role in tumor cell proliferation, survival, invasion, and metastasis, and in tumor angiogenesis.

**MET tyrosine kinase inhibitor EMD 1204831:** An inhibitor of the receptor tyrosine kinase MET (hepatocyte growth factor receptor) with potential antineoplastic activity. MET inhibitor EMD 1204831 selectively binds to MET tyrosine kinase, thereby disrupting MET-mediated signal transduction pathways. This may induce cell death in tumor cells overexpressing this kinase. MET is overexpressed or mutated in many tumor cell types, and plays key roles in tumor cell proliferation, survival, invasion, and metastasis, and tumor angiogenesis.

**MET tyrosine kinase inhibitor EMD 1214063:** An inhibitor of MET tyrosine kinase with potential antineoplastic activity. MET tyrosine kinase inhibitor EMD 1214063 selectively binds to MET tyrosine kinase and disrupts MET signal transduction pathways, which may induce apoptosis in tumor cells overexpressing this kinase. The receptor tyrosine kinase MET (also known as hepatocyte growth factor receptor or HGFR), is the product of the proto-oncogene c-Met and is overexpressed or mutated in many

tumor cell types; this protein plays key roles in tumor cell proliferation, survival, invasion, and metastasis, and tumor angiogenesis. Check for active clinical trials using this agent.

**MET tyrosine kinase inhibitor PF-02341066 :** A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of the anaplastic lymphoma kinase (ALK) gene or the ROS1 gene. It is also being studied in the treatment of other types of cancer. MET tyrosine kinase inhibitor PF-02341066 blocks the proteins made by the mutated ALK and ROS1 genes. Blocking these proteins may stop the growth and spread of cancer cells. MET tyrosine kinase inhibitor PF-02341066 may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called crizotinib, PF-02341066, and Xalkori.

**MET tyrosine kinase inhibitor PF-04217903:** An orally bioavailable, small-molecule tyrosine kinase inhibitor of the proto-oncogene c-Met (hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. c-Met inhibitor PF-04217903 selectively binds to and inhibits c-Met, disrupting the c-Met signaling pathway, which may result in the inhibition of tumor cell growth, migration and invasion of tumor cells, and the induction of death in tumor cells expressing c-Met. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays key roles in tumor cell proliferation, survival, invasion, metastasis, and tumor angiogenesis. Check for active clinical trials using this agent.

**MET tyrosine kinase inhibitor SAR125844:** An inhibitor of the proto-oncogene c-Met (also known as hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. Upon intravenous administration, c-Met inhibitor SAR125844 binds to c-Met, thereby disrupting c-Met-mediated signal transduction pathways. This may result in cell growth inhibition in tumors that overexpress c-Met. c-Met, a receptor tyrosine kinase overexpressed or mutated in a variety of cancers, plays an important role in tumor cell proliferation, survival, invasion, metastasis and tumor angiogenesis.

**MET/VEGFR-2 inhibitor GSK1363089 :** A substance being studied in the treatment of cancer. MET/VEGFR-2 inhibitor GSK1363089 blocks enzymes involved in the growth and spread of tumor cells. It may also

prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called foretinib and XL880.

**Meta:** Three really cool little greek words that we use to describe where things are attached to phenyl rings. Let's say we have one functional group attached to a phenyl ring - a carboxylic acid group, to give us benzoic acid. If we now attach a single amino group to the phenyl ring, there are three possible products: The third of these, para-amino benzoic acid, is known by its acronym PABA and is an ingredient in sunscreens. Ortho and meta are also used to distinguish between two acids whose molecular formulas are identical except for the amounts of hydrogen and oxygen. IUPAC is gradually cracking down on this sort of thing.

**meta-analysis :** A process that analyzes data from different studies done about the same subject. The results of a meta-analysis are usually stronger than the results of any study by itself.

**meta-fluorine F 18 fluorobenzylguanidine:** A radioconjugate composed of the positron-emitting radioisotope fluorine F 18-labeled benzylguanidine, a synthetic analogue of the adrenergic neurotransmitter norepinephrine (NE), with potential use in the diagnostic imaging of human norepinephrine transporter (hNET)-expressing cells by either positron emitting tomography (PET) or computed tomography (CT). Upon administration, meta-fluorine F 18 fluorobenzylguanidine (MFBG) is taken up by and accumulates in both the granules of adrenal medullary chromaffin cells and the pre-synaptic granules of adrenergic neurons in a manner almost identical to that of NE. In turn, hNET-expressing tumor cells can be imaged by PET or CT. hNET, a transmembrane protein and regulator of catecholamine uptake normally restricted to the central and peripheral sympathetic nervous system, is overexpressed in certain tumor cell types.

**metabolic :** Having to do with metabolism (the total of all chemical changes that take place in a cell or an organism to produce energy and basic materials needed for important life processes).

**metabolic acidosis:** a disturbance in the body's acid-base balance that results in excessive acidity of the blood; due to increased production of H<sup>+</sup> by the body or the inability of the body to form bicarbonate; usually causes rapid breathing, confusion or lethargy may also occur

**metabolic acidosis :** A condition in which the blood is too acidic. It may be caused by severe illness or sepsis (bacteria in the bloodstream).

**metabolic activation:** Biotransformation of relatively inert chemicals to biologically reactive metabolites (compounds). See biotransformation.

**metabolic alkalosis:** a disturbance in the body's acid-base balance that results in excessive alkalinity of the blood caused by an elevation in plasma bicarbonate ( $\text{HCO}_3^-$ ) concentration; in most cases, metabolic alkalosis is caused by loss of hydrochloric acid (HCl) through the kidney or GI tract, especially due to vomiting

**Metabolic Blockers:** Chemical groups added to a drug that slow down or block metabolism at that part of the drug.

**metabolic disorder :** A condition in which normal metabolic processes are disrupted, usually because of a missing enzyme.

**Metabolic engineering:** The targeted and purposeful alteration (using genetic engineering techniques) of an organism's metabolic pathways in order to better understand how the pathways work or to redesign them to produce a different set of products

**metabolic half-life :** The time required for one half of the quantity of the compound in the body to be metabolically transformed into a modified chemical compound (WHO, 1979).

**metabolic model:** An analysis and theoretical reconstruction of the way in which the body deals with a specific substance, showing the proportion of the intake that is absorbed, the proportion that is stored and in what tissues, the proportion and rate of breakdown in the body and the subsequent fate of the metabolic products, and the proportion of the substance and the rate at which it is eliminated by different organs (WHO, 1979).

**metabolic syndrome :** A condition marked by extra fat around the abdomen, high levels of blood glucose (sugar) when not eating, high levels of triglycerides (a type of fat) in the blood, low levels of high-density lipoproteins (a type of protein that carries fats) in the blood, and high blood pressure. People with metabolic syndrome are at increased risk of diabetes mellitus and diseases of the heart and blood vessels. Also called metabolic syndrome X.

**metabolic syndrome X :** A condition marked by extra fat around the abdomen, high levels of blood glucose (sugar) when not eating, high levels

of triglycerides (a type of fat) in the blood, low levels of high-density lipoproteins (a type of protein that carries fats) in the blood, and high blood pressure. People with metabolic syndrome X are at increased risk of diabetes mellitus and diseases of the heart and blood vessels. Also called metabolic syndrome.

**metabolic therapy :** Treatment to correct changes in metabolism that can be caused by disease.

**metabolic transformation :** The chemical transformation of substances that takes place within an organism (WHO, 1979).

**Metabolic turnover:** A measure of the rate at which already existing molecules of the given species are replaced by newly-synthesized molecules of the same type. Usually isotopic labeling is required to measure turnover.

**Metabolic turnover:** Metabolic turnover. A measure of the rate at which already existing molecules of the given species are replaced by newly-synthesized molecules of the same type. Usually isotopic labeling is required to measure turnover.

**metabolic type :** In alternative medicine, a theory that people fall into one of three groups (protein, carbohydrate, or mixed type) based on the main type of food that their bodies need to stay healthy.

**Metabolism:** In general, the sum total of all physical and chemical processes that take place within an organism; in a narrower sense, the physical and chemical changes that take place in a given chemical substance within an organism. It includes the uptake and distribution within the body of chemical compounds, the changes (biotransformations) undergone by such substances, and the elimination of the compounds and of their metabolites (WHO, 1979). OR the rapid turnover of chemical materials; involves the release or use of chemical energy. OR A set of enzyme-catalyzed reactions in a living organism that builds and breaks down organic molecules, producing or consuming energy in the process OR A highly integrated network of chemical pathways that enables a cell to extract energy from the environment and use this energy for biosynthetic purposes. OR A sequence of biochemical reactions that converts fuel molecules into energy used to drive other biological processes. Also refers to the sequence of transformations foreign compounds undergo inside a living cell. OR The entire set of enzyme-catalyzed transformations of

organic molecules in living cells; the sum of anabolism and catabolism. OR The sum total of the enzyme-catalyzed reactions that occur in a living organism.

**metabolism** : The chemical changes that take place in a cell or an organism. These changes make energy and the materials cells and organisms need to grow, reproduce, and stay healthy. Metabolism also helps get rid of toxic substances.

**Metabolite**: A chemical intermediate in metabolic reactions OR A chemical product of metabolism. OR A substance resulting from chemical transformation in an organism (WHO, 1979). OR A compound produced by metabolic reactions. OR A chemical intermediate in the enzyme-catalyzed reactions of metabolism.

**metabolite** : A substance made or used when the body breaks down food, drugs or chemicals, or its own tissue (for example, fat or muscle tissue). This process, called metabolism, makes energy and the materials needed for growth, reproduction, and maintaining health. It also helps get rid of toxic substances.

**metabolomics** : The study of substances called metabolites in cells and tissues. Metabolites are small molecules that are made when the body breaks down food, drugs, chemicals, or its own tissue. They can be measured in blood, urine, and other body fluids. Disease and environmental factors, such as diet, drugs, and chemicals, can affect how metabolites are made and used in the body. Metabolomics may help find new ways to diagnose and treat diseases, such as cancer.

**Metabolon**: The name for large, multienzyme complexes that facilitate the channeling of substrates between active sites.

**Metabotropic glutamate receptor**: A 7TM receptor that binds the neurotransmitter glutamate; a truncated version of the same protein detects the taste, termed umami, of glutamate.

**metahexamide**: A long-acting, first-generation, cyclohexyl sulfonylurea with antihyperglycemic activity. Metahexamide has greater potency than chlorpropamide and tolbutamide. This agent may cause jaundice.

**metaiodobenzylguanidine scan** : A procedure used to find neuroendocrine tumors, such as neuroblastomas and pheochromocytomas. A small amount of a substance called radioactive metaiodobenzylguanidine is injected into a

vein and travels through the bloodstream. Neuroendocrine tumor cells take up the radioactive metaiodobenzylguanidine and are detected by a scanner. Also called iobenguane scan and MIBG scan.

**metal:** An element that tends to lose electrons, forming positive ions, and is a good electrical conductor. OR A metal is a special type of element. Scientists say something is a metal because of the way it acts in nature. Metals conduct electricity well. That's why they are used in wires. They also conduct heat well. That's why your pans are made of metal. OR A metal is a substance whose atoms are so close together that their outer shells overlap. This allows electrons to wander from atom to atom as part of a delocalised sea of electrons. This allows the metal to conduct electricity. Metals also conduct heat, are shiny, malleable and ductile, sonorous. They also (usually) have high melting points and boiling points. OR A metal is a substance that conducts heat and electricity, is shiny and reflects many colors of light, and can be hammered into sheets or drawn into wire. Metals lose electrons easily to form cations. About 80% of the known chemical elements are metals.

**Metal ion catalysis:** Catalysis in which a metal acts as an electrophilic catalyst by stabilizing a negative charge on a reaction intermediate, generates a nucleophile by increasing the acidity of nearby molecules, or increases the binding energy of the enzyme-substrate interaction by binding to substrates.

**Metal safe:** A change to the part design that requires only the removal of metal from the mold to produce the desired geometry. Typically most important when a part design is changed after the mold has been manufactured, because then the mold can be modified rather than entirely re-machined. It is also commonly called "steel safe."

**Metal spraying:** Describes the process of spraying molten zinc or aluminium on to grit-blasted steel to provide protection against corrosion.

**metallic :** Having to do with metal. Some cancer treatments may change the sense of taste and cause foods to have a metallic taste.

**metallic bond:** atoms linked together by the migration of electrons from atom to atom.

**metallic compounds:** Compounds that contain at least one metallic element.

**metallic endoprosthesis :** A device made of metal that is placed inside the body to replace a body part removed by surgery. An example is a thigh bone replaced during surgery for cancer.

**METALLICS:** A class of paints that include metal flakes in their composition.

**Metallizing:** Applying a thin coating of metal to a non-metallic surface. May be done by chemical deposition or by exposing the surface to vaporized metal in a vacuum chamber.

**Metallocene:** Latest generation of resin technology utilizing a metallocene catalyst which is basically tiny particles of positively charged metal ions sandwiched between two rings of carbon atoms that have five atoms apiece.

**METALLOCENE CATALYZED POLYMERS:** Commonly and erroneously called metallocene polymers. Most polyolefins are produced nowadays with the help of so-called Ziegler-Natta catalysts. Recent developments in metallocene catalysts give the possibility to tailor the structure in such a way as to produce polymers having significantly improved mechanical and physical properties. The better properties of blown film are apparently accompanied by the trade off of poorer processability than conventional materials.

**metalloid:** An element with both metallic and nonmetallic properties. Examples are silicon, arsenic, and germanium.

**metalloid:** An element with properties intermediate between metals and non-metals.

**metalloids:** Metalloids are elements with properties of both metals and non-metals.

**metalloprotein:** A protein having a metal ion as its prosthetic group.

**metals:** the elements in the middle and left parts of the periodic table, except for hydrogen.

**Metamerism:** An apparent change in colour under different lighting conditions.

**metamerism:** Division of the body into segments; in insects, for example.

**metamorphic:** existing rock that undergoes extreme heat or pressure and is recrystallized. OR Referring to rock types it means that the rock has been

changed by the action of heat and / or pressure. Examples include marble (which is formed from limestone).

**metamorphic grades:** the different groups of minerals that crystallize and are stable at the different pressure and temperature ranges during regional metamorphism.

**Metamorphic Rock:** This is a rock type that has been reheated and crystallized. Metamorphic rocks can be created from both sedimentary and igneous rocks. The three main types of rock are igneous, sedimentary, and metamorphic. OR Metamorphic rock is rock formed as a result of heat and/or pressure, changing the structure and/or mineral composition (without the rock melting). OR a rock created by solid-state transformation (no melting) of a rock mass into a rock of generally the same chemistry but with different textures and minerals.

**Metamorphosis:** A change of form, especially the conversion of a larval form to an adult form.

**MetAP2 inhibitor SDX-7320:** A synthetic copolymer-drug conjugate of a fumagillin-derived methionine aminopeptidase 2 (MetAP2) inhibitor conjugated to the bio-compatible polymer poly(N-(hydroxypropyl)methacrylamide) (HPMA), with potential antineoplastic activity. Upon administration of SDX-7320, the active moiety SDX7539 is released inside the tumor cells. SDX7539 binds to and inhibits MetAP2, which prevents MetAP2-mediated signal transduction pathways and results in tumor cell death. MetAP2, a member of the dimetallohydrolase family upregulated in certain tumor cell types, plays a key role in angiogenesis, proliferation and survival. Polymer conjugation reduces systemic drug exposure and increases this agent's efficacy as compared to non-polymer conjugates.

**metaphase:** the stage during mitosis in which the pairs of chromatids line up on the equatorial plate.

**Metaphase:** That stage in mitosis or meiosis when all of the chromosomes are lined up on the equator (i.e., an imaginary line that bisects the cell).

**metaphase I:** the phase during meiosis in which tetrads align on the equatorial plate (as in mitosis).

**metaphase II:** the phase during meiosis II in which the chromatid pairs gather at the center of the cell prior to separation.

**metaphyses:** the wider portion of a long bone adjacent to the epiphyseal plate; the part of the bone that grows during childhood

**metaplasia :** A change of cells to a form that does not normally occur in the tissue in which it is found.

**metaplastic carcinoma :** A general term used to describe cancer that begins in cells that have changed into another cell type (for example, a squamous cell of the esophagus changing to resemble a cell of the stomach). In some cases, metaplastic changes alone may mean there is an increased chance of cancer developing at the site.

**metasomatism:** the process by which hot-water solutions carrying ions from an outside source move through a rock mass via fractures or pore space.

**Metastable form:** A form other than the most stable form.

**metastasectomy :** Surgery to remove one or more metastases (tumors formed from cells that have spread from the primary tumor). When all metastases are removed, it is called a complete metastasectomy.

**metastasis :** The spread of cancer cells from the place where they first formed to another part of the body. In metastasis, cancer cells break away from the original (primary) tumor, travel through the blood or lymph system, and form a new tumor in other organs or tissues of the body. The new, metastatic tumor is the same type of cancer as the primary tumor. For example, if breast cancer spreads to the lung, the cancer cells in the lung are breast cancer cells, not lung cancer cells. The plural form of metastasis is metastases (meh-TAS-tuh-SEEZ).

**metastasize :** To spread from one part of the body to another. When cancer cells metastasize and form secondary tumors, the cells in the metastatic tumor are like those in the original (primary) tumor.

**Metastat:** (Other name for: incyclinide)

**metastatic :** Having to do with metastasis, which is the spread of cancer from the primary site (place where it started) to other places in the body.

**Metastron:** (Other name for: strontium chloride Sr 89)

**metasynchronous :** Occurring at nearly the same time.

**metatinib tromethamine:** An orally bioavailable tyrosine kinase inhibitor of the BCR-ABL fusion oncoprotein, with potential antineoplastic activity. Upon oral administration, metatinib tromethamine may inhibit the BCL-

ABL protein, which may lead to decreased proliferation and enhanced apoptosis in tumor cells. BCR-ABL oncoprotein is generated by a reciprocal translocation between chromosome 9 and 22 specifically t(9;22)(q34;q11). The resulting fusion gene produces proteins with constitutively active tyrosine kinase activity, which stimulate both abnormal cell division and increased cellular proliferation. This fusion is associated with both chronic myeloid leukemia and acute lymphoblastic leukemia.

**meteor:** a meteoroid that enters the Earth's atmosphere; also known as a shooting star.

**meteoric water:** water that is derived from the atmosphere as rain or snow and that moves down into the bedrock from the earth's surface.

**meteorism :** Swelling of the abdomen caused by gas in the intestines or peritoneal cavity. Also called tympanites.

**meteorite:** a meteor that reaches the surface of the Earth.

**meteorite:** A mass of stone or metal that has reached the earth from outer space.

**meteoroid:** a rock fragment orbiting in the solar system.

**meter:** The meter is the basic unit of length in the SI system of units, defined as the distance light travels through a vacuum in exactly 1/299792458 seconds. 1 m = 39.37 inches. Meters are abbreviated as "m" in measurements.-amino--methylthiobutyric%20acid">methionine. Met; -amino--methylthiobutyric acid.A naturally occurring amino acid and building block of proteins with a sulfur-containing side chain.

**meter:** Unit of length in the metric system, slightly longer than 1 yard or 36 inches.

**Metering Screw:** An extrusion screw which has a shallow constant depth, and constant pitch section over, usually, the last 3 to 4 flights.

**Metering Section:** The flighted portion of the screw at the discharge end in which the melt is forced at a controlled rate towards the die.

**Metering stroke:** It is stroke of screw that determines the quantity of melt to be injected to the mould.

**METERING ZONE:** The single screw extrusion process consists of three functional zones the SOLIDS CONVEYING ZONE where the polymer pellets or powder are compacted and transported forward, the MELTING ZONE where the polymer melts mainly under the action of shear on the

barrel wall, and the METERING ZONE (PUMPING ZONE) where the polymer is transported forward by DRAG FLOW caused by the rotating action of the screw. OR Also called melt conveying. This zone, in which channel depth is the same throughout the zone, melts the last plastic resin particles and mixes to a uniform temperature and composition. The second metering zone in a twin screw extruder is the same as the first metering zone, but with greater channel depth, and it repressurizes the melt to get it through the resistance of the screens and the die. OR The final zone of an extruder barrel, in which the melt is conveyed at a uniform rate to the breaker plate or die. OR The area of the screw at the front end that contains properly melted plastic, which is ready to inject.

**metformin** : The active ingredient in a drug used to treat diabetes mellitus (a condition in which the body cannot control the level of sugar in the blood). It is also being studied in the treatment of cancer. It decreases the amount of glucose (a type of sugar) released into the bloodstream from the liver and increases the body's use of the glucose. Metformin is a type of antidiabetic agent.

**metformin hydrochloride**: The hydrochloride salt of the biguanide metformin with antihyperglycemic and potential antineoplastic activities. Metformin inhibits complex I (NADPH:ubiquinone oxidoreductase) of the mitochondrial respiratory chain, thereby increasing the cellular AMP to ATP ratio and leading to activation of AMP-activated protein kinase (AMPK) and regulating AMPK-mediated transcription of target genes. This eventually prevents hepatic gluconeogenesis, enhances insulin sensitivity and fatty acid oxidation and ultimately leads to a decrease in glucose levels. Metformin may exert antineoplastic effects through AMPK-mediated or AMPK-independent inhibition of mammalian target of rapamycin (mTOR), which is up-regulated in many cancer tissues. Furthermore, this agent also inhibits tumor cell migration and invasion by inhibiting matrix metalloproteinase-9 (MMP-9) expression which is mediated through the suppression of transcription activator protein-1 (AP-1) activation. or A drug used to treat diabetes mellitus (a condition in which the body cannot control the level of sugar in the blood ). It is also being studied in the treatment of cancer. It decreases the amount of glucose (a type of sugar) released into the bloodstream from the liver and increases the body's use of the glucose. Metformin hydrochloride is a type of antidiabetic agent. Also called Glucophage.

**Methacrylic acid:** Unsaturated monocarboxylic acid, used in the manufacture of resins and plastics.

**methadone hydrochloride:** The hydrochloride salt of methadone, a synthetic opioid with analgesic activity. Similar to morphine and other morphine-like agents, methadone mimics the actions of endogenous peptides at CNS opioid receptors, primarily the mu-receptor, resulting in characteristic morphine-like effects including analgesia, euphoria, sedation, respiratory depression, miosis, bradycardia and physical dependence. Because of the prolonged half-life of methadone compared to other morphine-like agents such as heroin, the onset of opiate withdrawal symptoms is slower, the duration of opiate withdrawal is prolonged, and opiate withdrawal symptoms are less severe. or A drug used to treat moderate to severe pain that does not respond to other types of pain medicine. It is also used to help people who are addicted to opioid drugs such as heroin. Methadone hydrochloride binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opioid.

**Methadose:** (Other name for: methadone hydrochloride)

**methaemoglobin/methaemoglobinaemia:** In some poisonings, haemoglobin (the substance in the red blood cells to which the oxygen is fixed) may be transformed to methaemoglobin. Methaemoglobin lacks the ability of binding the oxygen, consequently lack of oxygen occurs in the organism. When a certain amount of haemoglobin has been transformed to methaemoglobin, mucous membranes and skin become bluish and discolored.

**Methane:** Methane is a simple hydrocarbon with one carbon and four hydrogen atoms. It is very flammable. It is a compound found in the atmosphere of many planets.

**methanogenic:** "Methane (CH<sub>4</sub>) producing"; methanogenic bacteria use hydrogen and carbon dioxide as energy sources and produce methane and water as a result.

**Methanol:** Methanol, the simplest of the alcohol compounds, is a toxic, flammable liquid with a distinctive odour. Methanol is mainly produced by the reforming of hydrocarbon feedstock syngas, which is mainly derived from natural gas, but can also be derived from coal or refinery residues. As methanol is relatively simple to ship, it provides a means to exploit natural gas reserves which are too remote to be connected to consumers by

pipeline, so called "stranded gas". For this reason most of the world's methanol is now produced in remote areas and shipped to consumers in large dedicated methanol carriers. Methanol is a bulk commodity chemical and its major derivatives are formaldehyde, methyl tertiary butyl ether (MTBE), acetic acid, methyl methacrylate (MMA), and di methyl terephthalate (DMT).

**methanol :** A type of alcohol used to make antifreeze, pesticides, windshield wiper fluid, paint thinner, certain types of fuel, and other substances. Methanol catches fire easily and is very poisonous. It is one of many harmful chemicals found in tobacco smoke. Also called methyl alcohol and wood alcohol.

**methanol extraction residue of BCG:** A cell wall fraction of bacillus Calmette-Guerin (BCG) obtained by menthol extraction with immunomodulating properties and potential use in cancer immunotherapy. Check for active clinical trials using this agent.

**methazolamide:** A sulfonamide derivate and carbonic anhydrase inhibitor with potential antineoplastic activity. Methazolamide inhibits tumor-associated carbonic anhydrase IX (CAIX), which may result in increased cell death in hypoxic tumors. As a hypoxia-inducible transmembrane glycoprotein, CAIX catalyzes the rapid interconversion of carbon dioxide and water into carbonic acid, protons, and bicarbonate ions, helping to maintain acidification of the tumor microenvironment and enhance resistance to cytotoxic therapy in some hypoxic tumors.

**Methazolastone:** (Other name for: temozolomide)

**methemoglobin :** A form of hemoglobin found in the blood in small amounts. Unlike normal hemoglobin, methemoglobin cannot carry oxygen. Injury or certain drugs, chemicals, or foods may cause a higher-than-normal amount of methemoglobin to be made. This causes a condition called methemoglobinemia.

**methemoglobinemia :** A condition in which a higher-than-normal amount of methemoglobin is found in the blood. Methemoglobin is a form of hemoglobin that cannot carry oxygen. In methemoglobinemia, tissues cannot get enough oxygen. Symptoms may include headache, dizziness, fatigue, shortness of breath, nausea, vomiting, rapid heartbeat, loss of muscle coordination, and blue-colored skin. Methemoglobinemia can be

caused by injury or being exposed to certain drugs, chemicals, or foods. It can also be an inherited condition.

**methionine C 11:** A synthetic amino acid radiolabeled with carbon-11. Acting as a methyl donor, methionine C 11 is incorporated into macromolecules, where it serves as a positron emission tomography (PET) imaging agent for detecting tumors with high rates of protein synthesis.

**methodology :** In medicine, the rules and procedures for doing research and evaluating results.

**METHODS OF IONIZATION:** include photoionization (using light energy like ultraviolet rays), thermionic emission (using high temperature to boil off electrons), and electron bombardment (kick 'em out with a stream of electrons from another source).

**Methosarb:** (Other name for: calusterone)

**Methotrexate:** A competitive inhibitor of dihydrofolate reductase, an enzyme required for the regeneration of the coenzyme tetrahydrofolate, which is necessary for the synthesis of thymidylate; methotrexate is used as a chemotherapeutic agent. Also called amethopterin. OR An antimetabolite and antifolate agent with antineoplastic and immunosuppressant activities. Methotrexate binds to and inhibits the enzyme dihydrofolate reductase, resulting in inhibition of purine nucleotide and thymidylate synthesis and, subsequently, inhibition of DNA and RNA syntheses. Methotrexate also exhibits potent immunosuppressant activity although the mechanism(s) of actions is unclear.

**methotrexate :** A drug used to treat some types of cancer, rheumatoid arthritis, and severe skin conditions, such as psoriasis. Methotrexate stops cells from making DNA and may kill cancer cells. It is a type of antimetabolite. Also called amethopterin, MTX, and Rheumatex.

**Methotrexate LPF:** (Other name for: methotrexate)

**methotrexate-e therapeutic implant:** An injectable collagen matrix gel containing the antimetabolite methotrexate and the sympathicomimetic agent epinephrine with potential antineoplastic activity. After intratumoral injection, methotrexate binds to and inhibits the enzyme dihydrofolate reductase, resulting in inhibition of purine nucleotide and thymidylate synthesis and, subsequently, inhibition of DNA and RNA syntheses. Epinephrine, a potent vasoconstrictor, is added to the gel to enhance

penetration of methotrexate into the tumor tissue and reduce dispersion to the surrounding tissues thereby enhancing the local concentration of methotrexate and increasing its anti-tumor activity. Intratumoral injection of methotrexate combined with epinephrine may potentially increase chemotherapeutic efficacy compared to systemic administration and reduce systemic toxicity and side effects.

**methotrexate-encapsulating autologous tumor-derived microparticles:**

A suspension of autologous tumor-derived microparticles (ATMP), that are harvested from a patient with malignant pleural effusion, encapsulating the antimetabolic drug methotrexate (MTX), with potential anticancer activity. Although the exact mechanism(s) of action through which this agent exerts its effect has yet to be fully elucidated, upon administration of MTX-ATMP, the MTX moiety is released and internalized by tumor cells. It then binds to and inhibits the enzyme dihydrofolate reductase. This results in the inhibition of purine nucleotide synthesis and leads to decreased synthesis of both DNA and RNA, which induces cell death. Presumably, the encapsulation of MTX by the ATMP improves its bioavailability and decreases its toxicity.

**methoxsalen:** A naturally occurring substance isolated from the seeds of the plant *Ammi majus* with photoactivating properties. As a member of the family of compounds known as psoralens or furocoumarins, methoxsalen's exact mechanism of action is unknown; upon photoactivation, methoxsalen has been observed to bind covalently to and crosslink DNA. or A drug used together with UV light to treat psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma. It is also being studied in the treatment of graft-versus-host disease. It belongs to the family of drugs called psoralens and furocoumarins.

**methoxy polyethylene glycol epoetin beta:** A pegylated form of recombinant human erythropoietin, a glycosylated protein naturally produced in the kidney that stimulates erythrocyte production in the bone marrow. Methoxypolyethylene glycol epoetin beta may reverse anemias induced by cancer therapy.

**methoxyamine:** An orally bioavailable small molecule inhibitor with potential adjuvant activity. Methoxyamine covalently binds to apurinic/apyrimidinic (AP) DNA damage sites and inhibits base excision repair (BER), which may result in an increase in DNA strand breaks and

apoptosis. This agent may potentiate the anti-tumor activity of alkylating agents.

**methoxyamine hydrochloride :** A substance being studied in the treatment of cancer. It blocks the ability of a cell to repair damage to its DNA and may kill cancer cells. It may also help some anticancer drugs work better. It is a type of antineoplastic agent.

**methoxyflurane:** A fluorinated isopropyl ether with anesthetic and muscle relaxant activities. Although the mechanism of action has not been fully elucidated, upon inhalation, methoxyflurane acts through multiple mechanisms of action. This agent interferes with the release and re-uptake of neurotransmitters at post-synaptic terminals, and/or alters ionic conductance following receptor activation by a neurotransmitter, thereby disrupting neuronal transmission. In addition, this agent activates the inhibitory receptor gamma-aminobutyric acid (GABA). Altogether, this results in a general anesthetic effect and induces analgesia.

**methoxypolyethylene glycol epoetin beta :** A substance being studied in the treatment of anemia in patients who are receiving chemotherapy. It is a form of erythropoietin (a substance produced in the kidneys that stimulates the production of red blood cells) that has been changed in the laboratory. Also called Ro 50-3821.

**methyl alcohol :** A type of alcohol used to make antifreeze, pesticides, windshield wiper fluid, paint thinner, certain types of fuel, and other substances. Methyl alcohol catches fire easily and is very poisonous. It is one of many harmful chemicals found in tobacco smoke. Also called methanol and wood alcohol.

**Methyl Esters:** A material formed as a reaction between fats or fatty acids and methanol.

**Methyl ethyl ketone peroxide (MEKP):** An aliphatic peroxide, widely used for curing unsaturated polyester resins.

**methyl group :** A small molecule made of one carbon and three hydrogen atoms. Methyl groups are added or removed from proteins or nucleic acids and may change the way these molecules act in the body.

**Methyl Methacrylate:** Monomer commonly used in chain-addition polymerisations.

**Methyl methacrylate:** Unsaturated carboxylic acid ester used in the manufacture of resins and plastics.

**Methyl Tertiary Butyl Ether (MTBE):** Methyl tertiary butyl ether (MTBE) is a volatile, combustible, colourless liquid that is categorised as an oxygenate due to its ability to boost the oxygen content and octane rating of gasoline. It is relatively water soluble and exhibits an unpleasant taste and odour in solution. MTBE is produced from methanol and isobutylene, as is produced both by refiners to meet their own requirements and by major export-based producers in the Middle East, Europe and the United States. MTBE has marginal outlets as a solvent in chemical and medical applications, although its dominant end-use is as a gasoline additive. It is currently being phased out of the gasoline market in the USA due to concerns over groundwater contamination.

**methyl-5-aminolevulinate :** A drug used in photodynamic therapy; it is absorbed by tumor cells and, when exposed to light, becomes active and kills the cancer cells.

**methyl-5-aminolevulinate hydrochloride cream:** A topical cream formulation containing the hydrochloride salt of methyl-5-aminolevulinate, a lipophilic methyl ester of 5-aminolevulinic acid, with photosensitizer prodrug activity. Upon topical administration, methyl-5-aminolevulinate in the cream is selectively absorbed by tumor cells where it is converted to the photosensitizer protoporphyrin IX (PpIX). Upon photoirradiation, PpIX is activated and transfers energy to oxygen, generating singlet oxygen and superoxide and hydroxyl radicals, which may result in free-radical-mediated DNA damage and cell death.

**methyl:** A group  $-CH_3$ , derived from methane. For example,  $CH_3Cl$  is "methyl chloride" (systematic name: chloromethane);  $CH_3OH$  is "methyl alcohol" (systematic name: methanol).

**methylated:** Having a methyl group ( $CH_3$ ).

**methylation :** A chemical reaction in which a small molecule called a methyl group is added to other molecules. Methylation of proteins or nucleic acids may affect how they act in the body.

**methylene blue:** A synthetic basic dye. Methylene blue stains to negatively charged cell components like nucleic acids; when administered in the lymphatic bed of a tumor during oncologic surgery, methylene blue may stain lymph nodes draining from the tumor, thereby aiding in the visual

localization of tumor sentinel lymph nodes. When administered intravenously in low doses, this agent may convert methemoglobin to hemoglobin.

**methylene dimethane sulfonate:** A member of the homologous series of dimethane sulphonic acid esters with alkylating properties. Methylene dimethane sulfonate alkylates DNA, resulting in interstrand DNA crosslinking, inhibition of DNA replication, disruption of the cell cycle, and cell death.

**methylene group:** a — CH<sub>2</sub> group.

**methylmercaptapurine riboside:** A purine derivative with antineoplastic and anti-angiogenic properties. 6-methylmercaptapurine riboside (6-MMPR) inhibits amidophosphoribosyltransferase, the first committed step in de novo purine synthesis, and inhibits fibroblast growth factor-2 (FGF2)-induced cell proliferation.

**methylnaltrexone:** A methyl derivative of noroxymorphone with selective, opioid-receptor antagonistic activity. Methylnaltrexone displaces opioids from peripheral opioid receptors in the gastrointestinal tract, the bladder, and the skin, resulting in decreases in opioid-related constipation, urinary retention, and pruritis, respectively. Methylnaltrexone does not cross the blood-brain barrier and does not affect the centrally-mediated analgesic effect of opioids.

**methylnaltrexone :** The active ingredient in a drug used to relieve certain side effects caused by treatment with opioids (pain killers similar to morphine), such as constipation (hard, dry stools), itching, and low urine flow. Methylnaltrexone binds to opioid receptors outside the brain and may block the side effects of opioid drugs without affecting their ability to relieve pain. Methylnaltrexone is a type of peripheral opioid receptor antagonist.

**methylnaltrexone bromide :** A drug used to relieve certain side effects caused by treatment with opioids (pain killers similar to morphine), such as constipation (hard, dry stools), itching, and low urine flow. Methylnaltrexone bromide binds to opioid receptors outside the brain and may block the side effects of opioid drugs without affecting their ability to relieve pain. Methylnaltrexone bromide is a type of peripheral opioid receptor antagonist. Also called Relistor.

**methylphenidate hydrochloride:** The hydrochloride salt of the synthetic central nervous system stimulant methylphenidate. Methylphenidate appears to activate the brain stem arousal system and cortex to produce its stimulant effect and, in some clinical settings, may improve cognitive function. Check for active clinical trials using this agent. or A drug used to treat certain behavior disorders, such as attention deficit hyperactivity disorder (ADHD). It is also being studied as a way to improve brain function in patients treated with anticancer drugs. Methylphenidate hydrochloride acts on certain parts of the brain. It is a type of central nervous system stimulant. Also called Concerta and Ritalin.

**methylprednisolone:** A synthetic corticosteroid with anti-inflammatory and immunomodulating properties. Methylprednisolone binds to and activates specific nuclear receptors, resulting in altered gene expression and inhibition of proinflammatory cytokine production. This agent also decreases the number of circulating lymphocytes, induces cell differentiation, and stimulates apoptosis in sensitive tumor cell populations. Check for active clinical trials using this agent.

**Meti-derm:** (Other name for: prednisolone)

**metoclopramide :** A drug that increases the motility (movements and contractions) of the stomach and upper intestine. It is used to treat certain stomach problems and nausea and vomiting caused by chemotherapy. It is a type of antiemetic and a type of motility agent. Also called Reglan.

**metoclopramide hydrochloride:** The hydrochloride salt of the substituted benzamide metoclopramide, a para-aminobenzoic acid (PABA) derivative that is structurally related to procainamide, with gastroprokinetic and antiemetic activities. Metoclopramide binds to dopamine 2 (D2) receptors in the peripheral nervous system (PNS), antagonizing dopamine-mediated relaxation of gastrointestinal smooth muscle and promoting gastroprokinesis; the pyloric sphincter and the duodenal bulb are relaxed, peristalsis of the duodenum and jejunum increase, and gastric emptying and intestinal transit accelerate. This agent may also increase the resting tone of the lower esophagus sphincter (LES), preventing acid reflux. In the central nervous system (CNS), metoclopramide antagonizes D2 dopamine receptors in the chemoreceptive trigger zone (CTZ) of the medulla, thereby preventing nausea and vomiting.

**metoprine:** A diaminopyrimidine folate antagonist with potential antineoplastic activity. Metoprine inhibits dihydrofolate reductase, resulting in decreased cellular folate metabolism and cell growth; it also inhibits histamine-N-methyltransferase, resulting in decreased histamine catabolism. Lipid-soluble metoprine is capable of crossing the blood-brain barrier.

**metoprolol:** A cardioselective competitive beta-1 adrenergic receptor antagonist with antihypertensive properties and devoid of intrinsic sympathomimetic activity. Metoprolol antagonizes beta 1-adrenergic receptors in the myocardium, thereby reducing the rate and force of myocardial contraction leading to a reduction in cardiac output. This agent may also reduce the secretion of renin with subsequent reduction in levels of angiotensin II thereby preventing vasoconstriction and aldosterone secretion.

**Metric System:** The system of measurement used in almost all of science. It is a system based on measures of tens. Measures from the metric system include meters, liters, and grams.

**Metric ton:** Approximately 2,200 pounds.

**Metro I.V.:** (Other name for: metronidazole hydrochloride)

**Metrocort:** (Other name for: methylprednisolone)

**metronidazole :** A drug that is used to treat infection and is being studied in the treatment of cancer. It is a type of antibacterial, antiprotozoal, and anthelmintic. Also called Flagyl.

**metronidazole hydrochloride:** The hydrochloride salt of a synthetic nitroimidazole derivative with antiprotozoal and antibacterial activities. Although its mechanism of action is not fully elucidated, un-ionized metronidazole is readily taken up by obligate anaerobic organisms and is subsequently reduced by low-redox potential electron-transport proteins to an active, intermediate product. Reduced metronidazole causes DNA strand breaks, thereby inhibiting DNA synthesis and bacterial cell growth.

**metronomic therapy :** Continuous or frequent treatment with low doses of anticancer drugs, often given with other methods of therapy.

**Metvixia cream:** (Other name for: methyl-5-aminolevulinate hydrochloride cream)

**Metypred:** (Other name for: methylprednisolone)

**metyrosine:** A methylated tyrosine, a catecholamine synthesis antagonist with antihypertensive property. Metyrosine competitively inhibits tyrosine 3-monooxygenase, an enzyme that activates molecular oxygen to catalyze the hydroxylation of tyrosine to dihydroxyphenylalanine (Dopa), an intermediate to catecholamine (dopamine, norepinephrine, and epinephrine) production. This agent reduces the elevated levels of catecholamines associated with pheochromocytoma, thereby preventing hypertension.

**MeV linear accelerator :** A machine that uses electricity to form a stream of fast-moving subatomic particles. This creates high-energy radiation that may be used to treat cancer. Also called linac, linear accelerator, and megavoltage linear accelerator.

**Mevacor :** A drug used to lower the amount of cholesterol in the blood. It is also being studied in the prevention and treatment of some types of cancer. Mevacor is a type of HMG-CoA reductase inhibitor (statin). Also called lovastatin.

**Mevalonate:** A precursor for the synthesis of cholesterol; its formation by HMG-coa reductase constitutes the committed step in cholesterol biosynthesis.

**mevalonate pathway :** Describes a series of reactions in which proteins work together to make molecules. These molecules are part of many processes, including making cholesterol. Changes in this pathway may lead to cancer cell growth. Drugs or substances that affect this pathway are used to treat high cholesterol, and are being studied in the prevention and treatment of cancer and other diseases.

**Mexate:** (Other name for: methotrexate)

**Mexate-AQ:** (Other name for: methotrexate)

**Mexican:** Pertaining to Mexico, one of the major crude oil producers of Latin America. Petrologists now think the asteroid impact that helped kill off the dinosaurs (which crashed into Mexico 65 million years ago) also created the right geological conditions to form Mexico's petroleum deposits. Also sometimes used in a pejorative sense when referring to inhabitants of the state of Victoria.

**Mexican valerian :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden

valerian, Indian valerian, Pacific valerian, valerian, *Valeriana officinalis*, and *Valerianae radix*.

**MFI:** It stands for Melt Flow Index. It is the weight of polymer melt in grams extruded in 10 minutes through a standard nozzle or die under standard load condition at a certain temperature.

**mFOLFOX-6 :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called mFOLFOX-6 regimen, modified FOLFOX-6, and modified FOLFOX-6 regimen.

**mFOLFOX-6 regimen :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called mFOLFOX-6, modified FOLFOX-6, and modified FOLFOX-6 regimen.

**MG 98:** A second-generation, mixed-backbone, phosphorothioate antisense oligonucleotide (ODN) with potential antitumor activity. MG 98 is a highly specific inhibitor of translation of the mRNA for human DNA (cytosine-5-)-methyltransferase 1 (DNMT1), hybridizing to the 3' untranslated region of DNMT1 mRNA. The silencing of DNMT1 translation by MG 98 may result in the prevention or reversal of abnormal methylation of tumor suppressor genes and ultimately in tumor growth inhibition or tumor regression. or A substance being studied in the treatment of cancer. It blocks the production of a protein called DNA methyltransferase, which helps control gene expression. This may kill cancer cells that need DNA methyltransferase to grow. It is a type of antisense oligonucleotide.

**MGCD0103:** A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor. Also called mocetinostat.

**MGUS:** A benign condition in which there is a higher-than-normal level of a protein called M protein in the blood. Patients with MGUS are at an increased risk of developing cancer. Also called monoclonal gammopathy of undetermined significance.

**mho:** Units of conductivity that are used in the study of electricity.

**MIBG scan :** A procedure used to find neuroendocrine tumors, such as neuroblastomas and pheochromocytomas. A small amount of a substance called radioactive MIBG is injected into a vein and travels through the bloodstream. Neuroendocrine tumor cells take up the radioactive MIBG and are detected by a scanner. Also called iobenguane scan and metaiodobenzylguanidine scan.

**Mica:** Mineral silicates used in the manufacture of textured paints. OR A transparent, flaky mineral which splits into thin sheets and has excellent insulating and heat resisting properties, consisting of orthosilicates of aluminum or potassium; occurs naturally. OR Any of a group of mineral silicates crystallizing in monoclinic forms that readily separate into very thin leaves. Used as a filler for plastics molding materials.

**Micafungin:** A semi-synthetic echinocandin derived from a natural product of the fungus *Coleophoma empedri* with potent antifungal activity. Micafungin, like other cyclic lipopeptides, noncompetitively inhibits the fungal specific enzyme 1,3-beta-D-glucan synthase, an enzyme essential for fungal cell wall synthesis. Inhibition of this enzyme weakens of the cell wall, thereby leading to osmotic lysis and eventually, fungal cell death.

**micellar nanoparticle-encapsulated cisplatin NC-6004:** A nanoparticle-based prodrug formulation consisting of polymeric micelles incorporating the inorganic platinum agent cisplatin with potential antineoplastic activity. In micellar nanoparticle-encapsulated cisplatin NC-6004, cisplatin forms a polymer-metal complex with hydrophilic polyethylene glycol poly(glutamic acid) block copolymers by attaching to the micelle inner core consisting of the hydrophobic polymer polyamino acid. Upon cell entry and release from the polymer-metal complex, cisplatin forms highly reactive, charged platinum complexes that bind to nucleophilic groups such as GC-rich sites in DNA, inducing intrastrand and interstrand DNA cross-linking, DNA-protein cross-linking and, subsequently, tumor cell apoptosis and growth inhibition. Due to the hydrophilic nature of polyethylene glycol, this formulation increases the water-solubility of cisplatin and decreases the nephrotoxicity and neurotoxicity associated with the administration of cisplatin alone.

**MICELLE:** Colloidal aggregates of surfactant molecules. Micelles first form in a surfactant solution at a well-defined concentration known as the

Critical Micelle Concentration. (see RFF 705.10.03 - MICELLES). OR Organised blob of surfactant molecules with all the hydrophobic tails pointing inwards to create a tiny hydrophobic phase. If you try to dissolve surfactant molecules in water, you will succeed up to a point as more surfactant is added, and then any additional surfactant you add will form micelles. Under the same conditions, a particular surfactant will always form micelles of the same size and containing almost the same number of surfactant molecule. OR An aggregate of lipids in which the polar head groups face outward and the hydrophobic tails face inward; no solvent is trapped in the center. OR A globular structure formed by amphipathic molecules in which the hydrophilic part is exposed to water and the hydrophobic part is sequestered inside, away from the water. OR An aggregate of amphipathic molecules in water, with the nonpolar portions in the interior and the polar portions at the exterior surface, exposed to water. OR A tiny particle made of substances that are soluble in water and that come together to form a ball-like shape. These particles can carry other substances inside them. In medicine, micelles are made in the laboratory and are used to carry drugs to body tissues and cells.

**Michaelis constant:** OR The substrate concentration at which an enzyme-catalyzed reaction proceeds at one-half of the maximum velocity. The concentration of substrate at which half the active sites of an enzyme are filled; a ratio of rate constants for the reaction model.

**Michaelis-Menten constant (K<sub>m</sub>):** The substrate concentration at which an enzyme-catalyzed reaction proceeds at one-half its maximum velocity.

**Michaelis-Menten equation:** (also known as the Henri-Michaelis-Menten equation) An equation relating the reaction velocity to the substrate concentration of an enzyme. OR An equation that expresses the velocity (V) of an enzyme-catalyzed reaction in terms of maximum velocity (V<sub>max</sub>), substrate concentration (S), and the Michaelis-Menten constant (K<sub>M</sub>). The equation accounts for the hyperbolic kinetics observed when V is plotted as a function of S; the equation is  $V = V_{max} [S] / ([S] + K_M)$ .

**Michaelis-Menten equation:** The equation describing the hyperbolic dependence of the initial reaction velocity, V<sub>0</sub>, on substrate concentration, [S], in many enzyme-catalyzed reactions:

**Michaelis-Menten kinetics:** A kinetic pattern in which the initial rate of an enzyme-catalyzed reaction exhibits a hyperbolic dependence on substrate concentration.

**micro:** a prefix meaning one-millionth of a unit.

**Micro total analysis system (mTAS):** miniaturized system fabricated by the use of micromechanical technology capable of providing total chemical analysis on a microliter scale. The microdevice, fully integrated for example onto a silicon substrate (chip), performs: sample handling, reagent mixing, sample component separation and its analysis. A major area of interest has been the transfer of separation techniques such as capillary electrophoresis (CE) and high performance liquid chromatography (HPLC) to the chip format, coupled with detection systems such as spectrophotometric or conductometric detectors. MicroTAS can be also used in biochemistry for DNA chip analysis and drug discovery studies.

**Micro-:** A prefix that divides a unit into one million parts (0.000001). OR Prefix used in the SI system meaning "one millionth of". For example 1  $\mu\text{m}$  means "one millionth of a meter"; 3.1  $\mu\text{L}$  means " $3.1 \times 10^{-6}$  L".

**microarray :** A laboratory tool used to analyze large numbers of genes or proteins at one time. In a microarray, biologic molecules such as DNA, RNA, or protein are placed in a pattern onto a surface such as a glass slide. Other substances are added to these slides to detect specific patterns of molecules. Microarrays are being used to help diagnose diseases, such as cancer, and to develop treatments for them.

**microbicide :** Any substance or process that kills germs (bacteria, viruses, and other microorganisms that can cause infection and disease). Also called germicide.

**microbiome :** The collection of all the microorganisms and viruses that live in a given environment, including the human body or part of the body, such as the digestive system. The human microbiome may play a role in a person's health. Studying the human microbiome may help prevent and treat disease in the future.

**microbodies:** Cytoplasmic, membranebounded vesicles containing peroxideforming and peroxide-destroying enzymes; include lysosomes, peroxisomes, and glyoxysomes.

**microcalcification** : A tiny deposit of calcium in the breast that cannot be felt but can be detected on a mammogram. A cluster of these very small specks of calcium may indicate that cancer is present.

**microcephaly**: head circumference that is at least 2 standard deviations smaller than normal

**Microcurie**: One millionth of a curie. That amount of radioactive material that disintegrates (decays) at the rate of 37 thousand atoms per second.

**Microfilaments**: Filaments of actin approximately 7 nm in diameter; filaments (F-actin) are formed by the polymerization of G-actin monomers; a component of the cytoskeleton. OR Thin filaments composed of actin, found in the cytoplasm of eukaryotic cells; serve in structure and movement.

**microflora** : Bacteria and other organisms that live inside the intestines. They help digest food. Vitamins such as biotin and vitamin K are made by microflora. Also called gut flora, gut microflora, intestinal flora, and intestinal microflora.

**microfluidic device** : An instrument that uses very small amounts of fluid on a microchip to do certain laboratory tests. A microfluidic device may use body fluids or solutions containing cells or cell parts to diagnose diseases. Also called lab-on-a-chip.

**micrognathia**: abnormally small lower jaw

**microgram** : One millionth of a gram.

**microliter** : A measure of volume for a liquid, using the metric system. One microliter is equal to a millionth of a liter. Also called  $\mu\text{L}$ .

**micrometastasis** : Small numbers of cancer cells that have spread from the primary tumor to other parts of the body and are too few to be picked up in a screening or diagnostic test.

**micromolar**: Approximately  $1 \times 10^{-6}$  moles/liter. OR A concentration of 1/1,000,000 (one millionth) molecular weight per liter (mol/L).

**micromole** : The amount of a substance equal to a millionth of a mole (a measure of the amount of a substance). Also called  $\mu\text{M}$ .

**Micron**:  $\mu$ , one micron, one millionth of a meter. Also expressed as  $\mu\text{m}$  or micro-meter. OR A unit of length, equivalent to  $10^{-6}$  meters.

**Micronase**: (Other name for: glyburide)

**micronutrient :** A substance the body needs in tiny amounts to grow and stay healthy. Examples are vitamins and minerals.

**micronutrient-fortified probiotic yogurt:** An micronutrient-fortified fermented dairy product with potential positive immunomodulatory activity. Micronutrient-fortified probiotic yogurt contains various micronutrients in addition to beneficial microorganisms, such as strains of Lactobacillus. Probiotic Lactobacillus strains have been shown to protect against gastrointestinal and urogenital infections, to moderate diarrheal episodes, and to increase CD4 T-lymphocyte counts. In immunocompromised subjects, micronutrient supplementation may also increase CD4 T-lymphocyte counts.

**microorganism:** organisms (microbes) observable only through a microscope; larger, visible types are called macroorganisms.

**microorganism :** An organism that can be seen only through a microscope. Microorganisms include bacteria, protozoa, algae, and fungi. Although viruses are not considered living organisms, they are sometimes classified as microorganisms.

**Microporous:** A term used to describe paints which are permeable to water vapour allowing moisture to dry out through the paint coating without disruption of the paint film.

**microRNA :** A type of RNA found in cells and in blood. MicroRNAs are smaller than many other types of RNA and can bind to messenger RNAs (mRNAs) to block them from making proteins. MicroRNAs are being studied in the diagnosis and treatment of cancer. Also called miRNA.

**microsatellite :** Repetitive segments of DNA scattered throughout the genome in noncoding regions between genes or within genes (introns). They are often used as markers for linkage analysis because of their naturally occurring high variability in repeat number between individuals. These regions are inherently genetically unstable and susceptible to mutations. or A short sequence of DNA, usually 1 to 4 basepairs (a unit of DNA), that is repeated together in a row along the DNA molecule. There is variation from person to person in the number of repeats. There are hundreds of places in human DNA that contain microsatellites.

**microsatellite instability :** A characteristic of cells that contain an abnormality in DNA mismatch repair (see microsatellite). For example, the presence of MSI in colorectal tumor tissue may be used as a marker for

germline mutations in one of the DNA mismatch repair genes associated with HNPCC. MSI can also occur sporadically, and in these cases is related to gene hypermethylation. This is an issue in the differential diagnosis of HNPCC. Also called MSI. or A change that occurs in the DNA of certain cells (such as tumor cells) in which the number of repeats of microsatellites (short, repeated sequences of DNA) is different than the number of repeats that was in the DNA when it was inherited. The cause of microsatellite instability may be a defect in the ability to repair mistakes made when DNA is copied in the cell. Also called MSI.

**microscope :** An instrument that is used to look at cells and other small objects that cannot be seen with the eye alone.

**microscopic:** Seeing the situation at the particle level: atoms, molecules, or ions. OR Too small to be seen without a microscope.

**Microscopy:** Examination of crystals on a microscope by various techniques.

**microseism:** a very small seismic tremor. OR Closed vesicles formed by self-annealing fragments of the endoplasmic reticulum subsequent to following cell disruption. OR Membranous vesicles formed by fragmentation of the endoplasmic reticulum of eukaryotic cells; recovered by differential centrifugation.

**microsphere :** A very tiny, hollow, round particle made from glass, ceramic, plastic, or other materials. Microspheres injected into blood vessels that feed a tumor may kill the tumor by blocking its blood supply. They can also be filled with a substance that may help kill more tumor cells.

**microstaging :** A technique used to help determine the stage (extent) of melanoma and certain squamous cell cancers. A sample of skin that contains tumor tissue is examined under a microscope to find out how thick the tumor is and/or how deeply the tumor has grown into the skin or connective tissues.

**Microtubule:** A cytoskeleton element that is a major component of cilia, eukaryotic flagella, and the mitotic spindle; composed primarily of  $\alpha$ - and  $\beta$ -tubulin; capable of rapid assembly and disassembly. OR A narrow, hollow tube-like structure found in the cytoplasm (the fluid inside a cell) of plant and animal cells. Microtubules help support the shape of a cell. They also help chromosomes move during cell division and help small structures called cell organelles to move inside the cell. Certain anticancer drugs keep

microtubules from working the way they should. This may help keep cancer cells from dividing.

**Microtubule-organizing centers (mtocs):** Sites of the initiation of microtubule growth.

**microtubule-targeted agent BAL101553:** An orally available, highly water-soluble lysine prodrug of the synthetic small molecule BAL27862 with potential antitumor activity. Upon administration of BAL101553 and conversion into the active form BAL27862, this agent binds to tubulin at a site distinct from the vinca-alkaloid-binding site, and prevents tubulin polymerization and destabilizes microtubules, ultimately leading to cell cycle arrest, blockage of cell division and an induction of cell death in cancer cells.

**Microtubules:** Thin tubules, made from globular proteins, that serve multiple purposes in eukaryotic cells. OR Thin tubules assembled from two types of globular tubulin subunits; present in cilia, flagella, centrosomes, and other contractile or motile structures.

**microwave:** Electromagnetic radiation with wavelength between 3 mm and 30 cm.

**microwave acupuncture :** A type of acupuncture in which a microwave device is attached to an acupuncture needle to give microwave radiation at an acupuncture point.

**microwave therapy :** A type of treatment in which body tissue is exposed to high temperatures to damage and kill cancer cells or to make cancer cells more sensitive to the effects of radiation and certain anticancer drugs. Also called microwave thermotherapy.

**microwave thermotherapy :** A type of treatment in which body tissue is exposed to high temperatures to damage and kill cancer cells or to make cancer cells more sensitive to the effects of radiation and certain anticancer drugs. Also called microwave therapy.

**mid-latitude low:** low-pressure system that forms along a stationary front.

**mid-ocean ridge:** area between two diverging plates, where magma reaches the surface and causes an area of increased elevation and new crust along the ocean floor.

**midazolam :** A drug used to treat anxiety and tension and to relax muscles. It is also being studied in the treatment of nausea and vomiting caused by

some cancer treatments. It is a type of benzodiazepine. Also called midazolam hydrochloride and Versed.

**midazolam hydrochloride:** The hydrochloride salt of a short-acting benzodiazepine derivative with an imidazole structure and anxiolytic, amnestic, hypnotic, anticonvulsant and sedative properties. Midazolam binds to the benzodiazepine receptor at the gamma-aminobutyric acid (GABA) receptor-chloride ionophore complex in the central nervous system (CNS), resulting in increases in the opening of chloride channels, membrane hyperpolarization, and the inhibitory effect of GABA. This agent may also interfere with the reuptake of GABA, thereby causing accumulation of GABA in the synaptic cleft. or A drug used to treat anxiety and tension and to relax muscles. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of benzodiazepine. Also called midazolam and Versed.

**midazolam-containing buccal liquid:** An oromucosal solution containing the maleate salt form of midazolam, a short-acting benzodiazepine derivative, with anxiolytic, hypnotic, anticonvulsant and sedative activities. Upon administration of the solution into the buccal cavity, midazolam exerts its effect by binding to the benzodiazepine receptor at the gamma-aminobutyric acid (GABA) receptor-chloride ionophore complex in the central nervous system (CNS). This leads to an increase in the permeability of chloride channels, membrane hyperpolarization and enhances the inhibitory effect of GABA in the CNS. Midazolam may also interfere with the reuptake of GABA, thereby causing accumulation of GABA in the synaptic cleft. The oromucosal formulation facilitates administration to patients that are unable to swallow. The ethanol in this formulation improves the buccal absorption of midazolam.

**midbrain:** a portion of the brain that lies between the hindbrain and the forebrain that consists of a collection of crossing nerve tracts.

**Middle East:** Far North-West.

**midoceanic ridge:** a deep crustal fault on the ocean floor that separates crustal plates and generates new ocean crust.

**midostaurin:** A synthetic indolocarbazole multikinase inhibitor with potential antiangiogenic and antineoplastic activities. Midostaurin inhibits protein kinase C alpha (PKCalpha), vascular endothelial growth factor receptor 2 (VEGFR2), c-kit, platelet-derived growth factor receptor

(PDGFR) and FMS-like tyrosine kinase 3 (FLT3) tyrosine kinases, which may result in disruption of the cell cycle, inhibition of proliferation, apoptosis, and inhibition of angiogenesis in susceptible tumors. or A substance that is being studied in the treatment of leukemia. It belongs to the family of drugs called protein kinase inhibitors. Also called N-benzoyl-staurosporine and PKC412.

**midpoint:** the halfway point of a line segment, equidistant from each endpoint.

**mifamurtide:** A liposomal formulation containing a muramyl dipeptide (MDP) analogue with potential immunomodulatory and antineoplastic activities.. Muramyl tripeptide phosphatidylethanolamine (MTP-PE), a derivative of the mycobacterial cell wall component MDP, activates both monocytes and macrophages. Activated macrophages secrete cytokines and induce the recruitment and activation of other immune cells, which may result in indirect tumoricidal effects. Liposomal encapsulation of MTP-PE prolongs its half-life and enhances tissue targeting. or A drug being studied in the treatment of young adults with bone cancer that has gotten worse or come back. Mifamurtide activates certain types of white blood cells and helps the immune system kill cancer cells. It is a type of immunostimulant. Also called L-MTP-PE, MEPACT, and muramyl tripeptide phosphatidylethanolamine.

**Mifeprex :** A drug used to end early pregnancies. It is also being studied in the treatment of some types of cancer and other conditions. Mifeprex blocks the action of progesterone, a hormone that helps some cancers grow. It is a type of antiprogestone. Also called mifepristone and RU 486.

**mifepristone:** A derivative of the synthetic progestin norethindrone with antiprogestone activity. Mifepristone competitively binds to the progesterone receptor, resulting in inhibition of the effects of endogenous or exogenous progesterone. This agent also exhibits antigluocorticoid and weak antiandrogenic activities. or A drug used to end early pregnancies. It is also being studied in the treatment of some types of cancer and other conditions. Mifepristone blocks the action of progesterone, a hormone that helps some cancers grow. It is a type of antiprogestone. Also called Mifeprex and RU 486.

**miglitol:** A desoxynojirimycin derivative and inhibitor of alpha-glucosidase with antihyperglycemic activity. Miglitol binds to and inhibits

alpha-glucosidase, an enteric enzyme found in the brush border of the small intestines that hydrolyzes oligosaccharides and disaccharides into glucose and other monosaccharides. This prevents the breakdown of larger carbohydrates into glucose and decreases the rise in postprandial blood glucose levels. Compared to acarbose, miglitol is systemically absorbed. Check for active clinical trials using this agent.

**MIGRATION:** The exudation of an ingredient from one material by another material; such as the migration of a plasticizer from one material into an adjacent material with a lower plasticizer content. OR Also known as Bloom – an undesirable greasy cloud effect or white powdery deposit on the surface of a plastic product usually caused by the exudation of an additive such as lubricant, stabilizer, plasticizer, etc.

**Migration (also known as Bloom) :** An undesirable cloudy effect or whitish powdery deposit on the surface of a plastic article caused by the exudation of a compounding ingredient such as a lubricant, stabilizer pigment, plasticizer, etc.

**MiHA-loaded PD-L1/L2-silenced dendritic cell vaccine:** A dendritic cell (DC)-based vaccine composed of program death ligands 1 and 2 (PDL1/L2)-silenced DCs and loaded with the recipient's minor histocompatibility antigens (MiHA), with potential use for graft-versus-tumor (GVT) induction following allogeneic stem cell transplantation (allo-SCT). Donor DCs are electroporated ex vivo with MiHA mRNA and small interfering RNAs (siRNAs) designed to silence the expression of PD L1/L2. After allo-SCT and upon intravenous administration of the MiHA-loaded PD-L1/L2-silenced DC vaccine, the DCs induce the expansion and activation of MiHA-specific CD8-positive T-cells. These tumor antigen-reactive T-cells exert their GVT effect by killing MiHA-positive tumor cells. PD-L1/L2, co-inhibitory ligands expressed on DCs, play key roles in preventing MiHA-specific CD8-positive T-cell expansion; silencing enhances MiHA-specific CD8-positive T-cell expansion and activity and improves the GVT effect. The MiHA are human leukocyte antigen (HLA)-bound peptides and are exclusively expressed by the recipient's hematopoietic tumor cells.

**Mil:** One thousandth (0.001) of an inch (25.4 microns). Most common non-metric measurement of coating thickness. OR a unit of measurement equal to .001 inch. OR One thousandths ( 1/ 1000 ) of an inch expressed as

(001). The metric equivalent is 25.4 microns. OR a unit of measurement equal to .001 inch minimum wall a term designating the minimum thickness of the wall of a bottle.

**Milankovic period:** long term climate changes due the wobble of the Earth's revolution around the Sun.

**Milankovitch theory:** An astronomical theory formulated by the Yugoslav mathematician Milutin Milankovitch that associates climate change with fluctuations in the seasonal and geographic distribution of insolation determined by periodic variations of the Earth's eccentricity and obliquity and the longitude of the perihelion.

**milatuzumab:** A humanized monoclonal antibody directed against human CD74 with potential antineoplastic activity. Milatuzumab specifically binds to CD74 on CD74-positive cells. Although the exact mechanism through which this agent induces apoptosis is unknown, it may involve antibody-dependent cellular cytotoxicity (ADCC) or complement-mediated cytotoxicity (CMC). Alternatively, as CD74 is the cellular receptor for the cytokine migration-inhibitory factor (MIF), the cytotoxicity of this agent may be related to inhibition of CD74 activation by MIF. CD74, an integral membrane protein that functions as an MHC class II chaperone, may also be an accessory-signaling molecule; activation of CD74 may initiate cell survival mechanisms involving induction of a signaling cascade resulting in NFkB activation, entry of stimulated cells into the S phase of the cell cycle, elevation of DNA synthesis, cell division, and augmented expression of Bcl-xL. Check for active clinical trials using this agent. or A substance being studied in the treatment of multiple myeloma and several other types of cancer. It binds to CD74, a protein on the surface of myeloma cells and certain other types of cells. It may help kill cancer cells. Milatuzumab is a type of monoclonal antibody. Also called hLL1 and IMMU-110.

**milatuzumab-doxorubicin antibody-drug conjugate:** An immunoconjugate consisting of milatuzumab, a humanized monoclonal antibody against CD74, conjugated to the anthracycline antibiotic doxorubicin with potential antineoplastic activity. The milatuzumab moiety of this antibody-drug conjugate (ADC) selectively binds to CD74 on tumor cell surfaces; upon internalization, the doxorubicin moiety is released, where it intercalates between base pairs in the DNA helix and inhibits topoisomerase II, thereby preventing DNA replication and increasing

double-strand breakage. As a result, this agent may inhibit the proliferation of cancer cells that overexpress CD74. CD74, an integral membrane protein and tumor associated antigen (TAA), is overexpressed in certain cancer cells and promotes survival in rapidly proliferating tumor cells.

**MILDEW RESISTANCE:** The ability of a coating to resist the growth of molds and mildew. Mildew is particularly prevalent in moist, humid and warm climates.

**Mildewcides:** Chemical agent in quality paint that destroys mildew - a common problem in humid climates.

**Mile:** A non-metric unit of length which can be divided into 8 furlongs, 80 chains, 360 rods, 1760 yards, 5280 feet, 8000 links or 63360 inches. It is equal to 1609.344 metres, more or less.

**Milestrol:** (Other name for: diethylstilbestrol)

**milk duct :** A thin tube in the breast that carries milk from the breast lobules to the nipple. Also called breast duct.

**Milk of Magnesia:** (Other name for: magnesium hydroxide)

**milk protein-based energy drink:** An oral milk protein-based nutritional supplement. Milk protein-based energy drink is a flavored liquid that consists of milk protein, rapeseed and sunflower oils, carbohydrates, vitamins, minerals and trace-elements, providing 1.5kcal and 10 mg of protein per ml.

**milk thistle:** A substance derived from any of several Old World coarse prickly-leaved shrubs and subshrubs including the plant *Silybum marianum*. Milk thistle's active chemical component is silymarin, which is a combination of flavonoids such as silibinin, dehydrosilibinin, silychristin and silydianin. These compounds are antioxidants and may alter the membrane structure of the liver cell, thereby blocking the absorption of toxins; they may also stimulate the production of new liver cells. In addition, milk thistle may increase cellular adenosine triphosphate (ATP) levels, exhibiting dose-dependent cardiac myocyte cytoprotection against doxorubicin. The silibinin component of milk thistle has been shown to inhibit growth factor receptor-mediated mitogenic and cell survival signaling, thereby inhibiting tumor growth. (NCI04) or A plant that has been used in some cultures to treat certain medical problems, including stomach, liver, and gallbladder disorders. The active extract of milk thistle

seeds is called silymarin. It is being studied in the prevention of liver damage caused by some cancer treatments. Also called *Silybum marianum*.

**Milky Way galaxy:** the spiral galaxy that includes our solar system near its outer edge.

**Mill tailings:** Primarily, the sandy process waste material from a conventional uranium recovery facility. This naturally radioactive ore residue contains the radioactive decay products from the uranium chains (mainly the U-238 chain) and heavy metals. Although the milling process recovers about 93 percent of the uranium, the residues (known as "tailings") contain several naturally occurring radioactive elements, including uranium, thorium, radium, polonium, and radon. For further information, see Uranium Mill Tailings and the Backgrounder on Uranium Mill Tailings.

**Miller index:** A set of three integers used to designate the lattice planes of the crystal. Miller indices are used to designate: a) a set of lattice planes [e.g., the (010) plane], b) a particular member of this set, or c) a face of a macroscopic crystal [e.g., the (010) face].

**Milli-:** A prefix that divides a basic unit by 1000. OR Prefix used in the SI system meaning "one thousandth of". For example 1 mL means "one thousandth of a liter"; 1 mg means "one thousandth of a gram".

**milligram :** A measure of weight. A milligram is approximately 450,000 times smaller than a pound and 28,000 times smaller than an ounce.

**milligrams per liter (mg/l):** this is a weight per volume designation used in water and wastewater analysis.  $1\text{mg/L} = 1\text{ppm}$ .

**MILLIKAN OIL DROP EXPERIMENT:** measured the actual charge on an electron.

**milliliter :** A measure of volume in the metric system. One thousand milliliters equal one liter. Also called cc, cubic centimeter, and ml. OR A measure of length in the metric system. A millimeter is one thousandth of a meter. There are 25 millimeters in an inch.

**millimole :** The amount of a substance equal to a thousandth of a mole (a measure of the amount of a substance). Also called mM.

**Millirem:** One thousandth of a rem (0.001 rem).

**Milliroentgen (mR):** One thousandth of a roentgen (R).  $1\text{mR} = 10^{-3}\text{ R} = 0.001\text{ R}$ .

**Millscale:** Iron oxides, usually black in colour, which can be present in a complete layer on new steelwork. Although often firmly attached originally it can become loose and thus give rise to paint failure. Millscale should be completely removed prior to painting.

**milodistim:** A recombinant fusion protein derived from the coding sequences of two growth factors, interleukin-3 (IL-3) and granulocyte-macrophage colony-stimulating factor (GM-CSF). Milodistim exhibits greater receptor binding affinity and colony stimulating activity than its parent cytokines. This agent stimulates proliferation of immature hematopoietic cells and allows the stimulation and expansion of multi-lineage hematopoiesis from immature bone marrow progenitor cells.

**miltefosine:** An orally- and topically-active alkyl-phosphocholine compound with potential antineoplastic activity. Miltefosine targets cellular membranes, modulating cell membrane permeability, membrane lipid composition, phospholipid metabolism, and mitogenic signal transduction, resulting in cell differentiation and inhibition of cell growth. This agent also inhibits the anti-apoptotic mitogen-activated protein kinase (MAPK) pathway and modulates the balance between the MAPK and pro-apoptotic stress-activated protein kinase (SAPK/JNK) pathways, thereby inducing apoptosis. As an immunomodulator, miltefosine stimulates T-cells, macrophages and the expression of interleukin 3 (IL-3), granulocyte-macrophage colony stimulating factor (GM-CSF), and interferon gamma (INF-gamma).

**mimotope-P10s-PADRE peptide vaccine:** A peptide-based vaccine containing a carbohydrate mimetic peptide (CMP) P10s fused to the pan HLA DR-binding epitope (PADRE) peptide, with immunoadjuvant activity and potential antineoplastic activity. Upon injection of the mimotope-P10s-PADRE peptide vaccine, the P10s peptide, which mimics gangliosides and other tumor-associated carbohydrate antigens (TACA), both stimulates a cytotoxic T-lymphocyte (CTL) response towards cells expressing TACAs and induces the production of antibodies that are reactive with a broad set of TACAs. Additionally, the anti-TACA antibodies may interfere with cellular pathways involved in tumor cell survival and may induce antibody-dependent cellular cytotoxicity (ADCC) toward cells expressing TACAs. PADRE is a helper T-cell epitope that is able to increase the magnitude and duration of the CTL response.

**mind-body exercise** : A form of exercise that combines body movement, mental focus, and controlled breathing to improve strength, balance, flexibility, and overall health. Examples of mind-body exercises are yoga, tai chi, and qigong.

**mind-body modality** : A health practice that combines mental focus, controlled breathing, and body movements to help relax the body and mind. It may be used to help control pain, stress, anxiety, and depression, and for overall health. Examples of mind-body modalities include meditation, hypnosis, guided imagery, yoga, and tai chi. A mind-body modality is a type of complementary and alternative medicine. Also called mind-body practice.

**mind-body practice** : A health practice that combines mental focus, controlled breathing, and body movements to help relax the body and mind. It may be used to help control pain, stress, anxiety, and depression, and for overall health. Examples of mind-body practices include meditation, hypnosis, guided imagery, yoga, and tai chi. A mind-body practice is a type of complementary and alternative medicine. Also called mind-body modality.

**mindfulness relaxation** : A type of meditation based on the concept of being “mindful,” or having increased awareness, of the present. It uses breathing methods, guided imagery, and other practices to relax the body and mind and help reduce stress.

**Mineral:** Inorganic compounds usually found in crystalline form. They are made up of pure compounds or elements. Amethyst and quartz are good examples of minerals. These substances are not carbon-based or biologically active materials. A plant is not a mineral. A protein is not a mineral. Calcium Carbonate is a mineral. Granite is made up of minerals. or A mineral is a naturally occurring solid that consists entirely of a single element or compound. Or a combination of elements that forms an inorganic, naturally occurring crystalline solid of a definite chemical composition.

**mineral** : In medicine, a mineral is a nutrient that is needed in small amounts to keep the body healthy. Mineral nutrients include the elements calcium, magnesium, and iron.

**Mineral Color:** All minerals have colors that are unique to their chemical properties. Many minerals of the same compound have different colors

because of small impurities in the mineral structure. Color is always measured in natural light (not fluorescent).

**Mineral Hardness:** Hardness is measure of mineral properties. Some minerals are harder than others are. Diamonds are the hardest and something like talc or calcium carbonate is not hard at all. The harder a mineral, the less it will scratch. Friedrich Mohs designed the hardness scale.

**Mineral Luster:** When light is reflected from a mineral, it is called luster. All minerals reflect light in a unique way. Something like talc will not reflect much light while a diamond will reflect large amounts of light (vitreous). Other elements have a metallic shine.

**mineral oil :** A type of oil that is made from petroleum (mixture of oily liquids found in the earth). Mineral oil is used in laxatives, lubricants, creams, and lotions.

**Mineral Reinforcements :** Inorganic substances used as filler for plastics. Some common examples are:clay, mica, talc.

**Mineral Streak:** Minerals are often ground down into a powder. That powder can then be wiped across a white surface and leave a color streak. It is a more accurate alternative to measuring the color of the solid crystal.

**Mineral Transparency:** Transparency is a quality of how much light you can see through a substance. A window made of glass is very transparent while a piece of coal is not transparent at all. The several measures of transparency include transparent (clear), translucent (cloudy), and opaque (no light passes).

**Mineral Vein:** A strip of pure mineral found in a rock. Gold is often found in veins deep inside mountains.

**Mineralcorticoids:** A class of steroid hormones, synthesized by the adrenal cortex and exemplified by aldosterone, that act on the kidney to increase the absorption of  $\text{Na}^+$  and the excretion of  $\text{K}^+$  and  $\text{H}^+$ .

**minerals:** types of nutrients that include phosphorus, sulfur, potassium, magnesium, and zinc. OR The chemical substances from which rocks are made.

**minimal sedation :** A level of sedation in which a person is very relaxed and may be awake. The person is able to answer questions and follow instructions. Minimal sedation is caused by special drugs and is used to help

relieve anxiety during certain medical or surgical procedures. Also called anxiolysis.

**minimally invasive surgery :** Surgery that is done using small incisions (cuts) and few stitches. During minimally invasive surgery, one or more small incisions may be made in the body. A laparoscope (thin, tube-like instrument with a light and a lens for viewing) is inserted through one opening to guide the surgery. Tiny surgical instruments are inserted through other openings to do the surgery. Minimally invasive surgery may cause less pain, scarring, and damage to healthy tissue, and the patient may have a faster recovery than with traditional surgery.

**Minimum Specification:** The minimum values, usually of mechanical properties, that compounds, plastic extrusions, or other PVC profiles must meet by Quality Assurance prior to shipment. OR The minimum values, usually of mechanical properties, that a compound must meet by Quality Assurance prior to shipment.

**Minimum wall:** a term designating the minimum thickness of the wall of a bottle.

**Minnelide:** (Other name for: triptolide analogue)

**Minocin:** (Other name for: minocycline hydrochloride)

**minocycline hydrochloride:** The hydrochloride salt of minocycline, a broad spectrum long-acting derivative of the antibiotic tetracycline, with antibacterial and anti-inflammatory activities. Minocycline binds to the bacterial 30S ribosomal subunit and interferes with the binding of tRNA to the ribosomal complex, thereby inhibiting protein translation in bacteria. In addition, minocycline inhibits the inflammatory enzyme 5-lipoxygenase (5LOX) and may impede T cell-microglia interactions; both activities may contribute to minocycline's neuroprotective effects. 5LOX catalyzes the synthesis of inflammatory mediators such as prostaglandins and leukotrienes.

**minocycline-EDTA:** A combination preparation containing the broad-spectrum, semi-synthetic tetracycline antibiotic minocycline and the chelator ethylenediaminetetraacetate (EDTA) with antimicrobial and antibiofilm activities. Minocycline exhibits bacteriostatic activity by binding to the bacterial 30S ribosomal subunit and preventing binding of aminoacyl-tRNA to the mRNA-ribosome complex during protein translation; this results in an inhibition of bacterial protein synthesis and,

consequently, an inhibition of bacterial cell growth. EDTA may cause the dispersal and killing of biofilms by chelating metal ions important to the stabilization of biofilm structure. The two agents in this combination may act synergistically to eradicate bacteria embedded in biofilms. or A substance being studied in the prevention of bacterial infections that occur in catheters (thin tubes that carry fluids into or out of the body). It is a combination of minocycline, an antibiotic that blocks the growth of bacteria, and EDTA, a substance that keeps blood clots from forming. Minocycline-EDTA removes metals that bacteria use to form biofilms (thin layers stuck to surfaces). Also called M-EDTA.

**Minor groove:** A 6-Å-wide, 7.5-Å-deep groove in B-DNA that arises because the glycosidic bonds of a base pair are not diametrically opposite one another.

**minor product:** the product that forms in the least amount in a reaction.

**Mintezol:** (Other name for: thiabendazole)

**minute:** a subdivision of an angle, one-sixtieth of a degree.

**MIP test :** A test that measures the strength of the muscles used in breathing. A person inhales and exhales through a device called a manometer, and the pressures are recorded by a computer. Also called maximum inspiratory pressure test.

**mipsagargin:** A soluble, thapsigargin prodrug containing the cytotoxic analog of thapsigargin, 8-O-(12Aminododecanoyl)-8-O deutanoylthapsigargin (12-ADT) linked, via a carboxyl group, to the targeting peptide containing aspartic acid with potential antineoplastic activity. Upon intravenous administration, the non-toxic prodrug targets prostate specific membrane antigen (PSMA), a type II membrane carboxypeptidase, which is overexpressed in prostate cancer cells and in the neovasculature of most solid tumors but not in normal blood vessels. Mipsagargin is subsequently converted, through hydrolysis, into the active cytotoxic analog of thapsigargin 12-ADT-Asp. 12-ADT binds to and blocks the Sarcoplasmic/Endoplasmic Reticulum Calcium ATPase (SERCA) pump, thereby increasing the concentration of cytosolic calcium which leads to an induction of apoptosis. By preventing nutrient supply to tumor cells, mipsagargin may be able to inhibit tumor growth. Compared to thapsigargin alone, mipsagargin is able to achieve higher concentrations of the active agents at the tumor site while avoiding systemic toxicity.

**mirabegron:** An orally bioavailable agonist of the human beta-3 adrenergic receptor (ADRB3), with muscle relaxing, neuroprotective and potential antineoplastic activities. Upon oral administration, mirabegron binds to and activates ADRB3, which leads to smooth muscle relaxation. Mirabegron also restores sympathetic stimulation in mesenchymal stem cell (MSC) niches, inhibits JAK2-mutated hematopoietic stem cell (HSC) expansion and blocks the progression of myeloproliferative neoplasms (MPNs). Lack of sympathetic stimulation of the MSC and HSC niches is associated with the development of MPNs.

**Miraluma:** (Other name for: Tc 99m sestamibi)

**Miraluma test :** A type of breast imaging test that is used to detect cancer cells in the breasts of some women who have had abnormal mammograms, or who have dense breast tissue. It is not used for screening or in place of a mammogram. In this test, a woman receives an injection of a small amount of a radioactive substance called technetium 99, which is taken up by cancer cells, and a gamma camera is used to take pictures of the breasts. Also called scintimammography and sestamibi breast imaging.

**Mirapex:** (Other name for: pramipexole dihydrochloride)

**Mircera:** (Other name for: methoxy polyethylene glycol epoetin beta)

**Mirena:** (Other name for: levonorgestrel-releasing intrauterine system)

**miRNA:** A type of RNA found in cells and in blood. miRNA are smaller than many other types of RNA and can bind to messenger RNAs (mRNAs) to block them from making proteins. miRNA are being studied in the diagnosis and treatment of cancer. Also called microRNA.

**Mirror plane:** A crystallographic plane corresponding to a reflection operation (see Table 1.1).

**mirtazapine:** A synthetic tetracyclic derivative of the piperazino-azepines with antidepressant activity. Although its mechanism of action is unknown, mirtazapine enhances central adrenergic and serotonergic transmission, possibly by acting as an antagonist at central presynaptic alpha 2 adrenergic inhibitory autoreceptors and heteroreceptors. This agent is a potent antagonist of 5-hydroxytryptamine type 2 (5-HT<sub>2</sub>), 5-HT<sub>3</sub>, and histamine 1 (H<sub>1</sub>) receptors, and a moderate antagonist of peripheral alpha 1 adrenergic and muscarinic receptors.

**mirtazapine** : A drug used to treat depression. Mirtazapine increases the levels of the chemicals serotonin and norepinephrine in the brain, which helps improve mood. It is a type of antidepressant. Also called Remeron.

**mirvetuximab soravtansine**: An immunoconjugate consisting of the humanized monoclonal antibody M9346A against folate receptor 1 (FOLR1) conjugated, via the disulfide-containing cleavable linker sulfo-SPDB, to the cytotoxic maytansinoid DM4, with potential antineoplastic activity. The anti-FOLR1 monoclonal antibody moiety of mirvetuximab soravtansine targets and binds to the cell surface antigen FOLR1. After antibody-antigen interaction and internalization, the immunoconjugate releases DM4, which binds to tubulin and disrupts microtubule assembly/disassembly dynamics, thereby inhibiting cell division and cell growth of FOLR1-expressing tumor cells. FOLR1, a member of the folate receptor family is overexpressed on a variety of epithelial-derived cancer cells. The sulfo-SPDB linker prevents cleavage in the bloodstream and may improve this agent's efficacy in multidrug resistant tumor cells.

**miscible**: Two liquids are considered "miscible" or mixable if shaking them together results in a single liquid phase, with no meniscus visible between layers of liquid.

**Mismatch**: Unequal cross-sectional match between the two mold halves, seen in silicone injection molded parts.

**Mismatch repair**: The replacement of a base in a heteroduplex structure by one that forms a Watson-Crick base pair.

**misonidazole**: A nitroimidazole with radiosensitizing and antineoplastic properties. Exhibiting high electron affinity, misonidazole induces the formation of free radicals and depletes radioprotective thiols, thereby sensitizing hypoxic cells to the cytotoxic effects of ionizing radiation. This single-strand breaks in DNA induced by this agent result in the inhibition of DNA synthesis.

**misoprostol** : A radioprotective agent that belongs to the family of drugs called prostaglandins.

**misplaced modifier**: modifiers that do not clearly relate to the word they are modifying.

**Missense mutation**: A change in which a codon for one amino acid is replaced by a codon for another amino acid.

**missense mutation :** A single base pair substitution that alters the genetic code in a way that produces an amino acid that is different from the usual amino acid at that position. Some missense mutations will alter the function of the protein.

**Misses:** Unfortunately, no. Youâ€™ll need to thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Then rub down with a suitable abrasive and dust off before applying a new coat of paint to the affected area.

**Mississippi:** Basically Queensland with rather fewer beaches. The oppressed minority population of Mississippi could not vote until the 1860s! The geological epoch known as the Carboniferous (286-360 years before present) in which many of the world's major coal deposits were deposited, is divided into the Mississippian (286-320 ybp) and Pennsylvanian (320-360 ybp) in American-speaking countries.

**Mississippi Valley-type deposit:** a concentration of lead and zinc thought to be deposited in porous limestones and sandstones by low-temperature water that was driven out of deeper sediments by compaction.

**mist:** Liquid particles 40 to 500 microns in diameter that are formed by condensation of vapor in air.

**Mist coat:** A thin and thinly applied coat of paint, usually emulsion on bare plaster, which acts as a 'sealer'.

**mistake:** A mistake is a measurement which is known to be incorrect due to carelessness, accidents, or the ineptitude of the experimenter. It's important to distinguish mistakes from errors: mistakes can be avoided. Errors can be minimized but not entirely avoided, because they are part of the process of measurement. Data that is mistaken should be discarded. Data that contains errors can be useful, if the sizes of the errors can be estimated.

**mistletoe :** A semiparasitic plant that grows on some types of trees. Mistletoe extracts are being studied as treatments for cancer.

**mistletoe extract:** An extract of the whole plant *Viscum album* (mistletoe) with potential biological response modifier (BRM) activity. Mistletoe extract may both stimulate the antitumoral functions of the immune system and have a direct toxic effect on tumor cells.

**mistletoe lectin :** A substance that comes from the mistletoe plant and that is being studied as a treatment for cancer. A lectin is a complex molecule that has both protein and sugars. Lectins are able to bind to the outside of a cell and cause biochemical changes in it. Lectins are made by both animals and plants.

**Mithracin:** (Other name for: plicamycin) OR A drug used to treat some types of testicular cancer. It is also used to treat a higher-than-normal amounts of calcium in the blood or urine. Mithracin binds to DNA and prevents cells from making RNA and proteins. It is a type of antineoplastic antibiotic. Also called mithramycin and plicamycin.

**mithramycin :** A drug used to treat some types of testicular cancer. It is also used to treat a higher-than-normal amounts of calcium in the blood or urine. Mithramycin binds to DNA and prevents cells from making RNA and proteins. It is a type of antineoplastic antibiotic. Also called Mithracin and plicamycin.

**mitigate :** To make milder or less painful.

**mitochondria :** Small structures in a cell that are found in the cytoplasm (fluid that surrounds the cell nucleus). Mitochondria make most of the energy for the cell and have their own genetic material that is different from the genetic material found in the nucleus. Many diseases are caused by mutations (changes) in the DNA of mitochondria. Mitochondria are cell organelles.

**Mitochondrial diseases:** A set of diseases resulting from mutations in mitochondrial DNA; most prevalent in tissues that depend heavily on oxidative phosphorylation, such as the heart and nervous system.

**mitochondrion:** A membrane-bound organelle that carries out oxidative phosphorylation and produces most of the ATP in eucaryotic cells. OR the organelle that is the site of energy production in eukaryotic cells. OR An organelle, found in eukaryotic cells, in which oxidative phosphorylation takes place. It contains its own genome and unique ribosomes to carry out protein synthesis of only a fraction of the proteins located in this organelle. OR An oval-shaped organelle, about 2 μm in length and 0.5 μm in diameter, that is the site of oxidative phosphorylation, the enzymes of the citric acid cycle, and the enzymes of fatty acid oxidation. OR Membrane-bounded organelle in the cytoplasm of eukaryotes; contains the enzyme

systems required for the citric acid cycle, fatty acid oxidation, electron transfer, and oxidative phosphorylation.

**MitoGel:** (Other name for: sustained-release mitomycin C hydrogel formulation)

**mitoguazone:** A guanyldihydrazone with potential antineoplastic activity. Mitoguazone competitively inhibits S-adenosyl-L-methionine decarboxylase (SAMDC), an enzyme involved in the synthesis of polyamines, resulting in decreased proliferation of tumor cells, antimitochondrial effects, and p53-independent apoptosis. Polyamines, specifically spermine and spermidine, are essential for thymidine kinase production, DNA synthesis, and cell proliferation.

**mitoguazone dihydrochloride :** A substance being studied in the treatment of some leukemias and lymphomas. It blocks the growth of cells and may cause cancer cells to die. It is a type of polyamine synthesis inhibitor.

**mitolactol:** A synthetic derivative of hexitol with antineoplastic and radiosensitizing properties. Mitolactol alkylates DNA via actual or derived epoxide groups, resulting in inhibition of DNA and RNA synthesis. Or An anticancer drug that belongs to the family of drugs called alkylating agents.

**mitomycin C:** A methylaziridinopyrroloindoleone antineoplastic antibiotic isolated from the bacterium *Streptomyces caespitosus* and other *Streptomyces* bacterial species. Bio-reduced mitomycin C generates oxygen radicals, alkylates DNA, and produces interstrand DNA cross-links, thereby inhibiting DNA synthesis. Preferentially toxic to hypoxic cells, mitomycin C also inhibits RNA and protein synthesis at high concentrations. Check for active clinical trials using this agent. or A drug used to treat advanced cancer of the stomach and pancreas that has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Mitomycin C comes from bacteria. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called Mitozytrex and Mutamycin.

**Mitosis:** The process whereby replicated chromosomes segregate equally toward opposite poles prior to cell division. OR The multistep process in eukaryotic cells that results in the replication of chromosomes and cell division. OR The process by which a single parent cell divides to make two new daughter cells. Each daughter cell receives a complete set of

chromosomes from the parent cell. This process allows the body to grow and replace cells.

**mitosis-angiogenesis inhibitor R1530:** A pyrazolobenzodiazepine small molecule with potential antiangiogenesis and antineoplastic activities. Mitosis-angiogenesis inhibitor (MAI) R1530 inhibits multiple receptor tyrosine kinases involved in angiogenesis, such as vascular endothelial growth factor receptor (VEGFR)-1, -2, -3, platelet-derived growth factor receptor (PDGFR) beta, FMS-like tyrosine kinase (Flt)-3, and fibroblast growth factor receptor (FGFR) -1, -2. In addition, this agents exhibits anti-proliferative activity by initiating mitotic arrest and inducing apoptosis.

**mitotane:** A synthetic derivative of the insecticide dichlorodiphenyl trichloroethane (DDT) with anti-adrenocorticoid properties. Following its metabolism in the adrenal cortex to a reactive acyl chloride intermediate, mitotane covalently binds to adrenal proteins, specifically inhibiting adrenal cortical hormone production. or An anticancer drug used in treating adrenocortical cancer and ACTH-producing pituitary tumors (Cushing disease).

**mitotic activity :** Having to do with the presence of dividing (proliferating) cells. Cancer tissue generally has more mitotic activity than normal tissues.

**mitotic cycle :** The process a cell goes through each time it divides. The mitotic cycle consists of a series of steps during which the chromosomes and other cell material double to make two copies. The cell then divides into two daughter cells, each receiving one copy of the doubled material. The mitotic cycle is complete when each daughter cell is surrounded by its own outer membrane. Also called cell cycle.

**mitotic index :** In a population of cells, the ratio of the number of cells undergoing mitosis (cell division) to the number of cells not undergoing mitosis.

**mitotic inhibitor :** A type of drug that blocks cell growth by stopping mitosis (cell division). They are used to treat cancer. Also called antimitotic agent.

**mitotic rate :** A measure of how fast cancer cells are dividing and growing. To find the mitotic rate, the number of cells dividing in a certain amount of cancer tissue is counted. Mitotic rate is used to help find the

stage of melanoma (a type of skin cancer) and other types of cancer. Higher mitotic rates are linked with lower survival rates. Also called MR.

**mitoxantrone hydrochloride:** The hydrochloride salt of an anthracenedione antibiotic with antineoplastic activity. Mitoxantrone intercalates into and crosslinks DNA, thereby disrupting DNA and RNA replication. This agent also binds to topoisomerase II, resulting in DNA strand breaks and inhibition of DNA repair. Mitoxantrone is less cardiotoxic compared to doxorubicin. or A drug used with other drugs to treat acute myeloid leukemia (AML) and advanced prostate cancer that did not get better with hormone therapy. It is also used to treat certain forms of multiple sclerosis (MS). It is also being studied in the treatment of other types of cancer. Mitoxantrone hydrochloride damages the cell's DNA and may kill cancer cells. It may also stop certain immune cells from causing damage to the brain and spinal cord. Mitoxantrone hydrochloride is a type of antitumor antibiotic.

**Mitozytrex :** A drug used to treat advanced cancer of the stomach and pancreas that has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Mitozytrex comes from bacteria. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called mitomycin C and Mutamycin.

**Mitre:** A joint between two pieces at an angle to one another so that the line of the joint bisects the angle.

**mivobulin isethionate:** The isethionate salt of mivobulin, a synthetic colchicine analogue with potential antineoplastic activity. Mivobulin isethionate binds to tubulin, thereby inhibiting microtubule polymerization and mitosis. or An anticancer drug that belongs to the family of drugs called mitotic inhibitors. Also called CI-980.

**mixed bacteria vaccine:** A cancer vaccine containing a mixture of killed bacteria with potential immunostimulatory and antineoplastic activities. Mixed bacteria vaccine (MBV or Coley's toxins) consists of a pyrogenic bacterial lysate derived from *Serratia marcescens* and *Streptococcus pyogenes*; the active components in the lysate may be lipopolysaccharide (LPS), a component of the Gram-negative bacterial cell wall of *Serratia*, and streptokinase, an enzyme produced by *Streptococcus pyogenes*. LPS has been shown to stimulate the host humoral immune response and induce

the release of various antitumor cytokines such as tumor necrosis factor (TNF) and interleukin-12 (IL-12).

**Mixed C4:** Mixed C4 is the term used to describe the mixture of four carbon compounds that are commonly produced from a steam cracker. Four carbon compounds differ from the shorter olefins in that they can be formed in a variety of structures, being straight or branched and with one or two double bonds. These separate chemicals can either be separated within the steam cracker, or alternatively at separate dedicated extraction units.

**mixed glioma :** A brain tumor that forms from more than one type of brain cell, usually astrocytes and oligodendrocytes.

**mixed glyceride:** A diglyceride or triglyceride that contains more than one type of fatty acid connected to glycerol via an ester linkage. Natural oils and fats usually contain several different mixed glycerides.

**Mixed oxide (MOX) fuel:** A type of nuclear reactor fuel (often called "MOX") that contains plutonium oxide mixed with either natural or depleted uranium oxide, in ceramic pellet form. (This differs from conventional nuclear fuel, which is made of pure uranium oxide.) Using plutonium reduces the amount of highly enriched uranium needed to produce a controlled reaction in commercial light-water reactors. However, plutonium exists only in trace amounts in nature and, therefore, must be produced by neutron irradiation of uranium-238 or obtained from other manufactured sources. As directed by Congress, the NRC regulates the fabrication of MOX fuel by DOE, a program that is intended to dispose of plutonium from international nuclear disarmament agreements. For further detail, see the Backgrounder on Mixed Oxide Fuel and Frequently Asked Questions About Mixed Oxide Fuel.

**mixed-function oxidases (oxygenases):** Enzymes, often flavoproteins, that use molecular oxygen (O<sub>2</sub>) to simultaneously oxidize a substrate and a cosubstrate (commonly NADH or NADPH).

**Mixed-Xylenes:** Mixed xylenes refers to a mixture of xylene isomers, meta-xylene, ortho-xylene and para-xylene, which are obtained from various sources within a refinery or steam cracker. Although they can be used in a mixture for solvents, they are usually separated and used as feedstock for a limited range of intermediates. They are one of the "aromatic" compounds, along with benzene and toluene. The largest use is para-xylene for polyester production.

**mixture:** Composed of two or more substances, but each keeps its original properties. OR A grouping together of two or more substances in which each retains its original properties. OR Mixtures are substances held together by physical, not chemical, forces. Most things you find things in nature are mixtures. Rocks, the ocean, and just about everything is a mixture. OR several substances put together that can be easily separated by physical means. OR Two or more substances loosely joined together. The substances are not chemically joined together. Mixtures can usually be separated into their components quite easily.

**mixture problems:** Word problems that involve mixing two or more items to create a new mixture. Often, these are chemistry problems, but they can include problems in which two different types of nuts are mixed to create mixed nuts, and so on.

**MK-0646:** A substance being studied in the treatment of many types of cancer. MK-0646 binds to a protein called insulin-like growth factor receptor (IGFR) on the surface of cells. This may prevent the cells from growing when IGF is present. It may also kill cancer cells. MK-0646 is a type of monoclonal antibody. Also called anti-IGF1R recombinant monoclonal antibody MK-0646.

**MK0731:** A synthetic small molecule with potential antineoplastic activity. MK0731 selectively inhibits kinesin spindle protein (KSP), which may result in the inhibition of mitotic spindle assembly, induction of cell cycle arrest during the mitotic phase, and apoptosis in tumor cells that overexpress KSP.

**MK0752:** A substance being studied in the treatment of cancer. It blocks signals between growing cells and may kill cancer cells. It is a type of signal transduction inhibitor.

**MKC-1:** An orally bioavailable, small-molecule, bisindolylmaleimide cell cycle inhibitor with potential antineoplastic activity. MKC-1 and its metabolites inhibit tubulin polymerization, blocking the formation of the mitotic spindle, which may result in cell cycle arrest at the G2/M phase and apoptosis. In addition, this agent has been shown to inhibit the activities of the oncogenic kinase Akt, the mTOR pathway, and importin-beta, a protein essential to the transport of other proteins from the cytosol into the nucleus.

**MKNK1 inhibitor BAY 1143269:** An orally bioavailable inhibitor of mitogen-activated protein kinase interacting serine/threonine-protein kinase

1 (MKNK1), with potential antineoplastic activity. Upon oral administration, MKNK1 inhibitor BAY 1143269 binds to MKNK1, thereby preventing its activation and the downstream MKNK1-mediated phosphorylation and activation of eukaryotic translation initiation factor 4E (eIF4E). As eIF4E enhances the synthesis of oncogenic proteins, preventing eIF4E activity inhibits the synthesis of tumor angiogenic factors and leads to both the inhibition of cellular proliferation and apoptosis in susceptible tumor cells. eIF4E, overexpressed in a variety of cancer cells, plays a key role in tumor cell proliferation and survival.

**ml** : A measure of volume in the metric system. One thousand mls equal one liter. Also called cc, cubic centimeter, and milliliter.

**MLN1202**: A substance being studied as a treatment for atherosclerosis (a build-up of fat in the arteries). It is also being studied in the treatment of cancers that spread to the bone. MLN1202 binds to a protein called CCR2, which is found on the surface of certain bone cells, white blood cells, and cancer cells. MLN1202 blocks the action of a substance that is involved in keeping healthy bone mass. It may help keep the cancer cells from spreading to and growing in the bone. It is a type of monoclonal antibody. Also called anti-CCR2 monoclonal antibody MLN1202.

**MLN2704**: An immunoconjugate that consists of a humanized monoclonal antibody (MLN591), directed against prostate-specific membrane antigen linked to a maytansinoid (DM1). The monoclonal antibody moiety of MLN2704 binds to tumor cells expressing prostate-specific membrane antigen; MLN274 is then internalized into the tumor cell where the DM1 maytansinoid moiety binds to tubulin and inhibits tubulin polymerization and microtubule assembly, resulting in a disruption of microtubule activity and cell division, and cell death. or A substance that is being studied in the treatment of prostate cancer. It belongs to the family of drugs called antibody drug conjugates. Also called MLN591DM1.

**MLN518**: A substance being studied in the treatment of some types of cancer. It may stop cancer cell growth by blocking certain enzymes. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called CT53518 and tandutinib.

**MLN591DM1**: A substance that is being studied in the treatment of prostate cancer. It belongs to the family of drugs called antibody drug

conjugates. Also called MLN2704.

**MLPA:** A laboratory method commonly used for the detection of unusual copy number changes (insertions or deletions) of genomic sequences. Also called multiplex ligation-dependent probe amplification.

**mM :** The amount of a substance equal to a thousandth of a mole (a measure of the amount of a substance). Also called millimole.

**MMA:** Methyl methacrylate monomer

**MMMT:** A rare type of tumor that is a mixture of carcinoma and sarcoma cells. MMMT usually occurs in the uterus. Also called malignant mixed Müllerian tumor.

**MNDO:** A semi-empirical method ("minimal neglect of differential overlap").

**MNK1/2 inhibitor eFT508:** An orally bioavailable inhibitor of mitogen-activated protein kinase (MAPK)-interacting serine/threonine-protein kinase 1 (MNK1) and 2 (MNK2), with potential antineoplastic activity. Upon oral administration, MNK1/2 inhibitor eFT508 binds to and inhibits the activity of MNK1 and 2. This prevents MNK1/2-mediated signaling, and inhibits the phosphorylation of certain regulatory proteins, including eukaryotic translation initiation factor 4E (eIF4E), that regulate the translation of messenger RNAs (mRNAs) involved in tumor cell proliferation, angiogenesis, survival and immune signaling. This inhibits tumor cell proliferation in MNK1/2-overexpressing tumor cells. MNK1/2 are overexpressed in a variety of tumor cell types and promote phosphorylation of eIF4E; eIF4E is overexpressed in many tumor cell types and contributes to tumor development, maintenance and resistance.

**MnSOD mimetic BMX-001:** A third generation, cationic, lipophilic, manganese (Mn) and porphyrin-based mimetic of the human mitochondrial manganese superoxide dismutase (MnSOD), with antioxidant and potential chemoprotective activities. Upon administration, MnSOD mimetic BMX-001 is internalized by cells and mimics the activity of MnSOD by scavenging reactive oxygen species (ROS), such as superoxide anion, hydrogen peroxide, and hydroxyl radical. This prevents oxidative damage to macromolecules such as DNA and minimizes oxygen free radical-related chemotoxicity in normal tissues. This agent was designed to be more lipophilic and less toxic than first and second generation Mn-porphyrin mimetics. Check for active clinical trials using this agent.

**MnSOD-plasmid liposomes:** A plasmid DNA encoding human manganese superoxide dismutase (MnSOD) and liposomally encapsulated with potential chemoprotective activity. When administered orally and localizing in the esophagus, MnSOD-plasmid liposomes express MnSOD, which scavenges reactive oxygen species (ROS); MnSOD scavenging of ROS may result in a reduction in ROS-mediated lipid peroxidation, apoptosis, and micro-ulceration in the epithelial lining of the esophagus.

**MO:** Molecular orbital.

**MOAB Ch14.18:** A drug used with granulocyte-macrophage colony-stimulating factor (GM-CSF), aldesleukin (IL-2), and 13-cis-retinoic acid to treat high-risk neuroblastoma. It is used in children whose disease has improved with other anticancer treatment. MOAB Ch14.18 binds to a substance called GD2, which is found on some types of cancer cells. MOAB Ch14.18 may block GD2 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Ch14.18, dinutuximab, monoclonal antibody Ch14.18, and Unituxin.

**MoAb HuM195:** A substance being studied in the treatment of myelodysplastic syndromes and some types of leukemia. It binds to CD33, a protein on the surface of certain normal blood stem cells and some abnormal blood cells. It causes the immune system to kill these cells. MoAb HuM195 is a type of monoclonal antibody. Also called lintuzumab and monoclonal antibody HuM195.

**Mobec:** (Other name for: meloxicam)

**Mobic:** (Other name for: meloxicam)

**Mobicox:** (Other name for: meloxicam)

**Mobile genetic element:** A segment of the genome that can move as a unit from one location on the genome to another, without any requirement for sequence homology.

**Mobista:** (Other name for: recombinant flt3 ligand)

**Mobius :** Technique where return path is arranged to make the belt turn itself over each successive passes through the system.

**mocetinostat:** A rationally designed, orally available, Class 1-selective, small molecule, 2-aminobenzamide HDAC inhibitor with potential antineoplastic activity. Mocetinostat binds to and inhibits Class 1 isoforms of HDAC, specifically HDAC 1, 2 and 3, which may result in epigenetic

changes in tumor cells and so tumor cell death; although the exact mechanism has yet to be defined, tumor cell death may occur through the induction of apoptosis, differentiation, cell cycle arrest, inhibition of DNA repair, upregulation of tumor suppressors, down regulation of growth factors, oxidative stress, and autophagy, among others. Overexpression of Class I HDACs 1, 2 and 3 has been found in many tumors and has been correlated with a poor prognosis. A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor. Also called MGCD0103.

**modafinil:** A synthetic central nervous system stimulant with wakefulness-promoting activity. Modafinil appears to inhibit dopamine reuptake, resulting in an increase in extracellular dopamine. This agent exhibits pronounced wakefulness-promoting activity (without sympathomimetic activity) and may improve cognitive function in certain clinical settings. or A drug that is being studied as a treatment for fatigue in patients with cancer. It belongs to the family of drugs called stimulants.

**modality :** A method of treatment. For example, surgery and chemotherapy are treatment modalities.

**mode of inheritance :** The manner in which a genetic trait or disorder is passed from one generation to the next. Autosomal dominant, autosomal recessive, X-linked dominant, X-linked recessive, multifactorial, and mitochondrial inheritance are examples. Each mode of inheritance results in a characteristic pattern of affected and unaffected family members.

**model:** a scale representation of another object or idea. OR A formalized expression of a theory or the causal situation which is regarded as having generated observed data. In statistical analyses the model is generally expressed in symbols, that is to say in a mathematical form, but diagrammatic models are also found (Kendall & Buckland, 1982).

**Model organism:** A bacterium, animal, or plant used by scientists to study basic research questions; common model organisms include yeast, flies, worms, frogs, and fish

**modeling:** An investigative technique that uses a mathematical or physical representation of a system or theory that accounts for all or some of its known properties. Models are often used to test the effects of changes of system components on the overall performance of the system.

**moderate sedation :** A level of sedation in which a person is asleep but wakes when spoken to or touched. Moderate sedation is caused by special drugs and is used to help relieve anxiety during certain medical or surgical procedures. Drugs that relieve pain may be given at the same time. Also called conscious sedation.

**Moderator:** A material, such as ordinary water, heavy water, or graphite, that is used in a reactor to slow down high-velocity neutrons, thus increasing the likelihood of fission.

**Moderator temperature coefficient of reactivity:** As the moderator (water) increases in temperature, it becomes less dense and slows down fewer neutrons, which results in a negative change of reactivity. This negative temperature coefficient acts to stabilize atomic power reactor operations.

**Modicon:** (Other name for: ethinyl estradiol/norethindrone)

**Modified:** Containing ingredients such as fillers, pigments or other additives that help to vary the physical properties of a plastics material. An example is oil modified resin.

**modified citrus pectin supplement:** A dietary supplement containing the modified citrus pectin (MCP) derived from the soluble fiber of citrus fruit peels and a galectin-3 inhibitor with potential antioxidant, hypocholesterolemic, immunostimulatory, metal chelating, and anti-metastatic activities. MCP is a low molecular weight version of pectin composed of short, slightly-branched carbohydrate chains and is modified for enhanced absorbability. The bioactive fragments, most likely the galactan-containing portion, of pectin binds to galectin-3, a carbohydrate-binding protein involved in inflammation, heart disease and is upregulated on the surface of certain types of tumor cells. Binding of MCP may result in the suppression of cancer cell aggregation, adhesion, proliferation and metastasis. In addition, MCP decreases prostate specific antigen (PSA) levels and may remove heavy metals. Also, unsaturated oligogalacturonic acids in MCP may stimulate the immune system through the activation of natural killer cells, cytotoxic T-cells, and B-cells.

**modified FOLFOX-6 :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in

which the three drugs are given. Also called mFOLFOX-6, mFOLFOX-6 regimen, and modified FOLFOX-6 regimen.

**modified FOLFOX-6 regimen :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called mFOLFOX-6, mFOLFOX-6 regimen, and modified FOLFOX-6.

**modified Mercalli scale:** a ranking system for the intensity of an earthquake, ranking it from 1 to 12 depending on the amount of resulting damage.

**modified radical hysterectomy :** Surgery to remove the uterus, cervix, upper part of the vagina, and nearby ligaments and tissues. Nearby lymph nodes may also be removed. In this type of surgery, not as many tissues and/or organs are removed as in a radical hysterectomy.

**modified radical mastectomy :** Surgery for breast cancer in which the breast, most or all of the lymph nodes under the arm, and the lining over the chest muscles are removed. Sometimes the surgeon also removes part of the chest wall muscles.

**modified radical vulvectomy :** Surgery to remove most, but not all, of the vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina). The clitoris may not be removed. Sometimes lymph nodes in the groin area are also removed. Also called partial radical vulvectomy.

**modified vaccinia Ankara (Bavarian Nordic)-HER2 vaccine:** A cancer vaccine consisting of a proprietary, recombinant modified vaccinia Ankara (MVA) viral vector encoding an epitope of human epidermal growth factor receptor 2 (HER2) with potential antineoplastic activity. Upon administration, modified vaccinia Ankara (Bavarian Nordic)-HER2 vaccine may stimulate the host immune system to mount humoral and cytotoxic T lymphocyte responses against HER2-expressing tumor cells, resulting in tumor cell lysis. HER2, also known as ErbB-2, is a tyrosine kinase growth factor receptor and a member of the epidermal growth factor receptor family; it plays a significant role in the pathogenesis of some breast cancers.

**modified-release calcifediol capsule:** An orally available, modified-release formulation containing the calcitriol prohormone, calcifediol (25-

hydroxyvitamin D), which can potentially be used for vitamin D supplementation. Upon oral administration of the modified-release calcifediol capsule, calcifediol is slowly and gradually released in the gastrointestinal tract. Then it is taken up by the body and converted, in the kidneys, to the active form calcitriol (1,25-dihydroxyvitamin D or 1,25 D). This form increases and normalizes vitamin D plasma levels, which, in turn, regulates calcium plasma levels, and normalizes elevated parathyroid hormone (PTH) levels by suppressing both PTH synthesis, and secretion. This formulation appears to have fewer side effects than supplementation with formulations containing active 1,25 D and does not stimulate the upregulation of vitamin D 24-hydroxylase (CYP24), a cytochrome P-450 family enzyme that inactivates vitamin D. Check for active clinical trials using this agent.

**modifier:** describes or limits another word or group of words.

**Modrastane:** (Other name for: trilostane)

**modulate :** To adjust, or change.

**modulator:** A metabolite that, when bound to the allosteric site of an enzyme, alters its kinetic characteristics.

**Modulus:** Tensile stress at specific elongation, normally 100% elongation for silicone elastomers OR Derived from the Latin word meaning "small measure", modulus is the ratio of stress to strain in the linear region of the s-e curve.

**Modulus in Compression:** The ratio of compressive stress to strain within elastic limits of the material.

**Modulus in Flexure:** The ratio of the flexure stress to strain, within elastic limits of the material.

**Modulus in Shear:** The ratio of shear stress to strain within elastic limits of the material.

**Modulus of Elasticity:** One of several measurements of stiffness or resistance to deformation, but often incorrectly used to indicate specifically static tension modulus

**Modulus of Resilience :** The energy that can be absorbed per unit volume without creating a permanent distortion.

**mogamulizumab:** A humanized monoclonal antibody directed against C-C chemokine receptor 4 (CCR4) with potential anti-inflammatory and

antineoplastic activities. Mogamulizumab selectively binds to and blocks the activity of CCR4, which may inhibit CCR4-mediated signal transduction pathways and, so, chemokine-mediated cellular migration and proliferation of T cells, and chemokine-mediated angiogenesis. In addition, this agent may induce antibody-dependent cell-mediated cytotoxicity (ADCC) against CCR4-positive T cells. CCR4, a G-coupled-protein receptor for C-C chemokines such as MIP-1, RANTES, TARC and MCP-1, is expressed on the surfaces of some types of T cells, endothelial cells, and some types of neurons. CCR4, also known as CD194, may be overexpressed on adult T-cell lymphoma (ATL) and peripheral T-cell lymphoma (PTCL) cells.

**Mohorovicic discontinuity:** the first major boundary of the earth's interior; separates the crust from the underlying mantle.

**Mohs hardness scale:** a scale from 1 to 10 on which the relative hardness of minerals is measured; named after its originator, Friedrich Mohs, a German mineralogist. OR a relative scale ranging from 1 to 10, measuring whether a mineral can scratch another mineral.

**Mohs micrographic surgery :** A surgical procedure used to treat skin cancer. Individual layers of cancer tissue are removed and examined under a microscope one at a time until all cancer tissue has been removed. Also called Mohs surgery.

**Mohs Scale:** This is a scale that measures the hardness of rocks and minerals. Friedrich Mohs devised the scale in 1812. The scale goes from one to ten with ten being the hardest substance. A diamond would have a value of 10 while a quartz crystal would only have a value of 7.

**Mohs surgery :** A surgical procedure used to treat skin cancer. Individual layers of cancer tissue are removed and examined under a microscope one at a time until all cancer tissue has been removed. Also called Mohs micrographic surgery.

**moist adiabatic lapse rate:** rate at which humid air cools as it rises upward.

**Moisture Absorption:** The pick-up of moisture from the environment by a material.

**Moisture Marks or Welds:** Marks on the finished part that are caused from moisture in the resin and look like weld lines except they may be in

the wrong areas for weld lines

**Moisture Resistance:** The ability of a material to resist absorbing ambient moisture.

**Moisture Vapor Transmission:** The rate at which water vapor permeates through a plastic film or wall at a specified temperature and relative humidity.

**MOISTURE VAPOR TRANSMISSION:** The rate of permeation of water through a material at a specific temperature and relative humidity rate.

**Moisture vapor transmission rate (mvtr):** the rate at which water vapor permeates through a plastic film or bottle wall at a specified temperature and at relative humidity.

**molal:** a solution concentration having a mole of solute per 1,000 grams of solvent, usually water.

**molality:** a measure of solution concentration expressed in moles of solute per 1,000 grams of solvent. OR The number of moles of solute (the material dissolved) per kilogram of solvent (what the solute is dissolved in). OR The molal concentration, moles of solute per kilogram of solvent, usually given the symbol m. OR A measure of the number of moles of a solute compared to one thousand grams of the solvent. Scientists use 'm' when they describe the molality of a system. It is a measure of mass as opposed to volume. Volume is used in measuring molarity. OR the number of moles of solute in 1 kilogram of solvent. OR Concentration measured as moles of solute per kilogram of solvent. For example, a 1 m NaCl solution contains 1 mole of NaCl per kilogram of water. Molalities are preferred over molarities in experiments that involve temperature changes of solutions, e. g. calorimetry and freezing point depression experiments.

**molar:** a solution concentration having one mole of solute per liter of solution. OR An term expressing molarity, the number of moles of solute per liters of solution. OR The adjective derived from 'mole'. The total heat released when a mole of something burns is its molar heat of combustion; the concentration of a substance expressed in moles/litre is its molar concentration, usw. OR 1. Of or pertaining to moles. 2. An synonym for molarity; for example, a "six molar solution of hydrochloric acid" contains 6 moles of HCl per liter of solution.

**molar absorptivity:** The absorbance per centimeter of path length when the concentration of absorbing material is 1 M;  $a = A/(bc)$  where  $a$ ,  $A$ ,  $b$ , and  $c$  are the molar absorptivity, absorbance, path length in cm, and concentration in mol/L, respectively. Molar absorptivities are sometimes written as absorption cross sections by expressing the concentration in units of mol/cm<sup>3</sup>, so that the molar absorptivity takes on units of cm<sup>2</sup>/mol.

**molar heat capacity:** the amount of heat required to raise the temperature of 1 mole of substance 1 degree Celsius.

**molar heat capacity:** The heat required to raise the temperature of one mole of a substance by 1°C is called the molar heat capacity of the substance. Molar heat capacity is an intensive property with SI system units of J mol<sup>-1</sup> K<sup>-1</sup>. The molar heat capacity of elements is sometimes called the "atomic heat capacity".

**molar mass:** The mass of one mole of a material. For example, the molar mass of H<sub>2</sub>O is 18.015 g (obtained by adding twice the molar mass of hydrogen to the molar mass of oxygen).

**molar pregnancy :** A slow-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta) after fertilization of an egg by a sperm. A molar pregnancy contains many cysts (sacs of fluid). It is usually benign (not cancer) but it may spread to nearby tissues (invasive mole). It may also become a malignant tumor called choriocarcinoma. Molar pregnancy is the most common type of gestational trophoblastic tumor. Also called hydatidiform mole.

**molar solution:** One mole of solute dissolved in water to give a total volume of 1,000 mL.

**molar volume:** The volume occupied by one mole of a material. For example, the molar volume of an ideal gas at STP is 22.4 L/mol.

**molarity:** a measure of solution concentration expressed in moles of solute per liter of solution. OR The number of moles of solute (the material dissolved) per liter of solution. Used to express the concentration of a solution. OR The number of moles of solute per liter of aqueous solution. OR A measure of the number of moles of a solute that are dissolved in a liter of solution. As concentration increases, the molarity of the solution also increases. Scientists use the letter 'M' to describe the molarity of a solution. OR the number of moles of solute in 1 liter of solution. OR

Concentration of a solution measured as the number of moles of solute per liter of solution. For example, a 6 M HCl solution contains 6 moles of HCl per liter of solution.

**MOLCAS:** An ab initio software package that emphasizes electron correlation, esp. CASPT2 (14).

**Mold:** (v.) To shape plastic parts or finished articles by heat and pressure. (n.) (1) The cavity or matrix into which the plastic composition is placed and from which it takes its form. (2) The assembly of all the parts that function collectively in the molding process.

**Mold:** 1(n)A hollow form or matrix into which a plastic material is placed and which imparts to the material its final shape as a finished article. 2 (v)To impart shape to a plastic mass by means of a confining cavity or matrix.

**mold :** A form of fungus. Some molds can cause disease in humans.

**Mold Base:** Mold frame that holds mold cavities

**Mold Cavity:** Hollow space of the mold within which the liquid silicone rubber is injected and cured to the desired finished product form

**Mold Change :** rAn automated device for removing one mold from a machine and replacing it with another mold.

**Mold Finish:** The surface finish of the silicone injection mold which imparts the desired surface quality to the finished molded silicone product

**Mold Frame:** A series of steel plates which contain mold components, including cavities, cores, runner system, cooling system, ejection system, etc.

**Mold Marks:** Slight irregularities in the surface of molded articles caused by mold machining marks, or damage to the mold itself

**MOLD RELEASE:** A lubricant used to coat a mold cavity to prevent the molded piece from sticking to it, and thus to facilitate its removal from the mold. Also called "Release Agent."

**Mold Release:** In injection molding, a lubricant used to coat the surface of the mold to enhance ejection of the molded article or prevent it from sticking to the tool. Many resins are available with an internal mold release.

**Mold Release :** In injection molding, a lubricant used to coat the surface of the mold to enhance ejection of the molded article or prevent it from

sticking to the tool. Many resins are available with an internal mold release. OR A lubricant used to coat a mold cavity to prevent the molded piece from sticking to it, and thus to facilitate its removal from the mold. Also called Release Agent.”

**Mold Release Agent:** A lubricant used to coat a mold cavity to prevent adhesion of the molded piece when removed.

**Mold Release Problems:** Excess use of mold release may leave parts oily and weaken the material.

**Mold release spray:** A liquid applied to the mold as a spray to facilitate the ejection of parts from the B-side. It is typically used when the parts are difficult to eject because they are sticking to the mold.

**Mold Seam:** a vertical line formed at the point of contact of the mold halves. The prominence of the line depends on the accuracy with which the mating mold halves are matched. OR A line formed by mold construction such as removable members in cavity, cam slides, etc. (Not to be confused with mold parting line).

**Mold Shrinkage:** The difference in dimension, expressed in inches per inch, between a silicone part and the steel cavity in which it was injection silicone molded, when both are measured while at room temperature OR The difference in dimensions between the mold and the molded part.

**Mold Temperature :** The temperature at which the mold is maintained. Often the most important benefit of raising mold temperature is that it allows a slower injection rate without the plastic getting too cold.

**Mold Three Plate:** Integral moving plates in a conventional silicone injection mold, containing the cavities and allowing the injection point or gate to feed directly into the part

**Mold Venting:** The purpose of mold venting is to exhaust air from mold cavities to enable the inflation of the part. Drilled holes, vent bushings and continuous venting along mold seams are typical methods. If venting is needed on appearance surfaces, the vents are sometimes textured to match the part finish.

**Mold-Temperature-Control Unit :** Auxiliary equipment used to control mold temperature. Some units can both heat and cool the mold. Others, called chillers, only cool the mold.

**Moldability :** The characteristics of being easy to mold without rupturing or developing flaws due to movement of the polymer during gelation.

**Molding:** The method of forming objects from granular or powdered plastics, most often of the thermoplastic type, in which the material is fed from a hopper to a heated chamber in which it is softened, after which a ram or screw forces the material into a mold. Pressure is maintained until the mass has hardened sufficiently for removal from the mold.

**Molding Conditions:** The temperature of the mold and melt and the time required to fill the mold.

**Molding Cycle:** (1) The period of time occupied by the complete sequence of operations on a molding press requisite for the production of one set of moldings. (2) The operations necessary to produce a set of moldings without reference to the time taken. OR The period of time occupied by the complete sequence of operations on a molding press requisite for the production of one set of molded articles.

**MOLDING MATERIAL:** Plastic material in varying stages of granulation often comprising resin, filler, pigments, plasticizers and other ingredients, ready for use in the molding operation. Also called "Molding Compound" or 'Powder.'

**Molding Pressure:** The pressure applied to the ram of an injection machine or press to force the softened plastic completely to fill the mold cavities.

**Molding sensitivity :** the variability of the pressure to fill the cavity and temperature of the melt at the part as influenced by changes in injection time and barrel melt temperature.

**Molding Shrinkage:** The difference in dimensions, expressed in inches per inch, between a molding and the mold cavity in which it was molded, both the mold and the molding being at normal room temperature when measured. Also called "Mold Shrinkage," or "Shrinkage," and "Contraction.'

**Molding window:** the range of molding conditions under which a part can be successfully molded.

**mole:** an amount of a substance weighing the number of grams equal to the total atomic weight in one molecule (or atom). Equivalent to gram-atomic, gram-molecular, and gram-formula weights. OR A collection of  $6.022 \times 10^{23}$

1023 number of objects. Usually used to mean molecules. OR The amount of substance that contains the same number of elementary particles as are found in exactly 12 g of carbon-12. OR One mole is the number of carbon atoms in exactly 12 g of carbon ( $6.02 \times 10^{23}$ ). OR The mole is defined as the amount of a substance that contains as many atoms or molecules as atoms are contained in 0.012 kg of carbon-12. The easiest way to think of it is that a mole of a substance of a particular weight will weigh that many gramm. There are about  $6.02 \times 10^{23}$  particles in a mole. OR an amount of a substance equal in grams to the sum of the atomic weights. OR SI unit for amount of substance, defined as the number of atoms in exactly 12 g of carbon-12. One mole of a molecular compound contains Avogadro's number molecules and has a mass equal to the substance's molecular weight, in grams. OR The mole is the SI unit for amount of substance. 1 mole of particles is equal to the number of atoms in exactly 12 g of carbon-12. 1 mole of molecules has a mass equal to the molecular weight in grams. OR One gram molecular weight of a compound. See Avogadro's number.

**mole :** A benign (not cancer) growth on the skin that is formed by a cluster of melanocytes (cells that make a substance called melanin, which gives color to skin and eyes). A mole is usually dark and may be raised from the skin. Also called nevus.

**mole fraction:** The number of moles of a particular substance expressed as a fraction of the total number of moles. OR the fraction of moles (or molecules) of one substance in the total moles (or molecules) of all substances in the mixture. If the mole fraction of substance A is 0.1, one-tenth of all the molecules in a mixture are A molecules. OR Concentration of a substance in a mixture measured as moles of the substance per mole of mixture. For example, the mole fraction of oxygen in air is about 0.21, which means that 1 mol of air contains about 0.21 mol O<sub>2</sub>.

**Molecular change:** The second step of a hypothetical solid-state reaction. This step involves the actual chemical reaction that occurs. This step is similar to the corresponding reaction in solution.

**molecular diagnosis :** The process of identifying a disease by studying molecules, such as proteins, DNA, and RNA, in a tissue or fluid.

**molecular equation:** A molecular equation is a balanced chemical equation in which ionic compounds are written as neutral formulas rather than as ions. For example,  $\text{AgNO}_3(\text{aq}) + \text{NaCl}(\text{aq}) = \text{AgCl}(\text{s}) + \text{NaNO}_3(\text{aq})$

is a molecular equation;  $\text{Ag}^+(\text{aq}) + \text{NO}_3^-(\text{aq}) + \text{Na}^+(\text{aq}) + \text{Cl}^-(\text{aq}) = \text{AgCl}(\text{s}) + \text{Na}^+(\text{aq}) + \text{NO}_3^-(\text{aq})$  is not.

**molecular formula:** Shows the number of atoms of each element present in a molecule. OR shows the actual number of atoms in compound. Ex.  $\text{C}_2\text{H}_4$  OR The molecular formula gives the actual number of atoms of each element present in a molecule. OR describes the ratio of elements in a molecule. OR a chemical formula that shows the number and kinds of atoms in a molecule but not their arrangement; for example,  $\text{C}_2\text{H}_6$ . OR A notation that indicates the type and number of atoms in a molecule. The molecular formula of glucose is  $\text{C}_6\text{H}_{12}\text{O}_6$ , which indicates that a molecule of glucose contains 6 atoms of carbon, 12 atoms of hydrogen, and 6 atoms of oxygen. OR This shows the number of each kind of atom in a molecule. (eg  $\text{CH}_4$  has one carbon atom and four hydrogen atoms;  $\text{H}_2\text{SO}_4$  has two hydrogen atoms per molecule, one sulfur atom and four oxygen atoms per molecule)

**molecular geometry:** Shape of a molecule, based on the relative positions of the atoms. OR 1. The three-dimensional shape of a molecule. For example, methane ( $\text{CH}_4$ ) has a tetrahedral molecular geometry. 2. The study of molecular shapes.

**Molecular loosening:** The first step of a hypothetical solid-state reaction. This step allows the reacting molecules to gain enough molecular freedom to react. For solid–gas reactions, this step also involves diffusion of gases to the reaction site.

**molecular marker :** A biological molecule found in blood, other body fluids, or tissues that is a sign of a normal or abnormal process, or of a condition or disease. A molecular marker may be used to see how well the body responds to a treatment for a disease or condition. Also called biomarker and signature molecule.

**Molecular Mass:** is the sum of the atomic masses of all the atoms in a molecule. OR The combined mass (as given on the periodic table) of all the elements in a compound. OR Molecular mass is another term for formula mass. You can determine the formula mass by adding the individual masses of each atom in the compound. The formula mass of  $\text{NaCl}$  is 58.44. OR The sum of the atomic masses of all atoms in a molecule, based on a scale in which the atomic masses of hydrogen, carbon, nitrogen, and oxygen are 1, 12, 14, and 16, respectively. For example, the molecular mass of water,

which has two atoms of hydrogen and one atom of oxygen, is 18 (i.e., 2 + 16). Also called molecular weight.

**molecular medicine :** A branch of medicine that develops ways to diagnose and treat disease by understanding the way genes, proteins, and other cellular molecules work. Molecular medicine is based on research that shows how certain genes, molecules, and cellular functions may become abnormal in diseases such as cancer.

**Molecular mimicry:** Refers to a protein domain, such as those found in EF-G and release factor, that mimic the structure of a trna molecule.

**molecular model:** A representation of a molecule. The model can be purely computational or it can be an actual physical object. Stick models show bonds, ball-and-stick models show bonds and atoms, and spacefilling models show relative atomic sizes.

**Molecular Modelling:** Comprises of techniques used to investigate molecular structures and their properties using computational chemistry

**molecular orbital:** an orbital formed by the linear combination of two atomic orbitals. OR  $\pi$  a molecular orbital created by the side-to-side overlap of atomic p orbitals. OR A wavefunction that describes the behavior of an electron in a molecule. Molecular orbitals are usually spread across many atoms in the molecule, and they are often described as a combination of atomic orbitals on those atoms.

**molecular pathway :** A series of actions among molecules in a cell that leads to a certain end point or cell function.

**molecular risk assessment :** A procedure in which biomarkers (for example, biological molecules or changes in tumor cell DNA) are used to estimate a person's risk for developing cancer. Specific biomarkers may be linked to particular types of cancer.

**molecular sieve:** A material that contains many small cavities interconnected with pores of precisely uniform size. Zeolites are an example. Molecular sieves adsorb molecules that are small enough to pass through their pore systems- especially water. They are often used as drying agents, and to separate large molecules from smaller ones in preparatory work and in exclusion chromatography.

**molecular test :** In medicine, a laboratory test that checks for certain genes, proteins, or other molecules in a sample of tissue, blood, or other

body fluid. Molecular tests also check for certain changes in a gene or chromosome that may cause or affect the chance of developing a specific disease or disorder, such as cancer. A molecular test may be done with other procedures, such as biopsies, to help diagnose some types of cancer. It may also be used to help plan treatment, find out how well treatment is working, or make a prognosis.

**molecular weight:** the sum of the atomic weights of all the atoms in a molecule. OR Molecules are too small to put on a scale, but if you put  $6.022 \times 10^{23}$  of them (60 220 000 000 000 000 000, Avogadro's Number) of them on a scale, they will weigh about 2 g (if they are Hydrogen molecules, H<sub>2</sub>), 128 g (if they are butyl acrylate molecules, C<sub>7</sub>O<sub>2</sub>H<sub>12</sub>) or 10 tonnes (if they are typical molecules of poly(acrylamide)). This number is their 'molecular weight'. OR The average mass of a molecule, calculated by summing the atomic weights of atoms in the molecular formula. Note that the words mass and weight are often used interchangeably in chemistry. OR The sum of the atomic masses of the elements forming the molecule. OR Polymers are composed of long chain molecules. The monomer unit is repeated many times to give average molecular weights ranging from 50,000 to 500,000 for most common polymers. Of course, not all polymer chains are of the same length, so we have a MOLECULAR WEIGHT DISTRIBUTION (MWD). Different molecular weight averages are defined to express the breadth of the distribution. The number average molecular weight,  $M_n$ , is the sum of the individual molecular weights divided by their number. The weight average molecular weight,  $M_w$ , is the sum of the squares of the weights divided by the sum of the molecular weights. The POLYDISPERSITY INDEX (PDI)  $M_w/M_n$  (weight average / number average) would be 1.0 if all chains had exactly the same length (only theoretically possible). Usual grades of polymers have PI values from 1.5 to 30. Broad distribution polymers usually have lower viscosity, but higher elasticity.

**molecular weight :** The sum of the atomic masses of all atoms in a molecule, based on a scale in which the atomic masses of hydrogen, carbon, nitrogen, and oxygen are 1, 12, 14, and 16, respectively. For example, the molecular weight of water, which has two atoms of hydrogen and one atom of oxygen, is 18 (i.e.,  $2 + 16$ ). Also called molecular mass.

**Molecular Weight Distribution:** The ratio of the weight average molecular weight to the number average molecular weight gives an indication of the distribution.

**MOLECULAR WEIGHT DISTRIBUTION (MWD):** The relative amounts of polymers of different molecular weights (MW) that make up a specific polymer.

**Molecularity of a reaction:** The number of molecules involved in a specific reaction step.

**molecularly targeted therapy :** In cancer, a type of treatment that uses drugs or other substances to target specific molecules involved in the growth and spread of cancer cells. Blocking these molecules may kill cancer cells or may keep cancer cells from growing or spreading. Molecularly targeted therapy may cause less harm to normal cells and may have fewer side effects than other types of cancer treatment.

**molecule:** the simplest structural unit of a substance that retains the properties of the substance, and is composed of one or more atoms. OR Two or more atoms chemically combined. OR The smallest unit of a compound that has all the properties of the compound. OR This is a group of atoms bonded together. A molecule is the smallest piece of a compound that can exist. You can hold a compound such water in a glass. One water molecule would be one piece of the H<sub>2</sub>O. The atoms could be all the same type (like ozone) or they could be different (like carbon dioxide). OR is the smallest particle of a chemical compound. It contains two or more atoms. OR A molecule is a group of two or more atoms bonded together. OR a group of atoms linked together by covalent bonds. OR a covalently bonded collection of atoms that has no electrostatic charge. OR a precise arrangement of atoms of different elements. OR the smallest particle of a substance that still is that substance. OR Two or more atoms joined together by a covalent bond. Molecules can be elements (eg H<sub>2</sub> , O<sub>2</sub> etc) or compounds (eg CH<sub>4</sub> , H<sub>2</sub>SO<sub>4</sub>). OR A group of atoms held together by chemical forces. A molecule is the smallest unit of a compound that can exist by itself and retain all of its chemical properties. OR The smallest particle of an element or compound that retains the chemical properties of the element or compound. A molecule is a collection of chemically bound atoms with characteristic composition and structure. Making or breaking bonds in a molecule changes it into a new molecule. Ionic

compounds are not composed of molecules, because there is no distinct collection of ions that are chemically bound in the crystal. OR The smallest unit quantity of matter which can exist by itself and retain all of the properties of the original substance.

**molecule :** The smallest particle of a substance that has all of the physical and chemical properties of that substance. Molecules are made up of one or more atoms. If they contain more than one atom, the atoms can be the same (an oxygen molecule has two oxygen atoms) or different (a water molecule has two hydrogen atoms and one oxygen atom). Biological molecules, such as proteins and DNA, can be made up of many thousands of atoms.

**molluscicide:** A chemical used to kill molluscs.

**MOLPRO:** An ab initio software package that emphasizes electron correlation, esp. very large MRCI (15).

**Molybdenum:** Symbol:"Mo" Atomic Number:"42" Atomic Mass: 95.94amu. Molybdenum is one of the transition elements. This element has been confused with lead in the past. When pure, it is a silvery white metal and can be found in many alloys, aircraft parts, and even as a trace mineral in some plants. OR An element with atomic symbol Mo, atomic number 42, and atomic weight 95.94. Check for active clinical trials using this agent.

**momelotinib:** An orally bioavailable small-molecule inhibitor of Janus kinases 1 and 2 (JAK1/2) with potential antineoplastic activity.

Momelotinib competes with JAK1/2 for ATP binding, which may result in inhibition of JAK1/2 activation, inhibition of the JAK-STAT signaling pathway, and so the induction of apoptosis and a reduction of tumor cell proliferation in JAK1/2-expressing tumor cells. JAK2 is the most common mutated gene in bcr-abl-negative myeloproliferative disorders; the JAK2V617F gain-of-function mutation involves a valine-to-phenylalanine modification at position 617. The JAK-STAT signaling pathway is a major mediator of cytokine activity and is often dysregulated in a variety of tumor cell types.

**momentum:** Momentum is a property that measures the tendency of a moving object to keep moving in the same direction. Increasing the speed of an object increases its momentum, and a heavy object will have more momentum than a lighter one moving at the same speed. For a particle with mass  $m$  and velocity  $v$ , the momentum of the particle is  $mv$ .

**mometasone** : A drug that is used in a cream to treat certain skin conditions and in a nasal spray to treat sinus problems caused by allergies. It is being studied as a way to treat inflammation of the skin caused by radiation therapy. Mometasone is a type of corticosteroid. Also called Elocon, mometasone furoate, and Nasonex.

**mometasone furoate:** The furoate salt form of mometasone, a synthetic topical glucocorticosteroid receptor agonist with anti-inflammatory, anti-pruritic and vasoconstrictive properties. Mometasone furoate exerts its effect by binding to cytoplasmic glucocorticoid receptors and subsequently activates glucocorticoid receptor mediated gene expression. This results in synthesis of certain anti-inflammatory proteins, while inhibiting the synthesis of certain inflammatory mediators.. Specifically, mometasone furoate appears to induce phospholipase A2 inhibitory proteins, thereby controlling the release of the inflammatory precursor arachidonic acid from phospholipid membrane by phospholipase A2. Check for active clinical trials using this agent. or A drug that is used in a cream to treat certain skin conditions and in a nasal spray to treat sinus problems caused by allergies. It is being studied as a way to treat inflammation of the skin caused by radiation therapy. Mometasone furoate is a type of corticosteroid. Also called Elocon, mometasone, and Nasonex.

**monalizumab:** A humanized immunoglobulin G4 (IgG4) monoclonal antibody against the human natural killer (NK) and T-lymphocyte cell checkpoint inhibitor killer cell lectin-like receptor subfamily C member 1 (NKG2A), with potential antineoplastic activity. Upon administration, monalizumab binds to NKG2A and prevents the binding of NKG2A to its ligand human leukocyte antigen-E (HLA-E), which is overexpressed on tumor cells. This blocks the HLA-E-mediated inhibition of NKG2A-positive infiltrating NK and cytotoxic T-lymphocytes (CTLs) and induces a NK and CTL-mediated immune response against the cancer cells leading to their destruction. Human NKG2A, an inhibitory cell surface receptor covalently bound to CD94, is expressed by NK cells and CTLs. Stimulation of the CD94/NKG2A complex inhibits the cytotoxic activity of these cells. HLA-E, a nonclassical HLA class Ib molecule, is often overexpressed on tumor cells and is associated with poor prognosis.

**monatomic:** A monatomic gas is one that exists as single atoms.

**Monera:** the kingdom that includes the bacteria and the cyanobacteria; prokaryotic organisms.

**money problems:** Word problems that concern money.

**monitor :** In medicine, to regularly watch and check a person or condition to see if there is any change. Also refers to a device that records and/or displays patient data, such as for an electrocardiogram (EKG).

**monitoring (for health, environmental, and associated technical purposes):** The repetitive and continued observation, measurement, and evaluation of health and/or environmental or technical data for defined purposes, according to prearranged schedules in space and time, and using comparable methods for sensing and data collection (WHO, 1980).

**Monitoring of radiation:** Periodic or continuous determination of the amount of ionizing radiation or radioactive contamination in a region. Radiation monitoring is a safety measure to protect the health and safety of the public and the environment through the use of bioassay, alpha scans, and other radiological survey methods to monitor air, surface water and ground water, soil and sediment, equipment surfaces, and personnel. For related information, see Radiation Monitoring at Nuclear Power Plants and the related fact sheets listed on that page.

**monk's pepper :** An extract made from the fruit of the chaste tree (*Vitex agnus-castus*) found in parts of Asia and Europe. It is claimed to treat infertility and to lessen symptoms that may occur before or during a woman's menstrual period, such as headaches and irregular bleeding. Monk's pepper may affect levels of reproductive hormones in the blood. It is a type of phytomedicine. Also called chaste tree berry and *Vitex*.

**Mono Ethylene Oxide (MEG):** Mono ethylene glycol (MEG) is the main constituent of anti-freeze, although consumption of MEG in the production of PET has now overtaken this as the main end-use, and MEG is therefore classed as a polyester intermediate. MEG is produced by the reaction of ethylene oxide and water, and most modern plants are combined EO/MEG units. MEG is produced in all regions, although to an increasing extent in the Middle East.

**Mono Layer:** Film comprised of a homogeneous mixture of one or more polymers blended together in a molten state and extruded through a die assembly to form a film or sheet.

**monoacetyldiglyceride EC-18:** A synthetic version of a monoacetyldiacylglyceride naturally occurring in various seed oils, bovine udder and milk fat, antlers of sika deer, with potential antineoplastic activity. Although the exact mechanism of action through which EC-18 exerts its pharmacological effect has yet to be fully identified, upon administration, EC-18 stimulates calcium influx into T-lymphocytes and increases the production of various cytokines, including interleukin (IL) -2, IL-4, IL-12, interferon-gamma (IFN-g), and granulocyte-macrophage colony-stimulating factor (GM-CSF). This stimulates the proliferation of hematopoietic stem cells, bone marrow stromal cells and immune cells, including T- and B-lymphocytes, dendritic cells (DCs) and macrophages. Therefore, EC18 may stimulate the immune system to target cancer cells. In addition, EC-18 enhances the cytolytic activity of natural killer (NK) cells and suppresses the expression of the transmembrane protein tumor cell toll-like receptor 4 (TLR-4) on cancer cells. As activation of TLR-4 enhances immunosuppression and stimulates cancer cell growth, blocking TLR-4 expression suppresses tumor cell proliferation.

**monoamine oxidase inhibitor :** A type of drug used to treat depression. It stops the breakdown of certain chemicals in the brain that help improve a person's mood. A monoamine oxidase inhibitor is a type of antidepressant. Also called MAO inhibitor.

**monobenzene:** A monobenzyl ether of hydroquinone with topical depigmentation activity. Although the exact mechanism of action of depigmentation is unknown, the metabolites of monobenzene appear to have a cytotoxic effect on melanocytes. Furthermore, the depigmentation effect might be mediated through the inhibition of tyrosinase, which is essential in the synthesis of melanin pigments, thereby causing permanent depigmentation of the skin.

**monocarboxylate transporter 1 inhibitor AZD3965:** An orally available inhibitor of monocarboxylate transporter 1 (MCT1), with potential antineoplastic activity. Upon oral administration, MCT1 inhibitor AZD3965 binds to MCT1 and prevents the transport of lactate into and out of the cell. This leads to an accumulation of lactate, intracellular acidification, and eventually cancer cell death. MCT1, a protein overexpressed on tumor cells, is responsible for the transport of monocarboxylates across the cell

membrane and plays a key role in cell metabolism. Check for active clinical trials using this agent.

**monochromatic:** Radiation that has a single wavelength.

**Monoclinic Crystal:** A crystal that has a shape like a cube but is flattened in one dimension. Think about a flattened gift box for this one.

**Monoclinic crystal class:** A crystal class containing one two-fold rotation axis along the b axis. This class consists of 13 space groups and has no restrictions on the lengths of the axes except that one angle (b by convention) is not equal to 90°.

**monoclonal antibodies:** Antibodies produced by a cloned hybridoma cell, which therefore are identical and directed against the same epitope of the antigen.

**Monoclonal antibody:** An antibody derived from a clone—a large number of cells that are all descended from the same cell and have identical properties. Normally, antigens with a common specificity are heterogeneous because they are produced by a heterogeneous group of cells. Fusion of a single antigen-producing cell with an immortal myeloma cell facilitates the production of large amounts of homogeneous antibody protein, these antibodies are valuable analytical and preparative reagents.

**monoclonal antibody :** A type of protein made in the laboratory that can bind to substances in the body, including cancer cells. There are many kinds of monoclonal antibodies. A monoclonal antibody is made so that it binds to only one substance. Monoclonal antibodies are being used to treat some types of cancer. They can be used alone or to carry drugs, toxins, or radioactive substances directly to cancer cells.

**monoclonal antibody 105AD7 anti-idiotypic vaccine:** A cancer vaccine consisting of a humanized monoclonal antibody that mimics a tumor-associated antigen 791Tgp72 (also known as CD55). Vaccination with this agent may stimulate a host cytotoxic T-cell response against tumor cells expressing CD55, resulting in tumor cell lysis.

**monoclonal antibody 11D10 anti-idiotypic vaccine:** A vaccine consisting of a monoclonal antibody (MoAB) directed against an idiotype that mimics a human milk fat globule (HMFG) membrane epitope. Vaccination with monoclonal antibody 11D10 anti-idiotypic vaccine induces anti-anti-idiotypic antibodies (Ab3) that may react with breast cancer cell lines

expressing the HMFG membrane epitope. Check for active clinical trials using this agent.

**monoclonal antibody 14G2A:** A murine monoclonal antibody directed against the ganglioside GD2 with potential antineoplastic activity. Monoclonal antibody 14G2A binds to the ganglioside GD2 and induces antibody-dependent cell mediated cytotoxicity and complement-dependent cytotoxicity against GD2-expressing tumor cells. GD2 is overexpressed in malignant melanoma, neuroblastoma, osteosarcoma, and small cell carcinoma of the lung. Check for active clinical trials using this agent.

**monoclonal antibody 3F8:** A murine monoclonal antibody directed against the cell-surface, tumor-associated antigen ganglioside GD2. Vaccination with monoclonal antibody 3F8 may stimulate a host cytotoxic immune response against tumors that express ganglioside GD2.

**monoclonal antibody 3H1 anti-idiotypic vaccine:** A recombinant monoclonal antibody in which the heavy and light chain variable domains mimic a specific epitope of the tumor-associated protein carcinoembryonic antigen (CEA). This agent is used as a cancer vaccine against tumors that express CEA.

**monoclonal antibody 4B5 anti-idiotypic vaccine:** A humanized anti-idiotypic (anti-Id) monoclonal antibody (MoAb) that mimics the disialoganglioside GD2 with potential immunostimulating and antineoplastic activities. Upon administration, monoclonal antibody 4B5 anti-idiotypic vaccine may elicit both cellular and humoral immune responses against GD2-expressing tumor cells. GD2 is a glycosphingolipid (ceramide and oligosaccharide) that may be highly expressed by melanomas and other neuroectodermal tumors, while only minimally expressed by normal tissues.

**monoclonal antibody A27.15:** A murine IgG1 monoclonal antibody directed against the human transferrin (Tf) receptor. Monoclonal antibody A27.15 binds to the Tf receptor, blocking the binding of transferrin to the receptor and resulting in decreased tumor cell growth. Check for active clinical trials using this agent.

**monoclonal antibody A33:** A humanized monoclonal antibody directed against the human A33 antigen. Monoclonal antibody A33 recognizes the human A33 antigen, a 43 KDa transmembrane glycoprotein of the immunoglobulin superfamily, which is highly and homogeneously expressed

in 95% of colorectal cancer metastases with only restricted expression in normal colonic mucosa.

**monoclonal antibody AbGn-7:** A chimeric monoclonal antibody against a Lewis-A-like glycotope (AbGn-7 antigen) with potential immunomodulating and antineoplastic activities. Monoclonal antibody AbGn-7 targets and binds to the carbohydrate AbGn-7 antigen on the cell surface of tumor cells and may induce complement-dependent cytotoxicity (CDC) and antibody-dependent cell-mediated cytotoxicity (ADCC), thereby killing AbGn-7-epitope positive tumor cells. AbGn-7 antigen is expressed on a variety of tumor cell types, including human colorectal, pancreatic and gastric tumor cells.

**monoclonal antibody CAL:** A humanized monoclonal antibody directed against parathyroid hormone-related protein (PTH-rP). As a poly-hormone with diverse biological roles, PTH-rP is expressed by normal tissues, acting in local tissue environments in a variety of ways; it is commonly overexpressed by breast, prostate, and other cancers, acting systemically by promoting bone resorption, inhibiting calcium excretion from the kidney, inducing hypercalcemia, and possibly playing a role in the formation of bony metastases. By blocking the effects of PTH-rP on calcium metabolism, monoclonal antibody CAL may inhibit cancer-related hypercalcemia.

**monoclonal antibody CC49:** A second-generation murine monoclonal antibody based on the antibody B72.3 that is directed against tumor-associated glycoprotein 72 (TAG72). TAG72 is expressed by gastric, breast, pancreatic, colorectal, and ovarian carcinoma cells. Check for active clinical trials using this agent.

**monoclonal antibody CC49-delta CH2:** A humanized CH2 domain-deleted second-generation monoclonal antibody based on the antibody B72.3 that is directed against tumor-associated glycoprotein 72 (TAG72). TAG72 is expressed by gastric, breast, pancreatic, colorectal, and ovarian carcinoma cells. Check for active clinical trials using this agent.

**monoclonal antibody CEP-37250/KHK2804:** A humanized monoclonal antibody targeting glycolipids, with potential immunomodulating and antineoplastic activity. Upon administration, monoclonal antibody CEP-37250/KHK2804 targets and binds to a specific tumor antigen, thereby stimulating the immune system to exert an antibody-dependent cellular

cytotoxicity (ADCC) against the tumor associated antigen (TAA)-expressing cancer cells. This agent has shown to be active in both wild-type and mutant K-RAS-expressing colorectal cancer cells.

**monoclonal antibody Ch14.18 :** A drug used with granulocyte-macrophage colony-stimulating factor (GM-CSF), aldesleukin (IL-2), and 13-cis-retinoic acid to treat high-risk neuroblastoma. It is used in children whose disease has improved with other anticancer treatment. Monoclonal antibody Ch14.18 binds to a substance called GD2, which is found on some types of cancer cells. Monoclonal antibody Ch14.18 may block GD2 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Ch14.18, dinutuximab, MOAB Ch14.18, and Unituxin.

**monoclonal antibody E2.3:** A murine IgG1 monoclonal antibody directed against the human transferrin (Tf) receptor. Monoclonal antibody E2.3 binds to the Tf receptor, blocking the binding of transferrin to the receptor and resulting in decreased tumor cell growth. Check for active clinical trials using this agent.

**monoclonal antibody GD2 anti-idiotypic vaccine:** A class of vaccines that consist of anti-idiotypic monoclonal antibodies against the tumor-associated antigen disialoganglioside GD2 with potential antineoplastic activity. Vaccination with a monoclonal antibody GD2 anti-idiotypic vaccine produces an immunoglobulin response against GD2 with subsequent destruction of GD2 positive tumor cells via antibody-dependent cellular cytotoxicity (ADCC). GD2 is overexpressed in melanoma, neuroblastoma, soft tissue sarcoma, and small cell carcinoma of the lung.

**monoclonal antibody HeFi-1:** A murine monoclonal antibody with potential antineoplastic activity. Monoclonal antibody HeFi-1 binds to CD30, a cell surface antigen found on mitogen-activated B-cells and T-cells, and Reed-Sternberg cells. Monoclonal antibody HeFi-1 has been shown to arrest tumor growth and prevent metastasis in animal models.

**monoclonal antibody Hu3S193:** A humanized monoclonal antibody directed against the Lewis Y antigen, a tumor-associated epithelial antigen, with potential antineoplastic activity. Following binding, monoclonal antibody Hu3S193 triggers an antibody-dependent cell-mediated cytotoxicity in cells expressing Lewis Y antigen.

**monoclonal antibody HuAFP31:** A humanized monoclonal antibody directed against alpha fetoprotein with potential antineoplastic activity. Upon administration, monoclonal antibody HuAFP31 (mAb HuAFP31) binds to and stimulates a cytotoxic T lymphocyte (CTL) response against tumor cells that express alpha fetoprotein.

**monoclonal antibody HuHMFG1:** A humanized monoclonal antibody directed against MUC1, a mucin glycoprotein overexpressed in breast and other carcinomas. Monoclonal antibody HuHMFG1 stimulates antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells expressing MUC1, resulting in a decrease in tumor burden.

**monoclonal antibody HuM195 :** A substance being studied in the treatment of myelodysplastic syndromes and some types of leukemia. It binds to CD33, a protein on the surface of certain normal blood stem cells and some abnormal blood cells. It causes the immune system to kill these cells. Monoclonal antibody HuM195 is a type of monoclonal antibody. Also called lintuzumab and MoAb HuM195.

**monoclonal antibody HuPAM4:** A humanized monoclonal antibody directed against the pancreatic cancer antigen MUC1 with potential antineoplastic activity. Monoclonal antibody HuPAM4 (mAb HuPAM4) binds to cells expressing MUC1 antigen; mAb HuPAM4 may be useful as a carrier for radioisotopes and other antineoplastic therapeutic agents. Check for active clinical trials using this agent.

**monoclonal antibody L6:** A murine IgG2a monoclonal antibody with potential antineoplastic activity. Monoclonal antibody L6 binds to the L6 antigen, a cell surface glycoprotein overexpressed in many carcinomas, and induces antibody-dependent cell-mediated cytotoxicity and complement-dependent cytotoxicity against L6-expressing tumor cells. This agent may be conjugated with various toxins in order to target their cytotoxic activity to tumor cells expressing the L6 antigen.

**monoclonal antibody Lym-1:** A murine IgG2a monoclonal antibody directed against the HLA-Dr10 protein, a cell surface marker present on over eighty percent of lymphoma cells. When conjugated with a radioactive isotope, Lym-1 monoclonal antibody selectively transports the cytotoxic radioisotope to HLA-Dr10-expressing tumor cells, thereby sparing healthy B-cells and normal tissues. This agent also mediates antibody-dependent

cytotoxicity thereby promoting Raji B-lymphoid cell lysis by human neutrophils. Check for active clinical trials using this agent.

**monoclonal antibody m170:** A panadenocarcinoma murine monoclonal antibody with potential antineoplastic activity. Monoclonal antibody m170 may be conjugated with a radioactive element and used in radioimmunotherapy (RIT), a procedure that uses a tumor-specific monoclonal antibody to target radiation to cancer cells.

**monoclonal antibody Me1-14 F(ab')<sub>2</sub>:** The F(ab)<sub>2</sub> fragment of Me1-14, a murine IgG2a monoclonal antibody directed against proteoglycan chondroitin sulfate-associated protein expressed by gliomas and melanomas. By binding to proteoglycan chondroitin sulfate-associated protein, monoclonal antibody Me1-14 F(ab')<sub>2</sub> conjugated to a radioisotope may localize gliomas and melanomas when used as a tracer in radioimaging applications; in radioimmunotherapeutic applications, this agent conjugated to a radioisotope may be used to deliver targeted radiotoxicity to these tumors.

**monoclonal antibody MGA271:** An Fc-domain optimized, humanized monoclonal antibody directed against cancer stem cells (CSCs), with potential immunomodulating and antineoplastic activities. After binding of monoclonal antibody MGA271 to an as of yet not elucidated target expressed on CSCs and differentiated tumor cells, this agent may induce an antibody-dependent cell-mediated cytotoxicity (ADCC) against CSCs. CSCs are tumor initiating cells that are able to self-renew and are responsible for tumor cell growth and resistance. Check for active clinical trials using this agent.

**monoclonal antibody Mik-beta-1:** A murine monoclonal antibody directed against the beta subunit of the interleukin-2 receptor (IL-2R), expressed on resting T-lymphocytes, natural killer (NK) cells, and some leukemic cell types. Monoclonal antibody Mik-beta-1 prevents the binding of IL-2 to IL-2R beta, thereby inhibiting the IL-2-mediated proliferation and activation of T-cells. Check for active clinical trials using this agent.

**monoclonal antibody R24:** An IgG murine monoclonal antibody directed against the ganglioside GD3 glycolipid, located in the cell membranes of some tumor cells. Monoclonal antibody R24 binds to GD3-positive cells, thereby initiating antibody-dependent cytotoxicity against GD3-positive cells.

**monoclonal antibody RAV12:** A chimeric monoclonal antibody directed against a primate-restricted N-linked carbohydrate epitope (glycotope) expressed on various human carcinomas with potential antineoplastic activity. Following binding, monoclonal antibody RAV12 disrupts sodium channels of tumor cells expressing this glycotope, resulting in cell and organelle swelling, loss of membrane integrity, and cell death.

**monoclonal antibody SGN-30:** A genetically-engineered, chimeric mouse-human, anti-CD30 monoclonal antibody with potential antineoplastic activity. Monoclonal antibody SGN-30 specifically binds to the receptor CD-30, a member of the tumor necrosis factor receptor superfamily, which may be overexpressed on the surfaces of Hodgkin lymphoma cells and anaplastic-large cell lymphoma cells. After binding to CD30, this agent interferes with the G1 phase of the cell cycle, thereby inducing growth arrest and apoptosis in susceptible tumor cell populations.

**monoclonal B-cell lymphocytosis :** A condition in which a higher-than-normal number of identical B cells are found in the blood. People with monoclonal B-cell lymphocytosis may develop other B-cell diseases, such as chronic lymphocytic leukemia (CLL). Also called MBL.

**monoclonal gammopathy of undetermined significance :** A benign condition in which there is a higher-than-normal level of a protein called M protein in the blood. Patients with monoclonal gammopathy of undetermined significance are at an increased risk of developing cancer. Also called MGUS.

**monoclonal protein :** An antibody found in unusually large amounts in the blood or urine of people with multiple myeloma and other types of plasma cell tumors. Also called M protein.

**monoclonal T-cell receptor anti-CD3 scFv fusion protein IMCgp100:** A fusion protein containing a modified form of human T-cell receptor (TCR) specific for the gp100 antigen and fused to an anti-CD3 single-chain antibody fragment, with potential antineoplastic activity. Upon direct intratumoral administration of IMCgp100 into the melanoma lesion, the TCR moiety of this agent targets and binds to the tumor associated antigen (TAA) gp100 presented on the melanoma tumor cell; the anti-CD3 fragment moiety binds to CD3- expressing T lymphocytes, thereby selectively cross-linking tumor cells and T-lymphocytes. This may lead to the recruitment of cytotoxic T lymphocytes (CTL) to the T lymphocyte/tumor cell aggregates

and result in CTL-mediated death of gp100-expressing melanoma cancer cells.

**Monoculture:** While the farms of antiquity grew many sorts of plant and animal on the same location, modern factory farming involves the cultivation of a single species, to the exclusion of all other forms of life. This is called monoculture.

**monocyte :** A type of immune cell that is made in the bone marrow and travels through the blood to tissues in the body where it becomes a macrophage. Macrophages surround and kill microorganisms, ingest foreign material, remove dead cells, and boost immune responses. A monocyte is a type of white blood cell and a type of phagocyte.

**monocytes:** some of the white blood cells that function in phagocytosis.

**monodentate:** A ligand that has only one atom that coordinates directly to the central atom in a complex. For example, ammonia and chloride ion are monodentate ligands of copper in the complexes  $[\text{Cu}(\text{NH}_3)_6]^{2+}$  and  $[\text{CuCl}_6]^{2-}$ .

**Monofer:** (Other name for: iron isomaltoside 1000)

**Monohydrate:** A crystal form containing one mole of water per mole of compound.

**Monolayer:** A single layer of oriented lipid molecules.

**Monomer:** A molecule that can join with other identical monomers to form a larger structure called a polymer. OR A relatively simple molecular structure, usually containing carbon and of low molecular weight, which can react to form a polymer by combination with itself or with other molecules and energy. OR A monomer is the molecular unit from which polymers are prepared. A polymer is a molecular chain formed by combining many smaller molecules. Polymers are the product of a reaction called polymerization, the process of connecting many (poly) single units (mers or mono-mers) to form long chain molecules of higher molecular weight. Polymerization reactions may be controlled to produce molecules of a specific length or molecular weight. All plastic resins or materials are polymeric in nature. OR The term that most often refers to organic molecules which form synthetic polymers, such as, for example, vinyl chloride, which is used to produce the polymer polyvinyl chloride (PVC). OR A small molecule that is linked with large numbers of other small

molecules to form a chain or a network (polymer). OR One unit of a protein or other structure. OR the smallest molecule that reacts with itself to form a polymer. OR Any small molecule that can undergo a reaction in which it is incorporated into a large molecule containing many similar units.

Common monomers are vinyl acetate, styrene, butadiene and vinyl chloride. (Yes, it is appropriate to consider hydrocarbons as polymers of methylene!) OR Substance composed of low molecular weight molecules capable of reacting with like or unlike molecules to form a polymer. OR Monomers are small, reactive molecules that react together to form very large molecules called polymers. OR A simple molecule, such as styrene, which has the ability to combine with a number of like or unlike molecules to form a polymer - polystyrene or styrene/butadiene rubber. OR A molecule or substance which can be polymerized, usually of low molar mass.

**monooxygenase:** An enzyme catalyzing the incorporation of one atom from molecular oxygen into a compound and the reduction of the other atom of oxygen to water.

**Monooxygenases, cytochrome P450:** Enzymes that use O<sub>2</sub> and incorporate one atom of oxygen into a substrate and reduce the other atom to water; important in the synthesis of steroid hormones and tyrosine, as well as the detoxification of xenobiotic compounds.

**monophosphoryl lipid A:** A modified form of lipid A, the biologically active part of Gram-negative bacterial lipopolysaccharide (LPS) endotoxin, and a Toll-like receptor 4 (TL= R4) agonist, with potential immunostimulatory activity. As a vaccine adjuvant, monophosphoryl lipid A (MPLA) stimulates both cellular and humoral responses to the vaccine antigen. Compared to LPS, MPLA exerts a similar immunostimulatory activity but with reduced toxicity. Check for active clinical trials using this agent.

**monoprotic acid:** An acid having only one dissociable proton.

**monosaccharide:** A simple sugar most commonly having 5 or 6 carbon atoms present which cannot be hydrolyzed to simpler sugars. OR A monosaccharide is one sugar molecule. They usually have six carbon, twelve hydrogen, and six oxygen atoms in one molecule with the formula (CH<sub>2</sub>O)<sub>x</sub>. They may also be in a six-carbon ring or a five carbon ring. The important idea is that it is one piece. OR A carbohydrate that cannot be decomposed into simpler carbohydrates by hydrolysis. OR A carbohydrate

consisting of a single sugar unit. OR Single aldehydes or ketones that have two or more hydroxyl groups; the simplest carbohydrates. OR sugars that are composed of single molecules.

**monosialotetrahexosylganglioside:** A glycosphingolipid containing a sialic acid residue found in neuronal cell membranes, with potential neuroprotective and neuroregenerative activities. Upon administration, monosialotetrahexosylganglioside, also called GM-1, is able to both prevent neurologic damage and induce regeneration of damaged neurons through neurotrophic repair mechanisms, enhancement of the production of neurotrophins, and augmenting neurite outgrowth. In addition, GM-1 exerts anti-excitotoxic activity, prevents necrosis, and improves neuronal recovery and function.

**monotherapy :** Therapy that uses one type of treatment, such as radiation therapy or surgery alone, to treat a certain disease or condition. In drug therapy, monotherapy refers to the use of a single drug to treat a disease or condition.

**monotremes:** the egg-laying mammals that produce milk.

**Monotropic:** Referring to a system in which various solid forms retain the rank order of their stabilities at all temperatures (in contrast to enantiotropic).

**monsoon:** seasonal wind pattern changes that cause rainy and dry seasons. OR A name for seasonal winds, first applied to the winds over the Arabian Sea that blow for six months from the northeast and for six months from the southwest. The term has been extended to similar winds in other parts of the world (i.e., the prevailing west to northwest winds of summer in Europe have been called the European monsoon). The primary cause for these seasonal winds is the much greater annual variation of temperature over large land areas compared with neighboring ocean surfaces, causing an excess of pressure over the continents in winter and a deficit in summer, but other factors, such as topography of the land, also have an effect. The monsoons are strongest in the southern and eastern sides of Asia, but also occur along the coasts of tropical regions wherever the planetary circulation is not strong enough to inhibit them. The monsoon climate can be described as a long winter-spring dry season, which includes a cold season followed by a short hot season just preceding the rains; a summer and early autumn

rainy season, which is generally very wet but may vary greatly from year to year; and a secondary warming immediately after the rainy season.

**Montanide ISA 51 VG:** An water-in-oil (w/o) emulsion with immunoadjuvant activity. Montanide ISA 51 VG appears to act by enhancing the immune system's cytotoxic T-lymphocyte (CTL) response against antigen(s) in vaccines. The surfactant mannide monooleate in Montanide ISA 51 VG contains vegetable-grade (VG) oleic acid derived from olive oil.

**Montanide ISA 720:** A proprietary adjuvant, applicable for water-in-oil (W/O; 30/70 v/v) vaccine emulsion, with potential immunoadjuvant activity. Montanide ISA 720 is made of natural metabolizable non-mineral oil and a highly refined emulsifier from the mannide mono-oleate family; it is rapidly metabolized and eliminated, and may be used in various vaccines, including cancer vaccines. Upon administration, Montanide ISA 720 forms a depot at the injection site and is therefore capable of slowly releasing the antigen(s) from the injection site. This may result in enhanced cellular and humoral immune responses to the antigen vaccine. Check for active clinical trials using this agent.

**Montanide ISA-51 :** A mixture of oil and water that is combined with a specific antigen to boost the immune response to that antigen. It is being studied in immunotherapy and as a way to increase the immune response to cancer vaccines. It is a type of immune modulator. Also called IFA and incomplete Freund's adjuvant.

**montelukast :** The active ingredient in a drug used to treat symptoms of asthma, such as trouble breathing, tight chest, wheezing, coughing, and runny nose. Montelukast blocks the action of a substance that causes airways in the lungs to narrow and causes other symptoms of asthma. It is a type of leukotriene receptor antagonist and a type of antiasthmatic agent.

**montelukast sodium:** The orally bioavailable monosodium salt of montelukast, a selective cysteinyl leukotriene receptor antagonist with anti-inflammatory and bronchodilating activities. Montelukast selectively and competitively blocks the cysteinyl leukotriene 1 (CysLT1) receptor, preventing binding of the inflammatory mediator leukotriene D4 (LTD4). Inhibition of LTD4 activity results in inhibition of leukotriene-mediated inflammatory events including: migration of eosinophils and neutrophils; adhesion of leukocytes to vascular endothelium, monocyte and neutrophil

aggregation; increased airway edema; increased capillary permeability; and bronchoconstriction. The CysLT1 receptor is found in a number of tissues including spleen, lung, placenta, small intestine, and nasal mucosa, and in a variety of cell types including monocyte/macrophages, mast cells, eosinophils, CD34-positive hemopoietic progenitor cells, neutrophils and endothelial cells.

**montelukast sodium :** A drug used to treat symptoms of asthma, such as trouble breathing, tight chest, wheezing, coughing, and runny nose.

Montelukast sodium blocks the action of a substance that causes airways in the lungs to narrow and causes other symptoms of asthma. It is a type of leukotriene receptor antagonist and a type of antiasthmatic agent. Also called Singulair.

**Monurol:** (Other name for: fosfomycin tromethamine)

**mood:** refers to the manner or attitude of the speaker which the verb intends to convey; verbs have three moods: indicative, imperative, or subjunctive.

**MOPAC:** The most popular package for semiempirical MO calculations (16).

**MOPP :** An abbreviation for a chemotherapy combination used alone or with radiation therapy to treat Hodgkin lymphoma. It includes the drugs mechlorethamine hydrochloride, vincristine sulfate (Oncovin), procarbazine hydrochloride, and prednisone. Also called MOPP regimen.

**MOPP regimen:** A chemotherapy regimen consisting of mechlorethamine, vincristine (Oncovin), procarbazine and prednisone, used alone or in combination with radiation therapy for the treatment of stage I-IV Hodgkin lymphoma. Due to the increased risk of gonadal toxicity, this regimen has been widely replaced by the ABVD regimen. or An abbreviation for a chemotherapy combination used alone or with radiation therapy to treat Hodgkin lymphoma. It includes the drugs mechlorethamine hydrochloride, vincristine sulfate (Oncovin), procarbazine hydrochloride, and prednisone. Also called MOPP.

**MOQ:** Minimum Order Quantity

**MORAb-009:** A substance being studied in the treatment of mesothelioma. MORAb-009 binds to a protein called mesothelin, which is found on some cancer cells. MORAb-009 may help the immune system kill cancer cells. It

is a type of monoclonal antibody. Also called amatuximab and anti-mesothelin monoclonal antibody MORAb-009.

**moraine:** an accumulation of till either left behind when a glacier recedes or carried on top of alpine glaciers. OR large area of deposition left behind from the advance of a glacier.

**moral :** Having to do with beliefs about what is right and wrong in terms of how people behave. Also called ethical.

**morbidity:** Any departure, subjective or objective, from a state of physiological or psychological well-being. In this sense, sickness, illness, and morbid condition are similarly defined and synonymous (Last, 1988).

**morbidity :** Refers to having a disease or a symptom of disease, or to the amount of disease within a population. Morbidity also refers to medical problems caused by a treatment.

**morbidity survey:** A method for the estimation of the prevalence and/or incidence of disease or diseases in a population. A morbidity survey is usually designed simply to ascertain the facts as to disease distribution, and not to test a hypothesis (Last, 1988).

**Mordant:** Solution or preparation applied to a surface to assist paint to adhere thereon, e.g. on galvanised iron.

**Morinda citrifolia :** A tropical shrub. An extract from the fruit is being studied as a treatment for cancer, and extracts from the fruit, leaves, or roots have been used in some cultures to treat other diseases. Also called noni.

**Morinda citrifolia fruit extract:** An extract prepared from the fruit of *Morinda citrifolia*, a plant that yields various herbal preparations. *Morinda citrifolia* fruit juice has antioxidant properties and may prevent tumorigenesis via inhibition of DNA-carcinogen adduct formation.

**morphine sulfate:** The sulfate salt of morphine, an opiate alkaloid isolated from the plant *Papaver somniferum* and produced synthetically. Morphine binds to and activates specific opiate receptors (delta, mu and kappa), each of which are involved in controlling different brain functions. In the central nervous and gastrointestinal systems, this agent has widespread effects including analgesia, anxiolysis, euphoria, sedation, respiratory depression, and gastrointestinal system smooth muscle contraction.

**morphine sulfate :** A drug used to treat moderate to severe pain. It binds to opioid receptors in the central nervous system and some other tissues.

Morphine sulfate is made from opium. It is a type of opiate and a type of analgesic agent.

**morphine sulfate sustained-release tablet:** A sustained-release tablet formulation containing the sulfate salt of the opiate alkaloid morphine with analgesic activity. Morphine binds to and activates the mu-opioid receptors in the central nervous system (CNS), thereby mimicking the effects of the endogenous opioids. Binding of morphine to opioid receptors stimulates exchange of GTP for GDP, inhibits adenylate cyclase, and decreases intracellular cAMP. This inhibits the release of various nociceptive neurotransmitters, such as substance P, gamma-aminobutyric acid (GABA), dopamine, acetylcholine, noradrenaline, vasopressin, and somatostatin. In addition, morphine closes N-type voltage-gated calcium channels and opens calcium-dependent inwardly rectifying potassium channels, which results in hyperpolarization of neuronal membranes and a reduction in neuronal excitability, and subsequently, analgesia and sedation.

**Morphology:** The external shape of a crystal; synonymous with the crystal habit. OR The science of the form and structure of organisms (plants, animals, and other forms of life).

**mortality :** Refers to the state of being mortal (destined to die). In medicine, a term also used for death rate, or the number of deaths in a certain group of people in a certain period of time. Mortality may be reported for people who have a certain disease, live in one area of the country, or who are of a certain gender, age, or ethnic group.

**mortality rate:** See death rate.

**Mortar:** A mixture of lime or cement and sand used as the jointing mixture for bricks or stone. OR It is made by mixing sand and cement with water. It sets hard and is used to hold bricks etc together.

**Mortise:** A cavity cut into a piece of wood or stone to receive a corresponding projection (called a tenon) so as to form a strong joint.

**morula:** a solid mass of cells that develops about six days after fertilization of an egg cell.

**Mosaic protein:** A protein encoded by a gene assembled by exon shuffling; the exons encode the structural units of the protein.

**mosaicism :** The occurrence of 2 or more cell lines with different genetic or chromosomal make-up, within a single individual or tissue.

**most probable number (MPN):** that number of organisms per unit volume that, in accordance with statistical theory, would be more likely than any other number to be yielded with the greatest frequency in a specific test. Expressed as density of organisms per 100 ml. Results are computed from the number of positive findings of coliform-group organisms resulting from multiple-portion decimal-dilution plantings.

**Mota and motb:** A pair of bacterial proteins that form a ring around the base of the flagellum and, in conjunction with flig, form a proton channel that drives the rotation of the flagellum.

**motesanib diphosphate:** The orally bioavailable diphosphate salt of a multiple-receptor tyrosine kinase inhibitor with potential antineoplastic activity. Motesanib selectively targets and inhibits vascular endothelial growth factor (VEGFR), platelet-derived growth factor (PDGFR), kit, and Ret receptors, thereby inhibiting angiogenesis and cellular proliferation.

**motexafin gadolinium:** A synthetic metallotexaphyrin with radiosensitizing and chemosensitizing properties. Motexafin gadolinium accumulates in tumor cells preferentially due to their increased rates of metabolism, generating reactive oxygen species (ROS) intracellularly and lowering the tumor cell apoptotic threshold to ionizing radiation and chemotherapy. Check for active clinical trials using this agent. Or A substance being studied in the treatment and diagnosis of some types of cancer. It builds up in some cancer cells, which may make them easier to kill with radiation therapy and chemotherapy. Motexafin gadolinium is also used in magnetic resonance imaging (MRI) to help find cancer cells in the body. It is a type of radiosensitizing agent, a type of chemosensitizing agent, and a type of contrast agent. Also called gadolinium texaphyrin.

**motexafin lutetium :** A substance that is being studied in the treatment of cancer using photodynamic therapy. It belongs to the family of drugs called metallotexaphyrins. Also called lutetium texaphyrin. Or A pentadentate aromatic metallotexaphyrin with photosensitizing properties. Motexafin lutetium preferentially accumulates in tumor cells due to their increased rates of metabolism and absorbs light, forming an extended high energy conformational state that produces high quantum yields of singlet oxygen, resulting in local cytotoxic effects.

**mother liquor:** The solution in recrystallization.

**motor :** In medicine, having to do with the movement of body parts.

**motor neuron:** a type of neuron that transmits impulses from the brain and spinal cord to muscles or glands.

**motor neuron disease :** A type of disease in which the nerve cells in the brain that act on muscle cells break down and stop working. This affects basic activities such as speaking, walking, breathing, and swallowing. Symptoms include muscle weakness, wasting, twitching, trouble swallowing, and slowly becoming paralyzed. Motor neuron diseases are sometimes inherited. Amyotrophic lateral sclerosis (ALS or Lou Gehrig's disease) is the most common type of motor neuron disease.

**Motrin:** (Other name for: ibuprofen)

**Motrin :** A drug used to treat fever, swelling, pain, and redness by preventing the body from making a substance that causes inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called Advil and ibuprofen.

**Mould Cooling:** Mould cooling describes the process by which the melt temperature is reduced to the point where part can be removed from the mould.

**Mould growth on inside surfaces:** Mould flourishes in conditions of high humidity, poor ventilation and on surfaces with a high moisture content. It can be very destructive to paint coatings and needs to be eradicated before applying paint. Treat affected areas with Weathershield Multi-Surface Fungicidal Wash. Leave for 24 hours, wash down to remove residues and allow to dry thoroughly. If necessary, repeat the treatment.

**Mould Packing / Follow up pressure / Hold on phase:** Mould packing is the process of delivering an additional amount of melt to the mould, to compensate for the shrinkage after filling.

**Mould Temperature:** It refers to temperature of mould surface in contact with melt. It varies from point to point on surface if cooling design does not provide uniform heat extraction. It also fluctuates if heat is not balanced.

**Mould/algae moss on outside surfaces:** Yes, there is a very effective treatment for these types of vegetable growths, which are most likely to occur in damp conditions or on surfaces with a high moisture content.. Before treating, first repair the source of any leaks and check for blocked air bricks and defective or missing DPC. Treat affected areas with Weathershield Multi-Surface Fungicidal Wash. Leave for 24 hours, wash

down to remove residues and allow to dry thoroughly before applying coating. Isolated algae patches on a building exterior may indicate structural defects and should be investigated by a reputable builder or building surveyor.

**Moulding Cycle:** The moulding cycle is the series of steps that result in the machine producing a part. The cycle is usually described by breaking down into four separate phases. The amount of time that it takes to complete one cycle is called cycle time.

**mountain belt:** long chains of mountain ranges; typically thousands of kilometers long.

**mountain range:** a group of mountain peaks or ridges that form a discrete topographic area.

**mountain root:** a bulge of continental crust downward into the mantle beneath a mountain.

**mountain-building:** the process of building mountains through tectonic forces that deform, metamorphose, and uplift crustal rocks.

**Mounting Plate:** The part of the blow molding unit to which the mold is attached.

**mouse gp100 plasmid DNA vaccine:** A vaccine consisting of a plasmid DNA encoding the murine melanoma-associated antigen gp100. Upon administration, expressed gp100 antigen may stimulate a cytotoxic T cell HLA-A2.1-restricted immune response against tumor cells that express the gp100 antigen, resulting in tumor cell lysis.

**mouse model :** The use of special strains of mice to study a human disease or condition, and how to prevent and treat it.

**mouse prostate-specific membrane antigen plasmid DNA vaccine:** A vaccine consisting of a plasmid DNA encoding the murine prostate-specific membrane antigen (PSMA). Upon administration, expressed PSMA may stimulate a cytotoxic T cell response against tumor cells that express PSMA, resulting in tumor cell lysis. Check for active clinical trials using this agent.

**mouse renal adenocarcinoma cell-encapsulated agarose-agarose macrobeads:** An agarose matrix containing mouse renal adenocarcinoma (RENCA) cells, with potential antineoplastic activity. The agarose-agarose macrobeads consist of two spherical agarose layers; the mouse RENCA

cells are contained within the inner agarose layer. Upon placement into the abdominal cavity, the restricted mouse renal adenocarcinoma cells in the agarose macrobeads produce and release certain growth-retarding factors that inhibit the proliferation of the RENCA cells. Upon diffusion of these growth-slowing factors out of the agarose layers, these substances may inhibit cancer cell proliferation of proliferating tumors.

**mouth:** the terminus of a stream. OR the opening at the top of a bottle or jar.

**MOv-gamma chimeric receptor gene:** A recombinant engineered chimeric gene derived from the murine gene encoding the variable region of monoclonal antibody MOv18 against folate-binding protein, which is often overexpressed in human ovarian cancer cells, and the gene encoding the Fc receptor for the gamma subunit of human IgG and IgE. Peripheral blood lymphocytes expressing the MOv-gamma gene may be used in the immunotherapeutic treatment of ovarian cancer.

**Movable Platen:** The large back platen of an injection molding machine to which the back half of the mold is secured during operation. This platen is moved either by a hydraulic ram or a toggle mechanism.

**MOVABLE PLATEN:** The moving platen of an injection or compression molding machine to which half of the mold is secured during operation. This platen is moved either by a hydraulic ram or a toggle mechanism.

**Movalis:** (Other name for: meloxicam)

**Movantik:** (Other name for: naloxegol)

**Movatec:** (Other name for: meloxicam)

**Moving platen:** The platen of a molding machine that travels (opens and closes)It is connected to the clamp unit and is the mounting location for the ``b", or traveling half of the mold.

**Moviprep:** (Other name for: PEG-3350/sodium sulfate/sodium chloride/potassium chloride/sodium ascorbate/ascorbic acid-based laxative)

**moxetumomab pasudotox:** A recombinant immunotoxin consisting of the Fv portion of the anti-CD22 antibody covalently fused to a 38 KDa fragment of Pseudomonas exotoxin-A (PE38) with potential antineoplastic activity. The Fv portion of moxetumomab pasudotox binds to CD22, a cell surface receptor expressed on a variety of malignant B-cells, thereby delivering the toxin moiety PE38 directly to tumor cells. Once internalized,

PE38 induces caspase-mediated apoptosis via a mechanism involving mitochondrial damage and blocks translational elongation by binding to elongation factor 2 (EF-2). Moxetumomab Pasudotox exhibits a greater affinity for CD22 than its predecessor, anti-CD22 immunotoxin CAT-3888 (BL22 immunotoxin), and hence may be more effective against tumor cells expressing lower levels of CD22.

**moxibustion :** In traditional Chinese medicine, a type of heat therapy in which an herb is burned on or above the skin to warm and stimulate an acupuncture point or affected area.

**moxifloxacin :** A drug used to treat bacterial infections. It is a type of fluoroquinolone. Also called Avelox and moxifloxacin hydrochloride.

**moxifloxacin hydrochloride:** The hydrochloride salt of a fluoroquinolone antibacterial antibiotic. Moxifloxacin binds to and inhibits the bacterial enzymes DNA gyrase (topoisomerase II) and topoisomerase IV, resulting in inhibition of DNA replication and repair and cell death in sensitive bacterial species. or A drug used to treat bacterial infections. It is a type of fluoroquinolone. Also called Avelox and moxifloxacin.

**Mozobil:** (Other name for: plerixafor)

**Mozobil :** A drug used before autologous stem cell transplantation in patients with non-Hodgkin lymphoma or multiple myeloma. Mozobil is given together with granulocyte-colony stimulating factor (G-CSF) to help move stem cells from the bone marrow to the blood. The stem cells can then be collected, stored, and given back to the patient. Mozobil is a type of chemokine receptor antagonist. Also called AMD 3100 and plerixafor.

**MP-3549.1:** A formulation containing pegylated liposomal nanoparticles encapsulating a prodrug of the poorly water-soluble, second-generation taxane analog docetaxel, with potential antineoplastic activity. Upon intravenous administration of the liposomal docetaxel prodrug MNK-010, docetaxel is slowly released into the systemic circulation and accumulates at the tumor site due to the unique characteristics of the tumor's vasculature. In turn, docetaxel is taken up by tumor cells, and subsequently binds to and stabilizes the beta-subunit of tubulin, thereby stabilizing microtubules and inhibiting microtubule disassembly. This results in cell cycle arrest and induces cell death. Compared to the administration of docetaxel alone, this formulation is able to increase the delivery of docetaxel into tumors, thereby increasing docetaxel's efficacy while minimizing its toxicity. In

addition, this formulation solubilizes docetaxel without the use of toxic solvents, thereby permitting the administration of larger doses of docetaxel while avoiding solvent-associated toxicity.

**MP2:** Second-order Møller-Plesset perturbation theory. Standard Rayleigh-Schrödinger perturbation theory taken to second order. The least-expensive traditional method for including electron correlation. For open-shell cases with a UHF reference, MP2 is sometimes denoted "UMP2."

**MP2=fc:** Frozen-core MP2 calculation in Gaussian-style notation. (See "Frozen" and "MP2.")

**MP2=fu:** MP2=full.

**MP2=full:** MP2 calculation in which the core orbitals are active and not frozen.

**MP4:** Fourth-order MBPT. (See MP2.) At the heart of the BAC-MP4 method.

**MP470:** A substance being studied in the treatment of some types of cancer. It may block certain proteins involved in cancer cell growth and DNA repair. Blocking these proteins may make cancer cells more sensitive to anticancer drugs and radiation therapy. MP470 is a type of tyrosine kinase inhibitor. Also called amuvatinib.

**MPa:** Short for "megapascal", that is, one million pascals. A pascal is the pressure generated by a mass of approximately 100g on a square metre under the earth's gravitational field. Atmospheric pressure is about 100,000 pascal (100 kPa, or as weather forecasters like to say, 1000 hPa [hectopascal]), so 7 MPa is about 70 times atmospheric pressure. You may come across values in "psi", or "pound force per square inch": 1 MPa is about 145 psi.

**MPL gene :** A gene that makes a protein called the thrombopoietin receptor. This is a protein that helps control the number of blood cells that are made in the bone marrow, especially platelets. Mutated (changed) forms of the MPL gene may cause the body to make abnormal blood cells or too many platelets. Mutations in this gene have been found in some types of blood conditions, including essential thrombocythemia and primary myelofibrosis.

**MPNST:** A type of soft tissue sarcoma that develops in cells that form a protective sheath (covering) around peripheral nerves, which are nerves that are outside of the central nervous system (brain and spinal cord). Also called malignant peripheral nerve sheath tumor.

**Mps1 inhibitor BAY 1217389:** An orally bioavailable, selective inhibitor of the serine/threonine kinase monopolar spindle 1 (Mps1, TTK), with potential antineoplastic activity. Upon administration, the Mps1 inhibitor BAY 1217389 selectively binds to and inhibits the activity of Mps1. This inactivates the spindle assembly checkpoint (SAC), accelerates mitosis, causes chromosomal misalignment and missegregation, and mitotic checkpoint complex destabilization. This induces cell death in Mps1-overexpressing cancer cells. Mps1, a kinase expressed in proliferating normal tissues and aberrantly overexpressed in a wide range of human tumors, is activated during mitosis and is essential for proper SAC functioning and chromosome alignment.

**Mps1 kinase inhibitor BAY1161909:** An orally bioavailable, selective inhibitor of the serine/threonine monopolar spindle 1 (Mps1) kinase, with potential antineoplastic activity. Upon administration, the Mps1 kinase inhibitor BAY1161909 binds to and inhibits the activity of Mps1. This causes inactivation of the spindle assembly checkpoint (SAC), accelerated mitosis, chromosomal misalignment, chromosomal missegregation, mitotic checkpoint complex destabilization, and increased aneuploidy. This leads to the induction of cell death in cancer cells overexpressing Mps1. Mps1, a kinase expressed in proliferating normal tissues and aberrantly overexpressed in a wide range of human tumors, is activated during mitosis and is essential for SAC functioning and controls chromosome alignment.

**MR:** A measure of how fast cancer cells are dividing and growing. To find the MR, the number of cells dividing in a certain amount of cancer tissue is counted. MR is used to help find the stage of melanoma (a type of skin cancer) and other types of cancer. Higher MRs are linked with lower survival rates. Also called mitotic rate.

**MRA:** A procedure that uses radio waves and a powerful magnet linked to a computer to create detailed pictures of the blood vessels and blood flow inside the body. A dye may be injected into a vein to make the blood vessels and blood flow easier to see. MRA may be used to check for aneurysms (a bulge in the blood vessel wall), blockages in the arteries,

blood clots, and other blood vessel problems. Also called magnetic resonance angiography.

**MRCI:** Multi-reference configuration interaction. CI using more than one reference determinant, instead of the usual single Hartree-Fock reference. Among multi-reference theories, MR-CISD (singles and doubles CI) is popular and high-level (but not dissociation consistent).

**MRI:** A procedure in which radio waves and a powerful magnet linked to a computer are used to create detailed pictures of areas inside the body. These pictures can show the difference between normal and diseased tissue. MRI makes better images of organs and soft tissue than other scanning techniques, such as computed tomography (CT) or x-ray. MRI is especially useful for imaging the brain, the spine, the soft tissue of joints, and the inside of bones. Also called magnetic resonance imaging, NMRI, and nuclear magnetic resonance imaging.

**mRNA:** messenger RNA; the RNA molecules that receive the genetic code in the DNA and carry the code into the cytoplasm where protein synthesis takes place. OR See messenger RNA. OR A type of RNA found in cells. mRNA molecules carry the genetic information needed to make proteins. They carry the information from the DNA in the nucleus of the cell to the cytoplasm where the proteins are made. Also called messenger RNA.

**mRNA-derived lung cancer vaccine CV9202:** A non-small cell lung cancer (NSCLC) vaccine containing six modified mRNAs, which encode six different NSCLC associated antigens, with potential antitumor and immunomodulatory activities. Upon intradermal administration, mRNA-derived lung cancer vaccine CV9202 may stimulate the immune system to mount both humoral and cellular responses against NSCLC cells. The six tumor-associated antigens (TAAs) encoded by these mRNAs are frequently expressed by NSCLC cells and are minimally expressed or absent in normal, healthy cells.

**mRNA-derived prostate cancer vaccine CV9103:** A prostate cancer vaccine containing mRNAs encoding prostate specific antigen (PSA), prostate specific membrane antigen (PSMA), prostate stem cell antigen (PSCA) and six-transmembrane epithelial antigen of the prostate (STEAP), with potential antitumor activity. Upon administration, mRNA-derived prostate cancer vaccine CV9103 may stimulate the immune system to

mount a cytotoxic T lymphocyte response (CTL) against PSA-, PSMA-, PSCA- and STEAP-expressing prostate tumor cells. The mRNA used in this vaccine is modified and formulated to have enhanced translational potency and adjuvant activities. PSA, PSMA, PSCA and STEAP may be upregulated in prostate cancer cells; their expression in prostate cancer has been correlated with disease progression. Check for active clinical trials using this agent.

**mRNA-derived prostate cancer vaccine CV9104:** A prostate cancer vaccine containing six messenger RNAs (mRNAs) encoding for antigens upregulated in prostate cancer, including mRNAs for prostate specific antigen (PSA), prostate specific membrane antigen (PSMA), prostatic acid phosphatase (PAP), and mucin 1 (MUC1), with potential antineoplastic and immunomodulating activities. Upon intradermal administration of mRNA-derived prostate cancer vaccine CV9104, this agent enters cells, the mRNAs are translated into the respective prostate specific antigens and may cause the immune system to mount a cytotoxic T lymphocyte response (CTL) against PSA-, PSMA-, PAP- and MUC1-expressing prostate tumor cells. The mRNAs used in this vaccine are modified to have enhanced translational potency and adjuvant activities. PSA, PSMA, PAP and MUC1 are frequently upregulated in prostate cancer cells; their expression in prostate cancer has been correlated with disease progression.

**MRSI:** A noninvasive imaging method that provides information about cellular activity (metabolic information). It is used along with magnetic resonance imaging (MRI) which provides information about the shape and size of the tumor (spatial information). Also called <sup>1</sup>H-nuclear magnetic resonance spectroscopic imaging, magnetic resonance spectroscopic imaging, and proton magnetic resonance spectroscopic imaging.

**MS 209:** A substance that is being studied for its ability to make cancer cells respond better to chemotherapy drugs to which they have become resistant. It is a type of quinolone antibiotic.

**MS Contin:** (Other name for: morphine sulfate)

**MS-275:** A substance that is being studied in the treatment of cancers of the blood. It belongs to the family of drugs called histone deacetylase inhibitors.

**MSDS:** Material safety data sheet

**MSDS:** Short for Material Safety Data Sheet. OR Safety information sheet for a particular substance that lists physical properties, hazards, cleanup and disposal procedures, fire and explosion data, and protective equipment required.

**MSG:** MSG is monosodium glutamate, used as a flavor enhancer in many foods.

**MSI:** A characteristic of cells that contain an abnormality in DNA mismatch repair (see microsatellite). For example, the presence of MSI in colorectal tumor tissue may be used as a marker for germline mutations in one of the DNA mismatch repair genes associated with HNPCC. MSI can also occur sporadically, and in these cases is related to gene hypermethylation. This is an issue in the differential diagnosis of HNPCC. Also called microsatellite instability. or A change that occurs in the DNA of certain cells (such as tumor cells) in which the number of repeats of microsatellites (short, repeated sequences of DNA) is different than the number of repeats that was in the DNA when it was inherited. The cause of MSI may be a defect in the ability to repair mistakes made when DNA is copied in the cell. Also called microsatellite instability.

**MSir:** (Other name for: morphine sulfate)

**MTD:** The highest dose of a drug or treatment that does not cause unacceptable side effects. The MTD is determined in clinical trials by testing increasing doses on different groups of people until the highest dose with acceptable side effects is found. Also called maximum tolerated dose.

**MTF-1 inhibitor APTO-253 HCl:** The hydrochloride salt of a small molecule inhibitor of human metal-regulatory transcription factor 1 (MTF-1) with potential antitumor activity. MTF-1 inhibitor APTO-253 inhibits MTF-1 activity and thereby induces the expression of MTF-1 dependent tumor suppressor factor Kruppel like factor 4 (KLF4). This subsequently leads to the downregulation of cyclin D1, blocking cell cycle progression and proliferation. This agent also causes decreased expression of genes involved in tumor hypoxia and angiogenesis.

**mTOR:** A protein that helps control several cell functions, including cell division and survival, and binds to rapamycin and other drugs. mTOR may be more active in some types of cancer cells than it is in normal cells. Blocking mTOR may cause the cancer cells to die. It is a type of

serine/threonine protein kinase. Also called mammalian target of rapamycin and mechanistic target of rapamycin.

**mTOR inhibitor** : A substance that blocks a protein called mTOR, which helps control cell division. Blocking mTOR's action may keep cancer cells from growing and prevent the growth of new blood vessels that tumors need to grow. Some mTOR inhibitors are used to treat cancer.

**mTOR kinase inhibitor AZD8055**: An inhibitor of the mammalian target of rapamycin (mTOR) with potential antineoplastic activity. mTOR kinase inhibitor AZD8055 inhibits the serine/threonine kinase activity of mTOR, resulting in decreased expression of mRNAs necessary for cell cycle progression, which may induce cell cycle arrest and tumor cell apoptosis. mTOR phosphorylates transcription factors, such as S6K1 and 4E-BP1, which stimulate protein synthesis and regulate cell growth, proliferation, motility, and survival. Check for active clinical trials using this agent.

**mTOR kinase inhibitor CC-223**: An orally available inhibitor of the mammalian target of rapamycin (mTOR) with potential antineoplastic activity. mTOR kinase inhibitor CC-223 inhibits the activity of mTOR, which may result in the induction of tumor cell apoptosis and a decrease in tumor cell proliferation. mTOR, a serine/threonine kinase that is upregulated in a variety of tumors, plays an important role downstream in the PI3K/AKT/mTOR signaling pathway, which is frequently dysregulated in human cancers.

**mTOR kinase inhibitor OSI-027**: An orally bioavailable mammalian target of rapamycin (mTOR) kinase inhibitor with potential antineoplastic activity. mTOR kinase inhibitor OSI-027 binds to and inhibits both the raptor-mTOR (TOR complex 1 or TORC1) and the rictor-mTOR (TOR complex 2 or TORC2) complexes of mTOR, which may result in tumor cell apoptosis and a decrease in tumor cell proliferation. mTOR is a serine/threonine kinase that is upregulated in some tumors and plays an important role downstream in the PI3K/Akt/mTOR signaling pathway.

**mTOR1/2 kinase inhibitor ME-344**: An active metabolite of NV-128, a novel flavonoid small molecule inhibitor of the mammalian Target of Rapamycin (mTOR), with potential antineoplastic activity. Upon administration, mTOR1/2 Kinase inhibitor ME-344 downregulates the PI3K/AKT/mTOR pathway and results in chromatin condensation in the absence of caspase activation. Consequently, this agent induces caspase-

independent cell death in tumor cells with a de-regulated PI3K/AKT/mTOR pathway or chemotherapeutic resistant cells.

**mTORC1/2 kinase inhibitor BI 860585:** An orally bioavailable inhibitor of raptor-mammalian target of rapamycin (mTOR) complex 1 (mTOR complex 1; mTORC1) and rictor-mTOR complex 2 (mTOR complex 2; mTORC2), with potential antineoplastic activity. Upon oral administration, mTORC1/2 kinase inhibitor BI 860585 binds to the kinase domain of mTOR and inhibits both mTORC1 and mTORC2, in an ATP-competitive manner. This inhibits mTOR-mediated signaling and leads to both an induction of apoptosis and a decrease in the proliferation of mTORC1/2-expressing tumor cells. mTOR is a serine/threonine kinase that is upregulated in certain tumor cell types. It plays an important role in the PI3K/Akt/mTOR signaling pathway, which is often deregulated in cancer cells and promotes cell growth, survival, and resistance to chemotherapy and radiotherapy.

**mTORC1/mTORC2/DHFR inhibitor ABTL0812:** An orally bioavailable, lipid analogue and inhibitor of raptor-mammalian target of rapamycin (mTOR) (mTOR complex 1; mTORC1), rictor-mTOR (mTOR complex 2; mTORC2) and dihydrofolate reductase (DHFR) with potential antineoplastic activity. Upon oral administration, mTORC1/mTORC2/DHFR inhibitor ABTL0812 binds to and inhibits both mTORC1 and mTORC2, which may result in apoptosis and a decrease in proliferation in mTORC1/2-expressing tumor cells. mTOR is a serine/threonine kinase that is upregulated in some tumors; it plays an important role in the PI3K/Akt/mTOR signaling pathway which is often deregulated in cancer cells. In addition, ABTL0812 inhibits DHFR, an enzyme that reduces dihydrofolic acid to tetrahydrofolic acid, thereby blocking tetrahydrofolate synthesis, and resulting in both the depletion of nucleotide precursors and the inhibition of DNA, RNA and protein synthesis. This leads to autophagy-induced cell death and further inhibition of cell proliferation.

**MTX:** A drug used to treat some types of cancer, rheumatoid arthritis, and severe skin conditions, such as psoriasis. MTX stops cells from making DNA and may kill cancer cells. It is a type of antimetabolite. Also called amethopterin, methotrexate, and Rheumatrex.

**MUC-1:** A protein found on certain epithelial cells, which line the inside and outside surfaces of the body. It may be found in higher than normal amounts in patients with some types of cancer, including breast, ovarian, lung, and prostate cancers, or in other conditions. Measuring the amount of MUC-1 in the blood may help to find out how well cancer treatment is working or if cancer has come back. MUC-1 is a type of tumor marker.

**MUC1 antigen:** MUC-1 antigen is a mammary-type apomucin, a high molecular weight transmembrane glycoprotein, of which the extracellular domain is formed by a repeating 20 amino acid sequence (in tandem) with a high content of serine and threonine on which are O-linked carbohydrate chains. MUC-1 synthesis and secretion are features of glandular epithelial tissues; MUC-1 is overexpressed in lactating breast and in breast, ovary, lung, and prostate malignancies.

**MUC1 peptide vaccine:** A cancer vaccine comprised of a synthetic peptide derived from the mucin 1 (MUC1) antigen with potential antineoplastic activity. Upon administration, MUC1 peptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells positive for the MUC1 antigen, resulting in decreased tumor growth. Overexpressed on many tumor cells, MUC1 antigen, a mammary-type apomucin, is a high-molecular-weight transmembrane glycoprotein.

**MUC1 peptide-poly-ICLC adjuvant vaccine:** A vaccine preparation containing mucus 1 (MUC1) peptide and the adjuvant poly-ICLC with potential immunostimulatory and antineoplastic activities. Upon administration, MUC1 peptide-poly-ICLC adjuvant vaccine may induce the host immune system to mount a cytotoxic T cell response against MUC1-expressing tumor cells. MUC1, a tumor associated antigen normally present on the lining of the human colon, may be overexpressed and/or mutated in a variety of cancer cell types. The adjuvant poly-ICLC, a ligand for toll-like receptor-3, induces the release of cytokines which may help boost the immune response against MUC1.

**MUC1-KLH conjugate vaccine:** A peptide vaccine, containing human tumor-associated epithelial mucin (MUC1) conjugated with keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Vaccination with MUC1-KLH conjugate vaccine may stimulate humoral and cytotoxic T-lymphocyte (CTL) responses against tumor cells expressing the MUC1

antigen. In this vaccine, MUC1 antigen is conjugated with KLH, an immunostimulant and a hapten carrier, to enhance immune recognition. MUC1 antigen, a membrane-bound glycoprotein expressed by most glandular and ductal epithelial cells, is overexpressed in an aberrant or deglycosylated form in various cancers such as those of the breast, prostate, and ovary.

**MUC1-KLH vaccine/QS21:** A peptide vaccine containing the human tumor-associated antigen epithelial mucin (MUC1 antigen) conjugated with keyhole limpet hemocyanin (KLH) and combined with the nonspecific immunoadjuvant QS21 with potential antineoplastic activity. MUC1 antigen is linked with KLH, an immunostimulant and a hapten carrier, in order to enhance immune recognition; the co-administration of saponin-derived QS21 potentially amplifies the total immune response to the MUC1 antigen. Administration of MUC1-KLH vaccine/QS21 may result in both the production of antitumor antibodies and the stimulation of a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the MUC1 antigen. MUC1 antigen, a membrane-bound glycoprotein expressed by most glandular and ductal epithelial cells, is overexpressed as an aberrant or deglycosylated form in various cancers such as breast, prostate and ovarian cancers.

**MUC1-targeted peptide GO-2-03-2C:** An optimized small peptide drug candidate targeting epithelial mucin (MUC1) with antineoplastic activity. MUC1-targeted peptide GO-203-2C interacts with oncoprotein MUC1 C-terminal subunit on the cell surface, thereby impeding cell-cell interactions, signaling, and metastasis. MUC1 antigen, a membrane bound glycoprotein expressed by most glandular and ductal epithelial cells, is over-expressed in many diverse human carcinomas including those of the breast, prostate, lung, colon, pancreas, and ovary, and has been associated with poor prognosis.

**MUC16-targeted antibody-drug conjugate DMUC5754A:** An antibody drug conjugate (ADC) consisting of a humanized IgG1 monoclonal antibody targeting the MUC16 protein (CA-125) conjugated to, via a cleavable linker, the antimicrotubulin agent monomethyl auristatin E (MMAE), with potential antineoplastic activity. The monoclonal antibody moiety of DMUC5754A selectively binds to MUC16. After internalization of the drug conjugate and proteolytic cleavage of the linker, MMAE binds

to tubulin and inhibits its polymerization, which results in G2/M-phase growth arrest and tumor cell apoptosis. MUC16, a transmembrane protein, is overexpressed on the cell surface of more than 80 percent of ovarian cancer cells but not on healthy cells. Check for active clinical trials using this agent.

**mucin/peptide** : A protein/sugar compound made by some cancer cells.

**mucinous** : Containing or resembling mucin, the main compound in mucus.

**mucinous carcinoma** : A type of cancer that begins in cells that line certain internal organs and produce mucin (the main component of mucus).

**mucoadhesive hydrogel gargle**: An oral rinse composed of a viscous, mucoadhesive hydrogel, with potential protective and antimucositis activities. Upon gargling with the oral viscous mucoadhesive hydrogel formulation in the oral cavity, the hydrogel forms a protective barrier over the oral mucosa, which prevents inflammation of the mucosal membranes and may decrease chemotherapy- and/or radiation-induced oral mucositis. Check for active clinical trials using this agent.

**mucoadhesive oral wound rinse**: A viscous, oral hydrogel rinse intended for the management of oral mucositis/stomatitis. Mucoadhesive oral wound rinse consists of purified water, glycerin, benzyl alcohol, sodium saccharin, carbomer homopolymer A, potassium hydroxide, citric acid, polysorbate 60 and phosphoric acid. Upon gargling and rinsing with this solution, it forms a soothing protective hydrogel coating over the oral mucosa, thereby potentially preventing or reducing chemotherapy-induced mucositis.

**mucoadhesive paclitaxel formulation**: An orally available, mucoadhesive lipid preparation consisting of paclitaxel, a compound extracted from the Pacific yew tree *Taxus brevifolia*, in a formulation that is comprised of a mixture of monoolein, tricarylin, and Tween 80, with potential antineoplastic activity. Upon oral administration, DHP107 forms droplets and micelles in the intestine; these adhere to mucoepithelial cells in the gastrointestinal tract and are absorbed through lipid-based uptake mechanisms. Upon absorption, paclitaxel binds to and stabilizes tubulin molecules, which results in the inhibition of both microtubule depolymerization and cell division. This agent also induces apoptosis by both binding to and blocking the function of the apoptosis inhibitor protein B-cell Leukemia 2 (Bcl-2). The mucoadhesive paclitaxel formulation does

not contain P-glycoprotein inhibitors, the solvent cremophor or any other toxic solvent.

**Mucomyst:** (Other name for: acetylcysteine)

**mucopolysaccharide:** An older name for a glycosaminoglycan.

**mucosa :** The moist, inner lining of some organs and body cavities (such as the nose, mouth, lungs, and stomach). Glands in the mucosa make mucus (a thick, slippery fluid). Also called mucous membrane.

**mucosa-associated lymphoid tissue lymphoma :** A type of cancer that arises in cells in mucosal tissue that are involved in antibody production. Also called MALT lymphoma.

**mucositis :** A complication of some cancer therapies in which the lining of the digestive system becomes inflamed. Often seen as sores in the mouth.

**mucous membrane :** The moist, inner lining of some organs and body cavities (such as the nose, mouth, lungs, and stomach). Glands in the mucous membrane make mucus (a thick, slippery fluid). Also called mucosa.

**mucus :** A thick, slippery fluid made by the membranes that line certain organs of the body, including the nose, mouth, throat, and vagina.

**mucus colitis :** A disorder of the intestines commonly marked by abdominal pain, bloating, and changes in a person's bowel habits. This may include diarrhea or constipation, or both, with one occurring after the other. Also called IBS, irritable bowel syndrome, irritable colon, and spastic colon.

**Mud cracking:** It has most likely been caused by applying a thick, heavy coat of un-thinned paint to a textured or embossed surface. 'Mud cracking' can also be caused when the air temperature drops rapidly after applying a water-based product, or when over coating an emulsion without leaving sufficient drying time. The solution? Applying one or two thin coats will often successfully fill the cracks.

**mud flow:** the movement of a liquidy mass of soil, rock debris, and water down a well-defined channel.

**MUD Set:** MUD stands for Master Unit Die. A MUD set is a purchased universal injection mold base which reduces injection mold fabrication cost. Great for short runs, quick overturn and repair.

**mudpot:** a kind of hot spring that produces boiling mud and releases sulfurous gases.

**Mudstone** : A sedimentary rock made from small particles of mud.

**MuGard:** (Other name for: mucoadhesive oral wound rinse)

**muJ591:** A type of monoclonal antibody used in cancer detection or therapy. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells.

**Mullerian tumor** : A rare cancer of the uterus, ovary, or fallopian tubes.

**Mulliken population:** A procedure for assigning net atomic charges within a molecule. It includes an arbitrary choice involving overlap populations, and more seriously is very sensitive (values varying by more than 100%) to the choice of basis set. Still used mostly for convenience, since it has no cost and is included in all ab initio program packages. Superseded by NPA and AIM methods of population analysis.

**Mullion:** The upright frame member or division between the lights of a window or openings in a screen.

**multi-AGC kinase inhibitor AT13148:** An orally available, small molecule inhibitor of AGC group kinases, with potential antineoplastic activity. AT13148 inhibits, in an ATP-competitive manner, the enzymatic activity of two AGC kinases, protein kinase B (PKB or AKT) and p70S6K which play key roles in the PI3K/PKB/mTOR signaling pathway. Blockade of this pathway leads to an inhibition of cell growth and the induction of apoptosis in susceptible tumor cells. PI3K/PKB/mTOR pathway is dysregulated in greater than 50% of tumors, and is often correlated with resistance and increased tumor survival. AGC group kinases are serine/threonine kinases that are regulated by secondary messengers such as cyclic AMP and lipids.

**Multi-Cavity Mold:** A mold having two or more impressions for forming finished items in one machine cycle. OR A mold with multiple parts—allowing for more complex items to be made. OR A mold where more than one cavity is cut into the mold to allow for multiple parts to be formed in one cycle. Typically, if a mold is called “multi-cavity,” the cavities are all the same part number. See also “family mold.”

**multi-epitope anti-folate receptor peptide vaccine TPIV 200:** A peptide vaccine containing five immunogenic peptide epitopes of the human folate

receptor 1 (FOLR1; FR-alpha), with potential immunomodulating and antineoplastic activities. Upon intradermal administration, multi-epitope anti-folate receptor peptide vaccine TPIV 200 may induce a cytotoxic T-lymphocyte (CTL) response against FR-alpha-overexpressing tumor cells. FR-alpha is a high-affinity folate-binding protein and a member of the folate receptor family; this receptor is overexpressed in various cancer cell types. Check for active clinical trials using this agent.

**multi-epitope folate receptor alpha peptide vaccine:** A peptide vaccine containing five immunogenic peptide epitopes of the human folate receptor alpha (FR alpha or FOLR1), including FR30, FR56, FR76, FR113, and FR238, with potential immunomodulating and antineoplastic activity. Upon administration, the multi-epitope FR alpha peptide vaccine may induce a cytotoxic T-lymphocyte (CTL) response against FR alpha-overexpressing tumor cells. FR alpha is a high-affinity folate-binding protein and a member of the folate receptor family; this receptor is overexpressed in a majority of ovarian cancers and in about 50% of breast cancers.

**multi-epitope melanoma peptide vaccine:** A peptide cancer vaccine consisting of a combination of peptides derived from several melanoma epitopes. Vaccination with multi-epitope melanoma peptide vaccine stimulates the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing the corresponding antigens, resulting in tumor cell lysis. This vaccine may stimulate a broader CTL response compared to single-antigen vaccines.

**multi-glioblastoma-peptide-targeting autologous dendritic cell vaccine ICT-107:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with six synthetic glioblastoma (GBM) peptides: absent in melanoma 2 (AIM-2), melanoma-associated antigen 1 (MAGE-1), tyrosinase-related protein 2 (TRP-2), glycoprotein 100 (gp100), epidermal growth factor receptor 2 (HER-2), interleukin-13 receptor subunit alpha-2 (IL-13Ra2), with potential immunostimulatory and antineoplastic activities. Mononuclear cells obtained via leukapheresis are differentiated into DCs, and pulsed with the GBM-associated peptides. Upon administration, multi-glioblastoma-peptide-targeting autologous DC vaccine ICT-107 exposes the immune system to GBM-associated antigens, which activates a specific cytotoxic T-lymphocyte (CTL) response against GBM cells. This leads to GBM cell lysis. The six peptides are derived from tumor associated

antigens (TAA) expressed on GBM cells and cancer stem cells (CSCs). GBM stem-like cells contain a specific range of antigens that are essential for the neoplastic growth and survival of GBM cells.

**Multi-layer bottle:** a bottle that is co-extruded with two or more layers to contain oxygen sensitive foods or industrial chemicals. OR Containers composed of layers of specially selected plastics which are coextruded so that the unique characteristics of each material are retained. The objective is to improve the barrier qualities of the container, resulting in a longer shelf life.

**Multi-Modal Transportation:** The utilization of several different transportation methods within a company's supply chain (e.g., boat, rail, etc.) to maximize both cost efficiency and environmental sustainability.

**multi-peptide CMV-Modified Vaccinia Ankara vaccine:** A vaccine consisting of an inactivated, Modified Vaccinia Ankara (MVA) viral vector encoding three herpes virus cytomegalovirus (CMV) tumor-associated antigens (TAAs), including UL83 (pp65), UL123 (IE1) and UL122 (IE2), with potential immunostimulating activity. The viral peptides expressed after administration of the multi-peptide CMV-MVA vaccine, may stimulate the immune system to mount both cytotoxic T-lymphocyte (CTL) and helper T-cell responses against CMV-infected cells. This results in cell lysis and prevents viral replication and the development of CMV disease. This vaccine also provides active immunization and protective immunity against CMV infection in CMV-negative patients. CMV infection can cause serious complications in patients receiving either allogeneic hematopoietic cell transplants (HCT) or solid organ transplants.

**Multi-Shot Molding:** The injection of two-or-three materials, in sequence, into a single mold during a single molding cycle. OR A process where two or more plastic substances are injected into the mold to form a part. Toothbrushes are often manufactured using this technique. OR The injection of two-or-three materials, in sequence, into a single mold during a single molding cycle. The injection molding machine is equipped with two-or-three plasticators. (See also co-injection)

**Multi-Strand Weave :** A fabric consisting of alternating right and left hand double spirals (side by side as single units) joined by straight connecting rods.

**multicarotenoid supplement MCS-8:** A supplement containing multiple, as of yet undisclosed, carotenoids, with potential chemopreventive activity. Upon oral administration of the multicarotenoid supplement MCS-8, the carotenoids may be able to exert their chemopreventive activity through multiple mechanisms of action.

**multicenter study :** A clinical trial that is carried out at more than one medical institution.

**multicentric breast cancer :** Breast cancer in which there is more than one tumor, all of which have formed separately from one another. The tumors are likely to be in different quadrants (sections) of the breast. Multicentric breast cancers are rare.

**Multicomponent analysis:** analysis using several sensors connected directly to a sophisticated computer interface and software to monitor, process, and display the output from different sensors simultaneously. For example it can include simultaneous measurements of several different ions and/or pH, redox potential (ORP), dissolved oxygen and temperature.

**Multidirectional flow :** flow direction changes during filling resulting in orientation in different directions which can cause flow marks, stresses and warping.

**multidisciplinary :** In medicine, a term used to describe a treatment planning approach or team that includes a number of doctors and other health care professionals who are experts in different specialties (disciplines). In cancer treatment, the primary disciplines are medical oncology (treatment with drugs), surgical oncology (treatment with surgery), and radiation oncology (treatment with radiation).

**multidisciplinary opinion :** A treatment planning approach in which a number of doctors who are experts in different specialties (disciplines) review and discuss the medical condition and treatment options of a patient. In cancer treatment, a multidisciplinary opinion may include that of a medical oncologist (who provides cancer treatment with drugs), a surgical oncologist (who provides cancer treatment with surgery), and a radiation oncologist (who provides cancer treatment with radiation). Also called tumor board review.

**Multidrug resistance:** Adaptation of tumor cells to anticancer drugs in ways that make the drugs less effective. OR A phenomenon observed in cancer cells in which the development of resistance to one drug renders the

cells resistant to a range of other drugs; due to the action of an ATP-dependent pump called the multidrug-resistance protein (MDR), which contains an ABC domain.

**multidrug resistance inhibition :** Treatment used to make cancer cells less resistant to anticancer drugs.

**Multienzyme complex:** A polypeptide chain that contains domains for two or more enzymatic activities.

**multienzyme system:** A group of related enzymes participating in a given metabolic pathway.

**Multiferon:** (Other name for: multisubtype natural human leukocyte interferon alpha)

**multifocal breast cancer :** Breast cancer in which there is more than one tumor, all of which have arisen from one original tumor. The tumors are likely to be in the same quadrant (section) of the breast.

**Multifunctional enzymes:** Functionally related enzymes that are covalently linked in some fashion.

**multifunctional/multitargeted anticancer agent OMN54:** An orally available, multivalent herbal formulation containing a novel mixture of whole extracts from three commonly used Chinese medicinal herbs *Ganoderma lucidum* (lingzhi mushroom), *Salvia miltiorrhiza* (Chinese sage, or danshen) and *Scutellaria barbata* (ban zhi lian), with potential immunomodulating, antiangiogenic, anti-inflammatory, antiproliferative and antiviral activities. Although the exact mechanism of action remains to be fully elucidated due to the complexity of the multiple phytochemicals, multifunctional/multitargeted anticancer agent OMN54 appears to work in an additive and synergistic manner by acting on a variety of signaling pathways and on multiple targets, such as vascular endothelial growth factor, nuclear factor kappa B, interleukin-1beta, fibroblast growth factor, and epidermal growth factor.

**multigeneration study:** Toxicity test in which at least 3 generations of the test organism are exposed to the substance being assessed. Exposure is usually continuous.

**MultiHance:** (Other name for: gadobenate dimeglumine)

**MultiHance:** (Other name for: gadopentetate dimeglumine)

**MultiHance :** A drug used in MRI to help make clear pictures of blood vessels in the brain, spine, and nearby tissues. It is also being studied as a way to find abnormal areas in the liver and other organs and to help diagnose cancer. MultiHance is a type of contrast agent. Also called gadobenate dimeglumine.

**multikinase inhibitor 4SC-203:** A multikinase inhibitor with potential antineoplastic activity. Multikinase inhibitor 4SC-203 selectively inhibits FMS-related tyrosine kinase 3 (FLT3/STK1), FLT3 mutated forms, and vascular endothelial growth factor receptors (VEGFRs). This may result in the inhibition of angiogenesis and cell proliferation in tumor cells in which these kinases are upregulated. FLT3 (FLK2), a class III tyrosine kinase receptor, is overexpressed or mutated in most B lineage and acute myeloid leukemias (AML). VEGFRs, tyrosine kinase receptors, are overexpressed in a variety of tumor cell types and play key roles in angiogenesis. Check for active clinical trials using this agent.

**multikinase inhibitor AT9283:** A small-molecule inhibitor of several kinases with potential antineoplastic activity. Multikinase inhibitor AT9283 binds to and inhibits Aurora kinases A and B, JAK2 (Janus kinase 2) and the kinase BCR-ABL, which may result in the inhibition of cellular division and proliferation and the induction of apoptosis in tumor cells that overexpress these kinases. Aurora kinases are serine-threonine kinases that play essential roles in mitotic checkpoint control during mitosis; JAK2 is a kinase that transduces signals from the single chain and IL-3 cytokine receptor families, and from the IFN-gamma receptors; BCR-ABL is a fusion protein with tyrosine kinase activity that is commonly found in CML.

**multikinase inhibitor SAR103168:** A multikinase inhibitor with potential antineoplastic activity. Upon intravenous infusion, multikinase inhibitor SAR103168 may, through the inhibition of multiple kinases, inhibit the phosphorylation and activation of signal transducer and activator of transcription 5 (STAT5). STAT5, a protein often upregulated in cancer cells, plays a key role in signal transduction pathways and the suppression of apoptosis. Check for active clinical trials using this agent.

**Multikine:** (Other name for: recombinant leukocyte interleukin)

**multimodality therapy :** Therapy that combines more than one method of treatment. Also called combination therapy and multimodality treatment.

**multimodality treatment :** Therapy that combines more than one method of treatment. Also called combination therapy and multimodality therapy.

**multi-peptide vaccine S-588210:** A cancer vaccine composed of a combination of the injectable formulations S-488210, which contains the three HLA-A\*02:01-restricted peptides up-regulated lung cancer 10 (lymphocyte antigen 6K; LY6K; URLC10), cell division cycle-associated protein 1 (kinetochore protein Nuf2; NUF2; CDCA1) and insulin-like growth factor 2 mRNA-binding protein 3 (IGF2BP3; KOC1) and S-488211, which contains the two HLA-A\*02:01-restricted peptides DEP domain-containing protein 1A (DEPDC1) and M-phase phosphoprotein 1 (kinesin-like protein KIF20B; MPHOSPH1), with potential immunostimulatory and antitumor activities. Upon administration, multi-peptide vaccine S-588210 may stimulate a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing KOC1, CDCA1, URLC10, DEPDC1 or MPHOSPH1 peptides, resulting in tumor cell lysis and decreased tumor growth.

**multiple (or multiphasic) screening:** This procedure has evolved by combining single screening tests, and is the logical corollary of mass screening. Where much time and effort has been spent by a population in attending for a single test (e.g., mass radiography), it is natural to consider the economy of offering other tests at the same time. Multiple (or multiphasic) screening implies the administration of a number of tests, in combination, to large groups of people (Wilson & Jungner, 1968).

**multiple alleles:** a condition in which more than two alleles exist for a characteristic; one example is A, B, AB, and O blood types. OR a double or triple bond; multiple bonds involve the atomic p orbitals in side-to-side overlap, preventing rotation. OR Sharing of more than one electron pair between bonded atoms. A double bond consists of two shared pairs of electrons; a triple bond consists of three shared pairs.

**Multiple Cavity Flow:** Produces more than one identical part with each cycle.

**Multiple cavity mold:** produces more than one identical part with each cycle.

**multiple endocrine adenomatosis :** A rare, inherited disorder that affects the endocrine glands and can cause tumors in the parathyroid and pituitary glands and the pancreas. These tumors are usually benign (not cancer). They cause the glands to secrete high levels of hormones, which can lead to

other medical problems, such as kidney stones, fertility problems, and severe ulcers. In some cases, tumors inside the pancreas can become malignant (cancer). Also called MEN1 syndrome, multiple endocrine neoplasia type 1 syndrome, and Wermer syndrome.

**multiple endocrine adenomatosis type 2 :** A rare, genetic disorder that affects the endocrine glands and can cause tumors in the thyroid gland, parathyroid glands, and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. Multiple endocrine adenomatosis type 2 is caused by a mutation (change) in a gene called RET, and is divided into three subtypes (MEN2A, MEN2B, and FMTC). People with all subtypes of multiple endocrine adenomatosis type 2 have an increased risk of medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. Also called MEN2, MEN2 syndrome, and multiple endocrine neoplasia type 2 syndrome.

**multiple endocrine adenomatosis type 2A :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the parathyroid glands and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. An itchy skin condition may also occur. Multiple endocrine adenomatosis type 2A is caused by a mutation (change) in a gene called RET. Also called MEN2A, MEN2A syndrome, multiple endocrine neoplasia type 2A syndrome, and Sipple syndrome.

**multiple endocrine adenomatosis type 2B :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the adrenal glands and growths around the nerves in the lips, tongue, lining of the mouth, and eyelids. Gastrointestinal symptoms and trouble with the spine or bones in the feet and thighs may also occur. Multiple endocrine adenomatosis type 2B is caused by a mutation (change) in a gene called RET. Also called MEN2B, MEN2B syndrome, and multiple endocrine neoplasia type 2B syndrome.

**multiple endocrine neoplasia syndrome :** An inherited condition that may result in the development of cancers of the endocrine system. There are several types of multiple endocrine neoplasia syndrome, and patients with each type may develop different types of cancer. The altered genes that cause each type can be detected with a blood test. Also called MEN syndrome.

**multiple endocrine neoplasia type 1 syndrome :** A rare, inherited disorder that affects the endocrine glands and can cause tumors in the parathyroid and pituitary glands and the pancreas. These tumors are usually benign (not cancer). They cause the glands to secrete high levels of hormones, which can lead to other medical problems, such as kidney stones, fertility problems, and severe ulcers. In some cases, tumors inside the pancreas can become malignant (cancer). Also called MEN1 syndrome, multiple endocrine adenomatosis, and Wermer syndrome.

**multiple endocrine neoplasia type 2 syndrome :** A rare, genetic disorder that affects the endocrine glands and can cause tumors in the thyroid gland, parathyroid glands, and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. Multiple endocrine neoplasia type 2 syndrome is caused by a mutation (change) in a gene called RET, and is divided into three subtypes (MEN2A, MEN2B, and FMTC). People with all subtypes of multiple endocrine neoplasia type 2 syndrome have an increased risk of medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. Also called MEN2, MEN2 syndrome, and multiple endocrine adenomatosis type 2.

**multiple endocrine neoplasia type 2A syndrome :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the parathyroid glands and adrenal glands. The affected endocrine glands may make high levels of hormones, which can lead to other medical problems such as high blood pressure and kidney stones. An itchy skin condition may also occur. Multiple endocrine neoplasia type 2A syndrome is caused by a mutation (change) in a gene called RET. Also called MEN2A, MEN2A syndrome, multiple endocrine adenomatosis type 2A, and Sipple syndrome.

**multiple endocrine neoplasia type 2B syndrome :** A rare, genetic disorder that affects the endocrine glands and causes a type of thyroid cancer called medullary thyroid cancer, pheochromocytoma, and parathyroid gland cancer. It may also cause benign (noncancerous) tumors in the adrenal glands and growths around the nerves in the lips, tongue, lining of the mouth, and eyelids. Gastrointestinal symptoms and trouble with the spine or bones in the feet and thighs may also occur. Multiple endocrine neoplasia type 2B syndrome is caused by a mutation (change) in a gene called RET. Also called MEN2B, MEN2B syndrome, and multiple endocrine adenomatosis type 2B.

**multiple equation word problems:** Word problems that can be translated into more than one equation.

**multiple hamartoma syndrome :** An inherited disorder marked by the formation of many noncancerous growths called hamartomas. These growths occur in the skin, breast, thyroid, colon, intestines, and inside of the mouth. Patients with multiple hamartoma syndrome are at increased risk of certain types of cancer, including breast and thyroid. Also called Cowden disease and Cowden syndrome.

**Multiple Head Machine:** A (blow molding) machine in which the plastic melt prepared by the extruder is divided into a multiplicity of separate streams (parisons) each giving ultimately a finished item.

**multiple myeloma :** A type of cancer that begins in plasma cells (white blood cells that produce antibodies). Also called Kahler disease, myelomatosis, and plasma cell myeloma.

**multiple operations:** An expression has multiple operations when you see more than one symbol for addition, subtraction, multiplication, and/or division.

**multiple sclerosis :** A disorder of the central nervous system marked by weakness, numbness, a loss of muscle coordination, and problems with vision, speech, and bladder control. Multiple sclerosis is thought to be an autoimmune disease in which the body's immune system destroys myelin. Myelin is a substance that contains both protein and fat (lipid), serving as a nerve insulator and helping in the transmission of nerve signals.

**multiple-gene panel test :** Genetic tests that use next-generation sequencing to test multiple genes simultaneously. Also called multigene test and multiple-gene test. or A laboratory test in which many genes are studied

in a sample of tissue. Multiple-gene panel tests may help find mutations (changes) in certain genes that may increase a person's risk of a disease such as cancer. They may also look at the activity of certain genes in a sample of tissue. Multiple-gene panel tests may be used to help plan treatment or make a prognosis, including helping to predict whether cancer will spread to other parts of the body or come back. Also called multigene test and multiple-gene test.

**multiple-gene test :** Genetic tests that use next-generation sequencing to test multiple genes simultaneously. Also called multigene test and multiple-gene panel test. Or A laboratory test in which many genes are studied in a sample of tissue. Multiple-gene tests may help find mutations (changes) in certain genes that may increase a person's risk of a disease such as cancer. They may also look at the activity of certain genes in a sample of tissue. Multiple-gene tests may be used to help plan treatment or make a prognosis, including helping to predict whether cancer will spread to other parts of the body or come back. Also called multigene test and multiple-gene panel test.

**multiples of a number:** An infinite list of the products of a number and each whole number. For example, the multiples of 3 are 3, 6, 9, 12, 15, 18 .  
..

**multiplex genomic test :** A method for detecting multiple genetic alterations (i.e., gene mutations or single nucleotide polymorphisms in a single gene or across the genome) simultaneously.

**multiplex ligation-dependent probe amplification :** A laboratory method commonly used for the detection of unusual copy number changes (insertions or deletions) of genomic sequences. Also called MLPA.

**multiplication keywords:** Words that indicate multiplication.

**multiplication property of equations:** An equation is still true if both sides of the equation are multiplied by (or divided by) the same term.

**multiplicity :** A large number or variety.

**multistage cluster sampling:** Cluster sampling with more than two stages, each sampling being made on aggregates (or clusters) in which the clusters already obtained by the preceding sampling have been divided (ISO, 1977).

**multistage sampling:** A type of sampling in which the sample is selected by stages, the sampling units at each stage being subsampled from the larger units chosen at the previous state (ISO, 1977).

**MultiStem:** (Other name for: allogeneic multipotent adult progenitor cells)

**multisubtype natural human leukocyte interferon alpha:** A preparation containing a mixture of multiple naturally occurring, active subtypes 1, 2, 8, 10, 14 and 21 of interferon alpha (IFN-alpha) with immunomodulating, anti-viral and anti-cancer activities. Multi-subtype natural human leukocyte IFN-alpha is purified from the leukocyte fraction of human blood challenged with Sendai virus. Upon administration, IFN-alpha subtypes bind to cell surface IFN-alpha receptors (IFNARs), resulting in an upregulation of interferon stimulated genes and related protein products. This ultimately leads to the proliferation of human B cells, activation of natural killer (NK) cells and dendritic cells (DCs), an increase in HLA-I and HLA-II expression and activation of CD8-lymphocytes. Compared to single-subtype IFN, multi-subtypes act synergistically. Check for active clinical trials using this agent.

**multitargeted kinase inhibitor MGCD516:** An orally bioavailable, receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic activity. Upon administration, multitargeted kinase inhibitor MGCD516 binds to and inhibits the activity of several RTKs including hepatocyte growth factor receptor (HGFR; c-Met; MET), tyrosine-protein kinase receptor UFO (AXL receptor tyrosine kinase; AXL), mast/stem cell growth factor receptor (SCFR; c-kit; KIT), the receptor tyrosine kinase MER, discoidin domain receptor 2 (DDR2), vascular endothelial growth factor receptor (VEGFR) types 1 (VEGFR-1; FLT1), 2 (VEGFR-2; KDR; Flk-1) and 3 (VEGFR-3), members of the platelet-derived growth factor receptor (PDGFR) family, RET (rearranged during transfection), tropomyosin-related kinases (TRK) and members of the ephrin (Eph) family of receptor tyrosine kinases. This may result in both the inhibition of signal transduction pathways mediated by these RTKs and the reduction of tumor cell proliferation in cancer cell types that overexpress these RTKs.

**multitargeted receptor tyrosine kinase inhibitor ABT-869 :** A substance being studied in the treatment of several types of cancer. Multitargeted receptor tyrosine kinase inhibitor ABT-869 blocks the action of several growth factors. It may also block the growth of new blood vessels that tumors need to grow and may cause cancer cells to die. It is a type of receptor tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called ABT-869.

**multitargeted tyrosine kinase inhibitor JNJ-26483327:** An orally bioavailable, small-molecule, multitargeted reversible tyrosine kinase inhibitor with potential antineoplastic activity. Multitargeted tyrosine kinase inhibitor JNJ-26483327 binds to and inhibits several members of the epidermal growth factor receptor (EGFR) family, including EGFR, HER2 and HER4; Src family kinases (Lyn, Yes, Fyn, Lck and Src); and vascular endothelial growth factor receptor type 3 (VEGFR3). By inhibiting several different signaling molecules that play crucial roles at various stages in tumorigenesis, this agent may inhibit tumor growth, invasion, migration and metastasis. In addition, JNJ-26483327 crosses the blood-brain barrier (BBB).

**multitargeted tyrosine kinase inhibitor MGCD265:** An orally bioavailable, small-molecule, multitargeted tyrosine kinase inhibitor with potential antineoplastic activity. Multitargeted tyrosine kinase inhibitor MGCD265 binds to and inhibits the phosphorylation of several receptor tyrosine kinases (RTKs), including the c-Met receptor (hepatocyte growth factor receptor); the Tek/Tie-2 receptor; vascular endothelial growth factor receptor (VEGFR) types 1, 2, and 3; and the macrophage-stimulating 1 receptor (MST1R or RON). Inhibition of these RTKs and their downstream signaling pathways may result in the inhibition of tumor angiogenesis and tumor cell proliferation in tumors overexpressing these RTKs.

**multivitamin:** A dietary supplement containing all or most of the vitamins that may not be readily available in the diet. Vitamins may be classified according to their solubility either in lipids (vitamins A, D, E, K, F) or in water (vitamins C, B-complex). Present in minute amounts in various foods, vitamins are essential to maintaining normal metabolism and biochemical functions.

**mung bean :** A type of bean grown in warm climates, usually for its seed and for bean sprouts. Mung bean may have anticancer effects.

**Munsell:** A system of designating colour by colour, hue and chroma.

**Muntin:** The vertical framing member or stile between the panels of a door.

**muramyl tripeptide phosphatidylethanolamine :** A drug being studied in the treatment of young adults with bone cancer that has gotten worse or come back. Muramyl tripeptide phosphatidylethanolamine activates certain types of white blood cells and helps the immune system kill cancer cells. It

is a type of immunostimulant. Also called L-MTP-PE, MEPACT, and mifamurtide.

**mureletecan:** A water-soluble prodrug, consisting of camptothecin covalently linked to polymeric backbone methacryloylglycynamide, with potential antineoplastic activity. After entering tumor cells, the active moiety camptothecin is slowly released from mureletecan via hydrolysis of the ester linkage. Camptothecin, an alkaloid isolated from the Chinese tree *Camptotheca acuminata*, binds to and stabilizes the topoisomerase I-DNA covalent complex. This inhibits the religation of topoisomerase I-mediated single-stranded DNA breaks and produces potentially lethal double-stranded DNA breaks when encountered by the DNA replication machinery, resulting in the inhibition of DNA replication and apoptosis. Compared to camptothecin, this prodrug formulation increases camptothecin drug delivery to the tumor site while reducing systemic toxicity. Check for active clinical trials using this agent.

**murine TYRP2 plasmid DNA vaccine:** A plasmid DNA vaccine encoding the mouse tumor associated antigen tyrosinase-related protein-2 (TYRP2) with potential immunostimulating and antineoplastic activities. Upon administration, murine TYRP2 plasmid DNA vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing TYRP2; this vaccine may also induce an immune response against tyrosinase-related protein-1 (TYRP1). TYRP2 and TYRP1, melanosomal membrane glycoproteins upregulated in melanoma cells, are involved in melanin synthesis.

**muromonab-CD3:** A murine IgG2a monoclonal antibody with immunosuppressive activity. Muromonab-CD3 binds to and inhibits CD3 on the surface of circulating T-lymphocytes; binding of muromonab-CD3 to CD3-positive T cells results in an early activation of this T cell subset, followed by cytokine release, and subsequently inhibition of T cell functions. This agent may cause the opsonization and elimination of CD3-positive T cells from the circulation by mononuclear phagocytes in the liver and spleen. CD3 is part of the functional T cell receptor (TCR) complex, which is necessary for antigen recognition by T cells, and is required for signal transduction or A type of monoclonal antibody used in cancer detection or therapy. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells..

**muscadine grape skin extract:** A nutritional supplement containing an extract of the skin of muscadine grape (*Vitis rotundifolia*), with anti-inflammatory, antioxidant and potential chemopreventive activities. The skin extract of the muscadine grape contains numerous phytochemicals including hydrolyzable tannins and flavonoids, such as anthocyanin 3,5-diglucosides, quercetin, myricetin, and kaempferol glycosides. Upon administration, muscadine grape skin extract (MSKE) appears to inhibit PI3K/Akt and MAPK signaling, eventually leading to apoptosis and a reduction in tumor cell proliferation.

**Muscadine Plus:** (Other name for: muscadine grape skin extract)

**muscarinic agonist APD515:** A liquid, oromucosal formulation containing a muscarinic agonist with potential anti-xerostomia activity. Upon application to the inside lining of the mouth, muscarinic agonist APD515 may locally act on muscarinic receptors on the salivary glands and may stimulate the production of saliva thereby relieving dryness of the mouth. Check for active clinical trials using this agent.

**muscle contraction:** a process in which actin and myosin proteins move within a sarcomere.

**muscle wasting :** A weakening, shrinking, and loss of muscle caused by disease or lack of use. Muscle wasting decreases strength and the ability to move.

**musculoskeletal :** Having to do with muscles, bones, tendons, ligaments, joints, and cartilage.

**MUSE :** A method used to treat impotence (inability to have an erection). A suppository, in the form of a very small pellet, is inserted through the tip of the penis into the urethra. The suppository contains the drug alprostadil, which increases the flow of blood to the penis and causes an erection. Also called medicated urethral system for erection.

**music therapy :** A type of therapy that uses music to help improve a person's overall health and well-being. It may include creating, singing, moving, and/or relaxing to music. Music therapy may be used to help relieve stress, pain, anxiety, and depression caused by a disease, such as cancer, and its treatment. Music therapy is a type of complementary medicine.

**Mustargen:** (Other name for: mechlorethamine hydrochloride)

**Mustargen :** A drug used to treat non-Hodgkin lymphoma, advanced Hodgkin lymphoma, chronic leukemia, mycosis fungoides, and a type of lung cancer called bronchogenic carcinoma. It is also being studied in the treatment of other types of cancer. Mustargen damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called mechlorethamine hydrochloride and mustine.

**mustine :** A drug used to treat non-Hodgkin lymphoma, advanced Hodgkin lymphoma, chronic leukemia, mycosis fungoides, and a type of lung cancer called bronchogenic carcinoma. It is also being studied in the treatment of other types of cancer. Mustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called mechlorethamine hydrochloride and Mustargen.

**mutagen:** Anything that causes a mutation (a change in the DNA of a cell). DNA changes caused by mutagens may harm cells and cause certain diseases, such as cancer. Examples of mutagens include radioactive substances, x-rays, ultraviolet radiation, and certain chemicals. OR An agent that induces mutation (WHO, 1979). OR An agent that can bring about a heritable change (mutation) in an organism. OR Perturbs to the base sequence of DNA and causes a mutation; often chemicals but can also be energy sources such as ultraviolet light.

**Mutagenesis:** A process that leads to a change in the genetic material that is inherited in later generations.

**mutagenicity:** The property of a physical, chemical, or biological agent to induce mutations in living tissue (WHO, 1979).

**Mutamycin:** (Other name for: mitomycin C)

**Mutamycin :** A drug used to treat advanced cancer of the stomach and pancreas that has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Mutamycin comes from bacteria. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called mitomycin C and Mitozytrex.

**Mutant:** An organism that carries an altered gene or change in its genome.

**mutant p53 activator COTI-2:** An orally available third generation thiosemicarbazone and activator of mutant forms of the p53 protein, with potential antineoplastic activity. Upon oral administration, mutant p53 activator COTI-2 targets and binds to the misfolded mutant forms of the

p53 protein, which induces a conformational change that normalizes p53 and restores its activity. This induces apoptosis in tumor cells in which the p53 protein is mutated. In addition, COTI-2 inhibits the activation of Akt2 and prevents the activation of the PI3K/AKT/mTOR pathway, thereby inducing apoptosis in cancer cells in which this pathway is overexpressed. p53, a tumor suppressor protein, plays a key role in controlling cellular proliferation and survival. High levels of mutant p53 are seen in many cancers and are associated with uncontrolled cellular growth.

**mutant p53 peptide pulsed dendritic cell vaccine:** A cancer vaccine consisting of autologous dendritic cells which have been pulsed with a mutant p53 peptide. Vaccination with mutant p53 peptide pulsed dendritic cells may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing mutant p53, resulting in tumor cell lysis. Many tumor cells overexpress mutant p53 proteins, resulting in the loss of apoptosis regulation and abnormal cell proliferation.

**mutant-selective EGFR inhibitor PF-06459988:** An orally available, small molecule, third-generation, irreversible inhibitor of epidermal growth factor receptor (EGFR) mutant (EGFR<sub>m</sub>) forms with potential antineoplastic activity. EGFR inhibitor PF-06459988 specifically binds to and inhibits mutant forms of EGFR, including the secondary acquired resistance mutation T790M, which prevents EGFR-mediated signaling and leads to cell death in EGFR<sub>m</sub>-expressing tumor cells. Compared to some other EGFR inhibitors, PF-06459988 may have therapeutic benefits in tumors with T790M-mediated drug resistance. This agent shows minimal activity against wild-type EGFR (WT EGFR), and does not cause dose-limiting toxicities that are seen with the use of non-selective EGFR inhibitors, which also inhibit WT EGFR. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**Mutarotation:** The change in optical rotation of a sugar that is observed immediately after it is dissolved in aqueous solution, as the result of the slow approach of equilibrium of a pyranose or a furanose in its alpha and beta forms. OR For carbohydrates, the interconversion of  $\alpha$  and  $\beta$  anomers through the open-chain form; usually measured through changes in optical rotation. OR The change in specific rotation of a pyranose or furanose sugar

or glycoside accompanying the equilibration of its  $\alpha$ - and  $\beta$ -anomeric forms.

**Mutase:** An enzyme that catalyzes the intramolecular shift of a chemical group. OR Enzymes that catalyze the transposition of functional groups.

**mutate :** To change the genetic material of a cell. The changes (mutations) can be harmful, beneficial, or have no effect.

**mutation:** Any heritable change in genetic material. This may be a chemical transformation of an individual gene (a gene or point mutation), which alters its function. On the other hand, this change may involve a rearrangement, or a gain or loss of part of a chromosome, which may be microscopically visible. This is designated a chromosomal mutation (WHO, 1979). OR a random change in the gene pool of a population that gives rise to new alleles and is the source of variation in a population. OR The genetically inheritable alteration of a gene or group of genes. OR An inheritable change in the nucleotide sequence of a chromosome. OR Variations that alter the meaning of the genetic message; required for evolution.

**mutation :** A change in the usual DNA sequence at a particular gene locus. Although the term often has a negative connotation, mutations (including polymorphisms) can be harmful, beneficial, or neutral in their effect on cell function. The term variant is sometimes used as a synonym for the term mutation.orAny change in the DNA sequence of a cell. Mutations may be caused by mistakes during cell division, or they may be caused by exposure to DNA-damaging agents in the environment. Mutations can be harmful, beneficial, or have no effect. If they occur in cells that make eggs or sperm, they can be inherited; if mutations occur in other types of cells, they are not inherited. Certain mutations may lead to cancer or other diseases.

**mutation analysis :** Germline genetic testing method targeted to detect a specific mutation (such as a deleterious MSH2 mutation previously identified in a family), panel of mutations (such as the 3 BRCA mutations comprising the founder mutation panel for individuals of Ashkenazi Jewish ancestry) or type of mutation (such as a large deletions or insertions in the BRCA1 gene). This type of testing is distinct from complete gene sequencing or mutation scanning. The latter are designed to detect most mutations in the region being tested. Current usage also applies this term to any genetic test.

**mutation carrier :** A person who has a mutated (changed) copy of a gene. This change may cause a disease in that person or in his or her children.

**Mutual Prodrug:** A prodrug that consists of two generally synergistic drugs attached to each other.

**mutualism:** a living arrangement in which both partners benefit.

**MVA-EBNA1/LMP2 vaccine:** A cancer vaccine consisting of a recombinant modified vaccinia Ankara (MVA) viral vector encoding the gene for the CD4 epitope-rich C-terminal domain of the Epstein Barr Virus (EBV) antigen EBNA1 and fused to the full-length of the EBV-associated antigen latent membrane protein 2 (LMP2), with potential immunostimulatory and antineoplastic activities. Upon administration, MVA EBNA1/LMP2 vaccine may elicit a cytotoxic T-cell immune response against cancer cells expressing EBNA1 and LMP2. Multi-antigen vaccine therapy may be more efficacious than single-antigen vaccine therapy. EBNA1, a sequence-specific DNA binding protein, plays an important role in EBV episomal genome maintenance and gene transactivation. Check for active clinical trials using this agent.

**MVA-FCU1 TG4023:** A cancer vaccine comprised of a recombinant modified vaccinia Ankara (MVA) viral vector encoding the suicide gene FCU1 with potential antineoplastic activity. FCU1 is a bifunctional yeast cytosine deaminase (CD) / uracil phosphoribosyltransferase (UPRT) fusion gene. Upon intratumoral administration, MVA-FCU1 TG4023 enters tumor cells where FCU1 is expressed. Subsequently, the noncytotoxic prodrug 5-fluorocytosine (5-FC) is administered systemically and is deaminated by CD in FCU1- transduced tumor cells into 5-fluorouracil (5-FU), which is then directly metabolized to 5-fluoro-uridine monophosphate (5-FUMP) by UPRT; 5-FUMP may then be further transformed to 5-fluoro-deoxyuridine monophosphate (5-FdUMP), an irreversible inhibitor of thymidylate synthase and, so, DNA synthesis through deprivation of deoxythymidine triphosphate (dTTP). 5-FU and its active metabolites may then selectively kill tumor cells, avoiding toxicity in nonmalignant cells. The MVA viral vector, derived from the replication-competent strain Ankara, is a highly attenuated, replication-defective vaccinia strain incapable of virion assembly. Check for active clinical trials using this agent.

**MVA-MUC1-IL2 vaccine:** A bivalent cancer vaccine comprised of a modified vaccinia virus Ankara (MVA) strain encoding human mucin 1

(MUC1) and interleukin-2 (IL-2) with potential immunostimulating and antineoplastic activities. Originally developed for the eradication of smallpox, MVA is a highly attenuated and replication-defective strain incapable of virion assembly and exerts potent immunostimulatory activity against antigens. Vaccination with MVA-MUC1-IL2 vaccine may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) responses against tumor cells expressing MUC1, a tumor associated antigen, resulting in tumor cell lysis. Expression of IL-2 augments the specific CTL response against MUC1 expressing cells.

**MVA-PSA-PAP prostate cancer vaccine:** A cancer vaccine consisting of a recombinant modified vaccinia Ankara (MVA) viral vector encoding genes for prostate specific antigen (PSA) and prostate acid phosphatase (PAP) with potential immunostimulatory and antineoplastic activities. Upon administration, MVA-PSA-PAP prostate cancer vaccine expresses PSA and PAP peptides, which may elicit humoral and cellular immune responses against prostate cancer cells expressing PSA and PAP. Multi-antigen vaccine therapy may be more efficacious than single-antigen therapy vaccine therapy.

**MVF-HER-2(597-626)-MVF-HER-2 (266-296) peptide vaccine:** A combination peptide vaccine of 2 chimeric peptides of the promiscuous T cell epitope derived from measles virus fusion protein (MVF; amino acid residues 288-302) co-synthesized with B-cell epitopes derived from the HER-2/neu a.a. 597-626 and HER-2/neu a.a. 266-296, with potential antineoplastic activity. Vaccination with MVF-HER-2(597-626)/MVF-HER-2(266-296) peptide vaccine may induce an active specific immune response, mounting a cytotoxic T-lymphocyte (CTL) response and an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells that overexpress the HER-2 protein. The oncogenic protein HER-2, a member of the human epidermal growth factor receptor (EGFR) family of tyrosine kinases, is overexpressed in a variety of cancers and is correlated with increased tumor growth, progression and a poor prognosis. HER-2(597-626) corresponds to the binding site of trastuzumab on the extracellular domain IV of HER-2; HER-2 (266-296) corresponds to the binding site of pertuzumab on the dimerization loop of domain II of HER-2.

**MVX-1-loaded macrocapsule/autologous tumor cell vaccine MVX-ONCO-1:** A two-component, anti-cancer vaccine containing irradiated

tumor cells from a patient, and a capsule implanted with a genetically modified allogeneic cell line that continuously releases granulocyte-macrophage colony stimulating factor (GM-CSF), with potential immune-protective and -boosting activities. Upon subcutaneous injection of MVX-1-loaded macrocapsule/autologous tumor cell vaccine MVX-ONCO-1, the GM-CSF-secreting allogeneic cell capsules and the autologous irradiated cells isolated from the patient's tumor are co-localized in the patient's tissue. This permits the production of GM-CSF and exposes the immune system to the tumor-associated antigens (TAA) expressed by the autologous tumor cells at the injection site. Local expression of GM-CSF recruits and activates antigen-presenting cells (APC), which induces both antibody-dependent cell-mediated cytotoxicity (ADCC) and cytotoxic T-lymphocyte responses at the site of the injection and systemically. This may lead to tumor regression. By using the patient's own irradiated cancer cells as vaccine antigens, the patient's immune system is exposed to the entire repertoire of this individual's TAAs. The encapsulated cell technology (ECT) of GM-CSF-secreting allogeneic cell capsules ensures the continuous release of GM-CSF. GM-CSF, a monomeric glycoprotein that functions as a cytokine, is a strong immune booster and plays an important role in the activation of immune system. Check for active clinical trials using this agent.

**MW:** Molecular weight

**myalgia :** Pain in a muscle or group of muscles.

**Myanmar:** The country formerly known as Burma. It is not a major crude oil producer.

**myasthenia gravis :** A disease in which antibodies made by a person's immune system prevent certain nerve-muscle interactions. It causes weakness in the arms and legs, vision problems, and drooping eyelids or head. It may also cause paralysis and problems with swallowing, talking, climbing stairs, lifting things, and getting up from a sitting position. The muscle weakness gets worse during activity, and improves after periods of rest.

**MYC-N amplification study :** A laboratory test in which tumor or bone marrow cells are checked to see how many copies of the MYC-N gene are in the DNA. MYC-N is important for cell growth. Having more than 10 copies of the gene is called MYC-N amplification. Neuroblastoma with

MYC-N amplification is more likely to spread in the body and less likely to respond to treatment.

**MYC-targeting siRNA DCR-MYC:** A lipid nanoparticle-based formulation consisting of small-interfering RNAs (siRNAs) directed against the oncogene c-Myc encapsulated in lipids with potential antineoplastic activity. Upon intravenous administration of MYC-targeting siRNA DCR-MYC, the lipid formulation promotes the uptake by tumor cells where the siRNAs moieties are subsequently released. The siRNAs bind to c-Myc mRNAs, which may result in the inhibition of translation and expression of the c-Myc protein and leads to growth inhibition for tumor cells that are overexpressing c-Myc. c-Myc, a proto-oncogene overexpressed in a variety of cancers, is involved in cellular proliferation, differentiation, and apoptosis.

**Mycelex:** (Other name for: clotrimazole)

**Mycelex Troche:** (Other name for: clotrimazole)

**mycobacterial cell wall-DNA complex:** A proprietary preparation of mycobacterial DNA oligonucleotides embedded in mycobacterial cell wall fragments derived from cultures of *Mycobacterium phlei*, with potential immunomodulatory and antineoplastic activities. DNA oligonucleotides in the mycobacterial cell wall-DNA complex (MCC) induce apoptosis by increasing BAX protein levels, releasing cytochrome C from mitochondria, and activating caspase-3 and -7, which results in the cleavage of poly (ADP-ribose) polymerase and the release of nuclear matrix proteins. In addition to its pro-apoptotic effect, MCC activates monocytes and macrophages to produce various cytokines, including interleukin 6 (IL-6), IL-8, IL-12, IL-18, and tumor necrosis factor alpha (TNF- $\alpha$ ). This results in the activation of natural killer (NK) cells and cytotoxic T lymphocytes (CTLs) and interferon gamma (IFN- $\gamma$ ) synthesis.

**Mycobacterium tuberculosis arabinomannan Z-100:** An extract from *Mycobacterium tuberculosis* (*M. tuberculosis*) containing the polysaccharide arabinomannan, with potential immunostimulating activity. Upon administration of *M. tuberculosis* arabinomannan Z-100, this agent may activate the immune system by increasing the expression of various cytokines, such as interferon-gamma (IFN $\gamma$ ) and interleukin-12. This inhibits the activity of suppressor T-cells, increases T helper 1 cell (Th1)

activity and may restore the balance between Th1/Th2 cells. Additionally, Z-100 may inhibit metastasis and tumor cell proliferation.

**Mycobacterium w:** An attenuated strain of *Mycobacterium w*, a non-pathogenic, rapidly growing, atypical mycobacterium, with non-specific immunopotentiating properties. In addition to sharing a number of common B and T cell determinants with *Mycobacterium leprae* and *Mycobacterium tuberculosis*, *Mycobacterium w* (Mw) also shares an immunogenic determinant with prostate specific antigen (PSA). In vitro and in vivo studies have shown that heat-killed Mw can induce significant T-cell responses. This agent may induce host T-cell responses against tumor cells expressing PSA. PSA is a glycoprotein secreted by prostatic epithelial and ductal cells and may be overexpressed in prostate cancer cells.

**Mycobutin :** A drug used to prevent the spread of a bacterium called in patients with advanced HIV (the virus that causes AIDS) infection. It blocks an enzyme that the bacteria need to grow. It is a type of antibiotic. Also called rifabutin.

**mycophenolate mofetil:** The morpholinoethyl ester of mycophenolic acid (MPA) with potent immunosuppressive properties. Mycophenolate stops T-cell and B-cell proliferation through selective inhibition of the de novo pathway of purine biosynthesis. In vivo, the active metabolite, MPA, reversibly inhibits inosine 5'-monophosphate dehydrogenase, an enzyme involved in the de novo synthesis of guanine nucleotides. MPA displays high lymphocyte specificity and cytotoxicity due to the higher dependence of activated lymphocytes on both salvage and de novo synthesis of guanine nucleotides relative to other cell types. or A drug used to prevent graft-versus-host disease (GVHD) after organ transplants. It is also being studied in the prevention of GVHD after stem cell transplants for cancer, and in the treatment of some autoimmune disorders. Mycophenolate mofetil is a type of immunosuppressive agent. Also called CellCept.

**mycophenolic acid:** An antineoplastic antibiotic derived from various *Penicillium* fungal species. Mycophenolic acid is an active metabolite of the prodrug mycophenolate mofetil. Mycophenolic acid inhibits inosine monophosphate dehydrogenase (IMPDH), preventing the formation of guanosine monophosphate and synthesis of lymphocyte DNA that results in inhibition of lymphocyte proliferation, antibody production, cellular

adhesion, and migration of T and B lymphocytes. Mycophenolic acid also has antibacterial, antifungal, and antiviral activities.

**mycosis fungoides** : A type of non-Hodgkin lymphoma that first appears on the skin and can spread to the lymph nodes or other organs such as the spleen, liver, or lungs.

**mycosis fungoides patch** : A flat, red area on the skin of patients who have mycosis fungoides. The patches may look like a thin, red rash and may be itchy. They are most common on the chest, groin, hips, buttocks, and under the arms. They may look like eczema or psoriasis.

**mycosis fungoides plaque** : In mycosis fungoides, an area of skin that is thickened, raised, red, scaly, and itchy.

**Mycostatin** : A drug used to treat infections caused by fungi (a type of microorganism). It is made by certain strains of bacteria and kills fungi by binding to their membranes. Mycostatin is a type of antifungal agent.

**myelin** : The fatty substance that covers and protects nerves.

**myelin sheath**: a fatty layer of material that covers the axons of nerve cells.

**myeloablation** : A severe form of myelosuppression. Myelosuppression is a condition in which bone marrow activity is decreased, resulting in fewer red blood cells, white blood cells, and platelets. It is a side effect of some cancer treatments. Also called severe myelosuppression.

**myeloablative chemotherapy** : High-dose chemotherapy that kills cells in the bone marrow, including cancer cells. It lowers the number of normal blood-forming cells in the bone marrow, and can cause severe side effects. Myeloablative chemotherapy is usually followed by a bone marrow or stem cell transplant to rebuild the bone marrow.

**myeloblast** : A type of immature white blood cell that forms in the bone marrow. Myeloblasts become mature white blood cells called granulocytes (neutrophils, basophils, and eosinophils).

**myeloblastic** : Refers to myeloblasts (a type of immature cell that forms in the bone marrow).

**myelodysplasia** : Abnormal bone marrow cells that may lead to myelogenous leukemia.

**myelodysplastic syndrome** : A type of cancer in which the bone marrow does not make enough healthy blood cells (white blood cells, red blood

cells, and platelets) and there are abnormal cells in the blood and/or bone marrow. When there are fewer healthy blood cells, infection, anemia, or bleeding may occur. Sometimes, myelodysplastic syndrome becomes acute myeloid leukemia (AML). Also called MDS.

**myelofibrosis** : A disorder in which the bone marrow is replaced by fibrous tissue.

**myelogenous** : Having to do with, produced by, or resembling the bone marrow. Sometimes used as a synonym for myeloid; for example, acute myeloid leukemia and acute myelogenous leukemia are the same disease.

**myelogram** : An x-ray of the spinal cord after an injection of dye into the space between the lining of the spinal cord and brain.

**myeloid** : Having to do with or resembling the bone marrow. May also refer to certain types of hematopoietic (blood-forming) cells found in the bone marrow. Sometimes used as a synonym for myelogenous; for example, acute myeloid leukemia and acute myelogenous leukemia are the same disease.

**myeloma** : Cancer that arises in plasma cells, a type of white blood cell.

**myelomatosis** : A type of cancer that begins in plasma cells (white blood cells that produce antibodies). Also called Kahler disease, multiple myeloma, and plasma cell myeloma.

**myelomonocyte** : An abnormal type of white blood cell that is found in chronic myelomonocytic leukemia. These cells are similar to both monocytes and myelocytes (immature cells that develop into different types of immune system cells).

**myeloproliferative neoplasm** : A type of disease in which the bone marrow makes too many red blood cells, platelets, or certain white blood cells. Myeloproliferative neoplasms usually get worse over time as the number of extra cells build up in the blood and/or bone marrow. This may cause bleeding problems, anemia, infection, fatigue, or other signs and symptoms. Certain myeloproliferative neoplasms may become acute myeloid leukemia (AML). Myeloproliferative neoplasms include chronic myelogenous leukemia (CML), polycythemia vera, primary myelofibrosis, essential thrombocythemia, chronic neutrophilic leukemia, and chronic eosinophilic leukemia. Also called chronic myeloproliferative neoplasm.

**myelosclerosis with myeloid metaplasia :** A progressive, chronic disease in which the bone marrow is replaced by fibrous tissue and blood is made in organs such as the liver and the spleen, instead of in the bone marrow. This disease is marked by an enlarged spleen and progressive anemia. Also called agnogenic myeloid metaplasia, chronic idiopathic myelofibrosis, idiopathic myelofibrosis, and primary myelofibrosis.

**myelosuppression :** A condition in which bone marrow activity is decreased, resulting in fewer red blood cells, white blood cells, and platelets. Myelosuppression is a side effect of some cancer treatments. When myelosuppression is severe, it is called myeloablation.

**myelosuppressive therapy :** Treatment that stops or slows the growth of blood-forming cells in the bone marrow. Myelosuppressive therapies, such as chemotherapy and radiation therapy, kill normal cells and cancer cells in the bone marrow. This lowers the number of normal red blood cells, white blood cells, and platelets in the blood and bone marrow. Myelosuppressive therapy may be given before a bone marrow or stem cell transplant. It may also be used to treat some blood conditions, such as polycythemia vera (a disease in which there are too many red blood cells in the bone marrow and blood).

**Myfortic:** (Other name for: mycophenolic acid)

**Myleran :** A drug used to treat chronic myelogenous leukemia (CML). It is also used with other drugs to prepare patients with CML for a stem cell transplant. It is also being studied in the treatment of other types of cancer. Myleran attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called busulfan and Busulfex.

**Mylosar :** A drug that is used to treat myelodysplastic syndromes and is being studied in the treatment of other types of cancer. It belongs to the family of drugs called antimetabolites. Also called azacitidine and Vidaza.

**Mylotarg :** A drug that was used to treat acute myeloid leukemia (AML) that recurred (came back). It was used in older patients who were not able to take other anticancer drugs. Mylotarg was taken off the market but continues to be studied in clinical trials for the treatment of certain types of leukemia. It contains a monoclonal antibody that binds to a protein called CD33, which is found on some leukemia cells. It also contains a toxic substance, which may help kill cancer cells. Mylotarg is a type of antibody-drug conjugate. Also called gemtuzumab ozogamicin.

**Mylovenge:** (Other name for: idiotype-pulsed autologous dendritic cell vaccine APC8020)

**Myochrysin:** (Other name for: gold sodium thiomalate)

**myoclonic epilepsy:** a form of epilepsy associated with involuntary muscle twitching

**myoclonic jerk :** A sudden, brief, strong contraction of a muscle or group of muscles that cannot be controlled.

**myoclonus:** involuntary muscle twitching

**Myofibril:** A unit of thick and thin filaments in a muscle fiber. OR microscopic filaments that make up a muscle cell. OR Fibrils inside the cytosol of vertebrate muscle cells that give such cells their striated appearance; the functional unit of a myofibril is a sarcomere.

**Myoglobin:** A vertebrate oxygen-storage protein found in muscle; structurally similar to an individual hemoglobin subunit.

**myoinositol :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Myoinositol helps cells make membranes and respond to messages from their environment. It has the same chemical formula as glucose (the chief source of energy for living organisms) but has a different arrangement of atoms. It is found in beans, peas, brown rice, wheat bran and nuts. It is water-soluble (can dissolve in water) and must be taken in every day. Myoinositol is being studied in the prevention of cancer. Also called inositol.

**myometrium :** The muscular outer layer of the uterus.

**myosin:** a protein microfilament that comprises the sarcomere of muscle cells. OR The main protein of the thick filaments in a muscle myofibril. It is composed of two coiled subunits (Mr about 220,000) that can aggregate to form a thick filament, which is globular at each end. OR A protein that forms the thick filaments of striated muscle; displays atpase activity at its globular head, which, in conjunction with the ability to reversibly bind actin at its fibrous region, provides the power stroke of muscle contraction. OR A contractile protein; the major component of the thick filaments of muscle and other actin-myosin systems.

**Myrbetriq:** (Other name for: mirabegron)

**myristyl nicotinate cream :** A substance being studied in the prevention of skin cancer. Myristyl nicotinate cream is also being studied as a way to help

lessen the side effects of retinoic acid (a form of vitamin A) when it is used to treat skin that has been damaged by the sun. Myristyl nicotinate cream contains a form of niacin (a member of the vitamin B complex). It is a type of chemopreventive agent.

**MZL:** An indolent (slow-growing) type of B-cell non-Hodgkin lymphoma that begins forming in certain areas (the marginal zones) of lymph tissue. There are three types based on whether it forms in the spleen, lymph nodes, or other lymphoid tissue that contains a lot of B cells (a type of white blood cell). Also called marginal zone B-cell lymphoma and marginal zone lymphoma.

**N-acetyl-L-cysteine :** A drug usually used to reduce the thickness of mucus and ease its removal. It is also used to reverse the toxicity of high doses of acetaminophen. Also called acetylcysteine and N-acetylcysteine.

**N-acetylcysteine :** A drug usually used to reduce the thickness of mucus and ease its removal. It is also used to reverse the toxicity of high doses of acetaminophen. Also called acetylcysteine and N-acetyl-L-cysteine.

**N-acetyldinaline :** A substance that is being studied as an anticancer drug in the treatment of non-small cell lung cancer. Also called CI-994.

**N-benzoyl-staurosporine :** A substance that is used in cancer research to cause bladder tumors in laboratory animals. This is done to test new diets, drugs, and procedures for use in cancer prevention and treatment.

**n-Butanol:** N-Butanol is an oxo-alcohol mainly used in the production of the butyl acrylate, which finds uses in the coatings industry. Others uses are in smaller volume acetate and glycol ether formulations. It is also used directly as a solvent. Most butanol is manufactured propylene with syngas in an oxo-process, then catalytically hydrogenated. Another major route, developed by Shell involves a one-step reaction with propylene and co-produces 2-ethylhexanol. There are other routes, including fermentation, which is not commercially viable. N-Butanol is a propylene derivative, and is produced in all regions.

**N-butyl-N-(4-hydroxybutyl) nitrosamine :** A group of researchers, cancer centers, and community doctors who are involved in studies that test new ways to screen, prevent, diagnose, and treat cancer. Clinical trials run by cooperative groups are funded and supported by the National Cancer Institute (NCI), and large numbers of patients take part in many locations. The current U.S. cooperative groups are the Alliance for Clinical Trials in

Oncology, ECOG-ACRIN Cancer Research Group, SWOG, and Children's Oncology Group (COG). The NCI clinical trials cooperative groups are part of the National Clinical Trials Network (NCTN).

**N-methylformamide:** A water-soluble organic solvent. As an adjuvant antineoplastic agent, N-methylformamide depletes cellular glutathione, a key molecule involved in the antioxidation of reactive oxygen species (ROS) and other free radicals, thereby enhancing ionizing radiation-induced DNA cross-linking in and terminal differentiation of tumor cells.

**N-terminal rule:** The dependency of the half-life of a cytosolic protein on the nature of its N-terminal amino acid.

**NA-17/MAGE-3.A2/NY-ESO-1 peptide vaccine:** A peptide cancer vaccine consisting of peptides derived from the melanoma antigen NA-17, the human leukocyte antigen HLA-A2-restricted human melanoma antigen 3 (MAGE-3.A2) and the cancer-testis antigen (NY-ESO-1), with potential immunostimulating and antineoplastic activities. Upon administration, the NA-17/MAGE-3.A2/NY-ESO-1 peptide vaccine may stimulate the immune system to mount a cytotoxic T-cell (CTL) response against tumor cells expressing NA-17, MAGE-3.A2 and NY-ESO-1, resulting in tumor cell lysis. The tumor-associated antigens (TAAs) NA-17, MAGE-3.A2 and NY-ESO-1 are overexpressed in a variety of cancer cell types. Check for active clinical trials using this agent.

**NA17-A antigen:** A specific melanoma antigen protein derived from a patient (NA17) with cutaneous melanoma metastases. When administered in a vaccine formulation, NA17-A antigen may stimulate a cytotoxic T lymphocyte (CTL) response against tumors that express this antigen, which may result in a reduction in tumor size. The NA17-A antigen is part of the enzyme N-acetyl glucosaminyl-transferase V (GnT-V). Approximately half of melanomas have been found to express significant levels of this atypical protein, which is not expressed by normal tissues.

**NA17.A2 peptide vaccine:** A peptide cancer vaccine comprised of human leukocyte antigen HLA-A2-restricted peptide derived from a metastatic melanoma cell line of patient NA17, with potential immunomodulating and antineoplastic activity. NA17.A2 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumors that express this antigen, which may result in a reduction in tumor size. This NA17 specific antigen,

encoded by an intron sequence of N-acetylglucosaminyltransferase V (GnT-V) gene, is expressed in about 50% of melanomas.

**nabilone:** A synthetic cannabinoid and dibenzopyrane derivative with anti-emetic activity. Although the mechanism of action has not been fully elucidated yet, it has been suggested that nabilone is a highly selective and strong agonist for the cannabinoid receptors CB1 and CB2, both of which are coupled to Gi/o proteins. The CB1 receptors are expressed predominantly in central and peripheral neurons and receptor stimulation has been implicated in the reduction of chemotherapy-induced nausea. Check for active clinical trials using this agent.

**nabilone :** A synthetic pill form of an active chemical in marijuana called delta-9-tetrahydrocannabinol (THC). Nabilone is used to treat nausea and vomiting caused by chemotherapy in patients who have not been helped by other therapy. It is a type of cannabinoid. Also called Cesamet.

**nabiximols:** An herbal preparation containing a defined quantity of specific cannabinoids formulated for oromucosal spray administration with potential analgesic activity. Nabiximols contains a standardized extract of tetrahydrocannabinol (THC), the non-psychoactive cannabinoid cannabidiol (CBD), other minor cannabinoids, flavonoids, and terpenes from two cannabis plant varieties. Cannabinoids interact with G protein-coupled cannabinoid 1 (CB1) receptors in the central nervous system, resulting in analgesic, euphoric, and anticonvulsive effects.

**NaCl:** Chemical abbreviation for sodium chloride (table salt).

**NAD-binding domain:** A structural motif of NAD<sup>+</sup>-linked dehydrogenases that forms a binding site for NAD<sup>+</sup> and consists of four helices and six parallel  $\beta$  strands.

**NAD, NADP (nicotinamide adenine dinucleotide, nicotinamide adenine dinucleotide phosphate):** Nicotinamide-containing coenzymes functioning as carriers of hydrogen atoms and electrons in some oxidation-reduction reactions.

**NAD<sup>+</sup> and NADH (nicotinamide adenine dinucleotide):** An important electron carrier in the oxidation of fuel molecules; electrons are carried on the nicotinamide moiety of the coenzyme.

**NADH-Q oxidoreductase:** A large component of the respiratory chain that transfers electrons from NADH to ubiquinone and in the process pumps

protons across the inner mitochondrial membrane to generate the proton-motive force. Also called NADH dehydrogenase or Complex I.

**nadolol:** A non-selective beta-adrenergic antagonist with antihypertensive and antiarrhythmic activities. Nadolol competitively blocks beta-1 adrenergic receptors located in the heart and vascular smooth muscle, inhibiting the activities of the catecholamines epinephrine and norepinephrine and producing negative inotropic and chronotropic effects. This agent exhibits antiarrhythmic activity via the impairment of atrioventricular (AV) node conduction and a corresponding reduction in sinus rate. In the kidney, inhibition of the beta-2 receptor within the juxtaglomerular apparatus results in the inhibition of renin production and a subsequent reduction in angiotensin II and aldosterone levels, thus inhibiting angiotensin II-dependent vasoconstriction and aldosterone-dependent water retention. Check for active clinical trials using this agent.

**NADP<sup>+</sup> and NADPH (nicotinamide adenine dinucleotide phosphate):**

The electron donor for reductive biosynthesis; differs from NAD<sup>+</sup> and NADH in that a phosphate is attached to the adenine ribose at position 3.

**nadroparin calcium:** A low molecular weight heparin (LMWH) composed of a heterogeneous mixture of sulfated polysaccharide glycosaminoglycan chains obtained by depolymerisation of porcine mucosal sodium heparin, extraction/purification and conversion to the calcium salt. Nadroparin binds to antithrombin III (ATIII) and inhibits the activity of activated factor X (factor Xa), thereby inhibiting the final common pathway of the coagulation cascade and preventing the formation of a cross-linked fibrin clot.

**nafoxidine hydrochloride:** The hydrochloride salt of the partial estrogen antagonist nafoxidine. Nafoxidine competes with endogenous estrogen for binding to specific estrogen receptors. This agent also inhibits angiogenesis in some tissues by blocking the effects of fibroblast growth factor (FGF) and vascular endothelial growth factor (VEGF); paradoxically, it may enhance angiogenesis in uterine tissue. Nafoxidine also induces oxidative stress, protein kinase C and calcium signaling.

**naloxegol:** A pegylated form of naloxone, a peripherally-acting mu-opioid receptor antagonist, that can be used to reduce opioid-induced symptoms. Upon administration, naloxegol binds to and blocks mu-opioid receptors in the peripheral nervous system. This prevents peripheral opioid receptor

activation and abrogates opioid-induced side effects, such as opioid-induced constipation (OIC). Pegylation of naloxone reduces permeability across the blood-brain barrier (BBB) and prevents this agent from interfering with the analgesic activity of opioid receptor agonists.

**naloxone :** A substance that is being studied as a treatment for constipation caused by narcotic medications. It belongs to the family of drugs called narcotic antagonists.

**naloxone hydrochloride:** The hydrochloride salt of naloxone, a thebaine derivative with opioid antagonist activity. Naloxone binds to opioid receptors in the CNS in a competitive manner, reversing or inhibiting characteristic opioid effects, including analgesia, euphoria, sedation, respiratory depression, miosis, bradycardia, and physical dependence. This agent binds to mu-opioid receptors with a high affinity, and a lesser degree to kappa- and gamma-opioid receptors.

**naltrexone :** A drug that blocks the action of opiates (drugs used to treat pain). It may be used in the treatment of intravenous opiate addiction or alcohol dependence. Naltrexone is also being studied in the treatment of breast cancer. It may block the effects of the hormone estrogen, which causes some breast cancer cells to grow, or block the blood flow to tumors. It is a type of opiate antagonist. Also called naltrexone hydrochloride, ReVia, and Vivitrol.

**naltrexone hydrochloride:** The hydrochloride salt of naltrexone, a noroxymorphone derivative with competitive opioid antagonistic activity. Naltrexone and its metabolite 6-beta-naltrexol reverse the effects of opioids by binding to various opioid receptors in the central nervous system (CNS), including the mu-, kappa- and gamma-opioid receptors; opioid effects of analgesia, euphoria, sedation, respiratory depression, miosis, bradycardia, and physical dependence are inhibited. Naltrexone is longer-acting and more potent compared to naloxone.

**naltrexone hydrochloride :** A drug that blocks the action of opiates (drugs used to treat pain). It may be used in the treatment of intravenous opiate addiction or alcohol dependence. Naltrexone hydrochloride is also being studied in the treatment of breast cancer. It may block the effects of the hormone estrogen, which causes some breast cancer cells to grow, or block the blood flow to tumors. It is a type of opiate antagonist. Also called naltrexone, ReVia, and Vivitrol.

**Namenda:** (Other name for: memantine hydrochloride)

**Namenda :** A drug used to treat dementia caused by Alzheimer disease. It is also being studied in the treatment of side effects from whole-brain radiation therapy for cancer and other conditions. Namenda blocks the uptake of calcium by certain brain cells and decreases their activity. It is a type of N-methyl-D-aspartate (NMDA) receptor antagonist. Also called memantine hydrochloride.

**nandrolone decanoate:** The decanoate salt form of nandrolone, an anabolic steroid analog of testosterone with androgenic, anabolic, and erythropoietin stimulating effects. Nandrolone enters the cell and binds to and activates specific nuclear androgen receptors in responsive tissue, including the prostate, seminal vesicles, scrotum, penis, larynx, hair follicles, muscle, and bone. The resulting activated hormone receptor complex translocates into the nucleus and binds to androgen response elements (ARE) in the promoter region of targeted genes, where the complex promotes gene expression necessary for maintaining male sex characteristics. Mimicking the negative feedback mechanism of testosterone, nandrolone decanoate also suppresses the secretion of luteinizing hormone (LH). Furthermore, this agent also stimulates erythropoietin production by enhancing the production of erythropoietic stimulating factors.

**nano-:** Prefix meaning one billionth or  $10^{-9}$ . OR A prefix meaning one-billionth OR A prefix that divides a basic unit by one billion ( $10^{-9}$ ). OR Prefix used in the SI system meaning "multiply by  $10^{-9}$ ". For example 1 nm means "0.000000001 m"; 2.8 ng could also be written " $2.8 \times 10^{-9}$  g".

**nanocell-encapsulated miR-16-based microRNA mimic:** A nanoparticle-based formulation composed of a microRNA 16 (miR-16) mimic, a double-stranded, 23 base pair, synthetic RNA molecule, encapsulated in nonliving bacterial minicells and coated with anti-epidermal growth factor receptor (EGFR) antibodies, with potential antineoplastic activity. Upon intravenous administration and subsequent transfection, nanocell-encapsulated miR-16-based microRNA mimic targets EGFR-expressing tumor cells and facilitates the restoration of expression of the miR-16 family. This leads to the downregulation of the expression of tumor-promoting genes and the inhibition of tumor cell growth. In addition, restoration of miR-16 expression sensitizes the tumor cell to certain chemotherapeutic agents.

miR-16, a family of microRNAs, is critical to the regulation of gene expression and appears to have a tumor suppressor function; its expression is downregulated in various cancer cell types. Check for active clinical trials using this agent.

**Nanocurie:** One billionth  $10^{-9}$  of a curie.

**nanogram :** A measure of weight. One nanogram weighs a billion times less than one gram, and almost a trillion-times less than a pound.

**Nanometer:** A unit of measurement equivalent to one millionth of a meter. OR A unit of length, equal to  $10^{-9}$  meters, and equal to  $10 \text{ \AA}$  (Angstroms). OR A measure of length in the metric system. A nanometer is one billionth of a meter. An average human hair is about 60,000 nanometers thick. Nanometers are used to measure wavelengths of light and distances between atoms in molecules.

**nanomole :** The amount of a substance equal to a billionth of a mole (a measure of the amount of a substance). Also called nM.

**Nanoparticle:** Particles with sizes ranging from 1 - 100 nanometres OR A particle whose diameter measures between 0 and 1,000 nanometers.

**nanoparticle :** A particle of that is smaller than 100 nanometers (one-billionth of a meter). In medicine, nanoparticles can be used to carry antibodies, drugs, imaging agents, or other substances to certain parts of the body. Nanoparticles are being studied in the detection, diagnosis, and treatment of cancer.

**nanoparticle albumin-bound docetaxel ABI-008:** A nanoparticle albumin-bound formulation of the taxane docetaxel with antineoplastic activity. Docetaxel is a semi-synthetic, second-generation taxane derived from a compound found in the European yew tree *Taxus baccata*. Docetaxel binds to and stabilizes tubulin, thereby inhibiting microtubule disassembly which results in cell-cycle arrest at the G<sub>2</sub>/M phase and cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and displays immunomodulatory and pro-inflammatory properties by inducing various mediators of the inflammatory response. In nanoparticle albumin-bound docetaxel ABI-008 docetaxel is solubilized without the use of the nonionic solubilizer Cremophor ELP, permitting the administration of larger doses of docetaxel while avoiding Cremophor ELP-associated toxicity.

**nanoparticle albumin-bound rapamycin:** The macrolide antibiotic rapamycin bound to nanoparticle albumin with immunosuppressant (see sirolimus) and potential antiangiogenic and antineoplastic activities. Rapamycin binds to the immunophilin FK Binding Protein-12 (FKBP-12) to generate a complex that binds to and inhibits the activation of the mammalian Target Of Rapamycin (mTOR), a key regulatory kinase. In turn, inhibition of mTOR may result in the inhibition of the phosphatidylinositol 3 (PI-3) kinase/Akt pathway and vascular endothelial cell growth factor (VEGF) secretion, which may result in decreased tumor cell proliferation and tumor angiogenesis. The binding of water-insoluble rapamycin to nanoparticle albumin permits the albumin-mediated endocytosis of rapamycin by tumor cells and endothelial cells.

**nanoparticle paclitaxel :** A drug used to treat breast cancer that has come back or spread to other parts of the body. It is also used with carboplatin to treat advanced non-small cell lung cancer in patients who are not able to have surgery or radiation therapy. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that has spread to other parts of the body. It is being studied in the treatment of other types of cancer.

Nanoparticle paclitaxel is a form of the anticancer drug paclitaxel and may cause fewer side effects than paclitaxel. It stops cancer cells from growing and dividing, and may kill them. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called ABI-007, Abraxane, paclitaxel albumin-stabilized nanoparticle formulation, and protein-bound paclitaxel.

**nanoparticle-encapsulated docetaxel:** A nanoparticle-based formulation containing the poorly water-soluble, second-generation taxane analog docetaxel covalently conjugated to proprietary and as of yet undisclosed degradable linkers and encapsulated in polymers, with antineoplastic activity. Upon intravenous administration of nanoparticle-encapsulated docetaxel, the nanoparticles are able to accumulate at the tumor site due to the unique characteristics of the tumor's vasculature, while avoiding normal, healthy tissue. Docetaxel is released and becomes active upon cleavage from various linkers at a predetermined and controlled rate which is dependent on the properties of the proprietary linkers. In turn, active, unconjugated docetaxel binds to the beta-subunit of tubulin, stabilizes microtubules and inhibits microtubule disassembly. This prevents mitosis and results in tumor cell death. Compared to the administration of docetaxel alone, this formulation is able to increase docetaxel's efficacy while

avoiding systemic exposure, which minimizes its toxicity. By using different linkers, docetaxel can be released at various rates.

**nanoparticle-encapsulated doxorubicin hydrochloride:** A formulation of nanoparticles encapsulating the hydrochloride salt form of the anthracycline antibiotic doxorubicin, with potential antitumor activity. Upon intravenous administration, doxorubicin intercalates DNA, interferes with the activity of topoisomerase II, and causes DNA adducts and other DNA damage, resulting in tumor cell growth inhibition and apoptosis. This agent also interacts with cell membrane lipids causing lipid peroxidation. Delivery of doxorubicin in nanoparticles may improve drug penetration into tumors and may circumvent the tumor cells' multidrug resistance mechanisms and may therefore be effective in chemoresistant tumor cells.

**nanoprobe :** A device that uses x-rays instead of visible light to form images of very small structures, such as the insides of blood vessels and cells. It can be used to study processes such as angiogenesis (growth of blood vessels). The term nanoprobe is also used to describe very small particles that can be used in the detection, diagnosis, and treatment of cancer.

**nanosomal docetaxel lipid suspension:** A lipid-based nanosomal formulation of the poorly soluble, semi-synthetic, second-generation taxane docetaxel, with potential antineoplastic activity. Upon intravenous injection, docetaxel binds to and stabilizes tubulin, which inhibits microtubule disassembly and results in both cell cycle arrest at the G2/M phase and cell death. This liposomal formulation solubilizes docetaxel without the use of toxic solvents, such as polysorbate 80. This permits the administration of larger doses of docetaxel and improves the drug's safety profile by avoiding solvent-associated toxicities, such as hypersensitivity reactions and neurotoxicity. In addition, the nanosomal lipid-based delivery of docetaxel improves drug penetration into tumors and decreases drug clearance, all of which prolong the duration of docetaxel's therapeutic effects.

**Nanotechnology:** The creation of functional materials, devices and systems through control of matter on the nanometer length scale (1-100 nanometers), and exploitation of novel phenomena and properties (physical, chemical, biological) at that length scale. OR A branch of science and engineering devoted to the design and production of extremely small electronic devices and circuits built from individual atoms and molecules

OR The field of research that deals with the engineering and creation of things from materials that are less than 100 nanometers (one-billionth of a meter) in size, especially single atoms or molecules. Nanotechnology is being studied in the detection, diagnosis, and treatment of cancer.

**napabucasin:** An orally available cancer cell stemness inhibitor with potential antineoplastic activity. Even though the exact target has yet to be fully elucidated, napabucasin appears to target and inhibit multiple pathways involved in cancer cell stemness. This may ultimately inhibit cancer stemness cell (CSC) growth as well as heterogeneous cancer cell growth. CSCs, self-replicating cells that are able to differentiate into heterogeneous cancer cells, appear to be responsible for the malignant growth, recurrence and resistance to conventional chemotherapies.

**Naphtha:** Naphtha refers to a range of middle distillate streams whose composition lies part way between gasoline and kerosene. Paraffinic naphtha is a preferred feedstock for petrochemical production via the steam cracking to ethylene and co-products. Naphtha streams with a higher aromatic content are meanwhile processed in reformers to make additional gasoline as well as producing valuable aromatics compounds for the petrochemical industry.

**naphthalimide analogue UNBS5162:** An amonafide (naphthalimide) derivative and pan-antagonist of chemokine ligand (CXCL) expression, with potential anti-angiogenic activity. Although UNBS5162 is a derivative of amonafide, this agent appears to have a different profile than that of amonafide and its exact mechanism of action remains to be fully elucidated. This agent seems to decrease the expression of various proangiogenic CXCL chemokines in vitro and may have synergistic effects with radiotherapy or chemotherapy. CXCLs are small cytokines in the CXC chemokine family that are overexpressed in certain cancers; CXCL-mediated signaling plays a key role in angiogenesis and tumor progression.

**Naprosyn :** A drug used to treat mild pain and the symptoms of arthritis and several other conditions. It is also being studied in the treatment of bone pain in patients with cancer. Naprosyn stops the body from making substances that cause pain and inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID) and a type of cyclooxygenase inhibitor. Also called naproxen.

**naproxen:** A propionic acid derivative and a non-steroidal anti-inflammatory drug (NSAID) with anti-inflammatory, antipyretic and analgesic activities. Naproxen inhibits the activity of the enzymes cyclooxygenase I and II, resulting in a decreased formation of precursors of prostaglandins and thromboxanes. The resulting decrease in prostaglandin synthesis is responsible for the therapeutic effects of naproxen. Naproxen also causes a decrease in the formation of thromboxane A<sub>2</sub> synthesis, by thromboxane synthase, thereby inhibiting platelet aggregation. or A drug used to treat mild pain and the symptoms of arthritis and several other conditions. It is also being studied in the treatment of bone pain in patients with cancer. Naproxen stops the body from making substances that cause pain and inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID) and a type of cyclooxygenase inhibitor. Also called Naprosyn.

**Narcan:** (Other name for: naloxone hydrochloride)

**narcotic :** A substance used to treat moderate to severe pain. Narcotics are like opiates such as morphine and codeine, but are not made from opium. They bind to opioid receptors in the central nervous system. Narcotics are now called opioids.

**Nardil:** (Other name for: phenelzine sulfate)

**narnatumab:** A monoclonal antibody against RON (recepteur d'origine nantais; macrophage stimulating 1 receptor), with potential antineoplastic activity. Narnatumab binds to RON, thereby preventing binding of its ligand hepatocyte growth factor-like protein (HGFL or macrophage-stimulating protein (MSP)). This may prevent RON receptor-mediated signaling and may prevent cellular proliferation in tumor cells overexpressing RON. RON, a receptor tyrosine kinase, is overexpressed in a variety of epithelial cancer cell types and plays an important role in cellular proliferation, migration and invasion.

**Naropin :** A drug used to control pain and to cause a temporary loss of feeling in one part of the body, during and after surgery. It is also being studied for pain control after cancer surgery. It is a type of local anesthetic. Also called ropivacaine and ropivacaine hydrochloride.

**Narrow mouth:** a finish of a plastic container in which the diameter is small relative to the diameter of the body.

**Nasacort:** (Other name for: triamcinolone acetonide)

**nasal :** By or having to do with the nose.

**nasal saline irrigation solution:** A solution containing sodium chloride that can be used to cleanse the nasal passages. Upon nasal irrigation, the saline washes out thick or dry mucus, and irritants, such as pollen, dust particles, pollutants and bacteria, from the nasal cavities. This reduces nasal blockage, improves nasal airflow and helps keep nasal passages clean and clear, which decreases the risk of irritation and inflammation. The saline solution also moisturizes and soothes irritated mucus membranes. Check for active clinical trials using this agent.

**Nasalfent:** (Other name for: fentanyl citrate pectin-based nasal spray)

**Nascent RNA:** The initial transcripts of RNA, before any modification or processing.

**nasogastric :** Describes the passage from the nose to the stomach. For example, a nasogastric tube is inserted through the nose, down the throat and esophagus, and into the stomach.

**nasogastric tube :** A tube that is inserted through the nose, down the throat and esophagus, and into the stomach. It can be used to give drugs, liquids, and liquid food, or used to remove substances from the stomach. Giving food through a nasogastric tube is a type of enteral nutrition. Also called gastric feeding tube and NG tube.

**Nasonex :** A drug that is used in a cream to treat certain skin conditions and in a nasal spray to treat sinus problems caused by allergies. It is being studied as a way to treat inflammation of the skin caused by radiation therapy. Nasonex is a type of corticosteroid. Also called Elocon, mometasone, and mometasone furoate.

**nasopharyngeal cancer :** Cancer that forms in tissues of the nasopharynx (upper part of the throat behind the nose). Most nasopharyngeal cancers are squamous cell carcinomas (cancer that begins in flat cells lining the nasopharynx).

**nasopharynx :** The upper part of the throat behind the nose. An opening on each side of the nasopharynx leads into the ear.

**nasoscope :** A thin tube-like instrument used to examine the inside of the nose. A nasoscope has a light and a lens for viewing and may have a tool to remove tissue. Also called rhinoscope.

**nasoscopy** : Examination of the inside of the nose using a nasoscope (or rhinoscope). A nasoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called rhinoscopy.

**natalizumab**: A humanized recombinant IgG4 monoclonal antibody directed against the alpha4 subunit of the integrins alpha4beta1 and alpha4beta7 with immunomodulating, anti-inflammatory, and potential antineoplastic activities. Natalizumab binds to the alpha4-subunit of alpha4beta1 and alpha4beta7 integrins expressed on the surface of all leukocytes except neutrophils, inhibiting the alpha4-mediated adhesion of leukocytes to counter-receptor(s) such as vascular cell adhesion molecule-1 (VCAM-1); natalizumab –mediated disruption of VCAM-1 binding by these integrins may prevent the transmigration of leukocytes across the endothelium into inflamed parenchymal tissue. Integrins are cellular adhesion molecules (CAMs) that are upregulated in various types of cancer and some autoimmune diseases; alpha4beta1 integrin (VLA4) has been implicated in the survival of myeloma cells, possibly by mediating their adhesion to stromal cells.

**nateglinide**: A phenylalanine derivative of the meglitinide class of agents with hypoglycemic activity. Nateglinide, compared to repaglitinide, binds with a higher affinity to the SUR1 subunit and with a faster onset of action and a shorter duration of action. This agent is metabolized by the cytochrome P450 isoenzyme CYP2C9, and, to a lesser extent, by CYP3A4. The parent drug and metabolites are mainly excreted in the urine and its half-life is about 1.5 hours.

**National Center for Complementary and Integrative Health** : A federal agency that uses science to explore complementary and integrative health (CIH) practices, trains CIH researchers, and provides authoritative information about CIH to professionals and the public. The National Center for Complementary and Integrative Health awards grants for research projects, training, and career development in CIH; sponsors conferences, educational programs, and exhibits; studies ways to use proven CIH practices along with conventional medical practice; and supports adding CIH to medical, dental, and nursing school programs. The National Center for Complementary and Integrative Health is part of the National Institutes of Health. Also called NCCIH.

**National Clinical Trials Network :** A National Cancer Institute (NCI) program that gives funds and other support to cancer research organizations to conduct cancer clinical trials. The National Clinical Trials Network (NCTN) helps these organizations develop new clinical trials and manage their regulatory, financial, membership, and scientific committees. It also helps with statistics and data management, Institutional Review Boards (IRBs), and patient tissue sample collection and storage. This support allows researchers to conduct trials that focus on specific cancers and patient populations and new treatment methods. The groups in the NCTN include the Alliance for Clinical Trials in Oncology, ECOG-ACRIN Cancer Research Group, NRG Oncology, SWOG, Children's Oncology Group (COG), and the NCI of Canada-Clinical Trials Group (NCIC-CTG). The NCTN was previously known as the NCI Clinical Trials Cooperative Group Program. Also called NCTN.

**National Institutes of Health :** A lung cancer screening trial sponsored by the National Cancer Institute (NCI). In the trial, low-dose spiral CT scans were compared with chest x-rays for their ability to detect lung cancer early. The trial included more than 50,000 participants who were aged 55 to 74 years, were current or former heavy smokers, and had no signs or symptoms of lung cancer. The results of the trial showed that participants who were screened with spiral CT scans had about a 20% lower risk of dying from lung cancer than those who were screened with chest x-rays. Also called NLST.

**National Lung Screening Trial :** A type of immune cell that has granules (small particles) with enzymes that can kill tumor cells or cells infected with a virus. A natural killer cell is a type of white blood cell. Also called NK cell and NK-LGL.

**National Response Framework (NRF):** The guiding principles, roles, and structures that enable all domestic incident response partners to prepare for and provide a unified national response to disasters and emergencies. It describes how the Federal Government, States, Tribes, communities, and the private sector work together to coordinate a national response. The framework, which became effective March 22, 2008, builds upon the National Incident Management System, which provides a template for managing incidents. For additional detail, please see the NRC Incident Response Plan (NUREG-0728) .

**National Source Tracking System (NSTS):** A secure, Web-based data system that helps the NRC and its Agreement States track and regulate the medical, industrial, and academic uses of certain nuclear materials, from the time they are manufactured or imported to the time of their disposal or exportation. This information enhances the ability of the NRC and Agreement States to conduct inspections and investigations, communicate information to other government agencies, and verify the ownership and use of nationally tracked sources. For additional detail, see the NSTS page.

**native:** Native' is the term used to describe metal that is found in nature as the metal itself. OR Naturally occurring forms of precious metals, for example, native copper, native gold, and native silver. Native metals are often very impure. OR Used to describe a metal that is found as an element even though it may be mixed with other substances. Gold is often (!) found native. Even though it may not be in large lumps, it is not chemically combined with another element.

**native conformation:** The biologically active conformation of a macromolecule.

**Native Element Mineral:** A mineral that is made up of a pure element. Gold is often found alone and as a native element.

**Native form:** The stable, functional conformation of a biological macromolecule.

**Natrecor:** (Other name for: nesiritide)

**natural abundance:** The average fraction of atoms of a given isotope of an element on Earth.

**natural attenuation:** the natural breakdown of groundwater contaminants over time and distance from the point source.

**Natural circulation:** The circulation of the coolant in the reactor coolant system without the use of the reactor coolant pumps. The circulation is due to the natural convection resulting from the different densities of relative cold and heated portions of the system.

**Natural color:** Describes the translucent appearance of a plastic material which has not been colored.

**Natural Gas:** Natural gas is the name given to dry gas streams composing mainly of methane (CH<sub>4</sub>). It may also contain small volumes of ethane, propane and butane as well as traces of other gases, such as carbon dioxide.

Various components of natural gas is separated via distillation and are used to make methanol and various olefins. OR a gaseous mixture of hydrocarbons that usually occurs with crude oil. OR A mixture of methane and other gases, found trapped over petroleum deposits under the earth. OR The fossil fuel that is formed (usually along with crude oil) when the remains of dead sea creatures decompose over millions of years. It is composed mainly of methane (CH<sub>4</sub>) and it is the gas that is used in the home and in school for Bunsen burners.

**natural history study :** A type of leukemia in which large natural killer (NK) cells (a type of white blood cell) that contain granules (small particles) are found in the blood. It is a chronic disease that may last for a long time and get worse. Also called NK-LGL leukemia and NK-LGLL.

**natural human interferon alpha OPC-18:** A proprietary preparation of natural human interferon alpha (IFN alpha) with potential immunomodulatory and antineoplastic activities. Natural human interferon alpha OPC-18 binds to cell-surface IFN alpha receptors (IFNARs), resulting in the transcription and translation of genes whose products mediate antiviral, antiproliferative, and immune-modulating effects. IFN alpha is a type I interferon produced by peripheral blood leukocytes or lymphoblastoid cells when exposed to live or inactivated virus, double-stranded RNA, or bacterial products and is the primary interferon produced by virus-induced leukocyte cultures. In addition to its pronounced antiviral activity, it activates NK cells.

**natural killer cell :** A system of disease prevention and treatment that avoids drugs and surgery. Naturopathy is based on the use of natural agents such as air, water, light, heat, and massage to help the body heal itself. It also uses herbal products, nutrition, acupuncture, and aromatherapy as forms of treatment.

**natural killer cells ZRx101:** A population of activated, immortalized, interleukin-2 (IL-2)-dependent, cytotoxic natural killer (NK) cells with potential antitumor activity. Natural killer cells ZRx101 are derived from NK-92 cells, having been modified to target tumor-associated antigens (TAAs) upregulated in certain types of cancer. The NK-92 cell line was originally isolated from a patient with large granular lymphocytic (LGL) leukemia/lymphoma.

**natural killer-cell large granular lymphocyte leukemia :** A feeling of sickness or discomfort in the stomach that may come with an urge to vomit. Nausea is a side effect of some types of cancer therapy.

**natural levee:** a ridge of sand and silt deposited near the edge of a stream's channel.

**natural occurrence:** The occurrence in nature of a compound, when there are no man-made sources of the compound. The contamination of nature by some compounds may be so widespread that it is virtually impossible at the present time to get access to biota with a natural level and only "normal" levels can be measured, i.e., the levels that are usually prevalent at places where there is no obvious local contamination (WHO, 1979).

**natural orbital:** The natural orbitals are those for which the first-order density matrix is diagonal; each will contain some non-integer number of electrons between 0 and 2. Usually discussed in the context of a correlated calculation. RHF calculations give molecular orbitals that are also natural orbitals. The NOs are the orbitals for which the CI expansion converges fastest.

**Natural product:** A molecule produced by a living organism--a plant, marine organism or microorganism--that often has a medicinal use

**natural selection:** the concept that random, small variations take place in living things that lead to the gradual development of a species. OR theory by Charles Darwin which states that organisms best fit for their environment will survive and pass along these traits. OR The process of survival of the fittest by which organisms that adapt to their environment survive while those that do not adapt disappear.

**Natural uranium:** Uranium containing the relative concentrations of isotopes found in nature (0.7 percent uranium-235, 99.3 percent uranium-238, and a trace amount of uranium-234 by mass). In terms of radioactivity, however, the radiation emitted by natural uranium comes approximately 2.2 percent from uranium-235, 48.6 percent from uranium-238, and 49.2 percent from uranium-234. Natural uranium can be used as fuel in nuclear reactors.

**Naturally balanced runner system :** each succession of runner is identical to the runners in the same succession in all other flows in the mold.

**naturopathy :** A drug used to treat advanced non-small cell lung cancer. It blocks cell growth by stopping cell division and may cause cancer cells to die. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called vinorelbine tartrate.

**nausea :** A substance being studied in the treatment of lymphomas and other types of cancer. It blocks some of the enzymes that keep cancer cells from dying. It is a type of Bcl-2 family inhibitor. Also called ABT-263.

**Navelbine :** A substance that is being studied for its ability to make cancer cells respond to drugs to which they have become resistant. It is a type of nucleoside analog.

**navitoclax:** An orally bioavailable, synthetic small-molecule antagonist of a subset of the B-cell leukemia 2 (Bcl-2) family of proteins with potential antineoplastic activity. Bcl-2 family protein inhibitor ABT-263 selectively binds to apoptosis suppressor proteins Bcl-2, Bcl-XL, and Bcl-w and prevents their binding to the apoptotic effectors Bax and Bak proteins, which may trigger apoptosis in tumor cells overexpressing Bcl-2, Bcl-XL, and Bcl-w. Bcl-2, Bcl-XL, and Bcl-w are frequently overexpressed in a wide variety of cancers, including those of the lymphatic system, breast, lung, prostate, and colon, and have been linked to tumor drug resistance. or A substance that is being studied in the treatment of leukemia. It belongs to the family of drugs called protein kinase inhibitors. Also called midostaurin and PKC412.

**navy bean powder:** The powder form of the cooked navy bean with potential antioxidant and chemopreventive activities. Navy beans are rich in fiber, minerals, vitamins, and phytochemicals such as flavonoids and phytosterols. They appear to prevent carcinogenesis by inducing tumor cell apoptosis. Intake of navy bean powder may have a beneficial effect on intestinal microflora.

**NBI1011:** A substance being studied in the treatment of cancer. It is made by combining interleukin-4 with a bacterial toxin. NBI-3001 is a type of recombinant chimeric protein. Also called interleukin-4 PE38KDEL cytotoxin and interleukin-4 PE38KDEL immunotoxin.

**NBI-3001:** A federal agency that uses science to explore complementary and integrative health (CIH) practices, trains CIH researchers, and provides authoritative information about CIH to professionals and the public.

NCCIH awards grants for research projects, training, and career

development in CIH; sponsors conferences, educational programs, and exhibits; studies ways to use proven CIH practices along with conventional medical practice; and supports adding CIH to medical, dental, and nursing school programs. NCCIH is part of the National Institutes of Health. Also called National Center for Complementary and Integrative Health.

**NBO:** Natural bond order. See NPA.

**NCCIH:** (... suh-POR-ted KLIH-nih-kul TRY-ul)

**NCI clinical trials cooperative group :** A research study conducted by researchers and institutions that receive funding or other resources from the National Cancer Institute (NCI). Resources from NCI include programs that provide scientific review and Institutional Review Board (IRB) support and management of patient tissue sample collection and storage. NCI also provides information about the clinical trials, such as regulatory requirements, patient enrollment, funding, and education materials to these researchers. This support allows the people who run the clinical trials more time for patient care and research. NCI-supported trials include trials that are part of NCI's national networks, such as National Clinical Trials Network (NCTN), NCI Community Oncology Research Program (NCORP), and Experimental Therapeutics Clinical Trials Network (ETCTN). NCI also funds, in full or in part, trials taking place at NCI-designated cancer centers throughout the U.S. and trials taking place at the NIH Clinical Center in Bethesda, Maryland.

**NCI-supported clinical trial :** A National Cancer Institute (NCI) program that gives funds and other support to cancer research organizations to conduct cancer clinical trials. The NCTN helps these organizations develop new clinical trials and manage their regulatory, financial, membership, and scientific committees. It also helps with statistics and data management, Institutional Review Boards (IRBs), and patient tissue sample collection and storage. This support allows researchers to conduct trials that focus on specific cancers and patient populations and new treatment methods. The groups in the NCTN include the Alliance for Clinical Trials in Oncology, ECOG-ACRIN Cancer Research Group, NRG Oncology, SWOG, Children's Oncology Group (COG), and the NCI of Canada-Clinical Trials Group (NCIC-CTG). The NCTN was previously known as the NCI Clinical Trials Cooperative Group Program. Also called National Clinical Trials Network.

**ncmtRNA oligonucleotide Andes-1537:** A proprietary antisense oligonucleotide targeting a novel non-coding mitochondrial RNA (ncmtRNA), with potential antineoplastic activity. Upon administration, Andes-1537 binds to ncmtRNA, which is overexpressed in rapidly proliferating cells, such as cancer cells, and not expressed in resting cells. This may decrease the expression of the ncmtRNA, which may inhibit cell proliferation and eventually induce apoptosis in susceptible cancer cells. The proprietary mitochondrial RNA (mtRNA) belongs to the family of non-coding RNAs (ncRNA); it contains an inverted repeat (IR) of 815 nucleotides (nt), which can form a covalent link to the 5' end of the mitochondrial 16S ribosomal RNA (16S mtrRNA). Check for active clinical trials using this agent.

**NCTN:** A substance being studied in the prevention of colorectal cancer. It is a form of aspirin that gives off nitric oxide gas and is less irritating to the lining of the stomach than plain aspirin. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called nitric oxide-releasing acetylsalicylic acid derivative.

**NCX 4016:** A drug put on the skin to treat growths caused by sun exposure. A form of NDGA that is taken by mouth is being studied in the treatment of prostate cancer. NDGA is an antioxidant, and it may block certain enzymes needed for tumor growth. Also called Actinex, masoprocol, and nordihydroguaiaretic acid.

**NDGA:** Newcastle disease virus. A bird virus that is being studied in the treatment of cancer. It may be used to kill cancer cells directly, or it may be given as a cancer vaccine to stimulate the body's immune system. NDV is a type of biological response modifier and vaccine therapy. Also called Newcastle disease virus.

**NDV:** A device used to turn liquid into a fine spray.

**neap tide:** tide with the smallest tidal range; during both quarter phases.

**neap tides:** the lowest tides, which occur close to the first and third quarters of the moon.

**Nebcin:** (Other name for: tobramycin sulfate)

**nebula:** a cloud of gas and dust in space.

**nebular hypothesis:** the hypothesis that suggests that the planets and moons in the solar system formed from a huge hydrogen-helium cloud.

**nebulizer** : A drug used with gemcitabine and cisplatin to treat squamous non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has not been treated with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Necitumumab binds to a protein called epidermal growth factor receptor (EGFR), which is found on some types of cancer cells. Blocking this protein may help keep cancer cells from growing. Necitumumab is a type of monoclonal antibody. Also called Portrazza.

**NebuPent:** (Other name for: pentamidine isethionate)

**necitumumab:** A fully human IgG1 monoclonal antibody directed against the epidermal growth factor receptor (EGFR) with potential antineoplastic activity. Necitumumab binds to and blocks the ligand binding site of EGFR, thereby preventing the activation and subsequent dimerization of the receptor. This may lead to an inhibition of EGFR-dependent downstream pathways and so inhibition of EGFR-dependent tumor cell proliferation and metastasis. EGFR, a member of the epidermal growth factor family of extracellular protein ligands, may be overexpressed on the cell surfaces of various tumor cell types. Check for active clinical trials using this agent.

**necitumumab** : Surgery to remove lymph nodes and other tissues in the neck.

**Neck:** The part of a container where the shoulder cross section area decreases to form the finish.

**Neck** : the part of a container where the shoulders cross section area decreases to form the finish.

**Neck Bead:** A protruding circle on a container at the point where the neck meets the finish, the diameter of which usually equals the outside diameter of the closure.

**neck dissection** : Refers to the death of living tissues.

**Neck finish:** the plastic surrounding the opening of a bottle shaped to accommodate a specific closure. It's the portion of the neck that carries the threads, lugs or friction fit members to which the closure is applied, and includes the sealing surface and sealing bead; generally, the whole portion above the transfer or pry-off bead. B&C Plastics Ltd. makes continuous thread (c/t) necks for twist-on caps, and hinge-guard (j-cap) necks for snap-

on caps. OR Part of the mold assembly which forms the neck and finish. Sometimes called Neck Ring.

**Neck linker:** A short segment of kinesin that binds to the head domain of kinesin when ATP is bound and is released when the nucleotide-binding site is vacant or occupied by ADP.

**Neck ring:** that part of the mold equipment that forms the finish of a bottle.

**NECK-IN:** In extrusion coating, the difference between the width of the extrusion die opening and the width of the coating on the substrate.

**necrosis:** Mass death of areas of tissues surrounded by otherwise healthy tissue. OR The removal of tissue or fluid with a needle for examination under a microscope. When a wide needle is used, the procedure is called a core biopsy. When a thin needle is used, the procedure is called a fine-needle aspiration biopsy.

**nedaplatin:** A second-generation cisplatin analogue with antineoplastic activity. Containing a novel ring structure in which glycolate is bound to the platinum by a bidentate ligand, nedaplatin forms reactive platinum complexes that bind to nucleophilic groups in DNA, resulting in intrastrand and interstrand DNA cross-links, apoptosis and cell death. This agent appears to be less nephrotoxic and neurotoxic compared to both cisplatin and carboplatin.

**needle biopsy :** A procedure used to mark a small area of abnormal tissue so it can be removed by surgery. An imaging device is used to guide a thin wire with a hook at the end through a hollow needle to place the wire in or around the abnormal area. Once the wire is in the right place, the needle is removed and the wire is left in place so the doctor will know where the abnormal tissue is. The wire is removed when a biopsy is done. Also called needle/wire localization and wire localization.

**needle localization :** A procedure used to mark a small area of abnormal tissue so it can be removed by surgery. An imaging device is used to guide a thin wire with a hook at the end through a hollow needle to place the wire in or around the abnormal area. Once the wire is in the right place, the needle is removed and the wire is left in place so the doctor will know where the abnormal tissue is. The wire is removed when a biopsy is done. Also called needle localization and wire localization.

**needle valve:** A valve which allows fine control over the rate of gas or liquid flowing through it. The valve contains a thin needle with a point that fits into a conical cup. When the valve is closed, the needle blocks an orifice in the bottom of the cup.

**needle-localized biopsy :** In acupuncture, the insertion of a thin needle into a specific place on the body to unlock qi (vital energy). The needle may be twirled, moved up and down at different speeds and depths, heated, or charged with a low electric current.

**needle/wire localization :** A procedure to mark and remove abnormal tissue when the doctor cannot feel a lump. An imaging device is used to guide a thin wire with a hook on the end through a hollow needle to place the wire in or around the abnormal area. Once the wire is in the right place, the needle is removed and the wire is left in so the doctor will know where the abnormal tissue is. The wire is removed at the time the biopsy is done.

**Needled mat:** A mat formed of strands cut to short length and felted together in a needle loom, with or without a carrier.

**needling :** A drug used to treat depression. It belongs to the family of drugs called antidepressant agents. Also called Serzone.

**nefazodone :** A lymph node in the armpit that is free of cancer.

**nefopam hydrochloride:** The hydrochloride salt form of nefopam, a centrally-acting, non-opioid benzoxazocine with analgesic activity. The mechanism of action through which nefopam exerts its analgesic effects is, as of yet, largely unknown but may involve inhibition of serotonin, dopamine and noradrenaline reuptake.

**negative axillary lymph node :** A test result that shows the substance or condition the test is supposed to find is not present at all or is present, but in normal amounts. In genetics, a negative test result usually means that a person does not have a mutation (change) in the gene, chromosome, or protein that is being tested. More testing may be needed to make sure a negative test result is correct.

**negative budget:** of a glacier, the losing of more volume than that gained from new snowfall.

**Negative Catalyst:** A negative catalyst is another term for an inhibitor. A negative catalyst has an opposite reaction from a catalyst.

**Negative control:** Repression of biological activity by the presence of a specific molecule.

**negative cooperativity:** A phenomenon of some multisubunit enzymes or proteins in which binding of a ligand or substrate to one subunit impairs binding to another subunit.

**negative feedback:** An interaction that reduces or dampens the response of the system in which it is incorporated. OR Regulation of a biochemical pathway achieved when a reaction product inhibits an earlier step in the pathway.

**negative gravity anomaly:** the gravity reading of a rock if it is lower than the normal regional gravity value.

**negative magnetic anomaly:** a magnetic reading that is lower than the average regional magnetic field strength.

**Negative Mold:** A mold with a concave cavity.

**negative polarity:** of a rock, the polarity created when the earth's magnetic field was reversed, which reduced the earth's net field strength.

**negative predictive value :** The likelihood that an individual with a negative test result is truly unaffected and/or does not have the particular gene mutation in question. Also called NPV.

**Negative selection:** A selection process in T-cell development in which T cells that bind with high affinity to MHC complexes of antigen-presenting cells displaying self-peptides undergo apoptosis.

**negative test result :** A drug used to treat certain types of T-cell acute lymphoblastic leukemia (T-ALL) and T-cell lymphoblastic lymphoma (T-LBL). It belongs to the family of drugs called antimetabolites. Also called 506U78 and Arranon.

**neihulizumab:** A humanized, agonistic monoclonal antibody against P selectin glycoprotein ligand-1 (PSGL-1; SELPLG; CD162), with potential immunosuppressive activity. Upon administration, neihulizumab specifically targets and binds to CD162 expressed on activated T-lymphocytes. This induces apoptosis of activated T-cells and reduces T-cell-mediated immune responses. This may halt disease progression of T-cell-mediated autoimmune diseases and acute graft-versus-host disease (GvHD).

**nelarabine:** An arabinonucleoside antimetabolite with antineoplastic activity. Nelarabine is demethoxylated by adenosine deaminase to become

biologically active 9-beta-D-arabinosylguanine (ara-G); ara-G incorporates into DNA, thereby inhibiting DNA synthesis and inducing an S phase-dependent apoptosis of tumor cells. Check for active clinical trials using this agent. or A drug that interferes with the ability of a virus to make copies of itself.

**nelfinavir mesylate:** The mesylate salt form of the antiviral agent nelfinavir. Nelfinavir selectively inhibits human immunodeficiency virus (HIV) protease, thereby preventing cleavage of the gag-pol viral polyprotein and resulting in the release of immature, noninfectious virions. In vivo, this agent exhibits broad tissue distribution compared to related agents. or Treatment given as a first step to shrink a tumor before the main treatment, which is usually surgery, is given. Examples of neoadjuvant therapy include chemotherapy, radiation therapy, and hormone therapy. It is a type of induction therapy.

**nelipepimut-S plus GM-CSF vaccine:** A cancer peptide vaccine comprised of a human leukocyte antigen (HLA) A2/A3 restricted HER2/neu (ERBB2) peptide from the extracellular domain of the HER2 protein (E75 peptide) and combined with the immunoadjuvant granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential immunomodulating and antineoplastic activity. Upon intradermal injection, nelipepimut-S plus GM-CSF vaccine may induce a specific cytotoxic T-lymphocyte (CTL) response against HER2/neu-expressing tumor cell types. HER2/neu, a tumor-associated antigen and a member of the epidermal growth factor receptor family of tyrosine kinases, is overexpressed in various tumor cell types. GM-CSF potentiates the antitumor immune response.

**nematicide:** A chemical used to kill nematodes.

**Neo-Oestronol I:** (Other name for: diethylstilbestrol)

**neoadjuvant therapy :** Abnormal and uncontrolled cell growth.

**neoantigen-based glioblastoma vaccine:** A peptide-based, personalized glioblastoma cancer vaccine consisting of patient-specific glioblastoma-derived immunogenic mutated epitopes (neoantigens), with potential immunomodulating and antineoplastic activities. Vaccination with the neoantigen-based glioblastoma vaccine stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the neoantigens, which results in tumor cell lysis. Neoantigens

are tumor-specific antigens derived from mutated proteins that are present only in a specific tumor.

**neoantigen-based melanoma-poly-ICLC vaccine:** A peptide-based melanoma cancer vaccine consisting of neoantigens and peptides derived from patient-specific melanoma immunogenic epitopes, combined with the immunostimulant poly-ICLC with potential immunomodulating and antineoplastic activities. Vaccination with the neoantigen-based melanoma vaccine stimulates the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing the neoantigens, which results in tumor cell lysis. The adjuvant poly-ICLC, composed of double-stranded RNA molecules of polyinosinic-polycytidylic acid stabilized with poly L-lysine in carboxymethylcellulose, is a ligand for toll-like receptor-3 (TLR3) and induces the release of cytokines which may help to boost the immune response against the selected neoantigens.

**Neodymium:** Symbol:"Nd" Atomic Number:"60" Atomic Mass: 144.24amu. Neodymium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. This reactive metal tarnishes easily and can be found in lasers, alloys, and even lenses for specialized types of eyewear.

**Neogest:** (Other name for: norgestrel)

**Neon:** Symbol:"Ne" Atomic Number:"10" Atomic Mass: 20.18amu. Neon is a non-reactive gas. It has no color and no smell, but when you send electricity through neon, it glows red. It is one of the noble or inert gases. You will find neon in television tubes, cryogenics, neon signs, and lasers.

**neoplasia :** An abnormal mass of tissue that results when cells divide more than they should or do not die when they should. Neoplasms may be benign (not cancer), or malignant (cancer). Also called tumor. Or A serious problem that may occur in cancer in which cancer cells spread from the original (primary) tumor to the meninges (thin layers of tissue that cover and protect the brain and spinal cord). It can happen in many types of cancer, but is the most common in melanoma, breast, lung, and gastrointestinal cancer. The cancer may cause the meninges to be inflamed. Also called carcinomatous meningitis, leptomeningeal carcinoma, leptomeningeal carcinomatosis, leptomeningeal metastasis, meningeal carcinomatosis, and meningeal metastasis.

**neoplasm:** Any formation of tissue associated with disease such as tumour. See malignant, tumour.

**neoplastic meningitis :** Surgery to remove a kidney or part of a kidney. In a partial nephrectomy, part of one kidney or a tumor is removed, but not an entire kidney. In a simple nephrectomy, one kidney is removed. In a radical nephrectomy, an entire kidney, nearby adrenal gland and lymph nodes, and other surrounding tissue are removed. In a bilateral nephrectomy, both kidneys are removed.

**Neoprene:** The trivial name for poly(2-chlorobutadiene). This polymer is used in the manufacture of fan belts and wetsuits. The monomer, 2-chlorobutadiene (aka chloroprene), looks something like this:

**Neoprene (GR-M):** A DuPont Dow Elastomers polymer of chloroprene which is prepared from coal, salt and limestone, not injection molded

**Neoquin:** (Other name for: apaziquone)

**Neoral:** (Other name for: cyclosporine)

**Neosar:** (Other name for: cyclophosphamide)

**Neoscan:** (Other name for: gallium citrate Ga 67)

**Neovastat:** (Other name for: shark cartilage extract AE-941)

**nephelometer:** an instrument that measures scattered light in a liquid.

**nephelometric turbidity unit (NTU):** a standard unit of turbidity measurement, equivalent to FNU.

**nephrectomy :** A doctor who has special training in diagnosing and treating kidney disease.

**nephrologist :** Surgery to make an opening from the outside of the body to the renal pelvis (part of the kidney that collects urine). This may be done to drain urine from a blocked kidney or blocked ureter into a bag outside the body. It may also be done to look at the kidney using an endoscope (thin, lighted tube attached to a camera), to place anticancer drugs directly into the kidney, or to remove kidney stones.

**nephron:** the functional and structural unit of the kidney that produces urine and is the primary unit of homeostasis in the human body.

**nephrostomy :** A series of x-rays of the kidneys. The x-rays are taken from different angles and show the kidneys clearly, without the shadows of the organs around them.

**nephrotomogram** : Poisonous or damaging to the kidney.

**nephrotoxic** : Surgery to remove a kidney and its ureter. Also called ureteronephrectomy.

**nephroureterectomy** : A bundle of fibers that receives and sends messages between the body and the brain. The messages are sent by chemical and electrical changes in the cells that make up the nerves.

**Neptazane**: (Other name for: methazolamide)

**Neptunium**: Symbol:"Np" Atomic Number:"93" Atomic Mass: 237.05amu. Neptunium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. A silvery, radioactive element that can be used in nuclear reactors because its atomic structure is so close to plutonium.

**neratinib**: An orally available, 6,7-disubstituted-4-anilinoquinoline-3-carbonitrile irreversible inhibitor of the HER-2 receptor tyrosine kinase with potential antineoplastic activity. Neratinib binds to the HER-2 receptor irreversibly, thereby reducing autophosphorylation in cells, apparently by targeting a cysteine residue in the ATP-binding pocket of the receptor. Treatment of cells with this agent results in inhibition of downstream signal transduction events and cell cycle regulatory pathways; arrest at the G1-S (Gap 1/DNA synthesis)-phase transition of the cell division cycle; and ultimately decreased cellular proliferation. Neratinib also inhibits the epidermal growth factor receptor (EGFR) kinase and the proliferation of EGFR-dependent cells.

**Nernst equation**: the response of an electrode varies with respect to the logarithm of the activity of the measured ion. The Nernst equation is a mathematical description of the potentiometric sensor behavior. OR An equation that relates the redox potential to the standard redox potential and the concentrations of the oxidized and reduced form of the couple.

**Nernstian response**: an potentiometric sensor is said to have a Nernstian response over a given concentration range if a plot of the potential difference (when measured against a reference electrode) versus the logarithm of the ionic activity of a given species in the test solution is linear with a slope factor, which is given by the Nernst equation.

**nerve** : A procedure in which medicine is injected directly into or around a nerve or into the spine to block pain.

**nerve block :** A type of cell that receives and sends messages from the body to the brain and back to the body. The messages are sent by a weak electrical current. Also called neuron.

**nerve cell :** Replacing a damaged nerve with a section of a healthy nerve that has been removed from another part of the body. This procedure is being studied in the prevention of erectile dysfunction in men having surgery for prostate cancer.

**nerve chord:** also called a spinal cord; a hollow structure that extends the length of the animal just above the notochord.

**nerve grafting :** A protein made by the body that causes certain nerve cells to grow and helps keep them alive.

**nerve growth factor :** Surgery to remove the prostate in which an attempt is made to save the nerves that help cause penile erections.

**nerve impulse:** an electrochemical event that occurs within the neuron.  
OR The increase in membrane potential and the changes in sodium and potassium conductances that result from alterations in the permeability of the axon membrane to those ions. Also called action potential.

**nerve roots:** the 31 pairs of projections that extend out along each side of the spinal cord; the sites of axons of the sensory and motor neurons.

**nerve-sparing radical prostatectomy :** A type of surgery that attempts to save the nerves near the tissues being removed.

**nerve-sparing surgery :** The organized network of nerve tissue in the body. It includes the central nervous system (the brain and spinal cord), the peripheral nervous system (nerves that extend from the spinal cord to the rest of the body), and other nerve tissue.

**nerves:** bundles of axons bound together.

**nervous system :** A procedure in which small electric impulses are used to stimulate muscles that are weak or paralyzed. It helps to increase muscle strength, blood circulation, and range of motion and to lessen muscle spasms. Also called neuromuscular electrical stimulation, NMES, and therapeutic (subthreshold) electrical stimulation.

**NES:** A combination of two drugs used to prevent nausea and vomiting caused by chemotherapy. It is a combination of netupitant and palonosetron hydrochloride. Netupitant and palonosetron hydrochloride blocks the action of chemicals in the brain that may trigger nausea and vomiting. Netupitant

and palonosetron hydrochloride is a type of antiemetic. Also called Akynzeo.

**nesiritide:** A recombinant version of the cardiac neurohormone, human B-type natriuretic peptide (hBNP) produced by the ventricular myocardium. Nesiritide binds to natriuretic peptide receptors on vascular smooth muscle and endothelial cells, through which it triggers guanylate cyclase dependent signal transduction resulting in increase of intracellular concentrations of cGMP. This leads to smooth muscle cell relaxation causing arterial and venous dilatation.

**Nest Plate:** A retainer plate with a depressed area for cavity blocks used in injection molding. OR A retainer plate in the mold with a depressed area for cavity blocks.

**nesvacumab:** A fully human monoclonal antibody directed against angiopoietin 2 (ANG2) with potential antiangiogenic and antineoplastic activities. Nesvacumab binds to ANG2 and interferes with the interaction between Ang2 and its receptor TEK tyrosine kinase (Tie2), which may inhibit tumor cell angiogenesis and tumor cell proliferation. ANG2 is upregulated in a variety of cancer cell types and plays a crucial role in angiogenesis.

**net chemical reaction:** A reaction that actually occurs as several elementary steps. Equations for net reactions often omit intermediates and catalysts.

**Net electric generation:** The gross amount of electric energy produced by a generating station, minus the amount used to operate the station. Note: Electricity required for pumping at pumped-storage plants is regarded as electricity for station operation and is deducted from gross generation. Net electric generation is measured in watthours (Wh), except as otherwise noted.

**net ionic equation:** A net ionic equation is an ionic equation with all spectator ions eliminated. For example,  $\text{Ag}^+(\text{aq}) + \text{NO}_3^-(\text{aq}) + \text{Na}^+(\text{aq}) + \text{Cl}^-(\text{aq}) = \text{AgCl}(\text{s}) + \text{Na}^+(\text{aq}) + \text{NO}_3^-(\text{aq})$  is an ionic equation; the net ionic equation would be  $\text{Ag}^+(\text{aq}) + \text{Cl}^-(\text{aq}) = \text{AgCl}(\text{s})$  because the sodium and nitrate ions are spectators (they appear on both sides of the ionic equation).

**net primary production:** The part of the gross primary production that remains stored in the producer organism (primarily green plants) after

deducting the amount used during the process of respiration. Abbreviated NPP.

**Net shape:** The final desired shape of a part; or a shape that does not require additional shaping operations before use.

**Net summer capacity:** The steady hourly output that generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by measurements at the time of peak demand (summer). Net summer capacity is measured in watts unless otherwise noted.

**netazepide:** An orally active, benzodiazepine type, selective cholecystokinin B receptor (CCKBR; CCK2R; gastrin receptor) antagonist with potential gastric acid reducing and antiproliferative activity. Upon administration of netazepide, this agent selectively binds to and blocks the CCKBR, thereby preventing the binding of gastrin and cholecystokinin. This may prevent gastric neuroendocrine enterochromaffin-like (ECL) cell-induced secretion of histamine, ultimately preventing gastric acid secretion from adjacent parietal cells. In addition, YF476 may inhibit ECL cell proliferation and ECL-derived gastric carcinoids.

**netupitant:** A selective neurokinin 1 (NK1) receptor antagonist with potential antiemetic activity. Netupitant competitively binds to and blocks the activity of the human substance P/NK1 receptors in the central nervous system (CNS), thereby inhibiting NK1-receptor binding of the endogenous tachykinin neuropeptide substance P (SP), which may result in the prevention of chemotherapy-induced nausea and vomiting (CINV). SP is found in neurons of vagal afferent fibers innervating the brain-stem nucleus tractus solitarii and the area postrema, which contains the chemoreceptor trigger zone (CTZ), and may be elevated in response to chemotherapy. The NK-receptor is a G-protein receptor coupled to the inositol phosphate signal-transduction pathway and is found in both the nucleus tractus solitarii and the area postrema. Check for active clinical trials using this agent.

**netupitant and palonosetron hydrochloride:** An orally available combination formulation containing netupitant, a selective neurokinin 1 (NK1) receptor antagonist, and the hydrochloride salt form of palonosetron, a selective serotonin (5-hydroxytryptamine; 5-HT) receptor subtype 3 (5-HT3) antagonist, with antiemetic activity. Upon oral administration,

palonosetron competitively blocks the action of 5-HT at 5-HT<sub>3</sub> receptors located on vagal afferent nerves in the chemoreceptor trigger zone (CTZ). This inhibits acute emesis associated with 5-HT secretion and subsequent 5-HT<sub>3</sub> activation. Netupitant competitively binds to and blocks the activity of the human NK1 receptors in the central nervous system (CNS), thereby inhibiting NK1 receptor binding of the endogenous tachykinin neuropeptide substance P (SP). This prevents delayed emesis, which is associated with SP secretion. Altogether, this results in the prevention of chemotherapy-induced nausea and vomiting (CINV).

**netupitant and palonosetron hydrochloride :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. Neulasta is also used to help prevent damage to the bone marrow in patients who were exposed to high doses of certain types of radiation. Neulasta helps the bone marrow make more white blood cells. It is a form of filgrastim and is able to stay in the body longer. Neulasta is a type of colony-stimulating factor. Also called filgrastim-SD/01 and pegfilgrastim.

**network covalent solid:** A substance which consists of an array of atoms held together by an array of covalent bonds. A crystal of a network covalent solid is actually a single, gigantic molecule. Diamond and quartz are examples.

**Neugranin:** (Other name for: recombinant human albumin-human granulocyte colony-stimulating factor)

**Neulasta:** (Other name for: pegfilgrastim)

**Neulasta :** A drug used to increase the number of blood cells, especially platelets, in some cancer patients receiving chemotherapy. Neumega is a form of interleukin-11 (a cytokine normally made by support cells in the bone marrow) that is made in the laboratory. It is a type of biological response modifier. Also called oprelvekin, recombinant human interleukin-11, and rhIL-11.

**Neumega:** (Other name for: oprelvekin)

**Neumega :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. It is also used to treat chronic neutropenia and to prepare

the blood for the collection of certain types of blood cells. Neupogen is also used to help prevent damage to the bone marrow in patients who were exposed to very high doses of certain types of radiation. Neupogen helps the body make more white blood cells. It is a type of colony-stimulating factor. Also called filgrastim, G-CSF, granulocyte colony-stimulating factor, and Zarxio.

**Neupogen :** Having to do with nerves or the nervous system, including the brain and the spinal cord.

**Neuradiab:** (Other name for: iodine I 131 monoclonal antibody 81C6)

**neural :** Having to do with the way the brain affects emotion, behavior, and learning. Some cancers or their treatment may cause neurobehavioral problems.

**neuro-oncologist :** A pathologist who has special training in diseases of the nervous system. A pathologist identifies disease by studying cells and tissues under a microscope.

**neurobehavioral :** A type of cancer that forms from immature nerve cells. It usually begins in the adrenal glands but may also begin in the abdomen, chest, or in nerve tissue near the spine. Neuroblastoma most often occurs in children younger than 5 years of age. It is thought to begin before birth. It is usually found when the tumor begins to grow and cause signs or symptoms.

**neuroblastoma :** Having to do with the ability to think and reason. This includes the ability to concentrate, remember things, process information, learn, speak, and understand.

**neurocognitive :** A type of disease in which cells of the central nervous system stop working or die. Neurodegenerative disorders usually get worse over time and have no cure. They may be genetic or be caused by a tumor or stroke. Neurodegenerative disorders also occur in people who drink large amounts of alcohol or are exposed to certain viruses or toxins. Examples of neurodegenerative disorders include Alzheimer's disease and Parkinson's disease.

**neurodegenerative disorder :** A tumor of the central or peripheral nervous system.

**neuroectodermal tumor :** Having to do with the interactions between the nervous system and the endocrine system. Neuroendocrine describes certain

cells that release hormones into the blood in response to stimulation of the nervous system.

**neuroendocrine** : A rare type of cancer that forms on or just beneath the skin, usually in parts of the body that have been exposed to the sun. It is most common in older people and in people with weakened immune systems. Also called Merkel cell cancer, Merkel cell carcinoma, and trabecular cancer.

**neuroendocrine carcinoma of the skin** : A tumor that forms from cells that release hormones into the blood in response to a signal from the nervous system. Neuroendocrine tumors may make higher-than-normal amounts of hormones, which can cause many different symptoms. These tumors may be benign (not cancer) or malignant (cancer). Some examples of neuroendocrine tumors are carcinoid tumors, islet cell tumors, medullary thyroid cancer, pheochromocytomas, neuroendocrine carcinoma of the skin (Merkel cell cancer), small cell lung cancer, and large cell neuroendocrine carcinoma (a rare type of lung cancer).

**neuroendocrine tumor** : Having to do with tissue made up of sensory cells, such as tissue found in the ear, nose, and tongue.

**neuroepithelial** : A treatment being studied to improve brain function in certain brain disorders and in patients treated with chemotherapy for breast cancer. Sensors are placed on a person's head, which allows brain activity to be shown as patterns on a computer screen. A beep or a tone may be used as a reward to a person for changing certain brain activities. Neurofeedback may help cancer patients deal with the stress and mental side effects of chemotherapy. Also called EEG biofeedback.

**neurofeedback** : A benign tumor that develops from the cells and tissues that cover nerves.

**neurofibroma** : A rare genetic condition that causes brown spots and tumors on the skin, freckling in skin areas not exposed to the sun, tumors on the nerves, and developmental changes in the nervous system, muscles, bone, and skin. Also called NF1.

**neurofibromatosis type 1** : A genetic condition in which tumors form on the nerves of the inner ear and cause loss of hearing and balance. Tumors may also occur in the brain and on nerves in the skull and spinal cord, and may cause loss of speech, eye movement, and the ability to swallow. Also called acoustic neurofibromatosis and NF2.

**neurofibromatosis type 2** : Any of the cells that hold nerve cells in place and help them work the way they should. The types of neuroglia include oligodendrocytes, astrocytes, microglia, and ependymal cells. Also called glial cell.

**neuroglia** : the glial cells together with the extracellular tissue. OR A type of drug used to treat symptoms of psychosis. These include hallucinations (sights, sounds, smells, tastes, or touches that a person believes to be real but are not real), delusions (false beliefs), and dementia (loss of the ability to think, remember, learn, make decisions, and solve problems). Most neuroleptic agents block the action of certain chemicals in the nervous system. Also called antipsychotic and antipsychotic agent.

**neuroleptic agent** : A life-threatening condition that may be caused by certain drugs used to treat mental illness, nausea, or vomiting. Symptoms include high fever, sweating, unstable blood pressure, confusion, and stiffness. Also called NMS.

**neuroleptic malignant syndrome** : Having to do with nerves or the nervous system.

**neurologic** : A series of questions and tests to check brain, spinal cord, and nerve function. The exam checks a person's mental status, coordination, ability to walk, and how well the muscles, sensory systems, and deep tendon reflexes work.

**neurological exam** : A doctor who has special training in diagnosing and treating disorders of the nervous system.

**neurologist** : A tumor that arises in nerve cells.

**neuroma** : A procedure in which small electric impulses are used to stimulate muscles that are weak or paralyzed. It helps to increase muscle strength, blood circulation, and range of motion and to lessen muscle spasms. Also called NES, NMES, and therapeutic (subthreshold) electrical stimulation.

**neuromuscular electrical stimulation** : A rare nerve disorder that causes constant muscle activity that cannot be controlled, even during sleep. It often affects the muscles in the arms and legs, but may affect the whole body. Symptoms include muscle twitching, weakness, stiffness, and cramping; increased skin temperature, sweating, and heart rate; and problems with chewing, swallowing, speech, and breathing. The disorder

often gets worse over time. Neuromyotonia usually occurs in people aged 15 to 60 years. It may occur with certain types of cancer and is sometimes inherited. Also called Isaac syndrome.

**neuromyotonia :** A type of cell that receives and sends messages from the body to the brain and back to the body. The messages are sent by a weak electrical current. Also called nerve cell.

**neuron:** a nerve cell. OR A cell of nervous tissue specialized for transmission of a nerve impulse. OR A doctor who has special training in diagnosing and treating brain tumors and other tumors of the nervous system.

**Neurontin:** (Other name for: gabapentin)

**neuropathologist :** A nerve problem that causes pain, numbness, tingling, swelling, or muscle weakness in different parts of the body. It usually begins in the hands or feet and gets worse over time. Neuropathy may be caused by cancer or cancer treatment, such as chemotherapy. It may also be caused by physical injury, infection, toxic substances, or conditions such as diabetes, kidney failure, or malnutrition. Also called peripheral neuropathy.

**neuropathy:** disease or abnormality in the nervous system

**neuropeptide :** A member of a class of protein-like molecules made in the brain. Neuropeptides consist of short chains of amino acids, with some functioning as neurotransmitters and some functioning as hormones.

**neuropeptide :** A psychologist who diagnoses and treats behavioral and other problems related to the way the brain works. These may include problems with social interactions, ability to control emotions and behaviors, and cognitive abilities (thinking, learning, remembering, and problem solving). These problems may be caused by brain disease, injury, or medical treatment, such as cancer treatment.

**neuropsychologist :** The study of how the brain and central nervous system are related to behavior.

**neuropsychology :** A doctor trained in radiology who specializes in creating and interpreting pictures of the nervous system. The pictures are produced using forms of radiation, such as x-rays, sound waves, or other types of energy.

**neuroradiologist :** A doctor who has special training in surgery on the brain, spine, and other parts of the nervous system.

**neurosurgeon** : The tendency of some treatments to cause damage to the nervous system.

**neurotoxicity** : A substance that is poisonous to nerve tissue.

**neurotoxin** : A chemical that is made by nerve cells and used to communicate with other cells, including other nerve cells and muscle cells.

**neurotransmitter**: a chemical substance that accumulates in the synapse and increases the membrane permeability of the next dendrite. OR A small, diffusible molecule, such as acetylcholine, that mediates the passage of nerve impulses across the synapse. OR Neurotransmitters are molecules that are used to carry signals from one neuron to another. One neuron releases the neurotransmitter near another neuron's receptors. The neurotransmitter diffuses across the gap between the neurons and locks into a receptor site on the surface of the downstream neuron. This induces a change in the downstream neuron. OR A low molecular weight compound (usually containing nitrogen) secreted from the terminal of a neuron and bound by a specific receptor in the next neuron; serves to transmit a nerve impulse. OR A substance that transmits nerve impulses across a synapse. OR An ability to invade and live in neural tissue. This term is usually used to describe the ability of viruses to infect nerve tissue.

**neurotropism** : A condition in which there is a lower-than-normal number of neutrophils (a type of white blood cell).

**neutral**: An object that does not have a positive or negative charge. OR A substance that is neither acidic nor alkaline. It has a pH of 7. OR 1. having no net electrical charge. Atoms are electrically neutral; ions are not. 2. A solution containing equal concentrations of  $H^+$  and  $OH^-$ .

**Neutral oxide** : Although most metal oxides are bases and most non-metal oxides are acidic, a few form neutral solutions in water. One example of this kind of oxide is carbon monoxide.

**Neutralisation**: Adding base to an acidic solution until it is no longer acidic, or acid to a basic solution until it is no longer basic. pH 7, where equal amounts of  $H^+$  and  $OH^-$  ions will be present in any aqueous solution, is the pH of a truly neutral solution. OR A reaction where an acid "cancels out" an alkali. OR chemical addition of either acid or base to a solution such that the pH is adjusted to 7. OR A process where an acid and a base react with each other to form a salt and water. OR The process by which acids, such as sulfonic or sulfuric acids, are reacted with bases, such

as sodium hydroxide or triethanolamine, to give a salt, such as a sulfonate or sulfate. OR the chemical reaction of an acid and base to yield a salt and water. OR the reaction of an acid and a base. The products of an acid and base reaction are a salt and water.

**neutralization reaction:** A chemical change in which one compound acquires  $H^+$  from another. The compound that receives the hydrogen ion is the base; the compound that surrenders it is an acid.

**Neutrexin:** (Other name for: trimetrexate glucuronate)

**neutrino:** An elementary particle produced by certain nuclear decay processes. Neutrinos have no charge and extremely small masses compared to other subatomic particles.

**neutron:** a particle in the center of the atom with no charge. OR an uncharged particle in the atomic nucleus that has the same weight as a proton. Additional neutrons do not change an element but convert it to one of its isotopic forms. OR an uncharged sub-atomic particle, with a mass nearly equal to that of a proton. Present in the nucleus of all atoms except hydrogen. OR A particle found in the nucleus of an atom. It is almost identical in mass to a proton, but carries no electric charge. OR Electrically neutral subatomic particle found in the nucleus. OR One of the particles found in the nucleus of an atom. Whereas an electron has a negative (-) charge and a proton has a positive (+) charge, a neutron has a neutral charge (0). OR is a basic particle whose charge is 0 and whose mass is 1 g/mol (amu). OR Why atomic weights are complicated. Each element has a certain number of protons in its nucleus, which defines what element it is (e.g., 92 for Uranium, 2 for Helium, 109 for Meitnerium). To keep the positively charged protons from flying apart through electrostatic repulsion, they are bound together by the 'strong force' which is a very powerful force operating over very short distances between protons and neutrons. A certain number of neutrons gives optimal stability to a nucleus - too many or too few and the nucleus will be unstable (i.e., radioactive). Most elements are found naturally in a number of 'isotopes', forms with different number of neutrons - e.g., Carbon-12, Carbon-13, Carbon-14. Neutrons weigh about  $1.6749 \times 10^{-27}$  kg, slightly more than a proton. OR a heavy subatomic particle with zero charge; found in an atomic nucleus. OR An uncharged elementary particle, with a mass slightly greater than that of the proton, found in the nucleus of every atom heavier than hydrogen.

**neutron activation analysis:** An extremely sensitive technique for analyzing trace amounts of elements in a sample. The sample is bombarded with neutrons in a nuclear reactor, making it radioactive. Different elements produce different 'signatures' in the induced radiation which makes determination of their concentration in the sample possible.

**Neutron capture:** The reaction that occurs when a nucleus captures a neutron. The probability that a given material will capture a neutron is proportional to its neutron capture cross section and depends on the energy of the neutrons and the nature of the material.

**Neutron chain reaction:** A measure of the intensity of neutron radiation, determined by the rate of flow of neutrons. The neutron flux value is calculated as the neutron density ( $n$ ) multiplied by neutron velocity ( $v$ ), where  $n$  is the number of neutrons per cubic centimeter (expressed as neutrons/cm<sup>3</sup>) and  $v$  is the distance the neutrons travel in 1 second (expressed in centimeters per second, or cm/sec). Consequently, neutron flux ( $nv$ ) is measured in neutrons/cm<sup>2</sup>-sec.

**Neutron flux:** A measure of the intensity of neutron radiation, determined by the rate of flow of neutrons. The neutron flux value is calculated as the neutron density ( $n$ ) multiplied by neutron velocity ( $v$ ), where  $n$  is the number of neutrons per cubic centimeter (expressed as neutrons/cm<sup>3</sup>) and  $v$  is the distance the neutrons travel in 1 second (expressed in centimeters per second, or cm/sec). Consequently, neutron flux ( $nv$ ) is measured in neutrons/cm<sup>2</sup>/sec.

**Neutron generation:** The release, thermalization, and absorption of fission neutrons by a fissile material and the fission of that material producing a second generation of neutrons. In a typical nuclear power reactor system, there are about 40,000 generations of neutrons every second.

**Neutron leakage:** Neutrons that escape from the vicinity of the fissionable material in a reactor core. Neutrons that leak out of the fuel region are no longer available to cause fission and must be absorbed by shielding placed around the reactor pressure vessel for that purpose.

**Neutron source:** Any material that emits neutrons, such as a mixture of radium and beryllium, that can be inserted into a reactor to ensure a neutron flux large enough to be distinguished from background to register on neutron detection equipment.

**Neutron, thermal:** A neutron that has (by collision with other particles) reached an energy state equal to that of its surroundings, typically on the order of 0.025 eV (electron volts).

**neutron10:** An elementary particle found the atomic nucleus of all stable atoms except the hydrogen-1 atom. Neutrons have no charge and have a mass of 1.008665 daltons.

**neutropenia :** A type of immune cell that is one of the first cell types to travel to the site of an infection. Neutrophils help fight infection by ingesting microorganisms and releasing enzymes that kill the microorganisms. A neutrophil is a type of white blood cell, a type of granulocyte, and a type of phagocyte.

**neutrophil :** A genetic condition that causes unusual facial features and disorders of the skin, bones, nervous system, eyes, and endocrine glands. People with this syndrome have a higher risk of basal cell carcinoma. Also called basal cell nevus syndrome and Gorlin syndrome.

**neutrophil activation probe imaging agent:** A fluorescence imaging agent composed of a fluorescent agent linked, via a human neutrophil elastase (HNE) cleavable peptide, to a dequencher molecule, with imaging activity for diagnostic purposes. Upon local administration, the neutrophil activation probe (NAP) imaging agent, initially quenched, is quickly taken up by activated neutrophils. In turn, the HNE expressed by these cells specifically cleaves the linker and dequenches the fluorescent agent. The activated fluorescent moiety allows for visualization of activated neutrophils and HNE activity upon using a fluorescence imaging device. Activated neutrophils are upregulated at sites of inflammation and in inflammation-induced cancers, and express high levels of HNE.

**neutrophils:** the white blood cells that function in phagocytosis.

**Neuvence:** (Other name for: lapuleucel-T)

**nevirapine:** A non-nucleoside reverse transcriptase inhibitor (NNRTI) with activity against human immunodeficiency virus 1. Nevirapine binds directly to the human immunodeficiency virus type 1 (HIV-1) reverse transcriptase, an RNA-dependent DNA polymerase, blocking its function in viral DNA replication. In combination with other antiretroviral drugs, nevirapine reduces HIV viral loads and increases CD4 counts, thereby retarding or preventing the damage to the immune system and reducing the risk of developing AIDS. Check for active clinical trials using this agent.

**nevus** : A benign (not cancer) growth on the skin that is formed by a cluster of melanocytes (cells that make a substance called melanin, which gives color to skin and eyes). A nevus is usually dark and may be raised from the skin. Also called mole.

**neovirus** : A bird virus that is being studied in the treatment of cancer. It may be used to kill cancer cells directly, or it may be given as a cancer vaccine to stimulate the body's immune system. Newcastle disease virus is a type of biological response modifier and vaccine therapy. Also called NDV.

**New Chemical Entity (NCE)**: A compound that has not been previously described in the scientific literature.

**new mutation** : An alteration in a gene that is present for the first time in one family member as a result of a mutation in a germ cell (egg or sperm) of one of the parents, or a mutation that arises in the fertilized egg itself during early embryogenesis. Also called de novo mutation.

**Newcastle disease virus** : A drug used to treat advanced kidney cancer and a type of liver cancer that cannot be removed by surgery. It is also used to treat a type of advanced thyroid cancer that did not get better with radioactive iodine treatment. It is being studied in the treatment of other types of cancer. Nexavar stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It is a type of kinase inhibitor and a type of antiangiogenesis agent. Also called BAY 43-9006 and sorafenib tosylate.

**Newel**: The central post or wall (newel post - newel wall) around which a staircase is formed. Hence the main supporting posts of a staircase that continue upwards to form the ends of the balustrading.

**Newman projection**: a drawing of a molecule that shows a head-on view of a carbon-carbon bond. The front carbon is represented by a dot, and the rear carbon is represented by a circle. Substituents are shown as spokes radiating from the dot or circle. This projection is used to show the possible interactions of substituents bonded to adjacent carbon atoms.

**Newton, Issac**: developed the universal law of gravity.

**Newtonian fluid**: A fluid whose viscosity doesn't depend on gradients in flow speed. Gases and low-molecular weight liquids are usually Newtonian fluids.

**NEWTONIAN FLUIDS:** Fluids which exhibit constant viscosities independent of the shear rate. Water, glycerin, oil and other small molecule fluids are Newtonian.

**Nexavar :** A drug that blocks acid from being made in the stomach. It is used to treat acid reflux disease and to prevent certain types of gastrointestinal ulcers. Nexium is being studied in the prevention of esophageal cancer and in the treatment of other conditions, including side effects of chemotherapy. It is a type of anti-ulcer agent. Also called esomeprazole and esomeprazole magnesium.

**Nexium :** A rare genetic condition that causes brown spots and tumors on the skin, freckling in skin areas not exposed to the sun, tumors on the nerves, and developmental changes in the nervous system, muscles, bone, and skin. Also called neurofibromatosis type 1.

**Nexrutine:** (Other name for: Phellodendron amurense bark extract)

**next-generation sequencing :** A high-throughput method used to determine a portion of the nucleotide sequence of an individual's genome. This technique utilizes DNA sequencing technologies that are capable of processing multiple DNA sequences in parallel. Also called massively parallel sequencing and NGS.

**NF-kappa B :** A group of proteins that help control many functions in a cell, including cell growth and survival. These proteins also control the body's immune and inflammatory responses. NF-kB may be overactive or found in higher than normal amounts in some types of cancer cells. This may lead to cancer cell growth. High levels or overactivity of NF-kB may also lead to inflammatory disorders, such as asthma and ulcerative colitis, and autoimmune disorders, such as rheumatoid arthritis. Also called NF-kappa B and nuclear factor-kappa B.

**NF-kB:** A tube that is inserted through the nose, down the throat and esophagus, and into the stomach. It can be used to give drugs, liquids, and liquid food, or used to remove substances from the stomach. Giving food through an NG tube is a type of enteral nutrition. Also called gastric feeding tube and nasogastric tube.

**NF1:** A genetic condition in which tumors form on the nerves of the inner ear and cause loss of hearing and balance. Tumors may also occur in the brain and on nerves in the skull and spinal cord, and may cause loss of

speech, eye movement, and the ability to swallow. Also called acoustic neurofibromatosis and neurofibromatosis type 2.

**NF2:** A protein that controls how certain genes are expressed. These genes help protect the cell from damage caused by free radicals (unstable molecules made during normal cell metabolism). Free radicals may play a part in cancer, heart disease, stroke, and other diseases of aging. Also called Nrf2 and nuclear factor (erythroid-derived 2)-like 2.

**NFE2L2:** A group of proteins that help control many functions in a cell, including cell growth and survival. These proteins also control the body's immune and inflammatory responses. NF-kappa B may be overactive or found in higher than normal amounts in some types of cancer cells. This may lead to cancer cell growth. High levels or overactivity of NF-kappa B may also lead to inflammatory disorders, such as asthma and ulcerative colitis, and autoimmune disorders, such as rheumatoid arthritis. Also called NF-kB and nuclear factor-kappa B.

**NG tube :** An amino acid derivative used to counteract high blood pressure caused by interleukin-2.

**NG-monomethyl-L-arginine:** An amino acid derivative with potential antineoplastic activity. NG-monomethyl-L-arginine inhibits the enzyme nitric oxide synthase, resulting in a diminution of nitrous oxide production. This agent may inhibit tumor angiogenesis. Or A form of the amino acid arginine. An amino acid is a protein building block. NG-nitro-L-arginine is being studied in the treatment of cancer and other conditions. In cancer, it may stop the growth of tumor cells by blocking certain proteins needed for tumor cells to grow and by blocking blood flow to the tumor. It is a type of nitric oxide synthase inhibitor and an antiangiogenesis agent. Also called nitroarginine.

**NG-nitro-L-arginine:** An amino acid derivative and nitric oxide synthase (NOS) inhibitor with potential antineoplastic and antiangiogenic activities. Upon administration, NG-nitro-L-arginine inhibits the enzyme nitric oxide synthase, thereby preventing the formation of nitric oxide (NO). By preventing NO generation, the vasodilatory effects of NO are abrogated leading to vasoconstriction, reduction in vascular permeability and an inhibition of angiogenesis. As blood flow to tumors is restricted, this may result in an inhibition of tumor cell proliferation. NO plays an important role in tumor blood flow and stimulation of angiogenesis, tumor

progression, survival, migration and invasiveness. Check for active clinical trials using this agent.

**NG-nitro-L-arginine :** A substance being studied in the treatment of cancer. It is made by linking tumor necrosis factor (TNF) to a peptide. The peptide binds to tumor blood vessels, and TNF damages them. It is a type of biological response modifier. Also called tumor vasculature–targeted tumor necrosis factor alpha.

**NGR-TNF:** Any of a large group of cancers of lymphocytes (white blood cells). NHLs can occur at any age and are often marked by lymph nodes that are larger than normal, fever, and weight loss. There are many different types of NHL. These types can be divided into aggressive (fast-growing) and indolent (slow-growing) types, and they can be formed from either B-cells or T-cells. B-cell NHLs include Burkitt lymphoma, chronic lymphocytic leukemia/small lymphocytic lymphoma (CLL/SLL), diffuse large B-cell lymphoma, follicular lymphoma, immunoblastic large cell lymphoma, precursor B-lymphoblastic lymphoma, and mantle cell lymphoma. T-cell NHLs include mycosis fungoides, anaplastic large cell lymphoma, and precursor T-lymphoblastic lymphoma. Lymphomas that occur after bone marrow or stem cell transplantation are usually B-cell NHLs. Prognosis and treatment depend on the stage and type of disease. Also called non-Hodgkin lymphoma.

**NGS:** A high-throughput method used to determine a portion of the nucleotide sequence of an individual’s genome. This technique utilizes DNA sequencing technologies that are capable of processing multiple DNA sequences in parallel. Also called massively parallel sequencing and next-generation sequencing.

**NHL:** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Niacin helps some enzymes work properly and helps skin, nerves, and the digestive tract stay healthy. Niacin is found in many plant and animal products. It is water-soluble (can dissolve in water) and must be taken in every day. Not enough niacin can cause a disease called pellagra (a condition marked by skin, nerve, and digestive disorders). A form of niacin is being studied in the prevention of skin and other types of cancer. Niacin may help to lower blood cholesterol. Also called nicotinic acid and vitamin B3.

**niacin:** A water-soluble vitamin belonging to the vitamin B family, which occurs in many animal and plant tissues, with antihyperlipidemic activity. Niacin is converted to its active form niacinamide, which is a component of the coenzymes nicotinamide adenine dinucleotide (NAD) and its phosphate form, NADP. These coenzymes play an important role in tissue respiration and in glycogen, lipid, amino acid, protein, and purine metabolism. Although the exact mechanism of action by which niacin lowers cholesterol is not fully understood, it may act by inhibiting the synthesis of very low density lipoproteins (VLDL), inhibiting the release of free fatty acids from adipose tissue, increasing lipoprotein lipase activity, and reducing the hepatic synthesis of VLDL-C and LDL-C. or A form of niacin (vitamin B3) that the body needs in small amounts to function and stay healthy. Niacinamide is found in many plant and animal products and in dietary supplements. It is water-soluble (can dissolve in water) and must be taken in every day. Niacinamide may be used to treat diabetes and certain skin conditions and is being studied in the treatment of some types of cancer. It may increase blood flow to cancer cells and block certain enzymes they need to repair damage to their DNA. This may make cancer cells easier to kill with radiation therapy and chemotherapy. Niacinamide is a type of radiosensitizing agent and a type of chemosensitizing agent. Also called nicotinamide.

**niacinamide:** The active form of vitamin B3 and a component of the coenzyme nicotinamide adenine dinucleotide (NAD). Niacinamide acts as a chemo- and radio-sensitizing agent by enhancing tumor blood flow, thereby reducing tumor hypoxia. This agent also inhibits poly(ADP-ribose) polymerases, enzymes involved in the rejoining of DNA strand breaks induced by radiation or chemotherapy. or A form of niacin (vitamin B3) that the body needs in small amounts to function and stay healthy. Nicotinamide is found in many plant and animal products and in dietary supplements. It is water-soluble (can dissolve in water) and must be taken in every day. Nicotinamide may be used to treat diabetes and certain skin conditions and is being studied in the treatment of some types of cancer. It may increase blood flow to cancer cells and block certain enzymes they need to repair damage to their DNA. This may make cancer cells easier to kill with radiation therapy and chemotherapy. Nicotinamide is a type of radiosensitizing agent and a type of chemosensitizing agent. Also called niacinamide.

**nicardipine:** A synthetic derivative of nitrophenyl-pyridine and potent calcium channel blocker, nicardipine (Nifedipine Family) blocks calcium ions from certain cell walls and inhibits contraction of coronary and peripheral arteries, resulting in lowered oxygen requirements for heart muscle and decreased arterial contraction and spasm. It is used clinically as a cerebral and coronary vasodilator.

**Nickel:** Symbol:"Ni" Atomic Number:"28" Atomic Mass: 58.70amu. This element is one of the transition elements in period four. You can find nickel used in coins, many minerals, desalination plants, and in batteries with cadmium.

**niclosamide:** An orally bioavailable chlorinated salicylanilide, with anthelmintic and potential antineoplastic activity. Upon oral administration, niclosamide specifically induces degradation of the androgen receptor (AR) variant V7 (AR-V7) through the proteasome-mediated pathway. This downregulates the expression of the AR variant, inhibits AR-V7-mediated transcriptional activity, and reduces AR-V7 recruitment to the prostate-specific antigen (PSA) gene promoter. Niclosamide also prevents AR-V7-mediated STAT3 phosphorylation and activation. This inhibits AR/STAT3-mediated signaling and prevents expression of STAT3 target genes. Altogether, this may inhibit growth of AR-V7-overexpressing cancer cells. The AR-V7 variant, which is encoded by contiguous splicing of AR exons 1/2/3/CE3, is upregulated in a variety of cancer cell types, and is associated with both cancer progression and resistance to AR-targeted therapies.

**NicoDerm CQ:** (Other name for: nicotine patch)

**Nicorette:** (Other name for: nicotine gum)

**nicotinamide :** An addictive, poisonous chemical found in tobacco. It can also be made in the laboratory. When it enters the body, nicotine causes an increased heart rate and use of oxygen by the heart, and a sense of well-being and relaxation. It is also used as an insecticide.

**nicotinamide adenine dinucleotide (NAD):** a coenzyme that functions during respiration to produce ATP. OR a coenzyme that functions during photosynthesis to produce ATP.

**Nicotinate:** A vitamin that is a key component of the electron-transfer coenzymes NAD<sup>+</sup>, NADH, NADP<sup>+</sup>, and NADPH. Also called niacine.

**nicotine:** A plant alkaloid, found in the tobacco plant, and addictive central nervous system (CNS) stimulant that causes either ganglionic stimulation in low doses or ganglionic blockage in high doses. Nicotine acts as an agonist at the nicotinic cholinergic receptors in the autonomic ganglia, at neuromuscular junctions, and in the adrenal medulla and the brain. Nicotine's CNS-stimulating activities may be mediated through the release of several neurotransmitters, including acetylcholine, beta-endorphin, dopamine, norepinephrine, serotonin, and ACTH. As a result, peripheral vasoconstriction, tachycardia, and elevated blood pressure may be observed with nicotine intake. This agent may also stimulate the chemoreceptor trigger zone, thereby inducing nausea and vomiting.

**nicotine :** A chewing gum that contains a small dose of nicotine, which enters the blood by being absorbed through the lining of the mouth. This helps stop nicotine cravings and relieves symptoms that occur when a person is trying to quit smoking. A prescription is not needed for nicotine gum.

**nicotine gum:** A chewing gum containing nicotine used as a substitute for the active ingredient in tobacco. Nicotine chewing gum reduces the withdrawal symptoms associated with smoking cessation.

**nicotine gum :** A device used to inhale (breathe in) small doses of nicotine through the mouth. The nicotine is absorbed through the lining of the mouth and lungs and goes into the blood. This helps stop nicotine cravings and relieves symptoms that occur when a person is trying to quit smoking. A prescription is needed for nicotine inhalers.

**nicotine inhaler :** A hard candy-like tablet that contains a small dose of nicotine. The nicotine is absorbed through the lining of the mouth and goes into the blood. This helps stop nicotine cravings and relieves symptoms that occur when a person is trying to quit smoking. A prescription is not needed for nicotine lozenges.

**nicotine lozenge:** A lozenge preparation containing the alkaloid nicotine with nicotine replacement activity. Upon administration of the lozenge, nicotine is released and, although nicotine binds to nicotinic cholinergic receptors at the autonomic ganglia, adrenal medulla and at neuromuscular junctions as well, the binding of nicotine to the receptors in the central nervous system (CNS) appears to be responsible for the addictive nature of nicotine. Binding to CNS nicotinic acetylcholine receptors causes the

release of the neurotransmitter dopamine which appears to be responsible for the addiction of nicotine. Administration of nicotine may prevent nicotine craving and may help with the withdrawal symptoms associated with smoking cessation. or A nose spray that contains a small dose of nicotine, which enters the blood by being absorbed through the lining of the nose. This helps stop nicotine cravings and relieves symptoms that occur when a person is trying to quit smoking. A prescription is needed for nicotine nasal spray.

**nicotine nasal spray:** A method for nicotine replacement. Or A patch that sticks on the skin and contains a small dose of nicotine, which enters the blood by being absorbed through the skin. This helps stop nicotine cravings and relieves symptoms that occur when a person is trying to quit smoking. Nicotine patches are available with and without a prescription.

**nicotine patch:** A transepidermal patch designed to deliver nicotine, the addictive substance contained in cigarettes, directly through the skin and into the blood stream. Used for cessation of or A type of treatment that uses special products to give small, steady doses of nicotine to help stop cravings and relieve symptoms that occur when a person is trying to quit smoking. These products include nicotine gum, nicotine inhaler, nicotine nasal spray, nicotine lozenges, and nicotine patch, and some are available without a prescription. They do not contain any of the other chemicals found in tobacco products.

**nicotine replacement therapy :** A substance being studied to see if it can help people quit smoking or keep them from starting again. It may stimulate the body's immune system to make antibodies against nicotine. These antibodies may help keep nicotine from reaching the brain, which can help reduce a person's craving for nicotine.

**nicotine vaccine :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Nicotinic acid helps some enzymes work properly and helps skin, nerves, and the digestive tract stay healthy. Nicotinic acid is found in many plant and animal products. It is water-soluble (can dissolve in water) and must be taken in every day. Not enough nicotinic acid can cause a disease called pellagra (a condition marked by skin, nerve, and digestive disorders). A form of nicotinic acid is being studied in the prevention of skin and other types of cancer. Nicotinic

acid may help to lower blood cholesterol. Also called niacin and vitamin B3.

**nicotinic acid** : A drug used to treat prostate cancer that has spread to other parts of the body. It is used in patients who have had surgery to remove the testicles (orchiectomy). Nilandron binds to proteins called androgen receptors, which are found in some prostate cancer cells, and keeps androgens (male hormones) from binding to the receptors. This blocks the ability of androgens to cause prostate cancer cells to grow. Nilandron is a type of antiandrogen. Also called nilutamide.

**Nicotrol NS**: (Other name for: nicotine nasal spray)

**NicVax**: (Other name for: 3'-aminomethyl nicotine-P. aeruginosa r-exoprotein A conjugate vaccine)

**Niferex**: (Other name for: iron)

**nifurtimox**: A nitrofurantoin derivative with antiprotozoal and potential antineoplastic activities. Nifurtimox is reduced by cytosol enzymes or flavin-containing microsomal enzymes to a highly reactive nitro anion free radical; autooxidation of the nitro anion free radical generates cytotoxic superoxide anion ( $O_2^-$ ). In addition, nifurtimox-derived nitro anion free radicals may alkylate macromolecules such as nucleic acids and proteins, resulting in the disruption of their structure and function.

**Nigerian**: Pertaining to Nigeria, one of the major crude oil producers of Africa. If history had turned out rather differently, we would be referring to "Biafran Crude".

**NIH**: A drug used to treat certain types of chronic myelogenous leukemia (CML). It is used in some newly diagnosed patients. It is also used in patients who have not gotten better after treatment with other anticancer drugs or who are not able to take imatinib mesylate. It is also being studied in the treatment of other types of cancer. Nilotinib blocks a protein called BCR-ABL, which may help keep cancer cells from growing. It is a type of tyrosine kinase inhibitor. Also called Tasigna.

**NikolskiEisenman equation** : an extension of the Nernst equation which relates the sensor potential to the activity of all the contributing ions in the sample, including any interfering ions. It is the same as the Nernst equation but with  $\log A$  replaced by  $\log [ax + K_{x,y}(a_y)^{z_x/z_y} + K_{x,z}(a_z)^{z_x/z_z} \dots \text{etc.}]$  (where:  $K_{x,y}$  = selectivity coefficient for ion y of an

electrode sensitive to primary ion x;  $K_{x,z}$  = selectivity coefficient for ion z of an electrode sensitive to primary ion x;  $a_x$  = activity of primary ion x;  $a_y$  and  $a_z$  = activities of interfering ions y and z;  $Z_x$  = an integer with sign and magnitude corresponding to the charge on the primary ion x;  $Z_y$  and  $Z_z$  = integer with same sign as  $Z_x$  but magnitude = charge on interfering ions y and z).

**Nilandron** : Belongs to a family of drugs called calcium channel blockers. It is being investigated for use with anticancer drugs to prevent or overcome drug resistance and improve response to chemotherapy.

**nilotinib**: An orally bioavailable aminopyrimidine-derivative Bcr-Abl tyrosine kinase inhibitor with antineoplastic activity. Designed to overcome imatinib resistance, nilotinib binds to and stabilizes the inactive conformation of the kinase domain of the Abl protein of the Bcr-Abl fusion protein, resulting in the inhibition of the Bcr-Abl-mediated proliferation of Philadelphia chromosome-positive (Ph<sup>+</sup>) chronic myeloid leukemia (CML) cells. This agent also inhibits the receptor tyrosine kinases platelet-derived growth factor receptor (PDGF-R) and c-kit, a receptor tyrosine kinase mutated and constitutively activated in most gastrointestinal stromal tumors (GISTs). With a binding mode that is energetically more favorable than that of imatinib, nilotinib has been shown to have an approximately 20-fold increased potency in kinase and proliferation assays compared to imatinib. Check for active clinical trials using this agent. or A substance being studied in the treatment of some types of cancer. Nimotuzumab binds to a protein called epidermal growth factor receptor (EGFR), which is found on some normal cells and some types of cancer cells. Blocking this protein may help keep cancer cells from growing. Nimotuzumab is a type of monoclonal antibody. Also called Theraloc.

**nilutamide**: A synthetic, nonsteroidal agent with antiandrogenic properties. Nilutamide preferentially binds to androgen receptors and blocks androgen receptor activation by testosterone and other androgens; this agent may inhibit androgen-dependent growth of normal and neoplastic prostate cells. or A substance that has been studied in the treatment of some types of cancer. Nimustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea.

**Nimbex**: (Other name for: cisatracurium besylate)

**NIMBY:** Acronym for Not In My Back Yard. An expression describing the response from members of a community who disapprove of proposed sites for solid waste disposal. A milder form of NOPE (Not On Planet Earth).

**nimodipine:** A dihydropyridine derivative and an analogue of the calcium channel blocker nifedipine, with antihypertensive activity. Nimodipine inhibits the transmembrane influx of calcium ions in response to depolarization in smooth muscle cells, thereby inhibiting vascular smooth muscle contraction and inducing vasodilatation. Nimodipine has a greater effect on cerebral arteries than on peripheral smooth muscle cells and myocardial cells, probably because this agent can cross the blood brain barrier due to its lipophilic nature. Furthermore, this agent also inhibits the drug efflux pump P-glycoprotein, which is overexpressed in some multi-drug resistant tumors, and may improve the efficacy of some antineoplastic agents. or A drug used with lenalidomide and dexamethasone to treat multiple myeloma. It is used in patients who received at least one other anticancer treatment. It is also being studied in the treatment of other types of cancer. Ninlaro blocks enzymes called proteasomes, which may help keep cancer cells from growing and may kill them. It is a type of proteasome inhibitor. Also called ixazomib citrate.

**Nimotop:** (Other name for: nimodipine)

**nimotuzumab:** A humanized monoclonal antibody directed against the epidermal growth factor receptor (EGFR) with potential antineoplastic activity. Nimotuzumab binds to and inhibits EGFR, resulting in growth inhibition of tumor cells that overexpress EGFR. This agent may act synergistically with radiation therapy.

**nimotuzumab :** The active ingredient in a drug that is used to treat hairy cell leukemia and is being studied in the treatment of other types of cancer. Nipent blocks a protein needed for cell growth and may kill cancer cells. It is made by a bacterium. It is a type of adenosine deaminase inhibitor. Also called pentostatin.

**nimustine:** A nitrosourea with antineoplastic activity. Nimustine alkylates and crosslinks DNA, thereby causing DNA fragmentation, inhibition of protein synthesis, and cell death. Or In anatomy, the small raised area in the center of the breast through which milk can flow to the outside.

**ninhydrin reaction:** A color reaction given by amino acids and peptides on heating with ninhydrin; widely used for their detection and estimation.

**Ninlaro:** (Other name for: ixazomib citrate) or Fluid that is not milk coming from the nipple.

**nintedanib:** An orally bioavailable, indolinone-derived, receptor tyrosine kinase (RTK) inhibitor with potential antiangiogenic and antineoplastic activities. Multitargeted tyrosine kinase inhibitor BIBF 1120 selectively binds to and inhibits vascular endothelial growth factor receptor (VEGFR), fibroblast growth factor receptor (FGFR) and platelet-derived growth factor receptor (PDGFR) tyrosine kinases, which may result in the induction of endothelial cell apoptosis; a reduction in tumor vasculature; and the inhibition of tumor cell proliferation and migration. In addition, this agent also inhibits members of the Src family of tyrosine kinases, including Src, Lck, Lyn, and FLT-3 (fms-like tyrosine kinase 3). VEGFR, FGFR and PDGFR RTKs play key roles in tumor angiogenesis. Check for active clinical trials using this agent.

**Niobium:** Symbol:"Nb" Atomic Number:"41" Atomic Mass: 92.91amu. Niobium is one of the transition elements. This ductile metal (when pure) is found in many minerals. It actually turns blue when in the air and is used in spacecraft and superconducting magnets.

**NIP ROLLS:** In film blowing, a pair of rolls situated at the top of the tower which close the blown film envelope, seal air inside of it, and regulate the rate at which the film is pulled away from the extrusion die. One roll is usually covered with a resilient material, the other being bare metal.

**Nipent :** A toxic, corrosive, colorless liquid used to make fertilizers, dyes, explosives, and other chemicals.

**nipple :** A substance being studied in the prevention of colorectal cancer. It is a form of aspirin that gives off nitric oxide gas and is less irritating to the lining of the stomach than plain aspirin. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called NCX 4016.

**nipple discharge :** A form of the amino acid arginine. An amino acid is a protein building block. Nitroarginine is being studied in the treatment of cancer and other conditions. In cancer, it may stop the growth of tumor cells by blocking certain proteins needed for tumor cells to grow and by blocking blood flow to the tumor. It is a type of nitric oxide synthase inhibitor and an antiangiogenesis agent. Also called NG-nitro-L-arginine.

**niraparib:** An inhibitor of poly (ADP-ribose) polymerase (PARP) with potential antineoplastic activity. PARP Inhibitor MK4827 inhibits PARP activity, enhancing the accumulation of DNA strand breaks and promoting genomic instability and apoptosis. The PARP family of proteins detect and repair single strand DNA breaks by the base-excision repair (BER) pathway. The specific PARP family member target for PARP inhibitor MK4827 is unknown. Check for active clinical trials using this agent.

**Nitrogen oxides** : When nitrogen enters the cylinders of a car engine, it can be burned to form a variety of oxides. Rather than deal with all the different ones individually, it is useful to discuss them together as "nitrogen oxides". They are sometimes written as NO<sub>x</sub>. They are removed from the exhaust gases of a car by using a catalytic converter.

**nitazoxanide:** A synthetic benzamide with antiprotozoal activity. Nitazoxanide exerts its antiprotozoal activity by interfering with the pyruvate ferredoxin/ferredoxin oxidoreductase dependent electron transfer reaction, which is essential to anaerobic energy metabolism. PFOR enzyme reduces nitazoxanide, thereby impairing the energy metabolism. However, interference with the PFOR enzyme-dependent electron transfer reaction may not be the only pathway by which nitazoxanide exhibits antiprotozoal activity. Nitazoxanide is active against *Giardia lamblia* and *Cryptosporidium parvum*.

**nitrate<sup>3-</sup>:** 1. The NO<sub>3</sub><sup>-</sup> ion, formed by reaction of nitric acid with a base. 2. A compound containing the NO<sub>3</sub><sup>-</sup> ion, for example ammonium nitrate, NH<sub>4</sub>NO<sub>3</sub>.

**nitric acid** : An alkaloid drug belonging to a class of anticancer agents called topoisomerase inhibitors.

**nitric acid<sup>3</sup>:** A corrosive liquid with a sharp odor that acts as a strong acid when dissolved in water. Nitric acid is used to synthesize ammonium nitrate for fertilizers, and is also used in the manufacture of explosives, dyes, and pharmaceuticals. Salts of nitric acid are called nitrates.

**nitric oxide-releasing acetylsalicylic acid derivative:** A nitric oxide (NO) donating derivative of acetylsalicylic acid with anti-inflammatory, analgesic, antipyretic, antithrombotic, gastroprotective and potential antitumor activities. The acetylsalicylic acid derivative moiety of this agent inhibits the activities of cyclooxygenase (COX) I and II, preventing the formation of prostaglandins and thromboxanes. A reduction in

prostaglandin synthesis accounts for this agent's anti-inflammatory, anti-pyretic and analgesic activities; a reduction in thromboxane A<sub>2</sub> synthesis results in an irreversible inhibition of platelet aggregation. NO donation by this agent, after cleavage from the acetylsalicylic acid derivative in vivo, may protect the gastric mucosa against the damaging effects of the aspirin derivative by modulating prostaglandins. In tumor cells, the NO donating moiety may block the cell cycle in the G<sub>1</sub> and G<sub>2</sub> phases and may induce apoptosis through caspase-mediated mechanisms.

**nitric oxide-releasing acetylsalicylic acid derivative :** In medicine, a substance used as a drug to treat certain heart conditions and to widen the openings in blood vessels. Nitroglycerin is being studied as a way to help chemotherapy work better by making tumor cells more sensitive to the drugs. It is a type of vasodilator.

**nitrification:** the conversion of nitrogenous matter or free nitrogen into nitrates and ammonia by bacteria.

**Nitrile:** A carbon compound containing a carbon-nitrogen triple bond. An example is acetonitrile, a common organic solvent: OR Or Buna-N, The most commonly used elastomer for O-Rings because of its resistance to petroleum fluids, its good physical properties, and its useful temperature range

**nitrite<sup>2-</sup>:** 1. The NO<sub>2</sub><sup>-</sup> ion, formed by reaction of nitrous acid with a base.  
2. A compound containing the NO<sub>2</sub><sup>-</sup> ion.

**Nitro:** The -NO<sub>2</sub> functional group. You may have heard of trinitrotoluene (TNT) - here's a picture:

**nitroarginine :** A type of chemical found in tobacco products and tobacco smoke. Nitrosamines are also found in many foods, including fish, beer, fried foods, and meats. Some nitrosamines cause cancer in laboratory animals and may increase the risk of certain types of cancer in humans.

**Nitrobenzene:** Nitrobenzene is an aromatic derivative produced by nitration of benzene with nitric acid in the presence of sulfuric acid. Almost all nitrobenzene is converted to aniline by hydrogenation.

**nitrocamptothecin :** An anticancer drug that can cross the blood-brain barrier. Carmustine and lomustine are nitrosoureas.

**Nitrogen:** Symbol:"N" Atomic Number:"7" Atomic Mass: 14.00amu. Nitrogen is found as a gas in nature and it is classified as a non-metal. It

makes up over 75 percent of the air surrounding the Earth. It is also found in the soil and used by plants. You will also find nitrogen in ammonia, steel making, freezing liquids, and oil refineries. OR Element number 7, a colorless, odorless, tasteless gas that makes up about 80% of the earth's atmosphere.

**Nitrogen cycle:** The passage of nitrogen through various valence states, as the result of reactions carried out by a wide variety of different organisms. OR The cycling of various forms of biologically available nitrogen through the plant, animal, and microbial worlds, and through the atmosphere and geosphere.

**Nitrogen fixation:** Conversion of atmospheric nitrogen into a form that can be converted by biochemical reactions to an organic form. This reaction is carried out by a very limited number of microorganisms. OR The conversion of diatomic nitrogen into ammonia; the first step in the flow of nitrogen into amino acids, nucleotides, and other nitrogen-containing compounds in organisms. OR Conversion of atmospheric nitrogen ( $N_2$ ) into a reduced, biologically available form by nitrogen-fixing organisms.

**nitrogenase:** An enzyme system that catalyzes the reaction of molecular nitrogen ( $N_2$ ) to ammonia ( $NH_3$ ).

**Nitrogenase complex:** An enzyme complex that catalyzes the reduction of diatomic nitrogen to ammonia; found in bacteria and the blue-green algae. OR A system of enzymes capable of reducing atmospheric nitrogen to ammonia in the presence of ATP.

**nitrogenous base:** the nitrous molecules that make up DNA (and RNA) molecules; two major types are purines and pyrimidines. OR An aromatic nitrogen-containing molecule with basic properties. Such bases include purines and pyrimidines.

**nitroglycerin:** An organic nitrate with vasodilator activity. Nitroglycerin is converted into nitric oxide (NO) in smooth muscle and activates guanylyl cyclase, thereby increasing cGMP concentration, and resulting in smooth muscle relaxation. Dilatation of the veins results in decreased venous return to the heart, thereby decreasing left ventricular volume (reduced preload) and decreasing myocardial oxygen requirements. Arteriolar relaxation reduces arteriolar resistance (reduced afterload), thereby decreasing myocardial oxygen demands. In addition, nitroglycerin causes coronary artery dilatation, thereby improving myocardial blood distribution.

**nitroglycerin :** A drug used to treat classical Hodgkin lymphoma that has gotten worse after treatment with an autologous stem cell transplant and brentuximab vedotin (a type of anticancer drug). It is also used alone or with other drugs to treat certain types of melanoma, non-small cell lung cancer, and renal cell carcinoma (a type of kidney cancer). It is also being studied in the treatment of other types of cancer. Nivolumab binds to a protein called PD-1, which is found on T cells (a type of white blood cell). Nivolumab may block PD-1 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called Opdivo.

**nitroglycerin transdermal patch:** A sustained-release transdermal patch containing the organic nitrate nitroglycerin, with vasodilator and potential immunomodulating activities. Upon application to the skin, nitroglycerin is continuously released from the patch and absorbed. In turn, nitroglycerin is converted into nitric oxide (NO), which activates guanylyl cyclase, increasing cyclic guanosine monophosphate concentration thus resulting in smooth muscle relaxation. In addition, activation of NO-mediated signaling pathways may inhibit hypoxia-induced tumor cell invasiveness, chemoresistance, evasion of immune cell recognition and cancer cell progression. Particularly, reactivation of NO-mediated signaling appears to inhibit the increased tumor cell shedding of the major histocompatibility complex class I chain-related (MIC) molecules MICA and MICB as is seen in hypoxic tumor environments; MIC molecules play key roles in tumor cell immune surveillance through their interaction with the C-type lectin-like NKG2D receptor on natural killer, lymphokine-activated killer and effector T cells.

**nitroglycerin/sodium citrate/ethanol solution:** An antimicrobial lock solution (ALS) containing the nitrate nitroglycerin, sodium citrate and ethanol, with potential antimicrobial and anticoagulant activities. Upon application to the catheter as an ALS, the nitroglycerin is converted into nitric oxide (NO), which exerts antimicrobial activity. The citrate exerts anticoagulant activity, thereby preventing blood clotting and occlusion and maintaining the fluidity of the administered solution. In addition, both citrate and ethanol exert antimicrobial activity. This may prevent bacterial colonization on the surface of the catheter, biofilm formation, and catheter-associated infections.

**nitrosamine :** A type of immune cell that has granules (small particles) with enzymes that can kill tumor cells or cells infected with a virus. An NK cell is a type of white blood cell. Also called natural killer cell and NK-LGL.

**nitrosamines:** A group of organic compounds with the basic structure NNO, some of which are powerful cancer-causing chemicals.

**nitrosourea :** A type of immune cell that has granules (small particles) with enzymes that can kill tumor cells or cells infected with a virus. An NK-LGL is a type of white blood cell. Also called natural killer cell and NK cell.

**nivolumab:** A fully human immunoglobulin (Ig) G4 monoclonal antibody directed against the negative immunoregulatory human cell surface receptor programmed death-1 (PD-1, PCD-1,) with immune checkpoint inhibitory and antineoplastic activities. Nivolumab binds to and blocks the activation of PD-1, an Ig superfamily transmembrane protein, by its ligands programmed cell death ligand 1 (PD-L1), overexpressed on certain cancer cells, and programmed cell death ligand 2 (PD-L2), which is primarily expressed on APCs. This results in the activation of T-cells and cell-mediated immune responses against tumor cells or pathogens. Activated PD-1 negatively regulates T-cell activation and plays a key role in tumor evasion from host immunity. or A type of leukemia in which large natural killer (NK) cells (a type of white blood cell) that contain granules (small particles) are found in the blood. It is a chronic disease that may last for a long time and get worse. Also called natural killer-cell large granular lymphocyte leukemia and NK-LGLL.

**Nizoral:** (Other name for: ketoconazole)

**NK cell :** A type of leukemia in which large natural killer (NK) cells (a type of white blood cell) that contain granules (small particles) are found in the blood. It is a chronic disease that may last for a long time and get worse. Also called natural killer-cell large granular lymphocyte leukemia and NK-LGL leukemia.

**NK-LGL:** A rare type of Hodgkin lymphoma (a cancer of the immune system). It is marked by the presence of lymphocyte-predominant cells, which used to be called popcorn cells. These cells are different from the typical Reed-Sternberg cells found in classical Hodgkin lymphoma. NLPHL may change into diffuse large B-cell lymphoma. Also called

LPHL, lymphocyte-predominant Hodgkin lymphoma, and nodular lymphocyte-predominant Hodgkin lymphoma.

**NK-LGL leukemia :** A lung cancer screening trial sponsored by the National Cancer Institute (NCI). In the trial, low-dose spiral CT scans were compared with chest x-rays for their ability to detect lung cancer early. The trial included more than 50,000 participants who were aged 55 to 74 years, were current or former heavy smokers, and had no signs or symptoms of lung cancer. The results of the trial showed that participants who were screened with spiral CT scans had about a 20% lower risk of dying from lung cancer than those who were screened with chest x-rays. Also called National Lung Screening Trial.

**NK-LGLL:** The amount of a substance equal to a billionth of a mole (a measure of the amount of a substance). Also called nanomole.

**NLPHL:** A procedure in which small electric impulses are used to stimulate muscles that are weak or paralyzed. It helps to increase muscle strength, blood circulation, and range of motion and to lessen muscle spasms. Also called NES, neuromuscular electrical stimulation, and therapeutic (subthreshold) electrical stimulation.

**NLST:** A protein found inside the nucleus of a cell. It is involved in making DNA, RNA, and proteins. It also helps control how certain genes are expressed (turned on) in a cell. NMP22 may be found in higher than normal amounts in the urine of patients with some types of cancer, including bladder cancer. Measuring the amount of NMP22 in the urine may help diagnose cancer or find out how well treatment is working. It is a type of tumor marker. Also called nuclear matrix protein 22.

**nm:** An abbreviation for nanometers. A nanometer is equal to  $10^{-9}$  meters.

**nM :** A procedure in which radio waves and a powerful magnet linked to a computer are used to create detailed pictures of areas inside the body. These pictures can show the difference between normal and diseased tissue.

NMRI makes better images of organs and soft tissue than other scanning techniques, such as computed tomography (CT) or x-ray. NMRI is especially useful for imaging the brain, the spine, the soft tissue of joints, and the inside of bones. Also called magnetic resonance imaging, MRI, and nuclear magnetic resonance imaging.

**NM-3:** An orally bioavailable antiangiogenic isocoumarin with potential antineoplastic activity. NM-3 inhibits vascular endothelial growth factor

(VEGF), a pro-angiogenic growth factor, thereby inhibiting endothelial cell proliferation. This agent also induces apoptosis by a mechanism involving reactive oxygen species.

**NMES:** A life-threatening condition that may be caused by certain drugs used to treat mental illness, nausea, or vomiting. Symptoms include high fever, sweating, unstable blood pressure, confusion, and stiffness. Also called neuroleptic malignant syndrome.

**NMP22:** Cancer that has not spread to the lymph nodes.

**NMRI:** Cancer that has spread to the lymph nodes.

**NMS:** A rare type of Hodgkin lymphoma (a cancer of the immune system). It is marked by the presence of lymphocyte-predominant cells, which used to be called popcorn cells. These cells are different from the typical Reed-Sternberg cells found in classical Hodgkin lymphoma. Nodular lymphocyte-predominant Hodgkin lymphoma may change into diffuse large B-cell lymphoma. Also called LPHL, lymphocyte-predominant Hodgkin lymphoma, and NLPHL.

**NO:** Natural orbital.

**no acceptable daily intake allocated:** This expression is applicable to substances for which the available information is not sufficient to establish their safety or when the specifications for identity and purity are not adequate. The fact that an ADI for an additive was not established should not be interpreted as casting doubt on its safety nor should it be considered for its withdrawal for use (Vettorazzi, 1980).

**No Flow Temperature:** No flow temperature is the temperature at which the viscosity of the melt is so high that it effectively can not be made to flow.

**no-observed-adverse-effect-level (NOEL):** The greatest concentration or amount of a chemical, found by experiment or observation, that causes no detectable adverse alteration of morphology, functional capacity, growth, development, or life span of the target (WHO, 1979).

**Nobelium:** Symbol:"No" Atomic Number:"102" Atomic Mass: (259)amu. Nobelium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element.

**Noble Gas:** The Noble Gases are the all of the elements in the furthest right column of the periodic table. They all have filled outer shells and are

very non-reactive. OR A gaseous chemical element that does not readily enter into chemical combination with other elements. An inert gas. Examples are helium, argon, krypton, xenon, and radon.

**noble gas core:** All completely filled shells underneath the valence shell.

**Noble Gas Elements:** Elements in the periodic table whose outermost shells are filled with electrons (8). Helium, neon, and argon are examples of noble gas elements. They are very non-reactive.

**noble gases:** The noble gases are the elements in Group 0 (sometimes called Group 8) in the Periodic Table helium, neon, argon, krypton, xenon, and radon. OR the column of elements from helium to radon; also called inert gases.

**Nociceptor:** A specialized neuron that transmits signals to pain-processing centers of the spinal cord and brain in response to the onset of tissue damage.

**node:** a region of zero electron density in an orbital; a point of zero amplitude in a wave.

**node:** A point, region, or surface where the amplitude of a standing wave is zero. The probability of finding an electron at an orbital node is zero.

**node-negative :** A small mass of tissue within a gland or organ that carries out the specialized functions of the gland or organ.

**node-positive :** A growth or lump that may be malignant (cancer) or benign (not cancer).

**nodular lymphocyte-predominant Hodgkin lymphoma :** A substance that is being studied in the treatment of liver cancer. It belongs to the family of drugs called thymidylate synthase inhibitors. Also called AG337 and Thymitaq.

**nodular parenchyma :** A mathematical device or model that shows relationships between things. For example, a nomogram of height and weight measurements can be used to find the surface area of a person, without doing the math, to determine the right dose of chemotherapy. Nomograms of patient and disease characteristics can help predict the outcome of some kinds of cancer.

**nodule :** A vaccine that works by stimulating an immune response against nine different antigens, such as nine different viruses or other microorganisms. For example, Gardasil 9 is a nonavalent vaccine that helps

protect the body against infection with nine different types of human papillomaviruses (HPV).

**Noise:** abrupt, random, small changes in displayed sensor signal (in electrode, usually due to the pickup of strong static charges). Noise may be caused by air bubbles, poor conductors, or high electrical resistance somewhere in the circuit.

**Noise reduction:** The absorption of sound vibrations. Fluoropolymer coatings form good noise dampening surfaces.

**nolatrexed :** Describes a clinical trial or other experiment in which the researchers know what treatments are being given to each study subject or experimental group. If human subjects are involved, they know what treatments they are receiving.

**nolatrexed dihydrochloride:** The dihydrochloride salt of nolatrexed, a water-soluble lipophilic quinazoline folate analog with antineoplastic activity. Nolatrexed occupies the folate binding site of thymidylate synthase, resulting in inhibition of thymidylate synthase activity and thymine nucleotide synthesis with subsequent inhibition of DNA replication, DNA damage, S-phase cell cycle arrest, and caspase-dependent apoptosis. This agent also exhibits radiosensitizing activity.

**nomenclature:** The systematic naming of chemical compounds. OR A system for naming things. For example, "organic nomenclature" is the system used to name organic compounds.

**Nominal Dimension:** The mean dimension of a liquid silicone injection molded article, from which small dimensional (plus and minus) deviations are allowed as manufacturing tolerances

**nomogram :** A clinical study that includes some, but not all, of the eligible patients identified by the researchers during the study registration period. This type of study does not usually have a control group.

**Non Toxic:** not poisonous.

**non-adjuvanted A(H1N1) influenza vaccine:** A monovalent vaccine containing hemagglutinin (HA) of influenza A (H1N1)-like virus with potential immunomodulating activity. Upon administration, non-adjuvanted A(H1N1) influenza vaccine may stimulate the immune system to mount an antibody response against H1N1.

**Non-bonded interaction:** A through-space interaction of atoms that are typically electrostatic or van der Waals in nature.

**Non-covalent attractive force:** See Non-covalent interaction.

**Non-covalent interactions:** The van der Waals forces between multipoles in molecules that are responsible for many phenomena including cohesion of most solids, surface tension, friction, changes of phase, viscosity, the Joule-Thomson effect, and causing deviations in the ideal gas law.

**non-electrolyte:** A substance that dissolves in water to form a solution that is non-conducting.

**Non-fill:** An unintentional void or absence of material in the liquid silicone rubber part

**Non-Fill (also known as Short Shot):** Failure to completely fill the mold or cavities of the mold. Edges may appear melted.

**Non-Governmental Organizations (NGOs):** A voluntary association of individuals or organizations for regional or international action against a certain cause or activity. As it relates to sustainability, many environmental NGO organizations are focused on the protection of biodiversity.

**non-Hodgkin lymphoma :** (non-I-uh-NY-zing RAY-dee-AY-shun)

**non-ionic surfactants:** a general family of surfactants so called because in solution the entire molecule remains associated. Non-ionic molecules orient themselves at surfaces not by an electrical charge, but through separate grease-solubilizing and water-soluble groups within the molecule.

**non-ionizing radiation :** Not cancerous. Nonmalignant tumors may grow larger but do not spread to other parts of the body. Also called benign.

**Non-metals:** Although this sounds like it ought to be everything that is not a metal, it really means the elements that are not metals. The non-metals are usually dull, have low melting and boiling points and do not conduct electricity There are some exceptions though like the graphite form of carbon which can conduct electricit

**non-Newtonian fluid:** A fluid whose viscosity changes when the gradient in flow speed changes. Colloidal suspensions and polymer solutions like ketchup and starch/water paste are non-Newtonian fluids.

**NON-NEWTONIAN FLUIDS:** Fluids having viscosities that depend on the shear rate. Polymer solutions and melts are non-Newtonian fluids. They

also exhibit other non-Newtonian properties such as stress relaxation and normal stresses.

**Non-reactive:** This is the opposite of reactive. Non-reactive elements do not easily combine with the other elements. Helium, neon, and argon are examples of very non-reactive elements.

**Non-Return Valve:** Screw tip that allows for material to flow in one direction and closes to prevent back flow and inject material into the mold (check valve). OR A mechanism mounted in (or at) the nozzle of the injection machine, which operates to shut off injection flow at the end of the injection cycle. This eliminates material from the upcoming shot from drooling out of the nozzle when the mold opens to eject parts from the previous shot.

**non-small cell lung cancer :** A substance that affects the immune system in a general way and may help the body fight cancer, infection, or other diseases. Nonspecific immunomodulating agents include BCG and levamisole.

**non-small cell lung cancer mRNA-derived vaccine CV9201:** A non-small cell lung cancer (NSCLC) vaccine containing modified mRNAs encoding cancer-testis antigen NY-ESO-1, melanoma-associated antigens C1 (MAGE-C1/CT7) and C2 (MAGE-C2/CT10), survivin, and the oncofetal antigen 5T4 with potential antitumor and immunomodulatory activities. Upon subcutaneous administration, non-small cell lung cancer mRNA-derived vaccine CV9201 may stimulate the immune system to mount a cytotoxic, antigen-specific T lymphocyte response (CTL) against NSCLC cells. The modified mRNAs in this vaccine are taken up by cells after injection and exhibit enhanced translational potency. The five tumor-associated antigens (TAAs) encoded by these mRNAs are frequently expressed by NSCLC cells.

**Non-stochastic effect:** The health effects of radiation, the severity of which vary with the dose and for which a threshold is believed to exist. Radiation-induced cataract formation is an example of a non-stochastic effect (also called a deterministic effect) (see 10 CFR 20.1003).

**Non-stoichiometric hydrate (or solvate):** A solvated crystal structure in which the solvent molecules are not in well-defined positions and therefore are present in variable amounts, depending on the vapor pressure of the

solvent in the system, (i.e., the relative humidity in the case of crystal hydrates).

**Non-vital plant systems:** Systems at a nuclear facility that may or may not be necessary for the operation of the facility (i.e., power production) but that would have little or no effect on public health and safety should they fail. These systems are not safety related.

**nonagon:** a plane closed figure with nine sides and nine angles

**nonavalent vaccine :** Lymphoma in which the lymph nodes containing cancer are not next to each other, but are on the same side of the diaphragm (the thin muscle below the lungs that helps breathing and separates the chest from the abdomen).

**nonbenzenoid aromatic ring:** an aromatic ring system that does not contain a benzene ring.

**nonblinded :** A tumor that is found in endocrine tissue but does not make extra hormones. Nonfunctioning tumors usually do not cause symptoms until they grow large or spread to other parts of the body. Also called endocrine-inactive tumor.

**nonbonding electrons:** valence electrons that are not used for covalent bond formation.

**noncarrier :** An individual who does not carry a mutation previously identified in his or her family.

**Nonclaret disjunctional (ncd):** A member of the kinesin family of proteins that, in contrast with most family members, moves toward the negatively charged end of microtubules.

**Noncompetitive inhibition:** The reduction in the rate of enzyme activity observed when an enzyme can bind its substrate and its inhibitor simultaneously. Noncompetitive inhibitors decrease the turnover number for an enzyme but do not diminish the proportion of enzyme molecules bound to the substrate; their effects are not overcome by increasing substrate concentration. OR A type of enzyme inhibition not reversed by increasing the substrate concentration.

**Noncompetitive inhibitor:** An inhibitor of enzyme activity whose effect is not reversed by increasing the concentration of substrate molecule.

**nonconformity:** the erosional contact that separates a younger sedimentary rock unit from a plutonic or metamorphic rock unit.

**nonconsecutive case series :** Cancer that does not begin in the blood or bone marrow.

**noncontiguous lymphoma :** In medicine, describes a characteristic or trait that cannot be passed from a parent to a child through the genes.

Nonheritable forms of cancer may occur when there is a mutation (change) in the DNA in any of the cells of the body, except the germ cells (sperm and egg). People who have a nonheritable form of cancer do not have a family history of that cancer or an inherited change in their DNA that would increase their risk for that cancer.

**noncyclic electron flow:** The light-induced flow of electrons from water to NADP<sup>+</sup> in oxygen-evolving photosynthesis; it involves both photosystems I and II.

**nondynamic correlation:** Also called "static" correlation. The part of the correlation that is ascribed to the "multireference" nature of the problem at hand, i.e., to the qualitative failure of Hartree-Fock theory to describe the system. The best-known stable molecule with important nondynamic correlation is singlet methylene, CH<sub>2</sub> (  $\diamond$  1A<sub>1</sub>), for which two configurations are important: (a<sub>1</sub>)<sup>2</sup>(b<sub>1</sub>)<sup>0</sup> and (a<sub>1</sub>)<sup>0</sup>(b<sub>1</sub>)<sup>2</sup>. In many cases, the distinction between nondynamic and dynamic correlation is rather arbitrary. When nondynamic correlation is important, single-reference theories may be unreliable.

**Nonelectrolyte:** This is a solute that cannot conduct electricity when dissolved in the solvent (water). Water alone cannot conduct electricity well. Sugar is a good example of a nonelectrolyte substance that, when added to water, does not change the solution's ability to conduct electricity. Salt is a good electrolyte. OR A nonelectrolyte is a substance which does not ionize in solution.

**Nonessential amino acids:** Amino acids that can be synthesized by an organism and are thus not a dietary requirement.

**nonessential amino acids:** Amino acids that can be made by humans and other vertebrates from simpler precursors, and are thus not required in the diet.

**nonflowing artesian well:** a well in which water from the tapped aquifer must be pumped to the surface.

**nonfunctioning tumor :** Any of a large group of cancers of lymphocytes (white blood cells). Non-Hodgkin lymphomas can occur at any age and are often marked by lymph nodes that are larger than normal, fever, and weight loss. There are many different types of non-Hodgkin lymphoma. These types can be divided into aggressive (fast-growing) and indolent (slow-growing) types, and they can be formed from either B-cells or T-cells. B-cell non-Hodgkin lymphomas include Burkitt lymphoma, chronic lymphocytic leukemia/small lymphocytic lymphoma (CLL/SLL), diffuse large B-cell lymphoma, follicular lymphoma, immunoblastic large cell lymphoma, precursor B-lymphoblastic lymphoma, and mantle cell lymphoma. T-cell non-Hodgkin lymphomas include mycosis fungoides, anaplastic large cell lymphoma, and precursor T-lymphoblastic lymphoma. Lymphomas that occur after bone marrow or stem cell transplantation are usually B-cell non-Hodgkin lymphomas. Prognosis and treatment depend on the stage and type of disease. Also called NHL.

**nonhematologic cancer :** *Morinda citrifolia*. A tropical shrub. An extract from the fruit is being studied as a treatment for cancer, and extracts from the fruit, leaves, or roots have been used in some cultures to treat other diseases. Also called *Morinda citrifolia*.

**nonheme iron proteins:** Proteins, usually acting in oxidation-reduction reactions, containing iron but no porphyrin groups.

**nonheritable :** In medicine, it describes a procedure that does not require inserting an instrument through the skin or into a body opening. In cancer, it describes disease that has not spread outside the tissue in which it began.

**noni :** A type of low-energy radiation that does not have enough energy to remove an electron (negative particle) from an atom or molecule. Non-ionizing radiation includes visible, infrared, and ultraviolet light; microwaves; radio waves; and radiofrequency energy from cell phones. Most types of non-ionizing radiation have not been found to cause cancer.

**noninferiority study :** A research study that is designed to determine whether one intervention is not worse than another control intervention by a predetermined margin. An intervention that yields outcomes which are equivalent to or better than the control intervention is considered not inferior to the control intervention. Noninferiority studies are often conducted to examine whether a new, experimental treatment is not worse than an established standard of care.

**noninvasive** : In biology, refers to viruses that do not kill infected cells by disrupting their plasma membranes.

**Nonionic**: Er... not ionic? Any chemical species that has neither a positive or negative charge is nonionic.

**NONIONIC SURFACTANT**: A surfactant in which the hydrophile is uncharged. Examples; ethoxylated alcohols and phenols. (see RFF 750.10.01 - SURFACTANTS).

**nonlocal**: In DFT, indicates that a functional of the density gradient (i.e.,  $f[\text{grad } \rho]$ ) is included in addition to a local functional. The most popular NL exchange functional is that by Becke. Popular NL correlation functionals are those by Lee/Yang/Parr and by Perdew. A functional that includes nonlocal terms is sometimes called "gradient-corrected" or a "GGA," which stands for "generalized-gradient approximation." OR A nonmetal is a substance that conducts heat and electricity poorly, is brittle or waxy or gaseous, and cannot be hammered into sheets or drawn into wire. Nonmetals gain electrons easily to form anions. About 20% of the known chemical elements are nonmetals.

**nonlytic** : A disorder of the blood. Some nonmalignant hematologic disorders may lead to leukemia.

**nonmalignant** : Abnormal cells are found in the squamous cell or basal cell layer of the epidermis (topmost layer of the skin). These abnormal cells may become cancer and spread into nearby normal tissue. Also called stage 0 nonmelanoma skin carcinoma in situ.

**nonmalignant hematologic disorder** : Skin cancer that forms in the lower part of the epidermis (the outer layer of the skin) or in squamous cells, but not in melanocytes (skin cells that make pigment).

**nonmelanoma carcinoma in situ** : Abnormal cells are found in the epidermis (topmost layer of the skin). These abnormal cells may become cancer and spread into nearby normal tissue. Also called stage 0 nonmelanoma skin carcinoma in situ on the eyelid.

**nonmelanoma skin cancer** : Having to do with skin cancer that forms in the lower part of the epidermis (the outer layer of the skin) or in squamous cells, but not in melanocytes (skin cells that make pigment).

**nonmelanoma skin carcinoma in situ on the eyelid** : Cancer that has not spread from the primary site (place where it started) to other places in the

body.

**nonmelanomatous** : A drug that is not an opioid. Examples include acetaminophen and nonsteroidal anti-inflammatory drugs (NSAIDs), such as aspirin and ibuprofen.

**nonmetals**: the elements in the upper right part of the periodic table, and also hydrogen.

**nonmetastatic** : Refers to a medicine that can be bought without a prescription (doctor's order). Examples include analgesics (pain relievers), such as aspirin and acetaminophen. Also called OTC and over-the-counter.

**nonopioid** : A clinical trial in which the participants are not assigned by chance to different treatment groups. Participants may choose which group they want to be in, or they may be assigned to the groups by the researchers.

**nonparticulate**: Not composed of distinct particles.

**nonpenetrance** : The state in which a genetic trait, although present in the appropriate genotype, fails to manifest itself in the phenotype (e.g., a woman with a BRCA1 mutation who lives to be elderly and never develops breast or ovarian cancer).

**nonpolar**: Having no poles. Used to refer to a bond or molecule that overall has no separation of electrical charge. OR Having a relatively even or symmetrical distribution of charge. OR Hydrophobic; describing molecules or groups that are poorly soluble in water. OR Having no concentrations of electrical charge on a molecular scale, thus, incapable of significant dielectric loss. Examples among resins are polystyrene and polyethylene.

**nonpolar molecule**: A molecule in which the center of positive charge and the center of negative charge coincide. Examples are  $\text{CCl}_4$  and  $\text{CO}_2$ ; counterexamples are  $\text{CHCl}_3$  and  $\text{H}_2\text{O}$ .

**Nonpower reactor**: Reactors used for research, training, and test purposes, and for the production of radioisotopes for medical, industrial, and academic uses. For additional information, see Research and Test Reactors.

**Nonpower reactor (research and test reactor)**: A nuclear reactor that is used for research, training, or development purposes (which may include producing radioisotopes for medical and industrial uses) but has no role in producing electrical power. These reactors, which are also known as research and test reactors, contribute to almost every field of science,

including physics, chemistry, biology, medicine, geology, archeology, and ecology.

**nonprescription :** A type of cancer that begins in cells that form sperm or eggs. There are several types of nonseminoma tumors, including embryonal carcinoma, malignant teratoma, choriocarcinoma, and yolk sac tumor. These tumors are usually made up of more than one type of cancer cell. Although nonseminomas occur most often in the testicles or ovaries, they can occur in other tissues, such as the brain, chest, or abdomen. This happens when cells that have the ability to form sperm or eggs are found in other parts of the body.

**nonrandomized clinical trial :** A group of lung cancers that are named for the kinds of cells found in the cancer and how the cells look under a microscope. The three main types of non-small cell lung cancer are squamous cell carcinoma, large cell carcinoma, and adenocarcinoma. Non-small cell lung cancer is the most common kind of lung cancer.

**Nonreducing sugar:** A sugar that is not readily converted into a form with a free aldehyde group capable of reducing another compound. Such a conversion is prevented because the sugar forms a glycosidic bond with another compound.

**nonrenewable resources:** natural resources that cannot be replenished for millions of years, if at all.

**Nonribosomal peptides:** A class of peptides, including the antibiotic penicillin, formed by the action of specific megasynthases.

**Nonrigid Plastic:** A non-rigid plastic is one which has a stiffness or apparent modulus of elasticity of not over 50,000 psi. at 25 degrees C when determined according to ASTM test procedure D747-43 T.

**nonseminoma :** A cell (such as a phagocyte or a macrophage) that responds to many antigens, not just one antigen.

**nonsense codon:** A codon that does not specify an amino acid, but signals the termination of a polypeptide chain.

**Nonsense mutation:** A change in the base sequence that converts a sense codon (one that specifies an amino acid) to one that specifies a stop (a nonsense codon) There are three nonsense codons: amber, ochre and something I forget (let me know if you read this - SMowbray). OR Nonsense mutation. A change in the base sequence that converts a sense

codon (one that specifies an amino acid) to one that specifies a stop (a nonsense codon). There are three nonsense codons: amber, ochre and something I forget (let me know if you read this - S. Mowbray).

**nonsense mutation:** A mutation that results in the premature termination of a polypeptide chain.

**nonsense mutation :** A mutation that alters the genetic code in a way that causes the premature termination of a protein. The altered protein may be partially or completely inactivated, resulting in a change or loss of protein function.

**nonsense suppressor:** A mutation, usually in the gene for a tRNA, that causes an amino acid to be inserted into a polypeptide in response to a termination codon.

**nonsettleable matter:** the suspended matter which neither settles nor floats to the surface of water in a period of one hour.

**nonsettleable solids:** wastewater matter that will stay in suspension for an extended period of time. Such period may be arbitrarily taken for testing purposes as one hour.

**nonspecific immune cell :** A member of the family of vegetables that does not contain starch (sugar molecules joined chemically). Nonstarchy vegetables are usually lower in sugar and higher in fiber than starchy vegetables. Examples are broccoli, carrots, celery, peppers, tomatoes, and zucchini.

**nonspecific immunomodulating agent :** A drug that decreases fever, swelling, pain, and redness. Also called NSAID.

**nonstarchy vegetable :** A drug that decreases the production of sex hormones (estrogen or testosterone) and slows the growth of tumors that need sex hormones to grow.

**nonsteroidal anti-inflammatory drug :** Not harmful or destructive.

**nonsteroidal aromatase inhibitor :** A genetic disorder marked by unusual facial features, being shorter than normal, learning problems, heart defects, bleeding problems, defects in the skeleton (bones of the body), and fertility problems in males. People with Noonan syndrome have an increased risk of certain types of cancer, such as rhabdomyosarcoma (a soft tissue tumor), neuroblastoma (cancer of immature nerve cells), and some types of leukemia.

**nonterminal alkyne:** an alkyne in which the triple bond is located somewhere other than the 1 position.

**nontoxic :** A chemical made by some nerve cells and in the adrenal gland. It can act as both a neurotransmitter (a chemical messenger used by nerve cells) and a hormone (a chemical that travels in the blood and controls the actions of other cells or organs). Noradrenaline is released from the adrenal gland in response to stress and low blood pressure. Also called norepinephrine.

**nonvascular plants:** the plants that do not have specialized tissues to transport fluids.

**Nonvolatile:** The portion of a coating left after the solvent evaporates; sometimes called the solids content.

**Noonan syndrome :** A drug put on the skin to treat growths caused by sun exposure. A form of nordihydroguaiaretic acid that is taken by mouth is being studied in the treatment of prostate cancer. Nordihydroguaiaretic acid is an antioxidant, and it may block certain enzymes needed for tumor growth. Also called Actinex, masoprocol, and NDGA.

**noradrenaline :** A chemical made by some nerve cells and in the adrenal gland. It can act as both a neurotransmitter (a chemical messenger used by nerve cells) and a hormone (a chemical that travels in the blood and controls the actions of other cells or organs). Norepinephrine is released from the adrenal gland in response to stress and low blood pressure. Also called noradrenaline.

**Norcept-E:** (Other name for: ethinyl estradiol/norethindrone)

**Norcuron:** (Other name for: vecuronium bromide)

**nordihydroguaiaretic acid :** In medicine, a set of values that a doctor uses to interpret a patient's test results. The normal range for a given test is based on the results that are seen in 95% of the healthy population. Sometimes patients whose test results are outside of the normal range may be healthy, and some patients whose test results are within the normal range may have a health problem. The normal range for a test may be different for different groups of people (for example, men and women). Also called reference interval, reference range, and reference values.

**norepinephrine:** A neurotransmitter that increases heart rate, blood pressure, and is related to increased motor activity. It is the precursor to

epinephrine. OR a hormone produced in the adrenal medulla that intensifies the effects of epinephrine.

**norepinephrine :** A drug used to treat depression. It may also be used to treat panic or anxiety disorders and certain types of pain, and to help people quit smoking. Nortriptyline increases the levels of norepinephrine and other natural chemicals in the brain. This helps improve mood and may reduce a person's craving for nicotine. It is a type of tricyclic antidepressant. Also called Aventyl and Pamelor.

**Norethin:** (Other name for: ethinyl estradiol/norethindrone)

**norethindrone acetate:** The orally bioavailable acetate salt of norethindrone, a synthetic progestin with some anabolic, estrogenic, and androgenic activities. As do all progestins, norethindrone binds to and activates nuclear progesterone receptors (PRs) in target tissues such as the pituitary and reproductive system; ligand-receptor complexes are translocated to the nucleus where they bind to progesterone response elements (PREs) located on target genes, followed by various transcriptional events and histone acetylation. Physiological effects include the inhibition of luteinizing hormone (LH) release, an increase in the endometrial luteal-phase, and alterations in endocervical mucus secretion.

**norgestrel:** A synthetic progestin commonly used alone or in combination with an estrogen for contraception. Norgestrel suppresses the secretion of luteinizing and follicle-stimulating hormones (LH and FSH), thickens cervical mucus, and slows the transit of ova through the fallopian tubes. This agent also exhibits antiproliferative activity in endometrial tissue and may exhibit chemopreventive and antineoplastic activities in endometrial carcinoma.

**Norglycin:** (Other name for: tolazamide)

**Norinyl:** (Other name for: ethinyl estradiol/norethindrone)

**Norlutate:** (Other name for: norethindrone acetate)

**Norlutin:** (Other name for: norethindrone acetate)

**normal:** a solution concentration of one gram equivalent per liter of solution.

**normal dip-slip fault:** a dip-slip fault in which the hanging wall block has moved downward relative to the footwall block.

**normal fault:** fault that occurs when rocks are pulled apart, causing one side to move downward.

**normal force:** force that is parallel to the surface of the slope.

**normal range :** A drug used to treat infection with HIV (the virus that causes AIDS). It is also being studied in the treatment of some types of cancer. Norvir blocks the ability of HIV to make copies of itself and may block the growth of cancer cells. It is a type of anti-HIV agent and a type of protease inhibitor. Also called ritonavir.

**NORMAL STRESSES:** Polymer melts when sheared (i.e. when subjected to tangential forces) give rise to perpendicular (NORMAL) STRESSES. This means that when a fluid is flowing in a tube it is less compressed in the axial direction than in the radial direction. These NORMAL STRESSES are responsible for the phenomenon of EXTRUDATE SWELL at the exit of the die. Polymers containing a high molecular weight tail tend to give larger NORMAL STRESSES (i.e. they are more elastic).

**normality:** A measure of solution concentration, defined as the number of equivalents of solute per liter of solution. OR A measure of substance equivalents that are dissolved in a volume of solution. Equivalents are a measure of the actual mass of material divided by the equivalent mass. That equivalent mass is the atomic mass of the compound divided by the valence of the compound. Scientists use the letter 'N' to describe the normality of a solution. Normality can also be determined by multiplying the molarity of a solution by the net positive valence for the compound. OR a measure of solution concentration expressed in equivalent weights of solute per liter of solution. OR A concentration unit relating equivalents of solute to one liter of aqueous solution.

**Norplant:** (Other name for: levonorgestrel)

**Norpramin:** (Other name for: desipramine hydrochloride)

**North American ginseng extract AFX-2:** An orally available proprietary aqueous extract from the North American ginseng (*Panax quinquefolius*) dried root, primarily containing poly-furanosyl-pyranosyl-saccharides, with potential immunostimulating activity. Upon administration, North American ginseng extract AFX-2 may stimulate the proliferation and activation of B-lymphocytes and stimulates IgG production by B cells. Also, this agent induces maturation of dendritic cells, induces T cell

proliferation and activates peritoneal exudate macrophages leading to an increase in the production of the cytokines interleukin -1 and -6, tumor necrosis factor-alpha, interferon-gamma and nitric oxide.

**Northern blotting:** Analogous to Southern blotting, a technique in which a mixture of RNA fragments is separated by electrophoresis, transferred to a nitrocellulose sheet, hybridized to a radioactively labeled DNA probe complementary to the desired sequence, and visualized by autoradiography; the technique can therefore be used to locate and identify an RNA fragment containing a specific sequence.

**Nortrel:** (Other name for: ethinyl estradiol/norethindrone)

**nortriptyline :** A person who has a license that gives them the legal power to witness the signing of documents, to certify that documents are real, and to take statements made under oath.

**Norvir :** An antibiotic drug used to treat infection.

**noscapine hydrochloride:** The orally bioavailable hydrochloride salt of the opioid agonist noscapine, a phthalideisoquinoline alkaloid derived from the opium poppy *Papaver somniferum*, with mild analgesic, antitussive, and potential antineoplastic activities. Noscapine binds to tubulin and alters its conformation, resulting in a disruption of the dynamics of microtubule assembly (by increasing the time that microtubules spend idle in a paused state) and, subsequently, the inhibition of mitosis and tumor cell death. Unlike other tubulin inhibitors such as the taxanes and vinca alkaloids, noscapine does not affect microtubule polymerization.

**nose:** of a fold, its tip.

**Nose Roll :** Machined radius plate or roller, plastic or metal, located at the conveyor terminals which the belt wraps around, allowing a close transfer.

**Not Applicable (NA):** Specifies that a particular field is not applicable to the event.

**Not Reported (NR):** Specifies that information applicable to the particular field was not included in the event report.

**notary public :** A registered nurse who has additional education and training in how to diagnose and treat disease. NPs are licensed at the state level and certified by national nursing organizations. In cancer care, an NP may manage the primary care of patients and their families, based on a

practice agreement with a doctor. Also called advanced practice nurse, APN, and nurse practitioner.

**Notch Sensitivity:** the extent to which the sensitivity of a material to fracture is increased by the presence of a surface inhomogeneity such as a face notch, a sudden change in section, a crack, or a scratch. Low notch sensitivity is usually associated with ductile materials, and high notch sensitivity with brittle materials.

**Notch signaling pathway inhibitor MK0752:** A synthetic small molecule with potential antineoplastic activity. MK0752 inhibits the Notch signaling pathway, which may result in induction of growth arrest and apoptosis in tumor cells in which the Notch signaling pathway is overactivated. The Notch signaling pathway plays an important role in cell-fate determination, cell survival, and cell proliferation.

**notochord:** a flexible rod of tissue extending the length of an animal that provides internal support.

**noun:** a word that names a person, place, or thing, and can be either concrete or abstract.

**noun clause:** a clause that serves as a noun in a sentence.

**Novaban:** (Other name for: tropisetron hydrochloride)

**Novarel:** (Other name for: recombinant human chorionic gonadotropin)

**NovaSoy:** (Other name for: soy isoflavones)

**novel mutation :** A newly discovered, distinct gene alteration; NOT the same as new or de novo mutation.

**novobiocin :** A drug used to treat patients with immune thrombocytopenic purpura (ITP) who do not get better with other forms of treatment. In ITP, platelets (cells that cause blood clots to form) are destroyed by the immune system. Nplate is being studied as a way to treat low platelet counts caused by chemotherapy. It binds to the thrombopoietin receptor and causes the bone marrow to make more platelets. Nplate is also being studied in the treatment of myelodysplastic syndromes (a group of diseases in which the bone marrow does not make enough healthy blood cells). It is a type of thrombopoietin agonist. Also called AMG 531 and romiplostim.

**Novolac:** Multi-functional phenol.

**Novolauden:** (Other name for: hydromorphone hydrochloride)

**Novolin N:** (Other name for: insulin, NPH)

**Noxafil:** (Other name for: posaconazole)

**Nozzle:** As used in power water reactors and boiling water reactors, the interface (inlet and outlet) between reactor plant components (pressure vessel, coolant pumps, steam generators, etc.) and their associated piping systems. OR The hollow cored metal nose screwed into the extrusion end of (a) the heating cylinder of an injection machine or (b) a transfer chamber where this is a separate structure. A nozzle is designed to form under pressure a seal between the heating cylinder or the transfer chamber and the mold. The front end of a nozzle may be either flat or spherical in shape.

**NP:** A Latin abbreviation for “nothing by mouth.”

**NPA:** Natural population analysis. Considered better than Mulliken populations for assigning atomic charges; results are fairly independent of the basis set. Theory based upon chemical concepts of bonds, lone pairs, etc.

**Nplate:** (Other name for: romiplostim)

**Nplate :** A protein that controls how certain genes are expressed. These genes help protect the cell from damage caused by free radicals (unstable molecules made during normal cell metabolism). Free radicals may play a part in cancer, heart disease, stroke, and other diseases of aging. Also called NFE2L2 and nuclear factor (erythroid-derived 2)-like 2.

**NPO:** A protein found on the surface of some cancers.

**NPV:** The likelihood that an individual with a negative test result is truly unaffected and/or does not have the particular gene mutation in question. Also called negative predictive value.

**NQS:** See Interrupted decoupling.

**NR-LU-10 antigen :** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called antitumor antibiotics and topoisomerase inhibitors. Also called rebeccamycin analog.

**NRC Operations Center:** The primary center of communication and coordination among the NRC, its licensees, State and Tribal agencies, and other Federal agencies, regarding operating events involving nuclear reactors or materials. Located in Rockville, MD, the Operations Center is staffed 24 hours a day by employees trained to receive and evaluate event

reports and coordinate incident response activities. For additional detail, see How We Respond to an Emergency.

**Nrf2:** A drug that decreases fever, swelling, pain, and redness. Also called nonsteroidal anti-inflammatory drug.

**Nrf2 activator RTA 408:** A member of the synthetic oleanane triterpenoid class of compounds and an activator of nuclear factor erythroid 2 [NF-E2]-related factor 2 (Nrf2, Nfe2l2), with potential chemopreventive activity. Upon administration, RTA 408 activates the cytoprotective transcription factor Nrf2. In turn, Nrf2 translocates to the nucleus, dimerizes with a small Maf protein (sMaf), and binds to the antioxidant response element (ARE). This induces the expression of a number of cytoprotective genes, including NAD(P)H quinone oxidoreductase 1 (NQO1), sulfiredoxin 1 (Srxn1), heme oxygenase-1 (HO1, HMOX1), superoxide dismutase 1 (SOD1), gamma-glutamylcysteine synthetase (gamma-GCS), thioredoxin reductase-1 (TXNRD1), glutathione S-transferase (GST), glutamate-cysteine ligase catalytic subunit (Gclc) and glutamate-cysteine ligase regulatory subunit (Gclm), and increases the synthesis of the antioxidant glutathione (GSH). Nrf2, a leucine zipper transcription factor, plays a key role in the maintenance of redox balance and cytoprotection against oxidative stress.

**NS5B polymerase inhibitor BMS-791325:** A non-nucleoside, polymerase inhibitor of the hepatitis C virus (HCV) nonstructural protein 5B (NS5B), a RNA-dependent RNA polymerase, with potential activity against HCV. Upon administration and after intracellular uptake, BMS-791325 allosterically binds to the non-catalytic Thumb 1 site of viral HCV NS5B polymerase and causes a decrease in viral RNA synthesis and replication. The HCV NS5B protein is essential for the replication of the viral HCV RNA genome. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family.

**NSAID :** A virus being studied in the treatment of neuroendocrine tumors and other types of cancer. Neuroendocrine tumors form from cells that release hormones in response to a signal from the nervous system. The virus infects and breaks down these tumor cells but not normal cells. It is a type of oncolytic virus. Also called Seneca Valley virus-001 and SVV-001.

**NSC 655649:** A protein that controls how certain genes are expressed. These genes help protect the cell from damage caused by free radicals (unstable molecules made during normal cell metabolism). Free radicals

may play a part in cancer, heart disease, stroke, and other diseases of aging. Also called NFE2L2 and Nrf2.

**NSCLC Antigen-Loaded Dendritic Cell-derived Exosomesnon-small cell lung cancer tumor antigen-loaded dendritic cell-derived exosomes:**

Exosomes loaded with non-small cell lung cancer (NSCLC)-specific antigens, with potential immunostimulating and antineoplastic activities. Exosomes derived from autologous maturing dendritic cells (DCs) are pulsed with HLA-DP04-restricted MAGE-3, and HLA-A02-restricted peptides NY-ESO-1, MAGE-1, MAGE-3, and MART-1. Upon vaccination, these exosomes may stimulate natural killer (NK) cell activation and proliferation, restoration of NKG2D expression on NK cells, and antigen-specific T-cell responses. This may eventually lead to inhibition of tumor cell proliferation in NSCLC expressing these specific tumor antigens. These exosomes, nanovesicles secreted from DCs, are embedded with molecules necessary for potent immune responses on the exosomal surface, such as MHC class II molecules, CD40, ICAM-1, IL-15Ralpha, and NKG2D ligands. Check for active clinical trials using this agent.

**NSTS:** A secure, Web-based data system that helps the NRC and its Agreement States track and regulate the medical, industrial, and academic uses of certain nuclear materials, from the time they are manufactured or imported to the time of their disposal or exportation. This information enhances the ability of the NRC and Agreement States to conduct inspections and investigations, communicate information to other government agencies, and verify the ownership and use of nationally tracked sources. For additional detail, see the NSTS page.

**NTRK/ROS1 inhibitor DS-6051b:** An orally available inhibitor of the receptor tyrosine kinases C-ros oncogene 1 (ROS1) and the neurotrophic tyrosine receptor kinase (NTRK) types 1, 2 and 3, with potential antineoplastic activity. Upon oral administration, DS-6051b binds to and inhibits ROS1 and the NTRK family members. This inhibition leads to a disruption of ROS1- and NTRK-mediated signaling and eventually inhibits the growth of tumor cells that are overexpressing ROS1 and/or NTRKs. ROS1, overexpressed in certain cancer cells, plays a key role in cell growth and survival of cancer cells. NTRK mutations or rearrangements play a key role in cancer progression.

**NTU:** see nephelometric turbidity unit.

**NTX-010:** A group of proteins that help control many functions in a cell, including cell growth and survival. These proteins also control the body's immune and inflammatory responses. Nuclear factor-kappa B may be overactive or found in higher than normal amounts in some types of cancer cells. This may lead to cancer cell growth. High levels or overactivity of nuclear factor-kappa B may also lead to inflammatory disorders, such as asthma and ulcerative colitis, and autoimmune disorders, such as rheumatoid arthritis. Also called NF-kappa B and NF-kB.

**nuclear:** Of or pertaining to nucleus.

**nuclear binding energy:** Energy needed to break an atomic nucleus into separate protons and neutrons.

**Nuclear energy:** See Atomic energy.

**Nuclear Energy Agency (NEA):** A specialized agency within the Organisation for Economic Co-operation and Development (OECD), which was created to assist its Member countries in maintaining and further developing the scientific, technological, and legal bases for safe, environmentally friendly, and economical use of nuclear energy for peaceful purposes. The NEA's current membership consists of 31 countries in Europe, North America, and the Asia-Pacific region, which account for approximately 86% of the world's installed nuclear capacity.

**Nuclear envelope:** A double membrane, consisting of the inner nuclear membrane and the outer nuclear membrane, that surrounds the nucleus and is punctured with openings called nuclear pores.

**nuclear factor (erythroid-derived 2)-like 2 :** An evaluation of the size and shape of the nucleus in tumor cells and the percentage of tumor cells that are in the process of dividing or growing. Cancers with low nuclear grade grow and spread less quickly than cancers with high nuclear grade.

**nuclear factor-kappa B :** A procedure in which radio waves and a powerful magnet linked to a computer are used to create detailed pictures of areas inside the body. These pictures can show the difference between normal and diseased tissue. Nuclear magnetic resonance imaging makes better images of organs and soft tissue than other scanning techniques, such as computed tomography (CT) or x-ray. Nuclear magnetic resonance imaging is especially useful for imaging the brain, the spine, the soft tissue of joints, and the inside of bones. Also called magnetic resonance imaging, MRI, and NMRI.

**nuclear fission:** Splitting of a nucleus into two smaller nuclei and neutrons. The smaller nuclei have higher binding energy than the original nucleus, and fission results in the release of energy.

**Nuclear force:** A powerful short-ranged attractive force that holds together the particles inside an atomic nucleus.

**Nuclear fuel:** Fissionable material that has been enriched to a composition that will support a self-sustaining fission chain reaction when used to fuel a nuclear reactor, thereby producing energy (usually in the form of heat or useful radiation) for use in other processes.

**nuclear fusion:** Combination of two smaller nuclei to form a larger nucleus. The larger nucleus has higher binding energy per nucleon than the original nuclei, and fusion results in the release of energy.

**nuclear grade :** A protein found inside the nucleus of a cell. It is involved in making DNA, RNA, and proteins. It also helps control how certain genes are expressed (turned on) in a cell. Nuclear matrix protein 22 may be found in higher than normal amounts in the urine of patients with some types of cancer, including bladder cancer. Measuring the amount of nuclear matrix protein 22 in the urine may help diagnose cancer or find out how well treatment is working. It is a type of tumor marker. Also called NMP22.

**Nuclear hormone receptor:** A member of a large family of transcription factors that, on binding of a signal molecule such as a steroid hormone, modify the expression of specific genes by binding to control elements in the DNA.

**Nuclear localization sequence:** An amino acid sequence that directs a protein bearing such a sequence into the nucleus.

**Nuclear magnetic resonance:** A means of determining the structure of a protein in solution on the basis of the ability of certain atoms in a protein to absorb electromagnetic radiation.

**Nuclear Magnetic Resonance:** NMR is an analytical technique for working out what an organic compound actually is. It works by placing the sample inside a very strong magnetic field (typically around 100,000 times stronger than the earth's magnetic field, though it can be carried out with weaker and weaker fields as research continues) and playing FM radio waves at it. The strong magnetic field and the absorption and emission of the radio signals allows the operator to work out how the individual atoms

are connected within small to medium sized molecules. NMR was banned from export out of the USA for many years for fear that the Russians would get hold of this technology. The fear was based on the use of the word "Nuclear" in the title, not on what the machine actually did... A new version of NMR is able to resolve the spatial distribution of compounds and produce a 3D map. This has wonderful uses in the medical world, but once again the name "nuclear" was unacceptable, so the technique was renamed "Magnetic Resonance Imaging" or MRI. Perhaps if the FM link was made more widely known, we could refer to the technique as "Easy Listening Imaging" and make a clean break with anything remotely nuclear.

**Nuclear magnetic resonance (NMR) spectroscopy:** An analytical method used to study both liquid and solid samples. It involves placing the sample in a magnetic field and measuring the energy differences between spin states of the nuclei (most commonly protons and carbons). OR a method for measuring how much energy odd-numbered nuclei absorb in the radio frequency range when the atom is exposed to strong magnetic fields. This type of spectroscopy gives information on the environment surrounding the specific nucleus. OR A technique used to study the physical, chemical, and biological properties of matter; in this method, scientists subject a molecule to a strong magnet and watch what happens to the atoms that make up the molecule, which provides information about the molecule's composition. OR An analytical technique that takes advantage of the magnetic properties of certain nuclei.  $^1\text{H}$  NMR and  $^{13}\text{C}$  NMR are useful analytical techniques.

**nuclear magnetic resonance imaging :** A branch of medicine that uses small amounts of radioactive substances to make pictures of areas inside the body and to treat disease. In cancer, the radioactive substance may be used with a special machine (such as a PET scanner) to find the cancer, to see how far it has spread, or to see how well a treatment is working. Radioactive substances may also be used to treat certain types of cancer, such as thyroid cancer and lymphoma.

**Nuclear Material Management and Safeguards System (NMMSS):** A centralized U.S. Government database used to track and account for source and special nuclear material, to ensure that it has not been stolen or diverted to unauthorized users. The system contains current and historical data on the possession, use, and shipment of source and special nuclear material within the United States, as well as all exports and imports of such material.

The database is jointly funded by the NRC and DOE and is operated under a DOE contract.

**Nuclear materials:** See Special nuclear material, Source material, and Byproduct material. For additional detail, see Nuclear Materials.

**nuclear matrix protein 22 :** A method that uses radioactive substances to make pictures of areas inside the body. The radioactive substance is injected into the body, and locates and binds to specific cells or tissues, including cancer cells. Images are made using a special machine that detects the radioactive substance. Also called radioimaging.

**nuclear medicine :** An area inside the nucleus of a cell that is made up of RNA and proteins and is where ribosomes are made. Ribosomes help link amino acids together to form proteins. The nucleolus is a cell organelle.

**nuclear medicine scan :** A building block for nucleic acids (the molecules inside cells that carry genetic information). Nucleotides are attached end-to-end to form the nucleic acids DNA and RNA.

**Nuclear Overhauser enhancement spectroscopy (NOESY):** A technique that forms the basis of NMR analysis of protein structure; NOESY displays pairs of protons that are in close proximity in a protein even if they are not close together in primary structure; three-dimensional structure can then be determined from such observations.

**Nuclear poison (or neutron poison):** In reactor physics, a substance (other than fissionable material) that has a large capacity for absorbing neutrons in the vicinity of the reactor core. This effect may be undesirable in some reactor applications because it may prevent or disrupt the fission chain reaction, thereby affecting normal operation. However, neutron-absorbing materials (commonly known as "poisons") are intentionally inserted into some types of reactors to decrease the reactivity of their initial fresh fuel load. (Adding poisons, such as control rods or boron, is described as adding "negative reactivity" to the reactor.)

**Nuclear pores:** A complex protein assembly that provides openings in the nuclear membrane and permits the transit of large molecules into and out of the nucleus.

**Nuclear power plant:** An electrical generating facility using a nuclear reactor as its heat source to provide steam to a turbine generator. For additional detail, see Nuclear Power Plants.

**Nuclear Radiological Incident Annex:** An annex to the National Response Framework, which provides for a timely, coordinated response by Federal agencies to nuclear or radiological accidents or incidents within the United States. This annex covers radiological dispersal devices and improvised nuclear devices, as well as accidents involving commercial reactors or weapons production facilities, lost radioactive sources, transportation accidents involving radioactive material, and foreign accidents involving nuclear or radioactive material. For additional detail, please see the NRC Incident Response Plan (NUREG-0728) .

**Nuclear reactor:** The heart of a nuclear power plant or nonpower reactor, in which nuclear fission may be initiated and controlled in a self-sustaining chain reaction to generate energy or produce useful radiation. Although there are many types of nuclear reactors, they all incorporate certain essential features, including the use of fissionable material as fuel, a moderator (such as water) to increase the likelihood of fission (unless reactor operation relies on fast neutrons), a reflector to conserve escaping neutrons, coolant provisions for heat removal, instruments for monitoring and controlling reactor operation, and protective devices (such as control rods and shielding). For additional detail, see Nuclear Reactors.

**Nuclear receptor superfamily:** A class of transcription factors that bind DNA and activate transcription only in the presence of a specific signal molecule, such as a hormone.

**Nuclear steam supply system:** The reactor and the reactor coolant pumps (and steam generators for a pressurized water reactor) and associated piping in a nuclear power plant used to generate the steam needed to drive the turbine generator unit.

**Nuclear waste:** A subset of radioactive waste that includes unusable byproducts produced during the various stages of the nuclear fuel cycle, including recovery(or extraction), conversion, and enrichment of uranium; fuel fabrication; and use of the fuel in nuclear reactors. Specifically, these stages produce a variety of nuclear waste materials, including uranium mill tailings, depleted uranium, and spent (depleted) fuel, all of which are regulated by the NRC. (By contrast, "radioactive waste" is a broader term, which includes all wastes that contain radioactivity, regardless of how they are produced. It is not

considered "nuclear waste" because it is not produced through the nuclear fuel cycle and is generally not regulated by the NRC.)

**Nuclease:** An enzyme that cleaves phosphodiester bonds of nucleic acids. OR Enzymes that hydrolyze the internucleotide (phosphodiester) linkages of nucleic acids.

**Nucleating Agent:** Additive used in a polymer to increase crystallization rate by providing additional sites for crystal growth (i.e. Talc). This results in faster cycle time.

**Nucleation:** The formation of stable molecular assemblies leading to crystallization. Also, the initiation of a solid-state reaction. This occurs at a defect or impurity site in the crystal. The solid-state reaction often spreads from this site throughout the crystal.

**nucleation:** The process of providing sites for 1) new bubbles to form in a liquid that is boiling or supersaturated with gas; 2) new droplets to condense from a supersaturated vapor, or 3) new crystals to form in a supersaturated solution. Nucleation sites can be scratches in a surface, dust particles, seed crystals, and so on.

**Nucleation site:** The place at which nucleation occurs within a crystal.

**Nuclei:** Ordered arrays of solute molecules of sufficient size to persist in a given solution.

**Nucleic acid:** A large molecule composed of units of nucleotides; includes both RNA and DNA OR A polymer made of repeating nucleotides. Examples are DNA and RNA. OR large molecules comprised of nucleotides. OR Polymers of the ribonucleotides or deoxyribonucleotides. OR Biologically occurring polynucleotides in which the nucleotide residues are linked in a specific sequence by phosphodiester bonds; DNA and RNA.

**Nucleohistone:** A complex of DNA and histone.

**nucleoid:** In bacteria, the nuclear zone that contains the chromosome but has no surrounding membrane.

**nucleoli:** the small organelles that make up the nucleus; the site for ribosomal synthesis, assembly, and packaging (singular, nucleolus).

**Nucleolus:** A spherical structure visible in the nucleus during interphase. The nucleolus is associated with a site on the chromosome that is involved in ribosomal RNA synthesis. OR A densely staining structure in

the nucleus of eukaryotic cells; involved in rRNA synthesis and ribosome formation.

**nucleolus :** In biology, the structure in a cell that contains the chromosomes. The nucleus has a membrane around it, and is where RNA is made from the DNA in the chromosomes.

**nucleon:** A particle found in the nucleus, that is, a proton or a neutron. OR refers to the particles in the nucleus-- Protons and Neutrons. OR a proton or neutron found in an atomic nucleus. OR Common name for a constituent particle of the atomic nucleus. At present, applied to protons and neutrons, but may include any other particles found to exist in the nucleus. OR A proton or a neutron in the atomic nucleus.

**nucleophile:** a species that is capable of donating a pair of electrons to a nucleus. OR An electron-rich group with a strong tendency to donate electrons to an electron-deficient nucleus (electrophile); the entering reactant in a bimolecular substitution reaction.

**Nucleophilic group:** An electron-rich group that tends to attack an electron-deficient nucleus.

**nucleophilic substitution:** a reaction in which a group on a carbon atom, which has a full or partial positive charge, is displaced by a nucleophile.

**nucleoplasm:** The portion of a cell's contents enclosed by the nuclear membrane; ' also called the nuclear matrix.

**nucleoside:** A biologically important molecule consisting of an amine-containing purine or pyrimidine base joined to ribose, a 5-carbon sugar. OR An organic molecule containing a purine or pyrimidine base and a five-carbon sugar (ribose or deoxyribose). OR A purine or pyrimidine base linked to a sugar. OR A nucleotide base bound to a five-carbon sugar. OR A compound consisting of a purine or pyrimidine base covalently linked to a pentose.

**nucleoside analog DFP-10917:** A deoxycytosine analog with potential antineoplastic activity. Upon administration, DFP-10917 is phosphorylated to generate its nucleotide form, which functions as a deoxycytosine mimic and is incorporated into DNA in tumor cells. This causes DNA strand breaks during polymerization due to beta-elimination during the fidelity checkpoint, which results in G2/M phase-arrest and tumor cell apoptosis.

**nucleoside diphosphate kinase:** An enzyme that catalyzes the transfer of the terminal phosphate of a nucleoside 5'-triphosphate to a nucleoside 5'-diphosphate.

**nucleoside diphosphate sugar:** A coenzymelike carrier of a sugar molecule, functioning in the enzymatic synthesis of polysaccharides and sugar derivatives.

**nucleoside monophosphate kinase:** An enzyme that catalyzes the transfer of the terminal phosphate of ATP to a nucleoside 5'-monophosphate.

**Nucleosome:** A complex of DNA and an octamer of histone proteins in which a small stretch of the duplex is wrapped around a molecular bead of histone. OR Structural unit for packaging chromatin; consists of a DNA strand wound around a histone core.

**Nucleosomes:** The repeating unit of chromatin that consists of 200 base pairs of DNA and two each of the histones H2A, H2B, H3, and H4.

**nucleotide:** the unit that makes up nucleic acid; contains a nitrogen base, a phosphate group, and a carbohydrate molecule. OR A subunit of RNA or DNA containing a base, a phosphate, and a sugar; thousands of nucleotides link up to form a molecule of DNA or RNA OR An organic molecule containing a purine or pyrimidine base, a five-carbon sugar (ribose or deoxyribose), and one or more phosphate groups A phosphoester of a nucleoside. OR A nitrogenous purine or pyrimidine base linked to a sugar, which is in turn linked to one or more phosphate groups. OR A molecule which is a basic building block of nucleic acids and which plays a key role in energy transfer in biochemical reactions. Nucleotides consist of a five-carbon sugar, a heterocyclic nitrogen-containing organic base, and a phosphate group. OR A nucleoside phosphorylated at one of its pentose hydroxyl groups.

**nucleotide :** A molecule consisting of a nitrogen-containing base (adenine, guanine, thymine, or cytosine in DNA; adenine, guanine, uracil, or cytosine in RNA), a phosphate group, and a sugar (deoxyribose in DNA; ribose in RNA). DNA and RNA are polymers comprised of many nucleotides, strung together like beads in a necklace. or A drug used to treat moderate to severe pain. It binds to opioid receptors and other molecules in the central nervous system. Nucynta is a type of opioid and a type of analgesic agent. Also called tapentadol hydrochloride.

**nucleotide analogue GS 9219:** A prodrug of the acyclic nucleoside phosphonate analogue 9-(2-phosphonylmethoxyethyl)guanine (PMEG) with potential antineoplastic activity. Formulated to selectively accumulate in lymphocytes, nucleotide analogue GS 9219 is converted to its active metabolite, PMEG diphosphate (PMEGpp), via enzymatic hydrolysis, deamination, and phosphorylation; subsequently, PMEGpp is incorporated into nascent DNA chains by DNA polymerases, which may result in the termination of DNA synthesis, S-phase cell cycle arrest, and the induction of apoptosis in susceptible lymphoma cell populations.

**nucleotide base:** A heterocyclic nitrogen-containing base that is a constituent of nucleotides. Examples are adenine, guanine, thymine, uracil, and cytosine.

**Nucleotide kinases:** Enzymes that transfer the phosphoryl group of one nucleotide to another nucleotide, as in the reaction of ATP with UMP to form UDP and ADP.

**Nucleotide-excision repair:** A means of repairing DNA in which a stretch of DNA around the site of damage is removed and replaced.

**nucleus:** In eukaryotes, a membranebounded organelle that contains chromosomes. OR In eukaryotic cells, the centrally-located organelle that encloses most of the chromosomes. Minor amounts of chromosomal substance are found in some other organelles, most notably the mitochondria and the chloroplasts. OR The small, central, positively charged region of an atom. Except for the nucleus of ordinary hydrogen, which has only a proton, all atomic nuclei contain both protons and neutrons. The number of protons determines the total positive charge or atomic number. This number is the same for all the atomic nuclei of a given chemical element. The total number of neutrons and protons is called the mass number. OR the center of the atom consisting of the proton and neutron. OR the organelle within eukaryotic cells that contains the genetic material, DNA. OR the central core of an atom; the location of the protons and neutrons. OR the core of an atom, containing protons and neutrons. OR the central core of an atom; the location of the protons and neutrons. OR The nucleus is the centre of an atom, containing protons and neutrons. OR The nucleus of an atom is the center of the atom. The electrons orbit around the center and are arranged in shells. Protons and neutrons live in the nucleus. OR The central part of an atom containing protons and neutrons.

OR The central part of an atom that contains the protons and neutrons. Plural nuclei. OR A drug used to treat moderate to severe pain. It is also used as a sedative before surgery, to help with anesthesia during surgery, during labor, and to treat anxiety caused by some medical conditions. It is made from morphine and binds to opioid receptors in the central nervous system. Numorphan is a type of opioid and a type of analgesic agent. Also called Opana and oxymorphone hydrochloride.

**Nuclide:** A general term referring to all known isotopes, both stable (279) and unstable (about 2,700), of the chemical elements. OR An atom or ion with a specified mass number and atomic number. For example, uranium-235 and carbon-14 are nuclides.

**nuclide symbol:** A symbol for an nuclide that contains the mass number as a leading superscript and the atomic number as a leading subscript. For ions, the ionic charge is given as a trailing superscript. For example, the nuclide symbol for the most common form of the chloride ion is  $^{35}_{17}\text{Cl}^-$ , where 35 is the mass number, 17 is the atomic number, and the charge on the ion is -1. The atomic number is sometimes omitted from nuclide symbols.

**Nucynta :** A health professional trained to care for people who are ill or disabled.

**null allele :** A mutation that results in either no gene product or the absence of function at the phenotypic level.

**number:** refers to whether a noun or verb is singular or plural.

**Numorphan :** A registered nurse who has special training in how to plan, manage, and evaluate all aspects of patient care, especially for patients who get treatment over a long time. Also called case management nurse.

**nurse :** A registered nurse who has additional education and training in how to diagnose and treat disease. Nurse practitioners are licensed at the state level and certified by national nursing organizations. In cancer care, a nurse practitioner may manage the primary care of patients and their families, based on a practice agreement with a doctor. Also called advanced practice nurse, APN, and NP.

**nurse case manager :** A place that gives care to people who have physical or mental disabilities and need help with activities of daily living (such as taking a bath, getting dressed, and going to the bathroom) but do not need to be in the hospital.

**nurse practitioner :** A food or dietary supplement that is believed to provide health benefits.

**nursing home :** A chemical compound (such as protein, fat, carbohydrate, vitamin, or mineral) contained in foods. These compounds are used by the body to function and grow.

**nutraceutical :** Food that is high in nutrients but relatively low in calories. Nutrient-dense foods contain vitamins, minerals, complex carbohydrates, lean protein, and healthy fats. Examples of nutrient-dense foods include fruits and vegetables, whole grains, low-fat or fat-free milk products, seafood, lean meats, eggs, peas, beans, and nuts.

**nutraceutical TBL-12:** An orally available nutritional supplement and proprietary formulation containing extracts from the sea cucumber, sea sponge, shark fin, sea urchin and the marine grass Sargassum, with potential antioxidant, antitumor, anti-angiogenic and immunomodulating activities. TBL-12 contains various amino acids, minerals, vitamins and omega-3 fatty acids. Check for active clinical trials using this agent.

**Nutracort:** (Other name for: therapeutic hydrocortisone)

**NutreStore:** (Other name for: glutamine)

**nutrient:** A source of nourishment, especially a nourishing ingredient in food. OR Any substance assimilated by living things that promotes growth. OR The taking in and use of food and other nourishing material by the body. Nutrition is a 3-part process. First, food or drink is consumed. Second, the body breaks down the food or drink into nutrients. Third, the nutrients travel through the bloodstream to different parts of the body where they are used as "fuel" and for many other purposes. To give the body proper nutrition, a person has to eat and drink enough of the foods that contain key nutrients.

**nutrient-dense food :** Treatment based on nutrition. It includes checking a person's nutrition status, and giving the right foods or nutrients to treat conditions such as those caused by diabetes, heart disease, and cancer. It may involve simple changes in a person's diet, or intravenous or tube feeding. Nutrition therapy may help patients recover more quickly and spend less time in the hospital. Also called medical nutrition therapy.

**nutrient-rich whole wheat flour supplement:** A nutritional supplement composed of nutrient-rich whole wheat flour-based bread mix, with

potential anti-cachexia activity. Following the production of an unleavened bread from the mix and upon oral intake of the nutrient-rich whole wheat flour supplement, the various nutrients in the bread may improve cachexia symptoms. The bread is made from the flour of pulverized whole wheat from an Indian crop. Check for active clinical trials using this agent.

**nutrients:** materials which are considered essential to the support of biological life.

**nutrigenomics :** The study of the interaction of dietary and genetic factors and its effect on metabolism, health status, and risk of disease.

**Nutrison:** (Other name for: casein/whey protein/soy protein/pea protein/fat mix/EPA/DHA-based nutritional supplement)

**nutrition :** A process by which a health professional with special training in nutrition helps people make healthy food choices and form healthy eating habits. In cancer treatment, the goal of nutritional counseling is to help patients stay healthy during and after treatment and to stay strong enough to fight infections and the recurrence of disease. Also called dietary counseling.

**nutrition therapy :** The state of a person's health in terms of the nutrients in his or her diet.

**nutritional counseling :** A product that is added to the diet. A nutritional supplement is taken by mouth, and usually contains one or more dietary ingredient (such as vitamin, mineral, herb, amino acid, and enzyme). Also called dietary supplement.

**nutritional status :** A health professional with special training in nutrition who can help with dietary choices. Also called dietitian.

**nutritional supplement :** A drug that is used to treat certain sleep disorders, such as narcolepsy. It makes patients feel more alert and awake. It is also being studied in the treatment of insomnia and fatigue in patients treated for cancer. Nuvigil acts in a part of the brain that controls sleep and wakefulness. It is a type of wakefulness-promoting agent. Also called armodafinil.

**nutritional supplement drink:** A calorie-dense nutritional supplement drink containing a variety of vitamins and minerals. Nutritional supplement drink contains vitamin A, vitamin C, D, E and K, calcium, iron, thiamin, riboflavin, niacin, folate, vitamin B6, vitamin B12, pantothenic acid, biotin,

phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride and choline. In addition, this drink contains protein, fiber and fat, including omega-3 fatty acids.

**nutritional supplement drink (pediatric):** A liquid, milk protein-based, pediatric nutritional supplement containing a variety of vitamins and minerals. Nutritional supplement drink (pediatric) contains vitamins and minerals such as vitamin A, vitamin C, D, E and K, calcium, iron, thiamin, riboflavin, niacin, folate, vitamin B6, vitamin B12, pantothenic acid, biotin, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride and choline. In addition, this supplement contains soy protein isolate and medium-chain triglycerides (MCTs), sucrose and short-chain oligofructosaccharides. Check for active clinical trials using this agent.

**nutritional table method:** A method of evaluating the dietary intake of a large number of people. The accuracy of the method largely depends on the accuracy with which records of the food consumption can be established and the accuracy of the nutritional tables specifying the concentration of various nutrients, vitamins, and essential and non-essential substances including pesticide residues. For each record of quantity of food consumed during a certain time period, the daily intake of the substance in question is calculated by multiplying the substance concentration in the food item (as obtained from the nutritional table) by the quantity of food consumed and dividing by the time of observation (WHO, 1979).

**nutritionist :** The active ingredient in a drug used to treat infections caused by fungi (a type of microorganism). Nystatin is made by certain strains of bacteria and kills fungi by binding to their membranes. It is a type of antifungal agent.

**Nuvigil :** A drug that may improve the response of cancer cells to chemotherapy.

**Nuvion:** (Other name for: visilizumab)

**NY-ESO-1 peptide vaccine:** A cancer vaccine consisting of an immunogenic peptide derived from the cancer-testis antigen (NY-ESO-1), an antigen found in normal testis and various tumors. Vaccination with NY-ESO-1 peptide vaccine may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) response to cells expressing NY-ESO-1 antigen, resulting in tumor cell lysis.

**NY-ESO-1 plasmid DNA cancer vaccine:** A plasmid DNA encoding an immunogenic peptide derived from the cancer-testis antigen NY-ESO-1 with potential immunostimulating and antitumor activities. Upon administration, NY-ESO-1 plasmid DNA cancer vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing the NY-ESO-1 antigen, resulting in tumor cell lysis. NY-ESO-1 is a tumor associated antigen (TAA) found in normal testes and expressed on the surfaces of various tumor cells, including melanoma, breast, bladder, prostate, lung, ovarian, and hepatocellular tumor cells.

**NY-ESO-1 protein vaccine plus Montanide ISA-51 VG:** A cancer vaccine consisting of an immunogenic peptide derived from the cancer-testis antigen (NY-ESO-1) and emulsified in the immunoadjuvant Montanide ISA-51 VG, with potential immunomodulating and antineoplastic activities. Upon subcutaneous vaccination, the NY-ESO-1 protein vaccine emulsified in Montanide ISA-51 VG may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) response against tumor cells expressing the NY-ESO-1 antigen, resulting in tumor cell lysis. NY-ESO-1, an antigen found in normal testes and various tumors, including bladder, breast, hepatocellular, melanoma, and prostate cancers. The surfactant mannide monooleate in Montanide ISA 51 VG is derived from vegetable-grade (VG) oleic acid that was purified from olive oil.

**NY-ESO-1 protein/microparticle MDP/bacterial DNA-containing MIS416 vaccine:** A combination preparation composed of a protein derived from the human tumor-associated antigen (TAA) cancer-testis antigen 1 (NY-ESO-1) and a microparticle combining two immune-modifying components derived from the bacterium *Propionibacterium acnes*, a bacterial cell wall component that is rich in muramyl dipeptide (MDP) and bacteria-derived single-stranded DNA fragments, with potential immunomodulating, immunoadjuvant and antineoplastic activities. Upon administration of NY-ESO-1 protein/microparticle MDP/bacterial DNA-containing MIS416 vaccine, MIS416 localizes in and is taken up mainly by the liver, thereby forming a liver depot. MIS416 is then taken up by immune cells, such as monocytes and dendritic cells (DCs), where MDP and the bacterial DNA target and bind to the cytosolic innate pattern recognition receptors (PRRs) nucleotide-binding oligomerization domain-

containing protein 2 (NOD2), and toll-like receptor 9 (TLR9), respectively. The simultaneous binding and activation of both NOD2 and TLR9, leads to activation of both NOD2 and TLR9 signaling pathways. This stimulates the innate immune system, induces secretion of cytokines, particularly interferon (IFN), and modulates the activation of various immune cells. In the presence of the NY-ESO-1 peptide, MIS416 enhances the cytotoxic T-lymphocyte (CTL)-mediated immune response against NY-ESO-1, resulting in an increased anti-tumor immune response. NY-ESO-1 is expressed in normal testes and on the surfaces of various tumor cells, and plays a key role in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**NY-ESO-1 reactive TCR retroviral vector transduced autologous PBL:** Human autologous peripheral blood lymphocytes (PBLs) transduced with a retroviral vector encoding a T cell receptor (TCR) specific for the cancer-testis antigen NY-ESO-1, with potential antineoplastic activity. Upon isolation, transduction, expansion ex vivo, and reintroduction into the patient, the NY-ESO-1 reactive TCR-transduced autologous PBLs bind to NY-ESO-1-overexpressing tumor cells. This may result in a specific cytotoxic T-lymphocyte (CTL) killing of NY-ESO-1-positive cancer cells. NY-ESO-1, a tumor associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types; the TCR is specific for NY-ESO-1:157-165.

**NY-ESO-1-specific CD4-positive T lymphocytes:** A preparation of autologous CD4+ T-lymphocytes sensitized to cancer-testis antigen NY-ESO-1, with potential immunostimulating and antineoplastic activities. CD4-positive T-lymphocytes are exposed to a NY-ESO-1 peptide ex vivo, expanded, and introduced into the patient. The NY-ESO-1-specific CD4-positive T-lymphocytes may stimulate the host immune system to produce a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the NY-ESO-1 antigen, which results in tumor cell lysis. NY-ESO-1, an antigen found in normal testis, may be upregulated in various cancers.

**NY-ESO-1-specific TCR gene-transduced T lymphocytes TBI-1301:** Human peripheral blood T-lymphocytes transduced with a retroviral vector encoding a T-cell receptor (TCR) specific for the cancer-testis antigen NY-ESO-1, with potential antineoplastic activity. Following leukapheresis, isolation of lymphocytes, expansion ex vivo, transduction, and introduction

into the patient, the NY-ESO-1-specific TCR gene-transduced T lymphocytes TBI-1301 bind to NY-ESO-1 on tumor cells. This may result in cytotoxic T-lymphocyte (CTL)-mediated elimination of NY-ESO-1-positive cancer cells. NY-ESO-1, a tumor-associated antigen (TAA), is found in normal testis and on the surface of various tumor cell types.

**NY-ESO-1(157-165) peptide-pulsed autologous dendritic cell vaccine:**

A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with a peptide derived from the tumor associated antigen human cancer-testis antigen NY-ESO-1 (NY-ESO-1(157-165)), with potential immunostimulatory and antineoplastic activities. Upon administration, the NY-ESO-1(157-165) peptide-pulsed autologous dendritic cell vaccine may stimulate the immune system to mount both an anti-tumoral cytotoxic T-lymphocyte (CTL) and an antibody-mediated immune response against NY-ESO-1-expressing tumor cells, which may result in tumor cell lysis. NY-ESO-1 is expressed both in normal testes and on the surfaces of various tumor cells, and plays a key role in tumor cell proliferation and survival.

**NY-ESO-1/GLA-SE vaccine ID-G305:** A cancer vaccine composed of a recombinant form of the tumor antigen NY-ESO-1 and glucopyranosyl lipid adjuvant (GLA)-stable emulsion (GLA-SE), with potential antineoplastic and immunomodulating activities. Upon intramuscular injection, the adjuvant portion of the NY-ESO-1/GLA-SE vaccine ID-G30 binds to toll-like receptor subtype 4 (TLR-4) expressed on dendritic cells (DCs), monocytes, macrophages and B cells. The activated DCs present the NY-ESO-1 antigen to Th1 CD4 T-lymphocytes. This leads to the induction of cytotoxic T lymphocytes (CTLs) and the killing of NY-ESO-1-expressing tumor cells. This vaccine also induces specific antibody responses and increases the production of inflammatory cytokines.

**NY-ESO-1/LAGE-1 HLA class I/II peptide vaccine:** A cancer vaccine containing HLA class I- and II-binding peptides derived from the NY-ESO-1/LAGE-1 cancer/testis antigen with potential immunostimulatory and antineoplastic activities. Upon administration, NY-ESO-1/LAGE-1 HLA class I/II peptide vaccine may induce a cytotoxic immune response against tumor cells that over-express NY-ESO-1/LAGE-1. Rarely expressed by normal cells, the NY-ESO-1/LAGE-1 cancer/testis antigen has been shown to be preferentially expressed on the surface of some cancer cell types. Check for active clinical trials using this agent.

**NY-ESO-1/MART-1 peptide-pulsed dendritic cell vaccine:** A cell-based cancer vaccine composed of dendritic cells (DC) pulsed with peptides derived from the tumor-associated antigens human cancer/testis antigen NY-ESO-1 and melanoma antigen recognized by T-cells (MART-1/Melan-A), with potential immunostimulatory and antineoplastic activities. Upon administration, the NY-ESO-1/MART-1 peptide-pulsed DC vaccine may stimulate the immune system to mount an anti-tumor cytotoxic T-lymphocyte (CTL) response against NY-ESO-1/MART-1-expressing tumor cells, which may result in tumor cell lysis. NY-ESO-1 is expressed both in normal testes and on the surfaces of various tumor cells. MART-1 is expressed by melanoma cells.

**NY-ESO-1/PRAME/MAGE-A3/WT-1 peptide vaccine:** A peptide-based cancer vaccine comprised of synthetic peptides derived from the cancer-testis antigen NY-ESO-1, preferentially expressed antigen in melanoma (PRAME), human melanoma antigen A3 (MAGE-A3) and the human Wilms tumor protein-1 (WT-1), with potential immunostimulating and antineoplastic activities. Upon administration, NY-ESO-1/PRAME/MAGE-A3/WT-1 peptide vaccine may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing NY-ESO-1, PRAME, MAGE-A3 and WT-1, resulting in tumor cell lysis. The NY-ESO-1, PRAME, MAGE-A3 and WT-1 peptides, tumor-associated antigens (TAAs) overexpressed in a variety of cancer cell types, play a key role in tumor cell proliferation.

**NY-ESO-1b peptide vaccine:** A recombinant nonapeptide used as an antineoplastic vaccine. NY-ESO-1b peptide vaccine contains the amino acid sequence SLLMWITQC, derived from the cancer-testis tumor antigen (NY-ESO-1), which is expressed on tumor cells of many different types, including melanomas. Vaccination with this peptide vaccine may elicit strong humoral and cellular immune responses to NY-ESO-1-expressing cancers.

**NY-ESO-B:** A tumor-associated antigen belonging to the family of immunogenic testicular proteins that are aberrantly expressed in human cancers in a lineage-nonspecific fashion. Reverse transcription-PCR analysis showed NY-ESO-1 mRNA expression in a variable proportion of a wide array of human cancers, including melanoma, breast cancer, bladder cancer, prostate cancer, and hepatocellular carcinoma; and restricted

expression in normal tissues, with high-level mRNA expression found only in testis and ovary tissues. The gene for NY-ESO-1 maps to Xq28 and codes for an 18-kDa protein having no homology with any known protein. NY-ESO-1 elicits a strong, integrated humoral and cellular immune response in a high proportion of patients with NY-ESO-1-expressing tumors and is under investigation as a cancer immunotherapy agent.

**Nylon:** Nylons (polyamides) are the oldest and largest volume engineering polymers. Nylon refers to a family of a highly versatile materials that are consumed in a variety of applications including fibers, films and molded materials. Nylons are strong, tough polymers with good resistance to elevated temperatures and attack by chemicals. OR A class of polymers that is widely use in the clothing industry (amongst others). Their common feature is the presence of a -C(O)-NH- link between monomer units. This is also called a peptide bond. See Nylon 66 and Nylon 6. OR Generic name for all long-chain polymers which have recurring amide groups (-CONH-) as an integral part of the main polymer chain. Various types of nylons are described in subsequent listings, the numbers of which relate to the number of carbon atoms in the various reactants. OR There are five main types of nylon, including: 6/6, 6, 6/12, 11 and 12. Recently, due to a Global shortage of Nylon 11 and 12, many new blends of nylon are on the market. OR The generic name for all synthetic fiber-forming polyamides; they can be formed into monofilaments and yarns characterized by great toughness, strength and elasticity, high melt point, and good resistance to water and chemicals. The material is widely used for bristles in industrial and domestic brushes, and for many textile applications; it is also used in injection molding gears, bearings, combs, etc. OR Polyamide resins, with very high melting points, excellent clarity and stiffness. Two types are used for films: nylon-6 and nylon-66. The latter has much higher melt temperature, thus better temperature resistance, but the former is easier to process, and it is cheaper. Both have good oxygen and aroma barrier properties, but they are poor barriers to water vapor. Also, nylon films can be cast (see CAN), or oriented, (see BON).

**Nylon 6:** Another form of nylon that uses only one monomer unit (not two). This monomer is difunctional with a carboxylic acid group at one end and an amine group at the other. The condensation reaction between two such molecules produces an amide bond in the same way as the synthesis of Nylon 66. The monomer used is (I think) 7-amine-1-heptanoic acid.

**Nylon 66:** A polymer widely used in a fibrous form in fabrics as well as solid lumps of plastic (e.g. in chopping boards and bearings). Nylon 66 may be formed from the condensation polymerisation of 1,2-hexadamine and 1,8-octadioic acid, although modern industrial processes have improved upon these reactions by ionising the reagents to the hexadammium and 1,8-octadioate ions before the reaction is undertaken.

**Nylon Intermediates:** The Nylon Intermediates are the family of chemicals used in the production of the nylon family of polymers.

**nystagmus:** involuntary eye movements

**nystatin :** A branch of medicine that specializes in the care of women during pregnancy and childbirth and in the diagnosis and treatment of diseases of the female reproductive organs. It also specializes in other women's health issues, such as menopause, hormone problems, contraception (birth control), and infertility. Also called obstetrics and gynecology.

**O Ray:** See Ordinary ray.

**O-Ring:** A doughnut-shaped object that functions as a seal, blocking the passage of liquids or gases, by being compressed between the two mating surfaces comprising the walls of the cavity into which the ring is installed

**O(6)-benzylguanine :** A substance being studied in the treatment of several types of cancer. Obatoclax blocks the actions of certain proteins that cells need to live and it may kill cancer cells. It is a type of apoptosis inducer, a BCL2 protein antagonist, and a BH3 mimetic.

**O6-benzylguanine:** A guanine analogue with antineoplastic activity. O(6)-benzylguanine binds the DNA repair enzyme O(6)-alkylguanine DNA alkyltransferase (AGT), transferring the benzyl moiety to the active-site cysteine and resulting in inhibition of AGT-mediated DNA repair. Co-administration of this agent potentiates the effects of other chemotherapeutic agents that damage DNA.

**oat biscuit:** A biscuit containing oats.

**ob/gyn:** A substance being studied in the treatment of several types of cancer. It is a form of obatoclax, which blocks the activity of certain proteins needed for cells to live and may cause tumor cells to die. It is a type of apoptosis inducer.

**obatoclax :** Having an abnormally high, unhealthy amount of body fat.

**obatoclax mesylate:** The mesylate salt of obatoclax, a synthetic small-molecule inhibitor of the bcl-2 family of proteins with potential pro-apoptotic and antineoplastic activities. Obatoclax binds to members of the Bcl-2 protein family, preventing the binding of these anti-apoptotic proteins to the pro-apoptotic proteins Bax and Bak and so promoting the activation of the apoptotic pathway in Bcl-2-overexpressing cells. The Bcl-2 family of proteins (bcl-2, bcl-xl, bcl-w, and Mcl-1) are overexpressed in a wide variety of cancers, including those of the lymphatic system, breast, lung, prostate, and colon. or A condition marked by an abnormally high, unhealthy amount of body fat.

**obduction:** the process by which a crustal plate overrides another plate for a short distance.

**obese :** A drug used with bendamustine to treat follicular lymphoma that has come back or has not gotten better after treatment with rituximab. It is also used with chlorambucil to treat chronic lymphocytic leukemia (CLL) that has not already been treated. It is also being studied in the treatment of other types of cancer. Obinutuzumab binds to a protein called CD20, which is found on B cells (a type of white blood cell) and some types of leukemia and lymphoma cells. This may help the immune system kill cancer cells. Obinutuzumab is a type of monoclonal antibody. Also called Gazyva.

**obesity :** An improvement that can be measured by the health care provider (for example, when a tumor shrinks or there are fewer cancer cells in the blood).

**obinutuzumab:** A glycoengineered, fully humanized IgG1 monoclonal antibody with potential antineoplastic activity. Obinutuzumab, a third generation type II anti-CD20 antibody, selectively binds to the extracellular domain of the human CD20 antigen on malignant human B cells. The Fc region carbohydrates of the antibody, enriched in bisected non-fucosylated glycosylation variants, contribute to its higher binding affinity for human FcγRIII receptors compared to non-glycoengineered antibodies, resulting in enhanced antibody-dependent cellular cytotoxicity (ADCC) and caspase-independent apoptosis. In addition, modification of elbow hinge sequences within the antibody variable framework regions may account for the strong apoptosis-inducing activity of R7159 upon binding to CD20 on target cells. or A measurable response.

**object of the preposition:** a noun or pronoun that follows a preposition and completes the prepositional phrase.

**objective case:** when a noun or pronoun is the object of a verb, it is in the objective case.

**objective environment:** The actual physical, chemical, and social environment as described by objective measurements, such as noise levels in decibels and concentrations of air pollutants (WHO, 1979).

**objective improvement :** A substance being studied in the treatment of cancer. It may kill cancer cells by blocking the production of a protein that makes cancer cells live longer and by making them more sensitive to anticancer drugs. It is a type of antisense oligodeoxyribonucleotide. Also called augmerosen, bcl-2 antisense oligodeoxynucleotide G3139, and Genasense.

**objective response :** In medicine, watching a patient's condition but not giving treatment unless symptoms appear or change.

**oblate spheroid:** the shape of the Earth; not a perfect sphere, but flatter at the poles and slightly bulging at the Equator.

**Obligate anaerobes:** Organisms that cannot survive in the presence of oxygen and are thus usually dependent on fermentation as a source of cellular energy.

**oblimersen sodium:** The sodium salt of a phosphorothioate antisense oligonucleotide targeted to the initiation codon region of mRNA for the anti-apoptotic gene Bcl-2. Oblimersen inhibits Bcl-2 mRNA translation, which may result in decreased expression of the Bcl-2 protein and tumor cell apoptosis. This agent may enhance the efficacy of standard cytotoxic chemotherapy. The anti-apoptotic bcl-2 protein is an integral outer mitochondrial membrane protein (OMMP) that is overexpressed in some cancer cell types and is linked to tumor drug resistance. or A type of study in which individuals are observed or certain outcomes are measured. No attempt is made to affect the outcome (for example, no treatment is given).

**oblique-slip fault:** a fault in which the fault blocks show both horizontal and vertical displacement.

**Obliteration:** The quality or degree that a coat of paint hides the underlying surface; opacity.

**observation:** data that is collected through your senses. OR What you see during an experiment. You should look carefully at the substances before they react, while they are reacting and after they have reacted. Observations should include a colour and a physical state. A good observation could be something like "a pale brown liquid was formed near the positive electrode". That is far better than, "it went brown". OR An anxiety disorder in which a person has intrusive ideas, thoughts, or images that occur repeatedly, and in which he or she feels driven to perform certain behaviors over and over again. For example, a person may worry all the time about germs and so will wash his or her hands over and over again. Having an obsessive-compulsive disorder may cause a person to have trouble carrying out daily activities.

**observational study :** A doctor who specializes in caring for women during pregnancy and childbirth. Obstetricians also care for the fetus (unborn baby), treat problems with pregnancy, and deliver babies.

**obsessive-compulsive disorder :** A branch of medicine that specializes in the care of women during pregnancy and childbirth and in the diagnosis and treatment of diseases of the female reproductive organs. It also specializes in other women's health issues, such as menopause, hormone problems, contraception (birth control), and infertility. Also called ob/gyn.

**obstetrician :** Blockage of a passageway.

**obstetrics and gynecology :** A dulled or reduced level of alertness or consciousness.

**obstruction :** Cancer in which the site of the primary (original) tumor cannot be found. Most metastases from occult primary tumors are found in the head and neck.

**obtundation :** Cancer cells are found in sputum (mucus coughed up from the lungs), but no tumor can be found in the lung by imaging tests or bronchoscopy, or the tumor is too small to be checked.

**obtuse angle:** an angle greater than  $90^\circ$  but less than  $180^\circ$  OR An angle that measures more than 90 degrees and less than 180 degrees.

**obtuse triangle:** a triangle containing an obtuse angle OR A triangle with one obtuse angle.

**ocaratuzumab:** An Fc-engineered monoclonal antibody directed against human CD20 with potential antineoplastic activity. Ocaratuzumab

specifically binds to CD20 antigen (B1), preventing mitogen-induced B-cell proliferation; inhibiting B-cell differentiation; and promoting antibody-dependent cell-mediated cytotoxicity (ADCC) and apoptosis of B cells expressing CD20. The Fc portion of this monoclonal antibody has been engineered to possess a higher binding affinity for variant Fc receptors on T helper cells, resulting in an augmentation of the anti-tumor immune response. Because of Fc engineering, this agent may be significantly more potent than rituximab in inducing B cell-directed ADCC. CD20 is a non-glycosylated cell surface phosphoprotein that is exclusively expressed on B cells during most stages of B cell development.

**occluded front:** front that forms when a cold front catches up to a warm front.

**ocult primary tumor :** A health professional trained to help people who are ill or disabled learn to manage their daily activities.

**ocult stage non-small cell lung cancer :** A procedure that uses infrared light waves to give three-dimensional (3-D) pictures of structures inside tissues and organs. The pictures are made by a computer linked to the light source. Also called optical coherence tomography.

**Occupational Dose:** The internal and external dose of ionizing radiation received by workers in the course of employment in such areas as fuel cycle facilities, industrial radiography, nuclear medicine, and nuclear power plants. These workers are exposed to varying amounts of radiation, depending on their jobs and the sources with which they work. The NRC requires its licensees to limit occupational exposure to 5,000 mrem (50 mSv) per year. Occupational dose does not include the dose received from natural background sources, doses received as a medical patient or participant in medical research programs, or "second-hand doses" received through exposure to individuals treated with radioactive materials. For additional detail, see Information for Radiation Workers and Measuring Radation.

**occupational environment:** The environment at a work place (WHO, 1979).

**occupational hygiene:** The applied science concerned with recognition, evaluation and control of chemical, physical or biological factors arising from the workplace and which may affect the well-being of those at work or in the community.

**occupational therapist :** A drug similar to the naturally occurring growth hormone inhibitor somatostatin. Octreotide is used to treat diarrhea and flushing associated with certain types of tumors.

**occurrence (frequency):** In epidemiology, a general term describing the frequency of a disease or other attribute or event in a population without distinguishing between incidence and prevalence (Last, 1988).

**ocean mixing:** Processes that involve rates of advection, upwelling/downwelling, and eddy diffusion and that determine how rapidly excess atmospheric carbon dioxide can be taken up by the oceans.

**ocean-continent convergence:** convergence that occurs when oceanic crust is subducted under continental crust.

**ocean-ocean convergence:** convergence that occurs when two plates carrying ocean crust converge, with one slab subducted under the other at an ocean trench.

**oceanic trench:** a narrow deep trough that parallels the edge of a continent, island arc, or convergence of two oceanic plates and forms at the edge of a subduction zone.

**ocrelizumab:** A Fc-modified, humanized monoclonal antibody directed against the B-cell CD20 cell surface antigen, with immunosuppressive activity. Ocrelizumab binds to CD20 on the surfaces of B-cells, triggering complement-dependent cell lysis (CDCL) and antibody-dependent cell-mediated cytotoxicity (ADCC) of B-cells overexpressing CD20. The CD20 antigen, a non-glycosylated cell surface phosphoprotein that acts as a calcium ion channel, is found on over 90% of B-cells, B-cell lymphomas, and other lymphoid tumor cells of B-cell origin; it plays an important role in B-cell functioning.

**OCT:** A type of radionuclide scan used to find carcinoid and other types of tumors. Radioactive octreotide, a drug similar to somatostatin, is injected into a vein and travels through the bloodstream. The radioactive octreotide attaches to tumor cells that have receptors for somatostatin. A radiation-measuring device detects the radioactive octreotide, and makes pictures showing where the tumor cells are in the body. Also called somatostatin receptor scintigraphy and SRS.

**octagon:** a plane closed figure with eight sides and eight angles

**Octahedral Crystal:** This is a crystal that has eight sides. Think of a shape with two pyramids attached at their bases.

**octane<sup>818</sup>:** Flammable liquid compounds found in petroleum and natural gas. There are 18 different octanes- they have different structural formulas but share the molecular formula C<sub>8</sub>H<sub>18</sub>. Octane is used as a fuel and as a raw material for building more complex organic molecules. It is the eighth member of the alkane series.

**Octene:** Comonomer in production of usually linear low density polyethylene. OR A comonomer used in the production of linear low density polyethylenes. OR A co-monomer used in the production of linear low-density polyethylene plastics.

**octet:** In Lewis structures the goal is to make almost all atoms have an octet. This means that they will have access to 8 electrons regularly, even if they do have to share some of them. OR A stable group of eight electrons in the outer shell of an atom. OR eight electrons. Carbon, oxygen, and the halogens either share, lose, or gain electrons to have eight electrons in their valence shells. (Compare with "duet.") OR A set of eight valence electrons.

**octet rule:** A guideline for building Lewis structures that states that atoms tend to gain, lose, or share valence electrons with other atoms in a molecule until they hold or share eight valence electrons. The octet rule almost always holds for carbon, nitrogen, oxygen, and fluorine; it is regularly violated for other elements.

**Octreoscan:** (Other name for: indium In 111 pentetreotide)

**octreotide :** A rare cancer of melanocytes (cells that produce the pigment melanin) found in the eye. Also called intraocular melanoma.

**octreotide acetate:** The acetate salt of a synthetic long-acting cyclic octapeptide with pharmacologic properties mimicking those of the natural hormone somatostatin. Octreotide is a more potent inhibitor of growth hormone, glucagon, and insulin than somatostatin. Similar to somatostatin, this agent also suppresses the luteinizing hormone response to gonadotropin-releasing hormone, decreases splanchnic blood flow, and inhibits the release of serotonin, gastrin, vasoactive intestinal peptide (VIP), secretin, motilin, pancreatic polypeptide, and thyroid stimulating hormone. Check for active clinical trials using this agent.

**octreotide pamoate:** A synthetic long-acting octapeptide analogue of endogenous somatostatin. Octreotide pamoate binds to somatostatin receptors expressed by some neuroendocrine and non-neuroendocrine tumor cells, thereby initiating somatostatin receptor-mediated apoptosis. Other possible antineoplastic activities of this agent include suppression of tumor angiogenesis and tumor growth-promoting insulin-like growth factor 1 (IGF-1). Check for active clinical trials using this agent.

**octreotide scan :** A measure of the odds of an event happening in one group compared to the odds of the same event happening in another group. In cancer research, odds ratios are most often used in case-control (backward looking) studies to find out if being exposed to a certain substance or other factor increases the risk of cancer. For example, researchers may study a group of individuals with cancer (cases) and another group without cancer (controls) to see how many people in each group were exposed to a certain substance or factor. They calculate the odds of exposure in both groups and then compare the odds. An odds ratio of one means that both groups had the same odds of exposure and, therefore, the exposure probably does not increase the risk of cancer. An odds ratio of greater than one means that the exposure may increase the risk of cancer, and an odds ratio of less than one means that the exposure may reduce the risk of cancer. Also called relative odds.

**ocular:** The adjective applying to anything pertaining to the eye.

**ocular melanoma :** A drug used to treat locally advanced basal cell carcinoma (BCC) that has come back after surgery or radiation therapy. It is also used in patients who cannot be treated with surgery or radiation therapy. Odomzo is also being studied in the treatment of other types of cancer. Odomzo blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of hedgehog signaling pathway antagonist. Also called erismodegib, LDE225, and sonidegib.

**ocular proptosis:** abnormal protrusion of the eyeball

**oculomotor apraxia:** difficulty in moving the eyes from side to side

**OD, Outer Diameter:** The outermost, largest, surface of a circular object, such as a shaft or a round seal. the term OD is frequently used to indicate both the circumferential surface itself as well as the measured diameter of that surface

**odanacatib:** An inhibitor of cathepsin K with potential anti-osteoporotic activity. Odanacatib selectively binds to and inhibits the activity of cathepsin K, which may result in a reduction in bone resorption, improvement of bone mineral density, and a reversal in osteoporotic changes. Cathepsin K, a tissue-specific cysteine protease that catalyzes degradation of bone matrix proteins such as collagen I/II, elastin, and osteonectin plays an important role in osteoclast function and bone resorption.

**odd:** A number that is not divisible by two.

**odd integers:** Integers that are odd numbers.

**odds:** The ratio of the probability of occurrence of an event to that of non-occurrence, or the ratio of the probability that something is so, to the probability that it is not so (from Last, 1983).

**odds ratio:** The ratio of two odds. The term "odds" is defined differently according to the situation under discussion. Consider the following notation for the distribution of a binary exposure and a disease in a population or a sample.

**Odomzo :** A substance that gives off a smell.

**odontoid hypoplasia:** decreased ossification of the odontoid bone which is the anterior process of the second vertebra

**odor :** An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat a certain type of childhood Hodgkin lymphoma in males. It includes the drugs vincristine sulfate (Oncovin), etoposide, prednisone, and doxorubicin hydrochloride (Adriamycin). Also called OEPA regimen.

**odorant :** An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat a certain type of childhood Hodgkin lymphoma in males. It includes the drugs vincristine sulfate (Oncovin), etoposide, prednisone, and doxorubicin hydrochloride (Adriamycin). Also called OEPA.

**Odorants:** Small molecules in the air that bind to receptors in the main olfactory epithelium to generate the perception of smell.

**Odorants:** Used to add odor to materials, usually for safety reasons.

**Odorants & Deodorants:** Odorants are used to add odor to materials, usually for safety reasons.

**OEM:** Meaning Original Equipment Manufacturer, is a company that makes a component part that is used in another company's end product.

**OEPA:** A drug used to treat chronic lymphocytic leukemia (CLL) that has not gotten better with other anticancer drugs. It is also used with chlorambucil in patients who have not already been treated and cannot receive certain anticancer drugs. It is also being studied in the treatment of other types of cancer. Ofatumumab binds to a protein called CD20, which is found on B cells (a type of white blood cell) and some types of leukemia and lymphoma cells. This may help the immune system kill cancer cells. Ofatumumab is a type of monoclonal antibody. Also called Arzerra and HuMax-CD20.

**OEPA regimen:** A regimen consisting of vincristine, etoposide, prednisone and doxorubicin for the treatment of male patients with childhood Hodgkin lymphoma. Or An abbreviation for a chemotherapy combination used to treat pancreatic cancer. It includes the drugs oxaliplatin, fluorouracil, and leucovorin (folinic acid). Also called OFF regimen.

**Oestrogen:** A steroid hormone responsible for the development of female characteristics in mammals. The proper name for it is 'estradiol' and it looks like this:

**Oestrogenine:** (Other name for: diethylstilbestrol)

**Oestromenin:** (Other name for: diethylstilbestrol)

**Oestromon:** (Other name for: diethylstilbestrol)

**ofatumumab:** A fully human, high-affinity IgG1 monoclonal antibody directed against the B cell CD20 cell surface antigen with potential antineoplastic activity. Ofatumumab binds specifically to CD20 on the surfaces of B cells, triggering complement-dependent cell lysis (CDCL) and antibody-dependent cell-mediated cytotoxicity (ADCC) of B cells overexpressing CD20. The CD20 antigen, found on over 90% of B cells, B cell lymphomas, and other B cells of lymphoid tumors of B cell origin, is a non-glycosylated cell surface phosphoprotein that acts as a calcium ion channel; it is exclusively expressed on B cells during most stages of B cell development. or An abbreviation for a chemotherapy combination used to treat pancreatic cancer. It includes the drugs oxaliplatin, fluorouracil, and leucovorin (folinic acid). Also called OFF.

**OFF:** The office within the U.S. Department of Health and Human Services (DHHS) that protects the rights, welfare, and well-being of people involved in clinical trials. It also makes sure that the research follows the law 45 CFR 46 (Protection of Human Subjects). Also called OHRP.

**OFF regimen:** A chemotherapy regimen that includes leucovorin, 5-fluorouracil and oxaliplatin, which may be used in the treatment of pancreatic cancer. Or Describes the legal use of a prescription drug to treat a disease or condition for which the drug has not been approved by the U.S. Food and Drug Administration.

**off-label :** A substance that relieves pain and is being studied in the treatment of some types of cancer. OGFs bind to cells in the body, including tumor cells, which have OGF receptors on the surface. This may help stop the growth of the tumor cells. It may also prevent the growth of blood vessels that tumors need to grow. An OGF is a type of biological response modifier and a type of antiangiogenesis agent. Also called opioid growth factor.

**Off-register:** Misalignment of mold halves causing out-of-round O-Ring or part cross section

**Office for Human Research Protections :** An antibiotic drug used to treat infection. It belongs to the family of drugs called quinolone antibiotics.

**Offset:** A printing technique in which ink is transferred from a bath onto the raised surface of the printing plate by rollers. Subsequently, the printing plates transfer the ink to the object to be printed.

**Offset printing:** a printing technique in which ink is transferred from a reservoir to a printing plate. For the ink printing plate, the image is printed on a cylindrical rubber roll (blanket) and then to the object to be printed. OR A printing process in which the image to be printed is first applied to an intermediate carrier such as a roll or plate, then is transferred to a plastic film or molded article.

**ofloxacin:** A fluoroquinolone antibacterial antibiotic. Ofloxacin binds to and inhibits bacterial topoisomerase II (DNA gyrase) and topoisomerase IV, enzymes involved in DNA replication and repair, resulting in cell death in sensitive bacterial species.

**ofloxacin :** A substance being studied in the treatment of cancer. It blocks the production of a protein called clusterin, which helps cells live longer.

This may kill cancer cells that need clusterin to grow. It may also make cells more sensitive to anticancer drugs. It is a type of antisense oligonucleotide, and a type of chemosensitizing agent. Also called custirsen sodium.

**OGF:** The office within the U.S. Department of Health and Human Services (DHHS) that protects the rights, welfare, and well-being of people involved in clinical trials. It also makes sure that the research follows the law 45 CFR 46 (Protection of Human Subjects). Also called Office for Human Research Protections.

**oglufanide disodium:** The disodium salt of a synthetic form of a naturally-occurring dipeptide consisting of L-glutamic acid and L-tryptophan with potential antiangiogenic and potential immunomodulating activities. Oglufanide inhibits vascular endothelial growth factor (VEGF), which may inhibit angiogenesis. This agent has also been reported to stimulate the immune response to hepatitis C virus and intracellular bacterial infections.

**OGX-011:** A substance used on the skin to soothe or heal wounds, burns, rashes, scrapes, or other skin problems. Also called unguent.

**ohm:** a unit of electrical resistance equal to that of a conductor in which a current of one ampere is produced by a potential of one volt across its terminals. OR The unit of electrical resistance. A current of 1 amp at a potential difference of 1 volt experiences 1 ohm of resistance. OR The SI unit of electrical resistance, equal the resistance between two points when a constant voltage produces an electric current of 1 ampere. OR practical unit of electric resistance.

**Ohm's Law:** The strength of a direct current is directly proportional to the potential difference and inversely proportional to the resistance of the circuit.

**ohmmeter:** An instrument for measuring electrical resistance.

**OHRP:** A drug used to treat certain mental disorders. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of antipsychotic and a type of monoamine antagonist. Also called Zyprexa and Zyprexa Zydis.

**Oil** : Crude oil is the decayed remains of plants and animals that lived in the sea. The oil has been formed over a few million years. Crude oil is the major source of alkanes.

**oil field:** the occurrence of multiple oil pools in one area.

**Oil Resistant:** Ability of liquid silicone or natural rubber to resist swelling and other detrimental effects of exposure to various oils

**oil sands:** sandstone deposits that have been cemented with tar or asphalt. OR organic-rich shale formations from which oil can be extracted.

**ointment :** A drug used to treat advanced ovarian cancer caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is used in patients who have already received other anticancer drugs. It is also being studied in the treatment of other types of cancer. Olaparib blocks an enzyme involved in many cell functions, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Olaparib may cause cancer cells to die. It is a type of targeted therapy agent and a type of poly (ADP-ribose) polymerase inhibitor. Also called AZD2281, Lynparza, and PARP inhibitor AZD2281.

**oisomerase:** oisomerase. An enzyme that changes the extent of supercoiling of a DNA duplex.

**Okazaki fragment:** A short segment of single-stranded DNA that is an intermediate in DNA synthesis. In bacteria, Okazaki fragments are 1000-2000 bases in length; in eukaryotes, 100-200 bases in length. OR Small fragments of DNA (approximately 1000 nucleotides) that are formed on the lagging strand at the replication fork of DNA synthesis and later joined; enable 5' . 3' polymerization at the nucleotide level while overall growth is in the 3' . 5' direction. OR new sections of DNA that are placed along the lagging strand during DNA replication and are joined together by DNA ligase to produce a new DNA strand.

**olanzapine:** A synthetic derivative of thienobenzodiazepine with antipsychotic, antinausea, and antiemetic activities. As a selective monoaminergic antagonist, olanzapine binds with high affinity binding to the following receptors: serotonergic, dopaminergic, muscarinic M1-5, histamine H1, and alpha-1-adrenergic receptors; it binds weakly to gamma-aminobutyric acid type A, benzodiazepine, and beta-adrenergic receptors. The antinausea and antiemetic effects of this agent appear to be due to the blockade of 5-HT2 and 5-HT3 receptors for serotonin. Although its exact mechanism of action in schizophrenia is unknown, it has been proposed that olanzapine's antipsychotic activity is mediated through antagonism to dopamine D2 receptors with rapid ligand-receptor dissociation kinetics that

help to minimize extrapyramidal symptoms (EPS). Olanzapine may also stimulate appetite. or A drug used to treat depression. It may also be used to help relieve anxiety and insomnia (trouble sleeping) and to treat certain other disorders. Oleptro increases the level of the chemical serotonin in the brain, which helps improve mood. It is a type of antidepressant. Also called trazodone.

**olaparib:** A small molecule inhibitor of the nuclear enzyme poly(ADP-ribose) polymerase (PARP) with potential chemosensitizing, radiosensitizing, and antineoplastic activities. Olaparib selectively binds to and inhibits PARP, inhibiting PARP-mediated repair of single strand DNA breaks; PARP inhibition may enhance the cytotoxicity of DNA-damaging agents and may reverse tumor cell chemoresistance and radioresistance. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins and can be activated by single-stranded DNA breaks. or The sense of smell.

**olaratumab:** A fully human IgG1 monoclonal antibody directed against the platelet-derived growth factor receptor alpha (PDGFR alpha) with potential antineoplastic activity. Olaratumab selectively binds to PDGFR alpha, blocking the binding of its ligand, PDGF; signal transduction downstream of PDGFR through the MAPK and PI3K pathways is inhibited, which may result in inhibition of angiogenesis and tumor cell proliferation. Overexpressed by various cancer cell types, PDGFR is a transmembrane protein tyrosine kinase receptor, consisting of isoforms A and B, that is important in regulating cellular growth and differentiation and angiogenesis.

**Oleamide:** An ivory-coloured powder used as a slip additive in polyolefin plastics.

**oleandrin:** A lipid soluble cardiac glycoside with potential antineoplastic activity. Upon administration, oleandrin specifically binds to and inhibits the alpha3 subunit of the Na/K-ATPase pump in human cancer cells. This may inhibit the phosphorylation of Akt, upregulate MAPK, inhibit NF-kb activation and inhibit FGF-2 export and may downregulate mTOR thereby inhibiting p70S6K and S6 protein expression. All of this may lead to an induction of apoptosis. As cancer cells with relatively higher expression of the alpha3 subunit and with limited expression of the alpha1 subunit are more sensitive to oleandrin, one may predict the tumor response to treatment with lipid-soluble cardiac glycosides such as oleandrin based on

the tumors Na/K-ATPase pump protein subunit expression. Overexpression of the alpha3 subunit in tumor cells correlates with tumor proliferation.

**Oleate Ion:** The oleate ion is one of the most common soaps, being derived from triolein, a component of olive oil.

**OLEFIN:** A hydrocarbon containing a carbon-carbon double bond. Olefins are also known as alkenes.

**Olefin – :** and unsaturated simple hydrocarbon with one double bond per molecule, such as ethylene or butylene. Olefins are chained into polymers such as polyethylene.

**Olefins family:** The Olefins are a family of unsaturated hydrocarbons containing a double bond. The double bond provides a target for chemical reaction, both with other chemicals and with other olefins. Catalysed reaction of a pure olefin stream results in the production of polyolefins. Olefins are commonly produced by high temperature pyrolysis of refinery hydrocarbon streams in steam crackers.

**Oleochemicals:** Chemical materials or intermediates that are derived from plant and animal ingredients.

**Oleophobic:** Oil shedding.

**Oleoresinous:** Generally refers to varnishes composed of vegetable drying oils in conjunction with resins which may be either natural or synthetic.

**Oleptro :** Having to do with the sense of smell.

**Olfaction:** The sense of smell.

**olfaction :** A rounded mass of tissue that contains several types of nerve cells that are involved in the sense of smell. There are two olfactory bulbs on the bottom side of the brain, one above each nasal cavity. The olfactory bulbs receive information about smells from the nose and send it to the brain by way of the olfactory tracts.

**olfactory :** The parts of the body involved in sensing smell, including the nose and many parts of the brain. Smell may affect emotion, behavior, memory, and thought.

**olfactory bulb :** A series of events in which cells in the nose bind to scent-bearing molecules and send electrical signals to the brain where they are perceived as smells.

**olfactory nerve:** the nerve that carries the impulse from the nose to the brain for interpretation.

**olfactory system :** A brain tumor that forms from both oligodendrocytes and astrocytes, which are types of glial cells (cells that cover and protect nerve cells in the brain and spinal cord and help them work the way they should). An oligoastrocytoma is a type of mixed glioma.

**olfactory transduction :** A cell that forms the myelin sheath (a layer that covers and protects nerve cells) in the brain and spinal cord. An oligodendrocyte is a type of glial cell.

**oligoastrocytoma :** A rare, slow-growing tumor that begins in oligodendrocytes (cells that cover and protect nerve cells in the brain and spinal cord). Also called oligodendroglioma.

**oligodendrocyte :** A rare, slow-growing tumor that begins in oligodendrocytes (cells that cover and protect nerve cells in the brain and spinal cord). Also called oligodendroglial tumor.

**oligodendroglial tumor :** A substance that is used to improve the health of the digestive system and bones and is being studied in the prevention of colon cancer. Oligofructose-enriched inulin is made by combining two substances that occur naturally in many plants, including chicory root, wheat, bananas, onion, and garlic. Oligofructose-enriched inulin helps healthy bacteria grow in the intestines and helps the body absorb calcium and magnesium. Also called Raftilose Synergy 1.

**oligodendroglioma :** A type of metastasis in which cancer cells from the original (primary) tumor travel through the body and form a small number of new tumors (metastatic tumors) in one or two other parts of the body. For example, cancer cells may spread from the breast to form one or two new tumors in the brain or spread from the colon to form new tumors in the liver. These types of tumors may be treatable.

**oligofructose-enriched inulin:** A mixture of non-digestible carbohydrates, containing the fermentable plant fructans oligosaccharide and inulin, with potential prebiotic activity. Resisting hydrolysis by intestinal digestive enzymes, inulin and oligofructose serve as growth media and energy substrates for bifidobacteria in the colon; beneficial colonic commensal bacteria such as bifidobacteria may inhibit the colonization of the intestine by pathogenic bacteria and have been implicated to inhibit colon carcinogenesis. Oligofructose-enriched inulin may be administered in

combination with probiotic bifidobacteria. In addition, this agent may promote the absorption of calcium and magnesium from the gastrointestinal tract. or A drug used in cancer prevention.

**oligomer:** A molecule that consists of repeating molecular subunits--essentially a polymer but not as long. By analogy, if a yellow brick is a single subunit, the yellow brick road is a polymer, and the yellow brick driveway is an oligomer. OR A polymer made up with two, three or four monomer units, for example propylene tetramer. OR An oligomer is a molecule which is formed from a few smaller (identical) molecules joined together. Just as a monomer is one (mono) unit (mer) and a dimer is two (di) units, an oligomer is a few units. OR A short polymer, usually of amino acids, sugars, or nucleotides; the definition of "short" is somewhat arbitrary, but usually less than 50 subunits.

**oligomeric protein:** A multisubunit protein having two or more identical polypeptide chains.

**oligometastasis :** A drug used to treat certain types of chronic myelogenous leukemia (CML) that have not gotten better after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Omacetaxine mepesuccinate blocks certain proteins involved in cancer cell growth and may kill cancer cells. It is a type of plant alkaloid. Also called homoharringtonine and Synribo.

**Oligomycin:** An antibiotic that blocks ATP synthesis (and consequently the respiratory chain) by interfering with proton flow through the ATP synthase complex.

**Oligonucleotide:** A polynucleotide containing a small number of nucleotides. The linkages are the same as in a polynucleotide; the only distinguishing feature is the small size.

**oligonucleotide SPC2996:** A synthetic antisense oligonucleotide against Bcl-2 messenger RNA with potential antitumor activity. Oligonucleotide SPC2996 binds to and inactivates Bcl-2 mRNA, thereby inhibiting the expression of Bcl-2 protein, promoting tumor cell apoptosis, and potentially enhancing the efficacy of standard cytotoxic chemotherapy. Linked to tumor drug resistance, the antiapoptotic protein Bcl-2 is upregulated in several types of cancers.

**oligopeptide:** A few amino acids joined by peptide bonds.

**Oligosaccharide:** A molecule made up of several simple sugars linked together OR A molecule containing a small number of sugar residues joined in a linear or a branched structure by glycosidic bonds. OR

A carbohydrate that consists of only a few linked monosaccharide units. OR Several monosaccharide groups joined by glycosidic bonds.

**Oligosaccharides:** Carbohydrates composed of 2 to 12 monosaccharide units.

**olive oil extract/curcumin-based capsule:** A capsule containing an extract of olive oil, rich in polyphenols and curcumin, the polyphenol derived from the plant *Curcuma longa*, also known as turmeric, with potential anti-neoplastic, -angiogenic, -inflammatory, -oxidant and chemopreventive activities. The olive oil extract/curcumin-based capsule is rich in phytonutrients, especially polyphenols. Upon oral administration, the polyphenols, and other active ingredients in this supplement may exert anti-inflammatory activity by decreasing the production of inflammation mediators, such as TNF-alpha, interleukin (IL) 1-beta, IL-6, IL-10, interferon gamma, thromboxane B2, and leukotriene B4. They also inhibit a variety of pro-inflammatory enzymes, such as cyclooxygenase 1 (COX-1) and COX-2, block the formation of reactive-oxygen species and neutralize free radicals. In addition, curcumin and some other polyphenols disrupt cell signal transduction pathways involved in carcinogenesis. Specifically, curcumin inhibits cell invasion by inhibiting matrix metalloproteinase-9 (MMP-9) expression by suppressing NF-kB and AP-1 activation. Check for active clinical trials using this agent.

**olive oil/soya oil/egg lecithin-based emulsion:** An injectable, isotonic, nutritional lipid emulsion composed of approximately 80% refined olive oil and 20% refined soybean oil, used for parenteral nutrition. The olive oil/soya oil/egg lecithin emulsion provides about 15% of saturated fatty acids (SFA), 65% of mono-unsaturated fatty acids (MUFA) and 20% of essential poly-unsaturated fatty acids (EPUFA). Upon parenteral administration, the emulsion supplies calories, for energy, and essential fatty acids that can be incorporated into cell membranes. The fatty acids may decrease the production of certain pro-inflammatory cytokines, including interleukin 1 (IL-1), IL-6 and tumor necrosis factor (TNF). In addition to olive oil and soya oil, this lipid emulsion contains egg lecithin

and provides phosphorus and choline, which are needed to maintain cell membrane integrity.

**oltipraz** : A type of fat obtained in the diet and involved in immunity.

**omacetaxine mepesuccinate**: A semisynthetic formulation of the cytotoxic plant alkaloid homoharringtonine isolated from the evergreen tree *Cephalotaxus* with potential antineoplastic activity. Omacetaxine mepesuccinate binds to the 80S ribosome in eukaryotic cells and inhibits protein synthesis by interfering with chain elongation. This agent also induces differentiation and apoptosis in some cancer cell types. or Surgery to remove part or all of the omentum.

**omalizumab**: A humanized monoclonal antibody directed against the C-epsilon 3 domain of immunoglobulin E. Omalizumab binds to this IgE domain, thereby preventing IgE from binding to its high-affinity mast-cell receptor. Check for active clinical trials using this agent.

**ombitasvir/paritaprevir/ritonavir**: An orally bioavailable combination agent containing ombitasvir, an inhibitor of the hepatitis C virus (HCV) non-structural protein 5A (NS5A) replication complex, paritaprevir, a synthetic acylsulfonamide inhibitor of the HCV protease complex comprised of non-structural protein 3 and 4A (NS3/NS4A), and the cytochrome P450 (CYP) 3A4 inhibitor ritonavir, with potential activity against HCV. Upon oral administration of ombitasvir/paritaprevir/ritonavir, ombitasvir, enters the cell and binds to and blocks the activity of the NS5A protein. This results in the disruption of the viral RNA replication complex, blockage of HCV RNA production, and inhibition of viral replication. After intracellular uptake, paritaprevir reversibly binds to the active center and binding site of the HCV NS3/NS4A protease and prevents NS3/NS4A protease-mediated polyprotein maturation. This disrupts both the processing of viral proteins and the formation of the viral replication complex, which inhibits viral replication in HCV genotype 1-infected host cells. Although ritonavir is not active against HCV, it strongly inhibits the activity of CYP3A4, thereby blocking the degradation of paritaprevir, which is a CYP3A4 substrate. This leads to an increased concentration and half-life of paritaprevir as compared to the administration of paritaprevir without ritonavir. NS5A, a zinc-binding and proline-rich hydrophilic phosphoprotein, plays a crucial role in HCV RNA replication. NS3, a serine protease essential for the proteolytic cleavage of multiple sites within the

HCV polyprotein, plays a key role during HCV ribonucleic acid (RNA) replication. NS4A is an activating factor for NS3. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family, and infection is associated with the development of hepatocellular carcinoma (HCC).

**ombrabulin:** A synthetic water-soluble analogue of combretastatin A4, derived from the South African willow bush (*Combretum caffrum*), with potential vascular-disrupting and antineoplastic activities. Ombrabulin binds to the colchicine binding site of endothelial cell tubulin, inhibiting tubulin polymerization and inducing mitotic arrest and apoptosis in endothelial cells. As apoptotic endothelial cells detach from their substrata, tumor blood vessels collapse; the acute disruption of tumor blood flow may result in tumor necrosis. Check for active clinical trials using this agent.

**omega-3 fatty acid:** Any fatty acid that contains an unsaturated bond originating from the 3rd carbon from the methyl end. Omega-3 fatty acids do not occur naturally with chain lengths shorter than 16 carbon units. Or A fold of the peritoneum (the thin tissue that lines the abdomen) that surrounds the stomach and other organs in the abdomen.

**omentectomy :** A drug that inhibits gastric acid secretion.

**omentum :** A device surgically placed under the scalp and used to deliver anticancer drugs to the fluid surrounding the brain and spinal cord.

**omeprazole:** A benzimidazole with selective and irreversible proton pump inhibition activity. Omeprazole forms a stable disulfide bond with the sulfhydryl group of the hydrogen-potassium ( $H^+ - K^+$ ) ATPase found on the secretory surface of parietal cells, thereby inhibiting the final transport of hydrogen ions (via exchange with potassium ions) into the gastric lumen and suppressing gastric acid secretion. This agent exhibits no anticholinergic activities and does not antagonize histamine H<sub>2</sub> receptors. Check for active clinical trials using this agent. or A substance being studied in the treatment of cancer. It blocks certain proteins that are needed for cell growth and may kill cancer cells. ON 01910.Na is a type of protein kinase inhibitor and a type of benzyl styryl sulfone analog.

**omiganan pentahydrochloride:** A pentahydrochloride salt of omiganan, a synthetic cationic antimicrobial peptide with wide-spectrum activity against both gram-positive and gram-negative bacteria and fungi. Omiganan pentahydrochloride, an analog of indolicidin, acts by disrupting bacterial

cytoplasmic membranes and has been tested in a topical gel for the prevention of catheter-related bloodstream infections.

**Ommaya reservoir :** A drug used to treat certain medical conditions. These include severe underarm sweating and severe muscle spasms in the neck and shoulders. OnabotulinumtoxinA is also used to smooth wrinkles on the face. It is being studied in the treatment of pain in patients with skin leiomyomas (benign smooth muscle tumors) and other conditions. It is a form of a toxin made by the bacterium *Clostridium botulinum*.

**Omni-Grid :** Turn curve belting consisting of an assembly of metal links and rods, capable of accommodating turns in a conveyor system. Wire mesh and plastic overlays are available to give greater product support. Omni-Grid belts can also be used in straight run applications.

**Omni-Lite :** Omni-Lite is a High Density Polyethylene (HDPE) plastic overlay attachment that can be used in place of wire mesh overlay on Ashworth 1" pitch Heavy Duty Omni-Grid belts.

**Omni-Tough :** The Omni-Tough overlay has a flat surface and is made from high tensile strength spring stainless steel wire with a high resilience to impact. Omni-Tough is available in most mesh configurations.

**Omnipaque:** (Other name for: iohexol)

**OmniScan:** (Other name for: gadodiamide)

**omnivores:** animals that consume both plants and animals.

**ON 01910.Na:** A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the drug asparaginase that is linked to a substance called PEG, which makes the drug stay in the body longer. Asparaginase is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called PEG-asparaginase and pegaspargase.

**On-axis hole:** This is a hole that is concentric to the axis of revolution of the turned part. It is simply a hole on the end of a part and in the center.

**onabotulinumtoxinA :** A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the anticancer drug PEG-asparaginase that stays in the body longer. Oncaspar-IV is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called EZN-2285 and SC-PEG E. coli L-asparaginase.

**onartuzumab:** A humanized monovalent monoclonal antibody directed against the hepatocyte growth factor receptor (c-Met) with potential antineoplastic activity. Onartuzumab binds to the extracellular domain of c-Met, preventing the binding of its ligand, hepatocyte growth factor (HGF); the activation of the c-Met signaling pathway is thus inhibited, which may result in cell death in c-Met-expressing tumor cells. c-Met, a receptor tyrosine kinase, is overexpressed on the cell surfaces of a variety of cancer cell types and may play a key role in their proliferation, invasion and survival.

**Oncaspar :** A gene that is a mutated (changed) form of a gene involved in normal cell growth. Oncogenes may cause the growth of cancer cells. Mutations in genes that become oncogenes can be inherited or caused by being exposed to substances in the environment that cause cancer.

**Oncaspar-IV :** A doctor who has special training in diagnosing and treating cancer. Some oncologists specialize in a particular type of cancer treatment. For example, a radiation oncologist specializes in treating cancer with radiation.

**OncoGel:** (Other name for: PGLA/PEG copolymer-based paclitaxel)

**Oncogene:** A gene of cellular or viral origin that is responsible for rapid, unruly growth of animal cells. A cancer-causing gene. OR A gene whose expression contributes to the development of cancer. OR A cancer-causing gene; any of several mutant genes that cause cells to exhibit rapid, uncontrolled proliferation. See also proto-oncogene. OR A branch of medicine that specializes in the diagnosis and treatment of cancer. It includes medical oncology (the use of chemotherapy, hormone therapy, and other drugs to treat cancer), radiation oncology (the use of radiation therapy to treat cancer), and surgical oncology (the use of surgery and other procedures to treat cancer).

**OncoLAR:** (Other name for: octreotide pamoate)

**oncologist :** A nurse who specializes in treating and caring for people who have cancer.

**oncology :** A licensed pharmacist with special training in how to design, give, monitor, and change chemotherapy for cancer patients. Also called BCOP and board certified oncology pharmacy specialist.

**oncology nurse :** An extract made from cancer cells.

**oncology pharmacy specialist :** The lysis (breakdown) of cancer cells. This can be caused by chemical or physical means (for example, strong detergents or high-energy sound waves) or by infection with a strain of virus that can lyse cells.

**oncolysate :** Treatment using an oncolytic virus (a virus that infects and breaks down cancer cells but not normal cells ). Oncolytic virotherapy may make it easier to kill tumor cells with chemotherapy and radiation therapy. It is a type of targeted therapy. Also called oncolytic virus therapy, viral therapy, and virotherapy.

**oncolysis :** A type of virus that infects and lyses (breaks down) cancer cells but not normal cells. Oncolytic viruses can occur naturally or can be made in the laboratory by changing other viruses. Certain oncolytic viruses are being studied in the treatment of cancer. They may make it easier to kill tumor cells with chemotherapy and radiation therapy.

**oncolytic adenovirus Ad5-DNX-2401:** An adenovirus serotype 5 strain, selectively replication competent in cells defective in the Rb/p16 tumor suppressor pathway, with potential oncolytic activity. Oncolytic adenovirus Ad5-Delta 24RGD contains an integrin binding RGD-4C motif, allowing Coxsackie adenovirus receptor-independent infection of tumor cells, which are often deficient for Coxsackie and adenovirus receptors (CARs). Selectively replication competent in cells that are defective in retinoblastoma gene (Rb) or cyclin-dependent kinase inhibitor-2A (p16), active replication of oncolytic adenovirus Ad5-Delta 24RGD in tumor cells may induce oncolysis or cell lysis. As integral components of the late G1 restriction point, the Rb gene product and p16 are negative regulators of the cell cycle; ovarian cancer cells and non-small cell lung cancer cells may be defective in the Rb/p16 pathway.

**oncolytic adenovirus encoding GM-CSF:** A recombinant oncolytic adenovirus encoding the immunohematopoietic cytokine granulocyte-macrophage colony stimulating factor (GM-CSF) with potential antineoplastic activity. Upon administration, the oncolytic adenovirus selectively infects and replicates in tumor cells, which may result in tumor cells lysis. Synergistically, GM-CSF (sargramostim) expressed by the oncolytic adenovirus may promote a cytotoxic T cell response against tumor cells harboring the oncolytic adenovirus, resulting in an immune-mediated tumor cell death.

**oncolytic adenovirus ICOVIR5-infected autologous mesenchymal stem cells:** Bone marrow-derived autologous mesenchymal stem cells (MSCs) infected with the oncolytic, replication-competent adenovirus ICOVIR5, with potential antineoplastic activity. Upon infusion of the oncolytic adenovirus ICOVIR5-infected autologous MSCs, these cells target the adenovirus to tumors. The oncolytic virus then selectively transfects and replicates in the tumor cells causing a direct cytotoxic effect and lysis of the tumor cells. In addition, the viral infection may stimulate an immune response against the virally-infected tumor cells. This may lead to an inhibition of cancer cell proliferation. ICOVIR-5, a virus derived from wild-type human adenovirus serotype 5 (Had5), has been modified to selectively replicate in tumor cells that have a deregulated retinoblastoma/E2F pathway.

**oncolytic herpes simplex virus encoding GM-CSF:** An ICP34.5-, ICP47-deleted, oncolytic herpes simplex type-1 virus (HSV-1) isolated from the mouth of an HSV-1-infected patient of Chinese Han ethnicity, and encoding the immunostimulating factor cytokine granulocyte-macrophage colony stimulating factor (GM-CSF) with potential immunostimulating and antineoplastic activities. Upon administration, the recombinant human GM-CSF HSV-1 selectively infects and replicates in tumor cells, thereby inducing tumor cell lysis. In addition, GM-CSF attracts dendritic cells (DCs) and may stimulate a cytotoxic T cell response against tumor cells, which results in immune-mediated tumor cell death. Deletion of the gene encoding for ICP34.5 provides tumor selectivity and prevents replication in healthy cells. As ICP47 blocks antigen presentation in HSV-infected cells, deletion of this gene may induce a more potent antitumor immune response in the tumor cells. Additionally, deletion of ICP47 causes increased expression of the HSV US11 gene and allows US11 to be expressed as an immediate early and not a late gene. This further enhances the degree of viral replication and oncolysis of tumor cells. Interruption of the ICP6 gene, which encodes the large subunit of the viral ribonucleotide reductase, in the viral vector also enhances selective replication in tumor cells. Check for active clinical trials using this agent.

**oncolytic HSV-1 rRp450:** A gene therapy agent containing an attenuated, replication-competent, genetically engineered mutant form of the Herpes simplex virus 1 (HSV-1) strain KOS with potential antineoplastic activity. Upon infusion into the hepatic artery, oncolytic HSV-1 rRp450 replicates in

hepatocellular carcinoma (HCC) cells and exerts direct cytotoxic effects eventually disrupting cancer cell membranes and liberating progeny virions thereby infecting adjacent tumor cells. In addition, rRp450 expresses the cytochrome P450 transgene that activates oxazaphosphorines, such as cyclophosphamide (CPA). Therefore, CPA can become activated in the presence of rRp450 and exert its antineoplastic effect. rRp450 is deleted for the HSV-1 gene UL39, encoding the viral ribonucleotide reductase large subunit infected cell protein 6 (ICP6), thereby disrupting the activity of viral ribonucleotide reductase and resulting in the inhibition of nucleotide metabolism and viral DNA synthesis in nondividing cells but not in dividing cells. UL39 is replaced by the rat CYP2B1 gene, encoding a cytochrome P450 enzyme that activates oxazaphosphorines. rRp450 also expresses viral thymidine kinase, which activates the cancer prodrug ganciclovir.

**oncolytic HSV-1716:** A neuroattenuated, replication-restricted, ICP34.5 deleted (RL1 gene)-mutant herpes simplex virus (HSV) type I, constructed from wild-type strain 17, with potential oncolytic activity. Upon intratumoral injection, oncolytic HSV1716 transfects, replicates in, and lyses rapidly dividing cells such as tumor cells. Because the RL1 gene is deleted, HSV1716 is unable to replicate in non-dividing cells.

**oncolytic measles virus encoding thyroidal sodium iodide symporter:** An attenuated oncolytic Edmonston (Ed) strain of measles virus encoding the human thyroidal sodium iodide symporter (MV-NIS) with potential gene expression and antineoplastic activities. After attachment to and fusion with host tumor cell membranes, MV-NIS may induce tumor cell syncytia and tumor cell lysis. When combined with iodine 123 (I-123), expressed NIS facilitates uptake of I-123 by MV-NIS-infected tumor cells, allowing noninvasive imaging of these cells. MV-NIS may also enhance the oncolytic activity of MV against radiosensitive tumor cells by facilitating the uptake of iodine 131 (I-131) by MV-NIS-infected cells. The cellular receptor for MV is the human CD46 antigen, a type 1 integral membrane glycoprotein found on nearly all human tissues and overexpressed on many cancer cell types.

**oncolytic Newcastle disease virus:** An oncolytic viral agent containing the oncolytic, live-attenuated strain of the paramyxovirus Newcastle disease virus (NDV), with potential antineoplastic activity. Upon administration,

NDV specifically infects and replicates in cancer cells. This may result in a direct cytotoxic effect involving the lysis of tumor cells via apoptotic mechanisms and may eventually lead to an inhibition of cancer cell proliferation. Check for active clinical trials using this agent.

**oncolytic virotherapy** : Treatment using an oncolytic virus (a virus that infects and breaks down cancer cells but not normal cells ). Oncolytic virus therapy may make it easier to kill tumor cells with chemotherapy and radiation therapy. It is a type of targeted therapy. Also called oncolytic virotherapy, viral therapy, and virotherapy.

**oncolytic virus** : A substance being studied in the treatment of cancer. It is a type of ribonuclease enzyme. Also called ranpirnase.

**oncolytic virus therapy** : A vaccine made from a patient's tumor cells that may help the body's immune system kill cancer cells. This vaccine is used to treat kidney cancer, a type of brain cancer called glioma, and metastatic melanoma (a type of skin cancer that has spread). It is also being studied in the treatment of other types of cancer. Also called gp96 heat shock protein-peptide complex vaccine, gp96 HSP-peptide complex, and vitespen.

**Onconase** : A test that is used to help predict whether breast cancer will spread to other parts of the body or come back. The test looks at the activity of 21 different genes in breast cancer tissue of women who have early-stage breast cancer that is estrogen receptor positive and has not spread to the lymph nodes. If there is a high risk that the cancer will spread or come back, it may be used to help plan treatment with anticancer drugs. Also called 21-gene signature.

**Oncophage** : A drug used to treat acute leukemia. It is used in combination with other drugs to treat Hodgkin disease, non-Hodgkin lymphoma, rhabdomyosarcoma, neuroblastoma, and Wilms tumor. Oncovin is also being studied in the treatment of other types of cancer. It blocks cell growth by stopping cell division. It is a type of vinca alkaloid and a type of antimetabolic agent. Also called vincristine sulfate.

**Oncoquest-L vaccine**: (Other name for: autologous tumor cell proteoliposome chronic lymphocytic leukemia vaccine)

**Oncotype DX breast cancer assay** : A drug used to prevent nausea and vomiting caused by chemotherapy and radiation therapy. It is also used to prevent nausea and vomiting after surgery. Ondansetron hydrochloride blocks the action of the chemical serotonin, which binds to certain nerves

and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called Zofran.

**OncoVax-PR:** (Other name for: PSA prostate cancer vaccine)

**Oncovin :** A form of the anticancer drug irinotecan hydrochloride that is contained in very tiny, fat-like particles. Onivyde is used together with fluorouracil and leucovorin to treat a certain type of pancreatic cancer that has spread to other parts of the body and has gotten worse after treatment with gemcitabine anticancer therapy. It is also being studied in the treatment of other types of cancer. Irinotecan hydrochloride blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. Onivyde may have fewer side effects and work better than irinotecan hydrochloride. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called irinotecan hydrochloride liposome, liposome-encapsulated irinotecan hydrochloride PEP02, and PEP02.

**Oncoxin:** (Other name for: green tea extract-based antioxidant supplement)

**ondansetron:** A carbazole derivative with antiemetic activity. As a selective serotonin receptor antagonist, ondansetron competitively blocks the action of serotonin at 5HT<sub>3</sub> receptors, resulting in suppression of chemotherapy- and radiotherapy-induced nausea and vomiting. Check for active clinical trials using this agent.

**ondansetron hydrochloride:** The hydrochloride salt of the racemic form of ondansetron, a carbazole derivative and a selective, competitive serotonin 5-hydroxytryptamine type 3 (5-HT<sub>3</sub>) receptor antagonist with antiemetic activity. Although its mechanism of action has not been fully characterized, ondansetron appears to competitively block the action of serotonin at 5HT<sub>3</sub> receptors peripherally in the gastrointestinal tract as well as centrally in the area postrema of the CNS, where the chemoreceptor trigger zone (CTZ) for vomiting is located, resulting in the suppression of chemotherapy- and radiotherapy-induced nausea and vomiting. Check for active clinical trials using this agent. or A drug used to treat acute myelogenous leukemia (AML). It is also being studied in the treatment of several other types of cancer. It blocks cell growth by damaging the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called Cloretazine and Iaromustine.

**One-carbon metabolism:** Biochemical reactions in which tetrahydrofolate derivatives serve as donors of a variety of one-carbon units, ranging from the oxidation level of a methyl group to a formyl group; also includes reactions involving the fully oxidized carbon unit, carbon dioxide, and its carrier, biotin.

**Onivyde :** The length of time it takes for a medicine to start to work.

**ONLY ELECTRONS FLOW:** to produce ions. The protons are deep down in the nucleus and stay there. (Except in nuclear reactions, but that's another story ). So electrons are either added or subtracted to make ions.

**Onrigin :** A drug used to treat cutaneous T-cell lymphoma that can bind the cytokine IL-2 and that has not responded to other treatment. It is also being studied in the treatment of other types of cancer. Ontak is made by combining a part of IL-2 with a bacterial toxin. The IL-2 part of the drug attaches to the cancer cells and then the toxin kills the cells. Ontak is a type of immunotoxin and a type of fusion toxin. Also called denileukin diftitox.

**onset of action :** A modified cold virus that selectively grows in and destroys certain types of cancer cells and leaves normal cells undamaged.

**Onsolis:** (Other name for: fentanyl buccal soluble film)

**Ontak :** The process of freezing one or more unfertilized eggs (eggs that have not been combined with sperm) to save them for future use. The eggs are thawed and fertilized in the laboratory to make embryos that can be placed in a woman's uterus. Oocyte cryopreservation is being studied as a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called egg banking, egg cryopreservation, and egg freezing.

**Onyx:** (Other name for: ethylene-vinyl alcohol copolymer-based embolic agent)

**ONYX-015:** An E1B-55kDa-deleted adenovirus that is able to selectively replicate in and lyse TP53-deficient human tumor cells. After tumor cell lysis, released viruses infect neighboring tumor cells, tripping a chain of ONYX-015-mediated tumor cell cytotoxicity.

**ONYX-015:** Surgery to remove one or both ovaries.

**oocyte cryopreservation :** A procedure used to help keep a woman fertile by preventing damage to the ovaries during radiation therapy. Before

radiation therapy begins, one or both ovaries and fallopian tubes are separated from the uterus and attached to the wall of the abdomen away from where the radiation will be given. Oophoropexy may be useful for women who want to have children after having radiation therapy that can cause infertility. It is a type of fertility preservation. Also called ovarian transposition.

**oocytes:** the developed oogonia in a female after the age of puberty.

**oogonia:** primitive egg cells that accumulate in the ovaries before a female is born.

**oophorectomy :** A drug used to treat moderate to severe pain. It is also used as a sedative before surgery, to help with anesthesia during surgery, during labor, and to treat anxiety caused by some medical conditions. It is made from morphine and binds to opioid receptors in the central nervous system. Opana is a type of opioid and a type of analgesic agent. Also called Numorphan and oxymorphone hydrochloride.

**oophoropexy :** A drug used to treat classical Hodgkin lymphoma that has gotten worse after treatment with an autologous stem cell transplant and brentuximab vedotin (a type of anticancer drug). It is also used alone or with other drugs to treat certain types of melanoma, non-small cell lung cancer, and renal cell carcinoma (a type of kidney cancer). It is also being studied in the treatment of other types of cancer. Opdivo binds to a protein called PD-1, which is found on T cells (a type of white blood cell). Opdivo may block PD-1 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called nivolumab.

**OPACIFIER:** A substance, such as fatty acid esters, which, when added to a clear formulation, renders that formulation opaque - similar to pearlizer.

**Opacity:** A term to indicate the hiding power of pigmented (mostly white) plastic films. It is beneficial for packing materials sensitive to light (visible or ultraviolet). OR The amount of light that is blocked by a pigmented film. OR The degree of obscuration of light; for example, a glass window has almost 0% opacity, whereas a concrete wall has 100% opacity. OR The ability of a coat of paint to obliterate the surface to which it is applied. OR The ability of a paint to hide the previous surface or color.

**Opana :** A procedure in which a surgical incision (cut) is made through the skin to expose and remove tissues. The biopsy tissue is examined under a

microscope by a pathologist. An open biopsy may be done in the doctor's office or in the hospital, and may use local anesthesia or general anesthesia. A lumpectomy to remove a breast tumor is a type of open biopsy.

**Opaque:** Descriptive of a material or substance which will not transmit light. Opposite of transparent. Materials which are neither opaque nor transparent are sometimes described as semi-opaque, but are more properly classified as translucent.

**OPAQUE COATING:** A coating that hides the previous surface coating.

**OPCs/green tea,/spirullina/curcumin/antrodia camphorate/fermented soymilk extract capsule:** A capsule containing a fermented soymilk extract and oligomeric proanthocyanidins (OPCs), green tea, spirullina, curcumin and antrodia camphorate powder, with potential antioxidant, immunomodulating, anti-infective and anti-cancer activities. OPCs/green tea/spirullina/curcumin/antrodia camphorate/fermented soymilk extract capsule may boost the immune system and may alleviate fatigue and poor appetite in cancer chemotherapy patients.

**Opdivo :** An operation to remove all or part of the colon through a long incision made in the wall of the abdomen. When only part of the colon is removed, it is called a partial colectomy.

**Opdivo Injection:** (Other name for: nivolumab)

**opebacan:** An injectable formulation composed of opebacan, a 21 kDa recombinant fragment of human bactericidal/permeability-increasing protein (BPI), with potential anti-infective activity. Upon intravenous administration, opebacan is able to mimic BPI and binds to and neutralizes lipopolysaccharides (LPS or endotoxins), which are components of the cell wall of gram-negative bacteria that induce a potent innate immune response. This may prevent an endotoxin-mediated inflammatory response and may prevent graft-versus-host-disease (GvHD) after myeloablative allogeneic hematopoietic stem cell transplantation (aHSCT). BPI, a host-defense protein against microbial infection, is naturally produced by neutrophils. Chemotherapy and radiation therapy induce neutropenia and depletion of endogenous BPI. These therapies also cause intestinal damage and release of bacterial endotoxins into the bloodstream, which initiate a systemic inflammatory response, activate donor T-lymphocytes and possibly cause GvHD following aHSCT.

**open biopsy :** A type of study in which both the health providers and the patients are aware of the drug or treatment being given.

**Open circuit:** lack of electrical contact in any part of the measuring circuit (which consists of the sensing electrode, instrument, reference electrode and solutions). An open circuit is characterized by rapid large jumps in displayed potential, followed by an offscale reading. Frequent large erratic changes in potential indicate an intermittent open circuit.

**open colectomy :** Surgery to remove part or all of the prostate gland through an incision in the lower abdomen or perineum (the area between the anus and scrotum). An open prostatectomy may be done to remove an enlarged prostate gland in benign prostatic hyperplasia (BPH) or as a treatment for prostate cancer.

**open fold:** a broad feature in which the limbs of a fold dip at a gentle angle away from the crest of the fold.

**open label study :** Surgery to remove part or all of an organ or a tumor and nearby lymph nodes. The incision is large enough to let the surgeon see into the body.

**Open moulding:** Open moulding is the simplest and most widely used process to manufacture FRP parts. The mould is generally fabricated from FRP and is one sided. It can be male (part is moulded onto) or female (part is moulded into). The cosmetic surface of the part is fabricated next to the mould. The back of the mould is open.

**open prostatectomy :** Describes a condition that can be treated by surgery.

**open reading frame:** A group of contiguous nonoverlapping nucleotide codons in a DNA or RNA molecule that do not include a termination codon.

**open resection :** Having to do with the eye.

**open system:** A system that exchanges matter and energy with its surroundings. See also system.

**Opening :** Clear space on the carrying surface of the fabric between wires.

**Opening - Lateral :** The nominal inside distance between parallel wires, measured along a line perpendicular to the angle of weave to the nearest intersecting wire whether in the same or adjacent spiral. (Compound Balance Weave does not fall within this definition.)

**Opening - Longitudinal :** The nominal inside distance along the angle of weave measured between the connectors of the spirals. (Compound Balance Weave does not fall within this definition.)

**Operable:** A system, subsystem, train, component, or device is operable or has operability when it is capable of performing its specified functions and when all necessary attendant instrumentation, controls, electrical power, cooling or seal water, lubrication, or other auxiliary equipment that are required for the system, subsystem, train, component, or device to perform its functions are also capable of performing their related support functions. OR A method of delivering anticancer drugs directly to a tumor in the eye. A catheter (a thin, flexible tube) is put into an artery that leads to the eye and the anticancer drug is given through the catheter. A small balloon may then be put into the artery to block it, which keeps the anticancer drug near the tumor. Ophthalmic artery infusion may be used to treat certain types of retinoblastoma.

**Operating Pressure Range:** the range of pressures for which the component will perform normally.

**Operating Pressure Range:** the range of pressures for which the component will perform normally.

**Operational mode:** In a nuclear power reactor, an operational mode corresponds to any one inclusive combination of core reactivity condition, power level, and average reactor coolant temperature.

**Operator:** A DNA segment that is adjacent to a group of structural genes and is the target sequence for a repressor protein; a unit of gene regulation and expression that includes structural genes and regulatory elements recognized by one or more regulatory gene products. OR A region of DNA that interacts with a repressor protein to control the expression of a gene or group of genes. OR A group of contiguous genes that are coordinately regulated by two cis-acting elements, a promoter and an operator Found only in prokaryotic cells.

**operon:** A unit of genetic expression consisting of one or more related genes and the operator and promoter sequences that regulate their transcription.

**Operon model:** A model of prokaryotic gene regulation that consists of an operator sequence and its associated structural genes.

**ophiolite:** a mafic rock sequence at the earth's surface that is believed to be pieces of ancient oceanic crust that were thrust onto the continent during subduction and mountain-building.

**ophthalmic :** A doctor who has special training in diagnosing and treating eye problems, including injury and disease.

**ophthalmic artery infusion :** A lighted instrument used to examine the inside of the eye, including the retina and the optic nerve.

**ophthalmologist :** An exam that uses a magnifying lens and a light to check the fundus of the eye (back of the inside of the eye, including the retina and optic nerve). The pupils may be dilated (enlarged) with medicated eye drops so the doctor can see through the pupil to the back of the eye. Ophthalmoscopy may be used to check for eye problems, such as glaucoma, macular degeneration, eye cancer, optic nerve problems, or eye injury. Also called funduscopy and funduscopy.

**ophthalmoplegia:** paralysis or weakness of one or more of the muscles that control eye movement

**ophthalmoscope :** A substance used to treat pain or cause sleep. Opiates are made from opium or have opium in them. Opiates bind to opioid receptors in the central nervous system. Examples of opiates are codeine, heroin, and morphine. An opiate is a type of analgesic agent.

**ophthalmoscopy :** A substance used to treat moderate to severe pain. Opioids are like opiates, such as morphine and codeine, but are not made from opium. Opioids bind to opioid receptors in the central nervous system. Opioids used to be called narcotics. An opioid is a type of alkaloid.

**opiate :** A substance that relieves pain and is being studied in the treatment of some types of cancer. Opioid growth factors bind to cells in the body, including tumor cells, which have opioid growth factor receptors on the surface. This may help stop the growth of the tumor cells. It may also prevent the growth of blood vessels that tumors need to grow. An opioid growth factor is a type of biological response modifier and a type of antiangiogenesis agent. Also called OGF.

**opioid :** An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat a certain type of childhood Hodgkin lymphoma in females. It includes the drugs vincristine sulfate (Oncovin),

prednisone, procarbazine hydrochloride, and doxorubicin hydrochloride (Adriamycin). Also called OPPA regimen.

**opioid agonist GIC-1001:** A sulfonate-based salt form of a trimebutine derivative, an orally available, peripherally-acting opioid agonist and muscarinic antagonist, with potential visceral analgesic activity. Upon oral administration of GIC-1001, this agent may exert its therapeutic effects through the potential mechanisms of action for the trimebutine and sulfonate moieties: The trimebutine moiety can act as a motility enhancer in the gastrointestinal (GI) tract, as an antispasmodic agent to reduce colonic spasms, as an agonist of colonic mu and kappa opioid receptors, which could provide an analgesic effect, and blocks sodium channels and the release of a variety of GI peptides, which modulates the activity of visceral afferents. The sulfonate moiety releases hydrogen sulfide (H<sub>2</sub>S), which is involved, through an as of yet not fully elucidated mechanism of action, in the modulation of visceral perception and pain, possibly through the activation of ATP-sensitive potassium (K<sub>ATP</sub>) ion channels and mu opioid receptors. Altogether, administration of this agent may both facilitate the insertion of the colonoscope during a colonoscopy and reduce colonic spasms and pain.

**opioid agonist GIC-1002:** An orally available, peripherally-acting opioid agonist, with potential visceral analgesic activity. Upon oral administration of GIC-1002, this agent binds to colonic mu and kappa opioid receptors causing analgesic effects.

**opioid growth factor:** An endogenous pentapeptide with potential antineoplastic and antiangiogenic activities. Opioid growth factor (OGF) binds to and activates the opioid growth factor receptor (OGFr), present on some tumor cells and vascular cells, thereby inhibiting tumor cell proliferation and angiogenesis. or An abbreviation for a chemotherapy combination that is often used with radiation therapy to treat a certain type of childhood Hodgkin lymphoma in females. It includes the drugs vincristine sulfate (Oncovin), prednisone, procarbazine hydrochloride, and doxorubicin hydrochloride (Adriamycin). Also called OPPA.

**opium tincture:** Also known as laudanum and formulated for oral administration, opium tincture is made of air-dried poppy (*Papaver somniferum*) latex and contains alkaloids such as morphine and codeine. As an antidiarrheal agent, it slows transit of intestinal contents by increasing

intestinal smooth muscle tone and inhibiting motility; water is absorbed from fecal contents, decreasing diarrhea.

**OPPA:** An infection caused by an organism that does not normally cause disease. Opportunistic infections occur in people with weakened immune systems.

**OPPA regimen:** A regimen consisting of vincristine, prednisone, procarbazine and doxorubicin (OPPA) used in combination with radiation therapy for the treatment of female patients with childhood Hodgkin lymphoma with low-risk features. Or A drug used to increase the number of blood cells, especially platelets, in some cancer patients receiving chemotherapy. Oprelvekin is a form of interleukin-11 (a cytokine normally made by support cells in the bone marrow) that is made in the laboratory. It is a type of biological response modifier. Also called Neumega, recombinant human interleukin-11, and rhIL-11.

**opportunistic infection :** A substance being studied in the treatment of diarrhea caused by infection with *Clostridium difficile* (a type of bacteria that can grow without oxygen) in cancer patients. OPT-80 is a type of antibiotic. Also called PAR-101 and tiacumicin B.

**oprelvekin:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine interleukin 11 (IL-11). Secreted by bone marrow stromal cells and a number of mesenchymal cells, IL-11 binds to and activates its cell-surface receptor, promoting primary and secondary immune responses, modulating antigen-specific antibody reactions, and preventing apoptotic cell death. This agent also stimulates the T-cell-dependent development of IgG-secreting B-cells in spleen cell cultures and may be an important regulator of megakaryocytopoiesis. or The place in the brain where some of the optic nerve fibers coming from one eye cross optic nerve fibers from the other eye. Also called optic chiasma.

**oprozomib:** An orally bioavailable proteasome inhibitor with potential antineoplastic activity. Oprozomib inhibits the activity of the proteasome, thereby blocking the targeted proteolysis normally performed by the proteasome; this may result in an accumulation of unwanted or misfolded proteins. Disruption of various cell signaling pathways may follow, eventually leading to the induction of apoptosis and inhibition of tumor growth. Proteasomes are large protease complexes that degrade unneeded or damaged proteins that have been ubiquitinated.

**Opsin:** A 7TM receptor of rod cells that, when bound to 11-cis-retinal to form rhodopsin, absorbs visible light to initiate the visual signal-transduction pathway.

**OPT-80:** The place in the brain where some of the optic nerve fibers coming from one eye cross optic nerve fibers from the other eye. Also called optic chiasm.

**optic chiasm :** The nerve that carries messages from the retina to the brain.

**optic chiasma :** Inflammation of the optic nerve (the nerve that carries messages from the back of the eye to the brain). It may be caused by infection, drugs, toxins, and diseases of the immune system, such as multiple sclerosis. Symptoms include sudden changes in vision in one eye, including loss of vision and pain with eye movement. The symptoms often disappear within a few weeks.

**optic nerve :** A rare, slow-growing tumor that usually forms in the optic nerve, optic chiasm, or optic tract. These are parts of the nervous system that carry messages from the eye to the brain. Also called visual pathway glioma.

**optic neuritis :** The nerves that travel from the optic chiasm (place in the brain where some of the optic nerve fibers cross) into certain parts of the brain involved in vision.

**optic pathway glioma :** A procedure that uses infrared light waves to give three-dimensional (3-D) pictures of structures inside tissues and organs. The pictures are made by a computer linked to the light source. Also called OCT.

**optic tract :** In medicine, a technique that uses low power light, fiberoptic instruments, and detectors to examine tissue. It is being studied as a way to identify differences between normal cells and cells that may become cancer, and as a way to identify cancer cells that remain in the edges of tumor tissue removed from a patient.

**optical activity:** The capacity of a substance to rotate the plane of plane-polarized light. OR A substance that is capable of rotating plane-polarized light. Molecules of an optically active substance cannot be superimposed on their own mirror images, just as your left hand cannot be superimposed on your right when both are held palm-down. OR The property of a molecule that leads to rotation of the plane of polarization of plane-polarized light

when the latter is transmitted through the substance Chirality is a necessary and sufficient property for optical activity. OR the ability of some chemicals to rotate plane-polarized light. OR the nerve that carries impulses from the eye to the brain.

**Optical axis:** The direction in a crystal in which both components of the plane-polarized light are equal.

**optical coherence tomography :** The tendency to believe that there is good in everything and to have positive thoughts about most things that happen.

**Optical Comparator:** A device that applies the principles of optics to the inspection of manufactured parts. In a comparator, the magnified silhouette of a part is projected upon the screen, and the dimensions and geometry of the part are measured against prescribed limits.

**Optical goniometry:** See Reflective goniometry.

**optical isomer:** another name for an enantiomer.

**optical purity:** a number equal to the angle of rotation of a solution divided by the rotation of the pure enantiomer (x 100).

**Optical rotation:** The change in direction of polarization of linearly polarized light on passing through an optically active solution; can be used as an indicator of the main-chain conformation of a protein.

**optical spectroscopy :** By or having to do with the mouth.

**optical thickness (optical depth):** In calculating the transfer of radiant energy, the mass of an absorbing or emitting material lying in a vertical column of unit cross-sectional area and extending between two specified levels. Also, the degree to which a cloud prevents light from passing through it; the optical thickness then depends on the physical constitution (crystals, drops, and/or droplets), the form, the concentration, and the vertical extent of the cloud.

**Optical trap:** A means of measuring the force exerted by a single myosin molecule on an actin filament. In this device, a laser beam is focused on a bead, which is attached to an actin filament. The laser holds or traps the bead at the center of the beam. The strength of the force holding the beam may be adjusted by altering the intensity of the laser beam. The force exerted by a myosin molecule on the actin filament is measured as the force required to hold the bead in the optical trap.

**optimism** : A dentist who has special training in surgery of the mouth, face, and jaw.

**optimum pH**: The characteristic pH at which an enzyme has maximal catalytic activity.

**OptiPrep**: (Other name for: iodixanol)

**Optison**: (Other name for: perflutren protein-type A microspheres)

**Optoelectronic interface**: an element of the fiber optic chemical sensor, which can be regarded as transducer. Optoelectronic interface converts the light beam, after having interacted with the chemooptical interface, into an electrical signal. It contains a photodetector (e.g. photodiode) and an amplifier.

**Optomembrane** : the receptor part (chemooptical interface) of the fiber optic chemical sensor, containing an immobilized reagent (e.g. dye, indicator or chromoionophore).

**Optrode/Optode**: term, which comprises optic sensor or in certain cases only the optomembrane (receptor part of the optic sensor). The term optrode is related to optic+electrode, from the similar operation mode (dipping in the sample solution) of the ionselective electrodes and fiber optic chemical sensors.

**Ora-Testryl**: (Other name for: fluoxymesterone)

**Oracit**: (Other name for: sodium citrate)

**oral** : Cancer that forms in tissues of the oral cavity (the mouth) or the oropharynx (the part of the throat at the back of the mouth).

**oral aminolevulinic acid hydrochloride**: A powder for an oral solution comprised of the hydrochloride salt of 5-aminolevulinic acid (ALA) with a potential application for photodynamic therapy. After oral administration, ALA is converted intracellularly into the photosensitizer protoporphyrin IX (PpIX). Upon exposure to light of appropriate wavelength (violet to blue range), excited PpIX emits a characteristic red fluorescence which could facilitate guided resection, and generates excited singlet oxygen molecules that could kill cells when appropriate laser dosage is applied. ALA is preferentially taken up by and accumulates in many types of cancer cells compared to normal, healthy cells. Consequently, cancer cells can be visualized and can be distinguished from normal, healthy cells. Check for active clinical trials using this agent.

**oral and maxillofacial surgeon :** Refers to the mouth. It includes the lips, the lining inside the cheeks and lips, the front two thirds of the tongue, the upper and lower gums, the floor of the mouth under the tongue, the bony roof of the mouth, and the small area behind the wisdom teeth.

**oral azacitidine:** An orally bioavailable formulation of azacitidine, a pyrimidine nucleoside analogue of cytidine, with antineoplastic activity. Upon oral administration, azacitidine is taken up by cells and metabolized to 5-azadeoxycytidine triphosphate. The incorporation of 5-azadeoxycytidine triphosphate into DNA reversibly inhibits DNA methyltransferase, and blocks DNA methylation. Hypomethylation of DNA by azacitidine may reactivate tumor suppressor genes previously silenced by hypermethylation, resulting in an antitumor effect. In addition, the incorporation of 5-azacitidine triphosphate into RNA disrupts normal RNA function and impairs tRNA (cytosine-5)-methyltransferase activity, resulting in an inhibition of RNA and protein synthesis.

**oral cancer :** Cancer that forms in tissues of the oral cavity (the mouth). The tissues of the oral cavity include the lips, the lining inside the cheeks and lips, the front two thirds of the tongue, the upper and lower gums, the floor of the mouth under the tongue, the bony roof of the mouth, and the small area behind the wisdom teeth.

**oral cavity :** Treatment with drugs given by mouth to kill cancer cells or stop them from dividing.

**oral cavity cancer :** A pill used to prevent pregnancy. It contains hormones that block the release of eggs from the ovaries. Most oral contraceptives include estrogen and progesterin. Also called birth control pill.

**oral chemotherapy :** A dentist with special training in surgery of the mouth and jaw.

**oral contraceptive pill :** A substance being studied in the treatment of cancer. Orantinib blocks proteins involved in the growth and spread of cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called SU006668 and SU6668.

**oral fludarabine phosphate:** An oral formulation of the phosphate salt of fludarabine, a synthetic purine nucleoside analogue antimetabolite with antineoplastic activity. Fludarabine is preferentially transported into malignant cells and metabolized by deoxycytidine kinase to its active form,

2-fluoro-ara-ATP; 2-fluoro-ara-ATP competes directly with deoxyadenosine triphosphate (dATP) and inhibits alpha DNA polymerase, RNA reductase, and DNA primase, which may result in inhibition of DNA synthesis and cell death.

**oral Hsp90 inhibitor IPI-493:** An orally bioavailable formulation of the ansamycin derivative 17-amino-17-demethoxygeldanamycin (17-AG) with potential antineoplastic activity. Oral Hsp90 inhibitor IPI-493 binds to and inhibits Hsp90, which may result in growth inhibition in sensitive tumor cell populations. Hsp90, a 90 kDa molecular chaperone, may be highly expressed in tumor cells, playing a key role in the conformational maturation, stability and function of other substrate or "client" proteins within the cell; many of these client proteins are involved in signal transduction, cell cycle regulation and apoptosis, and may include kinases, transcription factors and hormone receptors.

**oral microencapsulated diindolylmethane:** An orally bioavailable microencapsulated formulation of diindolylmethane, an indole phytonutrient found in cruciferous vegetables, with estrogen-modulating, antiandrogenic, and potential antineoplastic activities. As a dimer of indole-3-carbinol, diindolylmethane (DIM) modulates estrogen balance by reducing the levels of 16-hydroxy estrogen metabolites and increasing the formation of beneficial 2-hydroxy estrogen metabolites. DIM also antagonizes androgen receptor activity, which may result in diminished cell proliferation and apoptosis in susceptible tumor cell populations. Pure DIM, which is relatively hydrophobic, is poorly absorbed after oral administration. This oral formulation, which consists of DIM, d-alpha-tocopheryl acid succinate, phosphatidylcholine, and silica microencapsulated in starch, significantly improves the gastrointestinal absorption of DIM.

**oral milataxel:** An orally bioavailable taxane with potential antineoplastic activity. Upon oral administration, milataxel and its major active metabolite M-10 bind to and stabilize tubulin, resulting in the inhibition of microtubule depolymerization and cell division, cell cycle arrest in the G2/M phase, and the inhibition of tumor cell proliferation. Unlike other taxane compounds, milataxel appears to be a poor substrate for the multidrug resistance (MDR) membrane-associated P-glycoprotein (P-gp) efflux pump and may be useful for treating multidrug-resistant tumors.

**oral picoplatin:** An oral preparation of picoplatin, a third generation platinum compound with antineoplastic activity. Designed to overcome platinum drug resistance, picoplatin alkylates DNA, forming both inter- and intra-strand cross-linkages, resulting in inhibition of DNA replication and RNA transcription and the induction of apoptosis. Because of the increase in steric bulk around the platinum center, there is a relative reduction in the inactivation of picoplatin by thiol-containing species such as glutathione and metallothionein in comparison to cisplatin.

**oral rehydration solution:** An aqueous solution composed of glucose and electrolytes, including sodium, potassium, chloride, magnesium, and phosphorus, with dehydration preventative and rehydration activities. Upon oral administration of the oral rehydration solution (ORS), water, electrolytes and glucose are absorbed from the gastrointestinal (GI) tract into the systemic circulation. This replenishes the body's supply of water, carbohydrates and electrolytes, and prevents both dehydration and renal dysfunction.

**oral sodium phenylbutyrate:** An orally active derivative of the short-chain fatty acid butyrate with potential antineoplastic activity. 4-Phenylbutyrate inhibits histone deacetylase, resulting in cell cycle gene expression modulation, reduced cell proliferation, increased cell differentiation, and apoptosis. This agent also initiates fragmentation of genomic DNA, resulting in decreased DNA synthesis and the inhibition of tumor cell migration and invasion.

**oral surgeon :** Surgery to remove one or both testicles. Also called orchiectomy.

**oral topotecan hydrochloride:** An oral formulation of the hydrochloride salt of topotecan, a semisynthetic derivative of the quinoline alkaloid camptothecin, with potential antineoplastic activity. Topotecan selectively inhibits topoisomerase I activity by stabilizing topoisomerase I-DNA covalent complexes during the S phase of the cell cycle, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery. Check for active clinical trials using this agent.

**Oralet:** (Other name for: fentanyl citrate)

**Oramorph:** (Other name for: morphine sulfate)

**Oramorph SR:** (Other name for: morphine sulfate)

**Orange Field:** Said of injection moldings that have unintentionally rough surfaces.

**Orange Peel:** A surface finish on a molded part usually caused by moisture in the mold cavity or poor heat transfer properties. OR A type of granular surface finish resembling the peel of an orange. OR The 'dimple' effect on a paint coating. With spray application it is often caused by insufficient thinning. With roller application it is usually caused by insufficient thinning and/or type of roller used. OR Film having the roughness of an orange due to poor roller or spray application.

**Orange peeling:** When spraying, insufficient thinning can create this 'dimple' effect on a paint coating. The same is true when using a roller, or it could be the wrong type of roller for the product used. In any case, to correct the fault, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Rub down with wet 'dry' abrasion, using water or a suitable solvent, then rinse down and allow to dry thoroughly prior to applying a new paint coating.

**orantinib:** An orally bioavailable receptor tyrosine kinase inhibitor. Orantinib binds to and inhibits the autophosphorylation of vascular endothelial growth factor receptor 2 (VEGFR2), platelet-derived growth factor receptor (PDGFR), and fibroblast growth factor receptor (FGFR), thereby inhibiting angiogenesis and cell proliferation. Orantinib also inhibits the phosphorylation of the stem cell factor receptor tyrosine kinase c-kit, often expressed in acute myelogenous leukemia cells. or Surgery to remove one or both testicles. Also called orchidectomy.

**Orathecin:** (Other name for: rubitecan)

**oraxol:** A combination formulation composed of a capsule containing the taxane compound paclitaxel and a tablet containing the multidrug resistance (MDR) efflux pump P-glycoprotein (P-gp) inhibitor HM30181A, with potential antineoplastic activity. Upon oral administration of oraxol, the HM30181A moiety binds to and inhibits P-gp, which prevents P-gp-mediated efflux of paclitaxel, therefore enhancing its oral bioavailability. In turn, paclitaxel binds to and stabilizes microtubules, preventing their depolymerization, which results in the inhibition of cellular motility, mitosis, and replication. Altogether, this may result in greater intracellular concentration of paclitaxel, and enhanced cytotoxicity against tumor cells,

when compared to the administration of paclitaxel alone. P-gp, encoded by the MDR-1 gene, is a member of the ATP-binding cassette (ABC) superfamily of transmembrane transporters; it prevents the intestinal uptake and intracellular accumulation of various cytotoxic agents.

**Orazol:** (Other name for: enteric-coated zoledronic acid tablet MER-101)

**orbit:** an area around an atomic nucleus where there is a high probability of finding an electron; also called a shell. An orbit is divided into orbitals, or subshells.

**Orbit:** An orbit is the path one object takes when it spins around another object. An electron has a path in a circle around the center of the atom. The Earth has an orbit around the sun. Since electrons can move in any direction around the center of the atom, their space is called a shell.

**orbital:** A region of space where there is a high probability of finding an electron in an atom or ion. OR The orbital is where an atom keeps its electrons. An atom can have up to seven orbitals. We also call it a shell. OR a component of a subshell occupied by up to 2 electrons. OR s the spherical orbital nearest the nucleus of an atom. OR an area in an orbit where there is a high probability of finding an electron; a subshell. All of the orbitals in an orbit have the same principal and angular quantum numbers. OR are the probability distributions of where electrons may be found in their atoms, s -orbitals are spherical, p - orbitals are dumbbell shaped. OR An energy state in the atomic model which describes where an electron will likely be. OR Usually an eigenfunction of a one-electron hamiltonian, e.g., from Hartree-Fock theory. A spin orbital has an explicit spin and a spatial orbital does not. Orbitals are probably the most useful concept from quantum chemistry: one can think of an atom or molecule as having a set of orbitals that are filled with electrons (occupied) or vacant (unoccupied or "virtual").

**orchidectomy :** A monoclonal antibody that is being studied in the treatment of ovarian cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Oregovomab binds to the CA-125 antigen, which is found on most ovarian cancer cells. Also called OvaRex.

**orchietomy :** A part of the body that performs a specific function. For example, the heart is an organ.

**order:** a grouping of similar families. OR The order of a reaction is the sum of concentration exponents in the rate law for the reaction. For example, a reaction with rate law  $d[C]/dt = k[A]^2[B]$  would be a third order reaction. Noninteger orders are possible.

**order of operations:** When an expression has multiple operations, they must be performed in the following order: 1) operations within parentheses; 2) exponents; 3) multiplication and division, from left to right; and 4) addition and subtraction, from left to right.

**Ordinary ray:** The component of plane-polarized light that travels through a uniaxial crystal with a constant velocity.

**ore:** An ore is a rock containing a metal or metal compound from which it is economically viable to extract the metal. OR A substance that can be used as a source of a metal. Haematite is an ore of iron. To be useful, an ore has to have a high enough percentage of the metal in it to be economically viable to extract.

**Ore flotation:** A common way for extracting particles of metal from an ore is to crush the ore into a fine powder, add water and surfactant, and bubble air through. Particles of many useful minerals, which are more hydrophobic than the rock that surrounds them, will stick to the surfactant bubbles and collect at the surface.

**oregovomab:** A murine monoclonal antibody that attaches to the tumor-associated antigen CA125. Vaccination with monoclonal antibody B43.13 may stimulate a host cytotoxic immune response against tumor cells that express CA125.

**oregovomab :** A small structure in a cell that is surrounded by a membrane and has a specific function. Examples of organelles are the nucleus (a structure that contains the cell's chromosomes and is where RNA is made), mitochondria (structures that make energy for the cell), and lysosomes (sac-like containers filled with enzymes that digest and help recycle molecules in the cell).

**Orencia:** (Other name for: abatacept)

**Orestralyne:** (Other name for: ethinyl estradiol)

**organ :** Food produced without the use of man-made fertilizer, drugs that increase growth, or drugs that kill insects, bacteria, or other living things. In

the United States, the Department of Agriculture sets standards for growing, harvesting, processing, and labeling organic foods.

**Organelle:** A subcellular membrane-bounded body with a well-defined function. OR microscopic bodies within the cytoplasm that perform distinct functions. OR Membrane-bounded structures found in eukaryotic cells; contain enzymes and other components required for specialized cell functions. OR A living thing, such as an animal, a plant, a bacterium, or a fungus.

**Organic:** When referring to chemical compounds, anything that contains carbon. The original definition was more like "any chemical found in or derived from a living organism" and most chemists still feel funny calling carbon monoxide or the carbonate ion ( $\text{CO}_3^{2-}$ ) organic compounds. OR refers to compounds based on carbon. OR Carbon-containing OR Compounds that contain carbon chemically bound to hydrogen. They often contain other elements (particularly O, N, halogens, or S). Organic compounds were once thought to be produced only by living things. We now know that any organic compound can be synthesized in the laboratory (although this can be extremely difficult in practice!)

**organic chemistry:** The study of compounds that contain carbon chemically bound to hydrogen, including synthesis, identification, modelling, and reactions of those compounds. OR the study of the compounds of carbon. OR A branch of chemistry dedicated to the study of the structures, synthesis, and reactions of carbon-containing compounds OR an area of chemistry dealing principally with the chemistry of carbon. OR originally applied to chemicals derived from living organisms, as distinguished from "inorganic" chemicals found in minerals and inanimate substances; modern chemist define organic chemicals more exactly as those, which contain the element carbon.

**Organic crystal:** A crystal consisting of a regular arrangement of organic molecules held together by van der Waals forces.

**Organic fluorophosphates:** Compounds such as diisopropylfluorophosphate, which inhibits acetylcholinesterase by forming a stable phosphoryl enzyme complex at a serine residue in the active site.

**organic food :** The final part of the sex act, which involves contraction of sexual organs and a sudden release of endorphins, leading to a feeling of pleasure. In males, orgasm usually occurs with release of semen.

**organic matter:** chemical compounds based on carbon chains or rings, and also containing hydrogen with or without oxygen, nitrogen, or other compounds.

**organic nitrogen:** nitrogen combined in organic molecules such as protein, amines, and amino acids.

**Organic polymer :** Organic polymers can be water soluble or water insoluble. Typical examples of water insoluble polymers are plastics. Water soluble organic polymers can be anionically or cationically charged, or they can be non-charged. Organic polymers can be long chained, like flocculants, or short chained, like antiscalting agents or organic coagulants. The origin of an organic polymer may be in synthetic building blocks, monomers, like in polyacrylamides, or it may be a natural based polymer, like starch.

**organic sedimentary rock:** a sedimentary rock composed primarily of accumulations of organic remains from plants or animals.

**Organic Synthesis:** A branch of chemical synthesis that focuses on the synthesis of organic molecules.

**Organisation for Economic Co-operation and Development (OECD):**

An intergovernmental organization (based in Paris, France) which provides a forum for discussion and cooperation among the governments of industrialized countries committed to democracy and the market economy. The primary goal of the OECD and its member countries is to support sustainable economic growth, boost employment, raise living standards, maintain financial stability, assist other countries' economic development, and contribute to growth in world trade. In addition, the OECD is a reliable source of comparable statistics and economic and social data. The OECD also monitors trends, analyzes and forecasts economic developments, and researches social changes and evolving patterns in trade, environment, agriculture, technology, taxation, and other areas.

**organism :** A medical system that has been used for thousands of years to prevent, diagnose, and treat disease. It is based on the belief that qi (the body's vital energy) flows along meridians (channels) in the body and keeps a person's spiritual, emotional, mental, and physical health in balance. Oriental medicine aims to restore the body's balance and harmony between the natural opposing forces of yin and yang, which can block qi and cause disease. Oriental medicine includes acupuncture, diet, herbal therapy,

meditation, physical exercise, and massage. Also called TCM and Traditional Chinese Medicine.

**Organization of the Petroleum Exporting Countries:** A powerful grouping of oil producing countries that seeks to maintain steady oil prices and regulate production. The current member nations are: Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, Vatican City and Venezuela.

**organochromic indicators:** Colored organic compounds that change color when they chelate different metals. Organochromic indicators are used to determine the endpoint in complexometric titrations. Examples of organochromic indicators are Eriochrom Black T, calmagite, and Eriochrom Cyanine R.

**Organometallic Chemistry:** A branch of chemistry that mainly studies the chemistry of compounds that contain Carbon-Metal bonds.

**organometallic reaction:** a reaction in which a metallic element adds between a carbon atom and an electronegative atom in an organic molecule.

**orgasm :** Cancer that forms in tissues of the oropharynx (the part of the throat at the back of the mouth, including the soft palate, the base of the tongue, and the tonsils). Most oropharyngeal cancers are squamous cell carcinomas (cancer that begins in flat cells lining the oropharynx).

**Oriental medicine :** The part of the throat at the back of the mouth behind the oral cavity. It includes the back third of the tongue, the soft palate, the side and back walls of the throat, and the tonsils.

**Orientation:** the alignment of the crystalline structure in polymeric materials so as to produce a highly uniform structure. Orientation can be accomplished by cold drawing or stretching during fabrication. OR the arrangement of the molecules of the melt. If the molecules are orientated, they are aligned with each other; if non-orientated they are not in alignment. In general, orientated material shrinks more than non-orientated material. OR The process of stretching a hot plastic article to align the molecules, thus altering mechanical properties. When the stretching force is applied in one direction, the process is called uniaxial orientation. When stretching is in two directions, the term biaxial orientation is used. Upon reheating, an oriented film will shrink in the direction(s) of orientation. This property is useful in applications such as shrink packaging, and for improving the strength of molded or extruded articles such as pipe and fibers.

**Oriental defect:** A defect at which the tenant molecule takes up an abnormal orientation.

**Orifice:** An opening in a mold or finished product. OR An opening in a dispensing closure or fitment from which the product is dispensed. OR The opening in the extruder die formed by the orifice bushing (ring) and mandrel.

**Orifice Bushing:** The outer part of the die in an extruder head.

**origin:** The nucleotide sequence or site in DNA where DNA replication is initiated.

**Original Equipment Manufacturer (OEM):** A company who makes components that are used in other products

**ormaplatin:** A platinum(IV) analogue with antineoplastic activity. Ormaplatin alkylates DNA, forming both inter- and intra-strand platinum-DNA crosslinks, which result in inhibition of DNA replication and transcription and cell-cycle nonspecific cytotoxicity.

**orogeny:** a mountain-building period or event. OR the folding, faulting, deformation, and metamorphism from the onset of intense tectonic stress that results in mountain-building.

**oropharyngeal cancer :** A drug used to treat, prevent, or diagnose an orphan disease. An orphan disease is a rare disease or condition that affects fewer than 200,000 people in the United States. Orphan diseases are often serious or life threatening. In 1983, the U.S. government passed a law, called the Orphan Drug Act, to give drug companies certain financial benefits for developing orphan drugs that are safe and effective.

**oropharynx :** A status given to certain drugs called orphan drugs, which show promise in the treatment, prevention, or diagnosis of orphan diseases. An orphan disease is a rare disease or condition that affects fewer than 200,000 people in the United States. Orphan diseases are often serious or life threatening. In 1983, the U.S. government passed a law, called the Orphan Drug Act, to give drug companies certain financial benefits for developing orphan drugs. This law is meant to help bring more drugs to patients with rare diseases.

**Orotidylate:** A nucleotide precursor to uridylate and cytidylate formed by the reaction of orotate with 5-phosphoribosyl-1-pyrophosphate (PRPP).

**Orphan Drug:** Pharmaceutical agents that are used to treat rare medical conditions.

**orphan drug :** A system in which medical doctors and other healthcare professionals (such as nurses, pharmacists, and therapists) treat symptoms and diseases using drugs, radiation, or surgery. Also called allopathic medicine, biomedicine, conventional medicine, mainstream medicine, and Western medicine.

**orphan drug designation :** A surgeon who has special training in diagnosing and treating injuries and diseases of the musculoskeletal system. This includes the bones, joints, tendons, ligaments, and muscles.

**Orplatna:** (Other name for: satraplatin)

**ortataxel:** A semisynthetic, second-generation taxane derivative with potential antineoplastic activity. Ortataxel binds to and stabilizes tubulin molecules, thereby interfering with the dynamics of microtubule assembly/disassembly. This results in the inhibition of cell division and cellular proliferation. As it represents a poor substrate for P-glycoprotein (P-gp), multi-drug resistance protein (MRP-1) and breast cancer resistance protein (BCRP) mediated efflux, ortataxel modulates multi-drug resistance mechanisms and may be useful for treating multi-drug resistant tumors that express Pgp, MRP-1 and BCRP.

**orteronel:** An orally bioavailable non-steroidal androgen synthesis inhibitor of steroid 17alpha-monooxygenase (17,20 lyase) with potential antiandrogen activity. Orteronel binds to and inhibits the steroid 17alpha-monooxygenase in both the testes and adrenal glands, thereby inhibiting androgen production. This may decrease androgen-dependent growth signaling and may inhibit cell proliferation of androgen-dependent tumor cells. The cytochrome P450 enzyme CYP17A1 (P450C17), localized to the endoplasmic reticulum (ER), exhibits both 17alpha-hydroxylase and 17,20-lyase activities, and plays a key role in the steroidogenic pathway that produces steroidal hormones, such as progestins, mineralocorticoids, glucocorticoids, androgens, and estrogens.

**Ortho-Novum:** (Other name for: ethinyl estradiol/norethindrone)

**Ortho-Xylene:** Ortho-Xylene is an aromatic compound with two methyl groups substituted onto the benzene ring. Ortho-xylene is recovered from a mixed xylenes stream by fractionation. Its main application is for phthalic anhydride, which is used in plasticiser production.

**Orthoclone OKT3:** (Other name for: muromonab-CD3)

**orthodox medicine :** In medicine, refers to something that occurs in the normal or usual place in the body. It is often used to describe tissue or an organ that is transplanted into its normal place in the body.

**Orthologs:** Homologous molecules that are present within different species and have similar or identical functions.

**orthopedic surgeon :** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, that patients diagnosed with the disease are still alive. In a clinical trial, measuring the OS is one way to see how well a new treatment works. Also called overall survival.

**orthophosphate:** an acid or salt containing phosphorus as  $PO_4$ , such as  $K_3PO_4$  (potassium phosphate).

**Orthorhombic Crystal:** This crystal forms a prism that has three edges at ninety-degree angles.

**Orthorhombic crystal class:** A crystal class containing three mutually perpendicular two-fold rotation axes. This class consists of 59 space groups and has one restriction: all of the angles are equal to  $90^\circ$ . There are no restrictions on the lengths of the axes.

**orthotopic :** A drug used to prevent and to treat influenza virus infections. It blocks the release of the virus from infected cells. It is a type of antiviral agent. Also called Tamiflu.

**Orudis:** (Other name for: ketoprofen)

**Oruvail:** (Other name for: ketoprofen)

**OS:** A drug used to treat certain types of non-small cell lung cancer. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that cannot be removed by surgery or has spread to other parts of the body. It is being studied in the treatment of other types of cancer. OSI-774 blocks a protein called epidermal growth factor receptor (EGFR), which may help keep cancer cells from growing. It is a type of EGFR tyrosine kinase inhibitor. Also called CP-358,774, erlotinib hydrochloride, and Tarceva.

**Oscillating Seal:** Most commonly used in faucet valves, in this application the inner or outer member of the gland moves in an arc around the axis of a shaft. Movement is limited to a few turns in one direction and a few turns in the return direction (i.e. faucet on, faucet off)

**OSE 2101:** A proprietary cancer DNA vaccine that contains multiple natural and modified epitopes derived from the four tumor associated antigens, CEA, HER2/neu, p53, and MAGE 2/3. OSE 2101 also includes CAP1-6D, a heteroclitic CEA analog, and PADRE, a proprietary universal T-cell epitope that serves to enhance the immunogenicity of the epitopes. This agent has been shown to elicit cytotoxic T-lymphocyte responses against tumor cells expressing these multiple epitopes.

**oseltamivir phosphate:** The phosphate salt of oseltamivir, a synthetic derivative prodrug of ethyl ester with antiviral activity. By blocking neuraminidases on the surfaces of influenza viruses, oseltamivir interferes with host cell release of complete viral particles. Or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called thymidylate synthase inhibitors.

**OSI-774:** A substance being studied in the treatment of cancer. It blocks a protein called IGF-1R, which is found at high levels in some types of tumors. IGF-1R is needed for cell growth and blocking it may cause tumor cells to die. OSI-906 is a type of IGF-1R inhibitor. Also called IGF-1R inhibitor OSI-906.

**OSI-7904L:** A liposome-encapsulated formulation of the benzoquinazoline folate analog OSI-7904 with antineoplastic activity. As a thymidylate synthase inhibitor, OSI-7904 noncompetitively binds to thymidylate synthase, resulting in inhibition of thymine nucleotide synthesis and DNA replication. Liposome encapsulation improves the efficacy and increases the half-life of OSI-7904. or A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of a cell protein called epidermal growth factor receptor and whose disease got worse during or after treatment with an anticancer drug that blocks EGFR. It is also being studied in the treatment of other types of cancer. Osimertinib blocks this mutated protein, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor. Also called Tagrisso.

**OSI-906:** The concentration of particles dissolved in a fluid. The osmolality of serum can help diagnose several medical conditions such as dehydration, diabetes, and shock.

**osimertinib:** An orally available, irreversible, third-generation, mutant-selective epidermal growth factor receptor (EGFR) inhibitor, with potential

antineoplastic activity. Upon oral administration, osimertinib selectively and covalently binds to and inhibits the activity of the mutant forms of EGFR, including the T790M EGFR mutant form, thereby preventing EGFR-mediated signaling. This may both induce cell death and inhibit tumor growth in EGFR-overexpressing tumor cells. EGFR, a receptor tyrosine kinase overexpressed or mutated in many types of cancers, plays a key role in tumor cell proliferation and tumor vascularization. As osimertinib inhibits T790M, a secondarily acquired resistance mutation, this agent may have therapeutic benefits in tumors with T790M-mediated resistance. As this agent is selective towards mutant forms of EGFR, its toxicity profile may be reduced as compared to non-selective EGFR inhibitors, which also inhibit wild-type EGFR. Check for active clinical trials using this agent. or Having to do with osmosis (the passage of a liquid through a membrane from a less concentrated solution to a more concentrated one). This causes the more concentrated solution to become diluted, and makes the concentrations in both solutions more equal. Osmotic also refers to a type of laxative that increases the amount of water in the large intestine, which softens the stool to help it pass more easily.

**Osmitol:** (Other name for: mannitol)

**Osmium:** Symbol:"Os" Atomic Number:"76" Atomic Mass: 190.20amu. This element is one of the transition elements. Osmium is found in nature with platinum and nickel. It actually has the highest melting point of the group and is used in alloys that require a lot of strength.

**osmolality :** A chronic condition in which both the breakdown and regrowth of bone are increased. Osteitis deformans occurs most frequently in the pelvic and leg bones, skull, and lower spine. It is most common in older individuals, and may lead to bone pain, deformities, and fractures. Also called Paget disease of bone.

**osmometry:** Determination of the average molecular weight of a dissolved substance from measurements of osmotic pressure.

**osmosis:** The movement of solvent molecules through a membrane from region of lower solute concentration to a region of higher solute concentration. OR This process happens when water molecules move from an area of high concentration to low concentration. They need to pass through a semi-permeable membrane. It often happens when larger molecules are not able to cross the membrane and concentrations need to be

evened out. OR the movement of water molecules across a membrane from a region of high concentration to a region of low concentration. OR The movement of a solvent across a membrane in the direction that tends to equalize concentrations of solute on the two sides of the membrane. OR Passage of solvent molecules from a dilute solution through a semipermeable membrane to a more concentrated solution. OR Bulk flow of water through a semipermeable membrane into another aqueous compartment containing solute at a higher concentration.

**osmotic** : A benign (not cancer) tumor that has both bone and cartilage in it. This type of tumor usually occurs at the ends of the long bones of the arms and legs or in the pelvis or shoulder. It may cause abnormal growth of the arms, hands, and legs; problems moving the joints; and pain, numbness, and tingling. There may be one or more tumors, and having multiple tumors runs in families. Osteochondromas may also occur at some point in time after cancer treatment, such as stem cell transplant.

**Osmotic Pressure:** Where two solutions of different concentration are separated by a membrane which the solvent molecules can move through, but the dissolved particles (solute) can't, the solvent will move from the less concentrated to the more concentrated solution to attempt to equalise the concentrations. The pressure that must be exerted on the solution to stop this influx of solvent is called the Osmotic Pressure, which is given by a simple equation for dilute solutions:  $\text{Pressure} = 8.314 \times (\text{Temperature}) \times (\text{difference in number of solute molecules per litre})$  OR The pressure generated by the mass flow of water to that side of a membrane-bounded structure that contains the higher concentration of solute molecules. A stable osmotic pressure is seen in systems in which the membrane is not permeable to some of the solute molecules. OR Pressure which must be applied to a solution to prevent water from flowing in via a semipermeable membrane. OR Pressure generated by the osmotic flow of water through a semipermeable membrane into an aqueous compartment containing solute at a higher concentration.

**Ossirene:** (Other name for: ammonium trichlorotellurate)

**Ostarine:** (Other name for: enobosarm)

**osteitis deformans** : A cancer of the bone that usually affects the large bones of the arm or leg. It occurs most commonly in young people and affects more males than females. Also called osteosarcoma.

**osteochondroma** : Causing the breakdown of bone.

**osteogenic sarcoma** : A condition in adults in which bones become soft and deformed because they don't have enough calcium and phosphorus. It is usually caused by not having enough vitamin D in the diet, not getting enough sunlight, or a problem with the way the body uses vitamin D. Symptoms include bone pain and muscle weakness. When the condition occurs in children, it is called rickets. Also called adult rickets.

**osteolytic** : Inflammation of the bone caused by an infection, which may spread to the bone marrow and tissues near the bone. Osteomyelitis can cause severe pain in the infected bone. If it is not treated, it can kill bone tissue.

**Osteomalacia**: A clinical condition in adults that is due to vitamin D deficiency and is characterized by softening and weakening of the bones. OR A condition in which there is a loss of blood flow to bone tissue, which causes the bone to die. It is most common in the hips, knees, shoulders, and ankles. It may be caused by long-term use of steroid medicines, alcohol abuse, joint injuries, and certain diseases, such as cancer and arthritis. It may also occur at some point in time after cancer treatment that included methotrexate, bisphosphonates, or corticosteroids. Also called aseptic necrosis, avascular necrosis, and ischemic necrosis.

**osteomyelitis** : A condition in which there is a lower-than-normal bone mass or bone mineral density (the amount of bone mineral contained in a certain amount of bone). Osteopenia is a less severe form of bone loss than osteoporosis.

**osteonecrosis** : A condition that is marked by a decrease in bone mass and density, causing bones to become fragile.

**osteopenia** : A cancer of the bone that usually affects the large bones of the arm or leg. It occurs most commonly in young people and affects more males than females. Also called osteogenic sarcoma.

**osteoporosis** : An operation to create an opening (a stoma) from an area inside the body to the outside. Colostomy and urostomy are types of ostomies.

**osteosarcoma** : Refers to a medicine that can be bought without a prescription (doctor's order). Examples include analgesics (pain relievers),

such as aspirin and acetaminophen. Also called nonprescription and over-the-counter.

**ostomy :** A doctor who has special training in diagnosing and treating diseases of the ear, nose, and throat. Also called ENT doctor.

**Ostwald ripening:** A spontaneous process during which ultrafine (high-energy) crystals dissolve and the corresponding material redeposits on larger crystals.

**OTC:** A measure of weight (one-sixteenth pound) and volume (one-eighth cup).

**otlertuzumab:** A recombinant single-chain polypeptide engineered to exhibit the full binding and activity of an anti-CD37 monoclonal antibody with potential immunostimulatory and antineoplastic activities.

Otlertuzumab binds to CD37 on B-cells, which may result in antibody-dependent cell-mediated cytotoxicity (ADCC) and apoptosis. CD37 is a transmembrane glycoprotein expressed at high-levels on B cells and to a lesser extent on T cells and myeloid cells. This agent may have a longer half-life in vivo than conventional monoclonal antibodies.

**otolaryngologist :** A specific result or effect that can be measured.

Examples of outcomes include decreased pain, reduced tumor size, and improvement of disease.

**OTR:** Oxygen transmission rate measured by the amount of oxygen which passes across the film.

**OTR Oxygen transmission rate:** OTR of plastic materials varies considerably with humidity; therefore it needs to be specified. Standard conditions of testing are 0, 60 or 100% relative humidity. Units are cc.100 square inches/24 hours, (or cc/square meter/24 Hrs.) (cc = cubic centimeters)

**ounce :** A patient who visits a health care facility for diagnosis or treatment without spending the night. Sometimes called a day patient.

**Out Run :** Length of belt from the point tangent to the cage or turn to discharge of the product. Also known as out feed.

**OUT-OF-ROUND:** Non uniform radius or diameter.

**Outage:** The period during which a generating unit, transmission line, or other facility is out of service. Outages may be forced or scheduled, and full or partial.

**Outage (full forced):** A forced outage that causes a generating unit to be removed from the Committed state (when the unit is electrically connected and generating or pumping) or the Available state (when the unit is available for dispatch as a generator or pump but is not electrically connected and not generating or pumping). Full-forced outages do not include failed starts.

**Outage (scheduled):** The shutdown of a generating unit, transmission line, or other facility for inspection, maintenance, or refueling, which is scheduled well in advance (even if the schedule changes). Scheduled outages do not include forced outages and could be deferred if there were a strong commercial reason to do so.

**outcome :** A monoclonal antibody that is being studied in the treatment of ovarian cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. OvaRex binds to the CA-125 antigen, which is found on most ovarian cancer cells. Also called oregovomab.

**outcrop:** a bedrock exposure at the surface of the earth.

**outer core:** the iron- and nickel-rich liquid layer near the center of the Earth. OR the outer shell of the core, between the mantle and the inner core, that is inferred to be molten (liquid).

**Outer Die Ring:** The element of tubing die that shapes the outer surface of a tube.

**outer-shell electron:** see valence electron.

**outgassing:** gases that escape to the atmosphere during volcanic eruptions. OR to remove occluded gases by heating. OR A phenomenon wherein a substance (i.e. silicone or natural rubber) spontaneously releases volatile constituents in the form of vapors or gases normally during curing process with liquid silicone rubber.

**outline:** establishes an overall pattern of organization for an essay; they may be formal or informal but are essential to good writing.

**outpatient :** Having to do with the ovaries, the female reproductive glands in which the ova (eggs) are formed. The ovaries are located in the pelvis, one on each side of the uterus.

**outwash:** the sediments deposited by glacial meltwater.

**outwash plain:** sandy area downstream from a moraine created by drift particles and meltwater from a glacier. OR the broad front of outwash associated with an ice sheet.

**ovapuldencel-T:** A cancer vaccine consisting of autologous dendritic cells (DCs) loaded with autologous, lethally irradiated cancer cells and mixed with the cytokine granulocyte-macrophage colony stimulating factor (GM-CSF), with potential immunostimulatory and antineoplastic activities. Upon vaccination, ovapuldencel-T may stimulate the immune system to exert a cytotoxic T-lymphocyte (CTL) immune response against the repertoire of tumor associated antigens (TAAs) found in the irradiated cancer cells. GM-CSF enhances the activation of dendritic cells (DCs) and promotes antigen presentation to both B- and T-lymphocytes.

**OvaRex :** Treatment that stops or lowers the amount of estrogen made by the ovaries. Types of ovarian ablation include surgery to remove both ovaries, radiation therapy, and the use of certain drugs. Ovarian ablation may be used to prevent and treat breast cancer. Also called ovarian suppression.

**ovarian :** A condition in which cells that may become cancer form in the thin layer of tissue that covers an ovary (female reproductive gland in which eggs are made). In this condition, tumor cells rarely spread outside of the ovary. Also called ovarian low malignant potential tumor.

**ovarian ablation :** Cancer that forms in tissues of the ovary (one of a pair of female reproductive glands in which the ova, or eggs, are formed). Most ovarian cancers are either ovarian epithelial cancers (cancer that begins in the cells on the surface of the ovary) or malignant germ cell tumors (cancer that begins in egg cells). Fallopian tube cancer and primary peritoneal cancer are similar to ovarian epithelial cancer and are staged and treated the same way.

**ovarian borderline malignant tumor :** Cancer that forms in the tissue covering the ovary (one of a pair of female reproductive glands in which eggs are made). Most ovarian cancers are ovarian epithelial cancers. Fallopian tube cancer and primary peritoneal cancer are similar to ovarian epithelial cancer and are staged and treated the same way. Also called epithelial ovarian cancer.

**ovarian cancer :** An abnormal mass of tissue that forms in germ (egg) cells in the ovary (female reproductive gland in which the eggs are formed).

These tumors usually occur in teenage girls or young women, usually affect just one ovary, and can be benign (not cancer) or malignant (cancer). The most common ovarian germ cell tumor is called dysgerminoma.

**ovarian cancer peptide vaccine:** A cancer vaccine comprised of synthetic peptides corresponding to naturally-occurring peptides derived from ovarian cancer cell antigens. Ovarian cancer peptide vaccine may elicit a cytotoxic T-cell response against tumor cells expressing the related ovarian cancer cell antigens.

**ovarian cancer stem cell/hTERT/survivin mRNAs-loaded autologous dendritic cell vaccine:** A cancer vaccine containing autologous dendritic cells (DCs) that are transfected with mRNAs extracted from amplified ovarian cancer stem cells, and mRNAs of the universal tumor antigens human telomerase reverse transcriptase (hTERT) and survivin with potential immunostimulatory and antineoplastic activities. Upon administration, ovarian cancer stem cell/hTERT/survivin mRNAs-loaded autologous DC-006 vaccine may elicit a highly specific cytotoxic T-cell (CTL) response against ovarian cancer cells expressing hTERT, survivin, and specific ovarian cancer stem cell antigens. hTERT, the catalytic subunit of human telomerase, and survivin, a member of the inhibitor of apoptosis (IAP) family of proteins, may be upregulated in certain tumor cell types, playing key roles in tumor cell growth and survival. Ovarian cancer stem cells contain a specific range of antigens that are essential for the neoplastic growth and survival of ovarian cancer cells. Check for active clinical trials using this agent.

**ovarian epithelial cancer :** A condition in which cells that may become cancer form in the thin layer of tissue that covers an ovary (female reproductive gland in which eggs are made). In this condition, tumor cells rarely spread outside of the ovary. Also called ovarian borderline malignant tumor.

**ovarian germ cell tumor :** A procedure done during radiation therapy in which a protective cover is placed on the outside of the body, over the area of the ovaries and other parts of the female reproductive system (ovaries, fallopian tubes, uterus, cervix, and vagina). This may prevent damage from radiation therapy. Ovarian shielding is a type of fertility preservation.

**ovarian low malignant potential tumor :** Treatment that stops or lowers the amount of estrogen made by the ovaries. Types of ovarian suppression

include surgery to remove both ovaries, radiation therapy, and the use of certain drugs. Ovarian suppression may be used to prevent and treat breast cancer. Also called ovarian ablation.

**ovarian shielding :** The process of freezing ovarian tissue to save for future infertility treatment. Part or all of an ovary is removed, and the tissue that contains the eggs is cut into thin slices and frozen. The tissue may later be thawed and placed back into the woman's body, usually on the remaining ovary. Ovarian tissue banking is a type of fertility preservation. It may be useful for women who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Also called ovarian tissue cryopreservation and ovarian tissue freezing.

**ovarian suppression :** The process of freezing ovarian tissue to save for future infertility treatment. Part or all of an ovary is removed, and the tissue that contains the eggs is cut into thin slices and frozen. The tissue may later be thawed and placed back into the woman's body, usually on the remaining ovary. Ovarian tissue cryopreservation is a type of fertility preservation. It may be useful for women who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Also called ovarian tissue banking and ovarian tissue freezing.

**ovarian tissue banking :** The process of freezing ovarian tissue to save for future infertility treatment. Part or all of an ovary is removed, and the tissue that contains the eggs is cut into thin slices and frozen. The tissue may later be thawed and placed back into the woman's body, usually on the remaining ovary. Ovarian tissue freezing is a type of fertility preservation. It may be useful for women who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Also called ovarian tissue banking and ovarian tissue cryopreservation.

**ovarian tissue cryopreservation :** A procedure used to help keep a woman fertile by preventing damage to the ovaries during radiation therapy. Before radiation therapy begins, one or both ovaries and fallopian tubes are separated from the uterus and attached to the wall of the abdomen away from where the radiation will be given. Ovarian transposition may be useful for women who want to have children after having radiation therapy that can cause infertility. It is a type of fertility preservation. Also called oophoropexy.

**ovarian tissue freezing :** One of a pair of female reproductive glands in which the ova, or eggs, are formed. The ovaries are located in the pelvis, one on each side of the uterus.

**ovarian transposition :** Too much thyroid hormone. Symptoms include weight loss, chest pain, cramps, diarrhea, and nervousness. Also called hyperthyroidism.

**ovarian tumor antigen-activated autologous dendritic cell vaccine:** A dendritic cell (DC)-based cancer vaccine composed of autologous dendritic cells (DCs) activated with an ovarian tumor cell lysate containing tumor-associated antigens (TAAs) with potential immunostimulatory and antineoplastic activities. Upon administration, the ovarian tumor antigen-activated autologous DC vaccine may stimulate an anti-tumoral cytotoxic T-lymphocyte (CTL) response against ovarian cancer cells expressing ovarian tumor cell-specific antigens, which may result in ovarian tumor cell lysis.

**ovary:** an endocrine gland that secretes estrogens. In plants, the structure of the pistil where the ovules are enclosed.

**ovary :** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, that patients diagnosed with the disease are still alive. In a clinical trial, measuring the overall survival is one way to see how well a new treatment works. Also called OS.

**OVax:** (Other name for: autologous dinitrophenyl-modified ovarian cancer vaccine)

**Ovcon:** (Other name for: ethinyl estradiol/norethindrone)

**Over Molding:** A process in which a mold cavity is first partially filled with one plastic, then a second shot is injected to encapsulate the first shot. OR A two-shot process, in which two plastic substances, are injected into a mold sequentially, usually a harder base material with a coating of softer material.

**over-the-counter :** Being too heavy for one's height. Excess body weight can come from fat, muscle, bone, and/or water retention. Being overweight does not always mean being obese.

**overactive thyroid :** The percentage of people in a study or treatment group who are still alive for a certain period of time after they were diagnosed with or started treatment for a disease, such as cancer. The

overall survival rate is often stated as a five-year survival rate, which is the percentage of people in a study or treatment group who are alive five years after their diagnosis or the start of treatment. Also called survival rate.

**overall survival :** Finding cases of cancer with a screening test (such as a mammogram or PSA test) that will never cause any symptoms. These cancers may just stop growing or go away on their own. Some of the harms caused by overdiagnosis are anxiety and having treatments that are not needed.

**overall survival rate :** An amount of drug that is more than what should be taken at one time.

**Overcap:** A cap (usually plastic) provided with some cans. It is used to cover the open end once the can has been opened. Sometimes, it is used to describe a cap which is used to cover the primary closure or other dispensing system, such as a fingertip sprayer or aerosol valve.

**Overcoating:** In extrusion coating, the practice of extruding a web beyond the edge of the substrate web.

**overdiagnosis :** In biology, to make too many copies of a protein or other substance. Overexpression of certain proteins or other substances may play a role in cancer development.

**overdose :** A group of genetic disorders in which there is an abnormal increase in the size of the body or a body part that is often noted at birth. Examples of overgrowth syndromes include neurofibromatosis, Sotos syndrome, Beckwith-Wiedemann syndrome, Simpson-Golabi-Behmel syndrome, Weaver syndrome, Proteus syndrome, Sturge-Weber syndrome, and fragile X syndrome. Many of these syndromes increase the risk of cancer.

**Overdrive :** The amount of slippage between the belt and the drum or cage, in a spiral system.

**overexpress :** Refers to a medicine that can be bought without a prescription (doctor's order). Examples include analgesics (pain relievers), such as aspirin and acetaminophen. Also called nonprescription and OTC.

**Overflow:** A designed escape reservoir for liquid silicone rubber, used to insure mold cavity fill and also allowance for excess compound, generally frowned upon because part requires post molding trimming

**Overflow:** A mass of material away from the part, typically at the end of fill, connected by a thin cross-section. The overflow is added to improve part quality and is removed as a secondary operation.

**Overflow capacity:** the capacity of a container to the top of the finish or to the point of overflow.

**overgrowth syndrome :** Treatment of a cancer that would have gone away on its own or never caused any symptoms. These cancers are usually found on a screening test. Overtreatment may lead to problems and harmful side effects from cancer therapies that are not needed.

**Overhead product:** the product that leaves the top of a distillation column. The overhead product is relatively rich in the most volatile components of the feed to the column.

**Overlap peptides:** Peptides resulting from the degradation of a protein by two different procedures that are subsequently sequenced; the sequence of a peptide from one degradation procedure frequently overlaps the sequences of two or more peptides of the other degradation procedure, thereby establishing the order of the peptides.

**overlap region:** the region in space where atomic or molecular orbitals overlap, creating an area of high electron density.

**Overpack :** melt will fill the easiest flow path first and will continue to pack this area while material reaches the other areas. This is a cause of warping created by unbalanced flow.

**overriding plate:** crustal plate which collides with a more dense plate and moves above the plate.

**overtreatment :** The release of an egg from an ovary during the menstrual cycle.

**overturned fold:** a fold whose limbs dip in the same direction, indicating that the upper part of the fold has overridden the lower part.

**overturning:** rock layers that are flipped upside-down during the mountain-building process.

**overweight :** A protein being studied in the treatment of cancer. Substances that attach to OX-40 on the surface of T cells (a type of white blood cell) may help the T cells grow and kill more cancer cells. OX-40 is a type of tumor necrosis factor (TNF) receptor. Also called CD134.

**Ovrette:** (Other name for: norgestrel)

**ovulation:** the process by which an egg cell is released from the follicle and swept into the Fallopian tube where it moves toward to uterus. OR A drug used with other drugs to treat colorectal cancer that is advanced or has come back. It is also being studied in the treatment of other types of cancer. Oxaliplatin attaches to DNA in cells and may kill cancer cells. It is a type of platinum compound. Also called Eloxatin.

**ovules:** the protective structures that contain egg cells produced by the female.

**OX-40:** A drug used to help patients gain weight after injury, chronic infection, or severe illness. It belongs to the family of drugs called anabolic steroids.

**oxaliplatin:** An organoplatinum complex in which the platinum atom is complexed with 1,2-diaminocyclohexane (DACH) and with an oxalate ligand as a 'leaving group.' A 'leaving group' is an atom or a group of atoms that is displaced as a stable species taking with it the bonding electrons. After displacement of the labile oxalate ligand leaving group, active oxaliplatin derivatives, such as monoquo and diaquo DACH platinum, alkylate macromolecules, forming both inter- and intra-strand platinum-DNA crosslinks, which result in inhibition of DNA replication and transcription and cell-cycle nonspecific cytotoxicity. The DACH side chain appears to inhibit alkylating-agent resistance. Check for active clinical trials using this agent. or A chemical reaction that takes place when a substance comes into contact with oxygen or another oxidizing substance. Examples of oxidation are rust and the brown color on a cut apple.

**oxaliplatin-encapsulated transferrin-conjugated N-glutaryl phosphatidylethanolamine liposome:** A nanoparticle formulation containing N-glutaryl phosphatidylethanolamine (NGPE)-liposomes encapsulating oxaliplatin and conjugated to the human transferrin (Tf) ligand, with potential antineoplastic activity. Upon infusion of oxaliplatin-encapsulated transferrin-conjugated NGPE liposomes, the transferrin moiety targets and binds to the Tf receptor, which is overexpressed on a variety of human cancer cells. Upon binding and internalization, oxaliplatin is released and its active derivatives alkylate macromolecules, forming both inter- and intra-strand platinum-DNA crosslinks, resulting in an inhibition of DNA replication and transcription. By extending the circulation time and specifically targeting transferrin receptors, this formulation may improve

the efficacy and safety of oxaliplatin therapy, compared to administration of oxaliplatin alone. NGPE, a reactive phospholipid, is used as a linker to attach the Tf ligand, to the liposome.

**Oxandrin:** (Other name for: oxandrolone)

**oxandrolone:** A synthetic, anabolic steroid hormone analog of testosterone. Similar to testosterone, oxandrolone binds to and activates specific nuclear receptors. This agent may be used for testosterone replacement therapy in hypogonadal men, in HIV-wasting syndrome, and in other conditions in order to increase nitrogen retention and fat-free muscle mass. or A chemical reaction that takes place between an oxidizing substance and a reducing substance. The oxidizing substance loses electrons in the reaction, and the reducing substance gains electrons. For example, rust forms when there is an oxidation-reduction reaction between oxygen contained in water or moist air (an oxidizing substance) and iron (a reducing substance). Oxidation-reduction reactions also occur when glucose (a type of sugar) and fat are broken down in the body to make energy. Also called redox.

**oxbow lake:** a body of water shaped roughly like a U and formed when a meander begins to close on itself and the stream breaks through and bypasses the meander.

**oxcarbazepine:** A dibenzazepine carboxamide derivative with an anticonvulsant property. As a prodrug, oxcarbazepine is converted to its active metabolite, 10-monohydroxy. Although the mechanism of action has not been fully elucidated, electrophysiological studies indicate this agent blocks voltage-gated sodium channels, thereby stabilizing hyper-excited neural membranes, inhibiting repetitive neuronal firing, and decreasing the propagation of synaptic impulses.

**Oxecta:** (Other name for: oxycodone hydrochloride)

**Oxepa:** (Other name for: gluten-free DHA/EPA/GLA/antioxidant-rich nutritional liquid)

**oxidant:** a chemical agent that oxidizes.

**oxidation :** A chemical process in which oxygen is used to make energy from carbohydrates (sugars). Also called aerobic metabolism, aerobic respiration, and cell respiration.

**Oxidation** : A reaction in which oxygen is added to a substance. For every oxidation, there is always a reduction (something losing oxygen) of some kind. OR The addition of oxygen to a compound or the reduction of hydrogen. OR In respect to polyethylene, the reaction of air or oxygen in polyethylene causing the formation of hydroxy groups which affects the physical properties adversely. OR the addition of oxygen to a compound or the reduction of hydrogen. OR Oxidation is the loss of one or more electrons by an atom, molecule, or ion. Oxidation is accompanied by an increase in oxidation number on the atoms, molecules, or ions that lose electrons. OR The loss of electrons from a compound. OR the loss of electrons by an atom in a covalent bond. In organic reactions, this occurs when a compound accepts additional oxygen atoms. OR in a broad sense oxidation is the increase in positive valence of any element in a substance. On the basis of the electron theory, oxidation is a process in which an element loses electrons. In a narrow sense, oxidation means the chemical addition of oxygen to a substance. OR A process in which an electron is lost by an atom, molecule or ion. OR This is when an atom loses one or more electrons. Scientists may also use the term when describing ions or molecules. OR A chemical reaction which increases the oxygen content of a compound. In metal-working, oxidation usually leads to viscosity increases and deposit formation. OR Oxidation is the loss of electrons from an atom or ion (or addition of oxygen in a reaction). OR Chemical reaction upon exposure to oxygen. Some coatings cure by oxidation, when oxygen enters the liquid coating and cross-links the resin molecules. This film-forming method is also called "Air Cure" and "Air Dry." (Oxidation also causes rust on bare metals.) OR The process whereby substances combine with oxygen. Oil paints dry by oxidation of the oil content. OR the loss of electrons by a species.

**oxidation half reaction:** That part of a redox reaction that involves loss of electrons. In the oxidation half reaction, the oxidation number of one or more atoms within the reactants is increased.

**oxidation number:** A number assigned to each atom to help keep track of the electrons during a redox-reaction. OR a signed integer representing the real or hypothetical charge on an atom. OR A convention for representing a charge of an atom embedded within a compound, if the compound were purely ionic. For example, H<sub>2</sub>O is a covalent compound; if it were ionic, the hydrogens would be H<sup>+</sup> (oxidation number +1) and the oxygen would

be O<sup>2-</sup> (oxidation number -2). Oxidation number rises for at least one atom in a compound that is oxidized; oxidation number becomes smaller if the compound is reduced.

**OXIDATION NUMBERS or VALENCES:** are the number of electrons lost, gained or shared in a chemical reaction. Free elements have zero as an oxidation number.

**oxidation reaction:** A reaction where a substance loses electrons. OR A reaction that transfers electrons. OR A reaction in which electrons are transferred from a donor to an acceptor molecule; also called a redox reaction. OR A reaction involving the transfer of electrons.

**oxidation-reduction :** A condition in which antioxidant levels are lower than normal. Antioxidant levels are usually measured in blood plasma.

**oxidation,  $\beta$ :** See  $\beta$  oxidation.

**oxidative metabolism :** A type of chemical substance that is a combination of oxygen and another substance. Oxides are found in essential oils.

**Oxidative phosphorylation:** The formation of ATP as the result of the transfer of electrons to oxygen. OR The process in which ATP is formed as a result of the transfer of electrons from NADH or FADH<sub>2</sub> to O<sub>2</sub> by a series of electron carriers. OR The enzymatic phosphorylation of ADP to ATP coupled to electron transfer from a substrate to molecular oxygen.

**oxidative stress :** To cause oxidation (a chemical reaction that takes place when a substance comes into contact with oxygen or another oxidizing substance).

**oxide:** a compound of oxygen and another element. OR The new substance that is formed when a substance has reacted with oxygen. OR A binary compound that contains oxygen in the -2 oxidation state.

**oxide :** A drug used to treat moderate to severe pain. It is made from morphine and binds to opioid receptors in the central nervous system. Oxycodone hydrochloride is a type of analgesic agent and a type of opiate.

**Oxide layer :** Some metals (like iron) have oxides that crumble away to expose new metal. Some metals (aluminium and titanium are two good examples) form oxide layers that are tough and protect the metal from further attack. Think about the position of aluminium in the reactivity series (very high) but yet it is used to make window frames that have to resist corrosion for many years. If you want to see the true reactivity of

aluminium ask your teacher to show you aluminium in water once it has had its oxide layer removed by reaction with mercury

**Oxide Mineral:** A mineral that is made up of compounds with an oxygen atom bonded to a metal. A ruby is a good example of an oxide mineral.

**oxidize :** A colorless, odorless gas. It is needed for animal and plant life. Oxygen that is breathed in enters the blood from the lungs and travels to the tissues.

**oxidized avidin:** An oxidized form of the glycoprotein avidin, that can be used as a linking agent for tissue-pretargeted radionuclide therapy. Upon intralesional administration, the aldehyde groups of oxidized avidin strongly bind to the amino groups on tissue proteins, via the formation of Schiff bases. As avidin is able to strongly bind to biotin, intravenous administration of radiolabeled biotin may lead to the selective eradication of the pre-targeted tumor cells.

**Oxidizer:** An oxidizer can also be called an oxidizing agent. It is something that can oxidize another substance. Some major oxidizing elements are chlorine and oxygen.

**oxidizing:** This adjective applied to a chemical is a substance which gives off oxygen to another substance. Oxidizing chemicals may increase and sustain fires. For example, chemicals belonging to following groups may act as oxidizers bromates, chlorates, chromates, dichromates, iodates, nitrates, oxides, perborate, perbromates, perchlorates, periodates, permanganates and peroxides.

**oxidizing agent:** The acceptor of electrons in an oxidation-reduction reaction. OR A reactant that removing electrons from other reactants in a chemical reaction. Oxidizing agents cause other substances to be oxidized in chemical reactions while they themselves are reduced. For example, nitrate ion is an oxidizing agent in the following reaction:

**Oxido-reductase:** An enzyme that catalyzes oxidation-reduction reactions.

**oxirane:** a three-membered ring that contains oxygen; also called an epoxide ring.

**oxitriptan:** An aromatic amino acid with antidepressant activity. In vivo, oxitriptan is converted into 5-hydroxytryptamine (5-HT or serotonin) as well as other neurotransmitters. Oxitriptan may exert its antidepressant activity via conversion to serotonin or directly by binding to serotonin (5-

HT) receptors within the central nervous system (CNS). Endogenous 5-hydroxytryptophan (5-HTP) is produced from the essential amino acid L-tryptophan. Exogenous therapeutic 5-HTP is isolated from the seeds of the African plant *Griffonia simplicifolia*.

**Oxo-or oxy-:** Prefixes meaning oxygen-containing

**oxoacid:** When one or more hydroxide (OH) groups are bonded to a central atom.

**oxonium ion:** a positively charged oxygen atom.

**OxPhos Inhibitor VLX600:** A lipophilic cation-based triazinoindolyl-hydrazone compound and mitochondrial oxidative phosphorylation (OxPhos) inhibitor, with potential antineoplastic activity. Upon infusion, in normal cells and proliferating tumor cells where glucose is readily available, inhibition of OxPhos by VLX600 induces a hypoxia-inducible factor 1-alpha (HIF-1alpha)-dependent shift to, and an increase in glycolysis. Glycolysis alone does not produce enough energy to support the growth of tumor cells in this environment, and the induction of autophagy occurs. In the metabolically compromised tumor microenvironment, the availability of oxygen and glucose is limited due to poor vascularization and perfusion of tumor micro-areas. Tumor cells growing in this environment are thus unable to compensate for decreased mitochondrial function by increasing glycolysis. This leads to nutrient depletion, decreased energy production, induction of autophagy, tumor cell death and an inhibition of cell proliferation in quiescent tumor cells. Mitochondrial OxPhos, which is hyperactivated in cancer cells, plays a key role in the promotion of cancer cell proliferation. Check for active clinical trials using this agent.

**Oxsoralen:** (Other name for: methoxsalen)

**Oxsoralen-Ultra:** (Other name for: methoxsalen)

**Oxyanion hole:** A region on certain proteolytic enzymes that stabilizes the oxyanion constituent of the tetrahedral intermediate of the reaction.

**oxycodone hydrochloride:** The hydrochloride salt of oxycodone, a methylether of oxymorphone and semisynthetic opioid agonist with analgesic and antitussive properties. Oxycodone binds to mu-receptors in the central nervous system (CNS), thereby mimicking the effects of endogenous opiates. In addition to analgesia and a depressive effect on the

cough center in the medulla, this agent may cause euphoria, anxiolysis, miosis, sedation, physical dependence, constipation, and respiratory depression, depending on dosage and variations in individual metabolism. or A type of unstable molecule that contains oxygen and that easily reacts with other molecules in a cell. A build up of oxygen radicals in cells may cause damage to DNA, RNA, and proteins, and may cause cell death. An oxygen radical is a free radical. Also called reactive oxygen species.

**oxycodone hydrochloride/naloxone hydrochloride prolonged-release tablet:** A prolonged-release tablet formulation composed of the hydrochloride salt form of the opioid receptor agonist oxycodone and the hydrochloride salt form of the opioid receptor antagonist naloxone which may produce analgesia while relieving opioid-mediated gastrointestinal (GI) side effects. Upon oral administration, oxycodone binds to opioid receptors, thereby mimicking the effects of endogenous opiates to provide analgesia. As naloxone is very poorly absorbed, this agent binds locally to opiate receptors in the GI tract, thereby preventing oxycodone from binding to these receptors. This relieves the opioid-related side effects on the GI tract, including opioid-induced constipation. Check for active clinical trials using this agent.

**oxycodone/acetaminophen:** A combination preparation of the analgesic and antipyretic acetaminophen and the semisynthetic opioid agonist oxycodone with analgesic and antitussive properties. Acetaminophen exerts its analgesic activity by inhibiting prostaglandin synthesis, while oxycodone exerts its analgesic activity by binding to the mu-receptors in the central nervous system (CNS), thereby mimicking the effects of endogenous opioids. Check for active clinical trials using this agent.

**OxyContin:** (Other name for: oxycodone hydrochloride)

**Oxygen:** Symbol:"O" Atomic Number:"8" Atomic Mass: 16.00amu. Oxygen is a gas and is classified as a non-metal. It is found in the crust of the Earth and in the air. Animals need oxygen to survive. It is also very reactive. You will also find it in ozone and plastics. OR Element 8, atomic weight 15.9994, a colorless, odorless gas that makes up about 1/5 of the earth's atmosphere and (in combined form) 8/9ths of earth's oceans and almost half of the earth's crust. The name is derived from the French oxygène, which means "acid generating".

**oxygen :** A test that measures the amount of oxygen being carried by red blood cells. One method uses a device that shines light through a finger. The device measures the amount of oxygen in the blood based on the way red blood cells carrying oxygen absorb and reflect light. In another method blood is taken from an artery and the amount of oxygen is measured directly. An oxygen level that is lower than normal may be a sign of lung disease or other medical conditions.

**oxygen debt:** The extra oxygen (above the normal resting level) consumed in the recovery period after strenuous physical exertion.

**Oxygen Index :** A flammability test based on the principle that a certain volumetric concentration of oxygen is necessary to maintain combustion of a specimen after it has been ignited.

**oxygen radical :** Treatment in which a storage tank of oxygen or a machine called a compressor is used to give oxygen to people with breathing problems. It may be given through a nose tube, a mask, or a tent. The extra oxygen is breathed in along with normal air. Also called supplemental oxygen therapy.

**oxygen saturation test :** A drug used to treat moderate to severe pain. It is also used as a sedative before surgery, to help with anesthesia during surgery, during labor, and to treat anxiety caused by some medical conditions. It is made from morphine and binds to opioid receptors in the central nervous system. Oxymorphone hydrochloride is a type of opioid and a type of analgesic agent. Also called Numorphan and Opana.

**oxygen therapy :** Funds awarded to certain U.S. institutions by the National Cancer Institute (NCI) for them to become cancer centers in the United States, based on scientific merit. The funds help the cancer centers improve the way they are run and develop new ways to prevent, diagnose, and treat cancer. To receive the award, one goal of the cancer center must be to turn clinical and basic research into better health care. Also called CCSG.

**Oxygen-dissociation curve:** A plot of the oxygen-binding capacity of a protein versus the partial pressure of oxygen.

**oxygenases:** Enzymes that catalyze reactions in which oxygen is introduced into an acceptor molecule.

**oxygenates:** Liquid organic compounds that can be blended into gasoline to increase its oxygen content; during combustion, this additional oxygen

reduces the output of CO and may reduce emissions of ozone-forming materials. The two major oxygenates in use today are ethanol and MTBE.

**oxymorphone hydrochloride:** The hydrochloride salt form of oxymorphone, a semisynthetic opioid with a potent analgesic property. Oxymorphone hydrochloride binds to and activates opiate receptors, specifically mu-receptors, in the central nervous system (CNS). This results in sedation, analgesia, decreased gastrointestinal motility, and respiratory depression. or A radioactive form of the element phosphorus used in the treatment of cancer.

**ozarelix:** A highly modified, fourth generation linear decapeptide with gonadotropin-releasing hormone (GnRH or LHRH) antagonizing properties. Ozarelix competitively binds to and blocks the gonadotropin releasing hormone receptor in the anterior pituitary gland, thereby inhibiting the secretion and release of luteinizing hormone (LH) and follicle stimulating hormone (FSH). In males, the inhibition of LH secretion prevents the release of testosterone. As a result, this may relieve symptoms associated with hormonally dependent disease states such as hormone-dependent prostate cancer.

**ozone:** oxygen in molecular form with three atoms of oxygen forming each molecule (O<sub>3</sub>). Atmospheric oxygen is molecular in form but each molecule contains only two atoms of oxygen. Ozone is formed by passing high voltage electric charges through dry air. The third atom of oxygen in each molecule of ozone is loosely bound and is easily released, thus making it a powerful oxidant; used to purify water and treat industrial wastes. OR The allotrope of oxygen that contains 3 atoms in one molecule, the formula for ozone being O<sub>3</sub>. OR A molecule made up of three atoms of oxygen. In the stratosphere, it occurs naturally and it provides a protective layer shielding the Earth from ultraviolet radiation and subsequent harmful health effects on humans and the environment. In the troposphere, it is a chemical oxidant and major component of photochemical smog.

**ozone layer:** An atmosphere layer at about 20 to 30 miles high (32 to 48 km), normally characterized by high ozone content, which blocks most solar UV radiation from entering the lower atmosphere.

**Ozone Resistance:** Ability to withstand the deteriorating effect of ozone, which generally causes cracking

**ozonide:** a compound formed by the addition of ozone to a double bond.

**ozonolysis:** the cleavage of double and triple bonds by ozone, O<sub>3</sub>.

**Ozurdex:** (Other name for: dexamethasone intravitreal implant)

**P body wave:** a compressional (longitudinal) body wave that induces rock to vibrate parallel to the direction the wave is traveling.

**P-32:** A health professional who is licensed to do certain medical procedures under the guidance of a doctor. A PA may take medical histories, do physical exams, take blood and urine samples, care for wounds, and give injections and immunizations. Also called physician assistant.

**p-cadherin antagonist PF-03732010:** An agent that inhibits p-cadherin (cdh3), with potential antineoplastic activity. PF-03732010 binds to and inhibits the activity of p-cadherin. Inhibition of the activity of p-cadherin may inhibit tumor cell invasion and proliferation in p-cadherin expressing tumor cells. P-cadherin, a cell-surface protein and member of the cadherin family, is overexpressed in a variety of solid tumors, and plays a role in cell adhesion, motility, invasion and proliferation.

**P-cadherin inhibitor PCA062:** An agent that inhibits p-cadherin, with potential antineoplastic activity. Upon intravenous infusion, PCA062 binds to and inhibits the activity of p-cadherin. Inhibition of the activity of p-cadherin may inhibit both invasion and proliferation of p-cadherin expressing tumor cells. P-cadherin, a cell-surface protein and member of the cadherin family, is overexpressed in a variety of tumors and plays a role in cell adhesion, motility, invasion, and proliferation.

**P-cadherin-targeting agent PF-06671008:** An agent that targets p-cadherin (CDH3), with potential antineoplastic activity. Upon administration, PF-06671008 binds to and inhibits the activity of p-cadherin; this may inhibit both invasion and proliferation of p-cadherin-expressing tumor cells. P-cadherin, a cell-surface protein and member of the cadherin family, is overexpressed in a variety of tumors and plays a role in cell adhesion, motility, invasion, and proliferation.

**p-glycoprotein :** A protein that pumps substances out of cells. Cancer cells that have too much p-glycoprotein may not be killed by anticancer drugs.

**P-glycoprotein inhibitor HM30181AK:** An inhibitor of the adenosine triphosphate (ATP)-binding cassette (ABC) transporter P-glycoprotein (P-gp), with adjuvant activity. Upon oral administration, P-gp inhibitor

HM30181AK selectively binds to and inhibits the multidrug resistance (MDR) efflux pump P-gp, which prevents the efflux of various chemotherapeutic agents from intestinal epithelial cells to the gastrointestinal tract. This leads to an increase in both oral bioavailability and therapeutic efficacy. P-gp prevents the intestinal uptake and intracellular accumulation of various cytotoxic agents. HM30181AK is not systemically absorbed.

**P-loop:** A component, characteristic of nucleotide-binding proteins, of the NTP-binding domain that interacts with the phosphoryl groups of a bound nucleotide.

**P-p68 inhibitor RX-5902:** An orally bioavailable small molecule inhibitor of phosphorylated-p68 RNA helicase (P-p68), with potential anti-proliferative and antineoplastic activity. Upon oral administration, P-p68 inhibitor RX-5902 may both inhibit the activity of the anti-apoptotic B-cell lymphoma 2 (Bcl-2) protein and facilitate the induction of cyclin-dependent kinase inhibitor 1 (p21). This may prevent G2/M cell cycle progression and lead to growth inhibition in tumor cells. P-p68 is overexpressed in various types of solid tumors but absent in normal tissues, and plays a role in tumor progression and metastasis. p21 is a potent cyclin-dependent kinase inhibitor which regulates cell cycle progression and mediates both growth arrest and cellular senescence.

**P-type atpases:** A family of enzymes that use the energy of hydrolysis to move ions across membranes; called “P-type atpases” because the reaction mechanism includes a phosphoaspartate intermediate.

**p-value :** A term in statistics. It helps show whether a difference found between groups that are being compared is due to chance. A small p-value usually means that the difference between groups is not due to chance alone, but is due to some other factor, such as a treatment one of the groups received. A large p-value usually means that the difference between groups is probably due to chance alone.

**P-wave shadow zone:** that area on the earth's surface in which P waves from an earthquake cannot be detected.

**P-waves:** primary waves generated by an earthquake; these compression waves are the fastest and travel through solids, liquids, and gases.

**p.DOM-WT1-126 DNA vaccine:** A fusion DNA vaccine containing the first domain of fragment C (FrC) of tetanus toxin (TT865-1120) (p.DOM)

fused to the human Wilms' Tumor gene-1 (WT1)-derived MHC class I-binding epitope WT1.126, with potential antitumor activity. Upon vaccination with p.DOM-WT1-126 DNA and subsequent electroporation, this vaccine may induce a WT1 epitope-specific cytotoxic T-lymphocyte (CTL) response against WT1 expressing cells, resulting in cell lysis and inhibition of cancer cell proliferation in WT1-overexpressing cancer cells. WT1, a tumor associated antigen, is overexpressed in most types of leukemia and in a variety of solid cancers. The FrC of tetanus toxin contains the MHC II-binding sequence, p30, which induces T-helper cell activation for long-lasting immunity. Check for active clinical trials using this agent.

**p.DOM-WT1-37 DNA vaccine:** A fusion DNA vaccine containing the first domain of fragment C (FrC) of tetanus toxin (TT865-1120) (p.DOM) fused to the human Wilms' Tumor gene-1 (WT1)-derived MHC class I-binding epitope WT1.37, with potential antitumor activity. Upon vaccination with p.DOM-WT1-37 DNA and subsequent electroporation, this vaccine may induce a WT1 epitope-specific cytotoxic T-lymphocyte (CTL) response against WT1 expressing cells, resulting in cell lysis and inhibition of cancer cell proliferation in WT1-overexpressing cancer cells. WT1, a tumor associated antigen, is overexpressed in most types of leukemia and in a variety of solid cancers. The FrC of tetanus toxin contains the MHC II-binding sequence, p30, which induces T-helper cell activation for long-lasting immunity. Check for active clinical trials using this agent.

**p110beta/delta PI3K Inhibitor GS-9820:** An inhibitor of the beta and delta isoforms of the 110 kDa catalytic subunit of class IA phosphoinositide-3 kinases (PI3K) with potential immunomodulating and antineoplastic activities. p110beta/delta PI3K inhibitor GS-9820 inhibits the activity of PI3K, thereby preventing the production of the second messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3), which decreases tumor cell proliferation and induces cell death. PI3K-mediated signaling is often dysregulated in cancer cells; the targeted inhibition of PI3K is designed to preserve PI3K signaling in normal, non-neoplastic cells.

**P30 Cancer Center Support Grant :** A tumor suppressor gene that normally inhibits the growth of tumors. This gene is altered in many types of cancer.

**p38 MAPK inhibitor LY2228820 dimesylate:** The dimesylate salt form of LY2228820, a tri-substituted imidazole derivative and orally available, p38 mitogen-activated protein kinase (MAPK) inhibitor with potential anti-inflammatory and antineoplastic activities. Upon administration, LY2228820 inhibits the activity of p38, particularly the alpha and beta isoforms, thereby inhibiting MAPKAPK2 phosphorylation and preventing p38 MAPK-mediated signaling. This may inhibit the production of a variety of cytokines involved in inflammation, cellular proliferation and angiogenesis such as tumor necrosis factor alpha (TNF $\alpha$ ), interleukin (IL)-1, -6 and -8, vascular endothelial growth factor, and macrophage inflammatory protein-1 alpha. Ultimately this induces apoptosis and reduces tumor cell proliferation. In addition, inhibition of the p38 MAPK pathway by LY2228820 increases the antineoplastic activity of certain chemotherapeutic agents. p38 MAPK, a serine/threonine protein kinase that is often upregulated in cancer cells, plays a crucial role in tumor cell proliferation, angiogenesis and metastasis.

**p38 MAPK inhibitor LY3007113:** An orally active p38 mitogen-activated protein kinase (MAPK) inhibitor with potential immunomodulating, anti-inflammatory, and antineoplastic activity. Upon administration, LY3007113 inhibits the activity of p38, thereby preventing p38 MAPK-mediated signaling. This may result in the inhibition of the production of proinflammatory cytokines and the induction of tumor cell apoptosis. p38 MAPK, a serine/threonine protein kinase often upregulated in cancer cells, plays a crucial part in the production of a variety of cytokines involved in inflammation and cellular proliferation such as tumor necrosis factor (TNF) and interleukin (IL)-1 and -6.

**p38/Tie2 kinase inhibitor Arry-614:** An orally bioavailable small-molecule inhibitor of p38 and Tie2 kinases with potential antineoplastic, anti-inflammatory and antiangiogenic activities. p38/Tie2 kinase inhibitor Arry-614 binds to and inhibits the activities of p38 and Tie2 kinases, which may inhibit the production of proinflammatory cytokines and may decrease tumor angiogenesis and tumor cell growth and survival. p38 is a MAP kinase that is often upregulated in cancer cells, playing a crucial part in the production of a variety of cytokines involved in inflammation and cellular proliferation such as tumor necrosis factor (TNF) and interleukin (IL)-1 and -6. Tie2 is an endothelial cell specific receptor that is activated by angiopoietins, growth factors required for angiogenesis. This agent has also

been reported to inhibit other kinases including vascular endothelial growth factor receptor (VEGFR2) and Src tyrosine kinases.

**p53 gene :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Bacteria that live in the intestines need PABA to survive. PABA is found in grains and foods from animals. It is being studied as a radiosensitizer (a substance that makes tumor cells more sensitive to radiation therapy) and in the treatment of certain skin disorders. Also called aminobenzoic acid and para-aminobenzoic acid.

**p53 peptide vaccine:** A peptide-based cancer vaccine composed of amino acids 264 to 272 of the wild-type protein encoded by the P53 gene. p53 peptide vaccine may elicit an HLA-A2.1-restricted cytotoxic T lymphocyte immune response against tumor cells that overexpress p53 protein.

**p53 synthetic long peptide (70-251) vaccine:** A peptide vaccine consisting of 10 synthetic long peptides (SLPs), 25-30 amino acids in size and derived from the middle portion of p53 (amino acids 70-251), mixed with the adjuvant Montanide ISA-51 with potential immunostimulatory and antitumor activities. Upon administration, p53 synthetic long peptide (70-251) vaccine may stimulate the host immune system to mount a cytotoxic T-cell lymphocyte (CTL) response against p53-expressing tumor cells. p53, a tumor associated antigen (TAA), may be overexpressed in variety of cancer cell types.

**p53-HDM2 protein-protein interaction inhibitor MI-773:** An orally available spiro-oxindole HDM2 (human double minute 2) antagonist with potential antineoplastic activity. Upon oral administration, the p53-HDM2 protein-protein interaction inhibitor MI-773 binds to HDM2, preventing the binding of the HDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this HDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited and the transcriptional activity of p53 is restored, which may result in the restoration of p53 signaling and lead to the p53-mediated induction of tumor cell apoptosis. HDM2, a zinc finger protein and a negative regulator of the p53 pathway, is often overexpressed in cancer cells. It has been implicated in cancer cell proliferation and survival.

**p53/HDM2 interaction inhibitor CGM097:** An orally bioavailable HDM2 (human homolog of double minute 2) antagonist with potential

antineoplastic activity. Upon oral administration, p53/HDM2 interaction inhibitor CGM097 inhibits the binding of the HDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this HDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited, which may result in the restoration of p53 signaling and, thus, the p53-mediated induction of tumor cell apoptosis. HDM2, a zinc finger nuclear phosphoprotein, is a negative regulator of the p53 pathway, often overexpressed in cancer cells and has been implicated in cancer cell proliferation and survival.

**P680:** A special pair of molecules in photosystem II in green plants; absorption of light by P680 results in the transfer of electrons from water to plastoquinone, which generates a proton gradient.

**P700:** A special pair of molecules in photosystem I in green plants; absorption of light by P700 results in the transfer of electrons that generates ferredoxin and, ultimately, NADPH.

**p70S6K inhibitor LY2584702:** An orally available inhibitor of p70S6K signaling, with potential antineoplastic activity. p70S6K inhibitor LY2584702 inhibits ribosomal protein S6 Kinase (p70S6K), and prevents phosphorylation of the S6 subunit of ribosomes, thereby inhibiting normal ribosomal function within tumor cells leading to a decrease in protein synthesis and in cellular proliferation. P70S6K, a serine/threonine kinase, acts downstream of PIP3 and phosphoinositide-dependent kinase-1 in the PI3 kinase pathway, is often upregulated in a variety of cancer cells, and is involved in the regulation of cell growth, proliferation, motility, and survival.

**p70S6K/Akt inhibitor MSC2363318A:** An orally available inhibitor of the serine/threonine protein kinases ribosomal protein S6 Kinase (p70S6K) and Akt (protein kinase B), with potential antineoplastic activity. Upon administration, p70S6K/Akt inhibitor MSC2363318A binds to and inhibits the activity of p70S6K and Akt. This prevents the activation of the PI3K/Akt/p70S6K signaling pathway and inhibits tumor cell proliferation in cancer cells that have an overactivated PI3K/Akt/p70S6K signaling pathway. Constitutive activation and dysregulated signaling of the PI3K/Akt/p70S6K pathway are frequently associated with tumorigenesis of many tumor types; targeting multiple kinases in this pathway is more efficacious than targeting a single kinase.

**P960:** A dimer of bacterial chlorophyll-b molecules, called the special pair, that absorbs light maximally at 960 nm; initiates charge separation in bacterial photosynthesis.

**p97 inhibitor CB-5083:** An orally bioavailable inhibitor of valosin-containing protein (VCP) p97, with potential antineoplastic activity. Upon oral administration, CB-5083 specifically binds to and inhibits the activity of p97. This prevents ubiquitin-dependent protein degradation and causes cellular accumulation of poly-ubiquitinated proteins. The inhibition of endoplasmic reticulum (ER)-associated protein degradation activates the ER-dependent stress response pathway, and leads to both an induction of apoptosis and inhibition of cell proliferation in susceptible tumor cells. p97, a type II AAA ATPase, plays a key role in cellular protein homeostasis. Its overexpression in many tumor cell types is associated with increased tumor cell proliferation and survival.

**PA:** Polyamide (nylon) OR An electronic device that is implanted in the body to monitor heart rate and rhythm. It gives the heart electrical stimulation when it does not beat normally. It runs on batteries and has long, thin wires that connect it to the heart. Also called artificial pacemaker and cardiac pacemaker.

**PABA :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden valerian, Indian valerian, Mexican valerian, valerian, *Valeriana officinalis*, and *Valeriana radix*.

**pacemaker :** A way to measure the amount a person has smoked over a long period of time. It is calculated by multiplying the number of packs of cigarettes smoked per day by the number of years the person has smoked. For example, 1 pack year is equal to smoking 1 pack per day for 1 year, or 2 packs per day for half a year, and so on.

**Pacific valerian :** A drug used to treat breast cancer, ovarian cancer, and AIDS-related Kaposi sarcoma. It is also used together with another drug to treat non-small cell lung cancer. Paclitaxel is also being studied in the treatment of other types of cancer. It blocks cell growth by stopping cell division and may kill cancer cells. It is a type of antimetabolic agent. Also called Taxol.

**Pacinian corpuscles:** the touch and pain receptors on the skin, muscles, and tendons.

**Pack Out:** The filling of the liquid silicone mold cavity or cavities as full as possible without causing undue stress on the silicone mold or causing flash to appear on the finished parts

**pack year :** A drug used to treat breast cancer that has come back or spread to other parts of the body. It is also used with carboplatin to treat advanced non-small cell lung cancer in patients who are not able to have surgery or radiation therapy. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Paclitaxel albumin-stabilized nanoparticle formulation is a form of the anticancer drug paclitaxel and may cause fewer side effects than paclitaxel. It stops cancer cells from growing and dividing, and may kill them. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called ABI-007, Abraxane, nanoparticle paclitaxel, and protein-bound paclitaxel.

**Packer:** packers are wide-mouth bottles typically used for pills, capsules and tablets. B&C Plastics Ltd. makes several different styles of packers, including rounds (also called pharma rounds), oblongs (with square bases) and apothecary styles (with concave shoulder areas) in both pet and hdpe. OR The filling of the mold cavity or cavities as full as possible without causing undue stress on the molds or causing flash to appear on the finished parts.

**Packing:** See Crystal packing.

**Packing ratio:** The degree of condensation of DNA in chromatin; the ratio of linear DNA to the length of the packaged DNA; the packing ratio of metaphase human chromosomes is 104.

**paclitaxel:** A compound extracted from the Pacific yew tree *Taxus brevifolia* with antineoplastic activity. Paclitaxel binds to tubulin and inhibits the disassembly of microtubules, thereby resulting in the inhibition of cell division. This agent also induces apoptosis by binding to and blocking the function of the apoptosis inhibitor protein Bcl-2 (B-cell Leukemia 2).

**paclitaxel :** A form of the anticancer drug paclitaxel that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of several types of

cancer. Paclitaxel liposome blocks the ability of cells to divide and may kill cancer cells. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called LEP-ETU, liposomal paclitaxel, LipoTaxen, and PNU-93914.

**paclitaxel albumin-stabilized nanoparticle formulation:** A Cremophor EL-free, albumin-stabilized nanoparticle formulation of the natural taxane paclitaxel with antineoplastic activity. Paclitaxel binds to and stabilizes microtubules, preventing their depolymerization and so inhibiting cellular motility, mitosis, and replication. This formulation solubilizes paclitaxel without the use of the solvent Cremophor, thereby permitting the administration of larger doses of paclitaxel while avoiding the toxic effects associated with Cremophor.

**paclitaxel albumin-stabilized nanoparticle formulation :** A form of the anticancer drug paclitaxel combined with a protein called poliglumex that may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of breast cancer, ovarian cancer, lung cancer, and other types of cancer. It belongs to the family of drugs called mitotic inhibitors. Also called CT-2103, paclitaxel polyglutamate, and Xyotax.

**paclitaxel injection concentrate for nanodispersion:** A nanoparticle-based injectable concentrate containing the water-insoluble taxane paclitaxel, with potential antineoplastic activity. Upon reconstitution and administration, paclitaxel binds to tubulin and inhibits the disassembly of microtubules, thereby resulting in the inhibition of cell division. Compared to paclitaxel alone, the nanodispersion-based formulation uses less toxic solvents and allows for administration of higher doses resulting in higher concentrations of paclitaxel at the tumor site, and an increased safety profile. Check for active clinical trials using this agent.

**paclitaxel liposome :** A form of the anticancer drug paclitaxel combined with a protein called poliglumex that may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of breast cancer, ovarian cancer, lung cancer, and other types of cancer. It belongs to the family of drugs called mitotic inhibitors. Also called CT-2103, paclitaxel poliglumex, and Xyotax.

**paclitaxel poliglumex:** The agent paclitaxel linked to a biodegradable, water-soluble polyglutamate polymer with antineoplastic properties. The polyglutamate residue increases the water solubility of paclitaxel and allows

delivery of higher doses than those achievable with paclitaxel alone. Paclitaxel promotes microtubule assembly and prevents microtubule depolymerization, thus interfering with normal mitosis. or A form of the anticancer drug paclitaxel used to treat breast cancer, ovarian cancer, and AIDS-related Kaposi sarcoma. It is also used with another drug to treat non-small cell lung cancer. Paclitaxel is mixed with very tiny particles of a substance that makes it easier to dissolve in water. This allows higher doses of paclitaxel to be given. It is a type of antimetabolic agent.

**paclitaxel polyglutamate :** An abbreviation for a chemotherapy combination used to treat multiple myeloma. It includes the drugs bortezomib, doxorubicin (Adriamycin), and dexamethasone. Also called PAD regimen.

**paclitaxel vitamin E-based emulsion formulation:** A cremophor-free, P-glycoprotein-inhibiting, vitamin E-based emulsion particle formulation of paclitaxel with antineoplastic activity. Paclitaxel binds to tubulin and inhibits the disassembly of microtubules, thereby resulting in the inhibition of cell division. This agent also induces apoptosis by binding to and blocking the function of the apoptosis inhibitor protein Bcl-2 (B-cell Leukemia 2). The vitamin-E based emulsion allows bolus infusion without steroid premedication and may diminish hypersensitivity reactions; tumor tissue may be passively targeted due to preferential deposition of emulsion particles while an emulsion formulation component inhibits the P-glycoprotein drug efflux pump. Check for active clinical trials using this agent.

**paclitaxel-loaded polymeric micelle:** A biodegradable poly(ethylene glycol)-poly(D,L-lactide) copolymer micellar nanoparticle-entrapped formulation of paclitaxel with antineoplastic activity. Paclitaxel promotes microtubule assembly and prevents depolymerization, thus interfering with normal mitosis. The copolymer residue increases the water-solubility of paclitaxel and allows delivery of higher doses than those achievable with paclitaxel alone. or An abbreviation for a chemotherapy combination used to treat multiple myeloma. It includes the drugs bortezomib, doxorubicin (Adriamycin), and dexamethasone. Also called PAD.

**pacritinib:** An orally bioavailable inhibitor of Janus kinase 2 (JAK2) and the JAK2 mutant JAK2V617F with potential antineoplastic activity. Pacritinib competes with JAK2 for ATP binding, which may result in

inhibition of JAK2 activation, inhibition of the JAK-STAT signaling pathway, and so caspase-dependent apoptosis. JAK2 is the most common mutated gene in bcr-abl-negative myeloproliferative disorders; the JAK2V617F gain-of-function mutation involves a valine-to-phenylalanine modification at position 617. The JAK-STAT signaling pathway is a major mediator of cytokine activity.

**PAD:** A chronic condition in which both the breakdown and regrowth of bone are increased. Paget disease of bone occurs most frequently in the pelvic and leg bones, skull, and lower spine. It is most common in older individuals, and may lead to bone pain, deformities, and fractures. Also called osteitis deformans.

**PAD regimen:** A chemotherapy regimen containing bortezomib, doxorubicin and dexamethasone regimen used in the treatment of multiple myeloma. Or A condition in which abnormal cells are found in the nipple. Symptoms commonly include itching and burning and an eczema-like condition around the nipple. There may also be oozing or bleeding from the nipple.

**padeliporfin:** A vascular-acting photosensitizer consisting of a water-soluble, palladium-substituted bacteriochlorophyll derivative with potential antineoplastic activity. Upon administration, padeliporfin is activated locally when the tumor bed is exposed to low-power laser light; reactive oxygen species (ROS) are formed upon activation and ROS-mediated necrosis may occur at the site of interaction between the photosensitizer, light and oxygen. Vascular-targeted photodynamic therapy (VTP) with padeliporfin may allow tumor-site specific cytotoxicity while sparing adjacent normal tissues.

**PADRE 965.10:** Pan-DR epitope (PADRE) 965.10 is a helper peptide. PADRE peptides have been shown the capacity to deliver help for antibody responses in vivo. They were also found to be able to provide significant helper T-cell activity in vivo. Acts as an adjuvant.

**PADRE-CMV fusion peptide vaccine:** A peptide-based vaccine containing a pan HLA DR-binding epitope (PADRE) fused to a cytomegalovirus (CMV) peptide epitope, with potential anti-viral and immunomodulating activities. Upon administration, PADRE-CMV fusion peptide may stimulate a cytotoxic T-lymphocyte (CTL) response against

CMV in the CMV-infected host. The synthetic peptide PADRE is a universal helper T cell epitope.

**Paget disease of bone :** A type of chemical formed when coal, oil, gas, garbage, tobacco, meat, and other substances are burned. These chemicals are also made for use in many products, including coal tar, creosote, roofing tar, pesticides, mothballs, dandruff shampoos, and some medicines. Being exposed to one of these chemicals over a long time may cause cancer. Also called polycyclic aromatic hydrocarbon.

**Paget disease of the nipple :** A sudden increase in pain that may occur in patients who already have chronic pain from cancer, arthritis, fibromyalgia, or other conditions. A pain flare usually lasts for a short time. During a pain flare, the level of pain may be severe but the type of pain and where it is in the body are usually the same as the patient's chronic pain. Pain flares may occur with stress, illness, and certain activities, such as exercising or coughing, or when the dose of pain medicine that the patient is taking wears off. Pain flares are usually not a symptom of a new condition or a condition that has gotten worse. Also called breakthrough pain.

**PAH:** The point at which a person becomes aware of pain.

**pahoehoe flow:** a basalt flow with a ropy or undulating surface resulting from quick cooling and solidification of the lava.

**PAI:** Polyamide-imide

**pain flare :** A substance that is being studied for its ability to increase the effectiveness of the anticancer drug fluorouracil.

**pain threshold :** The roof of the mouth. The front portion is bony (hard palate), and the back portion is muscular (soft palate).

**Paint:** A coating including resin, a solvent, additives, pigments and, in some products, a diluent. Paints are generally opaque, and commonly represent the portion of the industry known as "architectural coatings."

**Paint deodorants:** Aromatic materials which are added to paint to mask paint odour.

**PAINT GAUGE:** Instrument for measuring the thickness of paint film.

**PAINT REMOVER:** A compound that softens old paint or varnish and permits scraping off the loosened material.

**Paint remover:** A liquid composition that is applied to a dry paint film and softens it sufficiently to permit its removal by scraping.

**paired spin:** the spinning in opposite directions of the two electrons in a bonding orbital.

**PAK4 inhibitor PF-03758309:** An orally bioavailable small-molecule inhibitor of p21-activated kinase 4 (PAK4) with potential antineoplastic activity. PAK4 inhibitor PF-03758309 binds to PAK4, inhibiting PAK4 activity and cancer cell growth. PAK4, a serine/threonine kinase belonging to the p21-activated kinase (PAK) family, is often upregulated in a variety of cancer cell types and plays an important role in cancer cell motility, proliferation, and survival.

**PAK4/NAMPT inhibitor KPT-9274:** An orally bioavailable inhibitor of both the serine/threonine kinase P21-activated kinase 4 (PAK4) and the nicotinamide adenine dinucleotide (NAD)-synthesizing enzyme nicotinamide phosphoribosyltransferase (NAMPT; NAMPTase), with potential antineoplastic activity. Upon administration, KPT-9274 allosterically binds to, destabilizes and causes degradation of PAK4. This inhibits PAK4-mediated signaling, induces cell death in, and inhibits the proliferation of PAK4-overexpressing tumor cells. In addition, KPT-9274 binds to and inhibits the activity of NAMPT. This depletes cellular NAD and inhibits NAD-dependent enzymes, both of which are needed for rapid cell proliferation; this results in tumor cell death in NAMPT-overexpressing cancer cells. PAK4, a serine/threonine kinase and member of the PAK family of proteins upregulated in various cancer cell types, regulates cell motility, proliferation and survival. NAMPT, an enzyme that is responsible for maintaining the intracellular NAD pool, plays a key role in the regulation of cellular metabolism and has cytokine-like activities. NAMPT is often overexpressed in a variety of cancers and metabolic disorders and tumor cells rely on NAMPT activity for their NAD supply.

**PALA:** The soft flap of tissue that hangs down at the back of the mouth (at the edge of the soft palate). Also called uvula.

**palate :** A drug used to treat hormone-receptor positive (HR+), HER2 negative (HER2-) breast cancer that is advanced or has spread to other parts of the body. It is used with fulvestrant in women whose disease has gotten worse after treatment with hormone therapy. It is used with letrozole in postmenopausal women who have not been treated with hormone therapy. It is also being studied in the treatment of other types of cancer. Palbociclib

blocks certain proteins, which may help keep cancer cells from growing. It is a type of cyclin-dependent kinase inhibitor. Also called Ibrance.

**palatine uvula :** A form of keratinocyte growth factor (KGF) that is made in the laboratory. KGF stimulates the growth of cells that line the surface of the mouth and intestinal tract. Palifermin is used to prevent and treat oral mucositis (mouth sores) caused by high-dose chemotherapy and radiation therapy in leukemia and lymphoma. It is also being studied in the prevention and treatment of oral mucositis and dysphagia (difficulty swallowing) in other types of cancer. Palifermin is a type of recombinant human keratinocyte growth factor. Also called Kepivance.

**palbociclib:** An orally available cyclin-dependent kinase (CDK) inhibitor with potential antineoplastic activity. Palbociclib selectively inhibits cyclin-dependent kinase 4 (CDK4) and 6 (CDK6), thereby inhibiting retinoblastoma (Rb) protein phosphorylation early in the G1 phase leading to cell cycle arrest. This suppresses DNA replication and decreases tumor cell proliferation. CDK4 and 6 are serine/threonine kinases that are upregulated in many tumor cell types and play a key role in the regulation of cell cycle progression. or Relief of symptoms and suffering caused by cancer and other life-threatening diseases. Palliation helps a patient feel more comfortable and improves the quality of life, but does not cure the disease.

**paleocoast:** an old coastline that has been preserved in the geologic record.

**paleocurrent:** a direction of sediment transport or ice movement that is revealed by sedimentary or glacial features.

**paleomagnetic field:** an ancient magnetic field that can be detected from the orientation of magnetic crystals in rocks such as basalt.

**paleontology:** the science of locating, cataloging, and interpreting the life forms that existed in past millennia. OR the study of fossils.

**paleosol:** An ancient soil or soil horizon that formed on the surface during the geologic past.

**Palestrol:** (Other name for: diethylstilbestrol)

**palifermin:** A recombinant form of the endogenous human keratinocyte growth factor. Palifermin binds to epithelial cell surface receptors in the lining of the mouth and gastrointestinal tract, resulting in stimulation of

epithelial cell proliferation, differentiation and upregulation of cytoprotective mechanisms. or Care given to improve the quality of life of patients who have a serious or life-threatening disease. The goal of palliative care is to prevent or treat as early as possible the symptoms of a disease, side effects caused by treatment of a disease, and psychological, social, and spiritual problems related to a disease or its treatment. Also called comfort care, supportive care, and symptom management.

**palifosfamide:** A synthetic mustard compound with potential antineoplastic activity. An active metabolite of ifosfamide covalently linked to the amino acid lysine for stability, palifosfamide irreversibly alkylates and cross-links DNA through GC base pairs, resulting in irreparable 7-atom inter-strand cross-links; inhibition of DNA replication and cell death follow. Unlike ifosfamide, this agent is not metabolized to acrolein or chloroacetaldehyde, metabolites associated with bladder and CNS toxicities. In addition, because palifosfamide does not require activation by aldehyde dehydrogenase, it may overcome the tumor resistance seen with ifosfamide.

**palifosfamide tromethamine:** A synthetic mustard compound of the tromethamine (tris) salt of palifosfamide (Isophosphamide mustard), with potential antineoplastic activity. As the stabilized active metabolite of ifosfamide, palifosfamide irreversibly alkylates and crosslinks DNA through GC base pairs, resulting in irreparable 7-atom interstrand crosslinks. This leads to an inhibition of DNA replication and ultimately cell death. Unlike ifosfamide, this agent is not metabolized to acrolein or chloroacetaldehyde, metabolites associated with bladder and CNS toxicities. In addition, because palifosfamide does not require activation by aldehyde dehydrogenase, it may overcome the tumor resistance seen with ifosfamide. Stabilization with tris instead of lysine further increases stability and may further decrease nephrotoxicity.

**palindrome:** A segment of duplex DNA in which the base sequences of the two strands exhibit twofold rotational symmetry about an axis. OR A sequence of bases that reads the same in both directions on opposite strands of the DNA duplex (e.g., GAATTC). OR A word, sentence, or verse that reads the same from right to left as it does from left to right; an example is "radar." By extension to biochemistry, a sequence of double-stranded DNA that is the same in each strand when the strands are read in the same

direction; that is, it displays a twofold rotational symmetry—for example, 3'-CCTAGG-5'/5'-GGATCC-3'.

**Palladium:** Symbol:"Pd" Atomic Number:"46" Atomic Mass: 106.40amu. Palladium is one of the transition elements. Palladium is another member of the platinum group. It is a white color and will not tarnish (oxidize) in air. You will find it used in jewelry, surgical instruments, and watches.

**palladium Pd 103:** A radioisotope of the metal palladium used in brachytherapy implants or 'seed'. With a half-life of 17 days, palladium 103 administered with brachytherapy allows continuous, tumor-site specific low-energy irradiation to the tumor cell population while sparing normal adjacent tissues from radiotoxicity.

**palladium-bacteriopheophorbide:** A novel palladium-substituted bacteriochlorophyll derivative and photosensitizer with potential antitumor activity. Upon administration, inactive palladium-bacteriopheophorbide is activated locally when the tumor bed is exposed to photoirradiation; the activated form induces local cytotoxic processes, resulting in local tissue damage, disruption of tumor vasculature, and tumor hypoxia and necrosis.

**Palletizing:** A process of producing pellets.

**palliation :** The use of special drugs called sedatives to relieve extreme suffering by making a patient calm, unaware, or unconscious. This may be done for patients who have symptoms that cannot be controlled with other treatment. Palliative sedation may be used in patients who are near the end of life to make them more comfortable. It is not meant to shorten life or cause death.

**palliative care :** Treatment given to relieve the symptoms and reduce the suffering caused by cancer and other life-threatening diseases. Palliative cancer therapies are given together with other cancer treatments, from the time of diagnosis, through treatment, survivorship, recurrent or advanced disease, and at the end of life.

**palliative sedation :** A condition marked by pain, swelling, numbness, tingling, or redness of the hands or feet. It sometimes occurs as a side effect of certain anticancer drugs. Also called hand-foot syndrome.

**palliative therapy :** A drug used to prevent nausea and vomiting caused by chemotherapy. It is also used to prevent nausea and vomiting after surgery. Palonosetron hydrochloride blocks the action of the chemical serotonin in

the brain, which may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called Aloxi.

**Palm Kernel Oil (PKO):** An edible plant oil derived from the kernel, or seed, of the oil palm tree.

**Palm Oil (PO):** An edible plant oil derived from the oil palm tree. Palm oil is extracted from the pulp of the oil palm fruit, contained and grown in bunches in the tree.

**Palm Plantation:** A large development and planting of palm oil trees, usually encompassing several hectares of land for this use. Such plantations, many of which are located in either Malaysia or Indonesia, are often found adjacent to harvesting and processing facilities, allowing the company to process the palm fruit into derivatives that can be used in consumer products and foods.

**palmar-plantar erythrodysesthesia :** A term used to describe cancer that can be felt by touch, usually present in lymph nodes, skin, or other organs of the body such as the liver or colon.

**palonosetron hydrochloride:** The hydrochloride salt of palonosetron, a carbazole derivative and a selective serotonin receptor antagonist with antiemetic activity. Palonosetron competitively blocks the action of serotonin at 5-hydroxytryptamine type 3 (5-HT<sub>3</sub>) receptors located on vagal afferents in the chemoreceptor trigger zone (CTZ), resulting in suppression of chemotherapy-induced nausea and vomiting. The CTZ is located in the area postrema on the dorsal surface of the medulla oblongata at the caudal end of the fourth ventricle and outside the blood-brain barrier (BBB). or Examination by pressing on the surface of the body to feel the organs or tissues underneath.

**palpable disease :** A rapid or irregular heartbeat that a person can feel.

**palpation :** A drug used to treat depression. It may also be used to treat panic or anxiety disorders and certain types of pain, and to help people quit smoking. Pamelor increases the levels of norepinephrine and other natural chemicals in the brain. This helps improve mood and may reduce a person's craving for nicotine. It is a type of tricyclic antidepressant. Also called Aventyl and nortriptyline.

**palpitation :** A drug used to treat hypercalcemia (high blood levels of calcium) caused by certain types of cancer. It is also used with other

anticancer drugs to treat multiple myeloma and breast cancer that has spread to bone. It is also used to treat Paget disease of the bone. Pamidronate disodium may help keep bone from breaking down and prevent the loss of calcium from the bones. It is a type of bisphosphonate. Also called Aredia.

**paludification:** The expansion of a bog caused by the gradual rising of the water table as accumulation of peat impedes water drainage.

**palynology:** The science of reconstructing the past flora and past climate from pollen data obtained from lake and bog sediments. The fossil pollen record is a function of the regional flora and vegetation at a given time and location.

**Pamelor :** A cure-all.

**pamidronate disodium:** The disodium salt of the synthetic bisphosphonate pamidronate. Although its mechanism of action is not completely understood, pamidronate appears to adsorb to calcium phosphate crystals in bone, blocking their dissolution by inhibiting osteoclast-mediated bone resorption. This agent does not inhibit bone mineralization and formation. Check for active clinical trials using this agent. or A type of lung cancer that begins in the upper part of a lung and spreads to nearby tissues such as the ribs and vertebrae. Most Pancoast tumors are non-small cell cancers. Also called pulmonary sulcus tumor.

**Pamolyn 300:** (Other name for: conjugated linoleic acid)

**PAN:** Polyacrylonitrile

**pan FGFR inhibitor ARQ 087:** An orally bioavailable inhibitor of the fibroblast growth factor receptor (FGFR) with potential antineoplastic activity. FGFR inhibitor ARQ 087 binds to and potently inhibits the activity of FGFR subtypes 1, 2 and 3. This may result in the inhibition of FGFR-mediated signal transduction pathways, tumor cell proliferation, tumor angiogenesis and tumor cell death in FGFR-overexpressing tumor cells. FGFR, a receptor tyrosine kinase, is upregulated in many tumor cell types and plays a key role in tumor cellular proliferation, differentiation, angiogenesis and survival.

**pan FGFR kinase inhibitor BGJ398:** An orally bioavailable pan inhibitor of human fibroblast growth factor receptors (FGFRs) with potential antiangiogenic and antineoplastic activities. pan FGFR kinase inhibitor

BGJ398 selectively binds to and inhibits the activities of FGFRs, which may result in the inhibition of tumor angiogenesis and tumor cell proliferation, and the induction of tumor cell death. FGFRs are a family of receptor tyrosine kinases which may be upregulated in various tumor cell types and may be involved in tumor cell differentiation and proliferation, tumor angiogenesis, and tumor cell survival.

**pan-AKT inhibitor ARQ 751:** An orally bioavailable pan inhibitor of the serine/threonine protein kinase AKT (protein kinase B) enzyme family with potential antineoplastic activity. Upon oral administration, AKT inhibitor ARQ 751 selectively binds to and inhibits the activity of the AKT isoforms 1, 2 and 3, which may result in the inhibition of the phosphatidylinositol 3-kinase (PI3K)/AKT signaling pathway. This may lead to a reduction in tumor cell proliferation and the induction of tumor cell apoptosis. The AKT signaling pathway is often deregulated in cancer and is associated with tumor cell proliferation, survival and migration. Check for active clinical trials using this agent.

**pan-AKT kinase inhibitor GSK690693:** An aminofurazan-derived inhibitor of Akt kinases with potential antineoplastic activity. Pan-AKT kinase inhibitor GSK-690693 binds to and inhibits Akt kinases 1, 2, and 3, which may result in the inhibition of protein phosphorylation events downstream from Akt kinases in the PI3K/Akt signaling pathway, and, subsequently, the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. In addition, this agent may inhibit other protein kinases including protein kinase C (PKC) and protein kinase A (PKA). As serine/threonine protein kinases which are involved in a number of biological processes, AKT kinases promote cell survival by inhibiting apoptosis and are required for glucose transport.

**pan-FGFR tyrosine kinase inhibitor BAY1163877:** A pan inhibitor of human fibroblast growth factor receptors (FGFRs) with potential antiangiogenic and antineoplastic activities. Pan-FGFR kinase inhibitor BAY1163877 inhibits the activities of FGFRs, which may result in the inhibition of both tumor angiogenesis and tumor cell proliferation, and the induction of tumor cell death. FGFRs are a family of receptor tyrosine kinases, which may be upregulated in various tumor cell types and may be involved in tumor cell differentiation and proliferation, tumor angiogenesis, and tumor cell survival.

**pan-FGFR tyrosine kinase inhibitor JNJ-42756493:** An orally bioavailable, pan fibroblast growth factor receptor (FGFR) inhibitor with potential antineoplastic activity. Upon oral administration, JNJ-42756493 binds to and inhibits FGFR, which may result in the inhibition of FGFR-related signal transduction pathways and thus the inhibition of tumor cell proliferation and tumor cell death in FGFR-overexpressing tumor cells. FGFR, upregulated in many tumor cell types, is a receptor tyrosine kinase essential to tumor cell proliferation, differentiation and survival. Check for active clinical trials using this agent.

**pan-HER kinase inhibitor AC480:** An orally bioavailable, small-molecule pan-HER tyrosine kinase inhibitor with potential antineoplastic and radiosensitizing activities. Pan-HER kinase inhibitor AC480 binds to and inhibits the human epidermal growth factor receptors (HER) HER1 (EGFR), HER2 (ErbB-2) and HER4, which may prevent downstream signaling and inhibit the proliferation of tumor cells that overexpress these receptors. In addition, this agent may enhance the radiosensitivity of certain tumor cell types that express HER1 and HER2 through cell cycle redistribution in G1 phase and inhibition of DNA repair. EGFRs, frequently overexpressed on tumor cells, play a key role in tumor cell proliferation and survival.

**pan-HER/VEGFR2 receptor tyrosine kinase inhibitor BMS-690514:** A pyrrolotriazine-based compound and a pan inhibitor of receptor tyrosine kinases with potential antineoplastic activity. Pan HER/VEGFR2 receptor tyrosine kinase inhibitor BMS-690514 binds to human epidermal growth factor receptors (EGFR) 1, 2 and 4 (HER1, HER2 and HER4) and vascular endothelial growth factor receptor 1, 2 and 3 (VEGFR-1, -2 and -3), all of which are frequently overexpressed by a variety of tumor types. Binding of this agent to these receptors may result in the inhibition of tumor cell proliferation; the inhibition of endothelial cell migration and proliferation and angiogenesis; and tumor cell death.

**pan-PI3K inhibitor CLR457:** An orally bioavailable pan inhibitor of phosphatidylinositol-3-kinase (PI3K), with potential antineoplastic activity. Upon oral administration, pan-PI3K inhibitor CLR457 inhibits all of the PI3K kinase isoforms, which may result in apoptosis and growth inhibition in tumor cells overexpressing PI3K. Activation of the PI3K pathway

promotes cell growth, survival, and resistance to both chemotherapy and radiotherapy.

**pan-PI3K/mTOR inhibitor PQR309:** An orally bioavailable pan inhibitor of phosphoinositide-3-kinases (PI3K) and inhibitor of the mammalian target of rapamycin (mTOR), with potential antineoplastic activity. PI3K/mTOR kinase inhibitor PQR309 inhibits the PI3K kinase isoforms alpha, beta, gamma and delta and, to a lesser extent, mTOR kinase, which may result in tumor cell apoptosis and growth inhibition in cells overexpressing PI3K/mTOR. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to both chemotherapy and radiotherapy. As mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K, this agent may potentially be more potent than an agent that inhibits either PI3K kinase or mTOR kinase. By inhibiting mTOR to a lesser extent than PI3K, PQR309 does not interfere with the mTOR-mediated negative feedback loop on PI3K signaling. Blocking the negative feedback loop would potentially increase PI3K signaling and decrease therapeutic efficacy.

**pan-PI3K/mTOR inhibitor SF1126:** A water soluble, small-molecule prodrug containing the pan-PI3K/mTOR inhibitor LY294002/SF1101 conjugated to the RGD-containing tetra-peptide SF1174 with potential antineoplastic and antiangiogenic activities. The targeting peptide SF1174 moiety of pan-PI3K/mTOR inhibitor SF1126 selectively binds to cell surface integrins and, upon cell entry, the agent is hydrolyzed to the active drug SF1101; SF1101 selectively inhibits all isoforms of phosphoinositide-3-kinase (PI3K) and other members of the PI3K superfamily, such as the mammalian target of rapamycin (mTOR) and DNA-PK. By inhibiting the PI3K signaling pathway, this agent may inhibit tumor cell and tumor endothelial cell proliferation and survival. Integrins are transmembrane cell adhesion proteins expressed on the surfaces of endothelial and tumor cells.

**pan-PIM inhibitor INCB053914:** An orally available, small molecule and selective ATP-competitive pan-inhibitor of proviral integration sites for Moloney murine leukemia virus (PIM) kinases, with potential antineoplastic activity. Upon oral administration, pan-PIM kinase inhibitor INCB053914 binds to and inhibits the activities of the three PIM isoforms, PIM1, PIM2 and PIM3. This prevents phosphorylation of their downstream targets and inhibits proliferation in cells that overexpress PIMs. PIMs,

constitutively active proto-oncogenic serine/threonine kinases upregulated in various types of cancers, play key roles in tumor cell proliferation and survival.

**pan-PIM kinase inhibitor AZD1208:** An orally available, small molecule inhibitor of PIM kinases with potential antineoplastic activity. Pan-PIM kinase inhibitor AZD1208 inhibits the activities of PIM1, PIM2 and PIM3 serine/threonine kinases, which may result in the interruption of the G1/S phase cell cycle transition, thereby causing cell cycle arrest and inducing apoptosis in cells that overexpress PIMs. The growth inhibition of several leukemia cell lines by this agent is correlated with the expression levels of PIM1, which is the substrate of STAT transcription factors. PIM kinases are downstream effectors of many cytokine and growth factor signaling pathways and are upregulated in various malignancies.

**pan-Raf inhibitor LXH254:** An orally available inhibitor of all members of the serine/threonine protein kinase Raf family, with potential antineoplastic activity. Upon administration, pan-RAF inhibitor LXH254 binds to Raf proteins and inhibits Raf-mediated signal transduction pathways. This inhibits proliferation of Raf-overexpressing tumor cells. Raf protein kinases are critical enzymes in the Ras/Raf/MEK/ERK signaling pathway and are upregulated in a variety of cancer cell types. They play key roles in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**pan-RAF inhibitor LY3009120:** An orally available inhibitor of all members of the serine/threonine protein kinase Raf family, including A-Raf, B-Raf and C-Raf protein kinases, with potential antineoplastic activity. Upon administration, pan-RAF kinase inhibitor LY3009120 inhibits Raf-mediated signal transduction pathways, which may inhibit tumor cell growth. Raf protein kinases play a key role in the RAF/mitogen-activated protein kinase kinase (MEK)/extracellular signal-regulated kinase (ERK) signaling pathway, which is often dysregulated in human cancers and plays a key role in tumor cell proliferation and survival.

**pan-RAF kinase inhibitor CCT3833:** An orally available inhibitor of the serine/threonine protein kinase family Raf, including A-Raf, B-Raf and C-Raf, with potential antineoplastic activity. Upon administration, pan-RAF kinase inhibitor CCT3833 inhibits Raf-mediated signal transduction pathways, which may inhibit the proliferation of Raf-overexpressing tumor

cells. Raf protein kinases play a key role in the RAF/mitogen-activated protein kinase kinase (MEK)/extracellular signal-regulated kinase (ERK) signaling pathway, which is often dysregulated in human cancers and plays a key role in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**pan-RAF kinase inhibitor TAK-580:** An orally available inhibitor of A-Raf, B-Raf and C-Raf protein kinases, with potential antineoplastic activity. Upon administration, pan-RAF kinase inhibitor TAK-580 inhibits Raf-mediated signal transduction pathways, which may inhibit tumor cell growth. Raf protein kinases play a key role in the RAF/MEK/ERK signaling pathway, which is often deregulated in human cancers and plays a key role in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**pan-selectin antagonist GMI-1070:** A synthetic, glycomimetic molecule and pan-selectin antagonist, with potential use in a vaso-occlusive crisis. Upon administration, GMI-1070 prevents the interaction between leukocytes and the endothelium and may prevent cell activation and adhesion. By preventing selectin-mediated cell adhesion in sickle cell anemia, this agent may inhibit red blood cell-white blood cell interactions, normalize blood flow and reduce inflammation and vascular occlusive pain. GMI-1070 has the strongest antagonistic activity towards E-selectin but the incorporation of a sulfate-binding domain allows for interactions with P- and L-selectins. Selectins, containing lectin- and EGF-like domains, are a family of cell adhesion molecules implicated in inflammatory processes and cancer. Check for active clinical trials using this agent.

**pan-VEGFR/Tie2 tyrosine kinase inhibitor CEP-11981:** An orally bioavailable inhibitor of vascular endothelial growth factor receptor (VEGFR) and Tie2 receptor tyrosine kinases with potential antiangiogenic and antineoplastic activities. Pan-VEGFR/Tie2 tyrosine kinase inhibitor CEP-11981 selectively binds to VEGFR and Tie2 receptor tyrosine kinases, which may result the inhibition of endothelial cell migration, proliferation and survival and the inhibition of tumor cell proliferation and tumor cell death. VEGFR and Tie2 are frequently overexpressed by a variety of tumor cell types and play crucial roles in the regulation of angiogenesis and the maintenance of tumor blood vessels. Tie2 (tyrosine kinase with

immunoglobulin-like and EGF-like domains) is activated by angiopoietin-1 (Ang-1).

**panacea** : A glandular organ located in the abdomen. It makes pancreatic juices, which contain enzymes that aid in digestion, and it produces several hormones, including insulin. The pancreas is surrounded by the stomach, intestines, and other organs.

**Pancoast tumor** : Surgery to remove all or part of the pancreas. In a total pancreatectomy, part of the stomach, part of the small intestine, the common bile duct, gallbladder, spleen, and nearby lymph nodes also are removed.

**pancreas**: a large, glandular organ lying near the stomach that produces many of the enzymes used to digest food.

**pancreas** : Having to do with the pancreas.

**Pancrease**: (Other name for: pancrelipase)

**pancreatectomy** : A disease in which malignant (cancer) cells are found in the tissues of the pancreas. Also called exocrine cancer.

**pancreatic** : Part of a system of ducts in the pancreas. Pancreatic juices containing enzymes are released into these ducts and flow into the small intestine.

**pancreatic cancer** : A rare cancer that forms in islet cells (hormone-making cells) of the pancreas. Islet cells make several different hormones that affect body functions, including controlling the amount of glucose (sugar) in the blood and helping digest food in the stomach. Functional pancreatic endocrine cancers make extra amounts of these hormones, which can cause symptoms. Nonfunctional pancreatic endocrine cancers do not make extra amounts of hormones, but they may cause symptoms as they grow and spread. Also called islet cell carcinoma.

**pancreatic duct** : A tumor that forms in islet cells (hormone-making cells) of the pancreas. Pancreatic endocrine tumors may be benign (not cancer) or malignant (cancer). Islet cells make several different hormones that affect body functions, including controlling the amount of glucose (sugar) in the blood and helping digest food in the stomach. Functional pancreatic endocrine tumors make extra amounts of these hormones, which can cause symptoms. Nonfunctional pancreatic endocrine tumors do not make extra

amounts of hormones, but they may cause symptoms as they grow and spread. Also called islet cell tumor and pancreatic neuroendocrine tumor.

**pancreatic endocrine cancer :** A protein secreted by the pancreas that aids in the digestion of food.

**pancreatic endocrine tumor :** A test used to measure the ability of the pancreas to respond to a hormone called secretin. Secretin causes the pancreas, liver, and stomach to release substances that help digest food. During a pancreatic function test, a tube is inserted through the nose or throat into the stomach and small intestine. Secretin is given to the patient by injection into a vein. After a certain amount of time, samples of fluid are taken from the small intestine through the tube and sent to a lab to test for a response. A pancreatic function test may be used to help diagnose problems that affect the pancreas, such as pancreatitis, cystic fibrosis, and a type of pancreatic tumor called a gastrinoma. Also called secretin stimulation test.

**pancreatic enzyme :** An abnormal mass that grows in the beta cells of the pancreas that make insulin. Pancreatic insulin-producing tumors are usually benign (not cancer). They secrete insulin and are the most common cause of low blood sugar caused by having too much insulin in the body. Also called beta cell neoplasm, beta cell tumor of the pancreas, and insulinoma.

**pancreatic function test :** Fluid made by the pancreas. Pancreatic juices contain proteins called enzymes that aid in digestion.

**pancreatic insulin-producing tumor :** A tumor that forms in islet cells (hormone-making cells) of the pancreas. Pancreatic neuroendocrine tumors may be benign (not cancer) or malignant (cancer). Islet cells make several different hormones that affect body functions, including controlling the amount of glucose (sugar) in the blood and helping digest food in the stomach. Functional pancreatic neuroendocrine tumors make extra amounts of these hormones, which can cause symptoms. Nonfunctional pancreatic neuroendocrine tumors do not make extra amounts of hormones, but they may cause symptoms as they grow and spread. Also called islet cell tumor and pancreatic endocrine tumor.

**pancreatic juice :** A small protein made by the pancreas that helps control the release of other substances made by the pancreas. The amount of pancreatic polypeptide in the blood increases after a person eats. It may also increase with age, and in certain diseases, such as diabetes and pancreatic cancer. Also called PP.

**pancreatic neuroendocrine tumor :** A tumor that forms in the cells of the pancreas. The two main types of pancreatic tumors are pancreatic exocrine tumors and pancreatic neuroendocrine tumors. Most pancreatic cancers are exocrine tumors, which form in cells that make enzymes to help the body digest food. Pancreatic neuroendocrine tumors form in neuroendocrine pancreas cells (such as islet cells). These cells make hormones that help control sugar levels in the blood. Pancreatic neuroendocrine tumors may be benign (not cancer) or malignant (cancer). They are much less common than pancreatic exocrine tumors and have a better prognosis.

**pancreatic polypeptide :** Inflammation of the pancreas. Chronic pancreatitis may cause diabetes and problems with digestion. Pain is the primary symptom.

**pancreatic tumor :** A type of surgery used to treat pancreatic cancer. The head of the pancreas, the duodenum, a portion of the stomach, and other nearby tissues are removed. Also called Whipple procedure.

**pancreatitis :** A rare condition in which the pituitary gland stops making most or all hormones. Pituitary hormones help control the way many parts of the body work. Symptoms of the condition depend on the hormones that are missing. They include growth problems (in children), obesity (in adults), hair loss, slow heart rate, low blood sugar, low blood pressure, fatigue, and problems with reproduction. This condition may be caused by a tumor on or near the pituitary gland, infection, stroke, injury, surgery, or radiation therapy. It may also be inherited. Also called PHP.

**pancreatoduodenectomy :** Sudden extreme anxiety or fear that may cause irrational thoughts or actions. Panic may include rapid heart rate, flushing (a hot, red face), sweating, and trouble breathing.

**pancrelipase:** A standardized enzyme concentrate containing the pancreatic enzymes, lipase, protease and amylase used in enzyme substitution therapy. Lipase, protease and amylase break down fat, protein, and starches, respectively in the small intestine, thereby promoting digestion. Pancrelipase is used to reduce malabsorption when the pancreas is unable to secrete sufficient amounts of these enzymes.

**Paneling:** distortion, side wall collapse of a container occurring during aging or storage. Paneling is caused by the development of a reduced pressure inside the bottle.

**Pangaea:** a single continental mass that rifted to form our present-day continents.

**Panglobulin:** (Other name for: therapeutic immune globulin)

**Panhematin:** (Other name for: therapeutic hemin)

**panhypopituitarism :** A human monoclonal antibody that is being used to treat colorectal cancer that has spread to other parts of the body. It is used in patients whose disease has not gotten better during or after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells.

Panitumumab binds to the epidermal growth factor receptor (EGFR) and may block tumor cell growth. Also called ABX-EGF and Vectibix.

**panic :** A drug used with bortezomib and dexamethasone to treat multiple myeloma. It is used in patients who have already been treated with bortezomib and an immunomodulating agent. It is also being studied in the treatment of other types of cancer. Panobinostat blocks certain enzymes needed for cells to grow and divide and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of histone deacetylase inhibitor and a type of antiangiogenesis agent. Also called Farydak and LBH589.

**panitumumab:** A human monoclonal antibody produced in transgenic mice that attaches to the transmembrane epidermal growth factor (EGF) receptor. Panitumumab may inhibit autocrine EGF stimulation of tumor cells that express the EGF receptor, thereby inhibiting tumor cell proliferation. or A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Pantothenic acid helps some enzymes use foods and make many substances used in the body and protects cells against damage from peroxides. It is found in almost all plant and animal foods. Pantothenic acid is water-soluble (can dissolve in water) and must be taken in every day. Also called vitamin B5.

**panitumumab-IRDye800:** An imaging agent composed of panitumumab, a humanized anti-epidermal growth factor receptor (EGFR) monoclonal antibody, conjugated to the near-infrared (NIR) fluorescent dye IRDye800, that can potentially be used for the imaging of EGFR-expressing tumors. Upon administration of panitumumab-IRDye800, the panitumumab moiety

targets and binds to EGFR expressed on tumor cells. Upon fluorescence imaging of IRDye800, the tumor cells can be detected.

**PankoMab-GEX:** (Other name for: anti-TA-MUC1 monoclonal antibody PankoMab)

**panobinostat:** A cinnamic hydroxamic acid analogue with potential antineoplastic activity. Panobinostat selectively inhibits histone deacetylase (HDAC), inducing hyperacetylation of core histone proteins, which may result in modulation of cell cycle protein expression, cell cycle arrest in the G2/M phase and apoptosis. In addition, this agent appears to modulate the expression of angiogenesis-related genes, such as hypoxia-inducible factor-1alpha (HIF-1a) and vascular endothelial growth factor (VEGF), thus impairing endothelial cell chemotaxis and invasion. HDAC is an enzyme that deacetylates chromatin histone proteins. or A cancer vaccine made with a form of vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins, including the tumor markers called CEA and MUC-1, that may help immune cells in the body kill tumor cells. Also called inalimarev and recombinant vaccinia-CEA-MUC-1-TRICOM vaccine.

**Panretin:** (Other name for: alitretinoin)

**pantoprazole sodium:** The sodium salt form of a substituted benzimidazole with proton pump inhibitor activity. Pantoprazole is a lipophilic, weak base that crosses the parietal cell membrane and enters the acidic parietal cell canaliculus where it becomes protonated, producing the active metabolite sulfenamide, which forms an irreversible covalent bond with two sites of the H<sup>+</sup>/K<sup>+</sup>-ATPase enzyme located on the gastric parietal cell, thereby inhibiting both basal and stimulated gastric acid production.

**Pantothenate:** A vitamin that is a key component of coenzyme A.

**pantothenic acid :** An enzyme produced by the prostate. It may be found in increased amounts in men who have prostate cancer. Also called prostatic acid phosphatase.

**PANVAC-F:** (Other name for: falimarev)

**PANVAC-V :** A procedure in which a small brush or spatula is used to gently remove cells from the cervix so they can be checked under a microscope for cervical cancer or cell changes that may lead to cervical

cancer. A Pap smear may also help find other conditions, such as infections or inflammation. It is sometimes done at the same time as a pelvic exam and may also be done at the same time as a test for certain types of human papillomavirus (HPV). Also called Pap test and Papanicolaou test.

**Panwarfin:** (Other name for: warfarin)

**Panzem:** (Other name for: 2-methoxyestradiol)

**PAP:** A procedure in which a small brush or spatula is used to gently remove cells from the cervix so they can be checked under a microscope for cervical cancer or cell changes that may lead to cervical cancer. A Pap test may also help find other conditions, such as infections or inflammation. It is sometimes done at the same time as a pelvic exam and may also be done at the same time as a test for certain types of human papillomavirus (HPV). Also called Pap smear and Papanicolaou test.

**Pap smear :** A procedure in which a human papillomavirus (HPV) test and a Pap test are done at the same time to check for cervical cancer. The HPV test looks for DNA or RNA from certain high-risk types of HPV in samples of cells taken from the cervix. The Pap test checks for cervical cancer cells and cell changes that may lead to cervical cancer. The same cell sample may be used for both the HPV test and the Pap test. Women aged 30 to 65 years may have a Pap/HPV cotest every 5 years. Cotesting is more likely to find abnormal cells or cervical cancer than a Pap test alone is. Also called HPV/Pap cotest.

**Pap test :** A procedure in which a small brush or spatula is used to gently remove cells from the cervix so they can be checked under a microscope for cervical cancer or cell changes that may lead to cervical cancer. A Papanicolaou test may also help find other conditions, such as infections or inflammation. It is sometimes done at the same time as a pelvic exam and may also be done at the same time as a test for certain types of human papillomavirus (HPV). Also called Pap smear and Pap test.

**Pap/HPV cotest:** The thin top layer of the dermis (the inner layer of the skin). The papillary dermis has connective tissue and blood vessels that give nutrients to the epidermis (the outer layer of the skin) and that help control the temperature of the skin.

**Papanicolaou test :** (PA-pih-LAYR-ee IN-truh-lim-FA-tik AN-jee-oh-EN-doh-THEE-lee-oh-muh)

**papaverine:** An opiate alkaloid isolated from the plant *Papaver somniferum* and produced synthetically. As a direct-acting smooth muscle relaxant, papaverine is not closely related to the other opium alkaloids in structure or pharmacological actions; its mechanism of action may involve the non-selective inhibition of phosphodiesterases and direct inhibition of calcium channels. This agent also exhibits antiviral activity against respiratory syncytial virus, cytomegalovirus, and HIV.

**papillary dermis :** A rare, slow-growing tumor of blood vessels that forms in or under the skin anywhere on the body. Papillary intralymphatic angioendotheliomas may appear as firm, raised, purplish bumps, which may be small or large. They usually do not spread to other parts of the body. Papillary intralymphatic angioendotheliomas can occur in children and adults. They are a type of vascular tumor. Also called Dabska tumor.

**papillary intralymphatic angioendothelioma :** An aggressive cancer that usually affects the uterus/endometrium, peritoneum, or ovary.

**papillary serous carcinoma :** Cancer that forms in follicular cells in the thyroid and grows in small finger-like shapes. It grows slowly, is more common in women than in men, and often occurs before age 45. It is the most common type of thyroid cancer.

**papillary thyroid cancer :** A tumor shaped like a small mushroom, with its stem attached to the epithelial layer (inner lining) of an organ.

**papillary tumor :** The layer of the skin between the papillary dermis (the thin top layer of the dermis) and the reticular dermis (the thick bottom layer of the dermis). The dermis is the layer of skin below the epidermis (the outer layer of the skin).

**papillary-reticular dermal interface :** Swelling around the optic disk, the area where the optic nerve (the nerve that carries messages from the eye to the brain) enters the eyeball. Papilledema occurs when increased brain pressure caused by tumors or other problems results in swelling of the optic nerve.

**papilledema :** A small, solid, raised bump on the skin that has a border with edges that are easy to see. Papules may be red, purple, brown, or pink.

**papule :** A substance being studied in the treatment of diarrhea caused by infection with *Clostridium difficile* (a type of bacteria that can grow without

oxygen) in cancer patients. PAR-101 is a type of antibiotic. Also called OPT-80 and tiacumicin B.

**PAR-101:** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Bacteria that live in the intestines need para-aminobenzoic acid to survive. Para-aminobenzoic acid is found in grains and foods from animals. It is being studied as a radiosensitizer (a substance that makes tumor cells more sensitive to radiation therapy) and in the treatment of certain skin disorders. Also called aminobenzoic acid and PABA.

**para-aminobenzoic acid :** A procedure in which a thin needle or tube is put into the abdomen to remove fluid from the peritoneal cavity (the space within the abdomen that contains the intestines, the stomach, and the liver).

**Para-Xylene:** para-Xylene is an aromatic compound with two methyl groups substituted onto the benzene ring at opposite positions. Para-xylene is recovered from a mixed xylenes stream by adsorption and by isomerisation of C8 aromatics. Almost all para-xylene consumed for chemicals production is used for the production of PTA and DMT, which are used in polyester production.

**parabolic dune:** a deeply curved dune with the tips pointing into the wind; usually forms around a blowout in vegetated areas.

**paracentesis :** A collection of cells that came from embryonic nervous tissue, and are found near the adrenal glands and some blood vessels and nerves. Most paraganglia secrete epinephrine and norepinephrine.

**paradigm:** In biochemistry, an experimental model or example.

**paraffin:** 1. a waxy substance that is a mixture of alkanes with chains containing 18 to 36 carbon atoms. 2. An alkane.

**Paraflex:** (Other name for: chlorzoxazone)

**paraganglia :** A rare, usually benign tumor that develops from cells of the paraganglia. Paraganglia are a collection of cells that came from embryonic nervous tissue, and are found near the adrenal glands and some blood vessels and nerves. Paragangliomas that develop in the adrenal gland are called pheochromocytomas. Those that develop outside of the adrenal glands near blood vessels or nerves are called glomus tumors or chemodectomas.

**paraganglioma :** A bad taste in the mouth. Also called dysgeusia.

**parageusia :** Loss of ability to move all or part of the body.

**paragraph:** develops one idea with a series of logically connected sentences and may vary in length.

**paragraph coherence:** the smooth logical flow of a paragraph.

**paragraph unity:** a paragraph that focuses on one idea and one idea only.

**parallax:** ) the apparent change in the position of stars due to Earth's revolution.

**parallel lines:** two or more lines, always the same distance apart. Parallel lines never meet.

**parallel retreat:** the retention by slopes of their original steepness as they erode.

**parallelism:** refers to matching grammatical structures; elements in a sentence that have the same function or express similar ideas should be grammatically parallel, or grammatically matched.

**parallelogram:** a four-sided plane closed figure having opposite sides equal and parallel. (Opposite angles are equal, and consecutive angles are supplementary.)

**parallels:** lines that never meet, such as latitude.

**Paralogs:** Homologous molecules that are present within one species; often differ in their detailed biochemical functions.

**paralysis :** A condition in which the muscles of the intestines do not allow food to pass through, resulting in a blocked intestine. Paralytic ileus may be caused by surgery, inflammation, and certain drugs.

**paralytic ileus :** The fat and connective tissue that surrounds the uterus. The parametrium helps connect the uterus to other tissues in the pelvis.

**paramagnetism:** Paramagnetic materials are attracted to a magnetic field due to the presence of least one unpaired spin in their atoms or molecules.

**parametrium :** A type of virus that has hemagglutinin-neuraminidase proteins in the outer coat and RNA as the genetic material. Measles (rubeola) virus, mumps virus, and Newcastle disease virus are paramyxoviruses.

**paramyxovirus :** One of many small hollow spaces in the bones around the nose. Paranasal sinuses are named after the bones that contain them: frontal (the lower forehead), maxillary (cheekbones), ethmoid (beside the

upper nose), and sphenoid (behind the nose). The paranasal sinuses open into the nasal cavity (space inside the nose) and are lined with cells that make mucus to keep the nose from drying out during breathing.

**paranasal sinus :** Cancer that forms in tissues of the paranasal sinuses (small hollow spaces in the bones around the nose) or nasal cavity (the inside of the nose). The most common type of paranasal sinus and nasal cavity cancer is squamous cell carcinoma (cancer that begins in flat cells lining these tissues and cavities).

**paranasal sinus and nasal cavity cancer :** A group of symptoms that may develop when substances released by some cancer cells disrupt the normal function of surrounding cells and tissue.

**paraneoplastic syndrome :** A mental disorder in which a person has an extreme fear and distrust of others. A paranoid person may have delusions that people are trying to harm him or her.

**paranoia :** A drug that is used to treat advanced ovarian cancer that has never been treated or symptoms of ovarian cancer that has come back after treatment with other anticancer drugs. It is also used with other drugs to treat advanced, metastatic, or recurrent non-small cell lung cancer and is being studied in the treatment of other types of cancer. Paraplatin is a form of the anticancer drug cisplatin and causes fewer side effects in patients. It attaches to DNA in cells and may kill cancer cells. It is a type of platinum compound. Also called carboplatin.

**paraparesis:** weakness in the lower extremities

**Parapet:** A low wall built along the edge of a roof bridge or other structure; the continuation of the main wall above the eaves level to form such a wall.

**paraphrase:** involves borrowing an idea that you rephrase in your own words.

**Paraplat:** (Other name for: carboplatin)

**Paraplatin :** An animal or plant that gets nutrients by living on or in an organism of another species. A complete parasite gets all of its nutrients from the host organism, but a semi-parasite gets only some of its nutrients from the host.

**parasite :** Having to do with or being a parasite (an animal or plant that gets nutrients by living on or in an organism of another species).

**parasites:** organisms that attack living things and cause disease.

**parasitic :** An abnormal disruption of sleep, such as sleep walking, sleep talking, nightmares, bedwetting, sleep apnea (problems with breathing that cause loud snoring), or nighttime seizures.

**parasitism:** a type of symbiosis in which one population benefits while the other is harmed.

**Parasolid:** A file format for exchanging CAD data.

**parasomnia :** The part of the nervous system that slows the heart, dilates blood vessels, decreases pupil size, increases digestive juices, and relaxes muscles in the gastrointestinal tract.

**parasympathetic nervous system:** a subdivision of the autonomic nervous system that returns the body to normal after an emergency.

**parasympathetic nervous system :** A substance made by the parathyroid gland that helps the body store and use calcium. A higher-than-normal amount of parathormone causes high levels of calcium in the blood and may be a sign of disease. Also called parathyrin, parathyroid hormone, and PTH.

**parathesis:** an abnormal sensation of the skin, such as numbness, tingling due to poor circulation in the limbs

**parathormone :** A substance made by the parathyroid gland that helps the body store and use calcium. A higher-than-normal amount of parathyrin causes high levels of calcium in the blood and may be a sign of disease. Also called parathormone, parathyroid hormone, and PTH.

**parathyrin :** A rare cancer that forms in tissues of one or more of the parathyroid glands (four pea-sized glands in the neck that make parathyroid hormone, which helps the body store and use calcium).

**parathyroid cancer :** One of four pea-sized glands found on the surface of the thyroid. The parathyroid hormone made by these glands increases the calcium level in the blood.

**parathyroid gland :** A substance made by the parathyroid gland that helps the body store and use calcium. A higher-than-normal amount of parathyroid hormone causes high levels of calcium in the blood and may be a sign of disease. Also called parathormone, parathyrin, and PTH.

**parathyroid glands:** glands located on the posterior surfaces of the thyroid gland that produce parathyroid hormone.

**parathyroid hormone** : Surgery to remove one or more parathyroid glands (four pea-sized organs found on the thyroid).

**parathyroid hormone-related protein (1-36)**: A recombinant form of a mature, N-terminal secretory peptide derived from a parathyroid hormone-related protein (PTHrP) prohormone through posttranslational endoproteolytic processing with vasodilating, myorelaxant, and parathyroid hormone (PTH)-like calciotropic activities. Expressed throughout the cardiovascular system, parathyroid hormone-related protein (1-36) [PTHrP (1-36)] was first identified as the PTH-like hypercalcemic factor of humoral hypercalcemia of malignancy; however, its sequence differs significantly from that of PTH (1-34) although both proteins share the same N-terminal end which accounts for the calciotropic activity. Both PTHrP (1-36) and PTH (1-34) bind to the type 1 parathyroid hormone receptor (PTH1R), a specific seven-transmembrane-helix-containing G protein-coupled receptor mainly located in bone and kidney cells.

**parathyroidectomy** : The essential or functional elements of an organ.

**parecoxib sodium**: A water-soluble, injectable sodium salt form of parecoxib, an amide prodrug of the cyclooxygenase II (COX-2) selective, non-steroidal anti-inflammatory drug (NSAID) valdecoxib, with anti-inflammatory, analgesic, and antipyretic activities. Upon intravenous or intramuscular administration, parecoxib is hydrolyzed by hepatic carboxyesterases to its active form, valdecoxib. Valdecoxib selectively binds to and inhibits COX-2. This prevents the conversion of arachidonic acid into prostaglandins, which are involved in the regulation of pain, inflammation, and fever. This NSAID does not inhibit COX-1 at therapeutic concentrations and, therefore, does not interfere with blood coagulation. Check for active clinical trials using this agent.

**parenchyma** : A form of nutrition that is delivered into a vein. Parenteral nutrition does not use the digestive system. It may be given to people who are unable to absorb nutrients through the intestinal tract because of vomiting that won't stop, severe diarrhea, or intestinal disease. It may also be given to those undergoing high-dose chemotherapy or radiation and bone marrow transplantation. It is possible to give all of the protein, calories, vitamins and minerals a person needs using parenteral nutrition. Also called hyperalimentation, total parenteral nutrition, and TPN.

**Parent:** A radionuclide that upon radioactive decay or disintegration yields a specific nuclide (the daughter).

**parent isotope:** An element that undergoes nuclear decay.

**parent name:** the root name of a molecule according to the IUPAC nomenclature rules; for example, hexane is the parent name in trans-1,2-dibromocyclohexane.

**parent rock:** the original rock from which a metamorphic rock was formed.

**parenteral nutrition :** An abnormal touch sensation, such as burning or prickling, that occurs without an outside stimulus.

**parentheses:** punctuation devices used to set off incidental information.

**paresthesia :** A substance that is being used to treat overactive parathyroid glands in patients with kidney failure. It is also being studied in the treatment of cancer. Paricalcitol belongs to the family of drugs called vitamin D analogs.

**paricalcitol:** A synthetic noncalcemic, nonphosphatemic vitamin D analogue. Paricalcitol binds to the vitamin D receptor and has been shown to reduce parathyroid hormone (PTH) levels. This agent also increases the expression of PTEN ('Phosphatase and Tensin homolog deleted on chromosome Ten'), a tumor-suppressor gene, in leukemic cells and cyclin-dependent kinase inhibitors, resulting in tumor cell apoptosis and tumor cell differentiation into normal phenotypes. or Surgery to cut the parts of the vagus nerve that cause gastric acid to be made in the stomach. It is done to treat stomach ulcers or other conditions in which the stomach makes too much acid.

**parietal cell vagotomy :** The outer layer of the pericardium, which is a thin sac of tissue that surrounds the heart.

**parietal pericardium :** The layers of tissue that line the abdominal wall and the pelvic cavity.

**parietal peritoneum :** A progressive disorder of the nervous system marked by muscle tremors, muscle rigidity, decreased mobility, stooped posture, slow voluntary movements, and a mask-like facial expression.

**Parison:** the extruded hot plastic tube that will be placed in a high-density polyethylene mold to be inflated into a bottle or other hollow form. OR The hollow plastic tube from which a container, toy, etc. is blow molded. OR A

round, hollow tube of molten plastic that is extruded from the head of the blow molding machine.

**Parison Curtaining:** The tendency for a parison to lose its tubular shape because of conditions in the extrusion process. Generally, the bottom of the parison tends to drape irregularly, causing the entire parison to lose its original shape, creating difficulties in molding the part.

**Parison Melt Strength:** Parison melt strength depends directly on the melt characteristics of the resin being extruded. The ability to extrude a parison of sufficient dimensions to produce the desired part depends on the melt strength of the parison. The larger and heavier the parison, the greater its melt strength requirements.

**Parison Pre-Blowing:** Introducing air pressure into the parison before closing the mold halves. This provides better distribution of wall thickness and prevents the parison wall from coming in contact before the inflation of the part.

**Parison Programming:** Varying the wall thicknesses in a parison to conform to the wall thickness requirements of a given part.

**Parison Swell:** In blow molding the ratio of the cross-sectional area of the parison to the cross-sectional area of the die opening.

**Parison Tail :** The bottom portion of a parison that is severed by the lower pinch-offs and falls outside the mold.

**Parkinson disease :** Cancer that forms in a parotid gland, the largest of the salivary glands, which make saliva and release it into the mouth. There are 2 parotid glands, one in front of and just below each ear. Most salivary gland tumors begin in parotid glands.

**Parlodel:** (Other name for: bromocriptine mesylate)

**Parnate:** (Other name for: tranlycypromine sulfate)

**paromomycin sulfate:** The sulfate salt form of paromomycin, a structural derivative of neomycin, an aminoglycoside antibiotic with amebicidal and bactericidal effects against predominantly aerobic gram-negative bacteria. Paromomycin binds specifically to the RNA oligonucleotide at the A site of bacterial 30S ribosomes, thereby causing misreading and premature termination of translation of mRNA and inhibition of protein synthesis followed by cell death.

**parotid gland cancer :** Surgery to remove all or part of the parotid gland (a large salivary gland located in front of and just below the ear). In a radical parotidectomy, the entire gland is removed.

**parotidectomy :** A drug used to treat depression and anxiety disorders. It is a type of selective serotonin reuptake inhibitor (SSRI). Also called Paxil.

**paroxetine hydrochloride:** The hydrochloride salt form of paroxetine, a phenylpiperidine derivative and a selective serotonin reuptake inhibitor (SSRI) with antidepressant and anxiolytic properties. Paroxetine binds to the pre-synaptic serotonin transporter complex resulting in negative allosteric modulation of the complex thereby blocking reuptake of serotonin by the pre-synaptic transporter. Inhibition of serotonin recycling enhances serotonergic function through serotonin accumulation in the synaptic cleft, resulting in long-term desensitization and downregulation of 5HT<sub>1</sub> (serotonin) receptors and leading to symptomatic relief of depressive illness. or A rare disorder in which red blood cells are easily destroyed by certain immune system proteins. Symptoms include blood clots, and red or brownish urine in the morning. Aplastic anemia (decreased production of blood cells) may lead to PNH, and people with PNH are at increased risk of acute myelogenous leukemia. Also called PNH.

**paroxysmal nocturnal hemoglobinuria :** A type of enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Inhibitors of one enzyme, PARP-1, are being studied in the treatment of cancer. Also called poly (ADP-ribose) polymerase.

**PARP :** A substance that blocks an enzyme in cells called PARP. PARP helps repair DNA when it becomes damaged. DNA damage may be caused by many things, including exposure to UV light, radiation, certain anticancer drugs, or other substances in the environment. In cancer treatment, blocking PARP may help keep cancer cells from repairing their damaged DNA, causing them to die. PARP inhibitors are a type of targeted therapy. Also called poly (ADP-ribose) polymerase inhibitor.

**PARP 1/2 inhibitor E7449:** An orally available small molecule inhibitor of the nuclear enzymes poly (ADP-ribose) polymerase (PARP) 1 and 2, with potential antineoplastic activity. Upon administration, E7449 selectively binds to PARP 1 and 2, thereby preventing the repair of

damaged DNA via the base excision repair (BER) pathway. This agent enhances the accumulation of single and double strand DNA breaks and promotes genomic instability eventually leading to apoptosis. PARP 1/2 inhibitor E7449 may enhance the cytotoxicity of DNA-damaging agents and of radiotherapy. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins that signal and recruit other proteins to repair damaged DNA. Check for active clinical trials using this agent.

**PARP inhibitor :** A drug used to treat advanced ovarian cancer caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is used in patients who have already received other anticancer drugs. It is also being studied in the treatment of other types of cancer. PARP inhibitor AZD2281 blocks an enzyme involved in many cell functions, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. PARP inhibitor AZD2281 may cause cancer cells to die. It is a type of targeted therapy agent and a type of poly (ADP-ribose) polymerase inhibitor. Also called AZD2281, Lynparza, and olaparib.

**PARP inhibitor AZD2281 :** An enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Inhibitors of PARP-1 are being studied in the treatment of cancer. Also called poly (ADP-ribose) polymerase-1.

**PARP inhibitor BGB-290:** An orally bioavailable inhibitor of the nuclear enzyme poly(ADP-ribose) polymerase (PARP), with potential antineoplastic activity. PARP inhibitor BGB-290 selectively binds to PARP and prevents PARP-mediated repair of single-strand DNA breaks via the base-excision repair (BER) pathway. This enhances the accumulation of DNA strand breaks, promotes genomic instability, and eventually leads to apoptosis. PARP is activated by single-strand DNA breaks and, subsequently, catalyzes post-translational ADP-ribosylation of nuclear proteins which then transduce signals to recruit other proteins to repair damaged DNA. BGB-290 may both potentiate the cytotoxicity of DNA-damaging agents and reverse tumor cell chemo- and radioresistance.

**PARP inhibitor CEP-9722:** A small-molecule prodrug of CEP-8983, a novel 4-methoxy-carbazole inhibitor of the nuclear enzymes poly(ADP-ribose) polymerase (PARP) 1 and 2, with potential antineoplastic activity.

Upon administration and conversion from CEP-9722, CEP-8983 selectively binds to PARP 1 and 2, preventing repair of damaged DNA via base excision repair (BER). This agent enhances the accumulation of DNA strand breaks and promotes genomic instability and apoptosis. CEP-8983 may potentiate the cytotoxicity of DNA-damaging agents and reverse tumor cell chemo- and radioresistance. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins that signal and recruit other proteins to repair damaged DNA and can be activated by single strand breaks in DNA.

**PARP inhibitor E7016:** An inhibitor of the nuclear enzyme poly(ADP-ribose) polymerase (PARP) with potential chemo- and/or radiosensitizing activity. PARP inhibitor E7016 selectively binds to PARP and prevents PARP-mediated DNA repair of single strand DNA breaks via the base-excision repair pathway. This enhances the accumulation of DNA strand breaks and promotes genomic instability and eventually leads to apoptosis. In addition, this agent may enhance the cytotoxicity of DNA-damaging agents and reverse tumor cell resistance to chemotherapy and radiation therapy. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins that signal and recruit other proteins to repair damaged DNA and is activated by single-strand DNA breaks.

**PARP-1 :** A substance being studied in the treatment of breast cancers caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is also being studied in the treatment of other types of cancer. It blocks an enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. PARP-1 inhibitor ABT-888 may cause cancer cells to die. It is a type of poly(ADP-ribose) polymerase inhibitor. Also called ABT-888 and veliparib.

**PARP-1 inhibitor ABT-888 :** A substance being studied in the treatment of breast cancers caused by mutations (changes) in the BRCA1 and BRCA2 genes. It is also being studied in the treatment of other types of cancer. It blocks an enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. PARP-1 inhibitor AG014699 may cause cancer cells to die. It is a type of poly(ADP-ribose) polymerase inhibitor. Also called AG014699.

**PARP-1 inhibitor AG014699 :** Surgery to remove part of the bladder (the organ that holds urine). Also called segmental cystectomy.

**PARP-1/2 inhibitor ABT-767:** An orally available inhibitor of the nuclear enzymes poly(ADP-ribose) polymerase (PARP) 1 and 2, with potential antineoplastic activity. Upon administration, ABT-767 selectively binds to PARP 1 and 2, thereby preventing repair of damaged DNA via the base excision repair (BER) pathway. This agent enhances the accumulation of DNA strand breaks and promotes genomic instability eventually leading to apoptosis. ABT-767 may enhance the cytotoxicity of DNA-damaging agents and reverse tumor cell chemo- and radioresistance. PARP catalyzes post-translational ADP-ribosylation of nuclear proteins that signal and recruit other proteins to repair damaged DNA and can be activated by single strand DNA (ssDNA) breaks. Check for active clinical trials using this agent.

**Part A/Part B:** LSR is a two-part compound; these components are kept separate until the LSR molding process begins.

**Part Picker :** An auxiliary unit usually mounted on fixed platen, which reaches into the open mold to grab parts and remove them prior to next molding cycle. Also called a robot, the device is used when you do not want to drop parts from mold upon ejection.

**Partial cure:** Process sometimes utilized when multiple layers of fluoropolymer coatings are to be applied. The first coat is incompletely cured; the second coat is applied and both are fully cured together. See Flashing.

**partial cystectomy :** Surgery to remove the uterus, but not the cervix. Also called subtotal hysterectomy.

**partial hysterectomy :** An operation to remove part of the larynx (voice box).

**partial laryngectomy :** An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the cancer is near it. Also called breast-conserving surgery, breast-sparing surgery, lumpectomy, quadrantectomy, and segmental mastectomy.

**partial mastectomy** : Surgery to remove part of one kidney or a kidney tumor, but not an entire kidney.

**partial melting**: the process by which a portion of the magma that is forming from a melting mass of rock separates and rises as a distinct magma.

**partial miscibility**: Two liquids are considered partially miscible if shaking equal volumes of the liquids together results in a meniscus visible between two layers of liquid, but the volumes of the layers are not identical to the volumes of the liquids originally added.

**partial nephrectomy** : Surgery to remove part of one ovary or part of both ovaries.

**partial oophorectomy** : Surgery to remove most, but not all, of the vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina). The clitoris may not be removed. Sometimes lymph nodes in the groin area are also removed. Also called modified radical vulvectomy.

**partial pressure**: The pressure exerted by a certain gas in a mixture. OR Partial pressure is the pressure of one gas in a system of two or more nonreacting gases.

**partial radical vulvectomy** : A decrease in the size of a tumor, or in the extent of cancer in the body, in response to treatment. Also called partial response.

**partial remission** : A decrease in the size of a tumor, or in the extent of cancer in the body, in response to treatment. Also called partial remission.

**partial response** : Surgery to remove an affected area of the vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina) along with a small amount of surrounding normal tissue.

**partial vacuum**: A volume that contains traces of gas at very low pressure.

**partial vulvectomy** : A type of radiation therapy given only to the part of the breast that has cancer in it. Partial-breast irradiation gives a higher dose over a shorter time than is given in standard whole-breast radiation therapy. Partial-breast irradiation may be given using internal or external sources of radiation. Also called accelerated partial-breast irradiation.

**partial-breast irradiation** : Treatment with injections of antibodies made in another animal or in the laboratory.

**Partially-balanced runner system**: composed of both naturally and artificially balanced runners.

**participial phrase**: begins with a past or present participle and is followed by its object and modifiers; participial phrases are used as adjectives.

**participle**: a verb that ends in -ing (present participle) or -ed, -d, -t, -en, -n (past participle).

**particle**: Small portion of matter.

**Particle-size distribution**: The size distribution of particles in a solid, typically represented graphically as a histogram or numerically as three values: 1) 10% of the sample is less than the value stated, 2) 50% of the sample is less than the value stated (the median), and 3) 90% of the sample is less than the value stated.

**Particles** : The bits of matter from which everything is made. If the particles stick together in fixed places and vibrate, we have a solid; if they can roll and slide about but remain in contact with each other, we have a liquid; if they fly around and are free from each other, we have a gas.

**particulate**: Composed of distinct particles. Smoke is particulate; pure gases are not. OR When fossil fuels are burned, some tiny bits of carbon can be left. These small particles are a source of air pollution and can lead to global dimming.

**particulate matter**: Very small pieces of solid or liquid matter, such as particles of soot, dust, aerosols, fumes, or mists.

**Particulate theory** : Matter is made of particles.

**Parting Agent**: A lubricant, often wax, used to coat a mold cavity to prevent the molded piece from sticking to it, and thus to facilitate its removal from the mold. Also called Release Agent.

**Parting line**: A plane at which two halves of a mold meet Also applies to any other plane where two moving sections come together and form a surface of a molded part or runner.

**partition coefficient**: A constant that expresses the ratio in which a given solute will be partitioned or distributed between two given immiscible liquids at equilibrium.

**partition coefficient:** The constant ratio that is found when a heterogenous system of two phases is in equilibrium; the ratio of the concentrations of the same molecular species (substance) in two phases (usually water and octanol) is constant at given temperature and pressure.

**Partitioned Mold Cooling:** A large diameter hole drilled into the mold (usually the core) and partitioned by a metal plate extending to near the bottom end of the channel. Water is introduced near the top of one side of the partition and removed on the other side.

**PARTITIONED MOLD COOLING:** See BUBBLER.

**PARTITIONED MOLD COOLING:** See BUBBLER.

**parts of speech:** there are eight parts of speech: noun, verb, pronoun, adjective, adverb, preposition, conjunction, and interjection.

**parts per million (ppm):** the unit commonly used to represent the degree of pollutant concentration where the concentrations are small. Larger concentrations are given in percentages.  $1\text{ ppm} = 1\text{ mg/L}$ . In BOD analysis, the results are expressed in ppm, whereas in the suspended solids test, the values are expressed in percents. In air, ppm is usually a volume/volume ratio; in water, ppm represents a weight/volume ratio. OR Concentration expressed as parts of solute per million parts of solution. Usually refers to parts per million by mass. For example, a 10 ppm NaCl solution can be written as: 10 mg NaCl/kg solution, 10  $\mu\text{g}$  NaCl/g solution, 10 ng NaCl/mg solution. In very dilute aqueous solutions, ppm is approximately equal to mg solute per liter of solution. OR Parts (molecules) of a substance contained in a million parts of another substance (e.g., water).

**ParvOryx:** (Other name for: parvovirus H-1)

**parvovirus H-1:** A replication-competent oncolytic parvovirus with potential antineoplastic activity. Upon infection of host cells, parvovirus H-1 preferentially replicates in tumor cells compared to healthy normal cells, thereby potentially resulting in tumor cell lysis and leading to an inhibition of tumor cell proliferation. In addition, H1-infected tumor cells strongly induce the release of the inducible heat shock protein 72 (Hsp72i), which chaperone tumor associated antigens in the H1-mediated tumor lysates and may activate antigen presenting cells (APCs), thereby leading to antitumor immune responses. Parvovirus H-1 does not cause any pathogenic effect in normal, healthy cells and is able to cross the blood brain barrier (BBB).

**pascal:** The SI unit of pressure, equal to a force of one newton per square meter. 101325 pascals = 1atmosphere; 105 pascals = 1 bar.

**pasireotide:** A synthetic long-acting cyclic peptide with somatostatin-like activity. Pasireotide activates a broad spectrum of somatostatin receptors, exhibiting a much higher binding affinity for somatostatin receptors 1, 3, and 5 than octreotide in vitro, as well as a comparable binding affinity for somatostatin receptor 2. This agent is more potent than somatostatin in inhibiting the release of human growth hormone (HGH), glucagon, and insulin. Check for active clinical trials using this agent.

**passive antibody therapy :** A person who is trained to give spiritual and mental health advice.

**passive continental margin:** area along the coast where sediments are deposited. OR marked by a landward, continental shelf followed by a deeper continental slope, continental rise, and flat abyssal plain; characterized by a lack of earthquake activity.

**Passive transport:** Transport of an ion or a molecule down a concentration gradient, where  $\Delta G$  for the transported species is negative. Also called facilitated diffusion.

**past climate analogs:** The reconstructing of past climates at a given locality from modern climatic conditions in a different elevation or latitudinal zone to infer past climatic conditions.

**past perfect:** a verb tense indicating action in past times in relation to another past time; it is formed with had and the past participle of the verb.

**past tense:** a verb tense indicating that an action is finished or complete.

**Pasteur effect:** The inhibition of glycolysis by respiration, discovered by Louis Pasteur; the rate of glycolysis is lower in the presence of oxygen than under anaerobic conditions, a phenomenon largely due to the inhibition of phosphofructokinase by ATP and citrate.

**pastoral counselor :** A bushy herb that is a member of the mint family. A strong-smelling oil taken from the leaves is used in perfumes, incense, detergents, and hair conditioners. It has been used in some cultures to prevent disease. The scientific name is *Pogostemon cablin*

**posttranslational modification:** Enzymatic processing of a polypeptide chain after translation from its mRNA.

**Patch prime:** The priming of localised bare surfaces when bringing forward, prior to stopping up and/or painting.

**Patch-clamp technique:** A method for studying ion channels in which a high-resistance seal is formed between a pipette and a small patch of plasma membrane, allowing the monitoring of the flow of ions through a single channel with high time resolution.

**Patchiness:** This is caused either by different levels of porosity in the substrate or by uneven application. Usually, one more coat will rectify the problem. Before applying, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants. Rub down with a suitable abrasive, dust off and apply coating.

**patchouli :** Having to do with the father, coming from the father, or related through the father.

**patent blue V dye:** A synthetic dye with imaging and food coloring property. It is a sodium or calcium salt of [4-(alpha-(4-diethylaminophenyl)-5-hydroxy-2,4-disulfophenyl-methylidene)-2,5-cyclohexadien-1-ylidene] diethylammonium hydroxide inner salt. Patent blue V dye is used in sentinel lymph node (SLN) technique to guide nodal dissection or other imaging procedures.

**paternal :** A disorder marked by anemia caused by iron deficiency, and a web-like growth of membranes in the throat that makes swallowing difficult. Having Paterson-Kelly syndrome may increase the risk of developing esophageal cancer. Also called Plummer-Vinson syndrome and sideropenic dysphagia.

**Paterson-Kelly syndrome :** Having to do with a sign or symptom that is specific to a certain disease.

**path length:** In absorption spectroscopy, the length of a path taken by radiation through a sample.

**pathogenic:** organisms that cause human disease. OR Disease-causing.

**pathogenic bacteria:** bacteria which may cause disease in the organisms by their parasitic growth.

**pathognomonic :** Findings that are distinctive or characteristic of a particular disease or condition and make the diagnosis. or A broken bone caused by disease, often by the spread of cancer to the bone.

**pathologic fracture :** The stage of cancer (amount or spread of cancer in the body) that is based on how different from normal the cells in samples of tissue look under a microscope.

**pathological stage :** A method used to find out the stage of cancer (amount or spread of cancer in the body) by removing tissue samples during surgery or a biopsy. The pathological stage is based on how different from normal the cells in the samples look under a microscope.

**pathological staging :** A doctor who has special training in identifying diseases by studying cells and tissues under a microscope.

**pathologist :** The description of cells and tissues made by a pathologist based on microscopic evidence, and sometimes used to make a diagnosis of a disease.

**pathology report :** A person who helps a patient work with others who have an effect on the patient's health, including doctors, insurance companies, employers, case managers, and lawyers. A patient advocate helps resolve issues about health care, medical bills, and job discrimination related to a patient's medical condition. Cancer advocacy groups try to raise public awareness about important cancer issues, such as the need for cancer support services, education, and research. Such groups work to bring about change that will help cancer patients and their families.

**patidegib:** An orally bioavailable, cyclopamine-derived inhibitor of the Hedgehog (Hh) pathway with potential antineoplastic activity. Specifically, patidegib binds to and inhibits the cell membrane-spanning G-protein coupled receptor SMO, which may result in the suppression of Hh pathway signaling and a decrease in tumor cell proliferation and survival. SMO is activated upon binding of Hh ligand to the cell surface receptor Patched (PTCH); inappropriate activation of Hh signaling and uncontrolled cellular proliferation may be associated with SMO mutations. The Hh signaling pathway plays an important role in proliferation of neuronal precursor cells in the developing cerebellum and other tissues.

**patient advocate :** A method of pain relief in which the patient controls the amount of pain medicine that is used. When pain relief is needed, the person can receive a preset dose of pain medicine by pressing a button on a computerized pump that is connected to a small tube in the body. Also called PCA.

**patient-controlled analgesia :** A drug used to treat depression and anxiety disorders. It is a type of selective serotonin reuptake inhibitor (SSRI). Also called paroxetine hydrochloride.

**patient-specific follicular lymphoma-derived anti-idiotypic vaccine:** A patient-specific cancer vaccine directed against the soluble protein idiotype of an individual follicular lymphoma with potential antineoplastic activity. A patient-specific follicular lymphoma-derived anti-idiotypic vaccine may be composed of a patient-specific, synthetic idiotype-related peptide (such as one corresponding to a hypervariable region of an IgG heavy chain) conjugated to the immunostimulant carrier protein keyhole limpet hemocyanin (KLH). Upon administration, this vaccine may induce an idiotype-specific cytotoxic T-lymphocyte (CTL) response against follicular lymphoma cells expressing the idiotype, resulting in tumor cell lysis.

**patina:** A thin layer of corrosion products with a distinctive coloration that forms on a metal surface exposed to air and water. Patina usually refers to the greenish coating that forms on copper alloys over time.

**Patisiran:** (Other name for: anti-transferrin receptor 1 siRNA ALN-TTR02)

**patritumab:** A fully human monoclonal antibody directed against the membrane-bound receptor HER3 (ERBB3) with potential antineoplastic activity. Patritumab binds to and inhibits HER3 activation, which may result in inhibition of HER3-dependent PI3K/Akt signaling and so inhibition of cellular proliferation and differentiation. HER3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in solid tumors, including breast, lung, and colorectal tumors of epithelial origin; it has no active kinase domain itself but is activated through heterodimerization with other members of the EGFR receptor family that do. Check for active clinical trials using this agent.

**pattern recognition:** A computational technique used to find patterns and develop classification schemes for data in very large data sets.

**patupilone:** A compound isolated from the myxobacterium *Sorangium cellulosum*. Similar to paclitaxel, patupilone induces microtubule polymerization and stabilizes microtubules against depolymerization conditions. In addition to promoting tubulin polymerization and stabilization of microtubules, this agent is cytotoxic for cells overexpressing

P-glycoprotein, a characteristic that distinguishes it from the taxanes.  
Epothilone B may cause complete cell-cycle arrest.

**Pauli exclusion principle:** states that no two electrons in an atom can have the same set of quantum numbers.

**PAULI EXCLUSION PRINCIPLE:** states that no two electrons may have the same quantum numbers. Only two electrons may occupy an orbital, but they must have opposite spins.

**Pauli principle:** No two electrons in an atom can have the same set of 4 quantum numbers. Because the n, l, and m quantum numbers address a particular orbital, and because the ms quantum number has only two possible values, the Pauli principle says that a maximum of two electrons can occupy an atomic orbital- and these electrons must have opposite spins.

**pause:** a region separating two layers of the atmosphere.

**Pavabid:** (Other name for: papaverine)

**Pavatym:** (Other name for: papaverine)

**Paxil:** (Other name for: paroxetine hydrochloride)

**Paxil :** A drug used to treat advanced renal cell carcinoma, which is the most common type of kidney cancer. It is also used to treat advanced soft tissue sarcoma that has been treated with other anticancer drugs. It is being studied in the treatment of other types of cancer. Pazopanib hydrochloride may prevent the growth of new blood vessels that tumors need to grow. It is a type of protein tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called GW786034 and Votrient.

**pazopanib hydrochloride:** The hydrochloride salt of a small molecule inhibitor of multiple protein tyrosine kinases with potential antineoplastic activity. Pazopanib selectively inhibits vascular endothelial growth factor receptors (VEGFR)-1, -2 and -3, c-kit and platelet derived growth factor receptor (PDGF-R), which may result in inhibition of angiogenesis in tumors in which these receptors are upregulated. or A chemotherapy combination used to treat endometrial, ovarian, and head and neck cancers, and non-small cell lung cancer that has spread. It includes the drugs carboplatin and paclitaxel (Taxol). Also called Carbo-Tax regimen, carboplatin-Taxol, carboplatin-Taxol regimen, and CaT regimen.

**PB:** Polybutylene

**pBCAR3 phosphopeptide-tetanus peptide vaccine:** A vaccine composed of a phosphorylated peptide from the tumor-associated antigen breast cancer anti-estrogen resistance-3 (BCAR3) and a tetanus-derived peptide, with potential immunomodulating and antineoplastic activities. Upon administration of pBCAR3 phosphopeptide-tetanus peptide vaccine, the pBCAR3 phosphopeptide may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against phosphopeptide-containing tumor cells. The tetanus peptide serves as an immunoadjuvant and induces a helper T-cell response, which may help stimulate an immune response against the pBCAR3-expressing melanoma tumor cells. BCAR3 is upregulated in a variety of cancer cells.

**pBCAR3/pIRS2-phosphopeptide-tetanus peptide vaccine:** A vaccine composed of phosphorylated peptides from the tumor associated antigens breast cancer anti-estrogen resistance-3 (BCAR3) and insulin receptor substrate-2 (IRS2) and a tetanus-derived peptide, with potential immunomodulating and antineoplastic activities. Upon administration of pBCAR3/pIRS2 phosphopeptide-tetanus peptide vaccine, the pBCAR3/pIRS2 phosphopeptide may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing either phosphopeptide. The tetanus peptide serves as an immunoadjuvant and induces a helper T-cell response which may help stimulate an immune response against pBCAR3 and pIRS2-expressing melanoma tumor cells. BCAR3 and IRS2 are upregulated in a variety of cancer cells.

**pbi-shRNA STMN1 lipoplex:** A proprietary RNA interference construct consisting of bifunctional short hairpin RNAs (shRNA) against human stathmin 1 (STMN1) encapsulated in the cationic bilamellar invaginated vesicle lipoplex (LP) with potential antineoplastic activity. pbi-shRNA STMN1 LP contains 2 stem-loop structures encoded by a plasmid vector. Upon intratumoral administration, one shRNA unit with a perfectly matched sequence renders the suppression of STMN1 mRNA translation (mRNA sequestration and cleavage-independent degradation) while the other unit with an imperfectly matched sequence renders STMN1 mRNA degradation via RNase H-like cleavage (cleavage-dependent mRNA silencing). The suppression of STMN1 expression in tumor cells results in a reduction of tumor cell proliferation. STMN1, a ubiquitous cytosolic

phosphoprotein and tubulin modulator that plays a key role in mitosis, is overexpressed in a variety of tumors and correlates with poor prognosis.

**PBN derivative OKN-007:** A disulfonyl derivative of phenyl-tert-butyl nitrene (PBN), with potential anti-glioma activity. Although the exact mechanism(s) of action of OKN007 are still largely unknown, this agent appears to inhibit cancer cell proliferation and migration. This agent appears to inhibit the activity of sulfatase 2 (SULF2), a highly specific endoglucosamine-6-sulfatase that is overexpressed in the extracellular matrix of cancer cells and catalyzes the removal of sulfate from the 6-O-sulfate esters of heparin. In addition, OKN007 may induce changes in tumor metabolism and scavenge free radicals.

**PBT:** Polybutylene terephthalate

**PBTL CD19CAR-28 zeta:** Peripheral blood T-lymphocytes (PBTLs) transduced with a retroviral vector expressing a chimeric antigen receptor (CAR) consisting of an anti-CD19 scFv (single chain variable fragment) coupled to the costimulatory signaling domain CD28, the signaling domain of 4-1BB (CD137), and the zeta chain of the T-cell receptor (TCR), with potential immunomodulating and antineoplastic activities. Upon transfusion, PBTL CD19CAR-28/CD137zeta directs the T-lymphocytes to CD19-expressing tumor cells and induces selective toxicity in CD19-expressing tumor cells. CD28, a T-cell surface-associated co-stimulatory molecule, is required for full T-cell activation, proliferation, and survival. The 4-1BB co-stimulatory molecule signaling domain enhances activation and signaling after recognition of CD19. Furthermore, inclusion of the 4-1BB signaling domain may increase the antitumor activity compared to the inclusion of the CD28 costimulatory domain and TCR zeta chain alone. CD19 antigen is a B-cell specific cell surface antigen, which is expressed in all B-cell lineage malignancies.

**PBTP:** Polybutylene terephthalate

**PC:** Polycarbonate

**PC regimen :** A method of pain relief in which the patient controls the amount of pain medicine that is used. When pain relief is needed, the person can receive a preset dose of pain medicine by pressing a button on a computerized pump that is connected to a small tube in the body. Also called patient-controlled analgesia.

**PC-SPES :** An abbreviation for a chemotherapy combination used to treat certain types of brain tumors. It is often used with radiation therapy. It includes the drugs procarbazine hydrochloride, lomustine (CCNU), and vincristine sulfate. Also called PCV regimen.

**PCA:** Primary CNS lymphoma. Cancer that forms in the lymph tissue of the brain, spinal cord, meninges (outer covering of the brain), or eye (called ocular lymphoma). Also called primary central nervous system lymphoma and primary CNS lymphoma.

**PCNSL:** A condition marked by infertility, enlarged ovaries, menstrual problems, high levels of male hormones, excess hair on the face and body, acne, and obesity. Women with PCOS have an increased risk of diabetes, high blood pressure, heart disease, and endometrial cancer. Also called polycystic ovary syndrome.

**pCO<sub>2</sub>:** The partial pressure of CO<sub>2</sub> in the atmosphere and the ocean. In the atmosphere, the partial pressure of CO<sub>2</sub> is defined as the pressure the CO<sub>2</sub> would exert if all other gases were removed. The sum of the partial pressure of all the atmospheric gases will equal the atmospheric pressure. The partial pressure of CO<sub>2</sub> in the atmosphere is determined by the atmospheric CO<sub>2</sub> concentration and atmospheric temperature. In the ocean, the pCO<sub>2</sub> is determined by the amount of dissolved CO<sub>2</sub> and H<sub>2</sub>CO<sub>3</sub>. It varies with alkalinity, latitude, depth, and temperature. Biological processes in the ocean also exert an influence on the pCO<sub>2</sub> in the ocean.

**PCOS:** A laboratory method used to make many copies of a specific piece of DNA from a sample that contains very tiny amounts of that DNA. PCR allows these pieces of DNA to be amplified so they can be detected. PCR may be used to look for certain changes in a gene or chromosome, which may help find and diagnose a genetic condition or a disease, such as cancer. It may also be used to look at pieces of the DNA of certain bacteria, viruses, or other microorganisms to help diagnose an infection. Also called polymerase chain reaction.

**PCR:** polymerase chain reaction; a technique used to amplify a gene of interest. OR Polymerase chain reaction A method for amplifying DNA sequences.

**PCR:** A procedure that produces millions of copies of a short segment of DNA through repeated cycles of: (1) denaturation, (2) annealing, and (3) elongation. PCR is a very common procedure in molecular genetic testing

and may be used to generate a sufficient quantity of DNA to perform a test (e.g., allele-specific amplification, trinucleotide repeat quantification). Also called polymerase chain reaction. or A mixture of eight herbs that has been sold as a dietary supplement and promoted as a way to keep the prostate healthy and to treat prostate cancer. PC-SPES has been studied in the treatment of prostate cancer, but has been taken off the market in the U.S. because of safety concerns.

**PCTFE:** Polychlorotrifluoroethylene

**PCV:** An abbreviation for a chemotherapy combination used to treat certain types of brain tumors. It is often used with radiation therapy. It includes the drugs procarbazine hydrochloride, lomustine (CCNU), and vincristine sulfate. Also called PCV.

**PCV regimen:** A regimen consisting of procarbazine, lomustine and vincristine used for the treatment of gliomas. Or A protein found on T cells (a type of immune cell) that helps keep the body's immune responses in check. When PD-1 is bound to another protein called PD-L1, it helps keep T cells from killing other cells, including cancer cells. Some anticancer drugs, called immune checkpoint inhibitors, are used to block PD-1. When this protein is blocked, the "brakes" on the immune system are released and the ability of T cells to kill cancer cells is increased.

**PD-1:** A family of molecules released from platelets (tiny pieces of cells that are found in the blood and that help the blood clot). Forms of PDGF help to heal wounds and to repair damage to blood vessel walls. They also help blood vessels grow. Also called platelet-derived growth factor.

**PD-1 knockout autologous T lymphocytes:** A population of engineered autologous T lymphocytes in which the gene encoding for the programmed cell death protein 1 (PDCD-1) is deleted, with potential immunomodulating activity. Following collection of peripheral blood lymphocytes and selection of T cells, the PDCD-1 gene was knocked out and the T cells were expanded. Upon reinfusion of the PDCD-1 knockout T lymphocytes, these T cells target and lyse cancer cells. The PDCD-1 protein, found on activated T cells and often overexpressed on T cells in cancer patients, negatively regulates T-cell activity; it plays a key role in immune evasion and prevents tumor cell lysis. PDCD-1 knockout enhances cytotoxicity and T-cell-mediated anti-tumor immune responses. Check for active clinical trials using this agent.

**PD0325901:** An orally bioavailable, synthetic organic molecule targeting mitogen-activated protein kinase kinase (MAPK/ERK kinase or MEK) with potential antineoplastic activity. MEK inhibitor PD325901, a derivative of MEK inhibitor CI-1040, selectively binds to and inhibits MEK, which may result in the inhibition of the phosphorylation and activation of MAPK/ERK and the inhibition of tumor cell proliferation. The dual specific threonine/tyrosine kinase MEK is a key component of the RAS/RAF/MEK/ERK signaling pathway that is frequently activated in human tumors.

**PDGF:** The largest amount of a substance or radiation that a person is exposed to at one time. Peak exposure to a harmful substance or radiation may increase the risk of certain diseases or conditions.

**PDGFR alpha/KIT mutant-specific inhibitor BLU-285:** An orally bioavailable inhibitor of specific mutated forms of platelet-derived growth factor receptor alpha (PDGFR alpha; PDGFRA) and mast/stem cell factor receptor c-Kit (SCFR), with potential antineoplastic activity. Upon oral administration, BLU-285 specifically binds to and inhibits specific mutant forms of PDGFRA and c-Kit, including the PDGFRA D842V mutant and various KIT exon 17 mutants. This results in the inhibition of PDGFRA- and c-Kit-mediated signal transduction pathways and the inhibition of proliferation in tumor cells that express these PDGFRA and c-Kit mutants. PDGFRA and c-Kit, protein tyrosine kinases and tumor-associated antigens (TAAs), are mutated in various tumor cell types; they play key roles in the regulation of cellular proliferation.

**PDK1 inhibitor AR-12:** An orally bioavailable, small-molecule, celecoxib-derived inhibitor of phosphoinositide-dependent kinase-1 (PDK1) with potential antineoplastic activity. Devoid of any COX inhibiting activity, PDK1 inhibitor AR-12 binds to and inhibits the phosphorylation of 3-phosphoinositide-dependent kinase-1 (PDK-1).; subsequently, the phosphorylation and activation of the serine/threonine protein kinase Akt (protein kinase B or PKB) is inhibited, which may result in inhibition of the PI3K/Akt signaling pathway, inhibition of tumor cell proliferation, and the induction of tumor cell apoptosis. In addition, this agent appears to induce the activity of protein kinase R-like endoplasmic reticulum kinase (PERK), which plays a key role in the endoplasmic reticulum stress pathway. Activation and dysregulation of the PI3K/Akt signaling pathway is

frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**PE:** Polyethylene

**PE/HPV16 E7/KDEL fusion protein TVGV-1:** A fusion protein consisting of a peptide sequence of human papillomavirus (HPV) type 16 E7 nuclear protein and fused to the *Pseudomonas aeruginosa* exotoxin A (PE) and a endoplasmic reticulum (ER) retention signal (KDEL), with potential antineoplastic activity. Upon administration of PE/HPV16 E7/KDEL fusion protein TVGV-1, the PE moiety binds to CD91 (LRP1) expressed on a variety of cells, including antigen-presenting cells such as dendritic cells (DCs), which facilitates the internalization, through endocytosis, of TVGV-1. Following endocytosis, this agent is proteolytically cleaved by the proteasome and the epitopes from the HPV E7 protein become bound to MHC-I molecules and are presented on the DC-cell surface. This facilitates a cytotoxic T-cell-mediated immune response against HPV16 E7 expressing-tumor cells. KDEL targets the fusion protein to the ER, which increases this agent's potential to be bound by MHC-I molecules; this increases the immune response against HPV16 E7-expressing cancer cells. Check for active clinical trials using this agent.

**peak exposure :** A dimpled condition of the skin of the breast, resembling the skin of an orange, sometimes found in inflammatory breast cancer.

**PEARLIZER:** A substance, such as glycol distearate (EGDS), which, when added to a formulation, imparts an opalescent finish to that formulation.

**peat:** an unlithified organic material that can be cut into blocks and burned for fuel.

**peau d'orange :** An abbreviation for a chemotherapy combination used in children to treat certain types of malignant (cancer) germ cell tumors that are not in the brain. It includes the drugs cisplatin (Platinol), etoposide phosphate, and bleomycin sulfate. Also called PEB regimen.

**PEB:** (... REH-jih-men)

**PEB regimen:** A chemotherapy regimen consisting of bleomycin, etoposide and cisplatin used for the treatment of pediatric germ cell tumors (GCT). In the PEB regimen, the pediatric patients receive bleomycin once

per cycle and do not receive weekly bleomycin during the weeks between cycles (every 21 days); in the adult BEP regimen, patients receive weekly bleomycin.

**PEB regimen :** An abbreviation for a chemotherapy combination used in children to treat certain types of malignant (cancer) germ cell tumors that are not in the brain. It includes the drugs cisplatin (Platinol), etoposide phosphate, and bleomycin sulfate. Also called PEB.

**Pebble dash:** A rough finish given to external walls by coating it with mortar or cement and sand and throwing small pebbles onto the surface before it has set.

**PEC:** Polyphenylene ether copolymer

**PectaSol-C:** (Other name for: modified citrus pectin supplement)

**pectus carinatum:** also called pigeon chest, is a deformity of the chest characterized by a protrusion of the sternum and ribs

**pectus excavatum:** also called funnel chest, a condition in which the ribs and sternum grow inward producing a concave appearance of the anterior chest wall

**pedalfer:** a thick soil high in aluminum and iron that develops in response to abundant rainfall, organic acids, and strong downward leaching.

**Pedi-Vit-A:** (Other name for: retinol)

**PEDIARIX:** (Other name for: diphtheria toxoid/tetanus toxoid/acellular pertussis adsorbed, recombinant hepatitis B/inactivated poliovirus vaccine combined)

**PediaSure:** (Other name for: nutritional supplement drink (pediatric))

**PediaSure :** A nutritional drink that helps children who cannot get everything they need in their diet from foods and other drinks. It may be given through a small tube that is inserted through the nose into the stomach or the small intestine. It may also be given through a tube that is put into the stomach or the intestinal tract through an opening made on the outside of the abdomen. Also called pediatric polymeric enteral nutrition formula.

**pediatric :** Having to do with children.

**pediatric hematologist :** A doctor who has special training in diagnosing and treating blood disorders in children.

**pediatric nurse specialist :** A registered nurse with an advanced degree in nursing who specializes in the care of children.

**pediatric oncologist :** A doctor who has special training in diagnosing and treating children with cancer.

**pediatric polymeric enteral nutrition formula :** A nutritional drink that helps children who cannot get everything they need in their diet from foods and other drinks. It may be given through a small tube that is inserted through the nose into the stomach or the small intestine. It may also be given through a tube that is put into the stomach or the intestinal tract through an opening made on the outside of the abdomen. Also called PediaSure.

**pediatric surgeon :** A surgeon who has special training in treating children. A surgeon removes or repairs a part of the body by operating on the patient.

**pediatrician :** A doctor who has special training in preventing, diagnosing, and treating diseases and injuries in children. Pediatricians also help manage other problems that affect children, such as developmental disorders and behavioral, emotional, and social problems.

**pedicle flap :** A type of surgery used to rebuild the shape of the breast after a mastectomy. Tissue, including skin, fat, and muscle, is moved from one area of the body, such as the back or abdomen, to the chest to form a new breast mound. The tissue flap, along with its blood vessels, stays connected to the body and is passed through a tunnel under the skin to the chest. A pedicle flap is a type of breast reconstruction.

**pedigree :** A graphic illustration of family history. Or A diagram that shows relationships among family members. In medicine, a pedigree may also show the pattern of certain genes or diseases within a family.

**pediment:** a low-angle erosion surface at the foot of a mountain range that is typically covered by up to 100 feet of sediment; occurs between the bajada and the range front.

**pedocal:** a thin, poorly leached soil formed in arid climates by the upward movement of soil water by subsurface evaporation and capillary action.

**pedunculated :** In the body, a structure that has a peduncle (a stalk or stem) or is attached to another structure by a peduncle.

**PedvaxHIB:** (Other name for: Haemophilus influenzae b vaccine)

**PEEK:** Polyetherether ketone

**Peeling:** An open blister.

**PEELING:** Detachment of a dried paint film in relatively large pieces, usually caused by moisture or grease under the painted surface.

**Peeling:** The detachment of paint from the surface in ribbons or sheets. Like flaking, it is the result of loss of adhesion properties. OR Like flaking, peeling results from paint losing its adhesion properties. The cure is to thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants, then scrape back all areas of poorly adhering or defective coatings to a firm edge. Finally, rub down to "feather" broken edges, dust off and repaint.

**peer review process :** The process by which original articles and grants written by researchers are evaluated for technical and scientific quality and correctness by other experts in the same field.

**peer-reviewed scientific journal :** A publication that contains original articles that have been written by scientists and evaluated for technical and scientific quality and correctness by other experts in the same field.

**PEG:** A polymer made by joining molecules of ethylene oxide and water together in a repeating pattern. PEG can be a liquid or a waxy solid. In medicine, forms of PEG can be used in ointments, in drugs or substances to make them stay in the body longer, or in laxatives. Also called polyethylene glycol.

**PEG tube :** A tube inserted through the wall of the abdomen directly into the stomach. It allows air and fluid to leave the stomach and can be used to give drugs and liquids, including liquid food, to the patient. Giving food through a PEG tube is a type of enteral nutrition. Also called gastrostomy tube and percutaneous endoscopic tube.

**PEG-3350/sodium sulfate/sodium chloride/potassium chloride/sodium ascorbate/ascorbic acid-based laxative:** A preparation containing the nonabsorbable polymer polyethylene glycol (PEG or macrogol) 3350 and sodium sulfate, sodium chloride, potassium chloride, sodium ascorbate and ascorbic acid with laxative activity. Upon oral administration, the PEG-3350, sodium sulfate, sodium chloride, potassium chloride, sodium ascorbate and ascorbic acid-based laxative promotes the retention of water in the bowel. This increases the water content of stool, which results in

increased gastrointestinal motility and evacuation of colonic contents. This results in a complete cleansing of the colon. Compared to the 4 liter PEG-3350-based preparations, this PEG-based laxative is a low volume (2 liter) preparation, which improves patients' tolerance.

**PEG-asparaginase :** A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the drug asparaginase that is linked to a substance called PEG, which makes the drug stay in the body longer. Asparaginase is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called Oncaspar and pegaspargase.

**PEG-based laxative NER1006:** A preparation containing the nonabsorbable polymer polyethylene glycol (PEG or macrogol) 3350 with laxative activity. Upon oral administration, the PEG-3350-based laxative NER1006 promotes the retention of water in the bowel. This increases both the water content and volume of stool, which results in increased gastrointestinal motility and the evacuation of colonic contents leading to a complete cleansing of the colon. Compared to the 4 liter PEG-3350-based preparations, this PEG-based laxative is a low volume (2 liter) preparation, which may improve tolerance.

**PEG-interferon alfa-2a:** A covalent conjugate of recombinant interferon alfa, subtype 2a, and polyethylene glycol (PEG), used as an antiviral and antineoplastic agent. The biological activity of this agent is derived from its interferon alpha-2a protein moiety. Interferons alfa bind to specific cell-surface receptors, leading to the transcription and translation of genes whose protein products mediate antiviral, antiproliferative, anticancer and immune-modulating effects. The PEG moiety lowers the clearance of interferon alpha-2a, thereby extending the duration of its therapeutic effects, but may also reduce interferon-mediated stimulation of an immune response.

**PEG-interleukin-2:** A complex of polyethylene glycol conjugated with human recombinant cytokine interleukin-2 (IL-2) with antineoplastic activity. PEG-interleukin-2 induces natural killer (NK) cell activity and the production of interferon-gamma (IFN-gamma), and enhances T cell-mediated cytotoxicity. Pegylation of IL-2 protects the cytokine from degradation. Check for active clinical trials using this agent.

**PEG-Intron :** A drug used to treat hepatitis C infections. PEG-Intron is a brand name for peginterferon alfa-2b. It is a type of cytokine and a type of biological response modifier.

**PEG-linked L-RNA oligonucleotide hepcidin-targeting agent NOX-H94:** A proprietary 44-nucleotide L-stereoisomer RNA oligonucleotide conjugated to a 40 kDa polyethylene glycol (PEG) that targets hepcidin with potential anti-anemic activity. Upon intravenous or subcutaneous administration, PEG-linked L-RNA oligonucleotide hepcidin targeting agent NOX-H94 binds to hepcidin and prevents it from binding to the iron channel ferroportin, located on the basolateral surface of gastrointestinal enterocytes and the plasma membrane of macrophages. This prevents hepcidin-induced internalization and degradation of ferroportin, thus decreasing macrophage iron retention. In turn, binding of NOX-H94 to hepcidin normalizes plasma iron levels and increases erythropoiesis. This may inhibit anemia caused by inflammation. Hepcidin, a peptide hormone that plays a key role in the homeostasis of systemic iron, is upregulated during acute and chronic inflammation in response to cytokines. The unique mirror-image configuration of this agent renders it resistant to hydrolysis and shows a low antigenicity profile. Pegylation increases the half-life of this agent.

**PEG-MGDF:** A form of megakaryocyte growth and development factor (MGDF) that is made in the laboratory. MGDF comes from the protein thrombopoietin, which is normally made in the body to help make platelets. PEG-MGDF is being studied as a way to increase the number of platelets in patients receiving chemotherapy. Also called PEG-rhMGDF and polyethylene glycosylated recombinant human megakaryocyte growth and development factor.

**PEG-PEI-cholesterol lipopolymer-encased IL-12 DNA plasmid vector GEN-1:** A nanoparticle-based formulation composed of a non-viral plasmid DNA vector encoding the human pro-inflammatory cytokine interleukin-12 (IL-12) encapsulated in a biodegradable, biocompatible lipoplex composed of polyethylene glycol (PEG), polyethylenimine (PEI), and cholesterol, with potential immuno-activating and antineoplastic activities. Upon intraperitoneal (IP) delivery of the PEG-PEI-cholesterol lipopolymer-encased IL-12 DNA plasmid vector GEN-1, the lipoplex is endocytosed by nearby cells, and the plasmid DNA is transported into the

nucleus, which leads to local expression of IL-12. In turn, the increased IL-12 production at the tumor site activates the immune system by promoting the activation of natural killer cells (NKs), inducing secretion of interferon-gamma (IFN-g) and promoting cytotoxic T-cell responses against tumor cells.

**PEG-proline-interferon alpha-2b:** A long-acting formulation of recombinant interferon alpha subtype 2b (IFN-a2b) protein, in which IFN-a2b is coupled, via proline, to polyethylene glycol (PEG), with antiviral, immunomodulating and antineoplastic activities. Upon subcutaneous administration, IFN-a2b binds to specific interferon cell-surface receptors. This activates interferon-mediated signal transduction pathways and induces the transcription and translation of genes with interferon-specific response elements (ISREs); the protein products mediate antiviral, antiproliferative, anticancer, and immune-modulating effects. The PEG moiety inhibits proteolytic breakdown and clearance of IFN-a2b, which prolongs its half-life, extends the duration of its therapeutic effects and allows less frequent dosing. The proline linker facilitates the synthesis of a predominant (90%) positional isomer which allows for further increases in stability and a longer half-life than previous PEG conjugates.

**PEG-rhMGDF:** A form of megakaryocyte growth and development factor (MGDF) that is made in the laboratory. MGDF comes from the protein thrombopoietin, which is normally made in the body to help make platelets. PEG-rhMGDF is being studied as a way to increase the number of platelets in patients receiving chemotherapy. Also called PEG-MGDF and polyethylene glycosylated recombinant human megakaryocyte growth and development factor.

**pegaspargase:** A complex of polyethylene glycol conjugated with L-asparaginase. Asparaginase hydrolyzes L-asparagine to L-aspartic acid and ammonia, thereby depleting these cells of asparagine and blocking protein synthesis and tumor cell proliferation, especially in the G1 phase of the cell cycle. The agent also induces apoptosis in tumor cells. Pegylation decreases the enzyme's antigenicity. Asparagine is critical to protein synthesis in leukemic cells, which cannot synthesize this amino acid due to the absence of the enzyme asparagine synthase. or A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the drug asparaginase that is linked to a substance called PEG, which makes the drug stay in the body

longer. Asparaginase is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called Oncaspar and PEG-asparaginase.

**Pegasys :** A drug used to treat hepatitis C infections. It is also being studied in the treatment and prevention of cancer. It is a cytokine that is modified in the laboratory. It is a type of biological response modifier. Also called peginterferon alfa-2a.

**pegdinetanib:** A highly specific, synthetic peptide vascular endothelial growth factor receptor-2 (VEGFR-2) antagonist with potential antiangiogenic activity. Derived from human fibronectin with a proprietary protein engineering process, pegdinetanib may block the activation of VEGFR-2 by all known activating ligands, thereby inhibiting the growth of new tumor blood vessels.

**pegfilgrastim:** A long-acting pegylated form of a recombinant therapeutic agent which is chemically identical to or similar to an endogenous human granulocyte colony-stimulating factor (G-CSF). Produced endogenously by monocytes, fibroblasts, and endothelial cells, G-CSF binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions. Conjugation of the cytokine with a branched polyethylene glycol molecule (pegylation) significantly increases its therapeutic half-life.

**pegfilgrastim :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. Pegfilgrastim is also used to help prevent damage to the bone marrow in patients who were exposed to high doses of certain types of radiation. Pegfilgrastim helps the bone marrow make more white blood cells. It is a form of filgrastim and is able to stay in the body longer. Pegfilgrastim is a type of colony-stimulating factor. Also called filgrastim-SD/01 and Neulasta.

**pegfilgrastim anti-neutropenic factor:** A long-acting, engineered and pegylated version of human granulocyte-colony stimulating factor (G-CSF), with potential hematopoietic activity. Similar to G-CSF, pegfilgrastim anti-neutropenic factor (ANF) binds to and activates specific cell surface receptors, and stimulates neutrophil progenitor proliferation and

differentiation. Therefore, this agent may prevent the duration and incidence of chemotherapy-induced neutropenia. Compared to filgrastim, the conjugation with a branched polyethylene glycol molecule reduces renal clearance and increases its plasma half-life.

**pegfilgrastim biosimilar LA-EP2006:** A biosimilar of pegfilgrastim, a long-acting pegylated form of recombinant human granulocyte colony-stimulating factor (G-CSF) filgrastim, with hematopoietic activity. In a similar manner to G-CSF, pegfilgrastim biosimilar LA-EP2006 binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions.

Therefore, this agent may prevent the incidence and shorten the duration of chemotherapy-induced neutropenia. Conjugation of the cytokine with a branched polyethylene glycol molecule significantly increases this agent's therapeutic half-life compared to filgrastim.

**peginterferon alfa-2a :** A drug used to treat hepatitis C infections. It is also being studied in the treatment and prevention of cancer. It is a cytokine that is modified in the laboratory. It is a type of biological response modifier. Also called Pegasys. Or A covalent conjugate of recombinant interferon alpha, subtype 2b, and polyethylene glycol (PEG), used as an antiviral and antineoplastic agent. The biological activity of this agent is derived from its interferon alpha-2b protein moiety. Interferons alfa bind to specific cell-surface receptors, leading to the transcription and translation of genes whose protein products mediate antiviral, antiproliferative, anticancer, and immune-modulating effects. The PEG moiety lowers the clearance of interferon alpha-2b, thereby extending the duration of its therapeutic effects, but may also reduce the interferon-mediated stimulation of an immune response.

**peginterferon alfa-2b :** A drug used to treat melanoma and hepatitis C. It is also being studied in the treatment of other types of cancer. It is used under the brand name Sylatron to treat melanoma in patients who have had surgery to remove cancer that has spread to lymph nodes. It is used under the brand name PEG-Intron to treat hepatitis C infections. Peginterferon alfa-2b is a form of interferon alfa (a substance normally made by cells in the immune system) linked to a substance called PEG, which makes the drug stay in the body longer. Peginterferon alfa-2b is made in the

laboratory. It is a type of cytokine and a type of biological response modifier. Also called SCH 54031.

**pegmatite:** a dike that contains very coarse-grained crystals.

**pegol sihematide:** A synthetic peptide derived from erythropoietin (EPO) linked to polyethylene glycol (PEG), with erythropoietic stimulating activity. Upon administration, pegol sihematide binds to and activates EPO receptors on the surface of erythroid progenitor cells in the bone marrow resulting in their differentiation and proliferation. This increases the production of red blood cells and prevents anemia. Pegylation increases this agent's blood circulation time.

**pegteograstim:** An analogue of pegfilgrastim, a recombinant, pegylated form of endogenous human granulocyte colony-stimulating factor (G-CSF), with hematopoietic activity. Similar to endogenous G-CSF, this agent binds to and activates specific cell surface receptors, and stimulates neutrophil progenitor proliferation, differentiation and selected neutrophil functions. Pegteograstim may prevent and shorten the duration of chemotherapy-induced neutropenia (CIN). Pegylation of teograstim increases the half-life of this agent. Check for active clinical trials using this agent.

**pegvisomant:** A pegylated, recombinant, human growth hormone (GH) structural analog with GH receptor antagonist activity. As a GH analog, the structure of pegvisomant is similar to that of native GH with the exception of 9 amino acid substitutions. Pegvisomant selectively binds to GH receptors on cell surfaces, interfering with endogenous GH receptor binding and so GH signal transduction. Inhibition of GH signal transduction results in decreased serum concentrations of insulin-like growth factor-I (IGF-I), and other GH-responsive serum proteins, including IGF binding protein-3 (IGFBP-3) and the acid-labile subunit (ALS), and may inhibit the growth of cancers in which IGF-1 is upregulated.

**pegylated anti-GFR antibody fragment:** A pegylated, cross-linked, humanized divalent-Fab' antibody fragment directed against vascular endothelial growth factor receptor-2 (VEGFR-2) with potential antiangiogenic and antitumor activities. Pegylated anti-GFR antibody fragment binds to and inhibits VEGFR-2, which may inhibit angiogenesis and tumor cell proliferation. Multivalent Fab' antibody fragments may exhibit improved retention and internalization properties compared to their parent IgGs.

**pegylated arginine deiminase:** An agent consisting of the arginine-degrading enzyme arginine deiminase combined with polyethylene glycol (20,000 MW) (ADI-PEG 20) with potential antineoplastic activity. Upon administration, arginine deiminase breaks down the amino acid arginine into citrulline. Although arginine is a nonessential amino acid for normal human cells, certain cancer cells are autotrophic for arginine and need arginine in order to survive. Depletion of arginine may lead to an inhibition of cellular proliferation in those cancer cells. ADI is coupled to PEG in order to enhance this agent's half-life. or A substance being studied in the treatment of melanoma, liver cancer, and other types of cancer. It breaks down the amino acid arginine and may block the growth of cancer cells that need arginine to grow. It is a type of iminohydrolase. Also called ADI-PEG 20.

**pegylated granulocyte colony stimulating factor MAXY-G34:** A long-acting, pegylated recombinant variant of human granulocyte colony-stimulating factor (G-CSF) with immunomodulating activity. Pegylated granulocyte colony stimulating factor MAXY-G34 contains multiple non-naturally occurring lysines that have been introduced into alpha helices of wild type human G-CSF as pegylation sites; other naturally occurring lysine residues have been removed to prevent pegylation and the variant G-CSF is pegylated with methoxypolyethylene glycol succinimidyl propionate (mPEG SPA) at three amino acid residues. Similar to endogenous G-CSF, this agent binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions. A difference in the degree of pegylation may account for the extended half-life of this agent compared to pegfilgrastim which is pegylated at only one amino acid residue.

**pegylated human recombinant arginase AEB1102:** A recombinant modified form of the human enzyme arginase 1 (ARG1), in which cobalt is substituted for manganese as a cofactor, covalently attached to polyethylene glycol (PEG), with potential arginine degrading and antineoplastic activities. Upon intravenous administration of pegylated recombinant human ARG1 AEB1102, ARG1 metabolizes the amino acid arginine to ornithine and urea, thereby lowering blood arginine levels. This normalizes blood arginine levels in patients with ARG1 deficiency and prevents hyperargininemia. This also inhibits the proliferation of cancer cells that are dependent on extracellular arginine uptake for their proliferation. In normal,

healthy cells, arginine is synthesized intracellularly by the enzymes ornithine transcarbamylase (OTC), argininosuccinate synthase (ASS), and argininosuccinate lyase (ASL); thus they are not dependent on extracellular arginine for survival. In cancer cells these enzymes are disabled; therefore, this agent may inhibit proliferation and survival of these cells by depleting extracellular arginine. Pegylation improves blood circulation times and cobalt substitution increases the catalytic activity of ARG1.

**pegylated interferon alfa:** A covalent conjugate of recombinant interferon alpha and polyethylene glycol (PEG), used as an antiviral and antineoplastic agent. The biological activity of this agent is derived from its interferon alpha protein moiety. Interferons alfa bind to specific cell-surface receptors, leading to the transcription and translation of genes whose protein products mediate antiviral, antiproliferative, anticancer, and immune-modulating effects. The PEG moiety lowers the clearance of interferon alpha, thereby extending the duration of its therapeutic effects, but may also reduce interferon-mediated stimulation of an immune response.

**pegylated irinotecan NKTR 102:** A formulation of polyethylene glycol (PEG)-encapsulated irinotecan with antineoplastic activity. The prodrug irinotecan, a semisynthetic derivative of camptothecin, is converted to the biologically active metabolite 7-ethyl-10-hydroxy-camptothecin by a carboxylesterase-converting enzyme. One thousand-fold more potent than its parent compound irinotecan, 7-ethyl-10-hydroxy-camptothecin inhibits topoisomerase I activity by stabilizing the cleavable complex of topoisomerase I and DNA, resulting in DNA breaks that inhibit DNA replication and trigger apoptosis. Pegylation provides improved drug penetration into tumors and decreases drug clearance, thereby increasing the duration of therapeutic effects while lowering the toxicity profile.

**pegylated liposomal doxorubicin hydrochloride:** A liposome-encapsulated form of the hydrochloride salt of the anthracycline antineoplastic antibiotic doxorubicin. Doxorubicin intercalates between base pairs in the DNA helix, thereby preventing DNA replication and ultimately inhibiting protein synthesis. Additionally, doxorubicin inhibits topoisomerase II which results in an increased and stabilized cleavable enzyme-DNA linked complex during DNA replication and subsequently prevents the ligation of the nucleotide strand after double-strand breakage. Doxorubicin also forms oxygen free radicals resulting in cytotoxicity

secondary to lipid peroxidation of cell membrane lipids. Liposomal delivery of doxorubicin HCL improves drug penetration into tumors and decreases drug clearance, thereby increasing the duration of therapeutic drug effects; a liposomal formulation of doxorubicin also modulates toxicity, specifically the cardiac effects commonly seen with anthracycline antitumor drugs.

**pegylated liposomal irinotecan:** A formulation of polyethylene glycol (PEG)-modified liposomes encapsulating the semisynthetic derivative of camptothecin irinotecan, with antineoplastic activity. As a prodrug, irinotecan is converted to the biologically active metabolite 7-ethyl-10-hydroxy-camptothecin (SN-38) by a carboxylesterase-converting enzyme. In turn, SN-38 inhibits topoisomerase I activity by stabilizing the cleavable complex of topoisomerase I and DNA, resulting in DNA breaks. This results in an inhibition of DNA replication and an induction of apoptosis. Pegylated liposomal delivery of irinotecan improves drug penetration into tumors and decreases drug clearance, thereby increasing the duration of exposure while lowering systemic toxicity.

**pegylated liposomal mitomycin C lipid-based prodrug:** A pegylated liposomal formulation comprised of a lipophilic prodrug of the antineoplastic antibiotic mitomycin C containing a cleavable disulfide bond (PL-MLP), with potential antineoplastic activity. Upon administration of the pegylated liposomal mitomycin C lipid-based prodrug, the MLP moiety becomes activated upon thiolysis at the tumor site, thereby releasing mitomycin C. Bio-reduced mitomycin C generates oxygen radicals, alkylates DNA, and produces interstrand DNA cross-links, thereby inhibiting DNA synthesis. The thiolytic environment and upregulated expression of thioredoxins at the tumor site allow for the activation and release of mitomycin C. This prodrug formulation allows for greater circulation time, less systemic toxicity and increased accumulation of mitomycin C at the tumor site.

**pegylated recombinant human arginase I BCT-100:** A recombinant human arginase I (liver arginase) covalently attached, via a succinamide propionic acid (SPA) linker, to a polyethylene glycol (PEG) of molecular weight 5,000 [rhArg-peg(5,000mw)] with potential antineoplastic activity. Upon intravenous administration of pegylated recombinant human arginase I BCT-100, arginase metabolizes the amino acid arginine to ornithine and urea, depleting intracellular arginine, which may inhibit proliferation of

cells that are auxotrophic for arginine such as hepatocellular carcinoma (HCC) cells. This agent may also work synergistically with various cytotoxic agents.

**pegylated recombinant human hyaluronidase PH20:** A pegylated formulation of a recombinant form of human hyaluronidase with potential antitumor activity. Upon intravenous administration, pegylated recombinant human PH20 degrades hyaluronic acid (HA) coating tumor cells, which may result in the inhibition of tumor cell growth. In addition, the degradation of HA may result in a lowering of the interstitial fluid pressure (IFP), allowing better penetration of chemotherapeutic agents into the tumor bed. HA is a glycosaminoglycan found in the extracellular matrix (ECM) that is frequently overproduced by various tumor cell types. The presence of HA in tumors correlates with increased tumor cell growth, metastatic potential, tumor progression, increased resistance to chemotherapeutic agents, and an elevation in tumor IFP. Check for active clinical trials using this agent.

**pegylated recombinant human interleukin-10 AM0010:** A covalent conjugate of recombinant human interleukin-10 (IL-10) and polyethylene glycol (PEG), with potential anti-fibrotic, anti-inflammatory, immunomodulating and antineoplastic activities. Upon subcutaneous administration, pegylated recombinant human interleukin-10 AM0010 may activate cell-mediated immunity against cancer cells by stimulating the differentiation and expansion of tumor specific cytotoxic CD8<sup>+</sup> T cells. This agent may also lower serum cholesterol levels and reduce atherosclerotic plaques by inhibiting the synthesis of pro-inflammatory cytokines, such as Interferon-gamma, IL-2, IL-3, TNF-alpha, and GM-CSF. The PEG moiety inhibits proteolytic breakdown and clearance of AM0010, which prolongs its half-life, extends the duration of its therapeutic effects and allows less frequent dosing.

**pegylated recombinant L-asparaginase Erwinia chrysanthemi:** A pegylated, recombinant form of L-asparaginase derived from the bacterium *Erwinia chrysanthemi* (mPEG-R-crisantaspase), with potential antineoplastic activity. Upon intravenous administration of pegylated recombinant L-asparaginase *Erwinia chrysanthemi*, asparaginase hydrolyzes L-asparagine to L-aspartic acid and ammonia, thereby depleting cancer cells of asparagine thus blocking protein synthesis and tumor cell

proliferation. Asparagine is critical to protein synthesis in cancer cells, which cannot synthesize this amino acid due to the absence of the enzyme asparagine synthase. Compared to other available *Erwinia chrysanthemi* derived L-asparaginase agents, the pegylated form is longer acting and less immunogenic. Check for active clinical trials using this agent.

**PEH:** Polyphenylene ether homopolymer

**PEI:** An injection of ethanol (alcohol) through the skin directly into a tumor to kill cancer cells. Ultrasound or a CT scan is used to guide the needle into the tumor. Also called alcohol ablation, ethanol ablation, and percutaneous ethanol injection.

**PEI:** Polyetherimide

**PEITC:** A substance being studied in the prevention of cancer. It is a naturally occurring compound found in some cruciferous vegetables. Also called phenethyl isothiocyanate.

**pelagic sediment:** a sea-floor sediment that is composed of finegrained clay particles and microskeletons of marine organisms that settle slowly to the ocean floor; its clay component (and sometimes volcanic ash) is generally carried from land by wind and deposited on the surface of the ocean.

**pelargonium :** A type of plant that is native to southern Africa and has white, pink, purple, or red flowers and 3- to 5-lobed leaves. An essential oil that smells like roses is taken from the leaves and used in perfume, in mosquito repellants, and in aromatherapy to treat skin problems and to reduce stress. The scientific name is *Pelargonium graveolens*. Also called geranium.

**peldesine :** A substance that is being studied for the treatment of cancer.

**pelitinib:** A 3-cyanoquinoline pan-ErbB tyrosine kinase inhibitor with potential antineoplastic activity. Pelitinib irreversibly binds covalently to epidermal growth factor receptors (EGFR) ErbB-1, -2 and -4, thereby inhibiting receptor phosphorylation and signal transduction and resulting in apoptosis and suppression of proliferation in tumor cells that overexpress these receptors. or A substance being studied in the treatment of some types of cancer. It blocks the action of certain proteins that are part of the epidermal growth factor receptor (EGFR) family of proteins. These proteins may be found in increased amounts on the surface of some types of cancer

cells. Blocking the action of these proteins may stop cancer cells from growing and may kill cancer cells. Pelitinib is a type of EGFR inhibitor. Also called EKB-569.

**pelitrexol:** A water soluble antifolate with anti-proliferative activity. Pelitrexol inhibits activity of glycinamide ribonucleotide formyltransferase (GARFT), the first folate-dependent enzyme of the de novo purine synthesis pathway essential for cell proliferation. Enzyme inhibition reduces the purine nucleotides pool required for DNA replication and RNA transcription. As a result, this agent causes cell cycle arrest in S-phase, and ultimately inhibits tumor cell proliferation.

**Pellagra:** A disease caused by dietary deficiencies of tryptophan and nicotinate and characterized by dermatitis, diarrhea, and dementia.

**Pellet:** A small ball or spherical shape.

**Pellet, fuel:** A thimble-sized ceramic cylinder (approximately 3/8-inch in diameter and 5/8-inch in length), consisting of uranium (typically uranium oxide, UO<sub>2</sub>), which has been enriched to increase the concentration of uranium-235 (U-235) to fuel a nuclear reactor. Modern reactor cores in pressurized-water reactors (PWRs) and boiling-water reactors (BWRs) may contain up to 10 million pellets, stacked in the fuel rods that form fuel assemblies.

**Pellets:** Resins or mixtures of resins with compounding additives similar in shape or size that have been extruded or chopped into short segments to prepare them for molding operations. OR Tablets of uniform size, consisting of resins or mixtures of resins with compounding additives which have been prepared for molding operations by shaping in a pelletizing machine or by extrusion and chopping into short segments. OR Tablets or granules of uniform size, consisting of resins or mixtures of resins with compounding additives which have been prepared for molding operations by extrusion and chopping into short segments.

**pelvic :** Having to do with the pelvis. The pelvis is the area of the body below the abdomen that is located between the hip bones and contains the bladder and rectum. In females, it also contains the vagina, cervix, uterus, fallopian tubes, and ovaries. In males, it also contains the prostate and seminal vesicles. or The area of the body below the abdomen that contains the hip bones, bladder, and rectum. In females, it also contains the vagina,

cervix, uterus, fallopian tubes, and ovaries. In males, it also contains the prostate and seminal vesicles.

**pelvic exam :** A physical exam of the vagina, cervix, uterus, fallopian tubes, ovaries, and rectum. First, the area outside the vagina is checked for signs of disease. A speculum is then inserted into the vagina to widen it so the vagina and cervix can be checked for signs of disease. Cell samples may be taken for a Pap test, or to test for sexually transmitted diseases or other infections. The doctor or nurse then inserts one or two lubricated, gloved fingers of one hand into the vagina and presses on the lower abdomen with the other hand to feel for lumps and check the size, shape, and position of the uterus and ovaries. The rectum may also be checked for lumps or abnormal areas. Also called internal exam.

**pelvic exenteration :** Surgery to remove the lower colon, rectum, and bladder, and create stomata (openings) through which urine and stool are passed out of the body. In women, the cervix, vagina, ovaries, and nearby lymph nodes are also removed.

**pelvic inflammatory disease :** A condition in which the female reproductive organs are inflamed. It may affect the uterus, fallopian tubes, ovaries, and certain ligaments. Pelvic inflammatory disease is usually caused by a bacterial infection. It may cause infertility and an increased risk of an ectopic pregnancy (pregnancy in the fallopian tubes). Also called PID.

**pelvic lymphadenectomy :** Surgery to remove lymph nodes in the pelvis for examination under a microscope to see if they contain cancer.

**pelvic wall :** The muscles and ligaments that line the part of the body between the hips.

**pembrolizumab:** A humanized monoclonal immunoglobulin (Ig) G4 antibody directed against human cell surface receptor PD-1 (programmed death-1 or programmed cell death-1) with potential immune checkpoint inhibitory and antineoplastic activities. Upon administration, pembrolizumab binds to PD-1, an inhibitory signaling receptor expressed on the surface of activated T cells, and blocks the binding to and activation of PD-1 by its ligands, which results in the activation of T-cell-mediated immune responses against tumor cells. The ligands for PD-1 include programmed cell death ligand 1 (PD-L1), overexpressed on certain cancer cells, and programmed cell death ligand 2 (PD-L2), which is primarily expressed on APCs. Activated PD-1 negatively regulates T-cell activation

and plays a key role in in tumor evasion from host immunity. or A drug used to treat squamous cell cancer of the head and neck that has recurred (come back) or spread to other parts of the body. It is used in patients whose disease got worse during or after treatment. It is also used to treat certain types of non-small cell lung cancer that have spread to other parts of the body and got worse during or after treatment. Pembrolizumab is also used to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Pembrolizumab binds to a protein called PD-1, which is found on T cells (a type of white blood cell). Pembrolizumab may block PD-1 and help the immune system kill cancer cells. It is a type of monoclonal antibody and a type of immune checkpoint inhibitor. Also called Keytruda.

**pemetrexed disodium:** The disodium salt of a synthetic pyrimidine-based antifolate. Pemetrexed binds to and inhibits the enzyme thymidylate synthase (TS) which catalyses the methylation of 2'-deoxyuridine-5'-monophosphate (dUMP) to 2'-deoxythymidine-5'-monophosphate (dTMP), an essential precursor in DNA synthesis. or A drug used alone or with another drug to treat certain types of non-small cell lung cancer and malignant pleural mesothelioma. It is being studied in the treatment of other types of cancer. Pemetrexed disodium blocks DNA synthesis and may kill cancer cells. It is a type of folate antagonist. Also called Alimta and LY231514.

**Pen-Vee:** (Other name for: penicillin V potassium)

**Pencil hardness:** A value determined by measuring the relative hardness of a coating based upon the ability of the coating to resist penetration and gouging by pencil lead of varying hardness. The order of pencils from softest to hardest is 4B, 3B, 2B, B, HB, F, H, 2H, 3H, 4H, 5H, 6H, 7H, and 8H. The hardness rating of the coating is equal to the first pencil which does not penetrate and gouge the coating when tested from softest to hardest.

**penclomedine:** A synthetic derivative of pyrimidine with antineoplastic activity. Penclomedine alkylates and crosslinks DNA, resulting in DNA strand breaks and inhibition of DNA and RNA synthesis. This agent is more active against tumor cells that are defective in p53 function. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called alkylating agents.

**penectomy** : Surgery to remove part or all of the penis (an external male reproductive organ).

**peneplain**: an area reduced by erosion nearly to a plain.

**penetrance** : A characteristic of a genotype; it refers to the likelihood that a clinical condition will occur when a particular genotype is present. Or Describes how likely it is that a person who has a certain disease-causing mutation (change) in a gene will show signs and symptoms of the disease. Not everyone who has the mutation will develop the disease. For example, some people who have a BRCA1 or BRCA2 gene mutation will develop cancer during their lifetime, but others will not. Currently, there is no way to know which people who have a cancer-causing mutation will develop cancer. Complete penetrance means that every person who has the mutation will show signs and symptoms of the disease.

**Penetrating Finish**: A finish that sinks into the substrate, as opposed to settling on the surface.

**penetration**: Electrons in penetrating orbitals can reach the nucleus. The  $n$  and  $l$  quantum numbers determine how well an orbital penetrates. Lower  $n$  and lower  $l$  values mean better penetration. A low  $n$  value means the orbital is small. A low  $l$  value means the orbital has fewer nuclear nodes (planes that pass through the nucleus where the probability of locating the electron is zero).

**penicillamine**: A beta dimethyl analog of the amino acid cysteine. As a degradation product of penicillin antibiotics, penicillamine chelates with heavy metals and increases their urinary excretion. Possessing antineoplastic properties, penicillamine induces apoptosis by a p53-mediated mechanism and inhibits angiogenesis by chelating with copper, a cofactor for angiogenesis. or A drug that removes copper from the body and is used to treat diseases in which there is an excess of copper. It is also being studied as a possible angiogenesis inhibitor in the treatment of brain tumors.

**penicillin** : A drug that is used to treat infection. It belongs to the family of drugs called antibiotics.

**penicillin V potassium**: The potassium salt of penicillin V, a member of the penicillin antibiotic family with broad-spectrum bactericidal activity. Penicillin V binds to and inactivates penicillin-binding proteins (PBPs), enzymes located on the inner membrane of the bacterial cell wall, resulting

in the weakening of the bacterial cell wall and cell lysis. PBPs participate in the terminal stages of assembling the bacterial cell wall, and in reshaping the cell wall during cell division. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity.

**penile cancer** : A rare cancer that forms in the penis (an external male reproductive organ). Most penile cancers are squamous cell carcinomas (cancer that begins in flat cells lining the penis).

**penile implant** : A firm rod or inflatable device that is placed in the penis (an external male reproductive organ) during a surgical procedure. The implant makes it possible to have and keep an erection. Penile implants are used to treat erectile dysfunction or impotence.

**penis** : An external male reproductive organ. It contains a tube called the urethra, which carries semen and urine to the outside of the body.

**Pennsylvanian**: Pertaining to Pennsylvania. The geological epoch known as the Carboniferous (286-360 years before present), in which many of the world's major coal deposits were deposited, is divided into the Mississippian (286-320 ybp) and Pennsylvanian (320-360 ybp) in American-speaking countries.

**pentagon**: a five-sided plane closed figure. The sum of its five angles is  $540^\circ$ .

**Pentam** : A drug used to treat infections caused by certain microorganisms. It is also being studied in the treatment of melanoma. It prevents DNA from being copied and may kill cancer cells. It is a type of antifungal agent, a type of antiprotozoal agent, and a type of PRL phosphatase inhibitor. Also called pentamidine isethionate.

**pentamethylmelamine**: A principal metabolite of hexamethylmelamine with antineoplastic activity. Pentamethylmelamine alkylates DNA and other macromolecules and forms DNA intrastrand and DNA-protein crosslinks, thereby preventing DNA replication. Check for active clinical trials using this agent.

**pentamidine**: A synthetic derivative of amidine with antiprotozoal and antifungal activities. Although the precise mode of action of pentamidine is unclear, it appears to interact directly with the pathogen genome by binding

to AT-rich regions of duplex DNA and the minor groove of DNA, thereby interfering with DNA replication.

**pentamidine :** The active ingredient in a drug used to treat infections caused by certain microorganisms. It is also being studied in the treatment of melanoma. It prevents DNA from being copied and may kill cancer cells. It is a type of antifungal agent, a type of antiprotozoal agent, and a type of PRL phosphatase inhibitor.

**pentamidine isethionate:** A synthetic amidine derivative, Pentamidine Isethionate is an antiprotozoal and antifungal agent that appears to interact with the minor groove of AT-rich DNA regions of the pathogen genome, interfering with DNA replication and function. It is effective in the treatment of trypanosomiasis, leishmaniasis, some fungal infections, and Pneumocystis carinii pneumonia in HIV-infected patients. or A drug used to treat infections caused by certain microorganisms. It is also being studied in the treatment of melanoma. It prevents DNA from being copied and may kill cancer cells. It is a type of antifungal agent, a type of antiprotozoal agent, and a type of PRL phosphatase inhibitor. Also called Pentam.

**Pentasa:** (Other name for: mesalamine)

**pentavalent KLH conjugate vaccine:** A pentavalent vaccine comprised of the epitope antigens of the ganglioside lactones GD2L and GD3L, Globo H hexasaccharide 1 (Globo H), fucosyl GM1 and N-propionylated polysialic acid conjugated with the immunostimulant keyhole limpet hemocyanin (KLH), with potential immunostimulating and antineoplastic activity. Vaccination with the pentavalent KLH conjugate vaccine may induce production of IgG and IgM antibodies as well as an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumors expressing any of these antigens. The antigens included in the pentavalent KLH conjugate vaccine are upregulated in a variety of cancer cells. KLH, a natural protein isolated from the marine mollusk keyhole limpet, is an immunostimulant carrier protein.

**pentetic acid calcium:** The calcium salt of pentetic acid, a synthetic chelating agent related to the chelating agent ethylenediaminetetraacetic acid (EDTA). Pentetic acid chelates with the metallic radioisotopic moieties of unbound, extracellular radioimmunotherapeutic agents, resulting in higher specific tumor cell binding of radioimmunotherapeutic agents; this

results in improved tumor cell radiocytotoxicity and the sparing of normal cells and tissues from the radiocytotoxic effects of these agents.

**pentetic acid calcium :** A drug that protects healthy tissues from the toxic effects of anticancer drugs.

**pentosan polysulfate :** A drug used to relieve pain or discomfort associated with chronic inflammation of the bladder. It is also being evaluated for its protective effects on the gastrointestinal tract in people undergoing radiation therapy.

**pentosan polysulfate sodium:** The sodium salt of a semisynthetic heparin-like glucosaminoglycan. Although its mechanism of action is unknown, pentosan polysulfate may act as a buffer to control cell permeability by preventing irritating solutes from reaching cells coated with it.

Administered orally, excreted pentosan polysulfate adheres to the urinary bladder wall, preventing irritants from entering bladder cells and the development or progression of interstitial cystitis (IC), a complication of some chemotherapies. This agent also exhibits anticoagulant and fibrinolytic properties.

**Pentose:** A sugar with five carbon atoms. OR A simple sugar with a backbone containing five carbon atoms.

**Pentose phosphate pathway:** The pathway involving the oxidation of glucose-6-phosphate to pentose phosphates and further reactions of pentose phosphates. OR A metabolic pathway that generates NADPH and five-carbon sugars such as ribose 5-phosphate from glucose 6-phosphate; it includes oxidative reactions that produce NADPH and ribose 5-phosphates as well as nonoxidative reactions that together convert five-carbon sugar phosphates into gluconeogenic precursors of glucose 6-phosphate. Also referred to as the hexose monophosphate shunt or the phosphogluconate pathway. OR A pathway that serves to interconvert hexoses and pentoses and is a source of reducing equivalents and pentoses for biosynthetic processes; present in most organisms. Also called the phosphogluconate pathway.

**Pentoses:** Monosaccharides that have five carbon atoms.

**pentostatin:** A purine nucleotide analogue antibiotic isolated from the bacterium *Streptomyces antibioticus*. Also known as 2'-deoxycoformycin, pentostatin binds to and inhibits adenine deaminase (ADA), an enzyme essential to purine metabolism; ADA activity is greatest in cells of the

lymphoid system with T-cells having higher activity than B-cells and T-cell malignancies higher ADA activity than B-cell malignancies. Pentostatin inhibition of ADA appears to result in elevated intracellular levels of dATP which may block DNA synthesis through the inhibition of ribonucleotide reductase. This agent may also inhibit RNA synthesis and may selectively deplete CD26+ lymphocytes. Check for active clinical trials using this agent.

**pentostatin :** The active ingredient in a drug that is used to treat hairy cell leukemia and is being studied in the treatment of other types of cancer. Pentostatin blocks a protein needed for cell growth and may kill cancer cells. It is made by a bacterium. It is a type of adenosine deaminase inhibitor. Also called Nipent.

**pentoxifylline:** A methylxanthine derivative with hemorrheologic and immunomodulating properties. Pentoxifylline inhibits phosphodiesterase, resulting in increased levels of cyclic adenosine monophosphate (cAMP) in erythrocytes, endothelium, and the surrounding tissues. This leads to vasodilation, improves erythrocyte flexibility, and enhances blood flow. In addition, the increased level of cAMP in platelets inhibits platelet aggregation, which may contribute to a reduction in blood viscosity. This agent also inhibits production of tumor necrosis factor-alpha and interferon-gamma, while it induces Th2-like (T-helper 2) cytokine production, thereby inhibiting Th1-mediated (T-helper 1) inflammatory and autoimmune responses. or A drug used to prevent blood clotting and as a treatment that may help decrease weight loss in people with cancer.

**penumbra:** the lighter, gray area of a shadow.

**PEO:** Polyethylene oxide

**PEP-3-KLH conjugate vaccine:** A cancer vaccine consisting of PEP-3, a synthetic peptide encompassing a tumor-specific mutated segment of the epidermal growth factor receptor type VIII (EGFRvIII), conjugated to the naturally-occurring immunoadjuvant keyhole limpet hemocyanin (KLH) with potential immunostimulating and antineoplastic activities. Upon administration, PEP-3-KLH conjugate vaccine may induce a cytotoxic immune response against tumor cells that overexpress EGFRvIII; this antitumoral immune response may involve antibody-dependent cellular cytotoxicity (ADCC).

**PEP-CMV vaccine:** A peptide vaccine derived from cytomegalovirus (CMV) antigens with potential immunostimulating activity. Intradermal

administration of the PEP-CMV vaccine may stimulate the immune system to mount a specific helper and cytotoxic T-lymphocyte (CTL) response against CMV-infected tumor cells. Infection with the herpesvirus CMV may play a significant role in tumor cell initiation and progression as well as chemoresistance.

**PEP02:** A form of the anticancer drug irinotecan hydrochloride that is contained in very tiny, fat-like particles. PEP02 is used together with fluorouracil and leucovorin to treat a certain type of pancreatic cancer that has spread to other parts of the body and has gotten worse after treatment with gemcitabine anticancer therapy. It is also being studied in the treatment of other types of cancer. Irinotecan hydrochloride blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. PEP02 may have fewer side effects and work better than irinotecan hydrochloride. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called irinotecan hydrochloride liposome, liposome-encapsulated irinotecan hydrochloride PEP02, and Onivyde.

**Pepcid:** (Other name for: famotidine)

**Pepcid AC:** (Other name for: famotidine)

**peplomycin:** A semisynthetic analog of Bleomycin, a mixture of several basic glycopeptide antineoplastic antibiotics isolated from the fungus *Streptomyces verticillus*. Peplomycin forms complexes with iron that reduce molecular oxygen to superoxide and hydroxyl radicals that cause single- and double-stranded breaks in DNA. This agent appears to show greater antitumor activity than bleomycin; its use is limited due to pulmonary toxicity.

**pepsin :** An enzyme made in the stomach that breaks down proteins in food during digestion. Stomach acid changes a protein called pepsinogen into pepsin.

**pepsinogen :** A substance made by cells in the stomach. Acid in the stomach changes pepsinogen to pepsin, which breaks down proteins in food during digestion.

**Peptamen:** (Other name for: enzymatically hydrolyzed whey protein-based nutritional supplement)

**peptic ulcer :** A break in the lining of the lower part of the esophagus, the stomach, or the upper part of the small intestine. Peptic ulcers form when

cells on the surface of the lining become inflamed and die. They are usually caused by *Helicobacter pylori* bacteria and by certain medicines, such as aspirin and other nonsteroidal anti-inflammatory drugs (NSAIDs). Peptic ulcers may be linked to cancer and other diseases.

**peptidase:** An enzyme that hydrolyzes a peptide bond.

**peptide:** A small polymer of amino acids, formed by the condensation copolymerization of several amino acids. OR A molecule consisting of a chain of amino acids; a small protein fragment OR An organic molecule in which a covalent amide bond is formed between the  $\alpha$ -amino group of one amino acid and the  $\alpha$ -carboxyl group of another amino acid, with the elimination of a water molecule. The resulting connection is called a peptide bond. OR Two or more amino acids joined by peptide bonds. OR A short polymer made by linking together amino acid molecules. OR Two or more amino acids covalently joined by peptide bonds.

**peptide :** A molecule that contains two or more amino acids (the molecules that join together to form proteins). Peptides that contain many amino acids are called polypeptides or proteins.

**peptide 946 :** A piece of a protein found only on melanoma (a type of skin cancer) cells. It is being used in vaccines to help the immune system kill melanoma cells.

**Peptide bond:** The chemical link joining amino acids in peptides and proteins OR A covalent linkage formed between the  $\alpha$ -carboxyl group of one amino acid and the  $\alpha$ - amino group of another. Also known as an amide bond. OR A substituted amide linkage between the  $\alpha$ -amino group of one amino acid and the  $\alpha$ -carboxyl group of another, with the elimination of the elements of water.

**peptide mapping:** The characteristic two-dimensional pattern (on paper or gel) formed by the separation of a mixture of peptides resulting from partial hydrolysis of a protein; also known as peptide fingerprinting.

**peptides:** small proteins.

**Peptidoglycan:** The main component of the bacterial cell wall, consisting of a two-dimensional network of heteropolysaccharides running in one direction, cross-linked with polypeptides running in the perpendicular direction. OR A macromolecule that consists of linear polysaccharides cross-linked by short peptides; often found in bacterial cell walls,

peptidoglycans confer mechanical support and protect bacterial cells from disruption by osmotic pressure. OR A major component of bacterial cell walls; generally consists of parallel heteropolysaccharides cross-linked by short peptides.

**Peptidyl transferase center:** A region of the large ribosomal subunit that catalyzes peptide-bond formation between the aminoacyl (or peptidyl) trna in the P site and the aminoacyl trna in the A site.

**Pepto-Bismol:** (Other name for: bismuth subsalicylate)

**Peracetic acid (CH<sub>3</sub>CO<sub>3</sub>H) :** A highly oxidative organic compound. This organic peroxide is a colorless liquid with a characteristic odor reminiscent of acetic acid. It can be highly corrosive.

**perampanel:** An orally active, non-competitive, and selective alpha-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid (AMPA) glutamate receptor antagonist, with anti-epileptic activity. Although the mechanism of action through which perampanel exerts its antiepileptic effect has not been fully elucidated, this agent antagonizes the AMPA subtype of the excitatory glutamate receptor found on postsynaptic neurons in the central nervous system (CNS). This antagonistic action prevents AMPA receptor activation by glutamate and results in the inhibition of neuronal excitation, repetitive neuronal firing, and the stabilization of hyper-excited neural membranes. Glutamate, the primary excitatory neurotransmitter in the CNS, plays an important role in various neurological disorders caused by neuronal hyperexcitation.

**percent composition:** Expresses the mass ratio between different elements in a compound.

**percent error:** formula used to find the inaccuracy of a measurement. OR The relative error times 100%.

**percent yield:** Percent yield equals experimental yield divided by theoretical yield times 100%.

**percent(s):** The part per one hundred in the percent proportion:

**percentage composition:** The percentage composition is the proportions of each element present in a compound by mass (expressed as percentages). OR This composition measurement reflects the percentage of total mass for a specific element. The percentage composition of sodium in sodium chloride (NaCl) is about 39%. Just take the total mass of one element of the

compound and divide it by the total mass of the compound. Then multiply by 100. OR can be found by totaling the atomic masses of the atoms in the formula, dividing each mass by the total, and changing the results to %-age.

**percentages:** A given part in every hundred.

**perched water table:** an accumulation of groundwater that is held above the water table in the unsaturated zone by an impermeable bed such as clay.

**Percocet:** (Other name for: oxycodone/acetaminophen)

**percolation:** The movement of water downward and radially through the subsurface soil layers, usually continuing downward to the groundwater.

**percutaneous :** Passing through the skin, as an injection or a topical medicine.

**percutaneous endoscopic tube :** A tube inserted through the wall of the abdomen directly into the stomach. It allows air and fluid to leave the stomach and can be used to give drugs and liquids, including liquid food, to the patient. Giving food through a percutaneous endoscopic tube is a type of enteral nutrition. Also called gastrostomy tube and PEG tube.

**percutaneous epididymal sperm aspiration :** A procedure in which a sample of sperm cells is removed from the epididymis through a syringe attached to a small needle. The epididymis is a narrow, tightly-coiled tube that is attached to each of the testicles and is where sperm cells mature and are stored. The sperm is looked at under a microscope in a laboratory, where it may be used right away to fertilize eggs or frozen for future infertility treatment. Percutaneous epididymal sperm aspiration may be useful for men who have fertility problems caused by a blockage that keeps sperm from being ejaculated. This could be caused by previous vasectomy, certain genetic conditions, infection, or other conditions. It may also be useful for men who want to have children after having treatment that may cause infertility, such as certain cancer treatments. Percutaneous epididymal sperm aspiration is a type of sperm retrieval method.

**percutaneous ethanol injection :** An injection of ethanol (alcohol) through the skin directly into a tumor to kill cancer cells. Ultrasound or a CT scan is used to guide the needle into the tumor. Also called alcohol ablation, ethanol ablation, and PEI.

**percutaneous transhepatic biliary drainage :** A procedure to drain bile to relieve pressure in the bile ducts caused by a blockage. An x-ray of the liver

and bile ducts locates the blockage of bile flow. Images made by ultrasound guide placement of a stent (tube), which remains in the liver. Bile drains through the stent into the small intestine or into a collection bag outside the body. This procedure may relieve jaundice before surgery. Also called percutaneous transhepatic cholangiodrainage and PTCD.

**percutaneous transhepatic cholangiodrainage :** A procedure to drain bile to relieve pressure in the bile ducts caused by a blockage. An x-ray of the liver and bile ducts locates the blockage of bile flow. Images made by ultrasound guide placement of a stent (tube), which remains in the liver. Bile drains through the stent into the small intestine or into a collection bag outside the body. This procedure may relieve jaundice before surgery. Also called percutaneous transhepatic biliary drainage and PTCD.

**percutaneous transhepatic cholangiography :** A procedure to x-ray the hepatic and common bile ducts. A contrasting agent is injected through the skin into the liver or bile duct, and the ducts are then x-rayed to find the point of obstruction. Also called PTC.

**Perdolat:** (Other name for: penicillamine)

**peretinoin:** An orally available, acyclic retinoid with potential antineoplastic and chemopreventive activities. Peretinoin binds to and activates nuclear retinoic acid receptors (RAR), which in turn recruit coactivator proteins and promote, with other transcriptional complexes, the transcription of target genes. As a result, this agent may modulate the expression of genes involved in the regulation of cell proliferation, cell differentiation, and apoptosis of both normal and tumor cells.

**perfect crystal:** A crystal with no defects or impurities, made of completely identical repeating subunits. Further, a perfect crystal has only one possible arrangement of subunits, with every subunit making exactly the same contribution to the total energy of the crystal.

**perflenapent emulsion:** An oil-in-water nano-emulsion composed of the perfluorocarbon perflenapent, that has oxygen-carrying capacity, can be used as a contrast agent and has potential antihypoxic and radiosensitizing activities. Upon intravenous administration of the perflenapent emulsion, this agent increases the oxygen-carrying capacity of blood, enhances the transport of oxygen to hypoxic and ischemic tissues and increases the oxygen concentration in these tissues. Hypoxic tumors are correlated with increased resistance to radiation treatment; therefore, since perflenapent

may increase tumor oxygenation, it may improve the tumor's sensitivity to radiation therapy.

**perflubron:** A synthetic radiopaque liquid form of perfluorooctyl bromide. Used as a contrast agent for magnetic resonance imaging (MRI), perflubron is also used as a liquid ventilation agent to improve pulmonary gas exchange and lung compliance and may be used in surgery to reduce or eliminate the need for a donor blood. Ventilation with perfluorocarbon fluid improves lung function in conditions involving surfactant deficiency and dysfunction, including respiratory distress syndrome and adult respiratory distress syndrome. Check for active clinical trials using this agent.

**perflutren:** A fluorinated hydrocarbon and gaseous substance used as an imaging contrast agent. After administration in microsphere form, perflutren exhibits lower acoustic impedance than blood and improves ultrasound signaling.

**perflutren lipid microspheres:** An injectable suspension of liposome-encapsulated microspheres containing the fluorocarbon gas perflutren for contrast enhancement in ultrasound procedures. Because the acoustic impedance of perflutren lipid microspheres is much lower than that of blood, impinging ultrasound waves are scattered and reflected at the microsphere-blood interface and may be visualized with ultrasound imaging. Check for active clinical trials using this agent.

**perflutren protein-type A microspheres:** A sterile non-pyrogenic suspension of microspheres of human serum albumin with the stable, high-molecular-weight fluorocarbon gas perflutren, used as a contrast enhancement agent for ultrasound procedures. Because the acoustic impedance of perflutren protein-type A microspheres is much lower than that of blood, impinging ultrasound waves are scattered and reflected at the microsphere-blood interface and may be visualized with ultrasound imaging. At the frequencies used in adult echocardiography (2-5 MHz), the microspheres resonate which further increases the extent of ultrasound scattering and reflection.

**PERFORATING:** Processes by which plastic film or sheeting is provided with holes ranging from relatively large diameters for decorative effects (by means of punching or clicking) to very small, even invisible, sizes. The latter are attained by passing the material between rollers or plates, one of which is equipped with closely-spaced fine needles, or by spark erosion.

**Perforating:** Processes used by plastic manufacturers by which plastic film or plastic sheeting, or extrusions are provided with holes within the plastic material ranging from relatively large diameters for decorative effects to very small, even invisible, sizes on the plastic.

**Perforin:** A protein secreted by activated T cells that renders target cells permeable by forming 10-nm pores in the target-cell membranes; pores allow entry of granzymes.

**PERFORM:** A pill, tablet, or biscuit used in thermoset molding. Material measured by volume, the bulk factor of powder reduced by pressure all in the interest of efficiency and accuracy.

**Performance:** A term used to indicate the degree to which a paint system will meet the requirements of any specific job, e.g. an interior quality paint would give poor performance (would have poor durability) if used on exterior surfaces.

**Performance indicator:** A quantitative measure of a particular attribute of licensee performance that shows how well a plant is performing when measured against established thresholds. Licensees submit their data quarterly; the NRC regularly conducts inspections to verify the submittals and then uses its own inspection data plus the licensees' submittals to assess each plant's performance. For additional detail, see Assessment of Performance, What is a performance indicator? and Reactor Performance Assessment Basics.

**performance status :** A measure of how well a patient is able to perform ordinary tasks and carry out daily activities.

**Performance-based regulation:** A regulatory approach that focuses on desired, measurable outcomes, rather than prescriptive processes, techniques, or procedures. Performance-based regulation leads to defined results without specific direction regarding how those results are to be obtained. At the NRC, performance-based regulatory actions focus on identifying performance measures that ensure an adequate safety margin and offer incentives for licensees to improve safety without formal regulatory intervention by the agency. For additional detail, see Risk Assessment in Regulation.

**Performance-based regulatory action:** Licensee attainment of defined objectives and results without detailed direction from the NRC on how these results are to be obtained. (See the Communication Plan for

Performance-Based Regulation by using accession number ML021120533 in ADAMS.)

**perfosfamide:** The active metabolite of the nitrogen mustard cyclophosphamide with potent antineoplastic and immunosuppressive properties. Perfosfamide alkylates DNA, thereby inhibiting DNA replication and RNA and protein synthesis. Check for active clinical trials using this agent.

**perfusion :** Bathing an organ or tissue with a fluid. In regional perfusion, a specific area of the body (usually an arm or a leg) receives high doses of anticancer drugs through a blood vessel. Such a procedure is performed to treat cancer that has not spread.

**perfusion magnetic resonance imaging :** A special type of magnetic resonance imaging (MRI) that uses an injected dye in order to see blood flow through tissues. Also called magnetic resonance perfusion imaging.

**Pergamid:** (Other name for: perfosfamide)

**Periactin:** (Other name for: cyproheptadine hydrochloride)

**periampullary cancer :** A cancer that forms near the ampulla of Vater (an enlargement of the ducts from the liver and pancreas where they join and enter the small intestine).

**pericardial effusion :** A condition in which extra fluid collects between the heart and the pericardium (the sac around the heart). The extra fluid causes pressure on the heart. This keeps it from pumping blood normally. Lymph vessels may also be blocked, which can cause infection. Pericardial effusions may be caused by cancer or cancer treatment, infection, injury, autoimmune disorders, thyroid or kidney problems, or other conditions.

**pericyclic process:** a step in a reaction in which the bonding electrons are redistributed through a cyclic structure.

**Peridex:** (Other name for: chlorhexidine gluconate)

**perifosine:** An orally active alkyl-phosphocholine compound with potential antineoplastic activity. Targeting cellular membranes, perifosine modulates membrane permeability, membrane lipid composition, phospholipid metabolism, and mitogenic signal transduction, resulting in cell differentiation and inhibition of cell growth. This agent also inhibits the anti-apoptotic mitogen-activated protein kinase (MAPK) pathway and modulates the balance between the MAPK and pro-apoptotic stress-

activated protein kinase (SAPK/JNK) pathways, thereby inducing apoptosis. Perifosine has a lower gastrointestinal toxicity profile than the related agent miltefosine.

**perifosine :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called alkylphospholipids.

**perigee:** position in an orbit that is closest to the Earth.

**perihelion:** point in an orbit that is closest to the Sun.

**perillyl alcohol:** A naturally occurring monoterpene related to limonene with antineoplastic activity. Perillyl alcohol inhibits farnesyl transferase and geranylgeranyl transferase, thereby preventing post-translational protein farnesylation and isoprenylation and activation of oncoproteins such as p21-ras, and arresting tumor cells in the G1 phase of the cell cycle. or A substance that is being studied in the prevention of cancer. It belongs to the family of plant drugs called monoterpenes.

**perimenopausal :** Describes the time in a woman's life when menstrual periods become irregular as she approaches menopause. This is usually three to five years before menopause and is often marked by many of the symptoms of menopause, including hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility.

**perimeter:** The sum of the lengths of the sides of any closed figure. OR the total distance around the outside of any polygon. The total length of all the sides.

**perindopril erbumine:** The tert-butylamine salt of perindopril, the ethyl ester of a non-sulfhydryl angiotensin converting enzyme (ACE) inhibitor with antihypertensive activity. Upon hydrolysis, perindopril erbumine is converted to its active form perindoprilat, inhibiting ACE and the conversion of angiotensin I to angiotensin II; consequently, angiotensin II-mediated vasoconstriction and angiotensin II-stimulated aldosterone secretion from the adrenal cortex are inhibited and diuresis and natriuresis ensue.

**perineal colostomy :** An opening made surgically to allow the colon to exit the body through the perineum (the area of the body between the anus and the vulva in females, and between the anus and the scrotum in males). A colostomy provides a new path for waste material to leave the body after part of the colon has been removed.

**perineal prostatectomy** : Surgery to remove the prostate through an incision made between the scrotum and the anus.

**perineum** : The area of the body between the anus and the vulva in females, and between the anus and the scrotum in males.

**perineural** : Around a nerve or group of nerves.

**period**: a series of elements, arranged in order of atomic number represented by a horizontal row on the Periodic Table. OR The horizontal rows in the periodic table. OR Periods are the rows of the periodic table. All elements in a period have the same number of atomic shells, or orbitals. OR The periods are the horizontal rows in the Periodic Table. OR a horizontal row of elements in the periodic table. OR punctuation device used with statements, requests, mild exclamations, courtesy questions, and abbreviations. OR Rows in the periodic table are called periods. For example, all of the elements in the second row are referred to as 'second period elements'. All elements currently known fall in the first seven periods.

**periodic neutropenia** : A chronic condition that affects neutrophils (a type of white blood cell). In periodic neutropenia, the number of neutrophils in the blood goes in cycles from normal to low and back to normal again. Symptoms include fever, inflamed mucous membranes in the mouth, and infections. Also called cyclic neutropenia.

**Periodic table** : of the elements in order of atomic number with similar elements falling into columns. OR Most people use the form of periodic table formulated by Mendeleev. This shows all the elements that have so far been discovered. They are in order of atomic number. the sets of elements with similar properties are arranged in vertical columns called GROUPS. The horizontal rows are called PERIODS. OR An arrangement of the elements according to increasing atomic number that shows relationships between element properties. OR An arrangement of chemical elements in order of increasing atomic number. Elements of similar properties are placed one under the other, yielding groups or families of elements. Within each group, there is a variation of chemical and physical properties, but in general, there is a similarity of chemical behavior within each group. (See an online periodic table.) OR chart of the elements arranged in columns and rows according to the increasing atomic numbers. OR A chart of all the elements arranged by atomic number. OR A logical

way of writing down all the 111 elements so that the connections between their properties and their electronic structure is 'obvious'. I think 111 is the right number this week.... There are many fantastic periodic tables on the web, such as WebElements. OR The Periodic Table is a table listing the elements in order of atomic number, arranged so that similar elements appear in columns. OR (first worked out by Mendeleev in 1869) is organized by the regularly repeating pattern of chemical properties of the elements. Each column is a family of elements having similar properties. The properties are a periodic function of the atomic numbers. Atomic number is symbolized "Z". The table is based on the electron configuration of the atoms. OR This famous table organizes all of the known chemical elements by their atomic number. The periodic table usually shows the atomic number, atomic symbol, and, atomic mass of the element. OR Grouping of the known elements by their number of protons. There are many other trends such as size of elements and electronegativity that are easily expressed in terms of the periodic table. OR a table in which the elements are commonly arranged in order of increasing atomic number. Elements of similar properties are placed one under the other, yielding eight families or groups of elements. Within each group there is a gradation of chemical and physical properties, but in general a similarity of chemical behavior. From group to group, however, there is a progressive shift of chemical behavior from one end of the table to the other. OR The periodic law states that physical and chemical properties of the elements recur in a regular way when the elements are arranged in order of increasing atomic number.

**periodic trend:** A regular variation in element properties with increasing atomic number that is ultimately due to regular variations in atomic structure.

**perioperative :** Around the time of surgery. This usually lasts from the time the patient goes into the hospital or doctor's office for surgery until the time the patient goes home.

**peripheral blood :** Blood circulating throughout the body.

**peripheral blood lymphocyte therapy :** A treatment for Epstein-Barr virus infection or overgrowth of white blood cells (lymphocytes) after an organ or bone marrow transplant. Specific lymphocytes from a sibling donor are infused into the patient to try and reverse these conditions.

**peripheral blood smear :** A procedure in which a sample of blood is viewed under a microscope to count different circulating blood cells (red blood cells, white blood cells, platelets, etc.) and see whether the cells look normal.

**peripheral blood stem cell transplant :** A method of replacing blood-forming cells destroyed by cancer treatment. Immature blood cells (stem cells) in the bloodstream are given to the patient after treatment. This helps the bone marrow recover and continue to make healthy blood cells. A stem cell transplant may be autologous (a patient's own blood cells saved earlier), allogeneic (blood cells donated by someone else), or syngeneic (blood cells donated by an identical twin). Also called peripheral stem cell support.

**Peripheral membrane protein:** A protein associated with the surface of a membrane by electrostatic and hydrogen-bond interactions.

**peripheral nervous system:** a collection of nerves that connect the brain and spinal cord to other parts of the body and the external environment.

**peripheral neuropathy :** A nerve problem that causes pain, numbness, tingling, swelling, or muscle weakness in different parts of the body. It usually begins in the hands or feet and gets worse over time. Peripheral neuropathy may be caused by cancer or cancer treatment, such as chemotherapy. It may also be caused by physical injury, infection, toxic substances, or conditions such as diabetes, kidney failure, or malnutrition. Also called neuropathy.

**peripheral primitive neuroectodermal tumor :** A type of cancer that forms in bone or soft tissue. Also called Ewing sarcoma and pPNET.

**peripheral proteins:** Proteins that are loosely or reversibly bound to a membrane by hydrogen bonds or electrostatic forces; generally water-soluble once released from the membrane.

**peripheral stem cell :** An immature cell found circulating in the bloodstream. New blood cells develop from peripheral stem cells.

**peripheral stem cell support :** A method of replacing blood-forming cells destroyed by cancer treatment. Immature blood cells (stem cells) in the bloodstream are given to the patient after treatment. This helps the bone marrow recover and continue to make healthy blood cells. A stem cell transplant may be autologous (a patient's own blood cells saved earlier),

allogeneic (blood cells donated by someone else), or syngeneic (blood cells donated by an identical twin). Also called peripheral blood stem cell transplant.

**peripheral T-cell lymphoma :** One of a group of aggressive (fast-growing) non-Hodgkin lymphomas that begin in mature T lymphocytes (T cells that have matured in the thymus gland and gone to other lymphatic sites in the body, including lymph nodes, bone marrow, and spleen.) Also called mature T-cell lymphoma.

**peripheral venous catheter :** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. A thin, flexible tube is inserted into a vein, usually in the back of the hand, the lower part of the arm, or the foot. A needle is inserted into a port to draw blood or give fluids.

**peripherally inserted central catheter :** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. A thin, flexible tube is inserted into a vein in the upper arm and guided (threaded) into a large vein above the right side of the heart called the superior vena cava. A needle is inserted into a port outside the body to draw blood or give fluids. A peripherally inserted central catheter may stay in place for weeks or months and helps avoid the need for repeated needle sticks. Also called PICC.

**Periplasm:** The region between the inner (cytoplasmic) membrane and the cell wall or outer membrane of a bacterium.

**peristalsis:** a rhythmic series of muscular contractions that propels the bolus along.

**peristalsis :** The rippling motion of muscles in the intestine or other tubular organs characterized by the alternate contraction and relaxation of the muscles that propel the contents onward.

**Peristaltic Pump:** A pump based on a flexible tube. Fluid is moved through the tube by rollers that compress the tube, usually in a rotary alignment. A primary advantage of this type of pump is that the fluid never comes in contact with moving parts and the tube can be easily sterilized. Used extensively in medical applications.

**peritoneal :** Having to do with the parietal peritoneum (the tissue that lines the abdominal wall and pelvic cavity) and visceral peritoneum (the tissue

that covers most of the organs in the abdomen, including the intestines).

**peritoneal cavity** : The space within the abdomen that contains the intestines, the stomach, and the liver. It is bound by thin membranes.

**peritoneal fluid** : A liquid that is made in the abdominal cavity to lubricate the surface of the tissue that lines the abdominal wall and pelvic cavity and covers most of the organs in the abdomen.

**peritoneal infusion** : A method of delivering fluids and drugs directly into the abdominal cavity through a thin tube. Also called intraperitoneal infusion.

**peritoneal perfusion** : A method of delivering fluids and drugs directly to tumors in the peritoneal cavity.

**peritoneal washing** : A procedure in which a salt-water solution is used to wash the peritoneal cavity and then is removed to check for cancer cells. The peritoneal cavity is the space in the abdomen that contains the intestines, stomach, and liver. Peritoneal washings are commonly done during surgery for cancer of the ovary and uterus, to see if cancer has spread to the peritoneal cavity.

**peritoneum** : The tissue that lines the abdominal wall and covers most of the organs in the abdomen.

**peritonitis** : Inflammation of the peritoneum (tissue that lines the abdominal wall and covers most of the organs in the abdomen). Peritonitis can result from infection, injury, or certain diseases. Symptoms may include swelling of the abdomen, severe pain, and weight loss.

**Perjeta** : A drug used with other drugs to treat breast cancer that is HER2-positive. It is used in patients whose disease has spread to other parts of the body and has not been treated with anticancer drugs. It is also used before surgery in certain patients who are at high risk for their disease to recur (come back) or spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Perjeta binds to HER2 on the surface of some cancer cells, and may kill them. It is a type of monoclonal antibody. Also called pertuzumab.

**permafrost**: Perennially frozen ground that occurs wherever the temperature remains below 0 degrees C for several years.

**Permanent change** : The new substance that you have made cannot be changed back into the starting materials. Chemical changes are permanent

changes. Some people use the term "irreversible change" too.

**permanent hardness:** Water hardness that remains after boiling the water, mainly due to dissolved calcium sulfate. Chlorides also contribute to permanent hardness.

**PERMANENT SET:** The increase in length, expressed in a percentage of the original length, by which an elastic material fails to return to original length after being stressed for a standard period of time. OR The deformation remaining in a liquid silicone rubber specimen following both stress and relaxation over a period of time

**permanganate<sup>4-</sup>:** Permanganate ion (MnO<sub>4</sub><sup>-</sup>) is a powerful oxidizing agent used in chemical analysis and water treatment. The ion has an intense purple color.

**Permeability:** (1) the passage or diffusion of a gas, vapor, liquid, or solid through a barrier without physically or chemically affecting it. (2) the rate of such passage. OR The passage or diffusion of a gas, vapor, liquid, or solid through a barrier without physically or chemically affecting it. OR The rate at which liquid or gas, under pressure, passes through a solid material by diffusion and solution. In silicone rubber terminology: the rate of gas flow, expressed in atmospheric cubic centimeters per second, through an elastomeric material, one centimeter square and one centimeter thick OR the rate at which water sinks into the ground. OR of a rock, the ease with which fluid is transmitted through its pore space.

**Permeable:** A paint system which is said to be permeable when it allows water vapour to pass through the paint film, i.e. the paint allows the substrate to breathe.

**Permeable:** The property of allowing material to pass through, as a permeable membrane.

**Permease:** A protein that catalyzes the transport of a specific small molecule across a membrane. OR See transporters. peroxisome: Membrane-bounded organelle in the cytoplasm of eukaryotic cells; contains peroxide-forming and peroxide-destroying enzymes.

**Permeation:** Flowing into the pores and gaps of a substance; why you can pour water into a cup that is already full of sand, and pour a lot of water into a cup that is already full of popcorn.

**Permitil:** (Other name for: fluphenazine hydrochloride)

**Permittivity:** preferred term for dielectric constant. It is that property of a dielectric material that determined how much electrostatic energy can be stored per unit of volume when unit voltage is applied; the relative permittivity of most materials varies from 2 to 10, air having 1.

**Pernicious anemia:** A disease in which vitamin B12 absorption is impaired, owing to a deficiency of intrinsic factor, which results in an inability to synthesize thymine and purines. OR A type of anemia (low red blood cell count) caused by the body's inability to absorb vitamin B12.

**Peroxidases:** Heme enzymes catalyzing the reduction of an alkyl peroxide to produce an alcohol and water.

**peroxide:** a compound that contains an oxygen-oxygen single covalent bond. OR Oxygen-rich compounds used to cure polyester resins.

**peroxin:** name for any of several proteins/enzymes functioning in the peroxisomes; usually the proteins are identified as PEX followed by a number, e.g. PEX1

**peroxisome:** cytoplasmic body containing enzymes for digestion.

**peroxisome proliferator-activated receptor gamma pathway :**

Describes a group of proteins in a cell that work together to help control how certain genes are expressed and the use of lipids (fats) and glucose (sugar) in the body. Changes in the peroxisome proliferator-activated receptor gamma pathway may lead to diseases such as heart disease, diabetes, and cancer. Drugs or substances that affect this pathway are being studied in the prevention and treatment of cancer and other diseases. Also called PPAR gamma pathway.

**Peroxisomes:** Subcellular organelles that contain flavin-requiring oxidases and that regenerate oxidized flavin by reaction with oxygen. OR Small membrane-bounded organelles that are present in most eukaryotes and play a role in detoxification, the synthesis of plasmalogens and bile salts, and  $\beta$ -oxidation of long-chain fatty acids.

**peroxyacid:** an acid of general form

**perpendicular:** Two line segments are perpendicular if they meet at a right angle, 90 degrees.

**perpendicular lines:** two lines that intersect at right angles.

**Persantine:** (Other name for: dipyrindamole)

**persistence:** When applied to a chemical this has a meaning of ability to remain unchanged in the environment.

**person:** refers to the person (or thing) that is a subject or object; person can be either first (I, me, my, mine), second (you, your), or third (he, she, him, her, it, they).

**personal health record :** A collection of information about a person's health that allows the person to manage and track his or her own health information. A personal health record may include information about allergies, illnesses, surgeries, immunizations, and results of physical exams, tests, and screenings. It may also include information about medicines taken and health habits, such as diet and exercise. Also called personal history, personal medical history, and PHR.

**personal history :** A collection of information about a person's health that allows the person to manage and track his or her own health information. A personal history may include information about allergies, illnesses, surgeries, immunizations, and results of physical exams, tests, and screenings. It may also include information about medicines taken and health habits, such as diet and exercise. Also called personal health record, personal medical history, and PHR.

**personal medical history :** A collection of information about a person's health that allows the person to manage and track his or her own health information. A personal medical history may include information about allergies, illnesses, surgeries, immunizations, and results of physical exams, tests, and screenings. It may also include information about medicines taken and health habits, such as diet and exercise. Also called personal health record, personal history, and PHR.

**personal pronoun:** (I, me, he, she, it, and so on) stand in for one or more persons or things and differ in form depending upon their case.

**personalized medicine :** A form of medicine that uses information about a person's genes, proteins, and environment to prevent, diagnose, and treat disease. In cancer, personalized medicine uses specific information about a person's tumor to help diagnose, plan treatment, find out how well treatment is working, or make a prognosis. Examples of personalized medicine include using targeted therapies to treat specific types of cancer cells, such as HER2-positive breast cancer cells, or using tumor marker testing to help diagnose cancer. Also called precision medicine.

**personalized polyepitope plasmid DNA breast cancer vaccine:** A polyepitope DNA vaccine composed of a DNA plasmid encoding multiple, highly immunogenic tumor-associated antigens (TAAs) that are specifically selected after genome profiling of the patient's breast cancer cells, with potential immunostimulatory and antineoplastic activities. Upon intramuscular administration and electroporation of the personalized polyepitope plasmid DNA breast cancer vaccine, the expressed TAAs induce cytotoxic T-lymphocyte (CTL) immune responses against tumor cells expressing the TAAs.

**personalized synthetic long peptide breast cancer vaccine:** A cancer vaccine consisting of one or more long, synthetic peptides derived from patient-specific breast cancer tumor-associated antigens (TAAs), with potential immunomodulating and antineoplastic activities. Upon intramuscular administration of the personalized synthetic long peptide breast cancer vaccine, the peptides stimulate the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing the TAAs, which results in tumor cell lysis.

**Personnel monitoring:** The use of portable survey meters to determine the amount of radioactive contamination on individuals, or the use of dosimetry to determine an individual's occupational radiation dose.

**Pertofrane:** (Other name for: desipramine hydrochloride)

**perturbation :** A disruption or disturbance.

**pertussis :** A serious bacterial infection of the lungs and breathing tubes that spreads easily. Pertussis begins like a cold, but develops into severe coughing and gasping for air. Long spells of coughing may cause vomiting, and broken blood vessels in the eyes and on the skin. Also called whooping cough.

**pertuzumab:** A humanized recombinant monoclonal antibody directed against the extracellular dimerization domain of the HER-2 tyrosine kinase receptor. Binding of the antibody to the dimerization domain of the HER-2 tyrosine kinase receptor protein directly inhibits the ability of the HER-2 tyrosine kinase receptor protein (the most common pairing partner) to dimerize with other HER tyrosine kinase receptor proteins; inhibiting receptor protein dimerization prevents the activation of HER signaling pathways, resulting in tumor cell apoptosis. or A drug used with other drugs to treat breast cancer that is HER2-positive. It is used in patients whose

disease has spread to other parts of the body and has not been treated with anticancer drugs. It is also used before surgery in certain patients who are at high risk for their disease to recur (come back) or spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Pertuzumab binds to HER2 on the surface of some cancer cells, and may kill them. It is a type of monoclonal antibody. Also called Perjeta.

**PES:** Potential energy surface. The 3N-6 (or 3N-5, for linear molecules) dimensional function that indicates how the molecule's energy depends upon its geometry. (Not to be confused with experimental photoelectron spectroscopy.) OR Polyethersulfone

**pesticide :** Any substance that is used to kill insects and other pests.

**pesticide residue:** A pesticide residue is any substance or mixture of substances in food for man or animals resulting from the use of a pesticide and includes any specified derivatives, such as degradation and conversion products, metabolites, reaction products, and impurities that are considered to be of toxicological significance (WHO, 1976).

**pesticides:** This is a descriptor applied to chemicals used to kill pests and minimize their impact in agriculture, health and other human interests. Pesticides are often classified according to the organisms which they are used to control, for example as fungicides, herbicides, insecticides, molluscicides, nematocides, rodenticides, etc.

**PET:** Short for poly(ethylene terephthalate), a condensation polymer that is commonly used in soft-drink bottles. It can be prepared by the reaction between ethylene glycol and terephthalic acid to give polymer and water:  
OR Polyethylene terephthalate

**Pet (polyethylene terephthalate):** known as thermoplastic polyester. Pet has the unusual ability to exist in either an amorphous or highly crystalline state. The crystalline state is necessary for extruding the material. The amorphous state permits it to be oriented.

**PET scan :** A procedure in which a small amount of radioactive glucose (sugar) is injected into a vein, and a scanner is used to make detailed, computerized pictures of areas inside the body where the glucose is taken up. Because cancer cells often take up more glucose than normal cells, the pictures can be used to find cancer cells in the body. Also called positron emission tomography scan.

**PET-CT scan :** A procedure that combines the pictures from a positron emission tomography (PET) scan and a computed tomography (CT) scan. The PET and CT scans are done at the same time with the same machine. The combined scans give more detailed pictures of areas inside the body than either scan gives by itself. A PET-CT scan may be used to help diagnose disease, such as cancer, plan treatment, or find out how well treatment is working. Also called positron emission tomography-computed tomography scan.

**pet-facilitated therapy :** A type of therapy that uses dogs or other pets to improve the physical and mental health of patients with certain acute or chronic diseases. It is being studied as a way to relieve distress in cancer patients undergoing treatment for pain. Also called animal-assisted therapy.

**petechiae :** Pinpoint, unraised, round red spots under the skin caused by bleeding.

**PETG:** Glycol-modified PET

**PETP:** Polyethylene terephthalate

**Petrifying liquid:** Usually a dilute emulsion of drying oil and/or varnish in water used as a sealing coat on surfaces under water paint or as a thinning agent for water paint.

**Petrochemical Feedstocks:** Petrochemical Feedstocks are those groupings of feedstock materials that are consumed by the petrochemical industry. Conventionally these feed streams are obtained from refinery operations, however the last 20 years has seen non refinery streams, such as ethane extracted from natural gas, grow in importance as a feedstock.

**Petrochemical Industry:** Industries based on petroleum and chemicals derived from petroleum.

**Petrochemical Materials:** Petrochemical materials are derived from crude oil, and thus are considered to be “synthetic” materials. P&G’s use of natural, renewable materials provides a sustainable solution versus petrochemical, or petroleum based, alternatives.

**Petrochemicals:** Value-added products made from crude oil or natural gas. Most all of the chemicals we use to keep civilisation rolling along.

**petrolatum :** A thick, greasy, substance with no odor or taste made from petroleum (mixture of oily liquids found in the earth). Petrolatum is used on

the skin to prevent drying and to help heal scrapes and burns. It is also used as a base for some ointments. Also called petroleum jelly.

**petrolatum-mineral oil-lanolin-ceresin ointment:** A petrolatum-based ointment absorbed by dry and moist skin, petrolatum-mineral oil-lanolin-ceresin ointment is non-comedogenic, non-irritating, and non-sensitizing. It can reduce healing time of cracked, dry skin on hands, elbows, and knees, and helps prevent diaper rash. The original ointment also contained mineral oil, ceresin, lanolin alcohol. Its use is indicated in atopic dermatitis, eczema, and psoriasis when extra protection from a heavier base is needed.

**petroleum:** a general term that includes both natural gas and crude oil.

**Petroleum:** A sticky, oily, flammable liquid that is a complex mixture of organic compounds (mostly hydrocarbons) and other may vary in colour from nearly colourless to black. Basically, it is another word for crude oil. 'Petr' means something like 'rock' and 'oleum' means something like 'oil'.

**PETROLEUM ETHER EXTRACT (PEE):** see - UNREACTED

**petroleum jelly :** A thick, greasy, substance with no odor or taste made from petroleum (mixture of oily liquids found in the earth). Petroleum jelly is used on the skin to prevent drying and to help heal scrapes and burns. It is also used as a base for some ointments. Also called petrolatum.

**Peutz-Jeghers syndrome :** A genetic disorder in which polyps form in the intestine and dark spots appear on the mouth and fingers. Having Peutz-Jeghers syndrome increases the risk of developing gastrointestinal and many other types of cancer. Also called PJS.

**pevonedistat:** A small molecule inhibitor of Nedd8 activating enzyme (NAE) with potential antineoplastic activity. Pevonedistat binds to and inhibits NAE, which may result in the inhibition of tumor cell proliferation and survival. NAE activates Nedd8 (Neural precursor cell expressed, developmentally down-regulated 8), an ubiquitin-like (UBL) protein that modifies cellular targets in a pathway that is parallel to but distinct from the ubiquitin-proteasome pathway (UPP). Functioning in diverse regulatory activities, proteins conjugated to UBLs like Nedd8 typically are not targeted for proteasomal degradation.

**pexastimogene-devacirepvec:** A thymidine kinase-deleted vaccinia virus expressing human GM-CSF (hGM-CSF) with oncolytic activity. Upon intratumoral or intravenous administration, pexastimogene-devacirepvec

may selectively infect and lyse tumor cells. While vaccinia displays a natural tumor cell tropism, deletion of the thymidine kinase gene increases the tumor selectivity of vaccinia by limiting viral replication to transformed cells. hGM-CSF expression by this agent may help recruit antigen processing cells (APCs), such as dendritic cells and macrophages, to virally infected tumor cells, initiating a systemic antitumoral immune response.

**pexidartinib:** A capsule formulation containing a small-molecule receptor tyrosine kinase (RTK) inhibitor of KIT, CSF1R and FLT3 with potential antineoplastic activity. Pexidartinib binds to and inhibits phosphorylation of stem cell factor receptor (KIT), colony-stimulating factor-1 receptor (CSF1R) and FMS-like tyrosine kinase 3 (FLT3), which may result in the inhibition of tumor cell proliferation and down-modulation of macrophages, osteoclasts and mast cells involved in the osteolytic metastatic disease. FLT3, CSF1R and FLT3 are overexpressed or mutated in many cancer cell types and play major roles in tumor cell proliferation and metastasis. Check for active clinical trials using this agent.

**PF:** Phenyl-formaldehyde

**PF-00299804:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called protein tyrosine kinase inhibitors.

**PF-02341066:** A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has a mutated (changed) form of the anaplastic lymphoma kinase (ALK) gene or the ROS1 gene. It is also being studied in the treatment of other types of cancer. PF-02341066 blocks the proteins made by the mutated ALK and ROS1 genes. Blocking these proteins may stop the growth and spread of cancer cells. PF-02341066 may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called crizotinib, MET tyrosine kinase inhibitor PF-02341066, and Xalkori.

**PF-3512676:** A substance that is being studied in the treatment of some types of cancer. It belongs to the family of drugs called biological response modifiers. Also called CpG 7909 and ProMune.

**PFA:** Perfluoroalkoxy (resin)

**PFA (perfluoroalkoxy):** Thermoplastic member of fluoropolymer family of engineering plastics, one characterized by excellent release, low friction and toughness.

**PFIC:** A rare, inherited disorder marked by a buildup in the liver of bile (fluid that helps digest fat). This can lead to liver disease and liver failure. It may also increase the risk of liver cancer. PFIC is caused by mutations (changes) in certain genes that make proteins needed to help the liver work the way it should. It usually occurs in infants and children. Also called progressive familial intrahepatic cholestasis.

**PFS:** The length of time during and after the treatment of a disease, such as cancer, that a patient lives with the disease but it does not get worse. In a clinical trial, measuring the PFS is one way to see how well a new treatment works. Also called progression-free survival.

**PFT:** A test used to measure how well the lungs work. It measures how much air the lungs can hold and how quickly air is moved into and out of the lungs. It also measures how much oxygen is used and how much carbon dioxide is given off during breathing. A PFT can be used to diagnose a lung disease and to see how well treatment for the disease is working. Also called lung function test and pulmonary function test.

**PG:** One of several hormone-like substances made by the body. Different PGs control blood pressure, contraction of smooth muscles, and other processes within tissues where they are made. Certain PGs are being studied as cancer biomarkers. Also called prostaglandin.

**PGE1:** A drug that is used to treat impotence (inability to have an erection) and is being studied in the treatment of sexual problems in men who have had surgery for prostate cancer. It is a type of vasodilator. Also called alprostadil and prostaglandin E1.

**PGG beta-glucan:** An injectable formulation of the polysaccharide beta 1,3/1,6 glucan derived from the cell wall of the yeast *Saccharomyces cerevisiae* with potential immunomodulating and antineoplastic activities. PGG beta-glucan binds to an alternate site on the neutrophil complement receptor 3 (CR3), priming the neutrophil to become cytotoxic when binding to complement on tumor cells via CR3. This agent has been reported to selectively activate immune cells without inducing pro-inflammatory cytokines, potentially reducing potential side effects observed with the induction of broad innate immune responses. In addition, PGG beta-glucan may induce hematopoietic progenitor cell (HPC) mobilization. Check for active clinical trials using this agent.

**PGLA/PEG copolymer-based paclitaxel:** A controlled-release, intratumoral paclitaxel formulation in which paclitaxel is incorporated into a thermosensitive, biodegradable triblock copolymer consisting of poly(lactide-co-glycolide) (PLGA) and polyethylene glycol (PEG). Upon intratumoral injection, paclitaxel is released slowly and continuously into tumor tissues from the gelled thermosensitive triblock copolymer over a period of 4 to 6 weeks; in tumor cells, paclitaxel binds to tubulin and inhibits the disassembly-assembly dynamics of microtubules, resulting in cell cycle arrest and cell death. The thermosensitive triblock copolymer component of this formulation transforms from a water-soluble polymer at room temperature to a water-insoluble, biodegradable gel depot at body temperature; intratumoral controlled-release of paclitaxel from the gel minimizes systemic exposure to paclitaxel and the paclitaxel toxicity profile.

**pH:** A measure of how acidic or basic a substance or solution is. pH is measured on a scale of 0 to 14. On this scale, a pH value of 7 is neutral, which means it is neither acidic nor basic. A pH value of less than 7 means it is more acidic, and a pH value of more than 7 means it is more basic. In medicine, having the right pH in the blood and other body fluids is important for the body to work the way it should. OR An expression of the degree of acidity or alkalinity of a substance. Neutrality is pH 7 -acid solutions being under 7 and alkaline solution over 7. pH meters are commercially available for accurate readings. OR Determines the concentration of either an acid or a base OR The negative logarithm of the hydrogen ion concentration of an aqueous solution. OR pH is a measure of effective concentration of hydrogen ions in a solution. It is approximately related to the molarity of H<sup>+</sup> by  $\text{pH} = -\log [\text{H}^+]$  OR a number describing the concentration of hydrogen ions in a solution. Equals  $-\log[\text{H}^+]$ . OR a convenient way of expressing the activity (concentration) of hydrogen ions which is a measure of the degree of acidity or alkalinity of a solution. It is calculated as the negative logarithm of the hydrogen ion concentration (in mol/l):  $\text{pH} = -\log [\text{H}^+]$ . Pure water undergoes a certain amount of dissociation or self-ionization to form hydrogen (or more strictly, hydroxonium) and hydroxyl ions. OR An expression of the degree of acidity or alkalinity of a substance expressed as a number from 0 to 14. Neutrality is pH 7. Acid solutions are less than 7 and alkaline solutions are greater than 7. OR A measure of the acidity or basicity of a solution.

Mathematically the pH is  $-\log_{10}$  of the hydrogen ion concentration of the solution. Under normal circumstances, the possible range of values is 0 -14. A  $\text{pH} < 7$  indicates acidity,  $> 7$  indicates basicity. pH is a common specification for water soluble materials. OR A mean to express and to compare the acidity and alkalinity of a solution. It is expressed in a scale from 0 to 14. The solution of pH 7 is neutral; if the pH is lower than 7 the solution is acidic; if the pH is higher than 7 the solution is alkaline (basic). OR pH is a measure of acidity. In logarithmic value, the pH is equal to the logarithm of one over the concentration of hydrogen ions. A pH less than seven indicates an acid. Seven is a neutral solution. A value above seven indicates a base. OR A measure of the amount of hydrogen ions in a solution, equal to the negative of the base-10 logarithm of the hydrogen ion concentration. OR Measures the acidity of a solution. It is the negative log of the concentration of the hydrogen ions in a substance. OR the negative logarithm of the hydrogen ion concentration ( $-\log_{10}[\text{H}^+]$ ) where  $\text{H}^+$  is the hydrogen-ion concentration in moles per liter. Neutral water has a pH value of 7.

**pH adjustment:** a means of maintaining the optimum pH through the use of chemical additives.

**pH electrode:** specific ion electrode, made of glass, that responds to hydrogen ion activity, over the range  $1 \text{ M H}^+$  ( $\text{pH} = 0$ ) to  $10^{14} \text{ M H}^+$  ( $\text{pH} = 14$ ). Special purpose electrodes are made for very acidic or very alkaline solutions, solutions containing high levels of other cations, high temperature operation, and industrial and medical applications. pH electrodes may be subject to "acid error" in strongly acidic solutions and are also subject to alkaline error caused by response to sodium or other cations in highly basic solutions.

**pH range (of an ISE):** all ionselective electrodes are also sensitive to pH to some extent, most commonly at the high and low ends of the pH scale. The pH range is the range over which a change in pH will not cause a significant change in the measured voltage. It is the plateau on a graph of pH against mV at constant concentration of the detected ion. Outside this range, a change in pH may cause a significant change in the measured signal. Thus if samples lie outside the pH range then they must be treated with a buffer solution to bring them within the range, or, if samples all have the same pH, then the calibration standard solutions must be treated so as to

make them the same pH as the samples. In practice both the standard and sample solutions are treated with the same buffer to ensure that they have the same pH; then it is irrelevant whether this pH is within or without the range quoted for the electrode.

**pH unit:** a tenfold change in hydrogen ion activity, expressed as the negative logarithm of the hydrogen ion activity. Thus a solution of pH 7 is  $10^{-7}$  M in hydrogen ion activity and a pH 8 solution is  $10^{-8}$  M. The lower the solution pH, the more acidic the solution.

**pH value:** The pH value of a solution is a number on a scale indicating how strongly acidic or alkaline the solution is. The lower the pH value, the more acidic it is. pH values less than 7 are acidic, pH values over 7 are alkaline, and a pH value of 7 indicates a neutral solution.

**pH/mV meter:** an instrument that measures and displays the voltage developed between a sensing electrode and a reference electrode placed in a solution, and which can convert the voltage developed by a pH electrode to a corresponding pH value.

**PH20 hyaluronidase-expressing adenovirus VCN-01:** An oncolytic, replication-competent adenovirus encoding the human glycosylphosphatidylinositol-anchored enzyme PH20 hyaluronidase with potential antitumor activity. After intratumoral administration, PH20 hyaluronidase-expressing adenovirus VCN-01 selectively replicates in tumor cells, which may both cause oncolytic virus-induced cell death and induce the infection of adjacent tumor cells. In addition, the virus expresses hyaluronidase, which hydrolyzes and degrades the hyaluronic acid (HA) that coats tumor cells. The degradation of HA may result in a decrease for both the viscosity of the interstitial space and the tumor's interstitial fluid pressure (IFP). This increases viral spread and may result in the inhibition of tumor cell growth. In addition, HA degradation facilitates the penetration of chemotherapeutic agents into the tumor. HA is a glycosaminoglycan found in the extracellular matrix (ECM) and is frequently overproduced by various tumor cell types. The presence of HA in tumors correlates with increases in tumor cell growth, metastatic potential, tumor progression and resistance to chemotherapeutic agents.

**PHA-739358:** A substance being studied in the treatment of chronic myelogenous leukemia. PHA-739358 may stop tumor growth by blocking

certain enzymes needed for cancer cells to divide and causing them to die. It is a type of kinase inhibitor.

**phage:** See bacteriophage.

**phagocyte :** A type of immune cell that can surround and kill microorganisms, ingest foreign material, and remove dead cells. It can also boost immune responses. Monocytes, macrophages, and neutrophils are phagocytes. A phagocyte is a type of white blood cell.

**phagocytes:** cells that attack and engulf invading microorganisms.

**phagocytosis:** occurs when the vesicle formed from endocytosis contains particulate matter; the process by which cells or microorganisms are engulfed by another cell.

**phagocytosis :** The process by which a phagocyte (a type of white blood cell) surrounds and destroys foreign substances (such as bacteria) and removes dead cells.

**Phaleria macrocarpa Extract DLBS-1425:** An extract of the flesh from the fruit of *Phaleria macrocarpa*, an Indonesian herbal medicine, with potential antineoplastic activity. Although the active ingredients and exact components are unclear, gallic acid and its derivatives in DLBS-1425 appear to inhibit the phosphoinositide-3 kinase (PI3K)/protein kinase B (AKT) signaling pathway by reducing PI3K transcription followed by a reduction in AKT phosphorylation. This extract also appears to induce apoptosis through induction of pro-apoptotic genes such as BAX, BAD and PUMA and inhibition of the apoptosis suppressor Bcl-2. Check for active clinical trials using this agent.

**phantom limb pain :** The sensation of pain or other unpleasant feelings in the place of a missing (phantom) limb.

**pharmacist :** A health professional who has special training in preparing and dispensing (giving out) prescription drugs. Pharmacists have been taught how drugs work, how to use them, and their side effects.

**Pharmacodynamics:** The study of the processes by which ligands interact with their binding site and the biochemical and physiological changes associated with the ligand. In simple terms, it is the study of what the drug does to the body.

**pharmacogenetics :** The study of how a person's genes affect the way he or she responds to drugs. Pharmacogenetics is being used to learn ahead of

time what the best drug or the best dose of a drug will be for a person. Also called pharmacogenomics. OR The study of how people's genetic make-up affects their response to medicines

**pharmacognosy:** Identification, isolation, and characterization of biologically active substances in living things.

**Pharmacokinetics:** The study of the fate of the drug administered to a living organism. Pharmacokinetics involves the study of a compound's ADME properties. In simple terms, it is the study of what the body does to the drug. OR The activity of drugs in the body over a period of time, including the processes by which drugs are absorbed, distributed in the body, localized in the tissues, and excreted.

**pharmacology:** The science of drugs; the properties of drugs related to their therapeutic effects. OR The study of drugs, of the body's reaction to drugs, and of the sources of drugs OR The study of drugs, which includes determination of biological activity, biological effects, breakdown and synthesis, and delivery.

**pharmacology :** The study of the origin, chemistry, and uses of drugs and their effects on the body.

**Pharmacophore:** A description of the main molecular features necessary for biological activity and their relative positions in space. Sometimes referred to as the minimum structure required to elicit a biological response.

**Pharmacopoeia:** An official documentation which details the analytical procedures, effects and directions of use of medicinal substances.

**pharmacopoeia :** A book describing chemicals, drugs, and other substances and how they are used as medicines. It is prepared by a recognized authority.

**pharyngeal cancer :** Cancer that forms in tissues of the pharynx (the hollow tube inside the neck that starts behind the nose and ends at the top of the windpipe and esophagus). Pharyngeal cancer includes cancer of the nasopharynx (the upper part of the throat behind the nose), the oropharynx (the middle part of the pharynx), and the hypopharynx (the bottom part of the pharynx). Cancer of the larynx (voice box) may also be included as a type of pharyngeal cancer. Most pharyngeal cancers are squamous cell carcinomas (cancer that begins in thin, flat cells that look like fish scales). Also called throat cancer.

**pharynx:** the cavity at the rear of the mouth that the nasal chambers open into; the throat.

**pharynx :** The hollow tube inside the neck that starts behind the nose and ends at the top of the trachea (windpipe) and esophagus (the tube that goes to the stomach). The pharynx is about 5 inches long, depending on body size. Also called throat.

**Phase:** If you call a 'system' anything that is in a bucket, that a 'phase' is a part of the system that can be (at least in theory) separated mechanically without any chemical reaction, and is of uniform composition. You could have ice and water mixed in a bucket (two phases) ice and soda water (three phases, if you count the bubbles) or ice and salad dressing (three phases - ice, oil, and vinegar - yuck). OR a substance with uniform composition and definite physical state. OR 1. A phase is a part of a sample of matter that is in contact with other parts but is separate from them. Properties within a phase are homogeneous (uniform). For example, oil and vinegar salad dressing contains two phases: an oil-rich liquid, and a vinegar-rich liquid. Shaking the bottle breaks the phases up into tiny droplets, but there are still two distinct phases. 2. In wave motion, phase is the fraction of a complete cycle that has passed a fixed point since the current cycle began. The phase is often expressed as an angle, since a full cycle is  $360^\circ$ ; (2). Two waves are "in phase" if the peaks of one wave align with the peaks of the other; they are "out of phase" if the peaks of one wave align with the troughs of the other.

**phase boundary:** A phase boundary is a surface where two samples of matter with different properties are in contact. The surface of a gas bubble in water or the surface of a crystal are examples of phase boundaries.

**phase change:** A change in the state of a sample of matter; for example, solid to liquid or liquid to gas. Phase changes are considered physical rather than chemical changes.

**phase diagram:** A map that shows which phases of a sample are most stable for a given set of conditions. Phases are depicted as regions on the map; the borderlines between regions correspond to conditions where the phases can coexist in equilibrium.

**phase I clinical trial :** The first step in testing a new treatment in humans. A phase I study tests the safety, side effects, best dose, and timing of a new treatment. It may also test the best way to give a new treatment (for

example, by mouth, infusion into a vein, or injection) and how the treatment affects the body. The dose is usually increased a little at a time in order to find the highest dose that does not cause harmful side effects. Phase I clinical trials usually include only a small number of patients who have not been helped by other treatments. Sometimes they include healthy volunteers.

**phase I detoxification :** A process in which the liver uses one of two major enzyme pathways to change a toxic substance, such as an anticancer drug, into a less toxic substance that is easier for the body to excrete.

**phase I/II clinical trial :** A study that tests the safety, side effects, and best dose of a new treatment. Phase I/II clinical trials also test how well a certain type of cancer or other disease responds to a new treatment. In the phase II part of the clinical trial, patients usually receive the highest dose of treatment that did not cause harmful side effects in the phase I part of the clinical trial. Combining phases I and II may allow research questions to be answered more quickly or with fewer patients.

**phase II clinical trial :** A study that tests whether a new treatment works for a certain type of cancer or other disease (for example, whether it shrinks a tumor or improves blood test results). Phase II clinical trials may also provide more information about the safety of the new treatment and how the treatment affects the body.

**phase II detoxification :** A process in which the liver uses one of two major enzyme pathways to change a toxic substance, such as an anticancer drug, into a less toxic substance that is easier for the body to excrete. In phase II detoxification, liver cells add a substance (such as cysteine, glycine, or a sulfur molecule) to a toxic chemical or drug, to make it less harmful.

**phase II/III clinical trial :** A study that tests how well a new treatment works for a certain type of cancer or other disease and compares the new treatment with a standard treatment. Phase II/III clinical trials may also provide more information about the safety and side effects of the new treatment. Combining phases II and III may allow research questions to be answered more quickly or with fewer patients.

**phase III clinical trial :** A study that tests the safety and how well a new treatment works compared with a standard treatment. For example, phase III clinical trials may compare which group of patients has better survival

rates or fewer side effects. In most cases, treatments move into phase III trials only after they meet the goals of phase I and II trials. Phase III clinical trials may include hundreds of people.

**phase IV clinical trial :** A type of clinical trial that studies the side effects caused over time by a new treatment after it has been approved and is on the market. These trials look for side effects that were not seen in earlier trials and may also study how well a new treatment works over a long period of time. Phase IV clinical trials may include thousands of people. Also called post-marketing surveillance trial.

**Phase problem:** Although the amplitude  $F(hkl)$  of the diffracted beam is readily available, the phase  $\alpha(hkl)$  necessary to compute the electron density is not known because X-rays cannot be focused. The phase is needed to determine the three-dimensional arrangement of the atoms without which the stereochemistry cannot be determined.

**phase sign:** the positive and negative symbols assigned to the upward and downward displacement, respectively, of the standing wave that describes the orbitals about an atom's nucleus. Each upward and downward displacement is called a phase.

**Phase transformation:** A transformation of one crystalline form of a solid to another. This can be a solid-solid, a solid-liquid-solid, or a vapor-mediated transformation.

**Phases of Drug Action:** The three phases of drug action are the pharmaceutical phase, pharmacokinetic phase, and the pharmacodynamic phase.

**Phases of Matter:** A phase is another name for a physical state of matter. Some scientists talk about what phase a piece of matter exists in. That's another way of saying what state that piece of matter is currently in. Examples of phases and states are solids, gases, and liquids.

**PHC:** (Other name for: cholecalciferol/d-alpha tocopherol/L-selenomethionine/green tea extract/saw palmetto berry extract/daidzein/genistein/lycopene prostate health supplement)

**Phellodendron amurense bark extract:** A proprietary formulation consisting of a Phellodendron amurense (Amur cork tree) bark extract, often used in traditional Chinese medicine, with anti-inflammatory, anti-oxidant and potential chemopreventive and antineoplastic activities.

Phellodendron amurense bark extract contains certain isoquinoline alkaloids, flavone glycosides and phenolic compounds. Upon administration of Phellodendron amurense bark extract, the various phytochemicals in this formulation modulate multiple signal transduction pathways. This agent appears to block the activation of the transcription factor cAMP response binding protein (CREB) and inhibits Akt signaling, thereby inhibiting tumor cell growth and inducing apoptosis in Akt- and CREB-overexpressing cancer cells. In addition, this agent inhibits cyclooxygenase type 2 (COX-2), nuclear factor kappa b (NF-kB) and tumor necrosis factor alpha (TNF-a)-mediated signaling; COX-2, NF-kB and TNF-a are upregulated in certain types of cancer and during inflammation.

**phenelzine sulfate:** A hydrazine derivative and a potent non-selective monoamine oxidase (MAO) inhibitor with anxiolytic and antidepressant properties. Phenelzine sulfate irreversibly binds to MAO, thereby blocking the oxidative deamination of monoamines resulting in an increased concentration of biogenic amines and a concurrent decrease in catabolism of monoamine neurotransmitters, norepinephrine and serotonin, in the brain. In addition, through its primary metabolite phenylethylidenehydrazine (PEH), phenelzine causes elevated GABA levels in the caudate-putamen and nucleus accumbens thereby exerting its anxiolytic effects.

**Phenergan:** (Other name for: promethazine hydrochloride)

**phenethyl isothiocyanate:** An isothiocyanate found in cruciferous vegetables with chemopreventive and potential antitumor activities. Although the mechanism of action is unclear, phenethyl Isothiocyanate (PEITC) was shown to induce apoptosis in tumor cells, possibly mediated through its metabolic intermediates, reactive oxygen species (ROS). PEITC also is able to activate ERK and JNK signal transduction, which in turn induces expression of stress-responsive genes. Specifically, this agent has been shown to reactivate gene expression of a detoxification enzyme, glutathione S-transferase that is silenced in prostate carcinoma.

**phenethyl isothiocyanate :** A substance being studied in the prevention of cancer. It is a naturally occurring compound found in some cruciferous vegetables. Also called PEITC.

**phenethyl isothiocyanate-containing watercress juice:** A juice extracted from watercress containing high amounts of phenethyl isothiocyanate (PEITC), with potential chemopreventive and antitumor activities.

Although the mechanism(s) of action through which PEITC exerts its effect(s) has yet to be fully elucidated, PEITC is able to induce apoptosis in tumor cells through the induction of reactive oxygen species (ROS). Additionally, PEITC is able to modulate extracellular signal-regulated kinases (ERK), c-Jun N-terminal kinase (JNK) and mitogen-activated protein kinase (MAPK) signal transduction pathways, activating the expression of stress-responsive genes and eventually inducing apoptosis. PEITC also inhibits the expression of genes involved in tumor progression such as HIF, STAT-3, HER2, BCL-XL, and XIAP and induces the expression of genes involved in tumor suppression such as p53, ATF-2, and p57. Furthermore, this agent has been shown to reactivate the gene expression of certain detoxification enzymes.

**phenformin hydrochloride:** The hydrochloride salt form of phenformin, an agent belonging to the biguanide class of antidiabetics with antihyperglycemic activity. Phenformin is not used clinically due to the high risk of lactic acidosis that is associated with its use.

**phenobarbital:** A long-acting barbituric acid derivative with antipsychotic property. Phenobarbital binds to and activates the gamma-aminobutyric acid (GABA)-A receptor, thereby mimicking the inhibitory actions of GABA in the brain. The activation effects of the phenobarbital-receptor-ionophore complex include increased frequency of chloride channel openings, membrane hyperpolarization and ultimately synaptic inhibition and decreased neuronal excitability. In addition, this agent inhibits glutamate induced depolarization. Check for active clinical trials using this agent.

**phenobarbital :** A drug that is used to treat seizures and as a sedative. It is being studied in the treatment of diarrhea and for its ability to increase the antitumor effect of other therapies. It belongs to the family of drugs called barbiturates.

**phenocopy :** A phenotypic trait or disease that resembles the trait expressed by a particular genotype, but in an individual who is not a carrier of that genotype. For example, breast cancer in a hereditary breast/ovarian cancer syndrome family member who does not carry the family's BRCA1 or BRCA2 mutation would be considered a phenocopy. Such an individual does not have the family's cancer-related mutation and therefore, they do not have the associated cancer risk from that specific mutation.

**Phenol:** A very poisonous chemical substance made from tar and also found in some plants and essential oils (scented liquid taken from plants). Phenol is used to make plastics, nylon, epoxy, medicines, and to kill germs. Also called carbolic acid. OR Phenol is a major commodity chemical intermediate produced from cumene. Phenol is used to produce phenolic resins for wood binding and bisphenol-A for polycarbonate resins. Other engineering applications include the production of caprolactam and adipic acid, which are nylon intermediates. It can also be used directly in some medical and water treatment applications, e.g. anesthetic, disinfectant, exfoliate in cosmetic surgery, acetyl salicylic acid (aspirin) and slimicide. Phenol production is principally from the reaction of propylene and benzene to cumene, then cumene oxidation; hence phenol is classed as a propylene derivative. A white, crystalline powder at room temperature, phenol has for a long time been produced directly from coal distillation, although the volumes from this source are now small relative to propylene-based production. Phenol production is widespread globally with the exception of the Middle East, although capacity is expected to develop there also. OR A group or molecule containing a benzene ring that has a hydroxyl group substituted for a ring hydrogen.

**Phenolic:** A resin or plastic, usually thermosetting, made by condensation of a phenol with an aldehyde and used for molding, insulating, coatings and adhesives. OR A synthetic resin used in the manufacture of some industrial finishes.

**Phenolic:** The generic name for phenolformaldehyde thermosetting plastic that's molded or cast.

**Phenolic Resin:** 1) A synthetic resin produced by the condensation of phenol with an aldehyde (usually formaldehyde). 2) Any of several types of thermoset plastics obtained by the condensation of phenol or substituted phenols. OR resins made by reaction of a phenol compound or tar acid with an aldehyde; more commonly applied to thermosetting resins made from pure phenol.

**phenology:** The study of periodic biological phenomena with relation to climate, particularly seasonal changes. These phenomena can be used to interpret local seasons and the climatic zones.

**phenolphthalein:** An organic compound used as an acid-base indicator. The compound is colorless in acidic solution and pink in basic solution

(with the transition occurring around pH 8.3). Phenolphthalein was used for many years as a laxative in very low concentrations- high concentrations are toxic!

**phenolphthalein alkalinity:** a measure of the hydroxides plus one-half of the normal carbonates in aqueous suspension. Measured by the amount of sulfuric acid required to bring the water to a pH value of 8.3, as indicated by a change in color of phenolphthalein. It is expressed in ppm of calcium carbonate (CaCO<sub>3</sub>).

**phenolphthalein:** A common misspelling of phenolphthalein.

**phenothiazine :** A type of drug that is used to treat severe mental and emotional disorders, severe nausea and vomiting, and certain other conditions. It belongs to the families of drugs called antipsychotics and antiemetics.

**phenotype:** The observable characteristics of an organism. OR the expression of genes and the physical characteristics that result. OR The observable trait(s) that result from the genotype in cooperation with the environment. OR The observable characteristics in an individual resulting from the expression of genes; the clinical presentation of an individual with a particular genotype.

**phenoxodiol :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called signal transduction inhibitors.

**phenoxybenzamine hydrochloride:** The hydrochloride salt form of phenoxybenzamine, a synthetic, dibenzamine alpha-adrenergic antagonist with antihypertensive and vasodilatory properties. Phenoxybenzamine non-selectively and irreversibly blocks the postsynaptic alpha-adrenergic receptor in smooth muscle, thereby preventing vasoconstriction, relieving vasospasms, and decreasing peripheral resistance. Reflex tachycardia may occur and may be enhanced by blockade of alpha-2 receptors which enhances norepinephrine release. Phenoxybenzamine is reasonably anticipated to be a human carcinogen.

**phenprocoumon:** An orally available, long-acting derivative of coumarin with anticoagulant activity. Upon administration, phenprocoumon inhibits the vitamin K epoxide reductase enzyme; inhibition of this enzyme prevents the formation of the reduced, active form of vitamin K (vitamin KH<sub>2</sub>), which is essential for the carboxylation of glutamate residues of vitamin K-dependent proteins. This prevents the activation of vitamin K-dependent

coagulation factors II, VII, IX, and X and the anticoagulant proteins C and S, which abrogates both thrombin production and thrombus formation.

**phentermine:** Amphetamine-like component of fen-phen that increases metabolism by raising the body's levels of dopamine and norepinephrine.

**phentolamine mesylate:** The mesylate salt of a synthetic imidazoline with alpha-adrenergic antagonist activity. As a competitive alpha-adrenergic antagonist, phentolamine binds to alpha-1 and alpha-2 receptors, resulting in a decrease in peripheral vascular resistance and vasodilatation. This agent also may block 5-hydroxytryptamine (5-HT) receptors and stimulate release of histamine from mast cells.

**phenyl:** A molecular group or fragment formed by abstracting or substituting one of the hydrogen atoms attached to a benzene ring.

**phenylacetate :** A substance that is being studied in the treatment of cancer. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called differentiating agents.

**Phenylketonuria:** A human disease caused by a genetic deficiency in the enzyme that converts phenylalanine to tyrosine. The immediate cause of the disease is an excess of phenylalanine, which can be alleviated by a diet low in phenylalanine. OR A disease caused by the inability to convert phenylalanine into tyrosine, which results in excess phenylalanine and its secondary metabolites; the disease is characterized by severe retardation. OR An inherited disorder that causes a build-up of phenylalanine (an amino acid) in the blood. This can cause mental retardation, behavioral and movement problems, seizures, and delayed development. Using a blood test, PKU can easily be found in newborns, and treatment is a diet low in phenylalanine. Also called PKU.

**phenytoin sodium :** A drug used to treat or prevent seizures or convulsions that may be caused by epilepsy, brain surgery, or treatment for brain cancer. It is a type of anticonvulsant agent. Also called Dilantin.

**pheochromocytoma :** Tumor that forms in the center of the adrenal gland (gland located above the kidney) that causes it to make too much adrenaline. Pheochromocytomas are usually benign (not cancer) but can cause high blood pressure, pounding headaches, heart palpitations, flushing of the face, nausea, and vomiting.

**pheresis** : A procedure in which blood is collected, part of the blood such as platelets or white blood cells is taken out, and the rest of the blood is returned to the donor. Also called apheresis.

**Pheromone**: A hormone-like substance that acts as an attractant.

**Philadelphia chromosome** : An abnormality of chromosome 22 in which part of chromosome 9 is transferred to it. Bone marrow cells that contain the Philadelphia chromosome are often found in chronic myelogenous leukemia and sometimes found in acute lymphocytic leukemia.

**philosophical** : Having to do with the deeper questions of life and with a person's basic beliefs, ideas, and attitudes.

**phlebitis** : Inflammation (redness, swelling, pain, and heat) of a vein, usually in the legs. Phlebitis may be caused by infection, injury, or irritation.

**phlebotomy** : A procedure in which a needle is used to take blood from a vein, usually for laboratory testing. Phlebotomy may also be done to remove extra red blood cells from the blood, to treat certain blood disorders. Also called blood draw and venipuncture.

**phlegm** : A more than normal amount of thick mucus made by the cells lining the upper airways and lungs. A buildup of phlegm may be caused by infection, irritation, or chronic lung disease, and can cause discomfort in the chest and coughing.

**phloem**: structures of vascular plants that transport sugars and other nutrients from the leaves to the other parts of the plant.

**Phlogiston** : An old theory said that when metals burn they lose phlogiston. The theory explained the fact that metals get heavier when they burn by stating that phlogiston had negative mass. Although interesting as a theory to show how science has developed, we no longer believe the phlogiston theory.

**phobia** : An extreme, irrational, fear of something that may cause a person to panic. Examples of common phobias include fear of spiders, flying in an airplane, elevators, heights, enclosed rooms, crowded public places, and embarrassing oneself in front of other people.

**Phorbol esters**: Polycyclic alcohol derivatives of croton oil that resemble diacylglycerol and inappropriately stimulate protein kinase C; phorbol esters are tumor promoters.

**Phosphatase:** An enzyme that catalyzes the removal of a phosphoryl group from a substrate by hydrolysis.

**phosphate :** A form of phosphoric acid, which contains phosphorus. In the body, phosphates are found in the bones and teeth. Phosphates may be used to treat a high level of calcium in the blood. Adding or removing phosphate chemical groups may affect the way proteins act in the body.

**phosphate group:** a group derived from a molecule of phosphoric acid that connects the DNA molecules to one another.

**phosphate ion:** a product of adenosine triphosphate (ATP) together with ADP.

**Phosphate Mineral:** A mineral that is made up of compounds with a phosphate group bonded to a metal. Turquoise is a good example of a phosphate mineral.

**Phosphatidate (diacylglycerol 3-phosphate):** A precursor to triacylglycerols as well as many phospholipids.

**phosphatidylcholine-bound silybin:** An oral preparation of the flavonoid silybin with potential antioxidant and chemopreventive activities. Silybin, also known as silibinin, is a mixture of two stereoisomers, denoted silybin A and silybin B, and is the major active constituent of silymarin, a mixture of flavonolignans extracted from blessed milk thistle (*Silybum marianum*). Silybin modulates P-glycoprotein (P-gp)-mediated cellular efflux; has oxygen radical-scavenging effects; inhibits the arachidonic acid pathway; and inhibits various cytochrome P450 enzymes. This agent may also exhibit anti-angiogenic activity, possibly by inducing endothelial cell apoptosis via modulation of the transcription factor NF- $\kappa$ B, the Bcl-2 family of proteins, and caspases. Complexing silybin with phosphatidylcholine increases its bioavailability.

**phosphatidylinositol-3 kinase :** A type of enzyme that transmits signals in cells and that helps control cell growth. Some tumors have higher-than-normal levels of phosphatidylinositol-3 kinase. Also called PI3 kinase and PI3K.

**Phosphating:** Surface pretreatment used on ferrous parts that provide a very thin crystalline film that enhances both corrosion resistance and adhesion.

**Phosphating:** The treatment of steel or other metal surfaces or articles with solutions containing phosphates and phosphoric acid to produce a coating which inhibits corrosion and assists paint adhesion.

**Phosphodiester:** A molecule containing two alcohols esterified to a single molecule of phosphate. For example, the backbone of nucleic acids is connected by 5'-3' phosphodiester linkages between the adjacent individual nucleotide residues.

**phosphodiester linkage:** A chemical grouping that contains two alcohols esterified to one molecule of phosphoric acid, which thus serves as a bridge between them.

**Phosphodiesterase:** An enzyme that converts cyclic nucleotides (e.g., cAMP) into the noncyclic form (e.g., AMP).

**Phosphofructokinase:** A kinase that phosphorylates fructose 6-phosphate to fructose 1,6-bisphosphate; phosphofructokinase, an allosteric enzyme, is the major control point for flux through the glycolytic pathway.

**Phosphogluconate pathway:** Another name for the pentose phosphate pathway. This name derives from the fact that 6-phosphogluconate is an intermediate in the formation of pentoses from glucose. OR An oxidative pathway beginning with glucose-6-phosphate and leading, via 6-phosphogluconate, to pentose phosphates and yielding NADPH. Also called the pentose phosphate pathway.

**Phosphoinositide cascade:** A set of reactions that convert an extracellular signal into an intracellular one; the conversion entails the cleavage of the phospholipid phosphatidyl inositol 4,5-bisphosphate into two second messengers, inositol 1,4,5-trisphosphate and diacylglycerol.

**Phospholipases:** A class of enzymes of varying specificity that catalyze the degradation of phospholipids; can function as digestive enzymes as well as components of signal-transduction pathways.

**Phospholipid:** A lipid made up of glycerol and fatty acids, with a phosphate group attached OR A lipid containing charged hydrophilic phosphate groups; a component of cell membranes.

**phospholipid:** An ester of glycerol with two fatty acids and phosphoric acid ( $H_3PO_4$ ) or a derivative of phosphoric acid group (like  $H_2PO_4CH_2CH_2N(CH_3)_3$ ). Phospholipids have a hydrophilic head (the

phosphate group) and a lipophilic tail (the fatty acids). OR A lipid containing one or more phosphate groups.

**phospholipid** : A lipid (fat) that contains phosphorus. Phospholipids are a major part of cell membranes.

**phospholipid bilayer**: In an aqueous environment phospholipids can form a two-layered "sandwich" with the hydrophobic lipid tails on the inside and the hydrophilic phosphate heads facing outward. These bilayers are the essential structure for building cell membranes.

**phospholipid complex** : A chemical or drug that is attached to a lipid (fat) that contains phosphorus.

**Phospholipids**: Important constituents of membranes and composed of three components: a backbone (usually glycerol or sphingosine), two fatty acid chains, and a phosphorylated alcohol.

**phosphonoformate trisodium** : A drug used to treat infections with herpesviruses in people whose immune systems are weakened by AIDS. It blocks the viruses from making copies of themselves. It is a type of antiviral agent. Also called foscarnet sodium and Foscavir.

**Phosphoral**: (Other name for: sodium phosphate)

**Phosphoric**: Phosphoric acid,  $H_3PO_4$ , is a weak acid found in many soft drinks.

**phosphoric** : Having to do with or containing the element phosphorus.

**phosphoric acid** : An acid that contains phosphorus and is used in medicine and dentistry. It is also used to remove rust. A dilute form of phosphoric acid is used to flavor soft drinks.

**phosphorodiamidate morpholino oligomer AVI-4126**: A c-Myc antisense phosphorodiamidate morpholino oligomer (PMO) with potential antineoplastic activity. Phosphorodiamidate morpholino oligomer AVI-4126 binds to c-Myc mRNA and blocks its translation, which may result in the death of tumor cells overexpressing c-Myc. Differing from traditional antisense oligodeoxynucleotides (ODNs), neutrally charged PMOs are composed of subunits of nucleic acid bases linked to a synthetic backbone and, so, are less prone to enzymatic degradation. c-Myc, a proto-oncogene overexpressed in a variety of cancers, is involved in cellular proliferation, differentiation, and apoptosis.

**Phosphorolysis:** The cleavage of a bond by orthophosphate, as in the degradation of glycogen to glucose 1-phosphate. OR Cleavage of a compound with phosphate as the attacking group; analogous to hydrolysis.

**Phosphorus:** Symbol:"P" Atomic Number:"15" Atomic Mass: 30.97amu. Phosphorus is a very reactive element and is classified as a non-metal. Plants and animals need phosphorus to survive. When you go looking for it, you can find it in the soil. You will also find it in baking soda, making china, fireworks, fertilizers, and glass making.

**phosphorus :** A nonmetallic element that is found in the blood, muscles, nerves, bones, and teeth and is a component of adenosine triphosphate (ATP; the primary energy source for the body's cells).

**phosphorus P32:** A radioactive isotope of phosphorus with beta particle-emitting radiocytotoxic activity. Emitted by phosphorus P32, beta particles directly damage cellular DNA and, by ionizing intracellular water to produce several types of cytotoxic free radicals and superoxides, indirectly damage intracellular biological macromolecules, resulting in tumor cell death.

**phosphorus-32 :** A radioactive form of phosphorus used in the treatment of cancer. It is also used to help locate areas of DNA damage.

**Phosphoryl transfer potential:** A measure of the tendency of a phosphorylated compound to transfer a phosphate to another compound; presented as the  $\Delta G^\circ$  of hydrolysis of the phosphate compound; the more negative the  $\Delta G^\circ$  of hydrolysis, the greater the phosphoryl transfer potential.

**Phosphorylation:** The formation of a phosphate derivative of a biomolecule. OR Formation of a phosphate derivative of a biomolecule, usually by enzymatic transfer of a phosphate group from ATP.

**phosphorylation :** A process in which a phosphate group is added to a molecule, such as a sugar or a protein.

**Phosphorylation potential:** A means of measuring the energy status of a cell that is derived by dividing the concentration of ATP by the product of the concentrations of ADP and Pi.

**phosphorylation potential ( $\Delta G_p$ ):** The actual free-energy change of ATP hydrolysis under the nonstandard conditions prevailing within a cell.

**Photo-biodegradation:** Degradation of the polymer is triggered by UV light and assisted by the presence of UV sensitizers. In this process the

polymer is converted to low molecular weight material (waxes) and in a second step converted to carbon dioxide and water by bacterial action.

**photoactivity :** The effect produced when certain substances are exposed to light. In cancer treatment, some drugs become active when exposed to light and are then able to kill tumor cells.

**photochemical reaction center:** The part of a photosynthetic complex where the energy of an absorbed photon causes charge separation, initiating electron transfer.

**photochemical smog:** Air pollution caused by chemical reactions among various substances and pollutants in the atmosphere.

**photochemistry:** The study of chemical changes caused by light. For example, many of the key reactions that generate smog are photochemical.

**Photochlor:** (Other name for: HPPH)

**Photochromism:** A compound exhibits photochromism if, upon exposure to light, a color change occurs. Often the color change is reversible.

**photocoagulation :** The use of an intense beam of light, such as a laser, to seal off blood vessels or destroy tissue. It is used to treat certain eye conditions, and may be used to destroy blood vessels that a tumor needs to grow.

**photocyanine:** A metal complex compound of phthalocyanide with photosensitizing activity. Upon injection with photocyanide and subsequent introduction to photodynamic therapy (PDT), photocyanide becomes activated and forms reactive oxygen species that induce apoptosis.

**Photodegradable:** A process where ultraviolet radiation degrades the chemical bond or link in the polymer or chemical structure of a plastic. OR Degradation of plastics due to the action of light. OR Degradation of plastics due to the action of light. In the recycled plastic and plastic material industry, most plastics tend to absorb high-energy radiation in the UV portion of the spectrum this generates in the formation of free radicals and causes degradation in plastic materials.

**Photodetector:** (e.g. photodiode) an electronic device converting optical radiation into electrical signal.

**photodynamic therapy :** Treatment with drugs that become active when exposed to light. These activated drugs may kill cancer cells.

**photoelectric:** Of or relating to the electrical effects of light, including the emission of electrons, the generation of a voltage, or a change in resistance.

**PHOTOELECTRIC EFFECT:** is the emission of electrons from metal when the metal is struck by light. OR Ejection of electrons from an atom or molecule that has absorbed a photon of sufficient energy. The photoelectric effect is the operating principle behind "electric eyes"; it is experimental evidence for particle-like behavior of electromagnetic radiation.

**photoelectron:** An electron ejected from an atom or molecule that has absorbed a photon.

**Photofrin :** A drug used to treat some types of cancer. When absorbed by cancer cells and exposed to light, Photofrin becomes active and kills the cancer cells. It is a type of photodynamic therapy agent. Also called porfimer sodium.

**Photoinduced charge separation:** The excitation of an electron from its ground state to a higher energy level by light absorption and the subsequent movement of the excited electron from the initial molecule to an acceptor, resulting in a positive charge on the initial molecule and a negative charge on the acceptor molecule.

**Photolon:** (Other name for: phytochlorin sodium-polyvinylpyrrolidone complex)

**Photomicrography:** The technique of photographing a crystal on a microscope, sometimes at various stages in a reaction.

**photon:** Massless packet of energy, which behaves like both a wave and a particle. OR A particle of electromagnetic radiation having zero mass. OR A quantum (or packet) of energy emitted in the form of electromagnetic radiation. Gamma rays and x-rays are examples of photons. OR A discrete packet of energy associated with electromagnetic radiation. Each photon carries energy  $E$  proportional to the frequency of the radiation:  $E = h\nu$ , where  $h$  is Planck's constant. OR The ultimate unit (a quantum) of light energy.

**photon beam radiation therapy :** A type of radiation therapy that uses x-rays or gamma rays that come from a special machine called a linear accelerator (linac). The radiation dose is delivered at the surface of the body and goes into the tumor and through the body. Photon beam radiation therapy is different from proton beam therapy.

**photopheresis** : A procedure in which blood is removed from the body and treated with ultraviolet light and drugs that become active when exposed to light. The blood is then returned to the body. It is being studied in the treatment of some blood and bone marrow diseases and graft-vs-host disease (GVHD). Also called extracorporeal photopheresis.

**photophobia** : A condition in which the eyes are more sensitive than normal to light.

**photophosphorylation**: The enzymatic formation of ATP from ADP coupled to the light-dependent transfer of electrons in photosynthetic cells.

**Photoreactivation**: DNA repair in which the damaged region is repaired with the help of light and an enzyme. The lesion (break) is repaired without excision (cutting out) from the DNA.

**Photoreceptors**: Membrane proteins that can convert light into atomic motion and then into a chemical signal.

**photoreduction**: The light-induced reduction of an electron acceptor in photosynthetic cells.

**Photorespiration**: The conversion of organic carbon into carbon dioxide without the production of energy-rich metabolites; the result of the oxygenase reaction catalyzed by rubisco and the subsequent regeneration of glucose from two molecules of glycolate, with the release of carbon dioxide and ammonia and the consumption of ATP. OR Oxygen consumption occurring in illuminated temperate-zone plants, largely due to oxidation of phosphoglycolate.

**photosensitizer** : A drug used in photodynamic therapy. When absorbed by cancer cells and exposed to light, the drug becomes active and kills the cancer cells. Also called photosensitizing agent.

**photosensitizer LUZ 11**: A bacteriochlorin-based photosensitizer, with antineoplastic activity upon photodynamic therapy (PDT). Following intravenous administration, the photosensitizer LUZ 11 preferentially accumulates in hyperproliferative tissues, such as tumors. Local application of laser light at the tumor site results in the absorption of light by this agent and a photodynamic reaction between LUZ 11 and oxygen. This results in the production of reactive oxygen species (ROS), which includes singlet oxygen molecules, the superoxide ion, and other cytotoxic free radicals.

The formation of ROS induces free radical-mediated DNA damage and cell death.

**photosensitizing agent :** A drug used in photodynamic therapy. When absorbed by cancer cells and exposed to light, the drug becomes active and kills the cancer cells. Also called photosensitizer.

**Photospectrometer:** a spectrometer is an optical instrument used to examine light of various wavelengths. A photospectrometer (or spectrophotometer) examines those wavelengths of light in the visible and UV range. It can give  $L^*$ ,  $a^*$ , and  $b^*$  readings, although these readings can be affected by the surface texture and metallic content of the sample being measured.

**photosphere:** outer layer of the Sun.

**photosynthesis :** A chemical process that occurs in plants, algae, and some types of bacteria, when they are exposed to sunlight. During photosynthesis, water and carbon dioxide combine to form carbohydrates (sugars) and give off oxygen. Photosynthesis is needed for animal and plant life. OR Plants take in carbon dioxide and water. They use the energy from the Sun to make new substances glucose and oxygen. Glucose and oxygen have a higher energy content than carbon dioxide and water. OR The use of light energy to produce carbohydrates from carbon dioxide and a reducing agent such as water. OR A complex process used by many plants and bacteria to build carbohydrates from carbon dioxide and water, using energy derived from light. OR The biosynthesis that directly harnesses the chemical energy resulting from the absorption of light. Frequently used to refer to the formation of carbohydrates from  $CO_2$  that occurs in the chloroplasts of plants or the plastids of photosynthetic microorganisms. OR The manufacture by plants of carbohydrates and oxygen from carbon dioxide and water in the presence of chlorophyll with sunlight as the energy source. Oxygen and water vapor are released in the process. Photosynthesis is dependent on favorable temperature and moisture conditions as well as on the atmospheric carbon dioxide concentration. Increased levels of carbon dioxide can increase net photosynthesis in many plants. OR A nifty reaction carried out inside green plants, and by a number of different kinds of bacteria, which basically uses energy from the sun to run the combustion reaction backwards. OR Photosynthesis is the generation of glucose (and oxygen) from carbon dioxide and water in green plants. The reaction needs

sunlight and chlorophyll to take place. OR Process in which water and carbon dioxide are combined in the presence of sunlight to produce glucose and oxygen. This is the process used by green plants to create their food.

**photosynthetic phosphorylation:** See photophosphorylation.

**Photosynthetic unit:** A light-harvesting complex that includes about 2500 antenna chlorophyll molecules and a reaction-center chlorophyll pair, all in the thylakoid membrane.

**photosystem:** In photosynthetic cells, a functional set of light-absorbing pigments and its reaction center. OR the site within the chloroplast in which sunlight is captured; includes the pigment molecules, proton pumps, enzymes, coenzymes, and cytochromes.

**Photosystem I:** In chloroplasts, a photosynthetic unit that includes a light-harvesting complex, a reaction center, and an electron-transport chain. The system catalyzes the light-driven transfer of electrons from reduced plastoquinone to ferredoxin, which in turn drives the formation of NADPH; it requires light of wavelength shorter than 700 nm.

**Photosystem II:** In chloroplasts, a photosynthetic unit that includes a light-harvesting complex, a reaction center, and an electron-transport chain. The system catalyzes the light-driven transfer of electrons from water to plastoquinone, with the concomitant generation of oxygen; it requires light of wavelength shorter than 680 nm.

**phototesting :** Special tests used to measure the reaction of the skin to ultraviolet radiation. Phototesting is being used to see if drugs taken by mouth to treat cancer make the skin more sensitive to ultraviolet radiation.

**phototherapy :** The treatment of disease with certain types of light. Phototherapy can use lasers, LED, fluorescent lamps, and ultraviolet or infrared radiation. Also called light therapy.

**phototoxicity :** A condition in which the skin or eyes become very sensitive to sunlight or other forms of light. It can be caused by taking certain drugs, or rubbing certain essential oils (scented liquid taken from plants) or other topical agents into the skin. Phototoxicity causes sunburn, blisters, and other skin problems.

**phototroph:** An organism that can use the energy of light to synthesize its own fuels from simple molecules such as carbon dioxide, oxygen, and water; as distinct from a chemotroph.

**Phototrophs:** Organisms that can meet their energy needs by converting light energy into chemical energy.

**phototropism:** the bending and turning of the plant stem toward a light source.

**PHP:** A rare condition in which the pituitary gland stops making most or all hormones. Pituitary hormones help control the way many parts of the body work. Symptoms of the condition depend on the hormones that are missing. They include growth problems (in children), obesity (in adults), hair loss, slow heart rate, low blood sugar, low blood pressure, fatigue, and problems with reproduction. This condition may be caused by a tumor on or near the pituitary gland, infection, stroke, injury, surgery, or radiation therapy. It may also be inherited. Also called panhypopituitarism.

**PHR:** Parts per Hundred parts Resin. A measure of solids content in a coating. Example: a coating with a silica content of 70% PHR would contain 700 milligrams of silica per every gram of resin. OR A collection of information about a person's health that allows the person to manage and track his or her own health information. A PHR may include information about allergies, illnesses, surgeries, immunizations, and results of physical exams, tests, and screenings. It may also include information about medicines taken and health habits, such as diet and exercise. Also called personal health record, personal history, and personal medical history.

**phrase:** a group of related words that have no subject-predicate combination and cannot stand alone as a sentence.

**phrenic nerve :** A nerve that runs from the spinal cord to the diaphragm (the thin muscle below the lungs and heart that separates the chest from the abdomen). It causes the diaphragm to contract and relax, which helps control breathing.

**Phthalate:** A common substance added to some plastics (usually PVC) to increase flexibility. It doesn't bond with the plastic so over time it may be released into the environment. There are studies linking phthalates to a variety of ailments, particularly in children.

**Phthalic Anhydride:** Phthalic anhydride is an aromatics derivative produced by the oxidation of ortho-xylene. Phthalic anhydride is used to make phthalate plasticizers, which are used for PVC production. Phthalic anhydride is also used in the production of alkyd resins and unsaturated

polyester resins. OR Aromatic dicarboxylic acid anhydride, a chemical intermediate in the plastics industry.

**Phycobilisome:** A large assembly of phycobiliproteins, which contain the light-absorbing compound bilin, that harvests light for organisms, such as red algae and cyanobacteria, living at a depth of a meter or more in seawater.

**phyla:** related classes grouped together (singular, phylum).

**Phyllocontin:** (Other name for: aminophylline)

**phyllodes tumor :** A type of tumor found in breast or prostate tissue. It is often large and bulky and grows quickly. It may be benign (not cancer) or malignant (cancer) and may spread to other parts of the body. Also called CSP and cystosarcoma phyllodes.

**physiatrist :** A doctor who has special training in physical medicine. Physical medicine is the prevention and treatment of disease or injury with physical methods, such as exercise and machines. Also called physical medicine specialist.

**physical change:** A physical change is one in which no new substances are made, e.g. changes of state. OR No new substances are made. It is fairly easy to reverse this kind of change. OR A change which does not transform one substance into another. For example, freezing water is a physical change because both water and ice are H<sub>2</sub>O. However, electrolysis of water would not be a physical change because passing a strong electric current through water can decompose it into H<sub>2</sub> and O<sub>2</sub>.

**physical chemistry:** A branch of chemistry that studies chemical phenomena from a physical and mathematical perspective. Physical chemistry includes chemical thermodynamics, kinetics, spectroscopy, quantum chemistry, and statistical mechanics.

**physical dependence :** A condition in which a person takes a drug over time, and unpleasant physical symptoms occur if the drug is suddenly stopped or taken in smaller doses.

**physical examination :** An exam of the body to check for general signs of disease.

**physical geology:** the study of the earth's rocks, minerals, and soils and how they have formed through time.

**physical map:** a map that locates a gene of interest precisely by showing the actual number of base pairs between genes on a chromosome.

**physical medicine specialist :** A doctor who has special training in physical medicine. Physical medicine is the prevention and treatment of disease or injury with physical methods, such as exercise and machines. Also called physiatrist.

**physical model:** a representation of an object that you can hold.

**PHYSICAL PROPERTIES:** are such things color, density, hardness, ductility, malleability, solubility, heat conduction, electrical properties, melting and boiling point. OR A property that can be measured without changing the chemical composition of a substance. OR Measurement of a physical property may change the arrangement but not the structure of the molecules of a material. Examples of physical properties are density, color, boiling point, volume, temperature, and mass.

**Physical stability:** A term used to refer to the stability of a drug with respect to physical transformations, for example, to another polymorph or crystal form.

**physical therapist :** A health professional trained to evaluate and treat people who have conditions or injuries that limit their ability to move and do physical activities. Physical therapists use methods such as exercise, massage, hot packs, ice, and electrical stimulation to help strengthen muscles, relieve pain, and improve movement. They also teach exercises to help prevent injury and loss of motion.

**physical therapy :** The use of exercises and physical activities to help condition muscles and restore strength and movement. For example, physical therapy can be used to restore arm and shoulder movement and build back strength after breast cancer surgery.

**physical touch methods :** A type of therapy in which the therapist moves or manipulates one or more parts of the patient's body. It may be used to treat pain, stress, anxiety, and depression, and for general well-being. Examples include chiropractic treatments, physical therapy, and massage therapy. Also called manipulative and body-based practice and manual healing.

**Physical transformation:** A transformation of a solid in which the crystal structure or content of the crystal changes but in which no covalent bonds

are made or broken. Physical transformations include polymorph transformations and desolvations.

**Physical weathering** : Physical processes (such as temperature change, wind-borne grit etc) that can cause a rock to be broken down into smaller pieces.

**physician** : Medical doctor.

**physician assistant** : A health professional who is licensed to do certain medical procedures under the guidance of a doctor. A physician assistant may take medical histories, do physical exams, take blood and urine samples, care for wounds, and give injections and immunizations. Also called PA.

**physiologic** : Having to do with the functions of the body. When used in the phrase "physiologic age," it refers to an age assigned by general health, as opposed to calendar age.

**Physiology**: The study of how living organisms function

**phytic acid** : A substance found in many foods that come from plants, including corn, wheat, rice, and soybeans, and in large amounts in cereals and legumes. It is being studied in the prevention of cancer. Also called inositol hexaphosphate and IP6.

**phytochemical**: The term 'phyto' originated from a Greek word meaning plant. Phytonutrients are certain organic components of plants, and these components are thought to promote human health. Fruits, vegetables, grains, legumes, nuts and teas are rich sources of phytonutrients. Unlike the traditional nutrients (protein, fat, vitamins, minerals), phytonutrients are not 'essential' for life, so some people prefer the term 'phytochemical'. (USDA Agricultural Research Service) or A substance found in plants. Some phytochemicals may reduce the risk of cancer.

**phytochemistry**: The study of substances found in plants.

"Phytochemicals" are materials extracted from plant tissue.

**phytochlorin sodium-polyvinylpyrrolidone complex**: A photosensitizer composed of the sodium salt form of chlorin e6 and its derivatives complexed with a low-molecular weight polyvinylpyrrolidone (PVP) polymer component, with diagnostic and antineoplastic activities upon photodynamic therapy (PDT). Upon intravenous administration, the photosensitizer phytochlorin-PVP sodium complex preferentially

accumulates in hyperproliferative tissues, such as tumors. Local application of light with a certain wavelength to the tumor site results in the absorption of light by this agent, leading to its photoactivation. This results in a photodynamic reaction between phytochlorin and oxygen, which causes the production of reactive oxygen species (ROS), including singlet oxygen molecules, the superoxide ion, and other cytotoxic free radicals. The formation of ROS induces free radical-mediated oxidative DNA damage followed by apoptosis of tumor cells. Chlorin e6-PVP is able to penetrate deeply into tissues and is therefore able to treat hard-to-reach tumors.

**phytoestrogen :** An estrogen-like substance found in some plants and plant products. Phytoestrogens may have anticancer effects.

**phytohemagglutinin :** A substance found in plants that causes red blood cells to clump together and certain white blood cells to divide.

**phytol :** A chemical substance that comes from plants and is used to make vitamins E and K. Phytol is also found in soaps, beauty care products, and household products.

**phytonadione:** An analogue of the naphthoquinone vitamin K found in plants. The vitamins K are essential for blood coagulation as it is necessary for the hepatic synthesis of the coagulation factors II, VII, IX, and X; deficiency results in a bleeding diathesis. These vitamins are lipo-soluble; absorption via intestinal lymphatics requires the presence of bile salts.

**phytoplankton:** Algae, microscopic single-celled plants that float in the surface waters of the sea, lakes and rivers. In the ocean they constitute the bottom of the marine food chain. They have been called 'the pasture of the sea.' Like plants on land, they use sunlight to convert carbondioxide and water into sugars and oxygen in the process of photosynthesis. OR microscopic plants floating freely in the ocean. OR That portion of the plankton community comprised of tiny plants (e.g., algae and diatoms).

**phytoremediation:** Using plants to clear toxic metals from the environment by chelation.

**phytosterol :** A plant-based compound that can compete with dietary cholesterol to be absorbed by the intestines, resulting in lower blood cholesterol levels. Phytosterols may have some effect in cancer prevention. Also called plant sterol.

**PI:** Polyimide OR The person(s) in charge of a clinical trial or a scientific research grant. The PI prepares and carries out the clinical trial protocol (plan for the study) or research paid for by the grant. The PI also analyzes the data and reports the results of the trial or grant research. Also called principal investigator. OR a constant used in determining a circle's area or circumference. Equals approximately 3.14 or  $22/7$

**pi bond:** In the valence bond theory, a pi bond is a valence bond formed by side-by-side overlap of p orbitals on two bonded atoms. In most multiple bonds, the first bond is a sigma bond and all of the others are pi bonds. OR A type of covalent bond in which the electron density is concentrated around the line bonding the atoms. OR "A chemical bond formed by the indirect overlap of two atomic orbitals. I don't think I actually want to get into this, but the two bonds in a double bond are not the same; one is a sigma bond, formed by the direct "Head-to-Head" overlap of two atomic orbitals, and this is considerably stronger than the second one, which is a pi-bond."...

**PI-88:** A mixture of highly sulfated, monophosphorylated mannose oligosaccharides, derived from the extracellular phosphomannan of the yeast *Pichia (Hansenula) holstii*, with potential antiangiogenic activity. Heparanase inhibitor PI-88 inhibits the endo-beta-D-glucuronidase heparanase, which may interfere with the heparanase-mediated degradation of heparan-sulfate proteoglycans in extracellular matrices, an important step in the metastatic process. This agent may also bind with high affinity to the heparan sulfate-binding domains of vascular endothelial growth factor (VEGF) and fibroblast growth factors 1 and 2, thereby reducing their functional activities and inhibiting VEGF and FGF stimulation of tumor angiogenesis. Increased heparanase activity has been implicated in tumor angiogenesis and metastasis.

**PI-88:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antiangiogenesis agents.

**Pi-Pi (p-p) interactions:** Attractive non-covalent interactions that arise between aromatic rings

**PI3 kinase :** A type of enzyme that transmits signals in cells and that helps control cell growth. Some tumors have higher-than-normal levels of PI3 kinase. Also called phosphatidylinositol-3 kinase and PI3K.

**PI3K:** A type of enzyme that transmits signals in cells and that helps control cell growth. Some tumors have higher-than-normal levels of PI3K. Also called phosphatidylinositol-3 kinase and PI3 kinase.

**PI3K alpha inhibitor MLN1117:** An orally bioavailable inhibitor of the class I phosphoinositide 3-kinase (PI3K) alpha isoform with potential antineoplastic activity. PI3K alpha inhibitor MLN1117 selectively inhibits PI3K alpha kinase, including mutations of PIK3CA, in the PI3K/Akt/mTOR pathway, which may result in tumor cell apoptosis and growth inhibition in PI3K alpha-expressing tumor cells. By specifically targeting class I PI3K alpha, this agent may be more efficacious and less toxic than pan PI3K inhibitors. Dysregulation of the PI3K/Akt/mTOR pathway is frequently found in solid tumors and results in promoting tumor cell growth, survival, and resistance to chemotherapy and radiotherapy; PIK3CA, one of the most highly mutated oncogenes, encodes the p110-alpha catalytic subunit of the class I PI3K.

**PI3K alpha/beta inhibitor BAY1082439:** An orally bioavailable inhibitor of the class I phosphoinositide 3-kinase (PI3K) alpha and beta isoforms with potential antineoplastic activity. PI3K alpha/beta inhibitor BAY1082439 selectively inhibits both PI3K alpha, including mutated forms of PIK3CA, and PI3K beta in the PI3K/Akt/mTOR pathway, which may result in tumor cell apoptosis and growth inhibition in PI3K-expressing and/or PTEN-driven tumor cells. By specifically targeting class I PI3K alpha and beta, this agent may be more efficacious and less toxic than pan PI3K inhibitors. Dysregulation of the PI3K/Akt/mTOR pathway is frequently found in solid tumors and results in increased tumor cell growth, survival, and resistance to chemotherapy and radiotherapy. PIK3CA, one of the most highly mutated oncogenes, encodes the p110-alpha catalytic subunit of the class I PI3K. PTEN, a tumor suppressor protein and negative regulator of PI3K activity, is often mutated in a variety of cancer cells.

**PI3K alpha/mTOR inhibitor PWT33597 mesylate:** The mesylate salt form of PWT33597, an orally bioavailable dual inhibitor of phosphatidylinositol 3-kinase (PI3K) alpha and mammalian target of rapamycin (mTOR) kinase with potential antineoplastic activity. PI3K alpha/mTOR dual inhibitor PWT33597 selectively inhibits both PI3K alpha kinase and mTOR kinase, which may result in tumor cell apoptosis and growth inhibition in PI3K/mTOR-overexpressing tumor cells. Activation of

the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K.

**PI3K delta inhibitor PWT143:** An orally bioavailable inhibitor of the delta isoform of phosphatidylinositide 3-kinase (PI3K), with potential antineoplastic activity. Upon oral administration, PI3K-delta inhibitor PWT143 selectively inhibits the delta isoform of PI3K and prevents the activation of the PI3K/AKT signaling pathway. This both decreases proliferation and induces cell death in PI3K-delta-overexpressing tumor cells. PI3K-delta plays a key role in the proliferation and survival of hematologic cancer cells. The targeted inhibition of PI3K-delta is designed to preserve PI3K signaling in normal, non-neoplastic cells. PI3K, an enzyme often overexpressed in cancer cells, plays a crucial role in tumor cell regulation and survival.

**PI3K delta inhibitor TGR-1202:** An orally bioavailable, selective inhibitor of the delta isoform of the 110 kDa catalytic subunit of class I phosphoinositide-3 kinases (PI3K) with potential antineoplastic activity. PI3K-delta inhibitor TGR-1202 inhibits PI3K and prevents the activation of the PI3K/AKT kinase signaling pathway. This decreases proliferation and induces cell death in susceptible tumor cells. Unlike other isoforms of PI3K, PI3K-delta is expressed primarily in tumor cells and cells of the hematopoietic lineage. The targeted inhibition of PI3K-delta allows for PI3K signaling in normal, non-neoplastic cells. PI3K, an enzyme often overexpressed in cancer cells, plays a crucial role in tumor cell regulation and survival. Check for active clinical trials using this agent.

**PI3K delta/gamma inhibitor RP6530:** An orally active, highly selective, small molecule inhibitor of the delta and gamma isoforms of phosphoinositide-3 kinase (PI3K) with potential immunomodulating and antineoplastic activities. Upon administration, PI3K delta/gamma inhibitor RP6530 inhibits the PI3K delta and gamma isoforms and prevents the activation of the PI3K/AKT-mediated signaling pathway. This may lead to a reduction in cellular proliferation in PI3K delta/gamma-expressing tumor cells. In addition, this agent modulates inflammatory responses through various mechanisms, including the inhibition of both the release of reactive oxygen species (ROS) from neutrophils and tumor necrosis factor (TNF)-alpha activity. Unlike other isoforms of PI3K, the delta and gamma

isoforms are overexpressed primarily in hematologic malignancies and in inflammatory and autoimmune diseases. By selectively targeting these isoforms, PI3K signaling in normal, non-neoplastic cells is minimally impacted or not affected at all, which minimizes the side effect profile for this agent.

**PI3K inhibitor ACP-319:** An orally available inhibitor of phosphatidylinositol 3-kinase (PI3K), with potential antineoplastic activity. PI3K inhibitor ACP-319 inhibits PI3K, which prevents the activation of the PI3K/AKT (protein kinase B)-mediated signaling pathway. This results in the inhibition of growth and survival of PI3K-overexpressing tumor cells. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Check for active clinical trials using this agent.

**PI3K inhibitor BGT226:** A phosphatidylinositol 3-kinase (PI3K) inhibitor with potential antineoplastic activity. PI3K inhibitor BGT226 specifically inhibits PI3K in the PI3K/AKT kinase (or protein kinase B) signaling pathway, which may trigger the translocation of cytosolic Bax to the mitochondrial outer membrane, increasing mitochondrial membrane permeability; apoptotic cell death may ensue. Bax is a member of the proapoptotic Bcl2 family of proteins.

**PI3K inhibitor GDC-0084:** A phosphatidylinositol 3-kinase (PI3K) inhibitor with potential antineoplastic activity. PI3K inhibitor GDC-0084 specifically inhibits PI3K in the PI3K/AKT kinase (or protein kinase B) signaling pathway, thereby inhibiting the activation of the PI3K signaling pathway. This may result in the inhibition of both cell growth and survival in susceptible tumor cell populations. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**PI3K inhibitor GDC-0941 bismesylate:** The orally bioavailable bismesylate salt of a potent small-molecule thieno[3,2-d]pyrimidine inhibitor of the class I phosphatidylinositol 3 kinase (PI3K) isoforms p100alpha and p100delta with potential antineoplastic activity. PI3K inhibitor GDC-0941 selectively binds to PI3K isoforms in an ATP-competitive manner, inhibiting the production of the secondary messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3) and activation of the PI3K/Akt signaling pathway; inhibition of tumor cell growth, motility and

survival in susceptible tumor cell populations may result. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis; dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents. Check for active clinical trials using this agent.

**PI3K inhibitor GSK1059615:** A phosphoinositide 3-kinase (PI3K) inhibitor with potential antineoplastic activity. PI3K inhibitor GSK1059615 inhibits PI3K in the PI3K/AKT kinase signaling pathway, which may trigger the translocation of cytosolic Bax to the mitochondrial outer membrane and an increase in mitochondrial membrane permeability, followed by apoptosis. Bax is a member of the proapoptotic Bcl-2 family of proteins. PIK3, an enzyme often overexpressed in cancer cells, plays a crucial role in tumor cell regulation and survival. Check for active clinical trials using this agent.

**PI3K inhibitor GSK2126458:** A small-molecule pyridylsulfonamide inhibitor of phosphatidylinositol 3-kinase (PI3K) with potential antineoplastic activity. PI3K inhibitor GSK2126458 binds to and inhibits PI3K in the PI3K/mTOR signaling pathway, which may trigger the translocation of cytosolic Bax to the mitochondrial outer membrane, increasing mitochondrial membrane permeability and inducing apoptotic cell death. Bax is a member of the proapoptotic Bcl2 family of proteins. PI3K, often overexpressed in cancer cells, plays a crucial role in tumor cell regulation and survival.

**PI3K inhibitor PX-866:** A small-molecule wortmannin analogue inhibitor of the alpha, gamma, and delta isoforms of phosphoinositide 3-kinase (PI3K) with potential antineoplastic activity. PI3K inhibitor PX-866 inhibits the production of the secondary messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3) and activation of the PI3K/Akt signaling pathway, which may result in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**PI3K inhibitor WX-037:** A phosphatidylinositol 3-kinase (PI3K) inhibitor with potential antineoplastic activity. PI3K inhibitor WX-037 specifically inhibits PI3K, which prevents the activation of the PI3K/protein kinase B-

mediated signaling pathway. This may result in the inhibition of both tumor cell growth and survival in PI3K-overexpressing tumor cells. Activation of the PI3K signaling pathway is frequently associated with tumorigenesis. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**PI3K inhibitor ZSTK474:** An orally available, s-triazine derivative, ATP-competitive phosphatidylinositol 3-kinase (PI3K) inhibitor with potential antineoplastic activity. PI3K inhibitor ZSTK474 inhibits all four PI3K isoforms. Inhibiting the activation of the PI3K/AKT kinase (or protein kinase B) signaling pathway results in inhibition of tumor cell growth and survival in susceptible tumor cell populations. Dysregulated PI3K signaling may contribute to tumor resistance to a variety of antineoplastic agents. This agent does not induce apoptosis but rather induces strong G(0)/G(1) arrest, which might contribute to its favorable efficacy in tumor cells.

**PI3K p110beta/delta inhibitor KA2237:** A dual selective inhibitor of the beta and delta isoforms of the 110 kDa catalytic subunit of class I phosphoinositide-3 kinase (PI3K)-beta/delta, with potential antineoplastic activity. PI3K-beta/delta inhibitor KA2237 selectively inhibits the PI3K-beta and -delta isoforms and prevents their activation, which inhibits PI3K-beta/delta-mediated signal transduction pathways. This decreases proliferation and induces cell death in susceptible tumor cells. Unlike other isoforms of PI3K, PI3K-beta and -delta are overexpressed primarily in solid and hematological tumor cells and play crucial roles in tumor cell survival, and immunoregulation. The targeted inhibition of these PI3Ks allows this agent to potentially be more efficacious and less toxic than pan-PI3K inhibitors, which also affect normal, healthy cells.

**PI3K-beta inhibitor GSK2636771:** An orally bioavailable, substituted benzimidazole inhibitor of the class I phosphoinositide 3-kinase (PI3K) beta isoform with potential antineoplastic activity. PI3K beta inhibitor GSK2636771 selectively inhibits PI3K beta kinase activity in the PI3K/Akt/mTOR pathway, which may result in tumor cell apoptosis and growth inhibition in PI3K beta-expressing and/or PTEN-driven tumor cells. Dysregulation of the PI3K/Akt/mTOR pathway is frequently found in solid tumors and results in the promotion of tumor cell growth, survival, and resistance to both chemotherapy and radiotherapy. PI3K beta is the p110-beta catalytic subunit of the class I PI3K. PTEN, a tumor suppressor protein

and negative regulator of PI3K activity, is often mutated in a variety of cancer cells.

**PI3K-beta Inhibitor SAR260301:** An orally bioavailable inhibitor of the class I phosphatidylinositol 3-kinase (PI3K) beta isoform with potential antineoplastic activity. PI3K beta inhibitor SAR260301 selectively inhibits PI3K beta kinase activity in the PI3K/Akt/mTOR pathway, which may result in apoptosis and growth inhibition in PI3K beta-expressing and/or phosphatase and tensin homolog (PTEN)-deficient tumor cells.

Dysregulation of the PI3K/Akt/mTOR pathway is frequently found in solid tumors and contributes to increased tumor cell growth, tumor cell survival, and resistance to both chemotherapy and radiotherapy. PI3K beta is the p110-beta catalytic subunit of the class I PI3K. PTEN, a tumor suppressor protein and negative regulator of PI3K activity, is often mutated in a variety of cancer cells. By specifically targeting class I PI3K beta, this agent may be more efficacious and less toxic than pan-PI3K inhibitors.

**PI3K-delta inhibitor AMG 319:** A highly selective, potent, and orally bioavailable small molecule inhibitor of the delta isoform of the 110 kDa catalytic subunit of class IA phosphoinositide-3 kinases (PI3K) with potential immunomodulating and antineoplastic activities. PI3K-delta inhibitor AMG 319 prevents the activation of the PI3K signaling pathway through inhibition of the production of the second messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3), thus decreasing proliferation and inducing cell death. Unlike other isoforms of PI3K, PI3K-delta is expressed primarily in hematopoietic lineages. The targeted inhibition of PI3K-delta is designed to preserve PI3K signaling in normal, non-neoplastic cells.

**PI3K-delta inhibitor INCB050465:** An inhibitor of the delta isoform of phosphoinositide-3 kinase (PI3K) with potential antineoplastic activity. PI3K-delta inhibitor INCB050465 inhibits the delta isoform of PI3K and prevents the activation of the PI3K/AKT signaling pathway. This both decreases proliferation and induces cell death in PI3K-delta-overexpressing tumor cells. Unlike other isoforms of PI3K, PI3K-delta is expressed primarily in hematopoietic disease and cell lineages. The targeted inhibition of PI3K-delta is designed to preserve PI3K signaling in normal, non-neoplastic cells. PI3K, an enzyme often overexpressed in cancer cells, plays a crucial role in tumor cell regulation and survival.

**PI3K-gamma inhibitor IPI-549:** An orally bioavailable, highly selective small molecule inhibitor of the gamma isoform of phosphoinositide-3 kinase (PI3K-gamma) with potential immunomodulating and antineoplastic activities. Upon administration, IPI-549 prevents the activation of the PI3K-gamma-mediated signaling pathways, which may lead to a reduction in cellular proliferation in PI3K-gamma-expressing tumor cells. In addition, this agent is able to modulate anti-tumor immune responses and inhibit tumor-mediated immunosuppression. Unlike other isoforms of PI3K, the gamma isoform is overexpressed in certain tumor cell types and immune cells; its expression increases tumor cell proliferation and survival. By selectively targeting the gamma isoform, PI3K signaling in normal, non-neoplastic cells is minimally or not affected, which results in a reduced side effect profile.

**PI3K/HDAC inhibitor CUDC-907:** An orally bioavailable inhibitor of both phosphoinositide 3-kinase (PI3K) class I and pan histone deacetylase (HDAC) enzymes, with potential antineoplastic activity. Upon oral administration, CUDC-907 inhibits the activity of both PI3K class I isoforms and HDAC, thereby preventing the activation of the PI3K-AKT-mTOR signal transduction pathway that is often overactivated in many cancer cell types. This may prevent growth of PI3K and/or HDAC-expressing tumor cells. CUDC-907 shows an increased inhibition of tumor cell growth and induction of apoptosis when compared to inhibitors that target either PI3K or HDAC.

**PI3K/mTOR dual kinase inhibitor XL765:** An orally bioavailable small molecule targeting the phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) kinases in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR dual kinase inhibitor XL765 inhibits both PI3K kinase and mTOR kinase, which may result in tumor cell apoptosis and growth inhibition in susceptible tumor cell populations. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated in a PI3K-independent fashion in response to nutrient and energy deprivation. Accordingly, this agent maybe more potent compared to an agent that inhibits either PI3K kinase or mTOR kinase alone.

**PI3K/mTOR inhibitor LY3023414:** An orally bioavailable, small molecule inhibitor of certain class I phosphoinositide 3-kinase (PI3K) isoforms and mammalian target of rapamycin kinase (mTOR) in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR inhibitor LY3023414 inhibits both certain PI3K isoforms and mTOR in an ATP-competitive manner which may inhibit both the PI3K/mTOR signaling pathway in and proliferation of tumor cells overexpressing PI3K and/or mTOR. The PI3K/mTOR pathway is upregulated in a variety of tumor cells and plays a key role in promoting cancer cell proliferation, and survival, motility and resistance to chemotherapy and radiotherapy. mTOR, a serine/threonine kinase downstream of PI3K, may also be activated in a PI3K-independent fashion; therefore, this agent may be more potent than an agent that inhibits either PI3K or mTOR alone. In addition, LY3023414 may inhibit DNA-dependent protein kinase (DNA-PK), thereby inhibiting the ability of tumor cells to repair damaged DNA. DNA-PK is activated upon DNA damage and plays a key role in repairing double-stranded DNA breaks.

**PI3K/mTOR kinase inhibitor BEZ235:** An orally bioavailable imidazoquinoline targeting the phosphatidylinositol 3 kinase (PI3K) and the mammalian target of rapamycin (mTOR), with potential antineoplastic activity. PI3K/mTOR inhibitor BEZ235 inhibits PI3K kinase and mTOR kinase in the PI3K/AKT/mTOR kinase signaling pathway, which may result in tumor cell apoptosis and growth inhibition in PI3K/mTOR-overexpressing tumor cells. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K.

**PI3K/mTOR kinase inhibitor DS-7423:** An orally bioavailable inhibitor of phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) kinase in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR kinase inhibitor DS-7423 inhibits both PI3K kinase and mTOR kinase, which may result in tumor cell apoptosis and growth inhibition in susceptible tumor cells. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K.

Consequently, this agent may potentially be more potent than an agent that inhibits either PI3K kinase or mTOR kinase.

**PI3K/mTOR kinase inhibitor PF-04691502:** An agent targeting the phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR kinase inhibitor PF-04691502 inhibits both PI3K and mTOR kinases, which may result in apoptosis and growth inhibition of cancer cells overexpressing PI3K/mTOR. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K.

**PI3K/mTOR kinase inhibitor VS-5584:** A potent and selective inhibitor of both phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) kinase in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR kinase inhibitor VS-5584 inhibits mTOR kinase and all class I PI3K isoforms. Consequently, this disrupts phosphorylation of substrates downstream of PI3K and mTOR and may result in apoptosis and growth inhibition in susceptible tumor cells. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy. mTOR is a serine/threonine kinase downstream of PI3K, which also has PI3K-independent activity. Consequently, this agent may potentially be more potent than an agent that inhibits either PI3K kinase or mTOR kinase.

**PI3K/mTOR/ALK-1/DNA-PK inhibitor P7170:** An orally bioavailable inhibitor of phosphoinositide 3-kinase (PI3K), mammalian target of rapamycin (mTOR), activin receptor-like kinase 1 (ALK-1) and DNA-dependent protein kinase (DNA-PK), with potential anti-angiogenic and antineoplastic activities. Upon oral administration, PI3K/mTOR/ALK-1/DNA-PK inhibitor P7170 inhibits the activity of all four kinases. This prevents PI3K/mTOR and ALK-1-mediated signaling pathways and may lead to the inhibition of cancer cell growth in PI3K/mTOR-overexpressing tumor cells and angiogenesis in ALK-1-overexpressing endothelial cells. Also, by inhibiting DNA-PK, this agent inhibits the ability of tumor cells to repair damaged DNA. The PI3K/mTOR pathway is upregulated in a variety of tumors and plays an important role in regulating cancer cell proliferation, growth, and survival. ALK-1, a member of the transforming growth factor

beta (TGF- $\beta$ ) type I receptor family, is overexpressed on endothelial cells in a variety of tumor types and increases endothelial cell proliferation and migration. DNA-PK is activated upon DNA damage and plays a key role in repairing double-stranded DNA breaks.

**PI3K/mTORC1/mTORC2 inhibitor DCBCI0901:** An inhibitor of phosphatidylinositol 3-kinase (PI3K), raptor-mTOR (mTOR complex 1 or mTORC1) and rictor-mTOR (mTOR complex 2 or mTORC2) with potential antineoplastic activity. Upon intravenous infusion, PI3K/mTORC1/mTORC2 inhibitor DCBCI0901 binds to and inhibits PI3K as well as both mTORC1 and mTORC2, which may result in both apoptosis and a decrease in cell proliferation in tumor cells overexpressing PI3K, mTORC1, and mTORC2. Activation of the PI3K/mTOR signaling pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independently of PI3K.

**PI3K $\alpha$ /mTOR inhibitor PKI-179:** A second generation, small-molecule mimetic of ATP that targets the mammalian target of rapamycin (mTOR) with potential antineoplastic activity. PKI-179 selectively inhibits mTOR and phosphoinositide-3-kinase (PI3K)  $\alpha$ . By inhibiting the PI3K/mTOR signaling pathway, this agent may inhibit tumor cell proliferation and survival.

**PI3K $\alpha$  inhibitor AZD8835:** An orally bioavailable inhibitor of the class I phosphatidylinositol-4,5-bisphosphate 3-kinase (PI3K) catalytic subunit  $\alpha$  (PIK3CA), with potential antineoplastic activity. PI3K  $\alpha$  inhibitor AZD8835 selectively binds to and inhibits PIK3CA and its mutated forms, in the PI3K/Akt (protein kinase B)/mammalian target of rapamycin (mTOR) pathway. This results in both apoptosis and growth inhibition in PIK3CA-expressing tumor cells. By specifically targeting PIK3CA, this agent may be more efficacious and less toxic than pan-PI3K inhibitors. Dysregulation of the PI3K/Akt/mTOR pathway is often found in solid tumors and results in the promotion of tumor cell growth, survival, and resistance to chemo- and radio-therapy. PIK3CA, one of the most frequently mutated oncogenes, encodes the p110- $\alpha$  catalytic subunit of the class I PI3K.

**PI3K $\beta$  inhibitor AZD8186:** An inhibitor of the beta isoform of phosphoinositide-3 kinase (PI3K), with potential antineoplastic activity.

Upon administration, PI3Kbeta inhibitor AZD8186 selectively inhibits the activity of PI3Kbeta in the PI3K/Akt/mTOR signaling pathway, which may result in a decrease of tumor cell proliferation. It also induces cell death in PI3K-expressing cancer cells. By specifically targeting class I PI3K beta, this agent may be more efficacious and less toxic than pan PI3K inhibitors. PI3K-mediated signaling is often dysregulated in cancer cells and contributes to increased tumor cell growth, survival, and tumor resistance to a variety of antineoplastic agents.

**PI3Kdelta inhibitor INCB040093:** An orally bioavailable, selective inhibitor of the delta isoform of the 110 kDa catalytic subunit of class I phosphoinositide-3 kinases (PI3K) with potential antineoplastic activity. PI3Kdelta inhibitor INCB040093 specifically inhibits PI3Kdelta, which prevents both the production of the second messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3) and the activation of the PI3K/AKT kinase signaling pathway. This decreases proliferation and induces cell death in PI3K-overexpressing tumor cells. Unlike other isoforms of PI3K, PI3Kdelta is often overexpressed in tumor cells, especially those of hematologic origin, and plays a crucial role in tumor cell regulation and survival. The targeted inhibition of PI3Kdelta allows for PI3K signaling in normal, non-neoplastic cells.

**PIB:** Polyisobutylene

**pibenzimol:** A fluorescent dye of benzimidazole derivative. Pibenzimol binds to AT-specific sites in the minor groove of duplex DNA and inhibits topoisomerase I, and DNA polymerase, thereby preventing DNA replication. This agent prolongs the G2 phase of the cell cycle and initiates apoptosis in tumor cells.

**pibrozelesin:** A semisynthetic water-soluble derivative of the antineoplastic antibiotic duocarmycin B2. Activated by carboxyl esterase, pibrozelesin alkylates DNA by binding to adenine-thymine (A-T)-rich sequences in the minor groove of DNA, thereby inhibiting DNA replication and inducing apoptosis.

**Picato:** (Other name for: ingenol mebutate gel)

**PICC :** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. A thin, flexible tube is inserted into a vein in the upper arm and guided (threaded) into a large vein above the right side of the heart called the superior vena cava. A needle is

inserted into a port outside the body to draw blood or give fluids. A PICC may stay in place for weeks or months and helps avoid the need for repeated needle sticks. Also called peripherally inserted central catheter.

**picibanil:** A lyophilized formulation containing cultures of a low-virulent strain of *Streptococcus pyogenes*, treated and killed with penicillin G, with potential sclerosing, immunostimulating and antineoplastic activities. Besides its activity as a sclerosing agent, picibanil appears to have multiple effects on the immune system as a non-specific immunostimulant. This agent activates the host immune system by stimulating the activity of natural killer (NK) cells, macrophages and lymphocytes, and by enhancing the production of several key immune mediators, including interleukins (ILs) and tumor necrosis factor (TNF). Check for active clinical trials using this agent.

**Picket :** A continuous corrugation of that flat strip with pre-positioned holes. (Applicable to flat wire belts).

**Picking out:** The individual colour treatment of ornamental units and/or mouldings in cornices and similar architectural features.

**Picking up:** This has two meanings: 1. The process of joining up to 'wet' or 'live' edges on lapping. 2. The lifting or softening of a previous coat of paint when applying a subsequent coating. OR There are two meanings for this term. One is the process of joining up to 'wet' or 'live' edges on lapping; the other meaning concerns the lifting or softening of a previous coat of paint when applying a new coat. The remedy in both cases is to thoroughly clean the surfaces to remove all dirt, grease and surface contaminants. Then scrape back all areas of poorly adhering or defective coatings to a firm edge, rub down to 'feather' broken edges, dust off and apply a new coating.

**Pickling:** The treatment of steel by immersion in a special acid solution in order to remove millscale (acid pickling). Alternatively, a method of removing paint varnish or varnished wallpaper with a strong alkaline solution. Hence any alkaline cleaning solution may be referred to as 'pickle'.

**Pickling liquor :** Pickling liquor refers to acid, which is used in mild steel pickling (surface treatment) in hot-roll process of steel manufacturing. After pickling the acid contains iron (Fe) metal and it is called spent pickling liquor (SPL). It is considered waste by many steel manufacturers. SPL can,

however, be utilized as iron (Fe) and acid by-product raw material in iron-based coagulant manufacturing.

**Pickouts:** A mold insert that remains stuck to the ejected part and has to be pulled out of the part and placed back into the mold before the next cycle.

**Pico-:** A prefix that divides a basic unit by one trillion ( $10^{-12}$ ). OR Prefix used in the SI system meaning "multiply by  $10^{-12}$ ". For example, 3 pm means  $3 \times 10^{-12}$  meters.

**Picocurie:** One trillionth ( $10^{-12}$ ) of a curie.

**picogram:** One picogram is  $10^{-12}$  grams.

**picoliter:** One picoliter is  $10^{-12}$  liters.

**picometer:** One picometer is  $10^{-12}$  meters.

**picoplatin:** A new generation organic platinum analog with an extended spectrum of antineoplastic activity. Designed to overcome platinum drug resistance, picoplatin alkylates DNA, forming both inter- and intra-strand cross-linkages, resulting in inhibition of DNA replication and transcription, and the induction of apoptosis.

**picropodophyllin:** A cyclolignan alkaloid found in the mayapple plant family (*Podophyllum peltatum*), and a small molecule inhibitor of the insulin-like growth factor 1 receptor (IGF1R) with potential antineoplastic activity. Picropodophyllin specifically inhibits the activity and downregulates the cellular expression of IGF1R without interfering with activities of other growth factor receptors, such as receptors for insulin, epidermal growth factor, platelet-derived growth factor, fibroblast growth factor and mast/stem cell growth factor (KIT). This agent shows potent activity in the suppression of tumor cell proliferation and the induction of tumor cell apoptosis. IGF1R, a receptor tyrosine kinase overexpressed in a variety of human cancers, plays a critical role in the growth and survival of many types of cancer cells.

**PID:** A condition in which the female reproductive organs are inflamed. It may affect the uterus, fallopian tubes, ovaries, and certain ligaments. PID is usually caused by a bacterial infection. It may cause infertility and an increased risk of an ectopic pregnancy (pregnancy in the fallopian tubes). Also called pelvic inflammatory disease.

**pidilizumab:** A humanized, immunoglobulin (Ig) G1 monoclonal antibody directed against human inhibitory receptor programmed cell death 1 (PD-1;

PDCD1), with potential immune checkpoint inhibitory and antineoplastic activities. Pidilizumab binds to PD-1 and blocks the interaction between PD-1 and its ligands, PD-1 ligand 1 (PD-L1) and PD-1 ligand 2 (PD-L2). This prevents the activation of PD-1 and its downstream signaling pathways. This may restore immune function through the activation of natural killer (NK) cells and cytotoxic T-lymphocytes (CTLs) against tumor cells. PD-1, an inhibitory receptor belonging to the B7-receptor family expressed on activated T-lymphocytes, B-cells and NK cells, negatively regulates T-cell activation and effector function when activated by its ligands; it plays an important role in tumor evasion from host immunity.

**piedmont glacier:** the forwardmost extension of a valley glacier; forms where the ice emerges at the front of the mountain range.

**Pier:** The supports of the arches of a bridge; area of plain wall between arches or openings. Hence is commonly used to describe any rectangular projection in a wall flank.

**Pig:** A colloquial term describing a container (usually lead or depleted uranium) used to ship or store radioactive materials. The thick walls of this shielding device protect the person handling the container from radiation. Large containers used for spent fuel storage are commonly called casks.

**pig iron:** Pig iron is impure iron from a blast furnace.

**Pigment:** This powder like substance is one of paint's basic components (the other is the binder). The pigment gives the paint its colour and hiding power. Titanium dioxide is the most important pigment used to provide hiding in paint. OR (Colorant) A plastic compound which contains a high percentage of pigment, to be blended in appropriate amounts with the base resin so that the correct final color is achieved. OR Any colorant, usually an insoluble powdered substance used to produce a desired color of hue. OR A plastic compound which contains a high percentage of pigment, to be blended in appropriate amounts with the base resin so that the correct final color is achieved. OR Paint ingredients mainly used to impart color and hiding power.

**pigment :** A substance that gives color to tissue. Pigments are responsible for the color of skin, eyes, and hair.

**PIHNOLE:** Very small holes in paint film, usually not deep enough to show undercoat.

**Pile:** A colloquial term describing the first nuclear reactors. They are called piles because the earliest reactors were "piles" of graphite and uranium blocks.

**Pillaster:** A square pillar, often purely ornamental, projecting from a pier or wall, often in symmetry with a line of columns.

**pillow structures:** blobs of submarine lava that break through the thin, hardened exterior of a lava flow and chill immediately in the cold water, forming small rounded shapes.

**pilocarpine :** A drug used to increase salivation in people who have dry mouth caused by opioids or radiation therapy. Pilocarpine belongs to the family of drugs called alkaloids.

**pilocarpine hydrochloride:** The hydrochloride salt of a natural alkaloid extracted from plants of the genus *Pilocarpus* with cholinergic agonist activity. As a cholinergic parasympathomimetic agent, pilocarpine predominantly binds to muscarinic receptors, thereby inducing exocrine gland secretion and stimulating smooth muscle in the bronchi, urinary tract, biliary tract, and intestinal tract. When applied topically to the eye, this agent stimulates the sphincter pupillae to contract, resulting in miosis; stimulates the ciliary muscle to contract, resulting in spasm of accommodation; and may cause a transitory rise in intraocular pressure followed by a more persistent fall due to opening of the trabecular meshwork and an increase in the outflow of aqueous humor.

**pilocytic :** Made up of cells that look like fibers when viewed under a microscope.

**pilot study :** The initial study examining a new method or treatment.

**PIM kinase inhibitor LGH447:** An orally available pan-PIM protein kinase inhibitor with potential antineoplastic activity. PIM kinase inhibitor LGH447 binds to and inhibits the activities of PIM-1, -2 and -3 serine/threonine kinases, which may result in the interruption of the G1/S phase cell cycle transition, the expression of the pro-apoptotic Bcl2 protein, and tumor cell apoptosis in cells that overexpress PIMs. PIM kinases, downstream effectors of many cytokine and growth factor signaling pathways, play key roles in cell cycle progression and apoptosis inhibition and may be overexpressed in various malignancies. Check for active clinical trials using this agent.

**Pim kinase inhibitor SGI-1776:** A small-molecule pan-Pim protein kinase inhibitor with potential antineoplastic activity. Pim kinase inhibitor SGI-1776 binds to and inhibits the activities of Pim-1, -2 and -3, serine-threonine kinases, which may result in the interruption of the G1/S phase cell cycle transition, the expression of pro-apoptotic Bcl2 proteins and tumor cell apoptosis. PIM kinases play key roles in cell cycle progression and apoptosis inhibition and may be overexpressed in various malignancies.

**pimasertib:** An orally bioavailable small-molecule inhibitor of MEK1 and MEK2 (MEK1/2) with potential antineoplastic activity. Pimasertib selectively binds to and inhibits the activity of MEK1/2, preventing the activation of MEK1/2-dependent effector proteins and transcription factors, which may result in the inhibition of growth factor-mediated cell signaling and tumor cell proliferation. MEK1/2 (MAP2K1/K2) are dual-specificity threonine/tyrosine kinases that play key roles in the activation of the RAS/RAF/MEK/ERK pathway and are often upregulated in a variety of tumor cell types.

**pimecrolimus cream:** A 33-epi-chloro-derivative of the ascomycin macrolactam with immunosuppressant properties. Pimecrolimus binds to the receptor macrophilin-12 (FKBP-12) forming a complex that blocks the calcium-dependent signal transduction cascade mediated by calcineurin. Via dephosphorylation, calcineurin is the enzyme responsible for activating nuclear factor of activated T-cells (NF-AT), a T cell transcriptional regulatory factor. As a consequence, the synthesis and release of Th1- (T helper 1) and Th2- (T helper 2) type cytokines, and other inflammatory mediators from T-cells and mast cells are blocked and the expression of signals essential for the activation of inflammatory T-lymphocytes is inhibited. However, pimecrolimus mode of action is cell-selective and does not affect Langerhans' cells/dendritic cells and primary fibroblasts. Check for active clinical trials using this agent.

**pimonidazole:** A nitroimidazole with hypoxic selectivity and radiosensitizing property. Pimonidazole is reduced in hypoxic environments as in tumor cells, thereby it can be used as an hypoxia marker. In hypoxic cells, reduced pimonidazole binds to -SH-containing molecules such as glutathione and proteins, and the resulting complexes accumulated in tissues, thereby sensitizing cells to be more susceptible for radiation treatment.

**pimonidazole hydrochloride:** A substituted nitroimidazole salt. Hypoxic cells bio-reductively activate and bind pimonidazole. This agent may be used as a hypoxia marker for detecting oxygen gradients in living tissues. Pimonidazole also exhibits radiosensitizing properties.

**PIN :** Noncancerous growth of cells lining the internal and external surfaces of the prostate gland. Having high-grade PIN may increase the risk of developing prostate cancer. Also called prostatic intraepithelial neoplasia.

**pinaverium bromide:** An orally available bromide salt form of pinaverium, a calcium channel blocker (CCB) with antispasmodic activity. Upon oral administration, pinaverium blocks the voltage-dependent calcium channels and inhibits calcium ion influx into the smooth muscle cells located in the gastrointestinal (GI) tract. This prevents smooth muscle contraction and relaxes the GI tract. In addition, pinaverium may both reduce bowel uptake of and facilitate the function of locally active, co-administered drugs.

**Pinch-off:** a raised edge around the cavity in the mold, which seals off the part and separates the excess material as the mold closes around the parison in the extrusion blow molding operation. OR A pinch-off is needed when the parison falls outside the cavity of the mold. It is the protruding edge separating the cavity from the flash pocket, and it compresses the flash to the point of severance. Inserted beryllium copper is preferred because the alloy has thermal conductivity equal to that of the aluminum alloy used in the mold. Steel pinches are used when pinch wear is critical - for example, when molding materials such as polycarbonates are used.

**pineal body :** A tiny organ in the cerebrum that produces melatonin. Also called pineal gland and pineal organ.

**pineal germinoma :** A type of germ cell tumor that is found in the pineal gland in the brain. Symptoms of pineal germinomas include headaches, changes in vision, nausea, and vomiting.

**pineal gland:** a human endocrine gland in the midbrain that regulates mating behaviors and day-night cycles. OR A tiny organ in the cerebrum that produces melatonin. Also called pineal body and pineal organ.

**pineal organ :** A tiny organ in the cerebrum that produces melatonin. Also called pineal body and pineal gland.

**pineal region tumor :** A type of brain tumor that forms in or around the pineal gland (a tiny organ near the center of the brain). Pineal region tumors may be benign (not cancer) or malignant (cancer). They include pineocytomas, pineoblastomas, and pineal germinomas. Also called pinealoma.

**pinealoma :** A type of brain tumor that forms in or around the pineal gland (a tiny organ near the center of the brain). Pinealomas may be benign (not cancer) or malignant (cancer). They include pineocytomas, pineoblastomas, and pineal germinomas. Also called pineal region tumor.

**pineoblastoma :** A fast growing type of brain tumor that occurs in or around the pineal gland, a tiny organ near the center of the brain.

**pineocytoma :** A slow growing type of brain tumor that occurs in or around the pineal gland, a tiny organ near the center of the brain.

**Pinhole:** A small hole in the surface of a moulded product, usually occurring in multiples.

**Pinholing:** The formation of minute holes in a paint film during application and drying. OR If minute holes appear in the paint film while applying or during the drying phase, it's likely due to the surface being contaminated by oil, grease or a similar substance. Apply a new coat, after first cleaning down the surfaces to remove all contaminants, rubbing down with a suitable abrasive and dusting off.

**pinkeye :** A condition in which the conjunctiva (membranes lining the eyelids and covering the white part of the eye) become inflamed or infected. Also called conjunctivitis.

**pinocytosis:** when the vesicle formed from endocytosis contains droplets of fluid.

**Pinpoint Gate:** A restricted gate of 0.030 in or less in diameter, this gate is common on hot-runner molds.

**pioglitazone :** A drug that is used to treat type 2 diabetes and is being studied in the prevention of head and neck cancer. It may be able to stop leukoplakia (a condition affecting the mouth ) from developing into cancer. It is a type of thiazolidinedione. Also called Actos.

**pioglitazone hydrochloride:** The hydrochloride salt of an orally-active thiazolidinedione with antidiabetic properties and potential antineoplastic activity. Pioglitazone activates peroxisome proliferator-activated receptor

gamma (PPAR-gamma), a ligand-activated transcription factor, thereby inducing cell differentiation and inhibiting cell growth and angiogenesis. This agent also modulates the transcription of insulin-responsive genes, inhibits macrophage and monocyte activation, and stimulates adipocyte differentiation.

**Pipe:** A tube usually for the conveyance of liquids. OR As it relates to tobacco use, a device that has a mouthpiece at one end of a tube and a small bowl at the other end that is filled with tobacco, which is lit and smoked. The smoke from a pipe is usually not inhaled into the lungs. It contains nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Pipe smoking can lead to nicotine addiction and can cause cancers of the mouth, larynx (voice box), esophagus, lung, pancreas, and bladder. It can also cause heart disease, lung disease, and other health problems.

**piperacillin sodium:** The sodium salt of piperacillin, a broad-spectrum semisynthetic, ampicillin-derived ureidopenicillin antibiotic with bactericidal activity. Piperacillin binds to and inactivates penicillin-binding proteins (PBPs), enzymes located on the inner membrane of the bacterial cell wall, resulting in the weakening of the bacterial cell wall and cell lysis. PBPs participate in the terminal stages of assembling the bacterial cell wall, and in reshaping the cell wall during cell division. Inactivation of PBPs interferes with the cross-linkage of peptidoglycan chains necessary for bacterial cell wall strength and rigidity. Check for active clinical trials using this agent.

**piperacillin-tazobactam :** A drug combination that is used to treat infection in people with cancer. Piperacillin is a synthetic penicillin; tazobactam enhances the effectiveness of piperacillin.

**piperazinedione:** A crystalline antibiotic fermentation product isolated from the bacterium *Streptomyces griseoluteus* with antineoplastic activity. Piperazinedione alkylates DNA at the N-7 position of guanine, inhibiting DNA replication and inducing cell cycle arrest.

**piperine extract (standardized):** A standardized extract containing the active alkaloid piperine, derived from the fruit of the plant *Piper nigrum* (black pepper) and/or the plant *Piper longum* L. (long pepper), with thermogenic properties. Co-ingestion of piperidine enhances the bioavailability of various nutrients, including beta-carotene, curcumin,

selenium, pyridoxine and coenzyme Q10. In addition, this agent may exert anti-inflammatory and anti-tumor activities and may enhance the production of serotonin.

**Pipracil:** (Other name for: piperacillin sodium)

**pirarubicin:** An analogue of the anthracycline antineoplastic antibiotic doxorubicin. Pirarubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent is less cardiotoxic than doxorubicin and exhibits activity against some doxorubicin-resistant cell lines. Check for active clinical trials using this agent.

**pirfenidone:** An orally active synthetic antifibrotic agent structurally similar to pyridine 2,4-dicarboxylate. Pirfenidone inhibits fibroblast, epidermal, platelet-derived, and transforming beta-1 growth factors, thereby slowing tumor cell proliferation. This agent also inhibits DNA synthesis and the production of mRNA for collagen types I and III, resulting in a reduction in radiation-induced fibrosis. Or A substance that is being studied in the prevention and treatment of scar tissue caused by radiation therapy. It belongs to the family of drugs called anti-inflammatory agents.

**piritramide:** A diphenylpropylamine and opioid receptor agonist, with analgesic activity. Upon administration, piritramide binds to and activates mu-opioid receptors in the central nervous system (CNS), thereby mimicking the effects of endogenous opioids and producing analgesic relief.

**piritrexim:** A synthetic antifolate agent with antiparasitic, antipsoriatic and antitumor properties. Piritrexim inhibits the enzyme dihydrofolate reductase enzyme, thereby disrupting folate metabolism and DNA synthesis and cell division. Or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called folate antagonists.

**pirotinib:** An orally bioavailable inhibitor of the receptor tyrosine kinase (RTK) epidermal growth factor receptor (ErbB; EGFR) family, with potential antineoplastic activity. Upon administration, pirotinib selectively and irreversibly binds to and inhibits the epidermal growth factor receptors 1 (ErbB1; EGFR), 2 (ErbB2; HER2), and 4 (ErbB4; HER4). This may result in the inhibition of cell growth and angiogenesis in tumors overexpressing these RTKs. EGFRs play major roles in both tumor cell

proliferation and tumor vascularization, and are overexpressed in many cancer cell types.

**piroxastrone:** An anthrapyrazole antineoplastic antibiotic. Piroxastrone intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. Although less cardiotoxic than doxorubicin, this agent exhibits a narrow spectrum of antineoplastic activity.

**piroxicam:** A nonsteroidal oxycam derivative with anti-inflammatory, antipyretic and analgesic properties. As a non-selective, nonsteroidal anti-inflammatory drug (NSAID), piroxicam binds and chelates both isoforms of cyclooxygenases (COX1 and COX2), thereby stalling phospholipase A2 activity and conversion of arachidonic acid into prostaglandin precursors at the rate limiting cyclooxygenase enzyme step. This results in inhibition of prostaglandin biosynthesis. As a second, independent effect, piroxicam inhibits the activation of neutrophils thereby contributing to its overall anti-inflammatory effects.

**pIRS2 phosphopeptide-tetanus peptide vaccine:** A vaccine composed of a phosphorylated peptide from the tumor associated antigen insulin receptor substrate-2 (IRS2) and a tetanus-derived peptide, with potential immunomodulating and antineoplastic activities. Upon administration of pIRS2 phosphopeptide-tetanus peptide vaccine, the pIRS2 phosphopeptide may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against phosphopeptide-containing tumor cells. The tetanus peptide serves as an immunoadjuvant and induces a helper T-cell response which may help stimulate an immune response against the pIRS2-expressing melanoma tumor cells. IRS2 is upregulated in a variety of cancer cells.

**pistil:** the structure of the flower that contains a stigma, a style, and an ovary.

**Pit:** An imperfection, a small crater in the surface of the plastic. OR A small imperfection in plastic.

**Pitch:** A dark coloured bituminous substance. The angle of a sloping roof to the horizontal. OR The distance from any point on the flight of a screw line to the corresponding point on an adjacent flight, measured parallel to the axis of the screw line or threading.

**Pitch length (or pitch):** The number of base pairs per turn of a duplex helix.

**pith:** the structure at the center of the stem of vascular plants.

**Pitocin:** (Other name for: recombinant oxytocin)

**pituitary gland:** a gland at the base of the brain consisting of the anterior and posterior lobes that secretes several hormones. OR A pea-sized organ attached to the part of the brain called the hypothalamus. It lies at the base of the brain above the back of the nose. The hypothalamus sends signals to the pituitary gland, which then makes hormones that control other glands and many of the body's functions, including growth.

**pituitary tumor :** A tumor that forms in the pituitary gland. The pituitary gland is a pea-sized organ at the base of the brain. It makes hormones that affect other glands and many of the body's functions, including growth. Symptoms depend on the hormones affected by the tumor. Most pituitary tumors are benign (not cancer) and many do not cause any symptoms.

**pixantrone :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called antitumor antibiotics. Also called BBR 2778.

**pixantrone dimaleate:** The dimaleate salt of a synthetic, noncardiotoxic aza-anthracenedione analogue with potential antineoplastic activity. Pixantrone intercalates into DNA and induces topoisomerase II-mediated DNA strand crosslinks, resulting in inhibition of DNA replication and tumor cell cytotoxicity.

**PJS:** A genetic disorder in which polyps form in the intestine and dark spots appear on the mouth and fingers. Having PJS increases the risk of developing gastrointestinal and many other types of cancer. Also called Peutz-Jeghers syndrome.

**pK:** The negative logarithm of an equilibrium constant.

**pK<sub>aa</sub>:** The pK<sub>a</sub> of an acid is minus the base-10 log of its acid dissociation constant,  $pK_a = -\log K_a$ . For example, a pK<sub>a</sub> of 5 is equivalent to an acid dissociation constant of  $10^{-5}$ .

**pK<sub>bb</sub>:** The pK<sub>b</sub> of an base is minus the base-10 log of its base hydrolysis constant,  $pK_b = -\log K_b$ . For example, a pK<sub>b</sub> of 5 is equivalent to an base hydrolysis constant of  $10^{-5}$ .

**PKC:** An enzyme found throughout the body's tissues and organs. Several forms of PKC are involved in many cellular functions. PKC is being studied in the treatment of cancer. Also called protein kinase C.

**PKC412:** A substance that is being studied in the treatment of leukemia. It belongs to the family of drugs called protein kinase inhibitors. Also called midostaurin and N-benzoyl-staurosporine.

**PKU:** An inherited disorder that causes a build-up of phenylalanine (an amino acid) in the blood. This can cause mental retardation, behavioral and movement problems, seizures, and delayed development. Using a blood test, PKU can easily be found in newborns, and treatment is a diet low in phenylalanine. Also called phenylketonuria.

**PLA:** polymerized lactic acid - a corn-based resin made by natureworks pla that requires significantly less energy to mold into plastic containers.

**placebo:** An inactive substance, treatment or procedure that is intended to provide baseline measurements for the experimental protocol of a clinical trial. Check for active clinical trials using this agent.

**placebo :** An inactive substance or treatment that looks the same as, and is given the same way as, an active drug or treatment being tested. The effects of the active drug or treatment are compared to the effects of the placebo.

**placebo therapy :** An inactive treatment or procedure that is intended to mimic as closely as possible a therapy in a clinical trial. Also called sham therapy.

**placebo-controlled :** Refers to a clinical study in which the control patients receive a placebo.

**placenta:** the structure that supplies the fetus with nourishment. OR The organ that nourishes the developing fetus in the uterus.

**placental blood transplantation :** The transfer of blood from a placenta to an individual whose own blood production system is suppressed. Placental blood contains high levels of stem cells needed to produce new blood cells. It is being studied in the treatment of cancer and severe blood disorders such as aplastic anemia.

**placental mammals:** mammals that have a nutritive connection between the embryo and the mother's uterine wall.

**placer deposit:** a deposit of heavy metallic minerals, such as iron or titanium minerals, or native gold or diamonds, that have been concentrated

by wave or water action in a river or beach environment.

**pladienolide derivative E7107:** A synthetic urethane derivative of pladienolide D with potential antineoplastic activity. Pladienolide derivative E7107 is generated from the 12-membered macrolide pladienolide D, one of several macrolides derived from the bacterium *Streptomyces platensis* Mer-11107. This agent appears to bind to the 130-kDa subunit 3 (spliceosome-associated protein 130; SAP130) of the splicing factor 3b (SF3b), resulting in inhibition of pre-messenger RNA splicing and the arrest of cell-cycle progression. The splicing factor SF3b is a multiprotein complex integral to the accurate excision of introns from pre-messenger RNA; the subunit SAP130 associates with U2 snRNP and is recruited to prespliceosomal complexes.

**plagiarism:** the use of another writer's words or ideas without acknowledging that person's contribution.

**Plan:** The horizontal section of a building as shown on a drawing.

**Plan B :** A form of the hormone progesterone that is made in the laboratory and used to prevent pregnancy. It is being studied in the prevention of ovarian and endometrial cancer, and in the treatment of other conditions. Plan B is a type of oral contraceptive. Also called L-norgestrel and levonorgestrel.

**plan geologic map:** a two-dimensional map showing the locations and shapes of the outcrops at an appropriate scale and indicating, through a variety of geologic symbols, features such as folds, faults, contacts between different rock units, and strike and dip.

**Planck:** Planck contributed to the understanding of the electromagnetic spectrum by realizing that the relationship between the change in energy and frequency is quantized according to the equation  $\nabla E = hv$  where  $h$  is Planck's constant.

**Planck's constant:** A proportionality constant that relates the energy carried by a photon to its frequency. Planck's constant has a value of  $6.6262 \times 10^{-34}$  J s.

**plane:** often described as a flat surface.

**plane figure:** shape having only length and width (two dimensional).

**plane geometry:** the study of shapes and figures in two dimensions.

**plane of symmetry:** an imaginary plane that bisects a molecule, producing two halves that are mirror images of each other.

**plane-polarized light:** ordinary light that has had all oscillations of the electromagnetic field filtered out but one. The remaining oscillation exists in only one plane.

**Plane-polarized light:** The result of light passing through a polarizing filter resulting in only the extraordinary ray emerging as light polarized in only one plane.

**planetary albedo:** The fraction (approximately 30%) of incident solar radiation that is reflected by the earth-atmosphere system and returned to space, mostly by backscatter from clouds in the atmosphere.

**planetary boundary layer:** The transition region between the turbulent surface layer and the normally nonturbulent free atmosphere. This region is about 1 km in thickness and is characterized by a well-developed mixing generated by frictional drag as the air masses move over the Earth's surface. This layer contains approximately 10% of the mass of the atmosphere. Also called the atmospheric boundary layer or frictional layer.

**plankton:** Passively floating or weakly motile aquatic plants ( phytoplankton) and animals (zooplankton ).

**Planned special exposure:** An infrequent exposure to radiation, separate from and in addition to the annual dose limits (see 10 CFR 20.1003 and 20.1206).

**plant hormones:** hormones that regulate the growth and development of many plants.

**plant sterol :** A plant-based compound that can compete with dietary cholesterol to be absorbed by the intestines, resulting in lower blood cholesterol levels. Plant sterols may have some effect in cancer prevention. Also called phytosterol.

**plant-derived hematopoiesis enhancer PG2:** A proprietary botanical formulation derived from a traditional Chinese medicinal (TCM) plant with hematopoietic activity. Although the mechanism of action has yet to be fully elucidated, plant-derived hematopoiesis enhancer PG2 appears to stimulate multi-lineage progenitor cells that may be closely related to the hematopoietic stem cell. In both chemotherapy- and radiation therapy-induced animal models of myelosuppression, this agent has been shown to

restore granulocyte, erythrocyte, and platelet counts to normal levels. Plant-derived hematopoiesis enhancer PG2 stimulates the production of numerous cytokines such as granulocyte-colony stimulating factor (G-CSF) and may stimulate the production of neuroendocrine hormones.

**Plaque:** A circular clearing on a lawn (continuous layer) of bacterial or culture cells, resulting from cell lysis and production of phage or animal virus progeny.

**plaque :** In medicine, a small, abnormal patch of tissue on a body part or an organ. Plaques may also be a build-up of substances from a fluid, such as cholesterol in the blood vessels.

**plaque radiotherapy :** A type of radiation therapy used to treat eye tumors. A thin piece of metal (usually gold) with radioactive seeds placed on one side is sewn onto the outside wall of the eye with the seeds aimed at the tumor. It is removed at the end of treatment, which usually lasts for several days

**plasma:** A gas-like phase of matter that contains charged particles. OR a straw-colored liquid composed primarily of water; the fluid portion of blood. OR 1. In biology, the fluid in which blood cells or lymph cells are suspended. 2. A gaslike state of matter consisting of positively charged ions, free electrons, and neutral particles. Plasma is found in stars, the sun, the solar wind, lightning, and fire.

**plasma :** The clear, yellowish, fluid part of the blood that carries the blood cells. The proteins that form blood clots are in plasma.

**plasma cell :** A type of immune cell that makes large amounts of a specific antibody. Plasma cells develop from B cells that have been activated. A plasma cell is a type of white blood cell. Also called plasmacyte. OR large antibody-producing cells derived from B lymphocytes when stimulated.

**plasma cell myeloma :** A type of cancer that begins in plasma cells (white blood cells that produce antibodies). Also called Kahler disease, multiple myeloma, and myelomatosis.

**plasma cell tumor :** A tumor that begins in plasma cells (white blood cells that produce antibodies). Multiple myeloma, monoclonal gammopathy of undetermined significance (MGUS), and plasmacytoma are types of plasma cell tumors.

**plasma membrane:** also called a cell membrane; a membrane composed of lipids, proteins, and phospholipids. OR The membrane that separates the contents of a cell from its outside environment; it consists of a double layer of phospholipids with embedded proteins OR The membrane that surrounds the cytoplasm. OR The exterior membrane surrounding the cytoplasm of a cell. OR The outer membrane of a cell.

**plasma proteins:** The proteins present in blood plasma.

**plasmablastic lymphoma :** A very aggressive (fast-growing) type of large B-cell non-Hodgkin lymphoma (cancer that begins in the cells of the immune system). It is most common in patients with HIV infection, but may also occur in patients whose immune system is suppressed for other reasons.

**plasmacyte :** A type of immune cell that makes large amounts of a specific antibody. Plasmacytes develop from B cells that have been activated. A plasmacyte is a type of white blood cell. Also called plasma cell. or Having to do with plasma cells (a type of white blood cells).

**plasmacytoid dendritic cell vaccine:** A whole cell vaccine derived from a distinct subset of dendritic cells (DCs) with a plasma cell-like morphology that exhibits immunomodulating activity. Plasmacytoid dendritic cells (pDCs) express a characteristic set of surface markers, such as CD123 (interleukin-3 receptor alpha chain), BDCA-2 (blood dendritic cell antigen 2; CD303) and BDCA-4 (CD304), as well as intracellular toll-like receptors 7 and 9. Upon stimulation, the activated pDCs produce substantial amounts of interferon (IFN) alpha, and to a lesser degree IFN-beta, as well as other cytokines and chemokines, such as tumor necrosis factor alpha and interleukins 1, 6 and 8. In addition, these pDCs, directly or indirectly stimulate T-cells, B-cells and natural killer cells. This may potentially lead to increased immunity against tumor cells.

**plasmacytoma :** A type of cancer that begins in plasma cells (white blood cells that produce antibodies). A plasmacytoma may turn into multiple myeloma.

**plasmalogen:** A phospholipid with an alkenyl ether substituent on the C-1 of glycerol. OR Phospholipids containing an  $\alpha,\beta$ -unsaturated ether at the C-1 position of glycerol; abundant in phospholipids of the nervous system.

**plasmapheresis :** The process of separating certain cells from the plasma in the blood by a machine; only the cells are returned to the person.

Plasmapheresis can be used to remove excess antibodies from the blood.

**plasmid:** small circular DNA molecules often used as vectors to transform specific genes into cells. OR A circular DNA duplex that replicates autonomously in bacteria. Plasmids that integrate into the host genome are called episomes. Plasmids differ from viruses in that they never form infectious nucleoprotein particles. OR An extrachromosomal, independently replicating, small circular DNA molecule; commonly employed in genetic engineering. OR Circular duplex DNA molecules that replicate autonomously and act as accessory chromosomes in bacteria; they carry useful genes but are disposable under certain conditions.

**plasmid encoding antiangiogenic metargidin peptide:** A plasmid encoding the protein antiangiogenic metargidin plasmid (AMEP), the disintegrin domain of ADAM-15 (metargidin), with potential antiangiogenic and antimetastatic activities. Upon intratumoral electrotransfer of plasmid encoding AMEP, AMEP binds to cellular integrin receptors alpha-v-beta-3 (avb3) and alpha-5-beta-1 (a5b1), which are upregulated on activated endothelial cells and a variety of tumor cells. Binding to the integrin receptors may inhibit angiogenesis and may inhibit tumor cell proliferation.

**Plaster board:** A building board having a plaster core between two layers of stout paper.

**Plastering:** The operation of applying plaster and other similar materials to structures to produce a smooth surface. The normal process consists of three coats: (1) rendering, (2) floating, (3) setting.

**Plastic:** What most people think of when they think of polymers. Strictly speaking, a plastic is a polymeric material that can be molded into different shapes when heated (a thermoplastic) - this is true for most of the materials mentioned on this website, including poly(styrene), nylon66, PVC, and PET. Some misguided people say nasty things about plastic, but it wouldn't be everywhere if it wasn't (a) incredibly useful and (b) incredibly cheap. OR 1) High polymeric substances, including both natural and synthetic products, but excluding the rubbers that are capable in their manufacture of flowing under heat and pressure. 2) A material that contains an organic substance of large molecular weight, solid in finished state. OR A material that contains as an essential ingredient one or more organic polymeric substances of large molecular weight, is solid in its finished state,

and, at some stage in its manufacture or processing into finished articles, can be shaped by flow. OR An adjective indicating that the noun modified is made of, consists of, or pertains to plastics. (Noun) A material that in its finished state contains as an essential ingredient a synthetic polymer of high molecular weight, is a flexible or rigid solid but not an elastomer in its finished state, and at some stage in its manufacture or in its processing into finished articles can be shaped by flow or by in-situ polymerization or curing.

**Plastic Compound:** A mixture of resin(s) and additives to provide the end-user with a finished grade suitable for the required plastic extrusion profile or other manufactured plastic products.

**plastic deformation:** the physical, permanent changes, such as folds or stretching, in a rock from tectonic forces that do not result in fracturing. OR A change in dimensions of an object under load that is not recovered when the load is removed: opposed to elastic deformation. OR A change in dimensions of an object under load that is not recovered when the load is removed.

**Plastic Extrusion Machines:** Machines used for the process of plastic extrusion. Extruders produce items such as pipe/tubing, weather stripping, plastic fence posts and railings, synthetic decking, window frames, plastic films, thermoplastic coatings, and wire insulation, to name but a few.

**Plastic Extrusion Manufacturing:** Plastic extrusions are manufactured by loading plastic chips or pellets, in to a hopper before being fed into the screw barrel. The polymer resin is heated to molten state by a combination of heating elements and shear heating from the extrusion screw. The screw forces the resin through a die, forming the resin into the desired shape. The extrudate is cooled and solidified as it is pulled through the die or water tank.

**Plastic Extrusion Tooling:** Tooling consists of the dies which are designed for bespoke PVC extrusions

**Plastic Extrusions:** Plastic products extruded in a high-volume manufacturing process in which raw plastic material is melted and formed into a continuous profile. The first thermoplastic extrusion was made in Germany in 1935.

**Plastic Film:** Is a very thin piece of thermoplastic resin that is considerably longer than it is wide with a thicknesses of 10 mils (1 mil = 0.001 inch) or less (averaging 0.7 mils to 1.5 mils).

**plastic flow:** the ability of a material, such as glacial ice, to flow plastically without breaking.

**Plastic Jet Printing:** This process involves melting a solid plastic and extruding it layer by layer until the 3D -model is formed. In more complicated shapes, sometimes a soluble plastic is also extruded as a support piece, these can either be defined by the designer, or automatically rendered in the 3D modeling program.

**Plastic Manufacturing:** Fabrication of plastic products by various processes such as thermoplastic extrusion, sheet/film extrusion, blown film extrusion, various forms of plastic moulding, for example injection moulding, and vacuum forming of plastic sheet.

**Plastic Memory:** A phenomenon of plastic to return to its original molded form. Different plastics possess varying degrees of this characteristic.

**Plastic Modular Belt :** Plastic modules assembled with adjacent modules using a round stainless rod or plastic rod inserted through the modules.

**Plastic paint:** A plaster composition which can be manipulated after application to produce a patterned or modelled effect. The description should not be used for paints based on synthetic resins.

**Plastic Pellets:** Small plastic beads of uniform size, consisting of resins or mixtures of resins with compounding additives prepared for the plastic extrusion process, or other plastic manufacturing processes.

**Plastic Recycling:** The process of recovering plastic scrap or waste plastic material and reprocessing the plastic material into useful recycled plastic products.

**Plastic Sheet:** Is a comparatively thick piece of thermoplastic resin that is much longer than it is wider and as thick as 10 mils (1 mil = 0.001 inch) or more (up to 30 mils thick).

**plastic strain:** strain that results in a permanent change in the shape of a rock.

**plastic surgeon :** A surgeon who has special training in reducing scarring or disfigurement that may occur as a result of accidents, birth defects, or treatment for diseases.

**plastic surgery :** An operation that restores or improves the appearance of body structures.

**PLASTIC TOOLING:** Tools. e.g.. dies. jigs. fixtures, etc., for the metal forming trades constructed of plastics, generally laminates or casting materials.

**Plastic Tubing:** Plastic tubing can be made out of many different kinds of materials including, nylon, vinyl, polyurethane, polyethylene, among others.

**Plastic Virgin Material:** Any plastic compound or resin that has not been subjected to use or processing other than that required for the plastic compound or resin's original manufacture.

**Plasticiser:** "A compound added to a polymer to make it softer and more flexible. These are usually small molecules with dangling bits that can disrupt the packing of polymer chains. A common plasticiser used to soften PVC is dioctyl phthalate:

**Plasticiser:** A chemical compound added to some plastics to render them softer or more flexible.

**PLASTICITY:** A property of plastics which allows the material to be deformed continuously and permanently without rupture upon the application of a force that exceeds the yield value of the material.

**Plasticity:** The ability of a material to withstand continuous and permanent deformation by stresses exceeding the yield value of the material without rupture. OR A property of plastics which allows the material to be deformed continuously and permanently without rupture upon the application of a force that exceeds the yield value of the material. OR A property of plastics which allows the material to be deformed continuously and permanently without rupture upon the application of a force that exceeds the yield value of the material.

**Plasticize :** To render a material softer, more flexible and/or more moldable by the addition of a plasticizer. OR To soften a material and make it plastic or moldable, either by means of a plasticizer or the application of heat. OR To render a material softer, more flexible and/or more moldable by the addition of a plasticizer.

**Plasticizer:** Are usually low-melting solids or high-boiling organic liquids which, when added to hard plastics, impart flexibility. They have varying

degrees of softening action and solvating ability resulting from a reduction of intermolecular forces in the polymer. OR a liquid or solid incorporated in natural and synthetic resins and related substances to develop such properties as resiliency, elasticity, and flexibility. OR membrane solvent used in polymeric liquid membrane sensors. Solvent polymeric membranes are usually based on matrix containing about 33% (w/w) of PVC and 66% (w/w) of plasticizer. The presence of such a high amount of plasticizer provides membranes with required physical properties (i.e. lowers the glass transition temperature (T<sub>g</sub>) of the membrane polymer, decreases membrane resistance and ensures relatively high mobility of its components). In order to obtain a homogenous membrane phase the plasticizer should be compatible with the polymer.

**plastid:** In plants, a self replicating organelle; may differentiate into a chloroplast.

**Plastisol:** Mixtures of plasticizers and resins that can be converted to continuous films by applying heat.

**PLASTISOLS:** Mixtures of vinyl resins and plasticizers which can be molded: cast, or converted to continuous films by the application of heat.

**plate:** a segment of the earth's crust that is bounded by deep faults and moves in response to internal forces.

**Plate Dispersion Plug:** Two perforated plates held together with a connecting rod which are placed in the nozzle of an injection molding machine to aid in dispersing a colorant in a resin as it flows through the orifices in the plates.

**Plate Retainer:** The plate on which demountable pieces, such as mold cavities, ejector pins, guide pins, and bushings are mounted during molding

**Plate Stripper:** A plate that strips a liquid silicone molded piece from core pins or force plugs. The stripper-plate is set into operation by the opening of the mold

**plate tectonics:** the theory that the earth's surface is divided into large, slow-moving crustal plates that are driven by internal forces, such as convection currents in the mantle.

**Plate-mark:** Any imperfection in a pressed plastic sheet resulting from the surface of the pressing plate.

**Plate-Out :** An objectionable coating gradually formed on metal surfaces of molds during processing of plastics due to extraction and deposition of some ingredient such as pigment, lubricant, stabilizer or plasticizer.

**plateau:** a flat-lying hill underlain by resistant rock.

**platelet :** A tiny piece of cell that is made by breaking off of a large cell in the bone marrow. Platelets are found in the blood and spleen. They help form blood clots to slow or stop bleeding, and to help wounds heal. Also called thrombocyte.

**platelet-derived growth factor :** A family of molecules released from platelets (tiny pieces of cells that are found in the blood and that help the blood clot). Forms of platelet-derived growth factor help to heal wounds and to repair damage to blood vessel walls. They also help blood vessels grow. Also called PDGF.

**platelets:** small disk-shaped blood fragments produced in the bone marrow that serve as the starting material for blood clotting. OR Small, enucleated cells that initiate blood clotting; they arise from cells called megakaryocytes in the bone marrow. Also known as thrombocytes.

**Platen :** The large metal plates the mold attaches to on a plastic molding machine.

**Platen Movable:** The large back platen of an silicone injection molding machine to which the back half of the mold is secured during operation. The platen is moved horizontally or vertically by either a hydraulic ram or a toggle mechanism

**Platen Stationary:** The large front plate of an silicone injection molding machine to which the front plate of the mold is secured during operation

**Platens:** The flat surfaces of a molding machine to which the two halves of the mold are mounted One is stationary and the other travels There is a third platen (stationary) at the clamp end of the machine that serves as an anchoring point for the clamp unit.

**Platform Blowing:** A special technique for blowing large parts. To prevent excessive sag of the heavy parison the machine employs a table which after rising to meet the parison at the die descends with the parison but at a slightly lower rate than the parison extrusion speed.

**Platinol :** A drug used to treat cancers of the bladder, ovaries, and testicles. It is used in patients whose cancer cannot be treated with or has not gotten

better with other anticancer treatment. It is also being studied in the treatment of other types of cancer. Platinol contains the metal platinum. It kills cancer cells by damaging their DNA and stopping them from dividing. It is a type of DNA crosslinking agent. Also called cisplatin and Platinol-AQ.

**Platinol-AQ:** (Other name for: cisplatin)

**Platinol-AQ :** A drug used to treat cancers of the bladder, ovaries, and testicles. It is used in patients whose cancer cannot be treated with or has not gotten better with other anticancer treatment. It is also being studied in the treatment of other types of cancer. Platinol-AQ contains the metal platinum. It kills cancer cells by damaging their DNA and stopping them from dividing. It is a type of DNA crosslinking agent. Also called cisplatin and Platinol.

**Platinum:** Symbol:"Pt" Atomic Number:"78" Atomic Mass: 195.08amu. This is one of the many transition elements. Platinum is one of the Earth's precious metals. This shiny, silvery element has uses in jewelry, electronics, magnets, and airplane parts. Platinum is very non-reactive and does not oxidize in air. OR A metal that is an important component of some anticancer drugs, such as cisplatin and carboplatin.

**platyspodylia:** flatness of the bodies of the vertebrae

**Plausible accidents:** Postulated events that meet a probability test rather than the more challenging test represented by a design-basis event.

**Plavix:** (Other name for: clopidogrel bisulfate)

**playa lake:** a lake formed from water that drains from mountains into the central part of a valley.

**PLC (Performance Level Categories):** As defined by UL: "In order to avoid an excessive level of implied precision and bias, material performances for several tests are recorded as PLC, based on the mean test results (rather than recording the exact numerical results)". PLC levels are assigned to electric properties, tested according to UL 746A

**pleated sheet:** The side-by-side, hydrogen-bonded arrangement of polypeptide chains in the extended  $\beta$  conformation.

**PLED-based MnSOD mimetic:** A derivative of pyridoxyl ethyldiamine (PLED) and mimetic of the human mitochondrial manganese superoxide dismutase (MnSOD), with antioxidant, metal chelating and potential

chemoprotective activities. Upon administration, PLED-based MnSOD mimetic mimics MnSOD and scavenges oxygen free radicals such as superoxide anion, hydrogen peroxide, and hydroxyl radical, thereby preventing oxygen free radical damage to macromolecules such as DNA and minimizing oxygen free radical-related chemotoxicity in normal tissues. In addition, this agent is able to strongly bind to iron.

**pleiotropic pathway modifier CC-122 hydrochloride:** The hydrochloride salt form of CC-122, an orally available pleiotropic pathway modulator with potential antineoplastic activity. Check for active clinical trials using this agent.

**Pleistocene:** The earlier of the two epochs of the Quaternary period, starting 2 to 3 million years before the present and ending about 10,000 years ago. It was a time of glacial activity.

**Plenaxis :** A drug used to reduce the amount of testosterone made in patients with advanced symptomatic prostate cancer for which no other treatment options are available. It belongs to the family of drugs called gonadotropin-releasing hormone (GnRH) antagonists. Also called abarelix.

**Pleochroic:** Showing more than one color.

**pleomorphic :** Occurring in various distinct forms. In terms of cells, having variation in the size and shape of cells or their nuclei.

**plerixafor:** A bicyclam with hematopoietic stem cell-mobilizing activity. Plerixafor blocks the binding of stromal cell-derived factor (SDF-1alpha) to the cellular receptor CXCR4, resulting in hematopoietic stem cell (HSC) release from bone marrow and HSC movement into the peripheral circulation. or A drug used before autologous stem cell transplantation in patients with non-Hodgkin lymphoma or multiple myeloma. Plerixafor is given together with granulocyte-colony stimulating factor (G-CSF) to help move stem cells from the bone marrow to the blood. The stem cells can then be collected, stored, and given back to the patient. Plerixafor is a type of chemokine receptor antagonist. Also called AMD 3100 and Mozobil.

**pleura :** A thin layer of tissue that covers the lungs and lines the interior wall of the chest cavity. It protects and cushions the lungs. This tissue secretes a small amount of fluid that acts as a lubricant, allowing the lungs to move smoothly in the chest cavity while breathing.

**pleural cavity :** The space enclosed by the pleura, which is a thin layer of tissue that covers the lungs and lines the interior wall of the chest cavity.

**pleural effusion :** An abnormal collection of fluid between the thin layers of tissue (pleura) lining the lung and the wall of the chest cavity.

**pleurectomy :** Surgery to remove part of the pleura (a thin layer of tissue that covers the interior wall of the chest cavity).

**pleurodesis :** A medical procedure that uses chemicals or drugs to cause inflammation and adhesion between the layers of the pleura (a thin layer of tissue that covers the lungs and lines the interior wall of the chest cavity). This prevents the buildup of fluid in the pleural cavity. It is used as a treatment for severe pleural effusion.

**pleuropulmonary blastoma :** A rare and very aggressive (fast-growing) cancer that forms in tissues of the lung and pleura (a thin layer of tissue that covers the lungs and lines the interior wall of the chest cavity).

Pleuropulmonary blastoma is most common in children.

**plevitrexed:** An orally bioavailable, small molecule, non-polyglutamatable, antifolate quinazoline derivative thymidine synthetase inhibitor with potential antineoplastic activity. Plevitrexed is transported into the cell via the physiological reduced folate carrier (RFC) system. Intracellularly, this agent selectively binds to the folate binding site of thymidylate synthase and inhibits thymidine synthesis, which may result in DNA synthesis inhibition and apoptosis.

**plexiform fibrohistiocytic tumor :** A rare tumor found mainly in children and young adults. It usually forms in the skin on the arms and legs. It is slow-growing and usually does not spread to other parts of the body. It is a type of soft tissue tumor.

**plexiform neurofibroma :** A nerve that has become thick and misshapen due to the abnormal growth of cells and tissues that cover the nerve.

**plexopathy :** A disorder affecting a network of nerves, blood vessels, or lymph vessels.

**plicamycin:** An antibiotic isolated from the bacterium *Streptomyces plicatus* with antineoplastic activity. Plicamycin, also known as mithramycin, binds to the minor groove of DNA at GC-rich sites, resulting in inhibition of RNA synthesis; this agent also inhibits mRNA expression, resulting in a reduction in protein synthesis. In addition, plicamycin may

inhibit bone resorption by down regulating transcription of c-src, an oncogene involved in bone metabolism and resorption. or A drug used to treat some types of testicular cancer. It is also used to treat a higher-than-normal amounts of calcium in the blood or urine. Plicamycin binds to DNA and prevents cells from making RNA and proteins. It is a type of antineoplastic antibiotic. Also called Mithracin and mithramycin.

**plinabulin:** An orally active diketopiperazine derivative with potential antineoplastic activity. Plinabulin selectively binds to the colchicine-binding site of tubulin, thereby interrupting equilibrium of microtubule dynamics; mitotic spindle assembly is disrupted, resulting in cell cycle arrest at the M phase and blockage of cell division in tumor cells. In addition, this agent induces tubulin depolymerization in vascular endothelial cells, resulting in the disruption of tumor blood vessel architecture and a selective collapse of tumor vasculature. or A cyclic depsipeptide isolated from the marine tunicate *Aplidium albicans*. Plitidepsin displays a broad spectrum of antitumor activities, inducing apoptosis by triggering mitochondrial cytochrome c release, initiating the Fas/DC95, JNK pathway and activating caspase 3 activation. This agent also inhibits elongation factor 1-a, thereby interfering with protein synthesis, and induces G1 arrest and G2 blockade, thereby inhibiting tumor cell growth.

**Pliolite:** A synthetic type of resin used in the manufacture of some types of masonry paints. Pliolite is the trade mark of the Goodyear Tire & Rubber Co. Inc.

**PLK1 inhibitor TAK-960:** An orally available, Polo-like kinase 1 (PLK1) inhibitor with potential antineoplastic activity. Polo-like kinase 1 inhibitor TAK-960 selectively inhibits PLK1, inducing selective G2/M cell-cycle arrest followed by apoptosis in a variety of tumor cells while causing reversible cell-cycle arrest at the G1 and G2 stages without apoptosis in normal cells. PLK1 inhibition may result in the inhibition of proliferation in PLK1-overexpressed tumor cells. PLK1, named after the polo gene of *Drosophila melanogaster*, is a serine/threonine kinase crucial in the regulation of mitosis.

**PLL:** A type of chronic lymphocytic leukemia (CLL) in which too many immature white blood cells (prolymphocytes) are found in the blood and

bone marrow. PLL usually progresses more rapidly than classic CLL. Also called prolymphocytic leukemia.

**ploidy** : The number of sets of chromosomes in a cell or an organism. For example, haploid means one set and diploid means two sets.

**Plots**: graphical representations of analysis results.

**plozalizumab**: A humanized monoclonal antibody directed against the human chemokine receptor 2 (CCR2), with potential antiangiogenic, immunomodulating, antimetastatic, and antineoplastic activities.

Plozalizumab binds to CCR2 and prevents binding of the endothelium-derived CLL2 (monocyte chemoattractant protein-1 or MCP1) to its receptor CCR2, which may result in inhibition of CCR2 activation and so inhibition of angiogenesis, tumor cell migration, and tumor cell proliferation. In addition, this agent may reduce levels of C-reactive protein (CRP). The G-protein coupled receptor CCR2 is expressed on the surface of monocytes and macrophages, stimulates the migration and infiltration of these cell types, and plays an important role in inflammation, angiogenesis, and tumor cell migration and proliferation.

**PLS (partial least-squares) treatment**: A technique used to perform quantitative analyses on multicomponent mixtures with overlapping bands. PLS also allows calibration using mixtures permitting the modeling of interactions between components and the use of combinations of multiple numbers of wavelengths in the calibration.

**Plug Assist**: – A form created to help push material down for it to be vacuum formed. If this isn't used, webbing can occur which are small creases in the material on corners and edges. Bottoms of the cavity can get very weak in strength.

**Plug Forming**: A thermoforming process in which a plug or male mold is used to partially preform the part before forming is completed using vacuum or pressure.

**Plug-and-ring**: Method of sheet forming in which a plug, functioning as a male mold, is forced into a heated plastic sheet held in place by a clamping ring.

**Plummer-Vinson syndrome** : A disorder marked by anemia caused by iron deficiency, and a web-like growth of membranes in the throat that makes swallowing difficult. Having Plummer-Vinson syndrome may

increase the risk of developing esophageal cancer. Also called Paterson-Kelly syndrome and sideropenic dysphagia.

**plunge:** the angle between the horizontal and the hinge line in a plunging fold.

**PLUNGER:** That part of a transfer or injection press that applies pressure on the unmelted plastic material to push it into the chamber, which in turn forces plastic melt at the front of the chamber out through the nozzle. See RAM. OR The injecting member of a non-screw design molding machine. Plungers do not rotate (auger) to bring material forward in preparation for the next cycle. Nor do they blend the material as a screw does.

**plunging fold:** a fold that has been tipped by tectonic forces and that has a hinge line, or axis, that is not horizontal.

**pluripotent :** Able to mature or develop in any of several ways.

**pluripotent stem cell :** A cell that is able to develop into many different types of cells or tissues in the body.

**plutonic:** rock that forms below the Earth's surface (intrusive).

**plutonic rock:** an intrusive, discordant, generally coarse-grained rock that was formed deep in the earth's crust.

**Plutonium:** Symbol:"Pu" Atomic Number:"94" Atomic Mass: (244)amu. Plutonium is one of the elements in the actinide series of inner transition elements. It may be classified as a rare earth element. It is a radioactive and unstable element and you will find it in nuclear devices and reactors.

**Plutonium (Pu):** A heavy, radioactive, manmade metallic element with atomic number 94. Its most important isotope is fissile plutonium-239, which is produced by neutron irradiation of uranium-238. It exists in only trace amounts in nature.

**pluvial lake:** a lake formed during the wetter climates that existed during and after glacial retreat.

**PLX4032:** A drug used to treat advanced melanoma that has a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. PLX4032 blocks this mutated protein, which may stop the growth of cancer cells. It is a type of kinase inhibitor and a type of targeted therapy agent. Also called BRAF (V600E) kinase inhibitor RO5185426, RG7204, vemurafenib, and Zelboraf.

**pM-81:** A monoclonal antibody that is being studied in the detection and treatment of cancer. Monoclonal antibodies are produced in the laboratory and can locate and bind to cancer cells.

**PM00104:** A synthetic tetrahydroisoquinoline alkaloid related to the marine natural compounds Jorumycin and the family of Renieramycins, obtained from molluscs and sponges, respectively, with potential antineoplastic activity. PM00104 reversibly binds to DNA and interferes with DNA replication, transcription, and translation. DNA binding by this agent does not trigger DNA damage checkpoint responses, hence PM00104 exhibits a reversible cytotoxicity.

**PM3:** A semi-empirical method.

**PMMA:** Polymethyl methacrylate

**PMN:** A type of immune cell that has granules (small particles) with enzymes that are released during infections, allergic reactions, and asthma. Neutrophils, eosinophils, and basophils are PMNs. A PMN is a type of white blood cell. Also called granular leukocyte, granulocyte, and polymorphonuclear leukocyte.

**PMP2:** Spin-projected MP2 energy. Analog of PUHF, but for UMP2 energy instead of UHF energy. Likewise, the PMP3 and PMP4 energies are the UMP3 and UMP4 analogs.

**PMS:** Paramethylstyrene

**PMT:** Polymethylpentene

**PN401:** A drug used in the emergency treatment of patients who receive too much fluorouracil or capecitabine (types of anticancer drugs). It is also used in the emergency treatment of heart or central nervous system (CNS) toxicity or other serious side effects that occur within 4 days of ending treatment with fluorouracil or capecitabine. PN401 may help protect healthy cells from some of the side effects caused by certain anticancer drugs. It is a type of cytoprotective agent. Also called triacetyluridine, uridine triacetate, and Vistogard.

**PNET :** One of a group of cancers that develop from the same type of early cells, and share certain biochemical and genetic features. Some PNETs develop in the brain and central nervous system (CNS-PNET), and others develop in sites outside of the brain such as the limbs, pelvis, and chest wall (peripheral PNET). Also called primitive neuroectodermal tumor.

**Pneumatic:** moved or worked by air pressure.

**pneumatic larynx :** A device that is used to help a person talk after a laryngectomy. It uses air to produce a humming sound, which is converted to speech by movement of the lips, tongue, or glottis.

**pneumococcal 13-valent conjugate vaccine:** A pneumococcal conjugate vaccine containing 13 different strains of the bacterium *Streptococcus pneumoniae*, used in children and studied in immunocompromised patients for the prevention of pneumococcal disease. The pneumococcal 13-valent conjugate vaccine contains capsular antigen polysaccharides derived from the *S. pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F that are individually conjugated to a nontoxic diphtheria cross-reactive material (CRM) carrier protein (CRM197). Upon vaccination, pneumococcal 13-valent conjugate vaccine induces active immunization against 13 different serotypes of *S. pneumoniae* and protects against pneumococcal disease.

**pneumococcal 7-valent conjugate vaccine:** An active immunizing agent used to prevent infection by the bacterium *Streptococcus pneumoniae*. Pneumococcal 7-valent conjugate vaccine consists of a solution of saccharides of the capsular antigens of *Streptococcus* serotypes 4, 6B, 9V, 14, 18C, 19F, and 23F individually conjugated to diphtheria CRM 197 protein. Check for active clinical trials using this agent.

**pneumococcal polyvalent vaccine:** An polyvalent vaccine used to prevent infection by the bacterium *Streptococcus pneumoniae*. Pneumococcal polyvalent vaccine contains highly purified capsular antigens from the 23 most prevalent or invasive pneumococcal types of *Streptococcus pneumoniae* to ensure cross-protection. Following vaccination, protective capsular type-specific antibody levels typically develop by the third week; serotype-specific antibody levels generally decline after 5-10 years.

**pneumonectomy :** Surgery to remove all of one lung. In a partial pneumonectomy, one or more lobes of a lung are removed.

**pneumonia :** A severe inflammation of the lungs in which the alveoli (tiny air sacs) are filled with fluid. This may cause a decrease in the amount of oxygen that blood can absorb from air breathed into the lung. Pneumonia is usually caused by infection but may also be caused by radiation therapy, allergy, or irritation of lung tissue by inhaled substances. It may involve part or all of the lungs.

**pneumonitis :** Inflammation of the lungs. This may be caused by disease, infection, radiation therapy, allergy, or irritation of lung tissue by inhaled substances.

**pneumothorax:** abnormal presence of air in the pleural cavity resulting in the collapse of the lung

**Pneumovax 23:** (Other name for: pneumococcal polyvalent vaccine)

**pNGVL3-hICD vaccine:** A plasmid DNA cancer vaccine encoding the intracellular domain (ICD) of the HER-2/neu proto-oncogene. Upon administration and after cellular uptake by skin or muscle cells, the pNGVL3-hICD vaccine plasmid expresses the HER-2/neu protein, which, after intracellular processing, may elicit both antigen-specific cytotoxic T-lymphocyte (CTL) and humoral immune responses against tumor cells expressing HER-2. The HER-2/neu ICD protein is highly immunogenic and, as a subdominant epitope, may be associated with decreased immune tolerance.

**pNGVL4a-CRT/E7(detox) DNA vaccine:** A cancer vaccine consisting of the DNA plasmid pNGVL4a-A encoding calreticulin (CRT) linked to a detox form of human papillomavirus (HPV) type 16 E7 antigen, with potential immunomodulating and antineoplastic activities. Upon administration, this vaccine may generate a potent cytotoxic T-lymphocyte (CTL) response against E7-expressing tumor cells, resulting in tumor cell death. For E7(detox), the amino acids in E7 at positions 24 (cysteine to glycine) and 26 (glutamic acid to glycine) were substituted. CRT, a 46 kDa protein located in the lumen of the cell's endoplasmic reticulum (ER), may potentiate MHC class I presentation of HPV-16 E7 to E7-specific CD8-positive T cells. In addition, pNGVL4a-A contains two short immunostimulatory DNA sequences (ISS) in the noncoding region, which may elicit the production of IFN- and IL-12 in transfected keratinocytes and dermal antigen presenting cells (APCs), resulting in a potent T helper cell type 1 response.

**pNGVL4a-Sig/E7(detox)/HSP70 DNA vaccine:** An antigen-specific DNA cancer vaccine consisting of the coding sequences of a signal peptide (pNGVL4a-Sig), a detox form of the human papillomavirus type 16 (HPV-16) antigen E7, and the heat shock protein 70 (HSP70). Upon administration, this vaccine may generate potent cytotoxic CD8(+) T-cell responses against E7-expressing tumor cells, resulting in tumor cell death.

**PNH:** Paroxysmal nocturnal hemoglobinuria. A rare disorder in which red blood cells are easily destroyed by certain immune system proteins. Symptoms include blood clots, and red or brownish urine in the morning. Aplastic anemia (decreased production of blood cells) may lead to PNH, and people with this disorder are at increased risk of acute myelogenous leukemia. Also called paroxysmal nocturnal hemoglobinuria.

**PNP-expressing ovine atadenovirus FP253:** An ovine atadenovirus encoding E. coli purine nucleoside phosphorylase (PNP) with prodrug activating activity. Under the control of a prostate-directed promoter, PNP-expressing atadenovirus vaccine FP253 expresses PNP in prostate tissue only after intraprostatic administration; this enzyme catalyzes systemically administered fludarabine prodrug into the active agent, 2-fluoroadenine. Localized prodrug activation provides prostate-targeted chemotherapy, potentially reducing systemic side effects. Check for active clinical trials using this agent.

**PNU 166148:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called topoisomerase inhibitors.

**PNU-93914:** A form of the anticancer drug paclitaxel that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of several types of cancer. PNU-93914 blocks the ability of cells to divide and may kill cancer cells. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called LEP-ETU, liposomal paclitaxel, LipoTaxen, and paclitaxel liposome.

**Pnu-Imune 23:** (Other name for: pneumococcal polyvalent vaccine)

**Pocket dosimeter:** A small ionization detection instrument that indicates ionizing radiation exposure directly. An auxiliary charging device is usually necessary.

**podiatrist :** A doctor who has special training in diagnosing and treating foot and ankle problems.

**pOH:** Measures the basicity of a solution. It is the negative log of the concentration of the hydroxide ions. OR pOH is the measure of hydroxide ion concentration. The scale is the reverse of the pH scale. Seven is still neutral but values below seven are basic and values above seven are acidic.

**point:** a basic element of geometry, a location. If two lines intersect, they do so at a point.

**point mutation :** An alteration in a DNA sequence caused by the substitution of a single nucleotide for another nucleotide.

**point source:** A single source, usually in a defined location (WHO, 1979). OR the point of contamination.

**Pointing:** Filling the joints in brickwork or masonry with mortar.

**Poise:** A measurement of viscosity. OR A cgs unit of resistance to fluid flow (viscosity). If a force of 1 dyne is needed to force two fluid layers with 1 cm<sup>2</sup> area that are 1 cm apart past each other at a speed of 1 cm/s, the liquid has a viscosity of 1 poise. OR The unit of viscosity expressed as one dyne per second per square centimeter.

**POISEUILLE FLOW (also called PRESSURE FLOW):** The flow of a fluid caused by a pressure difference. The resulting velocity profile in a tube is parabolic for Newtonian fluids and somewhat "flatter" for polymer melts. The pressure drop is linear in the direction of flow for tubes or channels with parallel walls.

**Poison, neutron:** In reactor physics, a substance (other than fissionable material) that has a large capacity for absorbing neutrons in the vicinity of the reactor core. This effect may be undesirable in some reactor applications because it may prevent or disrupt the fission chain reaction, thereby affecting normal operation. However, neutron-absorbing materials (commonly known as "poisons") are intentionally inserted into some types of reactors to decrease the reactivity of their initial fresh fuel load. (Adding poisons, such as control rods or boron, is described as adding "negative reactivity" to the reactor.)

**poisoned catalyst:** a deactivated catalyst; one that is less effective in reactions than the nonpoisoned material.

**Poisoning:** the chemical conversion of the surface of a solid state electrode to a form, which is less responsive to, changes in ionic activity. In many cases, electrode function may be restored by physically removing a thin layer of the sensing element or by reversing the poisoning reaction chemically.

**Poisson's Ratio :** The constant relating the changes in dimensions which occur when a material is stretched. It is obtained by dividing the change in

width per unit length by the change in length per unit length.

**Pol I inhibitor CX5461:** An orally bioavailable inhibitor of RNA polymerase I (Pol I), with potential antineoplastic activity. Upon oral administration, CX-5461 selectively binds to and inhibits Pol I, prevents Pol I-mediated ribosomal RNA (rRNA) synthesis, induces apoptosis, and inhibits tumor cell growth. Pol I, the multiprotein complex that synthesizes rRNA, is upregulated in cancer cells and plays a key role in cell proliferation and survival. Hyperactivated rRNA transcription is associated with uncontrolled cancer cell proliferation.

**polaprezinc:** An orally bioavailable chelate composed of zinc and L-carnosine, with potential gastroprotective, anti-oxidant, anti-ulcer and anti-inflammatory activities. Upon administration, polaprezinc increases the expression of various anti-oxidant enzymes, such as superoxide dismutase 1 (SOD-1), SOD-2, heme oxygenase-1 (HO-1), glutathione S-transferase (GST), glutathione peroxidase (GSH-px), peroxidoredoxin-1 (PRDX1; PRXI) and PRXD5 (PRXV) in the gastric mucosa, which protect cells against reactive oxygen species (ROS). In addition, this agent inhibits the activity of the transcription factor nuclear factor-kappaB (NF-kB) and reduces the expression of several pro-inflammatory cytokines, such as interleukin (IL) 1beta, IL-6, IL-8, and tumor necrosis factor alpha (TNF-a). Polaprezinc also increases the expression of various growth factors, such as platelet-derived growth factor-B (PDGF-B), vascular endothelial growth factor (VEGF), and nerve growth factor (NGF), and various heat shock proteins (HSPs), including HSP90, HSP70, HSP60, HSP47, HSP27, and HSP10. This protects against damages to, and accelerates healing of the gastric mucosa.

**polar:** Hydrophilic, or "water-loving"; describing molecules or groups that are soluble in water.

**polar bond:** a bond with both ionic and covalent characteristics. OR A bond involving electrons that are unequally shared. Polar bonds can be thought of as intermediate between the extremes represented by covalent bonds and ionic bonds.

**polar covalent bond:** a bond in which the shared electrons are not equally available in the overlap region, leading to the formation of partially positive and partially negative ends on the molecule.

**Polar group:** A hydrophilic (water-loving) group.

**polar molecules:** Molecule with a partial charge. OR A polar molecule is a molecule with an imbalance of electrical charge. OR An asymmetric molecule containing polar bonds. H<sub>2</sub>O, NH<sub>3</sub>, and HCl are examples of polar molecules. Non-examples are CO<sub>2</sub>, CCl<sub>4</sub>, and BCl<sub>3</sub> which contain polar bonds but are nonpolar because they have symmetric shapes. Alkanes are usually asymmetric but are nonpolar because they contain no polar bonds. Polar molecules are electric dipoles and they attract each other via dipole-dipole forces.

**Polar mutation:** A mutation in one gene that reduces the expression of a gene or genes distal to the promoter in the same operon.

**polar wandering:** the apparent movement of the earth's geographic and magnetic poles through geologic time.

**polarimeter:** a device that first polarizes light and then passes the polarized light through a chemical solution. An analyzer shows the degree and direction of rotation of the plane-polarized light if the chemical is optically active. OR An instrument for determining the rotation of polarization of light as the light passes through a solution containing an optically-active substance.

**Polaris:** the North Star, located in the Little Dipper constellation.

**polarity:** the asymmetrical distribution of electrons in a molecule, leading to positive and negative ends on the molecule. OR (1) In chemistry, the nonuniform distribution of electrons in a molecule; polar molecules are usually soluble in water. (2) In molecular biology, the distinction between the 5' and 3' ends of nucleic acids. OR A property associated with molecules when the center of positive charge and the center of negative charge don't coincide. See also polar molecule and polar bond.

**polarizability:** Indication of the ease of distortion of an electron cloud around an atom. Large atoms (like iodine) have many electrons, and their location may easily shift, producing regions of partial positive and negative charge. The larger the atom, the greater the polarizability, or the more easily an electron cloud may be distorted.

**polarized:** A "polarized" basis set includes functions that are of higher angular momentum than is minimally required. For example, carbon atoms have 1s, 2s, and 2p orbitals, so a polarized basis set would also include at least a set of d-functions. The added functions are often called "polarization

functions." Polarization functions help to account for the fact that atoms within molecules are not spherical.

**polarizer:** a filter that blocks light waves in all planes except one; a polarizer creates plane-polarized light.

**Polarography:** An analytical technique that measures the current flow at a liquid-drop electrode at a given potential. The current flow is proportional to the amount of compound present.

**polatuzumab vedotin:** An antibody-drug conjugate (ADC) composed of a monoclonal antibody directed against B-cell antigen receptor complex-associated protein beta chain (CD79B) conjugated, via a protease-cleavable peptide linker, to monomethyl auristatin E (MMAE), an auristatin derivative and a potent microtubule inhibitor, with potential antineoplastic activity. Upon administration, polatuzumab vedotin selectively binds to CD79B, a protein which is abundantly expressed on the surface of B-cells. Upon internalization and proteolytic cleavage, MMAE binds to tubulin and inhibits its polymerization, resulting in G2/M phase arrest and tumor cell apoptosis. CD79B, a component of the B-cell receptor (BCR), plays a key role in B-cell receptor signaling and is expressed on the surface of almost all types of malignant B-cells.

**polifeprosan 20 carmustine implant :** A biodegradable wafer that is used to deliver the anticancer drug carmustine directly into a brain tumor site after the tumor has been removed by surgery. Also called carmustine implant and Gliadel Wafer.

**polifeprosan 20 with carmustine implant:** A synthetic, biodegradable wafer containing the agent carmustine with antineoplastic activity. Used to deliver drug directly into a brain tumor site and typically implanted post-surgically, the wafer is made of a biodegradable poly-anhydride copolymer and contains the nitrosourea carmustine. As an antineoplastic nitrosourea, carmustine alkylates and cross-links DNA during all phases of the cell cycle, resulting in disruption of DNA function, cell cycle arrest, and apoptosis. Carmustine also carbamoylates proteins, including DNA repair enzymes, resulting in an enhanced cytotoxic effect. Carmustine is highly lipophilic and crosses the blood-brain barrier readily.

**polihexanide solution:** A solution containing the polymer polihexanide, with potential antimicrobial, disinfectant and wound healing activities. Upon application to a wound, polihexanide strongly binds to the wound

surface and exerts an antiseptic effect through the binding of the positively charged guanidine groups of polyhexanide with the negatively charged phospholipids of the bacterial cell membrane. This compromises the stability of the bacterial cell membrane, which results in the leakage of cytoplasmic components and leads to bacterial cell death. In addition, polyhexanide accelerates wound healing by promoting epithelial cell migration and proliferation.

**pollutant:** A substance that contaminates an environment. OR Any undesirable solid, liquid, or gaseous matter in a gaseous, liquid, or solid medium (ISO, 1977). For the meaning of "undesirable" in air pollution contexts, see pollution. A primary pollutant is a pollutant emitted into the atmosphere from an identifiable source. A secondary pollutant is a pollutant formed by chemical reaction in the atmosphere (WHO, 1980).

**pollution:** The introduction of pollutants into a solid, liquid, or gaseous medium, the presence of pollutants in a solid, liquid, or gaseous medium, or any undesirable modification of the composition of a solid, liquid, or gaseous medium (ISO, 1979). For air pollution, an undesirable modification is one that has injurious or deleterious effects. OR a substance that harms living organisms or the environment.

**Polo-like kinase 1 inhibitor GSK-461364:** A small molecule Polo-like kinase 1 (PLK1) inhibitor with potential antineoplastic activity. Polo-like kinase 1 inhibitor GSK461364 selectively inhibits Plk1, inducing selective G2/M arrest followed by apoptosis in a variety of tumor cells while causing reversible cell arrest at the G1 and G2 stage without apoptosis in normal cells. Plk1, named after the polo gene of *Drosophila melanogaster*, is a serine/threonine protein kinase involved in regulating mitotic spindle function in a non-ATP competitive manner. Check for active clinical trials using this agent.

**Polo-like kinase 1 inhibitor MK1496:** An orally bioavailable Polo-like kinase 1 (Plk1) inhibitor with potential antineoplastic activity. Polo-like kinase 1 inhibitor MK1496 selectively inhibits Plk1, inducing selective G2/M arrest followed by apoptosis in a variety of tumor cells while causing reversible cell arrest at the G1 and G2 stage without apoptosis in normal cells. Plk1, named after the polo gene of *Drosophila melanogaster*, is a serine/threonine protein kinase involved in regulating mitotic spindle function in a non-ATP competitive manner.

**Polo-like kinase 1 inhibitor NMS-1286937:** An orally bioavailable, small-molecule Polo-like kinase 1 (PLK1) inhibitor with potential antineoplastic activity. Polo-like kinase 1 inhibitor NMS-1286937 selectively inhibits PLK1, inducing selective G2/M cell-cycle arrest followed by apoptosis in a variety of tumor cells while causing reversible cell-cycle arrest at the G1 and G2 stages without apoptosis in normal cells. PLK1 inhibition may result in the inhibition of proliferation in PLK1-overexpressing tumor cells. PLK1 is a serine/threonine protein kinase crucial in the regulation of mitosis.

**Polo-like kinase 4 inhibitor CFI-400945 fumarate:** An orally available fumarate salt form of CFI-400945, a polo-like kinase 4 (PLK4) inhibitor with potential antineoplastic activity. Upon oral administration, polo-like kinase 4 inhibitor CFI-400945 selectively inhibits PLK4, which results in the disruption of mitosis and the induction of apoptosis. PLK4 inhibition also prevents cell division and inhibits proliferation of PLK4-overexpressing tumor cells. PLK4, a member of the polo family of serine/threonine kinases overexpressed in a variety of cancer cell types, plays a crucial role in the regulation of centriole duplication during the cell cycle.

**Polocaine:** (Other name for: mepivacaine hydrochloride)

**Polonium:** Symbol:"Po" Atomic Number:"84" Atomic Mass: (209)amu. Polonium is a rare element often found in nature with uranium. It is radioactive and very dangerous. You may find it as a byproduct of reactions in a nuclear reactor.

**poly (ADP-ribose) polymerase :** A type of enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Inhibitors of one enzyme, poly (ADP-ribose) polymerase-1, are being studied in the treatment of cancer. Also called PARP.

**poly (ADP-ribose) polymerase inhibitor :** A substance that blocks an enzyme in cells called PARP. PARP helps repair DNA when it becomes damaged. DNA damage may be caused by many things, including exposure to UV light, radiation, certain anticancer drugs, or other substances in the environment. In cancer treatment, blocking PARP may help keep cancer cells from repairing their damaged DNA, causing them to die. Poly (ADP-

ribose) polymerase inhibitors are a type of targeted therapy. Also called PARP inhibitor.

**poly (ADP-ribose) polymerase-1 :** An enzyme involved in many functions of the cell, including the repair of DNA damage. DNA damage may be caused by normal cell actions, UV light, some anticancer drugs, and radiation used to treat cancer. Inhibitors of poly (ADP-ribose) polymerase-1 are being studied in the treatment of cancer. Also called PARP-1.

**poly AU:** A synthetic polyadenylic-polyuridylic acid double-stranded RNA. Poly AU may stimulate the release of cytotoxic cytokines and, by inducing the production of interferon, may increase the number and tumoricidal activities of various immunohematopoietic cells. Check for active clinical trials using this agent.

**poly IC:** A synthetic polyinosinic-polycytidylic acid double-stranded RNA. Poly IC may stimulate the release of cytotoxic cytokines and, by inducing interferon-gamma production, may increase the number and tumoricidal activities of various immunohematopoietic cells.

**poly ICLC:** A synthetic complex of carboxymethylcellulose, polyinosinic-polycytidylic acid, and poly-L-lysine double-stranded RNA. Poly ICLC may stimulate the release of cytotoxic cytokines and, by inducing interferon-gamma production, may increase the tumoricidal activities of various immunohematopoietic cells.

**poly-alendronate dextran-guanidine conjugate:** A polybisphosphonate dextran-guanidine conjugate with potential anti-resorptive and antineoplastic activities. Alendronic acid and aminoguanidine were conjugated sequentially to oxidized dextran resulting in an average of 8 alendronate and 50 guanidine groups coupled to the dextran backbone. Upon administration, the poly-alendronate dextran-guanidine conjugate inhibits the mevalonate pathway by inhibiting farnesyl diphosphate synthase (FDPS) which leads to a reduction in protein prenylation and to the loss of downstream metabolites essential for osteoclast function. This eventually leads to the induction of apoptosis in osteoclasts. Also, by preventing osteoclast-mediated bone resorption, this agent decreases bone turnover and stabilizes the bone matrix. The guanidine moiety increases the nitrogen content and possibly the activity of the bisphosphonate and its ability to inhibit FDPS. In addition, the guanidine moiety facilitates cell internalization and may contribute to this agent's cytotoxicity.

**poly-gamma glutamic acid:** A water-soluble and biodegradable polymer naturally synthesized by various strains of Bacillus and composed of D- and L-glutamic acid polymerized via gamma-amide linkages, with potential antineoplastic activity. Upon administration, poly-gamma glutamic acid may augment the immune response by increasing the production of interferon-gamma (IFN-gamma) and tumor necrosis factor-alpha (TNF-alpha) and inducing the activation of macrophage and natural killer (NK) cells. In addition to its tumor control properties, IFN-gamma is a major mediator of innate and adaptive immunity against viral and intracellular bacterial infections. TNF-alpha is a cytokine involved in systemic inflammation, which is capable of inducing apoptotic cell death and exhibits anti-tumoral effects.

**poly-ICLC :** A substance that is being studied in the treatment of cancer and for its ability to stimulate the immune system. It is made in the laboratory by combining the nucleic acid RNA with the chemicals poly-L-lysine and carboxymethyl cellulose.

**poly-TLR agonist polyantigenic vaccine CADI-05:** A poly-Toll-like receptor (TLR) agonist polyantigenic vaccine containing heat killed Mycobacterium indicus pranii (Mycobacterium w or Mw) with potential immunostimulating and antineoplastic activities. Upon administration, poly-TLR agonist polyantigenic vaccine activates a number of TLRs, which may result in macrophage and plasmacytoid dendritic cell (pDC) stimulation; secretion of interferon alpha; production of pro-inflammatory cytokines; upregulation of co-stimulatory molecules, enhanced T and B-cell stimulatory responses; T cell proliferation, and a Th1 immune response. TLRs are transmembrane receptors that recognize structurally conserved microbial molecules such as bacterial cell-surface lipopolysaccharides (LPS), lipoproteins, lipopeptides, lipoarabinomannan and flagellin, among others; immune responses stimulated by TLR activation may result in antineoplastic effects.

**Poly(A) tail:** A long (as many as 250 nucleotides) polyadenylate segment added posttranscriptionally to the 3' end of most eukaryotic mRNA.

**Polya's four-step process:** A process of problem solving published in 1945 by George Polya. The steps are as follows: 1) Understand the problem; 2) Devise a plan; 3) Carry out the plan; 4) Look back over the results.

**polyacrylamide hydrogel:** A transparent, biocompatible, non-resorbable, homogenous hydrogel containing 97.5% apyrogenic water and 2.5% of the cross-linked, synthetic polyacrylamide. Upon injection into the urethral submucosal tissue, the polyacrylamide hydrogel serves as a bulk forming agent and may possibly increase the strength of the urethral sphincter and thereby prevent or decrease stress-induced urinary incontinence. Check for active clinical trials using this agent.

**Polyacrylate :** A typically acrylic acid based, short chained and highly charged water soluble anionic polymer. Used typically as dispersant and as antiscalting agent.

**Polyaluminum chloride, PAC or PAX :** Polyaluminum chloride is a generic name for aluminum-based inorganic coagulants carrying cationic charge also at neutral and mildly alkaline pH range. PAX is produced from aluminum hydrate and hydrochloric acid. PAX is used in drinking water and waste water treatment to remove impurities from the water.

**Polyamide:** A polymer in which the structural units are linked by amide or thioamide groupings. Many polyamides are fiber-forming.

**Polyamide (PA):** Also known as nylon, a thermoplastic used for high strength, puncture resistance, heat resistance, and barrier to certain gasses.

**Polyamine:** A hydrocarbon containing more than two amino groups. OR A short chained, but highly charged water soluble cationic polymer. Used typically as organic coagulant in water treatment and as anionic trash control agent in papermaking.

**polyamine analogue PG11047:** A second generation polyamine analogue, synthesized through the restriction of molecular conformations of parent polyamine compounds, with potential antineoplastic activity. Polyamine analogue PG11047 may displace endogenous polyamines from DNA binding sites, thereby interfering with cell cycle processes dependent upon polyamine binding and function, and resulting in cell-cycle arrest, induction of apoptosis, depletion of polyamines, and interference with gene and ligand-receptor activities involved with cell growth. This agent may exhibit decreased toxicity and enhanced cytotoxicity profiles compared to first-generation polyamine compounds. In tumor cells, there is an increase dependence on polyamines as well as a dysregulated polyamine metabolic pathway resulting in abnormal or sustained tumor growth.

**polyatomic ion:** A polyatomic ion is a charged particle that contains more than two covalently bound atoms. See Polyatomic Ions for more.

**polyatomic molecule:** A polyatomic molecule is an uncharged particle that contains more than two atoms.

**polycarbonate:** A polymer in which the repeating unit is an organic carbonate  $[-R-O-C(O)-O-]_n$ . OR Polycarbonate is a resilient engineering resin with excellent optical properties. It is commonly made from bisphenol A linked by carbonate groups (O-CO-O) in the Engineering Polymers family. Polycarbonate is an engineering resin that exhibits good strength and high clarity thus used in technical applications such as optical media and automotive applications such as transparent construction sheet, automotive headlamps, CDs and DVDs. Polycarbonates are also compounded with ABS and used in thin walled electronic applications such as mobile phones and laptop computer cases. PC faces some competition from other glass-like polymers such as PMMA and PS resin. It is stronger than PMMA and has a better light transmission characteristics than glasses. OR A very tough thermoplastic, usually found as a substitute for glass, e.g. vandal proof telephone kiosks, bullet proof shields, baby bottles and picnic ware. It is also extensively used in the automobile industry. OR A high impact thermoplastic resin used in making “bulletproof glass” and microwave cookware.

**Polycarbonate Resin (PC):** A family of special types of polyesters in which groups of dihydric phenols are linked through carbonate linkages.

**polycarbophil/carbomer/glycerin/palm oil glyceride/mineral oil-containing vaginal moisturizer:** A commercial combination preparation that contains an adhesive polycarbophil polymer, which is used for vaginal lubrication. Polycarbophil is an insoluble compound that absorbs water and, after topical administration, adheres to vaginal epithelial cells. As a result, it helps both moisturize vaginal tissue and relieve the discomfort that is associated with vaginal dryness.

**Polychromism:** The capacity of a solid to exhibit more than one color.

**Polycistronic message:** Refers to an mRNA molecule that encodes for more than one protein.

**Polycistronic messenger RNA:** In prokaryotes, an RNA that contains two or more cistrons; note that only in prokaryotic mRNAs can more than one cistron be utilized by the translation system to generate individual proteins.

**Polyclonal antibodies:** Antibodies that are the products of many different populations of antibody-producing cells. OR A heterogeneous pool of antibodies produced in an animal by a number of different B lymphocytes in response to an antigen. Different antibodies in the pool recognize different parts of the antigen.

**Polycondensation:** Preparation of polyesters with liberation of water.

**polycyclic aromatic hydrocarbon :** A type of chemical formed when coal, oil, gas, garbage, tobacco, meat, and other substances are burned. These chemicals are also made for use in many products, including coal tar, creosote, roofing tar, pesticides, mothballs, dandruff shampoos, and some medicines. Being exposed to one of these chemicals over a long time may cause cancer. Also called PAH.

**polycystic ovary syndrome :** A condition marked by infertility, enlarged ovaries, menstrual problems, high levels of male hormones, excess hair on the face and body, acne, and obesity. Women with polycystic ovary syndrome have an increased risk of diabetes, high blood pressure, heart disease, and endometrial cancer. Also called PCOS.

**polycythemia vera :** A disease in which there are too many red blood cells in the bone marrow and blood, causing the blood to thicken. The number of white blood cells and platelets may also increase. The extra blood cells may collect in the spleen and cause it to become enlarged. They may also cause bleeding problems and make clots form in blood vessels.

**polydactyly:** refers to extra fingers and/or toes

**polydentate:** A ligand that has more than one atom that coordinates directly to the central atom in a complex. Polydentate ligands are called chelating agents when two or more coordinating atoms are attached to the same metal ion in a complex. For example, EDTA or ethylenediaminetetraacetic acid is a hexadentate ligand of calcium ion.

**POLYDISPERSITY INDEX (PDI):** The ratio of weight average to number average molecular weight ( $M_w/M_n$ ) (see also MOLECULAR WEIGHT).

**polydipsia:** increased thirst

**Polyester:** Polyesters are a class of polymer which use ester linkages (-C-O-C(O)-) to join the monomer units. Polyesters are condensation polymers.

**Polyester:** Usual term for unsaturated polyester resin. OR A resin formed by the reaction between a dibasic acid and a dihydroxy alcohol, both organic. Modification with multi-functional acids and/or bases and some unsaturated reactants permit cross-linking to thermosetting resins. Polyesters modified with fatty acids are called Alkyds. OR A large classification of resins that are used for making textile fibers. Not a tubing compound.

**Polyester Family:** The Polyester Intermediates are the family of chemicals used in the production of the polymer polyethylene terephthalate, also known as polyester, which is used for fibre and packaging applications.

**Polyethylene (PE):** A thermoplastic material composed by polymers of ethylene. It is normally a translucent, tough, waxy solid which is unaffected by water and by a large range of chemicals. It can be supplied in high or low density depending on application and is suitable for indoor and outdoor uses. It has good resistance to chemicals and low temperatures. OR Resins of various densities produced by polymerizing ethylene gas. Examples are Low Density (LDPE), Linear Low Density (LLDPE) and High Density (HDPE). OR PolyethylenePolyethylene, also known by its scientific name, “polyethene,” is a polymer with eleven different classifications. Freelin-Wade carries both LDPE and LLDPE Polyethylene tubing. OR A thermoplastic material composed by polymers of ethylene. It is normally a translucent, tough, waxy solid which is unaffected by water and by a large range of chemicals. OR A family of resins obtained by polymerizing the gas ethylene. By varying the catalysts and methods of polymerization, properties such as density, melt index, crystallinity, degree of branching and crosslinking, molecular weight, and molecular weight distribution can be regulated over wide ranges. Further modifications are obtained by copolymerization, chlorination, and compounding additives.

**polyethylene glycol :** A polymer made by joining molecules of ethylene oxide and water together in a repeating pattern. Polyethylene glycol can be a liquid or a waxy solid. In medicine, forms of polyethylene glycol can be used in ointments, in drugs or substances to make them stay in the body longer, or in laxatives. Also called PEG.

**polyethylene glycol 1000 cetyl ether cream:** A cream containing a non-ionic surfactant belonging to the polyethylene glycol (PEG) family.

Polyethylene glycol 1000 cetyl ether is used as an ointment base, but can also be used as an emulsifier and solubilizer.

**polyethylene glycol 3350-containing enema NER1008:** An enema containing the osmotic agent polyethylene glycol (PEG) 3350, also called macrogol 3350, with laxative activity. Upon rectal administration of the PEG3350-containing enema NER1008, PEG creates an osmotic gradient, which promotes the retention of water in the bowel. This increases the water content of stool, which results in increased gastrointestinal (GI) motility, decreased stool transit time and evacuation of colonic contents.

**polyethylene glycol recombinant endostatin:** A formulation containing recombinant endostatin attached to polyethylene glycol (PEG), with potential anti-angiogenic and antineoplastic activities. Endostatin, a 20 kDa C-terminal proteolytic fragment of collagen XVIII, induces microvascular endothelial cell apoptosis and inhibits endothelial proliferation and angiogenesis, which may result in a reduction of tumor cell growth. Modification with PEG extends the circulation half-life of endostatin, improves stability and increases solubility in organic solvents. Check for active clinical trials using this agent.

**polyethylene glycosylated recombinant human megakaryocyte growth and development factor :** A form of megakaryocyte growth and development factor (MGDF) that is made in the laboratory. MGDF comes from the protein thrombopoietin, which is normally made in the body to help make platelets. Polyethylene glycosylated recombinant human megakaryocyte growth and development factor is being studied as a way to increase the number of platelets in patients receiving chemotherapy. Also called PEG-MGDF and PEG-rhMGDF.

**POLYETHYLENE TEREPHTHALATE:** A saturated thermoplastic polyester resin made by condensing ethylene glycol and terephthalic acid, used for fibers and films (for example, DuPont's "Mylar" film), and, more recently, for injection molded parts. It is extremely hard, wear-resistant, dimensionally stable, resistant to chemicals, and has good dielectric properties.

**Polyethylene Terephthalate (PET or PETE):** PET is clear, tough and has good gas and moisture barrier properties. Some of this plastic is used in PET soft drink bottles and other blow molded containers, although sheet applications are increasing. Cleaned, recycled PET flakes and pellets are in

great demand for spinning fiber for carpet yarns and producing fiberfill and geotextiles. Other applications include strapping, molding compounds and both food and non-food containers. (Adapted from Modern Plastics Encyclopedia 1995).

**Polyethylene terephthalate (PET):** A resin with outstanding clarity and good resistance to impact, along with good barrier properties to resist grease and oil, cold and sunlight. Polyethylene Terephthalate is an excellent material for use in orientation blow molding (stretch blow molding). It is commonly used for carbonated beverage bottles. Oriented PET provides very good alcohol and essential oil barrier properties, generally good chemical resistance (although acetones and ketones will attack PET) and a high degree of impact resistance and tensile strength. The orienting process also serves to improve gas and moisture barrier properties. This material does not provide resistance to high temperature application (max. temp. 160½ F). However, heat-set PET creates a container which will accept a 195½ F hot fill and exhibit the clarity of other PET containers. This process provides an alternative to glass for products such as juice.

**Polyethylene Terephthalate (PET):** PET is one of the most commonly used plastics in Europe's packaging industry for several reasons. It is very strong, it can withstand high pressures and being dropped without bursting. It has excellent gas barrier properties, so it keeps the fizz in carbonated drinks, and protects the taste of the drinks in the bottles.

**Polyethylene Terephthalate (PET) Bottle Grade:** PET bottle grade is a transparent polyethylene terephthalate polymer used mainly for bottling carbonated soft drinks and mineral water. The production of PET bottle grade is by solid state polymerisation (SSP) of PET melt phase, which increases the viscosity of the polymer by vacuum treatment, but involves no other raw materials. Due to the ubiquitous usage of PET bottle grade, plants are located in all regions.

**Polyethylene Terephthalate (PET) Melt Phase:** PET Melt Phase is the basic, amorphous grade of PET (polyethylene terephthalate) which can be used directly for the production of polyester fibre or upgraded to PET bottle grade by solid state polymerisation (SSP). PET Melt phase is produced by the melt-phase polymerisation of terephthalic acid (from PTA or DMT) with MEG. PET melt phase plants for fibre production are increasingly

concentrated in Asia, while PET melt phase plants linked to PET bottle grade operations continue to be built around the world.

**Polyethylene terephthalate glycol (PETG):** A resin with good barrier properties and outstanding clarity, with a slightly higher tolerance to distortion temperatures, as compared to PET. PETG: Glycol modified Polyethylene Terephthalate is a durable material with excellent gloss, clarity and sparkle desired for clear bottles. PETG can be processed via conventional extrusion blow molding methods, generally on machines designed to process PVC. Applications include shampoos, soaps, and detergents. PETG exhibits a good impact strength and gas barrier. The chemical resistance of PETG is fair and compatibility testing is recommended, especially with products that contain alcohol.

**Polyethylene, high-density (HDPE):** In the high-density grade, this thermoplastic material is more rigid and less permeable than the low-density grade. It also displays a higher tolerance to distortion temperatures. HDPE is the most widely used resin for extrusion blown plastic bottles. This material is economical, impact resistant, and provides a good moisture barrier. HDPE is compatible with a wide range of products including acids and caustics but is not compatible with solvents. It is usually supplied in FDA approved food grade. HDPE is naturally translucent and flexible. The addition of color will make HDPE opaque although not glossy. Adding extra weight to the bottle will yield a rigid container. HDPE is supplied flame-treated on a stock basis and lends itself readily to silk screen decoration. While HDPE provides good protection at below freezing temperatures, it cannot be used with products filled at over 160½ F or products requiring a hermetic seal.

**Polyethylene, low-density (LDPE):** Squeezability is good, especially in the low-density grade of this thermoplastic material. It also displays better resistance to impact than the high-density grade. LDPE is similar to HDPE in composition. It is less rigid and generally less chemically resistant than HDPE, but is more translucent. LDPE is used primarily for squeeze applications. LDPE is significantly more expensive than HDPE, but will yield a glossy bottle when produced in colors.

**Polyethylene, medium-density (MDPE):** MDPE combines the characteristics of low and high density polyethylene. Bottles are less

translucent than LDPE but more flexible than HDPE. Like LDPE, MDPE is glossy when produced in colors.

**polyethyleneglycol-7-ethyl-10-hydroxycamptothecin:** A polyethylene glycol (PEG) conjugate of 7-ethyl-10-hydroxycamptothecin with potential antineoplastic activity. After hydrolysis in vivo, 7-ethyl-10-hydroxycamptothecin (SN38), an active metabolite of irinotecan, is released from polyethyleneglycol-7-ethyl-10-hydroxycamptothecin (PEG-SN38); 7-ethyl-10-hydroxycamptothecin selectively stabilizes topoisomerase I-DNA covalent complexes, resulting in single-stranded and double-stranded DNA breaks, the inhibition of DNA replication, and the induction of apoptosis. This agent is designed to deliver the active metabolite to tumor cells without the need for conversion as is the case with irinotecan. Compared to unPEGylated 7-ethyl-10-hydroxycamptothecin, PEGylation improves solubility and allows for parental delivery, and may result in a longer half-life and higher exposure for tumor cells.

**polyethyleneglycol-7-ethyl-10-hydroxycamptothecin DFP-13318:** A long-acting formulation composed of 7-ethyl-10-hydroxycamptothecin (SN38), a camptothecin derivative and active metabolite of irinotecan conjugated to polyethylene glycol (PEG), via a proprietary, cleavable linker, with potential antineoplastic activity. Upon administration, the proprietary linkage system allows for very slow release of SN38 from the formulation. Upon release, SN38 selectively stabilizes covalent topoisomerase I-DNA complexes, and results in single-stranded and double-stranded DNA breaks, the inhibition of DNA replication, and the induction of apoptosis. This agent is designed to deliver the active metabolite to tumor cells without the need for conversion as is the case with irinotecan. Compared to other PEG-SN38-based formulations, the linker system in DFP-13318 increases its half-life and the exposure time for tumor cells, while decreasing both blood plasma concentrations and exposure to off-target organs; this results in increased efficacy.

**Polygam S/D:** (Other name for: therapeutic immune globulin)

**polygenic inheritance:** the condition in which some characteristics are determined by an interaction of genes on several chromosomes or at several places on one chromosome; one example is human skin color.

**polyglutamate camptothecin:** A therapeutic formulation consisting of camptothecin, an alkaloid isolated from the Chinese tree *Camptotheca*

acuminata, conjugated with polyglutamate. During the S phase of the cell cycle, camptothecin selectively stabilizes topoisomerase I-DNA covalent complexes, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery. Conjugation with polyglutamate renders this agent more water soluble and less toxic than the parent molecule.

**polyglutamate camptothecin :** A form of the anticancer drug camptothecin that may have fewer side effects and work better than camptothecin. It is being studied in the treatment of cancer. It is a type of DNA topoisomerase inhibitor. Also called CT-2106.

**polygon:** many-sided plane closed figure. Triangle, quadrilateral, pentagon, and so on.

**polyHEMA (poly(hydroxyethyl methacrylate)) :** polymer used as hydrogel layer, soaked with an internal solution, to create solid electrolyte in CHEMFETs. The deposition of this layer (between the gate oxide of an ISFET and an ionselective membrane) is required to obtain a thermodynamically welldefined interface between the sensing membrane and solid transducer. Additionally polyHEMA reduces the noise level and eliminates the carbon dioxide interference on the CHEMFET signal.

**Polyimide Resins:** A new group of resins recently introduced in the United States. The material is an aromatic polyimide made by reacting pyromellitic dianhydride with aromatic diamines. The polymer is characterized by the fact that it has rings of four carbon atoms tightly bound together, and the manufacturers claim that the new resin has greater resistance to heat than any other unfilled organic material yet discovered. Suggested applications include components for internal combustion engines.

**Polyisobutylene:** The polymerization product of isobutylene. It varies in consistency from a viscous liquid to a rubber-like solid with corresponding variation in molecular weight from 1,000 to 400,000.

**Polyketides:** A class of compounds, including the antibiotic erythromycin, formed by the action of specific megasynthases.

**Polylactic Acid:** (PLA)- Eco-friendly biodegradable thermoplastic derived from renewable resources.

**Polyliner:** A perforated longitudinally ribbed sleeve that fits inside the cylinder of an injection molding machine; used as a replacement for conventional injection cylinder torpedoes.

**Polymer:** A high-molecular-weight organic compound, natural or synthetic, whose structure can be represented by a repeated small unit, the MER: e.g., polyethylene, rubber, cellulose. Synthetic polymers are formed by addition or condensation polymerization of monomers. If two or more monomers are involved, a copolymer is obtained. Some polymers are elastomers, some plastics.

**Polymer :** When certain individual molecules (monomers) come together and link up in a chain-like manner, they form a polymer. A high molecular weight, chain-like substance with a similar repeating chemical structure along the whole molecule chain. Made from smaller building blocks, monomers. OR Another word for plastic material made from chains of molecules of one or more monomers. Polymers (plastics) are organic substances of high molecular weight, made from hundreds or thousands of molecules linked together in a repeating chain pattern. OR The generic word used to describe many plastics. Specifically, a polymer can be natural or synthetic. The compounds are formed from many low molecular weight monomers that are combined into long molecular chains. OR A high-molecular-weight organic compound, natural or synthetic, whose structure can be represented by a repeated small unit, the MER: e.g., polyethylene, rubber, cellulose. Synthetic polymers are formed by addition or condensation polymerization of monomers. If two or more monomers are involved, a copolymer is obtained. Some polymers are elastomers, some plastics. OR A short, often synthetic, fragment of DNA containing recognition sequences for several restriction endonucleases. OR Molecules which are composed of linked repeating units (called monomers) are referred to as polymers. Polymers are the basis for many plastics and synthetic fibers such as Teflon and polyester. OR Polymers are very large molecules made from repeating units formed when many small, reactive molecules (called monomers) join together. OR Polymer is the name given to a solid that is constructed by the repeated addition of simple monomer units. The majority of petrochemical value chains end in the production of a useful polymer material, with examples including polyethylene, polystyrene and polyester. OR Substance, the molecules of which consist of one or more structural units repeated any number of times; vinyl resins are examples of

true polymers. OR A large molecule (molecular weight ~10 000 or greater) composed of many smaller molecules (monomer) covalently bonded together. Some of us think they are much better than any of those little molecules, but the other chemists are always telling us size doesn't matter. OR This binder is produced from petrochemical feedstocks. The binder's polymer particles are small in size and carried in water. The binder polymer and water mix is known as emulsion. OR a very large molecule composed of repeating smaller units. OR A large molecule formed by combining many similar, smaller molecules OR A large molecule made by linking smaller molecules ("monomers") together. OR A molecule made up of small identical molecules called monomers. The monomers are joined together in a repeating pattern.

**Polymer (Synthetic):** The product of a polymerization reaction. The product of polymerization of one monomer is called a homopolymer, monopolymer or simply a polymer. When two different monomers are polymerized simultaneously the product is called a copolymer. The term terpolymer is sometimes used for polymerization products of three monomers.

**Polymer Chains:** A linear polymer is a polymer in which the monomers are bound to each other in a straight chain without any branches. Branched polymers have branched connections of molecules. Copolymers are polymers with repeating molecular units from at least two different monomers. Two kinds of arrangements are possible: random and alternating, resulting in random copolymers and alternating copolymers. Such polymers are called block-copolymers, characterized by both monomers A and B forming the backbone chain of the polymer. They have repeating monomers in linearly connected blocks. Another possibility is the formation of a graft-copolymer, which is essentially a branched-chain structure. It has side chains composed of one type of monomer unit attached to the backbone or main chain from another monomer unit.

**Polymer Matrix:** A mass of polymer consisting of a number of chains is often described as being a polymer matrix. In a mass of polymer like this, the chains will often be entangled. If the chains can slide past each other easily, the polymer matrix will be rubbery and flexible; if they cannot, the matrix will be hard and glassy.

**Polymer Process Aid (PPA):** Additives incorporated into plastic material as a modifier to help in the extrusion of plastic materials.

**POLYMER PROCESS AID (PPA):** Additives which are added or incorporated into plastics as a modifier to aid in the extrusion of film, pipe, sheet, etc.

**Polymer Scientist:** A species of selfless professional divided into two subspecies: polymer physicists, who do boring stuff, and polymer chemists, who do exciting stuff. The highest form of sentient life.

**Polymer Structure :** A general term referring to the relative positions, arrangement in space, and freedom of motion of atoms in a polymer molecule.

**Polymerase:** An enzyme that catalyzes the synthesis of a polymer from monomers. OR An enzyme that catalyzes the step-by-step addition of ribo- or deoxyribonucleotide units to a polynucleotide chain.

**Polymerase chain reaction:** A method for amplifying DNA sequences by using DNA polymerase; a series of three-step cycles is employed, in which parental DNA strands are separated by heating, primers to flanking regions of the target sequence are annealed to the separated strands, and the primers are then extended by DNA synthesis. OR A repetitive procedure that results in a geometric amplification of a specific DNA sequence.

**polymerase chain reaction :** A procedure that produces millions of copies of a short segment of DNA through repeated cycles of: (1) denaturation, (2) annealing, and (3) elongation. Polymerase chain reaction is a very common procedure in molecular genetic testing and may be used to generate a sufficient quantity of DNA to perform a test (e.g., allele-specific amplification, trinucleotide repeat quantification). Also called PCR. or A laboratory method used to make many copies of a specific piece of DNA from a sample that contains very tiny amounts of that DNA. Polymerase chain reaction allows these pieces of DNA to be amplified so they can be detected. Polymerase chain reaction may be used to look for certain changes in a gene or chromosome, which may help find and diagnose a genetic condition or a disease, such as cancer. It may also be used to look at pieces of the DNA of certain bacteria, viruses, or other microorganisms to help diagnose an infection. Also called PCR.

**polymeric camptothecin prodrug XMT-1001:** A polymeric prodrug of camptothecin (CPT) with potential antineoplastic activity. Polymeric

camptothecin prodrug XMT-1001 consists of CPT conjugated to the 60-70 kDa, inert, bio-degradable, hydrophilic copolymer poly[1-hydroxymethylene hydroxymethyl formal] (PHF). Through a dual-phase, non-enzymatic release mechanism, CPT is first released in plasma from XMT-1001 as the lipophilic prodrugs CPT-SI (a succinimidoglycinate derivative) and CPT-SA (a succinamidoyl glycinate derivative), which are then hydrolyzed within tissues to release the lactone form of CPT. CPT inhibits the catalytic activity of DNA topoisomerase I, thereby inhibiting DNA replication and inducing apoptosis. This agent may exhibit a more favorable pharmacokinetic profile than other agents in the same class.

**polymeric enteral nutrition formula :** A nutritional drink that may help people who cannot get everything they need in their diet from foods and other drinks. It may be taken by mouth or given through a small tube inserted through the nose into the stomach or the small intestine. It may also be given through a small tube that is put into the stomach or intestinal tract through an opening made on the outside of the abdomen. One example of a polymeric enteral nutrition formula is Ensure. Polymeric enteral nutrition formula is a type of dietary supplement.

**Polymeric membrane matrix:** inert polymeric phase providing necessary physical properties (i.e. mechanical stability, elasticity and solubility of membrane components) of the ionselective polymeric liquid membrane. Originally, liquid ISE membranes were obtained by soaking porous materials with a solution of the ionophore in organic solvent. Homogenous polymeric membranes have been used firstly as membrane matrix for charged carriers. The most often used polymeric membrane matrix is plasticized PVC (the plasticizer is necessary due to the high Tg of PVC). Other polymer, which not require plasticizer (Tg below room temperature), like silicone rubber, polysiloxanes, polyurethanes are also applied as matrix of liquid membranes.

**Polymerisation:** The process in which many small molecules (molecular weight ~100) are joined together to form a few, much larger molecules (molecular weight 10 000 - 10 000 000). The two ways in which this happens are chain-growth and step-growth polymerisation.

**Polymerization:** The interlocking of molecules by chemical reaction to produce very large molecules. The process of making plastics and plastic-based resins. OR the process by which an organic compound reacts with

itself to form a high-molecular-weight compound from repeating units of the original compound. Polymerization occurs by either cationic or free-radical mechanisms. OR A process that links smaller molecules together to form a larger molecule. OR The process of converting a monomer or a mixture of monomers into a polymer. Addition polymerization is the stepwise addition of a simple repeated unit. Or, the reaction that yields a product that is an exact multiple of the original monomeric molecule. Condensation polymerization is the combination of functional molecules, leading to the formation of a polymer with the liberation of simple by-products, usually water. OR A chemical reaction in which the molecules of a monomer are linked together to form large molecules whose molecular weight is a multiple of that of the original substance. When two or more monomers are involved, the process is called copolymerization or heteropolymerization.

**polymerize:** To link smaller molecules together to form a larger molecule.

**Polymethyl Methacrylate:** A thermoplastic material composed of polymers of methyl methacrylate. It is a transparent solid with exceptional optical properties and good resistance to water. It is obtainable in the form of sheets, granules, solutions, and emulsions. It is extensively used for aircraft domes, lighting, fixtures, decorative articles, etc.; it is also used in optical instruments and surgical appliances.

**polymorph:** Solid substances that occur in several distinct forms. Polymorphs have different chemical and physical properties. allotropes are polymorphs of elements.

**Polymorph (polymorphism):** One of the different crystal structures in which a compound can crystallize. Polymorphs are best characterized by their space group and unit-cell parameters. This term is usually reserved for materials with the same elemental analysis.

**polymorphic:** Describing a protein for which amino acid sequence variants exist in a population of organisms, but the variations do not destroy the protein's function.

**Polymorphic transformation:** A physical transformation in which the crystal structure of a compound is converted to a different crystal structure.

**polymorphism :** A common mutation. “Common” is typically defined as an allele frequency of at least 1%. All genes occur in pairs, except when x and y chromosomes are paired in males; thus a polymorphism with an allele

frequency of 1% would be found in about 2% of the population, with most carriers having one copy of the polymorphism and one copy of the normal allele. or A common change in the genetic code in DNA. Polymorphisms can have a harmful effect, a good effect, or no effect. Some polymorphisms have been shown to increase the risk of certain types of cancer.

**polymorphonuclear leukocyte :** A type of immune cell that has granules (small particles) with enzymes that are released during infections, allergic reactions, and asthma. Neutrophils, eosinophils, and basophils are polymorphonuclear leukocytes. A polymorphonuclear leukocyte is a type of white blood cell. Also called granular leukocyte, granulocyte, and PMN.

**Polymox:** (Other name for: amoxicillin)

**PolyMVA:** (Other name for: alpha-lipoic acid/vitamin/mineral supplement PolyMVA)

**polymyositis :** An inflammatory disease of the muscles closest to the center of the body. It causes weakness, inability to stand, climb stairs, lift, or reach. It may also cause muscle pain and difficulty swallowing, and may affect the lungs and heart. Having polymyositis increases the risk of certain types of cancer.

**polymyxin B:** A mixture of the polypeptides polymyxins B1 and B2, both obtained from *Bacillus polymyxa* strains, with antimicrobial activity.

Polymyxin B exerts its antimicrobial effect through its cationic detergent action on cell membranes. Specifically, this antibiotic binds to the negatively charged site in the lipopolysaccharide layer of the bacterial cell membrane via electrostatic affinity with the positively charged amino groups in the cyclic peptide portion. Subsequently, the fatty acid portion of polymyxin B dissolves in the hydrophobic region of the bacterial cell membrane. This results in an alteration in cell membrane structure, disruption of cell wall integrity and an increase in permeability for water and molecules. This will eventually lead to bacterial cell death.

**polyneuritis :** Inflammation of several peripheral nerves at the same time.

**Polynucleotide:** A chain structure containing nucleotides linked together by phosphodiester (5'-3') bonds. The polynucleotide chain has a directional sense with a 5' and a 3' end. OR A covalently linked sequence of nucleotides in which the 3' hydroxyl of the pentose of one nucleotide residue is joined by a phosphodiester bond to the 5' hydroxyl of the pentose of the next residue.

**Polynucleotide phosphorylase:** An enzyme that polymerizes ribonucleotide diphosphates. No template is required.

**Polyolefin:** A polymer of olefins, molecules that have an alkene (double bond) functionality. These polymers include polystyrene and poly(vinyl chloride). They are normally formed by free radical polymerisation (a form of addition polymerisation).

**Polyolefins:** Polyolefins is the name given to the polymers of the olefin family. By convention these are the single double bond olefins and the grouping does not contain rubber compounds that can be produced by polymerising butadiene.

**Polyoxymethylene:** A polymer in which the repeated structural unit in the chain is oxymethylene.

**polyp :** A growth that protrudes from a mucous membrane.

**polypectomy :** Surgery to remove a polyp.

**Polypeptide:** A linear polymer of amino acids held together by peptide linkages. The polypeptide has a directional sense, with an amino- and a carboxy-terminal end. OR A series of amino acids, each connected to the next in the series by a peptide bond. OR A long chain of amino acids linked by peptide bonds; the molecular weight is generally less than 10,000. OR A substance that contains many amino acids (the molecules that join together to form proteins).

**polyphagia:** increased appetite

**polyphenol :** A substance that is found in many plants and gives some flowers, fruits, and vegetables their color. Polyphenols have antioxidant activity.

**Polyphenon E :** A mixture that is prepared from the leaves of the Camellia sinensis plant. It contains substances called catechins, which are antioxidants. Antioxidants help protect cells from damage caused by certain chemicals that may increase the risk of cancer and other diseases.

Polyphenon E is being studied in the prevention of cancer and other diseases. It is a trademarked product of Mitsui Norin Co., Ltd.

**Polyphenon E Ointment:** (Other name for: kunecatechins ointment)

**polyposis :** The development of numerous polyps (growths that protrude from a mucous membrane).

**Polypropylene (PP):** Polypropylene (PP) is the propylene analogue of polyethylene and is also a member of the polyolefin family. PP has a higher chemical and temperature resistance than the polyethylenes. It also has a higher toughness than HDPE and can be used in applications that experience cycling loads. PP's mechanical properties are allowing it to grow into markets that previously specified Engineering Polymers, such as under bonnet applications in the automotive industry. PP goods are commonly marked with a 5 following the recycling codes developed by the American Society of the Plastics Industry. PP is commonly produced using specialized Ziegler-Natta catalysts in slurry reactors. OR A tough, lightweight, rigid plastic made by the polymerization of high-purity propylene gas in the presence of an organometallic catalyst at relatively low pressures and temperatures. Polypropylene is a naturally translucent material which provides contact clarity and an excellent moisture barrier. PP is easily processed via injection molding (jars and closures), and injection, extrusion, or stretch blow-molding (bottles). One major advantage of polypropylene is its stability at high temperatures, up to 200½ F. Polypropylene is autoclavable and offers the potential for steam sterilization. The compatibility of PP with high filling temperatures is responsible for its use with hot fill products such as pancake syrup. PP has excellent chemical resistance, but provides poor impact resistance in cold temperatures. Oriented PP offers improved impact resistance and clarity at low temperatures. Produced in color, PP exhibits a glossy finish. OR Polypropylene has excellent chemical resistance, is strong and has the lowest density of the plastics used in packaging. It has a high melting point, making it ideal for hot-fill liquids. In film form it may or may not be oriented (stretched). PP is found in everything from flexible and rigid packaging to fibers and large molded parts for automotive and consumer products. (Adapted from Modern Plastics Encyclopedia 1995; Plastic Packaging Opportunities and Challenges, February 1992).

**polyprotic:** refers to an acid with several hydrogens that can ionize.

**polyribosome:** See polysome.

**Polyribosome (polysome):** A complex of an mRNA and two or more ribosomes actively engaged in protein synthesis.

**Polysaccharide:** These are very complicated carbohydrates made of simple sugars (glucose, fructose) in long chains. The chains include many

mono-saccharides. They are found in the cell wall and other areas of organisms. Cellulose is a good example of a poly-saccharide. OR Any of a class of carbohydrates consisting of chains of simple sugars; see oligosaccharide, glycan OR A linear or branched chain structure containing many sugar molecules linked by glycosidic bonds. OR A carbohydrate consisting of a large number of linked monosaccharide units. Examples of polysaccharides are cellulose and starch.

**polysaccharide :** A large carbohydrate molecule. It contains many small sugar molecules that are joined chemically. Also called glycan.

**polysaccharide-K:** A protein-bound polysaccharide derived from the mushroom *Trametes versicolor* (Turkey Tail) with immunoadjuvant and potential antitumor activities. Although its mechanism of action has yet to be fully elucidated, in vitro and in vivo studies indicate that polysaccharide-K induces peripheral blood monocyte secretion of IL-8 and TNF-alpha, induces T cell proliferation, and prevents cyclophosphamide-induced immunosuppression. This agent has also been reported to stimulate macrophages to produce reactive nitrogen intermediates and superoxide anions and to promote apoptosis in the promyelocytic leukemia cell line HL-60.

**Polysaccharides:** Carbohydrates composed of large numbers of linear or branched monosaccharide units; homopolysaccharides are composed of large numbers of one type of sugar, whereas heteropolysaccharides contain more than one type. OR complex carbohydrates formed by linking multiple monosaccharides. OR A linear or branched polymer of monosaccharide units linked by glycosidic bonds.

**Polysome:** A group of ribosomes bound to an mRNA molecule and simultaneously carrying out translation. Also called polyribosome.

**polysome (polyribosome):** A complex of an mRNA molecule and two or more ribo

**polysomes:** also called polyribosomes, are a cluster of ribosomes, bound to a mRNA

**polysomnogram :** A group of recordings taken during sleep that shows brain wave changes, eye movements, breathing rate, blood pressure, heart rate, and the electrical activity of the heart and other muscles. A polysomnogram may be used to help diagnose sleep disorders.

**Polystyrene:** Is an aromatic polymer made from the aromatic monomer styrene, a liquid hydrocarbon that is commercially manufactured from petroleum by the chemical industry. Polystyrene is one of the most widely used materials in custom thermoforming. OR Thermoplastic compound used to make plastic containers, closures and more. OR Polystyrene is a very versatile plastic that can be rigid or foamed. General purpose polystyrene is clear, hard and brittle. It has a relatively low melting point. Typical applications include protective packaging, containers, lids, cups, bottles, trays and tumblers. (Plastic Packaging Opportunities and Challenges, February 1992). OR A water-white thermoplastic produced by the polymerization of styrene (vinyl benzene). The electrical insulating properties of polystyrene are outstandingly good and the material is relatively unaffected by moisture

**Polystyrene (PS):** Polystyrene (PS) is a solid aromatic polymer made from the monomer styrene. A commodity polymer used largely for semi/rigid packaging applications, it can be melted at high temperature for molding or extrusion, and then resolidified. It is commonly used as insulation in building structures and packaging. Other applications include electronics housing.

**Polytetrafluoroethylene (PTFE) Resins:** Members of the fluorocarbons family of plastics made by the polymerization of tetrafluoroethylene. PTFE is characterized by its extreme inertness to chemicals, very high thermal stability and low frictional properties. Among the applications for these materials are bearings, fuel hoses, gaskets and tapes, and coatings for metal and fabric.

**Polytetrafluoroethylene (PTFE):** A highly resistant plastic that does not react to chemical influences. It is most commonly known by its brand name, Teflon®.

**polyunsaturated fatty acid:** A fatty acid containing more than one double bond (C=C). The essential fatty acids omega-3 and omega-6 are polyunsaturated fatty acids (PUFAs) that contain 2 or more cis double bonds. Dietary intake of some PUFAs may have beneficial effects on blood pressure, serum lipids, and inflammation. Some PUFAs, such as omega-3 PUFAs, may have antineoplastic or chemopreventive activities.

**Polyurethane:** Polyurethane A thermoplastic noted for its high resistance to abrasion while being highly flexible and kink resistant. Available in both

an ether and ester base. The ester-based PUR is less desirable due to how it degrades in moisture. The ether-based polymer is much more durable and the key component in Freelin-Wade's Fre-Thane® polyurethane tubing. An outstanding tubing compound, available in four primary durometers.

**Polyurethane:** Polyurethanes are made by the reaction of isocyanates (MDI and TDI) with polyols. Polyurethanes can be in the form of flexible or rigid foams, elastomers, coatings, adhesives and low molecular weight additives. MDI is typically used for rigid foams, whereas TDI is used mostly in flexible foams.

**POLYURETHANE:** Wide range of coatings, ranging from hard gloss enamels to soft flexible coatings. Good to very good adhesion, hardness, flexibility and resistance. Surface preparation critical.

**Polyurethane (PUR):** Polyurethane is categorised as a polymer. It is a resilient, flexible and durable material that can be rigid or soft, protective like varnish, elastic like rubber, or have adhesive qualities. Polyurethanes are used in the manufacture of flexible, high-resilience foam seating; rigid foam insulation panels, microcellular foam seals and gaskets, elastomeric wheels and tires, automotive suspension units, high performance adhesives, surface coatings and surface sealants, synthetic fibres, carpet underlay, and hard-plastic parts (e.g., for electronic instruments). Polyurethane is also used for the manufacture of hoses and skateboard wheels as it combines the best properties of both rubber and plastic.

**Polyurethane Resins:** A family of resins produced by reacting diisocyanate with organic compounds containing two or more active hydrogens to form polymers having free isocyanate groups. These groups, under the influence of heat or certain catalysts, will react with each other, or with water, glycols, etc., to form a thermosetting material.

**polyuria:** excess urinary water and electrolyte output

**polyvalent antigen-KLH conjugate vaccine:** A multivalent cancer vaccine comprised of the five tumor-associated antigens (TAAs) globo H, GM2 ganglioside, Tn-MUC1, TF, and sTn conjugated with the immunoadjuvant keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Upon administration, polyvalent antigen-KLH conjugate vaccine may induce production of IgG and IgM antibodies and antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells expressing these TAAs, resulting in tumor cell death and tumor growth

inhibition. Globo H (globo H hexasaccharide 1); GM2 ganglioside; Tn-MUC1 (human tumor-associated epithelial mucin 1 carrying the tumor-specific glycan Tn); TF (Thompson-Friedreich); and sTn (sialyl-Tn) are overexpressed in a variety of cancer cells. KLH is a hapten carrier and serves as an immunostimulant to improve immune recognition of antigens. Check for active clinical trials using this agent.

**polyvalent melanoma vaccine:** A cancer vaccine consisting of whole irradiated heterologous melanoma cells which express multiple melanoma-related antigens. Polyvalent melanoma vaccine may stimulate an antitumoral cytotoxic T-cell immune response in the host, resulting in inhibition of tumor cell proliferation and tumor cell death.

**Polyvinyl Acetal:** A member of the family of vinyl plastics. Polyvinyl acetal is the general name for resins produced from a condensation of polyvinyl alcohol with an aldehyde. There are three main groups: polyvinyl acetal itself; polyvinyl butyl, and polyvinyl formal. Polyvinyl acetal resins are thermoplastics which can be processed by casting, extruding, molding and coating, but their main uses are in adhesives, lacquers, coatings and films.

**POLYVINYL ACETATE:** A thermoplastic material composed of polymers of vinyl acetate in the form of a colorless solid. Used extensively in adhesives for paper and fabric coatings.

**POLYVINYL ALCOHOL:** A thermoplastic material composed of polymers of the hypothetical vinyl alcohol.

**Polyvinyl Carbazole:** A thermoplastic resin, brown in color, obtained by reacting acetylene with carbazole. The resin has excellent electrical properties and good heat and chemical resistance. It is used as an impregnate for paper capacitors.

**Polyvinyl Chloride:** A synthetic resin used in the binders of coatings. Tends to discolor under exposure to ultraviolet radiation. Commonly called "vinyl."

**POLYVINYL CHLORIDE:** Thermoplastic compounds formed by polymerization or copolymerization of vinyl or vinylidene chlorides and vinyl esters.

**Polyvinyl Chloride (PVC):** Polyvinyl chloride (PVC) is a versatile polymer, produced by the polymerisation of VCM. PVC is almost always

converted into a compound by the incorporation of additives, allowing it to be used in both rigid and flexible forms as a plastic resin. Extensively used in the construction sector, PVC has a wide variety of applications, including pipe, siding and window/door profiles, wire and cable insulation, rigid film/sheet, and flooring. OR Polyvinyl Chloride (PVC): PVC tubing is made from a polymer that is tasteless, odorless and will not degrade in most organic solvents. When a plasticizer is introduced, the compound becomes highly flexible with good abrasion resistance. Does not break down the way rubber does. OR A thermoplastic material composed of copolymers of vinyl chloride and vinyl acetate; a colorless solid with good resistance to water, and concentrated acids and alkalies. It is obtainable in the form of granules, solutions, and emulsions. Compounded with plasticizers it yields a flexible material superior to rubber in aging properties. It is widely used for cable and wire coverings, in chemical plants, and in protective garments.

**Polyvinylidene chloride (PVDC):** Improves barrier properties to increase shelf life or to protect product. Used as a barrier material in a coating form, a layer in lamination or as part of a coextruded structure for a rigid container.

**polyvinylpyrrolidone-sodium hyaluronate gel:** An oral bioadherent gel containing polyvinylpyrrolidone (PVP) and sodium hyaluronate with mucoprotective activity. Upon oral application, this gel adheres to the mucosal surface of the mouth and throat, forming a thin layer that acts as a barrier to protect exposed and sensitized nerve endings from the painful stimuli associated with eating, drinking, and talking. or A gel used to lessen pain from mouth sores caused by chemotherapy or radiation therapy, oral surgery, braces, or disease. Polyvinylpyrrolidone-sodium hyaluronate gel is being studied in the treatment of pain caused by mouth sores in children receiving cancer treatment. It forms a thin layer over the surface of the mouth and throat to prevent irritation while eating, drinking, and talking. Also called Gelclair.

**POM:** The chemical abbreviation for Acetal, also known as Polyoxymethylene.

**pomalidomide:** An orally bioavailable derivative of thalidomide with potential immunomodulating, antiangiogenic and antineoplastic activities. Although its exact mechanism of action has yet to be fully elucidated, pomalidomide appears to inhibit TNF-alpha production, enhance the

activity of T cells and natural killer (NK) cells and enhance antibody-dependent cellular cytotoxicity (ADCC). In addition, pomalidomide may inhibit tumor angiogenesis, promote cell cycle arrest in susceptible tumor cell populations, and stimulate erythropoiesis. or A drug that is a form of thalidomide, and is used to treat multiple myeloma that has not gotten better with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Pomalidomide may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of immunomodulating agent and a type of antiangiogenesis agent. Also called CC-4047 and Pomalyst.

**Pomalyst :** A drug that is a form of thalidomide, and is used to treat multiple myeloma that has not gotten better with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Pomalyst may help the immune system kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of immunomodulating agent and a type of antiangiogenesis agent. Also called CC-4047 and pomalidomide.

**pomegranate :** A subtropical shrub or tree. Juice from the fruit may contain substances that decrease or slow the rise of prostate-specific antigen (PSA) levels. It is being studied for its ability to delay or prevent recurrent prostate cancer. The scientific name is *Punica granatum*.

**pomegranate juice:** A natural juice isolated from the fruit of the plant *Punica granatum* with antioxidant, potential antineoplastic, and chemopreventive activities. Pomegranate juice contains flavonoids which promote differentiation and apoptosis in tumor cells by down-regulating vascular endothelial growth factor (VEGF) and stimulating migration inhibitory factor (MIF), thereby inhibiting angiogenesis. The flavanoids in pomegranate juice also scavenge reactive oxygen species (ROS) and, in some cell types, may prevent ROS-mediated cell injury and death.

**pomegranate liquid extract:** A liquid extract preparation derived from pomegranate (*Punica granatum*) seeds with antioxidant, and potential antineoplastic and chemopreventive activities. Pomegranate liquid extract contains flavonoids which may promote differentiation and apoptosis in tumor cells by down-regulating vascular endothelial growth factor (VEGF) and stimulating migration inhibitory factor (MIF), thus inhibiting angiogenesis. Pomegranate liquid extract flavanoids also scavenge reactive

oxygen species (ROS) and, in some cell types, may prevent ROS-mediated cell injury and death.

**pomegranate-extract pill:** A pill formulation of polyphenol extracts derived from the fruit of the deciduous shrub *Punica granatum* with antioxidant and potential chemopreventive activities. By binding and neutralizing free-radical compounds, the polyphenol extracts contained in pomegranate-extract pill may prevent their genotoxic and carcinogenic effects. Check for active clinical trials using this agent.

**Pompe disease:** A disease that affects all tissues and is due to a lack of a lysosomal glycogen-degrading enzyme; the glycogen is structurally normal but present in abnormally large amounts; death results at an early age from cardiovascular failure.

**POMx:** (Other name for: pomegranate-extract pill)

**ponatinib hydrochloride:** An orally bioavailable multitargeted receptor tyrosine kinase (RTK) inhibitor with potential antiangiogenic and antineoplastic activities. Ponatinib hydrochloride inhibits unmutated and all mutated forms of Bcr-Abl, including T315I, the highly drug therapy-resistant missense mutation of Bcr-Abl. This agent also inhibits other tyrosine kinases including those associated with vascular endothelial growth factor receptors (VEGFRs) and fibroblast growth factor receptors (FGFRs); in addition, it inhibits the tyrosine kinase receptor TIE2 and FMS-related tyrosine kinase receptor-3 (Flt3). RTK inhibition by ponatinib hydrochloride may result in the inhibition of cellular proliferation and angiogenesis and may induce cell death. Bcr-Abl is a fusion tyrosine kinase encoded by the Philadelphia chromosome. or A drug used to treat chronic myelogenous leukemia (CML) and Philadelphia chromosome-positive acute lymphoblastic leukemia. It is used in patients who are not able to take or have not gotten better after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Ponatinib hydrochloride blocks BCR-ABL and other proteins, which may help keep cancer cells from growing and may kill them. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called Iclusig.

**ponesimod:** An orally available sphingosine-1-phosphate receptor 1 (S1PR1, S1P1) agonist that acts as a functional antagonist, with potential

immunomodulating activity. Upon oral administration, ponesimod selectively binds to S1PR1 on lymphocytes and causes transient receptor activation followed by S1PR1 internalization and degradation. This results in the sequestration of lymphocytes in lymph nodes. By preventing egress of lymphocytes, ponesimod reduces both the number of circulating peripheral lymphocytes and the infiltration of lymphocytes into target tissues. This prevents a lymphocyte-mediated immune response. S1PR1, a G-protein coupled receptor, plays a key role in lymphocyte migration from lymphoid tissues.

**pons:** the portion of the hindbrain below the medulla and the midbrain that acts as a bridge between various portions of the brain. OR Part of the central nervous system, located at the base of the brain, between the medulla oblongata and the midbrain. It is part of the brainstem.

**pontine :** Having to do with the pons (part of the central nervous system, located at the base of the brain, between the medulla oblongata and the midbrain).

**Pool reactor:** A reactor in which the fuel elements are suspended in a pool of water that serves as the reflector, moderator, and coolant. Popularly called a "swimming pool reactor," it is used for research and training, not for electrical generation.

**Poor gloss level on new paintwork:** Condensation forming on the surface soon after application can take the gloss of new paintwork. This can be caused by painting in cold, damp conditions or painting outside when rain or frost are imminent. Porous under-surfaces can also absorb gloss and make it appear dull. To remedy, lightly abrade the surface and apply a further finishing coat of paint when conditions more favourable.

**population:** an interbreeding group of individuals of one species occupying a defined geographic area.

**population (general usage):** The total number of persons inhabiting a country, town, or other area. A population may also be defined by some other characteristic (such as biological, legal, social, or economic) than living in a particular area, e.g., the male population, the gainfully occupied population.

**population (statistics):** The totality of items under consideration. Every clearly defined part of a population is called a "subpopulation". In the case of a random variable, the probability distribution is considered as defining

the population of that variable (ISO, 1977). The term Population Segment is sometimes used as a synonym for subpopulation.

**population at risk:** The number of people who can develop the adverse health effect under study and who are potentially exposed to the risk factor of interest. For example, all people in a population who have not developed immunity to an infectious disease are at risk of developing the disease, if they are exposed. Similarly, people already having chronic disease are excluded from the population at risk in studies of the incidence of the disease (WHO, 1979).

**population critical concentration (PCC):** The concentration of a chemical in the critical organ (toxicology) at which a specified percentage of the exposed population has reached their individual critical organ concentrations. The percentage indicated by PCC-10 for 10%, PCC- 50 for 50% etc. (similar to the use of the term LC50) (Kjellström et al., 1984).

**population risk :** The proportion of individuals in the general population who are affected with a particular disorder or who carry a certain gene; often discussed in the genetic counseling process as a comparison to the patient's personal risk given his or her family history or other circumstances.

**population study :** A study of a group of individuals taken from the general population who share a common characteristic, such as age, sex, or health condition. This group may be studied for different reasons, such as their response to a drug or risk of getting a disease.

**porcine :** Having to do with or coming from pigs.

**porcupine inhibitor ETC-1922159:** An orally bioavailable inhibitor of the membrane-bound O-acyltransferase (MBOAT) porcupine (PORCN), with potential antineoplastic activity. Upon oral administration, ETC-1922159 binds to and inhibits PORCN in the endoplasmic reticulum (ER), which blocks post-translational palmitoylation of Wnt ligands and inhibits their secretion. This prevents the activation of Wnt ligands, interferes with Wnt-mediated signaling, and inhibits cell growth in Wnt-driven tumors. Porcupine catalyzes the palmitoylation of Wnt ligands, and plays a key role in Wnt ligand secretion. Wnt signaling is dysregulated in a variety of cancers.

**porcupine inhibitor WNT974:** An orally available inhibitor of porcupine (PORCN), with potential antineoplastic activity. Upon oral administration,

WNT974 binds to and inhibits PORCN in the endoplasmic reticulum (ER), which blocks post-translational acylation of Wnt ligands and inhibits their secretion. This prevents the activation of Wnt ligands, interferes with Wnt-mediated signaling, and inhibits cell growth in Wnt-driven tumors.

Porcupine, a membrane-bound O-acyltransferase (MBOAT), is required for the palmitoylation of Wnt ligands, and plays a key role in Wnt ligand secretion and activity. Wnt signaling is dysregulated in a variety of cancers.

**pore space:** open space between sediment grains.

**porfimer sodium:** The sodium salt of a mixture of oligomers formed by ether and ester linkages of up to eight porphyrin units with photodynamic activity. Absorbed selectively by tumor cells, porfimer produces oxygen radicals after activation by 630 nm wavelength laser light, resulting in tumor cell cytotoxicity. In addition, tumor cell death may occur due to ischemic necrosis secondary to vascular occlusion that appears to be partly mediated by the release of thromboxane A<sub>2</sub>. or A drug used to treat some types of cancer. When absorbed by cancer cells and exposed to light, porfimer sodium becomes active and kills the cancer cells. It is a type of photodynamic therapy agent. Also called Photofrin.

**porfiromycin:** An N-methyl derivative of the antineoplastic antibiotic mitomycin C isolated from the bacterium *Streptomyces ardens* and other *Streptomyces* bacterial species. Bioreduced porfiromycin generates oxygen radicals and alkylates DNA, producing interstrand cross-links and single-strand breaks, thereby inhibiting DNA synthesis. Porfiromycin is preferentially toxic to hypoxic cells. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called anticancer antibiotics.

**Porin:** A transmembrane protein that forms channels in the outer mitochondrial membrane, permitting the passage of small molecules and ions to the inner membrane space.

**porosity:** The ratio of the size of a material's pores to the volume of the material's mass. OR The degree to which a material will absorb liquids. OR of a rock or sedimentary deposit, the percentage of volume that consists of voids and open space. OR the percentage of open space between soil particles and rocks. OR Undesired voids included in a part. Porosity can manifest in many sizes and shapes from many causes. Generally, a porous part will be less strong than a fully dense part. OR Air pockets or voids in a

moulded product. Porosity can also be expressed as the ratio of void volume to total product volume.

**Porous:** Porous rocks have tiny holes in them that can soak up water or other liquids. Crude oil is found soaked into porous rocks.

**Porphyrias:** Inherited or acquired metabolic disorders caused by an enzyme deficiency in the biosynthetic pathway for heme; often characterized by the accumulation of one or more pathway intermediates in blood or other tissues, as well as their excretion in urine.

**Porphyrin:** A complex planar structure containing four substituted pyrroles covalently joined in a ring and frequently containing a central metal atom. For example, heme is a porphyrin with a central iron atom.

**porphyrin:** Complex nitrogenous compound containing four substituted pyrroles covalently joined into a ring; often complexed with a central metal atom.

**porphyritic:** of an igneous rock, containing coarser crystals that are supported in a fine-grained groundmass.

**porphyritic texture:** rocks that have different-sized crystals, created at different times.

**porphyry copper deposit:** a disseminated deposit in which copper and molybdenum are found in porphyritic intrusive rocks.

**port :** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. The port is placed under the skin, usually in the chest. It is attached to a catheter (a thin, flexible tube) that is guided (threaded) into a large vein above the right side of the heart called the superior vena cava. A port may stay in place for many weeks or months. A needle is inserted through the skin into the port to draw blood or give fluids. Also called port-a-cath.

**port-a-cath :** A device used to draw blood and give treatments, including intravenous fluids, drugs, or blood transfusions. The port is placed under the skin, usually in the chest. It is attached to a catheter (a thin, flexible tube) that is guided (threaded) into a large vein above the right side of the heart called the superior vena cava. A port-a-cath may stay in place for many weeks or months. A needle is inserted through the skin into the port to draw blood or give fluids. Also called port.

**portal hypertension :** High blood pressure in the vein that carries blood to the liver from the stomach, small and large intestines, spleen, pancreas, and gallbladder. It is usually caused by a block in the blood flow through the liver due to cirrhosis (scarring) of the liver.

**portal vein :** A blood vessel that carries blood to the liver from the intestines, spleen, pancreas, and gallbladder. Also called hepatic portal vein.

**Portrazza :** A drug used with gemcitabine and cisplatin to treat squamous non-small cell lung cancer that has spread to other parts of the body. It is used in patients whose cancer has not been treated with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Portrazza binds to a protein called epidermal growth factor receptor (EGFR), which is found on some types of cancer cells. Blocking this protein may help keep cancer cells from growing. Portrazza is a type of monoclonal antibody. Also called necitumumab.

**posaconazole:** A broad-spectrum, second generation, triazole compound with antifungal activity. Posaconazole strongly inhibits 14-alpha demethylase, a cytochrome P450-dependent enzyme. Inhibition of 14-alpha-demethylase prevents the conversion of lanosterol to ergosterol, an important component of the fungal cell wall. Inhibition of ergosterol synthesis changes the fungal cell membrane composition and integrity, alters membrane permeability and eventually leads to fungal cell lysis. Compared to other azole antifungals, posaconazole is a significantly more potent inhibitor of sterol 14-alpha demethylase.

**Posidur:** (Other name for: extended release bupivacaine hydrochloride resorbable matrix formulation)

**Position of Equilibrium:** This measurement is the point in a chemical reaction where the forward reaction rate equals the reverse reaction rate. OR When a reaction's equilibrium "lies to the right", the concentrations of products will be greater than the concentrations of reactants when equilibrium is established. Conversely, an equilibrium that lies to the left will have a relatively small fraction of products.

**positive axillary lymph node :** A lymph node in the area of the armpit (axilla) to which cancer has spread. This spread is determined by surgically removing some of the lymph nodes and examining them under a microscope to see whether cancer cells are present.

**positive budget:** of a glacier, the gaining of more volume from new snowfall than the losing from melting.

**Positive control:** A system that is turned on by the presence of a regulatory protein.

**positive cooperativity:** A phenomenon of some multisubunit enzymes or proteins in which binding of a ligand or substrate to one subunit facilitates binding to another subunit.

**positive feedback:** An interaction that amplifies the response of the system in which it is incorporated.

**positive gravity anomaly:** the gravity reading of a rock if it is higher than the normal regional gravity value.

**positive magnetic anomaly:** a magnetic reading that exceeds the average magnetic field strength.

**Positive Mold:** A mold with a convex shape.

**positive polarity:** of a rock, when its magnetic field is the same as the earth's field today.

**positive predictive value :** The likelihood that an individual with a positive test result truly has the particular gene and/or disease in question. Also called PPV.

**Positive selection:** A selection process in T cell development in which T cells that can bind to MHC molecules survive, whereas those that cannot undergo apoptosis.

**positive test result :** A test result that shows that a person has the disease, condition, or biomarker for which the test is being done. In genetics, a positive test result usually means that a person has a mutation (change) in the gene, chromosome, or protein that is being tested. More testing may be needed to make a diagnosis or to make sure a positive test result is correct.

**Positive Valence:** This term describes the trait of elements that tend to give up electrons in electrovalent compounds. These are the positive ions of salts. Think about sodium, magnesium, and boron.

**Positron:** Particle equal in mass but opposite in charge to the electron. A positive electron.

**positron emission tomography scan :** A procedure in which a small amount of radioactive glucose (sugar) is injected into a vein, and a scanner

is used to make detailed, computerized pictures of areas inside the body where the glucose is taken up. Because cancer cells often take up more glucose than normal cells, the pictures can be used to find cancer cells in the body. Also called PET scan.

**positron emission tomography-computed tomography scan :** A procedure that combines the pictures from a positron emission tomography (PET) scan and a computed tomography (CT) scan. The PET and CT scans are done at the same time with the same machine. The combined scans give more detailed pictures of areas inside the body than either scan gives by itself. A positron emission tomography-computed tomography scan may be used to help diagnose disease, such as cancer, plan treatment, or find out how well treatment is working. Also called PET-CT scan.

**POSITRONS:** are electrons with a +1 charge. They are found in cosmic rays and in nuclear reactions. They are antimatter. When they meet an electron there is complete annihilation to give pure energy in the form of gamma rays. This is total matter and energy conversion by  $E = mc^2$ .

**Possession-only license:** A license, issued by the NRC, that authorizes the licensee to possess specific nuclear material but does not authorize its use or the operation of a nuclear facility. For additional detail, see Licensing.

**possessive case:** the case of a noun or pronoun used to show ownership.

**Post Cure:** The process of baking or autoclaving silicone parts after molding. This process is used to improve the heat and compression set resistance of specific elastomers- like silicone and fluorocarbons.

**Post gate:** A specialized gate that uses a hole that an ejector pin passes through to inject resin into the mold cavity. This leaves a post vestige that usually needs to be trimmed.

**Post-Consumer materials:** Are collected only after they were used for the purpose for which they were originally manufactured. Post consumer materials are acquired by residential curbside collection programs, drop-off programs, and collection at institutions such as schools and colleges. These materials are limited to PET and HDPE (bottle and film grade), some polypropylene from battery casings collected from vehicle battery return programs, and LDPE and HDPE film grocery bags collected at recycling stations by supermarkets

**Post-consumer Plastic:** Any plastic that has entered the stream of commerce, served its intended purpose, and has now been diverted for recycling or export. This includes residential, commercial and institutional plastic. This does not include industrial scrap material like factory regrind and plant scrap used within the primary manufacturing facility. (Post-consumer plastic resin is also known as PCR). (1995 post-consumer plastic Plastics Recycling/Recovery Rate Survey, Glossary of Terms, R.W. Beck & Associates).

**Post-cure:** A second cure at high temperature to enhance specific properties such as release and non-wetting. OR Application of external heat to bring a resin to a stable state of cure in the shortest possible time.

**post-marketing surveillance trial :** A type of clinical trial that studies the side effects caused over time by a new treatment after it has been approved and is on the market. These trials look for side effects that were not seen in earlier trials and may also study how well a new treatment works over a long period of time. Post-marketing surveillance trials may include thousands of people. Also called phase IV clinical trial.

**post-transplant lymphoproliferative disorder :** A condition in which a group of B-cells grow out of control after an organ transplant in patients with weakened immune systems. This usually happens if the patient has also been infected with Epstein-Barr virus. Post-transplant lymphoproliferative disorder may progress to non-Hodgkin lymphoma. Also called PTLN.

**post-traumatic stress disorder :** An anxiety disorder that develops in reaction to physical injury or severe mental or emotional distress, such as military combat, violent assault, natural disaster, or other life-threatening events. Having cancer may also lead to post-traumatic stress disorder. Symptoms interfere with day-to-day living and include reliving the event in nightmares or flashbacks; avoiding people, places, and things connected to the event; feeling alone and losing interest in daily activities; and having trouble concentrating and sleeping. Also called PTSD.

**Postcure:** Those additional operations to which a cured thermosetting plastic or rubber composition are subjected to enhance the level of one or more properties.

**posterior :** In human anatomy, has to do with the back of a structure, or a structure found toward the back of the body.

**posterior pelvic exenteration :** Surgery to remove the lower part of the bowel, rectum, uterus, cervix, ovaries, fallopian tubes, and vagina. Pelvic lymph nodes may also be removed.

**posterior urethral cancer :** A disease in which malignant (cancer) cells are found in the part of the urethra (the tube through which urine leaves the body) that connects to the bladder (the organ that stores urine).

**Postforming:** Process of shaping parts after a coating has been applied and cured, a technique commonly used with stamped, blanked or spun parts. OR The forming, bending, or shaping of fully cured, C-stage thermoset laminates that have been heated to make them flexible. On cooling, the formed laminate retains the contours and shape of the mold over which it has been formed.

**postmenopausal :** Having to do with the time after menopause. Menopause (“change of life”) is the time in a woman's life when menstrual periods stop permanently.

**postmortem :** After death. Often used to describe an autopsy.

**postoperative :** After surgery.

**postprandial :** After a meal.

**postremission therapy :** Treatment that is given after cancer has disappeared following the initial therapy. Postremission therapy is used to kill any cancer cells that may be left in the body. It may include radiation therapy, a stem cell transplant, or treatment with drugs that kill cancer cells. Also called consolidation therapy and intensification therapy.

**posttranscriptional processing:** The enzymatic processing of the primary RNA transcript, producing functional mRNA, tRNA, and rRNA molecules.

**Posttranslational modification:** The covalent bond changes that occur in a polypeptide chain after it leaves the ribosome and before it becomes a mature protein.

**Pot life:** This refers to the period during which a two-pack material remains useable after mixing. OR Amount of time after mixing a two-part paint system during which it can be applied.

**potable water:** water suitable for drinking or cooking purposes from both health and aesthetic considerations.

**Potassium:** Symbol:"K" Atomic Number:"19" Atomic Mass: 39.10amu. One of the alkali metal family. Potassium is a metallic element and one of the essential elements for organisms to survive. You can also find potassium in potash, many minerals, and fertilizers. OR Watch out for the spelling of this word. It is a silvery metal that reacts violently with water. It is one of the alkali metals. By comparing the reactivity of lithium, sodium and potassium you can see some of the trends in the groups of the periodic table.

**potassium :** A metallic element that is important in body functions such as regulation of blood pressure and of water content in cells, transmission of nerve impulses, digestion, muscle contraction, and heartbeat.

**potassium hydroxide :** A toxic and highly corrosive chemical used to make soap, in bleaching, and as a paint remover. It is used in small amounts as a food additive and in the preparation of some drugs.

**potential daily intake:** The potential daily intake of a pesticide is the theoretical intake calculated on the basis of the maximum residue limits and/or extraneous residue limits and the per caput consumption of the relevant food commodities per day. The same concept applies to food additive intakes (Vettorazzi, 1980).

**potential difference:** Work that must be done to move an electric charge between specified points. Electric potential differences are measured in volts.

**potential energy:** The energy an object has because of its composition or position. OR the energy a substance has due to its position or composition. OR energy an object possesses by virtue of its position. For example, lifting a mass  $m$  by  $h$  meters increases its potential energy by  $mgh$ , where  $g$  is the acceleration due to gravity.

**potentiation:** The joint action of two or more chemicals on an organism is more than additive (WHO, 1978a). OR In medicine, the effect of increasing the potency or effectiveness of a drug or other treatment.

**pothole:** a circular depression eroded into the bedrock of a stream by abrasive sediments.

**Potlife:** Time, usually in hours, during which a two or three component product can be used after it is mixed. Sometimes measured in terms of time to gel and/or double in viscosity. OR The time during which a liquid resin remains useable, after addition of catalyst and accelerator. Also known as

working life. Typically pot-life refers to neat resins (unreinforced) and working life refers to prepregs (reinforced.)

**POTTING:** Similar to ENCAPSULATING, except that steps are taken to insure complete penetration of all the voids in the object before the resin polymerizes.

**Pour-out finish:** a bottle finish having uniform undercut lips as a dealing surface, to facilitate pouring without dripping.

**povidone-iodine solution:** An iodophor solution containing a water-soluble complex of iodine and polyvinylpyrrolidone (PVP) with broad microbicidal activity. Free iodine, slowly liberated from the povidone-iodine (PVPI) complex in solution, kills eukaryotic or prokaryotic cells through iodination of lipids and oxidation of cytoplasmic and membrane compounds. This agent exhibits a broad range of microbicidal activity against bacteria, fungi, protozoa, and viruses. Slow release of iodine from the PVPI complex in solution minimizes iodine toxicity towards mammalian cells.

**Powder bridging:** The formation in a bulk powder of large cohesive regions, or “bridges,” that interfere with uniform flow of the powder in pharmaceutical operations.

**Powder diffraction method:** See X-Ray powder diffraction.

**Powder Molding:** General term used to denote several techniques for producing objects of varying sizes and shapes by melting polyethylene powder, usually against the inside of a mold. The techniques vary as to whether the molds are stationary (e.g., as in variations on slush molding techniques) or rotating (e.g., as in variations on rotational molding).

**Powdery/chalky surfaces on outside paintwork:** Powdery or chalky old paintwork is caused by the paint film wearing away due to exposure to weather. This natural erosion of the paint coating can often be removed by thoroughly washing down prior to repainting. If washing doesn't remove a chalky surface, seal with primer before painting, or in severe cases remove the chalky surface entirely.

**Powdery/chalky surfaces on plaster:** Powdery and chalky surfaces are quite common in older properties that have been painted with distemper or white wash. You should completely remove these coatings by washing with warm water and a detergent solution. Rinse with clean water and change the

water regularly. If the surface still remains slightly chalky, seal with an appropriate Dulux primer or plaster sealer prior to finishing.

**Powdery/chalky surfaces on previously painted exterior masonry:**

Brick and masonry surfaces painted with cement-based paint will eventually corrode and become powdery or chalky. Even unpainted pebbledash or render can become powdery with age. In each case, ensure the surface is sound, clean and dry. Remove all loose material with a stiff brush or paint scraper. If powdery or chalky residues still remain, stabilise the surface with a coat of Weathershield Stabilising Primer. However, don't use a stabilising solution on new or sound bare rendering that has never been painted. A well-thinned first coat of the appropriate Weathershield Masonry Paint is usually all that is required.

**power:** The rate at which energy is supplied. Power has define[SI] units of J/s, sometimes called "Watts" (W).

**Power coefficient of reactivity:** The change in reactivity per percent change in power. The power coefficient is the summation of the moderator temperature coefficient of reactivity, the fuel temperature coefficient of reactivity, and the void coefficient of reactivity.

**Power defect:** The total amount of reactivity added due to a given change in power. It can also be expressed as the integrated power coefficient over the range of the power change.

**Power Factor:** In a perfect condenser, the current leads the voltage by 90 degrees. When a loss takes place in the insulation, the absorbed current, which produces heat, throws the 90 degree relationship out according to the proportion of current absorbed by the dielectric. The power factor is the cosine of the angle between voltage applied and the current resulting.

**power of attorney :** A power of attorney is a legal document that gives one person (such as a relative, lawyer, or friend) the authority to make legal, medical, or financial decisions for another person. It may go into effect right away, or when that person is no longer able to make decisions for himself or herself.

**Power reactor:** A reactor designed to produce heat for electric generation (as distinguished from reactors used for research), for producing radiation or fissionable materials or for reactor component testing.

**Power stroke:** The conformational change in myosin heads powered by phosphate release as myosin binds to actin and pulls the actin filament, with the resulting displacement of the myosin heads.

**Power uprate:** The process of increasing the maximum power level at which a commercial nuclear power plant may operate. This power level, regulated by the NRC, is included in the plant's operating license and technical specifications. A licensee may only change its maximum power output after the NRC approves an uprate application. The NRC analyses must demonstrate that the plant could continue to operate safely with its proposed new configuration. When all requisite conditions are fulfilled, the NRC may grant the power uprate by amending the plant's operating license and technical specifications. For additional detail, see Power Uprates.

**POWER-LAW MODEL:** A simple mathematical expression describing the shear thinning behavior of polymers. Where  $m$  is the consistency index,  $n$  is the power-law index, and  $\dot{\gamma}$  is the shear rate (for polymer melts  $0.2 < n < 0.8$ ). The power-law model does a good job in fitting high shear rate viscosity data but a poor job for fitting low shear rate viscosity data. In fact for the power-law model gives  $\tau = K \dot{\gamma}^n$  which is, of course, unrealistic. The usefulness of the power-law model is derived from the fact that several analytical solutions are possible and many practical flow problems occur at high shear rates where the power-law model gives a reasonable fit of viscosity data.

**poziotinib:** An orally bioavailable, quinazoline-based, small-molecular and irreversible pan-epidermal growth factor receptor (EGFR or HER) inhibitor with potential antineoplastic activity. Poziotinib inhibits EGFR (HER1 or ErbB1), HER2, HER4 and EGFR mutants, thereby inhibiting the proliferation of tumor cells that overexpress these receptors. EGFRs, cell surface receptor tyrosine kinases, are often upregulated in a variety of cancer cell types and play key roles in cellular proliferation and survival.

**PP:** Polypropylene OR A small protein made by the pancreas that helps control the release of other substances made by the pancreas. The amount of PP in the blood increases after a person eats. It may also increase with age, and in certain diseases, such as diabetes and pancreatic cancer. Also called pancreatic polypeptide.

**PP14 derivative-treated HLA-matched donor mononuclear cell-enriched leukocytes:** A preparation of allogeneic HLA-matched leukocytes treated with a derivative of placental protein 14 (PP14) with potential immunomodulating activity. PP14 derivative-treated HLA-matched donor mononuclear cell-enriched leukocytes contain at least fifty-five percent early-apoptotic T cells; after infusion and when processed by recipient dendritic cells, early-apoptotic T cells may help induce a decrease in the donor effector T-cell responses against the recipient of an allogeneic hematopoietic stem cell (HSC) transplant, thereby minimizing allogeneic HSC transplant-related graft-versus-host disease (GVHD). PP14, a 162 amino acid glycosylated protein secreted by the late secretory phase endometrium, binds to T cells in a carbohydrate fashion and has been shown to induce T-cell apoptosis; maternal immune tolerance to the fetus and pregnancy-related remissions of autoimmune disease may involve PP14-induced T cell apoptosis.

**PPAP:** (Part Production Approval Process) Our ability, as product supplier, to meet requirements determined by our customers through continued process documentation and analysis. See PPAP link for more information.

**PPAR gamma pathway :** Describes a group of proteins in a cell that work together to help control how certain genes are expressed and the use of lipids (fats) and glucose (sugar) in the body. Changes in the PPAR gamma pathway may lead to diseases such as heart disease, diabetes, and cancer. Drugs or substances that affect this pathway are being studied in the prevention and treatment of cancer and other diseases. Also called peroxisome proliferator-activated receptor gamma pathway.

**ppb:** parts per billion

**PPE-expressing replication-defective HSV-1 vector NP2:** A replication-defective (ICP4-deleted) herpes simplex virus type 1 (HSV-1) viral vector expressing the human preproenkephalin A (PPE) gene with potential antinociceptive activity. Upon intradermal administration, PPE-expressing replication-defective HSV-1 vector NP2 is transported by retrograde axonal transport to the dorsal root ganglion (DRG) and becomes dormant. In the DRG, the vector transduces sensory neurons with high efficiency, delivering the engineered PPE gene; transduced neurons then express the protein proenkephalin A, the precursor for Met- and Leu-enkephalin. After proteolytic cleavage from proenkephalin A in the DRG neuronal cytosol,

transgene-mediated Met- and Leu-enkephalin bind to mu and gamma-opioid receptors, which may result in the inhibition of nociceptive neurotransmission.

**PPI:** A substance used to treat certain disorders of the stomach and intestines, such as heartburn and ulcers. PPIs block the actions of an enzyme in the stomach and reduce the amount of acid made in the stomach. Also called proton pump inhibitor.

**PPI-2458:** A synthetic derivative of fumagillin with antineoplastic and cytotoxic properties. PPI-2458 irreversibly inhibits the enzyme methionine aminopeptidase type 2 (MetAP2), thereby preventing abnormal cell growth and angiogenesis. PPI-2458 is reported to have a better toxicity profile compared to other agents of its class.

**ppm:** parts per million

**pPNET:** A type of cancer that forms in bone or soft tissue. Also called Ewing sarcoma and peripheral primitive neuroectodermal tumor.

**PPO:** Polyphenylene oxide

**PPS:** Polyphenylene sulfide

**PPV:** The likelihood that an individual with a positive test result truly has the particular gene and/or disease in question. Also called positive predictive value.

**PR:** A protein found inside the cells of the female reproductive tissue, some other types of tissue, and some cancer cells. The hormone progesterone will bind to the receptors inside the cells and may cause the cells to grow. Also called progesterone receptor.

**PR- :** Describes cells that do not have a protein to which the hormone progesterone will bind. Cancer cells that are PR- do not need progesterone to grow, and usually do not stop growing when treated with hormones that block progesterone from binding. Also called progesterone receptor negative.

**PR-104:** A non-toxic, small-molecule, hypoxia-activated, 3,5-dinitrobenzamide nitrogen mustard pre-prodrug with potential antitumor activity. Upon intravenous administration, PR-104 is converted by systemic phosphatases to the alcohol intermediate PR-104A, which is reduced to form the active DNA-crosslinking mustard species hydroxylamine PR-104H intracellularly under hypoxic conditions. PR-104H specifically

crosslinks hypoxic tumor cell DNA, resulting in the inhibition of DNA repair and synthesis, cell-cycle arrest, and apoptosis in susceptible hypoxic tumor cell populations while sparing normoxic tissues.

**PR-104:** A substance being studied in the treatment of cancer. PR-104 becomes active when cancer cells don't receive enough oxygen. It may kill cancer cells by damaging their DNA.

**PR+ :** Describes cells that have a protein to which the hormone progesterone will bind. Cancer cells that are PR+ need progesterone to grow and will usually stop growing when treated with hormones that block progesterone from binding. Also called progesterone receptor positive.

**PR1 leukemia peptide vaccine:** A cancer vaccine containing PR1, a 9 amino-acid human leukocyte antigen (HLA)-A2 restricted peptide derived from proteinase 3, with potential immunotherapeutic activity. Vaccination with PR1 leukemia peptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing proteinase 3, resulting in tumor cell lysis. Often overexpressed in leukemic cells, proteinase 3 is a serine proteinase that activates progelatinase A and is involved in angiogenesis and metastasis.

**pracinostat:** An orally bioavailable, small-molecule histone deacetylase (HDAC) inhibitor with potential antineoplastic activity. Pracinostat inhibits HDACs, which may result in the accumulation of highly acetylated histones, followed by the induction of chromatin remodeling; the selective transcription of tumor suppressor genes; the tumor suppressor protein-mediated inhibition of tumor cell division; and, finally, the induction of tumor cell apoptosis. This agent may possess improved metabolic, pharmacokinetic and pharmacological properties compared to other HDAC inhibitors.

**practitioner :** A person who works in a specific profession. For example, a doctor or nurse is a healthcare practitioner.

**Pradaxa:** (Other name for: dabigatran etexilate mesylate)

**pralatrexate:** A folate analogue inhibitor of dihydrofolate reductase (DHFR) exhibiting high affinity for reduced folate carrier-1 (RFC-1) with antineoplastic and immunosuppressive activities. Pralatrexate selectively enters cells expressing RFC-1; intracellularly, this agent is highly polyglutamylated and competes for the folate binding site of DHFR, blocking tetrahydrofolate synthesis, which may result in depletion of

nucleotide precursors; inhibition of DNA, RNA and protein synthesis; and apoptotic tumor cell death. Efficient intracellular polyglutamylation of pralatrexate results in higher intracellular concentrations compared to non-polyglutamylated pralatrexate, which is more readily effluxed by the MRP (multidrug resistance protein) drug efflux pump. RFC-1, an oncofetal protein expressed at highest levels during embryonic development, may be overexpressed on the cell surfaces of various cancer cell types. or A drug used in the treatment of peripheral T-cell lymphoma (a fast-growing form of non-Hodgkin lymphoma). It is also being studied in the treatment of other types of cancer. Pralatrexate may block the growth of cancer cells and cause them to die. It is a type of dihydrofolate reductase (DHFR) inhibitor. Also called FOLOTYN.

**PRAME-targeting T-cell receptor/Inducible caspase 9 BPX-701:**

Human allogeneic T lymphocytes transduced with a retroviral vector encoding a high-affinity T-cell receptor (TCR) specific for human leukocyte antigen (HLA)-A2-01-restricted, preferentially-expressed antigen in melanoma (PRAME) and containing the chemical induction of dimerization (CID) suicide/safety switch, composed of a drug binding domain coupled to the signaling domain of the suicide enzyme caspase-9, with potential antineoplastic activity. Peripheral blood mononuclear cells (PBMCs) are isolated from a patient, transduced with an anti-PRAME-HLA-A2 restricted TCR, expanded ex vivo, and reintroduced into the HLA-A2-positive patient. Upon reintroduction, PRAME-targeting T-cell receptor-based therapy BPX-701 binds to tumor cells expressing PRAME, which may induce cell death in and halt the growth of PRAME-expressing cancer cells. The tumor-associated antigen PRAME is overexpressed by a variety of cancer cell types. If potential T-cell toxicity due to graft-versus-host disease (GvHD) occurs, the chemical dimerizer rimiducid (AP1903) can be administered. Rimiducid binds to the drug binding domain expressed by the BPX-701 T cells, and triggers activation of the caspase-9 domain, which leads to caspase 9-mediated signaling, the induction of apoptosis and to selective and complete elimination of BPX-701 cells.

**pramipexole dihydrochloride:** The hydrochloride salt of pramipexole, a benzothiazole derivative. As a nonergot dopamine agonist, pramipexole binds to D2 and D3 dopamine receptors in the striatum and substantia nigra of the brain. Compared to other dopamine agonists, the use of this agent may be associated with fewer dyskinetic side effects in treated subjects.

**Prandin:** (Other name for: repaglinide)

**Praseodymium:** Symbol:"Pr" Atomic Number:"59" Atomic Mass: 140.91amu. Praseodymium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. This soft, silvery metal can be found in many minerals and even some cigarette lighter sparking mechanisms.

**prasterone:** A synthetic form of dehydroepiandrosterone with potential chemopreventive activity. Produced endogenously, dehydroepiandrosterone (DHEA) is an intermediate in the conversion of cholesterol to androgens and estrogens. Although the mechanisms of action of exogenously administered DHEA have not been fully illuminated, they may result in both direct and indirect physiologic effects. Direct effects include GABA-a receptor complex and NMDA receptor modulation, and enhanced pancreatic beta cell insulin secretion and antiglucocorticoid activities.

**Pravachol :** A drug used to lower the amount of cholesterol in the blood and to prevent stroke and heart attack. It is also being studied in the treatment of cancer and other conditions. Pravachol blocks an enzyme that helps make cholesterol in the body. It may also make tumor cells more sensitive to anticancer drugs. It is a type of HMG-CoA reductase inhibitor, a type of statin, and a type of chemosensitizer. Also called pravastatin sodium.

**pravastatin :** The active ingredient in a drug used to lower the amount of cholesterol in the blood and to prevent stroke and heart attack. It is also being studied in the treatment of cancer and other conditions. Pravastatin blocks an enzyme that helps make cholesterol in the body. It may also make tumor cells more sensitive to anticancer drugs. It is a type of HMG-CoA reductase inhibitor, a type of statin, and a type of chemosensitizer.

**pravastatin sodium:** The sodium salt of pravastatin with cholesterol-lowering and potential antineoplastic activities. Pravastatin competitively inhibits hepatic hydroxymethyl-glutaryl coenzyme A (HMG-CoA) reductase, the enzyme which catalyzes the conversion of HMG-CoA to mevalonate, a key step in cholesterol synthesis. This agent lowers plasma cholesterol and lipoprotein levels, and modulates immune responses by suppressing MHC II (major histocompatibility complex II) on interferon gamma-stimulated, antigen-presenting cells such as human vascular endothelial cells. In addition, pravastatin, like other statins, exhibits pro-

apoptotic, growth inhibitory, and pro-differentiation activities in a variety of tumor cells; these antineoplastic activities may be due, in part, to inhibition of the isoprenylation of Ras and Rho GTPases and related signaling cascades. orA drug used to lower the amount of cholesterol in the blood and to prevent stroke and heart attack. It is also being studied in the treatment of cancer and other conditions. Pravastatin sodium blocks an enzyme that helps make cholesterol in the body. It may also make tumor cells more sensitive to anticancer drugs. It is a type of HMG-CoA reductase inhibitor, a type of statin, and a type of chemosensitizer. Also called Pravachol.

**Pre-mrna:** The unspliced, immediate product of RNA polymerase II in eukaryotes.

**Pre-treatment:** The initial treatment of a surface prior to painting, e.g. treatment of galvanised metal with mordant solution or sterilising surfaces with fungicidal solution.

**precancerous :** A term used to describe a condition that may (or is likely to) become cancer. Also called premalignant.

**precancerous dermatitis :** A skin disease marked by scaly or thickened patches on the skin and often caused by prolonged exposure to arsenic. The patches often occur on sun-exposed areas of the skin and in older white men. These patches may become malignant (cancer). Also called Bowen disease and precancerous dermatosis.

**precancerous dermatosis :** A skin disease marked by scaly or thickened patches on the skin and often caused by prolonged exposure to arsenic. The patches often occur on sun-exposed areas of the skin and in older white men. These patches may become malignant (cancer). Also called Bowen disease and precancerous dermatitis.

**precancerous polyps :** Growths that may become cancer that protrude from a mucous membrane.

**Precedex:** (Other name for: dexmedetomidine hydrochloride)

**Precession camera:** A camera used in X-ray crystallography in which the center of a flat film is always kept aligned with the direct beam of X-rays as a crystal is oscillated.

**Precession photograph:** An X-ray diffraction photograph made on a precession camera. Direct measurement of all lattice parameters are possible from a series of these photographs.

**prechlorination:** chlorination of water prior to filtration, or chlorination of sewage prior to treatment.

**precipitant:** a chemical or chemicals that cause a precipitate to form when added to a solution. OR the discrete particles of material separate from the liquid solution. OR A solid formed in a chemical reaction. OR A precipitate is an insoluble solid formed when two solutions react together. OR a solid that separates from solution. OR An insoluble substance that has been formed from substances dissolved in a solution. For example, mixing silver nitrate and sodium chloride solutions produces a precipitate, insoluble silver chloride (along with soluble sodium nitrate). OR An insoluble solid which is formed when two solutions react together.

**precipitation:** Any or all forms of liquid or solid water particles that fall from the atmosphere and reach the Earth's surface. It includes drizzle, rain, snow, snow pellets, snow grains, ice crystals, ice pellets, and hail. The ratio of precipitation to evaporation is the most important factor in the distribution of vegetation zones. Precipitation is also defined as a measure of the quantity, expressed in centimeters or milliliters of liquid water depth, of the water substance that has fallen at a given location in a specified amount of time. OR Precipitation is the conversion of a dissolved substance into insoluble form by chemical or physical means.

**precipitation, chemical:** to cause a solid substance to be separated (precipitate out) of a solution by the addition of chemical additives; the process of softening water by the addition of lime and soda ash as the precipitants.

**Precision:** a measure of the reproducibility of a method i.e. the closeness of agreement between independent test results, when multiple measurements are made on the sample under the same conditions. The observed values may differ from the true values without affecting the precision and reproducibility (see accuracy). OR Precision is reproducibility. Saying "These measurements are precise" is the same as saying, "The same measurement was repeated several times, and the measurements were all very close to one another". Don't confuse precision with accuracy.

**PRECISION:** gives consistent results. (Something can be precisely inaccurate.)

**precision:** The agreement of repeated measurements with each other. OR The closeness of agreement between the results obtained by applying the experimental procedure several times under prescribed conditions (ISO, 1977).

**precision medicine :** A form of medicine that uses information about a person's genes, proteins, and environment to prevent, diagnose, and treat disease. In cancer, precision medicine uses specific information about a person's tumor to help diagnose, plan treatment, find out how well treatment is working, or make a prognosis. Examples of precision medicine include using targeted therapies to treat specific types of cancer cells, such as HER2-positive breast cancer cells, or using tumor marker testing to help diagnose cancer. Also called personalized medicine.

**preclinical study :** Research using animals to find out if a drug, procedure, or treatment is likely to be useful. Preclinical studies take place before any testing in humans is done.

**Precose:** (Other name for: acarbose)

**precursor:** In metabolism, a chemical substance from which another chemical substance is formed OR the substance from which another compound is formed.

**precursor B-lymphoblastic leukemia :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many B-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. It is the most common type of acute lymphoblastic leukemia (ALL). Also called B-cell acute lymphoblastic leukemia and B-cell acute lymphocytic leukemia.

**precursor lymphoblastic lymphoma :** An aggressive (fast-growing) type of non-Hodgkin lymphoma in which too many lymphoblasts (immature white blood cells) are found in the lymph nodes and the thymus gland. These lymphoblasts may spread to other places in the body. It is most common in teenagers and young adults and affects more males than females. It may be a T or B cell type. Also called lymphoblastic lymphoma.

**precursor T-lymphoblastic leukemia :** An aggressive (fast-growing) type of leukemia (blood cancer) in which too many T-cell lymphoblasts (immature white blood cells) are found in the bone marrow and blood. Also called T-cell acute lymphoblastic leukemia and T-cell acute lymphocytic leukemia.

**precursor T-lymphoblastic lymphoma :** A type of non-Hodgkin lymphoma in which too many T-cell lymphoblasts (immature white blood cells) are found in the lymph nodes and spleen. It is most common in young men. Also called T-lymphoblastic lymphoma.

**predation:** a relationship in which one population within a community may capture and feed upon another population.

**predicate:** part of a sentence that tells what the subject does or is, or what is done to the subject.

**predictive factor :** A condition or finding that can be used to help predict whether a person's cancer will respond to a specific treatment. Predictive factor may also describe something that increases a person's risk of developing a condition or disease.

**predisposing mutation :** A germline mutation that increases an individual's susceptibility or predisposition to a certain disease or disorder. When such a mutation is inherited, development of symptoms is more likely, but not certain. Also called susceptibility gene.

**prednisolone:** A synthetic glucocorticoid with anti-inflammatory and immunomodulating properties. After cell surface receptor attachment and cell entry, prednisolone enters the nucleus where it binds to and activates specific nuclear receptors, resulting in an altered gene expression and inhibition of proinflammatory cytokine production. This agent also decreases the number of circulating lymphocytes, induces cell differentiation, and stimulates apoptosis in sensitive tumor cell populations. or A drug that lessens inflammation and suppresses the body's immune response. It may also kill cancer cells. Prednisolone is used to treat disorders in many organ systems and to treat the symptoms of several types of leukemia and lymphoma. It is also being studied in the treatment of other types of cancer. Prednisolone is a type of therapeutic glucocorticoid.

**prednisone:** A synthetic glucocorticoid with anti-inflammatory and immunomodulating properties. After cell surface receptor attachment and cell entry, prednisone enters the nucleus where it binds to and activates specific nuclear receptors, resulting in an altered gene expression and inhibition of proinflammatory cytokine production. This agent also decreases the number of circulating lymphocytes, induces cell differentiation, and stimulates apoptosis in sensitive tumor cell populations. or A drug used to lessen inflammation and lower the body's immune

response. It is used with other drugs to treat leukemia and lymphoma and other types of cancer. It is also used alone or with other drugs to prevent or treat many other conditions. These include conditions related to cancer, such as anemia (a low level of red blood cells), allergic reactions, and loss of appetite. Prednisone is a type of therapeutic glucocorticoid.

**preferential order of discharge:** The preferential order of discharge is a list of negatively charged ions arranged in the order that they are likely to be oxidized at the anode during electrolysis.

**Preferred orientation:** The crystals in a powder are said to be in a preferred orientation when they are not randomly oriented and their diffraction intensities differ from those obtained when crystals are randomly oriented.

**Preform :** A plastic pre- shaped part produced by injection molding systems in the first step of a two-stage injection molding and blow molding process used to produce bottles or containers. The preform is subsequently re-heated and stretch blown through a blow molding process into the final container shape.

**pregabalin:** A 3-isobutyl derivative of gamma-amino butyric acid (GABA) with anti-convulsant, anti-epileptic, anxiolytic, and analgesic activities. Although the exact mechanism of action is unknown, pregabalin selectively binds to alpha2delta (A2D) subunits of presynaptic voltage-dependent calcium channels (VDCCs) located in the central nervous system (CNS). Binding of pregabalin to VDCC A2D subunits prevents calcium influx and the subsequent calcium-dependent release of various neurotransmitters, including glutamate, norepinephrine, serotonin, dopamine, and substance P, from the presynaptic nerve terminals of hyperexcited neurons; synaptic transmission is inhibited and neuronal excitability is diminished. Pregabalin does not bind directly to GABA-A or GABA-B receptors and does not alter GABA uptake or degradation. or A drug used to treat nerve pain caused by diabetes or herpes zoster infection and certain types of seizures. It is being studied in the prevention and treatment of nerve pain in the hands and feet of cancer patients given chemotherapy. Pregabalin is a type of anticonvulsant. Also called Lyrica.

**pregnancy :** The condition between conception (fertilization of an egg by a sperm) and birth, during which the fertilized egg develops in the uterus. In humans, pregnancy lasts about 288 days.

**Pregnenolone:** A steroid formed by the removal of the six-carbon side chain from cholesterol; steroid hormones are synthesized from pregnenolone.

**Pregnyl:** (Other name for: recombinant human chorionic gonadotropin)

**Preheat Roll:** In extrusion coating, a heated roll installed between the pressure roll and unwind roll whose purpose is to heat the substrate before it is coated.

**PREHEATING:** The heating of a compound prior to molding or casting in order to facilitate the operation, reduce cycle, and improve product.

**Preheating:** Warming of parts prior to application of a coating, recommended when adhesion is critical and when parts are being coated in humid atmospheres. In some cases, this technique can be used to achieve higher-than-normal film builds.

**preimplantation factor PIF-1:** A synthetic version, known as PIF-1, of the peptide preimplantation factor (PIF), an embryo-secreted peptide, with potential activity against graft-versus-host disease (GVHD). PIF-1 is believed to have wide-ranging activity on the immunologic system, including a whole host of immunologic changes that resemble pregnancy, in which there is neither graft-versus-host or host-versus-graft disease between the mother and the embryo. Replication of the immunologic profile of pregnancy through the administration of PIF-1 may thus benefit patients undergoing bone marrow transplant (BMT) who experience graft-versus-host disease (GVHD). Native embryonic PIF has been found to have a multi-targeted effect on various aspects of the immune system, coordinated so that there is a successful embryonic implantation and a successful pregnancy.

**Preimpregnation:** The practice of mixing resin and reinforcement before shipping it to the molder.

**Prelay:** (Other name for: troglitazone)

**Preliminary Notification (PN):** A brief summary report issued by the NRC staff to notify the Commission of the occurrence of a significant event that appears to have health and safety significance or major public or media interest. PNs are based on information provided by State radiation control program staff.

**Preloads (for fasteners):** The "tightness" of a fastener, equal to the make-up energy applied minus the energy required to overcome friction at the fastener's bearing surfaces and threads.

**Prelone:** (Other name for: prednisolone)

**pre-malignant :** A term used to describe a condition that may (or is likely to) become cancer. Also called precancerous.

**Premarin:** (Other name for: conjugated estrogens)

**premature birth :** The birth of a baby before 37 weeks of pregnancy. In humans, a normal pregnancy lasts about 40 weeks. The risk of premature birth may be increased by certain health problems in the mother, such as diabetes, heart disease, and kidney disease, or problems during pregnancy. Smoking cigarettes, being exposed to secondhand tobacco smoke, drinking alcohol, and taking certain drugs during pregnancy may also increase the risk of a premature birth. Also called preterm birth.

**premature death :** Death that occurs before the average age of death in a certain population. In the United States, the average age of death is about 75 years. Smoking cigarettes and being exposed to secondhand tobacco smoke are leading causes of premature death in the United States. They can increase the risk of cancer, heart disease, stroke, lung disease, and many other health problems. Other causes of premature death are injuries and suicide.

**premature menopause :** A condition in which the ovaries stop working and menstrual periods stop before age 40. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility. Premature menopause can be caused by some cancer treatments, surgery to remove the ovaries, and certain diseases or genetic conditions. Also called early menopause, premature ovarian failure, and primary ovarian insufficiency.

**premature ovarian failure :** A condition in which the ovaries stop working and menstrual periods stop before age 40. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility. Premature ovarian failure can be caused by

some cancer treatments, surgery to remove the ovaries, and certain diseases or genetic conditions. Also called early menopause, premature menopause, and primary ovarian insufficiency.

**premenopausal :** Having to do with the time before menopause.

Menopause ("change of life") is the time of life when a woman's menstrual periods stop permanently.

**PREMIX:** A molding compound prepared prior to and apart from the molding operations and containing all components required for molding: resin, reinforcement fillers, catalysts, release agents, and other compounds.

**premycotic phase :** A phase of mycosis fungoides in which a patient has areas of red, scaly, itchy skin on areas of the body that are usually not exposed to sun. This is early-phase mycosis fungoides, but it is hard to diagnose the rash as mycosis fungoides during this phase. The premycotic phase may last from months to decades.

**prenatal :** Having to do with the time a female is pregnant, before birth occurs. Also called antenatal.

**preparation:** a reaction in which a desired chemical is produced; for example, the dehydration of an alcohol is a preparation for an alkene. OR shows the relationship between a noun or pronoun and another noun or pronoun.

**prepositional idiom:** an expression that depends on the choice of a particular preposition.

**prepositional phrase:** a phrase that begins with a preposition and includes a noun or pronoun that is the object of the preposition.

**Prepreg:** A factory-made combination of reactive resins and reinforcing fibres, plus other necessary additive chemicals, ready to be moulded. To process prepregs, individual layers of prepreg are laid up on a tool and a vacuum bag is placed over the lay-up and the air evacuated. The bagged part is placed in an oven or an autoclave and cured for the specified time, temperature and pressure. OR A term generally used in reinforced plastics to mean the reinforcing material containing or combined with the full complement of resin before molding.

**prescription :** A doctor's order for medicine or another intervention.

**present perfect:** a verb tense that indicates action in past time in relation to present time; it is formed with has or have and the past participle of the

verb.

**present tense:** a verb tense that indicates the action is occurring now.

**PRESERVATIVE:** A chemical added to a product to inhibit the growth of bacteria.

**Press:** An injection molding machine.

**Pressure** : The force per unit area. OR Force per unit area. The SI unit of pressure is the pascal, defined as one newton per square meter. Other common pressure units are the atmosphere, the bar, and the Torr. OR The force caused by particles hitting the walls of a vessel.

**Pressure Drop:** energy loss in a fluid as it passes through a flow passage. The loss is due to friction between fluid particles and can be measured as a decrease in pressure in the direction of flow. OR Pressure drop is the loss of pressure that occurs when the melt is pushed into a section of the mould during the filling phase.

**PRESSURE FLOW (also called POISEUILLE FLOW):** The flow of a fluid caused by a pressure difference. The resulting velocity profile in a tube is parabolic for Newtonian fluids and somewhat "flatter" for polymer melts. The pressure drop is linear in the direction of flow for tubes or channels with parallel walls. In the metering section of an extruder screw, pressure flow is the relatively backward flow of material down the screw channel caused by pressure in the head.

**PRESSURE FORMING:** A thermoforming process wherein pressure is used to push the sheet to be formed against the mold surface as opposed to using a vacuum to suck the sheet flat against the mold.

**Pressure Forming:** Version of thermoforming, whereby a sheet of plastic is heated to a forming temperature while pressure forces the plastic downward onto a mold or tool to form its shape.

**Pressure Injection:** The pressure on the face of the injection ram at which molding silicone rubber is injected into a mold, liquid silicone rubber generally uses much lower injection pressures when compared with plastic injection

**Pressure Pads:** Reinforcements or hardened steel distributed around the dead areas in the faces of a mold to help the land absorb the final pressure of closing without collapsing.

**Pressure Profile:** After switch over point injection speed should remain at lower value and pressure is changed with time till the mould is just filled with out over packing. This follow up / hold on pressure change with respect to time is called Injection pressure profile.

**Pressure Roll:** In extrusion coating, the roll which with the chill roll applies pressure to the substrate and the molten extruded web.

**Pressure spraying:** Coating technique similar to siphon spraying, except that the coating is delivered from a pressurized pot to the spray nozzle under positive pressure. Generally used for high-volume production.

**Pressure vessel:** A strong-walled container housing the core of most types of power reactors. It usually also contains the moderator, neutron reflector, thermal shield, and control rods.

**Pressurized-water reactor (PWR):** A common nuclear power reactor design in which very pure water is heated to a very high temperature by fission, kept under high pressure (to prevent it from boiling), and converted to steam by a steam generator (rather than by boiling, as in a boiling-water reactor). The resulting steam is used to drive turbines, which activate generators to produce electrical power. A pressurized-water reactor (PWR) essentially operates like a pressure cooker, where a lid is tightly placed over a pot of heated water, causing the pressure inside to increase as the temperature increases (because the steam cannot escape) but keeping the water from boiling at the usual 212°F (100°C). About two-thirds of the operating nuclear reactor power plants in the United States are PWRs. For additional detail, see Pressurized Water Reactors (PWRs).

**Pressurizer:** A tank or vessel that acts as a head tank (or surge volume) to control the pressure in a pressurized water reactor.

**Prestoflex :** Prestoflex plastic belting has a connectorless construction, made up of plastic modules, which snap or unsnap together for quick and uncomplicated repairs.

**presymptomatic testing :** Genetic analysis of an asymptomatic or unaffected individual who is at risk of a specific genetic disorder.

**preterm birth :** The birth of a baby before 37 weeks of pregnancy. In humans, a normal pregnancy lasts about 40 weeks. The risk of preterm birth may be increased by certain health problems in the mother, such as

diabetes, heart disease, and kidney disease, or problems during pregnancy. Smoking cigarettes, being exposed to secondhand tobacco smoke, drinking alcohol, and taking certain drugs during pregnancy may also increase the risk of a preterm birth. Also called premature birth.

**pretracheal space :** The area in front of the trachea (windpipe).

**pretreatment:** any wastewater treatment process used to partially reduce pollution load before the wastewater is introduced into a main sewer system or delivered to a treatment plant; a substantial reduction of the pollution load. OR Processes for cleaning and conditioning a substrate to be coated. Next to the choice of coating, this may be the most important factor in the use of high-performance coatings. OR Usually used to indicate the chemical treatment of bare metal prior to painting.

**Prevacid :** A drug that reduces the amount of acid made in the stomach. It is used to treat stomach ulcers, gastroesophageal reflux disease (a condition in which acid from the stomach causes heartburn), and conditions in which the stomach makes too much acid. Prevacid is a type of proton pump inhibitor (PPI). Also called lansoprazole.

**prevailing westerlies:** planetary winds between 30° and 60° latitude; they guide weather systems for the United States (from SW to NE).

**prevalence:** The number of instances of a given disease or other condition in a given population at a designated time; sometimes used to mean prevalence rate. When used without qualification, the term usually refers to the situation at a specified point in time (point prevalence).

**prevalence rate (ratio):** The total number of individuals who have an attribute or disease at a particular time (or during a particular period) divided by the population at risk of having the attribute or disease at this point in time or midway through the period. A problem may arise with calculating period prevalence rates because of the difficulty of defining the most appropriate denominator (Last, 1988).

**prevalence, annual:** (an occasionally used index)The total number of persons with the disease or attribute at any time during a year. It includes cases of the disease arising before but extending into or through the year as well as those having their inception during the year.

**prevalence, lifetime:** The total number of persons known to have had the disease or attribute for at least part of their life.

**prevalence, period:** The total number of persons known to have had the disease or attribute at any time during a specified period.

**prevalence, point:** The number of persons with a disease or an attribute at a specified point in time (Last, 1988).

**prevascular space :** The area in the front part of the chest between the lungs. Also called anterior mediastinum.

**prevention :** In medicine, action taken to decrease the chance of getting a disease or condition. For example, cancer prevention includes avoiding risk factors (such as smoking, obesity, lack of exercise, and radiation exposure) and increasing protective factors (such as getting regular physical activity, staying at a healthy weight, and having a healthy diet).

**preventive :** Used to prevent disease.

**preventive mastectomy :** Surgery to reduce the risk of developing breast cancer by removing one or both breasts before disease develops. Also called prophylactic mastectomy.

**Pprevnar:** (Other name for: pneumococcal 7-valent conjugate vaccine)

**Pprevnar 13:** (Other name for: pneumococcal 13-valent conjugate vaccine)

**prexasertib:** An inhibitor of checkpoint kinase 1 (chk1) with potential antineoplastic activity. Upon administration, prexasertib selectively binds to chk1, thereby preventing activity of chk1 and abrogating the repair of damaged DNA. This may lead to an accumulation of damaged DNA and may promote genomic instability and apoptosis. Prexasertib may potentiate the cytotoxicity of DNA-damaging agents and reverse tumor cell resistance to chemotherapeutic agents. Chk1, a serine/threonine kinase, mediates cell cycle checkpoint control and is essential for DNA repair and plays a key role in resistance to chemotherapeutic agents.

**Prialt:** (Other name for: ziconotide)

**Prialt :** A drug used in the treatment of chronic pain. Also called SNX 111 and ziconotide.

**Pribnow box:** A promoter component of prokaryotic genes that has the consensus sequence 5'- TATAAA-3' located 10 base pairs downstream from the transcription start site.

**Prilosec:** (Other name for: omeprazole)

**PRIMA-1 analogue APR-246:** A methylated derivative and structural analog of PRIMA-1 (p53 re-activation and induction of massive apoptosis), with potential antineoplastic activity. Upon administration, PRIMA-1 analogue APR-246 covalently modifies the core domain of mutated forms of cellular tumor antigen p53 (p53) through the alkylation of thiol groups. These modifications restore both the wild-type conformation and function to mutant p53, which reconstitutes endogenous p53 activity, leading to cell cycle arrest and apoptosis in tumor cells. This agent may work synergistically with other antineoplastic agents. p53, a tumor suppressor and transcription factor normally activated upon DNA damage, is frequently mutated and overexpressed in cancer cells; it plays a key role in both DNA repair and the induction of apoptosis. Check for active clinical trials using this agent.

**primary (1°) carbon:** a carbon atom that is attached to one other carbon atom.

**primary amenorrhea:** failure of menses to occur by age 16

**primary cancer :** A term used to describe the original, or first, tumor in the body. Cancer cells from a primary cancer may spread to other parts of the body and form new, or secondary, tumors. This is called metastasis. These secondary tumors are the same type of cancer as the primary cancer. Also called primary tumor.

**primary carbocation:** a carbocation to which one alkyl group is bonded.

**primary care :** Health services that meet most basic health care needs over time. Primary care includes physical exams, treatment of common medical conditions, and preventive care such as immunizations and screenings. Primary care doctors are usually the first health professionals patients see for basic medical care. They may refer a patient to a specialist if needed.

**primary care doctor :** A doctor who manages a person's health care over time. A primary care doctor is able to give a wide range of care, including prevention and treatment, can discuss cancer treatment choices, and can refer a patient to a specialist.

**primary central nervous system lymphoma :** Cancer that forms in the lymph tissue of the brain, spinal cord, meninges (outer covering of the brain), or eye (called ocular lymphoma). Also called PCNSL and primary CNS lymphoma.

**primary CNS lymphoma :** Cancer that forms in the lymph tissue of the brain, spinal cord, meninges (outer covering of the brain), or eye (called ocular lymphoma). Also called PCNSL and primary central nervous system lymphoma.

**primary effusion lymphoma :** A rare, aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma marked by an abnormal build-up of fluids in a body cavity. It usually occurs together with a human herpesvirus or Epstein-Barr virus in people who have weakened immune systems, such as in patients with HIV disease.

**primary endpoint :** The main result that is measured at the end of a study to see if a given treatment worked (e.g., the number of deaths or the difference in survival between the treatment group and the control group). What the primary endpoint will be is decided before the study begins.

**primary mediastinal large B-cell lymphoma :** An aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma (cancer of the immune system). Primary mediastinal large B-cell lymphoma develops from B cells in the mediastinum (the area behind the breastbone). It may spread to organs and tissues such as the lungs, pericardium (sac around the heart), liver, gastrointestinal tract, ovaries, adrenal glands, and central nervous system. Most patients with primary mediastinal large B-cell lymphoma are women who are age 30 to 40 years but it may also occur in older children. Also known as primary mediastinal B-cell lymphoma.

**Primary messenger:** The information embodied in the interaction of ligand with its receptor molecule.

**primary myelofibrosis :** A progressive, chronic disease in which the bone marrow is replaced by fibrous tissue and blood is made in organs such as the liver and the spleen, instead of in the bone marrow. This disease is marked by an enlarged spleen and progressive anemia. Also called agnogenic myeloid metaplasia, chronic idiopathic myelofibrosis, idiopathic myelofibrosis, and myelosclerosis with myeloid metaplasia.

**Primary nucleation:** Nucleation in a system that does not contain crystalline matter.

**primary ovarian insufficiency :** A condition in which the ovaries stop working and menstrual periods stop before age 40. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause

include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility. Primary ovarian insufficiency can be caused by some cancer treatments, surgery to remove the ovaries, and certain diseases or genetic conditions. Also called early menopause, premature menopause, and premature ovarian failure.

**primary peritoneal cancer :** Cancer that forms in the peritoneum (the tissue that lines the abdominal wall and covers organs in the abdomen), and has not spread there from another part of the body. Primary peritoneal cancer sometimes spreads to the ovary. It is similar to ovarian epithelial cancer and is staged and treated the same way.

**Primary production:** Digging stuff up and selling it. Also, growing stuff and selling it. Just about the entire Australian economy, really.

**primary productivity:** See gross primary production and net primary production.

**primary prostate cancer tissue/hTERT/survivin mRNA-loaded autologous dendritic cell vaccine:** An autologous dendritic cell (DCs) vaccine targeting prostate cancer with immunostimulating activity. The autologous DC vaccine is prepared via transfecting DCs with mRNAs extracted from primary prostate cancer tissue, and mRNAs of human telomerase reverse transcriptase (hTERT) and survivin. Upon administration, this DC vaccine may elicit a potent cytotoxic T-cell (CTL) response against prostate cancer cells, resulting in tumor cell death. Both hTERT and survivin are essential in neoplastic growth, and are considered to be universal tumor antigens.

**primary protection standard:** An accepted maximum level of a pollutant (or its indicator) in the target, or some part thereof, or an accepted maximum intake of a pollutant or nuisance into the target under specified circumstances (UN, 1972).

**primary standard:** A stable, high-purity material used in titrations and other chemical analyses to prepare solutions of precisely known concentration, or to determine the concentrations of substances which react with the primary standard material. For example, NaCl is a primary standard that can be used to determine the concentration of AgNO<sub>3</sub> in a solution by titration:  $\text{NaCl(aq)} + \text{AgNO}_3\text{(aq)} = \text{AgCl(s)} + \text{NaNO}_3\text{(aq)}$ .

**Primary structure:** In a polymer, the sequence of monomers and the covalent bonds. In proteins, it refers to the amino acid sequence. OR Usually

refers to the linear sequence of amino acids in a protein; more generally, the linear sequence of units that form a polymer. OR A description of the covalent backbone of a polymer (macromolecule), including the sequence of monomeric subunits and any interchain and intrachain covalent bonds.

**primary succession:** The natural development of vegetation and soil on a site that had not previously borne vegetation (e.g., a sand dune or lava flow), which vegetation will be replaced by other, successive plant communities.

**Primary system:** A term that may be used for referring to the reactor coolant system.

**primary therapy :** The first treatment given for a disease. It is often part of a standard set of treatments, such as surgery followed by chemotherapy and radiation. When used by itself, primary therapy is the one accepted as the best treatment. If it doesn't cure the disease or it causes severe side effects, other treatment may be added or used instead. Also called first-line therapy, induction therapy, and primary treatment.

**primary transcript:** The immediate RNA product of transcription before any posttranscriptional processing reactions.

**primary treatment :** The first treatment given for a disease. It is often part of a standard set of treatments, such as surgery followed by chemotherapy and radiation. When used by itself, primary treatment is the one accepted as the best treatment. If it doesn't cure the disease or it causes severe side effects, other treatment may be added or used instead. Also called first-line therapy, induction therapy, and primary therapy.

**primary tumor :** A term used to describe the original, or first, tumor in the body. Cancer cells from a primary tumor may spread to other parts of the body and form new, or secondary, tumors. This is called metastasis. These secondary tumors are the same type of cancer as the primary tumor. Also called primary cancer.

**Primase:** A specialized RNA polymerase that synthesizes the RNA primers for DNA synthesis.

**primase:** An enzyme that catalyzes the formation of RNA oligonucleotides used as primers by DNA polymerases.

**PRIME COAT OR PRIMER:** The first coat or undercoat that helps bind the topcoat to the substrate.

**prime meridian:** 0° longitude line, running through Greenwich, England.

**Primer:** First complete coat of paint of a painting system applied to a surface. Such paints are designed to provide adequate adhesion to new surfaces or are formulated to meet the special requirements of the surfaces. OR The first coat of paint applied to a surface which is then the foundation for subsequent coats. OR A structure that serves as a growing point for polymerization. Short primers of DNA are often used in sequencing and mutagenesis procedures. OR In the elongation of polymers, the initial segment of the polymer that is to be extended; elongation depends on the primer. OR A short oligomer (of sugars or nucleotides, for example) to which an enzyme adds additional monomeric subunits.

**primitive equations:** The Eulerian equations of fluid motion in which the primary dependent variables are the velocity components of the fluid. In meteorology, they can be specialized to apply directly to the cyclonic-scale motions.

**primitive neuroectodermal tumor :** One of a group of cancers that develop from the same type of early cells, and share certain biochemical and genetic features. Some primitive neuroectodermal tumors develop in the brain and central nervous system (CNS-PNET), and others develop in sites outside of the brain such as the limbs, pelvis, and chest wall (peripheral PNET). Also called PNET.

**Primitive space group:** A space group that contains only a single lattice point or a single unit of the repeated motif in a crystal lattice; symbolized by P (or R for rhombohedral crystals).

**primitives:** Also called "primitive functions." The individual gaussian functions that are summed to produce a contracted basis function (cGTO). So a set of p-functions is three basis functions, but may be many primitives ( $3n$ , where there are  $n$  primitives in the cGTO).

**Primosome:** A multiprotein complex that catalyzes synthesis of RNA primer at various points along the DNA template. OR A complex of proteins that facilitate the unwinding of DNA and the synthesis of RNA primers, thus initiating DNA synthesis.

**principal investigator :** The person(s) in charge of a clinical trial or a scientific research grant. The principal investigator prepares and carries out the clinical trial protocol (plan for the study) or research paid for by the

grant. The principal investigator also analyzes the data and reports the results of the trial or grant research. Also called PI.

**principal quantum number:**  $n$  the first number in Schrödinger's electron wave equation, which tells the location of an orbital relative to the atom's nucleus. OR The quantum number that determines the size and (in hydrogen atoms) the energy of an orbital.  $n$  is used to label electron shells.  $n$  may take on integer values from 1 to infinity.

**principal quantum number:** The number related to the amount of energy an electron has and therefore describing which shell the electron is in.

**PRINCIPAL QUANTUM NUMBER,  $n$ :** gives the energy of the orbital. This is determined by the distance of the electron from the nucleus.

**Prinivil :** A drug used to treat high blood pressure and certain heart conditions. It is also being studied in the prevention and treatment of side effects caused by some anticancer drugs. It blocks certain enzymes that cause blood vessels to constrict (narrow). It is a type of angiotensin-converting enzyme (ACE) inhibitor. Also called lisinopril and Zestril.

**prinomastat:** A synthetic hydroxamic acid derivative with potential antineoplastic activity. Prinomastat inhibits matrix metalloproteinases (MMPs) (specifically, MMP-2, 9, 13, and 14), thereby inducing extracellular matrix degradation, and inhibiting angiogenesis, tumor growth and invasion, and metastasis. As a lipophilic agent, prinomastat crosses the blood-brain barrier. or A substance that is being studied in the treatment of cancer. It is a matrix metalloproteinase inhibitor and belongs to the family of drugs called angiogenesis inhibitors. Also called AG3340.

**priority rules:** the rules in the Cahn-Ingold-Prelog notational system that allow atoms or groups around a chiral carbon atom to be ranked by atomic weight.

**prism:** a three-dimensional shape bounded by congruent parallel faces and a set of parallelograms formed by joining the corresponding vertices of the bases.

**Prismatic Habit:** A shape of a large group of crystals that is very geometric and orderly. Sometimes the crystals line up in one direction.

**Pristiq:** (Other name for: desvenlafaxine succinate)

**PRN Bags:** PRN refers to the Latin abbreviation for "take as needed". The PRN bags contain medication (usually pain or anti-nausea medicine) that

can be consumed by the patient on an "as needed" basis. The blue or orange color of this type of bag is provided as a preference -choice for the clinic to assign color code use.

**pro-oxidant** : A substance that can produce oxygen byproducts of metabolism that can cause damage to cells.

**Pro-Stat 101:** (Other name for: concentrated, fortified, collagen protein hydrolysate liquid supplement)

**Probabilistic risk analysis:** A systematic method for addressing the risk triplet as it relates to the performance of a complex system to understand likely outcomes, sensitivities, areas of importance, system interactions, and areas of uncertainty. The risk triplet is the set of three questions that the NRC uses to define "risk": (1) What can go wrong? (2) How likely is it? and (3) What are the consequences? NRC identifies important scenarios from such an assessment.

**Probabilistic risk assessment (PRA):** A systematic method for assessing three questions that the NRC uses to define "risk." These questions consider (1) what can go wrong, (2) how likely it is, and (3) what its consequences might be. These questions allow the NRC to understand likely outcomes, sensitivities, areas of importance, system interactions, and areas of uncertainty, which the staff can use to identify risk-significant scenarios. The NRC uses PRA to determine a numeric estimate of risk to provide insights into the strengths and weaknesses of the design and operation of a nuclear power plant. For additional detail, see Risk Assessment in Regulation and Probabilistic Risk Assessment.

**proband** : The individual through whom a family with a genetic disorder is ascertained. In males this is called a propositus, and in females it is called a proposita.

**probe:** A labeled fragment of nucleic acid containing a nucleotide sequence complementary to a gene or genomic sequence that one wishes to detect in a hybridization experiment.

**probenecid:** A benzoic acid derivative with antihyperuricemic property. Probenecid competitively inhibits the active reabsorption of urate at the proximal tubule in the kidney thereby increasing urinary excretion of uric acid and lowering serum urate concentrations. This prevents urate deposition and promotes resolution of existing urate deposits. In addition, probenecid modulates the transport of organic acids and acidic drugs at the

proximal and distal renal tubule, thereby increasing the drug serum concentration. or A drug that is used to treat gout and is used together with some antibiotics to make them work better. It is being studied in the treatment of cancer. It belongs to the family of drugs called antibiotic therapy adjuncts.

**probiotic** : A live microorganism used as a dietary supplement to help with digestion and normal bowel function. It may also help keep the gastrointestinal (GI) tract healthy. A bacterium found in yogurt called *Lactobacillus acidophilus*, is the most common probiotic.

**PROBLEM SOLVING:** can best be reviewed by working the examples in your chemistry notebook. Try them first without peeking at the solutions. Then spend your time on those that you failed to solve.

**procarbazine** : The active ingredient in a drug that is used to treat advanced Hodgkin lymphoma and is being studied in the treatment of other types of cancer. Procarbazine blocks cells from making proteins and damages DNA. It may kill cancer cells. It is a type of antineoplastic agent and a type of alkylating agent.

**procarbazine hydrochloride:** The hydrochloride salt of a methylhydrazine derivative with antineoplastic and mutagenic activities. Although the exact mode of cytotoxicity has not been elucidated, procarbazine, after metabolic activation, appears to inhibit the trans-methylation of methionine into transfer RNA (t-RNA), thereby preventing protein synthesis and consequently DNA and RNA synthesis. This agent may also undergo auto-oxidation, resulting in the formation of cytotoxic free radicals which damage DNA through an alkylation reaction. or A drug that is used to treat advanced Hodgkin lymphoma and is being studied in the treatment of other types of cancer. Procarbazine hydrochloride blocks cells from making proteins and damages DNA. It may kill cancer cells. It is a type of antineoplastic agent and a type of alkylating agent. Also called Matulane.

**procaspase activating compound-1 VO-100:** An orally bioavailable procaspase activating compound-1 (PAC-1), with potential proapoptotic and antineoplastic activities. Upon administration, VO-100 binds to and forms a chelating complex with zinc (Zn) ions inside cells, which prevents the binding of Zn ions to procaspase-3 (PC3) and abrogates the Zn-mediated inhibition of PC3. This allows for the proteolytic autoactivation of PC3 into

the active form caspase-3. This results in the selective caspase-3-mediated induction of apoptosis and cell death in cancer cells. In addition, VO-100 is able to cross the blood-brain-barrier (BBB). PC3, a Zn-inhibited proenzyme, is upregulated in a variety of cancer cell types, while its expression is minimal in normal healthy cells.

**Process Aid:** Additives used in the production of plastics to improve extrusion performance and reduce surface defects of film.

**Process chemical :** Process chemicals are chemicals used to improve the efficiency of the production process, but which have no direct effect on product properties. Process chemicals are, e.g., defoamers preventing foaming, biocides preventing microbial growth, dispersing agents and fixatives to prevent deposit forming, antiscalants to prevent inorganic scale forming and retention aids to improve fines retention on paper machine.

**process, biological:** the process by which the life activities of bacteria, and other microorganisms in the search for food, break down complex organic material into simple, more stable substances. Self-purification of sewage, polluted streams, sludge digestion, and all so-called secondary sewage treatments result from this process. Also called biochemical process.

**process, oxidation:** any method of sewage treatment for the oxidation of the decomposable organic matter that brings about the decomposition of such matter. The usual methods are biological filtration, and activated sludge processes.

**Processing:** An average value is given rather than the temperature range often specified by the manufacturer.

**Processing Aid:** An additive or component in a resin to facilitate processing. OR Some processing aids include thixotropic agents, flattening agents, and blocking and anticaking agents.

**Processing Methods:** The kind of processing (extruding, molding, casting, etc.) techniques recommended by the manufacturer.

**Processing Temperature:** An average value is given rather than the temperature range often specified by the manufacturer.

**Processivity:** A property of an enzyme that enables it to catalyze multiple rounds of elongation or the digestion of a polymer while the polymer stays bound to the enzyme. OR For any enzyme that catalyzes the synthesis of a

biological polymer, the property of adding multiple subunits to the polymer without dissociating from the substrate.

**Prochiral molecule:** A nonchiral molecule that lacks handedness and is optically inactive, but would become chiral by a change in one of the substituents at the chiral center. A prochiral molecule may react with an enzyme so that two groups that have a mirror-image relationship to each other are treated differently. OR A symmetric molecule that can react asymmetrically with an enzyme having an asymmetric active site, generating a chiral product.

**prochlorperazine:** A synthetic propylpiperazine derivative of phenothiazine with antiemetic, antipsychotic, antihistaminic, and anticholinergic activities. Prochlorperazine antagonizes the dopamine D2-receptor in the chemoreceptor trigger zone (CTZ) of the brain and may prevent chemotherapy-induced emesis. OR A drug used to prevent or reduce nausea and vomiting. It belongs to the family of drugs called antiemetics.

**Prochymal:** (Other name for: remestemcel-L)

**Procrit:** (Other name for: epoetin alfa)

**proctitis :** Inflammation of the mucous membrane that lines the rectum (the last several inches of the large intestine closest to the anus). Also called rectitis.

**Proctocort:** (Other name for: therapeutic hydrocortisone)

**proctoscope :** A thin, tube-like instrument used to look inside the anus and rectum. A proctoscope has a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**proctoscopy :** A procedure that uses a proctoscope to look inside the anus and rectum. A proctoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**proctosigmoidoscopy :** Examination of the lower colon using a sigmoidoscope, inserted into the rectum. A sigmoidoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called sigmoidoscopy.

**Prodiaben:** (Other name for: chlorpropamide)

**Prodrug:** Inactive derivatives of active drug molecules that are converted to parent drug molecules in the body.

**producers:** organisms within an ecosystem that trap energy (by photosynthesis).

**product:** A product is a substance formed in a chemical reaction. OR a substance on the right side of a chemical reaction. OR the substance that forms when reactants combine in a reaction. OR A substance formed as the result of a chemical reaction OR A substance that is produced during a chemical change. OR The new substance or substances that are formed during a chemical reaction.

**Production expense:** Production expense is one component of the cost of generating electric power, which includes costs associated with fuel, as well as plant operation and maintenance.

**products:** The compounds that are formed when a reaction goes to completion.

**Proellex:** (Other name for: telapristone acetate)

**Proenzyme:** A zymogen, or a catalytically inactive precursor of an enzyme; a proenzyme can be converted into the active form by the hydrolysis of one or a few peptide bonds.

**Profasi:** (Other name for: recombinant human chorionic gonadotropin)

**profile:** side view of land on a topographic map.

**proflavine hemisulfate:** The hemisulfate salt form of proflavine, an acridine-derived fluorescent contrast and disinfectant agent that can potentially be used for cellular imaging and antiseptic purposes. Upon topical application of proflavine hemisulfate, proflavine diffuses into cells and intercalates into DNA, thereby accumulating in and staining the nucleus. During fluorescence imaging, the cell nuclei can be visualized. This allows nuclear morphometry and the identification of cancer cells. In addition, proflavine exerts its antibacterial effect by binding to bacterial DNA, thereby disrupting DNA synthesis and halting bacterial cell growth.

**progenipoietin:** A recombinant, chimeric, dual-receptor agonist fusion protein with immunohematopoietic activity. Progenipoietin (ProGP) consists of portions of the ligands for granulocyte colony-stimulating factor (G-CSF) and human fetal liver tyrosine kinase-3 (FLT3); variants progenipoietin-1, 2 and 3 differ in the orientation of the two receptor

agonists. ProGP binds simultaneously to G-CSF and FLT3 receptors with receptor affinities approximately two- to three-fold higher than the respective native ligands. When administered in vivo, this agent may augment the number of circulating granulocytes and dendritic cells (DCs). ProGP may promote the proliferation of and prevent apoptosis in several human hematopoietic cell lineages, exhibiting the additive activities of a combination of C-GSF and FLT3.

**Progenta:** (Other name for: telapristone acetate)

**progeny :** Offspring; the product of reproduction or replication.

**Progestagen:** A class of steroid hormone, exemplified by progesterone, that prepares the uterus for implantation of the ovum; synthesized by the corpus luteum of the ovary.

**progesterone:** a hormone produced by the corpus luteum that regulates the buildup of tissue in the endometrium and inhibits the contractions of the uterus.

**progesterone :** A type of hormone made by the body that plays a role in the menstrual cycle and pregnancy. Progesterone can also be made in the laboratory. It may be used as a type of birth control and to treat menstrual disorders, infertility, symptoms of menopause, and other conditions.

**progesterone receptor :** A protein found inside the cells of the female reproductive tissue, some other types of tissue, and some cancer cells. The hormone progesterone will bind to the receptors inside the cells and may cause the cells to grow. Also called PR.

**progesterone receptor negative :** Describes cells that do not have a protein to which the hormone progesterone will bind. Cancer cells that are progesterone receptor negative do not need progesterone to grow, and usually do not stop growing when treated with hormones that block progesterone from binding. Also called PR-.

**progesterone receptor positive :** Describes cells that have a protein to which the hormone progesterone will bind. Cancer cells that are progesterone receptor positive need progesterone to grow and will usually stop growing when treated with hormones that block progesterone from binding. Also called PR+.

**progesterone receptor test :** A lab test to find out if cancer cells have progesterone receptors (proteins to which the hormone progesterone will

bind). If the cells have progesterone receptors, they may need progesterone to grow, and this can affect how the cancer is treated.

**progesterone vaginal insert:** A tablet preparation formulated for vaginal administration containing a micronized synthetic form of the endogenous steroid hormone progesterone with progesterone activity. Upon vaginal insertion, progesterone binds to the progesterone receptor, resulting in dissociation of heat shock proteins, receptor phosphorylation, and transcription activation through direct or indirect interaction with transcription factors. This agent exerts inhibitory effects on estrogen by decreasing the number of estrogen receptors and increasing its metabolism to inactive metabolites. Progesterone induces secretory changes in the endometrium, decreases uterine contractility during pregnancy, and maintains pregnancy.

**progestin :** Any natural or laboratory-made substance that has some or all of the biologic effects of progesterone, a female hormone.

**Proglycem:** (Other name for: diazoxide)

**prognosis :** The likely outcome or course of a disease; the chance of recovery or recurrence.

**prognostic factor :** A situation or condition, or a characteristic of a patient, that can be used to estimate the chance of recovery from a disease or the chance of the disease recurring (coming back).

**Prograf:** (Other name for: tacrolimus)

**Programmed cell death:** Refers to a cascade of proteolytic enzymes that result in controlled cell death in response to significant cell damage or specific development programs. Also called apoptosis. OR A type of cell death in which a series of molecular steps in a cell lead to its death. This is one method the body uses to get rid of unneeded or abnormal cells. The process of programmed cell death may be blocked in cancer cells. Also called apoptosis.

**Programming:** the extrusion of a parison which differs in thickness in the length direction in order to equalize wall thickness of the blown container. It can be done with a pneumatic or hydraulic device which activates the mandrel shaft and adjusts the mandrel position during parison extrusion (parison programmer, controller, or variator). It can also be done by varying extrusion speed on accumulator-type blow molding machines.

**progression** : In medicine, the course of a disease, such as cancer, as it becomes worse or spreads in the body.

**progression-free survival** : The length of time during and after the treatment of a disease, such as cancer, that a patient lives with the disease but it does not get worse. In a clinical trial, measuring the progression-free survival is one way to see how well a new treatment works. Also called PFS.

**progressive disease** : Cancer that is growing, spreading, or getting worse.

**progressive familial intrahepatic cholestasis** : A rare, inherited disorder marked by a buildup in the liver of bile (fluid that helps digest fat). This can lead to liver disease and liver failure. It may also increase the risk of liver cancer. Progressive familial intrahepatic cholestasis is caused by mutations (changes) in certain genes that make proteins needed to help the liver work the way it should. It usually occurs in infants and children. Also called PFIC.

**prohibitin-targeting peptide 1**: A chimeric, 25-mer peptide that targets prohibitin, with potential antineoplastic activity. Prohibitin-targeting peptide 1 (prohibitin-TP01) consists of a fat-targeting motif (CKGGRAKDC), two repeats of a proapoptotic peptide motif (KLAKLAK) and a GG linker. This peptide binds specifically to prohibitin in the white adipose vasculature; upon receptor-mediated cell internalization, the ligand/receptor complex triggers apoptosis and results in ablation of white fat. Destruction of white fat may potentially have positive consequences for men with prostate cancer since a high level of white fat has been implicated as a critical contributing factor in poor prostate cancer outcome. Prohibitin, a multifunctional membrane-associated protein that is thought to regulate cell survival and growth, has been shown by immunohistochemical analysis to be expressed in the membrane of endothelial cells in white adipose tissue.

**projection**: a drawing of a molecule.

**projection formulas**: A method for representing molecules to show the configuration of groups around chiral centers; also known as Fischer projection formulas.

**Prokaryote**: A unicellular organism that contains a single chromosome, no nucleus, no membrane-bound organelles, and has characteristic ribosomes and biochemistry. OR A bacterium; a unicellular organism with a single chromosome, no nuclear envelope, and no membranebounded organelles.

**prokaryotes:** cells that do not contain a nucleus or internal organelles; include bacteria, cyanobacteria, and archaeobacteria.

**Prokine:** (Other name for: sargramostim)

**prolactin :** A hormone that is made by the pituitary gland (a pea-sized organ in the center of the brain). Prolactin causes a woman's breasts to make milk during and after pregnancy, and has many other effects in the body.

**Prolarix:** (Other name for: caricotamide/tretazicar)

**Prolastin-C:** (Other name for: alpha-1-proteinase inhibitor human)

**Proleukin :** A drug used to treat some types of cancer. It is a form of interleukin-2, a cytokine made by leukocytes (white blood cells), that is made in the laboratory. Proleukin increases the activity and growth of white blood cells called T lymphocytes and B lymphocytes. It is a type of biological response modifier. Also called aldesleukin and recombinant human interleukin-2.

**Prolia:** (Other name for: denosumab)

**Prolia :** A drug used to prevent or treat certain bone problems. Under the brand name Xgeva, it is used to prevent broken bones and other bone problems caused by solid tumors that have spread to bone. It is also used in certain patients to treat giant cell tumor of the bone that cannot be removed by surgery. Under the brand name Prolia, it is used to treat osteoporosis (a decrease in bone mass and density) in postmenopausal women who have a high risk of breaking bones. Prolia is also being studied in the treatment of other conditions and types of cancer. It binds to a protein called RANKL, which keeps RANKL from binding to another protein called RANK on the surface of certain bone cells, including bone cancer cells. This may help keep bone from breaking down and cancer cells from growing. Prolia is a type of monoclonal antibody. Also called AMG 162, denosumab, and Xgeva.

**proliferating :** Multiplying or increasing in number. In biology, cell proliferation occurs by a process known as cell division.

**proliferative index :** A measure of the number of cells in a tumor that are dividing (proliferating). May be used with the S-phase fraction to give a more complete understanding of how fast a tumor is growing.

**proline:** A naturally occurring amino acid with a heterocyclic ring that is classified as nonessential in the diet.

**Prolixin:** (Other name for: fluphenazine hydrochloride)

**Prolutin:** (Other name for: therapeutic progesterone)

**prolymphocytic leukemia :** A type of chronic lymphocytic leukemia (CLL), in which too many immature white blood cells (prolymphocytes) are found in the blood and bone marrow. Prolymphocytic leukemia usually progresses more rapidly than classic CLL. Also called PLL.

**Promacta:** (Other name for: eltrombopag olamine)

**Promacta :** A drug used to treat thrombocytopenia (a lower-than-normal number of platelets in the blood) in patients with chronic immune thrombocytopenic purpura (a condition in which platelets are destroyed by the immune system). It is used in patients who did not get better with corticosteroids, immunoglobulins, or surgery to remove the spleen. It is also being studied in the treatment of other conditions and types of cancer. Promacta causes more platelets to be made in the bone marrow. It is a type of thrombopoietin receptor agonist. Also called eltrombopag olamine.

**promegapoeitin :** A drug given during chemotherapy to increase blood cell regeneration. Promegapoeitin is a colony-stimulating factor that stimulates the production of blood cells, especially platelets. It is a cytokine and belongs to the family of drugs called hematopoietic (blood-forming) agents.

**promethazine hydrochloride:** The hydrochloride salt form of promethazine, a phenothiazine derivative with antihistaminic, sedative and antiemetic properties. Promethazine hydrochloride selectively blocks peripheral H1 receptors thereby diminishing the effects of histamine on effector cells. Promethazine hydrochloride also blocks the central histaminergic receptors, thereby depressing the reticular system causing sedative and hypnotic effects. In addition, promethazine hydrochloride also has centrally acting anticholinergic properties and probably mediates nausea and vomiting by acting on the medullary chemoreceptive trigger zone.

**Promethium:** Symbol:"Pm" Atomic Number:"61" Atomic Mass: (145)amu. This is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. This

element is not found in nature and has only been created in a lab. You will not find many uses for it in real life.

**Promoter:** See Accelerator.

**Promoter:** That region of the gene that signals RNA polymerase binding and the initiation of transcription. OR A DNA sequence at which RNA polymerase may bind, leading to initiation of transcription.

**Promoter sites:** A specific sequence of DNA, usually just upstream of a gene, that specifies the site and extent of transcription of the associated gene.

**ProMune :** A substance that is being studied in the treatment of some types of cancer. It belongs to the family of drugs called biological response modifiers. Also called CpG 7909 and PF-3512676.

**promyelocytic leukemia :** An aggressive (fast-growing) type of acute myeloid leukemia in which there are too many immature blood-forming cells in the blood and bone marrow. It is usually marked by an exchange of parts of chromosomes 15 and 17. Also called acute promyelocytic leukemia and APL.

**pronase oral solution:** An oral solution containing a mixture of proteinases, which are produced by *Streptomyces griseus*, with mucolytic activity and potential diagnostic applications. Upon oral administration, pronase is able to cleave peptide chains of polypeptides into individual amino acids, thereby dissolving mucus. The removal of mucus may improve the visibility of parts of the digestive tract, such as the esophagus and the stomach, during endoscopy. Pre-treatment with pronase before endoscopic examination may help in the detection of certain cancers, such as esophageal and gastric cancer.

**pronoun:** a word that stands in for a noun.

**pronoun agreement:** a pronoun must agree with its antecedent in number (singular or plural) and gender (masculine or feminine).

**pronoun case:** refers to the way a pronoun is used in a sentence (see subjective, objective or possessive case).

**propacetamol:** A water-soluble para-aminophenol derivative and ester prodrug of acetaminophen in which acetaminophen is bound to the carboxylic acid diethylglycine, with analgesic and antipyretic activities. Upon intravenous administration, propacetamol is hydrolyzed by plasma

esterases into its active form acetaminophen. Although the exact mechanism of action has yet to be fully elucidated despite its widespread use, acetaminophen enters the central nervous system and acts centrally. This agent binds to cyclooxygenase (COX) and prevents the metabolism of arachidonic acid to prostaglandin. A reduction in prostaglandin formation relieves pain and reduces fever. Acetaminophen may also act centrally on cannabinoid receptors and on N-methyl-D-aspartate (NMDA) receptors.

**propagation step:** the step in a free radical reaction in which both a product and energy are produced. The energy keeps the reaction going.

**propagation step:** the step in a free-radical reaction in which both a product and energy are produced. The energy keeps the reaction going.

**Propane:** Propane is a member of the LPG (Liquified Petroleum Gases) and paraffin families, consisting of three saturated carbon atoms in a straight chain. The term liquified petroleum gas refers to its main production route as a liquified stream produced by the repressurisation of gas that separated from crude oil on extraction from underground. Propane is highly valued as a heating fuel, particularly in developing economies, and hence has a highly seasonal demand and pricing profile.

**propane<sup>38</sup>:** A colorless, odorless, flammable gas, found in petroleum and natural gas. It is used as a fuel and as a raw material for building more complex organic molecules. Propane is the third member of the alkane series.

**propellant:** 1. A mixture of fuel and oxidizing agent that reacts to produce a high-energy stream of product gases that can produce thrust. For examples, see What makes a good rocket fuel? 2. A compressed gas used to push a material through a nozzle, forming an aerosol or a foam. For example, nitrogen or propane are used as propellants for shaving cream; nitrous oxide is used as a propellant for whipped cream.

**PROPELLANT:** The gas used to expel materials from aerosol containers.

**Propeller twisting:** The twisting of base pairs in crystals of DNA from the coplanar conformation; enhances the stacking of bases within a strand.

**proper noun:** names a specific person or place, or a particular event or group and is always capitalized.

**property:** a characteristic of matter such as color, density, brittleness, etc..  
OR A feature of a substance that can be described or measured. Chemical

properties refer to how the substance behaves in a chemical reaction (eg it is an acid, it burns in air) while a physical property is to do with the substance itself (eg it is a hard, shiny solid with a melting point of 465°C).

**Prophage:** The silent phage genome. Some prophages integrate into the host genome; others replicate autonomously. The prophage state is maintained by a phage-encoded repressor. OR A bacteriophage in an inactive state in which the genome is either integrated into the chromosome of the host cell or (sometimes) replicated autonomously.

**prophase:** the first phase of mitosis; involves chromosomal condensation, nuclear membrane breakdown, and the migration of centrioles to opposite poles. OR The stage in meiosis or mitosis when chromosomes condense and become visible as refractile bodies.

**prophase I:** the first phase of meiotic division, during which crossing over takes place.

**prophase II:** the phase during meiosis II in which the chromatin material condenses and each chromosome contains two chromatids attached by the centromere.

**prophylactic :** In medicine, something that prevents or protects.

**prophylactic cranial irradiation :** Radiation therapy to the head to reduce the risk that cancer will spread to the brain.

**prophylactic mastectomy :** Surgery to reduce the risk of developing breast cancer by removing one or both breasts before disease develops. Also called preventive mastectomy.

**prophylactic oophorectomy :** Surgery intended to reduce the risk of ovarian cancer by removing the ovaries before disease develops.

**prophylactic surgery :** Surgery to remove an organ or gland that shows no signs of cancer, in an attempt to prevent development of cancer of that organ or gland. Prophylactic surgery is sometimes chosen by people who know they are at high risk for developing cancer.

**prophylaxis :** An attempt to prevent disease.

**Propionaldehyde or Propanal:** Propionaldehyde (or propanal) is a three-carbon aldehyde commonly produced by reacting syngas with ethylene. Its major use is in the manufacture of trimethylolethane via condensation with methanol. This is used in the manufacture of alkyd resins.

**Propionate (C<sub>2</sub>H<sub>5</sub>COO)** : A propionate (propionic acid minus one hydrogen ion) compound is a salt or ester of propionic acid.

**propofol**: A hypnotic alkylphenol derivative. Formulated for intravenous induction of sedation and hypnosis during anesthesia, propofol facilitates inhibitory neurotransmission mediated by gamma-aminobutyric acid (GABA). This agent is associated with minimal respiratory depression and has a short half-life with a duration of action of 2 to 10 minutes. Check for active clinical trials using this agent.

**proportion**: An equality between two ratios. OR Two ratios set equal to each other.

**Proportional counter**: A radiation instrument in which an electronic detection system receives pulses that are proportional to the number of ions formed in a gas-filled tube by ionizing radiation.

**Proportional Limit** : The greatest stress which a material is capable of sustaining without deviation from proportionality of stress and strain. (Hooke's Law).

**proportionate mortality rate, ratio (PMR)**: Number of deaths from a given cause in a specified time period, per 100 or 1000 total deaths in the same time period. Can give rise to misleading conclusions if used to compare mortality experience of populations with different distributions of causes of death (Last, 1988).

**proposita** : The female individual through whom a family with a genetic disorder is ascertained. In males this is called a propositus.

**propositus** : The male individual through whom a family with a genetic disorder is ascertained. In females this is called a proposita.

**propranolol hydrochloride**: The hydrochloride salt of propranolol, a synthetic beta-adrenergic receptor blocker with antianginal, antiarrhythmic, and antihypertensive properties. Propranolol competitively antagonizes beta-adrenergic receptors, thereby inhibiting beta-adrenergic reactions, such as vasodilation, and negative chronotropic and inotropic effects.

**propranolol hydrochloride** : A drug used under the brand name Hemangeol to treat infantile hemangioma (a benign blood vessel tumor). Propranolol hydrochloride is also used under other brand names to treat high blood pressure, including before surgery for pheochromocytoma, and to treat chest pain (angina), abnormal heartbeat (arrhythmia), and several

other conditions. It is also being studied in the treatment of other conditions and types of cancer. Propranolol hydrochloride blocks certain receptors on nerve cells and causes blood vessels to relax and dilate (widen). This allows blood to flow more easily and lowers blood pressure and heart rate. Propranolol hydrochloride may also help shrink certain types of vascular tumors. It is a type of beta blocker.

**Proprietary information:** Privately owned knowledge or data, such as that protected by a registered patent, copyright, or trademark.

**Proprotein:** A protein that is made in an active form, so that it requires processing to become functional.

**Propylene:** Propylene is the second member of the olefin chemical family, consisting of three hydrocarbons in a chain, linked by one double bond and one single bond. The double bond in propylene is less accessible and less reactive than that in ethylene and hence reaction conditions tend to be harsher for a given synthesis reaction. Propylene is also produced (to a lesser extent than ethylene) from the pyrolytic cracking in a steam cracker of a wide variety of hydrocarbons. Significant volumes of propylene are also produced from refinery FCC units.

**Propylene Glycol:** Mono, di and tri-propylene glycol are produced commercially. Monopropylene glycol (MPG) is the most widely used, and is found in cosmetics, foods, pharmaceuticals and laundry detergents, as well as substituting for monoethylene glycol in anti-freeze formulations where lower toxicity is required or chiefly to make unsaturated polyester resins used in fibreglass composites for construction applications. Most of polyester based fibreglass, however, are produced from propylene oxide. Di and tri-propylene glycol are mainly used in the production of resins and elastomers. A clear, viscous liquid at room temperature, propylene glycol is produced by the hydrolysis reaction of propylene oxide and water.

**Propylene oxide:** Propylene oxide is a chemical intermediate mainly used for the production of polyether polyols-which are in turn used in urethane foams, and also in production of propylene glycol, with the remainder consumed in glycol ethers. Propylene oxide is produced from propylene by two routes: mainly chlorohydrin route or to a lesser extent indirect route via hydroperoxidation of isobutane or ethylbenzene producing tertiary butyl alcohol (PO/TBA) or styrene monomer (PO/SM) as co-product respectively. Chlorohydrin route is more energy intensive, produces high

by-product yield of little application, and involved chlorine waste disposal. Nevertheless, it remains economically healthy, producing 40 to 50% of PO in the United States. Some propylene oxide is also produced from cumene. Propylene oxide production is widespread outside the Middle East, although projects are now under development in the Middle East.

**propylthiouracil:** A thiourea derivative with antithyroid property. Propylthiouracil (PTU) interferes with the oxidation of iodine possibly by interaction with peroxidase or a peroxidase-mediated complex reaction, thereby inhibiting synthesis of thyroid hormones tri-iodothyronine (T3) and thyroxine (T4). In addition, this agent inhibits the Type I 5'-deiodinase (D1), an enzyme involved in the peripheral conversion of thyroxine to tri-iodothyronine. This results in decreased plasma triiodothyronine concentrations and decreased entrance of thyroxine into cells thereby reducing thyroid hormone activity.

**Prorex:** (Other name for: promethazine hydrochloride)

**prosaposin:** precursor protein for the saposins; designated as SAP-A, -B, C, and -D

**Proscar:** (Other name for: finasteride)

**prospective :** In medicine, a study or clinical trial in which participants are identified and then followed forward in time.

**prospective cohort study :** A research study that follows over time groups of individuals who are alike in many ways but differ by a certain characteristic (for example, female nurses who smoke and those who do not smoke) and compares them for a particular outcome (such as lung cancer).

**Prost 30 :** A monoclonal antibody that is being studied in the detection and treatment of cancer. Monoclonal antibodies are produced in the laboratory and can locate and bind to cancer cells.

**Prostaglandin:** An oxygenated eicosanoid that has a hormonal function. Prostaglandins are unusual hormones in that they usually have effects only in that region of the organism where they are synthesized.

**prostaglandin :** One of several hormone-like substances made by the body. Different prostaglandins control blood pressure, contraction of smooth muscles, and other processes within tissues where they are made. Certain prostaglandins are being studied as cancer biomarkers. Also called PG.

**prostaglandin E1** : A drug that is used to treat impotence (inability to have an erection) and is being studied in the treatment of sexual problems in men who have had surgery for prostate cancer. It is a type of vasodilator. Also called alprostadil and PGE1.

**prostaglandin-endoperoxide synthase 2** : An enzyme that speeds up the formation of substances that cause inflammation and pain. It may also cause tumor cells to grow. Some tumors have high levels of prostaglandin-endoperoxide synthase 2 and blocking its activity may reduce tumor growth. Also called COX-2 and cyclooxygenase-2.

**prostaglandins**: A class of lipid-soluble, hormonelike regulatory molecules derived from arachidonate and other polyunsaturated fatty acids. OR A class of short-lived signal molecules that are 20-carbon fatty acids containing a five-membered ring. OR the hormones secreted by various tissue cells that produce their effects on smooth muscles, on various glands, and in reproductive physiology.

**ProstaMedix**: (Other name for: gallium Ga 68-labeled PSMA ligand Glu-urea-Lys(Ahx))

**ProstaScint** : A substance used to detect prostate cancer. It contains a monoclonal antibody that binds to prostate cells, linked to a substance that can bind radioisotopes. ProstaScint is combined with indium 111 and injected into the body. A gamma camera (a special camera that detects radioactivity) is used to find prostate cancer cells in the body. ProstaScint is a type of immunoconjugate. Also called capromab pendetide.

**ProstaScint scan** : An imaging test used to detect prostate cancer. The patient receives an injection of an indium 111-labeled form of ProstaScint, which contains a monoclonal antibody that binds to prostate cells. A gamma camera (a special camera that detects radioactivity) is used to find prostate cancer cells in the body.

**prostate** : A gland in the male reproductive system. The prostate surrounds the part of the urethra (the tube that empties the bladder) just below the bladder, and produces a fluid that forms part of the semen.

**prostate cancer** : Cancer that forms in tissues of the prostate (a gland in the male reproductive system found below the bladder and in front of the rectum). Prostate cancer usually occurs in older men.

**prostate cancer vaccine ONY-P1:** A cell-based vaccine derived from prostate cancer with potential immunopotentiating and antineoplastic activities. Prostate cancer vaccine ONY-P1 is derived from three irradiated allogeneic prostate cancer cell lines that represent different stages of prostate cancer and express a broad range of prostate and prostate cancer antigens. Upon administration, this vaccine may stimulate a host immune response against prostate cancer cells; in the vaccination schedule, the first two vaccinations are co-administered with bacillus Calmette-Guerin (BCG) as an adjuvant.

**Prostate Health Cocktail:** (Other name for: cholecalciferol/d-alpha tocopherol/L-selenomethionine/green tea extract/saw palmetto berry extract/daidzein/genistein/lycopene prostate health supplement)

**prostate tumor antigen-activated autologous dendritic cell vaccine:** A dendritic cell (DC)-based cancer vaccine composed of autologous dendritic cells (DCs) activated with a prostate tumor cell lysate containing tumor-associated antigens (TAAs) with potential immunostimulatory and antineoplastic activities. Upon administration, the prostate tumor antigen-activated autologous DC vaccine may stimulate an anti-tumoral cytotoxic T-lymphocyte (CTL) response against prostate cancer cells expressing prostate tumor cell-specific antigens, which may result in prostate tumor cell lysis.

**prostate-specific antigen :** A protein made by the prostate gland and found in the blood. Prostate-specific antigen blood levels may be higher than normal in men who have prostate cancer, benign prostatic hyperplasia (BPH), or infection or inflammation of the prostate gland. Also called PSA.

**prostate-specific antigen test :** A blood test that measures the level of prostate-specific antigen (PSA), a substance produced by the prostate and some other tissues in the body. Increased levels of PSA may be a sign of prostate cancer.

**prostatectomy :** Surgery to remove part or all of the prostate and some of the tissue around it. Nearby lymph nodes may also be removed. It may be done through an open prostatectomy, in which an incision (cut) is made in the wall of the lower abdomen or the perineum, or by using a laparoscope (a thin, tube-like instrument with a light and lens for viewing).

**prostatic acid phosphatase :** An enzyme produced by the prostate. It may be found in increased amounts in men who have prostate cancer. Also

called PAP.

**prostatic acid phosphatase-sargramostim fusion protein:** A genetically-engineered protein formed by the fusion of prostatic acid phosphatase (PAP) and sargramostim (GM-CSF). Vaccination with antigen-presenting cells (APC) loaded with prostatic acid phosphatase-sargramostim fusion protein may elicit a cytotoxic T-cell response against tumor cells that express PAP.

**prostatic intraepithelial neoplasia :** Noncancerous growth of the cells lining the internal and external surfaces of the prostate gland. Having high-grade prostatic intraepithelial neoplasia may increase the risk of developing prostate cancer. Also called PIN.

**prostatitis :** Inflammation of the prostate gland.

**prostatocystectomy :** Surgery to remove the bladder (the organ that holds urine) and the prostate. In a radical prostatocystectomy, the seminal vesicles are also removed. The prostate and seminal vesicles are glands in the male reproductive system that help make semen. Also called cystoprostatectomy.

**prosthesis :** A device, such as an artificial leg, that replaces a part of the body.

**Prosthetic group:** Synonymous with coenzyme except that a prosthetic group is usually more firmly attached to the enzyme it serves. OR A metal ion or an organic compound (other than an amino acid) that is covalently bound to a protein and is essential to its activity.

**prosthetist :** A person who has special training in making and fitting artificial body parts, such as arms or legs.

**prosthodontist :** A dentist who has special training in replacing missing teeth or other structures of the mouth to restore an individual's appearance, comfort, or health.

**prostration :** A condition in which a person is so tired or weak that he or she is unable to do anything.

**Protactinium:** Symbol:"Pa" Atomic Number:"91" Atomic Mass: 231.04amu. Protactinium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a radioactive and unstable element and you will not find it in use anywhere.

**Protamines:** Highly basic, arginine-rich proteins found complexed to DNA in the sperm of many invertebrates and fish. OR Enzymes that degrade proteins by cleaving peptide bonds. OR Large protein complexes that carry out routine degradation of ubiquitinated cellular proteins as well as of those from pathogens.

**protease inhibitor :** A compound that interferes with the ability of certain enzymes to break down proteins. Some protease inhibitors can keep a virus from making copies of itself (for example, AIDS virus protease inhibitors), and some can prevent cancer cells from spreading.

**proteasome inhibitor :** A drug that blocks the action of proteasomes. A proteasome is a large protein complex that helps destroy other cellular proteins when they are no longer needed. Proteasome inhibitors are being studied in the treatment of cancer.

**protecting group:** a group that is formed on a molecule by the reaction of a reagent with a substituent on the molecule. The resulting group is less sensitive to further reaction than the original group, but it must be able to be easily reconverted to the original group.

**Protection of Human Subjects :** Laws set by the U.S. Department of Health and Human Services (DHHS) to protect a person from risks in research studies that any federal agency or department has a part in. Also called 45 CFR 46, 45 Code of Federal Regulations Part 46, and human participant protection regulations.

**protective factor :** Something that may decrease the chance of getting a certain disease. Some examples of protective factors for cancer are getting regular physical activity, staying at a healthy weight, and having a healthy diet.

**protegrin :** One of a family of small proteins found in white blood cells in pigs. Protegrins kill certain bacteria, fungi, and viruses by making holes in their outer membranes and causing them to burst. A protegrin is a type of antimicrobial peptide.

**protein:** A biological polymer formed by condensation reactions among a set of 20 different amino acids. OR A large molecule composed of one or more chains of amino acids in a specific order and folded shape determined by the sequence of nucleotides in the gene encoding the protein OR A biological macromolecule composed of a linear array of amino acids joined by peptide bonds; roles of proteins in biological processes include catalysis,

transport and storage, motion, mechanical support, immune protection, the generation and transmission of nerve impulses, and the control of growth and differentiation. OR A complex polymer made by linking together amino acid molecules. Proteins sometimes contain non-amino acid components such as metal ions or porphyrin rings embedded within. OR A macromolecule composed of one or more polypeptide chains, each with a characteristic sequence of amino acids linked by peptide bonds.

**protein :** A molecule made up of amino acids. Proteins are needed for the body to function properly. They are the basis of body structures, such as skin and hair, and of other substances such as enzymes, cytokines, and antibodies.

**Protein Data Bank (PDB):** A Web storage site for the coordinates of protein structures that have been solved by x-ray crystallography and NMR analysis. With the use of the coordinates, the structures can be accessed for visualization and analysis.

**Protein disulfide isomerase:** An enzyme that catalyzes the formation of correct disulfide pairings in nascent proteins; preferentially reacting with peptides that contain cysteine residues but otherwise indiscriminating, the enzyme speeds up the disulfide shuffling required for a protein to find the most thermodynamically stable disulfide pairings among those that can be formed.

**protein expression :** Refers to the production of proteins by cells. The study of protein expression in cancer cells may give information about a specific type of cancer, the best treatment to use, and how well a treatment works.

**protein expression profile :** Information about all proteins that are made in blood, other body fluids, or tissues, at certain times. A protein expression profile may be used to find and diagnose a disease or condition and to see how well the body responds to treatment. Also called protein signature and proteomic profile.

**Protein kinase A:** A protein kinase that consists of two catalytic subunits and two regulatory subunits that inhibit the catalytic subunits; on binding of camp, the regulatory subunits dissociate from the catalytic subunits, which then become active.

**protein kinase B :** A group of enzymes involved in several processes related to cell growth and survival. Protein kinase B enzymes help to

transfer signals inside cells. A protein kinase B enzyme is a type of serine/threonine protein kinase. Also called Akt.

**Protein kinase C:** A protein kinase that is activated by the binding of diacylglycerol.

**protein kinase C :** An enzyme found throughout the body's tissues and organs. Several forms of protein kinase C are involved in many cellular functions. Protein kinase C is being studied in the treatment of cancer. Also called PKC.

**protein kinase C inhibitor LXS196:** An orally available protein kinase C (PKC) inhibitor with potential immunosuppressive and antineoplastic activities. Upon oral administration, protein kinase C inhibitor LXS196 binds to and inhibits PKC, which prevents the activation of PKC-mediated signaling pathways. This may lead to the induction of cell cycle arrest and apoptosis in susceptible tumor cells. PKC, a serine/threonine protein kinase overexpressed in certain types of cancer cells, is involved in tumor cell differentiation, proliferation, invasion and survival.

**protein kinase inhibitor :** A substance that blocks the action of enzymes called protein kinases. There are many different types of protein kinases and they take part in many cell functions. These include cell signaling, growth, and division. Blocking certain protein kinases may help keep cancer cells from growing. Some protein kinase inhibitors, such as imatinib, vemurafenib, and gefitinib, are used to treat cancer.

**Protein kinases:** A class of enzymes that transfer a phosphoryl group from ATP to proteins; protein kinases are frequently found in regulatory pathways. OR Enzymes that phosphorylate certain amino acid residues in specific proteins.

**Protein phosphatase 1:** A protein phosphatase stimulated by insulin that inhibits glycogen degradation and stimulates glycogen synthesis.

**Protein phosphatase 2A:** An insulin-responsive phosphatase that activates acetyl coa carboxylase to stimulate fatty acid synthesis.

**protein phosphatase 2A inhibitor LB-100:** A water soluble inhibitor of the protein phosphatase 2A (PP2A), with potential chemo- and radiotherapy enhancing activity. Upon injection, PP2A inhibitor LB-100 inhibits the removal of phosphate groups from proteins essential for cell cycle progression. When used with radio- or chemotherapy treatment, this agent

prevents the activation of PP2A-mediated repair mechanisms and allows for malignant cells to progress through the cell cycle without having their damaged DNA repaired. This enhances the cytotoxic effect of the chemotherapeutic or radiotherapeutic agent and results in tumor cell apoptosis. PP2A, a serine/threonine phosphatase that plays a key role in the control of cell growth and DNA damage repair.

**Protein phosphatases:** Enzymes that hydrolyze phosphorylated serine and threonine residues in other proteins; protein phosphatase 1 reverses the regulatory effects of kinases on glycogen metabolism.

**protein signature :** Information about all proteins that are made in blood, other body fluids, or tissues, at certain times. A protein signature may be used to find and diagnose a disease or condition and to see how well the body responds to treatment. Also called protein expression profile and proteomic profile.

**protein stabilized liposomal docetaxel nanoparticles:** A formulation containing protein-stabilized liposome nanoparticles encapsulating the poorly water-soluble, second-generation taxane analog docetaxel with antineoplastic activity. Docetaxel binds to and stabilizes the beta-tubulin subunit, thereby inhibiting microtubule disassembly which results in cell-cycle arrest at the G2/M phase and cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and displays immunomodulatory and pro-inflammatory properties by inducing various mediators of the inflammatory response. Compared to the use of toxic carriers to increase solubilization of docetaxel, protein-stabilized liposomal docetaxel improves drug solubility while avoiding carrier-associated toxicity.

**Protein subunit:** One of the components or monomers of a multicomponent protein.

**Protein synthesis:** The process in which the genetic code carried by messenger RNA directs cellular organelles called ribosomes to produce proteins from amino acids

**protein targeting:** The process by which newly synthesized proteins are sorted and transported to their proper locations in the cell.

**protein-bound paclitaxel :** A drug used to treat breast cancer that has come back or spread to other parts of the body. It is also used with carboplatin to treat advanced non-small cell lung cancer in patients who are

not able to have surgery or radiation therapy. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Protein-bound paclitaxel is a form of the anticancer drug paclitaxel and may cause fewer side effects than paclitaxel. It stops cancer cells from growing and dividing, and may kill them. It is a type of mitotic inhibitor and a type of antimicrotubule agent. Also called ABI-007, Abraxane, nanoparticle paclitaxel, and paclitaxel albumin-stabilized nanoparticle formulation.

**proteinoids:** the primitive polymers formed by the unison of amino acids; able to act as enzymes and catalyze organic reactions.

**proteins:** long chains of amino acid units that are the main molecules from which living things are constructed.

**proteinuria :** Higher-than-normal amount of protein in the urine.

**Proteoglycan:** A protein-linked heteropolysaccharide in which the heteropolysaccharide is usually the major component. OR A hybrid macromolecule consisting of a heteropolysaccharide joined to a polypeptide; the polysaccharide is the major component. OR A molecule that contains both protein and glycosaminoglycans, which are a type of polysaccharide. Proteoglycans are found in cartilage and other connective tissues.

**Proteoglycans:** Proteins containing one or more covalently linked glycosaminoglycan chains; cartilage proteoglycan contains keratan sulfate and chondroitin chains linked to a polypeptide backbone.

**proteolytic enzymes:** Enzymes produced and secreted by the pancreas which aid in the proteolysis of proteins in the digestive tract. Pancreatic proteolytic enzymes include trypsin, chymotrypsin and carboxypeptidase; these enzymes are secreted as zymogens, inactive precursors of the enzymes, and are activated in the lumen of the digestive canal. Another proteolytic enzyme, enteropeptidase, is associated with the brush border of enterocytes; this enzyme catalyses the conversion of trypsinogen into trypsin which, in turn, can activate a number of other pancreatic zymogens.

**Proteome:** The functional representation of the genome that includes the types, functions, and interactions of proteins that are present in a cell; the proteome is not a fixed characteristic of a cell but will vary, depending on such factors as developmental stage or hormonal status. OR The complete

set of proteins made by an organism. Proteins are made in different amounts and at different times, depending on how they work, when they are needed, and how they interact with other proteins inside cells. Information about a proteome may be used to help find which proteins are involved in diseases, such as cancer. It may also be used to help develop drugs that block these proteins.

**proteomic profile :** Information about all proteins that are made in blood, other body fluids, or tissues, at certain times. A proteomic profile may be used to find and diagnose a disease or condition and to see how well the body responds to treatment. Also called protein expression profile and protein signature.

**proteomics :** The study of the structure and function of proteins, including the way they work and interact with each other inside cells.

**proteosome:** machinery in the cell for targeted destruction of proteins

**Protist:** A relatively undifferentiated organism that can survive as a single cell.

**Protista:** a kingdom that includes protozoa, one-celled algae, and slime molds.

**Proto-oncogene:** A cellular gene that can undergo modification to a cancer-causing gene (oncogene). OR A signal transduction protein that usually regulates cell growth in some fashion; when proto-oncogenes mutated, they become oncogenes and contribute to the development of cancer. OR A cellular gene, usually encoding a regulatory protein, that can be converted into an oncogene by mutation. OR A gene involved in normal cell growth. Mutations (changes) in a proto-oncogene may cause it to become an oncogene, which can cause the growth of cancer cells.

**Protocel :** A liquid that has been promoted as a treatment for a wide range of diseases, including cancer. The ingredients thought to be in Protocel have been tested, and none of them have been shown to be effective in treating any form of cancer. Protocel is not available in the United States. Also called 126-F, Cancell, Cantron, Jim's Juice, JS-101, JS-114, and Sheridan's Formula.

**protocells:** the first cells.

**protocol :** A detailed plan of a scientific or medical experiment, treatment, or procedure. In clinical trials, it states what the study will do, how it will

be done, and why it is being done. It explains how many people will be in the study, who is eligible to take part in it, what study drugs or other interventions will be given, what tests will be done and how often, and what information will be collected.

**proton:** a sub-atomic particle, positively charged, in the nucleus of atoms. OR Particle found in a nucleus with a positive charge. Number of these gives atomic number. OR A positively charged subatomic particle found in the nucleus. OR A proton is a particle found in the nucleus of every atom. It holds a positive charge (+). The mass of a proton is almost equal to the mass of a neutron. Electrons are much smaller than protons. OR is a basic particle with a charge of +1 and a mass of 1g/mol (amu). OR Every uncharged atom has an equal number of positively charged protons (which are relatively big and sit in the nucleus with the neutrons) and negatively-charged electrons, which whirl around on the outside and make chemistry. A proton weighs about  $1.6726 \times 10^{-27}$  kg, slightly less than a neutron. OR a heavy subatomic particle with a positive charge; found in an atomic nucleus. OR a positively charged particle in the nucleus of an atom. OR a particle in the center of the atom that has a positive charge. OR An elementary nuclear particle with a positive electric charge located in the nucleus of an atom.

**proton :** A small, positively charged particle of matter found in the atoms of all elements. Streams of protons generated by special equipment can be used for radiation treatment.

**Proton acceptor:** A functional group capable of accepting a proton from a proton donor molecule. OR An anionic compound capable of accepting a proton from a proton donor; that is, a base.

**proton beam radiation therapy :** A type of radiation therapy that uses streams of protons (tiny particles with a positive charge) to kill tumor cells. This type of treatment can reduce the amount of radiation damage to healthy tissue near a tumor. It is used to treat cancers of the head and neck and organs such as the brain, eye, lung, spine, and prostate. Proton beam radiation is different from x-ray radiation.

**proton donor:** The donor of a proton in an acid-base reaction; that is, an acid. OR Because a free  $H^+$  ion is technically a bare proton, acids are sometimes referred to as "proton donors" because they release hydrogen ions in solution. The term "proton donor" is misleading, since in aqueous

solution, the hydrogen ion is never a bare proton- it's covalently bound to a water molecule as an  $\text{H}_3\text{O}^+$  ion. Further, acids don't "donate" protons; they yield them to bases with a stronger affinity for them.

**Proton gradient:** The unequal distribution of protons across a proton-impermeable membrane; such gradients can be used to power various biochemical processes, such as the synthesis of ATP.

**proton magnetic resonance spectroscopic imaging :** A noninvasive imaging method that provides information about cellular activity (metabolic information). It is used along with magnetic resonance imaging (MRI) which provides information about the shape and size of the tumor (spatial information). Also called  $^1\text{H}$ -nuclear magnetic resonance spectroscopic imaging, magnetic resonance spectroscopic imaging, and MRSI.

**Proton motive force (:** DThe thermodynamic driving force for proton translocation.

**proton pump inhibitor :** A substance used to treat certain disorders of the stomach and intestines, such as heartburn and ulcers. Proton pump inhibitors block the actions of an enzyme in the stomach and reduce the amount of acid made in the stomach. Also called PPI.

**Proton-motive force:** The energy inherent in the proton gradient established during the functioning of the respiratory chain; consists of a membrane potential as well as a chemical gradient. OR The electrochemical potential inherent in a transmembrane gradient of  $\text{H}^+$  concentration; used in oxidative phosphorylation and photophosphorylation to drive ATP synthesis.

**proton+:** An elementary particle found the atomic nucleus with a positive charge equal and opposite that of the electron. Protons have a mass of 1.007276 daltons.

**protonated:** Having acquired an additional proton ( $\text{H}^+$ ).

**protonation:** the addition of a proton (a hydrogen ion) to a molecule.

**protons:** positively charged particles within the nucleus of an atom.

**protoplasm:** A general term referring to the entire contents of a living cell.

**Protoporphyrin:** An organic constituent of the heme prosthetic group; consists of four pyrrole rings joined by methylene bridges and contains various side chains.

**Prototype:** Original example of a product after it has been designed and thermoformed.

**Prototype mold:** a simplified mold construction often made from a light-casting alloy or from epoxy resin in order to obtain information for the final mold or part design.

**Prototype tool:** Also called a soft tool, a preliminary mold built to produce prototype parts and used to make adjustments to the final production tool.  
OR A preliminary mold built upon which the final mold will be based.

**protozoal :** Having to do with the simplest organisms in the animal kingdom. Protozoa are single-cell organisms, such as ameba, and are different from bacteria, which are not members of the animal kingdom. Some protozoa can be seen without a microscope.

**Prout–Tompkins kinetics:** The equation that treats a solid-state reaction as a process controlled by growing nuclei that branch into chains. The equation is: where  $a$  is the extent of reaction,  $k$  is the rate constant, and  $t$  is the time.

**Provecta:** (Other name for: PV-10)

**provenance area:** the source from which sediment originated.

**Provenge:** (Other name for: sipuleucel-T)

**Provenge :** A drug used to treat prostate cancer that has spread. It is made from immune system cells collected from a patient with prostate cancer. The cells are treated with a protein that is made by combining a protein found on prostate cancer cells with a growth factor. When the cells are injected back into the patient, they may stimulate T cells to kill prostate cancer cells. Provenge is a type of vaccine and a type of cellular adoptive immunotherapy. Also called APC8015 and sipuleucel-T.

**Proventil:** (Other name for: albuterol sulfate)

**Provera:** (Other name for: medroxyprogesterone)

**Provera Dosepak:** (Other name for: medroxyprogesterone)

**Provigan:** (Other name for: promethazine hydrochloride)

**Provigil:** (Other name for: modafinil)

**proximal :** In medicine, refers to a part of the body that is closer to the center of the body than another part. For example, the knee is proximal to the toes. The opposite is distal.

**proximal colon :** The first and middle parts of the colon. The proximal colon includes the cecum (a pouch that connects the small intestine to the colon), the ascending colon (the right side of the colon), and the transverse colon (the part of the colon that goes across the body between the right and left sides of the colon).

**proximal urethra :** The part of the urethra closest to the inside of the body. The urethra is the tube through which urine leaves the body. In women, the proximal urethra is the part near the bladder and in men it is the part that goes through the prostate gland.

**proximal urethral cancer :** A rare cancer that forms in the part of the urethra closest to the inside of the body. The cancer often has spread deeply into the tissue.

**Proxinium :** A substance being studied in the treatment of certain types of head and neck cancer. Proxinium is made by linking a monoclonal antibody fragment to a toxic protein that may kill cancer cells. It binds to EpCAM (a protein on the surface of epithelial cells and some types of cancer cells). Also called anti-EpCAM-Pseudomonas-exotoxin fusion protein and VB4-845.

**proxy climate indicators:** Dateable evidence of a biological or geological phenomenon whose condition, at least in part, is attributable to climatic conditions at the time of its formation. Proxy data are any material that provides an indirect measure of climate and include documentary evidence of crop yields, harvest dates, glacier movements, tree rings, varves, glaciers and snow lines, insect remains, pollen remains, marine microfauna, isotope measurements:  $^{18}\text{O}$ , in ice sheets,  $^{18}\text{O}$ ,  $^2\text{H}$ , and  $^{13}\text{C}$  in tree rings;  $\text{CaCO}_3$  in sediments; and speleothems. There are three main problems in using proxy data: (1) dating, (2) lag and response time, and (3) meteorological interpretation. Tree rings, pollen deposits from varved lakes, and ice cores are the most promising proxy data sources for reconstructing the climate of the last five millennia because the dating are precise on an annual basis while other proxy data sources may only be precise to +/- 100 years.

**pruritus :** Itching. Severe itching may be a side effect of some cancer treatments and a symptom of some types of cancers.

**PS:** Polystyrene

**PS-341:** A drug used to treat multiple myeloma. It is also used to treat mantle cell lymphoma in patients who have already received at least one

other type of treatment and is being studied in the treatment of other types of cancer. PS-341 blocks several molecular pathways in a cell and may cause cancer cells to die. It is a type of proteasome inhibitor and a type of dipeptidyl boronic acid. Also called bortezomib and velcade.

**PSA:** A protein made by the prostate gland and found in the blood. PSA blood levels may be higher than normal in men who have prostate cancer, benign prostatic hyperplasia (BPH), or infection or inflammation of the prostate gland. Also called prostate-specific antigen.

**PSA bounce :** A brief rise and then fall in the blood level of PSA (prostate-specific antigen) that occurs in some patients 1-3 years after receiving radiation treatment for prostate cancer. PSA bounce does not mean that the cancer has come back. It may be caused by the release of PSA from destroyed cancer cells or from normal prostate tissue exposed to the radiation treatment.

**PSA failure :** A rise in the blood level of PSA (prostate-specific antigen) in prostate cancer patients after treatment with surgery or radiation. PSA failure may occur in patients who do not have symptoms. It may mean that the cancer has come back. Also called biochemical recurrence and biochemical relapse.

**PSA prostate cancer vaccine:** A peptide vaccine containing the prostate specific antigen (PSA) with potential antineoplastic activity. PSA, a glycoprotein secreted by prostatic epithelial and ductal cells, is overexpressed in prostate cancer cells and is used as a tumor marker for both diagnosis and treatment evaluation. Vaccination with PSA peptide vaccine may produce anti-PSA antibodies as well as elicit a cytotoxic T-cell (CTL) response against prostate cancer cells expressing this antigen, thereby decreasing tumor cell growth.

**PSA RNA-pulsed dendritic cell vaccine:** An autologous dendritic cell vaccine with potential immunostimulatory activity. Dendritic cells harvested from a prostate cancer patient are transfected with the mRNA encoding for prostate specific antigen (PSA), a tumor marker secreted by prostatic epithelial and ductal cells. When reintroduced back to the patient, these PSA RNA pulsed autologous dendritic cells may elicit a cytotoxic T-cell (CTL) response against PSA-positive prostate cancer cells.

**PSA test :** A laboratory test that measures the amount of prostate-specific antigen (PSA) found in the blood. PSA is a protein made by the prostate

gland. The amount of PSA may be higher in men who have prostate cancer, benign prostatic hyperplasia (BPH), or infection or inflammation of the prostate.

**PSA velocity :** A measurement of how fast PSA levels in the blood increase over time. A high PSA velocity may be a sign of prostate cancer and may help find fast-growing prostate cancers.

**PSA-PAP/KLH-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with the prostate-specific tumor associated antigens (TAAs) prostate specific antigen (PSA) and prostate acid phosphatase (PAP), and conjugated to the immunostimulant keyhole limpet hemocyanin (KLH), with potential immunostimulatory and antineoplastic activities. Upon administration, prostate cancer antigen/KLH-pulsed autologous dendritic cell vaccine may stimulate the immune system to mount anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against prostate cancer cells expressing PSA and PAP, which may result in prostate cancer cell lysis. KLH is an immunogenic carrier and serves as an immunostimulant to improve antigenic immune recognition and T-cell responses and can be used to evaluate vaccine efficacy.

**PSA:154-163(155L) peptide vaccine:** A cancer vaccine comprised of a synthetic peptide with an amino acid sequence corresponding to positions 154-163 of the amino acid sequence for prostate-specific antigen (PSA) with a leucine substitution at position 155. Upon administration, PSA:154-163(155L) peptide vaccine may elicit a cytotoxic T-cell response against tumor cells that express PSA.

**PSA/IL-2/GM-CSF vaccine:** A prostate cancer vaccine containing prostate specific antigen (PSA) combined with the cytokines, interleukin-2 (IL-2) and granulocyte macrophage-colony-stimulating factor (GM-CSF), with potential antineoplastic activity. Upon intradermal vaccination, PSA/IL-2/GM-CSF vaccine may activate the immune system to induce a cytotoxic T-cell (CTL) response against prostate cancer cells expressing this antigen, thereby decreasing tumor cell growth. PSA, a glycoprotein secreted by prostatic epithelial and ductal cells, is overexpressed by prostate cancer cells. IL-2 stimulates natural killer (NK) cells and cytotoxic T-cells against the PSA-expressing tumor cells. GM-CSF promotes antigen presentation to

dendritic cells and further stimulates a tumor-specific cytotoxic T-lymphocyte (CTL) response.

**PSA/PSMA DNA plasmid INO-5150:** A plasmid DNA vaccine encoding the tumor-associated antigens (TAAs) prostate-specific antigen (PSA) and prostate-specific membrane antigen (PSMA), with potential immunoactivating and antineoplastic activities. Upon intramuscular delivery and electroporation of the PSA/PSMA DNA plasmid INO-5150, both PSA and PSMA are translated in cells which then activate the immune system. This induces cytotoxic T-lymphocyte (CTL) responses against tumor cells expressing PSA and PSMA. This may result in both immune-mediated tumor cell death and the inhibition of tumor cell proliferation. PSA and PSMA are overexpressed on a variety of cancer cell types. The DNA encoding the TAAs in INO-5150 is based on both human and other primate antigen gene sequences. As the plasmid genes differ from the human gene sequences encoding these antigens, INO-5150 may overcome immune tolerance to human TAAs.

**psammoma body :** A structure found in some benign (not cancer) or malignant (cancer) tumor cells. Psammoma bodies look like hardened concentric rings when viewed under a microscope. They can be a sign of chronic inflammation.

**PSC 833:** A substance that is being studied for its ability to prevent or overcome the resistance of tumor cells to some anticancer drugs. It belongs to the family of drugs called cyclosporine analogs.

**pseudocore:** Electrons in d or f subshells which are outside the noble gas core.

**Pseudocycle:** A sequence of reactions that can be arranged in a cycle but that usually do not function simultaneously in both directions. Also called a futile cycle, since the net result of simultaneous functioning in both directions would be the expenditure of energy without accomplishing any useful work.

**pseudogene :** A DNA sequence that resembles a gene but has been mutated into an inactive form over the course of evolution. It often lacks introns and other essential DNA sequences necessary for function. Though genetically similar to the original functional gene, pseudogenes do not result in functional proteins, although some may have regulatory effects.

**Pseudogenes:** Sequences of DNA that resemble actual genes but do not encode functional products.

**Pseudomonas aeruginosa preparation:** A preparation containing the inactivated *Pseudomonas aeruginosa* bacterium with potential immunomodulating activity. Upon inoculation, *Pseudomonas aeruginosa* preparation may stimulate the immune system, increasing macrophage and natural killer cell activity; it may be used thereby in cancer adjuvant treatments, and it may reduce the incidence of infection.

**pseudomyxoma peritonei :** A build-up of mucus in the peritoneal cavity. The mucus may come from ruptured ovarian cysts, from the appendix, or from other abdominal tissues. Mucus-secreting cells may attach to the peritoneal lining and continue to secrete mucus.

**PSEUDOPLASTIC FLOW:** This term is synonymous to shear thinning flow, i.e. viscosity decreases as the shear rate increases.

**Pseudopolymorph:** A polymorph that differs from a true polymorph by the incorporation of solvent.

**pseudopotential:** see ECP.

**Pseudosubstrate:** An amino acid sequence that resembles the actual substrate for an enzyme except that a crucial amino acid has been changed, converting the sequence into an inhibitor; the regulated binding of pseudosubstrates is sometimes used to control enzyme activity.

**psilocybin :** A substance being studied in the treatment of anxiety or depression in patients with advanced cancer. It is taken from the mushroom *Psilocybe mexicana*. Psilocybin acts on the brain to cause hallucinations (sights, sounds, smells, tastes, or touches that a person believes to be real but are not real). Also called psilocybine.

**psilocybine:** A tryptamine alkaloid, isolated from various genera of fungi including the genus *Psilocybe*, with hallucinogenic, anxiolytic, and psychoactive activities. In vivo, psilocybine is rapidly dephosphorylated into the active compound psilocin, which activates serotonin 2A (5-HT<sub>2A</sub>) receptors in the central nervous system (CNS), mimicking the effects of serotonin. or A substance being studied in the treatment of anxiety or depression in patients with advanced cancer. It is taken from the mushroom *Psilocybe mexicana*. Psilocybine acts on the brain to cause hallucinations

(sights, sounds, smells, tastes, or touches that a person believes to be real but are not real). Also called psilocybin.

**PSMA-targeted docetaxel nanoparticles BIND-014:** A proprietary preparation of polymeric nanoparticles containing the second-generation taxane docetaxel, targeted to prostate-specific membrane antigen (PSMA), with antineoplastic activity. PSMA-targeted docetaxel nanoparticles BIND-014 carry docetaxel within a matrix of polylactic acid covered with a coating of polyethylene glycol; embedded on the surface of the polyethylene glycol coating are ligands targeted to PSMA. BIND-014 allows gradual release of docetaxel upon degradation of the polylactic acid, and the PEG encapsulation escapes the host immune response while PSMA ligands on the surface restrict the cytotoxic effect to PSMA-expressing cells. Docetaxel binds to and stabilizes the beta-tubulin subunit, thereby inhibiting microtubule disassembly which results in cell-cycle arrest at the G2/M phase and cell death. PSMA is a cell-surface antigen that is abundantly present on the surface of cancer cells and on the neovasculature that feeds a wide variety of tumor types.

**PSMA-targeted tubulysin B-containing conjugate EC1169:** An injectable, water soluble, small molecule drug conjugate (SMDC) containing a ligand specific for prostate-specific membrane antigen (PSMA), conjugated via a stable, enzyme-cleavable linker to the cytotoxic agent tubulysin B hydrazide (TubBH), with potential antineoplastic activity. Upon administration of PSMA-targeted tubulysin B-containing conjugate EC1169, the PSMA ligand specifically targets and binds to PSMA, a protein which is abundantly expressed on the surface of metastatic and hormone-refractory prostate cancer cells as well as on the neovasculature of many solid tumors. This allows for the specific delivery of TubBH to PSMA-expressing cancer cells. Upon internalization and cleavage, tubulysin B binds to tubulin and inhibits microtubule polymerization, which blocks cell division and results in G2/M phase arrest, tumor cell apoptosis and a decrease in PSMA-expressing tumor cells.

**PSMA/TARP peptide vaccine:** A peptide-based cancer vaccine containing epitopes of T cell receptor gamma-chain alternate reading frame protein (TARP) and prostate-specific membrane antigen (PSMA) in combination with a Poly IC-LC immunoadjuvant, with potential antineoplastic activity. Upon administration, PSMA/TARP peptide vaccine may stimulate a host

cytotoxic T-cell (CTL) response against TARP- and PSMA-expressing tumor cells, resulting in tumor cell cytotoxicity. The nuclear protein TARP and PSMA are commonly expressed in prostate cancer cells.

**psoralen** : A substance from plants that is sensitive to light (or can be activated by light). Psoralens are used together with UV light to treat psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma. They are also being studied in the treatment of graft-versus-host disease. Psoralen is a type of furocoumarin. An example of a psoralen is methoxsalen.

**psoralen and ultraviolet A therapy** : A type of photodynamic therapy used to treat skin conditions such as psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma. The patient receives psoralen (a drug that becomes active when it is exposed to light) by mouth or applied to the skin, followed by ultraviolet A radiation. Psoralen and ultraviolet A therapy may increase the risk of getting skin cancer. Also called PUVA therapy.

**Psoria-Gold**: (Other name for: curcumin-based gel)

**psoriasis** : A chronic disease of the skin marked by red patches covered with white scales.

**psychiatrist** : A medical doctor who has special training in preventing, diagnosing, and treating mental, emotional, and behavioral disorders.

**psychological** : Having to do with how the mind works and how thoughts and feelings affect behavior.

**psychologist** : A specialist who can talk with patients and their families about emotional and personal matters, and can help them make decisions.

**psychology** : The study of how the mind works and how thoughts and feelings affect behavior.

**psychosis** : A severe mental disorder in which a person loses the ability to recognize reality or relate to others. The person is not able to cope with the demands of everyday life. Symptoms include being paranoid, having false ideas about what is taking place or who one is, and seeing, hearing, or feeling things that are not there.

**psychosocial** : In medicine, describes the psychological (emotional) and social parts of a disease and its treatment. Some of the psychosocial parts of cancer are its effects on patients' feelings, moods, beliefs, the way they cope, and relationships with family, friends, and co-workers.

**psychostimulant** : A drug that causes a sense of well-being, decreases fatigue and depression, and increases the desire to eat. These drugs can also cause mood changes and trouble with sleeping.

**psychotherapy** : Treatment of mental, emotional, personality, and behavioral disorders using methods such as discussion, insight, and counseling. Also called talk therapy.

**psychrometer**: an instrument with a dry-bulb thermometer and a wet-bulb thermometer; used to measure dewpoint and relative humidity.

**psyllium** : A plant with seeds that are used as a mild laxative. The outer layer of the seeds swells when wet. This increases the size of stool and helps it pass more easily through the intestines (lower part of the digestive tract). Psyllium is a type of bulk laxative.

**PT-100**: A substance being studied in the treatment of cancer, including certain types of lung, pancreas, and brain cancer. PT-100 may help the immune system block the growth of cancer cells. It may also increase the growth of new blood cells. It is a type of enzyme inhibitor. Also called talabostat and talabostat mesylate.

**PTC**: A procedure to x-ray the hepatic and common bile ducts. A contrasting agent is injected into the liver or bile duct, and the ducts are then x-rayed to find the point of obstruction. Also called percutaneous transhepatic cholangiography.

**PTCD**: A procedure to drain bile to relieve pressure in the bile ducts caused by a blockage. An x-ray of the liver and bile ducts locates the blockage of bile flow. Images made by ultrasound guide placement of a stent (tube), which remains in the liver. Bile drains through the stent into the small intestine or into a collection bag outside the body. This procedure may relieve jaundice before surgery. Also called percutaneous transhepatic biliary drainage and percutaneous transhepatic cholangiodrainage.

**PTEN**: A protein that helps control many cell functions, including cell division and cell death. Mutations (changes) in the gene that makes PTEN are found in many types of cancer and other diseases. It is a type of tumor suppressor protein. Also called PTEN tyrosine phosphatase.

**PTEN tyrosine phosphatase** : A protein that helps control many cell functions, including cell division and cell death. Mutations (changes) in the gene that makes PTEN tyrosine phosphatase are found in many types of

cancer and other diseases. It is a type of tumor suppressor protein. Also called PTEN.

**PTFE:** Polytetrafluoroethylene

**PTFE (polytetrafluoroethylene):** A thermoplastic member of the fluoropolymer family of plastics. PTFE has the lowest coefficient of friction of any known solid and the highest operating temperatures of the fluoropolymers.

**PTH:** A substance made by the parathyroid gland that helps the body store and use calcium. A higher-than-normal amount of PTH causes high levels of calcium in the blood and may be a sign of disease. Also called parathormone, parathyrin, and parathyroid hormone.

**PTK787/ZK 222584:** A substance that is being studied in the treatment of cancer. It belongs to the families of drugs called protein tyrosine kinase inhibitors and VEGF receptor kinase inhibitors. Also called vatalanib.

**PTLD:** A condition in which a group of B-cells grow out of control after an organ transplant in patients with weakened immune systems. This usually happens if the patient has also been infected with Epstein-Barr virus. PTLD may progress to non-Hodgkin lymphoma. Also called post-transplant lymphoproliferative disorder.

**Ptolemy:** astronomer who developed the geocentric model.

**ptosis:** drooping eyelids OR Drooping of the upper eyelid.

**PTSD:** An anxiety disorder that develops in reaction to physical injury or severe mental or emotional distress, such as military combat, violent assault, natural disaster, or other life-threatening events. Having cancer may also lead to PTSD. Symptoms interfere with day-to-day living and include reliving the event in nightmares or flashbacks; avoiding people, places, and things connected to the event; feeling alone and losing interest in daily activities; and having trouble concentrating and sleeping. Also called post-traumatic stress disorder.

**pTVG-HP plasmid DNA vaccine:** A cancer vaccine containing plasmid DNA encoding human prostatic acid phosphatase (PAP) (pTVG-HP) with potential immunostimulatory and antineoplastic activities. Upon administration, pTVG-HP plasmid DNA vaccine may stimulate the host immune system to generate a cytotoxic T lymphocyte (CTL) response against PAP-expressing prostate cancer cells. PAP or prostatic specific acid

phosphatase (PSAP) is a tumor associated antigen (TAA) that may be overexpressed in prostate cancer.

**PU:** Polyurethane

**puberty :** The time of life when a child experiences physical and hormonal changes that mark a transition into adulthood. The child develops secondary sexual characteristics and becomes able to have children. Secondary sexual characteristics include growth of pubic, armpit, and leg hair; breast enlargement; and increased hip width in girls. In boys, they include growth of pubic, face, chest and armpit hair; voice changes; penis and testicle growth, and increased shoulder width.

**Public Dose:** The dose received by a member of the public from exposure to radiation or to radioactive material released by a licensee, or to any other source of radiation under the control of a licensee. Public dose does not include occupational dose or doses received from background radiation, from any medical administration the individual has received, from exposure to individuals administered radioactive materials and released in accordance with 10 CFR 35.75, or from voluntary participation in medical research programs.

**public health impact assessment:** Application of risk assessment procedures to a specific target population. The size of the populations needs to be known. The end product is a quantitative statement about the number of people affected in the specific target populations (WHO, 1988).

**PUHF:** Spin-projected UHF energy. An approximation intended to provide the energy that would result from a UHF calculation if it did not suffer spin-contamination. The PUHF energy is usually lower than the UHF energy because the contributions of higher-multiplicity states, which usually have high energies, have been (approximately) subtracted.

**Pulled Gate :** Area where the part was connected to the sprue or runner that has been drawn out or stretched from the surface.

**Pullwinding:** A variation of pultrusion where fibre is wound in the crosswise direction during the pultrusion process.

**pulmonary :** Having to do with the lungs.

**pulmonary artery:** the artery of the human circulatory system that pumps the blood from the right ventricle to the lungs for gas exchange.

**pulmonary disease :** A type of disease that affects the lungs and other parts of the respiratory system. Pulmonary diseases may be caused by infection, by smoking tobacco, or by breathing in secondhand tobacco smoke, radon, asbestos, or other forms of air pollution. Pulmonary diseases include asthma, chronic obstructive pulmonary disease (COPD), pulmonary fibrosis, pneumonia, and lung cancer. Also called lung disorder and respiratory disease.

**pulmonary edema :** A buildup of fluid in the alveoli (air spaces) in the lungs. This keeps oxygen from getting into the blood. Pulmonary edema is usually caused by heart problems, but it can also be caused by high blood pressure, pneumonia, certain toxins and medicines, or living at a high altitude. Symptoms include coughing, shortness of breath, and trouble exercising.

**pulmonary function :** A term used to describe how well the lungs work in helping a person breathe. During breathing, oxygen is taken into the lungs, where it passes into the blood and travels to the body's tissues. Carbon dioxide, a waste product made by the body's tissues, is carried to the lungs, where it is breathed out. There are different tests to measure pulmonary function. Also called lung function.

**pulmonary function test :** A test used to measure how well the lungs work. It measures how much air the lungs can hold and how quickly air is moved into and out of the lungs. It also measures how much oxygen is used and how much carbon dioxide is given off during breathing. A pulmonary function test can be used to diagnose a lung disease and to see how well treatment for the disease is working. Also called lung function test and PFT.

**pulmonary rehabilitation education :** Education about behavior and lifestyle changes to help patients with chronic lung disease decrease breathing problems, return to daily activities, and improve quality of life. Education may include instruction about breathing exercises, nutrition, use of medicines, and ways for the patient to reduce stress and save energy.

**pulmonary specialist :** A doctor who has special training in diagnosing and treating diseases of the lungs. Also called pulmonologist.

**pulmonary sulcus tumor :** A type of lung cancer that begins in the upper part of a lung and spreads to nearby tissues such as the ribs and vertebrae. Most pulmonary sulcus tumors are non-small cell cancers. Also called Pancoast tumor.

**pulmonary vein:** the vein of the human circulatory system that returns oxygen-rich blood from the lungs to the left atrium.

**pulmonologist :** A doctor who has special training in diagnosing and treating diseases of the lungs. Also called pulmonary specialist.

**pulmonology :** A branch of medicine that specializes in diagnosing and treating diseases of the lungs and other parts of the respiratory system. These diseases include asthma, emphysema, tuberculosis, and pneumonia.

**Pulmozyme :** A drug given in an aerosol mist to decrease the thickness of mucus in the lungs of patients with cystic fibrosis. It is also being studied as a treatment to reduce the thickness of saliva in patients being treated for head and neck cancer. Pulmozyme contains an enzyme that breaks the DNA in mucus into small pieces and makes the mucus thinner. Also called dornase alfa inhalation solution.

**Pulp:** A form of cellulose obtained from wood or other vegetable matter by prolonged cooking with chemicals.

**Pulp molding:** Process by which a resin-impregnated pulp material is preformed by application of a vacuum and subsequently oven cured or molded.

**pulsar:** a star that sends energy out in pulses.

**pulse :** In medicine, the number of times the heart beats within a certain time period, usually a minute. The pulse can be felt at the wrist, side of the neck, back of the knees, top of the foot, groin, and other places in the body where an artery is close to the skin. The resting pulse is normally between 60 and 100 beats a minute in a healthy adult who is at rest. Measuring the pulse gives important information about a person's health. Also called heart rate.

**Pulse-chase:** An experiment in which a short labeling period is followed by the addition of an excess of the same, unlabeled compound to dilute out the labeled material Useful for observing time-dependent behavior of compounds.

**Pulsed-field electrophoresis:** An electrophoretic technique for separating large DNA molecules. Electric fields, oriented at 120 degrees to each other, are applied in an alternating fashion. Large molecules reorient more slowly than small ones and hence cannot follow the electric field as rapidly.

**Pultrusion:** A process for making continuous profiles of composite materials. Fibres that are impregnated with a thermosetting resin and pulled through a heated die where curing takes place.

**Pump:** A protein passage in a membrane that can transport a molecule from one compartment to another against a concentration gradient; pumps undergo a cycle of conformational changes that alter the affinity of the binding site for the transported molecule, and the eversion of the molecule during the cycle is driven by expenditure of free energy. Also called active transporters. OR A device used to propel a liquid or slurry from one location to another, usually through a pipe or tube. OR A device that is used to give a controlled amount of a liquid at a specific rate. For example, pumps are used to give drugs (such as chemotherapy or pain medicine) or nutrients.

**pUMVC3-hIGFBP-2 multi-epitope plasmid DNA vaccine:** A plasmid DNA vaccine containing mammalian expression vector pUMVC3, encoding epitopes of human insulin-like growth factor-binding protein 2 (hIGFBP-2) with potential immunostimulating and antineoplastic activities. Upon vaccination, pUMVC3-hIGFBP-2 multi-epitope plasmid DNA vaccine may activate the immune system to mount a cytotoxic T-lymphocyte (CTL) response against hIGFBP-2-expressing cells. The tumor associated antigen (TAA) hIGFBP-2, a member of the insulin like growth factor receptor family, is overexpressed in a number of cancer cell types and its expression has been associated with increased invasiveness.

**pUMVC3-IGFBP2-HER2-IGF1R plasmid DNA vaccine:** A polyepitope plasmid DNA vaccine containing the mammalian expression vector pUMVC3 encoding epitopes derived from three tumor-associated antigens (TAAs): human insulin-like growth factor-binding protein 2 (IGFBP2), human epidermal growth factor receptor 2 (HER2; ERBB2) and insulin-like growth factor 1 receptor (IGF1R), with potential immunostimulating and antineoplastic activities. Upon intradermal vaccination, pUMVC3-IGFBP2-HER2-IGF1R plasmid DNA vaccine transfects local keratinocytes, which process the plasmid, express the epitopes and present them to antigen-presenting cells (APCs). This activates the immune system to mount a combined response from specific T helper type 1 (Th1) cells, memory T cells and cytotoxic T lymphocytes (CTL) against IGFBP2-, HER2-, and IGF1R-expressing tumor cells. IGFBP2, HER2, and IGF1R are tumor-

associated proteins overexpressed in certain tumor cell types, and play key roles in cellular proliferation and survival.

**punch biopsy :** A procedure in which a small round piece of tissue about the size of a pencil eraser is removed using a sharp, hollow, circular instrument. The tissue is then checked under a microscope for signs of disease. A punch biopsy may be used to check for certain types of cancer, including skin, vulvar, and cervical cancer. It may also be used to check for certain skin conditions and changes that may lead to cancer.

**punctuated equilibrium:** theory that organisms just "appear" on Earth.

**punctuation:** helps a reader make sense of what you write; punctuation devices include periods, question marks, exclamation points, commas, semicolons, colons, dashes, parentheses, and brackets.

**pupil :** The round opening in the center of the iris (the colored tissue that makes the "eye color" at the front of the eye). The pupil changes size to let light into the eye. It gets smaller in bright light and larger as the amount of light decreases.

**pure covalent bond:** a bond in which the shared electrons are equally available to both bonded atoms.

**pure substance:** A sample of matter that cannot be separated into simpler components without chemical change. Physical changes can alter the state of matter but not the chemical identity of a pure substance. Pure substances have fixed, characteristic elemental compositions and properties.

**Purging :** In extrusion or injection molding, the cleaning of one color or type of material from the machine by forcing it out with the new color or material to be used in subsequent production, or with another compatible purging material. OR Cleaning one color or type of material from the cylinder of an injection molding machine or extruder by forcing it out with the new color or material to be used in subsequent production. Purging materials are also available.

**Purified Terephthalic Acid (PTA):** Purified terephthalic acid (PTA) is produced by the oxidation of terephthalic acid (TA) in acetic acid, and its subsequent purification, often via crystallisation. Prior to the development of the purification process, the crude TA was esterified into DMT, which could then be purified. PTA is the main ingredient in the production of PET melt phase, although much smaller volumes are used in the production of

thermosetting resins and coatings. PTA production is highly capital intensive, and tends to be located close to demand centres.

**purine:** a type of nitrogenous base present in DNA molecules containing two fused rings of carbon and nitrogen atoms; two examples in DNA are adenine (A) and guanine (G). NPOR A heterocyclic ring structure with varying functional groups The purines adenine and guanine are found in both DNA and RNA. OR A nitrogenous base that includes a pyrimidine ring fused with a five-membered imidazole ring; the purine derivatives adenine and guanine are found in nucleotides and nucleic acids. OR A nitrogenous heterocyclic base found in nucleotides and nucleic acids; containing fused pyrimidine and imidazole rings. OR One of two chemical compounds that cells use to make the building blocks of DNA and RNA. Examples of purines are adenine and guanine. Purines are also found in meat and meat products. They are broken down by the body to form uric acid, which is passed in the urine. High levels of uric acid in the body may cause gout.

**Purinethol :** A drug used to treat acute lymphoblastic leukemia. It may also be used to treat certain other conditions, such as Crohn disease and ulcerative colitis. Purinethol stops cells from dividing and may kill cancer cells. It is a type of antimetabolite. Also called mercaptopurine and Purixan.

**Purixan:** (Other name for: mercaptopurine) or (Other name for: mercaptopurine oral suspension) or A drug used to treat acute lymphoblastic leukemia. It may also be used to treat certain other conditions, such as Crohn disease and ulcerative colitis. Purixan stops cells from dividing and may kill cancer cells. It is a type of antimetabolite. Also called mercaptopurine and Purinethol.

**Purkinje fibers:** the nerves that transfer amplified impulses to regions of the heart to control its function.

**Purlin:** Member laid horizontally across the main rafters or roof trusses and supporting the common rafters.

**Purlytin:** (Other name for: rostaporfin)

**Puromycin:** An antibiotic that inhibits polypeptide synthesis by competing with aminoacyl-tRNA for the ribosomal binding site A. OR An antibiotic that is an analog of the terminal aminoacyl-adenosine part of aminoacyltrna; in translation, it causes premature chain termination when its amino group joins the carboxyl group of the growing polypeptide chain

and the resulting adduct dissociates from the ribosomal complex. OR An antibiotic that inhibits polypeptide synthesis by being incorporated into a growing polypeptide chain, causing its premature termination.

**purple clover :** *Trifolium pratense*. A plant with flowers that has been used in some cultures to treat certain medical problems. It is being studied in the relief of menopausal symptoms and may have anticancer effects. Also called red clover, *Trifolium pratense*, and wild clover.

**purple coneflower :** An herb native to North America that has been used to prevent and treat the common cold and other respiratory infections. Purple coneflower may interfere with treatment that uses the immune system to fight cancer. The scientific names are *Echinacea purpurea* and *Echinacea angustifolia*. Also called echinacea.

**purple grape juice:** Juice made from dark, purple grapes that contain polyphenols with antioxidant and potential cardiovascular protecting activities. Purple grape juice contains high amounts of flavonoids that may increase antioxidant activity and reduce oxidative stress, reduce low-density lipoprotein (LDL), and improve nitric oxide formation, endothelial function and vasodilation.

**purpura fulminans:** hemorrhagic condition usually associated with infection or sepsis

**purpuric skin bleeding:** bleeding from purplish patches on the skin

**Push Up:** The bottom contour of a plastic container designed in such a manner as to allow an even bearing surface on the outside edge and to prevent the bottle from rocking. OR the contour of the bottom of the plastic container designed in such a manner as to allow an even bearing surface on outside edge and prevent the bottle from rocking.

**Putlog:** A short piece of timber or tube used in scaffolding to support the boards.

**putrefaction:** biological decomposition of organic matter accompanied by the production of a foul smell associated with anaerobic condition.

**Putty:** A composition usually made from linseed oil and whiting and used mainly for bedding glass into primed wooden window frames.

**PUVA therapy :** A type of photodynamic therapy used to treat skin conditions such as psoriasis, vitiligo, and skin nodules of cutaneous T-cell lymphoma. The patient receives psoralen (a drug that becomes active when

it is exposed to light) by mouth or applied to the skin, followed by ultraviolet A radiation. PUVA therapy may increase the risk of getting skin cancer. Also called psoralen and ultraviolet A therapy.

**PV-10:** An injectable ten percent solution of rose bengal disodium, an iodinated fluorescein derivative, with potential antineoplastic and radiosensitizing activities. When injected into tumor tissue, PV-10 specifically targets and concentrates in tumor cells, producing cytotoxic singlet oxygen when exposed to ionizing radiation. In addition, PV-10 may stimulate an anti-tumor immune response.

**PV, limiting PV (LPV) factor:** Mathematical limit of a coating's load-carrying ability and wear resistance under bearing conditions.

**PV701:** An attenuated, replication-competent, oncolytic strain of Newcastle disease virus. PV701 selectively lyses tumor cells. The selectivity of this agent is related to defects in the interferon-mediated antiviral response found in tumor cells. Check for active clinical trials using this agent. or A virus that is being studied in the treatment of cancer. It belongs to the family of viruses that cause Newcastle disease in birds.

**PVA:** Abbreviation for Polyvinyl Acetate which is used as a medium in emulsion paints.

**PVA microporous hydroospheres:** An embolic material composed of microspheres of polyvinyl alcohol (PVA) polymers. These water-soluble, compressible microspheres may be used to encapsulate various therapeutic agents; drug-loaded microspheres can then be used as a drug delivery vehicle during embolization of tumor vasculature.

**PVA microporous hydroospheres/doxorubicin hydrochloride:** An embolic material composed of microspheres of polyvinyl alcohol (PVA) polymers loaded with doxorubicin hydrochloride with antineoplastic activity. Doxorubicin hydrochloride-loaded microspheres may be used as a drug delivery vehicle during embolization of tumor vasculature. Doxorubicin intercalates DNA, interferes with catalytic activity of topoisomerase II, and causes DNA adducts and other DNA damage, resulting in tumor cell growth inhibition and apoptosis. When used in tumor vasculature embolization, this preparation may provide more tumor-specific treatment with doxorubicin compared to the systemic administration of doxorubicin, thereby reducing the systemic toxicity of doxorubicin.

**pVAXrcPSAv531 vaccine:** A cancer vaccine containing xenogenic DNA from rhesus macaque (*Macaca mulatta*) that encodes prostate specific antigen (PSA) with potential immunostimulating and antineoplastic activities. Upon repeated intradermal administration via electroporation, pVAXrcPSAv531 vaccine may induce a cytotoxic T-lymphocyte (CTL) response against PSA-expressing prostate cancer cells. Rhesus PSA is 89% homologous to human PSA. Check for active clinical trials using this agent.

**Pvc:** Pigment volume concentration. The ratio of the volume of pigment to the volume of total non-volatile material (i.e. pigment and binder) present in a coating. The figure is usually expressed as a percentage. OR Polyvinyl Chloride is a thermoplastic material composed of polymers of vinyl chloride. PVC is a versatile thermoplastic resin that can be formulated to be rigid or flexible. This material is durable and light, strong, fire resistant, with excellent insulating properties and low permeability. By varying the use of additives in the manufacturing of PVC products, features such as strength, rigidity, colour and transparency can be adjusted to meet most applications. PVC is used in a broad range of plastic extrusion applications. As a flexible it is used in wire and cable jacketing, flooring, garden hoses, and medical tubing. As a rigid it is used most commonly in building and constructions. For exterior siding, windows, pipe fitting, sprinkler systems and office furniture edging. It has outstanding resistance to water, alcohols, and concentrated acids and alkalis. Compounded with plasticizers it yields a flexible material superior to rubber in ageing properties. It is widely used for cable and wire coverings, in chemical plants, and in the manufacture of protective garments.

**PVC (Polyvinyl Chloride):** A thermoplastic vinyl polymer constructed of repeating vinyl groups (ethenyls) having one of their hydrogens replaced with a chloride group. Polyvinyl chloride is the third most widely produced plastic, after polyethylene and polypropylene.

**PVDF:** Polyvinylidene Fluoride

**PVDF (Polyvinylidene fluoride):** High-molecular weight thermoplastic of vinylidene fluoride with excellent strength, wear resistance and creep resistance.

**PVDF/sirolimus topical:** A topical formulation consisting of a polyvinylidene fluoride (PVDF) polymer resin containing the macrolide sirolimus (rapamycin), produced by the organism *Streptomyces*

hygroscopic, with immunosuppressive activity. Upon application of topical PVDF/sirolimus, sirolimus migrates from the PVDF polymer resin into the skin. Once inside cells, sirolimus binds to the immunophilin FK binding protein-12 (FKBP-12) and forms a sirolimus:FKBP-12 complex. This complex binds to and inhibits the activity of the serine/threonine kinase mammalian target of rapamycin (mTOR), which may result in the suppression of cytokine-driven T-cell activation and proliferation.

**PVF:** Polyvinyl Fluorid

**pV T diagram:** Polymer Melt follows law similar to famous gas law (Boyle's law). It is the relation ship between pressure, volume and temperature for plastic melt.

**pX:** this is exactly the same as pH but relates to the concentration (activity) of any other ion in solution. Because of the reduced sensitivity of other ionselective electrodes when compared with pH electrodes, the pX scale rarely extends below 7 (=  $10^{-7}$  mol/l).

**PXD101:** A drug used to treat peripheral T-cell lymphoma that has come back or has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. PXD101 blocks certain enzymes needed for cell division and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow and may help make cancer cells easier to kill with other anticancer drugs. It is a type of histone deacetylase (HDAC) inhibitor, a type of angiogenesis inhibitor, and a type of chemosensitizer. Also called Beleodaq and belinostat.

**pycnocline:** In the ocean, a region where the water density increases rapidly with depth.

**Pycnogenol:** (Other name for: French maritime pine bark extract)

**Pygas:** Pygas is the term given to the aromatic rich stream that is extracted within a steam cracker, immediately after the feedstream has been cracked and cooled. It is extracted by washing the stream with water, and is then separated from the water phase. Pygas composition varies according to both the cracker feedstock and the severity of operation, containing valuable quantities of benzene and gasoline components.

**pyogenic granuloma :** A benign (not cancer) blood vessel tumor that usually forms on the skin. It may also form on mucous membranes and inside capillaries (small blood vessels) or other places on the body.

Pyogenic granulomas usually appear as raised, bright red lesions that may grow quickly and bleed a lot. The lesions are sometimes caused by injury or use of certain medicines and often come back after treatment. They usually occur in older children and young adults but may occur at any age.

Pyogenic granulomas are a type of vascular tumor. Also called lobular capillary hemangioma.

**Pyranose:** A simple sugar containing the six-membered pyran ring. OR A six-membered heterocyclic ring formed when a monosaccharide cyclizes to form a hemiacetal or a hemiketal; the six-membered, oxygen-containing ring is similar to that of pyran. OR A simple sugar containing the six-membered pyran ring.

**pyrazinamide:** A synthetic pyrazinoic acid amide derivative with bactericidal property. Pyrazinamide is particularly active against slowly multiplying intracellular bacilli (unaffected by other drugs) by an unknown mechanism of action. Its bactericidal action is dependent upon the presence of bacterial pyrazinamidase, which removes the amide group to produce active pyrazinoic acid. Pyrazinamide is an important component of multidrug therapy for tuberculosis.

**pyrazine diazohydroxide:** A congener of pyridine 2-diazohydroxide. Pyrazine diazohydroxide forms DNA adducts via the reactive pyrazine diazonium ion, thereby inhibiting DNA synthesis. Or A substance that is being studied in the treatment of cancer.

**pyrazofurin:** A nucleoside analog. Pyrazofurin potently inhibits orotidine 5'-monophosphate (OMP) decarboxylase, thereby interfering with de novo synthesis of uridine nucleotides and resulting in cytotoxicity. This agent also causes a rapid depletion of the pyrimidine deoxynucleotide pool, thereby inhibiting DNA synthesis and cell replication. Check for active clinical trials using this agent.

**pyrazoloacridine:** A 9-methoxy acridine compound containing a reducible 5-nitro substituent. Pyrazoloacridine appears to intercalate into DNA and inhibit RNA synthesis, DNA synthesis, and the activities of topoisomerases I and II, thereby causing cytotoxicity. Or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called acridines.

**pyrgeometer:** An instrument that measures radiation from the earth's surface into space.

**pyridine nucleotide:** A nucleotide coenzyme containing the pyridine derivative nicotinamide; NAD or NADP.

**Pyridine nucleotides:** Nucleotides, such as NAD<sup>+</sup>, NADH, NADP<sup>+</sup>, and NADPH, that are employed in redox reactions; the functional group is nicotinamide, a derivative of pyridine.

**Pyridoxal phosphate:** A prosthetic group derived from vitamin B<sub>6</sub> (pyridoxine) that plays a key role in transamination reactions. OR A coenzyme containing the vitamin pyridoxine (vitamin B<sub>6</sub>); functions in reactions involving amino group transfer.

**pyridoxine :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Pyridoxine helps keep nerves and skin healthy, fight infections, keep blood sugar levels normal, produce red blood cells, and some enzymes work properly. Pyridoxine is a group of related compounds (pyridoxine, pyridoxal, and pyridoxamine) found in cereals, beans, peas, nuts, meat, poultry, fish, eggs, and bananas. It is water-soluble (can dissolve in water). Not enough pyridoxine can cause mouth and tongue sores and nervous disorders. Pyridoxine is being studied in the prevention of hand-foot syndrome (a disorder caused by certain anticancer drugs and marked by pain, swelling, numbness, tingling, or redness of the hands or feet). Also called vitamin B<sub>6</sub>.

**pyridoxine hydrochloride:** The hydrochloride salt of pyridoxine, a water-soluble B vitamin. Pyridoxine is converted in the liver into the metabolically active coenzyme form pyridoxal 5'-phosphate (P5P), an essential cofactor in many enzymatic reactions in amino acid metabolism, including transamination, deamination, and decarboxylation. P5P is required for glycogenolysis and the synthesis of sphingolipids and is essential to red blood cell, nervous system, and immune system functions.

**pyrimethamine:** A synthetic derivative of ethyl-pyrimidine with potent antimalarial properties. Pyrimethamine is a competitive inhibitor of dihydrofolate reductase (DHFR). DHFR is a key enzyme in the redox cycle for production of tetrahydrofolate, a cofactor that is required for the synthesis of DNA and proteins. This agent is often used in combination with other antimalarials for the treatment of uncomplicated falciparum malaria.

**pyrimidine:** a type of nitrogenous base in DNA molecules that has one ring containing carbon and nitrogen atoms; two examples in DNA are

cytosine (C) and thymine (T). OR A heterocyclic six-membered ring structure Cytosine and uracil are the main pyrimidines found in RNA, and cytosine and thymine are the main pyrimidines found in DNA. OR A nitrogenous base that is a six-membered heterocyclic ring containing two nitrogen atoms and four carbon atoms; the pyrimidine derivatives cytosine, uracil, and thymine are found in nucleotides and nucleic acids. OR A nitrogenous heterocyclic base found in nucleotides and nucleic acids.

**pyrimidine :** One of two chemical compounds that cells use to make the building blocks of DNA and RNA. Examples of pyrimidines are cytosine, thymine, and uracil. Cytosine and thymine are used to make DNA and cytosine and uracil are used to make RNA.

**pyrimidine dimer:** A covalently joined dimer of two adjacent pyrimidine residues in DNA, induced by absorption of UV light; most commonly derived from two adjacent thymines (a thymine dimer).

**Pyrimidine dimers:** Refers to a mutation in which exposure to ultraviolet light causes the covalent linkage of two adjacent pyrimidine residues.

**pyroclastic debris:** fragments of rock ejected from a volcano.

**pyroclastic flow:** a dense mixture of hot gas and pyroclastic debris.

**pyrolysis:** the application of high temperatures to a compound.

**PYROMETER:** A device for measuring high temperatures, usually by radiation. Radiation devices have the advantage of not having to touch the material being measured.

**pyrophoric:** Catches fire spontaneously when exposed to air at normal room temperature. For example, powdered potassium metal is pyrophoric

**pyrophosphatase:** See inorganic pyrophosphatase.

**Pyrophosphate:** A molecule formed by two phosphates in anhydride linkage.

**pyrotinib:** An orally bioavailable, dual kinase inhibitor of the epidermal growth factor receptor (EGFR or HER-1) and the human epidermal growth factor receptor 2 (ErbB2 or HER-2), with potential antineoplastic activity. Upon oral administration, pyrotinib binds to and inhibits both EGFR and HER2, which may result in the inhibition of tumor growth and angiogenesis, and tumor regression in EGFR/HER2-expressing tumor cells. EGFR and HER2 are receptor tyrosine kinases that are upregulated in

various tumor cell types and play major roles in tumor cell proliferation and tumor vascularization.

**pyroxamide:** A synthetic derivative of hydroxamic acid with antineoplastic properties, Pyroxamide inhibits histone deacetylases involved in transcription; induces hyperacetylation of core histones, modulating chromatin structure and affecting transcription of some genes that inhibit tumor growth; and induces growth arrest and apoptosis. Pyroxamide is used in clinical studies for cancer chemotherapy. or A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called histone deacetylase inhibitors.

**Pyrrrole:** A five-membered heterocyclic diene ring compound in which the hetero atom is nitrogen; a building block of the heme group.

**pyrrolobenzodiazepine-based anti-CD19 antibody-drug conjugate**

**SGN-CD19B:** An antibody-drug conjugate (ADC) consisting of an anti-CD19 humanized monoclonal antibody (hBU12ec) with engineered cysteines (EC-mAb) conjugated, via a maleimidocaproyl-valine-alanine dipeptide protease-cleavable linker, to the cytotoxic, DNA minor-groove crosslinking agent pyrrolobenzodiazepine (PBD) dimer (SGD-1882), with potential antineoplastic activity. Upon administration of anti-CD19 ADC SGN-CD19B, the antibody moiety targets the cell surface antigen CD19, which is found on B-cell-derived cancers. Upon antibody/antigen binding, internalization and lysosome uptake, the cytotoxic PBD moiety is released. In turn, the imine groups of the PBD moiety bind to the N2 positions of guanines on opposite strands of DNA. This induces DNA strand breaks, inhibits DNA replication, leads to G2/M cell cycle arrest, induces cell death, and inhibits the proliferation of CD19-overexpressing tumor cells. CD19, a transmembrane receptor belonging to the immunoglobulin superfamily and a B-cell specific antigen, is expressed on B-cell-derived cancers. The cysteine engineering of the EC-mAb allows for a site-specific and stable conjugation of PBD to the antibody.

**Pyruvate:** A prominent intermediate in metabolism; a precursor for alanine and glucose and can be converted into lactate in anaerobic glycolysis; can also be oxidized to acetyl coa, which can be further oxidized to yield energy aerobically, converted into fats, or used to synthesize cholesterol and other steroids.

**Pyruvate carboxylase:** A biotin-dependent enzyme that catalyzes the formation of oxaloacetate from pyruvate and CO<sub>2</sub> at the expense of ATP; important in gluconeogenesis as well as in the replenishment of the citric acid cycle.

**Pyruvate dehydrogenase complex:** A large, complex mitochondrial enzyme that catalyzes the oxidative decarboxylation of pyruvate to form acetyl coa; this irreversible reaction is the link between glycolysis and the citric acid cycle.

**pyruvate kinase inhibitor TLN-232:** A synthetic cyclic heptapeptide with potential antineoplastic activity. Pyruvate kinase (PK) inhibitor TLN-232 targets pyruvate kinase M2 (M2PK), which may disrupt tumor cell anaerobic glycolysis. M2PK is a dimeric isoform of PK and the predominant PK isoform found in tumor cells.

**Pythagorean theorem:** a theorem that applies to right triangles. The sum of the squares of a right triangle's two legs equals the square of the hypotenuse ( $a^2 + b^2 = c^2$ ).

**Q cycle:** A set of reactions in which coenzyme Q cycles between the fully reduced state and the fully oxidized state through one-electron transfer reactions in which one of the electrons is temporarily stored in cytochrome b; provides a means of passing the two electrons of coenzyme Q to the single-electron carrier cytochrome c, one electron at a time.

**Q-cytochrome c oxidoreductase:** c A component of the respiratory chain, this oxidoreductase carries electrons from coenzyme Q to cytochrome c and, in the process, pumps protons out of the mitochondrial matrix to generate the proton-motive force. Also called cytochrome reductase or Complex III.

**Q10:** A nutrient that the body needs in small amounts to function and stay healthy. Q10 helps mitochondria (small structures in the cell) make energy. It is an antioxidant that helps prevent cell damage caused by free radicals (highly reactive chemicals). Q10 is fat-soluble (can dissolve in fats and oils) and is found in fatty fish, beef, soybeans, peanuts, and spinach. It is being studied in the prevention and treatment of some types of cancer and heart disease and in the relief of side effects caused by some cancer treatments. Also called coenzyme Q10, CoQ10, ubiquinone, and vitamin Q10.

**QA:** A process that looks at activities or products on a regular basis to make sure they are being done at the required level of excellence. In clinical

trials, QA makes sure that all parts of the trial follow the law and the Good Clinical Practice guidelines. Also called quality assurance.

**QCI:** Quadratic configuration interaction. A CI method to which terms have been added to confer size-consistency. May also be considered to be an approximation to coupled-cluster theory.

**QCISD:** Quadratic configuration interaction, singles and doubles.  
(See QCI.)

**QCISD(T):** QCISD with a correction for triples. This method is at the core of the popular G2 theory. Usually gives similar results as CCSD(T), of which it is a truncation.

**qi :** In traditional Chinese medicine, vital energy or life force that keeps a person's spiritual, emotional, mental, and physical health in balance.

**qigong :** A form of traditional Chinese mind/body exercise and meditation that uses slow and precise body movements with controlled breathing and mental focusing to improve balance, flexibility, muscle strength, and overall health.

**QS 9000:** Quality System model, used in conjunction with the ISO 9000 standard, for the automotive industry

**QS21:** A purified, natural saponin isolated from the soapbark tree *Quillaja saponaria* Molina with potential immunoadjuvant activity. When co-administered with vaccine peptides, QS21 may increase total antitumoral vaccine-specific antibody responses and cytotoxic T-cell responses. or A substance from plants that is being studied together with vaccine therapy for its ability to improve the way the immune system responds to disease. It belongs to the family of drugs called saponin adjuvants.

**Quadramet :** A drug used to treat bone pain caused by bone cancer and other cancers that have spread to the bone. It contains a radioactive substance called samarium SM 153. Quadramet collects in bone and gives off radiation that may kill cancer cells. It is a type of radiopharmaceutical. Also called samarium Sm 153 lexidronam pentasodium.

**quadrantectomy :** An operation to remove the cancer and some normal tissue around it, but not the breast itself. Some lymph nodes under the arm may be removed for biopsy. Part of the chest wall lining may also be removed if the cancer is near it. Also called breast-conserving surgery,

breast-sparing surgery, lumpectomy, partial mastectomy, and segmental mastectomy.

**quadrilateral:** a four-sided plane closed figure. The sum of its four angles equals  $360^\circ$ .

**quadrivalent human papillomavirus (types 6, 11, 16, 18) recombinant vaccine:** A non-infectious recombinant, quadrivalent vaccine prepared from the highly purified virus-like particles (VLPs) of the major capsid (L1) protein of human papillomavirus (HPV) Types 6, 11, 16, and 18 with immunoprophylactic activity. The immunoprophylactic efficacy of L1 VLP vaccines, such as quadrivalent human papillomavirus (types 6, 11, 16, 18) recombinant vaccine, appear to be mediated by the development of humoral immune responses. HPV Types 16 and 18 account for approximately 70% of cervical cancers and HPV Types 6 and 11 account for approximately 90% of genital warts.

**quadrivalent vaccine :** A vaccine that works by stimulating an immune response against four different antigens, such as four different viruses or other microorganisms. For example, Gardasil is a quadrivalent vaccine that helps protect the body against infection with four different types of human papillomaviruses (HPV).

**Qualitative:** Qualitative descriptions are those that describe qualities and characteristics. For example, it could be a color, a smell, or a feeling.

**qualitative analysis:** A chemical analysis that detects the presence of a substance in a sample.

**Qualitative Analysis:** In analytical chemistry, quantitative analysis is the determination of the presence or absence of a substance in a sample.

**quality assurance :** A process that looks at activities or products on a regular basis to make sure they are being done at the required level of excellence. In clinical trials, quality assurance makes sure that all parts of the trial follow the law and the Good Clinical Practice guidelines. Also called QA.

**Quality Assurance/Control:** Like any other industry the plastics sector has stringent industry regulations and standards. These require constant monitoring and have to be reflected in quality control systems right across the board, from the plastic resin suppliers through to the finished plastic extrusions or other plastic products and their application.

**Quality factor:** The factor by which the absorbed dose (rad or gray) is to be multiplied to obtain a quantity that expresses, on a common scale for all ionizing radiation, the biological damage (rem or sievert) to an exposed individual. It is used because some types of radiation, such as alpha particles, are more biologically damaging internally than other types.

**quality of life :** The overall enjoyment of life. Many clinical trials assess the effects of cancer and its treatment on the quality of life. These studies measure aspects of an individual's sense of well-being and ability to carry out various activities.

**quanta:** Plural of quantum.

**quantal effect:** An effect that can be expressed only as "occurring" or "not occurring" (Finney, 1971). Typical examples of quantal effects are death or occurrence of a tumour.

**Quantitative:** Quantitative descriptions are those that are based on numbers and exact figures, such as a weight or a temperature.

**quantitative analysis:** A chemical analysis that determines the concentration of a substance in a sample.

**quantitative analysis:** chemical determination of the amounts or proportions of constituents in a substance. OR In analytical chemistry, quantitative analysis is the determination of the concentration of a substance in a sample.

**quantitative structure-activity relationship:** A mathematical connection between chemical structure and biological activity, established by statistical analysis or pattern recognition techniques. OR Expresses the biological activity of a set of compounds as a function of physicochemical and/or structural parameters.

**Quantities:** A bill of quantities sets out the measurements and amounts of work to be done on a building contract and is divided into sections according to the trades.

**quantum:** Something which comes in discrete units, for example, money is quantized (divided into units); it comes in quanta (divisions) of one cent. OR The minimum energy change of an atom emitting or absorbing energy. OR The term quantum is used to describe the amount of energy in one photon of light. OR A discrete packet of energy. OR The ultimate unit of energy.

**quantum mechanics:** the study of the mathematical formulas that describe the electronic structure of atoms. OR A branch of physics that describes the behavior of objects of atomic and subatomic size.

**quantum number:** Indices that label quantized energy states. Quantum numbers are used to describe the state of a confined electron, e. g. an electron in an atom. OR Set of numbers used to completely describe an electron. OR describe the distance, shape, and orientation of the electronic orbitals.

**Quantum theory:** The concept that energy is radiated intermittently in units of definite magnitude, called quanta, and absorbed in a like manner.

**quarfloxacin:** A fluoroquinolone derivative with antineoplastic activity. Quarfloxin disrupts the interaction between the nucleolin protein and a G-quadruplex DNA structure in the ribosomal DNA (rDNA) template, a critical interaction for rRNA biogenesis that is overexpressed in cancer cells; disruption of this G-quadruplex DNA:protein interaction in aberrant rRNA biogenesis may result in the inhibition of ribosome synthesis and tumor cell apoptosis. Check for active clinical trials using this agent.

**quartz:** An abundant mineral consisting of silicon dioxide ( $\text{SiO}_2$ ) with a hardness of 7 on the Mohs' scale.

**Quartzite** : This is a metamorphic rock that is made by the action of heat and pressure on sandstone.

**Quasi-isothermal mode:** A thermogravimetric analytical technique in which the sample is heated at a fixed temperature to a constant mass and the process repeated stepwise at increasingly higher temperatures.

**Quaternary ammonium:** You are probably aware of the ammonium ion,  $\text{NH}_4^+$ . A molecule that is  $\text{NR}_4^+$ , where 'R' is any carbon compound, is called a 'quaternary ammonium' species. See amines.

**quaternary ammonium polyethylenimine nanoparticles:** A crosslinked nanoparticle formulation containing quaternary ammonium polyethylenimine (QA-PEI) with potential antibacterial activity. The cationic polymer PEI kills bacteria by rupturing their cell membranes without the development of resistance. Quaternary ammonium polyethylenimine nanoparticles can be incorporated into dental composite resins or silicon obturator prostheses and may prevent or delay bacterial growth.

**quaternary carbon:** a carbon atom that is directly attached to four other carbon atoms.

**Quaternary period:** The latest period of geologic time, covering the most-recent 2,000,000 years of the Earth's history. It is divided into two epochs: the Pleistocene - 2 million years ago to approximately 10,000 years ago - and the Holocene - the period from approximately 10,000 years ago to the present. The Quaternary period is the artificial division of time separating prehuman and human periods. It contains five ice ages and four interglacial ages, and temperature indicators seem to show sharp and abrupt changes by several degrees.

**Quaternary structure:** In a protein, the way in which the different folded subunits interact to form the multisubunit protein. OR In proteins containing more than one polypeptide chain, the spatial arrangements of those chains (subunits) and the nature of contacts among them. OR The three-dimensional structure of a multisubunit protein; particularly the manner in which the subunits fit together.

**quench:** Stopping a reaction quickly, first used to refer to harden steel by quickly putting red-hot steel into cold water.

**Quench Bath:** The cooling medium used to quench molten thermoplastic materials to the solid state

**quercetin:** A polyphenolic flavonoid with potential chemopreventive activity. Quercetin, ubiquitous in plant food sources and a major bioflavonoid in the human diet, may produce antiproliferative effects resulting from the modulation of either EGFR or estrogen-receptor mediated signal transduction pathways. Although the mechanism of action of action is not fully known, the following effects have been described with this agent in vitro: decreased expression of mutant p53 protein and p21-ras oncogene, induction of cell cycle arrest at the G1 phase and inhibition of heat shock protein synthesis. This compound also demonstrates synergy and reversal of the multidrug resistance phenotype, when combined with chemotherapeutic drugs, in vitro. Quercetin also produces anti-inflammatory and anti-allergy effects mediated through the inhibition of the lipoxygenase and cyclooxygenase pathways, thereby preventing the production of pro-inflammatory mediators.

**question mark:** used to end questions.

**Quick Cast:** An SLA build style that produces a thin shell with a honeycombed interior. This method is used mostly for investment castings when the SLA model will be used as a sacrificial mold

**quicklime:** A common name for calcium oxide.

**Quicklime** : Calcium oxide (it is formed by heating limestone (calcium carbonate) very strongly)

**Quicksilver** : An old name for mercury.

**quinacrine dihydrochloride:** The dihydrochloride salt of the 9-aminoacridine derivative quinacrine with potential antineoplastic and antiparasitic activities. Quinacrine may inhibit the transcription and activity of both basal and inducible nuclear factor-kappaB (NF-kappaB), which may result in the induction of tumor suppressor p53 transcription, the restoration of p53-dependent apoptotic pathways, and tumor cell apoptosis. Continuous NF-kappaB signaling, present in many tumors and in chronic inflammatory processes, promotes the expression of antiapoptotic proteins and cytokines while downregulating the expression of proapoptotic proteins, such as p53.

**Quinamed:** (Other name for: amonafide dihydrochloride)

**quinidine:** An alkaloid extracted from the bark of the Cinchona tree with class 1A antiarrhythmic and antimalarial effects. Quinidine stabilizes the neuronal membrane by binding to and inhibiting voltage-gated sodium channels, thereby inhibiting the sodium influx required for the initiation and conduction of impulses resulting in an increase of the threshold for excitation and decreased depolarization during phase 0 of the action potential. In addition, the effective refractory period (ERP), action potential duration (APD), and ERP/APD ratios are increased, resulting in decreased conduction velocity of nerve impulses. Quinidine exerts its antimalarial activity by acting primarily as an intra-erythrocytic schizonticide through association with the heme polymer (hemazoin) in the acidic food vacuole of the parasite thereby preventing further polymerization by heme polymerase enzyme. This results in accumulation of toxic heme and death of the parasite.

**quinine:** A quinidine alkaloid isolated from the bark of the cinchona tree. Quinine has many mechanisms of action, including reduction of oxygen intake and carbohydrate metabolism; disruption of DNA replication and transcription via DNA intercalation; and reduction of the excitability of muscle fibers via alteration of calcium distribution. This agent also inhibits

the drug efflux pump P-glycoprotein which is overexpressed in multi-drug resistant tumors and may improve the efficacy of some antineoplastic agents. Check for active clinical trials using this agent.

**quinone oxidoreductase 1 :** An enzyme inside cells that makes certain molecules less toxic. Also called quinone reductase.

**quinone reductase :** An enzyme inside cells that makes certain molecules less toxic. Also called quinone oxidoreductase 1.

**Quirk:** Properly a groove in a moulding between a convex member and a flat fillet but commonly used for any groove.

**quisinostat:** An orally bioavailable, second-generation, hydroxamic acid-based inhibitor of histone deacetylase (HDAC) with potential antineoplastic activity. Quisinostat inhibits HDAC leading to an accumulation of highly acetylated histones, which may result in an induction of chromatin remodeling; inhibition of the transcription of tumor suppressor genes; inhibition of tumor cell division; and the induction of tumor cell apoptosis. HDAC, an enzyme upregulated in many tumor types, deacetylates chromatin histone proteins. Compared to some first generation HDAC inhibitors, JNJ-26481585 may induce superior HSP70 upregulation and bcl-2 downregulation.

**Quixin:** (Other name for: levofloxacin)

**quizartinib:** An orally available small molecule with potential antineoplastic activity. Quizartinib selectively inhibits class III receptor tyrosine kinases, including FMS-related tyrosine kinase 3 (FLT3/STK1), colony-stimulating factor 1 receptor (CSF1R/FMS), stem cell factor receptor (SCFR/KIT), and platelet derived growth factor receptors (PDGFRs), resulting in inhibition of ligand-independent leukemic cell proliferation and apoptosis. Mutations in FLT3, resulting in constitutive activation, are the most frequent genetic alterations in acute myeloid leukemia (AML) and occur in approximately one-third of AML cases.

**Quoin:** The external angle of a building.

**quotation marks:** used to indicate to the reader that the words or sentences within the quotation marks are borrowed from another writer.

**Qvar:** (Other name for: beclomethasone dipropionate)

**R group:** Shorthand for the side chain of an amino acid. OR (1) Formally, an abbreviation denoting any alkyl group. (2) Occasionally, used in a more

general sense to denote virtually any organic substituent (the R groups of amino acids, for example). OR A triple-stranded structure in which RNA displaces a DNA strand by DNA-RNA hybrid formation in a region of the DNA.

**R-(-)-gossypol acetic acid:** The orally bioavailable solvate of the R-(-) enantiomer of gossypol and acetic acid with potential antineoplastic activity. As a BH3 mimetic, R-(-)-gossypol binds to the hydrophobic surface binding groove BH3 of the anti-apoptotic proteins Bcl-2 and Bcl-xL, blocking their heterodimerization with pro-apoptotic members of the Bcl-2 family of proteins such as Bad, Bid, and Bim; this may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. Racemic gossypol is a polyphenolic compound isolated from cottonseed.

**R-CHOP :** An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma and mantle cell lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs rituximab, cyclophosphamide, doxorubicin hydrochloride (hydroxydaunorubicin), vincristine sulfate (Oncovin), and prednisone. Also called R-CHOP regimen.

**R-CHOP regimen:** An immunochemotherapy regimen consisting of rituximab, cyclophosphamide, hydroxydaunorubicin hydrochloride (doxorubicin hydrochloride), vincristine (Oncovin) and prednisone used to treat both indolent and aggressive forms of non-Hodgkin lymphoma. Or An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin lymphoma and mantle cell lymphoma and is being studied in the treatment of other types of cancer. It includes the drugs rituximab, cyclophosphamide, doxorubicin hydrochloride (hydroxydaunorubicin), vincristine sulfate (Oncovin), and prednisone. Also called R-CHOP.

**R-CVP:** An abbreviation for a chemotherapy combination used to treat indolent (slow-growing) non-Hodgkin lymphoma. It includes the drugs rituximab, cyclophosphamide, vincristine sulfate, and prednisone. Also called R-CVP regimen.

**R-CVP regimen:** A regimen consisting of rituximab, cyclophosphamide, vincristine, and prednisone used to treat indolent non-Hodgkin lymphoma. Or An abbreviation for a chemotherapy combination used to treat indolent

(slow-growing) non-Hodgkin lymphoma. It includes the drugs rituximab, cyclophosphamide, vincristine sulfate, and prednisone. Also called R-CVP.

**R-EPOCH:** An abbreviation for a chemotherapy combination used to treat certain types of non-Hodgkin lymphoma. It includes the drugs rituximab, etoposide phosphate, prednisone, vincristine sulfate (Oncovin), cyclophosphamide, and doxorubicin hydrochloride (hydroxydaunorubicin). Also called R-EPOCH regimen.

**R-EPOCH regimen:** A regimen consisting of rituximab, followed by a continuous infusion of etoposide, vincristine and doxorubicin, given with prednisone and a bolus dose of cyclophosphamide, used for the treatment of aggressive forms of non-Hodgkin's lymphoma, including mantle cell lymphoma. or An abbreviation for a chemotherapy combination used to treat certain types of non-Hodgkin lymphoma. It includes the drugs rituximab, etoposide phosphate, prednisone, vincristine sulfate (Oncovin), cyclophosphamide, and doxorubicin hydrochloride (hydroxydaunorubicin). Also called R-EPOCH.

**R-flurbiprofen :** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called nonsteroidal anti-inflammatory drugs (NSAIDs).

**R-ICE:** An abbreviation for a chemotherapy combination used to treat certain types of non-Hodgkin lymphoma. It includes the drugs rituximab, ifosfamide, carboplatin, and etoposide phosphate. Also called R-ICE regimen.

**R-ICE regimen:** A chemoimmunotherapy regimen consisting of rituximab, ifosfamide, carboplatin and etoposide used to treat indolent and aggressive forms of non-Hodgkin lymphoma; also used to treat relapsed and refractory non-Hodgkin lymphoma. Or An abbreviation for a chemotherapy combination used to treat certain types of non-Hodgkin lymphoma. It includes the drugs rituximab, ifosfamide, carboplatin, and etoposide phosphate. Also called R-ICE.

**r-metHuSCF:** A substance that causes blood stem cells (cells from which other types of cells develop) to change into different types of blood cells and increases the number and actions of these cells in the blood. It is being studied in the treatment of myelodysplasia. r-metHuSCF is a type of recombinant stem cell growth factor. Also called ancestim, recombinant human methionyl stem cell factor, and Stemgen.

**r-tPA:** A form of tissue plasminogen activator that is made in the laboratory. It helps dissolve blood clots and is used to treat heart attacks, strokes, and clots in the lungs. It is also being studied in the treatment of cancer. It is a type of systemic thrombolytic agent. Also called Activase, Alteplase, and recombinant tissue plasminogen activator.

**R(+)**XK469:**** The R-isomer of a synthetic quinoxaline phenoxypropionic acid derivative with proapoptotic and antiproliferative activities.

R(+)**XK469** selectively inhibits topoisomerase II-beta, blocks activation of MEK/MAPK signaling kinases, stimulates caspases, and upregulates p53-dependent proteins, including cyclins A and B1, thereby arresting cancer cells in the G2/M phase of the cell cycle. Both R(+) and S(-) isomers of this agent are cytotoxic, although the R-isomer is more potent.

**R1 Cooling Gel Plus R2 Moisturizing/Sun Protecting Lotion:** A skin care treatment system consisting of a cytokine-containing milk-based cooling gel and a cytokine-containing milk-based soothing lotion with hydrating and potential protective activity against radiation-induced dermatitis. Application of the R1 cooling gel immediately upon radiation treatment may hydrate the skin, provide cooling relief, and may protect the skin against radiation-induced dermatitis. The subsequent application of the R2 lotion moisturizes the skin while also protecting the skin against inflammation. In addition, R2 contains avobenzone, homosalate, octinoxate and octocrylene, which exert UVA and UVB skin protective activity. Check for active clinical trials using this agent.

**R101933:** A substance that is being studied for its ability to make cancer cells respond to drugs to which they have become resistant. It belongs to the family of drugs called multidrug resistance inhibitors.

**R115777:** A substance that is being studied in the treatment of acute myeloid leukemia (AML) and other types of cancer. It belongs to the family of drugs called farnesyltransferase inhibitors. Also called tipifarnib and Zarnestra.

**R1507:** A human monoclonal antibody being studied in the treatment of several types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. R1507 blocks the action of a protein needed for cell growth and may kill cancer cells. It is a type of insulin-like growth factor-1 receptor (IGF-1R) inhibitor.

**R788 sodium** : A substance being studied in the treatment of cancer and certain other diseases, such as rheumatoid arthritis. It may block tumor cell signaling and growth. It is a type of tyrosine kinase inhibitor. Also called fostamatinib disodium and Syk kinase inhibitor R-935788.

**rabeprazole sodium**: The sodium salt of the prodrug rabeprazole, a substituted benzimidazole proton pump inhibitor, with potential anti-ulcer activity. After protonation, accumulation, and transformation to the active sulfenamide within the acidic environment of gastric parietal cells, rabeprazole selectively and irreversibly binds to and inhibits the H<sup>+</sup>, K<sup>+</sup>ATPase (hydrogen-potassium adenosine triphosphatase) enzyme system located on the parietal cell secretory surface, inhibiting gastric acid secretion.

**rabies** : A disease of the nervous system caused by the rabies virus. Rabies is marked by an increase in saliva production, abnormal behavior, and eventual paralysis and death.

**RABINOWITSCH CORRECTION**: When viscosity data are obtained from a capillary viscometer, they require a correction to account for the fact that the viscosity decreases as the shear rate increases. Without this (RABINOWITSCH) correction the viscosity is referred to as APPARENT VISCOSITY. Errors up to 10-20% in viscosity are common when this correction has not been made. For the power-law viscosity model the Rabinowitsch correction gives (i.e. for  $n=0.45$   $m(\text{true}) = 0.89 m(\text{apparent})$ ).

**rabusertib**: An inhibitor of the cell cycle checkpoint kinase 2 (chk2) with potential chemopotentiating activity. Rabusertib binds to and inhibits the activity of chk2, which may prevent the repair of DNA caused by DNA-damaging agents, thus potentiating the antitumor efficacies of various chemotherapeutic agents. Chk2, an ATP-dependent serine-threonine kinase, is a key component in the DNA replication-monitoring checkpoint system and is activated by double-stranded breaks (DSBs); activated chk2 is overexpressed by a variety of cancer cell types.

**racemate**: another name for "racemic mixture"; a 1:1 mixture of enantiomers.

**Racemic**: A mixture is said to be racemic if the mixture contains equivalent amounts of the left and right-handed enantiomers of a molecule that is chiral. OR A mixture of equal parts of

the levorotatory and dextrorotatory isomers of the the same substance. Racemic mixtures are not optically active.

**racemic mixture:** a 1:1 mixture of enantiomers.

**racemic mixture (racemate):** An equimolar mixture of the D and L stereoisomers of an optically active compound.

**racemic XK469:** The racemic form of a synthetic quinoxaline phenoxypropionic acid derivative with antineoplastic properties. XK469R selectively inhibits topoisomerase II by stabilizing the enzyme-DNA intermediates in which topoisomerase subunits are covalently linked to DNA through 5-phosphotyrosyl linkages, thereby interfering with DNA repair and replication, RNA and protein synthesis. This agent possesses unusual solid tumor selectivity and activity against multidrug-resistant cancer cells. XK469R is more water soluble and active than the pure isomers, R(+)-XK469 and S(-)-XK469.

**rachitis :** A condition in children in which bones become soft and deformed because they don't have enough calcium and phosphorus. It is caused by not having enough vitamin D in the diet or by not getting enough sunlight. In adults, this condition is called osteomalacia. Also called infantile rickets, juvenile rickets, and rickets.

**RACI:** The Royal Australian Chemical Institute. RACI is the professional body for chemists in Australia. The Institute gives accreditation to people based on training and experience, organises conferences, career workshops and produces a monthly magazine Chemistry in Australia.

**racotumomab:** An anti-idiotypic murine monoclonal antibody (MoAb) specific to P3 MoAb with anti-metastatic effect. Racotumomab binds to the idiotype region of P3 MoAb and functionally mimics the three-dimensional structure of N-glycolyl ceramides of mono-sialyl lactose, the antigenic target of P3. As a result, this anti-idiotypic antibody may stimulate the host immune system to elicit humoral and cellular immune responses against tumor cells expressing NeuGc-GM3 gangliosides, which are expressed in a wide variety of tumor cells.

**Rad (radiation absorbed dose):** One of the two units used to measure the amount of radiation absorbed by an object or person, known as the "absorbed dose," which reflects the amount of energy that radioactive sources deposit in materials through which they pass. The radiation-absorbed dose (rad) is the amount of energy (from any type of ionizing

radiation) deposited in any medium (e.g., water, tissue, air). An absorbed dose of 1 rad means that 1 gram of material absorbed 100 ergs of energy (a small but measurable amount) as a result of exposure to radiation. The related international system unit is the gray (Gy), where 1 Gy is equivalent to 100 rad. For additional information, see *Doses in Our Daily Lives and Measuring Radiation*.

**rAD-p53:** A replication-defective, recombinant adenoviral vector encoding the wild-type human tumor-suppressor protein p53 gene with potential antineoplastic activity. Upon intratumoral administration, rAD-p53 binds to the coxsackie-and-adenovirus receptor (CAR) on tumor cells and enters cells selectively via receptor-mediated endocytosis, which may result in the overexpression of wild-type p53 intracellularly and p53-mediated tumor regression. In addition, this agent may stimulate the immune system to mount a cytotoxic T-lymphocyte (CTL) immune response against tumor cells, may activate natural killer (NK) cells to exert antitumor ‘bystander effects’ and may downregulate the expression of various oncogenes. The p53 protein blocks tumor cell cycle progression and directly initiates apoptosis; the p53 gene, a tumor suppressor gene, is deleted or mutated in a significant number of cancers.

**rAd/p53:** A substance that has been studied in the treatment of some types of cancer. rAd/p53 is a weakened adenovirus that carries the p53 gene into tumor cells, causing them to die. It is a type of gene therapy. Also called ACN53, recombinant adenovirus-p53, and SCH-58500.

**RAD001:** A drug used with exemestane to treat some postmenopausal women with advanced breast cancer that is hormone-receptor positive and HER2 negative. It is also used to treat certain types of pancreatic, lung, and gastrointestinal neuroendocrine tumors that cannot be removed by surgery, are advanced, or have spread to other parts of the body. It is also used to treat advanced renal cell carcinoma (a type of kidney cancer) and subependymal giant cell astrocytoma in some patients, including children. RAD001 is being studied in the treatment of other types of cancer. It stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It also lowers the body’s immune response. RAD001 is a type of kinase inhibitor, a type of angiogenesis inhibitor, and a type of immunosuppressant. Also called Afinitor, Afinitor Disperz, and everolimus.

**radial drainage pattern:** a drainage pattern that resembles the spokes on a wheel; occurs when the streams originate on the flanks of conical mountains.

**Radial hole:** This is a hole formed by live tooling that is perpendicular to the axis of revolution of a turned part, and could be considered a side hole. The center line of these holes are not required to intersect the axis of revolution.

**Radial Seal:** Compression is applied perpendicular to the seal center-line

**radian:** An angle with vertex at the center of a circle of radius  $r$  that encompasses an arc of length  $r$ .

**radiant energy:** Energy which is transmitted away from its source, for example, energy that is emitted when electrons transition down from one level to another.

**radiant flux density:** The total flow of radiation received on a unit area of a given real or imaginary surface. Also called the irradiance.

**radiant intensity:** Energy of radiation striking a unit area per unit time. The SI unit of radiant power is  $\text{J m}^{-2} \text{s}^{-1}$ .

**RadiaPlex Rx Gel:** (Other name for: sodium hyaluronate topical hydrogel)

**radiation:** transfer of energy through a vacuum; the way in which the Sun supplies the Earth with energy.

**radiation:** Energy in the form of photons. OR Energy emitted from some object.

**radiation :** Energy released in the form of particle or electromagnetic waves. Common sources of radiation include radon gas, cosmic rays from outer space, medical x-rays, and energy given off by a radioisotope (unstable form of a chemical element that releases radiation as it breaks down and becomes more stable).

**Radiation (ionizing radiation):** Alpha particles, beta particles, gamma rays, x-rays, neutrons, high-speed electrons, high-speed protons, and other particles capable of producing ions. Radiation, as used in 10 CFR Part 20, does not include non-ionizing radiation, such as radio- or microwaves, or visible, infrared, or ultraviolet light (see also 10 CFR 20.1003). For additional detail, see Radiation, ionizing.

**Radiation area:** Any area with radiation levels greater than 5 millirems (0.05 millisievert) in one hour at 30 centimeters from the source or from

any surface through which the radiation penetrates.

**radiation balance:** The difference between the absorbed solar radiation and the net infrared radiation. Experimental data show that radiation from the earth's natural surfaces is rather close to the radiation from a black body at the corresponding temperature; the ratio of the observed values of radiation to black body radiation is generally 0.90 - 1.0.

**radiation brachytherapy :** A type of radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into or near a tumor. Also called brachytherapy, implant radiation therapy, and internal radiation therapy.

**radiation dermatitis :** A skin condition that is a common side effect of radiation therapy. The affected skin becomes painful, red, itchy, and blistered.

**Radiation detection instrument:** A device that detects and displays the characteristics of ionizing radiation.

**radiation enteritis :** Inflammation of the small intestine caused by radiation therapy to the abdomen, pelvis, or rectum. Symptoms include nausea, vomiting, abdominal pain and cramping, frequent bowel movements, watery or bloody diarrhea, fatty stools, and weight loss. Some of these symptoms may continue for a long time.

**radiation fibrosis :** The formation of scar tissue as a result of radiation therapy.

**radiation necrosis :** The death of healthy tissue caused by radiation therapy. Radiation necrosis is a side effect of radiation therapy given to kill cancer cells, and can occur after cancer treatment has ended.

**radiation nurse :** A health professional who specializes in caring for people who are receiving radiation therapy.

**radiation oncologist :** A doctor who has special training in using radiation to treat cancer.

**radiation physicist :** A person who makes sure that the radiation machine delivers the right amount of radiation to the correct site in the body. The physicist works with the radiation oncologist to choose the treatment schedule and dose that has the best chance of killing the most cancer cells.

**radiation poisoning :** Serious illness caused by being exposed to high doses of certain types of radiation, usually over a short period of time.

Symptoms of radiation poisoning usually occur right after exposure but they may happen over time, and they may come and go. Symptoms include nausea and vomiting, diarrhea, headache, dizziness, weakness, fatigue, bleeding, hair loss, swelling, itching, and redness of the skin, and other skin problems. Very large doses of radiation may cause death. Also called acute radiation sickness, acute radiation syndrome, radiation sickness, and radiation sickness syndrome.

**Radiation shielding:** Reduction of radiation by interposing a shield of absorbing material between any radioactive source and a person, work area, or radiation-sensitive device.

**radiation sickness :** Serious illness caused by being exposed to high doses of certain types of radiation, usually over a short period of time. Symptoms of radiation sickness usually occur right after exposure but they may happen over time, and they may come and go. Symptoms include nausea and vomiting, diarrhea, headache, dizziness, weakness, fatigue, bleeding, hair loss, swelling, itching, and redness of the skin, and other skin problems. Very large doses of radiation may cause death. Also called acute radiation sickness, acute radiation syndrome, radiation poisoning, and radiation sickness syndrome.

**Radiation sickness (syndrome):** The complex of symptoms characterizing the disease known as radiation injury, resulting from excessive exposure (greater than 200 rads or 2 gray) of the whole body (or large part) to ionizing radiation. The earliest of these symptoms are nausea, fatigue, vomiting, and diarrhea, which may be followed by loss of hair (epilation), hemorrhage, inflammation of the mouth and throat, and general loss of energy. In severe cases, where the radiation exposure has been approximately 1000 rad (10 gray) or more, death may occur within two to four weeks. Those who survive six weeks after the receipt of a single large dose of radiation to the whole body may generally be expected to recover.

**radiation sickness syndrome :** Serious illness caused by being exposed to high doses of certain types of radiation, usually over a short period of time. Symptoms of radiation sickness syndrome usually occur right after exposure but they may happen over time, and they may come and go. Symptoms include nausea and vomiting, diarrhea, headache, dizziness, weakness, fatigue, bleeding, hair loss, swelling, itching, and redness of the skin, and other skin problems. Very large doses of radiation may cause

death. Also called acute radiation sickness, acute radiation syndrome, radiation poisoning, and radiation sickness.

**Radiation source:** A radioactive material or byproduct that is specifically manufactured or obtained for the purpose of using the emitted radiation. Such sources are commonly used in teletherapy or industrial radiography; in various types of industrial gauges, irradiators, and gamma knives; and as power sources for batteries (such as those used in spacecraft). These sources usually consist of a known quantity of radioactive material, which is encased in a manmade capsule, sealed between layers of nonradioactive material, or firmly bonded to a nonradioactive substrate to prevent radiation leakage. Other radiation sources include devices such as accelerators and x-ray generators.

**Radiation standards:** Exposure limits; permissible concentrations; rules for safe handling; and regulations regarding receipt, possession, use, transportation, storage, disposal, and industrial control of radioactive material. For detail, see Title 10, Part 20, of the Code of Federal Regulations (10 CFR Part 20), "Standards for Protection Against Radiation."

**radiation surgery :** A type of external radiation therapy that uses special equipment to position the patient and precisely give a single large dose of radiation to a tumor. It is used to treat brain tumors and other brain disorders that cannot be treated by regular surgery. It is also being studied in the treatment of other types of cancer. Also called radiosurgery, stereotactic radiosurgery, and stereotaxic radiosurgery.

**radiation therapist :** A health professional who gives radiation treatment.

**radiation therapy :** The use of high-energy radiation from x-rays, gamma rays, neutrons, protons, and other sources to kill cancer cells and shrink tumors. Radiation may come from a machine outside the body (external-beam radiation therapy), or it may come from radioactive material placed in the body near cancer cells (internal radiation therapy or brachytherapy). Systemic radiation therapy uses a radioactive substance, such as a radiolabeled monoclonal antibody, that travels in the blood to tissues throughout the body. Also called irradiation and radiotherapy.

**Radiation therapy (radiotherapy):** The therapeutic use of ionizing radiation to treat disease in patients. Although most radiotherapy procedures are intended to kill cancerous tissue or reduce the size of a

tumor, therapeutic doses may also be used to reduce pain or treat benign conditions. For example, intervascular brachytherapy uses radiation to treat clogged blood vessels. Other common radiotherapy procedures include gamma stereotactic radiosurgery (gamma knife), teletherapy, and iodine treatment to correct an overactive thyroid gland. These procedures use radiation sources, regulated by the NRC and its Agreement States, that may be applied either inside or outside the body. In either case, the goal of radiotherapy is to deliver the required therapeutic or pain-relieving dose of radiation with high precision and for the required length of time, while preserving the surrounding healthy tissue.

**Radiation warning symbol:** An officially prescribed magenta or black trefoil on a yellow background, which must be displayed where certain quantities of radioactive materials are present or where certain doses of radiation could be received.

**Radiation, ionizing:** A form of radiation, which includes alpha particles, beta particles, gamma rays, x-rays, neutrons, high-speed electrons, high-speed protons, and other particles capable of producing ions. Compared to non-ionizing radiation, such as radio- or microwaves, or visible, infrared, or ultraviolet light, ionizing radiation is considerably more energetic. When ionizing radiation passes through material such as air, water, or living tissue, it deposits enough energy to produce ions by breaking molecular bonds and displace (or remove) electrons from atoms or molecules. This electron displacement may lead to changes in living cells. Given this ability, ionizing radiation has a number of beneficial uses, including treating cancer or sterilizing medical equipment. However, ionizing radiation is potentially harmful if not used correctly, and high doses may result in severe skin or tissue damage. It is for this reason that the NRC strictly regulates commercial and institutional uses of the various types of ionizing radiation. Radiation, as used in 10 CFR Part 20, does not include non-ionizing radiation (see also 10 CFR 20.1003).

**Radiation, nuclear:** Energy given off by matter in the form of tiny fast-moving particles (alpha particles, beta particles, and neutrons) or pulsating electromagnetic rays or waves (gamma rays) emitted from the nuclei of unstable radioactive atoms. All matter is composed of atoms, which are made up of various parts; the nucleus contains minute particles called protons and neutrons, and the atom's outer shell contains other

particles called electrons. The nucleus carries a positive electrical charge, while the electrons carry a negative electrical charge. These forces work toward a strong, stable balance by getting rid of excess atomic energy (radioactivity). In that process, unstable radioactive nuclei may emit energy, and this spontaneous emission is called nuclear radiation. All types of nuclear radiation are also ionizing radiation, but the reverse is not necessarily true; for example, x-rays are a type of ionizing radiation, but they are not nuclear radiation because they do not originate from atomic nuclei. In addition, some elements are naturally radioactive, as their nuclei emit nuclear radiation as a result of radioactive decay, but others are induced to become radioactive by being irradiated in a reactor. Naturally occurring nuclear radiation is indistinguishable from induced radiation.

**radiative-convective models:** Thermodynamic models that determine the equilibrium temperature distribution for an atmospheric column and the underlying surface, subject to prescribed solar radiation at the top of the atmosphere and prescribed atmospheric composition and surface albedo. Submodels for the transfer of solar and terrestrial radiation, the heat exchange between the earth's surface and atmosphere, the vertical redistribution of heat within the atmosphere, the atmospheric water vapor content and clouds are included in these one-dimensional models. Abbreviated as RCM.

**radiatively active gases:** Gases that absorb incoming solar radiation or outgoing infrared radiation, thus affecting the vertical temperature profile of the atmosphere. Most frequently being cited as being radiatively active gases are water vapor, CO<sub>2</sub>, methane, nitrous oxide, chlorofluorocarbons, and ozone.

**radical:** an atom or group of atoms with at least one unpaired electron. OR A species with an odd number of electrons; formerly called free radical. OR A radical is a group of atoms that appear in a compound and act as a group. Functional groups are classified as radicals. Two examples are NaCl and NaOH. In these examples, the chlorine ion and hydroxide functional group bond in similar ways with the sodium atom. OR An atom or group of atoms possessing an unpaired electron; also called a free radical.

**radical cervicectomy :** Surgery to remove the cervix, nearby tissue and lymph nodes, and the upper part of the vagina. It may be used to treat women with early-stage cervical cancer who want to have children. After

the cervix is removed, the uterus is attached to the remaining part of the vagina. A special stitch or band is used to act as the cervix and create an opening to the uterus. The stitch or band may be opened or closed as needed. Also called radical trachelectomy.

**radical cystectomy :** Surgery to remove all of the bladder (the organ that holds urine) as well as nearby tissues and organs.

**radical hysterectomy :** Surgery to remove the uterus, cervix, and part of the vagina. The ovaries, fallopian tubes, and nearby lymph nodes may also be removed.

**radical local excision :** Surgery to remove a tumor and a large amount of normal tissue surrounding it. Nearby lymph nodes may also be removed.

**radical lymph node dissection :** A surgical procedure to remove most or all of the lymph nodes that drain lymph from the area around a tumor. The lymph nodes are then examined under a microscope to see if cancer cells have spread to them.

**radical mastectomy :** Surgery for breast cancer in which the breast, chest muscles, and all of the lymph nodes under the arm are removed. For many years, this was the breast cancer operation used most often, but it is used rarely now. Doctors consider radical mastectomy only when the tumor has spread to the chest muscles. Also called Halsted radical mastectomy. or Surgery to remove an entire kidney, nearby adrenal gland and lymph nodes, and other surrounding tissue.

**radical perineal prostatectomy :** Surgery to remove all of the prostate through an incision between the scrotum and the anus. Nearby lymph nodes are sometimes removed through a separate incision in the wall of the abdomen.

**radical prostatectomy :** Surgery to remove the entire prostate and some of the tissue around it. Nearby lymph nodes may also be removed. In a radical retropubic prostatectomy, an incision (cut) is made in the wall of the lower abdomen. In a radical perineal prostatectomy, an incision (cut) is made in the perineum (the area between the anus and scrotum). In a laparoscopic radical prostatectomy, several small incisions (cuts) are made in the wall of the abdomen. A laparoscope (a thin, tube-like instrument with a light and lens for viewing) is inserted through one opening to guide the surgery. Surgical instruments are inserted through the other openings to do the surgery.

**radical retropubic prostatectomy :** Surgery to remove all of the prostate and nearby lymph nodes through an incision in the wall of the abdomen.

**radical trachelectomy :** Surgery to remove the cervix, nearby tissue and lymph nodes, and the upper part of the vagina. It may be used to treat women with early-stage cervical cancer who want to have children. After the cervix is removed, the uterus is attached to the remaining part of the vagina. A special stitch or band is used to act as the cervix and create an opening to the uterus. The stitch or band may be opened or closed as needed. Also called radical cervicectomy.

**radical vulvectomy :** Surgery to remove the entire vulva (the external female genital organs, including the clitoris, vaginal lips, and the opening to the vagina) and nearby lymph nodes.

**radii:** plural of radius.

**Radio Frequency Welding:** A method of welding thermoplastics using a radio frequency field to apply the necessary heat. Also known as high frequency welding.

**radio wave :** A type of wave made when an electric field and a magnetic field are combined. Radio waves are being studied in the treatment of several types of cancer and other conditions. The radio waves are sent through needles inserted into tumor tissue and may kill cancer cells. Radio waves are also used in MRI to create detailed images of areas inside the body.

**radioactive:** Substance containing an element which decays.

**radioactive :** Giving off radiation.

**Radioactive contamination:** Undesirable radioactive material (with a potentially harmful effect) that is either airborne or deposited in (or on the surface of) structures, objects, soil, water, or living organisms (people, animals, or plants) in a concentration that may harm people, equipment, or the environment.

**radioactive decay:** the spontaneous breakdown of isotopes that contain unstable nuclei. OR The spontaneous transformation of one radioisotope into one or more different isotopes (known as “decay products” or “daughter products”), accompanied by a decrease in radioactivity (compared to the parent material). This transformation takes place over a defined period of time (known as a “half-life”), as a result

of electron capture; fission; or the emission of alpha particles, beta particles, or photons (gamma radiation or x-rays) from the nucleus of an unstable atom. Each isotope in the sequence (known as a “decay chain”) decays to the next until it forms a stable, less energetic end product. In addition, radioactive decay may refer to gamma-ray and conversion electron emission, which only reduces the excitation energy of the nucleus.

**radioactive drug :** A drug that contains a radioactive substance and is used to diagnose or treat disease, including cancer. Also called radiopharmaceutical.

**radioactive element:** an atom that emits gamma rays, alpha particles, and beta particles; can be used to determine age.

**radioactive fallout :** Airborne radioactive particles that fall to the ground during and after an atomic bombing, nuclear weapons test, or nuclear plant accident.

**radioactive glucose :** A radioactive form of glucose (sugar) often used during a positive emission tomography (PET) scan, a type of imaging test. In PET, a small amount of radioactive glucose is injected into a vein, and a scanner makes a picture of where the glucose is being used in the body. Cancer cells show up brighter in the picture because they are more active and take up more glucose than normal cells do. When used with PET, radioactive glucose helps find cancer cells in the body.

**radioactive half-life:** (i) For a single radioactive decay process, the time required for the activity to decrease to half its value by that process (ISO, 1972); (ii) the time taken for the activity of an amount of radioactive nuclide to fall to half its initial value (ICRU, 1980).

**radioactive iodine :** A radioactive form of iodine, often used for imaging tests or to treat an overactive thyroid, thyroid cancer, and certain other cancers. For imaging tests, the patient takes a small dose of radioactive iodine that collects in thyroid cells and certain kinds of tumors and can be detected by a scanner. To treat thyroid cancer, the patient takes a large dose of radioactive iodine, which kills thyroid cells. Radioactive iodine is also used in internal radiation therapy for prostate cancer, intraocular (eye) melanoma, and carcinoid tumors. Radioactive iodine is given by mouth as a liquid or in capsules, by infusion, or sealed in seeds, which are placed in or near the tumor to kill cancer cells.

**radioactive isotope:** An isotopic form of an element with an unstable nucleus that stabilizes itself by emitting ionizing radiation.

**radioactive palladium :** A radioactive form of palladium (a metallic element that resembles platinum). When used to treat prostate cancer, radioactive seeds (small pellets that contain radioactive palladium) are placed in the prostate. Cancer cells are killed by the energy given off as the radioactive material breaks down and becomes more stable.

**radioactive seed :** A small, radioactive pellet that is placed in or near a tumor. Cancer cells are killed by the energy given off as the radioactive material breaks down and becomes more stable.

**Radioactive series:** A succession of nuclides, each of which transforms by radioactive disintegration into the next until a stable nuclide results. The first member is called the parent, the intermediate members are called daughters, and the final stable member is called the end product.

**radioactivity:** The spontaneous emission of particles and/or energy from atomic nuclei. OR Radioactivity occurs when the nucleus of an atom breaks up into two or more pieces. A neutron is often released during radioactive decay. OR the emission of subatomic particles from a nucleus. OR the breakdown or decay of the nucleus of an atom by the emission or giving off of particles. OR The property possessed by some elements (such as uranium) of spontaneously emitting energy in the form of radiation as a result of the decay(or disintegration) of an unstable atom. Radioactivity is also the term used to describe the rate at which radioactive material emits radiation. Radioactivity is measured in curies (Ci), becquerels (Bq), or disintegrations per second.. For related information, see Measuring Radiation. OR Spontaneous emission of particles or high-energy electromagnetic radiation from the nuclei of unstable atoms.

"Radiation" refers to the emissions, and "radioactive source" refers to the source of the radiation. OR The use of sealed sources of ionizing radiation for nondestructive examination of the structure of materials. When the radiation penetrates the material, it produces a shadow image by blackening a sheet of photographic film that has been placed behind the material, and the differences in blackening suggest flaws and unevenness in the material.

**radioembolization :** A type of radiation therapy used to treat liver cancer that is advanced or has come back. Tiny beads that hold the radioisotope

yttrium Y 90 are injected into the hepatic artery (the main blood vessel that carries blood to the liver). The beads collect in the tumor and the yttrium Y 90 gives off radiation. This destroys the blood vessels that the tumor needs to grow and kills the cancer cells. Radioembolization is a type of selective internal radiation therapy (SIRT). Also called intra-arterial brachytherapy.

**radiofrequency ablation :** A procedure that uses radio waves to heat and destroy abnormal cells. The radio waves travel through electrodes (small devices that carry electricity). Radiofrequency ablation may be used to treat cancer and other conditions.

**radioimaging :** A method that uses radioactive substances to make pictures of areas inside the body. The radioactive substance is injected into the body, and locates and binds to specific cells or tissues, including cancer cells. Images are made using a special machine that detects the radioactive substance. Also called nuclear medicine scan.

**radioimmunoassay:** A sensitive and quantitative method for detecting trace amounts of a biomolecule, based on its capacity to displace a radioactive form of the molecule from combination with its specific antibody.

**radioimmunoconjugate :** A radioactive substance that carries radiation directly to cancer cells. A radioimmunoconjugate is made by attaching a radioactive molecule to an immune substance, such as a monoclonal antibody, that can bind to cancer cells. This may help kill cancer cells without harming normal cells. Radioimmunoconjugates may also be used with imaging to help find cancer cells in the body.

**radioimmunodiagnostics :** The use of radiolabeled monoclonal antibodies to help diagnose diseases, including cancer. The radiolabeled monoclonal antibody locates and binds to substances in the body, including cancer cells. Images are made using a special machine that detects the radioactive monoclonal antibody.

**radioimmunoguided surgery :** A procedure that uses radioactive substances to locate tumors so that they can be removed by surgery.

**radioimmunotherapeutics :** The use of radiolabeled monoclonal antibodies to treat diseases, including cancer. The radiolabeled monoclonal antibody locates and binds to substances in the body, including cancer cells. Radiation given off by the radioisotope may help kill the cancer cells.

**radioimmunotherapy** : A type of radiation therapy in which a radioactive substance is linked to a monoclonal antibody and injected into the body. The monoclonal antibody can bind to substances in the body, including cancer cells. The radioactive substance gives off radiation, which may help kill cancer cells. Radioimmunotherapy is being used to treat some types of cancer, such as lymphoma.

**radioisotope**: Contraction for words "radioactive isotope" of an element. OR A radioactive isotope. For example, tritium is a radioisotope of hydrogen.

**radioisotope** : An unstable form of a chemical element that releases radiation as it breaks down and becomes more stable. Radioisotopes may occur in nature or be made in a laboratory. In medicine, they are used in imaging tests and in treatment. Also called radionuclide.

**Radioisotope (Radionuclide)**: An unstable isotope of an element that decays or disintegrates spontaneously, thereby emitting radiation. Approximately 5,000 natural and artificial radioisotopes have been identified.

**radiolabeled** : Any compound that has been joined with a radioactive substance.

**radiologic exam** : A test that uses radiation or other imaging procedures to find signs of cancer or other abnormalities.

**Radiological sabotage**: Any deliberate act directed against a plant or transport in which an activity licensed pursuant to 10 CFR Part 73 of NRC's regulations is conducted or against a component of such a plant or transport that could directly or indirectly endanger the public health and safety by exposure to radiation.

**Radiological survey**: The evaluation of the radiation hazards accompanying the production, use, or existence of radioactive materials under a specific set of conditions. Such evaluation customarily includes a physical survey of the disposition of materials and equipment, measurements or estimates of the levels of radiation that may be involved, and a sufficient knowledge of processes affecting these materials to predict hazards resulting from expected or possible changes in materials or equipment.

**radiologist** : A doctor who has special training in creating and interpreting pictures of areas inside the body. The pictures are made with x-rays, sound waves, or other types of energy.

**Radiology**: That branch of medicine dealing with the diagnostic and therapeutic applications of radiant energy, including x-rays and radioisotopes. OR The use of radiation (such as x-rays) or other imaging technologies (such as ultrasound and magnetic resonance imaging) to diagnose or treat disease.

**Radionuclide**: An unstable isotope of an element that decays or disintegrates spontaneously, thereby emitting radiation. Approximately 5,000 natural and artificial radioisotopes have been identified.

**radionuclide** : An unstable form of a chemical element that releases radiation as it breaks down and becomes more stable. Radionuclides may occur in nature or be made in a laboratory. In medicine, they are used in imaging tests and in treatment. Also called radioisotope.

**radionuclide scanning** : A procedure that produces pictures (scans) of structures inside the body, including areas where there are cancer cells. Radionuclide scanning is used to diagnose, stage, and monitor disease. A small amount of a radioactive chemical (radionuclide) is injected into a vein or swallowed. Different radionuclides travel through the blood to different organs. A machine with a special camera moves over the person lying on a table and detects the type of radiation given off by the radionuclides. A computer forms an image of the areas where the radionuclide builds up. These areas may contain cancer cells. Also called scintigraphy.

**Radiopharmaceutical**: A pharmaceutical drug that emits radiation and is used in diagnostic or therapeutic medical procedures. Radioisotopes that have short half-lives are generally preferred to minimize the radiation dose to the patient and the risk of prolonged exposure. In most cases, these short-lived radioisotopes decay to stable elements within minutes, hours, or days, allowing patients to be released from the hospital in a relatively short time.

**radiopharmaceutical** : A drug that contains a radioactive substance and is used to diagnose or treat disease, including cancer. Also called radioactive drug.

**Radiopharmaceuticals**: Medicinal compounds that contain a radioactive nuclide.

**radioprotective agent** : A type of drug that helps protect healthy tissue from some of the side effects caused by radiation therapy. For example, a drug called amifostine helps reduce dry mouth in patients receiving radiation therapy for head and neck cancer.

**Radiosensitivity:** The relative susceptibility of cells, tissues, organs, organisms, or other substances to the injurious action of radiation.

**radiosensitization** : The use of a drug that makes tumor cells more sensitive to radiation therapy.

**radiosensitizer** : Any substance that makes tumor cells easier to kill with radiation therapy. Some radiosensitizers are being studied in the treatment of cancer. Also called radiosensitizing agent.

**radiosensitizer RRx-001:** A dinitroazetidine derivative with potential radiosensitizing activity. Upon administration, RRx-001 is able to dilate blood vessels, thereby increasing tumor blood flow and thus improving oxygenation to the tumor site. By increasing oxygen levels, these tumor cells may be more susceptible to radiation therapy. Tumor hypoxia is correlated with tumor aggressiveness, metastasis and resistance to radiotherapy. Check for active clinical trials using this agent.

**radiosensitizing agent** : Any substance that makes tumor cells easier to kill with radiation therapy. Some radiosensitizing agents are being studied in the treatment of cancer. Also called radiosensitizer.

**radiosonde:** weather balloon that carries instruments to record data and transmit readings to a base unit. OR A balloon-borne instrument for the simultaneous measurement and transmission of meteorological data up to a height of approximately 30,000 meters (100,000 feet). The height of each pressure level of the observation is computed from data received via radio signals.

**radiosurgery** : A type of external radiation therapy that uses special equipment to position the patient and precisely give a single large dose of radiation to a tumor. It is used to treat brain tumors and other brain disorders that cannot be treated by regular surgery. It is also being studied in the treatment of other types of cancer. Also called radiation surgery, stereotactic radiosurgery, and stereotaxic radiosurgery.

**radiotherapy** : The use of high-energy radiation from x-rays, gamma rays, neutrons, protons, and other sources to kill cancer cells and shrink tumors.

Radiation may come from a machine outside the body (external-beam radiation therapy), or it may come from radioactive material placed in the body near cancer cells (internal radiation therapy or brachytherapy). Systemic radiotherapy uses a radioactive substance, such as a radiolabeled monoclonal antibody, that travels in the blood to tissues throughout the body. Also called irradiation and radiation therapy.

**Radium (Ra):** A radioactive metallic element with atomic number 88. As found in nature, the most common isotope has a mass number of 226. It occurs in minute quantities associated with uranium in pitchblende, camotite, and other minerals. OR Symbol:"Ra" Atomic Number:"88" Atomic Mass: 226.03amu. Radium is a member of the alkaline metals group. It was discovered by the Curies in 1898 and is a radioactive, white metal that is often luminescent (glowing). You will find it in use for medicine, glowing paints, and the creation of radon gas.

**radium 223 dichloride :** A drug used to treat prostate cancer that has spread to the bone and has not gotten better with other treatment. It is also being studied in the treatment of other types of cancer. Radium 223 dichloride contains a radioactive substance called radium 223. Radium 223 collects in bone and gives off radiation that may kill cancer cells. Radium 223 dichloride is a type of radiopharmaceutical. Also called Xofigo.

**radium Ra 223 dichloride:** A radiopharmaceutical composed of the dichloride salt of the alpha-emitting isotope radium Ra 223, with antineoplastic activity. Like calcium, radium targets bone tissue and preferentially accumulates in osteoblastic lesions, such as those seen in areas of bone metastases. Radium Ra 223 forms complexes with hydroxyapatite and becomes incorporated into the bone matrix. The radioisotope Ra 223 kills bone cancer cells through local emission of high energy alpha particles, causing DNA double-strand breaks and tumor regression in the skeleton. The short range effects of alpha emission allows for localized DNA damage with limited toxicity to nearby healthy bone tissue.

**radius:** a line segment whose endpoints lie one at the center of a circle and one on the circle. Also, the length of this segment.

**Radius Weight :** This is a simplified formula for estimating the belt tension while in contact with the drum in a spiral system. It is another term used to describe the system tension.

**Radiused:** An edge or vertex that has been rounded. Typically, this occurs on part geometries as a natural result of the Protomold milling process. When a radius is intentionally added to an edge on a part, it is referred to as a fillet.

**Radix Angelicae sinensis/Radix Astragali herbal supplement:** A traditional Chinese medicine comprising of Radix Angelicae Sinensis (RAS) and Radix Astragali (RA), with potential anti-inflammatory, immunostimulatory, neuroprotective, anti-hepatotoxic and antineoplastic activities. The main chemical constituents of RAS include ferulic acid, Z-ligustilide, butylidenephthalide and various polysaccharides. RA is the dried root of *Astragalus membranaceus* with primary constituents such polysaccharides, triterpenoids as well as isoflavones. Though their mechanisms of action remain largely elusive, Radix Angelicae Sinensis/Radix Astragali herbal supplements are commonly used for the treatment of various health conditions affecting women including premenstrual syndrome, dysmenorrhea, pelvic pain, recovery from childbirth and menopausal symptoms. These agents are also used for alleviating constipation, preventing and treating anemia and allergic attacks, and for the management of hypertension, joint pain and ulcers.

**Radon:** Symbol:"Rn" Atomic Number:"86" Atomic Mass: (222)amu. It is one of the noble or inert gases. This element has not been found in nature and is a product of some nuclear reactions and the combustion of heavier elements. It is very dangerous and toxic to living organisms.

**radon :** A radioactive gas that is released by uranium, a substance found in soil and rock. Breathing in too much radon can damage lung cells and may lead to lung cancer.

**Radon (Rn):** A radioactive element that is one of the heaviest gases known. Its atomic number is 86. It is a daughter of radium.

**radotinib hydrochloride:** An orally available, hydrochloride salt form of radotinib, a second-generation tyrosine kinase inhibitor of Bcr-Abl fusion protein and the platelet-derived growth factor receptor (PDGFR), with potential antineoplastic activity. Upon administration, radotinib specifically inhibits the Bcr-Abl fusion protein, an abnormal enzyme expressed in Philadelphia chromosome-positive chronic myeloid leukemia (CML) cells. In addition, this agent also inhibits PDGFR thereby blocking PDGFR-mediated signal transduction pathways. The inhibitory effect of radotinib on

these specific tyrosine kinases may decrease cellular proliferation and inhibit angiogenesis. This agent has shown potent efficacy in CML cells that are resistant to the first-generation standard tyrosine kinase inhibitors, such as imatinib, nilotinib and dasatinib. PDGFR, upregulated in many tumor cell types, is a receptor tyrosine kinase essential to cell migration and the development of the microvasculature. Check for active clinical trials using this agent.

**Raf kinase inhibitor HM95573:** An orally available inhibitor of members of the Raf family of serine/threonine protein kinases, with potential antineoplastic activity. Upon administration, Raf kinase inhibitor HM95573 binds to and inhibits the B-Raf mutant V600E and C-Raf. This inhibits B-Raf V600E- and C-Raf-mediated signal transduction pathways, thereby inhibiting tumor cell growth of susceptible tumor cells. In addition, HM95573 may also inhibit mutated Ras proteins. Raf protein kinases play a key role in the Raf/mitogen-activated protein kinase kinase (MEK)/extracellular signal-related kinase (ERK) signaling pathway, which is often dysregulated in human cancers and plays a key role in tumor cell proliferation and survival. The Raf mutation B-Raf V600E, where the valine at residue 600 is substituted for glutamic acid, is frequently overexpressed in a variety of human tumors and results in the constitutive activation of the Raf/MEK/ERK signaling pathway. Check for active clinical trials using this agent.

**Raf kinase inhibitor LGX818:** An orally available Raf kinase inhibitor with potential antineoplastic activity. LGX818 specifically inhibits Raf kinase, a serine/threonine enzyme in the RAF/mitogen-activated protein kinase kinase (MEK)/extracellular signal-related kinase (ERK) signaling pathway. By inhibiting the activation of the RAF/MEK/ERK signaling pathway, the administration of LGX818 may result in a decrease in proliferation of tumor cells. The Raf mutation BRAF V600E is frequently upregulated in a variety of human tumors and results in the constitutive activation of the RAF/MEK/ERK signaling pathway that regulates cellular proliferation and survival.

**Raf kinase inhibitor XL281:** An orally active, small molecule with potential antineoplastic activity. XL281 specifically inhibits RAF kinases, located downstream from RAS in the RAS/RAF/MEK/ERK kinase signaling pathway, which may result in reduced proliferation of tumor cells.

RAS mutations may result in constitutive activation of the RAS/RAF/MEK/ERK kinase signaling pathway, and have been found to occur frequently in human tumors. Check for active clinical trials using this agent.

**Raf/MEK dual kinase inhibitor RO5126766:** A protein kinase inhibitor specific for the Raf and MEK mitogen-activated protein kinases (MAPKs) with potential anti-neoplastic activity. Raf/MEK dual kinase Inhibitor RO5126766 specifically inhibits the kinase activities of Raf and MEK, resulting in the inhibition of of target gene transcription that promotes malignant transformation of cells. Both Raf and MEK are serine/threonine-specific kinases that respond to extracellular stimuli, such as mitogens, and are involved in the regulation of cellular processes, such as gene expression, mitosis, differentiation, and apoptosis.

**Rafter:** A member in the roof structure running from the ridge to the eaves.

**Raftilose Synergy 1 :** A substance that is used to improve the health of the digestive system and bones and is being studied in the prevention of colon cancer. Raftilose Synergy 1 is made by combining two substances that occur naturally in many plants, including chicory root, wheat, bananas, onion, and garlic. Raftilose Synergy 1 helps healthy bacteria grow in the intestines and helps the body absorb calcium and magnesium. Also called oligofructose-enriched inulin.

**Rail:** Horizontal piece of timber in framing or panelling; any horizontal piece of timber. OR liquid precipitation larger than .02 cm in diameter.

**rain shadow:** an area on the lee side of a mountain range that is arid because most of the rain is precipitated on the other side of the range.

**Rain spotting:** Depressions or surface blemishes in a paint film caused by rain falling on the surface before the paint has fully dried. OR There's only one way to remove depressions or surface blemishes caused by rain spotting. Clean down the surfaces to remove all dirt, grease and surface contaminants. Then rub down the surfaces with Wet ' Dry abrasion, using water or a suitable solvent. Finally, rinse down and allow to dry thoroughly before applying a new coat of paint.

**Raised Ejector Site :** Where the ejector site is either heightened or raised above the surface of the component.

**Raking out:** The process of cutting out cracks in plaster or rendered surfaces to remove loose particles and to provide a key for the repair material.

**raloxifene :** The active ingredient in a drug used to reduce the risk of invasive breast cancer in postmenopausal women who are at high risk of the disease or who have osteoporosis. It is also used to prevent and treat osteoporosis in postmenopausal women. It is also being studied in the prevention of breast cancer in certain premenopausal women and in the prevention and treatment of other conditions. Raloxifene blocks the effects of the hormone estrogen in the breast and increases the amount of calcium in bone. It is a type of selective estrogen receptor modulator (SERM).

**raloxifene hydrochloride:** The hydrochloride salt form of raloxifene, a selective benzothiophene estrogen receptor modulator (SERM) with lipid lowering effects and activity against osteoporosis. Raloxifene hydrochloride specifically binds to estrogen receptors in responsive tissue, including liver, bone, breast, and endometrium. The resulting ligand-receptor complex is translocated to the nucleus where, depending on the tissue type, it promotes or suppresses the transcription of estrogen-regulated genes, thereby exerting its agonistic or antagonistic effects. This agent functions as an estrogen agonist in lipid metabolism, thereby decreasing total and LDL cholesterol levels. In tissue like bone, it decreases bone resorption and bone turnover and increases bone mineral density. Raloxifene hydrochloride acts as an estrogen antagonist in uterine and breast tissue. This agent also exerts an anti-proliferative effect on estrogen-sensitive breast cancer. OR A drug used to reduce the risk of invasive breast cancer in postmenopausal women who are at high risk of the disease or who have osteoporosis. It is also used to prevent and treat osteoporosis in postmenopausal women. It is also being studied in the prevention of breast cancer in certain premenopausal women and in the prevention and treatment of other conditions. Raloxifene hydrochloride blocks the effects of the hormone estrogen in the breast and increases the amount of calcium in bone. It is a type of selective estrogen receptor modulator (SERM). Also called Evista.

**raltegravir potassium:** The orally bioavailable potassium salt of a human immunodeficiency virus (HIV) integrase strand transfer inhibitor (HIV-1 INSTI) with HIV-1 antiviral activity. Raltegravir binds to and inhibits integrase, an HIV enzyme that inserts viral genetic material into the genetic

material of the infected human cell. Inhibition of integrase prevents insertion of HIV DNA into the human DNA genome, thus blocking HIV replication. Check for active clinical trials using this agent.

**raltitrexed:** A quinazoline folate analogue with antineoplastic activity. After transport into cells via the reduced folate carrier, raltitrexed undergoes intracellular polyglutamation and blocks the folate-binding site of thymidylate synthase, thereby inhibiting tetrahydrofolate activity and DNA replication and repair and resulting in cytotoxicity. or An anticancer drug that stops tumor cells from growing by blocking the ability of cells to make DNA. It belongs to the family of drugs called thymidylate synthase inhibitors. Also called ICI D1694.

**RAM:** The press member that enters the cavity block and exerts pressure on the molding compound designated as the "top force" or "bottom force" by position in the assembly. OR The forward motion of the screw in the plasticator barrel that forces the melt into the mold cavity.

**Ram Extruder:** A barrel with a temperature control, wherein a plunger pushes material in a melted state to the die.

**Ram Pressure -:** Used colloquially for the total force applied by a hydraulic ram, equal to the hydraulic pressure multiplied by the ram area.

**RAM TRAVEL:** Distance ram moves when operating a complete molding cycle.

**Ramachandran plot:** A steric contour diagram that depicts allowed ranges of the angles  $\phi$  and  $\psi$  for amino acid residues in polypeptide chains; for each residue, its conformation in the main chain of a polypeptide can be completely defined by  $\phi$  (the degree of rotation at the bond between the nitrogen atom and the  $\alpha$ -carbon atom) and  $\psi$  (the degree of rotation at the bond between the  $\alpha$ -carbon atom and the carbonyl carbon atom).

**ramelteon:** A synthetic melatonin analogue with hypnotic and circadian rhythm-modulating activities. Ramelteon binds to and activates melatonin receptors 1 and 2 in the suprachiasmatic nucleus (SCN) of the brain, thereby promoting the onset of sleep. Unlike the nonbenzodiazepine sedative hypnotics zolpidem and zaleplon, this agent does not activate GABA receptors and, so, produces no GABA receptor-mediated anxiolytic, myorelaxant, and amnesic effects.
