**Crystal:** A large number of objects that are all the same size and shape and are attracted to one another will tend to form repeating three-dimensional structures, instead of lying about randomly. A more complicated crystal will be formed if more than one kind of object is present. You are probably most familiar with crystals of simple covalent solids (like sugar) or ionic solids (like table salt), where the attractive forces between perfectly ordinary molecules and ions line up in an orderly fashion to give structure that we can actually see on the macroscopic scale. It is possible to form crystals even of proteins with molecular weights approaching a million, as each molecule of a protein will have the same molecular weight and three-dimensional shape, and we have all seen 'crystals' of oranges stacked in fruit shops. OR A sample of a crystalline solid that has a regular shape bound by plane surfaces (facets) that intersect at characteristic angles. The shape results from the arrangement of the substances atoms, ions, or molecules. Most crystals contain defects that can strongly affect their optical and electrical properties. OR A homogeneous solid having an orderly and repetitive three-dimensional arrangement of its atoms.

**Crystal Cleavage:** Cleavage is the way a crystal breaks when it is fractured. A crystal usually breaks along points of molecular weakness leaving a smooth break between two surfaces. The fresh surface is not as smooth as the naturally occurring surfaces of the crystal. There are four types of cleavage: none, distinct, indistinct, and perfect. Diamond cutters hope for perfect cleavage when they cut diamonds.

**crystal field splitting energy:** Ligands complexed to a metal ion will raise the energy of some of its d orbitals and lower the energy of others. The difference in energy is called the crystal field splitting energy.

**crystal field theory:** The color, spectra, and magnetic properties of metal-ligand complexes can be explained by modeling the effect of ligands on metal's d orbital energies.

**Crystal form:** A general term used to refer to the various types of crystalline solids of the same compound that can be obtained (i.e., polymorphs and pseudopolymorphs); synonymous with crystal modification.

**Crystal Fracture:** Crystals fracture in the same way anything would fracture. It is an uneven break. If you were to hit an ice cube with a hammer, it would fracture in an uneven manner.

**Crystal habit:** Crystals with the same internal structure but different external shape, thus, crystal in which different faces have developed during growth; synonymous with morphology.

**Crystal Habit:** The general form a crystal takes. This is a larger formation than the actual shape of a crystal. While a crystal shape can be cubic, groups of crystals can form a shape that is bladed or prismatic.

**Crystal Lattice:** A crystal lattice is a very exact organization of atoms that allows for a specific place for every molecule or atom in the solid. If a solid is made up of pure elements or compounds, it can create a very specific structure. A good example of a crystal lattice is a diamond. Salt (NaCl) has a specific cube shape for the crystal. One sodium atom connects to one chlorine atom and that combination repeats. The final structure is a cube.

**Crystal lattice:** The three-dimensional molecular repetition of the motif within a crystal.

**Crystal packing:** The arrangement of molecules in a crystal and the contacts between these molecules.

**Crystal ripening:** The process of reaching equilibrium after a crystallization is largely complete by continued stirring. This may bring about changes in crystal size, shape and perfection as high-energy sites are driven to equilibrium.

**crystal shape:** the arrangement of molecules in a mineral.

**Crystal structure:** The internal arrangement of atoms (and thus molecules) in a solid. The crystal structure is determined by X-ray crystallographic techniques and includes information about intramolecular and intermolecular contacts.

**Crystal system:** The space group and crystal lattice to which a crystal structure belongs.

**Crystal Twinning:** Crystal twinning occurs when two crystals grow in different directions and eventually intersecting. There are two basic types: penetration and contact. Penetration twin crystals intersect. Contact twin crystals meet at a center point.

**Crystalline:** the regular, geometric arrangement of atoms in a solid. OR A plastic material in which the molecular structure becomes mobile only after being heated above its melting point See amorphous. OR It is the structure

of polymer where the molecules are arranged in a very regular repeating lattice structure.

**Crystalline form:** A solid form that is crystalline; a solid form that gives a diffraction pattern. This include polymorphs, solvates, hydrates, and desolvated solvates.

**crystalline genistein formulation AXP107-11:** An orally available crystalline formulation of genistein, a soy-derived isoflavone and phytoestrogen with potential antineoplastic, chemosensitizing, and antioxidant activities. Similar to genistein, crystalline genistein formulation AXP107-11 increases expression of phosphatase and tensin homolog (PTEN), which deactivates protein kinase Akt and mitogen-activated protein kinases (MAPK1 and 3; ERK2 and 1), thereby disrupting PI3K/Akt signal transduction and inducing apoptosis. This agent also induces antioxidant enzymes through AMP-activated protein kinase (AMPK) activation, inhibits NF- $\kappa$ B activation and decreases inflammation response, thereby sensitizing tumors to chemotherapy. Compared to genistein itself, this crystalline formulation shows improved solubility and bioavailability. Check for active clinical trials using this agent.

**Crystalline Solid:** A crystalline solid has a specific organization of molecules and atoms. These are the classic crystals of the world such as diamonds and all gemstones. They are often made up of specific molecules and have very structured geometric shapes. These solids also have more clearly defined melting points. Table salt would be a good example of a crystalline solid. OR A solid that has a repeating, regular three-dimensional arrangement of atoms, molecules, or ions.

**Crystallinity:** A molecular structure resulting from the formation of solid crystals with a geometric pattern. OR crystalline polymers are those whose molecules are chemically and geometrically regular in structure. However, polymers are never fully crystalline, and should ideally be referred to as semi-crystalline polymers. Polyoxymethylene (POM), commonly called acetal, and polyamide (PA), commonly called nylon, are both examples of crystalline polymers. Acrylonitrile-butadiene-styrene (ABS), is an example of a non-crystalline, or amorphous, terpolymer. or The state of molecular structure in some resins denoting uniformity and compactness of the molecular chain. OR a molecular structure resulting from the formation of solid crystals with a geometric pattern. OR A state of molecular structure in

some resins which denotes uniformity and compactness of the molecular chains forming the polymer. Normally can be attributed to the formation of solid crystals having a definite geometric form. OR Ordered repeated structures (crystals) encountered in polymers below a certain temperature. Most polymers are semi-crystalline containing both crystalline and amorphous regions (see also GLASS TRANSITION and MELTING POINT). OR a molecular structure resulting from the formation of solid crystals with a geometric pattern. or A state of molecular structure in some resins which denotes uniformity and compactness of the molecular chains forming the polymer. Normally can be attributed to the formation of solid crystals having a definite geometric form. OR A state of molecular structure in some resins attributed to the existence of solid crystals with a definite geometric form, Such structures are characterized by uniformity and compactness.

**Crystallinity:** The ratio of crystalline and amorphous components in a sample. High crystallinity connotes a low amorphous component.

**crystallite:** A perfect crystalline part of a larger imperfect crystal. Real crystals are usually built of a large number of crystallites.

**Crystallization:** A process in which a liquid solution is cooled, or solvent is evaporated, to an extent that solid crystals of solute form. The crystals in the slurry (suspension of solids in a liquid) leaving the crystallizer may subsequently be separated from the liquid in a filter or centrifuge. OR Production of a purer sample of a substance by slow precipitation of crystals from a solution of the substance. OR The process of forming pure crystals by freezing a liquid, evaporating a solution, or precipitating a solid from solution. Impurities remain in the liquid, so crystallization is often to purify solid substances.

**CSF:** The length of time from either the date of diagnosis or the start of treatment for a disease, such as cancer, to the date of death from the disease. Patients who die from causes unrelated to the disease are not counted in this measurement. In a clinical trial, measuring the CSS is one way to see how well a new treatment works. Also called cause-specific survival.

**CSGE:** A type of mutation testing in which a segment of DNA is screened for mismatched pairing between normal and mutated base pairs. Also called conformation-sensitive gel electrophoresis.

**CSP:** A procedure that uses x-rays to create a series of detailed pictures of the blood vessels and blood flow inside the body. The pictures are taken from different angles and are created by a computer linked to an x-ray machine. A dye is injected into a vein to make the blood vessels and blood flow easier to see on the x-ray. CT angiography may be used to check for aneurysms (a bulge in the blood vessel wall), blockages in the arteries, blood clots, and other blood vessel problems. Also called computed tomography angiography and CTA.

**CSS:** A method to examine the inside of the colon by taking a series of x-rays. A computer is used to make 2-dimensional (2-D) and 3-D pictures of the colon from these x-rays. The pictures can be saved, changed to give better viewing angles, and reviewed after the procedure, even years later. Also called computed tomographic colonography, computed tomography colonography, CTC, and virtual colonoscopy.

**CT angiography :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The pictures are taken from different angles and are used to create 3-dimensional (3-D) views of tissues and organs. A dye may be injected into a vein or swallowed to help the tissues and organs show up more clearly. A CT scan may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called CAT scan, computed tomography scan, computerized axial tomography scan, and computerized tomography.

**CT colonography :** A form of the anticancer drug paclitaxel combined with a protein called poliglumex that may have fewer side effects and work better than paclitaxel. It is being studied in the treatment of breast cancer, ovarian cancer, lung cancer, and other types of cancer. It belongs to the family of drugs called mitotic inhibitors. Also called paclitaxel poliglumex, paclitaxel polyglutamate, and Xyotax.

**CT scan :** A form of the anticancer drug camptothecin that may have fewer side effects and work better than camptothecin. It is being studied in the treatment of cancer. It is a type of DNA topoisomerase inhibitor. Also called polyglutamate camptothecin.

**CT-2103:** A substance that is being studied in the treatment of cancer. It may prevent the growth of blood vessels from surrounding tissue into a solid tumor.

**CT-2106:** A substance being studied in the treatment of cancer. CT-322 may prevent the growth of new blood vessels that tumors need to grow and may kill cancer cells. It is a type of vascular endothelial growth factor receptor-2 (VEGFR-2) inhibitor and a type of antiangiogenesis agent. Also called Angiocept and VEGFR-2 inhibitor CT-322.

**CT-2584:** A substance being studied in the treatment of some types of cancer. It may stop cancer cell growth by blocking certain enzymes. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called MLN518 and tandutinib.

**CT-322:** A procedure that uses x-rays to create a series of detailed pictures of the blood vessels and blood flow inside the body. The pictures are taken from different angles and are created by a computer linked to an x-ray machine. A dye is injected into a vein to make the blood vessels and blood flow easier to see on the x-ray. CTA may be used to check for aneurysms (a bulge in the blood vessel wall), blockages in the arteries, blood clots, and other blood vessel problems. Also called computed tomography angiography and CT angiography.

**CT-guided biopsy :** A substance being studied in the diagnosis and treatment of glioma (a type of brain cancer) and other types of cancer. It binds to cancer cells in the brain and peripheral nervous system and may keep them from spreading. CTX comes from the venom of a type of scorpion. A form of CTX made in the laboratory is called TM-601. CTX is a type of neurotoxin. Also called chlorotoxin.

**CT53518:** A method to examine the inside of the colon by taking a series of x-rays. A computer is used to make 2-dimensional (2-D) and 3-D pictures of the colon from these x-rays. The pictures can be saved, changed to give better viewing angles, and reviewed after the procedure, even years later. Also called computed tomographic colonography, computed tomography colonography, CT colonography, and virtual colonoscopy.

**CTA:** A biopsy procedure that uses a CT scan (a special type of x-ray linked to a computer) to find an abnormal area in the body and help guide the removal of a sample of tissue from that area. A needle is usually used to remove the sample, which is then checked under a microscope for signs of disease. A CT-guided biopsy may be done when the abnormal area is deep inside the body or when the doctor cannot feel a lump or mass.

**CTC:** A protein found on T cells (a type of immune cell) that helps keep the body's immune responses in check. When CTLA-4 is bound to another protein called B7, it helps keep T cells from killing other cells, including cancer cells. Some anticancer drugs, called immune checkpoint inhibitors, are used to block CTLA-4. When this protein is blocked, the "brakes" on the immune system are released and the ability of T cells to kill cancer cells is increased.

**CTLA-4:** A drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It is also used to treat some types of kidney disease in children. CTX attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called cyclophosphamide and Cytosan.

**CTP-37-DT vaccine:** A vaccine composed of synthetic peptides derived from beta-human chorionic gonadotropin (hCG) conjugated to diphtheria toxoid. Vaccination with this peptide may elicit the host immune response against hCG-producing cancer cells.

**CTX:** A measure of volume in the metric system. One thousand cubic centimeters equal one liter. Also called cc, milliliter, and ml. or A drug used to treat certain bacterial skin and bloodstream infections in adults. Cubicin is also being studied in the treatment of fever and neutropenia (an abnormal decrease in the number of neutrophils, a type of white blood cell) in patients with cancer. It is a type of antibiotic. Also called daptomycin.

**cube:** a six-sided solid. All sides are equal squares and all edges are equal.

**Cube-root kinetics:** A diminishing sphere kinetics model with regard to particles of radius  $r$ :

**cubic centimeter :** The ability to understand, interact, and work well with people of different cultures. In medicine, one goal of cultural competency is to help make sure that the quality of the healthcare is equal among different cultural groups.

**Cubic Crystal:** A crystal shaped like a cube. A cube has six sides and might look like a die from a board game.

**Cubic crystal class:** A crystal class containing four three-fold rotation axis, one along each unit cell diagonal. This class contains 36 space groups and has two restrictions: 1) the lengths of all axes are equal, and 2) all angles are equal to  $90^\circ$ .

**Cubicin:** (Other name for: daptomycin) or The beliefs, values, and behaviors that are shared within a group, such as a religious group or a nation. Culture includes language, customs, and beliefs about roles and relationships. In medicine, culture also refers to the growth of microorganisms, such as bacteria and yeast, or human, plant, or animal cells or tissue in the laboratory.

**Cull:** Material remaining in a transfer chamber after mold has been filled. Unless there is a slight excess in the charge, the operator cannot be sure cavity is filled. Charge is generally regulated to control thickness of cull.

**cultural competency :** A human, plant, or animal cell that has been adapted to grow in the laboratory. Cultured cells may be used to diagnose infections, to test new drugs, and in research.

**culture :** Cells of a single type (human, animal, or plant) that have been adapted to grow continuously in the laboratory and are used in research.

**cultured cell :** A live form of a bacterium that makes lactic acid (a substance that is made from sugars found in milk and is also made in the body). Culturelle is given to help with digestion and normal bowel function. It may also help keep the gastrointestinal (GI) tract healthy. It is being studied in the prevention of infections in patients having donor stem cell transplants and in other conditions. Also called Lactobacillus rhamnosus GG.

**cultured cell line :** In medicine, the total amount of a drug or radiation given to a patient over time; for example, the total dose of radiation given in a series of radiation treatments.

**Culturelle:** (Other name for: Lactobacillus rhamnosus GG)

**Culturelle :** The total amount of a substance or radiation that a person is exposed to over time. Cumulative exposure to a harmful substance or radiation may increase the risk of certain diseases or conditions.

**Cumene:** Cumene is a chemical intermediate almost exclusively consumed in the production of phenol. Cumene is a propylene derivative produced by the reaction of propylene and benzene. Cumene production is widespread geographically, and almost all new plants are integrated with phenol. Alternative names for cumene include: isopropyl benzene, (1-methylethyl)benzene, 2-phenylpropane

**Cumulative dose:** The total dose that an occupationally exposed worker receives as a result of repeated exposures to ionizing radiation to the same portion of the body, or to the whole body, over time. For additional detail, see Information for Radiation Workers.

**cumulative dose :** A measure of the total risk that a certain event will happen during a given period of time. In cancer research, it is the likelihood that a person who is free of a certain type of cancer will develop that cancer by a specific age. For example, a woman with no known risk factors for breast cancer has a cumulative risk of getting breast cancer over a lifetime of 90 years of about 12-13%. This means one out of every eight women will get breast cancer by age 90 years.

**cumulative effect (functional accumulation):** Occurs when repeated doses of a toxic substance or harmful radiation summate to give an enhanced effect (WHO, 1979).

**cumulative exposure :** A case in which cancer cells are found in the body, but the place where the cells first started growing (the origin or primary site) cannot be determined. Also called cancer of unknown primary origin and carcinoma of unknown primary.

**Cumulative feedback inhibition:** A regulatory strategy in which the enzyme catalyzing the committed step common to several pathways is incrementally inhibited by the products of each of the pathways. Thus, each inhibitor can reduce the activity of the enzyme even if other inhibitors are bound at saturating levels.

**cumulative incidence ratio:** The ratio of the cumulative incidence rate in the exposed to the cumulative incidence rate in the unexposed (Last, 1983).

**cumulative incidence, cumulative incidence rate:** The number or proportion of a group of people who experience the onset of a health related event during a specified time interval; this interval is generally the same for all members of the group, but, as in lifetime incidence, it may vary from person to person without reference to age (Last, 1988).

**cumulative risk :** A procedure in which a rounded glass cup is warmed and placed upside down over an area of the body, creating suction that holds the cup to the skin. Cupping increases the flow of blood. In traditional Chinese medicine, it is also thought to increase the flow of qi (vital energy).

**cumulonimbus:** cumulus cloud that builds vertically; usually associated with a cold front and thunderstorms.

**cumulus:** puffy, cotton-like clouds formed by rising air.

**CUP:** Surgery to remove all malignant (cancerous) tissue, which is meant to cure the disease. This includes removing part or all of the cancerous organ or tissue and a small amount of healthy tissue around it. Nearby lymph nodes may also be removed. Curative surgery works best for localized cancer. Chemotherapy or radiation therapy may be given before surgery to shrink the tumor or after surgery to kill any cancer cells that remain.

**cupping :** A yellow pigment of the spice turmeric that is being studied in cancer prevention.

**Cuprenil:** (Other name for: penicillamine)

**cupric<sup>2+</sup>:** Deprecated. 1. the copper(II) ion,  $\text{Cu}^{2+}$ . 2. A compound that contains copper in the +2 oxidation state.

**Cuprimine:** (Other name for: penicillamine)

**cuprous<sup>+</sup>:** Deprecated. 1. the copper(I) ion,  $\text{Cu}^{+}$ . 2. A compound that contains copper in the +1 oxidation state.

**curative surgery :** To heal or restore health; a treatment to restore health.

**curcumin:** A phytopolyphenol pigment isolated from the plant *Curcuma longa*, commonly known as turmeric, with a variety of pharmacologic properties. Curcumin blocks the formation of reactive-oxygen species, possesses anti-inflammatory properties as a result of inhibition of cyclooxygenases (COX) and other enzymes involved in inflammation; and disrupts cell signal transduction by various mechanisms including inhibition of protein kinase C. These effects may play a role in the agent's observed antineoplastic properties, which include inhibition of tumor cell proliferation and suppression of chemically induced carcinogenesis and tumor growth in animal models of cancer. orRemoval of tissue with a curette (a spoon-shaped instrument with a sharp edge).

**curcumin-based gel:** A proprietary topical gel formulation containing an extract of curcumin, the polyphenol derived from the plant *Curcuma longa*, with potential anti-inflammatory, antioxidant, and wound healing activities. Upon topical administration to the affected areas, curcumin inhibits a variety of pro-inflammatory enzymes and reduces the production of certain

pro-inflammatory mediators. Curcumin also blocks the formation of reactive oxygen species (ROS), neutralizes free radicals and prevents oxidative stress and DNA damage. In addition, curcumin inhibits phosphorylase kinase (PhK) in the skin, which prevents multiple PhK-mediated signal transduction pathways that are induced upon skin injury. This further prevents inflammation, promotes healing and reduces scar tissue formation. The proprietary curcumin-based gel also provides moisture to the skin and contains tetrahydropiperine (THP), which is derived from black pepper fruit and increases skin uptake of curcumin.

**curcumin/green tea extract/Polygonum cuspidatum extract/soybean extract capsule:** An oral capsule containing curcumin, green tea extract, Polygonum cuspidatum extract, and soybean extract, with antioxidant and potential chemopreventive activities. The antioxidants in curcumin/green tea extract/Polygonum cuspidatum extract/soybean extract capsule bind to and neutralize free-radicals, which may prevent their genotoxic and carcinogenic effects.

**CURE:** To change the physical properties of a material by chemical reaction, which may be condensation. polymerization. or vulcanization: usually accomplished by the action of heat and catalysts. along or in combination. with or without pressure. OR to change the physical, chemical, or electrical properties of a material by chemical reaction, by the action of heat and catalysts alone or in combination, with or without pressure. Specifically to convert low molecular weight polymer or resin to an insoluble infusible state. OR The process of changing the properties of polymer into a more stable substance or material. OR The technique of cross-linking a plastics material. OR The process of changing properties of polymer into a more stable and usable condition. This is accomplished by the use of heat, radiation, or reaction with chemical additives. OR The heat induced process that causes a chemical change in the liquid silicone rubber material, turning it into the finished silicone rubber part OR The process of hardening of a thermosetting resin (by cross-linking of the molecular structure), under the influence of heat and/or curing agents. OR The process of allowing a plastic to harden or stabilize. OR The process of changing properties of polymer into a more stable and usable condition. This is accomplished by the use of heat, radiation, or reaction with chemical additives. or to change the physical, chemical or electrical properties of a material by chemical reaction, by the action of heat and catalysts alone or in

combination, with or without pressure. Specifically to convert a low molecular weight polymer or resin to an insoluble, infusible state. OR To change the physical properties of a material by chemical reaction, which may be condensation, polymerization, or vulcanization: usually accomplished by the action of heat and catalysts along with or in combination with or without pressure. OR The process of changing properties of polymer into a more stable and usable condition. This is accomplished by the use of heat, radiation, or reaction with chemical additives.

**cure :** A spoon-shaped instrument with a sharp edge.

**Cure Cycle:** The time periods at defined conditions to which a reacting thermosetting material is processed to reach a desired property level.

**Cure schedule:** The time/temperature relationship required to cure a coating.

**Cure Time:** The preset time needed to complete the liquid silicone rubber curing process

**Cure, Curing:** The process whereby a liquid coating becomes a hard film.

**curettage :** A condition in which there is too much cortisol (a hormone made by the outer layer of the adrenal gland) in the body. In Cushing disease, this happens when an adenoma (benign tumor) in the pituitary gland makes too much adrenocorticotrophic hormone (ACTH). This causes the adrenal gland to make too much cortisol. Symptoms include a round face, thin arms and legs, severe fatigue and muscle weakness, high blood pressure and high blood sugar, purple or pink stretch marks on the skin, and weight gain, especially in the abdomen.

**urette :** A condition in which there is too much cortisol (a hormone made by the outer layer of the adrenal gland) in the body. Cushing syndrome may be caused by taking too many steroid drugs or by certain types of tumors. Tumors that make adrenocorticotrophic hormone (ACTH) cause the adrenal gland to make too much cortisol. Symptoms of Cushing syndrome include a round face, thin arms and legs, severe fatigue and muscle weakness, high blood pressure, high blood sugar, purple or pink stretch marks on the skin, and weight gain, especially in the abdomen.

**Curie (Ci):** One of three units used to measure the intensity of radioactivity in a sample of material. This value refers to the amount

of ionizing radiation released when an element (such as uranium) spontaneously emits energy as a result of the radioactive decay (or disintegration) of an unstable atom. Radioactivity is also the term used to describe the rate at which radioactive material emits radiation, or how many atoms in the material decay (or disintegrate) in a given time period. As such, 1 Ci is equal to 37 billion ( $3.7 \times 10^{10}$ ) disintegrations per second, so 1 Ci also equals 37 billion ( $3.7 \times 10^{10}$ ) Becquerels (Bq). A curie is also a quantity of any radionuclide that decays at a rate of 37 billion disintegrations per second (1 gram of radium, for example). The curie is named for Marie and Pierre Curie, who discovered radium in 1898.

**Curie point:** Temperature above which a ferromagnetic material loses its ferromagnetism.

**Curing:** The chemical process by which paints dry. Most commonly used when referring to the chemical reaction by which two-pack products dry e.g. two-pack epoxies two-pack polyurethane. OR Final conversion or drying of a coating material. OR The forming of a polymer by polymerization and/or Cross Linking.

**Curing agents:** Chemical compounds used to cure thermosetting resins.

**Curing Temperature:** Temperature at which a cast, molded, or extruded product, a resin-impregnated reinforcing material, an adhesive, etc., is subjected to curing. OR Temperature at which a cast, molded or extruded product, a resin-impregnated reinforcing material, or adhesive. etc., is subjected to curing. OR The temperature of liquid silicone rubber thermoset vulcanization OR Temperature at which a cast, molded or extruded product, a resin-impregnated reinforcing material, or adhesive etc., is subjected to curing.

**Curing Time:** The period of time that a reacting thermosetting material is exposed to specific conditions to reach a specified property level. OR The time taken for a resin to cure (polymerise) to its full extent. With a cold-curing resin, the time is measured from addition of either activator or catalyst. Curing time can be influenced by other chemical aids – retarder or accelerator.

**Curium:** Symbol: "Cm" Atomic Number: "96" Atomic Mass: (247)amu. Curium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a very radioactive element but has been used in satellites and space exploration.

**current:** a movement of electrons through a conductor. Measured in amperes.

**Curretab:** (Other name for: medroxyprogesterone)

**Curtain Coating:** A method of coating which may be employed with low viscosity resins or solutions, suspensions, or emulsions of resins in which the substrate to be coated is passed through and perpendicular to a freely falling liquid “curtain” (or “waterfall”). The flow rate of the falling liquid and the linear speed of the substrate passing through the curtain are coordinated in accordance with the thickness of coating desired.

**Curvature:** A condition in which the parison is not straight, but somewhat bending and shifting to one side, leading to a deviation from the vertical direction of extrusion. Centering of ring and mandrel can often relieve this defect.

**Cushing disease :** A substance being studied in the treatment of cancer. It blocks the production of a protein called clusterin, which helps cells live longer. This may kill cancer cells that need clusterin to grow. It may also make cells more sensitive to anticancer drugs. It is a type of antisense oligonucleotide, and a type of chemosensitizing agent. Also called OGX-011.

**Cushing syndrome :** Having to do with the skin.

**Cushion:** A pad of material left in the barrel at the end of the injection stroke. It is excessive to the amount needed to fill the mold and acts as a focus point for holding pressure against the cooling melt. OR It is the a small amount of melt that is left in the barrel at the end of injection, follow up pressure. The cushion prevents the screw tip from making contact to the head of barrel

**custirsen sodium:** The eicosasodium salt of a mixed-backbone antisense oligodeoxynucleotide with chemosensitizing properties. Custirsen inhibits testosterone-repressed prostate message-2 (TRPM-2). Administration of custirsen abrogates the anti-apoptotic effect of TRPM-2, thereby sensitizing cells to chemotherapy and resulting in tumor cell death. TRPM-2 is an anti-apoptotic clusterin that is overexpressed by prostate cancer cells and is associated with chemoresistance.

**custirsen sodium :** Cancer that has spread from the breast to the skin.

**CUSTOM COLOR:** Special colors made by adding colorant to paint or by intermixing colors, which permits the retailer to match a color selected by the consumer.

**Custom Molder:** A firm specializing in the molding of items or components to the specifications of another firm which handles the sale or distribution of the item, or incorporates the custom molded components in one of its own products.

**Cut-off:** The line where the two halves of a compression mold come together; also called Flash Groove or Pinch-off.

**Cut-through resistance:** A coating film's resistance to penetration resulting from the combined application of sharp edges, heat and pressure.

**cutaneous :** Any of a group of T-cell non-Hodgkin lymphomas that begins in the skin as an itchy, red rash that can thicken or form a tumor. The most common types are mycosis fungoides and Sézary syndrome.

**cutaneous breast cancer :** In medicine, a loss of blood flow to part of the brain, which damages brain tissue. CVAs are caused by blood clots and broken blood vessels in the brain. Symptoms include dizziness, numbness, weakness on one side of the body, and problems with talking, writing, or understanding language. The risk of CVA is increased by high blood pressure, older age, smoking, diabetes, high cholesterol, heart disease, atherosclerosis (a buildup of fatty material and plaque inside the coronary arteries), and a family history of CVA. Also called cerebrovascular accident and stroke.

**cutaneous leiomyoma :** A benign tumor that arises from smooth muscle tissue in a hair follicle, forming a papule. Cutaneous leiomyomas (or leiomyomata) can be painful in the presence of cold or tactile stimuli.

**cutaneous lichen amyloidosis :** Itchy papules that are brownish-red in color and typically appear on the shins, thighs, feet, or neck.

**cutaneous T-cell lymphoma :** An abbreviation for a chemotherapy combination used to treat slow-growing forms of non-Hodgkin lymphoma (NHL) and chronic lymphocytic leukemia (CLL). It includes the drugs cyclophosphamide, vincristine sulfate, and prednisone. Also called CVP regimen.

**Cutting Nest-:** A formed nest for formed product to sit in while being cut. Ensures a clean and accurate cut

**CVA:** An abbreviation for a chemotherapy combination used to treat slow-growing forms of non-Hodgkin lymphoma (NHL) and chronic lymphocytic leukemia (CLL). It includes the drugs cyclophosphamide, vincristine sulfate, and prednisone. Also called CVP.

**CVP:** A poisonous chemical found in some foods and plants, tobacco smoke, and when certain substances are burned. It is used to make products such as paper, fabric, and plastic, and is used as a pesticide. Cyanide keeps cells in the body from using oxygen, so they die. Exposure to cyanide may cause serious health effects, including death.

**CVP regimen:** A regimen consisting of cyclophosphamide, vincristine and prednisone used to treat indolent forms of non-Hodgkin lymphoma. It is also used for the treatment of chronic lymphocytic leukemia.

**CVP regimen :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Cyanocobalamin helps make red blood cells, DNA, RNA, energy, and tissues, and keeps nerve cells healthy. It is found in liver, meat, eggs, poultry, shellfish, milk, and milk products. Cyanocobalamin is water-soluble (can dissolve in water) and must be taken in every day. Not enough cyanocobalamin can cause certain types of anemia (a condition in which the number of red blood cells is below normal) and neurologic disorders. It is being studied with folate in the prevention and treatment of some types of cancer. Also called cobalamin and vitamin B12.

**CXC chemokine receptor 2 antagonist AZD5069:** An orally bioavailable, selective and reversible antagonist of CXC chemokine receptor 2 (CXCR2), with potential anti-inflammatory and antineoplastic activities. Upon administration, CXC chemokine receptor 2 antagonist AZD5069 directly binds to CXCR2 and inhibits its activation. This inhibits CXCR2-mediated signaling and may inhibit tumor cell proliferation in CXCR2-overexpressing tumor cells. In addition, AZD5069 reduces both neutrophil recruitment and migration from the systemic circulation into sites of inflammation, including the lung mucosa; it may also prevent neutrophil migration from the bone marrow. This results in the reduction of inflammation, mucus production, and neutrophil proteinase-mediated tissue destruction in the lung. CXCR2, a G protein-coupled receptor protein also known as IL-8 receptor B (IL-8RB), is upregulated in a variety of tumor cell types and plays a key role in tumor cell proliferation and progression; it

is known to be elevated in several inflammatory diseases, such as chronic obstructive pulmonary disease (COPD), asthma and fibrotic pulmonary disorders.

**CXCR4 antagonist BL-8040:** An orally bioavailable inhibitor of CXC Chemokine Receptor 4 (CXCR4) with potential antineoplastic activity. CXCR4 antagonist BL-8040 selectively binds to the chemokine receptor CXCR4, preventing the binding of stromal derived factor-1 (SDF-1 or CXCL12) to the CXCR4 receptor and subsequent receptor activation, which may result in decreased tumor cell proliferation and migration. In addition, inhibition of CXCR4 may induce mobilization of hematopoietic cells from the bone marrow into blood. The G protein-coupled receptor CXCR4 plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types; SDF-1/CXCR4 interaction induces retention of hematopoietic cells in the bone marrow.

**CXCR4 inhibitor MSX-122:** An orally bioavailable inhibitor of CXCR4 with potential antineoplastic and antiviral activities. CXCR4 inhibitor MSX-122 binds to the chemokine receptor CXCR4, preventing the binding of stromal derived factor-1 (SDF-1) to the CXCR4 receptor and receptor activation, which may result in decreased tumor cell proliferation and migration. CXCR4, a chemokine receptor belonging to the GPCR (G protein-coupled receptor) gene family, plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types; it is also a co-receptor for HIV entry into T cells.

**CXCR4 inhibitor POL6326:** An orally bioavailable inhibitor of CXC chemokine receptor 4 (CXCR4) with receptor binding and hematopoietic stem cell-mobilization activities. CXCR4 inhibitor POL6326 binds to the chemokine receptor CXCR4, thereby preventing the binding of stromal derived factor-1 (SDF-1 or CXCL12) to the CXCR4 receptor and subsequent receptor activation. This may induce the mobilization of hematopoietic stem and progenitor cells from the bone marrow into blood. CXCR4, a chemokine receptor belonging to the G protein-coupled receptor (GPCR) gene family, plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types; CXCL12/CXCR4 interaction induces retention of hematopoietic cells in the bone marrow.

**CXCR4 inhibitor X4P-001:** An orally bioavailable inhibitor of C-X-C chemokine receptor type 4 (CXCR4), with potential antineoplastic and immune checkpoint inhibitory activities. Upon administration, the CXCR4 inhibitor X4P-001 selectively binds to CXCR4 and prevents the binding of CXCR4 to its ligand, stromal cell-derived factor 1 (SDF-1 or CXCL12). This inhibits receptor activation and results in decreased proliferation and migration of CXCR4-overexpressing tumor cells. In addition, inhibition of CXCR4 prevents the recruitment of regulatory T-cells and myeloid-derived suppressor cells (MDSCs) to the tumor microenvironment, thereby abrogating CXCR4-mediated immunosuppression and enabling the activation of a cytotoxic T-lymphocyte-mediated immune response against cancer cells. The G protein-coupled receptor CXCR4, which is upregulated in several tumor cell types, induces the recruitment of immunosuppressive cells in the tumor microenvironment, suppresses immune surveillance, and promotes tumor angiogenesis and tumor cell proliferation. It is also a co-receptor for HIV entry into T cells.

**CXCR4 peptide antagonist LY2510924:** An inhibitor of CXC chemokine receptor 4 (CXCR4), with potential antineoplastic activity. Upon subcutaneous administration, CXCR4 inhibitor LY2510924 binds to the chemokine receptor CXCR4, thereby preventing CXCR4 binding to its ligand, stromal derived factor-1 (SDF-1), and subsequent receptor activation. This may result in decreased tumor cell proliferation and migration. CXCR4, a chemokine receptor belonging to the G protein-coupled receptor (GPCR) gene family, plays an important role in chemotaxis and angiogenesis and is upregulated in several tumor cell types. Check for active clinical trials using this agent.

**cyanide:** 1. An ion with a -1 charge containing one atom of carbon bound to one atom of nitrogen. 2. A compound that contains CN<sup>-</sup> ions.

**cyanide :** A plant compound that contains sugar and produces cyanide.

**cyanide process:** A method for separating a metal from an ore. Crushed ore is treated with cyanide ion to produce a soluble metal cyanide complex. The complex is washed out of the ore and reduced to metallic form using an active metal (usually zinc).

**cyano group:** —C≡N the group.

**cyanocobalamin:** An essential nutrient and natural water-soluble vitamin of the B-complex family that must combine with an intrinsic factor for

absorption by the intestine. Cyanocobalamin is necessary for hematopoiesis, neural metabolism, DNA and RNA production, and carbohydrate, fat, and protein metabolism. B12 improves iron functions in the metabolic cycle and assists folic acid in choline synthesis. B12 metabolism is interconnected with that of folic acid. Vitamin B12 deficiency causes pernicious anemia, megaloblastic anemia, and neurologic lesions.

**cyanocobalamin** : Blue-colored skin caused by too little oxygen in the blood.

**cyanocobalamin/dexamethasone/gentamicin/procaine formulation:** A quadruple mixture composed of the corticosteroid dexamethasone, the aminoglycoside antibiotic gentamicin, the vitamin cyanocobalamin (vitamin B12), and the local anesthetic agent procaine, with antimucositis activity. Upon oral administration of the cyanocobalamin/dexamethasone/gentamicin/procaine formulation, the active ingredients prevent or inhibit inflammation and infection of the oral mucosa and reduce the associated pain. This may prevent or treat radiation-induced oral mucositis (OM).

**cyanogenic glucoside** : A substance being studied in the treatment of some types of cancer. It blocks certain enzymes involved in cell division and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of protein kinase inhibitor and a type of antiangiogenesis agent.

**cyanohydrin:** a compound with the general formula

**cyanosis:** The pathological condition where there is an excessive concentration of reduced haemoglobin in the blood. This results in blue appearance of the skin, especially on the face and extremities, indicating the lack of sufficient oxygen in arterial blood.

**cyanosis** : A chronic condition that affects neutrophils (a type of white blood cell). In cyclic neutropenia, the number of neutrophils in the blood goes in cycles from normal to low and back to normal again. Symptoms include fever, inflamed mucous membranes in the mouth, and infections. Also called periodic neutropenia.

**CYC116:** A protein that helps control cell division. It is found in higher than normal amounts in several types of cancer cells. Measuring the amount

of cyclin-D1 in blood cells may help to diagnose cancer or plan cancer treatment. Cyclin-D1 is a cell cycle protein and a type of tumor marker.

**Cycle:** complete, repeating sequence of operations for injection molding a part. Or The complete repeating sequence of operations in a process or part of a process. In molding, the cycle time is the period or elapsed time between a certain point in one cycle and the same point in the next. Or The overall time it takes for the plastic injection process to complete a finished part.

**Cycle Time:** The time required by an injection molding system to mold a part and return to its original position. Or The time it takes to make one part including the closing of the mold, the injection of the resin, the solidification of the part, the opening of the mold and the ejection of the part. Or In a molding operation, cycle time is the time elapsing between a particular point in one cycle and the same point in the next cycle. Or The time required by an injection molding system to mold a part and return to its original position/state.

**Cyclic AMP (cyclic 3', 5'-adenosine monophosphate):** A cyclic nucleotide formed from ATP and an important second messenger in a variety of signaling systems.

**cyclic AMP icAMP):** A second messenger within cells; its formation by adenylate cyclase is stimulated by certain hormones or other molecular signals.

**Cyclic AMP-response element binding protein (CREB):** A transcription factor that binds to the cyclic AMP-response element in DNA and, when phosphorylated by protein kinase A, recruits coactivators that result in the stimulation of transcription of specific genes.

**cyclic electron flow:** In chloroplasts, the light-induced flow of electrons originating from and returning to photosystem I.

**Cyclic GMP (cyclic 3', 5'-guanosine monophosphate):** A cyclic nucleotide formed from GTP and an important second messenger in vision.

**cyclic neutropenia :** COX inhibitor. A type of drug that is used to treat inflammation and pain, and is being studied in the prevention and treatment of cancer. Cyclo-oxygenase inhibitors belong to the family of drugs called nonsteroidal anti-inflammatory drugs (NSAIDs). Also called COX inhibitor.

**Cyclic photophosphorylation:** In photosynthesis, the generation of ATP without the concomitant formation of NADPH; electron cycling from the reaction center of photosystem I to ferredoxin and then back to the reaction center through cytochrome b<sub>6</sub> and plastoquinone generates a proton gradient that is used to drive ATP formation.

**cyclic photophosphorylation:** ATP synthesis driven by cyclic electron flow through photosystem I.

**cyclin B1 peptide-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine comprised of autologous dendritic cells (DCs) pulsed with cyclin B1 peptide, with potential immunostimulatory and antineoplastic activities. Upon administration, cyclin B1 peptide-pulsed autologous dendritic cell vaccine may stimulate anti-tumoral cytotoxic T lymphocyte (CTL) and anti-cyclin B1 antibody responses against cyclin B1-expressing cancer cells, resulting in tumor cell lysis. Cyclin B1, a key regulator of the cell cycle and cell division, is overexpressed in a variety of cancer cells.

**cyclooxygenase-2 (COX-2):** An enzyme that speeds up the formation of substances that cause inflammation and pain. It may also cause tumor cells to grow. Some tumors have high levels of cyclooxygenase-2 and blocking its activity may reduce tumor growth. Also called COX-2 and prostaglandin-endoperoxide synthase 2.

**cyclization:** the formation of ring structures.

**cycloaddition:** a reaction that forms a ring.

**cycloaddition:** a reaction that forms a ring.

**Cycloaddition reaction:** A chemical reaction that involves the addition of two substrates to form a ring system (e.g., the solid-state photodimerization of cinnamic acids). Cycloaddition reactions are controlled by the Woodward–Hoffmann rules.

**cycloalkane:** a ring hydrocarbon made up of carbon and hydrogen atoms joined by single bonds.

**cycloalkyl alkane:** an alkane to which a cyclical structure is bonded.

**cycloalkyl alkane:** an alkane to which a ring structure is bonded.

**cyclobenzaprine hydrochloride:** A centrally acting muscle relaxant, chemically similar to amitriptyline hydrochloride with antidepressant activity. The exact mechanism of action of cyclobenzaprine hydrochloride has not been fully determined. However, it primarily acts at the brain stem

to reduce tonic somatic motor activity, influencing both gamma and alpha motor neurons. This leads to a reduction in muscle spasms. Check for active clinical trials using this agent.

**cyclodextrin-based polymer-camptothecin CRLX101:** A formulation of camptothecin, an alkaloid isolated from the Chinese tree *Camptotheca acuminata*, conjugated with to a hydrophilic, cyclodextrin-based linear polymer with potential antineoplastic activity. Upon intravenous administration, camptothecin is slowly released from the formulation at the tumor site and taken up by tumor cells. During the S phase of the cell cycle, camptothecin selectively stabilizes topoisomerase I-DNA covalent complexes, thereby inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing potentially lethal double-strand DNA breaks when encountered by the DNA replication machinery. Compared to camptothecin alone, the cyclodextrin-based polymer formulation has a prolonged half life and greatly improves the biodistribution of camptothecin resulting in an accumulation of camptothecin at the tumor site, which enhances tumor exposure while greatly reducing toxic side effects. In addition, cyclodextrin-based polymer-camptothecin may be able to overcome certain kinds of multidrug resistance.

**Cycloflex:** (Other name for: cyclobenzaprine hydrochloride)

**cyclogenesis:** the process of forming storm systems.

**Cyclohexane:** Cyclohexane is a six-carbon saturated ring and is an intermediate in the production of nylon. In nylon production, it is used to produce KA oil, which is oxidized with nitric acid to produce adipic acid, which is then reacted with HMDA to produce nylon 6,6. It is also used as a solvent in many chemical processes.

**Cycloheximide:** An antibiotic that inhibits the peptidyl transferase activity of the 60S ribosomal subunit in eukaryotes.

**cyclohydrocarbon:** an alkane, alkene, or alkyne formed in a ring structure rather than a straight or branched chain. The cyclohydrocarbon general formula is  $C_nH_{2n}$  (n must be a whole number of 3 or greater). OR an alkane, alkene, or alkyne formed in a ring structure rather than a straight or branched chain.

**cycloleucine:** A non-metabolizable synthetic amino acid, formed through the cyclization of the amino acid leucine, with immunosuppressive,

antineoplastic, and cytostatic activities. Cycloleucine competitively inhibits the enzyme methionine adenosyltransferase, resulting in the inhibition of S-adenosylmethionine (SAM) synthesis from methionine and ATP, and subsequent nucleic acid methylation and polyamine production; RNA, and perhaps to a lesser extent, DNA biosyntheses and cell cycle progression are finally disrupted. This agent is also a competitive inhibitor at the glycine modulatory site of the N-methyl-D-aspartate (NMDA) receptor.

**cyclooxygenase inhibitor :** A nonsteroidal anti-inflammatory drug used to relieve pain and inflammation. Cyclooxygenase-2 inhibitors are being studied in the prevention of colon polyps, and as anticancer drugs. Also called COX-2 inhibitor.

**cyclooxygenase-2 :** A drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It is also used to treat some types of kidney disease in children. Cyclophosphamide attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called CTX and Cytosan.

**cyclooxygenase-2 inhibitor :** A drug used to help reduce the risk of rejection of organ and bone marrow transplants by the body. It is also used in clinical trials to make cancer cells more sensitive to anticancer drugs.

**cyclopentenyl cytosine:** A pro-drug carbocyclic analogue of cytidine with antineoplastic and antiviral activities. Cyclopentenyl cytosine (CPEC) is converted to the active metabolite cyclopentenyl cytosine 5'-triphosphate (CPEC-TP); CPEC-TP competitively inhibits cytidine triphosphate (CTP) synthase, thereby depleting intracellular cytidine pools and inhibiting DNA and RNA synthesis. This agent may also induce differentiation of some tumor cell types. The antiviral activity of this agent is broad-spectrum.

**cyclophosphamide:** A synthetic alkylating agent chemically related to the nitrogen mustards with antineoplastic and immunosuppressive activities. In the liver, cyclophosphamide is converted to the active metabolites aldophosphamide and phosphoramidate mustard, which bind to DNA, thereby inhibiting DNA replication and initiating cell death. OR A drug used to treat depression and peripheral neuropathy (pain, numbness, tingling, burning, or weakness in the hands or feet) that can occur with diabetes. It is also being studied in the treatment of peripheral neuropathy caused by certain anticancer drugs. Cymbalta increases the amount of certain chemicals in the brain that help relieve depression and pain. It is a

type of serotonin and norepinephrine reuptake inhibitor. Also called duloxetine and duloxetine hydrochloride.

**Cyclosporin:** A drug that is a potent suppressor of the immune system and is used to prevent rejection in organ transplants.

**cyclosporine:** A natural cyclic polypeptide immunosuppressant isolated from the fungus *Beauveria nivea*. The exact mechanism of action of cyclosporine is not known but may involve binding to the cellular protein cytophilin, resulting in inhibition of the enzyme calcineurin. This agent appears to specifically and reversibly inhibit immunocompetent lymphocytes in the G<sub>0</sub>-or G<sub>1</sub>-phase of the cell cycle. T-lymphocytes are preferentially inhibited with T-helper cells as the primary target. Cyclosporine also inhibits lymphokine production and release. or A drug that is used to treat asthma, allergies, and colds, and to relieve itching caused by certain skin disorders. It has also been used to stimulate appetite and weight gain, and is being studied in the treatment of weight loss caused by cancer and its treatment. Cyproheptadine belongs to the family of drugs called antihistamines.

**cyclosporine ophthalmic emulsion:** An topical ophthalmic formulation containing cyclosporine, an undecapeptide produced by the fungus *Beauveria nivea*, with immunosuppressant and anti-inflammatory activities. The exact therapeutic mechanism of action of cyclosporine is not known but may involve binding to the cellular protein cytophilin, resulting in inhibition of the enzyme calcineurin. This agent appears to specifically and reversibly inhibit immunocompetent lymphocytes in the G<sub>0</sub>-or G<sub>1</sub>-phase of the cell cycle. T-lymphocytes are preferentially inhibited with T-helper cells as the primary target. Cyclosporine also inhibits lymphokine production and release.

**Cyfos:** (Other name for: ifosfamide)

**Cyklokapron:** (Other name for: tranexamic acid)

**CYL-02 plasmid DNA:** A gene transfer preparation of a plasmid DNA encoding mouse somatostatin receptor subtype 2 (sst2) and a fusion protein of human deoxycytidine kinase (DCK) and uridine monophosphate kinase (UMK), complexed to a synthetic polycationic carrier, polyethylenimine, with antineoplastic adjuvant application. Upon administration, CYL-02 plasmid DNA expresses DCK::UMK fusion protein that converts gemcitabine into its toxic phosphorylated metabolite. Expression of sst2

protein by this agent could induce both antioncogenic and local antitumor bystander effects. A loss of sst2 gene expression often is found in pancreatic and colorectal cancers, and is the receptor for somatostatin which negatively regulates a number of processes such as epithelial cell proliferation. Combination effects of these gene products allows for less chemotherapy to cause tumor cell lysis in not only the original tumor, but in distant tumors as well.

**Cylasm:** Cylasm. The contents enclosed by the plasma (or cylasmic) membrane, excluding the nucleus.

**Cylindrical:** Refers to the shape of a container which has a circular cross section parallel to the minor axis and a rectangular cross section parallel to the major axis.

**Cymbalta :** A synthetic hormone being studied for treatment of hot flashes in men with prostate cancer who have had both testicles removed by surgery.

**Cynviloq™:** (Other name for: paclitaxel-loaded polymeric micelle)

**CYP17 inhibitor CFG920:** An orally available inhibitor of the steroid 17-alpha-hydroxylase/C17,20 lyase (CYP17A1 or CYP17), with potential antiandrogen and antineoplastic activities. Upon oral administration, CYP17 inhibitor CFG920 inhibits the enzymatic activity of CYP17A1 in both the testes and adrenal glands, thereby inhibiting androgen production. This may decrease androgen-dependent growth signaling and may inhibit cell proliferation of androgen-dependent tumor cells. The cytochrome P450 enzyme CYP17A1, localized to the endoplasmic reticulum, exhibits both 17alpha-hydroxylase and 17,20-lyase activities, and plays a key role in the steroidogenic pathway that produces steroidal hormones.

**CYP17 inhibitor VT-464:** An orally available non-steroidal, lyase-selective inhibitor of the steroid 17-alpha-hydroxylase/C17,20 lyase (CYP17A1 or CYP17), with potential anti-androgenic and antineoplastic activities. Upon oral administration, CYP17 inhibitor VT-464 selectively inhibits the enzymatic activity of the cytochrome P450 C17,20 lyase in both the testes and adrenal glands, thereby inhibiting androgen production. This may decrease androgen-dependent growth signaling and may inhibit cell proliferation of androgen-dependent tumor cells. The cytochrome P450 enzyme CYP17A1, localized to the endoplasmic reticulum, exhibits both 17alpha-hydroxylase and 17,20-lyase activities; it plays a key role in the

steroidogenic pathway. The lyase-selective activity of VT-464 prevents the increased synthesis of mineralocorticoids that is normally seen with non-selective CYP17 inhibitors, which also inhibit the 17-alpha-hydroxylase activity of CYP17A1.

**CYP17 lyase inhibitor ASN001:** An orally available non-steroidal, lyase-selective inhibitor of the steroid 17-alpha-hydroxylase/C17,20 lyase (CYP17A1 or CYP17), with potential anti-androgenic and antineoplastic activities. Upon oral administration, CYP17 lyase inhibitor ASN001 selectively binds to and inhibits the lyase activity of CYP17A1 in both the testes and adrenal glands, resulting in a significant reduction in androgen production to castrate-range levels. This may both decrease androgen-dependent growth signaling and inhibit the proliferation of androgen-dependent tumor cells. The cytochrome P450 enzyme CYP17A1, which is localized to the endoplasmic reticulum, exhibits both 17alpha-hydroxylase and 17,20-lyase activities; it plays a key role in the steroidogenic pathway. The selective inhibition of CYP17A1 lyase activity by ASN001 prevents the increased synthesis of mineralocorticoids that is normally seen with non-selective CYP17 inhibitors, which also inhibit the 17-alpha-hydroxylase activity of CYP17A1.

**CYP17/androgen receptor inhibitor ODM 204:** An orally available inhibitor of both the steroid 17-alpha-hydroxylase/C17,20 lyase (CYP17A1 or CYP17) and androgen receptor (AR), with potential anti-androgen and antineoplastic activities. Upon oral administration, CYP17/AR inhibitor ODM 204 selectively inhibits the enzymatic activity of CYP17A1 in both the testes and adrenal glands, thereby inhibiting androgen production. This may both decrease androgen-dependent growth signaling and inhibit the proliferation of androgen-dependent tumor cells. In addition, ODM 204 binds to ARs in target tissues and inhibits androgen-induced receptor activation and AR nuclear translocation, which prevents the binding to and transcription of AR-responsive genes. This leads to an inhibition of growth in AR-expressing prostate cancer cells. The cytochrome P450 enzyme CYP17A1, which is localized to the endoplasmic reticulum, exhibits both 17alpha-hydroxylase and 17,20-lyase activities.

**cyproheptadine :** A drug used with other drugs to treat colorectal cancer and non-small cell lung cancer that have spread to other parts of the body. It is used alone or with another drug to treat cancer of the stomach or

gastroesophageal junction (area where the esophagus connects to the stomach) that is advanced or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Cyramza binds to receptors for a protein called vascular endothelial growth factor (VEGF), which may be found on some types of cancer cells. This may prevent the growth of new blood vessels that tumors need to grow. Cyramza is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called anti-VEGFR-2 fully human monoclonal antibody IMC-1121B, IMC-1121B, and ramucirumab.

**cyproheptadine hydrochloride:** The hydrochloride salt of a synthetic methyl-piperidine derivative with antihistaminic and anti-serotonergic properties. Cyproheptadine competes with free histamine (HA) for binding at HA-receptor sites, thereby competitively antagonizing histamine stimulation of HA-receptors in the gastrointestinal tract, large blood vessels, and bronchial smooth muscle. This agent also competes with free serotonin for binding at serotonin receptor sites. Cyproheptadine exhibits anticholinergic and sedative properties and has been shown to stimulate appetite and weight gain.

**cyproterone acetate:** The acetate salt of a synthetic steroidal antiandrogen with weak progestational and antineoplastic activities. Cyproterone binds the androgen receptor (AR), thereby preventing androgen-induced receptor activation in target tissues and inhibiting the growth of testosterone-sensitive tumor cells. This agent also exerts progestational agonist properties at the level of the pituitary that reduce luteinizing hormone (LH), resulting in reductions in testicular androgen secretion and serum testosterone levels. Treatment with cyproterone alone results in incomplete suppression of serum testosterone levels.

**cyproterone acetate :** A closed, sac-like pocket of tissue that can form anywhere in the body. It may be filled with fluid, air, pus, or other material. Most cysts are benign (not cancer).

**Cyramza:** (Other name for: ramucirumab) or Surgery to remove all or part of the bladder (the organ that holds urine) or to remove a cyst (a sac or capsule in the body).

**Cyren A:** (Other name for: diethylstilbestrol)

**cyst :** A tube that carries bile from the gall bladder. It joins the common hepatic duct to form the common bile duct. It is part of the biliary duct

system.

**cystectomy** : A common hereditary disease in which exocrine (secretory) glands produce abnormally thick mucus. This mucus can cause problems in digestion, breathing, and body cooling.

**cysteine-rich non-denatured whey protein isolate IMN1207**: A biologically active, cysteine-rich, undenatured, bovine whey-based protein isolate with potential anti-cachexia and glutathione-enhancing properties. Upon administration of cysteine-rich whey protein isolate, cystine and glutamylcystine are taken up by cells and release free cysteine. The available cysteine allows cells to synthesize glutathione (GSH), a tripeptide made from amino acids glycine, glutamate and cysteine, thereby maintaining and increasing intracellular GSH concentrations. GSH plays a major role as an antioxidant, thereby protecting cells from oxidative damage due to harmful substances such as free radicals and reactive oxygen compounds. As IMN 1207 is rich in protein, this agent may prevent weight loss and increase body weight and strength. Check for active clinical trials using this agent.

**cystic duct** : Surgery to remove the bladder (the organ that holds urine) and the prostate. In a radical cystoprostatectomy, the seminal vesicles are also removed. The prostate and seminal vesicles are glands in the male reproductive system that help make semen. Also called prostatocystectomy.

**cystic fibrosis** : A type of tumor found in breast or prostate tissue. It is often large and bulky and grows quickly. It may be benign (not cancer) or malignant (cancer) and may spread to other parts of the body. Also called CSP and phyllodes tumor.

**cystoprostatectomy** : A thin, tube-like instrument used to look inside the bladder and urethra. A cystoscope has a light and a lens for viewing and may have a tool to remove tissue.

**cystosarcoma phyllodes** : Examination of the bladder and urethra using a cystoscope, inserted into the urethra. A cystoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**cystoscope** : Surgery to remove the bladder (the organ that holds urine) and urethra (the tube through which urine leaves the body).

**cystoscopy** : A drug used to treat certain types of leukemia and prevent the spread of leukemia to the meninges (three thin layers of tissue that cover and protect the brain and spinal cord). It is also being studied in the treatment of other types of cancer. Cytarabine blocks tumor growth by stopping DNA synthesis. It is a type of antimetabolite.

**cystourethrectomy** : A form of the anticancer drug cytarabine that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than cytarabine. It is used to treat lymphoma that has spread to the meninges (three thin layers of tissue that cover and protect the brain and spinal cord). It is also being studied in the treatment of other types of cancer. It is a type of antimetabolite. Also called Depo-Cyt and liposomal cytarabine.

**Cysview**: (Other name for: hexaminolevulinate hydrochloride)

**cytadine analogue RX-3117**: An orally available small molecule and nucleoside antimetabolite with potential antineoplastic activity. Upon administration, the cytidine analogue RX-3117 is taken up by cells through a carrier-mediated transporter, phosphorylated by uridine cytidine kinase (UCK) and then further phosphorylated to its diphosphate (RX-DP) and triphosphate forms (RX-TP). The triphosphate form is incorporated into RNA and inhibits RNA synthesis. The diphosphate RX-DP is reduced by ribonucleotide reductase (RR) to dRX-DP; its triphosphate form (dRX-TP) is incorporated into DNA. In addition, RX-3117 also inhibits DNA methyltransferase 1 (DNMT1). This eventually leads to cell cycle arrest and the induction of apoptosis. UCK is the rate-limiting enzyme in the pyrimidine-nucleotide salvage pathway.

**cytarabine**: A substance being studied in the treatment of cancer that has spread to the brain. It has also been studied in the treatment of other types of cancer. Cytochlor damages the DNA in cancer cells, which may make them easier to kill with radiation therapy. It is a type of radiosensitizing agent. OR An antimetabolite analogue of cytidine with a modified sugar moiety (arabinose instead of ribose). Cytarabine is converted to the triphosphate form within the cell and then competes with cytidine for incorporation into DNA. Because the arabinose sugar sterically hinders the rotation of the molecule within DNA, DNA replication ceases, specifically during the S phase of the cell cycle. This agent also inhibits DNA polymerase, resulting in a decrease in DNA replication and repair.

**cytarabine liposome:** A liposomal intrathecal formulation of the antimetabolite cytarabine. As an S-phase-specific antimetabolite, cytarabine is phosphorylated by deoxycytidine kinase to a triphosphate form which competes with thymidine for incorporation into DNA; the incorporation of cytarabine triphosphate into DNA appears to inhibit DNA polymerase and so DNA synthesis, resulting in cell death. A group of enzymes involved in drug metabolism and found in high levels in the liver. These enzymes change many drugs, including anticancer drugs, into less toxic forms that are easier for the body to excrete. OR

**cytarabine monophosphate prodrug MB07133:** A prodrug of the monophosphate (MP) form of the antimetabolite cytarabine (araCMP), an analogue of cytidine with a modified sugar moiety (arabinose instead of ribose), with potential antineoplastic activity. Upon administration of the cytarabine MP prodrug MB07133, the targeting moiety of this agent specifically delivers the cytarabine moiety to the liver. In turn, araCMP is selectively converted to araC triphosphate (araCTP) by a liver kinase, where it binds to and competes with cytidine for incorporation into DNA, thereby inhibiting DNA polymerase, and DNA synthesis. This leads to the inhibition of tumor cell proliferation and destruction of liver cancer cells. The liver is not able to convert araC into araCMP; araCMP is not converted into araCTP in tissues other than the liver. This enhances efficacy and minimizes systemic toxicity. Check for active clinical trials using this agent.

**Cytidine:** A pyrimidine nucleoside found in DNA and RNA.

**Cytidine diphosphodiacylglycerol (CDP-diacylglycerol):** An activated precursor for the synthesis of many phospholipids formed by the reaction of phosphatidate with CTP.

**cytochlor:** A radio-sensitizing pyrimidine nucleoside with potential antineoplastic activity. Cytochlor is metabolized first to a phosphate derivative, CldCMP, by the enzyme deoxycytidine kinase and then to the active uracyl derivative, CldUMP, by the enzyme dCMP deaminase; deoxycytidine kinase and dCMP deaminase have been found in abnormally high concentrations in most cancers. CldUMP, the active metabolite, incorporates into DNA and, upon exposure to radiation, induces the formation of uracil radicals and double-strand DNA breaks. or The study of chromosomes, which are long strands of DNA and protein that contain most of the genetic information in a cell. Cytogenetics involves testing samples

of tissue, blood, or bone marrow in a laboratory to look for changes in chromosomes, including broken, missing, or extra chromosomes. Changes in certain chromosomes may be a sign of a genetic disease or condition or some types of cancer. Cytogenetics may be used to help diagnose a disease or condition, plan treatment, or find out how well treatment is working.

**Cytochrome:** An electron-transferring protein that contains a heme prosthetic group whose iron component shuttles between the ferrous (+2) and ferric (+3) state during electron transfer. OR bf A cytochrome complex that links photosystem II and photosystem I in green plants; cytochrome bf contributes to the proton gradient by oxidizing plastoquinol to plastoquinone. OR c A water-soluble, highly conserved cytochrome component of the respiratory chain that accepts electrons from cytochrome reductase and is in turn oxidized by cytochrome oxidase.

**Cytochrome oxidase:** c The final complex of the respiratory chain, cytochrome oxidase transfers electrons from cytochrome c to molecular oxygen and concomitantly pumps protons across the inner mitochondrial membrane to generate the proton-motive force. Also called Complex IV.

**cytochrome P450 enzyme system :** A type of protein found on epithelial cells, which line the inside and outside surfaces of the body. Cytokeratins help form the tissues of the hair, nails, and the outer layer of the skin. They are also found on cells in the lining of organs, glands, and other parts of the body. Certain cytokeratins may be found in higher than normal amounts in patients with different types of epithelial cell cancers, including lung, breast, colorectal, bladder, and head and neck cancers. Measuring the amount of specific cytokeratins in the blood may help to plan cancer treatment or find out how well treatment is working or if cancer has come back. A cytokeratin is a type of tumor marker. Also called keratin.

**Cytochrome P450 system:** Found in adrenal mitochondria and liver microsomes, an electron-transport chain in which the terminal component is cytochrome P450; this system plays a role in the detoxification of foreign substances by altering them to increase their solubility and facilitate excretion.

**cytochromes:** molecules that accept and release electrons in an electron transport system. OR Heme-containing proteins that function as electron carriers in oxidative phosphorylation and photosynthesis.

**cytogenetics** : A type of protein that is made by certain immune and non-immune cells and has an effect on the immune system. Some cytokines stimulate the immune system and others slow it down. They can also be made in the laboratory and used to help the body fight cancer, infections, and other diseases. Examples of cytokines are interleukins, interferons, and colony-stimulating factors (filgrastim, sargramostim). OR The study of the structure, function, and abnormalities of human chromosomes.

**cytokeratin** : The study of cells using a microscope.

**cytokine** : A virus that may be carried in an inactive state for life by healthy individuals. It is a cause of severe pneumonia in people with a suppressed immune system, such as those undergoing bone marrow transplantation or those with leukemia or lymphoma. Also called CMV.

**cytokine-induced killer cells**: A preparation of autologous lymphocytes with potential immunopotentiating and antineoplastic activities. Cytokine-induced killer (CIK) cells are CD3- and CD56-positive, non-major histocompatibility complex (MHC)-restricted, natural killer (NK)-like T lymphocytes, generated ex-vivo by incubation of peripheral blood lymphocytes (PBLs) with anti-CD3 monoclonal antibody, interleukin (IL)-2, IL-1, and interferon gamma (IFN-gamma) and then expanded. When reintroduced back to patients after autologous stem cell transplantation, CIK cells may recognize and kill tumor cells associated with minimal residual disease (MRD). CIK cells may have enhanced cytotoxic activity compared to lymphokine-activated killer (LAK) cells.

**cytokinesis**: the process during mitosis in which the cytoplasm divides into two separate cells; also called cytoplasmic division. OR The final separation of daughter cells following mitosis.

**Cytokinin**: A plant hormone produced in root tissue.

**cytology** : A drug that is used to treat certain thyroid (a gland located near the voice box) conditions. It is also being studied in the treatment of thyroid cancer. Cytomel is made in the laboratory and is a form of the thyroid hormone triiodothyronine (T3). Also called liothyronine sodium and Triostat.

**cytomegalovirus** : A condition in which there is a lower-than-normal number of blood cells.

**cytomegalovirus IE-1-specific cytotoxic T lymphocytes**: Cytotoxic T-lymphocytes (CTLs), specifically reactive to the cytomegalovirus (CMV)

immediate early-1 (IE-1) protein, with immunomodulating activity. Adoptive immunotherapy with cytomegalovirus IE-1-specific cytotoxic T lymphocytes may help reconstitute CD8<sup>+</sup> cytomegalovirus-specific CTL responses in CMV-infected immunocompromised hosts. IE-1 is one of the first CMV antigens expressed by CMV-infected cells, predominantly inducing a CD8<sup>+</sup> CTL response. Check for active clinical trials using this agent.

**cytomegalovirus pp65-specific cytotoxic T lymphocytes:** Cytotoxic T lymphocytes (CTLs) specifically reactive to the cytomegalovirus (CMV) phosphoprotein pp65 with potential antiviral activity. To prepare CMV pp65-specific cytotoxic T lymphocytes in vitro, dendritic cells (DCs) are pulsed with CMV pp65 epitopes and then used to stimulate and propagate CMV pp65-specific cytotoxic T lymphocytes from peripheral blood mononuclear cells (PBMNCs); the CMV pp65-specific cytotoxic T lymphocyte population is then expanded so as to be sufficient for use in adoptive T lymphocyte therapy. When administered into a patient post-allogeneic hematopoietic stem cell transplantation, this agent may elicit a specific CTL response against CMV-infected host cells, which may result in the resolution of CMV infection. The CMV pp65 protein (65 kDa lower matrix phosphoprotein), the primary component of the enveloped subviral particle, is an immunodominant target for helper and cytotoxic T lymphocyte responses to CMV.

**Cytomel :** The fluid inside a cell but outside the cell's nucleus. Most chemical reactions in a cell take place in the cytoplasm.

**cytopenia :** A chemical compound that is used to make one of the building blocks of DNA and RNA. It is a type of pyrimidine.

**cytoplasm:** semiliquid substance that composes the foundation of the cell and contains the organelles. OR The contents enclosed by the plasma (or cytoplasmic) membrane, excluding the nucleus. OR The portion of a cell's contents outside the nucleus but within the plasma membrane; includes organelles such as mitochondria.

**cytoplasm :** A substance that slows or stops the growth of cells, including cancer cells, without killing them. These agents may cause tumors to stop growing and spreading without causing them to shrink in size.

**Cytosar-U:** (Other name for: cytarabine)

**Cytosine:** A pyrimidine base found in DNA and RNA.

**cytosine** : A substance that kills cells, including cancer cells. These agents may stop cancer cells from dividing and growing and may cause tumors to shrink in size.

**cytoskeleton**: an organelle within cells consisting of an interconnected system of fibers, threads, and interwoven molecules that give structure to the cell. OR The filamentous skeleton, formed in the eukaryotic cytoplasm, that is largely responsible for controlling cell shape. OR Internal scaffolding of cells, made up of microfilaments, intermediate filaments, and microtubules, which enables cells to transport vesicles, change shape, and migrate. OR Cytoskeleton. The filamentous skeleton, formed in the eukaryotic cytoplasm, that is largely responsible for controlling cell shape. OR The filamentous network providing structure and organization to the cytoplasm; includes actin filaments, microtubules, and intermediate filaments.

**Cytosol**: Cytosol. The liquid portion of the cytoplasm, including the macromolecules but not including the larger structures like subcellular organelles or cytoskeleton. OR The continuous aqueous phase of the cytoplasm, with its dissolved solutes; excludes the organelles such as mitochondria.

**cytostatic agent** : Anticancer drugs that kill cells, especially cancer cells.

**cytotoxic**: The adjective applied to anything that is harmful to the cell structure and function and ultimately causing cell death.

**cytotoxic agent** : A type of immune cell that can kill certain cells, including foreign cells, cancer cells, and cells infected with a virus. Cytotoxic T cells can be separated from other blood cells, grown in the laboratory, and then given to a patient to kill cancer cells. A cytotoxic T cell is a type of white blood cell and a type of lymphocyte. Also called cytotoxic T lymphocyte and killer T cell.

**cytotoxic chemotherapy** : A type of immune cell that can kill certain cells, including foreign cells, cancer cells, and cells infected with a virus. Cytotoxic T lymphocytes can be separated from other blood cells, grown in the laboratory, and then given to a patient to kill cancer cells. A cytotoxic T lymphocyte is a type of white blood cell and a type of lymphocyte. Also called cytotoxic T cell and killer T cell.

**cytotoxic T cell** : A substance that can kill cells.

**cytotoxic T lymphocyte** : A drug that is used to treat many types of cancer and is being studied in the treatment of other types of cancer. It is also used to treat some types of kidney disease in children. Cytosan attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called CTX and cyclophosphamide.

**Cytotoxic T lymphocytes**: T cells that trigger cell death by apoptosis in cells that display foreign antigens on class I MHC proteins. Also called killer T cells.

**cytotoxin** : A procedure to scrape and remove tissue from the inner lining of the uterus. The cervix is dilated (made larger) and a curette (spoon-shaped instrument) is inserted into the uterus to remove tissue. A tissue sample may then be checked under a microscope for signs of disease, such as infection or cancer. A D&C may also be done after a miscarriage or to treat certain conditions, such as abnormal bleeding. Also called dilatation and curettage and dilation and curettage.

**Cytosan** : A substance being studied in the treatment of melanoma and many other types of cancer. D-1MT blocks the breakdown of the amino acid tryptophan, which is needed for T cells (a type of immune system cell) to kill tumor cells. Giving D-1MT to patients who have received chemotherapy for cancer may help kill more tumor cells. It is a type of enzyme inhibitor and immunosuppressant. Also called 1-methyl-d-tryptophan.

**D loop**: An extended loop of single-stranded DNA displaced from a duplex structure by an oligonucleotide.

**D-1MT**: A drug used alone or with trametinib to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is used in patients with a mutated (changed) form of a cell protein called BRAF. It is also being studied in the treatment of other types of cancer. Dabrafenib blocks this mutated protein, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor and a type of targeted therapy. Also called Tafinlar.

**D-20761**: A rare, slow-growing tumor of blood vessels that forms in or under the skin anywhere on the body. Dabska tumors may appear as firm, raised, purplish bumps, which may be small or large. They usually do not spread to other parts of the body. Dabska tumors can occur in children and

adults. They are a type of vascular tumor. Also called papillary intralymphatic angioendothelioma.

**D-cycloserine:** An analogue of the amino acid D-alanine with broad-spectrum antibiotic and glycinergic activities. D-cycloserine interferes with bacterial cell wall synthesis by competitively inhibiting two enzymes, L-alanine racemase and D-alanine:D-alanine ligase, thereby impairing peptidoglycan formation necessary for bacterial cell wall synthesis. This agent may be bactericidal or bacteriostatic, depending on its concentration at the infection site and the susceptibility of the organism. In addition, D-cycloserine is an excitatory amino acid and partial agonist at the glycine binding site of the NMDA receptor in the central nervous system (CNS); binding to the central NMDA receptor may result in amelioration of neuropathic pain. or A chemotherapy combination used to treat colorectal cancer. It is also used with radiation therapy to treat esophageal cancer and stomach cancer. It includes the drugs fluorouracil and leucovorin calcium.

**D-methionine formulation MRX-1024:** A proprietary oral formulation of D-methionine with antioxidant and antimucositis activities. D-methionine formulation MRX-1024 may selectively protect the oral mucosa from the toxic effects of chemotherapy and radiation therapy without compromising antitumor activity. D-methionine may be converted into the L- isomer in vivo, particularly in instances of L-methionine deprivation; both isomers have antioxidant activity which may be due, in part, to their sulfur moieties and chelating properties. L-methionine, an essential amino acid, also may help to maintain the ratio of reduced glutathione to oxidized glutathione in cells undergoing oxidative stress and may provide a source of L-cysteine for glutathione synthesis.

**D'Amico criteria :** A set of clinical criteria that is used to stratify prostate cancers into three risk categories to estimate cancer growth and spread. The criteria include Gleason score, prostate-specific antigen level, and clinical stage at diagnosis.

**D/I unit:** Deionizing unit, frequently used to maintain water quality in aquariums. Advantages: does not waste water like the R/O unit, is designed to be hooked up to either a faucet or household piping system, the anion & cation resins can be regenerated (with another expensive unit) indefinitely, and these systems allow a larger water flow (up to 2,000 gallons a day), than an R/O system, but cost dramatically more too.

**D&C:** A synthetic luteinizing hormone-releasing hormone (LH-RH) antagonist that suppresses LH and sex steroid levels.

**D1/3-MAGE-3-His fusion protein:** A recombinant fusion protein derived from the melanoma antigen MAGE-3 with potential immunostimulating and antineoplastic activities. Recognized by specific cytotoxic T lymphocytes, D1/3-MAGE-3-His fusion protein may boost antitumoral immune responses when used in a vaccine formulation. This recombinant chimeric protein is produced by fusing MAGE-3 with a lipidated protein D derived from H. influenzae at its N-terminus and a sequence of several histidine residues at its C-terminus.

**da-huang :** A drug used to prevent blood clots from forming or to treat blood clots that have formed in patients with cancer or other conditions. Dalteparin is a type of anticoagulant. Also called dalteparin sodium and Fragmin.

**DAB389 epidermal growth factor:** A recombinant fusion protein composed of the diphtheria toxin with the receptor-binding domain replaced by human epidermal growth factor (EGF). When administered, EGF binds to the endothelial cell growth factor receptor, EGFR, which is upregulated in many solid tumors. After binding to the EGF receptor, the agent is internalized by the cell, where the diphtheria toxin moiety exerts its cytotoxic effect, inhibiting protein synthesis through ADP-ribosylation of elongation factor 2.

**dabigatran etexilate mesylate:** An orally available mesylate salt form of the etexilate prodrug of dabigatran, a benzimidazole and direct thrombin inhibitor with anticoagulant activity. Upon administration, dabigatran etexilate is hydrolyzed by esterases and is converted into dabigatran. Dabigatran reversibly binds to and inhibits the activity of thrombin, a serine protease that converts fibrinogen into fibrin. This disrupts the coagulation cascade and inhibits the formation of blood clots.

**dabrafenib:** An orally bioavailable inhibitor of B-raf (BRAF) protein with potential antineoplastic activity. Dabrafenib selectively binds to and inhibits the activity of B-raf, which may inhibit the proliferation of tumor cells which contain a mutated BRAF gene. B-raf belongs to the the raf/mil family of serine/threonine protein kinases and plays a role in regulating the MAP kinase/ERKs signaling pathway, which may be constitutively activated due to BRAF gene mutations. or A substance being studied in the

treatment of cancer. It is a type of topoisomerase inhibitor. Also called acridine carboxamide.

**Dabska tumor :** A drug used to treat Hodgkin lymphoma and malignant melanoma. It is also being studied in the treatment of other types of cancer. Dacarbazine attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called DTIC-Dome.

**DACA:** A drug used to keep the body from rejecting kidney transplants. It is also being studied in the treatment of some types of cancer and other conditions. Dacliximab binds to receptors for a protein called interleukin-2 (IL-2), which are found on some types of immune cells and cancer cells. This may help suppress the body's immune response and it may help kill cancer cells. Dacliximab is a type of monoclonal antibody. Also called daclizumab and Zenapax.

**dacarbazine:** A triazine derivative with antineoplastic activity. Dacarbazine alkylates and cross-links DNA during all phases of the cell cycle, resulting in disruption of DNA function, cell cycle arrest, and apoptosis. OR A drug used to keep the body from rejecting kidney transplants. It is also being studied in the treatment of some types of cancer and other conditions. Daclizumab binds to receptors for a protein called interleukin-2 (IL-2), which are found on some types of immune cells and cancer cells. This may help suppress the body's immune response and it may help kill cancer cells. Daclizumab is a type of monoclonal antibody. Also called dacliximab and Zenapax.

**dacetuzumab:** A humanized monoclonal antibody directed against the CD40 receptor with potential antineoplastic activity. Dacetuzumab specifically binds to and inhibits the CD40 receptor, thereby inducing apoptosis and inhibiting cellular proliferation via antibody-dependent cellular cytotoxicity (ADCC) in cells that overexpress this receptor. The CD40 receptor, a member of the tumor necrosis factor (TNF) receptor super-family, is highly expressed on most B lineage hematologic malignancies including multiple myeloma, non-Hodgkin's lymphoma, chronic lymphocytic leukemia, Hodgkin's disease and acute lymphoblastic leukemia.

**DACH polymer platinate AP5346:** A low molecular weight polymer-conjugated platinum complex with potential antineoplastic activity. This polymer drug delivery system consists of cytotoxic diaminocyclohexane

(DACH)-platinum (Pt) coupled to a water-soluble biocompatible hydroxypropylmethacrylamide (HPMA) copolymer via a pH sensitive linker. Due to decreased pH in tumor sites, the linker is cleaved and the chelated active moiety DACH-Pt is released in tumor cells. DACH-Pt alkylates macromolecules and causes both inter- and intra-strand platinum-DNA crosslinks, which impede DNA replication and transcription, resulting in cell-cycle independent cytotoxicity. The HPMA-based drug delivery system increases the concentration and prolongs the half-life of DACH-Pt in tumor sites, while minimizing adverse effects on normal tissues.

**DACH-platin micelle NC-4016:** Polymeric micellar nanoparticles containing diaminocyclohexane platinum (DACH-platin or DACH-Pt) with potential antineoplastic activity. DACH-platin micelle NC-4016 is prepared through the formation of a polymer-metal complex between DACH-platin and the polyethylene glycol-poly (glutamic acid) block copolymer, PEG-P(Glu). DACH-platin, an active metabolite of the platinum-based antineoplastic agent oxaliplatin, is highly hydrophobic and toxic when administered systemically. The use of polymeric micelles incorporating DACH-platin may both increase cell permeability and enhance the retention of the agent. This allows an extended half-life in the blood circulation and a selective and high accumulation of DACH-platin at tumor sites. This results in increased anticancer efficacy while reducing side effects due to DACH-platin toxicity. Upon intravenous administration and internalization by tumor cells, DACH-platin binds to and causes both inter- and intra-strand cross-links in DNA, forming platinum adducts and triggering tumor cell apoptosis.

**daclatasvir:** An orally available inhibitor of the hepatitis C virus (HCV) non-structural protein 5A (NS5A) replication complex, with potential activity against HCV. Although the exact mechanism of action of daclatasvir has yet to be fully determined, this agent, upon oral administration and after intracellular uptake, appears to bind to domain I of the NS5A protein. This inhibits the activity of the NS5A protein and results in the disruption of the viral RNA replication complex, blockage of viral HCV RNA production, and inhibition of viral replication. NS5A, a zinc-binding and proline-rich hydrophilic phosphoprotein, plays a crucial role in HCV RNA replication. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family.

**daclizumab:** A recombinant monoclonal antibody interleukin-2 receptor antagonist. Daclizumab binds specifically to the alpha subunit of the human interleukin-2 (IL-2) receptor expressed on the surface of activated lymphocytes in vivo, thereby inhibiting IL-2 binding and IL-2-mediated lymphocyte activation, a critical cellular immune response pathway. Check for active clinical trials using this agent. OR A drug that is used to treat myelodysplastic syndromes and is being studied in the treatment of other types of cancer. It is a type of antimetabolite. Also called decitabine.

**daclizumab :** A drug used to treat Ewing sarcoma, gestational trophoblastic tumor, Wilms tumor, and certain types of testicular cancer. It is also used to treat rhabdomyosarcoma in children. It is being studied in the treatment of other types of cancer. Dactinomycin comes from the bacterium *Streptomyces parvulus*. It damages the cell's DNA and may kill cancer cells. It is a type of anticancer antibiotic. Also called actinomycin D and Cosmegen.

**Dacogen:** (Other name for: decitabine) The root of this plant has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. The scientific name is *Rheum palmatum* or *Rheum officinale*. Also called Chinese rhubarb, Indian rhubarb, rhubarb, and Turkish rhubarb.

**dacomitinib:** An orally bioavailable, highly selective, second-generation small-molecule inhibitor of the pan-epidermal growth factor receptor (EGFR) family of tyrosine kinases (ErbB family) with potential antineoplastic activity. Dacomitinib specifically and irreversibly binds to and inhibits human EGFR subtypes, resulting in inhibition of proliferation and induction of apoptosis in EGFR-expressing tumor cells. EGFRs play major roles in tumor cell proliferation and tumor vascularization, and are often overexpressed or mutated in various tumor cell types.

**dactinomycin:** A chromopeptide antineoplastic antibiotic isolated from the bacterium *Streptomyces parvulus*. Dactinomycin intercalates between adjacent guanine-cytosine base pairs, blocking the transcription of DNA by RNA polymerase; it also causes single-strand DNA breaks, possibly via a free-radical intermediate or an interaction with topoisomerase II.

**dactinomycin :** An isoflavone found in soy products. Soy isoflavones are being studied in the prevention of cancer.

**Dado:** The plain face of the body of a pedestal hence the deep border or band around the lower part of a room wall.

**DAF:** Dissolved air flotation - one of many designs for waste treatment

**daidzein :** A drug used to prevent blood clots from forming or to treat blood clots that have formed in patients with cancer or other conditions. Dalteparin sodium is a type of anticoagulant. Also called dalteparin and Fragmin.

**Dakin's solution:** A highly diluted solution of sodium hypochlorite (0.5% w/v) with topical anti-infective activity. Dakin's solution is used as an antiseptic to clean infected topical wounds.

**dalantercept:** A soluble fusion protein containing the extracellular domain of activin receptor-like kinase-1 (ALK1) fused to a human Fc domain (ALK1-Fc fusion protein), with potential antiangiogenic and antineoplastic activities. Upon administration, dalantercept binds to various ALK1 ligands, preventing activation of tumor cell ALK1 receptors and so inhibiting the ALK1 signaling pathway; growth factor-induced angiogenesis is thus inhibited, which may result in the inhibition of tumor cell proliferation and tumor cell death. ALK1 is a type I cell surface receptor with serine/threonine kinase activity that mediates signaling by members of the transforming growth factor-beta (TGFbeta) superfamily and plays a key role in angiogenesis; ligands for this receptor include TGFbeta1 and TGFbeta2. The Fc moiety of this fusion protein mediates clearance of ligand-fusion protein complexes by the reticuloendothelial system (RES).

**Daliresp:** (Other name for: roflumilast)

**dalotuzumab:** A recombinant monoclonal antibody directed against the insulin-like growth factor 1 receptor (IGF1R) with potential antineoplastic activity. Dalotuzumab binds to membrane-bound IGF1R, preventing binding of the ligand IGF1 and the subsequent triggering of the PI3K/Akt signaling pathway; inhibition of this survival signaling pathway may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. The activation of IGF1R, a tyrosine kinase and a member of the insulin receptor family, stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF1R signaling has been highly implicated in tumorigenesis and metastasis. Check for active clinical trials using this agent.

**dalteparin:** A low molecular weight, synthetic heparin. As an anticoagulant/antithrombotic agent, dalteparin binds to antithrombin and enhances the inhibition of Factor Xa. Compared to unfractionated heparins, the use of dalteparin is associated with lower incidences of osteoporosis and heparin-induced thrombocytopenia. A synthetic hormone that is a type of androgen and is used to treat endometriosis. It is being evaluated in the treatment of endometrial cancer.

**dalteparin sodium :** A drug used to treat acne. It is also used to treat other types of skin diseases and certain bacterial infections, such as leprosy. It blocks bacteria from making a substance that they need to grow. Dapsone is a type of antibacterial agent and a type of anti-inflammatory agent.

**Dalton:** Atomic mass is not measured in pounds or grams. Scientists used something called Daltons. One Dalton is equal to one-twelfth the mass of a carbon atom. Scientists also call a Dalton an Atomic Mass Unit. OR A unit of mass equivalent to the mass of a hydrogen atom ( $1.66 \times 10^{-24}$  g) OR A unit of mass very nearly equal to that of a hydrogen ion and precisely equal to 1.000 on the atomic mass scale. OR The weight of a single hydrogen atom ( $1.66 \times 10^{-24}$ g).

**Dalton's law:** The total pressure exerted by a mixture of gases is the sum of the pressures that each gas would exert if it were alone. For example, if dry oxygen gas at 713 torr is saturated with water vapor at 25 torr, the pressure of the wet gas is 738 torr.

**DALTON'S LAW of DEFINITE PROPORTIONS:** states that every compound has a definite composition by weight. Ah, the formulas.

**Damp course:** A layer of slate lead or bituminous composition built into a wall to prevent damp rising from the ground or soaking in from a ledge or parapet.

**Damping:** The ability of a silicone elastomer to absorb forced vibrational energy or The effect on a mass that causes decreasing amplitude.

**Dampness in walls:** Dampness can be caused by any number of problems, from broken rainwater pipes to defective pointing in brickwork. Whatever the source, it needs to be identified and cured. Before painting, the surface must be completely dry. If a water stain remains on a dry surface that is to be painted, first touch in locally with Dulux Alkali Resisting Primer. Areas that are to remain unpainted, such as brick or stonework, can be protected with Dulux Weathershield Waterseal.

**danazol:** A synthetic androgen derived from ethinyl testosterone. Danazol indirectly reduces estrogen production by decreasing pituitary secretion of follicle-stimulating hormone and luteinizing hormone, and binds to sex hormone receptors in target tissues, thereby exhibiting antiestrogenic, anabolic and weakly androgenic effects. OR A drug used to treat certain bacterial skin and bloodstream infections in adults. Daptomycin is also being studied in the treatment of fever and neutropenia (an abnormal decrease in the number of neutrophils, a type of white blood cell) in patients with cancer. It is a type of antibiotic. Also called Cubicin.

**Dancer Roll :** Weighted roll at the bottom of a take-up loop.

**dangling modifiers:** are similar to misplaced modifiers except that the modifier is not just separated from the word it modifies; it is missing the word it modifies

**daniquidone:** A water-insoluble heterocyclic amide with potential antineoplastic activity. Daniquidone inhibits topoisomerases I and II, thereby inhibiting DNA replication and repair, and RNA and protein synthesis. The acetylated form of daniquidone is highly toxic and is capable of inducing unscheduled DNA synthesis; rapid acetylators are more likely to experience toxicity with this agent.

**Danocrine:** (Other name for: danazol)

**danusertib:** A small-molecule 3-aminopyrazole derivative with potential antineoplastic activity. Dalotuzumab binds to and inhibits the Aurora kinases, which may result in cell growth arrest and apoptosis in tumor cells in which Aurora kinases are overexpressed. This agent may preferentially bind to and inhibit Aurora B kinase. Aurora kinases, a family of serine-threonine kinases, are important regulators of cellular proliferation and division. Check for active clinical trials using this agent.

**daporinad:** A small molecule with potential antineoplastic and antiangiogenic activities. Daporinad binds to and inhibits nicotinamide phosphoribosyltransferase (NMPRTase), inhibiting the biosynthesis of nicotinamide adenine dinucleotide (NAD<sup>+</sup>) from niacinamide (vitamin B3), which may deplete energy reserves in metabolically active tumor cells and induce tumor cell apoptosis. In addition, this agent may inhibit tumor cell production of vascular endothelial growth factor (VEGF), resulting in the inhibition of tumor angiogenesis. The coenzyme NAD<sup>+</sup> plays an essential

role in cellular redox reactions, including the redox reaction linking the citric acid cycle and oxidative phosphorylation.

**dapsone** : A log of study drugs kept by an investigator running a clinical trial. It lists many things about each drug, including the drug name, lot number, expiration date, the amount of drug received, used, returned, or thrown away, and the amount left. DARs help make sure that a clinical trial is done safely and correctly. DARs are required by the U.S. Food and Drug Administration (FDA). Also called Drug Accountability Record.

**dapsone gel, 5%**: A gel containing 5% (w/w) dapsone, a synthetic derivative of diamino-sulfone with anti-infective properties. A structural analog of p-aminobenzoic acid (PABA), dapsone inhibits dihydropteroate synthase (DHPS), an enzyme important in folate synthesis, resulting in a depletion of the folate pool and a reduction in the amount of thymidylate available for DNA synthesis.

**Daptacel**: (Other name for: diphtheria toxoid/tetanus toxoid/acellular pertussis vaccine adsorbed)

**daptomycin**: A semi-synthetic cyclic lipopeptide antibiotic isolated from the bacterium *Streptomyces roseosporus* with broad-spectrum antibiotic activity against Gram-positive bacteria. Daptomycin has a distinct mechanism of action, in which it binds to bacterial membrane and causes rapid depolarization of the cell membrane due to calcium-dependant potassium efflux; the loss of membrane potential leads to inhibition of DNA, RNA and protein synthesis, resulting in bacterial cell death. This agent does not penetrate the outer membrane of gram-negative bacteria.

**daptomycin** : A drug used to treat multiple myeloma. It is used in patients whose cancer was treated with at least three anticancer therapies, including a proteasome inhibitor and an immunomodulating agent. It is also being studied in the treatment of other types of cancer. Daratumumab binds to a protein called CD38, which is found on some types of immune cells and cancer cells, including myeloma cells. Daratumumab may block CD38 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Darzalex.

**DAR**: A substance made in the laboratory that stimulates the bone marrow to produce red blood cells. It belongs to the family of drugs called antianemics.

**Daraprim**: (Other name for: pyrimethamine)

**daratumumab:** A fully human monoclonal antibody directed against the cell surface glycoprotein CD-38 with potential antineoplastic activity. The binding of daratumumab to natural killer (NK) cells mimics the normal CD38-CD31 interaction on the NK cell surface. CD38 is also present on multiple myeloma (MM) cells and plasma leukemia cells; this agent may preferentially bind these cells, triggering antitumoral antibody-dependent cellular cytotoxicity (ADCC) and complement-dependent cytotoxicity (CDC). CD38, a cell surface glycoprotein, is present on various immune cells and has been shown to regulate the cytotoxic response of activated NK cells.

**daratumumab :** A microscope (device used to magnify small objects) in which objects are lit at a very low angle from the side so that the background appears dark and the objects show up against this dark background.

**darbepoetin alfa:** A recombinant analog of the endogenous cytokine erythropoietin, an erythropoiesis-stimulating protein. Due to the addition of two carbohydrate chains, darbepoetin alfa exhibits a three-fold greater half-life than does erythropoietin. Similar to erythropoietin, darbepoetin alfa binds to and activates epoetin receptors, thereby inducing the differentiation and maturation of erythrocyte progenitors, stimulating endothelial cell proliferation, and stimulating B-cell proliferation and immunoglobulin production. OR A drug used to treat multiple myeloma. It is used in patients whose cancer was treated with at least three anticancer therapies, including a proteasome inhibitor and an immunomodulating agent. It is also being studied in the treatment of other types of cancer. Darzalex binds to a protein called CD38, which is found on some types of immune cells and cancer cells, including myeloma cells. Darzalex may block CD38 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called daratumumab.

**darinaparsin:** A small-molecule organic arsenical with potential antineoplastic activity. Although the exact mechanism of action is unclear, darinaparsin, a highly toxic metabolic intermediate of inorganic arsenicals (iAs) that occurs in vivo, appears to generate volatile cytotoxic arsenic compounds when glutathione (GSH) concentrations are low. The arsenic compounds generated from darinaparsin disrupt mitochondrial bioenergetics, producing reactive oxygen species (ROS) and inducing ROS-

mediated tumor cell apoptosis; in addition, this agent or its byproducts may initiate cell death by interrupting the G2/M phase of the cell cycle and may exhibit antiangiogenic effects. Compared to inorganic arsenic compounds such as arsenic trioxide (As<sub>2</sub>O<sub>3</sub>), darinaparsin appears to exhibit a wide therapeutic window.

**Dark reactions:** Reactions that can occur in the dark, in a process that is usually associated with light, such as the dark reactions of photosynthesis. OR In chloroplasts, the reactions in which carbon dioxide is fixed into organic compounds, driven by ATP and NADPH.

**dark-field microscope :** A drug used to treat certain types of chronic myeloid leukemia and acute lymphoblastic leukemia. Dasatinib is also being studied in the treatment of certain other blood diseases and types of cancer. Dasatinib binds to and blocks BCR-ABL and other proteins that help cancer cells grow. It is a type of tyrosine kinase inhibitor. Also called BMS-354825 and Sprycel.

**DART DROP:** Measurement of the puncture resistance/impact strength of film and its ability to withstand the shock of a falling "dart" without breaking. Expressed as gram weight of the heaviest dart which doesn't break the film when dropped from a specified height.

**Dart Drop Test:** Determines resistance to puncturing of the film. Measured in grams.

**Darzalex:** (Other name for: daratumumab)

**Darzalex :** An impartial group that oversees a clinical trial and reviews the results to see if they are acceptable. This group determines if the trial should be changed or closed. Also called DSMB.

**dasabuvir:** A non-nucleoside inhibitor of the hepatitis C virus (HCV) non-structural protein 5B (NS5B), an RNA-dependent RNA polymerase, with potential activity against HCV. Upon administration and after intracellular uptake, dasabuvir binds HCV NS5B and blocks viral RNA synthesis and replication. The HCV NS5B protein is essential for the replication of the HCV RNA genome. HCV is a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family; HCV infection is associated with the development of hepatocellular carcinoma (HCC).

**dasatinib:** An orally bioavailable synthetic small molecule-inhibitor of SRC-family protein-tyrosine kinases. Dasatinib binds to and inhibits the

growth-promoting activities of these kinases. Apparently because of its less stringent binding affinity for the BCR-ABL kinase, dasatinib has been shown to overcome the resistance to imatinib of chronic myeloid leukemia (CML) cells harboring BCR-ABL kinase domain point mutations. SRC-family protein-tyrosine kinases interact with a variety of cell-surface receptors and participate in intracellular signal transduction pathways; tumorigenic forms can occur through altered regulation or expression of the endogenous protein and by way of virally-encoded kinase genes. OR The active ingredient in a drug used to treat acute leukemias and some other types of cancer. It blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. It is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called daunorubicin.

**dash:** a punctuation device used to interrupt a sentence, or introduce a restatement or explanation.

**Dash-pot:** A device used in hydraulic systems for damping down vibration. It consists of a piston attached to the part to be damped and fitted into a vessel containing fluid or air. It absorbs shocks by reducing the rate of change in the momentum of moving parts of machinery.

**Data** : The results and information that has been collected form an experiment

**Data acquisition (DAQ):** process of acquiring data, typically from A/D or digital input plugin devices.

**Data and Safety Monitoring Board** : A drug used to treat acute leukemias and some other types of cancer. It blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. Daunomycin hydrochloride is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called Cerubidine and daunorubicin hydrochloride.

**Datalogger** : A device that can be linked to a computer to record the results from an experiment automatically.

**daughter isotope:** In a nuclear equation the compound remaining after the parent isotope (the original isotope) has undergone decay. A compound undergoing decay, such as alpha decay, will break into an alpha particle and a daughter isotope.

**daughter products:** products created as an element undergoes radioactive decay. OR Isotopes that are formed by the radioactive decay of some other isotope. In the case of radium-226, for example, there are 10 successive daughter products, ending in the stable isotope lead-206.

**daunomycin :** The active ingredient in a drug used to treat acute leukemias and some other types of cancer. It blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. It is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called daunomycin.

**daunomycin hydrochloride :** A drug used to treat acute leukemias and some other types of cancer. It blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. Daunorubicin hydrochloride is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called Cerubidine and daunomycin hydrochloride.

**daunorubicin :** A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with DBA may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–Diamond anemia, congenital hypoplastic anemia, congenital pure red cell aplasia, Diamond-Blackfan anemia, erythrocytopenia, and inherited erythroblastopenia.

**daunorubicin hydrochloride:** The hydrochloride salt of an anthracycline antineoplastic antibiotic with therapeutic effects similar to those of doxorubicin. Daunorubicin exhibits cytotoxic activity through topoisomerase-mediated interaction with DNA, thereby inhibiting DNA replication and repair and RNA and protein synthesis. OR A procedure used to look at the inside of the small intestine. A special instrument made up of two tubes (one inside the other) is inserted through the mouth or rectum and into the small intestine. The inside tube, which is an endoscope with a light and lens for viewing, is moved through part of the small intestine, and a balloon at the end of it is inflated to keep the endoscope in place. Next, the outer tube is moved through the small intestine to reach the end of the endoscope, and a balloon at the end of the outer tube is inflated to keep it in

place. Then, the balloon at the end of the endoscope is deflated, and the endoscope is moved through the next part of the small intestine. These steps are repeated many times as the tubes move through the whole small intestine. This allows the doctor to see all of the small intestine. Tissue samples may be removed so they can be checked under a microscope for signs of disease. Also called double balloon endoscopy and double balloon enteroscopy.

**DaunoXome:** (Other name for: liposomal daunorubicin citrate)

**DAVANAT:** (Other name for: galactomannan derivative)

**Davidson correction:** A correction sometimes made to some types of correlated calculations (esp. CISD and MR-CISD) to estimate higher-order contributions to the energy and correct approximately for size-inconsistency.

**Daylight Opening:** Clearance between two platens of a press in the open position. Or Clearance between two platens of a press in the open position. Or The clearance between two platens of a silicone injection molding machine in the open position

**DBA:** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, and etoposide. Also called ABVE, ABVE regimen, and DBVE regimen.

**DBE:** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, and etoposide. Also called ABVE, ABVE regimen, and DBVE.

**DBVE:** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate, vincristine sulfate, etoposide, prednisone, and cyclophosphamide. Also called ABVE-PC, ABVE-PC regimen, and DBVE-PC regimen.

**DBVE regimen :** An abbreviation for a chemotherapy combination used with radiation therapy to treat childhood Hodgkin lymphoma. It includes the drugs doxorubicin hydrochloride (Adriamycin), bleomycin sulfate,

vincristine sulfate, etoposide, prednisone, and cyclophosphamide. Also called ABVE-PC, ABVE-PC regimen, and DBVE-PC.

**DBVE-PC:** An abbreviation for a chemotherapy combination used to treat certain types of head and neck cancer and stomach cancer. It includes the drugs docetaxel (Taxotere), cisplatin (Platinol), and fluorouracil. Also called docetaxel-cisplatin-fluorouracil, Taxotere-Platinol-fluorouracil, TPF, and TPF regimen.

**DBVE-PC regimen :** A noninvasive condition in which abnormal cells are found in the lining of a breast duct. The abnormal cells have not spread outside the duct to other tissues in the breast. In some cases, DCIS may become invasive cancer and spread to other tissues. At this time, there is no way to know which lesions could become invasive. Also called ductal carcinoma in situ and intraductal carcinoma.

**DC-cholesterol liposome:** A cationic cholesterol derivative mixed with dimethylaminoethane-carbamoyl and sonicated to form small unilamellar vesicles that can complex with DNA, DNA/protein complexes and other drug complexes and mediates the delivery into the cytosol from the endosome compartment.

**DC-OVA vaccine:** An autologous, multivalent dendritic cell vaccine targeting ovarian cancer with potential immunostimulating and antineoplastic activities. DC-OVA vaccine is produced in vitro by pulsing autologous dendritic cells with killed autologous primary ovarian tumors as a source of tumor-associated antigens (TAAs); the pulsed DCs are then matured using various cytokines. Upon administration, DC-OVA vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against ovarian cancer TAA-expressing ovarian cancer cells.

**DCF:** A drug used to treat tuberculosis. It is also being studied in the treatment of pain and nerve problems (numbness, tingling) caused by chemotherapy and in the treatment of low back pain, autism, certain anxiety disorders, and schizophrenia. D-cycloserine is a type of antibiotic. Also called Seromycin.

**DCI:** See CID. In very recent papers, "DCI" may mean "direct" (see) CI .

**DCIS:** A rare disorder that causes kidney failure before age 3, abnormal development of the sexual organs, and, in most cases, Wilms tumor (a type of kidney cancer). Children with Denys-Drash syndrome are also at high risk of some other types of cancer. Also called Denys-Drash syndrome.

### **DCR ligand-bearing liposome-encapsulated melanoma antigens**

**vaccine:** A cancer cell-based vaccine containing liposome encapsulated melanoma antigens and an immunomodulatory factor, attached, via a metal chelator, to a dendritic cell receptor (DCR) ligand-containing a metal-affinity tag, with potential immunomodulating and antineoplastic activity. Upon intravenous administration of DCR ligand-bearing liposome-encapsulated melanoma antigens vaccine, the DCR ligand moiety of this vaccine targets receptors on dendritic cells (DCs), thereby presenting the antigens to DCs which may, in turn, stimulate the DCs and may activate the immune system to mount a cytotoxic T lymphocyte (CTL) response against melanoma cancer cell associated antigens. Check for active clinical trials using this agent.

**DDAVP:** (Other name for: desmopressin acetate)

**DDE:** Dynamic Data Exchange.

**DDS:** In cancer, the first occurrence of cancer in the body.

**De BROGLIE'S HYPOTHESIS:** states that electrons around atoms are in wave formation.

**de Gramont regimen :** Tingling, numbness, heaviness, and other feelings that occur after an acupuncture needle has been properly placed in the body. The needle may be twirled, moved up and down at different speeds and depths, heated, or charged with a small electric current until the de qi sensation occurs.

**de novo :** A type of poisonous mushroom that has harmful effects on the kidneys and liver. It is responsible for most fatal cases of mushroom poisoning. Also called *Amanita phalloides*.

**de novo mutation :** An alteration in a gene that is present for the first time in one family member as a result of a mutation in a germ cell (egg or sperm) of one of the parents, or a mutation that arises in the fertilized egg itself during early embryogenesis. Also called new mutation.

**De novo pathway:** A biochemical pathway that starts from elementary substrates and ends in the synthesis of a biochemical. OR A biosynthetic pathway that builds the final product from simple precursors. See also . OR Pathway for synthesis of a biomolecule, such as a nucleotide, from simple precursors; as distinct from a salvage pathway.

**De Novo Drug Design:** The use of molecular modelling software packages to design new drugs or lead compounds for binding sites.

**de qi sensation :** A gurgling sound that comes from the back of the throat of a dying person. It is caused by the build-up of saliva and mucus in the throat and upper airways when the person is too weak to cough.

**De-oiling :** Any process in which oil is removed from a material or surface such as water.

**deactivating group:** a group that causes an aromatic ring to become less reactive toward electrophilic aromatic substitution.

**Dead Flat:** No gloss or sheen.

**Deamination:** The enzymatic removal of an amine group, as in the deamination of an amino acid to an alpha keto acid. OR The enzymatic removal of amino groups from biomolecules such as amino acids or nucleotides.

**death cap :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of death receptor 4 on cancer cells may kill more cells. Also called DR4, TRAIL receptor 1, TRAIL-R1, and tumor necrosis factor receptor superfamily member 10A.

**death rate:** An estimate of the proportion of a population that dies during a specified period. The numerator is the number of persons dying during the period; the denominator is the size of the population, usually estimated as the mid-year population. The death rate in a population is generally calculated by the formula

**death rattle :** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of death receptor 5 on cancer cells may kill more cells. Also called DR5, TRAIL receptor 2, TRAIL-R2, and tumor necrosis factor receptor superfamily member 10B.

**death receptor 4 :** Surgical removal of as much of a tumor as possible. Debulking may increase the chance that chemotherapy or radiation therapy will kill all the tumor cells. It may also be done to relieve symptoms or help the patient live longer. Also called tumor debulking.

**death receptor 5 :** Dead.

**DEBORAH NUMBER (De):** The ratio of a characteristic material time to a characteristic process time. As the characteristic material time we can use the relaxation time and as a characteristic process time the inverse of the shear rate. Under usual extrusion conditions the relaxation might be 0.1 and the shear rate 100 s<sup>-1</sup> and thus  $De = 10$  (0.1 divided by 1/100). When  $De \ll 1$ , the polymer behaves as a purely viscous fluid while for  $De \gg 1$  as an elastic solid. The phenomena of extrudate swell and melt flow instability are evidence of polymer elasticity.

**debris avalanche:** a rapidly churning mass of rock debris, soil, water, and air that races down very steep slopes.

**debris flow:** a mass-wasting event in which movement and turbulence occur throughout the mass.

**debris slide:** the rapid movement of a mass of debris as a single unit.

**debulking :** A drug that is used to treat myelodysplastic syndromes and is being studied in the treatment of other types of cancer. It is a type of antimetabolite. Also called Dacogen.

**Deburr:** Removal of material from a drilled or punched hole, waste from saw cuts of material or sharp or rough edges

**Debye:** A common non-SI unit of dipole moment, named for Dutch physical chemist Peter Debye. A charge separation equal to one electron charge placed one Ångstrom unit apart has a dipole moment of 4.8 D. In SI units,  $1 D = 3.338 \times 10^{-30}$  coulomb meters.

**DEC-205/NY-ESO-1 fusion protein CDX-1401:** A fusion protein consisting of a fully human monoclonal antibody directed against the endocytic dendritic cell (DC) receptor, DEC-205, linked to the tumor-associated antigen (TAA) NY-ESO-1 with potential immunostimulating and antineoplastic activities. The monoclonal antibody moiety of DEC-205/NY-ESO-1 fusion protein CDX-1401 binds to the endocytic DC receptor, which may result in DC endocytic internalization of this agent, specifically delivering the NY-ESO-1 moiety. DC processing of NY-ESO-1 may boost the immune system to mount a cytotoxic T-lymphocyte response (CTL) against cancer cells expressing NY-ESO-1. NY-ESO-1, a cell surface protein expressed in normal fetal and adult testes, is upregulated in a variety of tumor cell types.

**decagon:** a plane closed figure with ten sides and ten angles.

**decant:** to remove the liquid portion of a settled mixture without disturbing the sediment.

**Decanter:** A device in which two liquid phases or liquid and solid phases separate by gravity.

**Decarboxylase:** An enzyme that removes a carbon atom from a substrate in the form of carbon dioxide.

**decarboxylation:** a reaction in which carbon dioxide is expelled from a carboxylic acid.

**Decarboxylation reaction:** A chemical reaction that involves the loss of CO<sub>2</sub> from a solid (e.g., the decarboxylation of 4-aminosalicylic acid).

**Decavac:** (Other name for: diphtheria toxoid/tetanus toxoid vaccine adsorbed)

**decay:** Change of an element into a different element, usually with some other particle(s) and energy emitted.

**Decay heat:** The heat produced by the decay of radioactive fission products after a reactor has been shut down.

**Decay, radioactive:** The spontaneous transformation of one radioisotope into one or more different isotopes (known as “decay products” or “daughter products”), accompanied by a decrease in radioactivity (compared to the parent material). This transformation takes place over a defined period of time (known as a “half-life”), as a result of electron capture; fission; or the emission of alpha particles, beta particles, or photons (gamma radiation or x-rays) from the nucleus of an unstable atom. Each isotope in the sequence (known as a “decay chain”) decays to the next until it forms a stable, less energetic end product. In addition, radioactive decay may refer to gamma-ray and conversion electron emission, which only reduces the excitation energy of the nucleus.

**deceased :** A substance being studied as a way to detect bone growth in patients receiving bisphosphonates (a type of drug used to treat bone pain caused by some types of cancer) for breast cancer. It binds to newly formed bone. A biopsy is done and bone growth is measured using a special microscope. Declomycin is a type of tetracycline antibiotic and a type of bone-labeling agent. Also called demeclocycline hydrochloride.

**decerebrate posturing:** an abnormal body posture that involves the arms and legs being held straight out, the toes being pointed downward, and the

head and neck being arched backwards

**dechlorination process:** a process by which excess chlorine is removed from water to a desired level. Usually accomplished by chemical reduction, by passage through carbon beds or by aeration at a suitable pH.

**decimal:** The number of digits to the right of the decimal point in a number.

**decitabine:** Removal of part or all of the external surface of an organ. OR A cytidine antimetabolite analogue with potential antineoplastic activity. Decitabine incorporates into DNA and inhibits DNA methyltransferase, resulting in hypomethylation of DNA and intra-S-phase arrest of DNA replication.

**Deckle Rod:** A small rod, or similar device, inserted at each end of the extrusion coating die which is used to adjust the length of the die opening.

**Declared pregnant woman:** A woman who is an occupational radiation worker and has voluntarily informed her employer, in writing, of her pregnancy and the estimated date of conception (see 10 CFR 20.1003 and 20.1208).

**Declining growth:** A growth phase in which the availability of food begins to limit cell growth.

**Declomycin:** (Other name for: demeclocycline hydrochloride)

**Declomycin :** A level of sedation in which a person is in a deep sleep, loses feeling, and is hard to wake up. Deep sedation is caused by special drugs and is used to help relieve anxiety during certain medical or surgical procedures. Oxygen may also be given to help the patient breathe and drugs that relieve pain may be given at the same time. The patient usually does not remember the procedure.

**Decommissioning:** The process of safely closing a nuclear power plant (or other facility where nuclear materials are handled) to retire it from service after its useful life has ended. This process primarily involves decontaminating the facility to reduce residual radioactivity and then releasing the property for unrestricted or (under certain conditions) restricted use. This often includes dismantling the facility or dedicating it to other purposes. Decommissioning begins after the nuclear fuel, coolant, and radioactive waste are removed. For additional information,

see Decommissioning of Nuclear Facilities and Find Sites Undergoing Decommissioning.

**decomposers:** the organisms of decay; usually bacteria and fungi.

**decomposers:** Heterotrophic organisms that break down dead protoplasm and use some of the products and release others for use by consumer organisms.

**decomposition:** a chemical reaction in which a compound is broken down into simpler compounds or elements. OR The breakdown of matter by bacteria and fungi. It changes the chemical makeup and physical appearance of materials. OR A reaction in which a compound is broken down into simpler compounds or elements. Compounds sometimes decompose if heated strongly or if subjected to a strong electric current (electrolysis). OR A reaction where one substance breaks down into two or more new substances. An example of a decomposition is heating calcium carbonate to produce calcium oxide and carbon dioxide

**Decomposition Product:** The constituent elements or simpler compounds formed when a substance decays or decomposes.

**Decompression:** A method of relieving pressure on the melt after preparing it for injection during the upcoming cycle This minimizes the drooling that occurs when a shutoff nozzle is not utilized.

**Decompression Section –:** The section of a two-stage extruder in which an increase in screw channel volume occurs.

**Decompression zone:** Zone in a double screw extruder, about two-thirds down the screw, the channel suddenly gets deeper, which relieves the pressure and allows any trapped gases (usually moisture or air) to be drawn out by vacuum.

**DECON:** A method of decommissioning, in which structures, systems, and components that contain radioactive contamination are removed from a site and safely disposed at a commercially operated low-level waste disposal facility, or decontaminated to a level that permits the site to be released for unrestricted use shortly after it ceases operation. For further information, see the Fact Sheet on Decommissioning Nuclear Power Plants.

**Decontamination:** A process used to reduce, remove, or neutralize radiological, chemical, or biological contamination to reduce the risk of exposure. Decontamination may be accomplished by cleaning or treating

surfaces to reduce or remove the contamination; filtering contaminated air or water; subjecting contamination to evaporation and precipitation; or covering the contamination to shield or absorb the radiation. The process can also simply allow adequate time for natural radioactive decay to decrease the radioactivity.

**Decorated filaments:** A structure resulting when S1 heads are mixed with actin filaments. Each S1 head binds to an actin filament with its long axis oriented at 45 degrees to the filament. With all S1 units similarly oriented, a structure looking like a set of arrowheads pointing in the same direction results.

**Decorative Sheet:** A laminated plastics sheet used for decorative purposes in which the color and/or surface pattern is an integral part of the sheet.

**decortication :** The formation of a blood clot in a deep vein of the leg or lower pelvis. Symptoms may include pain, swelling, warmth, and redness in the affected area. Also called DVT.

**Deep Injection:** A common molding defect identified by the deep depression in the rubber part at the point of injection

**deep sedation :** Movement of feces (undigested food, bacteria, mucus, and cells from the lining of the intestines) through the bowel and out the anus. Also called bowel movement.

**deep vein thrombosis :** A drug used to treat too much iron in the blood caused by blood transfusions. It is being studied in the treatment of myelodysplastic syndromes (a group of diseases in which the bone marrow does not make enough healthy blood cells) and other conditions.

Deferasirox binds to extra iron in the blood. The drug and the iron are passed from the body in urine. It is a type of chelating agent. Also called Exjade.

**deep water:** That part of the ocean below the main thermocline.

**Deep-Dose Equivalent (DDE):** The external whole-body exposure dose equivalent at a tissue depth of 1 cm (1000 mg/cm<sup>2</sup>). For further information, see Measuring Radiation.

**defactinib:** An orally bioavailable, small-molecule focal adhesion kinase (FAK) inhibitor with potential antiangiogenic and antineoplastic activities. Defactinib inhibits FAK, which may prevent the integrin-mediated activation of several downstream signal transduction pathways, including

those involving RAS/MEK/ERK and PI3K/Akt, thus inhibiting tumor cell migration, proliferation, survival, and tumor angiogenesis. The tyrosine kinase FAK, a signal transducer for integrins, is normally activated by binding to integrins in the extracellular matrix (ECM) but may be upregulated and constitutively activated in various tumor cell types.

**defecation :** An iron-chelating agent that removes iron from tumors by inhibiting DNA synthesis and causing cancer cell death. It is used in conjunction with other anticancer agents in pediatric neuroblastoma therapy.

**Defect:** An imperfection in a molded part that results in the product not meeting original design specifications. These defects can be visual, physical, and/or hidden.

**Defects:** Sites of imperfection in the crystal packing of solids. The most common defects are screw dislocations, slip dislocations, and orientational defects.

**Defense in depth:** An approach to designing and operating nuclear facilities that prevents and mitigates accidents that release radiation or hazardous materials. The key is creating multiple independent and redundant layers of defense to compensate for potential human and mechanical failures so that no single layer, no matter how robust, is exclusively relied upon. Defense in depth includes the use of access controls, physical barriers, redundant and diverse key safety functions, and emergency response measures.

**deferasirox:** A synthetic, orally bioavailable, achiral, tridentate triazole derived from salicylic acid with iron-chelating activity. Deferasirox chelates iron at a 2:1 (ligand:iron) ratio. Because of its oral availability, and long plasma half-life, this agent may be superior to desferrioxamine (desferal, DFO), which is orally inactive and has a short plasma half-life. OR Closely watching a patient's condition but not giving treatment unless symptoms appear or change, or there are changes in test results. Deferred therapy avoids problems that may be caused by treatments such as radiation or surgery. It is used to find early signs that the condition is getting worse. During deferred therapy, patients may be given certain exams and tests. It is sometimes used in prostate cancer. Also called expectant management.

**deferiprone:** An orally bioavailable bidentate ligand with iron chelating activity. Deferiprone binds to iron in a 3:1 (ligand:iron) molar ratio. By

binding to iron, deferiprone is able to remove excess iron from the body.

**deferoxamine :** A drug used to treat hepatic veno-occlusive disease (a condition in which small veins in the liver are blocked) in patients who have kidney or lung problems after a stem cell transplant. Defibrotide sodium may affect the cells that line the inside of blood vessels and may help improve blood flow inside the liver. Also called Defitelio.

**deferoxamine mesylate:** The mesylate salt of an iron-chelating agent that binds free iron in a stable complex, preventing it from engaging in chemical reactions. Deferoxamine chelates iron from intra-lysosomal ferritin and ferrioxamine, a water-soluble complex excreted by the kidneys and in the feces via the bile. This agent does not readily chelate iron bound to transferrin, hemoglobin, myoglobin or cytochrome.

**deferred therapy :** In medicine, a shortage of a substance (such as a vitamin or mineral) needed by the body.

**defibrotide sodium:** A polydeoxyribonucleotide with antithrombotic, thrombolytic, and fibrinolytic properties. Defibrotide sodium induces the release of prostaglandin 12 and reduces the expression of adhesion molecules on endothelial cells, thereby interfering with platelet and leukocyte adhesion to the endothelium. OR A final diagnosis that is made after getting the results of tests, such as blood tests and biopsies, that are done to find out if a certain disease or condition is present.

**deficiency :** The treatment plan for a disease or disorder that has been chosen as the best one for a patient after all other choices have been considered.

**deficit:** time during the water budget when drought conditions occur; there is not enough water to supply the needs of an area.

**defined green tea catechin extract:** A defined, decaffeinated green tea extract, containing polyphenolic flavonol catechins, isolated from the plant *Camellia sinensis* with antiviral, antioxidant, and potential chemopreventive activities. The primary catechins found in green tea are epicatechin (EC), epigallocatechin (EGC), epicatechin-3 gallate (ECG), and epigallocatechin-3-gallate (EGCG), the most potent. As potential chemopreventive agents, catechins scavenge free radicals; inhibit enzymes involved in cell replication and DNA synthesis; interfere with cell-to-cell contact adhesion; and inhibit various intracellular communication pathways required for cell division. In addition, it has been postulated that EGCG may "trap" growth

factors such platelet-derived growth factor (PDGF) on cell membranes, immobilizing growth factors on cell membranes and preventing ligand-receptor crosslinking and growth factor receptor activation.

**Definite Proportions:** This is a concept that explains how formulas of similar compounds are identical no matter where you are in the universe. Sodium chloride will always be made of one sodium and one chloride atom. Water will always be made of one oxygen and two hydrogen atoms.

**definitive diagnosis :** A drug used to treat hepatic veno-occlusive disease (a condition in which small veins in the liver are blocked) in patients who have kidney or lung problems after a stem cell transplant. Defitelio may affect the cells that line the inside of blood vessels and may help improve blood flow inside the liver. Also called defibrotide sodium.

**definitive treatment :** A drug that is used to treat advanced prostate cancer and is also being studied in the treatment of benign prostatic hyperplasia. Degarelix binds to gonadotropin-releasing hormone (GnRH) receptors in the pituitary gland. This causes the body to stop making testosterone, which prostate cancer needs to grow. Degarelix is a type of GnRH antagonist. Also called Firmagon.

**Definity:** (Other name for: perflutren) or (Other name for: perflutren lipid microspheres)

**Defitelio :** (Other name for: defibrotide sodium) OR A disease in which the function or structure of the affected tissues or organs changes for the worse over time. Osteoarthritis, osteoporosis, and Alzheimer disease are examples.

**DEFLASHING:** Covers the range of finishing techniques used to remove the flash (excess, unwanted material) on a plastic molding such as filing, sanding, milling, tumbling, etc. or Any of various processes used to remove extraneous silicone rubber from a silicone injection molded rubber part. Generally the sign of poor mold design or maintenance. Or Covers the range of finishing techniques used to remove the flash (excess, unwanted material) on a plastic molding such as filing, sanding, milling, tumbling, etc. or Any technique or method removing excess unwanted material from a molded article. Specifically, the excess material is removed from places on the article where parting lines of the mold that formed the article may have caused the excess material to be formed. or any technique or method of removing excess unwanted from a molded article. Specifically, the excess

material is removed from places on the article where parting lines of the mold that formed the article may have caused the excess material to be formed. or Covers the range of finishing techniques used to remove the flash (excess, unwanted material) on a plastic molding.

**deflation:** the removal of sediment from a land surface by wind.

**Deflection Temperature:** The measure of temperature at which a specimen deflects 0.01 inches under a load of 264 lb/in<sup>2</sup>. or the temperature at which a plastic structure will deflect a specific distance for a given loading. Or The measurement of temperature at which a specimen deflects to a set point under a defined load.

**Defoamer :** A chemical additive that reduces and hinders the formation of foam in industrial process liquids. A defoamer is normally used in industrial processes to increase production speed and reduce other problems. It addresses both problems with surface foam and entrained or entrapped air. The chemicals used as defoamers are typically surface active agents.

**Deforestation:** The practice of removing forestry and other associated vegetation from an area to make way for other use of the land, such as agriculture or commercial development. OR The removal of forest stands by cutting and burning to provide land for agricultural purposes, residential or industrial building sites, roads, etc. or by harvesting the trees for building materials or fuel. Oxidation of organic matter releases CO<sub>2</sub> to the atmosphere, and regional and global impacts may result.

**degarelix:** A long-acting, synthetic peptide with gonadotrophin-releasing hormone (GnRH) antagonistic properties. Degarelix targets and blocks GnRH receptors located on the surfaces of gonadotroph cells in the anterior pituitary, thereby reducing secretion of luteinizing hormone (LH) by pituitary gonadotroph cells and so decreasing testosterone production by interstitial (Leydig) cells in the testes. or A condition caused by the loss of too much water from the body. Severe diarrhea or vomiting can cause dehydration.

**Degassing:** Opening and closing of a mold to allow gas to escape. Trapped gas and/or air can cause parts defects such as blistering and bubbles. Or The momentary opening and closing of a mold during the early stages of the cycle to permit the escape of air or gas from the heated compound.

**degenerate:** A set of orbitals are said to be degenerate if they all have the same energy. This degeneracy can sometimes be "lifted" by external electric or magnetic fields.

**degenerate code:** A code in which a single element in one language is specified by more than one element in a second language.

**degenerative disease :** A substance being studied in the prevention of cancer. It is a type of steroid. Also called DHEA.

**deglycosylated ricin A chain-conjugated anti-CD19/anti-CD22**

**immunotoxins:** A combination preparation of 1:1 mixture of the immunotoxins HD37-dgA and RFB4-dgA with potential antineoplastic activity. Anti-CD19 IgG monoclonal antibody HD37 and anti-CD22 IgG monoclonal antibody RFB4 are attached individually to a deglycosylated ricin A chain (dgA) via N-succinimidyl-oxycarbonyl-alpha-methyl-alpha-(2-pyridyldithio) toluene (SMPT) linker. Deglycosylated ricin A chain-conjugated anti-CD19/anti-CD22 immunotoxins bind to CD19- and CD22-expressing tumor cells, specifically delivering cytotoxic ricin A chain to leukemia cells expressing these antigens. Ricin A chain is toxic to ribosomal activity and protein synthesis, and inhibits cell growth. CD19 and CD22 molecules are cell surface antigens present on the majority of B acute lymphoblastic leukemia (ALL) cells.

**degradable:** that which can be reduced, broken down or chemically separated. OR Degradable materials break down, by bacterial (biodegradable), thermal (oxidative) or ultraviolet (photodegradable) action. When degradation is caused by biological activity, especially by the enzymatic action of microorganisms, it is called 'biodegradation'.

**Degradation:** A growth phase in which the availability of food begins to limit cell growth. OR a deleterious change in the chemical composition, appearance, physical or mechanical properties of a plastic. Or A deleterious change in the chemical structure, physical properties, or appearance of a plastic caused by exposure to heat, light, oxygen, or weathering. Or A deleterious change in the chemical structure of a plastic. See DETERIORATION. or Caused by exposure to heat, light, oxygen, or weathering, degradation is a destructive change in the chemical structure, physical properties, or appearance of plastic materials. Or A deleterious change in the chemical structure, physical properties or appearance of

aplastic caused by exposure to heat, light, oxygen, weathering or other external influence.

**degreasing:** the process of removing greases and oils from sewage, waste, and sludge.

**degree:** a unit of measurement of an angle.

**Degree of Polymerization:** The number of structural units or mers in the “average” polymer molecule in a particle sample. In most plastics the DP must reach several thousand if worthwhile physical properties are to be had.

**Degrees of freedom:** When applied to a general process, the difference between the number of unknown process variables and the number of equations relating those variables; the number of unknown variables for which values must be specified before the remaining values can be calculated. When applied to a system at equilibrium, the number of intensive system variables for which values must be specified before the remaining values can be calculated. The degrees of freedom in the second sense is determined using the Gibbs Phase Rule.

**dehalogenation:** the elimination reaction in which two halogen atoms are removed from adjacent carbon atoms to form a double bond.

**dehydrated human amnion/chorion membrane:** Tissue derived from portions of the placenta donated by the patient during a C-section, with potential regenerative activity. Upon placement of the tissue around or on the affected area, dehydrated human amnion/chorion membrane (dHCAM), which contains regenerative cytokines, promotes wound angiogenesis and may help heal the wound, restore tissue function and reduce risk of inflammation.

**dehydration:** A reaction in which the elements that make up water (twice as many hydrogen as oxygen atoms) are removed from an organic compound. OR Dehydration is the removal of H<sub>2</sub>O in a chemical reaction. OR the elimination reaction in which a molecule of water is removed from a molecule. OR the elimination reaction in which water is removed from a molecule.

**dehydration :** An inflammatory response that develops 24 to 72 hours after exposure to an antigen that the immune system recognizes as foreign. This type of immune response involves mainly T cells rather than antibodies (which are made by B cells). Also called DTH.

**Dehydration reaction:** A reaction that involves loss of water from the crystal. The loss may be due to the physical loss of water from the crystal lattice or through a chemical reaction.

**dehydroepiandrosterone :** A mental state in which a person is confused, disoriented, and not able to think or remember clearly. The person may also be agitated and have hallucinations, and extreme excitement.

**Dehydrogenase:** An enzyme that catalyzes the removal of a pair of electrons (and usually one or two protons) from a substrate molecule. OR Enzymes catalyzing the removal of pairs of hydrogen atoms from their substrates.

**Dehydrogenation reaction:** A reaction that involves loss of hydrogen gas.

**dehydrohalogenation:** the elimination reaction in which a hydrogen atom and a halogen atom are removed from a molecule to form a double bond.

**Del-Vi-A:** (Other name for: retinol)

**Deladumone:** (Other name for: diethylstilbestrol)

**Delamination:** When the surface of a finished part separates. Strata or fish-scale-type appearance may be visible where the layers may be separated. Or the separation of a laminate along the planes of its layers. Also, the separation of banded insulation within the adhesive layer or at the adhesive interface. Or The separation of one or more layers in a laminate caused by the failing of the adhesive bond. Or Splitting, physical separation or loss of bond along the plane of layers of a laminated material. Or This defect appears as a flaky surface layer on the part and is often caused by contamination or moisture in the resin pellets. or the separation of a laminate along the plane of its layers. Also the separation of bonded insulation within the adhesive layer or at the adhesive interface. Or When the surface of a finished part separates. Strata or fish-scale-type appearance maybe visible where the layers may be separated.

**delanzomib:** An orally bioavailable synthetic P2 threonine boronic acid inhibitor of the chymotrypsin-like activity of the proteasome, with potential antineoplastic activity. Delanzomib represses the proteasomal degradation of a variety of proteins, including inhibitory kappaBalpha (IkappaBalpha), resulting in the cytoplasmic sequestration of the transcription factor NF-kappaB; inhibition of NF-kappaB nuclear translocation and transcriptional up-regulation of a variety of cell growth-promoting factors; and apoptotic

cell death in susceptible tumor cell populations. In vitro studies indicate that this agent exhibits a favorable cytotoxicity profile toward normal human epithelial cells, bone marrow progenitors, and bone marrow-derived stromal cells relative to the proteasome inhibitor bortezomib. The intracellular protein I $\kappa$ B $\alpha$  functions as a primary inhibitor of the proinflammatory transcription factor NF- $\kappa$ B.

**Delatestryl:** (Other name for: therapeutic testosterone)

**delayed-type hypersensitivity response :** A substance being studied as a way to detect bone growth in patients receiving bisphosphonates (a type of drug used to treat bone pain caused by some types of cancer) for breast cancer. It binds to newly formed bone. A biopsy is done and bone growth is measured using a special microscope. Demeclocycline hydrochloride is a type of tetracycline antibiotic and a type of bone-labeling agent. Also called Declomycin.

**deleterious mutation :** A mutation that is documented to be associated with risk of disease.

**Deletion:** A type of mutation in which one or more base pairs are left out in DNA replication; also, the absence of one or more bases from a nucleotide sequence in a gene.

**deletion :** A type of genetic change that involves the absence of a segment of DNA. It may be as small as a single base but can vary significantly in size.

**deletion mutation:** A mutation resulting from the deletion of one or more nucleotides from a gene or chromosome.

**Deliquescence:** The uptake of atmospheric moisture by a solid, sometimes ending in spontaneous liquefaction of the solid.

**Deliquescence:** This term describes the characteristic of some solids to absorb water and eventually dissolve. Sodium hydroxide is deliquescent. You may be familiar with little packets of powder used in packing materials. The chemicals inside those packs absorb any moisture from the air in the box and keep the contents dry.

**deliquescent:** Deliquescent compounds absorb so much moisture from the air that they dissolve. Examples are calcium chloride and sodium hydroxide.

**delirium** : A condition in which a person loses the ability to think, remember, learn, make decisions, and solve problems. Symptoms may also include personality changes and emotional problems. There are many causes of dementia, including Alzheimer disease, brain cancer, and brain injury. Dementia usually gets worse over time.

**delocalization**: the spreading of electron density or electrostatic charge across a molecule.

**delocalized**: Electrons are said to be delocalized if they are not associated with one particular atom.

**delta**: a thick, roughly wedge-shaped accumulation of sediment deposited at the mouth of a stream. OR a triangle-shaped area of deposition located at the mouth of an older river.

**delta-8-tetrahydrocannabinol**: An analogue of tetrahydrocannabinol (THC) with antiemetic, anxiolytic, appetite-stimulating, analgesic, and neuroprotective properties. Delta-8-tetrahydrocannabinol (delta-8-THC) binds to the cannabinoid G-protein coupled receptor CB1, located in the central nervous system; CB1 receptor activation inhibits adenylyl cyclase, increases mitogen-activated protein kinase activities, modulates several potassium channel conductances and inhibits N- and P/Q-type Ca<sup>2+</sup> channels. This agent exhibits a lower psychotropic potency than delta-9-tetrahydrocannabinol (delta-9-THC), the primary form of THC found in cannabis.

**Delta-Cortef**: (Other name for: prednisolone)

**delta-tocopherol**: The orally bioavailable delta form of the naturally-occurring fat-soluble vitamin E, mostly found in soybean and corn oils, with potential antioxidant activity. Although the exact mechanism of action of this tocopherol has yet to be fully identified, delta-tocopherol appears to have the ability to scavenge free radicals, thereby protecting cells against oxidative damage.

**demiczumab**: A humanized monoclonal antibody directed against the N-terminal epitope of Notch ligand DLL4 (delta-like 4) with potential antineoplastic activity. Demiczumab binds to the membrane-binding portion of DLL4 and prevents its interaction with Notch-1 and Notch-4 receptors, thereby inhibiting Notch-mediated signaling and gene transcription, which may impede tumor angiogenesis. Activation of Notch receptors by DLL4 stimulates proteolytic cleavage of the Notch intracellular domain (NICD);

after cleavage, NICD is translocated into the nucleus and mediates the transcriptional regulation of a variety of genes involved in vascular development. The expression of DLL4 is highly restricted to the vascular endothelium.

**demeclocycline hydrochloride:** The hydrochloride salt of demeclocycline, a broad-spectrum, tetracycline derivative exhibiting antimicrobial, aquaretic and chelating activities. In bacteria, demeclocycline binds reversibly to the 30S ribosomal subunit and blocks the binding of aminoacyl-tRNA to the A-site of the mRNA-ribosome complex, resulting in the inhibition of protein synthesis and bacterial cell death. In mammals, this agent interferes with the action of antidiuretic hormone (ADH) at the level of the renal collecting tubule, resulting in aquaresis. In addition, demeclocycline, which like other tetracyclines chelates calcium in bone and exhibits a yellow fluorescence under ultraviolet (UV) light, may be used as a fluorescent bone-labeling agent in bone histomorphometry. or A drug used to treat moderate to severe pain. It binds to opioid receptors in the central nervous system. Demerol is a type of analgesic agent and a type of opioid. Also called meperidine hydrochloride.

**dementia :** A special type of immune cell that is found in tissues, such as the skin, and boosts immune responses by showing antigens on its surface to other cells of the immune system. A dendritic cell is a type of phagocyte and a type of antigen-presenting cell (APC).

**Demerol :** (Other name for: meperidine hydrochloride) OR A vaccine made of antigens and dendritic antigen-presenting cells (APCs).

**demineralization:** removal from water of mineral contaminants. Methods include ion exchange, flash distillation, electrodialysis, or reverse osmosis.

**demineralized bone matrix:** Demineralized allograft bone with osteoinductive activity. Demineralized bone matrices are prepared by acid extraction of allograft bone, resulting in loss of most of the mineralized component but retention of collagen and noncollagenous proteins, including growth factors. The efficacy of a demineralized bone matrix (DBM) as a bone-graft substitute or extender may be related to the total amount of bone morphogenetic protein (BMP) present, and the ratios of the different BMPs present. BMPs belong to the transforming growth factor (TGF) superfamily of proteins.

**demonstrative pronoun:** (this, that, these, those) single out what you are talking about.

**DEMSEER:** (Other name for: metyrosine)

**DEMULSIBILITY:** A measure of a fluid's ability to separate from water.

**Demulsifier :** Is a class of specialty chemicals used to separate components in emulsions from each other (water in oil). It is commonly used in the processing of crude oil, which is typically produced along with significant quantities of saline water. This water (and salt) must be removed from the crude oil prior to refining. If the majority of the water and salt are not removed, significant corrosion problems can occur in the refining process. Demulsifiers are typically based on highly charged cationic polymers, but also other chemistries are used.

**Denaturation:** The disruption of the native folded structure of a nucleic acid or protein molecule; may be due to heat, chemical treatment, or change in pH. OR A disruption in the native conformation of a macromolecule that causes a loss of normal function. OR Partial or complete unfolding of the specific native conformation of a polypeptide chain, protein, or nucleic acid.

**denature:** 1. A loss of chemical function, usually due to some heat or chemically-induced structural change. For example, heating a protein causes it to lose its three dimensional form and it no longer functions correctly.

**denatured:** An enzyme is said to be denatured when its shape is disrupted (e.g. by the effect of heat or pH changes), resulting in its lack of activity.

**Denatured (grey) wood:** No. Failing to completely remove wood that has been exposed to weather and sunlight is a common cause of paint failure. Use a sander to remove the top surface layer of the grey wood, making sure that the surface is cleaned back to new sound wood. Prime all bare wood with Dulux Primer or Basecoat before re-painting.

**denatured protein:** A protein that has lost its native conformation by exposure to a destabilizing agent such as heat or detergent.

**Dendrid:** (Other name for: idoxuridine)

**dendrites:** the short extensions of the neuron.

**dendritic cell :** In psychiatry, a state in which a person is unable or unwilling to see the truth or reality about an issue or situation.

**dendritic cell vaccine :** A drug used to treat cutaneous T-cell lymphoma that can bind the cytokine IL-2 and that has not responded to other treatment. It is also being studied in the treatment of other types of cancer. Denileukin diftitox is made by combining a part of IL-2 with a bacterial toxin. The IL-2 part of the drug attaches to the cancer cells and then the toxin kills the cells. Denileukin diftitox is a type of immunotoxin and a type of fusion toxin. Also called Ontak.

**dendritic cell-autologous lung tumor vaccine:** A cancer vaccine consisting of lymphocytes harvested from a patient with lung cancer and induced to become antigen-presenting cells (APCs) known as dendritic cells. The dendritic cells are transduced with the gene encoding an antigen specific to the patient's cancer and then returned to the patient. In the host, the altered cells stimulate the immune system to mount a primary T cell response against lung tumor cells expressing the target antigen. Dendritic cell-autologous lung tumor vaccines have been investigated for use in cancer immunotherapy.

**dendritic cell-CEA peptide vaccine:** A cancer vaccine consisting of dendritic cells harvested from a patient with cancer and pulsed or transduced with a peptide fragment of carcinoembryonic antigen (CEA), a tumor-associated antigen expressed by a wide range of cancers. When the altered dendritic cells are returned to the patient, they may stimulate the host immune system to mount a cytotoxic T-lymphocyte immune response against tumor cells expressing CEA. Check for active clinical trials using this agent.

**dendritic cell-gp100-MART-1 antigen vaccine:** An autologous dendritic cell vaccine with antineoplastic property. Dendritic cells harvested from cancer patients are pulsed with human gp100 melanoma antigen and MART-1 antigen (a melanoma antigen recognized by T-cells); both antigens are up-regulated in melanomas. Vaccination with this vaccine may elicit the host immune response against MART-1 or gp100 expressing cells.

**dendritic cell-idiotype-keyhole limpet hemocyanin vaccine:** A cell-based vaccine composed of allogeneic dendritic cells (DC), pulsed with patient-specific non-Hodgkin's lymphoma idiotype (Id) determinants conjugated to keyhole limpet hemocyanin (KLH), with potential antitumor activity. Upon administration, this vaccine may stimulate the host immune system to mount a specific cytotoxic T-lymphocyte (CTL) response against

Id-expressing lymphoma cells, resulting in tumor cell lysis. Check for active clinical trials using this agent.

**dendritic cell-MART-1 peptide vaccine:** A cancer vaccine consisting of dendritic cells harvested from a patient with cancer and pulsed or transduced with a peptide fragment of MART-1 (melanoma antigen recognized by T-cells), an antigen expressed by melanoma cells. When the altered dendritic cells are returned to the patient, they stimulate the host immune system to mount a cytotoxic T-lymphocyte immune response against tumor cells expressing MART-1.

**dendritic cell-precision multiple antigen T lymphocytes:** A preparation of dendritic cell-precision multiple antigen T-cells (DC-PMAT) that have been induced to specifically target multiple undisclosed tumor-associated antigens (TAAs), with potential antitumor activity. Although the exact mechanism(s) of action through which DC-PMAT cells exert their effects has yet to be elucidated, upon infusion, these cells may stimulate the host immune system to mount a highly-specific cytotoxic T-lymphocyte (CTL) response against tumors expressing common TAAs, which leads to tumor cell lysis.

**dendritic cell-targeting lentiviral vector ID-LV305:** An engineered lentiviral vector targeting dendritic cells (DCs) and containing nucleic acids encoding for the human tumor-associated cancer-testis antigen NY-ESO-1, with potential immunostimulatory and antineoplastic activities. Upon intradermal administration, the DC-targeting lentiviral vector ID-LV305 targets and binds to dermal DCs via the DC-specific intercellular adhesion molecule-3-grabbing non-integrin (DC-SIGN) receptor. Upon internalization of the vector, the NY-ESO-1 protein is expressed, stimulates DC maturation and activates the immune system to mount a cytotoxic T-lymphocyte (CTL) response against NY-ESO-1-expressing cells, which may result in tumor cell lysis. NY-ESO-1 is expressed in normal testes and on the surfaces of various tumor cells, and plays a key role in tumor cell proliferation and survival.

**dendritic drainage pattern:** a veinlike drainage pattern that develops in a rock type that erodes uniformly, such as granite.

**Dendritic Habit:** A dendritic habit describes the shape of a large group of crystals that looks like the branching of veins or a plant.

**dendrochronology:** The dating of past events and variations in the environment and the climate by studying the annual growth rings of trees. The approximate age of a temperate forest tree can be determined by counting the annual growth rings in the lower part of the trunk. The width of these annual rings is indicative of the climatic conditions during the period of growth; wide annual rings signify favorable growing conditions, absence of diseases and pests, and favorable climatic conditions, while narrow rings indicate unfavorable growing conditions or climate. OR The use of tree growth rings as proxy climate indicators. Tree rings record responses to a wider range of climatic variables over a larger part of the Earth than any other type of annually dated proxy record.

**denenicokin:** A recombinant peptide similar to or identical to endogenous human cytokine interleukin-21 (IL-21) with potential antineoplastic activity. Denenicokin binds to and activates IL-21 receptors, expressed on T-cells, B-cells, dendritic cells (DC), and natural killer (NK) cells, modulating the proliferation and/or differentiation of T and B cells, promoting T cell survival, and increasing the cytolytic activity of cytotoxic T lymphocytes (CTLs) and NK cells.

**denial :** In religion, describes a group whose members are organized under a common name and set of rules and have common beliefs and practices.

**denibulin hydrochloride:** The hydrochloride salt of denibulin, a small molecular vascular disrupting agent, with potential antimetabolic and antineoplastic activities. Denibulin selectively targets and reversibly binds to the colchicine-binding site on tubulin and inhibits microtubule assembly. This results in the disruption of the cytoskeleton of tumor endothelial cells, ultimately leading to cell cycle arrest, blockage of cell division and apoptosis. This causes inadequate blood flow to the tumor and eventually leads to a decrease in tumor cell proliferation., a small molecule vascular disrupting agent (VDA), with potential antimetabolic and antineoplastic activity. Denibulin selectively targets and reversibly binds to the colchicine-binding site on tubulin and inhibits microtubule assembly. This results in the disruption of the cytoskeleton of tumor endothelial cells (EC), ultimately leading to cell cycle arrest, blockage of cell division and apoptosis. This causes inadequate blood flow to the tumor and eventually leads to a decrease in tumor cell proliferation. Check for active clinical trials using this agent.

**denileukin diftotox:** A cytotoxic recombinant protein consisting of interleukin-2 (IL-2) protein sequences fused to diphtheria toxin. The IL-2 protein sequence moiety of denileukin diftotox directs the cytotoxic action of diphtheria toxin to cells that express IL-2 receptors. After the toxin moiety is internalized into target IL-2 receptor-expressing cells, its catalytic domain catalyzes the transfer of the ADP-ribose moiety of NAD to a posttranslationally modified histidine residue of elongation factor 2 (EF-2), called diphthamine. This covalent modification inactivates EF-2 and disrupts polypeptide chain elongation, resulting in cell death.

**denileukin diftotox :** A drug used to prevent or treat certain bone problems. Under the brand name Xgeva, it is used to prevent broken bones and other bone problems caused by solid tumors that have spread to bone. It is also used in certain patients to treat giant cell tumor of the bone that cannot be removed by surgery. Under the brand name Prolia, it is used to treat osteoporosis (a decrease in bone mass and density) in postmenopausal women who have a high risk of breaking bones. Denosumab is also being studied in the treatment of other conditions and types of cancer. It binds to a protein called RANKL, which keeps RANKL from binding to another protein called RANK on the surface of certain bone cells, including bone cancer cells. This may help keep bone from breaking down and cancer cells from growing. Denosumab is a type of monoclonal antibody. Also called AMG 162, Prolia, and Xgeva.

**denintuzumab mafodotin:** An immunoconjugate consisting of an anti-CD19 monoclonal antibody conjugated to the auristatin derivative monomethyl auristatin F (MMAF), with potential antineoplastic activity. Upon administration of denintuzumab mafodotin, the antibody moiety targets the cell surface antigen CD19, found on a number of B-cell-derived cancers. Upon antibody/antigen binding and internalization, the immunoconjugate releases MMAF, which binds to tubulin and inhibits its polymerization. Inhibition of tubulin polymerization may result in G2/M phase arrest and tumor cell apoptosis. This causes inhibition of cell growth of CD19-expressing tumor cells. CD19, a B-cell antigen, is overexpressed by a variety of different cancer cell types.

**Denitrification:** An anaerobic biological reduction of nitrate nitrogen to nitrogen gas, the removal of total nitrogen from a system, and/or an anaerobic process that occurs when nitrite ions are reduced to nitrogen gas

and bubbles are formed as a result of this process. The bubbles attach to the biological floc in the activated sludge process and float the floc to the surface of the secondary clarifiers. This condition is often the cause of rising sludge observed in secondary clarifiers or gravity thickeners. (See Nitrification)

**denomination :** A metal device that is surgically placed in the jawbone. It acts as an anchor for an artificial tooth or teeth.

**denosumab:** A health professional who has special training in caring for the teeth, gums, and other tissues in the mouth. OR A humanized monoclonal antibody directed against the receptor activator of nuclear factor kappa beta ligand (RANKL) with antiosteoclast activity. Denosumab specifically binds to RANKL and blocks the interaction of RANKL with RANK, a receptor located on osteoclast cell surfaces, resulting in inhibition of osteoclast activity, a decrease in bone resorption, and a potential increase in bone mineral density. RANKL, a protein expressed by osteoblastic cells, plays an important role in osteoclastic differentiation and activation.

**dense:** A compact substance or a substance with a high density. OR is equal to mass/volume. OR the amount of matter in a given space. OR thickness of a substance OR Mass of a substance per unit volume. Saying "the density of mercury is  $13.55 \text{ g/cm}^3$  " is the same as saying "the mass of exactly  $1 \text{ cm}^3$  of mercury is  $13.55 \text{ g}$ ".

**Density:** To find the density of an object, you measure its mass and its volume, then divide the mass by the volume, giving a density measured in  $\text{g/cm}^3$  or  $\text{kg/dm}^3$ . Since all atoms are about the same size, the densest materials are metals like osmium and gold, which are elements with heavy nuclei, and the least dense are the very first elements in the periodic table, the gases hydrogen and helium. OR The mass per unit volume of a substance. For solids and liquids, typically, temperature would also be provided with density. For gasses, both temperature and pressure should be given with the density. Or Weight per unit volume of a substance expressed in grams per cubic centimeter, pounds per cubic foot, etc. OR The mass of a body divided by its volume. Something has a high density if it is heavy but only small. Diagonal relationship The properties of lithium and magnesium are similar in many ways. The same goes for aluminium and beryllium.

**density functional:** A model that describes the electronic structure of an atom or molecule by approximating the total energy as a function of

electron density.

**Density Functional Theory (DFT):** DFT computational approaches consider that the energy and other properties of a system can be computed from the electron density.

**Density rule:** The rule states that if a polymorph has a lower density than another polymorph at room temperature, then it may be assumed that at absolute zero the form with the lower density is metastable.

**Density-gradient centrifugation:** The separation, by centrifugation, of molecules according to their density, in a gradient varying in solute concentration.

**Density-gradient equilibrium sedimentation:** A centrifugal technique for separating biological molecules according to their densities in an aqueous solution of a salt such as cesium chloride. When such solutions are centrifuged at high speeds, opposing forces of sedimentation and diffusion create a concentration gradient of the salt; molecules in that gradient are driven by centrifugal force into the region where the solution density is equal to their own.

**Density/Specific Gravity :** Density and specific gravity are used interchangeably, which is formally incorrect. The difference is the following: density is mass per unit volume of a material at 73½°F (23½°C); specific gravity is the mass of a given volume of material at 73½°F (23½°C) divided by an equal volume of water at the same temperature. The conversion is: density = specific gravity X 0.99756. The often used English term "relative density" has the same meaning as "specific gravity.

**dental implant :** A rare disorder that causes kidney failure before age 3, abnormal development of the sexual organs, and, in most cases, Wilms tumor (a type of kidney cancer). Children with Denys-Drash syndrome are also at high risk of some other types of cancer. Also called DDS.

**dentigerous cysts:** an odontogenic cyst associated with the crown of an unerupted, or partially erupted, tooth

**dentist :** A drug that protects healthy tissues from the toxic effects of anticancer drugs.

**Denys-Drash syndrome :** The molecules inside cells that carry genetic information and pass it from one generation to the next. Also called DNA.

**deoxycytidine** : A drug used to treat epileptic seizures and bipolar disorder and to prevent migraine headaches. It is also being studied in the treatment of several types of cancer. It blocks an enzyme that cells need to grow and may cause cancer cells to die. It also blocks the growth of new blood vessels that tumors need to grow. It is a type of anticonvulsant, histone deacetylase (HDAC) inhibitor, antimaniacal, migraine headache prophylactic, and antiangiogenesis agent. Also called Stavzor and valproic acid.

**deoxycytidine analogue TAS-109**: An analogue of the nucleoside deoxycytidine with potential antineoplastic activity. Nucleoside analogue TAS-109 is incorporated into DNA and directly inhibits the activity of DNA polymerase, which may result in inhibition of DNA replication and cell cycle arrest in the S and G2/M phases, DNA fragmentation, and tumor cell apoptosis.

**Deoxyhemoglobin**: A conformation of hemoglobin that is unable to bind oxygen. Also called the T or tense form.

**Deoxynucleotide**: A nucleotide containing a purine or pyrimidine base covalently linked to 2- deoxyribose, which is in turn linked to one or more phosphate groups.

**deoxyribonucleic acid**: See DNA.

**deoxyribonucleic acid** : The molecular basis of heredity; encodes the genetic information responsible for the development and function of an organism and allows for transmission of that genetic information from one generation to the next. The DNA molecule is structured as a double-stranded helix held together by weak hydrogen bonds between purine-pyrimidine nucleotide base pairs: adenine (A) paired with thymine (T), and guanine (G) paired with cytosine (C). Also called DNA. OR The U.S. federal government agency responsible for protecting the public's health and providing important services, especially for people in need. The Department of Health and Human Services works with state and local governments throughout the country to do research and provide public health services, food and drug safety programs, health insurance programs, and many other services. There are several federal agencies that are a part of the Department of Health and Human Services. They include the Food and Drug Administration (FDA), the Centers for Disease Control and

Prevention (CDC), the National Institutes of Health (NIH), and the Centers for Medicare and Medicaid Services (CMMS). Also called DHHS.

**deoxyribonucleic acid (DNA):** is the constituent of the chromosomes which stores the hereditary information in the form of a sequence nitrogenous bases. Much of this information is related to the synthesis of proteins.

**deoxyribonucleotides:** Nucleotides containing 2-deoxy-n-ribose as the pentose component.

**Deoxyribose:** A five-carbon monosaccharide (C<sub>5</sub>H<sub>9</sub>O<sub>5</sub>) that constitutes the carbohydrate moiety of a deoxynucleotide; the deoxyribose commonly found in deoxynucleotides is 2-deoxyribose.

**deoxyribose:** the five-carbon carbohydrate attached to purine or pyrimidine bases within DNA molecules.

**Depacon:** (Other name for: divalproex sodium) OR (Other name for: valproic acid)

**Depade:** (Other name for: naltrexone hydrochloride)

**Depakene:** (Other name for: valproic acid) or A form of the anticancer drug cytarabine that is contained inside very tiny, fat-like particles. It may have fewer side effects and work better than cytarabine. It is used to treat lymphoma that has spread to the meninges (three thin layers of tissue that cover and protect the brain and spinal cord). It is also being studied in the treatment of other types of cancer. It is a type of antimetabolite. Also called cytarabine liposome and liposomal cytarabine.

**Depakote:** (Other name for: divalproex sodium)

**Depakote ER:** (Other name for: divalproex sodium)

**depAndro:** (Other name for: testosterone cypionate)

**Department of Health and Human Services :** A mental condition marked by ongoing feelings of sadness, despair, loss of energy, and difficulty dealing with normal daily life. Other symptoms of depression include feelings of worthlessness and hopelessness, loss of pleasure in activities, changes in eating or sleeping habits, and thoughts of death or suicide. Depression can affect anyone, and can be successfully treated. Depression affects 15-25% of cancer patients.

**Departure from nuclear boiling ratio (DNBR):** The ratio of the heat flux needed to cause departure from nucleate boiling to the actual local heat

flux of a fuel rod.

**Departure from nucleate boiling (DNB):** The point at which the heat transfer from a fuel rod rapidly decreases due to the insulating effect of a steam blanket that forms on the rod surface when the temperature continues to increase.

**DEPDC1/MPHOSH1 peptide vaccine:** A cancer vaccine containing HLA-A\*2402-restricted epitopes derived from DEP domain containing 1 (DEPDC1) and M phase phosphoprotein 1 (MPHOSPH1) with potential immunostimulatory and antineoplastic activities. Upon administration, DEPDC1/MPHOSH1 peptide vaccine may elicit a specific cytotoxic T lymphocyte (CTL) response against tumor cells expressing DEPDC1 and MPHOSPH1, tumor antigens that are overexpressed in bladder cancer cells. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**Depen:** (Other name for: penicillamine)

**dependent variable:** A dependent variable changes in response to changes in independent variables. For example, in an experiment where the vapor pressure of a liquid is measured at several different temperatures, temperature is the independent variable and vapor pressure is the dependent variable.

**Depleted uranium:** Uranium with a percentage of uranium-235 lower than the 0.7 percent (by mass) contained in natural uranium. (The normal residual U-235 content in depleted uranium is 0.2–0.3 percent, with U-238 comprising the remaining 98.7–98.8 percent.) Depleted uranium is produced during uranium isotope separation and is typically found in cylinders of depleted uranium hexafluoride, drums of depleted uranium oxide that was deconverted from depleted uranium hexafluoride, or spent fuel elements. Depleted uranium can be blended with highly-enriched uranium, such as that from weapons, to make reactor fuel. For further detail, see Background Information on Depleted Uranium and Fact Sheet on Updating Disposal Rules for New Types of Low-Level Waste.

**Deplin:** (Other name for: L-methylfolate)

**Depo-Cyt :** A substance that is made naturally by some bacteria, fungi, and other organisms, and can also be made in the laboratory. Depsipeptides are

being studied in the treatment of cancer.

**Depo-Medrol:** (Other name for: methylprednisolone)

**Depo-Provera:** (Other name for: medroxyprogesterone)

**Depo-Testosterone:** (Other name for: testosterone cypionate)

**DepoCyt:** (Other name for: cytarabine liposome)

**Depolymerisation:** The chemical reaction which results in a polymer chain being broken up into monomer units. For most polymers made by addition polymerisation, this is done by heating the polymer above its ceiling temperature in the absence of oxygen. Some polymers, like styrene and vinyl chloride, will be difficult to depolymerise because the bonds between the side-groups (the phenyl ring and chlorine in these examples) are weaker than the C-C bonds between ex-monomers, and the polymer will degrade into different species than the starting materials. Other polymers, such as those made by step growth polymerisation may be more easily depolymerised by undoing the condensation or elimination reaction that caused the monomer units to join. In the lab, this can often be done using a strong acid in harsh conditions, although industrially, there are other tricks that polymer scientists can play.

**Deposit control :** A system of chemical treatment to avoid unwanted deposition of materials in the circulation of a paper machine or tissue machine or on heated cylinders or calendar reels.

**deposition:** the rare process of a substance changing states from gas directly to a solid. OR The process by which a certain amount of a substance arrives at a particular site (e.g., the deposition of particles on the ciliated epithelium of the bronchial airways) (WHO, 1979).

**depositional coast:** a gently sloped coast that has been built up by sediments deposited from longshore drift.

**Depotest:** (Other name for: testosterone cypionate)

**depression :** In chemistry, a compound produced from or related to another.

**Depropagation:** The reaction in which small alkenes are generated from the decomposition of a large alkane radical. This reaction is important in Thermal Cracking, and is responsible for the ceiling temperature, which prohibits chain polymerisation above a certain temperature. OR the loss of a proton (hydrogen ion) from a molecule.

**depsipeptide :** A type of surgery used to make the skin smooth and to improve the way deep scars, pits, and wrinkles look. After numbing the skin, a doctor removes the top layer of skin using sandpaper or a brush or burr (small file) that spins at a high speed.

**depth of coverage :** Refers to the number of times a nucleotide is read during sequencing. A greater depth of coverage can increase confidence in the final results. Deep coverage aids in differentiating sequencing errors from single nucleotide polymorphisms. This can be specifically useful when a patient has a mosaicism or when a tumor is heterogeneous for a mutation.

**depth of focus:** of an earthquake, the distance between the epicenter and the focus.

**derivative :** Inflammation of the skin.

**Derived air concentration (DAC):** The concentration of a given radionuclide in air which, if breathed by the reference man for a working year of 2,000 hours under conditions of light work (with an inhalation rate of 1.2 cubic meters of air per hour), results in an intake of one annual limit on intake (ALI). Established DAC values are given in Table 1, Column 3, of Appendix B to Title 10, Part 20, of the Code of Federal Regulations (10 CFR Part 20), "Standards for Protection Against Radiation."

**Derived Air Concentration-Hour (DAC-hour):** The product of the concentration of radioactive material in air (expressed as a fraction or multiple of the derived air concentration for each radionuclide) and the time of exposure to that radionuclide, in hours. A licensee may take 2,000 DAC-hours to represent one annual limit on intake (ALI), equivalent to a committed effective dose equivalent of 5 rems (0.05 Sv).

**derived unit:** unit that is a combination of basic units. OR Derived units are units constructed from the SI system's base units. For example, the SI unit for density is kg/m<sup>3</sup>, derived from the base units kg and m.

**derma-membrane-structure topical cream:** A topical cream formulation containing physiological lipids with potential anti-xerotic activity. Derma-membrane-structure topical cream contains ingredients that mirror the lipid component of the the skin, including hydrated phosphatidyl choline, but does not contain conventional emulsifiers that may disrupt the skin-lipid

barrier. This cream can also be used as a vehicle or base for topically applied medications. Check for active clinical trials using this agent.

**dermabrasion :** A type of tumor that begins as a hard nodule and grows slowly. These tumors are usually found in the dermis (the inner layer of the two main layers of tissue that make up the skin) of the limbs or trunk of the body. They can grow into surrounding tissue but do not spread to other parts of the body. These tumors are related to giant cell fibroblastomas.

**Dermacort:** (Other name for: therapeutic hydrocortisone)

**dermal tissue:** the tissue that functions to protect the plant from injury and water loss and covers the outside of the plant.

**DermaMatrix:** (Other name for: acellular cadaveric dermal matrix)

**dermatitis:** Inflammation of the skin.

**dermatitis :** A doctor who has special training to diagnose and treat skin problems.

**dermatofibrosarcoma protuberans :** The inner layer of the two main layers of the skin. The dermis has connective tissue, blood vessels, oil and sweat glands, nerves, hair follicles, and other structures. It is made up of a thin upper layer called the papillary dermis, and a thick lower layer called the reticular dermis.

**dermatologist :** A type of benign (not cancer) germ cell tumor (type of tumor that begins in the cells that give rise to sperm or eggs) that often contains several different types of tissue such as hair, muscle, and bone. Also called mature teratoma.

**dermis :** A synthetic form of the hormone estrogen that was prescribed to pregnant women between about 1940 and 1971 because it was thought to prevent miscarriages. DES may increase the risk of uterine, ovarian, or breast cancer in women who took it. It also has been linked to an increased risk of clear cell carcinoma of the vagina or cervix in daughters exposed to DES before birth. Also called diethylstilbestrol.

**dermoid cyst :** A substance being studied in the treatment of cancer as a way to block sex hormones made by the ovaries or testicles. It is a type of gonadotropin-releasing hormone analog.

**DES:** A tumor of the tissue that surrounds muscles, usually in the abdomen. A desmoid tumor rarely metastasizes (spreads to other parts of

the body). It may be called aggressive fibromatosis when the tumor is outside of the abdomen.

**desalination:** Removal of dissolved salts from seawater.

**desaturases:** Enzymes that catalyze the introduction of double bonds into the hydrocarbon portion of fatty acids.

**Desensitization:** The resetting of the sensitivity level of receptors due to the continued presence of ligands. Also called adaptation.

**desert:** an area that receives less than 25 centimeters (10 inches) of rain annually.

**desert pavement:** a large surface of the desert floor that is covered by pebbles and stones that resemble rounded paving stones; caused by deflation or temperature changes.

**desertification:** The progressive destruction or degradation of vegetative cover especially in arid or semiarid regions bordering existing deserts. Overgrazing of rangelands, large-scale cutting of forests and woodlands, drought, and burning of extensive areas all serve to destroy or degrade the land cover. The climatic impacts of this destruction include increased albedo leading to decreased precipitation, which in turn leads to less vegetative cover; increased atmospheric dust loading could lead to decreased monsoon rainfall and greater wind erosion and/or atmospheric pollution.

**Desferal:** (Other name for: deferoxamine mesylate)

**desflurane:** A fluorinated ether with general anesthetic and muscle relaxant activities. Although the exact mechanism of action has not been established, desflurane, administered by inhalation, appears to act on the lipid matrix of the neuronal membrane, resulting in disruption of neuronal transmission in the brain. This agent may also enhance the synaptic activity of the inhibitory neurotransmitter gamma-aminobutyric acid (GABA). Check for active clinical trials using this agent.

**deshielding:** an effect in NMR spectroscopy that the movement of  $\sigma$  and  $\pi$  electrons within the molecule causes. Deshielding causes chemical shifts to appear at lower magnetic fields (downfield).

**Desiccant:** A desiccant goes through a process of deliquescence to dry an area or volume of air. Desiccants are often found in small packs when

humidity needs to be decreased. OR Substance which can be used for drying purposes because of its affinity for water

**desiccation crack:** a crack that develops when a muddy sediment is exposed to air and begins to dry out; these cracks combine to form a polygonal pattern.

**Design certification:** Certification and approval by the NRC of a standard nuclear power plant design independent of a specific site or an application to construct or operate a plant. A design certification is valid for 15 years from the date of issuance but can be renewed for an additional 10 to 15 years. For additional information, see the Backgrounder on New Nuclear Plant Designs and Design Certification Applications for New Reactors.

**DESIGN OF EXPERIMENTS (DOE):** A methodology for planning experiments where purposeful changes to the inputs (factors) to a process (or activity) are made in order to observe corresponding changes in the outputs (responses). A means of gaining knowledge about a process or activity with minimal effort.

**Design Review:** A review of a blueprint, of an application, to be molded in a plastic material, with recommendations given for design, material, processing and tooling.

**Design-basis accident:** A postulated accident that a nuclear facility must be designed and built to withstand without loss to the systems, structures, and components necessary to ensure public health and safety.

**Design-basis phenomena:** Earthquakes, tornadoes, hurricanes, floods, etc., that a nuclear facility must be designed and built to withstand without loss of systems, structures, and components necessary to ensure public health and safety.

**Design-basis threat (DBT):** A profile of the type, composition, and capabilities of an adversary. The NRC and its licensees use the DBT as a basis for designing safeguards systems to protect against acts of radiological sabotage and to prevent the theft of special nuclear material. The DBT is described in detail in Title 10, Section 73.1(a), of the Code of Federal Regulations [10 CFR 73.1(a)]. Nuclear facility licensees are expected to demonstrate they can defend against the DBT. For further detail, see Protecting Our Nation.

**desipramine hydrochloride:** The hydrochloride salt form of desipramine, a secondary amine tricyclic antidepressant (TCA). In the central nervous system (CNS), desipramine hydrochloride blocks the re-uptake of neurotransmitters, including norepinephrine and serotonin. This leads to an increase in the amount of these neurotransmitters in the synaptic cleft and prolongs their activities postsynaptically.

**deslorelin:** Causing or forming adhesions or fibrous connective tissue within a tumor. OR A synthetic nonapeptide analogue of the natural gonadotrophin releasing hormone (GnRH) with potential antineoplastic activity. Deslorelin binds to and activates pituitary gonadotropin releasing hormone (GnRH) receptors. Continuous, prolonged administration of goserelin in males results in pituitary GnRH receptor desensitization and inhibition of pituitary secretion of follicle stimulating hormone (FSH) and luteinizing hormone (LH), leading to a significant decline in testosterone production; in females, prolonged administration results in a decrease in estradiol production. Check for active clinical trials using this agent.

**desmoid tumor :** A rare form of malignant melanoma marked by nonpigmented lesions on sun-exposed areas of the body, most commonly on the head and neck.

**desmoplastic :** A rare, aggressive cancer that usually affects young males and usually is located in the abdomen.

**desmoplastic melanoma :** To make something less poisonous or harmful. It may refer to the process of removing toxins, poisons, or other harmful substances from the body.

**desmoplastic small round cell tumor :** The physical, mental, and emotional stages a child goes through as he or she grows and matures.

**desmopressin acetate:** An analogue of the hormone vasopressin with antidiuretic and antihemorrhagic properties. Desmopressin acetate has selective affinity for the V2 receptor and acts on the distal kidney tubule by increasing the cellular permeability thereby stimulating water reabsorption. This antidiuretic agent is used in the treatment of central diabetes insipidus. An unrelated action of desmopressin acetate is to increase circulating factor VIII and is used in patients with haemophilia and von Willebrand's disease.

**desogestral:** A synthetic progestogen structurally related to levonorgestrel, with progesterone hormone receptor agonistic activity, used as a

contraceptive and hormone replacement agent. Upon administration, desogestrel binds intracellular progesterone receptors in progesterone responsive tissue and the resultant complex interacts with DNA causing either gene transcription or gene repression. This eventually leads to an inhibition of gonadotropin releasing hormone (GnRH) secretion from the hypothalamus and a subsequent inhibition of luteinizing hormone (LH) and follicle-stimulating hormone (FSH) release. This prevents ovulation and alters the cervical mucus.

**Desolvated solvate:** A crystalline solvate that has lost the solvent of crystallization but has largely retained the original crystalline lattice.

**Desolvation:** The process by which solvent molecules disassociate from a species in solution. In medicinal chemistry, this usually refers to the removal of water molecules surrounding a biological target before the binding of a drug. OR A reaction in which the solvent of crystallization is lost from a crystal. Desolvation can be accompanied by a polymorphic transformation, or the original crystal structure can be maintained to produce a desolvated crystal. OR In aqueous solution, the release of bound water surrounding a solute.

**DESSICANT:** Substance which can be used for drying purposes because of its affinity for water. Or Treating plastics materials to minimize their accumulation of static electricity, and subsequently, the amount of dust picked up by the plastics because of such charges. See ANTISTATIC AGENTS. Or A permanent change in the physical properties of a plastic evidenced by impairment of these properties.

**destructive interference:** When the peaks of one wave match the troughs of another, the waves interfere destructively. The amplitudes of the interfering waves cancel to give the resultant wave a lower amplitude.

**desvenlafaxine succinate:** The succinate salt form of desvenlafaxine, a synthetic phenethylamine bicyclic derivative with antidepressant activity. Desvenlafaxine is a selective reuptake inhibitor of serotonin and norepinephrine due to its high binding affinities to the pre-synaptic serotonin and norepinephrine transporters. By blocking both transporters, this agent prolongs neurotransmitter activities of both serotonin and norepinephrine, thereby alleviating depressive state.

**detachment fault:** a low-angle fault above which is often a series of thrust faults and below which is undeformed bedrock.

**Detection limit :** the concentration at which the mean value of the output sensor signal is equal to two standard deviations. In practice, the lowest concentration of the analyte that can be detected and/or measured by a sensor. In other words, the concentration (or activity) of the measured ion at the point of intersection between the extrapolated linear segment of the calibration curve (representing the normal slope of the electrode) and a horizontal line (representing the voltage when the concentration is so low, that small changes in concentration do not produce any detectable change in the electrode response). The portion of the calibration curve between this point and the beginning of the truly linear section is known as the nonlinear range of the electrode. Samples are still measurable within this range provided that several standards are used to define the changing slope of the curve accurately, but the error in concentration (per millivolt error in measurement) will be progressively greater as the slope reduces.

**Detector:** A material or device that is sensitive to ionizing radiation and can display its characteristics and/or produce a signal suitable for measurement or analysis. See also radiation detection instrument. OR a device, which indicates the presence of the chemical species above a predetermined, threshold value. There is not explicit qualitative relationship between the output and stimulant.

**detention time:** the time allowed for solids to collect in a settling tank. Theoretically detention time is equal to the volume of the tank divided by the flow rate.

**Detergency:** Detergency is the property of surfactants that allows them to clean things for us. The surfactants accumulate on the oil/water interface so that when we scrub the oily stain to break it up, the oil drops do not coalesce.

**detergent:** A substance used for removing dirt. Detergents differ from soaps in that detergents are compounds that are derived from sulfur-containing organic acids. OR A detergent is a type of surfactant. Essentially, a detergent is any surfactant that is not a soap. OR A synthetic cleansing agent resembling soap in its ability to remove a soil from a surface. OR A washing powder or liquid used to clean and remove stains in garments and other fabrics in the home or in commercial applications, often based on soap and other surfactant chemistry.

**Deterministic (probabilistic):** Consistent with the principles of "determinism," which hold that specific causes completely and certainly determine effects of all sorts. As applied in nuclear technology, it generally deals with evaluating the safety of a nuclear power plant in terms of the consequences of a predetermined bounding subset of accident sequences. The term "probabilistic" is associated with an evaluation that explicitly accounts for the likelihood and consequences of possible accident sequences in an integrated fashion. See also Probabilistic risk assessment (PRA).

**Deterministic effect:** The health effects of radiation, the severity of which varies with the dose and for which a threshold is believed to exist. Radiation-induced cataract formation is an example of a deterministic effect (also called a non-stochastic effect) (see 10 CFR 20.1003).

**detorubicin:** A semi-synthetic derivative of the anthracycline antineoplastic antibiotic daunorubicin. Detorubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent also produces toxic free-radical intermediates and interacts with cell membrane lipids causing lipid peroxidation. Detorubicin is less toxic than daunorubicin. Check for active clinical trials using this agent.

**Detox-B adjuvant:** A cancer vaccine adjuvant that consists of an oil droplet emulsion of monophosphoryl lipid A and mycobacterial cell wall skeleton. Detox-B adjuvant is a non-specific immunostimulant that may enhance the host immune response to certain cancer vaccines. Detox-B differs from Detox adjuvant in that Detox-B contains lecithin.

**detoxify:** Reduce the toxicity of a substance either (1) by making it less harmful or (2) by treating patients suffering from poisoning in such away as to reduce the probability and/or severity of harmful effects. OR Different from what is normal or standard, especially in terms of behavior.

**DetoxPC:** A detoxified, nonspecific immunostimulant consisting of a combination of the active monophosphoryl lipid A component of lipopolysaccharide (LPS) isolated from the bacterium *Salmonella minnesota* combined with a residue of the cell wall of the bacterium *Mycobacterium phlei*. Detox-PC differs from Detox adjuvant and Detox-B in that Detox-PC contains egg phosphatidylcholine and alpha-tocopherol. Check for active clinical trials using this agent.

**Detritus:** Dead plant and animal matter, usually consumed by bacteria, but some remains.

**deuterated 3-methylhistidine:** A derivative of the amino acid histidine labeled with heavy hydrogen (D) used in diagnostic procedures. Upon intake of deuterated 3-methylhistidine (3-MH), this agent is incorporated into muscle protein and then is subsequently excreted unchanged in the urine. By measuring the amount of 3-MH in the urine, via analysis of deuterium, the rate of protein muscle catabolism can be determined and the risk of skeletal muscle atrophy or cachexia can be assessed. 3-methylhistidine is a myofibrillar-specific amino acid and is mainly found in muscle myosin and actin; proteolysis of myofibrils releases 3-MH that is excreted unchanged in the urine.

**deuterated phenanthrene:** A noncarcinogenic and structural analogue of polycyclic aromatic hydrocarbon (PAH), phenanthrene labeled with deuterium ([D10]Phe) with potential use in assessing an individual's capacity for PAH metabolism by the diol epoxide pathway. Upon oral or inhalation administration, [D10]Phe is metabolized into the tetraol end product ([D10]PheT) via the diol epoxide pathway, and can be quantified in urine. [D10]PheT can be used as a biomarker to assess PAHs metabolic activation and may therefore determine an individual's susceptibility to carcinogenicity upon PAH exposure.

**deuterium:** The isotope of hydrogen that has one neutron. OR An isotope of hydrogen with one proton and one neutron in the nucleus.

**deuterium oxide:** A stable, non-radioactive isotopic form of water, containing 2 atoms of deuterium (D) and one atom of oxygen (2D<sub>2</sub>O), with DNA-labeling activity. Upon ingestion of deuterium oxide, 2H is incorporated into the deoxyribose moiety of DNA of newly divided cells. Rapidly dividing cells, as in the case of B-cell chronic lymphocytic leukemia (B-CLL), can be labeled with deuterium oxide and measured using gas chromatography and/or mass spectrometry.

**deuterium<sup>2</sup>:** An isotope of hydrogen that contains one neutron and one proton in its nucleus.

**Deuteron:** The nucleus of deuterium. It contains one proton and one neutron. See also Heavy water (D<sub>2</sub>O).

**developmental stage :** An object that has a specific use. In medicine, wheelchairs, pumps, and artificial limbs are examples of devices.

**deviant :** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called BMD scan, bone mineral density scan, DEXA scan, dual energy x-ray absorptiometric scan, dual x-ray absorptiometry, and DXA.

**device :** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called BMD scan, bone mineral density scan, DEXA, dual energy x-ray absorptiometric scan, dual x-ray absorptiometry, and DXA.

**Dew Point:** The temperature to which air with a given quantity of water vapor must be cooled to cause condensation of the vapor in the air. OR the temperature at which the condensation of a vapor begins; the term is usually applied to condensation of moisture from the water vapor in the atmosphere. OR ) temperature at which water vapor condenses into liquid water.

**Dew point (of a gas mixture):** the temperature at which the first liquid droplet appears when the mixture is cooled at constant pressure.

**dewatering:** the step in lithification in which increasing pressure squeezes out some of the water between sediment particles.

**DEXA :** A drug used to reduce inflammation and lower the body's immune response. It is used with other drugs to treat leukemia, lymphoma, mycosis fungoides, and other types of cancer. Dexamethasone is also used to prevent or treat many other diseases and conditions. These include conditions related to cancer and its treatment, such as anemia, allergic reactions, swelling in the brain, and high levels of calcium in the blood. Dexamethasone is a type of corticosteroid.

**DEXA scan :** A substance being studied in the treatment of fatigue and nervous system side effects caused by chemotherapy. It is a type of central nervous system stimulant.

**dexamethasone:** A synthetic adrenal corticosteroid with potent anti-inflammatory properties. In addition to binding to specific nuclear steroid receptors, dexamethasone also interferes with NF-kB activation and apoptotic pathways. This agent lacks the salt-retaining properties of other

related adrenal hormones. OR The active ingredient in a drug used to treat severe side effects caused by certain anticancer drugs. Under the brand name Totect it is used to treat the toxic effects of an anticancer drug that leaks from a vein into surrounding tissue and causes tissue damage. Under the brand name Zinecard it is used to reduce heart damage in women given doxorubicin for breast cancer that has spread. Dexrazoxane is also being studied in the treatment of cancer. It is a type of cardioprotective agent, a type of chemoprotective agent, and a type of topoisomerase inhibitor.

**dexamethasone intravitreal implant:** An intravitreal implant containing the corticosteroid dexamethasone embedded in a biodegradable polymer matrix, with anti-inflammatory and macular edema-relieving activity. Upon insertion into the vitreous cavity, dexamethasone intravitreal implant is dissolved slowly and dexamethasone is released over an extended period of time. Dexamethasone inhibits inflammation thereby preventing leakage from the capillaries and a reduction of retinal edema. This may ultimately prevent vision impairment. Check for active clinical trials using this agent.

**Dexampex:** (Other name for: dextroamphetamine sulfate)

**dexanabinol:** A synthetic, terpene-based cannabinoid derivative devoid of cannabinoid receptors 1 and 2 agonist activity and with potential neuroprotective, antiinflammatory and antineoplastic activities. Functioning as an N-Methyl-D-aspartate (NMDA) receptor antagonist, dexanabinol protects neuronal cells against NMDA and glutamate neurotoxicity. This agent also scavenges peroxy radicals and protects neurons from the damages of reactive oxygen species. Furthermore, dexanabinol inhibits the activity of nuclear factor kappa B (NF-kB), thereby preventing the expression of NF-kB target genes, such as tumor necrosis factor alpha, cytokines and inducible nitric oxide synthase. As a result, this agent may restore apoptotic processes in cancerous cells. NF-kB is activated in a variety of cancer cells and plays a key role in the regulation of apoptosis and cellular proliferation. Check for active clinical trials using this agent.

**Dexedrine:** (Other name for: dextroamphetamine sulfate)

**dexmedetomidine hydrochloride:** The hydrochloride salt form of dexmedetomidine, an imidazole derivate and active d-isomer of medetomidine with analgesic, anxiolytic and sedative activities. Dexmedetomidine selectively binds to and activates presynaptic alpha-2 adrenoceptors located in the brain, thereby inhibiting the release of

norepinephrine from synaptic vesicles. This leads to an inhibition of postsynaptic activation of adrenoceptors, which inhibits sympathetic activity, thereby leading to analgesia, sedation and anxiolysis.

**dexmethylphenidate** : A drug used to treat severe side effects caused by certain anticancer drugs. It is used under the brand name Totect to treat the toxic effects of an anticancer drug that leaks from a vein into surrounding tissue and causes tissue damage. It is also used under the brand name Zinecard to reduce heart damage in women given doxorubicin for breast cancer that has spread. Dexrazoxane hydrochloride is also being studied in the treatment of cancer. It is a type of cardioprotective agent, a type of chemoprotective agent, and a type of topoisomerase inhibitor.

**dexpanthenol cream**: An alcoholic analogue of D-pantothenic acid and cholinergic agent. Dexpanthenol acts as a precursor of coenzyme A necessary for acetylation reactions and is involved in the synthesis of acetylcholine. Although the exact mechanism of the actions of dexpanthenol is unclear, it may enhance the effect of acetylcholine. Dexpanthenol acts on the gastrointestinal tract and increases lower intestinal motility. It is also applied topically to the skin to relieve itching and to promote healing.

**dexpanthenol mouthwash**: A mouthwash containing 5% dexpanthenol, the alcoholic analogue of the dextrorotatory isomer of pantothenic acid with potential antimucositis activity. Although the exact mechanism remains to be elucidated, upon rinsing with this solution dexpanthenol is converted to pantothenic acid (vitamin B5) which is required for coenzyme A synthesis as well as for the metabolism of proteins, carbohydrates, and fats. Coenzyme A is involved in fatty acids and sphingolipids synthesis crucial for cell membrane integrity. This mouthwash may have a protective and healing effect on the oral mucosa, may improve hydration and may potentially prevent or reduce radiation/chemotherapy-induced mucositis. Check for active clinical trials using this agent.

**dexrazoxane** : A combination of drugs used as a treatment for attention deficit hyperactivity disorder (ADHD) and narcolepsy (a sleep disorder). It is a type of stimulant. Also called Adderall.

**dexrazoxane hydrochloride**: The hydrochloride salt of a bisdioxopiperazine with iron-chelating, chemoprotective, cardioprotective, and antineoplastic activities. After hydrolysis to an active form that is

similar to ethylenediaminetetraacetic acid (EDTA), dexrazoxane chelates iron, limiting the formation of free radical-generating anthracycline-iron complexes, which may minimize anthracycline-iron complex-mediated oxidative damage to cardiac and soft tissues. This agent also inhibits the catalytic activity of topoisomerase II, which may result in tumor cell growth inhibition.

**dexrazoxane hydrochloride :** An anticancer drug that is a type of angiogenesis inhibitor.

**Dextri-Maltose:** (Other name for: maltodextrin)

**dextroamphetamine sulfate:** The salt of the dextro-isomer of amphetamine and sympathomimetic amine with CNS stimulating properties. Dextroamphetamine sulphate acts by facilitating the release of catecholamines, particularly noradrenaline and dopamine, from nerve terminals in the brain and inhibits their uptake. This leads to an increase in motor activity, causes euphoria, mental alertness and excitement and suppresses appetite. This drug causes dependence and may cause an increase in heart rate and blood pressure. It is used in the treatment of narcolepsy and attention deficit hyperactivity disorder.

**dextroamphetamine-amphetamine:** A combination of two synthetic agents with central nervous system stimulant activity. Both agents are non-catecholamine, sympathomimetic agents that elevate blood pressure and cause bronchodilation. These agents are commonly abused psychostimulant drugs that induce psychologic dependence manifested by elevated mood, increased wakefulness, concentration, physical performance and a feeling of well-being. Tolerance to various effects develops unequally, so that tachycardia and enhanced alertness diminish while psychotoxic effects (hallucinations and delusions) may occur. Check for active clinical trials using this agent.

**dextroamphetamine-amphetamine :** A substance being studied in the treatment of cancer. Also called difluoromethylornithine.

**dextromethorphan acetic acid :** In cancer, the length of time after primary treatment for a cancer ends that the patient survives without any signs or symptoms of that cancer. In a clinical trial, measuring the DFS is one way to see how well a new treatment works. Also called disease-free survival, relapse-free survival, and RFS.

**dextromethorphan hydrobromide:** The hydrobromide salt form of dextromethorphan, a synthetic, methylated dextrorotary analogue of levorphanol, a substance related to codeine and a non-opioid derivate of morphine. Dextromethorphan exhibits antitussive activity and is devoid of analgesic or addictive property. This agent crosses the blood-brain-barrier and activates sigma opioid receptors on the cough center in the central nervous system, thereby suppressing the cough reflex. orThe hydrochloride salt of the d-isomer of the synthetic opiate propoxyphene with weak narcotic analgesic activity. Dextropropoxyphene mimics the effects of endogenous opiates by binding to mu receptors located throughout the central nervous system. The binding results in GTP to GDP exchanges on the mu-G-protein complex, by which the effector adenylate cyclase is inactivated, decreasing intracellular cAMP. This, in turn, inhibits the release of various nociceptive neurotransmitters, such as substance P, gamma-aminobutyric acid (GABA), dopamine, acetylcholine, noradrenaline, vasopressin, and somatostatin. In addition, dextropropoxyphene closes N-type voltage-gated calcium channels and opens calcium-dependent inwardly rectifying potassium channels, which results in neuronal hyperpolarization, a reduction in neuronal excitability, and a further decrease in the perception of pain.

**dextrorotatory:** Able to rotate plane-polarized light in a clockwise fashion. OR describes the clockwise rotation of plane-polarized light (from Latin dextro, "to the right"). A lowercase "d" or a "+" is the notation used before an isomer's name to indicate that it is dextrorotatory; for example, d-2-butanol. (Compare with "levorotatory.") OR Having the property of rotating plane-polarized light clockwise. OR A stereoisomer that rotates the plane of plane-polarized light clockwise.

**Dextrostat:** (Other name for: dextroamphetamine sulfate)

**dexverapamil:** The R-enantiomer of the calcium channel blocker verapamil. Dexverapamil competitively inhibits the multidrug resistance efflux pump P-glycoprotein (MDR-1), thereby potentially increasing the effectiveness of a wide range of antineoplastic drugs which are inactivated by MDR-1 mechanisms. This agent exhibits decreased calcium antagonistic activity and toxicity compared to racemic verapamil.

**DFMO:** A combination of DHA (a natural fatty acid) and paclitaxel (an anticancer drug) being studied in the treatment of cancer. It is a type of

mitotic inhibitor.

**DFS:** A substance being studied in the prevention of cancer. It is a type of steroid. Also called dehydroepiandrosterone.

**DFT:** Density-functional theory. Ab initio method not based upon a wavefunction. Instead, the energy is computed as a functional of the electron density. Sometimes called Kohn-Sham theory. The correct functional has not yet been found, but many approximations are in use.

**DHA-paclitaxel:** A prodrug comprised of the naturally occurring omega-3 fatty acid docosahexaenoic acid (DHA) covalently conjugated to the anti-microtubule agent paclitaxel. Because tumor cells take up DHA, DHA-paclitaxel is delivered directly to tumor tissue, where the paclitaxel moiety binds to tubulin and inhibits the disassembly of microtubules, thereby resulting in the inhibition of cell division. Paclitaxel also induces apoptosis by binding to and blocking the function of the apoptosis inhibitor protein Bcl-2 (B-cell Leukemia 2). DHA-paclitaxel exhibits improved pharmacokinetic and toxicity profiles when compared to conventional paclitaxel and has demonstrated antineoplastic activity in animal models of cancer. or A substance that can build up in cancer cells and block them from using folate. Folate is a nutrient that rapidly dividing cells need to make DNA. Blocking folate use helps keep cancer cells from growing and may kill them. Some DHFR inhibitors are used to treat cancer. A DHFR inhibitor is a type of antifolate. Also called dihydrofolate reductase inhibitor.

**DHAP regimen:** A chemotherapy regimen consisting of dexamethasone, high-dose cytarabine (ARA-C) and cisplatin (Platinol), used for the treatment of relapsed and refractory Hodgkin and non-Hodgkin lymphomas.

**DHEA:** The U.S. federal government agency responsible for protecting the public's health and providing important services, especially for people in need. The DHHS works with state and local governments throughout the country to do research and provide public health services, food and drug safety programs, health insurance programs, and many other services. There are several federal agencies that are a part of the DHHS. They include the Food and Drug Administration (FDA), the Centers for Disease Control and Prevention (CDC), the National Institutes of Health (NIH), and the Centers for Medicare and Medicaid Services (CMMS). Also called Department of Health and Human Services.

**DHEA mustard:** A steroidal alkylating agent with potential antineoplastic activity. Alkylating agents exert cytotoxic and, in some cases, chemotherapeutic effects by transferring alkyl groups to DNA, thereby damaging DNA and interfering with DNA replication and cell division.

**dHER2+AS15 vaccine:** A cancer vaccine consisting of a truncated recombinant HER2/neu peptide (dHER2) combined with the immunoadjuvant AS15 with potential immunostimulatory and antineoplastic activities. Upon administration, dHER2+AS15 vaccine may stimulate the host immune response to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells that overexpress the HER2/neu protein, resulting in tumor cell lysis. The tumor-associated antigen (TAA) HER2/neu is often overexpressed by a variety of tumor cell types; dHER2 includes amino acids 1-645 or 1-653 of the extracellular domain (ECD) and an immunogenic carboxyl terminal autophosphorylation portion of the intracellular domain (ICD). AS15 is an adjuvant formulation that contains the adjuvant systems AS01B and AS07A; AS01 B is composed of liposomes containing 3D-MPL and QS21 and AS07A is composed of the synthetic oligodeoxynucleotide (ODN) Toll-like receptor-9 (TLR9) agonist CpG 7909.

**DHFR inhibitor :** A rare, aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma caused by changes in the DNA that affect a gene called the MYC gene and either the BCL2 gene or the BCL6 gene. DHL may be hard to treat and has a poor prognosis. It is a type of diffuse large B-cell lymphoma. Also called double-hit lymphoma.

**DHHS:** A childhood condition in which abnormal tissue grows on the outer part of one or both kidneys. DHPLN usually develops into Wilms tumor (a type of childhood kidney cancer) if not treated. Also called diffuse hyperplastic perilobar nephroblastomatosis.

**DHL:** A hormone made from testosterone in the prostate, testes, and certain other tissues. It is needed to develop and maintain male sex characteristics, such as facial hair, deep voice, and muscle growth. High amounts of DHT may increase the growth of prostate cancer and make it harder to treat. Also called androstanolone and dihydrotestosterone.

**DHPLN:** Any of several diseases in which the kidneys make a large amount of urine. Diabetes usually refers to diabetes mellitus in which there

is also a high level of glucose (a type of sugar) in the blood because the body does not make enough insulin or use it the way it should.

**DHT:** A condition in which a person is very thirsty and makes large amounts of urine. The most common types of diabetes insipidus are central diabetes insipidus (a pituitary disorder) and nephrogenic diabetes insipidus (kidney failure). Diabetes insipidus is not related to diabetes mellitus, which is more common.

**DI water:** deionized water, having had all the ions removed.

**Di-:** A prefix meaning two

**di-dgA-RFB4:** An anticancer drug that is a combination of a monoclonal antibody (RFB4) and an immunotoxin (dgA).

**DI-Leu16-IL2 immunocytokine:** A recombinant fusion protein consisting of de-immunized and humanized anti-CD20 monoclonal antibody Leu16 fused to human cytokine interleukin-2 (IL2) with potential antineoplastic activity. The antibody moiety of DI-Leu16-IL2 immunocytokine binds to tumor cells expressing the CD20 antigen, which may result in an antibody-dependent cell-mediated cytotoxicity (ADCC) towards CD20-expressing tumor cells; the localized IL2 moiety of this fusion protein may stimulate natural killer (NK) and T-lymphocyte mediated immune responses, enhancing the ADCC response. De-immunization involves the modification of potential helper T cell epitopes that bind to MHC class II molecules; humanization involves combining recombinant murine variable (V) regions with human immunoglobulin light and heavy chain constant regions. CD20 antigen, a hydrophobic transmembrane protein located on normal pre-B and mature B lymphocytes, is overexpressed by various cancer cell types.

**Diabeta:** (Other name for: glyburide)

**Diabetes:** A disease characterized by the overproduction of glucose by the liver and its underutilization by other organs. Type I diabetes is due to an insufficiency of insulin production, whereas type II is due to the inability of insulin receptors to respond to the hormone.

**diabetes :** A disease in which the body does not control the amount of glucose (a type of sugar) in the blood and the kidneys make a large amount of urine. This disease occurs when the body does not make enough insulin or does not use it the way it should.

**diabetes insipidus :** (dy-A-seh-til-MOR-feen HY-droh-KLOR-ide)

**diabetes mellitus:** A metabolic disease resulting from insulin deficiency; characterized by a failure in glucose transport from the blood into cells at normal glucose concentrations.

**diabetes mellitus :** A substance made from morphine. Diacetylmorphine hydrochloride is very addictive, and it is illegal to use or sell it in the United States. It may be used outside the United States to treat severe pain. Diacetylmorphine hydrochloride binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opiate. Also called diamorphine hydrochloride and heroin.

**Diabinese:** (Other name for: chlorpropamide)

**diacetylmorphine hydrochloride:** The hydrochloride salt of a diacetyl derivative of the opiate morphine, a naturally occurring alkaloid extracted from the seedpod of the Asian poppy (*Papaver* sp.). Once administered, diamorphine (or diacetylmorphine) is rapidly hydrolyzed to 6-monoacetylmorphine (6-MAM) and then to the end-product morphine which binds to opiate receptors located throughout the mammalian nervous and gastrointestinal systems. Inducing a potent analgesia, the use of diamorphine is often escalated due to a tolerance effect, resulting in abuse that is associated with fatal overdose, abortion, venous sclerosis, and opportunistic infections, among other adverse effects.

**diacetylmorphine hydrochloride :** The process of identifying a disease, condition, or injury from its signs and symptoms. A health history, physical exam, and tests, such as blood tests, imaging tests, and biopsies, may be used to help make a diagnosis.

**Diacylglycerol:** A second messenger in the phosphoinositide cascade, which leads to the activation of protein kinase C.

**diagnosis :** X-ray of the breasts used to check for breast cancer after a lump or other sign or symptom of breast cancer has been found.

**diagnostic mammogram :** A type of test used to help diagnose a disease or condition. Mammograms and colonoscopies are examples of diagnostic procedures. Also called diagnostic test.

**diagnostic procedure :** A type of method or test used to help diagnose a disease or condition. Imaging tests and tests to measure blood pressure, pulse, and temperature are examples of diagnostic techniques.

**diagnostic technique :** A type of test used to help diagnose a disease or condition. Mammograms and colonoscopies are examples of diagnostic tests. Also called diagnostic procedure.

**diagnostic test :** A research study that evaluates methods of detecting disease.

**diagnostic trial :** The process of filtering the blood when the kidneys are not able to cleanse it.

**Diagonal electrophoresis:** A means of determining the location of disulfide bonds in proteins. A mixture of proteins undergoes electrophoresis in a single lane in one direction, disulfide bonds are irreversibly reduced, and the sample is electrophoresed perpendicularly to the original direction. Peptides migrating as a single band in the first direction will migrate as two bands in the second direction if they contained a disulfide bond.

**diagonal of a polygon:** a line segment connecting one vertex to another vertex, and not a side of the polygon.

**dialysis:** the separation of a colloid from a substance in solution by allowing the solution to diffuse through a semipermeable membrane. OR Removal of small molecules from a macromolecule preparation by allowing them to pass across a semipermeable membrane. OR Dialysis is the separation of components in a mixture by passing them across a semipermeable membrane. OR Removal of small molecules from a solution of a macromolecule, by allowing them to diffuse through a semipermeable membrane into water.

**dialysis :** The length of a straight line that extends from one edge of a tumor or other object, through its center and to the opposite edge. It is usually used to measure the size of round or spherical shapes.

**diamagnetism:** Diamagnetic materials are very weakly repelled by magnetic fields. The atoms or molecules of diamagnetic materials contain no unpaired spins.

**diameter:** a line segment that contains the center and has its endpoints on the circle. Also, the length of this segment. (A chord through the center of the circle.) OR Diameter of the barrel described in inches. Term used to characterize the extruder.

**diameter :** A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients

may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with Diamond-Blackfan anemia may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–Diamond anemia, congenital hypoplastic anemia, congenital pure red cell aplasia, DBA, erythropoiesis imperfecta, and inherited erythroblastopenia.

**Diametrical Clearance:** The gap between the two mating metal surfaces forming a gland's internal cavity. Through slight oversizing and accompanying compression of the O-Ring seals this gap to prevent system leakage

**diammonium glycyrrhizinate:** The diammonium salt of glycyrrhizin and the active constituent in the traditional Chinese medicinal herb *Glycyrrhiza uralensis* (Chinese liquorice or Gan-Cao) with anti-inflammatory, antioxidant and hepatoprotective properties. Diammonium glycyrrhizinate (DG) is slowly metabolized within the cells into glycyrrhetic acid, which inhibits enzymes that control cortisol metabolism and contributes to this agent's anti-inflammatory effect. Although the exact mechanism of action remains to be fully elucidated, DG may prevent or reduce hepatotoxicity via the scavenging of free radicals. This agent also upregulates the expression of transcription coactivator PGC-1alpha and modulates hepatic enzymes such as alanine aminotransferase (ALT), aspartate aminotransferase (AST), superoxide dismutase and glutathion peroxidase.

**Diamond:** One of the allotropes of carbon. Allotropes have the atoms of the same element but arranged in a different way. OR A crystalline form of carbon, made of a network of covalent, tetrahedrally bound carbon atoms.

**Diamond-Blackfan anemia :** (dy-uh-MOR-feen HY-droh-KLOR-ide)

**diamorphine hydrochloride :** A substance made from morphine. Diamorphine hydrochloride is very addictive, and it is illegal to use or sell it in the United States. It may be used outside the United States to treat severe pain. Diamorphine hydrochloride binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opiate. Also called diacetylmorphine hydrochloride and heroin.

**dianhydrogalactitol:** A bifunctional hexitol derivative with potential antineoplastic activity. Dianhydrogalactitol alkylates and cross-links DNA

via an epoxide group during all phases of the cell cycle, resulting in disruption of DNA function and cell cycle arrest. Check for active clinical trials using this agent.

**diaphragm :** The thin muscle below the lungs and heart that separates the chest from the abdomen.

**DIAPHRAGM GATE:** Gate used in molding annular or tubular articles. Gate forms a solid web across the opening of the part. Or Used in symmetrical cavity filling to reduce weld-line formations and improve filling rates.

**diaphyses:** the main or mid section (shaft) of the long bones

**diapir:** a small magma blob resulting from localized melting of the crust; a component of batholiths.

**diarrhea :** Frequent and watery bowel movements.

**Diastereoisomers:** A pair of molecules, each with more than one asymmetric center, that have opposite configurations at one such center but are not mirror images of each other; in the aldotetrose series, Derythrose and D-threose are diastereoisomers.

**diastereomer:** a stereoisomer of an optical isomer that has more than one stereogenic center and is not a mirror image of one of the other enantiomers of the molecule. Diastereomers have the same configuration at one or more stereogenic centers but opposite configurations at others. OR Stereoisomers which are not mirror images of each other. Diastereomers are chemically similar but distinguishable; they have different melting points and boiling points and they react at different rates.

**Diastyl:** (Other name for: diethylstilbestrol)

**diathermy :** A procedure in which tissue is heated to destroy abnormal cells. The heat may come from electric currents, microwaves, radio waves, or ultrasound. Diathermy is a type of hyperthermia therapy. Also called electrodiathermy.

**Diatomaceous earth:** A fine, siliceous (made of silica) "earth" composed mainly of the skeletal remains of diatoms (single cell microscopic algae with rigid internal structure consisting mainly of silica). Tests prove that DE leaches unacceptable amounts of silicate into the water for fish health. If used as a filter substance, a silicone removing resin should be employed afterwards. OR a filter medium used for filtration of effluents from

secondary and tertiary treatments, particularly when a very high grade of water for reuse in certain industrial purposes is required; used as an absorbant for oils and oily emulsions in some wastewater treatment designs; also used historically in preparing standard suspensions for turbidity measurements.

**diatomic:** A diatomic molecule is made of two atoms bonded together, e.g. Cl<sub>2</sub>.

**diatomic molecule:** A molecule that contains only two atoms. All of the noninert gases occur as diatomic molecules; e. g. hydrogen, oxygen, nitrogen, fluorine, and chlorine are H<sub>2</sub>, O<sub>2</sub>, N<sub>2</sub>, F<sub>2</sub>, and Cl<sub>2</sub>, respectively.

**Diauxic growth:** Biphasic growth on a mixture of two carbon sources in which one carbon source is used up before the other one. For example, in the presence of glucose and lactose, E. coli will utilize the glucose before the lactose.

**diazepam :** A drug used to treat mild to moderate anxiety and tension and to relax muscles. It is a type of benzodiazepine. Also called Valium.

**diazepinomicin:** A small-molecule inhibitor of the RAS/RAF/MAPK signaling pathway with potential antineoplastic activity. Diazepinomicin binds to and inhibits Ras kinase, thereby preventing the phosphorylation and activation of proteins downstream of the Ras signal transduction pathway, including serine/threonine kinase RAF (BRAF) and extracellular signal-regulated kinases 1 and 2 (ERK1 and ERK-2). This agent also selectively binds to the peripheral benzodiazepine receptor (PBR), a receptor highly expressed in certain tumor cell types cells, inducing cell cycle arrest and apoptosis in PBR-expressing cells. Diazepinomicin can cross the blood-brain barrier (BBB).

**diaziquone:** A synthetic bifunctional quinone derivative with potential antineoplastic activity. Diaziquone alkylates and cross-links DNA during all phases of the cell cycle, resulting in disruption of DNA function, cell cycle arrest, and apoptosis. This agent can also form free radicals, thereby initiating DNA damage via DNA strand breaks. Due to its lipophilicity, diaziquone readily crosses the blood brain barrier.

**diazonium salt:** A diazonium salt is a compound with general form Ar-NN<sup>+</sup>X<sup>-</sup>, where Ar represents a substituted benzene ring and X<sup>-</sup> is a halide ion such as chloride. Diazonium salts are unstable and explosive in dry

form. They are used to manufacture many different organic compounds, including azo dyes. See also diazotization.

**diazooxonorleucine:** An anticancer drug that is able to cross the blood-brain barrier and kill cancer cells in the central nervous system. Also called AZQ. OR An L-glutamine diazo analogue amino acid antibiotic isolated from a species of the bacterial genus *Streptomyces* with potential antineoplastic activity. Diazooxonorleucine inhibits several glutamine-dependent biosynthetic pathways involved in the the syntheses of D-glucosamine phosphate, purines and pyrimidines. This agent inhibits phosphate-activated glutaminase, a key enzyme for the synthesis of releasable glutamine, depleting cells of this essential amino acid and reducing their capacity to proliferate.

**diazotization:** Diazotization is a reaction that converts an  $-NH_2$  group connected to a phenyl ring to a diazonium salt. For example, Diazotization reactions are extremely useful in organic synthesis. The nitrous acid provides  $NO^+$  which replaces a hydrogen on the  $-NH_3^+$  group to produce  $-NH_2NO^+$  and water; a second water is eliminated to produce the  $-N_2^+$  group.

**diazoxide:** A benzothiadiazine derivate with antihypertensive and hyperglycemic activities. Diazoxide increases membrane permeability to potassium ions in vascular smooth muscle, thereby stabilizing the membrane action potential and preventing vascular smooth muscle contraction; this results in peripheral vasodilatation and decreases in peripheral vascular resistance. This agent also inhibits insulin release by interacting with ATP-sensitive potassium channels of pancreatic islet beta-cells.

**Dibasic:** An acid that has two acidic hydrogen atoms that can react with a base is dibasic. An example is the amino acid aspartic acid, which contains two carboxylic acid groups with different reactivities.

**Dibenzylamine:** (Other name for: phenoxybenzamine hydrochloride)

**dichloromethane<sup>22</sup>:** Dichloromethane ( $CH_2Cl_2$ ) is an organic solvent often use to extract organic substances from samples. It is toxic but much less so than chloroform or carbon tetrachloride, which were previously used for this purpose.

**dichloromethotrexate:** A chlorinated methotrexate derivative. Dichloromethotrexate inhibits the enzyme dihydrofolate reductase, thereby

preventing the synthesis of purine nucleotides and thymidylates and inhibiting DNA and RNA synthesis. This agent is metabolized and excreted by the liver.

**diclofenac :** The active ingredient in a drug that is used to treat the symptoms of rheumatoid arthritis and is being studied in the prevention and treatment of some types of skin cancer. It blocks substances that cause inflammation and pain. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of cyclooxygenase inhibitor, a type of nonsteroidal anti-inflammatory drug (NSAID), and a type of antiangiogenesis agent.

**diclofenac epolamine patch:** A topical patch containing the epolamine salt form of the nonsteroid anti-inflammatory drug (NSAID) diclofenac, with anti-inflammatory, anti-pyretic and analgesic activities. Upon topical application of the diclofenac epolamine patch to a specific area, the patch releases diclofenac epolamine into the skin. Diclofenac locally binds to cyclooxygenase isoforms 1 and 2 (COX-1 and -2). The inhibition of COX-2 by diclofenac prevents the COX-2-mediated synthesis of proprostaglandins (PGs) and thereby locally relieves PG-mediated pain, fever and inflammation.

**diclofenac sodium :** A drug that is used to treat the symptoms of rheumatoid arthritis and is being studied in the prevention and treatment of some types of skin cancer. It blocks substances that cause inflammation and pain. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of cyclooxygenase inhibitor, a type of nonsteroidal anti-inflammatory drug (NSAID), and a type of antiangiogenesis agent. Also called Voltaren.

**diclofenac sodium gel:** A gel formulation of the sodium salt of diclofenac, a nonsteroidal benzeneacetic acid derivative with analgesic, antipyretic and anti-inflammatory activities. Diclofenac binds to and chelates both isoforms of cyclooxygenase (COX-1 and-2), thereby blocking the conversion of arachidonic acid (AA) to pro-inflammatory prostaglandins. This agent may also inhibit lipoxygenases, resulting in the inhibition of pro-inflammatory leukotriene synthesis from AA. or The gel form of a drug that is used to treat the symptoms of rheumatoid arthritis and is being studied in the prevention and treatment of some types of skin cancer. It blocks substances that cause inflammation and pain. It may also prevent the growth of new

blood vessels that tumors need to grow. It is a type of cyclooxygenase inhibitor, a type of nonsteroidal anti-inflammatory drug (NSAID), and a type of antiangiogenesis agent. Also called Voltaren gel.

**Dicoumarol:** An antagonist of vitamin K, which is a crucial factor in the carboxylation of  $\alpha$  carbon atoms in glutamate residues in the amino-terminal region of prothrombin; prothrombin synthesized in the presence of dicoumarol cannot bind calcium ion and therefore cannot promote the blood-clotting cascade.

**didanosine :** A drug used in the treatment of infections caused by viruses. Or A synthetic nucleoside analogue of deoxyadenosine in which the 3' hydroxyl on the ribose moiety is replaced by a hydrogen atom. In vivo, didanosine is converted to the active triphosphate form, which is incorporated into DNA. The absence of the 3' hydroxyl inhibits DNA elongation because phosphodiester bonds cannot be made with the substituted hydrogen.

**didemnin B:** A cyclic depsipeptide extracted from the Caribbean tunicate *Trididemnum cyanophorum*. Didemnin B activates caspase, thereby inducing apoptosis, and prevents eukaryotic elongation factor 2 (eEF-2)-dependent translocation, thereby inhibiting protein synthesis. This agent also has immunosuppressive and antiviral properties.

**dideoxyadenosine:** A synthetic nucleoside analogue of deoxyadenosine and a prodrug of didanosine in which the 3' hydroxyl group on the ribose moiety is replaced by a hydrogen atom. Dideoxyadenosine competitively inhibits adenylyl cyclase, thereby reducing levels of cyclic adenosine monophosphate (cAMP). By inhibiting cAMP-mediated gene activation in tumor cells, this agent may retard tumor cell proliferation.

**Die:** A steel block/tool containing an opening through which plastic is extruded, shaping the plastic extrusions to the desired form. Or The metal nozzle that the polymer is pressed through to create the tubing. The characteristics of size, wall thickness and shape are dictated by the die that is used. Or Metal attachment to the end of the extruder that gives the polymer melt its particular shape. Or The component on a plastics extruder affixed to the extruder head through which the melt is pushed to form the desired profile. or A circular steel block made up of an inner and outer ring through which plastic is extruded and inflated into a large tube. Or A steel block containing an orifice through which plastic is extruded, shaping the

extrudate to the desired form. OR Metal attachment to the end of the extruder that gives the polymer melt its particular shape.

**DIE ADAPTOR:** The part of an extrusion die which holds the die block.

**Die Cut:** The process of stamping out the ID or OD by placing the part on a mechanical fixture to perform this function

**Die Cutting:** The process of using a die to shear webs of low strength materials, such as plastics. Die cutting can be done on either flatbed or rotary presses. Rotary die cutting is often done inline with printing.

**Die Gap:** Distance between the metal surfaces which form the die opening. Or Distance between the metal faces forming the die opening within the material.

**Die Lines:** Vertical marks on the parison caused by damage of die parts or contamination. or Lines in the machine direction of film caused by buildup of oxidized materials on the die. Or Vertical or horizontal marks on the extrudate and in the finished product caused by damaged die elements or by contamination held-up in the die land. Or Vertical or horizontal marks on the extruded plastic and in the finished plastic products caused by contamination held up in the die area.

**DIE LIP BUILDUP (also known as DIE DROOL):** The gradual formation of an initially liquid deposit at the edge of the die exit which solidifies and may partially obstruct the flow of the extruded product and/or cause defective extrudate surface. Depending on the severity of the problem, continuous extrusion must be interrupted every few hours or few days and the solid deposit must be removed from the die lips.

**Die Plate:** The main support for the punch or mold cavity.

**DIE SWELL:** see EXTRUDATE SWELL

**Die Swell Ratio:** The ratio of the outer parison diameter (or parison thickness) to the outer diameter of the die (or die gap). Die swell ratio is influenced by polymer type, head construction, land length, extrusion speed, and temperature.

**Dieckmann condensation:** a condensation is a reaction in which two molecules join to form a new product, eliminating water or some other small molecule in the process. A Dieckmann condensation takes place within one molecule, resulting in a new cyclical molecule and the elimination of a small molecule.

**Diehead Pressure :** Pressure required to force the melt through the die.

**Dielectric:** 1) any insulating medium which intervenes between two conduits and permits electrostatic attraction or repulsion to take place across it 2) a material having the property that energy required to establish an electric field is recoverable in whole or in part, as electric energy. or Insulating material. In radio frequency preheating, dielectric may refer specifically to the material which is being heated. Or 1) any insulating medium which intervenes between two conduits and permits electrostatic attraction or repulsion to take place across is. 2) a material having the property that energy required to establish an electric field is recoverable in whole or in part, as electric energy (see insulation for clarification). or Insulating material. In radio frequency preheating, dielectric may refer specifically to the material which is being heated.

**Dielectric Constant:** The ratio of the capacity of a condenser made with a particular dielectric material to the capacity of the same condenser with air as the dielectric. Measured at a frequency of 106 cycles per second.

**Dielectric Constant (Permittivity or Specific Inductive Capacity):** the specific inductive capacity of a dielectric. That property of a dielectric which determines the electrostatic energy stored per unit volume for unit potential gradient.

**Dielectric Constant(permittivity of specific Inductive Capacity):** The specific conductive capacity of a dielectric. That property of a dielectric which determines the electrostatic energy stored per unit volume for unit potential gradient.

**Dielectric Heating (Electronic Heating):** The plastic to be heated forms the dielectric of a condenser to which is applied a high-frequency (20 to 80 mc.) voltage. Dielectric loss in the material is the basis. Process used for sealing vinyl films and preheating thermoset molding compounds.

**Dielectric Strength:** Ability to retain precise shape and size. Or the voltage which an insulating material can withstand before breakdown occurs, usually expressed as a voltage gradient (such as volts per mil). Or The voltage that an insulating material can withstand before dielectric breakdown occurs. Or ability to retain precise shape and size.

**Diels-Alder reaction:** a cycloaddition reaction between a conjugated diene and an alkene that produces a 1,4-addition product.

**diene:** an organic compound that contains two double bonds.

**dienogest:** An orally-active, semisynthetic, fourth generation, nonethinylated progestogen with potential antiproliferative, antiandrogenic, anti-inflammatory and antiangiogenic activities that is used in hormone therapy and as a female contraceptive. Upon oral administration, dienogest binds intracellular progesterone receptors which then translocate to the nucleus where the drug-receptor complex interacts with progesterone response elements, thus altering the expression of target genes. Dienogest reduces the production of estradiol, prevents ovulation and alters the cervical mucus and endometrium. In addition, dienogest appears to suppress the expression of cell cycle regulator cyclin D1. Altogether, this may prevent the growth of endometrial epithelial cells and may reduce symptoms associated with leiomyoma.

**dienophile:** the alkene that adds to the diene in a Diels-Alder reaction.

**DIEP flap :** A type of breast reconstruction in which blood vessels called deep inferior epigastric perforators (DIEP), and the skin and fat connected to them are removed from the lower abdomen and used for reconstruction. Muscle is left in place.

**Diesel:** Diesel is a middle distillate product obtained from the processing of crude oil in an oil refinery. Diesel is closely related in composition to Heating Oil, with the former differing by its lower sulphur content. The boiling point and density of diesel is higher than that for gasoline.

**diet :** The things a person eats and drinks.

**dietary counseling :** A process by which a health professional with special training in nutrition helps people make healthy food choices and form healthy eating habits. In cancer treatment, the goal of dietary counseling is to help patients stay healthy during and after treatment and to stay strong enough to fight infections and the recurrence of disease. Also called nutritional counseling.

**dietary protocol :** A detailed diet plan that states what, how, and when a person will eat and drink. It may be used to test how a specific diet affects a health outcome, such as lower cholesterol.

**Dietary Reference Intakes :** A set of guidelines developed by U.S. and Canadian scientists to give information about the role of nutrients in human health. These guidelines include the Reference Daily Intakes (RDI), which

are the recommended amounts of nutrients to be eaten each day to meet the needs of most healthy people. This system replaced the Recommended Dietary Allowances (RDA). Also called DRI.

**dietary supplement :** A product that is added to the diet. A dietary supplement is taken by mouth, and usually contains one or more dietary ingredient (such as vitamin, mineral, herb, amino acid, and enzyme). Also called nutritional supplement.

**diethyldithiocarbamate:** A sulfhydryl-containing carbamate that is the primary in vivo metabolite of disulfiram. Diethyldithiocarbamate chelates zinc, thereby inhibiting metalloproteinases, thereby preventing the degradation of the extracellular matrix and inhibiting an initial step in cancer metastasis and angiogenesis. A known inhibitor of superoxide dismutase, this agent can either potentiate or protect against cell oxidative damage caused by ionizing radiation, depending on the time of administration.

**diethylstilbestrol:** DES; the acronym for diethylstilbestrol, a synthetic, nonsteroidal form of estrogen. A well-known teratogen and carcinogen, DES inhibits the hypothalamic-pituitary-gonadal axis, thereby blocking the testicular synthesis of testosterone, lowering plasma testosterone, and inducing a chemical castration. OR A synthetic form of the hormone estrogen that was prescribed to pregnant women between about 1940 and 1971 because it was thought to prevent miscarriages. Diethylstilbestrol may increase the risk of uterine, ovarian, or breast cancer in women who took it. It also has been linked to an increased risk of clear cell carcinoma of the vagina or cervix in daughters exposed to diethylstilbestrol before birth. Also called DES.

**dietitian :** A health professional with special training in nutrition who can help with dietary choices. Also called nutritionist.

**Difference spectra:** Plots comparing the absorption spectra of a molecule or an assembly of molecules in different states, for example, those of mitochondria under oxidizing or reducing conditions.

**differential centrifugation:** Separation of cell organelles or other particles of different size by their different rates of sedimentation in a centrifugal field.

**Differential centrifugation:** Separation of molecules and/or organelles by sedimentation rate. OR A means of fractionating cell components by step-

by-step centrifugation of increasing centrifugal force. The supernatant of each step is centrifuged again at greater force to produce a pellet and another supernatant, which is subsequently centrifuged at yet greater force. The starting material consists of cells with disrupted plasma membranes.

**Differential Cooling:** Occurs when one area of the part cools at a different rate or when the mold surfaces are at different temperatures. Warping can result from differential cooling.

**Differential pressure (dp or dP):** The difference in pressure between two points of a system, such as between the inlet and outlet of a pump.

**Differential Scanning Calorimetry:** Used to measure the melting point of plastics. Different test method than vicat softening point, so different values result.

**DIFFERENTIAL SCANNING CALORIMETRY (DSC):** A thermal analysis technique, which measures the difference between a reference and a sample during a controlled temperature change. Changes in the heating rate can be converted into heat capacity and enthalpy changes. It is used to measure the Specific Heat (Heat Capacity  $C_p$ ), Glass Transition Temperature ( $T_g$ ), and Melting Temperature ( $T_m$ ), and to probe the structure of polymer blends.

**Differential scanning calorimetry (DSC):** An analytical technique measuring the heat flux (the quantity of heat transmitted per unit time) of the sample during a controlled heating process.

**differential stress:** stress usually caused by tectonic forces applied to a body of rock from different, but not opposite, directions, stretching the rock mass into an elongate shape.

**differential thermal analysis:** A technique that is often used to analyze materials that react or decompose at higher temperatures. The difference in temperature between the sample and an inert reference material is monitored as both are heated in a furnace. Phase transitions and chemical reactions taking place in the sample on heating cause the temperature difference to become larger, at temperatures that are characteristic of the sample.

**Differential thermal analysis (DTA):** An analytical technique in which the difference in temperature between the sample and an inert reference is detected during a controlled heating process.

**differential weathering:** the result of the resistance of some rocks more than other rocks to weathering, creating uneven rates of erosion and sometimes spectacular formations.

**differentiating agent :** A substance that causes a cell to change from an immature form to a mature form. In cancer, a differentiating agent may help cancer cells to become more like normal cells and to grow and spread more slowly. Some differentiating agents are being studied in the prevention and treatment of cancer.

**differentiation:** the process by which a magma forms different minerals according to changes in temperature and pressure. OR The process by which single cells grow into particular forms of specialized tissue (e.g., root, stem, or leaf). OR A change in the form and pattern of a cell and the genes it expresses as a result of growth and replication, usually during development of a multicellular organism Also occurs in microorganisms (e.g. in sporulation). OR Specialization of cell structure and function during embryonic growth and development.

**differentiation :** In biology, describes the processes by which immature cells become mature cells with specific functions. In cancer, this describes how much or how little tumor tissue looks like the normal tissue it came from. Well-differentiated cancer cells look more like normal cells and tend to grow and spread more slowly than poorly differentiated or undifferentiated cancer cells. Differentiation is used in tumor grading systems, which are different for each type of cancer.

**Diffiam:** (Other name for: benzydamine hydrochloride)

**diffraction:** The ability of a wave to bend around the edges of obstacles or holes. The effect is most noticeable when the obstacle or hole is comparable to the size of the wavelength.

**Diffraction pattern:** The recorded form of diffraction peaks and their relative intensities obtained when a material is subjected to X-ray diffraction analysis. The pattern may be in the form of a chart tracing or as bands on photographic film.

**Diffractionmeter:** A device used to accurately measure the intensities of diffracted X-rays as a function of the incident angle of the X-ray beam. This unit is usually computer-controlled and measures the intensities using a counter.

**diffuse:** Diffuse basis functions are typically of low angular momentum (unlike polarization functions) but with much smaller exponents, so that they spread more thinly over space. Usually essential for calculations involving negative ions or Rydberg states.

**diffuse :** Widely spread; not localized or confined.

**diffuse hyperplastic perilobar nephroblastomatosis :** A childhood condition in which abnormal tissue grows on the outer part of one or both kidneys. Diffuse hyperplastic perilobar nephroblastomatosis usually develops into Wilms tumor (a type of childhood kidney cancer) if not treated. Also called DHPLN.

**diffuse intrinsic pontine glioma :** A type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord. Diffuse intrinsic pontine glioma usually occurs in children. It forms in the brain stem.

**diffuse large B-cell lymphoma :** A type of B-cell non-Hodgkin lymphoma (cancer of the immune system) that is usually aggressive (fast-growing). It is the most common type of non-Hodgkin lymphoma, and is marked by rapidly growing tumors in the lymph nodes, spleen, liver, bone marrow, or other organs. Other symptoms include fever, night sweats, and weight loss. There are several subtypes of diffuse large B-cell lymphoma.

**Diffused Air Aeration:** A diffused air activated sludge plant takes air, compresses it, and then discharges the air below the water surface of the aerator through some type of air diffusion device.

**diffusion:** The gradual mixing of the molecules of 2 or more substances by random molecular motion. OR Diffusion is a process that happens when a substance moves from an area of higher concentration to an area of lower concentration. OR Diffusion is the process whereby one substance moves through another. The substances become mixed without us needing to stir them together. OR the movement of molecules through a membrane from a region of high concentration to low concentration. OR when a substance spreads out within another substance as when a solute spreads out within a solvent in a solution, sometimes unevenly. OR The mixing of two substances caused by random molecular motions. Gases diffuse very quickly; liquids diffuse much more slowly, and solids diffuse at very slow (but often measurable) rates. Molecular collisions make diffusion slower in liquids and solids. OR The net movement of molecules in the direction of

lower concentration. OR Particles spread out and mix. This occurs in both gases and liquids but goes faster in gases.

**Diffusion coefficient:** In the context of membranes, a means of expressing the lateral mobility of membrane constituents; for lipids, the diffusion coefficient is  $2 \mu\text{m}^2 \text{ s}^{-1}$ .

**diffusion rate:** The number of randomly moving molecules that pass through a unit area per second. Diffusion rates are fastest when a large concentration difference exists on either side of the unit area. Diffusion rates increase with temperature, and decrease with increasing pressure, molecular weight, and molecular size.

**Difinsa53:** (Other name for: dimethicone-containing botanicals-based lotion)

**Diflucan:** (Other name for: fluconazole)

**diflunisal:** A difluorophenyl derivate of salicylic acid and a nonsteroidal anti-inflammatory drug (NSAID) with antipyretic, analgesic and anti-inflammatory properties. Diflunisal competitively inhibits both cyclooxygenase (COX) -1 and -2, with higher affinity for COX-1, and subsequently blocks the conversion of arachidonic acid to prostaglandin precursors. This leads to an inhibition of the formation of prostaglandins that are involved in pain, inflammation and fever. Diflunisal differs from other salicylates, in that it is not metabolized to salicylic acid, hence it has a longer half-life. Check for active clinical trials using this agent.

**difluoromethylornithine :** A substance being studied in the treatment of cancer. Also called DFMO.

**Digester:** A tank in which sludge is placed to allow decomposition by microorganisms. Digestion may occur under anaerobic (most common) or aerobic conditions.

**digestion:** the biochemical decomposition of organic matter which results in the formation of mineral compounds and simple organic compounds. OR Enzymatic hydrolysis of major nutrients in the gastrointestinal system to yield their simpler components. OR The process of breaking down food into substances the body can use for energy, tissue growth, and repair.

**digestive system :** The organs that take in food and turn it into products that the body can use to stay healthy. Waste products the body cannot use leave the body through bowel movements. The digestive system includes

the salivary glands, mouth, esophagus, stomach, liver, pancreas, gallbladder, small and large intestines, and rectum.

**digestive tract :** The organs through which food and liquids pass when they are swallowed, digested, and eliminated. These organs are the mouth, esophagus, stomach, small and large intestines, and rectum and anus.

**digital image analysis :** A method in which an image or other type of data is changed into a series of dots or numbers so that it can be viewed and studied on a computer. In medicine, this type of image analysis is being used to study organs or tissues, and in the diagnosis and treatment of disease.

**digital mammography :** The use of a computer, rather than x-ray film, to create a picture of the breast.

**digital photography :** A type of photography in which images can be viewed on a computer screen.

**digital rectal examination :** An examination in which a doctor inserts a lubricated, gloved finger into the rectum to feel for abnormalities. Also called DRE.

**Digitalis:** A mixture of cardiotonic steroids derived from the dried leaf of the foxglove plant; such steroids inhibit the sodium-potassium pump. OR A substance used to make drugs that are used to treat several heart conditions, including congestive heart failure. Digitalis is made from the dried leaves of *Digitalis purpurea* (common foxglove) plants. It is a type of cardiac glycoside.

**digoxin:** A cardiac glycoside. Digoxin inhibits the sodium potassium adenosine triphosphatase (ATPase) pump, thereby increasing intracellular calcium and enhancing cardiac contractility. This agent also acts directly on the atrioventricular node to suppress conduction, thereby slowing conduction velocity. Apparently due to its effects on intracellular calcium concentrations, digoxin induces apoptosis of tumor cells via a pathway involving mitochondrial cytochrome c and caspases 8 and 3. OR A drug used to treat irregular heartbeat and some types of heart failure. It is also being studied in the treatment of some types of cancer. Digoxin helps the heart work normally by controlling the amount of calcium that goes into the heart muscle. It also may kill cancer cells and make them more sensitive to anticancer drugs. It is a type of cardiac glycoside. Also called Lanoxin.

**dihalide:** a compound that contains two halogen atoms; also called a "dihaloalkane."

**dihedral angle:** The angle between two intersecting planes. In a molecule with atoms A-B-C-D, the dihedral angle (A-B-C-D) is the angle between the planes defined by (A, B, C) and by (B, C, D). By convention, the angle is positive for a right-handed rotation from the first plane to the second, i.e., for a right-handed twist along the sequence A-B-C-D. OR A measure of the rotation about a bond, usually taken to lie between -180 and +180 degrees. Also called torsion angles.

**dihematoporphyrin ether :** Used in photodynamic therapy, a drug that is absorbed by tumor cells; when exposed to light, it becomes active and kills the cancer cells.

**dihydro-5-azacytidine:** A synthetic nucleoside analogue of deoxycytidine. Dihydro-5-azacytidine inhibits DNA methyltransferase, thereby interfering with abnormal DNA methylation patterns that are associated with genetic instability in some tumor cells. Inhibition of this enzyme may restore expression of tumor-suppressor genes and result in antitumor activity. Check for active clinical trials using this agent.

**Dihydrofolate reductase:** An enzyme that catalyzes the regeneration of tetrahydrofolate from dihydrofolate formed in the synthesis of thymidylate.

**dihydrofolate reductase inhibitor :** A substance that can build up in cancer cells and block them from using folate. Folate is a nutrient that rapidly dividing cells need to make DNA. Blocking folate use helps keep cancer cells from growing and may kill them. Some dihydrofolate reductase inhibitors are used to treat cancer. A dihydrofolate reductase inhibitor is a type of antifolate. Also called DHFR inhibitor.

**dihydroclenperone:** A butyrophenone that has been investigated for antineoplastic activity.

**dihydrotestosterone:** The most potent androgen, required for sex development. Dihydrotestosterone is synthesized from testosterone in the prostate gland, testes, hair follicles and adrenal glands by 5-alpha reductase. Dihydrotestosterone exerts its action similar to testosterone, which binds to and activates specific nuclear androgen receptors. After translocation into the nucleus, the activated hormone-receptor complex binds to the androgen response elements on the DNA and activates gene expressions that are required for sex development. Dihydrotestosterone is responsible for the

formation of male primary sex characteristics and most male secondary sex characteristics during puberty, such as muscular growth, facial and body hair growth, and deepening of the voice. OR A hormone made from testosterone in the prostate, testes, and certain other tissues. It is needed to develop and maintain male sex characteristics, such as facial hair, deep voice, and muscle growth. High amounts of dihydrotestosterone may increase the growth of prostate cancer and make it harder to treat. Also called androstanolone and DHT.

**diindolylmethane:** A phytonutrient and plant indole found in cruciferous vegetables including broccoli, brussels sprouts, cabbage, cauliflower and kale, with potential antiandrogenic and antineoplastic activities. As a dimer of indole-3-carbinol, diindolylmethane (DIM) promotes beneficial estrogen metabolism in both sexes by reducing the levels of 16-hydroxy estrogen metabolites and increasing the formation of 2-hydroxy estrogen metabolites, resulting in increased antioxidant activity. Although this agent induces apoptosis in tumor cells in vitro, the exact mechanism by which DIM exhibits its antineoplastic activity in vivo is unknown. OR A substance being studied in the treatment of prostate cancer and in the prevention of cervical cancer. Diindolylmethane is found in cruciferous vegetables like broccoli, brussels sprouts, cauliflower, cabbage, and kale. It is a type of plant indole. Also called DIM.

**DIIS:** Direct inversion in the iterative subspace. An extrapolation procedure used to accelerate the convergence of SCF calculations.

**dike:** an intrusive rock that generally occupies a discordant, or cross-cutting, crack or fracture that crosses the trend of layering in the country rock.

**Dilantin :** A drug used to treat or prevent seizures or convulsions that may be caused by epilepsy, brain surgery, or treatment for brain cancer. It is a type of anticonvulsant agent. Also called phenytoin sodium.

**dilatation and curettage :** A procedure to scrape and remove tissue from the inner lining of the uterus. The cervix is dilated (made larger) and a curette (spoon-shaped instrument) is inserted into the uterus to remove tissue. A tissue sample may then be checked under a microscope for signs of disease, such as infection or cancer. A dilatation and curettage may also be done after a miscarriage or to treat certain conditions, such as abnormal bleeding. Also called D&C and dilation and curettage.

**dilate :** To widen or enlarge an opening or hollow structure beyond its usual size, such as the pupil of the eye or a blood vessel.

**dilation and curettage :** A procedure to scrape and remove tissue from the inner lining of the uterus. The cervix is dilated (made larger) and a curette (spoon-shaped instrument) is inserted into the uterus to remove tissue. A tissue sample may then be checked under a microscope for signs of disease, such as infection or cancer. A dilation and curettage may also be done after a miscarriage or to treat certain conditions, such as abnormal bleeding. Also called D&C and dilatation and curettage.

**dilatometer:** A device for measuring volume changes.

**dilator :** A device used to stretch or enlarge an opening.

**Dilaudid :** (Other name for: hydromorphone hydrochloride) OR A drug used to treat moderate to severe pain. It may also be used to treat certain types of cough. Dilaudid is made from morphine and binds to opioid receptors in the central nervous system. It is a type of opioid and a type of analgesic agent. Also called Exalgo, hydromorphone hydrochloride, and Hydrostat IR.

**Dilaudid HP:** (Other name for: hydromorphone hydrochloride)

**diltiazem hydrochloride:** A benzothiazepine calcium channel blocking agent. Diltiazem hydrochloride inhibits the transmembrane influx of extracellular calcium ions into select myocardial and vascular smooth muscle cells, causing dilatation of coronary and systemic arteries and decreasing myocardial contractility. Because of its vasodilatory activity, this agent has been shown to improve the microcirculation in some tumors, thereby potentially improving the delivery of antineoplastic agents to tumor cells.

**Diluent:** A liquid used in coatings to reduce the consistency and make a coating flow more easily. The water in latex coatings is a diluent. A diluent may also be called a "Reducer," "Thinner," "Reducing Agent" or "Reducing Solvent." OR the thinning agent used to dilute a fluid, usually water.

**dilute:** to thin out, or having been thinned out; less than full strength. OR A solution that contains a relatively small amount of solute dissolved in a fixed amount of solvent. OR Having a relatively low concentration.

**dilute :** To make something thinner, weaker, less concentrated, or less pure by adding something to it.

**Dilute Solution:** A solution (liquid mixture) that has a small amount of solute dissolved. As you add more water to a sugar solution the solution, becomes more and more dilute.

**Dilution:** Dilution occurs when a solution with a known concentration (standard solution) has more solvent added. As the solvent is added, the molarity may change, but the number of equivalents will not. OR Adding solvent to a solution to lower its concentration.

**DIM:** A substance being studied in the treatment of prostate cancer and in the prevention of cervical cancer. DIM is found in cruciferous vegetables like broccoli, brussels sprouts, cauliflower, cabbage, and kale. It is a type of plant indole. Also called diindolylmethane.

**Dimensional Stability:** Retention of the precise shape of the part. Or Ability of a plastic part to retain the precise shape in which it was molded, fabricated, or cast. Or The ability of a material to maintain its shape under given processing or use conditions. Or the ability of a part to retain its size and proportion over time. Or ability to retain precise shape and size. Or Ability of a plastic part to retain the precise shape in which it was molded, fabricated. or cast.

**dimer:** A molecule or compound formed by the combination of two identical simple molecules. OR A dimer is two molecules (of the same type) bonded together. (just as monomer is one (mono) unit (mer) a dimer is two units). OR Structure resulting from the association of two subunits.

**Dimericine:** (Other name for: liposomal T4N5 lotion) OR A lotion being studied in the treatment of skin cancer and a skin condition called xeroderma pigmentosum. It has an enzyme contained in very tiny, fat-like particles. The enzyme repairs damage caused by ultraviolet radiation. Dimericine is a type of DNA repair enzyme topical agent. Also called T4N5 liposomal lotion.

**Dimerization:** A chemical reaction in which two monomers combine to form a single molecule.

**dimesna:** A drug that belongs to the family of drugs called chemoprotective agents. OR A synthetic derivative of dithio-ethane sulfonate with uroprotective properties. In the kidney, dimesna undergoes reduction to the free thiol compound, mesna, which reacts chemically with the urotoxic ifosfamide metabolites acrolein and 4-hydroxy-ifosfamide,

resulting in their detoxification. This agent also inhibits cyclophosphamide-induced hemorrhagic cystitis.

**dimethicone-containing botanicals-based lotion:** A skin lotion containing various proprietary botanical ingredients and the skin protectant dimethicone, a silicon-based polymer, with potential to prevent radiation dermatitis (RD). Upon topical application to the affected area before and after radiation therapy, the phytochemicals in the dimethicone-containing botanicals-based lotion may act as free radical scavengers and exert an antioxidant effect. The dimethicone component of the skin lotion protects against damage, and moisturizes and soothes the skin.

**dimethyl fumarate:** An orally bioavailable methyl ester of fumaric acid and activator of nuclear factor erythroid 2 [NF-E2]-related factor 2 (Nrf2, Nfe2l2), with potential neuroprotective, immunomodulating and radiosensitizing activities. Although the exact mechanism of action through which dimethyl fumarate exerts its neuroprotective and immunomodulatory effects have yet to be fully understood, upon oral administration, dimethyl fumarate is converted into its active metabolite monomethyl fumarate (MMF) and MMF binds to Nrf2. Subsequently, Nrf2 translocates to the nucleus and binds to the antioxidant response element (ARE). This induces the expression of a number of cytoprotective genes, including NAD(P)H quinone oxidoreductase 1 (NQO1), sulfiredoxin 1 (Srxn1), heme oxygenase-1 (HO1, HMOX1), superoxide dismutase 1 (SOD1), gamma-glutamylcysteine synthetase (gamma-GCS), thioredoxin reductase-1 (TXNRD1), glutathione S-transferase (GST), glutamate-cysteine ligase catalytic subunit (Gclc) and glutamate-cysteine ligase regulatory subunit (Gclm); this also increases the synthesis of the antioxidant glutathione (GSH). The intraneuronal synthesis of GSH may protect neuronal cells from damage due to oxidative stress. Dimethyl fumarate also appears to inhibit the nuclear factor-kappa B (NF-kB)-mediated pathway, modulates the production of certain cytokines and induces apoptosis in certain T-cell subsets. Its radiosensitizing activity is due to this agent's ability to bind to and sequester intracellular GSH, thereby depleting intracellular GSH and preventing its anti-oxidative effects. This enhances the cytotoxicity of ionizing radiation in hypoxic cancer cells. Nrf2, a leucine zipper transcription factor, plays a key role in redox homeostasis and cytoprotection against oxidative stress.

**dimethyl sulfoxide:** A polar organic solvent. DMSO is a free radical scavenger that has been used to treat extravasation damage caused by anthracycline-based chemotherapy. OR A colorless liquid that readily dissolves many chemicals and penetrates animal and plant tissues. It is used in human medicine, veterinary medicine, and pharmaceuticals.

**Dimethyl Terephthalate (DMT):** Dimethyl terephthalate (DMT) is an intermediate in the production of PET. DMT, an ester of terephthalic acid and methanol, was the main route for the terephthalic acid required for polyester production, but has now been largely superseded by PTA (purified terephthalic acid). DMT is classed as a polyester intermediate, as its main application is PET production. DMT production is now restricted to Europe, North America, East Asia and India. All plants oxidise para-xylene into crude terephthalic acid, which is then esterified with methanol.

**dimethylbusulfan:** An aliphatic analogue of busulfan with potential antineoplastic activity. As an alkylating agent, dimethylbusulfan induces neutropenia and has been shown to exhibit antitumor effects in some animal models. Alkylating agents exert cytotoxic and chemotherapeutic effects by transferring alkyl groups to DNA, thereby damaging DNA and interfering with DNA synthesis and cell division.

**dimethylxanthenone acetic acid :** An anticancer drug that is a type of angiogenesis inhibitor.

**Dimorphone:** (Other name for: hydromorphone hydrochloride)

**DIN:** A condition in which abnormal cells are found in the lining of a breast duct (milk duct). Having DIN may increase the risk of breast cancer in which these abnormal cells become cancer and spread outside the duct to other tissues in the breast. Types of DIN include atypical ductal hyperplasia and ductal carcinoma in situ (DCIS). Also called ductal intraepithelial neoplasia.

**dinaciclib:** A pyrazolo[1,5-a]pyrimidine with potential antineoplastic activity. Dinaciclib selectively inhibits cyclin dependent kinases CDK1, CDK2, CDK5, and CDK9; inhibition of CDK1 and CDK2 may result in cell cycle repression and tumor cell apoptosis. OR A substance being studied in the treatment of advanced melanoma (a type of skin cancer) and other types of cancer. It blocks cell division and may cause cancer cells to die. It is a type of cyclin-dependent kinase inhibitor. Also called CDK inhibitor SCH 727965.

**dinitrophenyl:** A small molecule containing 2 phenol rings, characterized as a hapten for use in vaccine preparation. Dinitrophenyl by itself will not elicit any immune response nor bind to antigen. Dinitrophenyl compound is commonly used to couple with peptides in vaccine preparation to enhance the immunogenicity of otherwise weak immunogenic antigens.

**dinoprost tromethamine:** A synthetic analogue of the naturally occurring prostaglandin F2 alpha. Prostaglandin F2 alpha stimulates myometrial activity, relaxes the cervix, inhibits corpus luteal steroidogenesis, and induces luteolysis by direct action on the corpus luteum. Check for active clinical trials using this agent.

**dinutuximab:** A chimeric mouse/human monoclonal antibody with potential antineoplastic activity. Dinutuximab binds to the ganglioside GD2 and induces antibody-dependent cell-mediated cytotoxicity and complement-dependent cytotoxicity against GD2-expressing tumor cells. GD2 is overexpressed in malignant melanoma, neuroblastoma, osteosarcoma, and small cell carcinoma of the lung. or A drug used with granulocyte-macrophage colony-stimulating factor (GM-CSF), aldesleukin (IL-2), and 13-cis-retinoic acid to treat high-risk neuroblastoma. It is used in children whose disease has improved with other anticancer treatment. Dinutuximab binds to a substance called GD2, which is found on some types of cancer cells. Dinutuximab may block GD2 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Ch14.18, MOAB Ch14.18, monoclonal antibody Ch14.18, and Unituxin.

**diode:** a component that readily passes current in one direction but opposes current flow in the opposite direction.

**diol:** a compound that contains two hydroxyl (— OH) groups; also called a "dihydroxy alkane."

**Dioscorea nipponica Makino extract DNE3:** An extract of the plant *Dioscorea nipponica* Makino and inhibitor of both the serine/threonine protein kinase Akt (protein kinase B) and members of the phosphatidylinositol 3-kinase (PI3K) family of lipid kinases, with potential antineoplastic and anti-metastatic activities. *Dioscorea nipponica* Makino extracted with ethyl acetate (DNE3) binds to and inhibits PI3K and Akt. This inhibits PI3K/Akt-mediated signaling and prevents both growth and survival of PI3K/Akt-overexpressing tumor cells. In addition, DNE3 increases the expression of tissue inhibitor of metalloproteinase-2 (TIMP-

2), inhibits the secretion of matrix metalloproteinases (MMPs), primarily MMP-2 and MMP-9, and inhibits the serine protease urokinase (urokinase-type plasminogen activator; u-PA). This inhibits tumor cell invasion, migration, motility, and adhesion. This agent also inhibits the activation of both cAMP response element-binding (CREB) and activating protein-1 (AP-1), and increases the expression of I $\kappa$ B (IkB), which inhibits the activation of nuclear factor-kappa B (NF- $\kappa$ B). These processes further contribute to this agent's anti-tumor potential in susceptible tumor cells.

**Diovan:** (Other name for: valsartan)

**dip angle:** the angle between the horizontal plane and a tilted bedding plane.

**Dip Coating:** Applying a plastic coating by dipping the article to be coated into a tank of melted resin or plastisol, then chilling the adhering melt.

**dip-slip fault:** a fault in which movement is parallel to the dip of the fault plane in an up or down direction between the two blocks.

**Dip/spin:** Coating application technique in which small parts are placed in a basket that is lowered into a coating bath, then raised and spun to remove excess coating. An economical system for coating high volumes of small parts.

**diphencyprone:** A synthetic, potent allergic contact sensitizer with potential immunostimulatory activity. After sensitization process by repeated topical application of diphencyprone to a specific area, further application of this agent to the affected area may stimulate an immune response and may potentially be useful to clear the affected area from infection or cancer.

**diphenhydramine :** A drug used to treat allergies and relieve cough and itching caused by insect bites, sunburn, and poison oak or ivy. It is also used to treat mild Parkinson disease, to prevent and treat motion sickness, to relieve cough and cold symptoms, and as a sleep aid. It is a type of antihistamine.

**diphenhydramine hydrochloride:** The hydrochloride salt form of diphenhydramine, an ethanolamine and first-generation histamine antagonist with anti-allergic activity. Diphenhydramine hydrochloride competitively blocks H<sub>1</sub> receptors, thereby preventing the actions of histamine on bronchial smooth muscle, capillaries, and gastrointestinal (GI)

smooth muscle. This prevents histamine-induced bronchoconstriction, vasodilation, increased capillary permeability, and GI smooth muscle spasms.

**diphenhydramine hydrochloride/dexamethasone/nystatin magic mouthwash:** An oral suspension containing diphenhydramine hydrochloride, dexamethasone and nystatin, with antihistaminic, antiinflammatory, and antifungal activities. Diphenhydramine hydrochloride/dexamethasone/nystatin magic mouthwash inhibits the cytokine-mediated inflammation and yeast colonization of the oral mucosa associated with chemotherapy and radiation therapy.

**diphosphonate :** A drug or substance used to treat hypercalcemia (abnormally high blood calcium) and bone pain caused by some types of cancer. Forms of diphosphonates are also used to treat osteoporosis and for bone imaging. Diphosphonates inhibit a type of bone cell that breaks down bone. Also called bisphosphonate.

**Diphtheria toxin:** A toxin, produced by *Corynebacterium diphtheriae*, that gains entrance to the cell by receptor-mediated endocytosis and kills the cell by ADP-ribosylation of protein synthesis elongation factor 2, thus inhibiting all protein synthesis.

**diphtheria toxin fragment-interleukin-2 fusion protein E7777:** A cytotoxic recombinant fusion protein consisting of the human cytokine interleukin-2 (IL-2) fused to diphtheria toxin fragments A and B, containing both the catalytic and translocation domains, with potential antineoplastic activity. Upon administration, the IL-2 moiety of diphtheria toxin fragment-IL-2 fusion protein E7777 binds to IL-2 receptors. After internalization by IL-2 receptor-expressing cells via endocytosis, the agent is proteolytically cleaved. This releases the catalytic domain of the toxin moiety, which catalyzes the transfer of the ADP-ribose moiety of NAD to a diphthamide residue of elongation factor 2 (EF-2). This covalent modification inactivates EF-2 and disrupts polypeptide chain elongation, resulting in an inhibition of translation and cell death. E7777 has the same amino acid sequence as denileukin diftotox (DD), but has an increased purity profile and an increased percentage of monomeric, active protein, which improves its efficacy.

**diphtheria toxoid/tetanus toxoid vaccine adsorbed:** A vaccine containing detoxified tetanus toxoid and detoxified diphtheria toxoid

adsorbed on aluminum phosphate with active immunizing activity against diphtheria and tetanus. Intramuscular injection with this vaccine activates the immune system to develop antibodies against tetanus toxin and diphtheria toxin.

**diphtheria toxoid/tetanus toxoid/acellular pertussis adsorbed, recombinant hepatitis B/inactivated poliovirus vaccine combined:** A vaccine consisting of detoxified tetanus toxoid, detoxified diphtheria toxoid, acellular pertussis antigens, inactivated poliovirus (IPV) types 1,2 and 3 and hepatitis B (HBV) surface antigen, with active immunizing activities against diphtheria, tetanus, pertussis, hepatitis B, and poliomyelitis. The acellular pertussis components in this vaccine, produced by *Bordetella pertussis*, are detoxified pertussis toxin (PT), filamentous hemagglutinin (FHA) and pertactin (PRN). Upon intramuscular injection, this vaccine activates the immune system to develop antibodies against tetanus toxin, diphtheria toxin, *B. pertussis* antigens, polioviruses and HBV. The diphtheria and tetanus toxoids and pertussis antigens (inactivated PT, FHA, and pertactin) are adsorbed onto aluminum hydroxide; the hepatitis B antigen is adsorbed onto aluminum phosphate.

**diphtheria toxoid/tetanus toxoid/acellular pertussis vaccine adsorbed:** A vaccine containing detoxified tetanus toxoid, detoxified diphtheria toxoid and acellular pertussis antigens, adsorbed on aluminum phosphate, with active immunizing activity against diphtheria, tetanus and pertussis. The acellular pertussis vaccine components, produced by *Bordetella pertussis*, are detoxified pertussis toxin (PT), filamentous hemagglutinin (FHA), pertactin (PRN) and fimbriae types 2 and 3 (FIM). Intramuscular injection with this vaccine activates the immune system to develop antibodies against tetanus toxin, diphtheria toxin and *B. pertussis* antigens. Check for active clinical trials using this agent.

**diphtheria-tetanus-acellular pertussis-inactivated poliomyelitis-Haemophilus influenzae type b vaccine:** A vaccine consisting of detoxified diphtheria toxoid (D), detoxified tetanus toxoid (T), acellular pertussis (aP) antigens, inactivated poliovirus (IPV) types 1, 2 and 3, and *Haemophilus influenzae* type b (Hib) capsular polysaccharide (polyribosylribitol phosphate; PRP) covalently bound to tetanus protein, suspended in water for injection and with active immunizing activity against diphtheria, tetanus, pertussis, poliomyelitis and *H. influenzae* type

b. The five purified pertussis antigens in this vaccine are pertussis toxin (PT), filamentous hemagglutinin (FHA), pertactin (PRN) and fimbriae types 2 and 3 (FIM). Upon intramuscular injection of the diphtheria-tetanus-acellular pertussis-inactivated poliomyelitis-Haemophilus influenzae type b vaccine (DTaP-IPV-Hib), this vaccine activates the immune system to develop antibodies against diphtheria toxin, tetanus toxin, B. pertussis antigens, polioviruses and Hib, thereby providing active immunization against these diseases. The diphtheria and tetanus toxoids and pertussis antigens (inactivated PT, FHA, PRN and FIM) are adsorbed separately onto aluminum phosphate and then combined with IPV and PRP.

**diploid:** cells having two sets of chromosomes. OR Having two sets of genetic information; describing a cell with two chromosomes of each type.

**Diploid cell:** A cell that contains two chromosomes (2N) of each type.

**diploid nuclei:** contained within a mass of cytoplasm within cellular slime molds.

**dipole:** Produced from an unequal sharing of electrons in a molecule in which there will be a region of partial positive charge and a separate region of partial negative charge. OR If one part of a molecule is more attractive to electrons than another part, it will have a permanent uneven distribution of charge - i.e., one end will be slightly positive and one will be slightly negative. There will be an attraction between two molecules of this substance, since they will turn so that the positive end of one is facing the negative end of the other. OR A separation of charge within a single molecule. OR A molecule having both positive and negative charges.

**Dipole moment:** A vector indicating the magnitude and direction of the uneven charge distribution in a covalent bond or molecule. The vector is represented by the symbol  $\mu$  with units of Debyes, abbreviated D. OR a measure of the polarity of a molecule; it is the mathematical product of the charge in electrostatic units (esu) and the distance that separates the two charges in centimeters (cm). For example, substituted alkynes have dipole moments caused by differences in electronegativity between the triple-bonded and single-bonded carbon atoms.

**dipole-dipole forces:** Intermolecular forces that exist between polar molecules. Active only when the molecules are close together. The strengths of intermolecular attractions increase when polarity increases.

**dipole-dipole interaction:** Electrostatic attraction between oppositely charged poles of two or more dipoles.

**Dipole-dipole interactions:** Intermolecular interactions between two separate dipoles.

**Diprivan:** (Other name for: propofol)

**diprotic acid:** An acid having two dissociable protons.

**dipyridamole:** A synthetic agent derivative of pyrimido-pyrimidine, with antiplatelet properties. Dipyridamole inhibits adenosine uptake by platelets and endothelial cells, triggering an accumulation of cyclic adenosine monophosphate (cAMP), and inhibiting the stimulation of platelet aggregation by agents such as platelet activating factor and collagen. Check for active clinical trials using this agent. or A drug that prevents blood cell clumping and enhances the effectiveness of fluorouracil and other chemotherapeutic agents.

**direct:** Indicates that integrals are not pre-computed and then written to disk, but instead are computed as needed. Done to save I/O time during a calculation.

**direct bilirubin:** when bilirubin is conjugated to glucuronate the measurement of this form of bilirubin does not require addition of alcohol to promote the azotization reaction used for determining bilirubin concentration

**direct current (dc):** a non-oscillating current that flows continually in one direction through a circuit

**Direct Gate:** A sprue that feeds directly into the mold cavity.

**Direct metal laser sintering (DMLS):** DMLS employs a fiber laser system that draws onto a surface of atomized metal powder, welding the powder into a solid. After each layer, a blade adds a fresh layer of powder and repeats the process until a final metal part is formed.

**Direct method:** The specific rates in a study population are averaged, using as weights the distribution of a specified standard population. The directly standardized rate represents what the crude rate would have been in the study population if that population had the same distribution as the standard population with respect to the variable(s) for which the adjustment or standardization was carried out. OR A group of statistical methods used to determine a crystal structure based on analysis of diffracted intensities.

**direct object:** a noun that receives the action of the sentence but that is not the subject.

**direct ophthalmoscopy :** An exam of the inside of the back of the eye using an ophthalmoscope (a flashlight-sized instrument with a light source and a set of rotating lenses).

**Direct potentiometry:** the simplest method of making ionselective electrode measurements. The electrodes are immersed in a test solution and the electrode potential is measured directly with a millivolt meter. The concentration is then related directly to this measurement by reading the answer from a calibration graph of concentration versus milivolts.

**Direct repair:** A means of repairing damaged DNA in which the damaged region is corrected in place. For example, pyrimidine dimers are simply cleaved to restore the original nucleotides.

**Direct roving:** Roving produced by winding a large and determined number of filaments direct from a bushing.

**direct translation strategy:** This strategy is used when you can translate each word, one at a time in the same order as written, into its corresponding algebraic symbol.

**Directed mutagenesis:** In a DNA sequence, an intentional alteration that can be genetically inherited.

**Direction of pull:** The direction the mold surfaces move when they are moving away from the part surfaces, either when the mold opens or when the part ejects

**dirty necrosis :** Presence of necrotic cellular debris within the lumen of the neoplastic glands in the colorectal mucosa.

**Dirty Systems:** Process dirt and belt wear debris may contaminate product, increase system friction and accelerate belt wear, thus reducing the useful life of the belt if the user does not practice proper cleaning. Cleaning practices and schedules are application specific.

**Disaccharide:** Just as there are monomers, dimers, trimers, oligomers, and polymers, indicating one, two, three, several, and many identical units joined together in a molecule, the combinations of saccharides (aka sugars) are known as mono-, di-, tri-, oligo- and polysaccharides. An example of a disaccharide is sucrose, composed of the simple sugars glucose and fructose joined by an ether linkage. An example of a polysaccharide is

chitin, a nitrogen-containing polymer of modified glucose units that makes up the exoskeleton of insects. OR A carbohydrate that is made up of two mono-saccharides. OR A carbohydrate consisting of two covalently joined monosaccharide units.

**disaccharide tripeptide glycerol dipalmitoyl:** A lipophilic disaccharide tripeptide derivative of muramyl dipeptide (MDP) with immunomodulatory activity. Disaccharide tripeptide glycerol dipalmitoyl (DTP-GDP) stimulates macrophage activity and increases serum levels of tumor necrosis factor alpha (TNF alpha), neopterin, interleukin (IL)-1 alpha, IL-1 beta, IL-6, IL-8, and IL-12, which may activate host immune system antitumor functions. DTP-GDP may be packaged in liposomes for improved delivery. The immunomodulatory effects of this agent may be superior to those of MDP.

**disaccharides:** sugars composed of two molecules.

**Disalcid:** (Other name for: sodium salicylate)

**discharge:** the amount of water in a river or stream that passes a certain point in a given amount of time.

**discharge :** In medicine, a fluid that comes out of the body. Discharge can be normal or a sign of disease. Discharge also means release of a patient from care.

**discharge (or effluent or emission) standard or release limit:** The maximum acceptable release of a pollutant from a given source to a specified medium under specified circumstances (WHO, 1979).

**Discoloration:** Any change from the designated color of the material or component. Or Any change from the original color, often caused by overheating, light exposure irradiation or chemical attack. Or Any change from an initial color possessed by a plastic; a lack of uniformity in color where color should be uniform over the whole area of a plastic object.

**Discolouration:** Any change from the original colour can be caused by a variety of factors e.g. atmospheric pollution ageing of oil based paints.

**disconformity:** an erosional contact usually parallel to the bedding planes of the upper and lower rock units.

**discontinuous branch:** the type of magmatic differentiation in which minerals form at discrete temperatures and not continuously during cooling.

**disease progression :** Cancer that continues to grow or spread.

**disease-causing mutation :** A gene alteration that causes or predisposes an individual to a specific disease.

**disease-free survival :** In cancer, the length of time after primary treatment for a cancer ends that the patient survives without any signs or symptoms of that cancer. In a clinical trial, measuring the disease-free survival is one way to see how well a new treatment works. Also called DFS, relapse-free survival, and RFS.

**disease-specific survival rate :** The percentage of people in a study or treatment group who have not died from a specific disease in a defined period of time. The time period usually begins at the time of diagnosis or at the start of treatment and ends at the time of death. Patients who died from causes other than the disease being studied are not counted in this measurement.

**DISHED:** Showing a symmetrical distortion of a flat or curved section of a plastic object, so that, as normally viewed, it appears concave, or more concave than intended. See—WARP.

**disinfectant :** Any substance or process that is used primarily on non-living objects to kill germs, such as viruses, bacteria, and other microorganisms that can cause infection and disease. Most disinfectants are harsh chemicals but sometimes heat or radiation may be used.

**Disinfection:** The process designed to kill most microorganisms in wastewater, including essentially all pathogenic (disease-causing) bacteria. There are several ways to disinfect, with chlorine being the most frequently used in water and wastewater treatment plants. OR effective killing by chemical or physical processes of all organisms capable of causing infectious disease. Chlorination is the disinfection method commonly employed in sewage-treatment processes. OR Disinfection means treatment process in which certain or all pathogenic organisms which may cause infection are destroyed from the water. Disinfection can take place by several means: chlorine gas is the most commonly used chemical, ozone and UV-light are competing technologies to chemicals.

**Dismutase:** An enzyme that catalyzes a dismutation reaction in which a single reactant is converted into two different products.

**disorder :** In medicine, a disturbance of normal functioning of the mind or body. Disorders may be caused by genetic factors, disease, or trauma.

**disorientation** : A mental state marked by confusion about time, place, or who one is.

**Dispensing closure:** A closure designed to be used to apply the contents of a container.

**DISPERSION:** A stable distribution of fine solid particles in a liquid. OR Two substances mixed together such that one is not dissolved in the other. For example, milk, a dispersion of globules of fat in water; latex paint, a dispersion of polymer particles in water; smoke, a dispersion of carbon particles in air. OR The suspension of very fine particles of solid pigment in oil varnish or other medium. OR Finely divided particles of a material in suspension in another substance. Or uniform distribution of an additive through the material. Since color is highly visible, it often is used to describe distribution of a colorant. Or Fine division of particles of a resin or solid in suspension in another material. Or Finely divided particles of a material in suspension in another substance.

**Dispersion Aids** : Flow alteration components placed at the entry point of an additive to aid in mixing or dispersing actions of a compounding process.

**Dispersion Forces:** Since electrons move around, even a molecule with no permanent separation of charge will have negative and positively charged bits from one instant to another. These imperfections generate an overall attractive force even between molecules as unreactive as N<sub>2</sub>. Since this explanation is already too complicated for anyone to understand, I may as well go on to say that they are called Dispersion Forces because they are related to a quantity called the dispersion of a substance, which is the rate of change in refractive index with frequency of transmitted radiation. You can also call them London Forces, after Fritz London (1900-1954).

**dispersion forces (also called London dispersion forces):** Dispersion is an intermolecular attraction force that exists between all molecules. These forces are the result of the movement of electrons which cause slight polar moments. Dispersion forces are generally very weak but as the molecular mass increases so does their strength.

**DISPERSIVE MIXING (also called INTENSIVE MIXING):** An operation that reduces the size of agglomerates or liquid drops of a minor component within a major fluid matrix.

**displacement:** A reaction in which a fragment of one reactant is replaced by another reactant (or by a fragment of another reactant). Displacement

reactions have the same number of products as reactants, and are described by equations of the form  $A + BC \rightarrow AB + C$  (single displacement) or  $AB + CD \rightarrow AC + BD$  (double displacement).

**displacement reaction:** A displacement reaction is one in which a more reactive element takes the place of a less reactive element in one of its compounds. OR Sometimes called a “reactivity series reaction” this is where a reactive metal takes the place of an unreactive one in a compound. Look at this example (zinc is more reactive than copper or you could say that zinc is higher in the reactivity series than copper):

**disproportionation:** A reaction involving a substance that produces two different forms of the substance, one more oxidized and the other more reduced than the original.

**disseminate :** Scatter or distribute over a large area or range.

**disseminated deposit:** a hydrothermal deposit in which the metal ore is evenly distributed in generally low concentrations throughout large masses of rock.

**Dissipation Factor:** The ratio of the power dissipated in watts in an insulating material to the product of the effective voltage and the current. Measured at a frequency of 106 cycles per second. Or (loss tangent,  $\tan\delta$ , approximate power factor) the tangent of the loss angle of the insulating material).

**dissociation:** Breaking down of a compound into its components to form ions from an ionic substance. OR In an aqueous solution, the separation of a compound into ions. OR Dissociation is the breaking of chemical bonds. For example, acidic molecules dissociate in water to form aqueous ions (one of which will be  $H^+(aq)$ ) OR the separation of a solute into constituent ions. OR separation of a substance into atoms or ions.

**dissociation constant:** (1) An equilibrium constant ( $K_d$ ) for the dissociation of a complex of two or more biomolecules into its components; for example, dissociation of a substrate from an enzyme. (2) The dissociation constant ( $K_a$ ) of an acid, describing its dissociation into its conjugate base and a proton.

**Dissociation constant:** An equilibrium constant for the dissociation of a molecule into two parts (e.g., dissociation of acetic acid into acetate anion and a proton);  $K_d$ .

**Dissociation constant (K):** number indicating the extent to which a molecule dissociates in solution to form free ions. For a simple twocomponent system (e.g.:  $\text{CH}_3\text{COOH} \rightleftharpoons \text{CH}_3\text{COO}^- + \text{H}^+$ ) it is the product of the molar concentration of the two ions divided by the molar concentration of the undissociated molecule:  $K = \frac{[\text{CH}_3\text{COO}^-] \times [\text{H}^+]}{[\text{CH}_3\text{COOH}]}$ . The smaller the value of K, the less dissociation is present. K varies with temperature, ionic strength, and the nature of the solvent.

**Dissolution profile:** A multi-time point description of the dissolution of a dose under standardized conditions.

**Dissolution rate:** The rate of dissolution of a solid, usually measured in water at physiological pH and temperature. An important physicochemical quantity used to predict the bioavailability of drugs.

**dissolved load:** earth material in a stream that has been dissolved into ions and carried in solution.

**dissolved oxygen (DO):** the oxygen dissolved in sewage, water, or other liquid, usually expressed in milligrams per liter or percent of saturation. It is the test used in BOD determination. dissolved solids: the total amount of dissolved material, organic and inorganic, contained in water or wastewater. Excessive dissolved solids make water unpalatable for drinking and unsuitable for industrial use. Measurements are expressed as ppm or mg/L. OR The amount of oxygen dissolved in a solvent (usually water). Dissolved oxygen levels are used as a general indicator of water quality.

**Dissolved solids:** Chemical substances either organic or inorganic that are dissolved in a waste stream and constitute the residue when a sample is evaporated to dryness.

**Dissolving** : A solid breaks down and spreads out through a liquid. The solute (the one that gets dissolved) particles are so small that they can pass through filter paper.

**distal** : In medicine, refers to a part of the body that is farther away from the center of the body than another part. For example, the fingers are distal to the shoulder. The opposite is proximal.

**distal colon** : The last part of the colon. The distal colon includes the descending colon (the left side of the colon) and the sigmoid colon (the S-shaped section of the colon that connects to the rectum).

**distal pancreatectomy** : Removal of the body and tail of the pancreas.

**distal urethra :** The part of the urethra closest to the outside of the body. The urethra is the tube through which urine leaves the body. In women, the distal urethra is approximately the last  $\frac{1}{2}$  inch, and in men it is the part of the urethra in the penis.

**distal urethral cancer :** A rare cancer that forms in the part of the urethra that is closest to the outside of the body. The cancer often has not spread deeply into the tissue.

**distance problems:** Word problems that involve traveling a distance. The formula  $d = rt$  is used for these problems.

**distant cancer :** Refers to cancer that has spread from the original (primary) tumor to distant organs or distant lymph nodes. Also known as distant metastasis.

**distant metastasis :** Refers to cancer that has spread from the original (primary) tumor to distant organs or distant lymph nodes. Also known as distant cancer.

**Distemper:** A term used for the broad classification of water thinned coatings which were generally used for walls and ceilings before the advent of modern emulsion paints.

**distillate:** The vapor collected and condensed from a distillation.

**distillation:** the process of heating a liquid to its boiling point, removing the vapors through a cooling and condensing apparatus, and finally collecting the condensed liquid in a separate receiver. It is commonly used for the separation of two or more liquids in a mixture, or for the separation of the solvent from dissolved substances. OR The process used to separate two or more liquids that have different boiling points. OR Distillation is a process in which one substance is boiled away from another and then collected. It is a process that purifies mixtures and solutions. Scientists often use lab equipment such as a distillation flask and a condenser. The boiled off vapor is cooled and "condensed". OR A method of physically separating liquid raw materials based on their different chemical properties. As an example, water can be distilled to remove impurities. OR A process in which a mixture of two or more species is fed to a vertical column that contains either a series of vertically spaced horizontal plates, or solid packing through which fluid can flow. Liquid mixtures of the feed components flow down the column and vapor mixtures flow up. Inter phase contact partial condensation of the vapor, and partial vaporization of the

liquid all take place t/o the column. The vapor flowing up the column becomes progressively richer in the more volatile components of the feed, and the liquid flowing down becomes richer in the less volatile components. OR Distillation is the process of separating a liquid from a mixture by evaporation followed by condensation. OR Separation of two liquid compounds by boiling point. For example, a mixture of two hydrocarbons can be heated so that the lower molecular weight hydrocarbon evaporates - if the vapour is not allowed to escape, but taken around the corner and cooled down, it can be extracted as a pure liquid. OR the separation of components of a liquid mixture based on differences in boiling points. OR A liquid is separated from its solution by heating it so that the liquid evaporates and then cooling the vapour so that it condenses somewhere else. OR Distillation is a technique for separating components of a mixture on the basis of differing boiling points. The mixture is heated, vaporizing some of the components. The vapor is collected and condensed to isolate the components with the lowest boiling points.

**Distillation Continued:** The vapor leaving the top of the column is condensed: part of the condensate is taken off as the overhead product and the rest is recycled to the reactor as reflux, becoming the liquid stream that flows down the column. The liquid leaving the bottom of the column is partially vaporized: the vapor is recycled to the reactor as boil-up, becoming the vapor stream that flows up the column, and the residual liquid is taken off as the bottoms product.

**distilled water:** An ultra-pure form of water with potential antineoplastic activity. Derived by boiling impure water and condensing the resultant steam in a sterile container, distilled water has been shown to kill bladder cancer cells in vitro through osmotic lysis (cytolysis). Check for active clinical trials using this agent.

**distilled water:** water that has been purified by distillation (boiling the water off as steam and condensing it back to a liquid, leaving the impurities behind). Having been boiled, it is also sterile. OR Distilled water is pure water. Tap water contains all sorts of impurities. When all of those impurities are removed, you have distilled water. You can get it by boiling water and collecting the steam. OR Distilled water is pure water. Tap water contains all sorts of impurities. When all of those impurities are removed,

you have distilled water. You can get it by boiling water and collecting the steam.

**Distortion Printing:** Unique process where artwork is modified to anticipate distortion produced by thermoforming. Once the distortions are predetermined, calculated and implemented into the art, the printing process begins, followed by the thermoforming process.

**distraction :** In medicine, a pain relief method that takes the patient's attention away from the pain.

**distress :** Emotional, social, spiritual, or physical pain or suffering that may cause a person to feel sad, afraid, depressed, anxious, or lonely. People in distress may also feel that they are not able to manage or cope with changes caused by normal life activities or by having a disease, such as cancer. Cancer patients may have trouble coping with their diagnosis, physical symptoms, or treatment.

**distributary:** a small, shifting channel that spreads out across a delta from the main river channel and disperses the sediment load.

**distribution:** This is a general term for the dispersal of a applied substance and its derivatives throughout an organism or environmental system.

**Distribution box:** Serves to distribute the flow from the septic tank evenly to the absorption field or seepage pits. It is important that each trench or pit receive an equal amount of flow. This prevents overloading of one part of the system.

**Distributive enzyme:** An enzyme that catalyzes the elongation or degradation of a polymer but dissociates from the polymer after each catalytic step.

**DISTRIBUTIVE MIXING (also called LAMINAR or EXTENSIVE mixing):** An operation that increases the randomness of the spatial distribution of the minor component within the major fluid matrix.

**distributive property of multiplication over addition:** The property that allows a number or term to be distributed (by multiplication) to the sum of two terms in parentheses, for example,  $a(b + c) = ab + ac$ .

**distributivity:** A math property which states:  $A*(B+C)=(A*B)+(A*C)$ .

**Distributor:** The rotating mechanism that distributes the wastewater evenly over the surface of a trickling filter or other process unit.

**Disulfide Bond:** Covalent disulfide bonds form during the tertiary structure of protein synthesis. It involves two sulfur atoms bonded to cysteine amino acids in the polypeptide chains. OR A covalent bond formed by the oxidation of two sulfhydryl groups; the oxidation of cysteine residues in a polypeptide yields a disulfide bond linking the two residues.

**Disulfide bridge:** A covalent linkage formed by oxidation between two cysteine SH groups either in the same polypeptide chain or in different polypeptide chains. Reversible by adding reducing agents. OR A covalent cross link between two polypeptide chains formed by a cysteine residue (two Cys residues).

**disulfiram:** A carbamoyl derivative used in the treatment of alcoholism. Disulfiram irreversibly inhibits acetaldehyde dehydrogenase that oxidizes the ethanol metabolite acetaldehyde into acetic acid. This leads to an accumulation of acetaldehyde that produces a variety of very unpleasant symptoms referred to as the disulfiram-alcohol reaction. This reaction includes, but is not limited to, flushing, headache, respiratory difficulty, nausea, vomiting, sweating, thirst, chest pain, tachycardia, blurred vision and hypotension. OR A drug that slows the metabolism of retinoids, allowing them to act over a longer period of time.

**diuresis :** An increase in the amount of urine made by the kidney and passed from the body.

**diuretic :** A type of drug that causes the kidneys to make more urine. Diuretics help the body get rid of extra fluid and salt. They are used to treat high blood pressure, edema (extra fluid in the tissues), and other conditions. There are many different types of diuretics. They are sometimes called water pills.

**divalent:** Binds to two other things (which may be other atoms, molecules, ions, or electrons). See also divalent anion and divalent cation.

**divalent anion:** An ion with a charge of -2.

**divalent cation:** An ion with a charge of +2.

**divalproex sodium:** A stable coordination compound comprised of sodium valproate and valproic acid with anticonvulsant and antiepileptic activities. Divalproex dissociates to the valproate ion in the gastrointestinal tract. This agent binds to and inhibits gamma-aminobutyric acid (GABA) transaminase and its anticonvulsant activity may be exerted by increasing

brain concentration of GABA and by inhibiting enzymes that catabolize GABA or block the reuptake of GABA into glia and nerve endings. Divalproex may also work by suppressing repetitive neuronal firing through inhibition of voltage-sensitive sodium channels.

**divergence:** A horizontal flow of water, in different directions, from a common center or zone; it is often associated with upwelling. Also see convergence.

**divergent boundary:** a fault boundary marked by plates that move away from one another.

**Divergent Die:** A die in which the internal channels leading to the orifice are diverging (applicable only to dies for hollow bodies).

**Divergent evolution:** The evolutionary process by which proteins with different properties are derived from a common ancestor.

**diverging plate boundary:** region where plates move apart.

**diverticulitis :** Inflammation of one or more pouches or sacs that bulge out from the wall of a hollow organ, such as the colon. Symptoms include muscle spasms and cramps in the abdomen.

**diverticulosis :** A condition marked by small sacs or pouches in the walls of a hollow organ, such as the colon. These sacs can become inflamed and cause a condition called diverticulitis.

**diverticulum :** A small pouch or sac that bulges out from the wall of a hollow organ, such as the colon.

**Dividers:** Devices used to separate a belt into longitudinal product lanes. These can be created with woven wire designs or plate attachments.

**Divine 9 with Carrageel:** (Other name for: carrageenan-containing gel)

**division keywords:** Words that indicate division.

**DJ-927:** A substance being studied in the treatment of cancer. It is a type of taxane derivative. OR A semi-synthetic, orally bioavailable taxane derivative with potential antineoplastic properties. Oral taxane derivative DJ-927 binds to tubulin, promoting microtubule assembly and stabilization and preventing microtubule depolymerization, thereby inhibiting cell proliferation. As it represents poor substrate for P-glycoprotein-related drug resistance mechanisms, this agent may be useful for treating multi-drug resistant tumors. As the first oral taxane derivative, oral taxane derivative DJ-927 is more potent than paclitaxel and docetaxel.

**DKK1-neutralizing monoclonal antibody DKN-01:** A humanized monoclonal antibody directed against Wnt antagonist Dickkopf-1 (DKK1) with potential anti-osteolytic activity. DKK1-neutralizing monoclonal antibody DKN-01 binds to and inhibits DKK1, which restores Wnt pathway signaling. Reactivation of the Wnt signaling pathway may result in the differentiation and activation of osteoblasts within the bone matrix and the reversal of tumor-induced osteolytic disease. Elevated levels of circulating DKK1, a potent Wnt signaling pathway antagonist, is associated with a number of neoplastic diseases.

**DLK1/ EPHA2/HBB/NRP1/RGS5/TEM1 peptide-pulsed alpha-type-1 polarized dendritic cell vaccine:** A cell-based cancer vaccine composed of mature polarized dendritic cells (alphaDC1) pulsed with six human leukocyte antigen (HLA)-A2-presented tumor blood vessel antigen (TBVA)-derived peptides, with potential immunostimulatory and antineoplastic activities. Dendritic cells (DCs) were treated with a “type-1 polarizing cytokine cocktail”, including interleukin-1beta, tumor necrosis factor alpha (TNF-a), interferon-alpha (IFN-a), IFN-gamma and polyinosinic:polycytidylic acid (pI:C) to produce mature alpha type-1 polarized DCs (alphaDC1) that are capable of producing high levels of interleukin-12p70 (IL-12p70). The alphaDC1 are subsequently pulsed with TBVA-derived peptides, including delta-like homologue 1 (DLK1) 310-318, EPH receptor A2 (EPHA2) 883-891, beta-globin (HBB) 31-39, neuropilin-1 (NRP1) 433-441, regulator of G-protein signaling 5 (RGS5) 5-13 and tumor endothelial marker 1 (TEM1) 691-700. Upon administration, these DCs are able to induce a potent cytotoxic T-lymphocyte (CTL) response against the TBVAs expressed on tumor-associated stromal cells, which results in stromal cell lysis and inhibition of angiogenesis. Disrupting the surrounding tumor vasculature inhibits tumor cell growth and survival. alphaDC1 are able to induce a potent tumor antigen-specific CTL response due to their high co-stimulatory activity and the secretion of anti-cancer cytokines, such as IL-12p70.

**DLL :** Dynamic Link Library.

**DM-CHOC-PEN:** A cholesterol carbonate derivative of 4-demethylpenclomedine (DM-PEN) with potential antineoplastic alkylating activity. Upon intravenous administration of 4-demethylcholesteryloxycarbonylpenclomedine, the carbonium moiety binds

to and alkylates DNA at the N7 guanine position, thereby causing DNA crosslinks. This prevents DNA replication, inhibits cellular proliferation and triggers apoptosis. In addition, due to its lipophilic cholesteryl moiety this agent is able to cross the blood brain barrier (BBB) and therefore can be given intravenously compared to other alkylating agents that need to be given intra-cranially.

**DM4-conjugated anti-Cripto monoclonal antibody BIIB015:** A humanized IgG1 monoclonal antibody directed against the cell surface-associated protein Cripto and conjugated to the maytansinoid DM4 with potential antineoplastic activity. The monoclonal antibody moiety of DM4-conjugated anti-Cripto monoclonal antibody BIIB015 binds to the tumor associated antigen (TAA) Cripto; upon internalization, the DM4 moiety binds to tubulin and disrupts microtubule assembly/disassembly dynamics, resulting in inhibition of cell division and cell growth of Cripto-expressing tumor cells. Constitutively expressed during embryogenesis, Cripto belongs to the EGF-CFC family of growth factor-like molecules and plays a key role in signaling pathways of certain transforming growth factor-beta superfamily members; as a TAA, Cripto is overexpressed in carcinomas such as those of the breast, ovary, stomach, lung, and pancreas while its expression is absent in normal tissues.

**DMA:** Direct Memory Access.

**DMC / Dough moulding compound:** See bulk moulding compound.

**DNA:** The molecules inside cells that carry genetic information and pass it from one generation to the next. Also called deoxyribonucleic acid. OR The molecular basis of heredity; encodes the genetic information responsible for the development and function of an organism and allows for transmission of that genetic information from one generation to the next. The DNA molecule is structured as a double-stranded helix held together by weak hydrogen bonds between purine-pyrimidine nucleotide base pairs: adenine (A) paired with thymine (T), and guanine (G) paired with cytosine (C). Also called deoxyribonucleic acid.

**DNA (deoxyribonucleic acid):** A polynucleotide having a specific sequence of deoxyribonucleotide units covalently joined through 3',5'-phosphodiester bonds; serves as the carrier of genetic information. OR A double-stranded molecule that encodes genetic information; composed of four nucleotides containing the bases adenine (A), cytosine (C), guanine

(G), and thymine (T) OR deoxyribonucleic acid; a double helix nucleotide molecule containing deoxyribose, nitrogenous base, and a phosphate group; contains the genetic information from which amino acids are determined. OR Deoxyribonucleic acid A polydeoxyribonucleotide in which the sugar is deoxyribose; the main repository of genetic information in all cells and most viruses. OR A nucleic acid with 2-deoxy-D-ribose as the sugar in its nucleotides. DNA contains encoded genetic information, specifically templates for the synthesis of all of an organism's proteins and enzymes.

**DNA chimera:** A DNA containing genetic information derived from two different species.

**DNA cloning:** See cloning. OR The propagation of individual segments of DNA as clones.

**DNA cross-linking agent :** A substance that binds DNA nucleotides together and blocks DNA synthesis. In cancer treatment, DNA cross-linking agents may kill cancer cells by damaging their DNA and stopping them from dividing.

**DNA fingerprinting:** a technique that uses electrophoresis to match DNA molecules to one another for identification purposes.

**DNA gene-expression microarray :** A process that allows thousands of pieces of DNA that are fixed to a glass slide to be analyzed at one time. It is used to identify the genes (pieces of DNA) in specific cells or tissue that are actively used to make RNA, which then may be used to make proteins.

**DNA gyrase:** A topoisomerase that catalyzes the ATP-driven introduction of negative supercoils into DNA. Also called topoisomerase II.

**DNA intercalating agent :** A substance that inserts itself into the DNA structure of a cell and binds to the DNA. This causes DNA damage. In cancer treatment, DNA intercalating agents may kill cancer cells by damaging their DNA and stopping them from dividing.

**DNA interference oligonucleotide PNT2258:** A liposomal formulation of the 24-mer oligonucleotide PNT100, with potential antineoplastic activity. PNT2258 targets and complements to untranscribed DNA sequence upstream of BCL2 promoters, thereby interfering with DNA replication and transcription of the BCL2 gene. This may promote and restore the apoptotic pathway in BCL2-overexpressing tumor cells. BCL2, an anti-apoptotic protein, is overexpressed in a wide variety of tumors.

**DNA library:** A mixture of clones, each containing a cloning vector and a segment of DNA from a source of interest. OR A random collection of cloned DNA fragments that includes all or most of the genome of a given organism; also called a genomic library.

**DNA ligase:** An enzyme that catalyzes the formation of a phosphodiester bond between the 3'-OH group at the end of one DNA chain and the 5'-phosphate group at the end of the other chain; it takes part in the synthesis, repair, and splicing of DNA. OR An enzyme that creates a phosphodiester bond between the 3' end of one DNA segment and the 5' end of another. OR An enzyme that creates a phosphodiester bond between the 3' end of one DNA segment and the 5' end of another.

**DNA looping:** The interaction of proteins bound at distant sites on a DNA molecule so that the intervening DNA forms a loop.

**DNA methylase :** An enzyme (a protein that speeds up chemical reactions in the body) that attaches methyl groups to DNA. A methyl group is a chemical group containing one carbon and three hydrogen atoms. Also called DNA methyltransferase.

**DNA methyltransferase :** An enzyme (a protein that speeds up chemical reactions in the body) that attaches methyl groups to DNA. A methyl group is a chemical group containing one carbon and three hydrogen atoms. Also called DNA methylase.

**DNA minor groove binding agent PM060184:** A marine-derived, synthetically produced compound with potential antineoplastic activity. DNA minor groove-binding agent PM060184 covalently binds to residues lying in the minor groove of DNA, which may result in delayed progression through S phase, cell cycle arrest in the G2/M phase and cell death.

**DNA minor groove binding agent SG2000:** A sequence-selective pyrrolbenzodiazepine (PBD) dimer with potential antineoplastic activity. Following intravenous administration, DNA minor groove binding agent SG2000 preferentially and covalently binds to purine-GATC-pyrimidine sequences, with the imine/carbinolamine moieties of SG2000 binding to the N2 positions of guanines on opposite strands of DNA. This induces interstrand cross-links and inhibits both DNA replication and gene transcription, which leads to the inhibition of cell growth. With a preference for binding to purine-GATC-pyrimidine sequences, SG2000 adducts do not appear to be susceptible to p53-mediated DNA excision repair.

**DNA plasmid encoding interleukin-12 INO-9012:** A plasmid DNA vaccine encoding the human pro-inflammatory cytokine interleukin-12 (IL-12) with potential immunoactivating activity. Upon intramuscular delivery by electroporation of DNA plasmid encoding interleukin-12 INO-9012, IL-12 is translated in cells and activates the immune system by promoting the activation of natural killer cells (NK cells), inducing secretion of interferon-gamma and promoting cytotoxic T-cell responses against tumor cells. This may result in both immune-mediated tumor cell death and the inhibition of tumor cell proliferation.

**DNA plasmid vector pPRA-PSM vaccine:** A cancer vaccine consisting of a DNA plasmid encoding epitopes of the human preferential antigen of melanoma (PRAME) and the prostate specific membrane antigen (PSMA) with potential immunostimulating activity. Upon direct administration of this vaccine into lymph nodes, peptides expressed by DNA plasmid vector pPRA-PSM may activate the immune system, resulting in a cytotoxic T-lymphocyte (CTL) response against PRAME- and PSMA-expressing cells. PRAME and PSMA are tumor associated antigens upregulated in a number of cancer cell types. As part of the MKC1106-PP regimen exploiting the 'prime-boost strategy', this plasmid is responsible for priming the immune response and is used in conjunction with a peptide vaccine consisting of PRAME and PSMA that boosts the immune system against PRAME- and PSMA-expressing tumor cells.

**DNA plasmid-encoding interleukin-12/HPV DNA plasmids therapeutic vaccine INO-3112:** A DNA-based combination immunotherapeutic, INO-3112, composed of VGX-3100, a preparation of DNA plasmids encoding the E6 and E7 genes of human papillomavirus (HPV) subtypes 16 and 18, combined with INO-9012, a DNA plasmid encoding the immune activator and pro-inflammatory cytokine human interleukin-12 (IL-12) with potential immunoactivating and antineoplastic activities. Upon intramuscular delivery by electroporation of VGX-3100, the HPV E6 and E7 proteins are translated in cells and elicit a cytotoxic T-lymphocyte (CTL) response against cancer cells expressing the E6 and E7 antigens, resulting in tumor cell lysis. HPV type 16 and HPV type 18 are associated with the development of certain types of cancer. Upon intramuscular delivery by electroporation of INO-9012, IL-12 is expressed and activates the immune system by promoting the activation of natural killer cells (NK cells), inducing secretion of interferon-gamma (IFN-g) and promoting CTL

responses against tumor cells. This boosts the immune response and results in increased CTL-mediated tumor cell death as compared with the administration of VGX-3100 alone.

**DNA polymerase:** An enzyme that catalyzes the formation of 3'-5' phosphodiester bonds from deoxyribonucleotide triphosphates. OR An enzyme that catalyzes template-dependent synthesis of DNA from its deoxyribonucleoside 5'-triphosphate precursors. OR Enzymes that catalyze the template-directed, primer-dependent addition of deoxynucleotide units, using deoxynucleotide triphosphates as substrates, to the 3' end of a DNA chain; chain growth is in the 5'-to 3'-direction; such enzymes replicate and repair DNA.

**DNA probe:** A radioactively labeled, single-stranded specific base sequence used to locate a complementary sequence among DNA fragments displayed on an electrophoretic gel.

**DNA replicase system:** The entire complex of enzymes and specialized proteins required in biological DNA replication. **DNA supercoiling:** The coiling of DNA upon itself, generally as a result of bending, underwinding, or overwinding of the DNA helix.

**DNA replication:** the process by which cells replicate or synthesize their DNA; takes place during S phase of the cell division cycle.

**DNA replication :** The process by which a copy of the DNA in a cell is made before the cell divides.

**DNA sequencing :** A laboratory process used to learn the exact sequence (order) of the four building blocks, or bases, that make up DNA. Information is stored in DNA in a code made by arranging the four bases (identified by the letters A, C, G, and T) in different orders. DNA sequencing can be used to find DNA mutations (changes) that may cause diseases, such as cancer.

**DNA transposition:** See transposition.

**DNA vaccine VB10.16:** A therapeutic DNA vaccine composed of three parts, one encodes the E6/E7 fusion protein of human papillomavirus (HPV) type 16 (HPV16), the second is a dimerization entity and the third part encodes a protein that specifically binds to antigen presenting cells (APCs), with potential immunostimulating and antineoplastic activities. Upon intramuscular administration, the DNA vaccine VB10.16 expresses

HPV16 E6/7 and a protein that targets receptors on APCs. Upon binding to APCs and subsequent internalization, the APCs mature and the HPV16 E6/7 antigenic protein is presented by the APCs. This attracts and stimulates B-lymphocytes, CD4-positive T-lymphocytes and elicits a cytotoxic T-lymphocyte (CTL) response against cancer cells expressing HPV16-associated E6 and E7 oncoproteins, which result in tumor cell lysis. HPV16 E6/7, a viral antigen, plays a key role in the development of certain types of cancer.

**DNA-binding domain:** The structural region of a transcription factor that recognizes and binds to a particular DNA sequence. See also .

**DNA-dependent protein kinase-targeting siDNA DT01:** A proprietary preparation of small interfering DNA (siDNA) molecules with potential chemo/radiosensitizing activity. By mimicking DNA double strand breaks (DSBs), DNA-dependent protein kinase-targeting siDNA DT01 inhibits the non-homologous end joining (NHEJ) process, one of the main DNA repair mechanisms, via binding to and activating DNA-dependent protein kinase (DNA-PK), a core component of the NHEJ complex. DNA-PK activation causes hyper-phosphorylation of histone variant H2AX on DNA and results in a different phosphorylated pattern of H2AX upon ionizing radiation treatment. This ultimately interferes with the repair of DNA DSBs during chemo- or radiotherapy, thereby increasing tumor cell death. The enhanced ability of tumor cells to repair DSBs plays a major role in the resistance of tumor cells to chemo- and radiotherapy.

**DNA-PK inhibitor MSC2490484A:** An orally available inhibitor of DNA-dependent protein kinase (DNA-PK), with potential antineoplastic and chemo/radiosensitizing activities. Upon oral administration, the DNA-PK inhibitor MSC2490484A binds to and inhibits the activity of DNA-PK. This inhibits the ability of tumor cells to repair damaged DNA, which may lead to a reduction in cellular proliferation of cancer cells expressing DNA-PK. DNA-PK, a serine/threonine kinase and a member of the PI3K-related kinase subfamily of protein kinases, is activated upon DNA damage and plays a key role in repairing DNA double-strand breaks (DSBs) via the DNA nonhomologous end joining (NHEJ) pathway. The enhanced ability of tumor cells to repair DSBs plays a major role in the resistance of tumor cells to chemo- and radiotherapy.

**DNA-PK/TOR kinase inhibitor CC-115:** A dual inhibitor of DNA-dependent protein kinase (DNA-PK) and mammalian target of rapamycin (mTOR), with potential antineoplastic activity. CC-115 binds to and inhibits the activity of DNA-PK and both raptor-mTOR (TOR complex 1 or TORC1) and rictor-mTOR (TOR complex 2 or TORC2), which may lead to a reduction in cellular proliferation of cancer cells expressing DNA-PK and TOR. DNA-PK, a serine/threonine kinase and a member of the PI3K-related kinase subfamily of protein kinases, is activated upon DNA damage and plays a key role in repairing double-stranded DNA breaks via the DNA nonhomologous end joining (NHEJ) pathway; mTOR, a serine/threonine kinase that is upregulated in a variety of tumors, plays an important role downstream in the PI3K/Akt/mTOR signaling pathway. Check for active clinical trials using this agent.

**DN Ai® drug PNT2258:** (Other name for: DNA interference oligonucleotide PNT2258)

**DNP-modified autologous renal cell carcinoma tumor cell vaccine:** A cancer vaccine consisting of autologous renal cell carcinoma (RCC) tumor cells modified with the hapten 2,4-dinitrophenol (DNP) with potential immunostimulating and antineoplastic activities. Administration of DNP-modified autologous renal cell carcinoma tumor cell vaccine may induce a cytotoxic T-lymphocyte (CTL) response against renal cell carcinoma tumor cells. DNP conjugation may enhance the immunogenicity of weakly immunogenic antigens.

**DNR order :** A type of advance directive in which a person states that healthcare providers should not perform cardiopulmonary resuscitation (restarting the heart) if his or her heart or breathing stops. Also called do not resuscitate order.

**DNR-expressing nasopharyngeal carcinoma-specific cytotoxic T lymphocytes:** A preparation of autologous, dominant-negative receptor (DNR)-expressing nasopharyngeal carcinoma (NPC)-specific cytotoxic T-lymphocytes (CTLs), with potential antineoplastic activity. The DNR-expressing NPC-specific CTLs specifically target Epstein-Barr virus (EBV) nuclear antigen 1 (EBNA1), latent membrane proteins (LMP) and BamHIA rightward frame 1 (BARF1), and are transduced with a retroviral vector expressing DNR, a dominant-negative form of the transforming growth factor beta (TGFβ) receptor, which blocks TGF-beta-mediated signaling.

Upon administration, the CTLs recognize and target NPC cells, which may result in both CTL-mediated cell lysis and the inhibition of tumor cell proliferation. Tumor-expressed TGF-beta inhibits T-lymphocyte activation and expansion; resistance to TGF-beta allows for optimal CTL activity. EBV infection plays a key role in NPC tumorigenesis.

**DO:** Dissolved Oxygen - a measure of the oxygen dissolved in water expressed in milligrams per liter.

**do not resuscitate order :** A type of advance directive in which a person states that healthcare providers should not perform cardiopulmonary resuscitation (restarting the heart) if his or her heart or breathing stops. Also called DNR order.

**dobutamine:** A synthetic catecholamine with sympathomimetic activity. Dobutamine is a direct-acting inotropic agent and an adrenergic agonist that stimulates primarily the beta-1 adrenoceptor, with lesser effect on beta-2 or alpha receptors. Via beta-1 adrenoceptor of the heart, this agent induces positive inotropic effect with minimal changes in chronotropic activities or systemic vascular resistance. Dobutamine also causes vasodilation by stimulating beta-2 adrenergic receptors in blood vessels, augmented by reflex vasoconstriction resulting in increased cardiac output.

**docetaxel:** A semi-synthetic, second-generation taxane derived from a compound found in the European yew tree *Taxus baccata*. Docetaxel displays potent and broad antineoplastic properties; it binds to and stabilizes tubulin, thereby inhibiting microtubule disassembly which results in cell-cycle arrest at the G2/M phase and cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and displays immunomodulatory and pro-inflammatory properties by inducing various mediators of the inflammatory response. Docetaxel has been studied for use as a radiation-sensitizing agent. or A drug used to treat certain types of cancers of the breast, stomach, lung, prostate, and head and neck. It is being studied in the treatment of other types of cancer. Docetaxel kills cancer cells by stopping them from dividing. It is a type of taxane. Also called Taxotere.

**docetaxel emulsion ANX-514:** An injectable emulsion formulation containing the taxane docetaxel, a semisynthetic analogue of paclitaxel, with antineoplastic activity. Docetaxel binds specifically to the beta-tubulin subunit of the microtubule, stabilizing tubulin and inhibiting microtubule

disassembly, which results in cell-cycle arrest at the G2/M phase and cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and induces various mediators of the inflammatory response. Docetaxel emulsion ANX-514 is formulated without polysorbate 80 or other detergents in order to reduce the incidence and severity of hypersensitivity reactions. In addition, the exclusion of polysorbate 80 in this formulation precludes foaming during the preparation process, thus facilitating preparation and administration.

**docetaxel formulation CKD-810:** An injectable formulation containing the taxane docetaxel, a semisynthetic analogue of paclitaxel, with antineoplastic activity. Docetaxel binds specifically to the beta-tubulin subunit of the microtubule, stabilizing tubulin and inhibiting microtubule disassembly, which results in cell-cycle arrest at the G2/M phase and cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and induces various mediators of the inflammatory response.

**docetaxel lipid microspheres:** A lipid microsphere (LM)-based formulation containing the poorly water soluble taxane docetaxel, a semi-synthetic analogue of paclitaxel, with antineoplastic activity. Docetaxel binds specifically to the beta-tubulin subunit of the microtubule, stabilizing tubulin and inhibiting microtubule disassembly, which causes cell cycle arrest at the G2/M phase and leads to cell death. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and induces various mediators of the inflammatory response. Compared to docetaxel alone, the LM formulation may enhance stability, improve efficacy and may reduce toxicity; this formulation does not contain toxic detergents needed to solubilize docetaxel which further improves its side effect profile.

**docetaxel-cisplatin-fluorouracil :** A chemotherapy combination used to treat certain types of head and neck cancer and stomach cancer. It includes the drugs docetaxel (Taxotere), cisplatin (Platinol), and fluorouracil. Also called DCF, Taxotere-Platinol-fluorouracil, TPF, and TPF regimen.

**docetaxel-loaded nanopharmaceutical CRLX301:** A nanoparticle-based formulation containing the poorly water-soluble, second-generation taxane analog docetaxel, with antineoplastic activity. Upon intravenous administration of the docetaxel-loaded nanopharmaceutical CRLX301, the

nanoparticles are able to accumulate at the tumor site due to the unique characteristics of the tumor's vasculature, while avoiding normal, healthy tissue. In turn, CRLX301 is taken up by the tumor cell via macropinocytosis. Subsequently, docetaxel is slowly released into the cytoplasm where it binds to and stabilizes the beta-subunit of tubulin, thereby stabilizing microtubules and inhibiting microtubule disassembly. This prevents mitosis and results in cell death. Compared to the administration of docetaxel alone, this formulation is able to increase docetaxel's efficacy while avoiding systemic exposure, which minimizes its toxicity.

**docetaxel-PNP:** A polymeric nanoparticle (PNP) formulation containing the taxane docetaxel, a semi-synthetic analogue of paclitaxel, with antineoplastic activity. Docetaxel binds specifically to the beta-tubulin subunit of the microtubule, stabilizing tubulin and inhibiting microtubule disassembly, which results in cell-cycle arrest at the G2/M phase, preventing cell proliferation. This agent also inhibits pro-angiogenic factors such as vascular endothelial growth factor (VEGF) and induces various mediators of the inflammatory response. Compared to docetaxel alone, the PNP formulation may enhance stability and improve delivery.

**dock :** A plant that has been used in some cultures to treat certain medical problems. It may have anticancer effects. The scientific name is *Rumex acetosella*. Also called sheep sorrel and sorrel.

**Docking:** In molecular modelling, docking refers to the process by which molecules fit into a binding site.

**doconexent:** A polyunsaturated very long-chain fatty acid with a 22-carbon backbone and 6 double bonds, originating from the 3rd, 6th, 9th, 12th, 15th and 18th positions from the methyl end.

**docosaheanoic acid:** A polyunsaturated very long-chain fatty acid with a 22-carbon backbone and 6 double bonds. Four separate isomers can be called by this name. Check for active clinical trials using this agent.

**Dodecahedral Crystal:** A crystal that has twelve sides. A twelve-sided object is called a dodecahedron.

**Dodgy example:** Imagine you have a certain number of Queenslanders, each representing molecules of the same reactant in a chemical reaction. You apply metaphorical kinetic energy (give them car keys) and tell them that they can have \$10000 dollars if they meet you at a certain address in

North Sydney. There is a strong incentive for them to meet you there (the reaction Queensland --> North Sydney) is thermodynamically favoured) - but, chances are they will get sucked through the Harbour Tunnel and Eastern Distributor to Botany instead (the reaction Queensland --> Botany is kinetically favoured). If you stop the reaction while they are all in Botany, you will obtain the kinetic product, but if you let them keep the car keys you should end up with the thermodynamic product eventually. At a certain stage in the reaction, you will have a mixture of the kinetic and thermodynamic products.

**dolasetron mesylate:** An indole derivative with antiemetic activity. As a selective serotonin receptor antagonist, dolasetron mesylate competitively blocks the action of serotonin at 5HT<sub>3</sub> receptors, resulting in suppression of chemotherapy- and radiotherapy-induced nausea and vomiting.

**dolasetron mesylate :** A drug used to prevent nausea and vomiting caused by chemotherapy. It is also used to prevent nausea and vomiting after surgery. Dolasetron mesylate blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called Anzemet.

**dolastatin 10:** A substance being studied in the treatment of cancer. It binds to a protein that cells need to divide and it may kill cancer cells. Dolastatin 10 comes from a marine organism. It is a type of mitotic inhibitor. OR A pentapeptide originally isolated from the marine mollusk *Dolabella auricularia* with potential antineoplastic activity. Binding to tubulin, dolastatin 10 inhibits microtubule assembly, resulting in the formation of tubulin aggregates and inhibition of mitosis. This agent also induces tumor cell apoptosis through a mechanism involving bcl-2, an oncoprotein that is overexpressed in some cancers.

**doldrums:** region along the Equator where the weather conditions are fairly consistent.

**dolichocephaly:** elongated skull

**Dolichol phosphate:** A lipid, residing in the ER membrane, containing approximately 20 isoprene units that serves as a carrier of oligosaccharides destined to be attached to a protein.

**dolichostenomelia:** condition of unusually long and thin extremities

**Dolobid:** (Other name for: diflunisal)

**Dolophine:** (Other name for: methadone hydrochloride)

**dolutegravir:** An orally bioavailable integrase strand transfer inhibitor (INSTI), with activity against human immunodeficiency virus type 1 (HIV-1) infection. Upon oral administration, dolutegravir binds to the active site of integrase, an HIV enzyme that catalyzes the transfer of viral genetic material into human chromosomes. This prevents integrase from binding to retroviral deoxyribonucleic acid (DNA), and blocks the strand transfer step, which is essential for the HIV replication cycle. This prevents HIV-1 replication.

**Domain:** A specific physical region or amino acid sequence in a protein which is associated with a particular function or corresponding segment of DNA. OR A segment of a folded protein structure showing conformational integrity. A domain could include the entire protein or just a fraction of the protein. Some proteins, such as antibodies, contain many structural domains. OR An independently folded unit in the tertiary structure of a polypeptide chain; may contain a number of supersecondary structures. In multienzyme complexes, each domain may carry out one or more catalytic reactions. In proteins, a compact globular unit of 100 to 400 residues, possibly joined to other domains by a flexible polypeptide segment; often encoded by a specific exon in the gene encoding the protein. OR A distinct structural unit of a polypeptide; domains may have separate functions and may fold as independent, compact units.

**Dome:** In reinforced plastics, an end of a filament wound cylindrical container. Or A closure that has a rounded surface. or Showing a symmetrical distortion of a flat or curved section of a plastic object, so that, as normally viewed, it appears convex, or more convex than intended. See —WARP.

**domestic breeding:** a process of directed evolution that brings about new forms that differ from ancestral stock.

**Domestrol:** (Other name for: diethylstilbestrol)

**Dominant:** Describing an allele whose phenotype is expressed regardless of whether the organism is homozygous or heterozygous for that allele.

**Dominant Flow Path :** At the juncture of two confronting flows the dominant flow will reverse the direction of the other.

**domoic acid:** Domoic acid is a toxic amino acid produced by certain species of algae. Domoic acid binds to a receptor that helps nerve cells control the flow of ions across their cell membranes. The receptor no longer works correctly, and the uncontrolled flux of ions damages and eventually kills the nerve cell.

**Domolene-HC:** (Other name for: therapeutic hydrocortisone)

**donepezil :** A drug that is used to treat Alzheimer disease and is being studied in the treatment of side effects caused by radiation therapy to the brain. It is a type of cholinesterase inhibitor.

**donepezil hydrochloride:** The hydrochloride salt of a piperidine derivative with neurocognitive-enhancing activity. Donepezil reversibly inhibits acetylcholinesterase, thereby blocking the hydrolysis of the neurotransmitter acetylcholine and, consequently, increasing its activity. This agent may improve neurocognitive function in Alzheimer's disease, reduce sedation associated with opioid treatment of cancer pain, and improve neurocognitive function in patients who have received radiation therapy for primary brain tumors or brain metastases.

**dong quai :** An herb native to China. A substance taken from the roots has been used in traditional Chinese medicine to treat menstrual and menopausal problems. Dong quai may increase the effect of the drug warfarin (a blood-thinner). The scientific name is *Angelica sinensis*.

**donor :** In medicine, a person who gives blood, cells, tissue, or an organ for use in another person, such as in a blood transfusion or an organ transplant.

**donor lymphocyte infusion :** A type of therapy in which lymphocytes from the blood of a donor are given to a patient who has already received a stem cell transplant from the same donor. The donor lymphocytes may kill remaining cancer cells. Donor lymphocyte infusion is used to treat chronic myelogenous leukemia (CML) that has come back and myeloma. It is being studied in the treatment of other types of cancer.

**donor lymphocytes:** A population of lymphocytes from the blood of a donor and administered to a patient who has already received a stem cell transplant from the same donor (allogeneic hematopoietic stem cell transplantation). The donor lymphocytes may be able to boost the patient's immune system and kill remaining cancer cells.

**donor regulatory T lymphocytes:** Donor-derived regulatory T-cells (Tregs), with potential immunomodulating activity. Tregs are a subset of CD4<sup>+</sup> T cells that express high levels of CD25 (interleukin 2 receptor) and the transcription factor Foxp3. The donor CD4<sup>+</sup>CD25<sup>+</sup> Tregs modulate immune responses and may induce tolerance to allogeneic organ transplants, such as hematopoietic stem cell transplants (HSCTs), thereby preventing graft-versus-host disease (GVHD).

**donor-derived WT1/PRAME/NY-ESO-1/survivin-specific T-lymphocytes:** Allogeneic T-lymphocytes specifically reactive to the tumor-associated antigens (TAAs) human Wilms tumor protein-1 (WT1), Preferentially Expressed Antigen in Melanoma (PRAME), the cancer-testis antigen NY-ESO-1, and survivin, with potential antineoplastic activity. Donor derived T-cells are mixed, *ex vivo*, with protein fragments derived from the TAAs WT1, PRAME, NY-ESO-1, and survivin. Upon intravenous administration, the donor-derived WT1/PRAME/NY-ESO-1/Survivin-specific T-lymphocytes recognize and kill cancer cells expressing these TAAs. WT1, NY-ESO-1, PRAME, and survivin, are expressed on certain tumor cell types and play key role in tumor cell proliferation and survival.

**Door furniture:** Term covering the fittings to a door viz. Handles finger-plates etc.

**dopamine:** One of many neurotransmitters that is essential in the functioning of the central nervous system and is often considered to be the primary reward neurotransmitter in the brain. It is the precursor to norepinephrine.

**dopamine–somatostatin chimeric molecule BIM-23A760:** A chimeric molecule directed against dopamine and somatostatin receptors with potential antineoplastic activity. Combining two pharmacological moieties, a somatostatin analogue and a dopamine agonist, dopamine–somatostatin chimeric molecule BIM-23A760 binds with high affinity to dopamine D2 receptor (D2R) and somatostatin receptor subtype 2 (SSTR2), and to a lesser extent to somatostatin receptor subtype 5 (SSTR5). This agent appears to exert its effect mainly by binding to D2R to activate the ERK1/2 and p38 MAPK pathways, thus inducing apoptosis and inhibiting cellular proliferation in non-functioning pituitary adenoma (NFPA) and neuroendocrine tumors. By binding to SSTR2, this agent may inhibit the secretion of growth hormone (GH) by the pituitary gland.

**Dopar:** (Other name for: levodopa)

**doping:** Using banned or illegal natural or synthetic chemicals to enhance athletic performance.

**Doppler coefficient:** Another name used for the "fuel temperature coefficient of reactivity," or the change in reactivity per degree of change in the temperature of nuclear fuel. The physical property of fuel pellet material (uranium-238) that causes the uranium to absorb more neutrons away from the fission process as fuel pellet temperature increases. This acts to stabilize power reactor operations.

**dormant volcano:** volcano that has not erupted during recorded history.

**dornase alfa:** A recombinant human deoxyribonuclease I (rhDNase) with selective DNA cleaving activity. Upon intrapleural administration, dornase alfa catalyzes the degradation of extracellular DNA in airway secretions, which can reduce their viscosity. Thus, dornase alfa may both promote the clearing of airway mucus and improve pulmonary function.

**dornase alfa inhalation solution:** A highly purified solution of recombinant human deoxyribonuclease I (rhDNase) with selective DNA cleaving activity. Administered through inhalation of the nebulized solution, dornase alpha catalyzes DNA degradation in viscous airway secretions, which may render airway secretions less viscous, thus promoting the clearing of airway mucous plugging and improvement in pulmonary function. or A drug given in an aerosol mist to decrease the thickness of mucus in the lungs of patients with cystic fibrosis. It is also being studied as a treatment to reduce the thickness of saliva in patients being treated for head and neck cancer. Dornase alfa inhalation solution contains an enzyme that breaks the DNA in mucus into small pieces and makes the mucus thinner. Also called Pulmozyme.

**Dose:** A general term, which may be used to refer to the amount of energy absorbed by an object or person per unit mass. Known as the "absorbed dose," this reflects the amount of energy that ionizing radiation sources deposit in materials through which they pass, and is measured in units of radiation-absorbed dose (rad). The related international system unit is the gray (Gy), where 1 Gy is equivalent to 100 rad. By contrast, the biological dose or dose equivalent, given in rems or sieverts (Sv), is a measure of the biological damage to living tissue as a result of radiation exposure. For additional information, see Doses in Our Daily

Lives and Measuring Radiation. OR The measured quantity of a substance, such as a drug, taken at one time. Or The amount of a chemical administered to an organism (WHO, 1978).

**dose :** The amount of medicine taken, or radiation given, at one time.

**Dose equivalent:** A measure of the biological damage to living tissue as a result of radiation exposure. Also known as the "biological dose," the dose equivalent is calculated as the product of absorbed dose in tissue multiplied by a quality factor and then sometimes multiplied by other necessary modifying factors at the location of interest. The dose equivalent is expressed numerically in rems or sieverts (Sv) (see 10 CFR 20.1003). For additional information, see Doses in Our Daily Lives and Measuring Radiation.

**dose exposure-response relationship:** The relationship between administered dose or exposure and the biological change in organisms. It may be expressed as the severity of an effect in one organism (or part of an organism) or as the proportion of a population exposed to a chemical that shows a specific reaction (WHO, 1979).

**dose rate:** (in radiation protection) The quantity of energy absorbed per unit of time (WHO, 1979). OR The dose of ionizing radiation delivered per unit time. For example, rems or sieverts (Sv) per hour.

**dose-dense chemotherapy :** A chemotherapy treatment plan in which drugs are given with less time between treatments than in a standard chemotherapy treatment plan.

**dose-dependent :** Refers to the effects of treatment with a drug. If the effects change when the dose of the drug is changed, the effects are said to be dose-dependent.

**dose-limiting :** Describes side effects of a drug or other treatment that are serious enough to prevent an increase in dose or level of that treatment.

**dose-rate :** The strength of a treatment given over a period of time.

**Dose, absorbed:** The amount of energy absorbed by an object or person per unit mass. Known as the "absorbed dose," this reflects the amount of energy that ionizing radiation sources deposit in materials through which they pass, and is measured in units of radiation-absorbed dose (rad). The related international system unit is the gray (Gy), where 1 Gy is equivalent

to 100 rad. For additional information, see Doses in Our Daily Lives and Measuring Radiation.

**Dosimeter:** A small portable instrument (such as a film badge, thermoluminescent dosimeter, or pocket dosimeter) used to measure and record the total accumulated personal dose of ionizing radiation. For additional information, see Detecting Radiation.

**dosimetrist :** A person who determines the proper radiation dose for treatment.

**Dosimetry:** The theory and application of the principles and techniques involved in measuring and recording doses of ionizing radiation.

**dosimetry :** Measurement of radiation exposure from x-rays, gamma rays, or other types of radiation used in the treatment or detection of diseases, including cancer.

**Dosing Stroke Metering stroke:** It is stroke of screw that determines the quantity of melt to be injected to the mould.

**Dostinex:** (Other name for: cabergoline)

**DOT1L inhibitor EPZ-5676:** A small molecule inhibitor of histone methyltransferase with potential antineoplastic activity. Upon intravenous administration, EPZ-5676 specifically blocks the activity of the histone lysine-methyltransferase DOT1L, thereby inhibiting the methylation of nucleosomal histone H3 on lysine 79 (H3K79) that is bound to the mixed lineage leukemia (MLL) fusion protein which targets genes and blocks the expression of leukemogenic genes. This eventually leads to an induction of apoptosis in the leukemic cells bearing the MLL gene translocations. DOT1L, a non-SET domain-containing histone methyltransferase, specifically methylates H3K79 and plays a key role in normal cell differentiation and in the development of leukemia with MLL gene rearrangement on chromosome 11 and promotes the expression of leukemia-causing genes.

**DOTAREM:** (Other name for: gadoterate meglumine)

**Double Balanced Weave:** A fabric consisting of pairs of interlaced right and left-hand spirals joined by crimped or straight rod connectors in a manner so that the pairs of spirals are inter-spaced by the adjacent spirals.

**double balloon endoscopy :** A procedure used to look at the inside of the small intestine. A special instrument made up of two tubes (one inside the

other) is inserted through the mouth or rectum and into the small intestine. The inside tube, which is an endoscope with a light and lens for viewing, is moved through part of the small intestine, and a balloon at the end of it is inflated to keep the endoscope in place. Next, the outer tube is moved through the small intestine to reach the end of the endoscope, and a balloon at the end of the outer tube is inflated to keep it in place. Then, the balloon at the end of the endoscope is deflated, and the endoscope is moved through the next part of the small intestine. These steps are repeated many times as the tubes move through the whole small intestine. This allows the doctor to see all of the small intestine. Tissue samples may be removed so they can be checked under a microscope for signs of disease. Also called DBE and double balloon enteroscopy.

**double bond:** When an atom is bonded to another atom by two sets of electron pairs. OR A double bond is a type of covalent bond formed between atoms by sharing two pairs of electrons, e.g. O<sub>2</sub>. OR a multiple bond composed of one  $\sigma$  bond and one  $\pi$  bond. Rotation is not possible around a double bond. Hydrocarbons containing one double bond are called alkenes, and hydrocarbons with two double bonds are called dienes. OR a multiple bond composed of one  $\sigma$  bond and one  $\pi$  bond. Rotation is not possible around a double bond. Hydrocarbons that contain one double bond are alkenes, and hydrocarbons with two double bonds are dienes. OR A type of covalent bond in which a pair of atoms shares two pairs of electrons

**double displacement:** double displacement reaction; double replacement; double replacement reaction; double exchange; exchange; metathesis. A double displacement or metathesis is a reaction in which two reactants trade fragments:  $AB + CD = AC + BD$

**Double helix:** A structure in which two helically-twisted polynucleotide strands are held together by hydrogen bonding and base stacking. OR The natural coiled conformation of two complementary, antiparallel DNA chains.

**double heterozygosity :** The presence of two different mutated alleles at two separate genetic loci.

**Double Replacement:** A chemical reaction where two compounds are mixed and they exchange parts of their compounds with each other. Think

about the mixing of an acid and a base. You start with an acid and base and finish with water and a salt.

**Double Rod Reinforced Weave (Dual or Duplex Weave):** A fabric consisting of pairs of either all right hand or left hand spirals, each pair being turned into the preceding pair, and reinforced with a rod through the hinging point of the spirals.

**Double Weave (Duplex) Edges:** Edge construction of double weave design extending in from both edges to a specific distance.

**Double Wound Sheeting:** Two plies of sheeting wound together.

**double-blinded :** A clinical trial in which the medical staff, the patient, and the people who analyze the results do not know the specific type of treatment the patient receives until after the clinical trial is over.

**double-contrast barium enema :** A procedure in which x-rays of the colon and rectum are taken after a liquid containing barium is put into the rectum. Barium is a silver-white metallic compound that outlines the colon and rectum on an x-ray and helps show abnormalities. Air is put into the rectum and colon to further enhance the x-ray.

**Double-displacement reaction:** A reaction having multiple substrates in which one or more products are released before all substrates bind the enzyme. The defining feature of these reactions is the formation of a substituted-enzyme intermediate. Also called ping-pong reaction.

**double-hit lymphoma :** A rare, aggressive (fast-growing) type of B-cell non-Hodgkin lymphoma caused by changes in the DNA that affect a gene called the MYC gene and either the BCL2 gene or the BCL6 gene. Double-hit lymphoma may be hard to treat and has a poor prognosis. It is a type of diffuse large B-cell lymphoma. Also called DHL.

**double-reciprocal plot:** A plot of  $1/V_0$  versus  $1/[S]$ , which allows a more accurate determination of  $V_{max}$  and  $K_m$ , than a plot of  $V_0$  versus  $[S]$ ; also called the Lineweaver-Burk plot.

**Double-shot molding:** A means of turning out two-color parts in thermoplastics materials by successive molding operations.

**doubling time :** In biology, the amount of time it takes for one cell to divide or for a group of cells (such as a tumor) to double in size. The doubling time is different for different kinds of cancer cells or tumors.

**douche :** A procedure in which the vagina is washed with water or a cleansing solution. Most cleansing solutions contain water mixed with vinegar, baking soda, or iodine. Regular douching can wash away some of the bacteria that normally live in the vagina. This may allow yeast or harmful types of bacteria to grow and cause infection. Douching may also cause other health problems, such as pelvic inflammatory disease (PID) and problems during pregnancy. Most doctors do not recommend douching.

**DOUR:** Dissolved Oxygen Uptake Ratio, reported as mg DO/L/hour, a test that is used to measure how much oxygen is being consumed by the microbes in a wastewater treatment plant, to assure that the biomass is receiving sufficient dissolved oxygen.

**dovitinib lactate:** The orally bioavailable lactate salt of a benzimidazole-quinolinone compound with potential antineoplastic activity. Dovitinib strongly binds to fibroblast growth factor receptor 3 (FGFR3) and inhibits its phosphorylation, which may result in the inhibition of tumor cell proliferation and the induction of tumor cell death. In addition, this agent may inhibit other members of the RTK superfamily, including the vascular endothelial growth factor receptor; fibroblast growth factor receptor 1; platelet-derived growth factor receptor type 3; FMS-like tyrosine kinase 3; stem cell factor receptor (c-KIT); and colony-stimulating factor receptor 1; this may result in an additional reduction in cellular proliferation and angiogenesis, and the induction of tumor cell apoptosis. The activation of FGFR3 is associated with cell proliferation and survival in certain cancer cell types.

**Dovonex:** (Other name for: calcipotriene)

**DOWEL:** Pin used to maintain alignment between two or more parts of a mold.

**Down Cage:** A spiral system where the belt's travel is from top to bottom.

**Down syndrome :** A disorder caused by the presence of an extra chromosome 21 and characterized by mental retardation and distinguishing physical features.

**Down's cell:** A Down's cell is an electrolytic cell in which sodium is extracted from molten sodium chloride (mixed with calcium chloride to lower its melting point).

**downcutting:** the erosion directly downward by a stream channel.

**Downstream Equipment:** Equipment in the process following the extruder. Generally consists of a sizing fixture, used for sizing and cooling of the extrudate; a puller, used to remove the extrudate from the extruder at a continuous rate; and a cutter.

**downwelling:** The process of accumulation and sinking of warm surface waters along a coastline. A change of air flow of the atmosphere can result in the sinking or downwelling of warm surface water. The resulting reduced nutrient supply near the surface affects the ocean productivity and meteorological conditions of the coastal regions in the downwelling area.

**Dox-SL:** (Other name for: pegylated liposomal doxorubicin hydrochloride) OR A form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than doxorubicin. Dox-SL is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Dox-SL is a type of anthracycline antitumor antibiotic. Also called Doxil, doxorubicin hydrochloride liposome, Evacet, LipoDox, and liposomal doxorubicin hydrochloride.

**doxazosin :** A drug used to treat high blood pressure and urinary problems caused by an enlarged prostate. It relaxes muscle tissue in blood vessels and in the prostate. Doxazosin is a type of alpha blocker. Also called Cardura and doxazosin mesylate.

**doxazosin mesylate:** A drug used to treat high blood pressure and urinary problems caused by an enlarged prostate. It relaxes muscle tissue in blood vessels and in the prostate. Doxazosin mesylate is a type of alpha blocker. Also called Cardura and doxazosin. OR The mesylate salt form of doxazosin, a quinazoline compound with smooth muscle relaxing activity. Doxazosin mesylate selectively antagonizes alpha-1-adrenergic receptors in smooth muscle of the bladder neck and prostate, thereby relaxing the smooth muscle and decreasing the obstruction and urethral resistance seen with benign prostate hyperplasia (BPH). This may improve BPH symptoms. This agent also blocks alpha-1-adrenergic receptors in peripheral vascular smooth muscle, which leads to vasodilatation and a subsequent decrease in peripheral vascular resistance. Check for active clinical trials using this agent.

**doxepin hydrochloride:** A dibenzoxepin derivative and tricyclic antidepressant with antipruritic and sedative activities. Doxepin blocks the reuptake of norepinephrine and serotonin into presynaptic terminals thereby prolonging the availability of the monoaminergic neurotransmitters within the synaptic cleft and enhancing their action leading to sedative effects. Doxepin also has antagonistic effects on histamine (H1 and H2), 5-HT<sub>2</sub>, alpha-1 adrenergic, and muscarinic receptors. The antipruritic effect of this agent is the result mediated through inhibition of histamine receptors.

**doxercalciferol:** A synthetic analog of vitamin D with potential antineoplastic activity. In the liver, doxercalciferol is converted to its biologically active vitamin D metabolites, which control the intestinal absorption of dietary calcium, the tubular reabsorption of calcium by the kidney and, in conjunction with parathyroid hormone (PTH), the mobilization of calcium from the skeleton. Through interaction with specific receptor proteins in target tissues, these vitamin D metabolites act directly on osteoblasts to stimulate skeletal growth, and on the parathyroid glands to suppress PTH synthesis and secretion. This agent has also been shown to inhibit the growth of retinoblastomas, and may exhibit some antiproliferative activity against prostate cancer cells. or A substance being studied in the prevention of recurrent prostate cancer. It is a type of vitamin D analog.

**doxifluridine:** A fluoropyrimidine derivative and oral prodrug of the antineoplastic agent 5-fluorouracil (5-FU) with antitumor activity. Doxifluridine, designed to circumvent the rapid degradation of 5-FU by dihydropyrimidine dehydrogenase in the gut wall, is converted into 5-FU in the presence of pyrimidine nucleoside phosphorylase. 5-FU interferes with DNA synthesis and subsequent cell division by reducing normal thymidine production and interferes with RNA transcription by competing with uridine triphosphate for incorporation into the RNA strand.

**DOXIL:** (Other name for: pegylated liposomal doxorubicin hydrochloride)

**Doxil :** A form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than doxorubicin. Doxil is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other

types of cancer. Doxil is a type of anthracycline antitumor antibiotic. Also called Dox-SL, doxorubicin hydrochloride liposome, Evacet, LipoDox, and liposomal doxorubicin hydrochloride.

**doxorubicin** : A drug used to treat many types of cancer, including leukemia, lymphoma, neuroblastoma, sarcoma, Wilms tumor, and cancers of the lung, breast, stomach, ovary, thyroid, and bladder. It is also being studied in the treatment of other types of cancer. Doxorubicin comes from the bacterium *Streptomyces peucetius*. It damages DNA and may kill cancer cells. It is a type of anthracycline antitumor antibiotic. The brand names Adriamycin PFS, Adriamycin RDF, and Rubex have been taken off the market and are no longer available. Also called doxorubicin hydrochloride and hydroxydaunorubicin.

**doxorubicin hydrochloride:** The hydrochloride salt of doxorubicin, an anthracycline antibiotic with antineoplastic activity. Doxorubicin, isolated from the bacterium *Streptomyces peucetius* var. *caesius*, is the hydroxylated congener of daunorubicin. Doxorubicin intercalates between base pairs in the DNA helix, thereby preventing DNA replication and ultimately inhibiting protein synthesis. Additionally, doxorubicin inhibits topoisomerase II which results in an increased and stabilized cleavable enzyme-DNA linked complex during DNA replication and subsequently prevents the ligation of the nucleotide strand after double-strand breakage. Doxorubicin also forms oxygen free radicals resulting in cytotoxicity secondary to lipid peroxidation of cell membrane lipids; the formation of oxygen free radicals also contributes to the toxicity of the anthracycline antibiotics, namely the cardiac and cutaneous vascular effects. or A drug used to treat many types of cancer, including leukemia, lymphoma, neuroblastoma, sarcoma, Wilms tumor, and cancers of the lung, breast, stomach, ovary, thyroid, and bladder. It is also being studied in the treatment of other types of cancer. Doxorubicin hydrochloride comes from the bacterium *Streptomyces peucetius*. It damages DNA and may kill cancer cells. It is a type of anthracycline antitumor antibiotic. The brand names Adriamycin PFS, Adriamycin RDF, and Rubex have been taken off the market and are no longer available. Also called doxorubicin and hydroxydaunorubicin.

**doxorubicin hydrochloride liposome** : A form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have

fewer side effects and work better than doxorubicin. Doxorubicin hydrochloride liposome is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Doxorubicin hydrochloride liposome is a type of anthracycline antitumor antibiotic. Also called Dox-SL, Doxil, Evacet, LipoDox, and liposomal doxorubicin hydrochloride.

**doxorubicin-eluting beads:** A drug-device combination product consisting of small polymeric beads impregnated with the anthracycline antibiotic doxorubicin with potential antineoplastic activity. The beads consist of polyvinyl alcohol (PVA) microspheres modified with sulfonic acid groups and loaded with doxorubicin. During transarterial chemoembolization (TACE), doxorubicin-eluting beads embolize to the tumor vasculature and release cytotoxic doxorubicin, which may result in both ischemic necrosis of tumor tissue due to mechanical blockage of the tumor vasculature and doxorubicin-mediated inhibition of tumor cell proliferation.

**doxorubicin-HPMA conjugate:** A copolymer conjugate of the antineoplastic anthracycline doxorubicin and the water-soluble polymer N-(2-hydroxypropyl) methacrylamide (HPMA). Doxorubicin, an intercalator and a topoisomerase II inhibitor, prevents DNA replication and ultimately inhibits protein synthesis. This agent also generates oxygen free radicals, resulting in cytotoxic lipid peroxidation of cell membrane lipid. HPMA conjugation enhances the permeability and retention of this agent within the tumor vasculature. Poorly cleared by the lymphatic system, this formulation undergoes increased cleavage by tumor cell lysosomal proteinases, resulting in increased, sustained intracellular concentrations of free doxorubicin. Compared to other doxorubicin-containing formulations, this formulation may exhibit an improved toxicity profile due to the lower concentrations of free doxorubicin to which non-malignant tissues are exposed. Check for active clinical trials using this agent.

**doxorubicin-loaded EGFR-targeting nanocells:** A nanocell formulation targeting the epidermal growth factor receptor (EGFR) using bispecific antibodies (bsAb) against EGFR and containing the antineoplastic anthracycline antibiotic doxorubicin, with potential antineoplastic activity. Upon administration of doxorubicin-loaded EGFR-targeting nanocells, the

nanocells are stable in the bloodstream and the anti-EGFR bsAb moiety targets and binds to EGFR-expressing tumor cells. Upon binding, the nanocell allows for specific delivery of doxorubicin to tumor cells overexpressing EGFR. Upon endocytosis by the tumor cells, the nanocell is broken down and releases doxorubicin, which intercalates into DNA and interferes with topoisomerase II activity, thereby inhibiting DNA replication and RNA synthesis. Compared to doxorubicin alone or liposomal doxorubicin, targeted delivery of doxorubicin improves efficacy while lowering the toxicity profile. EGFR, a tyrosine kinase receptor, is overexpressed in many cancer cell types. The nanocell is a bacterially derived nanosphere; the bacterial components are unlikely to induce an immune response in the immunosuppressed tumor microenvironment. Check for active clinical trials using this agent.

**doxorubicin-magnetic targeted carrier complex:** A formulation of the anthracycline antibiotic doxorubicin in which doxorubicin is bound to microscopic beads of activated carbon and iron as a magnetic-targeted carrier (MTC). Doxorubicin, an intercalator and a topoisomerase II inhibitor, prevents DNA replication and ultimately inhibits protein synthesis. This agent also generates oxygen free radicals, resulting in cytotoxic lipid peroxidation of cell membrane lipids. Guided by the placement of a magnet on the body surface overlying a tumor site, the doxorubicin-MTC complex delivers doxorubicin directly to the tumor site, thereby targeting and prolonging the duration of doxorubicin-mediated cytotoxicity to the tumor bed while minimizing systemic toxicity.

**doxycycline:** A drug used to treat many types of bacterial infections. It stops the growth of bacteria by keeping them from making proteins. It is a type of antibiotic. Also called doxycycline hyclate. OR A synthetic, broad-spectrum tetracycline with antimicrobial activity. Doxycycline binds reversibly to the 30S ribosomal subunit and possibly to the 50S ribosomal subunit, blocking the binding of aminoacyl-tRNA to the mRNA-ribosome complex, which results in an inhibition of bacterial protein synthesis. In addition, this agent may inhibit collagenase activity.

**doxycycline hyclate :** A drug used to treat many types of bacterial infections. It stops the growth of bacteria by keeping them from making proteins. It is a type of antibiotic. Also called doxycycline.

**doxycycline hyclate injection:** The hyclate salt form of doxycycline, a synthetic, broad-spectrum tetracycline antibiotic exhibiting antimicrobial activity. Doxycycline hyclate binds reversibly to the 30S ribosomal subunit, possibly to the 50S ribosomal subunit as well, thereby blocking the binding of aminoacyl-tRNA to the mRNA-ribosome complex. This leads to an inhibition of protein synthesis. In addition, this agent has exhibited inhibition of collagenase activity. Check for active clinical trials using this agent.

**DPA:** A type of power of attorney. A power of attorney is a legal document that gives one person (such as a relative, lawyer, or friend) the authority to make legal, medical, or financial decisions for another person. It may go into effect right away, or when that person is no longer able to make decisions for himself or herself. A DPA remains in effect until the person who grants it dies or cancels it. It does not need to be renewed over time. Also called durable power of attorney.

**DPPE:** Belongs to a group of antihormone drugs.

**DPT/BCG/measles/Serratia/pneumococcus vaccine:** A proprietary lipid emulsion containing five vaccines: diphtheria, pertussis, tetanus (DPT), Bacille Calmette-Guerin (BCG), measles, *Serratia marcescens* and pneumococcal, with potential immunostimulating activity. Subcutaneous administration of the DPT/BCG/measles/*Serratia/pneumococcus* vaccine activates the immune system and may both abrogate tumor-induced immune tolerance and induce an antitumor immune response, which may eradicate the tumor.

**DPT/typhoid/Staphylococcus aureus/paratyphoid A/paratyphoid B vaccine:** A proprietary lipid emulsion containing five vaccines: diphtheria, pertussis, tetanus (DPT), typhoid, *Staphylococcus aureus*, paratyphoid A and paratyphoid B, with potential immunostimulating activity. Subcutaneous administration of the DPT/typhoid/*Staphylococcus aureus/paratyphoid A/paratyphoid B* vaccine activates the immune system and may both abrogate tumor-induced immune tolerance and induce an antitumor immune response, which may eradicate the tumor. Check for active clinical trials using this agent.

**DR4:** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of DR4 on cancer cells may kill more cells. Also called death

receptor 4, TRAIL receptor 1, TRAIL-R1, and tumor necrosis factor receptor superfamily member 10A.

**DR5:** A protein on the surface of certain cells that binds another protein called TRAIL, which may kill some cancer cells. An increase in the amount or activity of DR5 on cancer cells may kill more cells. Also called death receptor 5, TRAIL receptor 2, TRAIL-R2, and tumor necrosis factor receptor superfamily member 10B.

**draft:** a written version of an essay; most writers create multiple drafts in the process of writing. OR A Slight taper in a mold wall designed to facilitate removal of the molded object from the mold. Or The degree of taper of a mold-cavity sidewall or the angle of clearance designed to facilitate removal of parts from a mold. Generally all plastic components should be designed with draft where possible. Or An angle (or taper) provided on the mold to facilitate ejection of the molded part. Or A taper applied to the faces of the part that prevent them from being parallel to the motion of the mold opening. This keeps the part from being damaged due to the scraping as the part is ejected out of the mold. Or The angle or degree of taper in a side wall to help facilitate removal of the parts from the mold. Or The degree of taper of a side wall or the angle of clearance designed to facilitate removal of parts from a mold.

**Drag Marks :** A form of deep scratch or scratches on the surface of the component usually caused by the ejection of the part.

**drain :** In medicine, to remove fluid as it collects; or, a tube or wick-like device used to remove fluid from a body cavity, wound, or infected area.

**drainage basin:** the area around a stream that could drain into the stream. OR a ridge that separates one drainage basin from another. OR the outer edge between drainage basins.

**Drape Assist Frame:** In sheet thermoforming, a frame (made up of anything from thin wires to thick bars) shaped to the peripheries of the depressed areas of the mold and suspended above the sheet to be formed. During forming, the assist frame drops down, drawing the sheet tightly into the mold and thereby preventing webbing between high areas of the mold and permitting closer spacing in multiple molds.

**Drape Forming:** Method of forming thermoplastic sheet in which the sheet is clamped into a movable frame, heated, and draped over high points of a male mold. Vacuum is then pulled to complete the forming operation.

**draw a picture:** Create a drawing that helps visualize the word problem.

**Draw down:** Reduction in thickness of plastics emerging from the die by controlling the haul off speed

**Draw Down Ratio:** The ratio of the thickness of the die opening to the final thickness of the product.

**Draw Ratio:** The ratio of the (drawn) area of the formed part and that of the unformed sheet of material required to form the part.

**DRAW RESONANCE:** A phenomenon by which a continuous drawing process becomes unsteady, alternating between thick and thin sections. It is often encountered in fiber spinning and cast film production.

**DRAWDOWN:** In extrusion, the process of pulling the extrudate away from the die at a linear speed higher than that at which the melt is emerging from the die, thus reducing the cross-sectional dimensions of the extrudate. Or Typically used by most plastic manufacturers, the drawdown process is pulling the plastic extrusions away from the die at a linear speed higher than that at which the melt is emerging from the die. Or The process of stretching a thermoplastic sheet or rod to reduce its cross-sectional area. OR The the act, process, or result of depleting, as in the drawdown of oil reserves. OR a local lowering of the water table around a well.

**drawing:** Ortep A structural representation of a set of atoms in which the atoms are portrayed as ellipsoids that depicts the atomic displacement parameters for those atoms. These representations were originally drawn using the ORTEP program.

**DRE:** An examination in which a doctor inserts a lubricated, gloved finger into the rectum to feel for abnormalities. Also called digital rectal examination.

**DRI:** A set of guidelines developed by U.S. and Canadian scientists to give information about the role of nutrients in human health. These guidelines include the Reference Daily Intakes (RDI), which are the recommended amounts of nutrients to be eaten each day to meet the needs of most healthy people. This system replaced the Recommended Dietary Allowances (RDA). Also called Dietary Reference Intakes.

**Driers:** Various compounds added to coatings to speed the drying.

**drift:** small particles carried away from larger rocks by glacial meltwater. OR slow changes in the signal of a sensor maintained in a solution of

constant composition and temperature.

**drizzle:** liquid precipitation that is less than .02 cm in diameter.

**dronabinol:** A synthetic pill form of delta-9-tetrahydrocannabinol (THC), an active ingredient in marijuana that is used to treat nausea and vomiting associated with cancer chemotherapy. OR An isomer of tetrahydrocannabinol (THC) that is the main and most active isomer found in the cannabis sativa L. plant, with potential anti-emetic, analgesic and appetite stimulating activities. Upon administration, dronabinol, also called delta-9-THC, targets and binds to cannabinoid receptors (CBRs) located in the central nervous system (CNS). Dronabinol acts directly on the appetite and vomiting control centers in the brain to stimulate appetite and prevent emesis. In addition, this agent induces analgesia. Urine levels may be used as a marker to determine the exposure to certain preparations containing parts of the cannabis plant, such as marijuana.

**Drooling:** The extrusion or leakage of molten liquid silicone rubber from a nozzle or nozzle sprue bushing area while or prior to shooting or The extrudation or leakage of molten resin from nozzle or nozzle sprue bushing area whilefilling or shooting the mold.

**Drop Test:** Any test method in which the article being tested is dropped in a specified manner for a specified number of times or until the article fails from impact.

**droperidol:** A butyrophenone with anti-emetic, sedative and anti-anxiety properties. Although the exact mechanism through which droperidol exerts its effects is unknown, droperidol may block dopamine receptors in the chemoreceptor trigger zone (CTZ), which may lead to its anti-emetic effect. This agent may also bind to postsynaptic gamma-aminobutyric acid (GABA) receptors in the central nervous system (CNS), which increases the inhibitory effect of GABA and leads to sedative and anti-anxiety activities. Check for active clinical trials using this agent. OR A drug used to prevent nausea and vomiting in patients who receive anesthesia before surgery. It is also used to treat anxiety. Droperidol is a type of antiemetic, adjunct anesthesia, and antipsychotic.

**Dropper cap:** A bottle closure that features a dropper and rubber bulb, designed to dispense liquids in small drops.

**Dropping a Parison:** Extruding a parison of sufficient length to position it between the two mold halves to produce a part.

**Droxia :** (Other name for: hydroxyurea) OR A drug used to treat certain patients with sickle cell anemia. It is also being studied in the treatment of other conditions and some types of cancer. Droxia may help keep abnormal red blood cells from forming. Droxia contains the active ingredient hydroxyurea. It is a type of antimetabolite.

**drug:** A biologically active compound or mixture used to cure, prevent, or detect disease, to control biological processes, or to alter mental state.

**drug :** Any substance, other than food, that is used to prevent, diagnose, treat or relieve symptoms of a disease or abnormal condition. Also refers to a substance that alters mood or body function, or that can be habit-forming or addictive, especially a narcotic.

**drug abuse :** The use of illegal drugs or the use of prescription or over-the-counter drugs for purposes other than those for which they are meant to be used, or in large amounts. Drug abuse may lead to social, physical, emotional, and job-related problems.

**Drug Accountability Record :** A log of study drugs kept by an investigator running a clinical trial. It lists many things about each drug, including the drug name, lot number, expiration date, the amount of drug received, used, returned, or thrown away, and the amount left. Drug Accountability Records help make sure that a clinical trial is done safely and correctly. Drug Accountability Records are required by the U.S. Food and Drug Administration (FDA). Also called DAR.

**Drug delivery:** The field of developing formulation modifications to enhance the efficiency and timing of delivering a drug to the biologically active site. Also, the total sequence of events leading to that delivery. OR Giving a medicine to achieve a therapeutic effect in humans or animals. The most common methods include: oral (through the mouth), topical (skin), transmucosal (nasal, buccal/sublingual, vaginal, ocular and rectal) and inhalation (through the lungs)

**drug interaction :** A change in the way a drug acts in the body when taken with certain other drugs, herbals, or foods, or when taken with certain medical conditions. Drug interactions may cause the drug to be more or less effective, or cause effects on the body that are not expected.

**Drug Master File:** A Drug Master File (DMF) is a submission to the Food and Drug Administration (FDA) that may be used to provide confidential detailed information about facilities, processes, or articles used in the

manufacturing, processing, packaging, and storing of one or more human drugs.

**drug resistance :** The failure of cancer cells, viruses, or bacteria to respond to a drug used to kill or weaken them. The cells, viruses, or bacteria may be resistant to the drug at the beginning of treatment, or may become resistant after being exposed to the drug.

**Drug Target:** In the simplest sense, drug targets are macromolecular biomolecules such as proteins whose activity can be altered by a pharmacologically active compound.

**drug therapy :** Treatment with any substance, other than food, that is used to prevent, diagnose, treat, or relieve symptoms of a disease or abnormal condition.

**drug tolerance :** A condition that occurs when the body gets used to a medicine so that either more medicine is needed or different medicine is needed.

**Drum :** Large cylindrical shaped core of a spiral system. The system's main driving component. (Also see Cage.)

**Drum Diameter:** Diameter of the drum or cage.

**drumlin:** a long, narrow, rounded ridge of till whose long axes parallel the direction a glacier traveled.

**dry adiabatic lapse rate:** rate at which dry air cools as it rises upward.

**Dry Blend –:** A free flowing blend of compound or resin and other ingredients as prepared for an additional manufacturing operation specifically for extrusion or molding.

**Dry cask storage:** A method for storing spent nuclear fuel in special containers known as casks. After fuel has been cooled in a spent fuel pool for at least 1 year, dry cask storage allows spent fuel assemblies to be sealed in casks or canisters and surrounded by inert gas. They are welded or bolted closed, and each is surrounded by steel, concrete, lead, or other material to provide leak-tight containment and radiation shielding. The casks may store the fuel horizontally or vertically in concrete vaults or on concrete pads.

**dry cell:** A electrolytic cell that uses a moist paste rather than a liquid as an electrolyte. Flashlight batteries are dry cells with a zinc cup for an anode,

a carbon rod for a cathode, and a paste made of powdered carbon,  $\text{NH}_4\text{Cl}$ ,  $\text{ZnCl}_2$ , and  $\text{MnO}_2$  for an electrolyte.

**DRY COLORING:** Method commonly used by fabricators for coloring plastic by tumble blending uncolored particles of the plastic material with selected dyes and pigments.

**Dry Coloring:** Method commonly used by fabricators for coloring plastics by tumble blending uncolored particles of the plastic material with selected dyes and pigments.

**dry orgasm :** Sexual climax without the release of semen from the penis.

**Dry Strength:** The strength of an adhesive joint determined immediately after drying under specified conditions or after a period of conditioning in the standard laboratory atmosphere. See Wet Strength.

**DRY TACK FREE:** That stage of drying when the paint no longer feels sticky or tacky when lightly touched.

**DRY TO HANDLE:** That stage of drying when a paint film has hardened sufficiently so the object or surface painted may be used without marring.

**DRY TO RECOAT:** That stage of drying when the next coat can be applied.

**DRY TO SAND:** That stage of drying when a paint film can be sanded without the sandpaper sticking or clogging.

**Dry-blend:** A free-flowing dry compound prepared without fluxing or addition of solvent. Also called powder blend.

**dry-bulb temperature:** temperature of the air.

**Drying:** A process in which a wet solid is heated or contacted with a hot gas stream, causing some or all of the liquid wetting the solid to evaporate. The vapor and the gas it evaporates into emerge as one outlet stream, and the solid and remaining residual liquid emerge as a second outlet stream.

OR The solidification of an applied paint film. Emulsions dry by evaporation of water oil based paints dry by evaporation of solvent followed by oxidation of the oil content. OR The removal of moisture from the resin pellets by exposure to certain time and temperature. All Hydroscopic Material must be dried prior to molding. OR The removal of moisture from the resin pellets by exposure to certain time and temperature.

**Drying of plastics:** Many plastics absorb water and must be dried prior to injection molding to ensure good cosmetics and material characteristics.

**Drying time:** The time required for an applied paint film to reach its full degree of hardness.

**Drywell:** The containment structure enclosing the vessel and recirculation system of a boiling-water reactor. The drywell provides both a pressure suppression system and a fission product barrier under accident conditions. For related information, see Boiling-Water Reactors.

**DSC:** See Differential scanning calorimetry.

**DSMB:** Data and Safety Monitoring Board. An impartial group that oversees a clinical trial and reviews the results to see if they are acceptable. This group determines if the trial should be changed or closed. Also called Data and Safety Monitoring Board.

**DSP :** Digital Sound Processing.

**DT(388)IL3 fusion protein:** A recombinant protein consisting of human interleukin 3 (IL3) fused to the first 388 amino acids of diphtheria toxin [DT(388)] (DT388IL3) with potential antineoplastic activity. Upon intravenous administration, the IL3 moiety of the DT(388)IL3 fusion protein SL-401 binds to IL3 receptors on cells expressing the receptor. Subsequently, the DT(388) toxin moiety, which contains both translocation and catalytic domains, is transported across the cell membrane via endocytosis. Within the cytosol, the catalytic domain of the toxin both catalyzes the ADP-ribosylation of, and inactivates, translation elongation factor 2 (EF-2), which results in the inhibition of translation during protein synthesis. IL3 may be overexpressed by a variety of cancers, including blastic plasmacytoid dendritic cell neoplasm and acute myeloid leukemia (AML).

**DT2219ARL immunotoxin :** A substance being studied in the treatment of some types of B-cell cancer. It contains an antibody linked to a toxic substance. The antibody binds to proteins called CD19 and CD22 on the surface of B cells, and the toxic substance kills the cells. It is a type of bispecific ligand-directed toxin.

**DT388IL3 fusion protein :** A substance being studied in the treatment of myeloid leukemia (a disease in which too many immature non-lymphocyte white blood cells are found in the blood and bone marrow). DT388IL3 fusion protein is made by combining IL-3 with a toxic substance. The IL-3 attaches to the cancer cells and the toxic substance kills them.

**DTA:** See Differential thermal analysis. OR Dental Trade Association. Freelin-Wade is a member.

**DTA-H19 plasmid:** A plasmid DNA encoding the A chain of the diphtheria toxin (DT-A) driven by the transcriptional regulatory sequences of human H19, with potential antineoplastic activity. Because the expression of DT-A is under the control of H19 promoter elements, DT-A is selectively expressed in tumor cells capable of turning on H-19. DT-A catalyzes ADP-ribosylation of translation elongation factor 2 (EF-2), resulting in the inhibition of protein synthesis and apoptosis. In addition, DT-A protein released from lysed cells cannot enter and kill neighboring cells because of the absence of the DT-B chain, further enhancing the selective cytotoxicity of this agent. Human H19 is a paternally-imprinted, oncofetal gene encoding an RNA product; it acts as a "riboregulator" in gene expression and is found at substantial levels in different human tumor cell types while its expression in normal adult tissue is limited.

**DTGM fusion protein :** An anticancer drug formed by the combination of diphtheria toxin and a colony-stimulating factor (GM-CSF). The colony-stimulating factor is attracted to cancer cells, and the diphtheria toxin kills the cells.

**DTH:** An inflammatory response that develops 24 to 72 hours after exposure to an antigen that the immune system recognizes as foreign. This type of immune response involves mainly T cells rather than antibodies (which are made by B cells). Also called delayed-type hypersensitivity response.

**DTIC-Dome:** (Other name for: dacarbazine)

**DTIC-Dome :** A drug used to treat Hodgkin lymphoma and malignant melanoma. It is also being studied in the treatment of other types of cancer. DTIC-Dome attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent. Also called dacarbazine.

**DU 145:** A cell line made from human prostate cancer cells that is used in the laboratory to study the way prostate cancer cells grow.

**dual energy x-ray absorptiometric scan :** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density).

Also called BMD scan, bone mineral density scan, DEXA, DEXA scan, dual x-ray absorptiometry, and DXA.

**dual PI3 kinase/mTOR inhibitor GDC-0980:** An orally available agent targeting phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) kinase in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. PI3K/mTOR kinase inhibitor GDC-0980 inhibits both PI3K kinase and mTOR kinase, which may result in tumor cell apoptosis and growth inhibition of cancer cells overexpressing PI3K/mTOR. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated in a PI3K-independent fashion.

**dual variable domain immunoglobulin ABT-165:** A dual-specific, tetravalent immunoglobulin (Ig)G-like molecule targeting two as of yet not publicly known targets, with potential antineoplastic activity. The target-binding variable domains of two monoclonal antibodies, which are not publicly known, are combined, via linkers, to create the tetravalent, dual-targeting single agent ABT-165. Upon administration of dual variable domain immunoglobulin (DVD-Ig) ABT-165, the target-binding variable domains specifically recognize and simultaneously bind to their two antigens expressed on tumor cells. This may both prevent antigen-mediated signaling and lead to an inhibition of cellular proliferation in susceptible tumor cells. The antigen targets are overexpressed on certain tumor cell types. The DVD-Ig may have enhanced physicochemical and pharmacokinetic properties as compared to their antibody counterparts.

**dual x-ray absorptiometry :** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called BMD scan, bone mineral density scan, DEXA, DEXA scan, dual energy x-ray absorptiometric scan, and DXA.

**Duavee:** (Other name for: conjugated estrogens/bazedoxifene)

**Dubnium:** Symbol:"Db" Atomic Number:"105" Atomic Mass: (262)amu  
Dubnium is one of several postactinide elements. Scientists have created these in labs and may have only found a few atoms of the element. You will not find these in use anywhere.

**duborimycin:** An anthracycline antineoplastic antibiotic with therapeutic effects similar to those of doxorubicin. Duborimycin exhibits cytotoxic activity through topoisomerase-mediated interaction with DNA, thereby inhibiting DNA replication and repair and RNA and protein synthesis.

**duct :** In medicine, a tube or vessel of the body through which fluids pass.

**ductal carcinoma :** The most common type of breast cancer. It begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple). Ductal carcinoma may be either ductal carcinoma in situ (DCIS) or invasive ductal carcinoma. DCIS is a noninvasive condition in which abnormal cells are found in the lining of a breast duct and have not spread outside the duct to other tissues in the breast. In some cases, DCIS may become invasive cancer. In invasive ductal carcinoma, cancer has spread outside the breast duct to surrounding normal tissue. It can also spread through the blood and lymph systems to other parts of the body.

**ductal carcinoma in situ :** A noninvasive condition in which abnormal cells are found in the lining of a breast duct. The abnormal cells have not spread outside the duct to other tissues in the breast. In some cases, ductal carcinoma in situ may become invasive cancer and spread to other tissues. At this time, there is no way to know which lesions could become invasive. Also called DCIS and intraductal carcinoma.

**ductal intraepithelial neoplasia :** A condition in which abnormal cells are found in the lining of a breast duct (milk duct). Having ductal intraepithelial neoplasia may increase the risk of breast cancer in which these abnormal cells become cancer and spread outside the duct to other tissues in the breast. Types of ductal intraepithelial neoplasia include atypical ductal hyperplasia and ductal carcinoma in situ (DCIS). Also called DIN.

**ductal lavage :** A method used to collect cells from milk ducts in the breast. A hair-size catheter (tube) is inserted into the nipple, and a small amount of salt water is released into the duct. The water picks up breast cells, and is removed. The cells are checked under a microscope. Ductal lavage may be used in addition to clinical breast examination and mammography to detect breast cancer.

**ductile:** The ability of a substance to be drawn out to form a thin wire. OR A ductile material can be drawn out into wire. OR of a rock, flowing plastically in response to stress. OR Capable of being drawn into wire.

Metals are typically ductile materials. OR property of a metal in which it can be stretched without breaking. OR The extent to which a solid material can be drawn into a thinner cross section.

**ductless glands:** glands that have no ducts, such as the endocrine glands.

**duet:** two electrons. Helium, the simplest noble gas, has a duet of electrons. The gaining of an electron by a hydrogen atom adds stability because it achieves the helium duet. (Compare with "octet.")

**Dukes A colorectal cancer :** Cancer has spread from the mucosa (innermost layer) of the colon and/or rectal wall to the submucosa (layer of tissue under the mucosa) of the colon and/or rectal wall. Cancer may have spread to the muscle layer of the colon and/or rectal wall. Also called stage I colorectal cancer.

**Dukes B colorectal cancer :** Cancer has spread (1) through the muscle layer of the colon and/or rectal wall to the serosa (outermost layer) of the colon and/or rectal wall; or (2) through the serosa of the colon and/or rectal wall but has not spread to nearby organs; or (3) through the serosa of the colon and/or rectal wall to nearby organs. Also called stage II colorectal cancer.

**Dukes C colorectal cancer :** Cancer (1) has spread through the mucosa (innermost layer) of the colon and/or rectal wall to the submucosa (layer of tissue under the mucosa) and may have spread to the muscle layer of the colon and/or rectal wall. Cancer has spread to at least one but not more than 3 nearby lymph nodes, or cancer cells have formed in tissues near the lymph nodes; or cancer has spread through the mucosa of the colon and/or rectal wall to the submucosa. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes. OR, (2) cancer has spread through the muscle layer of the colon and/or rectal wall to the serosa (outermost layer) of the colon and/or rectal wall or has spread through the serosa but not to nearby organs. Cancer has spread to at least one but not more than 3 nearby lymph nodes, or cancer cells have formed in tissues near the lymph nodes; or cancer has spread to the muscle layer of the colon and/or rectal wall or to the serosa of the colon and/or rectal wall. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes; or cancer has spread through the mucosa of the colon and/or rectal wall to the submucosa and may have spread to the muscle layer of the colon and/or rectal wall. Cancer has spread to 7 or more nearby lymph nodes. OR, (3) cancer has spread through the

serosa of the colon and/or rectal wall but has not spread to nearby organs. Cancer has spread to at least 4 but not more than 6 nearby lymph nodes; or cancer has spread through the muscle layer of the colon and/or rectal wall to the serosa of the colon and/or rectal wall or has spread through the serosa but has not spread to nearby organs. Cancer has spread to 7 or more nearby lymph nodes; or cancer has spread through the serosa of the colon and/or rectal wall and has spread to nearby organs. Cancer has spread to one or more nearby lymph nodes, or cancer cells have formed in tissues near the lymph nodes. Also called stage III colorectal cancer.

**Dukes classification :** A staging system used to describe the extent of colorectal cancer. Stages range from A (early stage) to D (advanced stage).

**dulanermin:** A recombinant human soluble protein corresponding to amino acids 114-281 of the Apo2 ligand/tumor necrosis factor-related apoptosis-inducing ligand (RhApo2L/TRAIL) with potential antineoplastic activity. Dulanermin binds to and activates TRAIL receptors 1 and 2 (TRAIL-R1/R2), which may activate caspases and induce p53-independent apoptosis in TRAIL-R1/R2-expressing tumor cells. The pro-apoptotic cell surface receptors TRAIL-R1 and -R2, also known as DR4 (death receptor 4) and DR5 (death receptor 5), are members of the TNF receptor family and are overexpressed by a variety of cancer cell types. Check for active clinical trials using this agent.

**duloxetine :** A drug used to treat depression and peripheral neuropathy (pain, numbness, tingling, burning, or weakness in the hands or feet) that can occur with diabetes. It is also being studied in the treatment of peripheral neuropathy caused by certain anticancer drugs. Duloxetine increases the amount of certain chemicals in the brain that help relieve depression and pain. It is a type of serotonin and norepinephrine reuptake inhibitor. Also called Cymbalta and duloxetine hydrochloride.

**duloxetine hydrochloride:** The hydrochloride salt of duloxetine, a fluoxetine derivative belonging to the class of selective serotonin (5-HT) and norepinephrine (NE) reuptake inhibitors (SSNRIs) and exhibiting antidepressant activity. Duloxetine selectively prevents the reuptake of 5-HT and NE via transporter complexes on the pre-synaptic membrane, thereby increasing the level of these neurotransmitters within the synaptic cleft. As a result, this agent potentiates serotonergic and noradrenergic activities in the central nervous system, and alleviates depression and

neuropathy sensations, such as pain and tingling. Furthermore, duloxetine does not show significant affinity for dopaminergic, adrenergic, cholinergic, histaminergic, opioid, glutamate, and gamma-aminobutyric acid (GABA) receptors.

**duloxetine hydrochloride** : A drug used to treat depression and peripheral neuropathy (pain, numbness, tingling, burning, or weakness in the hands or feet) that can occur with diabetes. It is also being studied in the treatment of peripheral neuropathy caused by certain anticancer drugs. Duloxetine hydrochloride increases the amount of certain chemicals in the brain that help relieve depression and pain. It is a type of serotonin and norepinephrine reuptake inhibitor. Also called Cymbalta and duloxetine.

**dumping syndrome** : A condition that occurs when food or liquid moves too fast into the small intestine. Symptoms include cramps, nausea, diarrhea, sweating, weakness, and dizziness. Dumping syndrome sometimes occurs in people who have had part or all of their stomach removed.

**DuNOUY RING TENSIO METER:** A piece of equipment which measures the force required to remove a ring of precisely known dimensions from a liquid surface. This force is directly related to the surface tension of that liquid. (see RFF 705.10.03 - SURFACE TENSION).

**duodenitis** : Inflammation of the duodenum (the first part of the small intestine that connects to the stomach).

**duodenum:** the first 10 to 12 inches of the small intestine in which most of the chemical digestion takes place. OR The first part of the small intestine. It connects to the stomach. The duodenum helps to further digest food coming from the stomach. It absorbs nutrients (vitamins, minerals, carbohydrates, fats, proteins) and water from food so they can be used by the body.

**Duplex:** Same as double helix.

**duplicate portion sampling method (duplicate diet study):** This method is frequently used for the same purposes as the total diet study technique. It implies that test persons consume their ordinary diet, but that, for each meal, they prepare a duplicate portion of all food as prepared, served, and consumed (WHO, 1979).

**dura mater** : The tough outer layer of tissue that covers and protects the brain and spinal cord and is closest to the skull. The dura mater is one of the

three layers that form the meninges.

**DURABILITY:** The ability of paint to last or hold up well against the destructive agents such as weather, sunlight, detergents, air pollution, abrasion or marring. OR The degree to which paint withstands the destructive effects on the environment to which it is exposed especially harsh weather conditions. Durability has two aspects. Its protective properties safeguard the substrate from degradation. Its decorative properties allow the paint to retain its attractive appearance.

**durable power of attorney :** A type of power of attorney. A power of attorney is a legal document that gives one person (such as a relative, lawyer, or friend) the authority to make legal, medical, or financial decisions for another person. It may go into effect right away, or when that person is no longer able to make decisions for himself or herself. A durable power of attorney remains in effect until the person who grants it dies or cancels it. It does not need to be renewed over time. Also called DPA.

**Durometer:** An instrument used for measuring the hardness of a material. Or The hardness of a material as measured by the Shore Durometer. Or a numerical scale for measuring the hardness of rubber or plastic based on the depth of penetration of an indenter point on the surface of a test specimen. Or A measure of a material's hardness. It is measured on a numeric scale ranging from lower (softer) to higher (harder). Or Standard rubber industry hardness test for liquid silicone rubber molded or extruded parts. The hardness scale most commonly used for silicone rubber durometer is the Shore A scale or The hardness of a polymer. There are three scales in use for measuring durometer and they are, Shore A, Shore D and Rockwell.or Instrument for measuring the hardness of a material. Plastic materials can have different shore hardnesses depending on the requirements of the plastic extrusion's final applications. The durometer measures the depth of an indentation in the material created by a given force on a standardized presser foot. OR One of several measures of the hardness of a material as well as the instrument used to measure hardness. Hardness may be defined as a material's resistance to permanent indentation. Durometer is often used to refer to the measurement as well as the instrument used.

**DUROMETER HARDNESS:** The hardness of a material as measured by the Shore Durometer.

**durvalumab:** A Fc optimized monoclonal antibody directed against programmed cell death-1 ligand 1 (PD-L1; B7 homolog 1; B7H1), with potential immune checkpoint inhibitory and antineoplastic activities. Upon intravenous administration, durvalumab binds to PD-L1, thereby blocking its binding to and activation of its receptor programmed death 1 (PD-1) expressed on activated T-cells. This may reverse T-cell inactivation and activate the immune system to exert a cytotoxic T-lymphocyte (CTL) response against PD-L1-expressing tumor cells. PD-L1, a member of the B7 protein superfamily, is overexpressed on certain tumor cell types and on various tumor-infiltrating immune cells. PD-L1 binding to PD-1 on T-cells suppresses the immune system and results in increased immune evasion. The Fc region of durvalumab is modified in such a way that it does not induce either antibody-dependent cytotoxicity (ADCC) or complement-dependent cytotoxicity (CDC). Check for active clinical trials using this agent.

**dust storm:** a windstorm that carries large amounts of sand or sediment through the air.

**dust veil index:** A quantitative method developed by H. H. Lamb for comparing the magnitude of volcanic eruptions. The formulae use observations either of the depletion of the solar beam, temperature lowering in middle latitudes, or the quantity of solid matter dispersed as dust. The reference dust veil index is 1000, assigned to the Krakatoa 1883 eruption, and the index is calculated using all three methods, where the information is available, for statistical comparison purposes. Abbreviated D.V.I.

**Dust/bittiness on new paintwork:** This can be caused by dust and dirt in the air settling on the paint surface; by using a dirty paint brush, or by stirring skin into the paint. In either case, let the paint dry and harden, then rub down using wet and dry abrasive paper and warm water with a bit of detergent. Rinse thoroughly with clean water and allow to dry before repainting. Use only good quality paint brushes and wash out with a little white spirit, making sure the brush is completely dry before starting work. Avoid stirring skin into the paint by straining into a clean kettle before use.

**dutasteride:** A drug used to treat symptoms of an enlarged prostate gland. It is being studied in the treatment of male hair loss and prostate cancer. Dutasteride blocks enzymes the body needs to make male sex hormones. It is a type of 5-alpha reductase inhibitor. Also called Avodart and GG745.

OR A synthetic 4-azasteroid compound with antiandrogenic activity. Dutasteride competitively and specifically binds to isoenzymes 1 and 2 of 5-alpha-reductase, forming stable enzyme complexes and inhibiting the conversion of testosterone to 5 $\alpha$ -dihydrotestosterone (DHT); the reduction in DHT activity may mitigate or prevent enlargement of the prostate gland. The type 2 5-alpha-reductase isoenzyme is primarily active in the reproductive tissues while the type 1 isoenzyme is also active in skin and the liver.

**Dutch metal:** A cheaper alternative to gold leaf consisting basically of copper.

**dUTPase inhibitor TAS-114:** An orally bioavailable inhibitor of both deoxyuridine triphosphatase (dUTPase) and dihydropyrimidine dehydrogenase (DPD), with potential antineoplastic adjuvant activity. Upon oral administration in combination with a prodrug of the pyrimidine antagonist 5-fluorouracil (5-FU), TAS-114 inhibits (DPD), the liver enzyme responsible for rapid catabolism of 5-FU into inactive metabolites. This prevents first-pass metabolism of 5-FU, allowing oral administration of the 5-FU prodrug and increasing the efficacy of 5-FU. In addition, as a dUTPase inhibitor, TAS-114 enhances the antitumor activity of 5-FU by preventing the hydrolysis and breakdown of 5-fluoro-deoxyuridine triphosphate (FdUTP) and deoxyuridine triphosphate (dUTP), which are active metabolites of 5-FU. This promotes DNA polymerase-dependent incorporation of these antimetabolites into DNA and leads to DNA damage and tumor cell death. Co-administration with TAS-114 allows lower dosing of 5-FU prodrugs, which decreases 5-FU-related toxicity, while maintaining therapeutic levels of 5-FU at the tumor site.

**duvelisib:** An orally bioavailable, highly selective and potent small molecule inhibitor of the delta and gamma isoforms of phosphoinositide-3 kinase (PI3K) with potential immunomodulating and antineoplastic activities. Upon administration, duvelisib prevents the activation of the PI3K delta/gamma-mediated signaling pathways which may lead to a reduction in cellular proliferation in PI3K delta/gamma-expressing tumor cells. Unlike other isoforms of PI3K, the delta and gamma isoforms are overexpressed primarily in hematologic malignancies and inflammatory and autoimmune diseases. By selectively targeting these PI3K isoforms, PI3K

signaling in normal, non-neoplastic cells is minimally or not affected which would result in a more favorable side effect profile.

**DVT:** The formation of a blood clot in a deep vein of the leg or lower pelvis. Symptoms may include pain, swelling, warmth, and redness in the affected area. Also called deep vein thrombosis.

**DWELL:** A pause in the application of pressure to a mold made just before the mold is completely closed, to allow the escape of gas from the molding material. Or A pause in the applied pressure to a mold during the injection cycle just before the mold is completely closed. This dwell allows any gases formed or present to escape from the molding material.

**DWJ1319:** An orally available agent that may prevent the formation of gallstones. Check for active clinical trials using this agent.

**DX-52-1:** An anticancer drug that is a type of antitumor antibiotic. It is an anthracycline.

**DX-8951f:** An anticancer drug that is a type of topoisomerase inhibitor. Also called exatecan mesylate.

**DXA:** An imaging test that measures bone density (the amount of bone mineral contained in a certain volume of bone) by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). Also called BMD scan, bone mineral density scan, DEXA, DEXA scan, dual energy x-ray absorptiometric scan, and dual x-ray absorptiometry.

**Dyad symmetry:** Property of a structure that can be rotated by  $180^\circ$  to produce the same structure.

**dye:** A substance used to give color to cloth, plastics, paper, or other materials. Dye may be made from plants or by synthetic chemical reactions.

**Dyes:** Synthetic or natural organic chemicals that are soluble in most common solvents. Characterized by good transparency, high tinctorial strength, and low specific gravity.

**Dymelor:** (Other name for: acetohexamide)

**Dynacin:** (Other name for: minocycline hydrochloride)

**dynamic equilibrium:** a system that fluctuates, but overall is in balance. OR Dynamic equilibrium is established when two opposing processes are occurring at precisely the same rate, so that there is no apparent change in the system over long periods of time. OR Dynamic equilibrium is the

position reached by a reversible reaction in a closed system when the rate of the forward reaction is the same as the rate of the reverse reaction. OR The condition in which the rate of a forward process is exactly the same as the rate of a reverse process.

**Dynamic instability:** A property of microtubules such that some microtubules in a population lengthen while other simultaneously shorten; a result of the random fluctuations in the number of GTP- tubulin subunits or GDP-tubulin subunits at the ends of the microtubule. GTP-tubulin polymerizes more readily.

**DYNAMIC MECHANICAL ANALYSIS (DMA):** In this technique the response of a material to an oscillatory load is measured during a temperature cycle. It provides information on material modulus of elasticity, which in turn can be related to impact strength, tensile strength, toughness and creep rate.

**Dynamic mode:** A common thermogravimetric analysis technique in which the temperature is raised at a known rate, typically linear.

**Dynamic range :** the range of concentrations in which the sensor sensitivity is greater than zero. The dynamic range can be also expressed as the difference between minimum and maximum signal values of the sensor in steadystates.

**Dynamic Seal:** A seal used in an environment that subjects it or a mating surface to movement

**dynamiccorrelation:** All the correlation energy or correlation effect that is not considered "nondynamic" or "static."

**dyne:** The unit of force in the obsolete cgs system of units. A dyne is the force required to accelerate a 1 g mass by 1 cm/s per second. OR Unit of measure for surface tension (treat level).

**Dyne Level:** Measure of surface tension.

**Dynein:** A large protein with atpase activity that is a component of microtubules; the atpase activity provides the power for the movement of cilia and flagella. In cytoplasm, a motor protein that is related to the dynein in flagella and cilia and powers retrograde transport

**dysarthria:** difficulty in articulating words caused by impairment of the muscles used in speech OR lack of coordination of movements characterized by under- or over-shooting intended position

**dyscrasia** : Disease. Usually refers to diseases of the blood.

**dysesthesia** : A condition in which a sense, especially touch, is distorted. Dysesthesia can cause an ordinary stimulus to be unpleasant or painful. It can also cause insensitivity to a stimulus.

**dysfunction** : A state of not functioning normally.

**dysgerminoma** : A type of tumor that begins in the type of cells that give rise to egg cells and is most often found in the ovaries. Dysgerminomas may also occur in other places in the body, including the central nervous system. They are the most common type of ovarian germ cell tumor and can spread to other parts of the body. They are most common in females who are younger than 20 years old.

**dysgeusia** : A bad taste in the mouth. Also called parageusia.

**dysmorphic**: relating to a body characteristic that is abnormally formed

**dysostosis multiplex**: characterized by an enlarged skull, thickened calvarium, premature closure of lamboid and sagittal sutures, shallow orbits, enlarged J-shaped sella and abnormal spacing of the teeth with dentigerous cysts

**dyspepsia** : Upset stomach.

**dysphagia** : Difficulty swallowing.

**dysphonia** : Trouble with the voice when trying to talk, including hoarseness and change in pitch or quality or voice.

**dysplasia**: abnormal development or growth of tissues, organs, or cells OR disordered eating OR Cells that look abnormal under a microscope but are not cancer.

**dysplastic nevus** : A specific type of nevus (mole) that looks different from a common mole. Dysplastic nevi are mostly flat and often larger than common moles and have borders that are irregular. A dysplastic nevus can contain different colors, which can range from pink to dark brown. Parts of the mole may be raised above the skin surface. A dysplastic nevus may develop into melanoma (a type of skin cancer), and the more dysplastic nevi a person has, the higher the risk of melanoma. A dysplastic nevus is sometimes called an atypical mole.

**dyspnea** : Difficult, painful breathing or shortness of breath.

**Dysport**: (Other name for: botulinum toxin type A)

**Dysprosium:** Symbol:"Dy" Atomic Number:"66" Atomic Mass: 162.50amu. Dysprosium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. You may find this element in lasers, many alloys, and even nuclear reactors.

**dystonia:** abnormal tonicity of muscle characterized by prolonged, repetitive muscle contractions that may cause twisting or jerking movements

**DZ:** Double-zeta. A basis set for which there are twice as many basis functions as are minimally necessary (see "MBS"). "Zeta" (Greek letter ) is the usual name for the exponent that characterizes a Gaussian function.

**DZP:** Double-zeta with polarization. DZ with polarization basis functions added. A polarization set generally has an angular momentum one unit higher than the highest valence function. So a polarization set on carbon is a set of d-functions.

**E (entgegen):** E the notation for the stereochemical arrangement in which the higher-ranked substituent groups are on opposite sides of the double bond.

**E coli (Escherzchia coli):** A common bacterium found in the small intestine of vertebrates; the most well-studied organism.

**E number:** E numbers are a way of classifying chemicals added to food (for example, colourings, preservatives, emulsifiers).

**E Ray:** See Extraordinary ray.

**E-101 solution:** An oxidant-generating coupled-enzyme system-based, topical solution comprised of two enzymes, *Aspergillus niger*-derived glucose oxidase (GO) and porcine myeloperoxidase (p-MPO), as well as glucose, sodium chloride and stabilizing amino acids, with potential broad-spectrum microbicidal activity. Following direct administration of E-101 solution into the surgical incisional wound via microspray, the enzyme GO converts oxygen into hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>). In turn, p-MPO catalyzes the reaction of H<sub>2</sub>O<sub>2</sub> with hypochlorous acid (HOCl), which is formed through oxidation of the chloride ion, to generate singlet oxygen (O<sub>2</sub>\*). As p-MPO binds to microorganisms, O<sub>2</sub>\* is able to exert direct oxidative damage to microorganisms, resulting in potent antimicrobial activity. E-101 may act as an anti-bactericidal agent against a variety of microorganisms,

including multidrug-resistant strains. This may prevent infection at the surgical site.

**e-cigarette :** A device that has the shape of a cigarette, cigar, or pen and does not contain tobacco. It uses a battery and contains a solution of nicotine, flavorings, and other chemicals, some of which may be harmful. When e-cigarettes are used, the nicotine solution turns into a mist that can be inhaled into the lungs. The amount of nicotine in individual e-cigarettes can vary. It is not yet known whether e-cigarettes are safe or if they can be used to help smokers quit smoking. Also called electronic cigarette.

**E-coli:** Escherichia coli - one of the non-pathogenic coliform organisms used to indicate the presence of pathogenic bacteria in water.

**E-Mycin:** (Other name for: erythromycin)

**E-selectin antagonist GMI-1271:** A synthetic, glycomimetic molecule and E-selectin (CD62E) antagonist, with potential anti-thrombotic, antineoplastic and chemopotentiating activities. Upon administration, GMI-1271 binds to E-selectin expressed on endothelial cells and prevents their interaction with selectin-E ligand-expressing cancer cells. This may prevent tumor cell activation, migration and metastasis. GMI-1271 also interferes with the binding of selectin E-expressing vascular endothelial cells to selectin-E ligand-expressing monocytes and neutrophils, thereby disrupting their activation. Consequently, this inhibits both the activation of the coagulation cascade and thrombus formation. This agent also prevents both leukocyte activation and inflammation. E-selectin is a cell adhesion molecule involved in cell rolling, signaling and chemotaxis; it also plays a crucial role in inflammatory processes and cancer.

**E-Z notation:** E-Z a notation, somewhat like the cis and trans system, that is used for alkenes with more than two substituents. The atoms or groups on either side of the double bond are ranked by atomic weight. If the heavier atoms are on the same side of the molecule, it is labeled Z, and if the heavier atoms are on opposite sides of the molecule, it is labeled E.

**E-Z Prep:** (Other name for: povidone-iodine solution)

**E-Z Scrub:** (Other name for: povidone-iodine solution)

**E. coli CD-expressing genetically modified neural stem cells:**

Genetically-modified neural stem cells (NSCs) transfected with the Escherichia coli (E. coli) suicidal gene cytosine deaminase (CD), with

potential antineoplastic adjuvant activity. Upon intracerebral injection, *E. coli* CD-expressing genetically modified NSCs express the *E. coli* cytosine deaminase, an enzyme that catalyzes the intracellular conversion of the nontoxic prodrug 5-fluorocytosine (5-FC) into the cytotoxic 5-fluorouracil (5-FU). Co-administration of this agent with 5-FC and upon local activation of 5-FU in the brain tumor, 5-FU disrupts DNA synthesis in tumor cells thereby impeding cellular proliferation with minimal systemic exposure and toxicity.

**E1:** an elimination reaction mechanism in which the slow step is a self-ionization of the molecule to form a carbocation. Thus, the rate-controlling step is unimolecular.

**E2:** an elimination reaction mechanism in which the rate-controlling step is the simultaneous removal of a proton from the molecule by a base, resulting in the creation of a double bond. The rate controlling step is bimolecular.

**E2F1 pathway activator ARQ 171:** A second-generation E2F1 pathway activator with potential antineoplastic activity. ARQ 171 induces the expression of E2F transcription factor 1, thereby activating the E2F1-mediated checkpoint process. As a result, this agent exerts anti-tumor activity through checkpoint activation independent of p53 mediated tumor suppression. E2F1, down-regulated in cancer cells, regulates expression of genes involved in the cell cycle progression from G1 into S phase. The G1/S checkpoint process selectively induces cell cycle arrest in cancer cells with irreparable DNA damages and triggers subsequent apoptosis, while allowing cell division to proceed in cells without or with minor reparable DNA damage.

**E7070:** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called sulfonamides.

**E7389:** A drug used to treat metastatic breast cancer in patients who have already been treated with other chemotherapy. It is also being studied in the treatment of other types of cancer. E7389 may block cancer cell growth by stopping cell division. It belongs to the family of drugs called antitubulin agents. Also called eribulin mesylate and Halaven.

**E7820:** A small molecule and aromatic sulfonamide derivative with potential antiangiogenic and antitumor activities. E7820 inhibits angiogenesis by suppressing integrin alpha 2, a cell adhesion molecule

expressed on endothelial cells. Inhibition of integrin alpha 2 leads to an inhibition of cell-cell interactions, endothelial cell-matrix interactions, vascular endothelial cell proliferation and angiogenesis.

**eardrum:** the tympanic membrane that receives vibrations from the outer ear.

**early menopause :** A condition in which the ovaries stop working and menstrual periods stop before age 40. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility. Early menopause can be caused by some cancer treatments, surgery to remove the ovaries, and certain diseases or genetic conditions. Also called premature menopause, premature ovarian failure, and primary ovarian insufficiency.

**early menopause :** A condition in which the ovaries stop working and menstrual periods stop before age 40. Natural menopause usually occurs around age 50. A woman is said to be in menopause when she hasn't had a period for 12 months in a row. Symptoms of menopause include hot flashes, mood swings, night sweats, vaginal dryness, trouble concentrating, and infertility. Early menopause can be caused by some cancer treatments, surgery to remove the ovaries, and certain diseases or genetic conditions. Also called premature menopause, premature ovarian failure, and primary ovarian insufficiency.

**Early site permit (ESP):** A permit through which the NRC resolves site safety, environmental protection, and emergency preparedness issues, in order to approve one or more proposed sites for a nuclear power facility, independent of a specific nuclear plant design or an application for a construction permit or combined license. An ESP is valid for 10 to 20 years, but can be renewed for an additional 10 to 20 years. For further detail, see Early Site Permit Applications for New Reactors.

**early-stage breast cancer :** Breast cancer that has not spread beyond the breast or the axillary lymph nodes. This includes ductal carcinoma in situ and stage I, stage IIA, stage IIB, and stage IIIA breast cancers.

**early-stage cancer :** A term used to describe cancer that is early in its growth, and may not have spread to other parts of the body. What is called early stage may differ between cancer types.

**Ears:** Parts soldered, bumped or riveted to the side of a can or pail to which a bail (or handle) is inserted for easier carrying.

**Earth pigments:** A class of pigments usually mined direct from the earth. Also known as natural or mineral pigments e.g. red and yellow iron oxides yellow ochre, raw sienna, raw umber.

**earthflow:** the movement of earth material down a hillside as a viscous fluid; earthflows typically occur on steep slopes with thick soil cover that becomes saturated by heavy rains.

**earthquake:** the ground shaking caused by rocks that suddenly move or jolt in response to tectonic stress.

**Earthquake, operating basis:** An earthquake that could be expected to affect the site of a nuclear reactor, but for which the plant's power production equipment is designed to remain functional without undue risk to public health and safety.

**East Indian sandalwood oil mouth rinse:** A mouth rinse containing 0.25% East Indian sandalwood oil, which is derived from the heartwood of *Santalum album*, a tree native to southern Asia, with potential anti-inflammatory, anti-infective and anti-mucositis activities. East Indian sandalwood oil (EISO) is primarily comprised of the sesquiterpene alcohols alpha- and beta-santalol. Although the exact mechanisms of action through which EISO exerts its effects have yet to be fully elucidated, upon rinsing the oral cavity with the EISO mouth rinse, the active ingredients in the oil may inhibit the production of pro-inflammatory cytokines and chemokines, most likely through the inhibition of the activity of key inflammatory enzymes, including the cyclooxygenases. This prevents inflammation of the mucosal membranes and may prevent or decrease chemotherapy- and/or radiation-induced oral mucositis.

**Eastern red cedar :** A type of evergreen tree with hard fragrant wood that is a member of the cypress family. The oil from the wood is used in soaps, shampoos, bath salts, perfumes, aromatherapy, and to keep insects away. The scientific name is *Juniperus virginiana*. Also called cedarwood and red cedar.

**Eaves:** The lower edge of a roof where it projects beyond the face of a wall.

**ebb currents:** tidal currents preceding low tide.

**ebesen-containing oral capsule SPI-1005:** An oral capsule containing a proprietary formulation of the organoselenium compound ebesen, with potential anti-oxidant, anti-inflammatory and cytoprotective activity. Upon oral administration of SPI-1005, this agent mimics the activity of glutathione peroxidase (GPx) and can utilize glutathione to reduce other unstable molecules, thus preventing the formation of reactive oxygen species (ROS) and reducing oxidative stress on the cell. In the cochlea, this agent may prevent drug-induced injury to the auditory hair cells thereby preventing hearing loss. GPx is the main antioxidant enzyme in the cochlea and protects the inner ear from loud sounds and biochemical damage. In addition, ebesen is able to inhibit the activity of many enzymes involved in inflammation. Check for active clinical trials using this agent.

**ebulliometry:** Determination of average molecular weight of a dissolved substance from the boiling point elevation of the solution.

**EBV:** A common virus that remains dormant in most people. It causes infectious mononucleosis and has been associated with certain cancers, including Burkitt lymphoma, immunoblastic lymphoma, and nasopharyngeal carcinoma. Also called Epstein-Barr virus.

**EC:** Ethyl cellulose

**ecchymosis :** A small bruise caused by blood leaking from broken blood vessels into the tissues of the skin or mucous membranes.

**eccrine gland :** A type of simple sweat gland that is found in almost all regions of the skin. These glands produce sweat that reaches the surface of the skin by way of coiled ducts (tubes). The body is cooled as sweat evaporates from the skin.

**Ecdysone:** A hormone that stimulates the molting process in insects.

**ECG:** A line graph that shows changes in the electrical activity of the heart over time. It is made by an instrument called an electrocardiograph. The graph can show that there are abnormal conditions, such as blocked arteries, changes in electrolytes (particles with electrical charges), and changes in the way electrical currents pass through the heart tissue. Also called EKG and electrocardiogram.

**echinacea :** An herb native to North America that has been used to prevent and treat the common cold and other respiratory infections. Echinacea may interfere with treatment that uses the immune system to fight cancer. The

scientific names are *Echinacea purpurea* and *Echinacea angustifolia*. Also called purple coneflower.

**echinomycin:** A polypeptide quinoxaline antineoplastic antibiotic isolated from the bacterium *Streptomyces echinatus*. Echinomycin intercalates into DNA at two locations simultaneously in a sequence-specific fashion, thereby inhibiting DNA replication and RNA synthesis.

**echocardiogram :** A computer picture of the heart created by bouncing high-energy sound waves (ultrasound) off internal tissues or organs of the chest. Echocardiograms show the size, shape, and position of the heart. They also show the parts inside the heart, such as the valves, and the motion of the heart while it is beating. An echocardiogram may be used to help diagnose heart problems, such as abnormal heart valves and heart rhythms, damage to the heart muscle from a heart attack, and heart murmurs. Echocardiograms can also show an infection on or around the heart valves, blood clots or tumors inside the heart, and fluid buildup in the sac around the heart.

**echocardiography :** A procedure that uses ultrasonic waves directed over the chest wall to obtain a graphic record of the heart's position, motion of the walls, or internal parts such as the valves.

**ecia lentis:** displacement of the crystalline lens of the eye

**eclipsed conformation:** one of the possible orientations of atoms or groups around two carbon atoms joined by a single bond. Atoms and groups bonded to an eclipsed conformer are positioned in line with one another, creating repulsive forces that give the molecule a high energy state. (Compare with "staggered conformation.")

**ecologic study :** A study that compares large groups of people instead of individuals for differences in things such as cancer rates. The groups can differ by location (for example, city, county, or country). They can also differ by time (a few days, years, or decades). Groups can be immigrants (compared with people who are native to the country) or people with different types of jobs. The Surveillance, Epidemiology, and End Results (SEER) Program conducts ecologic studies to collect information on cancer rates over time in certain parts of the United States. Also called ecological study.

**ecological study :** A study that compares large groups of people instead of individuals for differences in things such as cancer rates. The groups can

differ by location (for example, city, county, or country). They can also differ by time (a few days, years, or decades). Groups can be immigrants (compared with people who are native to the country) or people with different types of jobs. The Surveillance, Epidemiology, and End Results (SEER) Program conducts ecological studies to collect information on cancer rates over time in certain parts of the United States. Also called ecologic study.

**Ecology:** The study of all aspects of how organisms interact with each other and/or their environment

**Economic Simplified Boiling-Water Reactor (ESBWR):** A 4,500-MWt nuclear reactor design, which has passive safety features and uses natural circulation (with no recirculation pumps or associated piping) for normal operation. GE-Hitachi Nuclear Energy (GEH) submitted an application for final design approval and standard design certification for the ESBWR on August 24, 2005. For detail, see Design Certification Application Review: Economic Simplified Boiling-Water Reactor (ESBWR).

**Ecosystem:** Groupings of various organisms interacting with each other and their environment. OR The interacting system of a biological community and its nonliving environmental surroundings. OR systems formed from the interactions between communities and their physical environments.

**ecotoxicology:** The effects of chemical agents on the environment, including, in addition to effects on man, adverse events that take place in the general ecosystem. It is not necessarily related primarily to human health (WHO, 1979).

**Ecotrin:** (Other name for: acetylsalicylic acid)

**ECP:** Effective core potential. The core electrons have been replaced by an effective potential. Saves computational expense. May sacrifice some accuracy, but can include some relativistic effects for heavy elements (see RECP).

**ecromeximab:** A low-fucose, human-mouse chimeric IgG1 monoclonal antibody directed against the ganglioside GD3, a surface antigen expressed on many malignant melanoma cells, with potential antineoplastic activity. Ecomeximab binds to GD3-positive cells, thereby initiating antibody-dependent cytotoxicity against GD3-positive cells. This agent is prepared

by fusing murine immunoglobulin (Ig) light and heavy variable regions derived from the murine IgG3 antibody KM-641 to a human constant (Fc) region. The low fucose content of the oligosaccharide side chains of this antibody may enhance binding of the antibody Fc region to lymphocyte Fc receptors.

**ECT:** A treatment for severe depression and certain mental disorders. A brief seizure is induced by giving electrical stimulation to the brain through electrodes placed on the scalp. Also called electroconvulsive therapy and electroshock therapy.

**ecteinascidin 743 :** A drug used to treat liposarcoma and leiomyosarcoma (types of soft tissue sarcoma) that cannot be removed by surgery or have spread to other parts of the body. It is used in patients who were treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Ecteinascidin 743 may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called ET-743, trabectedin, and Yondelis.

**ectocervical :** Having to do with the part of the cervix that protrudes into the vagina and is lined with epithelial cells.

**ectoderm:** one of three germ layers that develops into the skin and nervous system.

**ectomesenchymoma :** A rare, fast-growing tumor of the nervous system or soft tissue that occurs in children and young adults. Ectomesenchymomas may form in the head and neck, abdomen, perineum, scrotum, or limbs. Also called malignant ectomesenchymoma.

**ectopic pregnancy :** A condition in which a fertilized egg grows outside of the uterus, usually in one of the fallopian tubes. Symptoms include sharp pain on one side of the abdomen and bleeding from the vagina. Also called extrauterine pregnancy.

**eculizumab :** A human monoclonal antibody directed against terminal complement protein C5. Eculizumab binds to terminal complement protein C5, thereby blocking C5 cleavage into pro-inflammatory components and blocking the complement-mediated destruction of paroxysmal nocturnal hemoglobinuria (PNH) red blood cells. Check for active clinical trials using this agent. OR A drug used to prevent red blood cells from being destroyed in patients with a rare red blood cell disorder called paroxysmal nocturnal hemoglobinuria (PNH). It is also used to treat another rare disorder called

atypical hemolytic urea syndrome (aHUS), in which blood clots form in small blood vessels. Eculizumab binds to an immune system protein called C5. This helps keep red blood cells from breaking down and helps keep blood clots from forming. Eculizumab is a type of monoclonal antibody. Also called Soliris. OR A drug used to prevent red blood cells from being destroyed in patients with a rare red blood cell disorder called paroxysmal nocturnal hemoglobinuria (PNH). It is also used to treat another rare disorder called atypical hemolytic urea syndrome (aHUS), in which blood clots form in small blood vessels. Eculizumab binds to an immune system protein called C5. This helps keep red blood cells from breaking down and helps keep blood clots from forming. Eculizumab is a type of monoclonal antibody. Also called Soliris.

**eczema :** A group of conditions in which the skin becomes inflamed, forms blisters, and becomes crusty, thick, and scaly. Eczema causes burning and itching, and may occur over a long period of time. Atopic dermatitis is the most common type of eczema.

**edatrexate :** An anticancer drug that belongs to a family of drugs called antimetabolites. Or A polyglutamatable folate antagonist analogue of methotrexate with antineoplastic activity. Edatrexate inhibits dihydrofolate reductase, thereby increasing cellular levels of polyglutamates, inhibiting thymidylate synthase and glycinamide ribonucleotide formyl transferase, impairing synthesis of purine nucleotides and amino acids, and resulting in tumor cell death. Edatrexate may overcome tumor resistance to methotrexate, which loses its activity after it is polyglutamated.

**eddy:** A circular movement of water or air that is formed where currents pass obstructions or between two adjacent currents that are flowing counter to each other.

**Edecrin:** (Other name for: ethacrynic acid)

**edema :** Swelling caused by excess fluid in body tissues.

**edetic acid :** A chemical that binds certain metal ions, such as calcium, magnesium, lead, and iron. It is used in medicine to prevent blood samples from clotting and to remove calcium and lead from the body. It is also used to keep bacteria from forming a biofilm (thin layer stuck to a surface). It is a type of chelating agent. Also called EDTA and ethylenediaminetetraacetic acid.

**Edge coverage:** A coating's ability to flow over, build and adhere to sharp corners, angles and edges.

**Edge Drives:** Edge drive units are designed to reduce tension to acceptable levels in applications where long belts pass through a series of turns and straight runs often resulting in tension levels which exceed recommended limits.

**Edge Gate:** Entrance to the part from the runner located on the parting line. Or An opening aligned with the parting line of the mold where resin flows into the cavity. Edge gates are typically placed on an outside edge of the part. Or A method of injecting liquid silicone rubber into the mold cavity

**Edge Wrinkles:** Rough cut, or jagged edge followed by a wrinkle extending into the roll.

**EDM:** Electric Discharge Machining. Sometimes colloquially also referred to as spark machining, spark eroding, burning, die sinking or wire erosion, is a manufacturing process whereby a desired shape is obtained using electrical discharges. Material is removed from the workpiece by a series of rapidly recurring current discharges between two electrodes, separated by a dielectric liquid and subject to an electric voltage. or Electric Discharge Machining. A moldmaking method which can create taller, thinner ribs than milling, text on top of ribs and square outside edges on parts.

**EDM or electric discharge machining:** A manufacturing process used to create molds, where the shape of the mold cavity is obtained by removing metal material using electrical discharges.

**Edman degradation:** The sequential removal of the N-terminal amino acid from a protein as a phenylthiohydantoin derivative; used in sequencing proteins.

**Edman degradation:** A systematic method of sequencing proteins, proceeding by stepwise removal of single amino acids from the amino terminus of a polypeptide chain.

**edotecarin:** A synthetic indolocarbazole with antineoplastic activity. Edotecarin inhibits the enzyme topoisomerase I through stabilization of the DNA-enzyme complex and enhanced single-strand DNA cleavage, resulting in inhibition of DNA replication and decreased tumor cell

proliferation. or A substance being studied in the treatment of cancer. It is a type of topoisomerase I inhibitor. Also called J-107088.

**edoxaban tosylate:** The tosylate salt form of edoxaban, an orally active inhibitor of coagulation factor Xa (activated factor X) with anticoagulant activity. Edoxaban is administered as edoxaban tosylate. This agent has an elimination half-life of 9-11 hours and undergoes renal excretion.

**edrecolomab:** A type of monoclonal antibody used in cancer detection or therapy. Monoclonal antibodies are laboratory-produced substances that can locate and bind to cancer cells. OR A murine monoclonal IgG2a antibody to tumor-associated epithelial cell adhesion molecule (EpCAM, or 17-1A) antigen. Edrecolomab attaches to EpCAM, a human cell surface glycoprotein that is found on normal epithelial cells and some tumor cells, such as those of colon and breast carcinomas. Upon binding, this agent recruits the body's immune effector cells, which may exhibit antitumor cytotoxicity.

**EDTA:** A polydentate ligand that tightly complexes certain metal ions. EDTA is used as a blood preservative by complexing free calcium ion (which promotes blood clotting). EDTA's ability to bind to lead ions makes it useful as an antidote for lead poisoning. OR A chemical that binds certain metal ions, such as calcium, magnesium, lead, and iron. It is used in medicine to prevent blood samples from clotting and to remove calcium and lead from the body. It is also used to keep bacteria from forming a biofilm (thin layer stuck to a surface). It is a type of chelating agent. Also called edetic acid and ethylenediaminetetraacetic acid.

**edta titration (edta):** ethylenediaminetetraacetic acid (or its salts). A standard method of measuring the hardness of a solution

**Edwards syndrome :** A genetic disorder caused by having an extra chromosome 18 in some or all of the body's cells. Edwards syndrome is marked by a low birth weight and certain abnormal features. These include a small, abnormally shaped head; a small jaw and mouth; clenched fists with overlapping fingers; and heart, lung, kidney, intestine, and stomach defects. Many babies with Edwards syndrome die before birth or within the first month of life, but some children live for several years. Having Edwards syndrome increases the risk of certain types of cancer, such as hepatoblastoma (a type of liver cancer) and Wilms tumor (a type of kidney cancer). Also called trisomy 18.

**EEG:** A recording of electrical activity in the brain. It is made by placing electrodes on the scalp (the skin covering the top of the head), and impulses are sent to a special machine. An EEG may be used to diagnose brain and sleep disorders. Also called electroencephalogram.

**EEG biofeedback :** A treatment being studied to improve brain function in certain brain disorders and in patients treated with chemotherapy for breast cancer. Sensors are placed on a person's head, which allows brain activity to be shown as patterns on a computer screen. A beep or a tone may be used as a reward to a person for changing certain brain activities. EEG biofeedback may help cancer patients deal with the stress and mental side effects of chemotherapy. Also called neurofeedback.

**EF hand:** A helix-loop-helix motif that forms a binding site for calcium; found in many calcium-sensitive proteins.

**EF5:** A drug that is used to plan cancer treatment by measuring oxygen levels in tumor cells. OR A fluorinated derivative of the 2-nitroimidazole etanidazole. EF5 is effective in accessing oxygen levels in tumor tissue through its adduct formation to intracellular macromolecules in the absence of oxygen. Reduction of this agent is carried out by a diverse group of enzymes in the cytoplasm, microsomes and mitochondria. Tissue hypoxia detection via EF5 has been reported in several cancers, including squamous cell carcinoma of the cervix and the head and neck, and in sarcoma.

**efalizumab:** A humanized IgG1 monoclonal antibody directed against CD11a, the alpha subunit of human leukocyte-function-associated antigen type 1 (LFA-1), with immunosuppressant activity. Efalizumab binds to CD11a, which is expressed on all leukocytes, resulting in a reduction in the cell surface expression of CD11a. In addition, this agent inhibits the binding of LFA-1 to intercellular adhesion molecule-1 (ICAM-1), resulting in the inhibition of leukocyte adherence and the suppression of cell-mediated immunity. LFA-1 binding to ICAM-1 is involved in the activation of T lymphocytes, adhesion of T lymphocytes to endothelial cells, and migration of T lymphocytes to sites of inflammation.

**efaproxiral:** A synthetic small molecule with radiosensitizing activity. Efaproxiral increases oxygen levels in hypoxic tumor tissues by binding non-covalently to the hemoglobin tetramer and decreasing hemoglobin-oxygen binding affinity. Increasing tumor oxygenation reduces tumor radioresistance. OR A substance being studied in the treatment of brain

tumors and some other types of cancer. It increases the amount of oxygen in tumor tissues, which may make the tumor cells easier to kill with radiation therapy. Efavirenz is a type of radiosensitizing agent. Also called RSR13.

**efatutazone dihydrochloride:** The dihydrochloride salt of efatutazone, an orally bioavailable agonist of peroxisome proliferator-activated receptor gamma (PPAR-gamma) with potential antineoplastic activity. Efatutazone binds to and activates PPAR-gamma, a nuclear hormone receptor and a ligand-activated transcription factor controlling gene expression involved in macromolecule metabolism and cell differentiation, specifically adipocyte differentiation. Mediated through activation of PPAR-gamma, this agent is capable of inducing cell differentiation and apoptosis, thereby leading to a reduction in cellular proliferation.

**efavirenz:** A synthetic non-nucleoside reverse transcriptase (RT) inhibitor with antiviral activity. Efavirenz binds directly to the human immunodeficiency virus type 1 (HIV-1) RT, an RNA-dependent DNA polymerase, blocking its function in viral DNA replication. In combination with other antiretroviral drugs, this agent has been shown to significantly reduce HIV viral load, retarding or preventing damage to the immune system and reducing the risk of developing AIDS. Efavirenz induces activity of the cytochrome P450 system, accelerating its own metabolism. or A drug used with other drugs to treat infection with the human immunodeficiency virus (HIV). It blocks HIV from making copies of itself. It is a type of non-nucleoside reverse transcriptase inhibitor and a type of antiviral agent. Also called Sustiva.

**effect:** A biological change in an organism, organ, or tissue (WHO, 1979).

**Effect of Strong Acids:** A descriptive notation to indicate the material's performance.

**Effective Dose Equivalent:** The sum of the products of the dose equivalent to the organ or tissue (HT) and the weighting factors (WT) applicable to each of the body organs or tissues that are irradiated ( $HE = \Sigma WTHT$ ).

**Effective half-life:** The time required for the activity of a particular radioisotope deposited in a living organism, such as a human or an animal, to be reduced by 50 percent as a result of the combined action of radioactive decay and biological elimination. Effective half-life is related to, but different from, the radiological half-life and the biological half-life.

**effective nuclear chargeeff:** The nuclear charge experienced by an electron when other electrons are shielding the nucleus.

**Effective Thread Turns:** The number of full 360 degree turns on a threaded closure that are actually in contact with the neck thread.

**effector cell :** A cell that performs a specific function in response to a stimulus; usually used to describe cells in the immune system.

**efferent neurons:** neurons that project out of the cortex of the brain; motor neurons are efferents

**Effexor :** A drug used to treat depression and certain anxiety disorders. It may also be used to treat hot flashes in women who are in menopause or are being treated for breast cancer. Effexor increases the levels of the chemicals serotonin and norepinephrine in the brain, which helps improve mood. It is a type of antidepressant and a type of serotonin-norepinephrine reuptake inhibitor. Also called venlafaxine.

**efficacy :** Effectiveness. In medicine, the ability of an intervention (for example, a drug or surgery) to produce the desired beneficial effect.

**efficiency:** The ratio of work done or energy developed by a machine or engine, to the energy supplied to it.

**Efficiency, plant:** The percentage of the total energy content of a power plant's fuel that is converted into electricity. The remaining energy is lost to the environment as heat.

**Efflorescence:** The loss of gas from a solid or liquid. OR Known as 'efflorescence', these effects appear as a result of salts crystallising in materials such as bricks. The fluffy deposits can be removed with coarse Hessian sacking or by dry brushing, repeated every few days until the deposits disappear. Hard, shiny efflorescence can be sanded to roughen the surface, then painted over. Conventional solvent-based paints should not be applied on new buildings where efflorescence occurs for at least 12 months, to allow the surface time to dry out thoroughly. Use Dulux Alkali Resisting Primer prior to applying any solvent-based finishes. Alternatively, specify a Dulux Quick Drying water-based paint. OR These salts originate from the bricks concrete blocks concrete etc. and brought to the surface by water drying out. These salts will go through plaster but will not normally originate from modern type plasters. Generally efflorescence is likely to

persist until such time as the substrate has fully dried out. Active efflorescence is likely to push off any type of sealer or paint coating.

**efflorescent:** Efflorescent substances lose water of crystallization to the air. The loss of water changes the crystal structure, often producing a powdery crust.

**Effluent:** Wastewater or other liquid - raw (untreated), partially or completely treated - flowing from a reservoir, basin, treatment process, or treatment plant. OR a liquid that has passed through a processing operation.

**effluent limitation:** any restriction (including schedules of compliance) established by a state or EPA on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources into navigable water, the waters of the contiguous zone, or the ocean.

**effusion:** Movement of gas molecules through a small opening. OR Gas molecules in a container escape from tiny pinholes into a vacuum with the same average velocity they have inside the container. They also move in straight-line trajectories through the pinhole.

**effusion :** An abnormal collection of fluid in hollow spaces or between tissues of the body. For example, a pleural effusion is a collection of fluid between the two layers of membrane covering the lungs.

**eflornithine:** A difluoromethylated ornithine compound with antineoplastic activity. Eflornithine irreversibly inhibits ornithine decarboxylase, an enzyme required for polyamine biosynthesis, thereby inhibiting the formation and proliferation of tumor cells. Polyamines are involved in nucleosome oligomerization and DNA conformation, creating a chromatin environment that stimulates neoplastic transformation of cells. This agent has been shown to induce apoptosis in leiomyoma cells.

**eflornithine :** A substance that is being studied in the prevention of cancer. It belongs to the family of drugs called antiprotozoals.

**eflornithine hydrochloride ointment:** An ointment formulation of the hydrochloride salt of an ornithine decarboxylase (ODC) inhibitor with hair-growth inhibitory and potential chemopreventive activities. When administered topically, eflornithine irreversibly inhibits skin ODC activity, thereby inhibiting the synthesis of polyamines; inhibition of polyamine synthesis may result in diminished hair growth and epidermal cell turnover.

**EFS:** In cancer, the length of time after primary treatment for a cancer ends that the patient remains free of certain complications or events that the treatment was intended to prevent or delay. These events may include the return of the cancer or the onset of certain symptoms, such as bone pain from cancer that has spread to the bone. In a clinical trial, measuring the EFS is one way to see how well a new treatment works. Also called event-free survival.

**EFS-ADA lentiviral vector-transduced CD34-positive autologous lymphocytes:** A preparation of autologous, CD34-positive stem/progenitor cells transduced with a lentiviral vector encoding the human adenosine deaminase (ADA) gene under the control of the human elongation factor alpha short promoter (EFS), with potential to restore ADA expression and function. Autologous hematopoietic CD34+ cells are isolated from the patient's own bone marrow, peripheral blood or cord blood, and transduced with the EFS-ADA lentiviral vector ex vivo. Upon re-infusion of the EFS-ADA vector-transduced lymphocytes back into the patient, these cells may both restore ADA activity and prevent severe combined immunodeficiency (SCID) due to ADA deficiency. ADA, an enzyme that catalyzes the deamination of adenosine to inosine, plays a key role in the development and functioning of the immune system.

**EFTs:** A group of cancers that includes Ewing tumor of bone (ETB or Ewing sarcoma of bone), extraosseous Ewing (EOE) tumors, primitive neuroectodermal tumors (PNET or peripheral neuroepithelioma), and Askin tumors (PNET of the chest wall). These tumors all come from the same type of stem cell. Also called Ewing sarcoma family of tumors.

**Efudex :** A drug used to treat cancers of the breast, colon, rectum, stomach, and pancreas. Under the brand names Carac, Tolak, Efudex, and Fluoroplex, it is used as a cream to treat actinic keratosis (a skin condition that may become cancer). It is also used under the brand name Efudex as a cream to treat basal cell skin cancer that is superficial (not invasive) and cannot be removed by surgery. Efudex is being studied in the treatment of other conditions and types of cancer. It stops cells from making DNA and may kill cancer cells. Efudex is a type of antimetabolite. Also called 5-fluorouracil, 5-FU, Carac, Fluoroplex, fluorouracil, and Tolak.

**Eg5 kinesin-related motor protein inhibitor 4SC-205:** A small-molecule inhibitor of the human kinesin-related motor protein Eg5 with potential

antineoplastic activity. Eg5 kinesin-related motor protein inhibitor 4SC-205 selectively inhibits the activity of Eg5, which may result in mitotic disruption, apoptosis and cell death. The ATP-dependent Eg5 kinesin-related motor protein (also known as KIF11 or kinesin spindle protein-5) is a plus-end directed kinesin motor protein essential for the regulation of spindle dynamics, including assembly and maintenance, during mitosis.

**Eg5 kinesin-related motor protein inhibitor ARQ 621:** A small-molecule inhibitor of the kinesin-related motor protein Eg5 with potential antineoplastic activity. Eg5 kinesin-related motor protein inhibitor ARQ 621 selectively inhibits the activity of Eg5, which may result in mitotic disruption, apoptosis and cell death. The ATP-dependent Eg5 kinesin-related motor protein (also known as KIF11 or kinesin spindle protein-5) is a plus-end directed kinesin motor protein involved in the regulation of spindle dynamics, including assembly and maintenance, during mitosis.

**EGb761:** A standardized ginkgo biloba extract with antioxidant and neuroprotective activities. EGb761 has been shown to inhibit the proliferation of certain tumor cells in vitro. Check for active clinical trials using this agent. Or A substance that is being studied in the prevention of cognitive dysfunction (slowed ability to think, reason, concentrate, or remember) in patients receiving chemotherapy. It comes from ginkgo biloba leaves.

**EGCG:** A substance found in green tea. It is being studied in the prevention of cancer and some other diseases. It is a type of antioxidant. Also called epigallocatechin-3-gallate.

**EGF:** A protein made by many cells in the body and by some types of tumors. It causes cells to grow and differentiate (become more specialized). It is a type of growth factor and a type of cytokine. Also called epidermal growth factor.

**EGFR:** The protein found on the surface of some cells and to which epidermal growth factor binds, causing the cells to divide. It is found at abnormally high levels on the surface of many types of cancer cells, so these cells may divide excessively in the presence of epidermal growth factor. Also called epidermal growth factor receptor, ErbB1, and HER1.

**EGFR antagonist Hemay022:** An orally available, irreversible inhibitor of epidermal growth factor receptor (EGFR), with potential antineoplastic activity. Upon oral administration, Hemay022 covalently binds to and

inhibits the activity of EGFR, thereby preventing EGFR-mediated signaling. This may both induce cell death and inhibit tumor growth in EGFR-overexpressing tumor cells. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**EGFR antisense DNA:** A synthetic sequence of DNA constructed in the antisense orientation to a sequence of DNA in epidermal growth factor receptor (EGFR), a member of the erbB gene family. EGFR antisense DNA suppresses the expression of EGFR by tumor cells, thereby inhibiting tumor cell proliferation and decreasing tumor growth. This agent also appears to reduce the invasiveness of certain breast cancer cells. Members of the erbB gene family are overexpressed in many cancers and play roles in carcinogenesis and the regulation of cell proliferation.

**EGFR CAR-CD3zeta-4-1BB-expressing autologous T-lymphocytes:** Autologous human T-lymphocytes transduced with a retroviral vector encoding an anti-epidermal growth factor receptor (EGFR) chimeric T cell receptor (chimeric antigen receptor or CAR) gene coupled to the signaling domains from both CD3 zeta and CD137 (4-1BB), with potential immunostimulatory and antineoplastic activities. Upon administration, the chimeric EGFR antigen receptor-modified autologous T lymphocytes bind to the EGFR antigen on tumor cell surfaces; subsequently, EGFR-expressing tumor cells may be lysed. Following binding to EGFR, the 4-1BB co-stimulatory molecule signaling domain enhances both activation and signaling. Inclusion of the 4-1BB signaling domain may also increase the antitumor activity when compared to the inclusion of the CD3-zeta chain alone. EGFR, a receptor tyrosine kinase (RTK) overexpressed by a variety of cancer cell types, plays key roles in tumor cell proliferation and tumor angiogenesis. Check for active clinical trials using this agent.

**EGFR inhibitor :** A substance that blocks the activity of a protein called epidermal growth factor receptor (EGFR). EGFR is found on the surface of some normal cells and is involved in cell growth. It may also be found at high levels on some types of cancer cells, which causes these cells to grow and divide. Blocking EGFR may keep cancer cells from growing. Some EGFR inhibitors are used to treat cancer. Also called EGFR tyrosine kinase inhibitor, epidermal growth factor receptor inhibitor, and epidermal growth factor receptor tyrosine kinase inhibitor.

**EGFR inhibitor ABT-414:** An epidermal growth factor receptor (EGFR) inhibitor, with potential antineoplastic activity. Upon intravenous infusion, ABT-414 inhibits the activity of EGFR, thereby preventing EGFR-mediated signaling. This may inhibit tumor growth in EGFR-overexpressing tumor cells. EGFR, a receptor tyrosine kinase overexpressed in certain tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**EGFR inhibitor ASP8273:** An orally available, irreversible, third-generation, mutant-selective, epidermal growth factor receptor (EGFR) inhibitor, with potential antineoplastic activity. Upon oral administration, ASP8273 covalently binds to and inhibits the activity of mutant forms of EGFR, including the T790M EGFR mutant, thereby preventing EGFR-mediated signaling. This may both induce cell death and inhibit tumor growth in EGFR-overexpressing tumor cells. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization. ASP8273 preferentially inhibits mutated forms of EGFR including T790M, a secondarily acquired resistance mutation, and may have therapeutic benefits in tumors with T790M-mediated resistance when compared to other EGFR tyrosine kinase inhibitors. As this agent is selective towards mutant forms of EGFR, its toxicity profile may be reduced as compared to non-selective EGFR inhibitors which also inhibit wild-type EGFR.

**EGFR inhibitor AZD3759:** An orally available inhibitor of the epidermal growth factor receptor (EGFR), with potential antineoplastic activity. Upon oral administration, AZD3759 binds to and inhibits the activity of EGFR as well as certain mutant forms of EGFR. This prevents EGFR-mediated signaling, and may lead to both induction of cell death and inhibition of tumor growth in EGFR-overexpressing cells. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**EGFR inhibitor EGF816:** An orally available, irreversible, third-generation, mutant-selective epidermal growth factor receptor (EGFR) inhibitor, with potential antineoplastic activity. Upon oral administration, EGF816 covalently binds to and inhibits the activity of mutant forms of EGFR, including the T790M EGFR mutant, thereby preventing EGFR-mediated signaling. This may both induce cell death and inhibit tumor growth in EGFR-overexpressing tumor cells. EGFR, a receptor tyrosine

kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization. EGF816 preferentially inhibits mutated forms of EGFR including T790M, a secondarily acquired resistance mutation, and may have therapeutic benefits in tumors with T790M-mediated resistance when compared to other EGFR tyrosine kinase inhibitors. As this agent is selective towards mutant forms of EGFR, its toxicity profile may be reduced as compared to non-selective EGFR inhibitors which also inhibit wild-type EGFR.

**EGFR inhibitor HM61713:** An orally available small molecule, mutant-selective inhibitor of epidermal growth factor receptor (EGFR) with potential antineoplastic activity. EGFR inhibitor HM61713 binds to and inhibits mutant forms of EGFR, thereby leading to cell death of EGFR-expressing tumor cells. As this agent is selective towards mutant forms of EGFR, its toxicity profile may be reduced as compared to non-selective EGFR inhibitors, which also inhibit the EGFR wild type form.

**EGFR mutation-selective inhibitor AC0010MA:** An orally available, third generation, selective inhibitor of mutant forms of the epidermal growth factor receptor (EGFR), including the second-site resistance mutation T790M, with potential antineoplastic activity. EGFR mutant-selective inhibitor AC0010MA specifically and irreversibly binds to and inhibits the activity of mutant forms of EGFR, which prevents EGFR mutant-mediated signaling and leads to cell death in EGFR mutant-expressing tumor cells. Compared to some other EGFR inhibitors, AC0010MA may have therapeutic benefits in tumors with T790M-mediated drug resistance. This agent does not inhibit wild-type EGFR (EGFRwt), and does not cause dose-limiting toxicities that occur during the use of non-selective EGFR inhibitors, which also inhibit EGFRwt. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**EGFR T790M inhibitor PF-06747775:** An orally available inhibitor of the epidermal growth factor receptor (EGFR) mutant form T790M, with potential antineoplastic activity. EGFR T790M inhibitor PF-06747775 specifically binds to and inhibits EGFR T790M, a secondarily acquired resistance mutation, which prevents EGFR-mediated signaling and leads to cell death in EGFR T790M-expressing tumor cells. Compared to some other EGFR inhibitors, PF-06747775 may have therapeutic benefits in

tumors with T790M-mediated drug resistance. This agent shows minimal activity against wild-type EGFR (WT EGFR), and does not cause dose-limiting toxicities that occur during the use of non-selective EGFR inhibitors, which can inhibit WT EGFR. EGFR, a receptor tyrosine kinase mutated in many tumor cell types, plays a key role in tumor cell proliferation and tumor vascularization.

**EGFR tyrosine kinase inhibitor :** A substance that blocks the activity of a protein called epidermal growth factor receptor (EGFR). EGFR is found on the surface of some normal cells and is involved in cell growth. It may also be found at high levels on some types of cancer cells, which causes these cells to grow and divide. Blocking EGFR may keep cancer cells from growing. Some EGFR tyrosine kinase inhibitors are used to treat cancer. Also called EGFR inhibitor, epidermal growth factor receptor inhibitor, and epidermal growth factor receptor tyrosine kinase inhibitor.

**EGFR/HER2 inhibitor AP32788:** An orally available inhibitor of specific mutant forms of both human epidermal growth factor receptor (EGFR) and human epidermal growth factor receptor 2 (HER2; ERBB2), with potential antineoplastic activity. Upon oral administration, EGFR/HER2 inhibitor AP32788 specifically and irreversibly binds to and inhibits certain mutant forms of EGFR and HER2. This prevents EGFR- and HER2-mediated signaling and leads to cell death in EGFR mutant- and HER2 mutant-expressing tumor cells. EGFR and HER2, receptor tyrosine kinases mutated in many tumor cell types, play key roles in tumor cell proliferation and tumor vascularization.

**EGFR/HER2 inhibitor AV-412:** A second-generation, orally bioavailable dual kinase inhibitor with potential antineoplastic activity. EGFR/HER2 inhibitor AV-412 binds to and inhibits the epidermal growth factor receptor (EGFR) and the human epidermal growth factor receptor 2 (HER2), which may result in the inhibition of tumor growth and angiogenesis, and tumor regression in EGFR/HER2-expressing tumors. This agent may be active against EGFR/HER2-expressing tumor cells that are resistant to first-generation kinase inhibitors. EGFR and HER2 are receptor tyrosine kinases that play major roles in tumor cell proliferation and tumor vascularization.

**EGFRBi-armed autologous activated T cells:** Autologous activated T cells, loaded with a bispecific antibody produced by heteroconjugation of anti-CD3 and anti-epidermal growth factor receptor (EGFR) monoclonal

antibodies, with potential antineoplastic activity. Binding of EGFRBi-armed autologous activated T cells to EGFR-positive tumor cells may result in increased T cell-mediated cytotoxicity towards tumor cells expressing EGFR. Arming activated T cells with this bispecific antibody may significantly increase T cell secretion of anti-tumor associated cytokines such as IL2, RANTES, IFN-gamma, and TNF-alpha. Check for active clinical trials using this agent.

**egg:** the haploid cell within the female ovary.

**egg banking :** The process of freezing one or more unfertilized eggs (eggs that have not been combined with sperm) to save them for future use. The eggs are thawed and fertilized in the laboratory to make embryos that can be placed in a woman's uterus. Egg banking is being studied as a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called egg cryopreservation, egg freezing, and oocyte cryopreservation.

**egg cryopreservation :** The process of freezing one or more unfertilized eggs (eggs that have not been combined with sperm) to save them for future use. The eggs are thawed and fertilized in the laboratory to make embryos that can be placed in a woman's uterus. Egg cryopreservation is being studied as a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called egg banking, egg freezing, and oocyte cryopreservation.

**egg freezing :** The process of freezing one or more unfertilized eggs (eggs that have not been combined with sperm) to save them for future use. The eggs are thawed and fertilized in the laboratory to make embryos that can be placed in a woman's uterus. Egg freezing is being studied as a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called egg banking, egg cryopreservation, and oocyte cryopreservation. or The process of freezing one or more unfertilized eggs (eggs that have not been combined with sperm) to save them for future use. The eggs are thawed and fertilized in the laboratory to make embryos that can be placed in a woman's uterus. Egg freezing is being studied as a type of fertility preservation. It may be useful

for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called egg banking, egg cryopreservation, and oocyte cryopreservation.

**Eggshell:** Gloss lying between semi-gloss and flat. OR A degree of glossiness broadly midway between matt and high gloss.

**EGGSHELL FINISH:** The degree of gloss between a flat and gloss finish.

**EGL:** Energy grade line - a line that represents the elevation of energy head in feet of water flowing in a pipe, conduit, or channel.

**EHR:** An electronic (digital) collection of medical information about a person that is stored on a computer. An EHR includes information about a patient's health history, such as diagnoses, medicines, tests, allergies, immunizations, and treatment plans. EHRs can be seen by all healthcare providers who are taking care of a patient and can be used by them to help make recommendations about the patient's care. Also called electronic health record and electronic medical record.

**Eicosanoid:** A carbon compound containing 20 carbon atoms; prostaglandins are examples. Eicosanoids often act as local hormones. OR Any fatty acid with 20 carbons.

**eicosapentaenoic acid:** An essential, polyunsaturated, 20-carbon omega-3 fatty acid with anti-inflammatory and potential antineoplastic and chemopreventive activities. Eicosapentaenoic acid (EPA) may activate caspase 3, resulting in apoptosis in susceptible tumor cell populations. In addition, this agent may inhibit cyclooxygenase-2 (COX-2), resulting in inhibition of prostaglandin synthesis and prostaglandin-mediated inflammatory processes.

**eicosapentaenoic acid-enriched nutritional supplement:** A nutritional supplement enriched with eicosapentaenoic acid (EPA), which is an essential, polyunsaturated, 20-carbon omega-3 fatty acid found in fish oil, with potential anti-inflammatory and anti-cachectic activities. Upon oral intake of the EPA-enriched nutritional supplement, EPA is incorporated in cell membrane phospholipids and replaces arachidonic acid. This affects the production of pro-inflammatory mediators, such as tumor necrosis factor-alpha (TNF-a), interleukin-1 (IL-1) and IL-6, through the inhibition of nuclear factor kappa B (NF-kB) activity. This inhibits inflammation and

may abrogate the cachexia-mediated decrease of lean body mass (LBM), which may lead to increased body weight. Pro-inflammatory mediators, such as TNF- $\alpha$ , interferon- $\gamma$ , and certain interleukins, such as IL-6 and IL-1 $\beta$ , play a key role in cachexia.

**eIF4E antisense oligonucleotide ISIS 183750:** A second-generation antisense oligonucleotide targeting the eukaryotic translation initiation factor 4E (eIF4E) with potential antitumor activity. Antisense oligonucleotide ISIS EIF4ERx suppresses the expression of eIF4E in fast dividing tumor cells. Blocking the expression of eIF4E results in inhibition of the synthesis of tumor angiogenic factors, thereby leading to the inhibition of cellular proliferation and apoptosis in tumor cells. eIF4E is overexpressed in a variety of cancers, is involved in the mRNA-ribosome binding step of eukaryotic protein synthesis and is the rate-limiting component of the eukaryotic translation apparatus.

**Einsteinium:** Symbol:"Es" Atomic Number:"99" Atomic Mass: (252)amu. Einsteinium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a radioactive and unstable element and you will not find it in use anywhere. It was named after the physicist Albert Einstein.

**ejaculation :** The release of semen through the penis during orgasm.

**Ejection:** The final stage of the injection-molding process where the completed part is pushed from the mold using pins or other mechanisms.

**Ejection Pin:** A rod, pin or sleeve that pushes a molded part off of a core or out of a cavity of a mold. Or Metal rods in the mold which push the parts from the mold.

**Ejection Pin Marks:** A residual mark on the part caused by the profile of the ejection pin.

**Ejector half:** The half of the mold that is mounted to the moving platen of the injection machine Sometimes called the ``live" half or the ``moveable" half because it moves This half of the mold usually contains the ejection system.

**Ejector Housing:** U shaped frame which is an integral part of the tool containing the ejector retainer plate and ejector plate

**EJECTOR PIN:** Or ejector sleeve. A rod, pin or sleeve which pushes a molding off of a core or out of a cavity of a mold. It is attached to an ejector

bar or plate which can be actuated by the ejector rod(s) of the press or by auxiliary hydraulic or air cylinders. Or A pin, normally circular, placed in either half of the mold (usually the ejector half), which pushes the finished molded product, or runner system, out of a mold. Also referred to as a knockout pin. Or A rod, pin or sleeve which pushes a molding off of a core or out of a cavity of a mold. or (knockout Pin) A pin or plate that is driven into a mold cavity from the rear as the mold opens to force out the finished part

**Ejector Pin (on Sleeve):** A pin or thin plate that is driven into a mold cavity from the rear as the mold opens, forcing out the finished pieces. Also Knockout Pin.

**EJECTOR PIN RETAINER PLATE:** Retainer into which ejector pins are assembled.

**Ejector Pin/Sleeve:** A rod, pin or sleeve which pushes a molding off a core or out of a cavity of a mold. This is attached to an ejector bar or plate which can be actuated by the ejector rod(s) of the press or by auxiliary hydraulic or air cylinders.

**Ejector Pins:** Pins that are pushed into a mold cavity from the rear as the mold opens to force the finished part out of the mold. Also called knockout pins. Or Pins installed in the B-side of the mold that push the part out of the mold when the part has cooled sufficiently. Or A rod, pin or sleeve which pushes a molding off of a core or out of a cavity of a mold.

**Ejector Plate:** A bar that actuates the ejector assembly when the mold opens

**Ejector return pins:** Pins that push the ejectors back into position once the parts have been released. OR Projections that push the ejector assembly back as the mold closes: also called Safety Pin, and Position Pushbacks. OR Projections that push the ejector assembly back as the mold closes. Also called surface pins or return pins.

**Ejector rod:** A bar that engages the ejector assembly and pins when the mold opens. OR Bar that actuates the ejector assembly when mold is opened.

**EKB-569:** A substance being studied in the treatment of some types of cancer. It blocks the action of certain proteins that are part of the epidermal growth factor receptor (EGFR) family of proteins. These proteins may be

found in increased amounts on the surface of some types of cancer cells. Blocking the action of these proteins may stop cancer cells from growing and may kill cancer cells. EKB-569 is a type of EGFR inhibitor. Also called pelitinib.

**EKG:** A line graph that shows changes in the electrical activity of the heart over time. It is made by an instrument called an electrocardiograph. The graph can show that there are abnormal conditions, such as blocked arteries, changes in electrolytes (particles with electrical charges), and changes in the way electrical currents pass through the heart tissue. Also called ECG and electrocardiogram.

**Eklund displacement views :** A procedure used to do a mammogram (x-ray of the breasts) in women with breast implants. The implant is pushed back against the chest wall and the breast tissue is pulled forward and around it so the tissue can be seen in the mammogram. Also called Eklund views and implant displacement views.

**Eklund views :** A procedure used to do a mammogram (x-ray of the breasts) in women with breast implants. The implant is pushed back against the chest wall and the breast tissue is pulled forward and around it so the tissue can be seen in the mammogram. Also called Eklund displacement views and implant displacement views.

**El Chicon:** Active volcano 7300 ft (2225 m) high in Mexico. The last eruption was in 1983.

**El Nino:** An irregular variation of ocean current that from January to March flows off the west coast of South America, carrying warm, low-salinity, nutrient-poor water to the south. It does not usually extend farther than a few degrees south of the equator, but occasionally it does penetrate beyond 12 degrees S, displacing the relatively cold Peru Current. The effects of this phenomenon are generally short-lived, and fishing is only slightly disrupted. Occasionally (in 1891, 1925, 1941, 1957 - 58, 1965, 1972 - 73, 1976, and 1982 - 83), the effects are major and prolonged. Under these conditions, sea surface temperatures rise along the coast of Peru and in the equatorial eastern Pacific Ocean and may remain high for more than a year, having disastrous effects on marine life and fishing. Excessive rainfall and flooding occur in the normally dry coastal area of western tropical South America during these events. Some oceanographers and meteorologists consider only the major, prolonged events as El Nino

phenomena rather than the annually occurring weaker and short-lived ones. The name was originally applied to the latter events because of their occurrence at Christmas time.

**El Niño, La Niña:** long-term weather patterns associated with changing global winds and ocean temperatures in the Pacific Ocean.

**Elacyt :** A drug used to treat advanced acute myeloid leukemia (AML). It is a form of the anticancer drug cytarabine that may work in patients with leukemia that is resistant to cytarabine. Elacyt blocks cell division and may kill cancer cells. It is a type of antimetabolite. Also called CP-4055 and elacytarabine.

**elacytarabine:** The lipophilic 5'-elaidic acid ester of the deoxycytidine analog cytosine arabinoside (cytarabine; Ara-C) with potential antineoplastic activity. As a prodrug, CP-4055 is converted intracellularly into cytarabine triphosphate by deoxycytidine kinase and subsequently competes with cytidine for incorporation into DNA, thereby inhibiting DNA synthesis. Compared to cytarabine, CP-4055 shows increased cellular uptake and retention, resulting in increased activation by deoxycytidine kinase to cytarabine triphosphate, decreased deamination and deactivation by deoxycytidine deaminase, and increased inhibition of DNA synthesis. This agent also inhibits RNA synthesis, an effect not seen with cytarabine.  
OR A drug used to treat advanced acute myeloid leukemia (AML). It is a form of the anticancer drug cytarabine that may work in patients with leukemia that is resistant to cytarabine. Elacytarabine blocks cell division and may kill cancer cells. It is a type of antimetabolite. Also called CP-4055 and Elacyt.

**Elastic:** Elastic describes a property of rebound. You may have heard of the elasticity of a rubber band. Rubber bands can stretch and return to their original shape. Elasticity of a collision describes how much energy is lost when an object hits. A very elastic surface absorbs little energy and the object will bounce off. A non-elastic surface absorbs a lot of energy and the objects involved in the collision lose energy.

**Elastic Deformation:** The part of the deformation of an object under load which is recoverable when the load is removed.

**Elastic Limit:** Maximum stress that a material will stand before permanent deformation occurs

**Elastic Memory:** A characteristic of certain plastics evidenced by their tendency to revert to a previously existing shape or dimension.

**elastic rebound theory:** the theory that suggests that in some cases energy is stored in rock that is being bent (deformed) by tectonic forces until the energy in the rock exceeds the rock's chemical bonds and it breaks, releasing the energy and causing motion.

**elastic strain:** strain after which the body of a rock returns to its previous shape when stress has been removed.

**Elasticity:** The ability of paint to expand and contract with the substrate without suffering damage or changes in its appearance. Expansion and contraction are usually caused by some temperature fluctuations. Some substrates such as yellow pine expand at different rates depending on the type of their grain. Elasticity is a key to durability. OR the ability of a substance to be stretched and then to return to its original shape. OR That property of a material of which it tends to recover its original size and shape after deformation. OR The ability of a material to quickly recover its original dimensions after removal of a load that has caused deformation.

**Elasticity/Plasticity:** The ability of a material to return to its original state after deformation: the yield point is not exceeded: elastic behavior. Plastics in general respond elastically. If a material's yield point is exceeded when stressed, it does not return to its original state after removal of the stress: permanent deformation by plastic behavior. Plasticity is the inverse of elasticity. Another way of explaining this is the following. During the first part of the pulling process in the tensile test, both tensile stress and tensile strain continue to increase, and in proportion. When this takes place, the material acts like a spring, and is said to have elastic behavior. Some materials – such as methacrylates – will be broken when they have been strained only a small amount, and while still showing essentially elastic behavior. Other materials – such as polycarbonates – can be stretched many times their original length before they break. The latter have a yield point, and a corresponding yield stress.

**Elastomer:** A polymer that, when deformed (stretched, twisted, spindled, mutilated, etc.) springs back into its original shape. The elastomer par excellence is lightly-crosslinked natural rubber. OR A material which at room temperature stretches under low stress to at least twice its length and snaps back to the original length upon release of stress. See also Rubber.

OR a material that exhibits almost complete recovery to its original size after undergoing dramatic strain levels (as high as 100% and sometimes more). OR A material which at room temperature can be stretched under low stress to at least twice its original length and, upon immediate release of the stress, will return with force to its approximate original length. OR A material which at room temperature stretches under low stress to at least twice its length and snaps back to the original length upon release of stress.

**Eldecort:** (Other name for: therapeutic hydrocortisone)

**Eldisine:** (Other name for: vindesine)

**Eldopar:** (Other name for: levodopa)

**electric charge:** A property used to explain attractions and repulsions between certain objects. Two types of charge are possible: negative and positive. Objects with different charge attract; objects with the same charge repel each other.

**electric current:** A flow of electric charges. The SI unit of electric current is the ampere.

**electric dipole:** An object whose centers of positive and negative charge do not coincide. For example, a hydrogen chloride (HCl) molecule is an electric dipole because bonding electrons are on average closer to the chlorine atom than the hydrogen, producing a partial positive charge on the H end and a partial negative charge on the Cl end.

**electric dipole moment:** A measure of the degree of polarity of a polar molecule. Dipole moment is a vector with magnitude equal to charge separation times the distance between the centers of positive and negative charges. Chemists point the vector from the positive to the negative pole; physicists point it the opposite way. Dipole moments are often expressed in units called Debyes.

**ELECTRIC DISCHARGE MACHINING (EDM):** A metal working process applicable to mold construction in which controlled sparking is used to erode away the work piece. OR A metalworking process in which controlled sparking is used to erode the workpiece.

**electric field:** A field of forces that act on any electric charge placed within it. The stronger the field, the stronger the force that acts on the charge. For example, the positive charge on an atomic nucleus creates an electric field that traps electrons.

**Electric power grid:** A system of synchronized power providers and consumers, connected by transmission and distribution lines and operated by one or more control centers. In the continental United States, the electric power grid consists of three systems—the Eastern Interconnect, the Western Interconnect, and the Texas Interconnect. In Alaska and Hawaii, several systems encompass areas smaller than the State.

**Electric utility:** A corporation, agency, authority, person, or other legal entity that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric power (primarily for use by the public). Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act (PURPA) are not considered electric utilities.

**electrical conductivity:** A measure of how easily an electric current can pass through a material. The conductivity is the reciprocal of the resistance. The SI unit of conductance is the siemens.

**Electrical conductor:** A substance that allows electricity to flow through it without any chemical change taking place.

**Electrical generator:** An electromagnetic device that converts mechanical (rotational) energy into electrical energy. Most large electrical generators are driven by steam or water turbine systems.

**Electrical properties:** primarily the resistance of a plastic to the passage of electricity e.g. dielectric strength.

**electrical resistance:** The ability of a material to oppose the flow of an electric current, converting electrical energy into heat. The SI unit of resistance is the ohm.

**electricity:** a form of energy coming from charges.

**electroacupuncture :** A procedure in which pulses of weak electrical current are sent through acupuncture needles into acupuncture points in the skin. This procedure is being studied in the prevention of nausea and vomiting in patients undergoing chemotherapy.

**electrocardiogram :** A line graph that shows changes in the electrical activity of the heart over time. It is made by an instrument called an electrocardiograph. The graph can show that there are abnormal conditions, such as blocked arteries, changes in electrolytes (particles with electrical

charges), and changes in the way electrical currents pass through the heart tissue. Also called ECG and EKG.

**electrocautery :** A procedure that uses heat from an electric current to destroy abnormal tissue, such as a tumor or other lesion. It may also be used to control bleeding during surgery or after an injury. The electric current passes through an electrode that is placed on or near the tissue. The tip of the electrode is heated by the electric current to burn or destroy the tissue. Electrocautery is a type of electrosurgery. Also called electrocoagulation, electrofulguration, and fulguration.

**electrochemical:** Describes any effect concerned with the electrical properties of solutions and the ions in solutions. OR cell a device that uses a chemical reaction to produce an electric current.

**electrochemical cell:** Gives an electric current with a steady voltage as a result of an electron transfer reaction. OR A device that uses a redox reaction to produce electricity, or a device that uses electricity to drive a redox reaction in the desired direction.

**electrochemical gradient:** The sum of the gradients of concentration and of electric charge of an ion across a membrane; the driving force for oxidative phosphorylation and photophosphorylation.

**electrochemical potential:** The energy required to maintain a separation of charge and of concentration across a membrane.

**electrocoagulation :** A procedure that uses heat from an electric current to destroy abnormal tissue, such as a tumor or other lesion. It may also be used to control bleeding during surgery or after an injury. The electric current passes through an electrode that is placed on or near the tissue. The tip of the electrode is heated by the electric current to burn or destroy the tissue. Electrocoagulation is a type of electrosurgery. Also called electrocautery, electrofulguration, and fulguration.

**electroconvulsive therapy :** A treatment for severe depression and certain mental disorders. A brief seizure is induced by giving electrical stimulation to the brain through electrodes placed on the scalp. Also called ECT and electroshock therapy.

**electrode:** A metal plate or wire for conducting electrons into or out of solutions. OR the point in an electrochemical cell at which reduction or

oxidation occurs. OR An electrically conducting surface that allows electrons to be transferred between reactants in an electrochemical cell.

**electrode :** In medicine, a device such as a small metal plate or needle that carries electricity from an instrument to a patient for treatment or surgery. Electrodes can also carry electrical signals from muscles, brain, heart, skin, or other body parts to recording devices to help diagnose certain conditions.

**Electrode head:** a molded plastic assembly containing one or more sockets for the insertion of appropriate electrodes fitted with plug-in connectors. The electrode head carries the expensive screened cable and plug for connecting to the measuring instruments. Various models are available for use with one electrode (mono head) or an ISE/reference combination (dual head), or a combination of different ISEs and/or pH, redox, or dissolved oxygen electrodes used with a common reference electrode for multicomponent analysis (multiple head).

**electrodermal response :** A change in the heat and electricity passed through the skin by nerves and sweat. Electrodermal response increases in certain emotional states and during hot flashes that happen with menopause. Also called galvanic skin response and skin conduction.

**electrodes:** Device that moves electrons into or out of a solution by conduction.

**electrodesiccation :** The drying of tissue by a high-frequency electric current applied with a needle-shaped electrode.

**electrodiathermy :** A procedure in which tissue is heated to destroy abnormal cells. The heat may come from electric currents, microwaves, radio waves, or ultrasound. Electrodiathermy is a type of hyperthermia therapy. Also called diathermy.

**electroencephalogram :** A recording of electrical activity in the brain. It is made by placing electrodes on the scalp (the skin covering the top of the head), and impulses are sent to a special machine. An EEG may be used to diagnose brain and sleep disorders. Also called EEG.

**Electroformed Molds:** A mold made by electroplating metal in the reverse pattern on the cavity. Molten steel may be then sprayed on the back of the mold to increase its strength.

**electrofulguration :** A procedure that uses heat from an electric current to destroy abnormal tissue, such as a tumor or other lesion. It may also be used

to control bleeding during surgery or after an injury. The electric current passes through an electrode that is placed on or near the tissue. The tip of the electrode is heated by the electric current to burn or destroy the tissue. Electrofulguration is a type of electrosurgery. Also called electrocautery, electrocoagulation, and fulguration.

**electrogenic:** Contributing to an electrical potential across a membrane.

**electrokinetically modified water:** Orally available, nanobubble-based, electrokinetically modified water (EMW) composed of reverse osmosis water where the minerals calcium chloride, magnesium chloride, and potassium bicarbonate have been added and with an increased oxygen concentration compared to normal water. Upon consumption, the EMW may have a beneficial effect on fatigue. This water may protect muscle cells against damage and may improve skeletal muscle function. The water is pretreated with strong, controlled turbulence to create charge-stabilized nanostructures.

**electrolarynx :** A battery-operated device that makes a humming sound. It is used to help a person talk after removal of the larynx (voice box).

**electrolysis:** Changing the chemical structure of a compound using electrical energy. OR The use of electrical energy to carry out a chemical reaction. OR Electrolysis is the breakdown of a substance by electricity. OR the decomposition of a substance by an electric current. OR The chemical change that is brought about by passing electricity through a substance. The substance must be ionic and either molten or in aqueous solution. OR The process of driving a redox reaction in the reverse direction by passage of an electric current through the reaction mixture.

**electrolyte:** A substance that, when dissolved in water produces a solution that conducts electricity. OR An electrolyte is a liquid that conducts electricity and is decomposed in the process, i.e. a liquid that undergoes electrolysis. OR a substance which ionizes in aqueous solution. Weak electrolytes are only slightly dissociated into ions in solution (acetic acid), and strong electrolytes are highly dissociated (HCl, NaCl). Strong electrolytes are good conductors of electricity, and conductance measurements are well correlated with electrolyte strength. OR a substance that forms ions when dissolved in water. OR A charged molecule (such as a sodium or potassium ion) that is present in body fluids OR A substance that dissociates fully or partially into ions when dissolved in a solvent,

producing a solution that conducts electricity. See strong electrolyte, weak electrolyte. OR A substance that breaks up into ions (particles with electrical charges) when it is dissolved in water or body fluids. Some examples of ions are sodium, potassium, calcium, chloride, and phosphate. These ions help move nutrients into cells, help move waste out of cells, and help nerves, muscles, the heart, and the brain work the way they should.

**electrolyte-free parenteral nutrition emulsion:** An electrolyte-free emulsion for infusion consisting of a three chamber bag system containing glucose, amino acids and lipids that can be used to provide parenteral nutritional supplementation. The lipid emulsion portion contains soybean oil, medium-chain triglycerides, olive oil and fish oil; the amino acid solution contains alanine, arginine, glycine, histidine, leucine, isoleucine, lysine, methionine, phenylalanine, proline, serine, taurine, threonine, tryptophan, tyrosine, and valine. The electrolyte-free parenteral nutrition emulsion contains no electrolytes, trace elements and vitamins. The three separate bags containing glucose, amino acids and lipids are mixed together before infusion.

**electrolytic cell:** A device that uses electricity from an external source to drive a redox reaction.

**Electrolytic process:** A process that causes the decomposition of a chemical compound by the use of electricity.

**electromagnetic field :** An area of electric and magnetic forces caused by electromagnetic radiation. Researchers are studying whether the electromagnetic fields from power lines, electrical appliances, and wireless and cellular telephones can cause cancer or other harmful health effects. Also called EMF.

**Electromagnetic radiation:** A traveling wave motion resulting from changing electric or magnetic fields. Familiar electromagnetic radiation range from x-rays (and gamma rays) of short wavelength, through the ultraviolet, visible, and infrared regions, to radar and radio waves of relatively long wavelength. OR A wave that involves perpendicular oscillations in the electric and magnetic fields, moving at a speed of  $2.99792458 \times 10^8$  m/s in a vacuum away from the source. gamma rays, x-rays, ultraviolet light, visible light, infrared radiation, and radio waves are all electromagnetic waves. OR Complete range of wavelengths which light can have. These include infrared, ultraviolet, and all other types of

electromagnetic radiation, as well as visible light. OR diagram that breaks down energy by wavelength.

**electromagnetic radiation :** Radiation that has both electric and magnetic fields and travels in waves. It comes from natural and man-made sources. Electromagnetic radiation can vary in strength from low energy to high energy. It includes radio waves, microwaves, infrared light, visible light, ultraviolet light, x-rays, and gamma rays. Also called EMR.

**electromagnetic wave:** the type of wave found in visible, infrared, and ultraviolet light as well as radio signals and X-rays.

**electromotive force:** the electrical potential produced by a chemical reaction voltage.

**electron :** A small particle with a negative charge that is found in all atoms. Streams of electrons made by special equipment can be used for radiation treatment.

**Electron :** An atomic particle of very small mass ( $1/1840$  of the mass of a proton) and a charge of one minus. It is found in an atom in shells or orbits surrounding the nucleus but not part of the nucleus. OR An elementary particle with a negative charge and a mass  $1/1837$  that of a proton. Electrons surround the positively charged nucleus of an atom, and determine its chemical properties. OR a particle of the atom that has a negative charge. The electron is not a part of the nucleus, but moves around in an orbit around the nucleus. OR negatively charged particles of little weight that exist in quantized probability areas around the atomic nucleus. OR a light subatomic particle with negative charge; found in orbitals surrounding an atomic nucleus. OR A tiny speck of electric charge, so far impossible to break into smaller pieces, weighing in at  $9.109 \times 10^{-31}$  kg and a charge of  $1.602 \times 10^{-19}$  Coulombs. An electron is so small that its 'size' is a nebulous concept; if it were a little round ball, it would be about 10-15 m across. OR Electrons are tiny, negatively charged particles that orbit the nucleus of an atom in energy levels (or shells). OR is a basic particle whose charge is -1 and whose mass is  $1/1837$  g/mol (amu). OR An electron is a very small particle that spins around the center of an atom. An electron has a negative (-) charge and is found in one of seven shells. OR A negatively charged subatomic particle, of extremely low mass found in the space outside the nucleus of an atom. OR One of the parts of the atom having a negative charge. Indivisible particle with a charge of -1. OR the

sub-atomic particle, with a negative charge, that orbits the nucleus of an atom.

**electron acceptor:** A substance that receives electrons in an oxidation-reduction reaction.

**electron affinity:** the amount of energy liberated when an electron is added to an atom in the gaseous state. OR The enthalpy change for the addition of one electron to an atom or ion in the gaseous state. For example, the electron affinity of hydrogen is H in the reaction  $\text{H}(\text{g}) + \text{e}^- \rightarrow \text{H}^-(\text{g})$   $\Delta H = -73 \text{ kJ/mol}$ .

**electron beam :** A stream of electrons (small negatively charged particles found in atoms) that can be used for radiation therapy.

**electron carrier:** A protein, such as a flavoprotein or a cytochrome, that can reversibly gain and lose electrons; functions in the transfer of electrons from organic nutrients to oxygen or some other terminal acceptor.

**electron configuration:** A list showing how many electrons are in each orbital or subshell. There are several notations. The subshell notation lists subshells in order of increasing energy, with the number of electrons in each subshell indicated as a superscript. For example,  $1s^2 2s^2 2p^3$  means "2 electrons in the 1s subshell, 2 electrons in the 2s subshell, and 3 electrons in the 2p subshell."

**electron donor:** A substance that donates electrons in an oxidation-reduction reaction.

**electron dot structure:** a system in which the entire structure of the atom, except its valence electrons, is represented by the symbol for the element. The valence electrons are represented by dots

**electron geometry:** Structure of a compound based on the arrangement of its electrons.

**electron microscope :** A microscope (device used to magnify small objects) that uses electrons (instead of light) to produce an enlarged image. An electron microscope shows tiny details better than any other type of microscope.

**Electron Redistribution:** Redistribution occurs when electrons in a chemical bond are given up, received, or shared by two or more atoms. The concept accepts that electrons will move around the nuclei of several atoms in a chemical bond.

**electron transfer:** Movement of electrons from substrates to oxygen via the carriers of the respiratory (electron transfer) chain.

**electron volt:** Energy required to move an electron through a potential difference of 1 volt. An electron volt is equivalent to  $1.6 \times 10^{-19}$  J.

**electron-:** A fundamental constituent of matter, having a negative charge of  $1.602\,176\,462 \times 10^{-19}$  coulombs  $\pm 0.000\,000\,063 \times 10^{-19}$  coulombs and a mass of  $9.109\,381\,88 \times 10^{-31}$  kg  $\pm 0.000\,000\,72 \times 10^{-31}$  kg [1998 CODATA values].

**Electron-density map:** A plot of electron density versus location in a unit cell. Electron-density maps are used early in a crystal structure solution to solve the structure.

**Electron-spin resonance (ESR) spectroscopy:** A method involving measuring the resonance of free electrons in material. This method can provide structural and dynamic information about a solid.

**electronegative:** Referring to the property of electronegativity. The most electronegative element is fluorine, having an electronegativity of 4.0 on the Pauling scale. Non-metals are more electronegative than metals. OR The ability of an atom to attract electrons is its electronegativity. Elements that easily form negatively charged ions, such as fluorine and oxygen, have a high electronegativity. Generally speaking, the top right corner of the periodic table is home to the most electronegative elements, while the bottom left is the least electronegative.

**electronegativity:** Measure of a substance's ability to attract electrons. OR The ability of an atom in a molecule to attract electrons toward itself. OR a number describing the attraction of an element for electrons in a chemical bond. OR the measure of an atom's ability to attract electrons toward itself in a covalent bond. The halogen fluorine is the most electronegative element. OR Electronegativity is a measure of the attraction an atom has for bonding electrons. Bonds between atoms with different electronegativities are polar, with the bonding electrons spending more time on average around the atom with higher electronegativity.

**electronegativity scale:** an arbitrary scale by which the electronegativity of individual atoms can be compared.

**electronic cigarette :** A device that has the shape of a cigarette, cigar, or pen and does not contain tobacco. It uses a battery and contains a solution

of nicotine, flavorings, and other chemicals, some of which may be harmful. When electronic cigarettes are used, the nicotine solution turns into a mist that can be inhaled into the lungs. The amount of nicotine in individual e-cigarettes can vary. It is not yet known whether electronic cigarettes are safe or if they can be used to help smokers quit smoking. Also called e-cigarette.

**electronic configuration:** The electronic configuration is a description of the arrangement of the electrons in an atom, starting from the lowest energy level (shell). For example, the electronic structure of sodium is 2, 8, 1. (Also known as an electronic structure.)

**electronic health record :** An electronic (digital) collection of medical information about a person that is stored on a computer. An electronic health record includes information about a patient's health history, such as diagnoses, medicines, tests, allergies, immunizations, and treatment plans. Electronic health records can be seen by all healthcare providers who are taking care of a patient and can be used by them to help make recommendations about the patient's care. Also called EHR and electronic medical record.

**electronic medical record :** An electronic (digital) collection of medical information about a person that is stored on a computer. An electronic medical record includes information about a patient's health history, such as diagnoses, medicines, tests, allergies, immunizations, and treatment plans. Electronic medical records can be seen by all healthcare providers who are taking care of a patient and can be used by them to help make recommendations about the patient's care. Also called EHR and electronic health record.

**electronic structure:** The electronic structure is a description of the arrangement of the electrons in an atom, starting from the lowest energy level (shell). For example, the electronic structure of sodium is 2, 8, 1. (Also known as an electronic configuration.)

**ELECTRONIC TREATING:** A method of oxidizing a film of polyethylene to render it printable by passing the film between electrodes and subjecting it to a high voltage corona discharge.

**ELECTRONS:** have both wave and particle properties.

**electrophile:** an "electron seeker;" an atom that seeks an electron to stabilize itself.

**electrophile:** An electron-deficient group with a strong tendency to accept electrons from an electron-rich group (nucleophile).

**electrophilic addition:** a reaction in which the addition of an electrophile to an unsaturated molecule results in the formation of a saturated molecule.

**Electrophilic aromatic substitution reaction:** A common chemical reaction that involves the attack of the pi electrons of an aromatic ring on an electrophile to form a resonance-stabilized carbocation intermediate that then loses a proton to form a substituted aromatic compound.

**electrophoresis:** A method of separating large molecules (such as DNA fragments or proteins) from a mixture of similar molecules. An electric current is passed through a medium containing the mixture, and each kind of molecule travels through the medium at a different rate, depending on its electrical charge and size. Separation is based on these differences.

**Electrophoresis:** The movement of particles in an electrical field. A commonly-used technique for analysis of mixtures of molecules in solution according to their electrophoretic mobilities. OR A technique used to separate charged molecules, such as proteins and nucleic acids, that is based on the fact that such molecules will move at differing rates in an electric field, depending on factors such as net charge, size, and shape of the molecules.

**electrophoresis :** A laboratory technique that uses an electric current to separate substances, such as proteins or nucleic acids. The size and electrical charge (either positive or negative) of a substance determines how far it moves with the current. Electrophoresis may be used to help diagnosis certain diseases. There are many different types of electrophoresis.

**electroplating:** Electroplating is the coating of a metal object by a thin layer of another metal(s) during electrolysis. OR The deposition of a layer of metal on a base of metal or conducting surface by electrolysis. OR Deposition of metals on certain plastics and molds for finish.

**electroporation therapy :** Treatment that generates electrical pulses through an electrode placed in a tumor to enhance the ability of anticancer drugs to enter tumor cells. Also called EPT.

**electrorefining:** Electrorefining is a method for purifying a metal using electrolysis. An electric current is passed between a sample of the impure metal and a cathode when both are immersed in a solution that

contains cations of the metal. Metal is stripped off the impure sample and deposited in pure form on the cathode.

**electroshock therapy :** A treatment for severe depression and certain mental disorders. A brief seizure is induced by giving electrical stimulation to the brain through electrodes placed on the scalp. Also called ECT and electroconvulsive therapy.

**Electrospray ionization mass spectrometry:** A means of determining the mass of a protein. A protein sample is sprayed into a mass spectrometer, and the mass of the protein is determined by the mass-to-charge ratio of proteins differing in the number of bound protons.

**electrostatic:** Having to do with the positive and negative charges on species such as electrons or ions. The important principle is that like charges repel and opposite charges attract.

**electrostatic attraction:** the attraction of a positive ion for a negative ion.

**electrostatic forces:** Forces between charged objects.

**electrosurgery :** A procedure that uses an electric current to cut, remove, or destroy tissue and control bleeding. The current is carried through an electrode that is placed on or near the tissue. Electrosurgery may be used to treat basal cell skin cancer or other types of skin problems, such as actinic keratoses, warts, and moles. It may also be used to remove abnormal cells from the cervix and to treat abnormal tissue of the vagina, vulva, penis, and anus that might become cancer. Examples of electrosurgery are electrodesiccation and fulguration.

**Electrovalence:** Electrovalence is the ability of an element to bond with other elements by giving or receiving an electron. This state of valence can be positive (positive ions) or negative (negative ions). The created bonds are called electrovalent or ionic bonds. Many salts (NaCl) have electrovalent bonds.

**Electrovalent Bond:** A chemical bond that occurs between two atoms when one or more electrons are passed from one atom to another. When they exchange electrons, each of the atoms should have a filled shell. A good example of an ionic bond is the sodium chloride bond. You may also hear the term ionic bond.

**Element:** a triangle defined by at least three nodes, creating the basis for the finite element analysis. OR One of the 103 known chemical substances

that cannot be broken down further without changing its chemical properties. Some examples include hydrogen, nitrogen, gold, lead, and uranium. See the periodic table of elements. OR This is a substance that is composed of only one kind of atom. All the atoms in an element are the same. A chemical reaction cannot break an element into anything simpler. OR a substance made of one kind of atom that cannot be broken down chemically. OR A component of the periodic table; a pure substance that cannot be separated into simpler substances by chemical means OR An element is a substance composed of atoms with identical atomic number. The older definition of element (an element is a pure substance that can't be decomposed chemically) was made obsolete by the discovery of isotopes. OR a substance that cannot be decomposed; each chemical element is characterized by the number of protons in the nucleus. OR An element is a substance made from only one type of atom. An element cannot be broken down into any simpler substances. OR is the simplest form of matter. OR A basic building block of matter that cannot be broken down into a simpler substance by ordinary means. OR Substance consisting of only one type of atom. OR a substance that cannot be resolved into two or more other substances; a substance made up of atoms with the same atomic number.

**element** : A basic part of a whole. In chemistry, refers to a simple substance that cannot be broken down into smaller parts or changed into another substance. The basic part of an element is an atom, which contains protons, neutrons, and electrons. All atoms of an element have the same number of protons. Examples of elements are hydrogen, carbon, oxygen, nitrogen, and calcium.

**element of unsaturation**: a  $\pi$  bond; a multiple bond or ring in a molecule.

**element symbol**: An international abbreviation for element names, usually consisting of the first one or two distinctive letters in element name. Some symbols are abbreviations for ancient names.

**elementary reaction**: A reaction that occurs in a single step. Equations for elementary reactions show the actual molecules, atoms, and ions that react on a molecular level.

**elesclomol**: A small-molecule bis(thio-hydrazide amide) with oxidative stress induction, pro-apoptotic, and potential antineoplastic activities. Elesclomol induces oxidative stress, creating high levels of reactive oxygen species (ROS), such as hydrogen peroxide, in both cancer cells and normal

cells. Because tumor cells have elevated levels of ROS compared to normal cells, the increase in oxidative stress beyond baseline levels elevates ROS beyond sustainable levels, exhausting tumor cell antioxidant capacity, which may result in the induction of the mitochondrial apoptosis pathway. Normal cells are spared because the increase in the level of oxidative stress induced by this agent is below the threshold at which apoptosis is induced.

**elesclomol sodium:** The water soluble sodium salt of a small-molecule bis(thio-hydrazide amide) with oxidative stress induction, pro-apoptotic, and potential antineoplastic activities. Elesclomol induces oxidative stress, creating high levels of reactive oxygen species (ROS), such as hydrogen peroxide, in both cancer cells and normal cells. Because tumor cells have elevated levels of ROS compared to normal cells, the increase in oxidative stress beyond baseline levels elevates ROS beyond sustainable levels, exhausting tumor cell antioxidant capacity, which may result in the induction of the mitochondrial apoptosis pathway. Normal cells are spared because the increase in the level of oxidative stress induced by this agent is below the threshold at which apoptosis is induced. OR A drug used in the treatment of skin cancer that has spread. It is also being studied in the treatment of other types of cancer. It increases the amount of harmful oxygen molecules in cells and may kill cancer cells. It may also help other drugs kill cancer cells. It is a type of oxidative stress inducer.

**Elevated Temperatures:** Thermal expansion of the belt width may adversely affect sprocket engagement with the belt openings.

**Elevation:** The facade of a building; the external elevation.

**Elidel:** (Other name for: pimecrolimus cream)

**Eligard :** A drug used to treat advanced prostate cancer. Under the brand name Lupron, it is also used to treat early puberty in children and certain gynecologic conditions. Eligard is also being studied in the treatment of other types of cancer. It blocks the testicles from making testosterone (a male hormone) and the ovaries from making estrogen and progesterone (female hormones). It may stop the growth of prostate cancer cells that need testosterone to grow. Eligard is a type of gonadotropin-releasing hormone (GnRH) agonist. Also called leuprolide acetate, Lupron, and Viadur.

**eligibility criteria :** In clinical trials, requirements that must be met for an individual to be included in a study. These requirements help make sure that patients in a trial are similar to each other in terms of specific factors such

as age, type and stage of cancer, general health, and previous treatment. When all participants meet the same eligibility criteria, it gives researchers greater confidence that results of the study are caused by the intervention being tested and not by other factors.

**elimination (in metabolism):** The expelling of a substance or other material from the body (or a defined part thereof), usually by a process of extrusion or exclusion but sometimes through metabolic transformation (WHO, 1979).

**elimination method:** Sometimes called the addition method, it is a method for solving a system of two equations. One or both of the equations needs to be modified so that when the two equations are added, one of the variables is eliminated.

**Eliquis:** (Other name for: apixaban)

**ELISA:** Short for enzyme-linked immunosorbent assay, an immunochemical test often employed in the biochemical sciences.

**ELISA :** A laboratory technique that uses antibodies linked to enzymes to detect and measure the amount of a substance in a solution, such as serum. The test is done using a solid surface to which the antibodies and other molecules stick. In the final step, an enzyme reaction takes place that causes a color change that can be read using a special machine. There are many different ways that an ELISA can be done. ELISAs may be used to help diagnose certain diseases. Also called enzyme-linked immunosorbent assay.

**ELISA (enzyme-linked immunoabsorbant assay):** An assay for quantifying the presence of an antigen by using an enzyme linked to an antibody to the antigen.

**elisodepsin:** A marine-derived, synthetic cyclic depsipeptide with potential antineoplastic activity. Elisodepsin is a derivative of a natural marine compound that belongs to a family of dehydro aminobutyric acid-containing peptides (kahalalides) isolated from the herbivorous marine mollusk *Elysia rufescens*. Although the primary mechanism of action has yet to be elucidated, this agent exhibits anti-proliferative activity in a wide variety of cancer cell types, including breast, colon, pancreas, lung, and prostate; it appears to induce oncolytic rather than apoptotic cell death.

**Elitek :** A drug used to treat high blood levels of uric acid in patients with leukemia, lymphoma, and other types of cancer who are receiving certain

types of cancer treatment. It is also being studied in the treatment of other medical conditions. Elitek is a type of recombinant enzyme and a type of urate-lowering drug. Also called rasburicase and recombinant urate oxidase.

**Elixophyllin:** (Other name for: theophylline)

**ellagic acid/Annona muricata supplement:** A nutritional supplement containing the phytochemical polyphenol, ellagic acid, and an extract of *Annona muricata*, with potential chemopreventive activity. Although the exact mechanism of action for ellagic acid has yet to be fully elucidated, this agent acts as an anti-oxidant and reduces oxidative stress. This agent also appears to protect the body against certain carcinogens, either through preventing DNA binding or by increasing the rate of their metabolism and deactivation. Certain extracts of *Annona muricata*, a member of the custard apple plants and belonging to the Annonaceae family, may have antiviral activity, potential targets include human papilloma virus (HPV), and may be cytotoxic against various types of cancer cells.

**Ellence :** A drug used together with other drugs to treat early breast cancer that has spread to lymph nodes. It is also being studied in the treatment of other types of cancer. Ellence is a type of anthracycline antibiotic. Also called epirubicin and epirubicin hydrochloride.

**ellipsis:** indicates an omission from a quotation.

**elliptical clause:** a clause in which a word or words have been omitted.

**elliptinium acetate:** Acetate salt of elliptinium, a derivative of the alkaloid ellipticine isolated from species of the plant family Apocynaceae, including *Bleekeria vitensis*, a plant with anti-cancer properties. As a topoisomerase II inhibitor and intercalating agent, elliptinium stabilizes the cleavable complex of topoisomerase II and induces DNA breakages, thereby inhibiting DNA replication and RNA and protein synthesis.

**Elmendorf Tear Test:** Test to measures the resistance to tearing.

**Elmiron:** (Other name for: pentosan polysulfate sodium)

**Elocon :** A drug that is used in a cream to treat certain skin conditions and in a nasal spray to treat sinus problems caused by allergies. It is being studied as a way to treat inflammation of the skin caused by radiation therapy. Elocon is a type of corticosteroid. Also called mometasone, mometasone furoate, and Nasonex.

**Elongated Spiral Edge:** A retaining edge fabricated by adding elongated spirals to the turned-up connectors or rod reinforcements.

**Elongation:** Usually expressed as a percentage, it is the increase in length of a test specimen when a tensile load is placed on the sample. Such test data is often obtained by equipment such as an Instron during tensile testing. OR The second of the three stages of all biological polymerization reactions. In this stage, polymerization is due to the repetition of a basic process characteristic of the specific molecule being synthesized. OR Deformation caused by stretching; the fractional increase in length of a material stressed in tension. OR the fractional increase in length of a material stressed in tension. OR Deformation caused by stretching; the fractional increase in length of a material stressed in tension. OR the fractional increase in length of a material stressed in tension.

**Elongation at break:** How much the material can stretch or deform before breaking. This property of LSR allows for some difficult parts to be surprisingly removed from molds. For example, LR 3003/50 has an elongation at break of 480 percent.

**Elongation factor:** One of a set of proteins that facilitate the elongation phase of protein synthesis.

**Elongation factor G (EF-G):** A member of the G-protein family that closely resembles the complex between EF-Tu and trna. Hydrolysis of GTP by EF-G causes the trnas and mrna to move through the ribosome a distance corresponding to one codon.

**Elongation factor Ts (EF-Ts):** A protein that binds to the GDP-bound form of EF-Tu and induces the release of GDP, thereby enabling EF-Tu to participate in another elongation step. OR A member of the G-protein family that delivers aminoacyl-trnas to the A site of the ribosome with the concomitant hydrolysis of GTP to GDP.

**Elongation factors:** Protein factors uniquely required during the elongation phase of protein synthesis. Elongation factor G (EF-G) brings about the movement of the peptidyl tRNA from the A site to the P site of the ribosome. OR Specific proteins required in the elongation of polypeptide chains by ribosomes.

**Elongation, Break:** The increase in distance between two gauge marks at the break point divided by the original distance between the marks. A zero value in the field indicates that it measured less than one.

**Elongation, Yield :** The increase in distance between two gauge marks at a yield point divided by the original distance between the marks. A zero value indicates that it measured less than one.

**ELONGATIONAL VISCOSITY (also called EXTENSIONAL VISCOSITY):** The resistance to extension (while the (common) viscosity term describes the resistance to shearing). For Newtonian fluids the elongational viscosity is equal to 3 times the (common) viscosity (3 is known as the Trouton Ratio). Polymer melts are non-Newtonian and the elongational viscosity is usually between 3 and 100 times the viscosity. Melt strength is just a rough engineering measure of the elongational viscosity, determined from the force required to break an extruded strand of polymer by a pair of rollers (see MELT STRENGTH).

**elotuzumab:** A drug used with lenalidomide and dexamethasone to treat multiple myeloma. It is used in patients whose cancer was treated with one to three anticancer therapies. Elotuzumab binds to a protein called CS1, which is found on myeloma cells and some types of immune cells.

Elotuzumab may block CS1 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called Empliciti and HuLuc63.

OR A humanized monoclonal antibody directed against the human CS1 (CD2 subset 1, CRACC, SLAMF7) antigen with potential antineoplastic activity. Elotuzumab binds to the CS1 antigen, which may trigger antibody-dependent cellular cytotoxicity (ADCC) in cells expressing CS1. CS1 is a cell surface glycoprotein belonging to the CD2 subset of the immunoglobulin superfamily (IgSF) and is highly expressed by multiple myeloma cells, but minimally expressed by normal cells.

**Eloxatin:** (Other name for: oxaliplatin)

**Eloxatin :** A drug used with other drugs to treat colorectal cancer that is advanced or has come back. It is also being studied in the treatment of other types of cancer. Eloxatin attaches to DNA in cells and may kill cancer cells. It is a type of platinum compound. Also called oxaliplatin.

**elsamitrucin:** A heterocyclic antineoplastic antibiotic isolated from the bacterium Actinomycete strain J907-21. Elsamitrucin intercalates into DNA at guanine-cytosine (G-C)-rich sequences and inhibits topoisomerase I and II, resulting in single-strand breaks and inhibition of DNA replication.

**elsiglutide:** A synthetic glucagon-like peptide-2 (GLP-2) analogue with potential antidiarrheal and intestinotrophic activities. Upon subcutaneous

administration, elsiglutide, a 39 amino acid polypeptide, binds to GLP-2 receptors and thereby promotes proliferation of epithelial cells.

Regeneration of endothelial cells damaged during chemotherapy may prevent or decrease chemotherapy-induced diarrhea. In addition, elsiglutide may prevent chemotherapy-induced intestinal injury. GLP-2, a peptide hormone primarily produced in the small intestines in response to food, plays a key role in intestinal epithelial growth, metabolism and regeneration of epithelial cells. Check for active clinical trials using this agent.

**Elspar :** A drug that is used to treat acute lymphoblastic leukemia (ALL) and is being studied in the treatment of some other types of cancer. It is an enzyme taken from the bacterium *Escherichia coli* (*E. coli*). It breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. Also called asparaginase and L-asparaginase.

**eltrombopag olamine:** The orally active ethanolamine salt of eltrombopag, a small-molecule, nonpeptide thrombopoietin receptor agonist with megakaryopoiesis-stimulating activity. Eltrombopag binds to and stimulates the transmembrane domain of the platelet thrombopoietin receptor (TPO-R or CD110), a member of the hematopoietin receptor superfamily. Activation of TPO-R leads to the proliferation and differentiation of cells in the megakaryocytic lineage and an increase in platelet production.

**eltrombopag olamine :** A drug used to treat thrombocytopenia (a lower-than-normal number of platelets in the blood) in patients with chronic immune thrombocytopenic purpura (a condition in which platelets are destroyed by the immune system). It is used in patients who did not get better with corticosteroids, immunoglobulins, or surgery to remove the spleen. It is also being studied in the treatment of other conditions and types of cancer. Eltrombopag olamine causes more platelets to be made in the bone marrow. It is a type of thrombopoietin receptor agonist. Also called Promacta.

**Eluate:** The fluid that has passed through (eluted from) a chromatographic column. OR The effluent from a chromatographic column.

**EM-1421:** A substance being studied in the treatment of cancer. It blocks proteins needed for cancer growth. It is a type of transcriptional inhibitor. Also called tetra-O-methyl NDGA and tetra-O-methyl nordihydroguaiaretic acid.

**embalmer** : A person who treats dead bodies with embalming fluid (a chemical like formaldehyde) to keep them from decaying.

**Embden-Meyerhof pathway:** Glycolysis.

**embolism** : A block in an artery caused by blood clots or other substances, such as fat globules, infected tissue, or cancer cells.

**embolization** : A procedure that uses particles, such as tiny gelatin sponges or beads, to block a blood vessel. Embolization may be used to stop bleeding or to block the flow of blood to a tumor or abnormal area of tissue. It may be used to treat some types of liver cancer, kidney cancer, and neuroendocrine tumors. It may also be used to treat uterine fibroids, aneurysms, and other conditions. Types of embolization are arterial embolization, chemoembolization, and radioembolization.

**Embossing:** Process for producing raised or sunken designs, or relief in custom plastic packaging. Aesthetic and functional. OR techniques used to create depressions of a specific pattern in plastic film and sheeting. OR Techniques used to create depressions of a specific pattern in plastics film and sheeting. Such embossing in the form of surface patterns on molded part by the treatment of the mold surface by photoengraving or other process. OR Pressing a raised pattern into a bag to increase the ease of opening and handling.

**EMBOSSING:** Techniques used to create depressions of a specific pattern in plastics film and sheeting. Such embossing in the form of surface patterns on molded part by the treatment of the mold surface by photoengraving or other process.

**Embossing:** Techniques used to create depressions of a specific pattern in plastics film and sheeting. Such embossing in the form of surface patterns on molded part by the treatment of the mold surface by photoengraving or other process.

**Embossing roll:** A roll having a patterned surface used to produce embossed sheeting.

**embryo:** This term is applied to the earliest stages of development of a plant or an animal. The embryo is generally contained in another structure the seed, egg or uterus. OR forms when all the organs of the body have taken shape. OR Plant or animal at an early stage of development.

**embryo :** Early stage in the development of a plant or an animal. In animals that have a backbone or spinal column, this stage lasts from shortly after fertilization until all major body parts appear. In particular, in humans, this stage lasts from about 2 weeks after fertilization until the end of the seventh or eighth week of pregnancy.

**embryo banking :** The process of freezing one or more embryos to save them for future use. Embryo banking involves in vitro fertilization, a procedure in which eggs are removed from a woman's ovary and combined with sperm in the laboratory to form embryos. The embryos are frozen and can later be thawed and placed in a woman's uterus. Embryo banking is a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called embryo cryopreservation and embryo freezing.

**embryo cryopreservation :** The process of freezing one or more embryos to save them for future use. Embryo cryopreservation involves in vitro fertilization, a procedure in which eggs are removed from a woman's ovary and combined with sperm in the laboratory to form embryos. The embryos are frozen and can later be thawed and placed in a woman's uterus. Embryo cryopreservation is a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called embryo banking and embryo freezing.

**embryo freezing :** The process of freezing one or more embryos to save them for future use. Embryo freezing involves in vitro fertilization, a procedure in which eggs are removed from a woman's ovary and combined with sperm in the laboratory to form embryos. The embryos are frozen and can later be thawed and placed in a woman's uterus. Embryo freezing is a type of fertility preservation. It may be useful for women with cancer who want to have children after having radiation therapy, chemotherapy, or certain types of surgery, which can cause infertility. Also called embryo banking and embryo cryopreservation.

**embryology:** the study of embryonic development.

**embryoma :** A mass of rapidly growing cells that begins in embryonic (fetal) tissue. Embryomas may be benign or malignant, and include neuroblastomas and Wilms tumors. Also called embryonal tumor.

**embryonal rhabdomyosarcoma** : A soft tissue tumor that is most common in infants and young children. It begins in muscles, usually in the head, neck, or genitourinary tract. Also called ERMS.

**embryonal tumor** : A mass of rapidly growing cells that begins in embryonic (fetal) tissue. Embryonal tumors may be benign or malignant, and include neuroblastomas and Wilms tumors. Also called embryoma.

**embryonic** : Having to do with an embryo, which is an early stage in the development of a plant or animal.

**embryotoxicity**: The potential of a substance to induce adverse effects in progeny in the first period of pregnancy between conception and the fetal stage (UNEP/IRPTC, 1982).

**Emcyt**: (Other name for: estramustine phosphate sodium)

**EMD 121974**: A substance that is being studied as an anticancer and antiangiogenesis drug. Also called cilengitide.

**Emend**: (Other name for: aprepitant)

**Emend** : A drug used together with other drugs to prevent and control the nausea and vomiting caused by cancer treatment. It is also used to treat nausea and vomiting after surgery. It is a type of antiemetic and a type of substance P/neurokinin 1 receptor antagonist. Also called aprepitant.

**Emend for Injection** : A drug used together with other drugs to prevent and control nausea and vomiting caused by cancer treatment. It is given in a vein. It is a type of antiemetic and a type of substance P/neurokinin 1 receptor antagonist. Also called fosaprepitant dimeglumine.

**emepepimut-S**: A liposome-encapsulated peptide vaccine consisting of a synthetic peptide derived from the mucin 1 (MUC-1) antigen with potential antineoplastic activity. Upon vaccination, emepepimut-S may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against MUC-1-expressing tumor cells, resulting in growth inhibition. MUC-1 antigen is a high-molecular-weight transmembrane glycoprotein that is overexpressed on the cell surfaces of many epithelial tumor cells as well as on the cell surfaces of some B-cell lymphoma cells and multiple myeloma cells.

**Emergency core cooling systems (ECCS)**: Reactor system components (pumps, valves, heat exchangers, tanks, and piping) that are specifically

designed to remove residual heat from the reactor fuel rods in the event of a failure of the normal core cooling system (reactor coolant system).

**Emergency feedwater:** Another name for auxiliary feedwater.

**Emergency preparedness (EP):** The programs, plans, training, exercises, and resources necessary to prepare emergency personnel to rapidly identify, evaluate, and react to emergencies, including those arising from terrorism or natural events such as hurricanes. EP strives to ensure that nuclear power plant operators can implement measures to protect public health and safety in the event of a radiological emergency. Plant operators, as a condition of their licenses, must develop and maintain EP plans that meet NRC requirements. For further detail, see Emergency Preparedness and Response and Backgrounder on Emergency Preparedness at Nuclear Power Plants.

**Emergent-EZ:** (Other name for: hydrocortisone sodium succinate)

**emesis :** Vomiting.

**emetic :** Describes a substance that causes vomiting. Also called emetogenic.

**emetogenic :** Describes a substance that causes vomiting. Also called emetic.

**EMF:** An area of electric and magnetic forces caused by electromagnetic radiation. Researchers are studying whether the EMFs from power lines, electrical appliances, and wireless and cellular telephones can cause cancer or other harmful health effects. Also called electromagnetic field.

**EMI:** Electromagnetic interference

**emission:** The giving off of environmental pollutants from various sources (WHO, 1979). OR the release of light from a chromogenic or fluorescent molecule, when an electron falls from an excited state to a lower energy state of the molecule.

**emission or exposure control:** The technical and administrative procedures applied for the reduction or elimination of emissions from the source or of exposure to the target (WHO, 1988).

**Emission spectrum:** a plot of emitted light wavelength versus the relative intensity of emitted light. Essentially a plot of wavelength versus the probability that the emitted light will have the energy of that wavelength.

OR A plot of relative intensity of emitted radiation as a function of wavelength or frequency.

**emission standard:** This regulatory value is a quantitative limit on the emission or discharge of a potentially toxic substance from a source. See limit values.

**emissions:** Materials (gases, particles, vapors, chemical compounds, etc.) that come out of smokestacks, chimneys, and tailpipes.

**emissivity:** The ratio of the radiation emitted by a surface to that emitted by a black body at the same temperature.

**emitefur :** An anticancer drug that belongs to the family of drugs called antimetabolites.

**emodin :** A substance found in certain plants, including rhubarb. It belongs to a family of compounds called anthraquinones, which have shown anti-inflammatory and anticancer effects.

**EMOLLIENT:** A softening agent, such as lanolin and its derivatives, for use on the skin. OR A substance added to a formulation that gives it softening ability. For example, oils that can soften skin are added as emollients in some skin creams.

**emollient:** A substance that softens or smoothes.

**emollient :** A substance that helps soothe, soften, and increase moisture levels, especially in the skin. Emollients may be used in a lotion, cream, ointment, or gel to prevent or treat dry, rough, scaly, itchy skin and other skin problems, such as rashes or burns. They may also be used to help protect the skin against irritation. Emollients may also be given by mouth to prevent or treat constipation by moistening and softening the stool.

**emphysema :** A disorder affecting the alveoli (tiny air sacs) of the lungs. The transfer of oxygen and carbon dioxide in the lungs takes place in the walls of the alveoli. In emphysema, the alveoli become abnormally inflated, damaging their walls and making it harder to breathe. People who smoke or have chronic bronchitis have an increased risk of emphysema. Emphysema is a type of chronic obstructive pulmonary disease (COPD).

**empirical formula:** Formula showing the simplest ratio of elements in a compound. OR is the simplest whole number ratio of elements in a compound, ie CH<sub>2</sub>. OR The empirical formula gives the simplest ratio of the number of moles of each element present in a compound. OR Empirical

formulas show which elements are present in a compound, with their mole ratios indicated as subscripts. For example, the empirical formula of glucose is  $\text{CH}_2\text{O}$ , which means that for every mole of carbon in the compound, there are 2 moles of hydrogen and one mole of oxygen.

**empirical temperature:** A property that is the same for any two systems that are in thermodynamic equilibrium with each other.

**Empirin:** (Other name for: acetylsalicylic acid)

**Empliciti :** A drug used with lenalidomide and dexamethasone to treat multiple myeloma. It is used in patients whose cancer was treated with one to three anticancer therapies. Empliciti binds to a protein called CS1, which is found on myeloma cells and some types of immune cells. Empliciti may block CS1 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called elotuzumab and HuLuc63.

**EMR:** Radiation that has both electric and magnetic fields and travels in waves. It comes from natural and man-made sources. EMR can vary in strength from low energy to high energy. It includes radio waves, microwaves, infrared light, visible light, ultraviolet light, x-rays, and gamma rays. Also called electromagnetic radiation.

**emtricitabine:** A synthetic fluoro derivative of thiacytidine with potent antiviral activity. Emtricitabine is phosphorylated to form emtricitabine 5'-triphosphate within the cell. This metabolite inhibits the activity of human immunodeficiency virus (HIV) reverse transcriptase both by competing with the natural substrate deoxycytidine 5'-triphosphate and by incorporation into viral DNA causing a termination of DNA chain elongation (due to the lack of the essential 3'-OH group).

**Emtriva:** (Other name for: emtricitabine)

**Emulsifier:** A compound added to a mixture of two immiscible liquids in order to make it an emulsion, and not just two layers of liquid lying on top of each other. An emulsifier will usually be a molecule where one end is highly soluble in water and the other is highly soluble in oil. Sodium dodecyl sulfate, the active ingredient in bubble-blowing mixture, is a surfactant. So is lecithin, found in egg yolk: OR A substance that promotes the dispersion of small globules of one liquid in another liquid when the two liquids will not mix. OR An additive or system which promotes a stable mixture of oils/fats in water.

**Emulsion:** a dispersion of one liquid in another possible only when they are mutually insoluble. OR A suspension of fine droplets of one liquid in another. OR A colloid formed from tiny liquid droplets suspended in another, immiscible liquid. Milk is an example of an emulsion. OR A dispersion where a liquid is dispersed in another liquid - for example, mayonnaise is an emulsion of water in oil and milk is an emulsion of oil in water. Strictly speaking, a dispersion is only an emulsion if the dispersed blobs of liquid are of colloidal dimensions. OR A mixture of solids suspended in a liquid. OR A dispersion of one liquid in a second, immiscible liquid. (see RFF 705.10.07 - EMULSIONS). OR a liquid system in which one liquid is finely dispersed in another liquid in such a manner that the two will not separate through the action of gravity alone. OR A liquid mixture of two or more liquid substances not normally dissolved in one another, one liquid held in suspension in the other. OR A system in which one liquid is dispersed as droplets into another liquid (e.g., oil in water or water in oil).

**Emulsion Paint:** Coating in which resins are suspended in water, then flow together with the aid of an emulsifier. Example: latex paint. OR Paint in which particles are suspended in water or oil with the aid of an emulsifier as in latex paint. OR Water thinned paints based on a variety of synthetic resins including acrylics vinyl acetate and vinyl versatate. These generally have fair to good resistance to alkali and are permeable to water vapour which enables them to be used for early decoration by direct application to new plaster cement rendering and similar surfaces.

**EMULSION POLYMERIZATION:** Emulsion polymerization is a heterogeneous, free-radical polymerization process in which the bulk of the polymeric product is formed inside micelles.

**Enacard:** (Other name for: enalapril maleate)

**enadenotucirev:** A complex, replication-selective, E1B and partial E3 gene deleted, adenovirus type 11p (Ad11p)/Ad3 chimeric oncolytic virus with potential antineoplastic activity. Upon intralesional injection of enadenotucirev, the adenovirus selectively and rapidly replicates in cancer cells; however, it is unable to replicate in normal, healthy cells. This induces a selective adenovirus-mediated cytotoxicity in cancer cells, which leads to cancer cell lysis. Following the lysis of infected cells, the replicated virus is released and can infect adjacent cells, which both induces further

tumor cell oncolysis and may activate the immune system to kill the infected tumor cells. The E1B protein causes p53 inactivation in host cells, which promotes viral replication. Deletion of E1B prevents replication in normal, healthy cells that express wild-type p53. The mutation and subsequent inactivation of p53 in cancer cells enables the E1B-deleted adenovirus to selectively replicate in cancer cells. Partial deletion of the E3 gene, which encodes the adenovirus death protein, enhances the safety profile of the administered adenovirus.

**enalapril :** An antihypertensive agent that can also be used to slow or prevent the progression of heart disease in people with childhood cancer treated with drugs that may be harmful to the heart.

**enalapril maleate:** The maleate salt form of enalapril, a dicarbocyl-containing peptide and angiotensin-converting enzyme (ACE) inhibitor with antihypertensive activity. As a prodrug, enalapril is converted by de-esterification into its active form enalaprilat. Enalaprilat competitively binds to and inhibits ACE, thereby blocking the conversion of angiotensin I to angiotensin II. This prevents the potent vasoconstrictive actions of angiotensin II and results in vasodilation. Enalapril also decreases angiotensin II-induced aldosterone secretion by the adrenal cortex, which leads to an increase in sodium excretion and subsequently increases water outflow.

**Enamel:** Broad classification of paints that dry to a hard, usually glossy finish. Most equipment-coating enamels require baking. Enamels for walls do not. OR Traditionally a slow-drying highly glossy paint having very good flowing properties but low opacity. Recently has been used more widely to describe any type of high-gloss finish. OR Broad classification paints that dry to a hard finish. They may be flat, gloss or semi-gloss.

**enantiomer:** One of a pair of non-superimposable, mirror-image stereoisomers. OR An enantiomer is either of a pair of molecules that are non-superposable mirror images of each other. OR In a chiral compound, either of the two molecular species, R and S, having equal optical rotation but of opposite sign and in which the mirror image is not superimposable with the original structure. OR a stereoisomer that cannot be superimposed on its mirror image. OR One of two "mirror images" of a chiral molecule OR Two molecules that are nonsuperimposable mirror images of each other. One enantiomer rotates plane-polarized light to the

left; the other rotates it to the right. OR A pair of molecules, each with one or more chiral centers, that are mirror images of each other. OR Stereoisomers that are nonsuperimposable mirror images of each other.

**enantiomeric pair:** in optically active molecules with more than one stereogenic center, the two structures that are mirror images of each other are enantiomeric pairs.

**Enantiomers:** Isomers that are mirror images of one another.

**Enantiotropy:** Referring to a situation in which the rank order of stability of the various solid forms changes at different temperatures (in contrast to monotropic).

**enavatumab:** A humanized monoclonal antibody directed against the tumor necrosis factor-like weak inducer of apoptosis receptor (TWEAKR) with potential antineoplastic, immunomodulating and antiangiogenic activities. Enavatumab binds to TWEAKR and inhibits TWEAK ligand binding and activation of NF-kappaB-mediated cytokine release, which may result in tumor cell apoptosis. TWEAKR is a cell-surface receptor with homology to tumor necrosis factor receptors. Upon binding with its ligand, TWEAKR has been shown to stimulate cytokine release and cell proliferation, migration, and survival; it may also promote apoptosis under some conditions. This receptor may be overexpressed in a variety of tumors including those of the pancreas, colon, lung, kidney, and breast.

**Enbrel:** (Other name for: etanercept)

**encapsulated :** Confined to a specific, localized area and surrounded by a thin layer of tissue.

**Encapsulating:** Enclosing an article (usually an electronic component or the like) in a closed envelope of plastic, by immersing the object in a casting resin and allowing the resin to polymerize or, if hot, to cool. OR Enclosing an article in a closed envelope of liquid silicone rubber or plastic, by immersing or over molding the object in a silicone rubber or plastic

**ENCAPSULATING:** Enclosing an article (usually an electronic component or the like) in a closed envelope of plastic, by immersing the object in a casting resin and allowing the resin to polymerize or, if hot, to cool. See POTTING.

**encephalopathy :** A disorder of the brain that can be caused by disease, injury, drugs, or chemicals.

**enchondroma :** A benign (not cancer) growth of cartilage in bones or in other areas where cartilage is not normally found.

**enclomiphene citrate:** The orally bioavailable citrate salt of enclomiphene, the trans-isomer of the nonsteroidal triphenylethylene compound clomiphene, with tissue-selective estrogenic and antiestrogenic activities. As a selective estrogen receptor modulator (SERM), enclomiphene binds to hypothalamic estrogen receptors, blocking the negative feedback of endogenous estrogens and stimulating the release of gonadotropin-releasing hormone (GnRH) from the hypothalamus; released GnRH subsequently stimulates the release of follicle-stimulating hormone (FSH) and luteinizing hormone (LH) from the anterior pituitary, resulting in ovulation. In addition, this agent may bind to estrogen receptors on breast cancer cells, resulting in the inhibition of estrogen-stimulated proliferation in susceptible cell populations.

**End Lock:** Rod cap with locking lip inserted into the module along both edges of the belt to secure rod position.

**End mill:** A cutting tool that is used to machine a mold.

**end moraine:** an extensive and typically crescent shaped pile of till built up at the front of a glacier.

**End Of Flow :** The melt is just touching the last part of the mold to be filled and the pressure at that point is zero.

**end point:** that stage in the titration at which an effect, such as a color change, occurs, indicating that a desired point in the titration has been reached.

**end-of-life care :** Care given to people who are near the end of life and have stopped treatment to cure or control their disease. End-of-life care includes physical, emotional, social, and spiritual support for patients and their families. The goal of end-of-life care is to control pain and other symptoms so the patient can be as comfortable as possible. End-of-life care may include palliative care, supportive care, and hospice care.

**End-product (feedback) inhibition:** The inhibition of the first enzyme in a pathway by the end product of that pathway.

**end-product inhibition:** See feedback inhibition.

**end-stage cancer :** Cancer that cannot be cured and leads to death. Also called terminal cancer.

**endemic :** In medicine, describes a disease that is constantly present in a certain geographic area or in a certain group of people. For example, endemic Burkitt lymphoma (a type of non-Hodgkin lymphoma) is seen at constant levels in certain parts of Africa.

**endergonic reaction:** chemical reactions in which energy is obtained and trapped from the environment. OR A reaction with a positive standard free energy change. OR A chemical reaction that consumes energy (that is, for which  $\Delta G$  is positive).

**Endo-Pat 2000 :** A medical device that tests to see if endothelial cells are damaged. Endothelial cells line the inner walls of blood vessels, lymph vessels, and the heart, and damage to them may be an early sign of heart disease. Endo-Pat 2000 looks for heart disease by using sensors that measure blood flow through a patient's fingers. It is also being used to check blood vessels in patients treated for breast cancer. Also called EndoPat.

**endocarditis :** A condition in which the tissues lining the inside of the heart and the heart valves become inflamed (red and swollen). Endocarditis may be caused by infection with microorganisms, such as bacteria or fungi.

**endocervical curettage :** A procedure in which a sample of abnormal tissue is removed from the cervix using a small, spoon-shaped instrument called a curette. The tissue is then checked under a microscope for signs of cervical cancer. This procedure may be done if abnormal cells are found during a Pap test.

**endocervix :** The inner part of the cervix that forms a canal that connects the vagina to the uterus. The endocervix is lined with cells that make mucus. During a pelvic exam, cells may be scraped from the endocervix. The cells are checked under a microscope for infection, inflammation, and cancer or changes that may become cancer.

**EndoClot:** (Other name for: absorbable modified polymer hemostatic powder)

**endocrine :** Refers to tissue that makes and releases hormones that travel in the bloodstream and control the actions of other cells or organs. Some examples of endocrine tissues are the pituitary, thyroid, and adrenal glands.

**endocrine cancer :** Cancer that occurs in endocrine tissue, the tissue in the body that secretes hormones.

**Endocrine disruptor:** A synthetic chemical that blocks, mimics, or otherwise interferes with naturally produced hormones

**endocrine glands:** glands throughout the animal body that secrete hormones, which help coordinate body systems.

**Endocrine glands:** Specialized tissues whose function is to synthesize and secrete hormones. OR Groups of cells specialized to synthesize hormones and secrete them into the blood to regulate other types of cells.

**endocrine pancreas cell :** A pancreatic cell that produces hormones (e.g., insulin and glucagon) that are secreted into the bloodstream. These hormones help control the level of glucose (sugar) in the blood. Also called islet cell and islet of Langerhans cell.

**endocrine system :** A system of glands and cells that make hormones that are released directly into the blood and travel to tissues and organs all over the body. The endocrine system controls growth, sexual development, sleep, hunger, and the way the body uses food.

**endocrine therapy :** Treatment that adds, blocks, or removes hormones. For certain conditions (such as diabetes or menopause), hormones are given to adjust low hormone levels. To slow or stop the growth of certain cancers (such as prostate and breast cancer), synthetic hormones or other drugs may be given to block the body's natural hormones. Sometimes surgery is needed to remove the gland that makes a certain hormone. Also called hormonal therapy, hormone therapy, and hormone treatment.

**endocrine-inactive tumor :** A tumor that is found in endocrine tissue but does not make extra hormones. Endocrine-inactive tumors usually do not cause symptoms until they grow large or spread to other parts of the body. Also called nonfunctioning tumor.

**endocrinologist :** A doctor who has special training in diagnosing and treating disorders of the endocrine system (the glands and organs that make hormones). These disorders include diabetes, infertility, and thyroid, adrenal, and pituitary gland problems.

**endocrinology :** A branch of medicine that specializes in diagnosing and treating disorders of the endocrine system, which includes the glands and organs that make hormones. These disorders include diabetes, infertility, and thyroid, adrenal, and pituitary gland problems.

**endocytosis:** the process in which a small patch of plasma membrane encloses particles that are near the cell surface. OR The process of internalization of extracellular material by invagination and budding of the cell membrane. OR The uptake of extracellular material by its inclusion within a vesicle (endosome) formed by an invagination of the plasma membrane.

**endoderm:** one of three germ layers that develops into the gastrointestinal tract.

**endogenous :** Produced inside an organism or cell. The opposite is external (exogenous) production.

**Endogenous respiration:** A reduced level of respiration (breathing) in which organisms break down compounds within their own cells to produce the oxygen they need.

**endometrial :** Having to do with the endometrium (the layer of tissue that lines the uterus).

**endometrial biopsy :** A procedure in which a sample of tissue is taken from the endometrium (inner lining of the uterus) for examination under a microscope. A thin tube is inserted through the cervix into the uterus, and gentle scraping and suction are used to remove the sample.

**endometrial cancer :** Cancer that forms in the tissue lining the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops). Most endometrial cancers are adenocarcinomas (cancers that begin in cells that make and release mucus and other fluids).

**endometrial disorder :** Abnormal cell growth in the endometrium (the lining of the uterus).

**endometrial hyperplasia :** An abnormal overgrowth of the endometrium (the layer of cells that lines the uterus). There are four types of endometrial hyperplasia: simple endometrial hyperplasia, complex endometrial hyperplasia, simple endometrial hyperplasia with atypia, and complex endometrial hyperplasia with atypia. These differ in terms of how abnormal the cells are and how likely it is that the condition will become cancer.

**Endometrin:** (Other name for: progesterone vaginal insert)

**endometriosis :** A benign condition in which tissue that looks like endometrial tissue grows in abnormal places in the abdomen.

**endometrium :** The layer of tissue that lines the uterus.

**EndoPat :** A medical device that tests to see if endothelial cells are damaged. Endothelial cells line the inner walls of blood vessels, lymph vessels, and the heart, and damage to them may be an early sign of heart disease. EndoPat looks for heart disease by using sensors that measure blood flow through a patient's fingers. It is also being used to check blood vessels in patients treated for breast cancer. Also called Endo-Pat 2000.

**Endopeptidase:** An enzyme that breaks a polypeptide chain at an internal peptide linkage. OR An enzyme that breaks a phosphodiester linkage at some point within a polynucleotide chain. OR An enzyme that hydrolyzes the interior phosphodiester bonds of a nucleic acid; that is, it acts at points other than the terminal bonds.

**endoplasmic reticulum :** A network of sac-like structures and tubes in the cytoplasm (gel-like fluid) of a cell. Proteins and other molecules move through the endoplasmic reticulum. The outer surface of the endoplasmic reticulum can be smooth or rough. The rough endoplasmic reticulum has many ribosomes on its outer surface and makes proteins the cell needs. The smooth endoplasmic reticulum makes other substances that the cell needs, such as lipids (fats) and carbohydrates (sugars). The endoplasmic reticulum is a cell organelle.

**Endoplasmic reticulum (ER):** An extensive system of double membranes in the cytoplasm of eukaryotic cells; it encloses secretory channels and is often studded with ribosomes (rough endoplasmic reticulum). OR an organelle comprised of a series of membranes extending throughout the cytoplasm; two types exist, rough and smooth ER. OR An extensive system of cytoplasmic membranes that comprises about half the total cell membrane. The region of the ER that binds ribosomes is called the rough ER, and the region that is devoid of ribosomes is called the smooth ER. OR A system of double membranes in the cytoplasm that is involved in the synthesis of transported proteins. The rough endoplasmic reticulum has ribosomes associated with it. The smooth endoplasmic reticulum does not. OR Endoplasmic reticulum. A system of double membranes in the cytoplasm that is involved in the synthesis of transported proteins. The rough endoplasmic reticulum has ribosomes associated with it. The smooth endoplasmic reticulum does not.

**endorphin :** One of several substances made in the body that can relieve pain and give a feeling of well-being. Endorphins are peptides (small

proteins) that bind to opioid receptors in the central nervous system. An endorphin is a type of neurotransmitter.

**endoscope :** A thin, tube-like instrument used to look at tissues inside the body. An endoscope has a light and a lens for viewing and may have a tool to remove tissue.

**endoscopic retrograde cholangiopancreatography :** A procedure that uses an endoscope to examine and x-ray the pancreatic duct, hepatic duct, common bile duct, duodenal papilla, and gallbladder. An endoscope is a thin, tube-like instrument with a light and a lens for viewing. The endoscope is passed through the mouth and down into the first part of the small intestine (duodenum). A smaller tube (catheter) is then inserted through the endoscope into the bile and pancreatic ducts. A dye is injected through the catheter into the ducts, and an x-ray is taken. Also called ERCP.

**endoscopic ultrasound :** A procedure in which an endoscope is inserted into the body. An endoscope is a thin, tube-like instrument that has a light and a lens for viewing. A probe at the end of the endoscope is used to bounce high-energy sound waves (ultrasound) off internal organs to make a picture (sonogram). Also called endosonography and EUS.

**endoscopic ultrasound-guided fine needle aspiration :** A procedure to take a sample of tissue for examination under a microscope. An endoscope with an ultrasound probe and a biopsy needle at the end is inserted through the mouth into the esophagus. An endoscope is a thin, tube-like instrument that has a light and a lens for viewing. The ultrasound probe is used to bounce high-energy sound waves off internal organs and tissues to make a picture on a monitor. This picture helps the doctor see where to place the biopsy needle. Also called EUS-FNA.

**endoscopy :** A procedure that uses an endoscope to examine the inside of the body. An endoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**endoskeleton:** an internal support system in the echinoderms and most vertebrates that may include a framework of bones and cartilage that serves as a point of attachment for muscle.

**Endosome:** A component of the receptor-mediated endocytotic pathway in which sorting decisions about the endocytosized material are made; endosomes are derived from coated vesicles that lose the clathrin coat.

**endosonography** : A procedure in which an endoscope is inserted into the body. An endoscope is a thin, tube-like instrument that has a light and a lens for viewing. A probe at the end of the endoscope is used to bounce high-energy sound waves (ultrasound) off internal organs to make a picture (sonogram). Also called endoscopic ultrasound and EUS.

**endosperm**: the female tissue that encloses the seed within the angiosperms.

**endostatin** : A substance being studied in the treatment of cancer. Endostatin is made from a type of collagen (a protein found in cartilage and other connective tissue). It may prevent the growth of new blood vessels that tumors need to grow. Endostatin is a type of antiangiogenesis agent. Also called COL18A1.

**endothelial cell** : The main type of cell found in the inside lining of blood vessels, lymph vessels, and the heart.

**endothelin B receptor agonist SPI-1620**: A highly selective peptide agonist of the endothelin-B receptor. Endothelin B receptor agonist SPI-1620 binds to endothelin-B receptors on endothelial cells in tumor blood vessels, which, unlike the angioarchitecture of normal blood vessels, are relatively devoid of smooth muscle. This agent may induce a transient, selective increase in blood flow to a tumor, which may result in an increase in the delivery of anticancer agents to the tumor and, so, an increase in anticancer agent efficacy.

**endothelin receptor antagonist** : A drug that blocks the hormone endothelin and may prevent prostate cancer from spreading to the bones. It may also prevent the growth and spread of other types of cancer, including colorectal cancer.

**endothelin-1 protein receptor antagonist** : A substance that blocks the binding of the endothelin-1 protein to its receptor. Endothelin-1 is a small molecule that causes changes in blood vessels and helps regulate blood pressure. It can also stimulate the growth of some types of cells.

**endothermic**: Process that absorbs heat from its surroundings as the reaction proceeds. OR A endothermic reaction absorbs energy from its surroundings, resulting in a fall in temperature. OR refers to a reaction that requires heat. OR A process that absorbs heat. The enthalpy change for an endothermic process has a positive sign.

**ENDOTHERMIC REACTION:** takes more energy to start it than it gives back. It has a positive  $\Delta H$ . It needs energy to keep it going. An example is cooking. (Chippers a baking!) OR When heat is given off curing a chemical reaction. OR A chemical reaction that takes up heat (that is, for which  $\Delta H$  is positive). OR A chemical reaction in which heat is absorbed.

**endpoint:** The experimental estimate of the equivalence point in a titration.

**endpoint :** In clinical trials, an event or outcome that can be measured objectively to determine whether the intervention being studied is beneficial. The endpoints of a clinical trial are usually included in the study objectives. Some examples of endpoints are survival, improvements in quality of life, relief of symptoms, and disappearance of the tumor.

**enema :** The injection of a liquid through the anus into the large bowel.

**energy:** Ability to do work. OR The ability to do work and transfer heat. OR the concept of motion or heat required to do work. OR the ability to do work or make change. OR Energy is an abstract property associated with the capacity to do work.

**energy balance :** In biology, the state at which the number of calories eaten equals the number of calories used. Energy balance is affected by physical activity, body size, amount of body fat and muscle, and genetics.

**energy balance models:** An analytical technique to study the solar radiation incident on the Earth in which explicit calculations of atmospheric motions are omitted. In the zero- dimensional models, only the incoming and outgoing radiation is considered. The outgoing infrared radiation is a linear function of global mean surface air temperature, and the reflected solar radiation is dependent on the surface albedo. The albedo is a step function of the global meansurface air temperatures, and equilibrium temperatures are computed for a range of values of the solar constant. The one-dimensional models have surface air temperature as a function of latitude. At each latitude, a balance between incoming and outgoing radiation and horizontal transport of heat is computed. (Abbreviated as EBM.)

**Energy charge:** The fractional degree to which the AMP-ADP-ATP system is filled with high-energy phosphates (phosphoryl groups). OR A means of determining the energy status of the cell, equal to the concentration of ATP plus one-half the concentration of ADP, all divided by the total adenine nucleotide concentration. OR The fractional degree to

which the ATP/ADP system is filled with high-energy phosphate groups.

**energy coupling:** The transfer of energy from one process to another.

**energy healing :** A form of complementary and alternative medicine based on the belief that a vital energy flows through the human body. The goal of energy healing is to balance the energy flow in the patient. It is used to reduce stress and anxiety and promote well-being. Energy healing is being studied in patients receiving cancer therapy, to find out if it can improve quality of life, boost the immune system, or reduce side effects. Also called energy therapy.

**Energy Information Administration (EIA):** The agency, within the U.S. Department of Energy, that provides policy-neutral statistical data, forecasts, and analyses to promote sound policymaking, efficient markets, and public understanding regarding energy and its interaction with the economy and the environment.

**Energy Minimisation:** In molecular modelling, energy minimisations refer to operations carried out to detect a stable conformation for a molecule

**energy of reaction:** the difference between the total energy content of the reactants and the total energy content of the products. The greater the energy of reaction, the more stable the products.

**energy therapy :** A form of complementary and alternative medicine based on the belief that a vital energy flows through the human body. The goal of energy therapy is to balance the energy flow in the patient. It is used to reduce stress and anxiety and promote well-being. Energy therapy is being studied in patients receiving cancer therapy, to find out if it can improve quality of life, boost the immune system, or reduce side effects. Also called energy healing.

**Engerix-B:** (Other name for: hepatitis B vaccine (recombinant))

**Engineering Plastics :** A broad term covering plastics, with or without fillers or reinforcements, which have improved mechanical, chemical and thermal properties over commodity grades of resins. OR A broad term covering all plastics, with or without fillers or reinforcements, which have mechanical, chemical and thermal properties suitable for use, in construction, machine components and chemical processing equipment. OR Plastic resins that have high-performance properties such as high

temperature stability, hot hardness, abrasion resistance and corrosion resistance.

**Engineering Polymers:** The Engineering Polymers are a grouping of specialised polymer materials that have been "engineered" to have specific materials properties. These generally relate to high strength as well as temperature and chemical resistance. These materials are costly to make and rely on their high performance characteristics as cost reduction programs provide OEM producers with a strong incentive to replace them with lower cost commodity polymers

**ENGINEERING RESINS:** Resins for high-performance applications. This category includes polycarbonates (PC) and polyamides (PA) like nylon.

**English chamomile :** A type of chamomile plant with daisy-like white flowers that is found in Europe, North America, and Argentina. The dried flowers are used in teas to calm and relax, to improve sleep, and to help with stomach problems. Its essential oil (scented liquid taken from plants) is used in perfumes, shampoos, face creams, lotions, and aromatherapy. The scientific names are *Chamaemelum nobile* and *Anthemis nobilis*. Also called Roman chamomile.

**English lavender :** A plant with aromatic leaves and flowers that is a member of the mint family. Oil from the flowers has been used in some cultures to treat certain medical problems, to keep insects away, and to wash in. It is also used in aromatherapy. Perillyl alcohol, a substance found in English lavender, is being studied in cancer prevention and treatment. The scientific name is *Lavandula angustifolia*. Also called lavender and true lavender.

**Enhancer:** A DNA sequence that can stimulate transcription at an appreciable distance from the site where it is located. It acts in either orientation and either upstream or downstream from the promoter. OR DNA sequences that have no promoter activity themselves but that can greatly enhance the activity of other promoters; enhancers can exert their stimulatory effect over a distance of several thousand nucleotides. OR DNA sequences that facilitate the expression of a given gene; may be located a few hundred, or even thousand, base pairs away from the gene.

**Enhanzyn:** (Other name for: Detox-B adjuvant)

**eniluracil:** An anticancer drug that increases the effectiveness of fluorouracil. Also called ethynyluracil. OR An orally-active fluoropyrimidine analogue. Eniluracil inhibits dihydropyrimidine dehydrogenase, the rate-limiting enzyme that catabolizes and inactivates 5-fluorouracil (5-FU) in the liver. Co-administration of ethynyluracil permits the oral administration of 5-FU.

**enkephalin:** Enkephalins are molecules produced naturally by the central nervous system to numb pain. Enkephalins lock into receptors on the surface of a nerve cell and open ion channels. Ions flow into the cell and the distribution of charge on either side of the cell membrane becomes such that the nerve cell cannot fire.

**enobosarm:** A non-steroidal agent with anabolic activity. Enobosarm is designed to work like testosterone, thus promoting and/or maintaining libido, fertility, prostate growth, and muscle growth and strength. Mimicking testosterone's action, this agent may increase lean body mass, thereby ameliorating muscle wasting in the hypermetabolic state of cancer cachexia.

**enol:** an unstable compound (for example, vinyl alcohol) in which a hydroxide group is attached to a carbon bearing a carbon-carbon double bond. These compounds tautomerize to form ketones, which are more stable.

**Enol phosphate:** A compound with a high phosphoryl transfer potential because the phosphoryl group traps the molecule in an unstable enol form. On transfer of the phosphate, the molecule converts into the more stable ketone form.

**enolate ion:** the resonance stabilized ion formed when an aldehyde or ketone loses an  $\alpha$  hydrogen.

**enoxaparin:** A drug used to prevent blood clots. It belongs to the family of drugs called anticoagulants. OR A low molecular weight, synthetic heparin. As an anticoagulant/antithrombotic agent, enoxaparin's mechanism of action is similar to that of heparin, although it exhibits a higher ratio of anti-Factor Xa to anti-Factor IIa activity. This agent also has anti-inflammatory properties, inhibiting monocyte adhesion to tumor necrosis factor alpha- or lipopolysaccharide-activated endothelial cells. Compared to unfractionated heparins, the use of enoxaparin is associated with lower incidences of osteoporosis and heparin-induced thrombocytopenia.

**enriched food :** A food that has nutrients added back that were lost during processing. Examples are bread, pasta, and other products made from white flour that have B vitamins added back.

**enrichment:** the addition of nitrogen, phosphorous, and carbonaceous compounds, or other nutrients into a lake or other waterway that greatly increases the growth potential for algae and other aquatic plants. Most frequently, enrichment results from the inflow of sewage effluents or from agricultural runoff. OR Ornament particularly carved or modelled decoration to a building.

**ensituximab:** A chimeric monoclonal antibody against human colorectal and pancreatic carcinoma-associated antigens (CPAAs) with potential immunomodulating and anti-tumor activities. Ensituximab binds to CPAAs, which may activate the immune system to exert a cytotoxic T-lymphocyte (CTL) response and an antibody-dependent cellular cytotoxicity (ADCC) response against CPAA-expressing tumor cells. CPAAs, cell surface proteins, are upregulated on colon and pancreatic tumor cells. Ensituximab contains the variable region of the heavy and light chain of murine NPC-1 and linked in-frame to constant regions of a human IgG1 isotype.

**Ensure :** A type of nutrition drink that may help people who cannot get all the nutrients they need from foods and other drinks. Ensure has vitamins, minerals, protein, and fats. It may be added to a person's diet to help build strong bones, rebuild muscle and strength, and help the body heal after injury or surgery. Ensure may be taken by mouth or given through tube feeding. Ensure is a type of polymeric enteral nutrition formula and a type of dietary supplement.

**ENT doctor :** A doctor who has special training in diagnosing and treating diseases of the ear, nose, and throat. Also called otolaryngologist.

**entecavir:** A synthetic analog of 2-deoxyguanosine with antiviral activity against hepatitis B virus (HBV). Entecavir is activated in vivo to a 5-triphosphate metabolite. In turn, the triphosphate form competes with the natural substrate deoxyguanosine triphosphate (dGTP) for incorporation into viral DNA. The incorporation of the activated triphosphate metabolite of entecavir inhibits the reverse transcriptase (RT) viral RNA-dependent HBV DNA polymerase and, so, the replication of viral DNA and transcription.

**EnteraGam:** (Other name for: serum-derived bovine immunoglobulin protein isolate)

**enteral nutrition :** A form of nutrition that is delivered into the digestive system as a liquid. Drinking nutrition beverages or formulas and tube-feeding are forms of enteral nutrition. People who are unable to meet their needs with food and beverages alone, and who do not have vomiting or uncontrollable diarrhea may be given tube-feedings. Tube-feeding can be used to add to what a person is able to eat or can be the only source of nutrition. A small feeding tube may be placed through the nose into the stomach or the small intestine, or it may be surgically placed into the stomach or the intestinal tract through an opening made on the outside of the abdomen, depending on how long it will be used.

**Entereg:** (Other name for: alvimopan)

**Enterex Glutapak-10:** (Other name for: glutamine)

**Enteric:** Of intestinal origin, especially applied to wastes or bacteria.

**enteric-coated TRPM8 agonist D-3263 hydrochloride:** An enteric-coated orally bioavailable formulation of the hydrochloride salt of a small-molecule agonist for transient receptor potential melastatin member 8 (TRPM8 or Trp-p8) with potential antineoplastic activity. The active ingredient in enteric-coated TRPM8 agonist D-3263 hydrochloride binds to and activates TRPM8, which may result in an increase in calcium and sodium entry; the disruption of calcium and sodium homeostasis; and the induction of cell death in TRPM8-expressing tumor cells. This agent may decrease dihydrotestosterone (DHT) levels, which may contribute to its inhibitory effects on prostate cancer and BPH. TRPM8 is a transmembrane calcium channel protein that is normally expressed in prostate cells and appears to be overexpressed in benign prostatic hyperplasia (BPH) and in prostate cancer.

**enteric-coated zoledronic acid tablet MER-101:** An oral tablet formulation containing zoledronic acid combined with a proprietary absorption enhancer for improved zoledronic acid gastrointestinal absorption with anti-bone-resorption activity. The third-generation bisphosphonate zoledronic acid binds to hydroxyapatite crystals in the bone matrix, slowing their dissolution and inhibiting the formation and aggregation of these crystals. This agent also inhibits farnesyl pyrophosphate synthase, an enzyme involved in terpenoid biosynthesis.

Inhibition of this enzyme prevents the biosynthesis of isoprenoid lipids, donor substrates of farnesylation and geranylgeranylation during the post-translational modification of small GTPase signalling proteins, which are important in the process of osteoclast turnover. The proprietary absorption enhancer is a GRAS (generally-recognized-as-safe) food additive.

**Entericin:** (Other name for: acetylsalicylic acid)

**enterohepatic circulation:** Intestinal reabsorption of material that has been excreted through the bile and transferred back to the liver, making it available for biliary excretion again (WHO, 1979).

**enterostomal therapist :** A health professional trained in the care of persons with stomas, such as colostomies or urostomies.

**Enthalpic change:** A change in the heat ( $\Delta H$ ) of the compound. For example, a change in the crystal form or structure is an enthalpic change.

**enthalpy:** Enthalpy (H) is defined so that changes in enthalpy (H) are equal to the heat absorbed or released by a process running at constant pressure. While changes in enthalpy can be measured using calorimetry, absolute values of enthalpy usually cannot be determined. Enthalpy is formally defined as  $H = U + PV$ , where U is the internal energy, P is the pressure, and V is the volume. OR Change in heat at constant pressure. OR is the heat of reaction, either exo- or endothermic. It is measured either in kilocalories/mole or kilojoules/mole. OR the thermodynamic quantity measuring the heat of a substance. OR The heat content of a system.

**enthalpy change ( $\Delta H$ ):** For a reaction, is approximately equal to the difference between the energy used to break bonds and the energy gained by the formation of new ones.

**enthalpy of atomization:** The change in enthalpy that occurs when one mole of a compound is converted into gaseous atoms. All bonds in the compound are broken in atomization and none are formed, so enthalpies of atomization are always positive.

**enthalpy of combustion:** The change in enthalpy when one mole of compound is completely combusted. All carbon in the compound is converted to  $\text{CO}_2(\text{g})$ , all hydrogen to  $\text{H}_2\text{O}(\text{l})$ , all sulfur to  $\text{SO}_2(\text{g})$ , and all nitrogen to  $\text{N}_2(\text{g})$ .

**Enthalpy of fusion rule:** If the higher melting form has the lower enthalpy (heat) of fusion the two modifications are enantiotropic. If the lower

melting form has the lower entropy (heat) of fusion the two modifications are monotropic.

**enthalpy of fusionfus:** The change in enthalpy when one mole of solid melts to form one mole of liquid. Enthalpies of fusion are always positive because melting involves overcoming some of the intermolecular attractions in the solid.

**enthalpy of hydrationhyd:** The change in enthalpy for the process  $A(g) \rightarrow A(aq)$  where the concentration of A in the aqueous solution approaches zero. Enthalpies of hydration for ions are always negative because strong ion-water attractions are formed when the gas-phase ion is surrounded by water.

**enthalpy of neutralization:** The heat released by an acid-base neutralization reaction running at constant pressure.

**enthalpy of reactionrxn:** The heat absorbed or released by a chemical reaction running at constant pressure.

**enthalpy of solutionsoln:** The heat absorbed or released when a solute is dissolved in a solvent. The heat of solution depends on the nature of the solute and on its concentration in the final solution.

**enthalpy of sublimationsub:** The change in enthalpy when one mole of solid vaporizes to form one mole of gas. Enthalpies of sublimation are always positive because vaporization involves overcoming most of the intermolecular attractions in the sublimation.

**Enthalpy of transition rule:** This rule states that if an endothermic transition is observed at some temperature it may be assumed that there is a transition point below it and that the two forms are related enantiotropically. If an exothermic transition is observed at some temperature it may be assumed that there is no transition point below it and that the two forms are either related monotropically or the transition temperature is higher.

**enthalpy of vaporizationvap:** The change in enthalpy when one mole of liquid evaporates to form one mole of gas. Enthalpies of vaporization are always positive because vaporization involves overcoming most of the intermolecular attractions in the liquid.

**Enthalpy(kJ):** property of a system defined as  $H=U+PV$ , where U=internal energy, P=absolute pressure, and V= volume of the system

**entinostat:** A synthetic benzamide derivative with potential antineoplastic activity. Entinostat binds to and inhibits histone deacetylase, an enzyme that regulates chromatin structure and gene transcription. This agent appears to exert dose-dependent effects in human leukemia cells including cyclin-dependent kinase inhibitor 1A (p21/CIP1/WAF1)-dependent growth arrest and differentiation at low drug concentrations; a marked induction of reactive oxygen species (ROS); mitochondrial damage; caspase activation; and, at higher concentrations, apoptosis. In normal cells, cyclin-dependent kinase inhibitor 1A expression has been associated with cell-cycle exit and differentiation. or A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor. Also called HDAC inhibitor SNDX-275 and SNDX-275.

**entolimod:** A polypeptide derived from the Salmonella filament protein flagellin with potential radioprotective and anticancer activities. As a toll-like receptor 5 (TLR5) agonist, entolimod binds to and activates TLR5 thereby stimulating tumor necrosis factor production and activating nuclear factor kappa B (NF-kB). This induces NF-kB-mediated signaling pathways and inhibits the induction of apoptosis. This may prevent apoptosis in normal, healthy cells during radiotherapy of cancerous cells and may allow for increased doses of ionizing radiation. In addition, entolimod may inhibit radiation-independent proliferation in TLR5-expressing tumor cells.

**ENTOMB:** A method of decommissioning, in which radioactive contaminants are encased in a structurally long-lived material, such as concrete. The entombed structure is maintained and surveillance is continued until the entombed radioactive waste decays to a level permitting termination of the license and unrestricted release of the property. During the entombment period, the licensee maintains the license previously issued by the NRC. For further information, see the Fact Sheet on Decommissioning Nuclear Power Plants.

**entospletinib:** An orally available inhibitor of spleen tyrosine kinase (Syk), with potential antineoplastic activity. Upon oral administration of entospletinib, this agent may inhibit the activity of Syk, which inhibits B-cell receptor (BCR) signaling and leads to an inhibition of tumor cell activation, migration, adhesion and proliferation. Syk, a non-receptor cytoplasmic, BCR-associated tyrosine kinase, is expressed in hematopoietic

tissues and is often overexpressed in hematopoietic malignancies. Check for active clinical trials using this agent.

**Entrance Angle:** Maximum angle at which the molten material enters the land area of the die, measured from the center line of the mandrel.

**entrectinib:** An orally bioavailable inhibitor of the tyrosine kinases tropomyosin receptor kinases (Trk) A, B and C, C-ros oncogene 1 (ROS1) and anaplastic lymphoma kinase (ALK), with potential antineoplastic activity. Upon administration, entrectinib binds to and inhibits TrkA, TrkB, TrkC, ROS1 and ALK. Inhibition of these kinases may result in a disruption of TrkA-, TrkB-, TrkC-, ROS1-, and ALK-mediated signaling. This leads to an induction of apoptosis and an inhibition of tumor cell proliferation in tumor cells that express these kinases. TrkA, TrkB, TrkC, ROS1 and ALK are overexpressed in a variety of cancer cell types.

**entropy:** The extent of randomness or disorder in a system. OR Entropy is a measure of energy dispersal. Any spontaneous change disperses energy and increases entropy overall. For example, when water evaporates, the internal energy of the water is dispersed with the water vapor produced, corresponding to an increase in entropy. OR A measure of the degree of randomness or disorder in a system; denoted by the symbol  $S$  in thermodynamics, the change in entropy ( $\Delta S$ ) increases when a system becomes more disordered and decreases when the system becomes more ordered, or less random. OR The randomness of a system. OR the degree of disorder or randomness of a system. OR the thermodynamic quantity measuring the disorder of a substance. OR A measure of the number of possible states a group of 'somethings can occupy' - the more possible ways the group can be arranged, the higher the entropy. For example, there are fewer possible configurations of students in chairs in a room where the chairs are bolted to the floor than where the chairs can be moved around - the room with fewer possibilities will have less entropy, and more order... It's also interesting that the entropy of the universe is always increasing, so any process that gives one part of the universe (e.g. your bedroom) more order is increasing the disorder in other places (e.g. the air due to the hard work of cleaning your room). On balance, then, it is better for the universe if you don't clean your room... try convincing your parents though... OR A measure of the disorder of a system. OR Measure of the disorder of a system.

**Entyvio:** (Other name for: vedolizumab)

**enucleation :** In medicine, the removal of an organ or tumor in such a way that it comes out clean and whole, like a nut from its shell.

**enveloped virus :** A virus that has an outer wrapping or envelope. This envelope comes from the infected cell, or host, in a process called "budding off." During the budding process, newly formed virus particles become "enveloped" or wrapped in an outer coat that is made from a small piece of the cell's plasma membrane. The envelope may play a role in helping a virus survive and infect other cells.

**environment:** The aggregate, at a given moment, of all external conditions and influences to which a system is subjected (ISO, 1975). The term ``system" covers all living organisms, including human beings. OR The sum of all external conditions affecting the life, development, and survival of an organism.

**environmental chemistry:** The study of natural and man-made substances in the environment, including the detection, monitoring, transport, and chemical transformation of chemical substances in air, water, and soil.

**environmental fitness:** an individual's ability to adapt to an environment and reproduce.

**Environmental Footprint:** The measure of the impact on an ecosystem or our overall environment from a manufacturing facility, operation or process.

**environmental health :** The health aspects of the human environment, including technical and administrative measures for improving the human environment from a health point of view (WHO, 1979).

**Environmental qualification:** A process for ensuring that equipment will be capable of withstanding the ambient conditions that could exist when the specific function to be performed by the equipment is actually called upon to be performed under accident conditions.

**environmental quality standard (EQS):** This regulatory value defines the maximum concentration of a potentially toxic substance which can be allowed in an environmental compartment, usually air or water, over a defined period. Synonym ambient standard. See limit values.

**Environmental resistance:** All biotic and abiotic factors combining to limit explosion.

**environmental sanitation:** Traditionally used to indicate activities concerned with the improvement of the basic environmental conditions affecting health, i.e., water supply, human and animal waste disposal, protection of food from biological contamination, and housing conditions, all of which are concerned with the quality of the human environment (WHO, 1979).

**Environmental Stress Cracking:** The susceptibility of a thermoplastic article to crack or craze formation under the influence of certain chemicals and stress. OR The susceptibility of a plastic part to crack or craze under the influence of certain chemicals, stress or other agents. OR the tendency of a material to craze or crack due to the combination of residual or applied stress in the material, and chemical, thermal, or electromagnetic environments.

**ENVIRONMENTAL STRESS CRACKING (ESC):** The susceptibility of a thermoplastic article to crack, or craze formation under the influence of certain chemicals or aging, or weather, and stress.

**environmental tobacco smoke :** Smoke that comes from the burning of a tobacco product and smoke that is exhaled by smokers. Inhaling environmental tobacco smoke is called involuntary or passive smoking. Also called ETS and secondhand smoke.

**environmental transformation:** Once emitted into the environment, a chemical substance may be transported in the biosphere and undergo various types of chemical changes (WHO, 1979).

**enzalutamide:** An orally bioavailable, organic, non-steroidal small molecule targeting the androgen receptor (AR) with potential antineoplastic activity. Through a mechanism that is reported to be different from other approved AR antagonists, enzalutamide inhibits the activity of prostate cancer cell ARs, which may result in a reduction in prostate cancer cell proliferation and, correspondingly, a reduction in the serum prostate specific antigen (PSA) level. AR over-expression in prostate cancer represents a key mechanism associated with prostate cancer hormone resistance.

**enzalutamide :** A drug used to treat prostate cancer that has spread to other parts of the body and did not get better with other treatment, including docetaxel. Enzalutamide binds to proteins called androgen receptors, which are found in some prostate cancer cells. These proteins bind to androgens

(male hormones) and may cause cancer cells to grow. Blocking these proteins may keep cancer cells from growing. Enzalutamide is a type of antiandrogen. Also called Xtandi.

**enzastaurin** : A substance being studied in the treatment of certain types of cancer, including non-Hodgkin lymphoma, breast, colon, lung, ovarian, and prostate. Enzastaurin blocks certain cell signaling pathways, and may prevent the growth of new blood vessels that tumors need to grow. It is a type of serine threonine kinase inhibitor and a type of antiangiogenesis agent. Also called enzastaurin hydrochloride and LY317615.

**enzastaurin hydrochloride:** The hydrochloride salt of enzastaurin, a synthetic macrocyclic bisindolemaleimide with potential antineoplastic activity. Binding to the ATP-binding site, enzastaurin selectively inhibits protein kinase C beta, an enzyme involved in the induction of vascular endothelial growth factor (VEGF)-stimulated neo-angiogenesis. This agent may decrease tumor blood supply and so tumor burden. or A substance being studied in the treatment of certain types of cancer, including non-Hodgkin lymphoma, breast, colon, lung, ovarian, and prostate. Enzastaurin hydrochloride blocks certain cell signaling pathways, and may prevent the growth of new blood vessels that tumors need to grow. It is a type of serine threonine kinase inhibitor and a type of antiangiogenesis agent. Also called enzastaurin and LY317615.

**enzymatic:** Relating to the activity of enzymes, which are biological catalysts that play crucial roles in most biological processes, including metabolism and gene expression.

**Enzymatic cascade:** A sequence of reactions in which, at each step, a product stimulates an ensuing reaction, generating an amplification of a relatively small stimulus or signal.

**enzymatically hydrolyzed whey protein-based nutritional supplement:**

An orally available, gluten-free, enzymatically hydrolyzed cysteine-rich whey-protein based nutritional supplement containing essential vitamins, minerals, and trace elements, as well as fat and carbohydrates. Upon oral intake of the nutritional supplement, the whey protein may improve gastric functioning and gastrointestinal health, thereby reducing vomiting and diarrhea. The whey-based hydrolyzed protein helps to alleviate the digestive burden for the pancreas and may be beneficial for patients with a pancreas-associated disease, such as pancreatitis or pancreatic cancer. Due

to the high levels of cysteine in the whey protein, this supplement increases levels of the antioxidant glutathione (GSH). The polyunsaturated fatty acids in this supplement are incorporated in cell membranes and affect the production of pro-inflammatory mediators, eliciting an anti-inflammatory effect. Medium chain triglycerides (MCT) in this supplement enhance fat absorption and may aid in the prevention of fat malabsorption. Altogether, this supplement may prevent both malnutrition and weight loss.

**Enzyme:** Organic substances (proteins) produced by living organisms and act as catalysts to speed up chemical changes. OR A biological catalyst that will increase the rate of a chemical reaction, but is not consumed in the course of a reaction. These catalysts are at least hundreds of times more efficient than any man-made catalyst used in industrial processes. OR An enzyme is a biological catalyst which speeds up reactions in living things. An enzyme is a protein molecule with a specific shape to accommodate reactant molecules. OR Large biological molecules (mostly proteins) that act as catalysts for a reaction. OR A protein that catalyses a biochemical reaction. For example, chemical engineers make nitrogen ( $N_2$ ) into ammonia ( $NH_3$ ) using high temperatures and pressures - generating the power to make fertiliser by this process accounts for about 2% of all anthropogenic greenhouse gas emissions. Bacteria do the same thing at soil temperature and pressure using enzymes to catalyse the reaction. OR a stereospecific chiral protein that acts as a biological catalyst. OR A molecule that acts as a catalyst, speeding up biochemical reactions OR A molecule, most often a protein, that contains a catalytic site for a biochemical reaction. OR Protein or protein-based molecules that speed up chemical reactions occurring in living things. Enzymes act as catalysts for a single reaction, converting a specific set of reactants (called substrates) into specific products. Without enzymes life as we know it would be impossible. OR A biomolecule, either protein or RNA, that catalyzes a specific chemical reaction. It does not affect the equilibrium of the catalyzed reaction; it enhances the rate of a reaction by providing a reaction path with a lower activation energy. OR Proteins which act as highly selective catalyst. This permits reactions in living cells to take place rapidly under physiological conditions. Enzymes are also used in the industry, for example as additives in the detergents. OR proteins that catalyze the chemical reactions within cells. OR Biological macromolecules that act as

catalysts for biochemical reactions; although almost all are composed of protein, catalytically active RNA molecules have been recently discovered.

**enzyme** : A protein that speeds up chemical reactions in the body.

**enzyme inhibitor** : A substance that blocks the action of an enzyme.

Enzymes help speed up chemical reactions in the body and take part in many cell functions, including cell signaling, growth, and division. In cancer treatment, enzyme inhibitors may be used to block certain enzymes that cancer cells need to grow.

**Enzyme multiplicity**: A regulatory strategy in which the committed step common to several pathways is catalyzed by different enzymes with the same catalytic properties but different regulatory properties. Each enzyme thus responds to the final product of one of the pathways having the committed step in common.

**enzyme-linked immunosorbent assay** : A laboratory technique that uses antibodies linked to enzymes to detect and measure the amount of a substance in a solution, such as serum. The test is done using a solid surface to which the antibodies and other molecules stick. In the final step, an enzyme reaction takes place that causes a color change that can be read using a special machine. There are many different ways that an enzyme-linked immunosorbent assay can be done. Enzyme-linked immunosorbent assays may be used to help diagnose certain diseases. Also called ELISA.

**Enzyme-substrate complex**: The product of specific binding between the active site of an enzyme and the substrate.

**Eoquin**: (Other name for: apaziquone)

**eosinophil** : A type of immune cell that has granules (small particles) with enzymes that are released during infections, allergic reactions, and asthma. An eosinophil is a type of white blood cell and a type of granulocyte.

**eosinophilia** : A condition in which the number of eosinophils (a type of white blood cell) in the blood is greatly increased. Eosinophilia is often a response to infection or allergens (substances that cause an allergic response).

**eosinophils**: white blood cells whose functions are uncertain.

**eotransport**: The simultaneous transport, by a single transporter, of two solutes across a membrane. See antiport, symport.

**Eovist**: (Other name for: gadoxetate disodium)

**EP ADDITIVE:** A lubricant additive or system which prevents sliding metal surfaces from seizing under conditions of extreme pressure and force.

**EP-2101:** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called cancer vaccines.

**EP4 receptor antagonist AAT-007:** An orally bioavailable antagonist of the prostaglandin E receptor subtype 4 (EP4), with potential analgesic, immunomodulating and antineoplastic activities. Upon administration of the EP4 receptor antagonist AAT-007, this agent selectively binds to and inhibits the binding of prostaglandin E2 (PGE2) and prevents the activation of the EP4 receptor. This inhibits PGE2-EP4 receptor-mediated signaling and prevents proliferation in tumor cells in which the PGE2-EP4 signaling pathway is over-activated. In addition, EP4 receptor inhibition modulates the immune system by preventing both interleukin-23 (IL-23) production and the IL-23-mediated expansion of Th17 cells. As EP4 is expressed by peripheral sensory neurons, blockade of EP4-mediated signaling may induce an analgesic effect. EP4, a prostanoid receptor subtype, is a G protein-coupled receptor that is expressed in certain types of cancers; it promotes tumor cell proliferation and invasion.

**epacadostat:** An orally available hydroxyamidine and inhibitor of indoleamine 2,3-dioxygenase (IDO1), with potential immunomodulating and antineoplastic activities. epacadostat targets and binds to IDO1, an enzyme responsible for the oxidation of tryptophan into kynurenine. By inhibiting IDO1 and decreasing kynurenine in tumor cells, epacadostat increases and restores the proliferation and activation of various immune cells, including dendritic cells (DCs), NK cells, and T-lymphocytes, as well as interferon (IFN) production, and a reduction in tumor-associated regulatory T cells (Tregs). Activation of the immune system, which is suppressed in many cancers, may inhibit the growth of IDO1-expressing tumor cells. IDO1 is overexpressed by a variety of tumor cell types and DCs. Check for active clinical trials using this agent.

**EpCAM-specific CAR-expressing autologous T lymphocytes:** A preparation of autologous T lymphocytes that have been genetically modified to express a chimeric antigen receptor (CAR) specific for the antigen epithelial cell adhesion molecule (EpCAM), with potential immunostimulating and antineoplastic activities. Upon administration, the EpCAM-specific CAR-expressing autologous T lymphocytes specifically

recognize and bind to EpCAM-expressing tumor cells, resulting in tumor cell lysis. EpCAM, a cell surface protein, is expressed by a variety of tumor cells. Check for active clinical trials using this agent.

**EPD:** What is an EPD? An environmental product declaration (EPD) is a document that transparently communicates the environmental impacts of a product across its lifecycle. Like material safety data sheets EPD's describe a product's attributes in a consistent and comparable way.

**EPDM:** Ethylene propylene diene monomer rubber

**ependyma :** A thin membrane that lines the fluid-filled spaces in the brain and spinal cord. It is made up of a type of glial cell called an ependymal cell.

**ependymal cell :** A cell that forms the lining of the fluid-filled spaces in the brain and spinal cord. It is a type of glial cell.

**ependymal tumor :** A type of brain tumor that begins in cells lining the spinal cord central canal (fluid-filled space down the center) or the ventricles (fluid-filled spaces of the brain). Ependymal tumors may also form in the choroid plexus (tissue in the ventricles that makes cerebrospinal fluid). Also called ependymoma.

**ependymoma :** A type of brain tumor that begins in cells lining the spinal cord central canal (fluid-filled space down the center) or the ventricles (fluid-filled spaces of the brain). Ependymomas may also form in the choroid plexus (tissue in the ventricles that makes cerebrospinal fluid). Also called ependymal tumor.

**EphA2-targeting DOPC-encapsulated siRNA:** A liposomal formulation consisting of short-interfering RNAs (siRNAs) directed against ephrin type-A receptor 2 (EphA2) and encapsulated into 1,2-dioleoyl-sn-glycero-3-phosphatidylcholine (DOPC) neutral liposomes, with potential antineoplastic activity. Upon internalization, EphA2-targeting DOPC-encapsulated siRNA can hybridize to EphA2 DNA and mRNA, thereby interfering with both the transcription and translation of EphA2, and thus inhibiting tumor cell growth. The cell-surface receptor EphA2, a member of the ephrin family of receptor tyrosine kinases (RTKs) involved in mammalian development, is overexpressed by a variety of different cancer cell types and plays an important role in tumor growth.

**ephedra** : A shrub native to China and India. The stems and roots are used in traditional medicine as a diuretic and for asthma, bronchitis, and cough. It has also been promoted as a decongestant, a weight loss aid, and as a supplement to increase energy. Ephedra may cause high blood pressure, increased heart rate, or death if used with certain drugs, and may reduce the effects of certain drugs used to treat cancer and other diseases. The U.S. Food and Drug Administration has banned the sale of dietary supplements that contain ephedra. The scientific name is *Ephedra sinica*. Also called ma huang.

**ephemeral stream**: a stream that flows intermittently as a result of periods of sudden rainfall.

**epicenter**: location on the Earth's surface directly above the focus of an earthquake. OR the point on the surface directly above the focus of an earthquake.

**EpiCept NP-1**: (Other name for: ketamine/amitriptyline NP-H cream)

**epicycle**: small circle made by a planet's orbit in the geocentric model.

**epidemiologist** : A scientist who studies the patterns, causes, and control of disease in groups of people.

**epidemiology**: The study of the patterns, causes, and control of disease in groups of people. OR The study of the patterns, causes, and control of disease in groups of people. The study of the distribution and determinants of health-related states or events in populations, and the application of this study to control of health problems (from Last, 1988). OR The study of diseases as they affect populations, including the distribution of disease or other health-related states and events in human populations, the factors (e.g., age, sex, occupation, and economic status) that influence this distribution, and the application of this study to control health problems.

**epidermal growth factor** : A protein made by many cells in the body and by some types of tumors. It causes cells to grow and differentiate (become more specialized). It is a type of growth factor and a type of cytokine. Also called EGF. OR A topical ointment containing a recombinant form of human epidermal growth factor (EGF) with potential protective activity against EGF receptor (EGFR/HER1) inhibitor-induced cutaneous toxicities. Upon topical application of the EGF ointment, EGF locally activates EGFR, thereby abrogating EGFR inhibition in the skin caused by systemic EGFR inhibiting agents. This may help inhibit the skin rash induced by

EGFR antagonists. EGFR, a tyrosine kinase, plays a key role in maintaining epidermal integrity. Check for active clinical trials using this agent.

**epidermal growth factor receptor :** The protein found on the surface of some cells and to which epidermal growth factor binds, causing the cells to divide. It is found at abnormally high levels on the surface of many types of cancer cells, so these cells may divide excessively in the presence of epidermal growth factor. Also called EGFR, ErbB1, and HER1.

**epidermal growth factor receptor inhibitor :** A substance that blocks the activity of a protein called epidermal growth factor receptor (EGFR). EGFR is found on the surface of some normal cells and is involved in cell growth. It may also be found at high levels on some types of cancer cells, which causes these cells to grow and divide. Blocking EGFR may keep cancer cells from growing. Some epidermal growth factor receptor inhibitors are used to treat cancer. Also called EGFR inhibitor, EGFR tyrosine kinase inhibitor, and epidermal growth factor receptor tyrosine kinase inhibitor.

**epidermal growth factor receptor tyrosine kinase inhibitor :** A substance that blocks the activity of a protein called epidermal growth factor receptor (EGFR). EGFR is found on the surface of some normal cells and is involved in cell growth. It may also be found at high levels on some types of cancer cells, which causes these cells to grow and divide. Blocking EGFR may keep cancer cells from growing. Some epidermal growth factor receptor tyrosine kinase inhibitors are used to treat cancer. Also called EGFR inhibitor, EGFR tyrosine kinase inhibitor, and epidermal growth factor receptor inhibitor.

**epidermis :** The outer layer of the two main layers of the skin.

**epidermoid carcinoma :** Cancer that begins in squamous cells. Squamous cells are thin, flat cells that look like fish scales, and are found in the tissue that forms the surface of the skin, the lining of the hollow organs of the body, and the lining of the respiratory and digestive tracts. Most cancers of the anus, cervix, head and neck, and vagina are epidermoid carcinomas. Also called squamous cell carcinoma.

**epidermolysis bullosa :** A group of chronic skin disorders in which fluid-filled blisters form on the skin and mucosa (the moist, inner lining of some organs and body cavities). Epidermolysis bullosa is inherited and usually starts at birth. Patients with epidermolysis bullosa may be at increased risk of squamous cell cancer of the skin.

**epididymis:** the tube in which sperm cells mature. OR A narrow, tightly-coiled tube that is attached to each of the testicles (the male sex glands that produce sperm). Sperm cells (male reproductive cells) move from the testicles into the epididymis, where they finish maturing and are stored.

**epidural :** Having to do with the space between the wall of the spinal canal and the covering of the spinal cord. An epidural injection is given into this space.

**epidural block :** An injection of an anesthetic drug into the space between the wall of the spinal canal and the covering of the spinal cord.

**epigallocatechin gallate:** A phenolic antioxidant found in a number of plants such as green and black tea. It inhibits cellular oxidation and prevents free radical damage to cells. It is under study as a potential cancer chemopreventive agent.

**epigallocatechin-3-gallate :** A substance found in green tea. It is being studied in the prevention of cancer and some other diseases. It is a type of antioxidant. Also called EGCG.

**epigastric :** Having to do with the upper middle area of the abdomen.

**epigenetic alteration :** A heritable change that does not affect the DNA sequence but results in a change in gene expression. Examples include promoter methylation and histone modifications. Also called epimutation.

**epigenetics:** refers to phenotype differences manifesting in the absence of genotype differences; acting the gene as opposed to the gene OR The study of heritable changes that do not affect the DNA sequence but influence gene expression. OR The study of how age and exposure to environmental factors, such as diet, exercise, drugs, and chemicals, may cause changes in the way genes are switched on and off without changing the actual DNA sequence. These changes can affect a person's risk of disease and may be passed from parents to their children.

**epiglottis:** a thin flap of tissue that folds over the opening to the mammalian trachea during swallowing and prevents food from entering the trachea. OR The flap that covers the trachea during swallowing so that food does not enter the lungs.

**epilepsy :** A group of disorders marked by problems in the normal functioning of the brain. These problems can produce seizures, unusual

body movements, a loss of consciousness or changes in consciousness, as well as mental problems or problems with the senses.

**Epilex:** (Other name for: divalproex sodium)

**epimer:** One of two stereoisomers with more than one chiral center that differ in stereochemical configuration at only one.

**Epimerases:** Enzymes that catalyze the interconversion of epimers of a compound. OR Enzymes that catalyze the reversible interconversion of two epimers.

**Epimers:** Two stereoisomers with more than one chiral center that differ in configuration at one of their chiral centers. OR Pairs of molecules, each with more than one asymmetric center, that differ in configuration at only one such center; glucose and galactose are epimers, differing only in the configuration at C-4. OR Two stereoisomers differing in configuration at one asymmetric center, in a compound having two or more asymmetric centers.

**epimutation :** A heritable change that does not affect the DNA sequence but results in a change in gene expression. Examples include promoter methylation and histone modifications. Also called epigenetic alteration.

**epinephrine:** A hormone and neurotransmitter. Also called adrenaline. OR a hormone produced in the adrenal medulla that increases heart rate, blood pressure, and the blood supply to skeletal muscle. OR A catecholamine released by the adrenal medulla in response to muscle activity or its anticipation that stimulates the breakdown of muscle glycogen. Also called adrenaline.

**epiphyseal:** relating to the growth area near the end of a bone

**epipodophyllotoxin :** A substance being studied in the treatment of some types of cancer. Epipodophyllotoxin is extracted from the mandrake root *Podophyllum peltatum*. It is a type of topoisomerase inhibitor.

**epirubicin :** A drug used together with other drugs to treat early breast cancer that has spread to lymph nodes. It is also being studied in the treatment of other types of cancer. Epirubicin is a type of anthracycline antibiotic. Also called Ellence and epirubicin hydrochloride.

**epirubicin :** A drug used together with other drugs to treat early breast cancer that has spread to lymph nodes. It is also being studied in the

treatment of other types of cancer. Epirubicin is a type of anthracycline antibiotic. Also called Ellence and epirubicin hydrochloride.

**epirubicin hydrochloride:** The hydrochloride salt of the 4'-epi-isomer of the anthracycline antineoplastic antibiotic doxorubicin. Epirubicin intercalates into DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. This agent also produces toxic free-radical intermediates and interacts with cell membrane lipids causing lipid peroxidation. or A drug used together with other drugs to treat early breast cancer that has spread to lymph nodes. It is also being studied in the treatment of other types of cancer. Epirubicin hydrochloride is a type of anthracycline antibiotic. Also called Ellence and epirubicin.

**episodic breathlessness :** A medical condition in which patients have periods of trouble breathing that are followed by periods with no trouble breathing. Episodic breathlessness is seen in patients with lung cancer or other lung diseases, and in some heart conditions.

**epistaxis:** relating to the nose

**epithelial :** Refers to the cells that line the internal and external surfaces of the body.

**epithelial carcinoma :** Cancer that begins in the cells that line an organ.

**epithelial cell:** Any cell that forms part of the outer covering of an organism or organ.

**epithelial ovarian cancer :** Cancer that forms in the tissue covering the ovary (one of a pair of female reproductive glands in which eggs are made). Most ovarian cancers are epithelial ovarian cancers. Fallopian tube cancer and primary peritoneal cancer are similar to epithelial ovarian cancer and are staged and treated the same way. Also called ovarian epithelial cancer.

**epithelioid hemangioendothelioma :** A rare blood vessel tumor that usually forms in the liver, lung, or bone, but it can also form on or in the skin. Epithelioid hemangioendotheliomas may be slow growing or fast growing and, in some people, may spread to other parts of the body very quickly. Signs and symptoms depend on where the tumor is in the body. On the skin, the tumor may be raised with round or flat, red-brown patches that feel warm. In the lung, the tumor can cause chest pain, trouble breathing, spitting up blood, and anemia. In the bone, the tumor can cause breaks.

Epithelioid hemangioendotheliomas usually occur in adults, but can sometimes occur in children. They are a type of vascular tumor and a type of soft tissue sarcoma.

**epithelioid hemangioma :** A rare benign (not cancer) tumor of small blood vessels surrounded by lymphocytes and eosinophils (types of white blood cells). Epithelioid hemangioma usually forms on or in the skin, especially the skin of the head, but can occur in other areas of the body, such as in bone. On the skin, it may appear as firm pink to red bumps that may be itchy or painful. If the tumor is in bone, it may cause swelling and pain. Epithelioid hemangioma is sometimes caused by injury and often comes back after treatment. Epithelioid hemangioma is most common in young and middle-aged adults. It is a type of vascular tumor. Also called angiolymphoid hyperplasia with eosinophilia and histiocytoid hemangioma.

**epithelium :** A thin layer of tissue that covers organs, glands, and other structures within the body.

**Epitol:** (Other name for: carbamazepine)

**Epitope:** The specific site on an antigen that is recognized by an antibody. Also known as the antigenic determinant. OR An antigenic determinant; the particular chemical group or groups within a macromolecule (antigen) to which a given antibody binds. OR a three-membered ring that contains oxygen. OR A part of a molecule that an antibody will recognize and bind to.

**Epival:** (Other name for: divalproex sodium)

**Epivir:** (Other name for: lamivudine)

**eplerenone:** A selective aldosterone receptor antagonist. Eplerenone binds to the mineralocorticoid receptor and blocks the binding of aldosterone, thereby decreasing sodium resorption and subsequently increasing water outflow. This leads to a decrease in blood pressure. Eplerenone is used in the treatment of hypertension and congestive heart failure.

**EPO906:** A substance that is being studied as a treatment for cancer. It belongs to the family of drugs called epothilones. Also called epothilone B.

**EPOCH :** An abbreviation for a chemotherapy combination used to treat aggressive forms of non-Hodgkin lymphoma, including mantle cell lymphoma. It includes the drugs etoposide phosphate, prednisone,

vincristine sulfate (Oncovin), cyclophosphamide, and doxorubicin hydrochloride (hydroxydaunorubicin). Also called EPOCH regimen.

**EPOCH regimen:** A chemotherapy regimen consisting of etoposide, prednisone, vincristine (Oncovin) and doxorubicin hydrochloride (hydroxydaunorubicin hydrochloride), which may be used in combination with rituximab (R-EPOCH) for the treatment of various aggressive B cell and T cell non-Hodgkin lymphomas. OR An abbreviation for a chemotherapy combination used to treat aggressive forms of non-Hodgkin lymphoma, including mantle cell lymphoma. It includes the drugs etoposide phosphate, prednisone, vincristine sulfate (Oncovin), cyclophosphamide, and doxorubicin hydrochloride (hydroxydaunorubicin). Also called EPOCH.

**epoetin alfa:** A recombinant therapeutic agent which is chemically identical to or similar to the endogenous cytokine human erythropoietin (EPO). Produced primarily by cells of the peritubular capillary endothelium of the kidney in response to hypoxia, circulating EPO binds to EPO receptors on the surface of committed erythroid progenitors in the bone marrow resulting in their replication and maturation into functional erythrocytes. Check for active clinical trials using this agent. OR A substance that is made in the laboratory and stimulates the bone marrow to make red blood cells. It is a type of antianemic and a type of recombinant human erythropoietin.

**epoetin beta:** A recombinant therapeutic agent that is chemically identical to or similar to the endogenous cytokine human erythropoietin (EPO). Produced primarily by cells of the peritubular capillary endothelium of the kidney in response to hypoxia, circulating EPO binds to EPO receptors on the surface of committed erythroid progenitors in the bone marrow resulting in their replication and maturation into functional erythrocytes. Check for active clinical trials using this agent. OR A substance that is made in the laboratory and stimulates the bone marrow to make red blood cells. It is a type of antianemic and a type of recombinant human erythropoietin.

**epoetin zeta:** A recombinant form of the endogenous human cytokine erythropoietin (EPO) with erythropoiesis-stimulating activity. Similar to EPO, epoetin zeta binds to and activates erythropoietin receptors on the surface of committed erythroid progenitors in the bone marrow resulting in their proliferation and differentiation into functional erythrocytes. This may

enhance red blood cell counts and hemoglobin levels. Epoetin zeta differs from other epoetins in its glycosylation profile. EPO is a glycosylated polypeptide primarily produced by renal peritubular cells and its synthesis is regulated by a serum oxygenation feedback mechanism. Check for active clinical trials using this agent.

**Epogen:** (Other name for: epoetin alfa)

**epothilone :** A substance obtained from bacteria that interferes with cell division. Some epothilones are being studied as treatments for cancer.

**epothilone analog UTD1:** A genetically engineered epothilone analog with potential antineoplastic activity. Upon administration, epothilone analog UTD1 binds to tubulin, induces microtubule polymerization and stabilizes microtubules against depolymerization, which may result in the inhibition of cell division, the induction of G2/M arrest, and apoptosis. Compared to first-generation epothilones, this agent exhibits greater safety and enhanced activity against certain multidrug-resistant (MDR) tumors.

**epothilone B :** A substance being studied in the treatment of cancer. It is a type of epothilone. Also called EPO906.

**epothilone D:** A substance being studied in the treatment of cancer. It is a type of mitotic inhibitor and epothilone. Also called KOS-862. OR A natural polyketide compound isolated from the myxobacterium *Sorangium cellulosum*. Also known as desoxyepothilone B, epothilone D binds to tubulin and inhibits the disassembly of microtubules, resulting in the inhibition of mitosis, cellular proliferation, and cell motility.

**epothilone KOS-1584:** A second-generation epothilone with potential antineoplastic activity. Epothilone KOS-1584 binds to tubulin and induces microtubule polymerization and stabilizes microtubules against depolymerization, which may result in the inhibition of cell division, the induction of G2/M arrest, and apoptosis. Compared to first-generation epothilones, this agent exhibits greater safety and efficacy with an enhanced pharmaceutical profile, including enhanced water solubility and tumor penetration, and reduced CNS exposure. In addition, epothilone KOS-1584 is a poor substrate for the P-glycoprotein (P-gp) drug efflux pump.

**epothilone ZK219477 :** A form of the substance epothilone that is made in the laboratory. It is being studied in the treatment of some types of cancer. Epothilone ZK2219477 stops the growth of tumor cells by blocking cell division. It is a type of antimetabolic agent.

**Epoxy:** A flexible resin, usually thermosetting, made by polymerization of an epoxide and used chiefly in coatings and adhesives. OR Clear finish having excellent adhesion qualities; extremely abrasion and chemical resistant. Epoxies are alcohol proof and very water-resistant.

**Epoxy resin:** straight-chain thermosetting resins containing at least one three-membered ring consisting of two carbon atoms and one oxygen atom. OR Synthetic resins which when used in a two-pack product have good resistance to chemicals hard wear and abrasion.

**epratuzumab:** A recombinant, humanized monoclonal antibody directed against CD22, a cell surface glycoprotein present on mature B-cells and on many types of malignant B-cells. After binding to CD22, epratuzumab's predominant antitumor activity appears to be mediated through antibody-dependent cellular cytotoxicity (ADCC). Check for active clinical trials using this agent. or A substance being studied in the treatment of certain types of non-Hodgkin lymphoma (NHL) and acute lymphoblastic leukemia (ALL). It is also being studied in the treatment of an autoimmune disease called systemic lupus erythematosus (SLE). Epratuzumab binds to a protein called CD22, which is found on B cells (a type of white blood cell) and some types of cancer cells. This may help suppress the body's immune response and it may help kill cancer cells. Epratuzumab is a type of monoclonal antibody.

**Eprex:** (Other name for: epoetin alfa)

**eprodisate disodium:** The orally available disodium salt form of eprodisate, a negatively charged sulfonated inhibitor of fibrillogenesis, that can be used in the treatment of amyloid A (AA) amyloidosis. Upon administration, eprodisate competitively binds to the glycosaminoglycan binding sites on serum amyloid A (SAA), which inhibits the formation of the glycosaminoglycan-amyloid fibril aggregate. This prevents the formation of amyloid deposits in certain organs, especially the kidneys, in AA amyloidosis. Check for active clinical trials using this agent.

**Epstein-Barr virus :** A common virus that remains dormant in most people. It causes infectious mononucleosis and has been associated with certain cancers, including Burkitt lymphoma, immunoblastic lymphoma, and nasopharyngeal carcinoma. Also called EBV.

**EPT:** Treatment that generates electrical pulses through an electrode placed in a tumor to enhance the ability of anticancer drugs to enter tumor cells.

Also called electroporation therapy.

**Equalizing basin:** A holding basin in which variations in flow and composition of liquid are averaged. Such basins are used to provide a flow of reasonably uniform volume and composition to a treatment unit. Also called a balancing reservoir.

**equation:** Two expressions set equal to each other. The easiest way to differentiate between an expression and an equation is that the equation has an equal sign.

**equatorial bond:** a bond attached to a ring structure that roughly parallels the equator of the ring.

**equatorial position:** the position a group occupies in an equatorial bond.

**equilateral triangle:** a triangle in which all three angles are equal in measure and all three sides have the same length. OR A triangle with all three sides of equal length.

**equilibrium:** When the reactants and products are in a constant ratio. The forward reaction and the reverse reactions occur at the same rate when a system is in equilibrium. OR A system in which the rates of the forward and the reverse reaction are equal. OR a balanced condition resulting from two opposing reactions. OR constant the ratio of concentrations of products to reactants for a reaction at chemical equilibrium. OR a system that is in balance. OR The point at which the concentrations of two compounds are such that the interconversion of one compound into the other compound does not result in any change in free energy. OR The state of a system in which no further net change is occurring; the free energy is at a minimum.

**equilibrium constant (K<sub>eq</sub>):** Value that expresses how far the reaction proceeds before reaching equilibrium. A small number means that the equilibrium is towards the reactants side while a large number means that the equilibrium is towards the products side. OR a measure of the degree of completion of an equilibrium reaction. OR A constant, characteristic for each chemical reaction; relates the specific concentrations of all reactants and products at equilibrium at a given temperature and pressure.

**equilibrium constant<sub>eq</sub>:** The product of the concentrations of the products, divided by the product of the concentrations of the reactants, for a chemical reaction at equilibrium. For example, the equilibrium constant for  $A + B = C + D$  is equal to  $[C][D] / ([A][B])$ , where the square

brackets indicate equilibrium concentrations. Each concentration is raised to a power equal to its stoichiometric coefficient in the expression. The equilibrium constant for  $A + 2B = 3C$  is equal to  $[C]^3/([A][B]^2)$ . For gas phase reactions, partial pressures can be used in the equilibrium constant expression in place of concentrations.

**equilibrium expressions:** The expression giving the ratio between the products and reactants. The equilibrium expression is equal to the concentration of each product raised to its coefficient in a balanced chemical equation and multiplied together, divided by the concentration of the product of reactants to the power of their coefficients.

**equilibrium line:** The level on a glacier where accumulation equals ablation and the net balance equals zero.

**equivalence point:** Occurs when the moles of acid equal the moles of base in a solution. OR The equivalence point is the point in a titration when enough titrant has been added to react completely with the analyte.

**Equivalent:** The equivalent is the mass of a compound that could replace the atomic mass of an element. An example would be the amount of substance to replace one gram of hydrogen or fourteen grams of nitrogen. OR 1. The amount of substance that gains or loses one mole of electrons in a redox reaction. 2. The amount of substances that releases or accepts one mole of hydrogen ions in a neutralization reaction. 3. The amount of electrolyte that carries one mole of positive or negative charge, for example, 1 mole of  $Ba^{2+}(aq)$  is 2 equivalents of  $Ba^{2+}(aq)$ .

**equivalent diameter (of a particle):** The diameter of a spherical particle of the same density that, relative to a given phenomenon or property, would behave as the particle under investigation (ISO, 1979).

**Equivalent Mass:** The equivalent mass is molecular mass of a substance divided by the valence of that compound. Valence is determined by multiplying the valence of the positive ion in a compound by the number of atoms of that ion. NaCl has one positive sodium atom with a valence of one.  $1 \times 1$  gives a positive valence of 1.

**equivalent orbitals:** orbitals of the same principal level and type, such as the three p orbitals.

**ER:** A protein found inside the cells of the female reproductive tissue, some other types of tissue, and some cancer cells. The hormone estrogen

will bind to the receptors inside the cells and may cause the cells to grow. Also called estrogen receptor. OR Describes cells that do not have a protein to which the hormone estrogen will bind. Cancer cells that are ER- do not need estrogen to grow, and usually do not stop growing when treated with hormones that block estrogen from binding. Also called estrogen receptor negative.

**ER-negative PR-negative HER2/neu-negative breast cancer :** Describes breast cancer cells that do not have estrogen receptors, progesterone receptors, or large amounts of HER2/neu protein. Also called triple-negative breast cancer.

**ER-negative PR-negative HER2/neu-negative breast cancer :** ER-negative PR-negative HER2/neu-negative breast cancer is defined by a lack of expression of estrogen receptor (ER), progesterone receptor (PR), and human epidermal growth factor receptor 2 (HER2/neu). Also called triple-negative breast cancer.

**ER+ :** Describes cells that have a receptor protein that binds the hormone estrogen. Cancer cells that are ER+ may need estrogen to grow, and may stop growing or die when treated with substances that block the binding and actions of estrogen. Also called estrogen receptor positive.

**ERA-923:** A substance that is being studied as a treatment for cancer. It belongs to a family of drugs called antiestrogens.

**ERa36 modulator icaritin:** A metabolite of A metabolite of icariin, a principal flavonoid glycoside in Herba Epimedii (a traditional Chinese medicine herb used in treating osteoporosis) with potential antineoplastic activity. ERa36 modulator icaritin selectively binds to a novel variant of estrogen receptor alpha, a36, and mediates a membrane-initiated "nongenomic" signaling pathway, which is linked to activated signaling pathways like the MAPK/ERK and the PI3K/Akt pathways. This agent induces cell cycle arrest at G1, or G2/M arrest depending upon the dose. Consistently with G1 arrest, icaritin increases protein expressions of pRb, p27(Kip1) and p16(Ink4a), while decreasing phosphorylated pRb, Cyclin D1 and CDK4. Forty percent of ER-negative breast cancer tumors express high levels of ERa36, and this subset of patients is less likely to benefit from tamoxifen treatment compared with those with ERa66-positive/ERa36-negative tumors.

**erastin analogue PRLX 93936:** A structural analogue of erastin with potential antineoplastic activity. Erastin analogue PRLX 93936 appears to inhibit mitochondrial outer membrane protein VDACs (voltage-dependent anion channels) 2 and 3, resulting in an oxidative, non-apoptotic cell death. Erastin analogue PRLX 93936 exhibits greater lethality in cell lines harboring mutations in the GTPase protein oncogenes HRAS and KRAS or the serine-threonine protein kinase oncogene BRAF than in non-tumorigenic cell lines. VDACs 2 and 3 are up-regulated in a wide variety of tumor cell lines.

**Eraxis:** (Other name for: anidulafungin)

**erb-38 immunotoxin:** A bivalent fusion protein consisting of disulfide-stabilized Fv fragments of an anti-HER2 (erbB2) monoclonal antibody (e23) and a truncated version of the M(r) 38 fragment of Pseudomonas exotoxin that lacks the toxin's cell binding domain. ERB-38 immunotoxin binds specifically to cells that overexpress HER2, the antigenic target of the monoclonal antibody; the exotoxin portion of the immunotoxin then lyses the cells bound by the antibody portion. or A toxic substance linked to an antibody that attaches to tumor cells and kills them.

**ErbB-2 inhibitor ARRY-380:** An orally bioavailable inhibitor of the human epidermal growth factor receptor tyrosine kinase ErbB-2 (also called HER2) with potential antineoplastic activity. ErbB-2 inhibitor ARRY-380 selectively binds to and inhibits the phosphorylation of ErbB-2, which may prevent the activation of ErbB-2 signal transduction pathways, resulting in growth inhibition and death of ErbB-2-expressing tumor cells. ErbB-2 is overexpressed in a variety of cancers and plays an important role in cellular proliferation and differentiation.

**ErbB1:** The protein found on the surface of some cells and to which epidermal growth factor binds, causing the cells to divide. It is found at abnormally high levels on the surface of many types of cancer cells, so these cells may divide excessively in the presence of epidermal growth factor. Also called EGFR, epidermal growth factor receptor, and HER1.

**Erbix:** (Other name for: cetuximab) or A drug used to treat certain types of head and neck cancer, and a certain type of colorectal cancer that has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. Erbitux binds to a protein called epidermal growth factor receptor (EGFR), which is on the surface of some types of cancer

cells. This may stop cancer cells from growing. Erbitux is a type of monoclonal antibody. Also called cetuximab.

**Erbium:** Symbol:"Er" Atomic Number:"68" Atomic Mass: 167.26amu. Erbium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element.

**ERCP:** A procedure that uses an endoscope to examine and x-ray the pancreatic duct, hepatic duct, common bile duct, duodenal papilla, and gallbladder. An endoscope is a thin, tube-like instrument with a light and a lens for viewing. The endoscope is passed through the mouth and down into the first part of the small intestine (duodenum). A smaller tube (catheter) is then inserted through the endoscope into the bile and pancreatic ducts. A dye is injected through the catheter into the ducts, and an x-ray is taken. Also called endoscopic retrograde cholangiopancreatography.

**erectile dysfunction :** An inability to have an erection of the penis adequate for sexual intercourse. Also called impotence.

**erection :** In medicine, the swelling of the penis with blood, causing it to become firm.

**Ergamisol:** (Other name for: levamisole hydrochloride)

**ergocalciferol:** Vitamin D<sub>2</sub>, a fat-soluble vitamin important for many biochemical processes including the absorption and metabolism of calcium and phosphorus. In vivo, ergocalciferol is formed after sun (ultraviolet) irradiation of plant-derived ergosterol, another form of vitamin D. Ergocalciferol is the form of vitamin D usually found in vitamin supplements. Check for active clinical trials using this agent.

**ergocalciferol :** A form of vitamin D that helps the body use calcium and phosphorus to make strong bones and teeth. It is fat-soluble (can dissolve in fats and oils) and is found in plants and yeast. It can be made in the body from another form of vitamin D when the body is exposed to the sun. Ergocalciferol is also made in the laboratory. It is used to prevent and to treat vitamin D deficiency. It is a type of dietary supplement. Also called vitamin D<sub>2</sub>. or A form of vitamin D that helps the body use calcium and phosphorus to make strong bones and teeth. It is fat-soluble (can dissolve in fats and oils) and is found in plants and yeast. It can be made in the body from another form of vitamin D when the body is exposed to the sun. Ergocalciferol is also made in the laboratory. It is used to prevent and to

treat vitamin D deficiency. It is a type of dietary supplement. Also called vitamin D2.

**eribulin mesylate** : A drug used to treat metastatic breast cancer in patients who have already been treated with other chemotherapy. It is also being studied in the treatment of other types of cancer. Eribulin mesylate may block cancer cell growth by stopping cell division. It belongs to the family of drugs called antitubulin agents. Also called E7389 and Halaven. OR The mesylate salt of a synthetic analogue of halichondrin B, a substance derived from a marine sponge (*Lissodendoryx* sp.) with antineoplastic activity. Eribulin binds to the vinca domain of tubulin and inhibits the polymerization of tubulin and the assembly of microtubules, resulting in inhibition of mitotic spindle assembly, induction of cell cycle arrest at G2/M phase, and, potentially, tumor regression. Check for active clinical trials using this agent.

**erismodegib** : A drug used to treat locally advanced basal cell carcinoma (BCC) that has come back after surgery or radiation therapy. It is also used in patients who cannot be treated with surgery or radiation therapy. Erismodegib is also being studied in the treatment of other types of cancer. Erismodegib blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of hedgehog signaling pathway antagonist. Also called LDE225, Odomzo, and sonidegib.

**eritoran tetrasodium**: The tetrasodium salt of a synthetic analogue of the lipid A portion of the endotoxin lipopolysaccharide (LPS) with potential immunomodulating activity. Eritoran binds to the Toll-like receptor (TLR)/CD14/MD2 receptor complex present on most cells of the immune system, inhibiting the activation of the receptor complex by LPS, which may result in the inhibition of pro-inflammatory cytokine secretion and a potentially fatal systemic inflammatory response syndrome (SIRS). LPS is found in the outer membrane of Gram-negative bacteria and binds to the TLR/CD14/MD2 receptor complex of immune cells, especially macrophages, resulting in the release of pro-inflammatory cytokines. Check for active clinical trials using this agent.

**Erivedge** : A drug used to treat advanced basal cell carcinoma that has spread to other parts of the body or has come back after surgery. It is also used in patients who cannot be treated with surgery or radiation therapy. It is also being studied in the treatment of other types of cancer. Erivedge

blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of Hedgehog signaling pathway antagonist. Also called GDC-0449 and vismodegib.

**ERK inhibitor BVD-523:** An orally available inhibitor of extracellular signal-regulated kinase (ERK) 1 and 2, with potential antineoplastic activity. Upon oral administration, BVD-523 inhibits both ERK 1 and 2, thereby preventing the activation of ERK-mediated signal transduction pathways. This results in the inhibition of ERK-dependent tumor cell proliferation and survival. The mitogen-activated protein kinase (MAPK)/ERK pathway is often upregulated in a variety of tumor cell types and plays a key role in tumor cell proliferation, differentiation and survival.

**ERK inhibitor CC-90003:** An orally available inhibitor of extracellular signal-regulated kinase (ERK), with potential antineoplastic activity. Upon oral administration, CC-90003 inhibits ERK activity, and prevents the activation of ERK-mediated signal transduction pathways. This results in the inhibition of ERK-dependent tumor cell proliferation and survival. The mitogen-activated protein kinase (MAPK)/ERK pathway is often upregulated in a variety of tumor cell types and plays a key role in tumor cell proliferation, differentiation and survival.

**ERK inhibitor GDC-0994:** An orally available inhibitor of extracellular signal-regulated kinase (ERK), with potential antineoplastic activity. Upon oral administration, GDC-0994 inhibits both ERK phosphorylation and activation of ERK-mediated signal transduction pathways. This prevents ERK-dependent tumor cell proliferation and survival. The mitogen-activated protein kinase (MAPK)/ERK pathway is upregulated in a variety of tumor cell types and plays a key role in tumor cell proliferation, differentiation and survival.

**ERK inhibitor LTT462:** An orally available inhibitor of extracellular signal-regulated kinase (ERK), with potential antineoplastic activity. Upon oral administration, LTT462 binds to and inhibits ERK, thereby preventing the activation of ERK-mediated signal transduction pathways. This results in the inhibition of ERK-dependent tumor cell proliferation and survival. The mitogen-activated protein kinase (MAPK)/ERK pathway is upregulated in numerous tumor cell types and plays a key role in tumor cell proliferation, differentiation and survival.

**erlotinib hydrochloride:** The hydrochloride salt of a quinazoline derivative with antineoplastic properties. Competing with adenosine triphosphate, erlotinib reversibly binds to the intracellular catalytic domain of epidermal growth factor receptor (EGFR) tyrosine kinase, thereby reversibly inhibiting EGFR phosphorylation and blocking the signal transduction events and tumorigenic effects associated with EGFR activation. or A drug used to treat certain types of non-small cell lung cancer. It is also used with gemcitabine hydrochloride to treat pancreatic cancer that cannot be removed by surgery or has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Erlotinib hydrochloride blocks a protein called epidermal growth factor receptor (EGFR), which may help keep cancer cells from growing. It is a type of EGFR tyrosine kinase inhibitor. Also called CP-358,774, OSI-774, and Tarceva.

**ERMS:** A soft tissue tumor that is most common in infants and young children. It begins in muscles, usually in the head, neck, or genitourinary tract. Also called embryonal rhabdomyosarcoma.

**erosion:** Erosion is the wearing away of rock as a result of the movement of pieces of weathered rock. OR The wearing away of a paint film caused by exposure to the weather. OR the picking up of sediment and soil particles by an agent such as wind or water. OR the transportation of weathered materials. OR This is the transport (movement) of bits of rock after they have been broken down weathered). OR

**erratic:** a boulder that has been deposited by a glacier and is not derived from the local bedrock. OR a large rock that is deposited by a glacier.

**Error (of a measurement):** the result of a measurement minus a true value of the measurand.

**ERT:** Treatment with the hormone estrogen to increase the amount of estrogen in the body. It is given to women who have gone through menopause or to women who have early menopause caused by cancer treatment or by having their ovaries removed by surgery. ERT may help relieve symptoms of menopause, such as hot flashes, night sweats, vaginal dryness, and sleep problems. It may also help protect against osteoporosis (thinning of the bones) and lower the risk of breast cancer in postmenopausal women. Also called estrogen replacement therapy.

**ertapenem sodium:** The sodium salt of ertapenem, a 1-beta-methyl carbapenem and a broad-spectrum beta-lactam antibiotic with bactericidal activity. Ertapenem binds to penicillin binding proteins (PBPs) located on the bacterial cell wall, in particular PBPs 2 and 3, thereby inhibiting the final transpeptidation step in the synthesis of peptidoglycan, an essential component of the bacterial cell wall. Inhibition of peptidoglycan synthesis results in weakening and lysis of the cell wall and cell death. In vitro, this agent has shown activity against Gram-positive and Gram-negative aerobic and anaerobic bacteria. Ertapenem is resistant to hydrolysis by a variety of beta-lactamases, including penicillinases, cephalosporinases and extended-spectrum beta-lactamases.

**ertumaxomab:** A murine monoclonal antibody with two antigen-recognition sites: one for CD3, an antigen expressed on mature T cells, and one for HER-2-neu, a tumor-associated antigen that promotes tumor growth. Ertumaxomab attaches to CD3-expressing T cells and HER-2-neu-expressing tumor cells, selectively cross-linking tumor and immunologic cells which results in the recruitment of cytotoxic T cells to the T cell/tumor cell aggregate.

**ERUCAMIDE:** A fatty acid-based slip additive used in polyolefin resins.

**Erucamide Slip:** A fatty acid based additive commonly used in polyolefin resins to reduce coefficient of friction.

**ERUS:** A procedure in which a probe that sends out high-energy sound waves is inserted into the rectum. The sound waves are bounced off internal tissues or organs and make echoes. The echoes form a picture of body tissue called a sonogram. ERUS is used to look for abnormalities in the rectum and nearby structures, including the prostate. Also called endorectal ultrasound, transrectal ultrasound, and TRUS.

**Erwinaze :** A drug used with other anticancer drugs to treat acute lymphoblastic leukemia (ALL). It is an enzyme that comes from the *Erwinia chrysanthemi* bacterium. It is used in patients who cannot take a similar drug that comes from the *E. coli* bacterium. It is also being studied in the treatment of other types of cancer. It breaks down the amino acid asparagine and may block the growth of cancer cells that need asparagine to grow. It may also kill cancer cells. Also called asparaginase *Erwinia chrysanthemi*.

**Ery-Tab:** (Other name for: erythromycin)

**ERYC:** (Other name for: erythromycin)

**erythema:** In medicine, this term is applied to redness of the skin due to blood vessel distension. OR Redness of the skin.

**erythrocyte:** A cell containing large amounts of hemoglobin and specialized for oxygen transport; a red blood cell. OR the red blood cells; disk-shaped cells produced in the bone marrow that have no nucleus; their cytoplasm is filled with hemoglobin to transport oxygen.

**erythrocyte :** A type of blood cell that is made in the bone marrow and found in the blood. Erythrocytes contain a protein called hemoglobin, which carries oxygen from the lungs to all parts of the body. Checking the number of erythrocytes in the blood is usually part of a complete blood cell (CBC) test. It may be used to look for conditions such as anemia, dehydration, malnutrition, and leukemia. Also called RBC and red blood cell.

**erythrocyte sedimentation rate :** The distance red blood cells travel in one hour in a sample of blood as they settle to the bottom of a test tube. The sedimentation rate is increased in inflammation, infection, cancer, rheumatic diseases, and diseases of the blood and bone marrow. Also called ESR and sedimentation rate.

**erythrocyte-encapsulated L-asparaginase suspension:** A suspension of erythrocytes encapsulating L-asparaginase with potential antineoplastic activity. Upon administration of erythrocyte-encapsulated L-asparaginase suspension, L-asparagine is hydrolyzed to L-aspartic acid and ammonia in plasma, thereby depleting tumor cells of asparagine. Due to low asparagine synthetase activity in tumor cells, de novo synthesis of asparagine is suppressed within tumor cells. Shortage of asparagine prevents synthesis of important proteins necessary for tumor cell growth. Encapsulation of asparaginase in erythrocytes decreases the immunogenicity of exogenous protein, enhances its circulation time and may limit toxicity. Check for active clinical trials using this agent.

**erythrodysplasia :** A condition in which immature red blood cells (erythroid cells) in the bone marrow are abnormal in size, shape, organization, and/or number. Erythrodysplasia may be caused by vitamin deficiency or chemotherapy, or it may be a sign of refractory anemia, which is a myelodysplastic syndrome. Also called erythroid dysplasia.

**erythrogenesis imperfecta** : A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with erythrogenesis imperfecta may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–Diamond anemia, congenital hypoplastic anemia, congenital pure red cell aplasia, DBA, Diamond-Blackfan anemia, and inherited erythroblastopenia.

**erythroid dysplasia** : A condition in which immature red blood cells (erythroid cells) in the bone marrow are abnormal in size, shape, organization, and/or number. Erythroid dysplasia may be caused by vitamin deficiency or chemotherapy, or it may be a sign of refractory anemia, which is a myelodysplastic syndrome. Also called erythrodysplasia.

**erythroleukemia** : Cancer of the blood-forming tissues in which large numbers of immature, abnormal red blood cells are found in the blood and bone marrow.

**erythroleukoplakia** : An abnormal patch of red and white tissue that forms on mucous membranes in the mouth and may become cancer. Tobacco (smoking and chewing) and alcohol may increase the risk of erythroleukoplakia.

**Erythromycin**: An antibiotic that binds to the 50S ribosomal subunit and inhibits peptide translocation in prokaryotes.

**erythromycin**: A broad-spectrum, topical macrolide antibiotic with antibacterial activity. Erythromycin diffuses through the bacterial cell membrane and reversibly binds to the 50S subunit of the bacterial ribosome. This prevents bacterial protein synthesis. Erythromycin may be bacteriostatic or bactericidal in action, depending on the concentration of the drug at the site of infection and the susceptibility of the organism involved.

**erythromycin topical cream**: A topical cream formulation containing the broad-spectrum macrolide antibiotic erythromycin with anti-bacterial activity. Erythromycin interacts with the 50S subunit of the bacterial 70S ribosomal RNA complex resulting in the inhibition of protein synthesis and bacterial cell death.

**erythroplakia** : An abnormal patch of red tissue that forms on mucous membranes in the mouth and may become cancer. Tobacco (smoking and chewing) and alcohol may increase the risk of erythroplakia.

**erythropoetin**: a hormone produced by the kidney cells that functions in the production of red blood cells.

**erythropoiesis** : The formation of red blood cells in blood-forming tissue. In the early development of a fetus, erythropoiesis takes place in the yolk sac, spleen, and liver. After birth, all erythropoiesis occurs in the bone marrow.

**erythropoiesis-stimulating agent** : A substance that stimulates the bone marrow to make more red blood cells. Erythropoiesis-stimulating agents are used to treat anemia caused by chronic kidney failure, some anticancer drugs, and certain treatments for HIV. They may also be used to lower the number of blood transfusions needed during and after certain major surgeries. Examples of erythropoiesis-stimulating agents are epoetin alfa (Epogen, Procrit) and darbepoetin alfa (Aranesp). Also called ESA.

**erythropoietin** : A substance that is naturally produced by the kidneys, and that stimulates the bone marrow to make red blood cells. When erythropoietin is made in the laboratory, it is called epoetin alfa or epoetin beta.

**ESA**: A substance that stimulates the bone marrow to make more red blood cells. ESAs are used to treat anemia caused by chronic kidney failure, some anticancer drugs, and certain treatments for HIV. They may also be used to lower the number of blood transfusions needed during and after certain major surgeries. Examples of ESAs are epoetin alfa (Epogen, Procrit) and darbepoetin alfa (Aranesp). Also called erythropoiesis-stimulating agent.

**Escherichia coli**: See E. coli.

**escitalopram** : A drug used to treat depression and certain anxiety disorders. It belongs to the family of drugs called selective serotonin reuptake inhibitors (SSRIs). Also called Lexapro.

**escitalopram oxalate**: The oxalate salt of escitalopram, a pure S-enantiomer of the racemic bicyclic phthalane derivative citalopram, with antidepressant activity. As a selective serotonin reuptake inhibitor (SSRI), escitalopram blocks the reuptake of serotonin by neurons in the central nervous system (CNS), thereby potentiating CNS serotonergic activity.

**ESCR:** Environmental stress crack resistance

**ESD:** Stands for “electro static discharge,” an electrical effect that may necessitate shielding in some applications. Some special grades of plastic are electrically conductive or dissipative and help prevent ESD.

**ESD (acronym):** Electro-static Discharge

**Eskalith:** (Other name for: lithium carbonate)

**esker:** a long, winding ridge of outwash deposited in streams flowing through ice caves and tunnels at the base of a glacier.

**esmolol:** The hydrochloride salt form of esmolol, a short, rapid-acting, selective beta-adrenergic receptor blocker, devoid of intrinsic sympathomimetic activity, and with anti-arrhythmic, antihypertensive and potential analgesic activities. Upon intravenous administration, esmolol binds to and blocks the beta-1 receptor in the myocardium thereby preventing the action of epinephrine and norepinephrine. This leads to a reduction in the force and rate of cardiac contractions and thereby preventing tachycardia, arrhythmias and/or hypertension. At higher doses, esmolol also blocks beta-2 receptors located in bronchial and vascular smooth muscle, thereby leading to smooth muscle relaxation. In addition, esmolol exerts a peripheral analgesic effect and intraoperative use of this agent may decrease the amount of opioid administration postoperatively. As the ester moiety in esmolol is rapidly hydrolyzed by plasma esterases, this agent has a very short half-life.

**esomeprazole :** A drug that blocks acid from being made in the stomach. It is used to treat acid reflux disease and to prevent certain types of gastrointestinal ulcers. Esomeprazole is being studied in the prevention of esophageal cancer and in the treatment of other conditions, including side effects of chemotherapy. It is a type of anti-ulcer agent. Also called esomeprazole magnesium and Nexium.

**esomeprazole magnesium:** The magnesium salt of esomeprazole, the S-isomer of omeprazole, with gastric proton pump inhibitor activity. In the acidic compartment of parietal cells, esomeprazole is protonated and converted into the active achiral sulphenamide; the active sulphenamide forms one or more covalent disulfide bonds with the proton pump hydrogen-potassium adenosine triphosphatase ( $H^+/K^+$  ATPase), thereby inhibiting its activity and the parietal cell secretion of  $H^+$  ions into the gastric lumen, the final step in gastric acid production.  $H^+/K^+$  ATPase is an

integral membrane protein of the gastric parietal cell. OR A drug that blocks acid from being made in the stomach. It is used to treat acid reflux disease and to prevent certain types of gastrointestinal ulcers. Esomeprazole magnesium is being studied in the prevention of esophageal cancer and in the treatment of other conditions, including side effects of chemotherapy. It is a type of anti-ulcer agent. Also called esomeprazole and Nexium.

**esophageal :** Having to do with the esophagus, the muscular tube through which food passes from the throat to the stomach.

**esophageal cancer :** Cancer that forms in tissues lining the esophagus (the muscular tube through which food passes from the throat to the stomach). Two types of esophageal cancer are squamous cell carcinoma (cancer that begins in flat cells lining the esophagus) and adenocarcinoma (cancer that begins in cells that make and release mucus and other fluids).

**esophageal reflux :** The backward flow of stomach acid contents into the esophagus (the tube that connects the mouth to the stomach). Also called gastric reflux and gastroesophageal reflux.

**esophageal speech :** Speech produced by trapping air in the esophagus and forcing it out again. It is used after removal of a person's larynx (voice box).

**esophageal stent :** A tube placed in the esophagus to keep a blocked area open so the patient can swallow soft food and liquids. Esophageal stents are made of metal mesh, plastic, or silicone, and may be used in the treatment of esophageal cancer.

**esophageal varices:** extremely dilated sub-mucosal veins in the esophagus

**esophagectomy :** An operation to remove a portion of the esophagus.

**esophagitis :** Inflammation of the esophagus (the tube that carries food from the mouth to the stomach).

**esophagoscopy :** Examination of the esophagus using an esophagoscope. An esophagoscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease.

**esophagram :** A series of x-ray pictures of the esophagus taken after a patient drinks a liquid containing barium sulfate (a form of the silver-white metallic element barium). The barium sulfate coats and outlines the inner wall of the esophagus so that it can be seen on the x-ray pictures. Also called contrast esophagram.

**esophagus:** a thick-walled muscular tube located behind the windpipe that extends through the neck and chest to the stomach.

**esophagus :** The muscular tube through which food passes from the throat to the stomach.

**esorubicin:** A synthetic derivative of the anthracycline antineoplastic antibiotic doxorubicin with potential antineoplastic activity. Esorubicin intercalates into DNA and inhibits topoisomerase II, thereby inhibiting DNA replication and ultimately, interfering with RNA and protein synthesis. This agent exhibits less cardiotoxicity than the parent antibiotic doxorubicin, but may cause more severe myelosuppression compared to other compounds within the anthracycline class.

**ESP:** Electrostatic potential. The electrical potential due to the nuclei and electrons in the molecule, as experienced by a test charge.

**ESR:** The distance red blood cells travel in one hour in a sample of blood as they settle to the bottom of a test tube. The sedimentation rate is increased in inflammation, infection, cancer, rheumatic diseases, and diseases of the blood and bone marrow. Also called erythrocyte sedimentation rate and sedimentation rate.

**Essential amino acids:** Amino acids that cannot be synthesized de novo and therefore must be acquired from the diet; in adult mammals, at least nine amino acids are considered essential.

**essential amino acids:** Amino acids that cannot be synthesized by humans (and other vertebrates) and must be obtained from the diet.

**essential fatty acids:** The group of polyunsaturated fatty acids produced by plants, but not by humans; required in the human diet.

**essential oil :** The scented liquid taken from certain plants using steam or pressure. Essential oils contain the natural chemicals that give the plant its “essence” (specific odor and flavor). Essential oils are used in perfumes, food flavorings, medicine, and aromatherapy.

**essential thrombocythemia :** An increased number of thrombocytes (platelets) in the blood, without a known cause. Also called essential thrombocytosis.

**essential thrombocytosis :** An increased number of thrombocytes (platelets) in the blood, without a known cause. Also called essential thrombocythemia.

**Essiac:** An herbal formula containing burdock root (*Arctium lappa*), Turkey rhubarb root (*Rheum palmatum*), sheep sorrel (*Rumex acetosella*), and slippery elm bark (*Ulmus fulva*) with potential immunostimulating, anti-inflammatory and anti-tumor activities. The exact chemical profile, their respective concentrations and the mechanism of action of Essiac are largely unknown due to the proprietary nature of the formula and product inconsistency. Several chemical classes in Essiac are consistently represented and may attribute to its therapeutic effect, including anthraquinone derivatives such as rhein and emodin, high molecular polysaccharides, and lignans such as arctigenin. However, all these chemicals are unlikely to occur in high concentrations in Essiac, and its potential therapeutic effect may be attributed to a potential synergistic effect of these various compounds. Check for active clinical trials using this agent. OR An herbal tea mixture that contains burdock root, Indian rhubarb root, sheep sorrel, and slippery elm bark. It has been claimed to remove toxins from the body, make the immune system stronger, relieve pain, control diabetes, treat AIDS, reduce tumor size, increase cancer survival, and improve quality of life. No clinical trial using Essiac in humans has been reported in a peer-reviewed, scientific journal, and the FDA has not approved the use of Essiac for the treatment of any medical conditions.

**Established cell line:** A group of cultured cells derived from a single origin and capable of stable growth for many generations.

**Ester:** Take a carboxylic acid and an alcohol and remove water, so that you are left with two bits linked by a C(O)-O- group - this is an ester. Many of the most important industrial polymers are esters. For example, ethyl acetate: OR An ester is a compound formed from an acid and an alcohol. In esters of carboxylic acids, the -COOH group and the -OH group lose a water and become a -COO- linkage:  $R-COOH + R'-OH = R-COO-R' + H_2O$  where R and R' represent organic groups. OR a compound formed by the elimination of water during the reaction between an alcohol and an acid; many esters are liquids. They are frequently used as plasticizer in rubber and plastic compounds.

**ester :** A chemical substance made when an acid and an alcohol combine and water is removed. Esters are found in essential oils (scented oils that come from plants).

**esterification:** Esterification is the reaction between an alcohol and a carboxylic acid (with a strong acid catalyst) which produces an ester plus water.

**esterified estrogen :** A form of estrogen that may have fewer side effects than other forms. Esterified estrogens are used to treat some types of cancer, including prostate cancer. They are also used to treat the symptoms of menopause, (such as hot flashes, vaginal dryness, or heavy and painful bleeding) and osteoporosis (loss of bone mass). It is a type of drug called hormone therapy.

**estimate:** An educated guess of the solution. This guess is made before setting up an equation and solving the problem.

**Estinyl:** (Other name for: ethinyl estradiol)

**Estrace:** (Other name for: therapeutic estradiol)

**estradiol :** A form of the hormone estrogen.

**estradiol vaginal ring:** A flexible elastomer ring containing 17 beta-estradiol used for estrogen replacement. Upon vaginal insertion, estradiol vaginal ring releases a consistent low-dose of estrogen which binds to and activates nuclear receptors in estrogen-responsive tissues. By increasing the amount of estradiol locally, symptoms of vaginal dryness or decreased sexual interest may improve. 17 beta-estradiol is the major naturally occurring estrogen produced in the ovaries of premenopausal women.

**estradiol valerate:** The parenterally-administered synthetic valerate ester of estradiol, a steroid sex hormone vital to the maintenance of fertility and secondary sexual characteristics in females. As the primary, most potent estrogen hormone produced by the ovaries, estradiol binds to and activates specific nuclear receptors. This agent exhibits mild anabolic and metabolic properties, and increases blood coagulability.

**estradiol/norethindrone acetate tablet:** An orally bioavailable tablet formulation containing the semisynthetic estrogen estradiol in combination with the acetate form of the synthetic progestin norethindrone, with estrogenic and progesteric activities. Estradiol binds to and activates intracellular estrogen receptors found in the reproductive tract and other estrogen-responsive tissues. The activated complex enters the nucleus, binds to the estrogen response elements on DNA, and activates the transcription of genes involved in the maintenance of the female

reproductive system and secondary sexual characteristics, the proliferation of the endometrium, and bone metabolism. Norethindrone binds to the intracellular progesterone receptors in the reproductive system and the activated ligand/receptor complex interacts with specific DNA response elements, resulting in an alteration in protein synthesis; inhibition of luteinizing hormone (LH) and follicle stimulating hormone (FSH) release; inhibition of ovulation; an increase in cervical mucus production; and induction of the secretory phase of the endometrial cycle. Administration of estradiol/norethindrone acetate may abrogate vasomotor symptoms associated with menopause and prevent bone loss associated with the postmenopause. Because chronic estrogen stimulation unopposed by progesterone may increase the risk of endometrial carcinoma, administration of a combination estrogen-progestin in postmenopause may reduce the risk for women who require estrogen replacement therapy.

**estramustine :** A combination of the hormone estradiol (an estrogen) and nitrogen mustard (an anticancer drug). Used in the palliative therapy of prostate cancer.

**estramustine phosphate sodium:** The orally available disodium salt, monohydrate, of estramustine phosphate, a synthetic molecule that combines estradiol and nornitrogen mustard through a carbamate link. Estramustine and its major metabolite estramustine bind to microtubule-associated proteins (MAPs) and tubulin, thereby inhibiting microtubule dynamics and leading to anaphase arrest in a dose-dependent fashion. This agent also exhibits anti-androgenic effects.

**ESTRING:** (Other name for: estradiol vaginal ring)

**estriol vaginal gel:** A vaginal gel formulation containing a very low concentration of the estrogen estriol, that can be used for hormone replacement. Upon topical application to the vagina, estriol maintains adequate levels of estrogen in the vagina, and decreases vaginal atrophy and its associated symptoms, such as vaginal dryness and itching. Check for active clinical trials using this agent.

**Estrobene:** (Other name for: diethylstilbestrol)

**EstroGel:** (Other name for: transdermal estrogen)

**estrogen:** a hormone produced by the ovaries that stimulates the development of secondary female characteristics.

**estrogen** : A type of hormone made by the body that helps develop and maintain female sex characteristics and the growth of long bones. Estrogens can also be made in the laboratory. They may be used as a type of birth control and to treat symptoms of menopause, menstrual disorders, osteoporosis, and other conditions.

**estrogen blocker** : A substance that keeps cells from making or using estrogen (a hormone that plays a role in female sex characteristics, the menstrual cycle, and pregnancy). Estrogen blockers may stop some cancer cells from growing and are used to prevent and treat breast cancer. They are also being studied in the treatment of other types of cancer. An estrogen blocker is a type of hormone antagonist. Also called antiestrogen.

**estrogen cream** : A cream that contains the hormone estrogen. It is used to treat some symptoms of menopause, such as vaginal dryness and painful intercourse. It may also be used to treat certain types of urinary incontinence (inability to control the flow of urine from the bladder). Estrogen cream is usually applied to the vagina, vulva, or opening of the urethra. It may also be applied to the cervix in some women who have certain abnormal cell changes caused by low hormone levels. Treatment with estrogen cream usually helps make these abnormal cells go away.

**estrogen receptor** : A protein found inside the cells of the female reproductive tissue, some other types of tissue, and some cancer cells. The hormone estrogen will bind to the receptors inside the cells and may cause the cells to grow. Also called ER.

**estrogen receptor agonist GTx-758**: An orally available, nonsteroidal selective estrogen receptor (ER) alpha agonist with potential antineoplastic activity. Upon administration of GTx-758, this agent suppresses the secretion of the gonadotropins follicle-stimulating hormone (FSH) and luteinizing hormone (LH) by the pituitary gland through feedback inhibition. In males, the inhibition of LH secretion prevents the synthesis of androgens, including testosterone, by the testes. This may result in suppressed total serum testosterone to the levels observed in castration.

**estrogen receptor negative** : Describes cells that do not have a protein to which the hormone estrogen will bind. Cancer cells that are estrogen receptor negative do not need estrogen to grow, and usually do not stop growing when treated with hormones that block estrogen from binding. Also called ER-.

**estrogen receptor positive :** Describes cells that have a receptor protein that binds the hormone estrogen. Cancer cells that are estrogen receptor positive may need estrogen to grow, and may stop growing or die when treated with substances that block the binding and actions of estrogen. Also called ER+.

**estrogen receptor test :** A lab test to find out if cancer cells have estrogen receptors (proteins to which estrogen will bind). If the cells have estrogen receptors, they may need estrogen to grow, and this may affect how the cancer is treated.

**estrogen replacement therapy :** Treatment with the hormone estrogen to increase the amount of estrogen in the body. It is given to women who have gone through menopause or to women who have early menopause caused by cancer treatment or by having their ovaries removed by surgery. Estrogen replacement therapy may help relieve symptoms of menopause, such as hot flashes, night sweats, vaginal dryness, and sleep problems. It may also help protect against osteoporosis (thinning of the bones) and lower the risk of breast cancer in postmenopausal women. Also called ERT.

**Estrosyn:** (Other name for: diethylstilbestrol)

**Estuaries:** Bodies of water which are located at the lower end of a river and are subject to tidal fluctuations.

**estuary:** a drowned river mouth from an older coastline; appears as a long arm of ocean water extending inland from the coast. OR Regions of interaction between rivers and near-shore ocean waters, where tidal action and river flow create a mixing of fresh and salt water.

**Estybon:** (Other name for: rigosertib sodium)

**eszopiclone:** A nonbenzodiazepine cyclopyrrolone and active dextrorotatory stereoisomer of zopiclone with hypnotic and sedative activities and without significant anxiolytic activity. Although the exact mechanism of action remains to be fully elucidated, eszopiclone binds to and activates the omega-1 subtype of the alpha subunit of the gamma-aminobutyric acid-benzodiazepine GABA receptor complex (GABA-A), a chloride ionophore complex in the central nervous system (CNS). This leads to the opening of chloride channels, causing hyperpolarization and inhibition of neuronal firing, which may result in a hypnotic effect and the induction of sleep.

**ET-743:** A drug used to treat liposarcoma and leiomyosarcoma (types of soft tissue sarcoma) that cannot be removed by surgery or have spread to other parts of the body. It is used in patients who were treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. ET-743 may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called ecteinascidin 743, trabectedin, and Yondelis.

**etanercept:** A recombinant soluble dimeric fusion protein consisting of the extracellular ligand-binding region of recombinant human tumor necrosis factor (rhTNF) receptor attached to the constant (Fc) region of human immunoglobulin G (FcIgG). The receptor moiety of etanercept binds to circulating TNF (2 molecules of TNF per receptor) and inhibits its attachment to endogenous TNF cell surface receptors, thereby rendering TNF inactive and inhibiting TNF-mediated mechanisms of inflammation. or A drug that is commonly used to treat arthritis. It is also being studied in the treatment of cancer, and as a treatment for loss of appetite and weight loss in cancer patients. It belongs to the family of drugs called tumor necrosis factor (TNF) antagonists.

**etanidazole:** A 2-nitroimidazole with radiosensitizing properties. Etanidazole depletes glutathione and inhibits glutathione transferase, thereby enhancing the cytotoxicity of ionizing radiation. This agent may also be useful as an imaging agent for identifying hypoxic, drug-resistant regions of primary tumors or metastases.

**etaracizumab :** A substance being studied in the treatment of some types of cancer and other conditions. Etaracizumab binds to a protein on the surface of blood vessels and may prevent the growth of new blood vessels that tumors need to grow. It may also prevent the spread of cancer. It is a type of antiangiogenesis agent, a type of metastasis inhibitor, and a type of monoclonal antibody. Also called Abegrin, humanized monoclonal antibody MEDI-522, and MEDI-522.

**ETCH:** Surface preparation by chemical means to improve the adhesion of coating.

**Etch primer:** A thin lightly pigmented primer designed to increase the adhesion of a paint process when applied to surfaces particularly of non-ferrous metal on which paint will not normally adhere well. Also called wash primer.

**ETFE:** Ethylene-tetrafluoroethylene

**ETFE (ethylene tetrafluoroethylene):** A thermoplastic member of the fluoropolymer family. ETFE is noted for exceptional chemical resistance, toughness and abrasion resistance.

**ethacrynic acid:** An aryloxy-acetic acid derivative belonging to the class of loop diuretics. Ethacrynic acid interferes with the chloride binding site of the Na<sup>+</sup>, K<sup>+</sup>, Cl<sup>-</sup> cotransporter system in the thick ascending loop of Henle, thereby inhibiting the reabsorption of sodium, potassium, and chloride ions. This leads to an increase in the excretion of sodium, potassium, chloride, calcium, and water.

**ethambutol:** An antibiotic with bacteriostatic, antimicrobial and antitubercular properties. Ethambutol interferes with the biosynthesis of arabinogalactan, a major polysaccharide of the mycobacterial cell wall. It inhibits the polymerization of cell wall arabinan of arabinogalactan and lipoarabinomannan by blocking arabinosyl transferases and induces the accumulation of D-arabinofuranosyl-P-decaprenol, an intermediate in arabinan biosynthesis. This results in halting bacterial growth.

**Ethane:** Ethane is a two-carbon hydrocarbon. At standard temperature and pressure, ethane is a colourless, odourless gas. Ethane is produced on an industrial scale either by extraction from natural and associated gas, or as a byproduct of petroleum refining. Its chief use is as petrochemical feedstock in steam crackers for ethylene production.

**ethanol:** A colorless organic liquid also known as ethyl alcohol or grain alcohol. Ethanol's primary physiologic effects involve the central nervous system. Depending on the dose delivered, ethanol behaves as an anxiolytic, a depressant, or a general anesthetic. Ethanol-induced immunosuppression involves dysregulation of CD4<sup>+</sup> T cells. Check for active clinical trials using this agent.

**Ethanol:** Ethanol is a two-carbon alcohol which are mainly industrially produced in two ways: by fermentation processes (using starches, sugar crops or lignocellulose as feedstock) which produces fuel grade, or by the catalytic hydration of ethylene (industrial grade). Around 95 percent of globally manufacture ethanol is sourced from the fermentation process. Industrial ethanol is used in the manufacture of several chemicals, acting, in the main, as an intermediate. It is also used as a solvent. The main use for ethanol via fermentation is in fuel. Fuel grade ethanol is used as a substitute

for gasoline. OR What most people just call alcohol, ethanol is the alcohol with which most people are most familiar. It's a very useful solvent, antiseptic, cleaner and is also known as a "social lubricant" due to its physiological effects, which can include death. Most polymer scientists never ever touch the stuff. Honest.

**ethanol ablation :** An injection of ethanol (alcohol) through the skin directly into a tumor to kill cancer cells. Ultrasound or a CT scan is used to guide the needle into the tumor. Also called alcohol ablation, PEI, and percutaneous ethanol injection.

**ethanol fermentation:** See alcohol fermentation.

**ethanol<sup>32</sup>:** A colorless, flammable liquid produced by fermentation of sugars. Ethanol is the alcohol found in alcoholic beverages.

**ethaselen:** An orally bioavailable organoselenium inhibitor of thioredoxin reductase 1 (TrxR1), with potential antineoplastic activity. Upon oral administration, ethaselen specifically binds to the selenocysteine-cysteine redox pair in the C-terminal active site of TrxR1 and inhibits its activity, which may result in growth inhibition and the induction of apoptosis in TrxR1-overexpressing tumor cells. TrxR1, upregulated in many cancer cell types, plays a key role in various redox-dependent cellular pathways, regulates transcription factor activity, inhibits apoptosis, and promotes cell growth and survival. Check for active clinical trials using this agent.

**Ethene:** Also known as ethylene, ethene is the simplest monomer for use in addition polymerisation reactions. Poly(ethene) (or polyethylene) is well known to you in the form of cling wrap.

**Ether:** Any carbon compound containing the functional group C-O-C. A commonly used ether is diethyl ether, which used to be used as an anaesthetic. OR an organic compound in which an oxygen atom is bonded to carbon atoms. The general formula is R — O — R'. Epoxyethane, an epoxide, is a cyclic ether. OR A molecule containing two carbons linked by an oxygen atom.

**ethylenediaminetetraacetic acid :** A chemical that binds certain metal ions, such as calcium, magnesium, lead, and iron. It is used in medicine to prevent blood samples from clotting and to remove calcium and lead from the body. It is also used to keep bacteria from forming a biofilm (thin layer stuck to a surface). It is a type of chelating agent. Also called edetic acid and EDTA.

**ethical :** Having to do with beliefs about what is right and wrong in terms of how people behave. Also called moral.

**ethical will :** A final personal message or document in which a person shares his or her thoughts, values, memories, life lessons, advice, and hopes for the future. The person may also ask for forgiveness and forgive others. An ethical will is not a legal document.

**Ethinoral:** (Other name for: ethinyl estradiol)

**ethinyl estradiol:** A semisynthetic estrogen. Ethinyl estradiol binds to the estrogen receptor complex and enters the nucleus, activating DNA transcription of genes involved in estrogenic cellular responses. This agent also inhibits 5-alpha reductase in epididymal tissue, which lowers testosterone levels and may delay progression of prostatic cancer. In addition to its antineoplastic effects, ethinyl estradiol protects against osteoporosis. In animal models, short-term therapy with this agent has been shown to provide long-term protection against breast cancer, mimicking the antitumor effects of pregnancy.

**ethinyl estradiol/norethindrone:** An oral contraceptive formulation containing the semisynthetic estrogen, ethinyl estradiol, combined with the synthetic progestin, norethindrone, with estrogenic and progestogenic activities, respectively. Ethinyl estradiol binds to and activates intracellular estrogen receptors found in the reproductive tract and other estrogen-responsive tissues. The activated complex enters the nucleus, binds to the estrogen response elements on DNA, activates the transcription of genes involved in the maintenance of the female reproductive system, inhibits the release of follicle stimulating hormone (FSH) from the anterior pituitary, and suppresses the development of the ovarian follicle. Norethindrone binds to intracellular progesterone receptors in progesterone-responsive tissues, such as the pituitary and those found in the reproductive system, and the activated ligand/receptor complex interacts with specific progesterone response elements on DNA, which results in the alteration in protein synthesis, the inhibition of ovulation, an increase in cervical mucus production, the induction of the secretory phase of the endometrial cycle, and the inhibition of luteinizing hormone (LH) release. The combination of an estrogen with a progestin suppresses the hypothalamic-pituitary system and alters the structure of the endometrium to discourage implantation. Check for active clinical trials using this agent.

**ethiodized oil:** A synthetic iodine addition product of the ethyl ester of the fatty acids of poppyseed oil. Ethiodized oil contains 37% organically bound iodine and is used as a diagnostic radiopaque medium or, labeled with I-131, as an antineoplastic agent. Selectively retained in tumor vessels for long periods, ethiodized oil is used for imaging organs such as liver, lung, stomach, and thyroid. Labeled with I-131 or other beta emitters (Y-90 or P-32), ethiodol can deliver a high internal radiation dose to certain tumors with minimal effect on healthy tissues. OR A form of poppy seed oil that contains iodine. Ethiodized oil is given by injection and builds up in the blood and lymph vessels in tumors. It is used for imaging (taking pictures) of the salivary glands and the lymph system. It is also being studied in the imaging of other organs such as the liver, lung, stomach, and thyroid. It is a type of diagnostic imaging agent. Also called Ethiodol, iodized oil, and Lipiodol.

**Ethiodol :** A form of poppy seed oil that contains iodine. Ethiodol is given by injection and builds up in the blood and lymph vessels in tumors. It is used for imaging (taking pictures) of the salivary glands and the lymph system. It is also being studied in the imaging of other organs such as the liver, lung, stomach, and thyroid. It is a type of diagnostic imaging agent. Also called ethiodized oil, iodized oil, and Lipiodol.

**ethmoid sinus :** A type of paranasal sinus (a hollow space in the bones around the nose). Ethmoid sinuses are found in the spongy ethmoid bone in the upper part of the nose between the eyes. They are lined with cells that make mucus to keep the nose from drying out.

**ethosuximide:** A succinimide with anticonvulsant activity. The exact mechanism of action is not entirely understood, but most likely ethosuximide exerts its effects by partial antagonism of T-type calcium channels of the thalamic neurons. This leads to a decrease in burst firing of thalamocortical neurons, which stabilizes the nerve activity in the brain and prevents seizures.

**ETHOXYLATE:** Common name for a compound formed by the chemical addition of a number of molecules of ethylene oxide to an alcohol.

**ethyl acetate<sup>323</sup>:** A flammable liquid with a fruity odor, used in flavorings and as a solvent.

**ethyl alcohol mouthwash:** A mouthwash containing ethyl alcohol, with topical antibacterial activity. Upon rinsing the oral cavity with the ethyl

alcohol mouthwash, ethyl alcohol denatures bacterial proteins, and dissolves and disrupts the bacterial lipid membrane, thereby killing the bacteria. This reduces oral colonization with harmful bacteria and may prevent oral mucositis. Check for active clinical trials using this agent.

**Ethyl Chloride:** Ethyl Chloride (chloroethane) is produced by the addition of hydrogen chloride to ethylene over an aluminum chloride catalyst. It is also generated as a co-product of PVC. Ethyl chloride's major use was in the production of tetraethyl lead (TEL) used as an anti-knock additive in gasoline, but its use for this application has been phased-out by most countries since leaded gasoline has been prohibited. The main current application is in thickening of cellulose for making ethyl cellulose, a thickening agent for paints and cosmetics. It is also used as a solvent, refrigerant, aerosol propellant, anesthetic and blowing agent for foam packaging.

**ethyl<sup>23</sup>:** A molecular fragment produced by removing a hydrogen atom from ethane (CH<sub>3</sub>-CH<sub>3</sub>). For example, ethyl chloride is CH<sub>3</sub>-CH<sub>2</sub>-Cl.

**Ethylbenzene (EB):** Ethylbenzene (EB), an aromatic liquid hydrocarbon, is a chemical intermediate made from the reaction of benzene and ethylene. It is a precursor to styrene production.

**Ethylene:** Ethylene is the most basic member of the olefin chemical family, consisting of two carbon atoms joined by a double bond. The ready accessibility and high reactivity of this double bond lends the molecule to many synthesis reactions, including its most common use as a monomer for producing polyethylenes. Ethylene is industrially produced by the pyrolytic cracking in a steam cracker of a wide variety of hydrocarbons, ranging from ethane to gas oil. OR The basic monomer building block of polyethylene, extracted from either natural gas or naphtha. OR A colorless, flammable gas derived by cracking of petroleum and natural gas fractions. Also serves as a monomer for polyethylene. OR A colorless gaseous alkene obtained from petroleum and natural gas and used in manufacturing the most common plastic bags.

**Ethylene Dichloride (EDC):** Ethylene dichloride (EDC) is the first molecule produced in the vinyls chain and is a toxic, flammable, and corrosive liquid at room temperature. EDC is most commonly formed from ethylene and chlorine, both of which are costly and difficult to transport, and thus EDC production is normally located close to sources of such raw

materials. EDC is principally used for VCM production, with small amounts used for the manufacture of other organic compounds.

**ethylene oxide :** A chemical used to make antifreeze, to clean medical equipment, and as a pesticide. It is also found in tobacco smoke. Being exposed to ethylene oxide can cause lung damage, headache, nausea, vomiting, diarrhea, and shortness of breath. Being exposed over a long time may increase the risk of certain types of cancer.

**Ethylene Oxide (EO):** Ethylene oxide (EO) has widespread uses in the production of surfactants although its largest and fastest growing end-use is in the production of monoethylene glycol (MEG). EO is grouped with polyester intermediates, as the majority is eventually consumed in the production of PET. EO is produced by reacting ethylene and oxygen over mainly silver-based catalysts. Due to its hazardous nature, minimal volumes of EO are transported, and production tends to be from complexes including both ethylene feedstock and EO derivatives. Production is widespread globally, with development mainly in the Middle East and Asia.

**Ethylene Plastics:** Plastics based on polymers of ethylene or copolymers of ethylene with other monomers, the ethylene being in greatest amount by mass.

**Ethylene Vinyl Acetate (EVA):** Random copolymerization of vinyl acetate and ethylene. Usually low density polyethylene is copolymerized with various levels of vinyl acetate to achieve a lower melt temperature resin. OR Copolymer member of the polyolefin family, derived from random copolymerization of vinyl acetate and ethylene. OR Copolymeric member of the polyolefin family derived from random copolymerization of vinyl acetate and ethylene. They are mainly used for foaming, coating, extrusion, and injection moulding applications for many industrial market sectors such as shoe soles, sheets, wire and cable, hot melt adhesive, and solar cell encapsulation.

**Ethylene Vinyl Alcohol (EVOH):** Copolymer exhibiting outstanding barrier to many chemicals and gasses.

**Ethylene-vinyl Acetate:** Copolymers from these two monomers form a new class of plastic materials. They retain many of the properties of polyethylene, but have considerably increased flexibility for their density – elongation and impact resistance are also increased.

**ethylene-vinyl alcohol copolymer-based embolic agent:** A non-adhesive, non-absorbable, permanent liquid embolic agent comprised of ethylene vinyl alcohol (EVOH) copolymer dissolved in dimethyl sulfoxide (DMSO), and of micronized tantalum powder that can be used to occlude blood vessels. Upon administration of the EVOH-based embolic agent, contact with fluids, such as blood, induces the solidification of EVOH into a sponge-like material. This causes occlusion of blood vessels and prevents blood flow to the treated area.

**ethynyluracil :** An anticancer drug that increases the effectiveness of fluorouracil. Also called eniluracil.

**Ethyol:** (Other name for: amifostine trihydrate)

**etidronate :** A drug that belongs to the family of drugs called bisphosphonates. Bisphosphonates are used as treatment for hypercalcemia (abnormally high levels of calcium in the blood) and for cancer that has spread to the bone (bone metastases).

**etidronate-cytarabine conjugate MBC-11:** A synthetic conjugate composed of the bisphosphonate etidronate linked to the cytostatic agent and antimetabolite cytarabine, with potential antineoplastic and antiresorptive activities. Upon intravenous administration of the etidronate-cytarabine conjugate MBC-11, the etidronate moiety targets bone and the two moieties are released upon hydrolysis of the phospho-ester bond locally. Etidronate binds to hydroxyapatite crystals in bone tissues and prevents its resorption. This prevents bone destruction and induces bone cell mineralization. In addition, the bone-targeting nature of this agent allows for the accumulation of cytarabine in bone tissue, where it is able to exert its antitumor effect locally by competing with cytidine for incorporation into DNA, thereby inhibiting DNA synthesis, while reducing systemic exposure. This leads to a destruction of bone-associated tumor cells, an inhibition of tumor cell proliferation and bone metastasis, and prevents tumor-mediated bone destruction. Check for active clinical trials using this agent.

**Etilamide:** (Other name for: buserelin)

**etiology :** The cause or origin of disease.

**etodolac:** A pyranocarboxylic acid and non-steroidal anti-inflammatory drug (NSAID) with antipyretic and analgesic activities. Etodolac inhibits the activity of cyclooxygenase I and II, thereby preventing the formation of

prostaglandin which is involved in the induction of pain, fever, and inflammation. It also inhibits platelet aggregation by blocking platelet cyclooxygenase and the subsequent formation of thromboxane A<sub>2</sub>.

**Etopophos:** (Other name for: etoposide phosphate) or A drug used to treat testicular and small cell lung cancers. It is also being studied in the treatment of several other types of cancer. Etopophos blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of podophyllotoxin derivative and a type of topoisomerase inhibitor. Also called etoposide phosphate.

**etoposide:** A semisynthetic derivative of podophyllotoxin, a substance extracted from the mandrake root *Podophyllum peltatum*. Possessing potent antineoplastic properties, etoposide binds to and inhibits topoisomerase II and its function in ligating cleaved DNA molecules, resulting in the accumulation of single- or double-strand DNA breaks, the inhibition of DNA replication and transcription, and apoptotic cell death. Etoposide acts primarily in the G<sub>2</sub> and S phases of the cell cycle. or A drug used to treat testicular and small cell lung cancers. It is also being studied in the treatment of several other types of cancer. Etoposide blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of podophyllotoxin derivative and a type of topoisomerase inhibitor.

**etoposide phosphate:** A phosphate salt of a semisynthetic derivative of podophyllotoxin. Etoposide binds to the enzyme topoisomerase II, inducing double-strand DNA breaks, inhibiting DNA repair, and resulting in decreased DNA synthesis and tumor cell proliferation. Cells in the S and G<sub>2</sub> phases of the cell cycle are most sensitive to this agent. OR A drug used to treat testicular and small cell lung cancers. It is also being studied in the treatment of several other types of cancer. Etoposide phosphate blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of podophyllotoxin derivative and a type of topoisomerase inhibitor. Also called Etopophos.

**etoposide prodrug CAP7.1:** A prodrug of etoposide, a semisynthetic derivative of podophyllotoxin extracted from the mandrake root *Podophyllum peltatum*, with potential antineoplastic activity. Upon intravenous administration of the etoposide prodrug CAP7.1, etoposide is released after enzymatic cleavage of CAP7.1 by specific carboxylesterases

(CE) 1 and 2, which are upregulated in certain tumor cell types. Etoposide acts primarily in the G2 and S phases of the cell cycle. This drug binds to and inhibits topoisomerase II, an enzyme elevated in tumor cells. This results in the accumulation of double-strand DNA breaks, the inhibition of DNA replication and transcription and the induction of apoptotic cell death. The tumor-specific activation of etoposide increases its efficacy while lowering its systemic toxicity.

**etoricoxib:** A synthetic, nonsteroidal anti-inflammatory drug (NSAID) with antipyretic, analgesic, and potential antineoplastic properties. Etoricoxib specifically binds to and inhibits the enzyme cyclooxygenase-2 (COX-2), resulting in inhibition of the conversion of arachidonic acid into prostaglandins. Inhibition of COX-2 may induce apoptosis and inhibit tumor cell proliferation and angiogenesis.

**Etrenol:** (Other name for: hycanthone)

**Etretin:** (Other name for: acitretin)

**ETS:** Smoke that comes from the burning of a tobacco product and smoke that is exhaled by smokers. Inhaling ETS is called involuntary or passive smoking. Also called environmental tobacco smoke and secondhand smoke.

**Ets-family transcription factor inhibitor TK216:** A proprietary biologic that inhibits the transcriptional-promoting activity of E26 transformation-specific (Ets, E-twenty-six) family transcription factors, with potential antineoplastic activity. Although the exact mechanism(s) of action through which this agent exerts its effect has yet to be fully elucidated, upon administration, Ets-family transcription factor inhibitor TK216 inhibits transcriptional activation mediated by Ets family proteins, including the oncogenic Ewing sarcoma breakpoint region 1/Friend leukemia virus integration 1 (EWSR1/FLI1; EWS/FLI1) fusion protein. This agent may both inhibit the malignant downstream effects mediated by genomic rearrangements that result in the overexpression of Ets family transcription factors and decrease tumor cell growth and proliferation. A chromosomal translocation t(11;22)(q24;q12) fuses the EWSR1 gene and the FLI1 gene and encodes the EWSR1/FLI1 fusion protein, which is an oncoprotein expressed by peripheral primitive neuroectodermal (pPNET) tumors.

**Eubacteria:** The most common form of extant prokaryotes.

**eucalyptus :** A type of evergreen tree that is a member of the myrtle family. Oil from the leaves is used in very small amounts in mouthwash and

in medicines and candy used to treat and soothe sore throats and coughs. It has also been used in some cultures to treat many other medical problems. The scientific name is *Eucalyptus globulus*.

**eucalyptus :** A type of evergreen tree that is a member of the myrtle family. Oil from the leaves is used in very small amounts in mouthwash and in medicines and candy used to treat and soothe sore throats and coughs. It has also been used in some cultures to treat many other medical problems. The scientific name is *Eucalyptus globulus*. OR The kingdom that describes ALL organisms (plants, fungi, animals, fish, birds, etc.) that have an organized nucleus surrounded by a nuclear membrane. The other major kingdom is the Prokaryotes (containing only the primitive bacteria and Archae)

**Eucerin:** (Other name for: therapeutic lotion)

**Eukaryote:** A cell or organism that has a membrane-bound nucleus. OR A unicellular or multicellular organism with cells having a membrane-bound nucleus, multiple chromosomes, and internal organelles. OR cells that contain a nucleus and internal cellular bodies called organelles.

**euphemism:** a mild or roundabout word or phrase used in place of one considered painful or offensive.

**euphoria :** A feeling of great happiness or well-being. Euphoria may be a side effect of certain drugs.

**euphotic zone:** The layer of a body of water that receives sufficient sunlight for photosynthesis. The depth of this layer, which is about 80 m, is determined by the water's extinction coefficient, the cloudiness, and the sunlight's angle of incidence.

**EUROMAP:** Euromap is the non profit organisation of the national association of machinery manufacturers for plastics and rubber industries in Austria, France, Germany, Italy, Luxembourg, Netherlands, Spain, Switzerland, and U.K. It represents 600 companies. It's Technical Commission deals with mechanical and electrical standardisation, the communication protocol, and interface for various types of processing machinery and safety standards. It's technical work started in early seventies describe recommendations for functional and specification, testing of machines etc.

**Europium:** Symbol:"Eu" Atomic Number:"63" Atomic Mass: 151.96amu. Europium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element.

**Eurythermal:** Bodies of water which are located at the lower end of a river and are subject to tidal fluctuations.

**EUS:** A procedure in which an endoscope is inserted into the body. An endoscope is a thin, tube-like instrument that has a light and a lens for viewing. A probe at the end of the endoscope is used to bounce high-energy sound waves (ultrasound) off internal organs to make a picture (sonogram). Also called endoscopic ultrasound and endosonography.

**EUS-FNA:** A procedure to take a sample of tissue for examination under a microscope. An endoscope with an ultrasound probe and a biopsy needle at the end is inserted through the mouth into the esophagus. An endoscope is a thin, tube-like instrument that has a light and a lens for viewing. The ultrasound probe is used to bounce high-energy sound waves off internal organs and tissues to make a picture on a monitor. This picture helps the doctor see where to place the biopsy needle. Also called endoscopic ultrasound-guided fine needle aspiration.

**eutectic mixture:** A mixture of two or more substances with melting point lower than that for any other mixture of the same substances.

**eutectic point:** The composition and the melting point of a eutectic mixture. For example, the eutectic point of a mixture of NaCl and water occurs at 23.3% NaCl (by mass) and  $-21.1^{\circ}\text{C}$ . That means that the lowest possible temperature at which a liquid NaCl solution can exist is  $-21.1^{\circ}\text{C}$ ; below the eutectic point the solution will freeze into a mixture of ice and salt crystals.

**euthanasia :** An easy or painless death, or the intentional ending of the life of a person suffering from an incurable or painful disease at his or her request. Also called mercy killing.

**eutrophication:** Eutrophication is the pollution of rivers and lakes caused by leaching of fertilizers, detergents, or sewage into the water. OR Usually, the limiting factor on how many living organisms can grow in a body of water is the supply of nutrient elements such as nitrogen and phosphorus. If these are supplied in overabundance (for example, by pouring fertilizer into the lake), plants and bacteria can multiply to such an extent that the oxygen consumed in their decomposition can exhaust the oxygen available in the

lake, causing a loss of species that like oxygen and the multiplication of anaerobic bacteria that generate nasty chemicals like hydrogen sulfide. This process, as well as the more stately natural accumulation of nutrients over time leading to a more complex and populous community of living things in the lake, is called eutrophication.

**EVA:** Ethylene-Vinyl Acetate copolymer is an additive. Much softer and clearer than LDPE or LLDPE and has lower melt temperature. Its melt temperature goes down, while its softness increases with increasing vinyl acetate (VA) content. EVA resins with 2-18% VA content are used for cast and blown packaging films.

**Evacet:** (Other name for: pegylated liposomal doxorubicin hydrochloride) or a form of the anticancer drug doxorubicin that is contained in very tiny, fat-like particles. It may have fewer side effects and work better than doxorubicin. Evacet is used to treat ovarian cancer, AIDS-related Kaposi sarcoma, and multiple myeloma in patients whose disease has not gotten better after treatment with other anticancer drugs. It may be used together with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Evacet is a type of anthracycline antitumor antibiotic. Also called Dox-SL, Doxil, doxorubicin hydrochloride liposome, LipoDox, and liposomal doxorubicin hydrochloride.

**evaluable disease :** Disease that cannot be measured directly by the size of the tumor but can be evaluated by other methods specific to a particular clinical trial.

**evaluable patients :** Patients whose response to a treatment can be measured because enough information has been collected.

**evaluation:** To follow the order of operations and determine the value.

**evaporate:** To convert a liquid into a gas.

**Evaporation:** Evaporation is a molecular phase change of a liquid to gas or vapor. The overall temperature of the system is not near the boiling point. While the average temperature of a liquid may be low, some molecules have high temperatures and high energy. Those molecules with higher energies are able to escape the system and become a gas. The molecules evaporate one by one. OR changing of a liquid to a vapor at any temperature below its boiling point. OR Conversion of a liquid into a gas. OR A liquid turning into a gas. Although a liquid may evaporate (from its surface) at any temperature, it can only boil at its boiling point.

**Evaporation (vaporization):** A process in which a pure liquid, liquid mixture, or solvent in a solution is vaporized.

**evaporitic rock:** a rock formed from minerals that chemically precipitated from water.

**evapotranspiration:** Discharge of water from the Earth's surface to the atmosphere by evaporation from bodies of water, or other surfaces, and by transpiration from plants.

**Evaux spring water-based cream:** A cream containing Evaux thermal spring water, with potential moisturizing and skin protecting activities. Upon application to the skin, Evaux spring water-based cream forms a protective barrier, which prevents water loss, provides moisture to the skin, protects the skin from damage, and soothes irritated skin. The Evaux thermal spring water contains the trace elements lithium and manganese which may help heal the skin.

**Evaux spring water-based topical spray:** A skin spray composed of Evaux thermal spring water, the emulsifier polysorbate 20, the preservatives phenoxyethanol and chlorphenesin, zinc gluconate, and the moisturizer caprylyl glycol with prophylactic and calming activity. Evaux thermal spring water is rich in mineral elements particularly of lithium, strontium and manganese. When sprayed directly onto the skin or scalp, this topical spray may have a calming, moisturizing, healing and nurturing effect. This agent may prevent or decrease skin rashes associated with the administration of EGFR inhibitors or with radiochemotherapy-induced skin reactions. Check for active clinical trials using this agent.

**Evaux thermal spring water-based solution:** A topical solution containing Evaux thermal spring water, with potential moisturizing and skin protecting activities. Upon application to the nails and surrounding skin, Evaux spring water-based solution forms a film on the nails that serves as a protective barrier. This prevents water loss from, provides moisture to, and strengthens the nails, and protects them from damage. The solution also relieves pain caused by cracked, peeled, thinning or soft nails. Evaux thermal spring water contains the elements lithium, manganese and strontium which may help heal the nails and prevent onycholysis. It also contains chlorphenesin and piroctone olamine, both of which have antifungal activity. Some chemotherapy and/or radiation therapy can induce damage to the nails.

**even integers:** Integers that are even numbers.

**even number:** A number divisible by two.

**Event Notification System:** An automated event tracking system used internally by the NRC's Headquarters Operations Center to track incoming notifications of significant nuclear events with an actual or potential effect on the health and safety of the public and the environment. Significant events are reported to the Operations Center by the NRC's licensees, Agreement States, other Federal agencies, the public, and other stakeholders.

**Event tree:** An event tree graphically represents the various accident scenarios that can occur as a result of an initiating event (i.e., a challenge to plant operation). Toward that end, an event tree starts with an initiating event and develops scenarios, or sequences, based on whether a plant system succeeds or fails in performing its function. The event tree then considers all of the related systems that could respond to an initiating event, until the sequence ends in either a safe recovery or reactor core damage. For additional information, see Probabilistic Risk Assessment.

**event-free survival :** In cancer, the length of time after primary treatment for a cancer ends that the patient remains free of certain complications or events that the treatment was intended to prevent or delay. These events may include the return of the cancer or the onset of certain symptoms, such as bone pain from cancer that has spread to the bone. In a clinical trial, measuring the event-free survival is one way to see how well a new treatment works. Also called EFS.

**everolimus:** A derivative of the natural macrocyclic lactone sirolimus with immunosuppressant and anti-angiogenic properties. In cells, everolimus binds to the immunophilin FK Binding Protein-12 (FKBP-12) to generate an immunosuppressive complex that binds to and inhibits the activation of the mammalian Target of Rapamycin (mTOR), a key regulatory kinase. Inhibition of mTOR activation results in the inhibition of T lymphocyte activation and proliferation associated with antigen and cytokine (IL-2, IL-4, and IL-15) stimulation and the inhibition of antibody production. OR A drug used with exemestane to treat some postmenopausal women with advanced breast cancer that is hormone-receptor positive and HER2 negative. It is also used to treat certain types of pancreatic, lung, and gastrointestinal neuroendocrine tumors that cannot be removed by surgery,

are advanced, or have spread to other parts of the body. It is also used to treat advanced renal cell carcinoma (a type of kidney cancer) and subependymal giant cell astrocytoma in some patients, including children. Everolimus is being studied in the treatment of other types of cancer. It stops cancer cells from dividing and may prevent the growth of new blood vessels that tumors need to grow. It also lowers the body's immune response. Everolimus is a type of kinase inhibitor, a type of angiogenesis inhibitor, and a type of immunosuppressant. Also called Afinitor, Afinitor Disperz, and RAD001.

**everolimus tablets for oral suspension:** Tablets for oral suspension containing everolimus, a derivative of the natural macrocyclic lactone sirolimus, with immunosuppressive and antineoplastic activities. After suspension of the everolimus tablets in water and oral administration, this agent inhibits the activation of the serine/threonine kinase mammalian target of rapamycin (mTOR) by binding to mTOR's cytosolic receptor immunophilin FK Binding Protein-12 (FKBP-12). Inhibition of the mTOR complex may result in the inhibition of the phosphatidylinositol 3 kinase/Akt/mTOR pathway and an inhibition in the expression of vascular endothelial cell growth factor (VEGF) and hypoxia-inducible factor. Ultimately, this may result in decreased tumor cell proliferation and tumor angiogenesis. This pediatric formulation can dissolve easily in a small volume of water making it easier to swallow and is available in smaller dose increments thereby allowing for greater dosing flexibility. Check for active clinical trials using this agent.

**Evista :** A drug used to reduce the risk of invasive breast cancer in postmenopausal women who are at high risk of the disease or who have osteoporosis. It is also used to prevent and treat osteoporosis in postmenopausal women. It is also being studied in the prevention of breast cancer in certain premenopausal women and in the prevention and treatment of other conditions. Evista blocks the effects of the hormone estrogen in the breast and increases the amount of calcium in bone. It is a type of selective estrogen receptor modulator (SERM). Also called raloxifene hydrochloride.

**evolution:** changes that occur within populations and organisms that make individuals able to adapt to their external environment.

**Evomela:** (Other name for: melphalan hydrochloride) or A drug used to treat multiple myeloma in patients who cannot take melphalan by mouth. It is also being studied in the treatment of other types of cancer. Evomela may kill cancer cells by damaging their DNA and stopping them from dividing. It is a type of alkylating agent. Also called Alkeran for Injection and melphalan hydrochloride.

**EvoNail:** (Other name for: Evaux thermal spring water-based solution)

**Evoskin cream:** (Other name for: Evaux spring water-based cream)

**Evoxac:** (Other name for: cevimeline hydrochloride) or A drug used to treat certain disorders of the salivary gland. It is also being studied as a treatment for dry mouth caused by radiation therapy to the head and neck. It increases the amount of saliva and sweat made by saliva and sweat glands. Evoxac is a type of cholinergic agonist. Also called cevimeline hydrochloride.

**Ewing sarcoma :** A type of cancer that forms in bone or soft tissue. Also called peripheral primitive neuroectodermal tumor and pPNET.

**Ewing sarcoma family of tumors :** A group of cancers that includes Ewing tumor of bone (ETB or Ewing sarcoma of bone), extraosseous Ewing (EOE) tumors, primitive neuroectodermal tumors (PNET or peripheral neuroepithelioma), and Askin tumors (PNET of the chest wall). These tumors all come from the same type of stem cell. Also called EFTs.

**ex vivo :** Outside of the living body. Refers to a medical procedure in which an organ, cells, or tissue are taken from a living body for a treatment or procedure, and then returned to the living body.

**ex vivo-activated autologous lymph node lymphocytes:** Autologous human lymph node T-lymphocytes, with potential immunostimulatory and antineoplastic activity. Upon collection of immune cells from the tumor-draining lymph node, the human lymph node lymphocytes are activated with anti-CD3/anti-CD28 microbeads, cultured with recombinant, human interleukin-2 (IL-2), expanded and isolated ex vivo. Upon reintroduction into the patient, the ex vivo-activated autologous lymph node lymphocytes recognize and lyse the tumor cells.

**ex vivo-expanded HER2-specific T cells:** T cells specific for the human epidermal growth factor receptor 2 (HER2) with potential immunopotentiating activity. T cells directed against HER2, overexpressed

on many tumor cells, are collected from HER2-expressing tumor tissue, expanded ex vivo and, then re-introduced in the patient. Re-introduction of ex vivo-expanded HER2-specific T cells may enhance the cytotoxic T cell response against tumor cells overexpressing HER2, resulting in inhibition of tumor growth.

**Exalgo :** A drug used to treat moderate to severe pain. It may also be used to treat certain types of cough. Exalgo is made from morphine and binds to opioid receptors in the central nervous system. It is a type of opioid and a type of analgesic agent. Also called Dilaudid, hydromorphone hydrochloride, and Hydrostat IR.

**exatecan mesylate:** A semisynthetic, water-soluble derivative of camptothecin with antineoplastic activity. Exatecan mesylate inhibits topoisomerase I activity by stabilizing the cleavable complex between topoisomerase I and DNA and inhibiting religation of DNA breaks, thereby inhibiting DNA replication and triggering apoptotic cell death. This agent does not require enzymatic activation and exhibits greater potency than camptothecin and other camptothecin analogues. or An anticancer drug that is a type of topoisomerase inhibitor. Also called DX-8951f.

**exchange energy:** Also called "exchange correlation energy." The energy associated with the correlation among the positions of electrons of like spin. This is included in Hartree-Fock calculations.

**Excimer:** An excited-state complex formed by two or more molecules.

**Excinuclease:** uvrabc enzyme that removes thymidine dimers by hydrolyzing the damaged DNA strand at sites on either side of the dimer site.

**Excipient:** Additives used in the preparation of the dosage form to either improve the handling and manufacturing of a product or to act as a filler (i.e., lactose, cellulose, starch, or dicalcium phosphate).

**excision :** Removal by surgery.

**Excision repair:** DNA repair in which a damaged region is replaced.

**excisional biopsy :** A surgical procedure in which an entire lump or suspicious area is removed for diagnosis. The tissue is then examined under a microscope.

**excisional skin surgery :** A surgical procedure used to remove moles, cysts, skin cancer, and other skin growths using local anesthesia. To treat

skin cancer, the doctor uses a scalpel to remove the entire tumor and some of the healthy tissue around it.

**Excitation :** the absorption of light energy by a fluorescent molecule, during which an electron in the molecule is boosted to a higher energy level.

**Excitation spectrum :** a plot of incident light wavelength versus the total fluorescence emitted.

**excited state:** a higher energy state than the ground state, achieved by adding energy to an atom or molecule in its ground state. OR An energy-rich state of an atom or a molecule, produced by the absorption of radiant energy. OR An atom or molecule which has absorbed energy is said to be in an excited state. Excited states tend to have short lifetimes; they lose energy either through collisions or by emitting photons to "relax" back down to their ground states. OR An energy-rich state of an atom or molecule; produced by the absorption of light energy.

**excitotoxin:** An excitotoxin is a toxic molecule that stimulates nerve cells so much that they are damaged or killed. Domoic acid and glutamate are examples of excitotoxins.

**exclamation point:** follow interjections and other expressions of strong feeling; they may also lend force to a command.

**Exclusion area:** The area surrounding the reactor where the reactor licensee has the authority to determine all activities, including exclusion or removal of personnel and property.

**excrete :** To get rid of waste material from the blood, tissues, or organs by a normal discharge (such as sweat, urine, or stool).

**excretion:** The discharge or elimination of an absorbed or endogenous substance, or of a waste product, via some tissue of the body and its appearance in urine, faeces, or other products normally leaving the body. Excretion of chemical compounds from the body occurs mainly through the kidney and the gut. For volatile compounds, however, elimination by exhalation may be important. Excretion via perspiration and through hair and nails may also be of importance under special circumstances. Excretion via the gastrointestinal tract may take place by various routes such as the bile, the shedding of intestinal cells, and transport through the intestinal mucosa (WHO, 1979).

**excretion:** The process of ridding the body of metabolic waste products.

**excretion rate:** The amount or proportion of a substance that is excreted per unit time. It should be noted that according to this definition excretion does not include the passing of a substance through the intestine without absorption. When discussing the total amount of a substance in faeces (including the unabsorbed part), it is preferable to speak about faecal content of substance (Task Group on Metal Accumulation, 1973).

**Excursion:** A sudden, very rapid rise in the power level of a reactor caused by supercriticality. Excursions are usually quickly suppressed by the moderator temperature coefficient, the fuel temperature coefficient, or the void coefficient of reactivity (depending upon reactor design), or by rapid insertion of control rods.

**Exelon:** (Other name for: rivastigmine tartrate)

**exemestane:** A synthetic androgen analogue. Exemestane binds irreversibly to and inhibits the enzyme aromatase, thereby blocking the conversion of cholesterol to pregnenolone and the peripheral aromatization of androgenic precursors into estrogens. Or A drug used to treat advanced breast cancer and to prevent recurrent breast cancer in postmenopausal women who have already been treated with tamoxifen. It is also being studied in the treatment of other types of cancer. Exemestane causes a decrease in the amount of estrogen made by the body. It is a type of aromatase inhibitor. Also called Aromasin.

**exenatide:** A 39 amino acid peptide and synthetic version of exendin-4, a hormone found in the saliva of the venomous lizard Gila monster, with insulin secretagogue and antihyperglycemic activity. Exenatide is administered subcutaneously and mimics human glucagon-like peptide-1 (GLP-1). Compared to GLP-1, exenatide has a longer half-life of 2.4 hours.

**exenteration :** Surgery to remove organs within a body cavity.

**exergonic process:** A process that liberates energy.

**Exergonic reaction:** A chemical reaction that takes place with a negative change in standard free energy. OR A chemical reaction that proceeds with the release of free energy (that is, for which  $\Delta G$  is negative). OR a chemical reaction in which energy is released.

**exfoliation:** the process by which curved sheets of rock loosen and fall from a weathered rock surface.

**exfoliation dome:** a large rounded landform (usually composed of intrusive rocks) that results from exfoliation.

**Exherin:** (Other name for: ADH-1)

**exisulind:** An inactive metabolite of the nonsteroidal, anti-inflammatory agent sulindac. After oral administration, sulindac undergoes extensive biotransformation including irreversible oxidation to sulindac sulfone. Approximately, one half of an administered dose of sulindac is eliminated through the urine, mostly as the conjugated sulfone metabolite. Check for active clinical trials using this agent. or A drug being studied in the treatment and prevention of cancer. It has been shown to cause apoptosis (cell death) in cells that are malignant (cancer) and in cells that may become cancer. It acts through a group of cellular enzymes called cGMP phosphodiesterases.

**Exjade:** (Other name for: deferasirox) or A drug used to treat too much iron in the blood caused by blood transfusions. It is being studied in the treatment of myelodysplastic syndromes (a group of diseases in which the bone marrow does not make enough healthy blood cells) and other conditions. Exjade binds to extra iron in the blood. The drug and the iron are passed from the body in urine. It is a type of chelating agent. Also called deferasirox.

**exocrine cancer :** A disease in which malignant (cancer) cells are found in the tissues of the pancreas. Also called pancreatic cancer.

**exocrine glands:** glands, such as the salivary glands, that deliver their enzymes via ducts.

**exocrine pancreas cell :** A pancreatic cell that produces enzymes that are secreted into the small intestine. These enzymes help digest food as it passes through the gastrointestinal tract.

**exocytosis:** The fusion of an intracellular vesicle with the plasma membrane, releasing the vesicle contents to the extracellular space.

**exomphalos:** an umbilical hernia at birth in which some abdominal organs push into the umbilical cord

**Exon:** A segment within a gene that carries part of the coding information for a protein.

**exon:** The segment of a eukaryotic gene that encodes a portion of the final product of the gene; a portion that remains after posttranscriptional

processing and is transcribed into a protein or incorporated into the structure of an RNA. See intron.

**exon :** Regions of pre-mrna that are retained in mature mrna. OR The sequence of DNA present in mature messenger RNA, some of which encodes the amino acids of a protein. Most genes have multiple exons with introns between them.

**Exon shuffling:** A hypothesis that suggests that new proteins arose in evolution by rearranging exons that encoded discrete structural elements.

**Exonuclease:** An enzyme that breaks a phosphodiester linkage at one or the other end of a polynucleotide chain so as to release single or small nucleotide residues. Or An enzyme that digests nucleic acids from the ends of the molecule, rather than at an internal site; exonucleases can be specific for digestion from the 3' or 5' ends of the nucleic acid. Or An enzyme that hydrolyzes only those phosphodiester bonds that are in the terminal positions of a nucleic acid.

**exoskeleton:** the hard, protective, outer covering of arthropods and mollusks.

**Exotherm:** The temperature/time curve of a chemical reaction giving off heat, particularly the polymerization of casting resins. (2) The amount of heat given off. The term has not been standardized with respect to sample size, ambient temperature, degree of mixing, etc

**exothermic:** Process that gives off heat to the environment. Or An exothermic reaction gives out energy to its surroundings, resulting in a rise in temperature. Or refers to a reaction that releases heat. Or describes the giving off of energy as heat. Or A process that releases heat. The enthalpy change for an exothermic process is negative. Examples of exothermic processes are combustion reactions and neutralization reactions.

**exothermic process:** A thermodynamic process in which heat flows from a system to the surroundings.

**EXOTHERMIC REACTION:** gives out more energy than was put in to start the reaction. It has a negative DH. It keeps going after it is started. An example is a fire. OR When heat is absorbed during a chemical reaction. OR A chemical reaction that releases heat (that is, for which  $\Delta H$  is negative). Or A chemical reaction in which heat is evolved.

**exotic terrane:** a terrane that did not form naturally through accretion and has likely collided with the continental margin.

**expanded access trial :** A way to provide an investigational therapy to a patient who is not eligible to receive that therapy in a clinical trial, but who has a serious or life-threatening illness for which other treatments are not available. Expanded access allows a patient to receive promising but not yet fully studied or approved cancer therapies when no other treatment option exists. Also called compassionate use trial.

**expanded umbilical cord blood product HSC835:** An umbilical cord blood product that has been expanded ex vivo and can be used during single umbilical cord blood transplantation.

**Expansion:** When a substance is heated, it expands or gets bigger. Some people think (incorrectly) that it is the particles themselves that are getting bigger but this is not true. Instead, the substance expands because the particles are moving more violently.

**Exparel:** (Other name for: bupivacaine hydrochloride liposome injectable suspension)

**expectant management :** Closely watching a patient's condition but not giving treatment unless symptoms appear or change, or there are changes in test results. Expectant management avoids problems that may be caused by treatments such as radiation or surgery. It is used to find early signs that the condition is getting worse. During expectant management, patients may be given certain exams and tests. It is sometimes used in prostate cancer. Also called deferred therapy.

**expensive:** Requiring large resources: cpu time, memory, and/or disk space.

**Experiment:** A controlled environment for the application of common sense. Having observed something interesting in the world of chemistry, we make an educated guess as to what is happening (a 'theory'), then say "if this explanation is true, we should see such-and-such an effect if we do such-and-such." Actually doing such-and-such and seeing what happens is called 'doing an experiment'. OR An experiment is direct observation under controlled conditions. Most experiments involve carefully changing one variable and observing the effect on another variable (for example, changing temperature of a water sample and recording the change volume that results).

**experimental :** In clinical trials, refers to a drug (including a new drug, dose, combination, or route of administration) or procedure that has undergone basic laboratory testing and received approval from the U.S. Food and Drug Administration (FDA) to be tested in human subjects. A drug or procedure may be approved by the FDA for use in one disease or condition, but be considered experimental in other diseases or conditions. Also called investigational.

**experimental drug :** A substance that has been tested in the laboratory and has been approved by the U.S. Food and Drug Administration (FDA) for testing in people. Clinical trials test how well experimental drugs work and whether they are safe to use. An experimental drug may be approved by the FDA for use in one disease or condition but still be considered investigational in other diseases or conditions. Also called IND, investigational agent, investigational drug, and investigational new drug.

**experimental group :** The group in a clinical research study that receives the drug, vaccine, or other intervention being tested. Interventions may also include medical procedures (such as radiation therapy and surgery), medical devices, behavior changes (such as diet and exercise), education programs, and counseling. Also called intervention group and investigational group.

**experimental yield:** The measured amount of product produced in a chemical reaction.

**Expiration date:** The date appearing on the label of a drug after which it should not be used or sold.

**exploratory surgery :** Surgery to look inside the body to help make a diagnosis.

**explosive eruption:** volcanic activity containing thick lava and more gases under pressure; creates steeper cones.

**exponentiation:** Raising something to a power.

**exposed group (in epidemiology):** A group whose members have been exposed to a supposed cause of a disease or health state of interest, or possess a characteristic that is a determinant of the health outcome of interest. The abbreviated term "the exposed" is sometimes used.

**exposed or non-exposed:** Qualitative terms defining the existence of or lack of a hazard in the environment of individuals (WHO, 1988).

**exposure:** The amount of an environmental agent that has reached the individual (external dose) or has been absorbed into the individual (internal dose, absorbed dose) (WHO, 1979). OR Absorption of ionizing radiation or ingestion of a radioisotope. Acute exposure is a large exposure received over a short period of time. Chronic exposure is exposure received over a long period of time, such as during a lifetime. The National Council on Radiation Protection and Measurements (NCRP) estimates that an average person in the United States receives a total annual dose of about 0.62 rem (620 millirem) from all radiations sources, a level that has not been shown to cause humans any harm. Of this total, natural background sources of radiation—including radon and thoron gas, natural radiation from soil and rocks, radiation from space and radiation sources that are found naturally within the human body—account for approximately 50 percent. Medical procedures such as computed tomography (CT scans) and nuclear medicine account approximately for another 48 percent. Other small contributors of exposure to the U.S. population includes consumer products and activities, industrial and research uses, and occupational tasks. The maximum permissible yearly dose for a person working with or around nuclear material is 5 rem. For additional detail, see Doses in Our Daily Lives and Measuring Radiation.

**exposure assessment:** The quantification of the amount of exposure to a hazard for an individual or group (WHO, 1979).

**exposure control:** see emission or exposure control.

**exposure limit:** A general term implying the level of exposure that should not be exceeded (WHO, 1979).

**exposure-odds ratio:** for a set of case control data is the ratio of the odds in favour of exposure among the cases ( $a/b$ ) to the odds in favour of exposure among non-cases ( $c/d$ ). This reduces to  $ad/bc$ . With incident cases, unbiased subject selection, and a "rare" disease (say, under 2% cumulative incidence rate over the study period),  $ad/bc$  is an approximate estimate of the risk ratio. With incident cases, unbiased subject selection, and density sampling of controls,  $ad/bc$  is an estimate of the ratio of the person-time incidence rates (forces of morbidity) in the exposed and unexposed (no rarity assumption is required for this).

**expression:** A collection of constants, variables, symbols of operations, and grouping symbols.

**expression vector:** See vector.

**extended release bupivacaine hydrochloride resorbable matrix**

**formulation:** An extended release (ER) injectable formulation composed of the hydrochloride salt form of bupivacaine, an amide-type, long-acting local anesthetic, in a resorbable sucrose acetate isobutyrate-based matrix, with analgesic activity. Following administration in or around a specific site, ER bupivacaine is released from the matrix over an extended period of time. Upon release, bupivacaine reversibly binds to specific voltage-gated sodium ion channels in the neuronal membrane, resulting in a decrease in the voltage-dependent membrane permeability to sodium ions, membrane destabilization, and depolarization inhibition thus disrupting nerve impulse conduction. This eventually leads to a reversible loss of sensation. This formulation may provide pain relief up to 72 hours.

**Extended Sidebar Chain :** A retaining edge provided by special attachments on the chain.

**extended-release flucytosine:** An extended release (ER) oral tablet that contains flucytosine (5-FC), a fluorinated cytosine analog, with antifungal activity and potential anti-cancer activity. Following oral administration of ER 5-FC, the 5-FC is deaminated to its active metabolite 5-fluorouracil (5-FU). 5-FU replaces uracil during RNA synthesis, which consequently inhibits downstream protein synthesis. In addition, 5-FU is metabolized further to 5-fluorodeoxyuridylic acid monophosphate, which inhibits thymidylate synthetase. Inhibition of this enzyme interrupts nucleotide synthesis, DNA replication and cell proliferation. Negative regulation of protein synthesis, DNA replication and cell proliferation can lead to cell death. Following ingestion of ER 5-FC, intravenous injection of a retroviral vector encoding cytosine deaminase (TC 511) at a tumor site may result in higher local concentrations of 5-FU and its metabolites, and increased tumor cell death than other 5-FU treatment regimens.

**extended-release onapristone:** An extended-release (ER) formulation of onapristone, an orally bioavailable progesterone receptor (PR) antagonist, with antineoplastic activity. Onapristone binds to the PR and inhibits both PR activation and the associated expression of PR-responsive genes. This may inhibit PR-mediated proliferative effects in cancer cells overexpressing PR. PR is expressed on certain cancer cell types and plays a key role in proliferation and survival. Check for active clinical trials using this agent.

**Extender:** Ingredients added to paint to increase coverage, reduce cost, achieve durability, alter appearance, control rheology and influence other desirable properties. Less expensive than prime hiding pigments such as titanium dioxide. Examples: barium sulfate, calcium carbonate, clay, gypsum, silica, talc. May also improve coating performance. OR A less expensive ingredient than pigment (titanium dioxide) it fills out and extends the pigment's capabilities. Extender cannot be used without pigment. Some common extenders are clays calcium carbonates and silicas. OR A material added to a polymer base that is designed to replace a portion of the polymer compound. Also known as "filler." Freelin-Wade does not use extenders. OR A filler material added to a plastic compound used to reduce the amount of resin required per unit value.

**Extending Flash:** Flash that is formed at the parting line of a liquid silicone mold, can be minimized by good silicone mold practices

**extensive property:** A property that depends on the amount of matter present. OR A property that changes when the amount of matter in a sample changes. Examples are mass, volume, length, and charge.

**extensive-stage small cell lung cancer :** Cancer has spread outside of the lung in which it began or to other parts of the body.

**extensor plantar response:** extension of the big toe and fanning of the other toes in response to stimulation of the bottom of the foot; more commonly known as the Babinski reflex

**EXTERIOR:** The outside surfaces of a structure.

**exterior angle:** an angle formed outside the polygon by extending one side. In a triangle, the measure of an exterior angle equals the sum of the measures of the two remote interior angles.

**External radiation:** Exposure to ionizing radiation when the radiation source is located outside the body.

**external radiation therapy :** A type of radiation therapy that uses a machine to aim high-energy rays at the cancer from outside of the body. Also called external-beam radiation therapy.

**external right atrial catheter :** A thin, flexible tube that is inserted into a vein in the neck or below the collar bone and guided (threaded) into the right atrium of the heart. It is used to give intravenous fluids, blood transfusions, and chemotherapy and other drugs, and for taking blood

samples. It avoids the need for repeated needle sticks. An external right atrial catheter is a type of central venous access device.

**external-beam radiation therapy :** A type of radiation therapy that uses a machine to aim high-energy rays at the cancer from outside of the body. Also called external radiation therapy.

**Extinction coefficient (å):** A measure of a compound's ability to absorb light, given in units that are the reciprocals of molarity and distance in centimeters ( $M^{-1} \text{ cm}^{-1}$ ).

**extracorporeal photopheresis :** A procedure in which blood is removed from the body and treated with ultraviolet light and drugs that become active when exposed to light. The blood is then returned to the body. It is being studied in the treatment of some blood and bone marrow diseases and graft-vs-host disease (GVHD). Also called photopheresis.

**extracranial :** Outside of the cranium (bones that surround the brain).

**extracranial germ cell tumor :** A rare cancer that forms in germ cells in the testicle or ovary, or in germ cells that have traveled to areas of the body other than the brain (such as the chest, abdomen, or tailbone). Germ cells are reproductive cells that develop into sperm in males and eggs in females.

**extract :** In medicine, a preparation of a substance obtained from plants, animals, or bacteria and used as a drug or in drugs.

**Extraction:** Extraction is the process of taking a solvent and using it to dissolve a compound from a mixture. If you want to remove salt from a mixture of salt and iron filings, you can pour water on the mixture. The salt will dissolve in the water (solvent). OR A technique for separating components in a mixture that have different solubilities. For example, caffeine can be separated from coffee beans by washing the beans with supercritical fluid carbon dioxide; the caffeine dissolves in the carbon dioxide but flavor compounds do not. Vanillin can be extracted from vanilla beans by shaking the beans with an organic solvent, like ethanol.

**Extraction (liquid extraction):** A process in which a liquid mixture of two species (the solute and the feed carrier) is contacted in a mixer with a third liquid (the solvent) that is immiscible or nearly immiscible with the feed carrier. When the liquids are contacted, solute transfers from the feed carrier to the solvent. The combined mixture is then allowed to settle into two phases that are then separated by gravity in a decanter.

**extragonadal :** An area of the body other than the ovaries or testes.

**extragonadal germ cell tumor :** A rare cancer that develops in germ cells that are found in areas of the body other than the ovary or testicle (such as the brain, chest, abdomen, or tailbone). Germ cells are reproductive cells that develop into sperm in males and eggs in females.

**extrahepatic :** Located or occurring outside the liver.

**extrahepatic bile duct :** The part of the common hepatic bile duct (tube that collects bile from the liver) that is outside the liver. This duct joins a duct from the gallbladder to form the common bile duct, which carries bile into the small intestine when food is being digested.

**extrahepatic bile duct cancer :** A rare cancer that forms in the bile ducts outside the liver. A bile duct is a tube that carries bile (fluid made by the liver) between the liver and gallbladder and the small intestine. Cancer that forms in the area where the right and left bile ducts meet outside the liver is called Klatskin tumor. It is the most common type of bile duct cancer.

**extraneous residue limit:** An extraneous residue limit is, for a particular commodity, the maximum toxicologically acceptable concentration of a residue unavoidably arising from sources other than the use of a pesticide directly or indirectly for the production of that commodity (WHO, 1976).

**extranodal :** Refers to an area or organ outside of the lymph nodes.

**extraocular :** Located outside the eye.

**Extraordinary ray:** The component of plane-polarized light that travels through a uniaxial crystal at a direction-dependent velocity.

**extraosseous :** Located or occurring outside of the bone. Also called extraskelatal.

**extrapleural pneumonectomy :** Surgery to remove a diseased lung, part of the pericardium (membrane covering the heart), part of the diaphragm (muscle between the lungs and the abdomen), and part of the parietal pleura (membrane lining the chest). This type of surgery is used most often to treat malignant mesothelioma.

**extrapolation:** The calculation, based on quantitative observations in exposed test species, of predicted dose-effect and dose-response relationships for a chemical in humans and other environmental biota (WHO, 1979).

**extraskkeletal :** Located or occurring outside of the bone. Also called extraosseous.

**extrauterine pregnancy :** A condition in which a fertilized egg grows outside of the uterus, usually in one of the fallopian tubes. Symptoms include sharp pain on one side of the abdomen and bleeding from the vagina. Also called ectopic pregnancy.

**extravasation :** The leakage of blood, lymph, or other fluid, such as an anticancer drug, from a blood vessel or tube into the tissue around it. It is also used to describe the movement of cells out of a blood vessel into tissue during inflammation or metastasis (the spread of cancer).

**extravasation injury :** Blistering and tissue damage caused by certain drugs when they leak out of a vein into the tissue around it. The damage is sometimes severe and can lead to tissue necrosis (tissue death).

**Extremities:** The hands, forearms, elbows, feet, knees, leg below the knees, and ankles. Permissible radiation exposures in these regions are generally greater than those for whole body exposure because the extremities contain fewer blood-forming organs and have smaller volumes for energy absorption. (See 10 CFR 20.1003.)

**extremity :** A limb of the body, such as the arm or leg.

**Extren:** (Other name for: acetylsalicylic acid)

**Extrinsic clotting pathway:** Blood-clotting cascade of enzyme activities that is initiated by the activation of factor VII and the release of the lipoprotein tissue factor, both of which are triggered by tissue trauma.

**Extrudate:** The product or result of an extrusion process. OR The product or material delivered from an extruder, for example, film, pipe profiles. OR The product or material delivered by an extruder, such as film, pipe, the coating on wire, etc. OR The product or material delivered from an extruder, for example, film, pipe profiles.

**EXTRUDATE SWELL (also called DIE SWELL):** Whenever a polymer melt emerges from a die the diameter or thickness is always larger than the diameter (or gap) of the die. At usual production throughputs, diameter or thickness ratios range from 1.20-1.40 for PVC to 1.50-2.00 for commercial grade Polyethylenes and much more for some polymers containing a high molecular weight tail. It is an indication of the elasticity of the polymer. The more elastic polymers give larger swell. Of course, by

pulling the extrudate the swell is reduced and of course extrudates can be drawn down to diameters (or thicknesses) much smaller than the die diameter or gap.

**EXTRUDER:** A machine for producing more or less continuous lengths of plastic sections such as rods, sheets, tubes, profiles, and cable coatings by melting and pumping resin through a forming die. OR A machine for producing more or less continuous lengths of plastics sections such as rods, sheets, tubes, and profiles.

**Extruder head:** A component which may be attached to the discharge end of the extruder barrel to house the die.

**Extruder Size:** The minimal inner diameter of the extruder barrel.

**EXTRUDER, TWIN SCREW:** Two screws, side by side, are placed within the extruder barrel, and they are either co-rotating or counter-rotating. Counter-rotating twin screw extruders are used primarily for processing PVC products such as pipe, siding, sheet, pellets, and film. The co-rotating units are used for compounding materials where thorough mixing and high output rates are important. The twin screw unit resembles a positive displacement screw pump. It conveys the material at low speeds with controlled shear. The positive action assures that all portions of the material experience a uniform residence time.

**Extrusion:** The method of processing plastic by forcing heat softened plastic through an opening of the desired shape of the cross-section of the finished product. OR Compacting and melting a plastic material and forcing it through an orifice in a continuous fashion. In the extrusion process, the material is conveyed through the heated machine barrel by a helical screw, where it is heated and mixed to a homogeneous state and then forced through a die of the shape required for the finished product. OR One of the most common plastics processing techniques covering a vast range of applications in which resins are melted, heated and pumped for processing. Extrusion machines accomplish these tasks by means of one or more internal screws. In extrusion, the material to be processed is sheared between the root of the screw and the wall of the barrel that surrounds it. This process produces frictional energy that heats and melts the substance as it is conveyed down the barrel. Melted extrudate from the machine is further processed after the extrusion phase, which typically produces

pellets, sheet, cast film, blown film, fibers, coatings, pipes, profiles or molded parts. (Modern Plastics Encyclopedia 1995).

**Extrusion Coating:** A coating technique in which molten plastic feeds directly from an extruder die into a nip-roll assembly combined with the substrate

**Extrusion Pressure -:** The pressure of the melt at the discharge end of the screw.

**extrusive:** rock that forms on the Earth's surface.

**extrusive igneous rock:** igneous rock that crystallized from liquid magmas that reached the surface and were generally vented as volcanic lavas.

**eye:** center of circulation in a hurricane, where the conditions are calm.

**eye cancer :** Cancer that forms in tissues of and around the eye. Some of the cancers that may affect the eye include melanoma (a rare cancer that begins in cells that make the pigment melanin in the eye), carcinoma (cancer that begins in tissues that cover structures in the eye), lymphoma (cancer that begins in immune system cells), and retinoblastoma (cancer that begins in the retina and usually occurs in children younger than 5 years).

**eye wall:** area surrounding the eye of a hurricane, where winds are most intense.

**EZ Transfer Finger Plate:** Eliminates the need for transfer dead plates at terminal discharges as the tines of the plates fill the space between the raised legs pickets or modules.

**ezatiostat hydrochloride:** The hydrochloride salt of a liposomal small-molecule glutathione analog inhibitor of glutathione S-transferase (GST) P1-1 with hematopoiesis-stimulating activity. After intracellular de-esterification, the active form of ezatiostat binds to and inhibits GST P1-1, thereby restoring Jun kinase and MAPK pathway activities and promoting MAPK-mediated cellular proliferation and differentiation pathways. This agent promotes the proliferation and maturation of hematopoietic precursor cells, granulocytes, monocytes, erythrocytes and platelets.

**ezetimibe:** An azetidinone derivative and a cholesterol absorption inhibitor with lipid-lowering activity. Ezetimibe appears to interact physically with cholesterol transporters at the brush border of the small intestine and

inhibits the intestinal absorption of cholesterol and related phytosterols. As a result, ezetimibe causes a decrease in the level of blood cholesterol or an increase in the clearance of cholesterol from the bloodstream. Overall, the following effects observed are a reduction of hepatic cholesterol stores and a reduction of total cholesterol, LDL cholesterol, and other triglycerides in the blood.

**ezetimibe/simvastatin:** An orally bioavailable combination agent containing the cholesterol absorption inhibitor ezetimibe and the hepatic hydroxymethyl-glutaryl coenzyme A (HMG-CoA) reductase inhibitor simvastatin, with lipid-lowering activity. Upon oral administration, ezetimibe binds to the sterol transporter Niemann-Pick C1-Like 1 (NPC1L1) at the brush border of the small intestine and inhibits the intestinal absorption of biliary and dietary cholesterol and related phytosterols. This decreases blood cholesterol levels, decreases the delivery of intestinal cholesterol to the liver, reduces hepatic cholesterol stores and enhances the clearance of cholesterol from the bloodstream. Upon administration of simvastatin and subsequent hydrolyzation to its active beta-hydroxyacid form, this statin competitively inhibits HMG-CoA reductase, the enzyme which catalyzes the conversion of HMG-CoA to mevalonate, which is an essential step in cholesterol synthesis. Ezetimibe and simvastatin together reduce blood levels of total cholesterol, low-density lipoprotein cholesterol (LDL-C), triglycerides (TGs), very-low-density lipoproteins (VLDL), and apolipoprotein B (Apo B), and increase the plasma concentration of high-density lipoprotein cholesterol (HDL-C). Higher cholesterol blood levels appear to be associated with an increased risk in the proliferation of certain cancer cells, such as prostate cancer cells.

**EZH1/2 inhibitor DS-3201:** An orally available selective inhibitor of the histone lysine methyltransferases enhancer of zeste homolog 1 (EZH1) and 2 (EZH2), with potential antineoplastic activity. Upon oral administration, DS-3201 selectively inhibits the activity of both wild-type and mutated forms of EZH1 and EZH2. Inhibition of EZH1/2 specifically prevents the methylation of lysine 27 on histone H3 (H3K27). This decrease in histone methylation alters gene expression patterns associated with cancer pathways, enhances transcription of certain target genes, and results in decreased proliferation of EZH1/2-expressing cancer cells. EZH1/2, histone lysine methyltransferase (HMT) class enzymes and catalytic subunits of the polycomb repressive complex 2 (PRC2), are overexpressed or mutated in a

variety of cancer cells and play key roles in tumor cell proliferation, progression, stem cell self-renewal and migration. Check for active clinical trials using this agent.

**EZH2 inhibitor CPI-1205:** An orally available selective inhibitor of the histone lysine methyltransferase EZH2, with potential antineoplastic activity. Upon oral administration, CPI-1205 selectively inhibits the activity of both wild-type and mutated forms of EZH2. Inhibition of EZH2 specifically prevents the methylation of histone H3 on lysine 27 (H3K27). This decrease in histone methylation alters gene expression patterns associated with cancer pathways and results in decreased proliferation of EZH2-expressing cancer cells. EZH2, a histone lysine methyltransferase (HMT) class enzyme and the catalytic subunit of the polycomb repressive complex 2 (PRC2), is overexpressed or mutated in a variety of cancer cells and plays a key role in tumor cell proliferation; its expression is correlated with tumor initiation, progression, stem cell self-renewal, migration and angiogenesis.

**EZN-2285:** A drug used to treat acute lymphoblastic leukemia (ALL). It is a form of the anticancer drug PEG-asparaginase that stays in the body longer. EZN-2285 is an enzyme that breaks down the amino acid asparagine and may block the growth of tumor cells that need asparagine to grow. It is a type of protein synthesis inhibitor. Also called Oncaspar-IV and SC-PEG *E. coli* L-asparaginase.

**F:** Food - represents BOD in the F/M ratio. Expressed in pounds.

**F 18 fluorodeoxygalactose:** A radioconjugate containing the D-galactose analogue 2-deoxy-2-fluoro-D-glucose (FDGal) labeled with the positron-emitting radioactive isotope fluorine F18, used for imaging upon positron emitting tomography (PET). With cell uptake much higher in tumor cells compared to normal cells, the F18 moiety of fluorodeoxygalactose F-18 can be visualized upon PET imaging and this agent can be used as a tracer for the evaluation of galactose tumor uptake and metabolism.

**F 18 sodium fluoride positron emission tomography :** A procedure used to find out if cancer has spread to the bone. A small amount of a radioactive substance called fluorine F 18 sodium fluoride is injected into a vein. A PET scan is then used to make detailed pictures of the bones. Bones with cancer in them take up more fluorine F18 sodium fluoride than normal

bones do. Also called F-18 NaF PET and fluorine F 18 sodium fluoride PET.

**F factor:** A large bacterial plasmid, known as the sex-factor plasmid because it permits mating between F<sup>+</sup> and F<sup>-</sup> bacteria.

**f orbital:** An orbital with angular momentum quantum number = 2. The f orbitals generally have 3 nuclear nodes and rather complex shapes.

**F-18 16 alpha-fluoroestradiol:** A radiopharmaceutical consisting of an estradiol analogue radiolabeled with the positron-emitting isotope fluorine F 18. F-18 16 alpha-fluoroestradiol is actively taken up in tumor cells expressing the estrogen receptor (ER), allowing visualization of ER-positive tumor cells with positron emission tomography (PET). Uptake of this agent depends upon the ER status of target tissues. or A radiolabeled substance being studied as an imaging agent in breast cancer. F-18 16 alpha-fluoroestradiol binds to estrogen receptors and gives off radiation that can be detected by a PET scan. The PET scan forms an image that shows where cancer cells with estrogen receptors can be found in the body. It is a type of radioimaging agent. Also called F-18 FES.

**F-18 FES:** A radiolabeled substance being studied as an imaging agent in breast cancer. F-18 FES binds to estrogen receptors and gives off radiation that can be detected by a PET scan. The PET scan forms an image that shows where cancer cells with estrogen receptors can be found in the body. It is a type of radioimaging agent. Also called F-18 16 alpha-fluoroestradiol.

**F-18 fluoroethyltyrosine:** An amino acid analog radiolabeled with fluorine F 18, a positron emitting isotope, used as a tracer in positron emission tomography (PET). Reflecting the increased amino acid transport capacity of tumor cells, F-18 fluoroethyltyrosine (F-18 FET) is actively taken up in tumor cells via amino acid transport system L, but is neither incorporated into proteins nor readily degraded, resulting in high intracellular concentrations of this imaging agent. Radiolabeled amino acid-based agents are useful in PET brain tumor imaging because F-18 fluoro-deoxyglucose (F-18 FDG), commonly used in PET tumor imaging, is relatively insensitive for detecting tumors in the brain due the high levels of glycolytic metabolism in the normal cortex and to a lesser extent in white matter. Check for active clinical trials using this agent.

**F-18 NaF PET:** A procedure used to find out if cancer has spread to the bone. A small amount of a radioactive substance called fluorine F 18 sodium fluoride is injected into a vein. A PET scan is then used to make detailed pictures of the bones. Bones with cancer in them take up more fluorine F18 sodium fluoride than normal bones do. Also called F 18 sodium fluoride positron emission tomography and fluorine F 18 sodium fluoride PET.

**F-actin:** A filament of G-actin monomers that is a polar, self-assembling, dynamic polymer.

**F/M:** A ratio of the amount of food to the amount of organisms. Used to control an activated sludge process.

**F16-IL2 fusion protein:** An immunocytokine of the human monoclonal antibody fragment F16 (scFv) against the extra-domain A1 of tenascin-C fused, via a short 5-amino acid linker, to a recombinant form of the human cytokine interleukin-2 (IL-2) with potential immunostimulating and antineoplastic activities. The monoclonal antibody portion of the F16-IL2 fusion protein binds to tumor cells expressing the tumor associated antigen (TAA) tenascin-C. In turn, the IL-2 moiety of the fusion protein stimulates natural killer (NK) cells, macrophages and neutrophils and induces T-cell antitumor cellular immune responses thereby selectively killing tenascin-C-expressing tumor cells. In addition, F16-IL2 may potentiate the cytotoxicity of other chemotherapeutic agents. Tenascin-C, a glycoprotein of the extracellular matrix, is expressed in many cancer cell types. Check for active clinical trials using this agent.

**F511 cream :** A substance being studied in the prevention of palmar-plantar erythrodysesthesia (pain, swelling, numbness, tingling, or redness of the palms of the hands or soles of the feet) in breast cancer patients treated with anticancer drugs. F511 cream contains a substance that is used in products to control excess sweating under the arms and on the palms of the hands and soles of the feet. It is a type of antiperspirant.

**Fabric :** That part of a complete belt consisting of connected spirals.

**Fabric-Base Laminate:** Laminated insulating material formed by bonding woven cloth (of fiberglass, cotton or synthetic fibers) with resin under heat and pressure.

**Fabricate:** Method of forming a plastic into a finished article by machining, drawing, and similar operations.

**FABRICATE:** To work a material into a finished form by machining, forming, or other operation.

**Fabricating:** The manufacture of plastic products by appropriate operations. This includes plastics formed into molded parts, rods, tubes, sheeting, extrusion and other forms by methods including punching, cutting, drilling, tapping, fastening or by using other mechanical devices.

**Facade:** The external surface of a building; the external elevation.

**Face:** Any one of the outer plane surfaces of a crystal or geometric solid.

**Face Seal:** A sealing system in which the sealing occurs in the axial direction of the seal. If the seal ring were to be placed flat upon a desktop, the seal compression would occur between the top and bottom of the seal

**Face-centered space group:** A crystallographic space group containing a pair of lattice points on opposite faces (symbolized by A, B, or C if the bc, ac, or ab faces are centered or F if all faces are centered).

**facies :** A distinctive facial feature or expression that is characteristic of a specific condition.

**facilitated diffusion:** the movement of molecules across a membrane from a region of high concentration to a region of low concentration that is assisted by proteins.

**Facing brick:** A type of brick of better quality and appearance than common brick.

**FACT complex-targeting curaxin CBL0137:** An orally available curaxin-based agent targeting the Facilitates Chromatin Transcription (FACT) complex, with potential antineoplastic activity. Upon administration, CBL0137 binds to FACT and sequesters the FACT complex on chromatin, which inhibits its activity. This prevents transcription of certain genes involved in cancer-associated signaling pathways; it specifically inhibits the transcription of both NF-kappa  $\beta$  and heat shock transcription factor 1 (HSF1) and simultaneously activates p53. This causes an increase in tumor cell apoptosis and a decrease in tumor cell proliferation, in FACT-positive cancers. In addition, this agent is able to sensitize FACT-positive tumor cells to the cytotoxic effects of other chemotherapeutic agents. FACT, a transcription and replication factor composed of the Structure Specific Recognition Protein (SSRP1) and suppressor of Ty 16 (Spt16) proteins, is expressed in a variety of tumor cells while almost absent in normal cells; its

expression is associated with increased tumor aggressiveness and poor prognosis. Check for active clinical trials using this agent.

**factor VIIa inhibitor PCI-27483:** A reversible small-molecule inhibitor of activated factor VII (factor VIIa) with potential antineoplastic and antithrombotic activities. FVII, a serine protease, becomes activated (FVIIa) upon binding with TF forming the FVIIa/TF complex, which induces intracellular signaling pathways by activating protease activated receptor 2 (PAR-2). Upon subcutaneous administration, factor VIIa inhibitor PCI-27483 selectively inhibits factor FVIIa in the VIIa/TF complex, which may prevent PAR-2 activation and PAR2-mediated signal transduction pathways, thereby inhibiting tumor cell proliferation, angiogenesis, and metastasis of TF-overexpressing tumor cells. In addition, this agent inhibits both the extrinsic and intrinsic coagulation cascades, preventing blood clot formation. TF, a blood protein overexpressed on the cell surface of a variety of tumor cell types, may correlate with poor prognosis; PAR-2 (also known as thrombin receptor-like 1) is a G protein-coupled receptor (GPCR) and a protease-activated receptor.

**facultative:** having the power to live under different conditions either with or without oxygen.

**Facultative aerobe:** An organism that can use molecular oxygen in its metabolism but that also can live anaerobically.

**Facultative anaerobe:** A bacterium capable of growing under aerobic conditions or anaerobic conditions in the presence of an inorganic ion ie. SO<sub>4</sub>, NO<sub>3</sub>.

**Facultative anaerobes:** Organisms that can function aerobically in the presence of oxygen or anaerobically, using fermentation as a source of cellular energy, in the absence of oxygen.

**facultative cells:** Cells that can live in the presence or absence of oxygen.

**Facultative pond:** The most common type of pond in current use. The upper portion (supernatant) is aerobic, while the bottom layer is anaerobic. Algae supply most of the oxygen to the supernatant.

**FAD (flavin adenine dinucleotide):** The coenzyme of some oxidation-reduction enzymes; it contains riboflavin.

**FAD and FADH (flavin adenine dinucleotide):** 2 An important electron carrier in the oxidation of fuel molecules; alternates between the oxidized

FAD form and the reduced FADH<sub>2</sub> form. It consists of a flavin moiety and an AMP unit; electrons are carried on the isoalloxazine moiety of the molecule.

**faddish words:** terms that appear suddenly and become very popular in language; some last, some fade, and some disappear altogether.

**Fading:** The change or loss of colour through exposure to the ultra violet content of sunlight etc. OR Surfaces where the colour has faded due to exposure to ultra violet sunlight should be thoroughly cleaned down to removed all dirt, grease and surface contaminants. Then rub down with a suitable abrasive, dust off and paint over.

**FADING:** The loss of color due to exposure to light, heat or weathering.

**fadrozole hydrochloride:** The hydrochloride salt of the nonsteroidal aromatase inhibitor fadrozole with potential antineoplastic activity.

Fadrozole specifically inhibits aromatase, blocking the aromatization of androstenedione and testosterone into estrone and estradiol, respectively, the final step in estrogen biosynthesis; the reduction in estrogen levels may inhibit growth in estrogen-dependent cancers. Aromatase, a member of the cytochrome P-450 superfamily, is found in many tissues; overexpression has been linked to the development of preneoplastic and neoplastic changes in breast tissue.

**Fahrenheit:** A temperature scale proposed by Daniel Gabriel Fahrenheit (1686-1736) which uses the melting point of ice (32°F) and the boiling point of water at one atmosphere (212°F) as calibration points. More... OR equals 1.8 multiplied to the sum of the temperature in Celsius and °F = 1.8 x (°C + 32).

**Faience:** Glazed pottery and hence glazed terracotta bricks used for facing work on buildings.

**failed rift:** rifting that ceases before the crustal mass has been separated into parts.

**Failure:** Breakdown of a paint film such as cracking, flaking, blistering etc.

**FAK inhibitor GSK2256098:** A focal adhesion kinase-1 (FAK) inhibitor with potential antiangiogenic and antineoplastic activities. FAK inhibitor GSK2256098 inhibits FAK, which may prevent the integrin-mediated activation of several downstream signal transduction pathways, including

ERK, JNK/MAPK and PI3K/Akt, thereby inhibiting tumor cell migration, proliferation and survival, and tumor angiogenesis. The tyrosine kinase FAK is normally activated by binding to integrins in the extracellular matrix (ECM) but may be upregulated and constitutively activated in various tumor cell types.

**FAK inhibitor PF-00562271:** An orally bioavailable small molecule and ATP-competitive focal adhesion kinase (FAK) inhibitor with potential antineoplastic and antiangiogenic activities. FAK inhibitor PF-00562271 inhibits the tyrosine kinase FAK, and to a lesser extent, proline-rich tyrosine kinase (PYK2), which may inhibit tumor cell migration, proliferation, and survival. As FAK is a signal transducer for integrins, inhibition of FAK by this agent may prevent integrin-mediated activation of several downstream signals including ERK, JNK/MAPK and PI3K/Akt. FAK and PYK2, upregulated in many tumor cell types, are involved in tumor cell invasion, migration and proliferation.

**FAK inhibitor VS-4718:** An orally bioavailable focal adhesion kinase (FAK) inhibitor with potential antineoplastic activity. Upon administration, VS-4718 inhibits FAK, blocks fibronectin-stimulated FAK autophosphorylation of Tyr397, and may prevent the integrin-mediated activation of several downstream signal transduction pathways, including ERK, JNK/MAPK and PI3K/Akt. This results in the reduction of the number of cancer stem cells (CSCs) and inhibits tumor cell migration, proliferation and survival. The cytoplasmic tyrosine kinase FAK is a signal transducer for integrins and is constitutively activated in various tumor cell types; it is involved in tumor cell invasion, migration and proliferation and plays a key role in the development, function and survival of CSCs.

**falimarev:** A cancer vaccine made with a form of a chicken virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins that may help immune cells in the body kill tumor cells. Also called recombinant fowlpox-CEA-MUC-1-TRICOM vaccine. OR A cancer vaccine comprised of a recombinant fowlpox viral vector encoding the carcinoembryonic antigen (CEA), MUC-1, a transmembrane glycoprotein secreted by glandular epithelial tissues, and TRICOM, comprised of three co-stimulatory molecule transgenes (B7-1, ICAM-1 and LFA-3). This agent may enhance CEA and MUC-1 presentation to antigen-presenting cells

(APC) and may activate a cytotoxic T-cell response against CEA- and MUC-1-expressing tumor cells.

**fall:** a mass-wasting movement in which earth material free-falls from a steep face or cliff and generally collects at the base as talus.

**fallopian tube :** A slender tube through which eggs pass from an ovary to the uterus. In the female reproductive tract, there is one ovary and one fallopian tube on each side of the uterus.

**fallopian tube cancer :** Cancer that forms in the tissue lining the fallopian tube (one of two long, slender tubes that connect the ovaries to the uterus). The cancer sometimes begins at the end of the fallopian tube near the ovary and spreads to the ovary. Fallopian tube cancer is similar to ovarian epithelial cancer and is staged and treated the same way.

**Fallopian tubes:** the passageways that egg cells enter after release from the ovaries; also called oviducts.

**False body:** Also known as 'Thixotropy'. Usually refers to gel type paints which in the tin appear to be very thick or even solid. When applied by brush or roller the gel structure breaks down and the paint becomes liquid thus allowing ease of application.

**False ceiling:** A lower dummy ceiling suspended below the main structure to improve appearance or proportions or to hide pipes structural steel etc.

**false-negative test result :** A test result that indicates that a person does not have a specific disease or condition when the person actually does have the disease or condition.

**false-positive result :** A test result that indicates an individual is affected and/or has a certain gene mutation when he or she is actually unaffected and/or does not have the mutation; i.e., a positive test result in a truly unaffected or mutation-negative individual.

**false-positive test result :** A test result that indicates that a person has a specific disease or condition when the person actually does not have the disease or condition.

**FAME:** Fatty Acid Methyl Ester, a means of identifying bacteria by analysis of the fatty acids in their cells. This is often done as an initial screening until a company, such as Alken-Murray Corporation, is sure that a bacterial strain is one they wish to use commercially, and then 16S rRNA

identification may be completed for a more definite identification and fingerprint of the strain, to keep competitors from copying that strain.

**familial** : A phenotype or trait that occurs with greater frequency in a given family than in the general population; familial traits may have a genetic and/or nongenetic etiology.

**familial adenomatous polyposis** : An inherited condition in which numerous polyps (growths that protrude from mucous membranes) form on the inside walls of the colon and rectum. It increases the risk of colorectal cancer. Also called familial polyposis and FAP.

**familial atypical multiple mole melanoma syndrome** : An inherited condition marked by the following: (1) one or more first- or second-degree relatives (parent, sibling, child, grandparent, grandchild, aunt, or uncle) with malignant melanoma; (2) many moles, some of which are atypical (asymmetrical, raised, and/or different shades of tan, brown, black, or red) and often of different sizes; and (3) moles that have specific features when examined under a microscope. Familial atypical multiple mole melanoma syndrome increases the risk of melanoma and may increase the risk of pancreatic cancer. Also called FAMMM syndrome.

**familial cancer** : Cancer that occurs in families more often than would be expected by chance. These cancers often occur at an early age, and may indicate the presence of a gene mutation that increases the risk of cancer. They may also be a sign of shared environmental or lifestyle factors.

**familial dysplastic nevi** : A condition that runs in certain families in which at least two members have dysplastic nevi (atypical moles) and have a tendency to develop melanoma.

**Familial hypercholesterolemia**: A disease that results from the dysfunctional receptor-mediated endocytosis of cholesterol-bearing lipoprotein particles. With this disease, patients have abnormally high blood levels of cholesterol, which can lead to arterial narrowing and heart attacks at an early age.

**familial isolated hyperparathyroidism** : A rare inherited condition in which one or more tumors form in the parathyroid glands (four pea-sized organs found on the thyroid) and cause them to make too much parathyroid hormone. The increased parathyroid hormone causes a loss of calcium from the bones and too much calcium in the blood. Also called FIHP.

**familial medullary thyroid cancer :** An inherited form of medullary thyroid cancer (cancer that forms in the cells of the thyroid that make the hormone calcitonin).

**familial polyposis :** An inherited condition in which numerous polyps (growths that protrude from mucous membranes) form on the inside walls of the colon and rectum. It increases the risk of colorectal cancer. Also called familial adenomatous polyposis and FAP.

**family:** similar genera classified together.

**family (of elements):** Elements found in the same column of the periodic table, also known as a group of elements. These elements will have similar properties.

**family history :** A record of the relationships among family members along with their medical histories. This includes current and past illnesses. A family history may show a pattern of certain diseases in a family. Also called family medical history.

**family medical history :** The genetic relationships within a family combined with the medical history of individual family members. When represented in diagram form using standardized symbols and terminology, it is usually referred to as a pedigree or family tree. Also called family history. OR A record of the relationships among family members along with their medical histories. This includes current and past illnesses. A family medical history may show a pattern of certain diseases in a family. Also called family history.

**FAMILY MOLD:** A multi-cavity mold wherein each of the cavities forms one of the component parts of the assembled finished object. The term often applied to molds wherein parts from different customers are grouped together in one mold for economy of production. Sometimes called “Combination Mold.” OR A multi-cavity mold wherein each of the cavities forms one of the component parts of the assembled finished object. The term often applied to molds wherein parts from different customers are grouped together in one mold for economy of production. This is sometimes referred to “Combination Mold.”

**family therapy :** A type of therapy in which the whole family talks with a professional counselor to solve family problems.

**famitinib:** An orally bioavailable receptor tyrosine kinase (RTK) inhibitor with potential antineoplastic activity. Famitinib binds to and inhibits several RTKs, dysregulated in a variety of tumors, including stem cell factor receptor (c-Kit; SCFR), vascular endothelial growth factor receptor (VEGFR) 2 and 3, platelet-derived growth factor receptor (PDGFR) and FMS-like tyrosine kinases Flt1 and Flt3. Inhibition of these RTKs may result in an inhibition of tumor growth and angiogenesis, and eventually tumor regression in tumor cells overexpressing these RTKs.

**FAMMM syndrome :** An inherited condition marked by the following: (1) one or more first- or second-degree relatives (parent, sibling, child, grandparent, grandchild, aunt, or uncle) with malignant melanoma; (2) many moles, some of which are atypical (asymmetrical, raised, and/or different shades of tan, brown, black, or red) and often of different sizes; and (3) moles that have specific features when examined under a microscope. FAMMM syndrome increases the risk of melanoma and may increase the risk of pancreatic cancer. Also called familial atypical multiple mole melanoma syndrome.

**famotidine:** A propanimidamide and histamine H<sub>2</sub>-receptor antagonist with antacid activity. As a competitive inhibitor of histamine H<sub>2</sub>-receptors located on the basolateral membrane of the parietal cell, famotidine reduces basal and nocturnal gastric acid secretion, resulting in a reduction in gastric volume, acidity, and amount of gastric acid released in response to various stimuli.

**Fan Gate:** A gate used to help reduce stress concentrations in the gate area by spreading the opening over a wider area. Less warping of parts can usually be expected by the use of this type of gate. OR This gate is used to help reduce stress concentrations in the gate area by spreading the opening over a wider area. Less warpage of parts can usually be expected by the use of this gate type. Frequently used in large silicone rubber parts

**Fanconi anemia :** A rare inherited disorder in which the bone marrow does not make blood cells. It is usually diagnosed in children between 2 and 15 years old. Symptoms include frequent infections, easy bleeding, and extreme tiredness. People with Fanconi anemia may have a small skeleton and brown spots on the skin. They also have an increased risk of developing certain types of cancer.

**Fanconi syndrome :** A group of kidney disorders that cause protein, sugar, minerals, and other nutrients to be lost in the urine. Symptoms include weakness, bone pain, and passing a greater than normal amount of urine. One form of Fanconi syndrome is inherited and is usually found in infants. Fanconi syndrome may also be caused by other diseases, a lack of vitamin D, or exposure to heavy metals or chemicals, including certain anticancer drugs.

**Fanlight:** Properly a window shaped like an open fan over a door or opening. From this it is often used to describe any shaped window in such a position.

**FAP:** An inherited condition in which numerous polyps (growths that protrude from mucous membranes) form on the inside walls of the colon and rectum. It increases the risk of colorectal cancer. Also called familial adenomatous polyposis and familial polyposis.

**FAP-specific CD8-positive T cells:** A preparation of CD8-positive T cells specific for human fibroblast activating protein (FAP) with potential immunopotentiating activity. T cells have been genetically modified to express a chimeric antigen receptor specific for FAP. Upon infusion, the FAP-specific CD8-positive T cells bind to FAP-expressing tumor cells and exhibit a selective toxicity to tumor cells. This may result in both tumor cell lysis and inhibition of tumor cell growth. FAP, a cell surface glycoprotein, is overexpressed on tumor-associated fibroblasts but minimally expressed on normal, healthy cells.

**FAQ:** Frequently Asked Questions.

**faraday:** a unit of electric charge equal to that on 1 mole of electrons.

**Faraday's laws:** two laws of electrolysis relating the amount of substance to the quantity of electric charge.

**Fareston:** (Other name for: toremifene)

**Farestone:** (Other name for: toremifene)

**farletuzumab:** A humanized, immunoglobulin G1 monoclonal antibody with potential antitumor activity. Farletuzumab specifically targets at glycoprotein 3 (GP-3), a cell surface antigen that is overexpressed on many epithelial-derived cancer cells. Upon binding to the GP-3 antigen, farletuzumab triggers a host immune response against GP-3 expressing cells resulting in cell lysis.

**Farydak:** (Other name for: panobinostat) or A drug used with bortezomib and dexamethasone to treat multiple myeloma. It is used in patients who have already been treated with bortezomib and an immunomodulating agent. It is also being studied in the treatment of other types of cancer. Farydak blocks certain enzymes needed for cells to grow and divide and may kill cancer cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of histone deacetylase inhibitor and a type of antiangiogenesis agent. Also called LBH589 and panobinostat.

**Fas receptor agonist APO010:** A recombinant, soluble, hexameric fusion protein consisting of three human Fas ligand (FasL) extracellular domains fused to the dimer-forming collagen domain of human adiponectin with potential pro-apoptotic and antineoplastic activities. Assembled into a soluble hexameric structure mimicking the ligand clustering of endogenous active FasL, Fas receptor agonist APO010 activates the Fas receptor, resulting in caspase-dependent apoptosis in susceptible tumor cell populations. FasL is a transmembrane protein of the tumor necrosis factor (TNF) superfamily and a pro-apoptotic ligand for the death receptor Fas.

**Fascia:** A broad flat surface or member over a shop front or below a cornice; a board carrying a gutter around the eaves of a building.

**Fasigyn:** (Other name for: tinidazole)

**Faslodex:** (Other name for: fulvestrant) or A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Faslodex blocks estrogen activity in the body and is a type of antiestrogen. Also called fulvestrant and ICI 182780.

**FASN inhibitor TVB-2640:** An orally bioavailable fatty acid synthase (FASN) inhibitor, with potential antineoplastic activity. Upon administration, TVB-2640 binds to and blocks FASN, which prevents the synthesis of palmitate needed for tumor cell growth and survival. This leads to a reduction in cell signaling, an induction of tumor cell apoptosis and the inhibition of cell proliferation in susceptible tumor cells. FASN, an enzyme responsible for the de novo synthesis of palmitic acid, is overexpressed in tumor cells and plays a key role in tumor metabolism, lipid signaling, tumor cell survival and drug resistance; tumor cells are dependent on increased fatty acid production for their enhanced metabolic needs and rapid growth.

**Fast fission:** Fission of a "heavy" atom (such as uranium-238) when it absorbs a fast (high energy) neutron. All fissionable materials can fission with fast neutrons. However, some (such as uranium-235 and Plutonium-239) fission more readily with slow (thermal) neutrons.

**Fast neutron:** A neutron with kinetic energy greater than its surroundings when released during fission.

**fast-neutron beam radiation :** A type of radiation therapy that uses tiny particles called neutrons made by a machine called a cyclotron.

**fat:** A solid ester of a long-chain carboxylic acid with glycerol.

**Fat edge:** A heavy accumulation of paint at the edge of a painted surface.

**fat emulsion:** A liquid composed of two immiscible substances, typically some form of fat and water. In parenteral nutrition, a fat emulsion may contain phospholipids, triglycerides and essential fatty acids. Check for active clinical trials using this agent.

**fat necrosis :** A benign condition in which fat tissue in the breast or other organs is damaged by injury, surgery, or radiation therapy. The fat tissue in the breast may be replaced by a cyst or by scar tissue, which may feel like a round, firm lump. The skin around the lump may look red, bruised or dimpled.

**fat-soluble vitamin :** A vitamin that can dissolve in fats and oils. Fat-soluble vitamins are absorbed along with fats in the diet and can be stored in the body's fatty tissue. They come from plant and animal foods or dietary supplements. Vitamins A, D, E, and K are fat-soluble.

**fatigue :** A condition marked by extreme tiredness and inability to function due to lack of energy. Fatigue may be acute or chronic.

**Fatigue Resistant :** Field experience shows that the most common cause of failure in Omniflex belts is fatigue. The fatigue failure in Omniflex belts is typically a break in the corner of the pickets between the third and fourth openings from the outside edge. This break is the result of progressive wear on the bar links transferring the cyclic load to the pickets.

**Fatigue Strength:** The maximum cyclic stress a material can withstand for a given number of cycles before failure occurs.

**fats:** lipids composed of a glycerol and fatty acids.

**fats (wastes):** triglyceride-esters of fatty acids. Erroneously used as synonymous with grease.

**Fattening:** An increase in the viscosity of a paint on storage. Also called 'feeding'.

**Fatty Acid:** A fatty acid has a carboxylic acid on a long chain of carbon atoms. The carboxylic acid may also be called the carboxyl functional group. Fatty acids are a major source of energy for the cell. Compounds called phospholipids are created from fatty acids. OR A long-chain hydrocarbon containing a carboxyl group at one end Saturated fatty acids have completely saturated hydrocarbon chains Unsaturated fatty acids have one or more carbon-carbon double bonds in their hydrocarbon chains. OR Fatty acids are carboxylic acids with long hydrocarbon side chains. Most natural fatty acids have hydrocarbon chains that don't branch; any double bonds occurring in the chain are cisomers (side chains are attached on the same side of the double bond). OR A long-chain aliphatic carboxylic acid found in natural fats and oils; also a component of membrane phospholipids and glycolipids.

**fatty acid :** A major component of fats that is used by the body for energy and tissue development. OR An aliphatic, monocarboxylic acid derived from an animal or vegetable-based fat. OR long chains of carbon atoms with carboxyl groups at one end. OR Carboxylic acids containing long hydrocarbon chains that are an important fuel source as well as a key component of membrane lipids.

**Fatty acid synthase:** An enzyme system that catalyzes the synthesis of saturated long-chain fatty acids from acetyl coa, malonyl coa, and NADPH; in bacteria, the constituent enzymes of the synthase complex can be dissociated when cell extracts are prepared; in mammals, all constituent enzyme activities in fatty acid synthase are part of the same polypeptide.

**Fatty Alcohols:** An aliphatic alcohol derived from a natural fat or oil, which is often derived from a plant or other natural source. These materials have widespread application in cosmetics, foods and industrial solvents.

**fatty-replaced breast tissue :** A term used in mammography that refers to the replacement of breast tissue with fatty tissue. This commonly occurs as a woman ages.

**FAU:** A substance being studied in the treatment of advanced solid tumors and lymphomas. It blocks the growth of cells and may cause cancer cells to die. It is a type of uracil analog. Also called 1-(2'-deoxy-2'-fluoro-β-D-arabinofuranosyl) uracil.

**fault:** a crack or break in a rock. OR an area in which rock has been displaced along a fracture, such as having one side that is moved up or down.

**fault block mountain:** a mountain that is bordered on both sides by steeply dipping faults, such as a horst.

**fault gouge:** the broken material within a fault.

**fault plane:** a plane of fracture in a rock along which movement has occurred. OR the surface that rocks move along when plates shift.

**Fault tree:** A fault tree identifies all of the pathways that lead to a system failure. Toward that end, the fault tree starts with the top event, as defined by the event tree, and identifies (using the AND, OR, M out of N logic connectors) what equipment and operator actions, if failed, would prevent successful operation of the system. All components and operator actions that are necessary for system function are considered. Thus, the fault tree is developed to a point where data are available for the failure rate of the modeled component or operator action. For additional information, see Probabilistic Risk Assessment.

**fault zone:** a series of parallel fault planes that are close together and form a wider zone of structural weakness.

**fault-block mountains:** mountain range formed when sections of sedimentary rocks are tilted upward in sections.

**faulty parallelism:** a failure to create grammatically parallel structures when appropriate, is referred to as faulty parallelism.

**favism:** a condition characterized by hemolytic anemia (breakup of red blood cells) after eating fava beans (*Vicia fava*)

**fazarabine:** An orally-active pyrimidine analogue of an aza-substituted cytidine in which the ribose moiety is replaced by an arabinose sugar. Similar in action to cytarabine, fazarabine is phosphorylated by deoxycytidine kinase to a triphosphate form which competes with thymidine for incorporation into DNA; its incorporation into DNA inhibits DNA synthesis, resulting in tumor cell death and tumor necrosis. The presence of deoxycytidine kinase in a tumor is a determinant of tumor sensitivity to this drug. or An anticancer drug that is a type of antimetabolite.

**FCI:** Full configuration interaction. A CI that includes all possible determinants. FCI is the best wavefunction (and provides the lowest variational energy) obtainable using a given basis set. Almost never affordable.

**FDA:** An agency in the U.S. federal government whose mission is to protect public health by making sure that food, cosmetics, and nutritional supplements are safe to use and truthfully labeled. The FDA also makes sure that drugs, medical devices, and equipment are safe and effective, and that blood for transfusions and transplant tissue are safe. Also called Food and Drug Administration.

**FDA:** Short for Food and Drug Administration, an agency in the USA that is responsible for regulating vaccines, cosmetics, legal drugs, and food products.

**FDA (acronym):** Food and Drug Administration

**FdCyd:** A substance being studied in the treatment of some types of cancer. It may prevent the growth of tumors by stopping cancer cells from dividing and by killing them. It is a type of antimetabolite. Also called 5-fluoro-2-deoxycytidine.

**FDR:** The parents, siblings, or children of an individual. Also called first-degree relative. OR A parent, brother, sister, or child. Also called first-degree relative.

**FEA:** (Finite Element Analysis) A mathematical technique for analyzing stress, which breaks down a physical structure into substructures called "finite elements." The finite elements and their interrelationships are converted into equation form and solved mathematically.

**Feather edged:** Boards tapered to one thin edge to allow for neat overlapping when used for cladding a structure. OR The sharp, thin edge on parts such as wiper seals. Also called a knife edge

**FEATHER SANDING:** Tapering the edge of dried paint film with sandpaper.

**Feathering:** Tapering off the edges of a coat of paint when touching in by laying off with a comparatively dry brush. Where some paint has flaked off 'feathering' is the tapering of the edges of the remaining paint by rubbing down to provide a smooth surface for overpainting.

**febrile neutropenia :** A condition marked by fever and a lower-than-normal number of neutrophils in the blood. A neutrophil is a type of white blood cell that helps fight infection. Having too few neutrophils increases the risk of infection.

**febuxostat:** An orally available, non-purine inhibitor of xanthine oxidase with uric acid lowering activity. Upon oral administration, febuxostat selectively and noncompetitively inhibits the activity of xanthine oxidase, an enzyme that converts oxypurines, including hypoxanthine and xanthine, into uric acid. By inhibiting xanthine oxidase, uric acid production is reduced and serum uric acid levels are lowered. Febuxostat may provide protection against acute renal failure caused by the excessive release of uric acid that occurs upon massive tumor cell lysis resulting from the treatment of some malignancies. Check for active clinical trials using this agent.

**FEC:** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer, including breast cancer that has spread or come back. It includes the drugs fluorouracil, epirubicin hydrochloride, and cyclophosphamide. Also called FEC regimen.

**FEC Regimen:** A regimen consisting of fluorouracil, epirubicin and cyclophosphamide used in the adjuvant setting and also for the treatment of recurrent and metastatic breast cancer.

**FEC regimen :** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer, including breast cancer that has spread or come back. It includes the drugs fluorouracil, epirubicin hydrochloride, and cyclophosphamide. Also called FEC.

**FEC regimen :** An abbreviation for a chemotherapy combination used with other types of therapy to treat breast cancer, including breast cancer that has spread or come back. It includes the drugs fluorouracil, epirubicin hydrochloride, and cyclophosphamide. Also called FEC.

**fecal immunochemical test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called FIT, iFOBT, immunoassay fecal occult blood test, immunochemical fecal occult blood test, and immunologic fecal occult blood test.

**fecal impaction :** A mass of dry, hard stool that cannot pass out of the colon or rectum. Fecal impaction may be caused by using laxatives too often, using certain types of pain medicines, little or no physical activity over a long period, diet changes, or constipation that is not treated. Signs and symptoms may include being unable to have a bowel movement, pain in the abdomen or back, problems urinating, and nausea and vomiting. Fecal impaction may also cause problems with circulation, the heart, or breathing.

**fecal incontinence :** Inability to hold stool in the rectum.

**fecal occult blood test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Guaiac fecal occult blood test and immunochemical fecal occult blood test are two types of fecal occult blood tests. Guaiac fecal occult blood test uses a chemical substance called guaiac to check for blood in the stool. Immunochemical fecal occult blood test uses an antibody to check for blood in the stool. Also called FOBT.

**feces :** The material in a bowel movement. Feces is made up of undigested food, bacteria, mucus, and cells from the lining of the intestines. Also called stool.

**Federal Emergency Management Agency (FEMA):** A component of U.S. Department of Homeland Security responsible for protecting the nation and reducing the loss of life and property from all hazards, such as natural disasters and acts of terrorism. FEMA leads and supports a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery, and mitigation. FEMA also administers the National Flood Insurance Program.

**Federal Energy Regulatory Commission (FERC):** An independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC also regulates and oversees hydropower projects, and the construction of liquefied natural gas terminals and interstate natural gas pipelines. FERC protects the economic, environmental, and safety interests of the American public, while working abundant, reliable energy in a fair, competitive market.

**Federal Land Development Authority (FELDA):** The Malaysian government agency that oversees the use and application of rural land in the country. FELDA is the world's largest plantation operator and owner, and is a 50:50 joint venture partner with P&G Chemicals in the FPG Oleochemicals operation located in Kuantan, Malaysia.

**FEED SECTION:** First section or zone of an extruder screw which is fed from the hopper and conveys solids to the melting zone. OR The section of the screw just under and slightly forward of the feed hopper.

**Feed System:** It is the main connecting channel between the machine nozzle and the part cavities of the mould.

**Feed throat:** The area at the rear end of the injection unit that allows fresh plastic to fall from the hopper into the heating barrel.

**Feed zone:** The area of the screw that is at the rear of the injection unit and receives fresh material from the feed throat. OR The first zone of an extruder screw. It receives material from the hopper and delivers it to the compression zone. OR Zone in the extruder's screw which feeds the resin into the plastic extrusion machine, and the channel depth is usually the same throughout the zone.

**Feedback:** Feedback in a closed loop system represents the return signal or response of the system to input instruction.

**Feedback inhibition:** A mode of enzyme regulation in which the end product of a biosynthetic pathway inhibits the enzyme that catalyzes the first step in that pathway.

**feedback inhibition:** Inhibition of an allosteric enzyme at the beginning of a metabolic sequence by the end product of the sequence; also known as end-product inhibition.

**feedback mechanisms:** A sequence of interactions in which the final interaction influences the original one. Also see positive feedback and negative feedback.

**Feedforward stimulation:** The activation of an allosteric enzyme in a later stage of a pathway by the product of a reaction that takes place earlier in the reaction pathway.

**feeding pattern:** the pattern in which animals obtain their nutrients.

**Feedstock:** A raw material or starting ingredient used as a "building block" for an intermediate or finished product. Used to describe a material that is

derived from nature, often remaining in an unprocessed or minimally processed state.

**Feedwater:** Water supplied to the reactor pressure vessel in a boiling-water reactor (BWR) or the steam generator in a pressurized-water reactor (PWR) that removes heat from the reactor fuel rods by boiling and becoming steam. The steam becomes the driving force for the plant's turbine generator.

**Feldene:** (Other name for: piroxicam)

**felsic:** magma that is aluminum or silica based, lighter in color, and less dense than mafic magma.

**felsic rock:** a rock that is rich in silica, potassium, sodium, and aluminum and that contains only small amounts of iron, magnesium, and calcium.

**Femara:** (Other name for: letrozole)

**Femara :** A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Femara lowers the amount of estrogen made by the body. This may stop the growth of cancer cells that need estrogen to grow. Femara is a type of aromatase inhibitor. Also called letrozole.

**Femest:** (Other name for: conjugated estrogens)

**Feminone:** (Other name for: ethinyl estradiol)

**femto-:** Prefix used in the SI system meaning "multiply by  $10^{-15}$ ". For example 22 fg means  $22 \times 10^{-15}$ g.

**fen:** A type of wetland that accumulates peat deposits; they are less acidic than bogs, deriving most of their water from groundwater rich in calcium and magnesium.

**fenfluramine:** Amphetamine-like component of fen-phen that suppresses appetite by increasing serotonin levels in the brain.

**fenofibrate:** A synthetic phenoxy-isobutyric acid derivative and prodrug with antihyperlipidemic activity. Fenofibrate is hydrolyzed in vivo to its active metabolite fenofibric acid that binds to and activates peroxisome proliferator activated receptor alpha (PPAR $\alpha$ ), resulting in the activation of lipoprotein lipase and reduction of the production of apoprotein C-III, an inhibitor of lipoprotein lipase activity. Increased lipolysis and a fall in plasma triglycerides, in turn, leads to the modification of the small, dense low density lipoprotein (LDL) particles into larger

particles that are catabolized more rapidly due to a greater affinity for cholesterol receptors. In addition, activation of PPARalpha also increases the synthesis of apoproteins A-I, A-II, and high density lipoprotein (HDL)-cholesterol. Overall, fenofibrate reduces total cholesterol, LDL cholesterol, apolipoprotein B, total triglycerides and triglyceride rich lipoprotein (VLDL) while increasing HDL cholesterol.

**fenofibrate :** A drug used to treat high levels of cholesterol and triglycerides in the blood. Fenofibrate is being studied in the treatment of advanced cancers in young patients and in the treatment of other conditions. It is a type of antilipidemic agent. Also called Lofibra and TriCor.

**fenretinide:** An orally-active synthetic phenylretinamide analogue of retinol (vitamin A) with potential antineoplastic and chemopreventive activities. Fenretinide binds to and activates retinoic acid receptors (RARs), thereby inducing cell differentiation and apoptosis in some tumor cell types. This agent also inhibits tumor growth by modulating angiogenesis-associated growth factors and their receptors and exhibits retinoid receptor-independent apoptotic properties. or A substance being studied in the treatment and prevention of some types of cancer. Fenretinide may cause ceramide (a wax-like substance) to build up in tumor cells and kill them. It is a type of retinoid, which are substances related to vitamin A.

**fenretinide lipid matrix:** An orally bioavailable powder formulation of a synthetic phenylretinamide analogue of retinol with potential chemopreventive and antineoplastic activities. Fenretinide binds to and activates retinoic acid receptors (RARs), thereby inducing cell differentiation and apoptosis in some tumor cell types, including those of the colon, breast, prostate, and neuroblastoma. Independent of RAR activation, this agent also modulates gene expression that leads to ceramide-induced, caspase-independent programmed cell death (PCD) via effectors such as ganglioside GD3 and reactive oxygen species (ROS). Compared to the capsule form, the powder contains a mixture of wheat flour, fats, and sugar that may contribute to the enhanced bioavailability of fenretinide. Check for active clinical trials using this agent.

**fenretinide LXS :** A powdered form of fenretinide that is being studied in the treatment of neuroblastoma. It may be used by the body more easily than the pill form. Fenretinide may cause ceramide (a wax-like substance)

to build up in tumor cells and kill them. It is a type of retinoid, which are substances related to vitamin A. Also called fenretinide Lym-X-Sorb.

**Fenretinide Lym-X-Sorb:** (Other name for: fenretinide lipid matrix) or A powdered form of fenretinide that is being studied in the treatment of neuroblastoma. It may be used by the body more easily than the pill form. Fenretinide may cause ceramide (a wax-like substance) to build up in tumor cells and kill them. It is a type of retinoid, which are substances related to vitamin A. Also called fenretinide LXS.

**fentanyl buccal soluble film:** A transmucosal formulation consisting of a small, mucoadhesive, bioerodible polymer disc formulated with the citrate salt of fentanyl, a synthetic anilidopiperidine opioid with analgesic activity. Upon application, fentanyl buccal soluble film rapidly releases fentanyl which is quickly absorbed into the systemic circulation. Fentanyl selectively binds to and activates mu-opioid receptors in the central nervous system (CNS), thereby mimicking the effects of endogenous opiates.

**fentanyl citrate:** The citrate salt of fentanyl, a synthetic opioid related to the phenylpiperidines with analgesic and anesthetic properties. Fentanyl exerts its analgesic effect by selectively binding to the mu-opioid receptor in the central nervous system (CNS), thereby mimicking the effects of endogenous opiates. Additional pharmacological effects of fentanyl include anxiolysis, euphoria, feelings of relaxation, respiratory depression, constipation, miosis, and cough suppression. or A drug used to treat severe cancer pain that occurs even though the patient is already taking opioids. It is also used during anesthesia for surgery. Fentanyl citrate binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opioid.

**fentanyl citrate buccal tablet:** A tablet formulation containing the citrate salt of the synthetic anilidopiperidine opiate fentanyl with analgesic activity. Upon contact with the buccal mucosa, fentanyl citrate buccal tablet rapidly releases fentanyl which is quickly absorbed into the systemic circulation. Fentanyl selectively binds to and activates mu-opioid receptors in the central nervous system (CNS), mimicking the effects of endogenous opioids.

**fentanyl citrate pectin-based nasal spray:** A pectin-based, aqueous nasal spray containing the citrate salt of fentanyl, a synthetic lipophilic phenylpiperidine opioid, with analgesic activity. Fentanyl binds to and

stimulates mu-opioid receptors in the central nervous system (CNS), mimicking the analgesic effect of endogenous opiates. Upon intranasal administration of this agent and contact with the nasal mucosa, pectin in low-viscosity aqueous solution gels in the presence of mucosal calcium ions; from this intranasal gel delivery platform, fentanyl is released into the systemic circulation in a relatively rapid but controlled and sustained manner. Check for active clinical trials using this agent.

**fentanyl citrate-containing nasal spray:** A nasal spray containing a phosphate-buffered solution of the citrate salt form of fentanyl, a short-acting, synthetic, lipophilic anilidopiperidine opioid, with analgesic activity. Upon applying one puff in the nostril, the fentanyl is rapidly absorbed through the nasal mucosa and selectively binds to and activates mu-opioid receptors in the central nervous system (CNS), mimicking the effects of endogenous opiates. Due to its quick onset and short duration of action, the administration of fentanyl nasal spray may relieve breakthrough pain in adults already receiving maintenance opioid therapy for chronic pain. Check for active clinical trials using this agent.

**fentanyl matrix transdermal patch:** A transdermal formulation containing the synthetic phenylpiperidine opioid agonist fentanyl, with analgesic activity. Upon topical administration, fentanyl diffuses from the transdermal patch through the skin, is transported via the systemic circulation, and selectively binds to the mu-receptor in the central nervous system (CNS), mimicking the effects of endogenous opiates. Stimulation of the mu-receptor inhibits adenylyl cyclase activity, induces opening of G-protein-coupled inwardly rectifying potassium (GIRK) channels, and blocks the opening of N-type voltage-gated calcium channels, resulting in hyperpolarization and reduced neuronal excitability; in addition, neuronal release of neurotransmitters such as substance P, GABA, dopamine, acetylcholine and noradrenaline may decrease.

**fentanyl sublingual spray:** A sublingual preparation of a short-acting, synthetic anilidopiperidine opioid with analgesic activity. After rapid sublingual transmucosal absorption, the active ingredient fentanyl selectively binds to and activates mu-opioid receptors in the central nervous system (CNS), mimicking the effects of endogenous opiates. or A form of the drug fentanyl that is sprayed under the tongue and then absorbed into the blood. It is being studied in the treatment of breakthrough pain (pain

that occurs even when pain-control medication is already being used) in cancer patients. Fentanyl is a type of opioid analgesic.

**Fentora:** (Other name for: fentanyl citrate buccal tablet)

**FEP:** FEP Fluorinated ethylene propylene, or FEP, is an alternative to Teflon® tubing. (Teflon® is a registered trademark of DuPont.) FEP tubing is known for chemical resistance and ability to withstand a large range of temperatures.

**FEP (fluorinated ethylene propylene):** A thermoplastic member of the fluoropolymer family. FEP has excellent nonstick and non-wetting properties.

**Feraheme:** (Other name for: ferumoxytol non-stoichiometric magnetite)

**Feridex:** (Other name for: ferumoxides injectable solution)

**Fermentation:** The energy-generating breakdown of glucose or related molecules by a process that does not require molecular oxygen. OR an anaerobic process in which energy can be released from glucose even though oxygen is not available; occurs in yeast cells. OR The process in which an organic substance is converted into another organic substance and carbon dioxide to generate energy by a (micro)organism in the absence of oxygen. "Fermentation" comes from the latin word for yeast, a kind of single-celled fungus. The most common fermentation reaction is the one by which glucose is converted into ethanol and carbon dioxide. This series of reactions is made use of humans when they use yeasts to make alcoholic drinks. It is easy to go wrong and make some different kind of alcohol (e.g., butanol), depending on the microorganisms involved, which is one reason you occasionally hear of deaths from drinking illicitly produced alcohol. OR Fermentation is the breakdown of glucose (and other sugars) into alcohol (ethanol) and carbon dioxide by enzymes in yeast (in the absence of oxygen). OR A chemical reaction whereby an enzyme helps convert one chemical substance into another. OR A type of heterotrophic metabolism in which an organic compound rather than oxygen is the terminal electron (or hydrogen) acceptor. Less energy is generated from this incomplete form of glucose oxidation than is generated by respiration, but the process supports anaerobic growth. OR An ATP-generating process in which organic compounds act as both donors and acceptors of electrons; fermentations can take place in the absence of oxygen. OR A class of biochemical reactions that break down complex organic molecules (such as carbohydrates) into

simpler materials (such as ethanol, carbon dioxide, and water).

Fermentation reactions are catalyzed by enzymes. OR Energy-yielding anaerobic breakdown of a nutrient molecule, such as glucose, without net oxidation; yields lactate, ethanol, or some other simple product.

**fermented soybean protein beverage:** A fermented soybean-derived phytochemical beverage with potential antineoplastic activity. Fermented soybean protein beverage is reported to exhibit immunostimulatory, anti-viral, pro-apoptotic, anti-angiogenic, anti-proliferative, and anti-inflammatory activities and to enhance the cytotoxic effects of natural killer (NK) cells. The fermentation process is reported to hydrolyze many soybean proteins into amino acids and nitrogen-rich compounds and to protect and enhance the activities of isoflavones such as genistein, protease inhibitors, saponins, phytosterols, inositol hexaphosphate, and other beneficial dietary nutrients and micronutrients found in soybeans. Check for active clinical trials using this agent.

**fermented wheat germ extract:** An extract of fermented wheat germ containing a concentrated, standardized amount of methoxy-substituted benzoquinones with immunomodulatory and potential antineoplastic activities. Fermented wheat germ extract (FWGE) inhibits the activities of several enzymes involved in de novo nucleic acid synthesis and in supplying the dNTP pool required for DNA replication. This agent also induces caspase-3-mediated inactivation of poly(ADP)ribose polymerase (PARP), a key enzyme in DNA repair that is overexpressed in many cancers; cleavage of PARP prevents DNA repair and induces apoptosis. The benzoquinones may contribute to the immunomodulatory effects of FWGE, down-regulating major histocompatibility complex class I (MHC-1) protein on the surface of cancer cells, allowing natural killer (NK) cell surveillance; and up-regulating the expression of intracellular adhesion molecule 1 (ICAM-1) on tumor endothelial cells. Check for active clinical trials using this agent.

**Fermium:** Symbol: "Fm" Atomic Number: "100" Atomic Mass: (257)amu. Fermium is one of the elements in the actinide series of inner transition elements. It may also be classified as a rare earth element. It is a radioactive and unstable element and you will not find it in use anywhere. The element was named after the physicist Enrico Fermi.

**Ferndex:** (Other name for: dextroamphetamine sulfate)

**ferric:** Deprecated. 1. the iron(III) ion,  $\text{Fe}^{3+}$ . 2. A compound that contains iron in the +3 oxidation state.

**ferric carboxymaltose solution:** A parenteral iron solution containing ferric iron complexed with carboxymaltose polymers, used in parenteral iron-replacement therapy. Upon administration, ferric carboxymaltose is removed from plasma by the reticuloendothelial system. Subsequently, ferric iron binds to transferrin or is stored as ferritin. Transferrin-bound iron is transported in the plasma to the liver, spleen and bone marrow, where it is incorporated into hemoglobin, and to muscle, where it is incorporated into myoglobin.

**Ferric sulfate :** Ferric sulfate (PIX) is  $\text{Fe}^{3+}$  -based inorganic coagulant, which is produced from iron raw material and sulphuric acid. The iron raw material is often copperas, which is a by-product from titanium dioxide - pigment manufacturing. The ferric sulfate is used both in drinking water and waste water treatment to remove impurities from the water.

**Ferrihemoglobin:** Hemoglobin in which the iron component of the heme prosthetic group is in the ferric (+3) state; ferrihemoglobin cannot bind oxygen. OR Hemoglobin in which the iron component of the heme prosthetic group is in the ferrous (+2) state; ferrohemoglobin is capable of binding oxygen.

**Ferriprox:** (Other name for: deferiprone)

**ferritin :** A protein that binds to iron and stores it for use by the body. Ferritin is found in cells in the liver, spleen, bone marrow, and other tissues.

**Ferrlecit:** (Other name for: sodium ferric gluconate complex in sucrose) or A form of the mineral iron that is used to treat anemia caused by low amounts of iron in the blood. Anemia is a condition in which the number of red blood cells is below normal. Ferrlecit is a type of hematinic and a dietary supplement. Also called sodium ferric gluconate.

**ferroin:** A blood-red complex of  $\text{Fe}^{2+}$  ion with 1,10-phenanthroline, used as a redox indicator. Ferroin changes from red to pale blue when oxidized.

**ferromagnetism:** Ferromagnetic materials exhibit magnetism even in the absence of an external magnetic field. Ferromagnetic materials contain regions where many paramagnetic atoms or ions have magnetic moments that are aligned in the same direction. Iron, cobalt, nickel, and gadolinium are elements that can exhibit ferromagnetic behavior.

**ferrous:** Deprecated. 1. the iron(II) ion,  $\text{Fe}^{2+}$ . 2. A compound that contains iron in the +2 oxidation state.

**ferrous fumarate:** The fumarate salt form of the mineral iron. Administration of ferrous fumarate results in elevation of serum iron concentration, which is then assimilated into hemoglobin, required for the transport of oxygen, or trapped in the reticuloendothelial cells for storage. This agent is used as a dietary supplement, and to prevent or treat iron deficiency related syndromes.

**ferrous sulfate:** A sulfate salt of mineral iron formulated for oral administration and used as a dietary supplement, ferrous sulfate is absorbed in the stomach and small intestine and combines with apoferritin to form ferritin, which is stored in the liver, spleen, red bone marrow, and intestinal mucosa. Important in transport of oxygen by hemoglobin to the tissues, iron is also found in myoglobin, transferrin, and ferritin, and is a component of many enzymes such as catalase, peroxidase, and cytochromes. or A form of the mineral iron that is used to treat anemia caused by low amounts of iron in the blood. Anemia is a condition in which the number of red blood cells is below normal. Ferrous sulfate is a type of hematinic and a type of dietary supplement.

**fertile :** Able to produce children.

**Fertile material:** A material, which is not itself fissile (fissionable by thermal neutrons), that can be converted into a fissile material by irradiation in a reactor. There are two basic fertile materials: uranium-238 and thorium-232. When these fertile materials capture neutrons, they are converted into fissile plutonium-239 and uranium-233, respectively.

**fertility :** The ability to produce children.

**Fertility factor:** A bacterial plasmid that contains genes required for conjugation.

**fertility preservation :** A type of procedure used to help keep a person's ability to have children. A fertility preservation procedure is done before a medical treatment that may cause infertility, such as radiation therapy or chemotherapy. Examples of fertility preservation procedures include sperm banking, egg freezing, in vitro fertilization with embryo freezing, and certain types of surgery for cervical and ovarian cancer.

**fertilized egg cell:** an egg cell that has been fertilized by a sperm cell.

**ferumoxides injectable solution:** An injectable, aqueous colloid solution containing a non-stoichiometric magnetite core of superparamagnetic iron oxide (SPIO) coated with dextran administered as a magnetic resonance imaging (MRI) contrast media. Upon intravenous administration, ferumoxides accumulates in phagocytic reticuloendothelial system (RES) cells of the liver (Kupffer cells). When exposed to a strong external magnetic field, ferumoxides exhibits enhanced T2 relaxation, resulting in signal loss in normal tissues (image darkening) on mid T1/T2 or strongly T2-weighted images. Tissues with decreased RES function such as metastases, primary liver cancer, cysts and various benign tumors, adenomas, and hyperplasia, retain their native signal intensity, consequently the contrast between normal tissue (with image darkening) and abnormal tissue is increased.

**ferumoxsil oral suspension:** An orally administered aqueous suspension of silicone-coated, superparamagnetic iron oxide used as a magnetic resonance imaging (MRI) contrast agent. After oral administration, ferumoxsil fills the stomach and intestines. Upon exposure to the strong external magnetic field during MRI, ferumoxsil exhibits strong T1 relaxation properties and a strongly varying local magnetic field; T2 relaxation is enhanced, thereby darkening the contrast agent-containing portion of the gastrointestinal tract. Delineation of the bowel is thus enhanced, distinguishing bowel from organs and tissues adjacent to the upper regions of the gastrointestinal tract.

**ferumoxtran-10:** A synthetic ultrasmall superparamagnetic iron oxide composed of dextran-coated iron oxide nanoparticles (also known as 'ultrasmall particulate iron oxides' or USPIO). Ferumoxtran-10, which accumulates in non-cancerous lymphatic tissue, is used as a molecular resonance imaging (MRI) contrast agent. or A substance being studied as a way of improving magnetic resonance imaging (MRI) in diagnosing cancer and finding lymph nodes to which cancer has spread. Ferumoxtran-10 is made of nanoparticles (ultrasmall pieces) of iron oxide coated with dextran (a type of sugar). It is injected into the blood of the patient and the particles collect in lymph nodes, liver, spleen, or brain tissue where they can be seen using MRI. Ferumoxtran-10 later breaks down and passes from the body in urine.

**ferumoxytol :** A nanoparticle form of iron made in the laboratory that is being studied for use in iron replacement therapy, and as a contrast agent for magnetic resonance imaging. Contrast agents are substances that are injected into the body and taken up by certain tissues, making the tissues easier to see in imaging scans.

**ferumoxytol non-stoichiometric magnetite:** A superparamagnetic iron oxide nanoparticle coated with a low molecular weight semi-synthetic carbohydrate, polyglucose sorbitol carboxymethyl ether, with potential anti-anemic and imaging properties. After intravenous administration, ferumoxytol replaces iron stores with fewer side effects compared to the use of oral iron. In addition, this agent generates T1 relaxation, producing a magnetic field and enhancing T2 relaxation, thereby darkening contrast media-containing structures in magnetic resonance imaging (MRI). Due to small particle size, ferumoxytol remains in the intravasculature for a prolonged period and so may be used as a blood pool agent.

**fesoterodine fumarate:** The fumarate salt form of fesoterodine, a competitive muscarinic receptor antagonist with muscle relaxant and urinary antispasmodic properties. Fesoterodine is rapidly hydrolyzed in vivo into its active metabolite 5-hydroxymethyltolterodine, which binds and inhibits muscarinic receptors on the bladder detrusor muscle, thereby preventing bladder contractions or spasms caused by acetylcholine. This results in the relaxation of bladder smooth muscle and greater bladder capacity, in addition to a reduction in involuntary muscle contractions and involuntary loss of urine. The active metabolite does not interact with alpha-adrenergic, serotonergic, histaminergic and excitatory amino acid receptors and is eliminated via renal excretion.

**fetal :** Having to do with a fetus. A fetus is an unborn baby that develops and grows inside the uterus. In humans, the fetal period begins 8 weeks after fertilization of an egg by a sperm and ends at birth.

**fetch:** length of open ocean for wind to create waves. OR the distance that wind travels over a surface of water.

**fetus:** (foetus)In medicine, this term is applied to the young of mammals when fully developed in the womb. In humans, this stage is reached after about 3 months of pregnancy. Prior to this, the developing mammal is in embryo stage. OR results from a developing embryo at about eight weeks when the embryo is somewhat human looking and the remaining

development consists chiefly of growth and maturation. OR In humans, an unborn baby that develops and grows inside the uterus (womb). The fetal period begins 8 weeks after fertilization of an egg by a sperm and ends at the time of birth.

**fever :** An increase in body temperature above normal (98.6 degrees F), usually caused by disease.

**fexofenadine :** A drug used to treat certain allergy symptoms. It blocks a chemical released during an allergic response that causes itching, sneezing, runny nose, wheezing, and watery eyes. It is a type of antihistamine. Also called Allegra.

**fexofenadine hydrochloride:** The hydrochloride salt form of fexofenadine, a carboxylated metabolic derivative of terfenadine and third generation selective histamine H1-receptor antagonist with antihistaminic and non-sedative effects. Fexofenadine competitively binds peripheral H1-receptors, thereby stabilizing an inactive conformation of the receptor. Consequently histamine binding and activity as a result of mast-cell degranulation followed by the release of multiple inflammatory mediators, such as interleukins, prostaglandin and leukotriene precursors, is blocked, thereby preventing the triggering of pro-inflammatory pathways.

**FFT:** Fast Fourier Transform.

**FGF/FGFR pathway inhibitor E7090:** An inhibitor of the fibroblast growth factor (FGF)/fibroblast growth factor receptor (FGFR) pathway, with potential antineoplastic activity. Upon administration, the FGF/FGFR pathway inhibitor E7090 selectively interferes with the binding of FGF to FGFR through an as of yet not fully elucidated mechanism. This inhibits FGFR-mediated signaling and leads to both cell proliferation inhibition and cell death in FGFR-overexpressing tumor cells. FGFR is a receptor tyrosine kinase essential to tumor cell proliferation, differentiation, and survival; its expression is upregulated in many tumor cell types.

**FGF401 inhibitor FGF401:** An inhibitor of human fibroblast growth factor receptor 4 (FGFR4), with potential antineoplastic activity. Upon administration, FGF401 binds to and inhibits the activity of FGFR4, which leads to an inhibition of tumor cell proliferation in FGFR4-overexpressing cells. FGFR4 is a receptor tyrosine kinase upregulated in certain tumor cells and involved in tumor cell proliferation, differentiation, angiogenesis, and survival.

**FGFR inhibitor ASP5878:** An orally bioavailable inhibitor of the fibroblast growth factor receptor (FGFR), with potential antineoplastic activity. Upon oral administration, FGFR inhibitor ASP5878 binds to and inhibits FGFR, which results in the inhibition of FGFR-mediated signal transduction pathways. This inhibits proliferation in FGFR-overexpressing tumor cells. FGFR, a family of receptor tyrosine kinases upregulated in many tumor cell types, plays a key role in cellular proliferation and survival.

**FGFR inhibitor AZD4547:** An orally bioavailable inhibitor of the fibroblast growth factor receptor (FGFR) with potential antineoplastic activity. FGFR inhibitor AZD4547 binds to and inhibits FGFR, which may result in the inhibition of FGFR-related signal transduction pathways, and, so, the inhibition of tumor cell proliferation and tumor cell death. FGFR, up-regulated in many tumor cell types, is a receptor tyrosine kinase essential to tumor cellular proliferation, differentiation and survival.

**FGFR inhibitor debio 1347:** An orally bioavailable inhibitor of the fibroblast growth factor receptor subtypes 1 (FGFR-1), 2 (FGFR-2) and 3 (FGFR-3), with potential antineoplastic activity. FGFR inhibitor debio 1347 binds to and inhibits FGFR-1, -2, and -3, which result in the inhibition of FGFR-mediated signal transduction pathways. This leads to the inhibition of both tumor cell proliferation and angiogenesis, and causes cell death in FGFR-overexpressing tumor cells. FGFR, a family of receptor tyrosine kinases upregulated in many tumor cell types, is essential for tumor cellular proliferation, differentiation and survival.

**FGFR inhibitor INCB054828:** An orally bioavailable inhibitor of the fibroblast growth factor receptor (FGFR) types 1, 2, and 3 (FGFR1/2/3), with potential antineoplastic activity. FGFR inhibitor INCB054828 binds to and inhibits FGFR1/2/3, which may result in the inhibition of FGFR1/2/3-related signal transduction pathways. This inhibits proliferation in FGFR1/2/3-overexpressing tumor cells. FGFR, a family of receptor tyrosine kinases upregulated in many tumor cell types, plays a key role in cellular proliferation, migration, and survival.

**FGFR inhibitor TAS-120:** An orally bioavailable inhibitor of the fibroblast growth factor receptor (FGFR) with potential antineoplastic activity. FGFR inhibitor TAS-120 selectively and irreversibly binds to and inhibits FGFR, which may result in the inhibition of both the FGFR-

mediated signal transduction pathway and tumor cell proliferation, and increased cell death in FGFR-overexpressing tumor cells. FGFR is a receptor tyrosine kinase essential to tumor cell proliferation, differentiation and survival and its expression is upregulated in many tumor cell types.

**FGFR1 receptor antagonist HGS1036:** A soluble fusion protein consisting of the extracellular domain of human fibroblast growth factor receptor 1 (FGFR1) fused to the Fc portion of human immunoglobulin G1 (IgG1) with potential antineoplastic and anti-angiogenic activities. FGFR1 receptor antagonist FP-1039 prevents FGFR ligands, such as FGF1, FGF2, FGF4, from binding to their cognate receptors, thereby inhibiting the activation of the related FGFR tyrosine kinases. Inhibition of FGFR1 by this agent may retard tumor cell proliferation and induce tumor cell death. FP-1039 may also inhibit vascular endothelial growth factor (VEGF)-induced angiogenesis. FGFR1 is a receptor tyrosine kinase upregulated in certain tumor cells and involved in tumor cellular proliferation, differentiation, angiogenesis, and survival; most ligands that bind to FGFR1 also bind to the related receptors FGFR3 and FGFR4.

**FGFR4 inhibitor BLU-554:** An orally bioavailable inhibitor of human fibroblast growth factor receptor 4 (FGFR4), with potential antineoplastic activity. Upon oral administration, BLU-554 specifically binds to and blocks the binding of the ligand FGF19 to FGFR4. This prevents the activation of FGFR4, inhibits FGFR4-mediated signaling and leads to an inhibition of tumor cell proliferation in FGFR4-overexpressing cells. FGFR4 is a receptor tyrosine kinase and is involved in tumor cell proliferation, differentiation, angiogenesis, and survival. FGF19 is overexpressed by certain tumor cell types.

**FIA (flow injection analysis) :** well-established technique of chemical analysis, which involves the injection of a sample plug into a flowing reagent stream with subsequent detection (electrochemical or spectroscopic) of the reaction zone further downstream.

**FIBER:** This term usually refers to thin fibers of glass which are used to reinforce both thermoplastic and thermosetting materials. One-inch long fibers are occasionally used, but the more commonly used fiber lengths are 1/2" and 1/4", or less. OR a thread or threadlike structure such as cellulose, wool, silk, or glass yarn.

**fiber :** In food, fiber is the part of fruits, vegetables, legumes, and whole grains that cannot be digested. The fiber in food may help prevent cancer. In the body, fiber refers to tissue made of long threadlike cells, such as muscle fiber or nerve fiber.

**Fiber Show:** Strands or bundles of fibers that are not covered by resin and that are at or above the surface of a reinforced plastic.

**fiberoptic :** Describes the use of a coated, thin, clear, glass or plastic fiber that can carry light and send information, including images. In medicine, flexible fiberoptic instruments are used to look inside the body. Fiberoptics are also used to deliver laser light to tumors injected with a type of drug that kills cancer cells when it is exposed to laser light.

**Fiberoptic chemical sensors :** optical sensors, which use fiber optics to guide light beam from a source of light to an optrode and from an optrode to a detector.

**Fibrous plaster:** Plaster slabs mouldings or ornament made up from wood laths course canvas and plaster and case in the desired form before fixing. Also called 'stick and rag work'.

**Fibre:** 1) a specific form of chemically jelled fibrous materials manufactured in sheets, rods and tubes. 2) commonly used interchangeably with fiber.

**Fibre board:** Building board made from fibrous material such as wood pulp or other vegetable fibre. The term is normally used for the hard-pressed board the soft board being termed 'insulation board'.

**Fibre brushes:** Brushes with a vegetable fibre filling and which are suitable for applying limewash because the fibres do not soften in contact with lime unlike bristles. Fibre is often used together with pure bristle and are often very effective for applying textured masonry paints.

**Fibre placement:** A hybrid between the filament winding and tape laying processes. A fibre placement machine or tow placement machine allows individual tows of prepreg to be placed.

**fibrin :** A protein involved in forming blood clots in the body. It is made from the protein fibrinogen and helps stop bleeding and heal wounds. Sometimes fibrin-like substances may be found in higher than normal amounts in the blood and urine of patients with some types of cancer or other conditions. Measuring the amount of these substances may help to

check how well cancer treatment is working or if the cancer has gotten worse. Fibrin is a type of tumor marker.

**fibrin sealant:** A plasma-derived fibrin biomatrix preparation consisting of two separate solutions that are combined on application. The sealer protein solution contains clottable human fibrinogen and bovine aprotinin, a fibrinolysis inhibitor; the thrombin solution contains human thrombin and calcium chloride. When the solutions are combined, a clot is formed, reproducing the final stages of the coagulation cascade. Check for active clinical trials using this agent. OR A substance used during surgery to help heal wounds. It contains proteins found in human blood that cause blood to clot. When fibrin sealant is placed on a wound, a clot forms. Fibrin sealant is being studied as a way to improve healing after lymph node removal in patients with cancer. It is a type of surgical glue.

**fibrinogen :** A protein involved in forming blood clots in the body. It is made in the liver and forms fibrin. Fibrin is the main protein in a blood clot that helps stop bleeding and heal wounds. Sometimes fibrin-like substances may be found in higher than normal amounts in the blood and urine of patients with some types of cancer or other conditions. Measuring the amount of these substances may help to check how well cancer treatment is working or if the cancer has gotten worse. Fibrinogen is a type of tumor marker.

**fibroadenoma :** A benign (not cancer) tumor that usually forms in the breast from both fibrous and glandular tissue. Fibroadenomas are the most common benign breast tumors.

**fibroblast:** A cell of the connective tissue that secretes connective tissue proteins such as collagen. OR A connective tissue cell that makes and secretes collagen proteins.

**Fibrocaps:** (Other name for: fibrin sealant)

**fibrocystic breast changes :** A common condition marked by benign (not cancer) changes in breast tissue. These changes may include irregular lumps or cysts, breast swelling or discomfort, sensitive nipples, and itching. These symptoms may change throughout the menstrual cycle and usually stop after menopause. Fibrocystic breast changes can occur at any age, but are most common in younger women. This condition does not increase the risk of breast cancer.

**fibrofolliculoma** : A benign tumor of the hair follicle that appears as a small, whitish papule. Fibrofolliculomas are typically found on the face, ears, neck, and upper torso. They are pathognomonic for Birt-Hogg-Dubé syndrome, a hereditary condition associated with the development of kidney cancer.

**fibroid** : A benign smooth-muscle tumor, usually in the uterus or gastrointestinal tract. Also called leiomyoma.

**fibromatosis** : A condition in which multiple fibromas develop. Fibromas are tumors (usually benign) that affect connective tissue.

**fibrosarcoma** : A type of soft tissue sarcoma that begins in fibrous tissue, which holds bones, muscles, and other organs in place.

**fibrosis** : The growth of fibrous tissue. Or Containing or resembling fibers.

**fibrous** : Containing or resembling fibers.

**fibrous proteins**: Insoluble proteins that serve in a protective or structural role; contain polypeptide chains that generally share a common secondary structure.

**ficlatuzumab**: A monoclonal antibody directed against human hepatocyte growth factor (HGF) with potential antineoplastic activity. Ficlatuzumab binds to the soluble ligand HGF, preventing the binding of HGF to its receptor c-Met and activation of the HGF/c-Met signaling pathway, which may result in cell death in c-Met-expressing tumor cells. c-Met, a receptor tyrosine kinase overexpressed or mutated in many tumor cell types, plays a key role in cancer cell growth, survival, angiogenesis, invasion, and metastasis.

**fidaxomicin**: A narrow-spectrum, 18-membered macrolide antibiotic isolated from the actinomycete *Dactylosporangium aurantiacum* subsp. *hamdenensis* with potential antibacterial activity. Although the exact mechanism of action has yet to be fully elucidated, fidaxomicin may bind to and inhibit bacterial DNA-dependent RNA polymerase, thereby inhibiting the initiation of bacterial RNA synthesis. When orally administered, this agent is minimally absorbed into the systemic circulation, acting locally in the gastrointestinal tract. Tiacumicin B appears to be active against pathogenic Gram-positive bacteria, such as clostridia, enterococci, and staphylococci, but does not appear to be active against other beneficial intestinal bacteria.

**Fidelin:** (Other name for: prasterone)

**fiducial marker :** A medical device or small object placed in or on the body to mark an area for radiation treatment or surgery. For example, tiny gold seeds may be put into the prostate to mark a tumor before radiation therapy. This allows the doctor to give higher doses of radiation to the tumor with less harm to nearby healthy tissue.

**field:** an area where there is a measurable amount of a specific value at every point.

**Field Specimen:** A field specimen is a sample taken from outside of the lab. This could refer to a piece of rock, plant life, or an organism.

**fifth cranial nerve :** The main sensory nerve of the head and face, and the motor nerve of the muscles used in chewing. Also called trigeminal nerve.

**fight-or-flight syndrome :** A group of changes that occur in the body to help a person fight or take flight in stressful or dangerous situations. This is the body's way of helping to protect itself from possible harm. During fight or flight, certain hormones, such as adrenaline and cortisol, are released into the blood. This causes an increase in blood pressure, heart rate, and breathing. Other changes include an increase in blood sugar, alertness, muscle tension, and sweating.

**figitumumab:** A human monoclonal antibody directed against the insulin-like growth factor type I receptor (IGF1R) with potential antineoplastic activity. Figitumumab selectively binds to IGF1R, preventing insulin-like growth factor type 1 (IGF1) from binding to the receptor and subsequent receptor autophosphorylation. Inhibition of IGF1R autophosphorylation may result in a reduction in receptor expression on tumor cells that express IGF1R, a reduction in the anti-apoptotic effect of IGF, and inhibition of tumor growth. IGF1R is a receptor tyrosine kinase expressed on most tumor cells and is involved in mitogenesis, angiogenesis, and tumor cell survival.

**figurative idiom:** expressions so common that they have become clichés.

**FIHP:** A rare inherited condition in which one or more tumors form in the parathyroid glands (four pea-sized organs found on the thyroid) and cause them to make too much parathyroid hormone. The increased parathyroid hormone causes a loss of calcium from the bones and too much calcium in the blood. Also called familial isolated hyperparathyroidism.

**Filament:** 1) Fiber characterized by extreme length. 2) The resistance wire through which filament current is sent in a thermionic tube to produce the heat required for electron emissions. OR A single textile element of small diameter and very long length, considered as continuous.

**Filament Winding:** Resin impregnated robbing or single strands of glass or other reinforcement wound in a pre-determined pattern onto a suitable form or mandrel and then cured. OR A process for manufacturing FRP parts in which dry fibre rovings are pulled through a resin bath prior to winding on a mandrel. Prepregged roving or tows can also be filament wound. Curing is usually carried out in an oven with or without a vacuum bag.

**Filamentous organisms:** Organisms that grow in a thread or filamentous form. Common types are Thiobacillus, Actinomyces, and Cyanobacteria (aka blue-green algae). This is a common cause of sludge bulking in the activated sludge process. Various known as "pond scum", "blue-green algae", or "moss", when it appears in a pond/lake, and confused with algae because it looks a lot like algae. Cyanobacteria forms a symbiotic relationship with some varieties of algae, making the combination very difficult to combat in lakes and ponds. Filamentous organisms and Actinomyces will naturally stick to solid surfaces. Common types of Cyanobacteria are: Oscillatoria, Anabaena, and Synechococcus. Other filament formers include: Spirogyra, Cladophora, Rhizoclonium, Mougeotia, Zygnema and Hydrodictyon. Nocardia is another filament former, which causes foaming and interferes with flocculation in a waste treatment plant.

**filgrastim:** A recombinant, non-glycosylated cytokine which is chemically identical to or similar to the endogenous cytokine human granulocyte colony-stimulating factor (G-CSF) isoform B, with immunomodulating activity. Filgrastim binds to and activates G-CSF receptors with the same biological activity and stability as the endogenous cytokine, thereby controlling the production, differentiation, and function of neutrophilic granulocyte progenitors. Check for active clinical trials using this agent. or A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. It is also used to treat chronic neutropenia and to prepare the blood for the collection of certain types of blood cells. Filgrastim is also

used to help prevent damage to the bone marrow in patients who were exposed to very high doses of certain types of radiation. Filgrastim helps the body make more white blood cells. It is a type of colony-stimulating factor. Also called G-CSF, granulocyte colony-stimulating factor, Neupogen, and Zarxio.

**filgrastim-primed peripheral blood progenitor cells:** Peripheral blood progenitor cells (PBPC) primed with a recombinant form of the human granulocyte colony-stimulating factor (filgrastim). As a hematopoietic growth factor, filgrastim is able to mobilize hematopoietic progenitor cells (HPCs) into the peripheral blood which allows for an increased number of HPCs upon collection by leukapheresis. Administration of filgrastim-primed PBPCs following hematopoietic stem cell transplantation provides increased numbers of progenitor cells which may prevent pancytopenia and relapse.

**filgrastim-SD/01 :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. Filgrastim-SD/01 is also used to help prevent damage to the bone marrow in patients who were exposed to high doses of certain types of radiation. Filgrastim-SD/01 helps the bone marrow make more white blood cells. It is a form of filgrastim and is able to stay in the body longer. Filgrastim-SD/01 is a type of colony-stimulating factor. Also called Neulasta and pegfilgrastim.

**Fill:** The packing of the cavity or cavities of the mold as required for parts that are free of flash and porosity. OR The packing of material into the mold

**Fill pattern:** the contours of the advance of the material as the cavity fills. (See flow pattern) OR The contour the melt takes sequentially as it fills the cavity. The mold should fill with a straight flow front with no changes in direction throughout filling. Mold-filling analysis software can be used to predict these filling patterns. OR It is a visual history of how a mould fills under a specific set of moulding conditions.

**Fill Point:** The level to which a container must be filled to furnish a designated quantity of the content. OR The level to which a container must be filled to furnish a designated quantity of the contents. OR the level to which a container must be filled to furnish a designated quantity of the contents.

**Fill Pressure:** The amount of pressure required to fill a cavity.

**Fill Time:** Fill time is the time in seconds that it takes to just fill the mould with melt during the filling phase (up to switchover point) of the moulding cycle.

**Fill-and-Wipe:** Parts are molded with depressed designs; after application of paint, surplus is wiped off, leaving paint remaining only in the depressed areas.

**Filled Edges :** Short lengths of wire (any shape) affixed between connectors.

**Filler:** A composition for levelling off the finer defects of a surface often after the coarser defects such as cracks have been made good with a hard stopper. A filler is applied with a filling knife or a broad knife. OR A product used to fill the pores of wood before applying a prime of finish coat. OR A material which is added to plastics to make it less costly. Filler can be inert or can alter various properties of the plastic. OR An additive to resins for the purpose of improving physical properties (impact resistance, hardness, dimensional stability, etc.), or to reduce cost of resin. OR A relatively inert substance added to a plastic compound to reduce its cost and/or to improve physical properties, particularly hardness, stiffness and impact strength. OR A relatively inert substance added to a plastic compound to reduce its cost and/or to improve physical properties, particularly hardness, stiffness and impact strength. OR A cheap, inert substance added to a plastic to make it less costly. Fillers may also improve physical properties, particularly hardness, stiffness, and impact strength. The particles are usually small, in contrast to those of reinforcements but there is some overlap between the function of the two. OR a substance added to a polymer that does not form a chemical bond with the base polymer. These may or may not enhance the performance properties of the final parts, but are usually added to alter density or reduce cost. Glass beads and talc are common fillers.

**Filler Rod :** A rod of any shape (usually round) inserted through a spiral or spirals to fill the mesh. These rods do not connect spirals or belt components. OR A relatively inert substance added to a plastic compound to reduce its cost and/or to improve physical properties, particularly hardness, stiffness and impact strength. OR Fillers are generally inert materials characterized by a low aspect ratio (4D). They are commonly

used as extenders; fillers do in fact improve certain material properties such as wear, resistance, electrical properties, modulus values, HDT and others.

**Fillers:** Pigments and other solids used to alter properties of coatings. OR An inactive substance used to make a product bigger or easier to handle. For example, fillers are often used to make pills or capsules because the amount of active drug is too small to be handled conveniently.

**Fillers & Reinforcements:** Fillers are used to make a resin less costly. They can be inert or they can alter some properties of the plastic. Reinforcements are substances used to strengthen or give dimensional stability to a material.

**Fillet:** A curved face where a rib meets a wall, intended to improve the flow of material and eliminate mechanical stress concentrations on the finished part. OR A rounded filling of the internal angle between two surfaces of a part OR A rounded filling of the internal angle between two surfaces.

**Filling solution :** the solution inside a sensing or reference electrode, that are permanently sealed within the electrode (like the buffer inside a pH electrode) are usually called internal reference solutions to differentiate them from filling solutions.

**Film :** Films are distinguished from sheets in the plastics industry only according to their thickness. In general, films have thicknesses no greater than .030". OR Films are flat materials that are extremely thin in comparison to its length and breadth. Typically, a film has a maximum nominal thickness of 0.25 millimeters. OR Sheet material having a nominal thickness not greater than 10 mil. OR Flat materials that are extremely thin in comparison to its length and breadth. Typically, a film has a maximum nominal thickness of 0.25 millimeters. OR Films are distinguished from sheets in the plastics industry only according to their thickness. In general, films have thicknesses no greater than .030". OR Layer or coat of paint or other finish.

**Film badge:** Photographic film used to measure exposure to ionizing radiation for purposes of personnel monitoring. The film badge may contain two or three films of differing sensitivities, and it may also contain a filter that shields part of the film from certain types of radiation.

**Film Build:** Amount of thickness produced in an application. Millimeters (mils) of dry film per mils of applied wet film.

**Film formation:** The paint's ability to form a continuous dry film. In a latex paint this process is the result of the water's evaporating and the coming together of the binder particles. A continuous dry film repels water.

**film mammography :** The use of x-rays to create a picture of the breast on a film.

**Film Strength:** This term refers to the physical strength of the can liner. Some resins have higher film strength than others. Our can liners are made from highest quality resins, giving them the highest quality film in the market place. Various types of strength testing are: Dart Drop Test - ASTM test used to determine the resistance of a bag to local failure or puncturing. Elmendorf Tear Test - ASTM test used to measure the resistance to tearing. Wet Load Capacity - Measurement of how much wet weight a can liner will hold. Dry Load Capacity - Measurement of how much dry weight a can liner will hold.

**Film Thickness:** Depth or thickness of the dry coating in millimeters.

**FILMS:** In the plastics and packaging industries, films are usually considered to be a web under 10 mils (0.010 inch or 250 microns) thick. Webs greater than 10 mils are considered sheet.

**filter:** To separate an insoluble solid from a liquid by pour it through a solid (usually paper) to trap the solid particles and separate them from the liquid.

**filter :** A material or device that allows certain substances to pass through it, while keeping other substances out. Filters may be used in cigarettes to help trap tar and other harmful substances found in tobacco smoke. In medicine, filter also means to remove toxins, poisons, or other harmful substances from the blood. For example, the kidneys remove waste and extra water from the blood (as urine). The liver also removes harmful substances from the blood.

**Filter aid:** A chemical (usually a polymer) added to water to help remove fine colloidal suspended solids.

**filter backwash:** the reversal of flow through a filter to wash clogged material out of the filter medium and reduce conditions causing loss in flow through the filter.

**Filterability:** Ability to filter a solid; related to particle size and morphology of the solid.

**Filtering (Filtration)** : A method of removing an insoluble solid from a liquid. The liquid particles and any dissolved particles are small enough to fit through the holes in a filter paper. An undissolved solid has particles that are too big to do so.

**Filtrate:** Filtrate is the solid substance remaining after you remove the liquid of a solution. If you mix water and chalk, you can remove the chalk by filtering it out. The chalk left in the filter paper is called the filtrate.

**filtration:** the process of separating solids from a liquid by means of a porous substance through which only the liquid can pass. OR A process in which a slurry of solid particles suspended in a liquid passes through a porous medium. Most of the liquid passes through the medium (e.g., a filter) to form the filtrate, and the solids and some entrained liquid are retained on the filter to form the filter cake. Filtration may also be used to separate solids or liquids from gases.

**Fin:** The web of material remaining in holes or openings in a molded part which must be removed in finishing. OR The web of material remaining in holes or openings in a molded part which must be removed for final assembly

**finasteride:** A synthetic 4-azasteroid compound. Finasteride competitively binds to and inhibits steroid type II 5-alpha-reductase in the prostate gland, liver, and skin, thereby interfering with the enzymatic conversion of testosterone to 5-dihydrotestosterone (DHT) and reducing serum DHT levels. The reduction in serum DHT levels results in diminished stimulation of androgen receptors in the nuclei of prostate cells and, so, diminished prostate cell proliferation. OR A drug used to reduce the amount of male hormone (testosterone) produced by the body.

**fine-needle aspiration biopsy :** The removal of tissue or fluid with a thin needle for examination under a microscope. Also called FNA biopsy.

**Fines:** In the classification of powdered or granular materials such as molding compounds according to particle size, fines are the portion of the material composed of particles which are smaller than a specified size.

**fingerprinting:** See peptide mapping.

**Fingerprinting:** The characteristic two-dimensional paper chromatogram obtained from the partial hydrolysis of a protein or a nucleic acid.

**Finish:** the plastic forming the opening of a container and shaped to accommodate a specific closure. OR A specific type of surface treatment applied to some or all faces of the part. This treatment can range from a smooth, polished finish to a highly contoured pattern that can obscure surface imperfections and create a better looking or better feeling part. OR To complete the secondary work on a molded part so that it is ready for use. Operations such as filing, deflashing, buffing, drilling, tapping, degating are commonly called finishing operations. See SURFACE FINISH.

**Finish coat:** The last coat applied in a multiple coat paint system e.g. primer undercoat with a gloss finishing coat. OR Last coat of paint or other finish.

**Finish Insert:** A removable part of a blow mold to form a specific neck of a plastic bottle. Sometimes called Neck Insert.

**Finite element analysis :** the solution of simultaneous equations for each element with resulting pressure, temperature and elapsed time at each node.

**fiord:** a steep-walled, fingerlike coastal inlet that was carved by glacial action and later flooded by the rising sea.

**Firdapse:** (Other name for: amifampridine)

**Fire Resistance:** The ability of a coating to withstand fire or to protect the substrate to which it is applied from fire damage. OR A coating which will (1) reduce flame spread, (2) resist ignition when exposed to high temperature or (3) insulate the substrate and delay damage to the substrate.

**Firmagon :** A drug that is used to treat advanced prostate cancer and is also being studied in the treatment of benign prostatic hyperplasia. Firmagon binds to gonadotropin-releasing hormone (GnRH) receptors in the pituitary gland. This causes the body to stop making testosterone, which prostate cancer needs to grow. Firmagon is a type of GnRH antagonist. Also called degarelix.

**firn:** rounded granules formed by the compaction of snow by pressure from overlying snow and cemented by ice. OR Material that is transitional between snow and glacier ice. It is formed from snow after passing through one summer melt season and becomes glacier ice after its permeability to liquid water falls to zero.

**first detection:** Identification of a precursor signal, detectable above the noise of natural climatic variability, of a significant change in a climate

parameter and attribution of this change to an increase in atmospheric carbon dioxide concentration. The signal may be estimated by numeric modeling of the climate, and the noise can be estimated using instrumental data. For any modeled signal that is estimated, the corresponding noise can be estimated from observational data, and a signal-to-noise ratio can be calculated to provide a quantitative measure of detectability.

**first ionization energy:** The energy needed to remove an electron from an isolated, neutral atom.

**first law:** The first law states that energy cannot be created or destroyed. Many equivalent statements are possible, including: Internal energy changes depend only on the initial and final states of the system, not on the path taken. The work done during an adiabatic process depends only on the initial and final states of the system, and not on the path taken. The internal energy change for any cyclic process is zero.

**first law of thermodynamics:** The law stating that in all processes, the total energy of the universe remains constant.

**First messengers:** Hormones; molecules that transduce signals from one tissue to another tissue (the target tissue) through the blood.

**first order reaction:** The sum of concentration exponents in the rate law for a first order reaction is one. Many radioactive decays are first order reactions.

**First Pass Effect:** Refers to the extent by which orally administered drugs undergo biotransformation during its first passage through the liver and the intestines, reducing the concentration of the drug that reaches general circulation.

**first-degree relative :** A parent, brother, sister, or child. Also called FDR.

**first-degree relative :** The parents, siblings, or children of an individual. Also called FDR.

**first-line therapy :** The first treatment given for a disease. It is often part of a standard set of treatments, such as surgery followed by chemotherapy and radiation. When used by itself, first-line therapy is the one accepted as the best treatment. If it doesn't cure the disease or it causes severe side effects, other treatment may be added or used instead. Also called induction therapy, primary therapy, and primary treatment.

**first-motion studies:** studies that indicate whether the first rock motion in an earthquake was a push (the rock moved toward the seismograph station) or a pull (the rock moved away from the station).

**Fiscal year (FY):** The 12-month period from October 1 through September 30 used by the Federal Government for budget formulation and execution. The fiscal year is designated by the calendar year in which it ends; for example, FY 2009 runs from October 1, 2008, through September 30, 2009.

**Fischer projection:** a projection that uses perpendicular lines to depict the absolute configuration of chiral molecules on a planar surface. OR A means of depicting the stereochemistry of a molecule. In a Fischer projection of a molecule, atoms joined to an asymmetric carbon atom by horizontal bonds are in front of the plane of the page, and those joined by vertical bonds are behind.

**Fischer projection formulas:** See projection formulas.

**FISH :** A technique used to identify the presence of specific chromosomes or chromosomal regions through hybridization (attachment) of fluorescently-labeled DNA probes to denatured chromosomal DNA. Examination through a microscope under fluorescent lighting detects the presence of the colored hybridized signal (and hence presence of the chromosome material) or absence of the hybridized signal (and hence absence of the chromosome material). Also called fluorescence in situ hybridization. or A laboratory technique used to look at genes or chromosomes in cells and tissues. Pieces of DNA that contain a fluorescent dye are made in the laboratory and added to cells or tissues on a glass slide. When these pieces of DNA bind to specific genes or areas of chromosomes on the slide, they light up when viewed under a microscope with a special light. Also called fluorescence in situ hybridization.

**Fish Eye:** A fault in transparent or translucent plastics materials, such as film or sheet, appearing as a small globular mass and caused by incomplete blending of the mass with surrounding materials.

**fish oil/glycerol/egg lecithin-based emulsion:** An injectable, nutritional lipid emulsion composed of 10% fish oil and high amounts of the fish oil-derived polyunsaturated omega-3 fatty acids eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA). Additionally, the fish oil/glycerol/egg lecithin-based emulsion contains myristic acid, palmitic acid, palmitoleic acid, stearic acid, oleic acid, linoleic acid, linolenic acid, octadecatetraenoic

acid, eicosaenoic acid, arachidonic acid, docosaenoic acid, and docosapentaenoic acid. This agent supplies essential fatty acids that can be incorporated into cell membranes. The fatty acids may decrease the production of certain pro-inflammatory cytokines, including interleukin 1 (IL-1), IL-6 and tumor necrosis factor (TNF). In addition to fish oil, this lipid emulsion contains egg phospholipids to maintain membrane integrity; glycerol to provide energy through glycolysis; and the antioxidant alpha-tocopherol (vitamin E).

**FISHEYE:** Small globular mass which has not blended completely into the surrounding material, resulting as a fault in film or sheet.

**Fisheyes :** Describes a very small void which has not blended completely with the surrounding material. Usually caused by a minute quantity of silicone, oil or other surface contaminate on the surface of the substrate.

**FishPaper:** 1) A type of vulcanized fibre paper treated chemically for insulating purposes where high mechanical and electrical strength and flexibility are required. 2) A vulcanized fibre in thin cross-section.

**fissile:** splitting naturally along layers.

**Fissile material:** A nuclide that is capable of undergoing fission after capturing low-energy thermal (slow) neutrons. Although sometimes used as a synonym for fissionable material, this term has acquired its more-restrictive interpretation with the limitation that the nuclide must be fissionable by thermal neutrons. With that interpretation, the three primary fissile materials are uranium-233, uranium-235, and plutonium-239. This definition excludes natural uranium and depleted uranium that have not been irradiated, or have only been irradiated in thermal reactors.

**fission:** The process in which heavy nuclei split to form lighter nuclei. OR A nuclear reaction in which an atomic nucleus breaks into smaller nuclei of comparable mass, releasing a large amount of energy.

**Fission (fissioning):** The splitting of an atom, which releases a considerable amount of energy (usually in the form of heat) that can be used to produce electricity. Fission may be spontaneous, but is usually caused by the nucleus of an atom becoming unstable (or "heavy") after capturing or absorbing a neutron. During fission, the heavy nucleus splits into roughly equal parts, producing the nuclei of at least two lighter elements. In addition to energy, this reaction usually releases gamma radiation and two or more daughter neutrons.

**Fission gases:** Those fission products that exist in the gaseous state. In nuclear power reactors, this includes primarily the noble gases, such as krypton and xenon.

**Fission products:** The nuclei (fission fragments) formed by the fission of heavy elements, plus the nuclide formed by the fission fragments' radioactive decay.

**Fissionable material:** A nuclide that is capable of undergoing fission after capturing either high-energy (fast) neutrons or low-energy thermal (slow) neutrons. Although formerly used as a synonym for fissile material, fissionable materials also include those (such as uranium-238) that can be fissioned only with high-energy neutrons. As a result, fissile materials (such as uranium-235) are a subset of fissionable materials. Uranium-235 fissions with low-energy thermal neutrons because the binding energy resulting from the absorption of a neutron is greater than the critical energy required for fission; therefore uranium-235 is a fissile material. By contrast, the binding energy released by uranium-238 absorbing a thermal neutron is less than the critical energy, so the neutron must possess additional energy for fission to be possible. Consequently, uranium-238 is a fissionable material.

**fistula :** An abnormal opening or passage between two organs or between an organ and the surface of the body. Fistulas may be caused by injury, infection, or inflammation, or may be created during surgery.

**FIT:** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called fecal immunochemical test, iFOBT, immunoassay fecal occult blood test, immunochemical fecal occult blood test, and immunologic fecal occult blood test.

**Fitch:** A small brush with a round oval or flat ferrule usually with a filling of white bristles. They are available in assorted sizes and among their uses are 'picking out' details of plaster ornament ruling painted lines and spot priming fine cracks and small areas.

**Fitment:** A device used as a part of a closure assembly designed to accomplish a specific purpose, such as a powder shaker, sprinkler or

dropper. OR a device used as part of a closure assembly to accomplish a certain purpose such as, dropper, sprinkler, powder shakers, etc.

**Fittings:** Any parts (other than ends) necessary to complete the closure of a can, including plugs, screw necks, spouts, bungs, caps and more.

**five element acupuncture :** An ancient form of acupuncture based on the principle that there are five universal elements (wood, fire, earth, metal, and water) that affect a person's emotions, personality, health, and response to treatment. Each person is affected by one element more than the others. Also called traditional acupuncture.

**five-year survival rate :** The percentage of people in a study or treatment group who are alive five years after they were diagnosed with or started treatment for a disease, such as cancer. The disease may or may not have come back.

**FIXTURE:** Means of holding a part during a machining or other operation. OR Block of metal or wood used to maintain the proper shape or to perform secondary operation.

**FK463:** An antibiotic/antifungal drug used to treat infection.

**Flagella, eukaryotic:** Hairlike organelles made up of microtubules that protrude from the cell surface; their movement propels the cell.

**Flagella, prokaryotic:** Extracellular appendages used to propel bacteria; the required energy is derived directly from a proton-motive force across the cell membrane.

**Flagellin:** The protein component of bacterial flagella.

**flagellum:** A cell appendage used in propulsion. Bacterial flagella have a much simpler structure than eukaryotic flagella, which are similar to cilia.

**Flagyl:** (Other name for: metronidazole hydrochloride) or A drug that is used to treat infection and is being studied in the treatment of cancer. It is type of antibacterial, antiprotozoal, and anthelmintic. Also called metronidazole.

**Flake:** Used to denote the dry, unplasticized base of cellulosic plastics.

**Flaking:** The detachment of pieces of paint from the substrate caused by a loss of adhesion and elasticity. Also known as scaling. OR A form of paint failure characterized by the detachment of small pieces of the film from the surface of previous coat of paint. Cracking or blistering usually precedes it.

**Flame Resistance:** The resistance to burning of material that will not withstand combustion under ordinary conditions

**Flame Retardant:** Used by recycled plastic and plastic compound manufacturers, flame retardants are reactive compounds and additive compounds to make the finished plastic extrusion products fire resistant. A flame retardant plastic is considered to be one that will not continue to burn or glow after the source of ignition has been removed. OR Having the ability to resist combustion (A flame retardant plastic is considered to be one that will not continue to burn or glow after the source of ignition has been removed.) Retardant, or retarder: a substance used in small proportion to reduce the reaction rate of a chemical system. Flame retardant: a substance added, or treatment applied, to a material in order to suppress, significantly reduce or delay the propagation of flame. Flame retardants may be added to plastics materials (external flame retardants) or incorporated as chemical groups in the base polymer during the polymerization process (internal flame retardants). Flame retardance is the property of a material, either inherent or by virtue of a substance added or a treatment applied, to suppress significantly, reduce or delay the propagation of flame. Flame retarded: treated with a flame retardant. fire retardant: a substance added, or treatment applied, to a material in order to suppress, significantly reduce or delay the combustion of the material. OR Having the ability to resist combustion (A flame retardant plastic is considered to be one that will not continue to burn or glow after the source of ignition has been removed.) OR Having the ability to resist combustion (A flame retardant plastic is considered to be one that will not continue to burn or glow after the source of ignition has been removed.) Retardant, or retarder: a substance used in small proportion to reduce the reaction rate of a chemical system. Flame retardant: a substance added, or treatment applied, to a material in order to suppress, significantly reduce or delay the propagation of flame. Flame retardants may be added to plastics materials (external flame retardants) or incorporated as chemical groups in the base polymer during the polymerization process (internal flame retardants). Flame retardance is the property of a material, either inherent or by virtue of a substance added or a treatment applied, to suppress significantly, reduce or delay the propagation of flame. Flame retarded: treated with a flame retardant. fire retardant: a substance added, or treatment applied, to a

material in order to suppress, significantly reduce or delay the combustion of the material.

**Flame Retardant Resin:** A resin which is compounded with certain chemicals to reduce or eliminate its tendency to burn. For polyethylene and similar resins, chemicals such as antimony trioxide and chlorinated paraffins are useful.

**Flame Spraying:** Method of applying a plastic coating in which finely powdered fragments of plastic, together with suitable fluxes, are projected through a cone of flame onto a surface. OR A method of rendering inert thermoplastic objects receptive to inks, lacquers, paints, adhesives, etc. The object is bathed in an open flame to promote oxidation of the surface of the article.

**Flame treating:** A method of bathing plastics in an open flame to promote oxidation of the surface, rendering it more receptive to inks, lacquers, paints, adhesives and more.

**Flame-cleaning:** The application of an intensely hot flame (usually oxy-acetylene) to a steel surface in order to remove heavy rust or scale.

**Flame, Fire & Smoke Retardants:** Are added to the resin to retard these undesirable effects.

**Flammability:** Measure of the extent to which a material will support combustion.

**FLAMMABLE LIQUID:** A liquid which has a flash point below 100F.

**Flange:** A rib or rim for strength, for guiding, or for attachment to a pipe.

**Flank:** The side of a building; the side surfaces of a building stone; any large internal wall area.

**flanvotumab:** A monoclonal antibody directed against the melanosomal membrane protein gp75 (or Tyrosinase-Related Protein 1 [TRP1]) with potential immunostimulatory and antineoplastic activities. Flanvotumab targets and binds to gp75. This may lead to the induction of cytotoxic T cell immune and antibody-mediated immune responses against melanoma cells expressing gp75. gp75, a pigmentation-associated antigen, is expressed in melanosomes of human melanocytes and melanomas.

**flaring:** The burning of waste gases through a flare stack or other device before releasing them to the air.

**Flash:** Any excess material that is formed with and attached to the component along a seam or mold parting line. OR Extra plastic attached to a molding along the parting line; it must be removed before the part can be considered finished. OR Excess material that is formed along a seam and attached to an otherwise completed item. OR A thin film of plastic that tends to form at parting line areas of a mold. May also be found in vent areas and around ejector pins. Flash is caused by too great a clearance between mating metal surfaces, which allows plastic material to enter. OR Resin that is forced out of the mold cavity area and onto the parting line or into the vents of the mold. A very thin film of cured resin attached to the molded part. OR Extra plastic attached to a mold along the parting line; under most conditions it would be objectionable and must be removed before the parts are acceptable.

**flash flood:** flood resulting from very heavy rainfall over short periods.

**Flash Gate:** Wide gate extending from a runner which runs parallel to an edge of a molded part along the parting line of a mold. OR Usually a long gate extending from a runner which runs parallel to an edge of a molded part along the flash or parting line of the mold.

**Flash Line:** A raised line appearing on the surface of a molding and formed at the junction of mold faces.

**Flash mold:** A mold designed to permit excess molding material to escape during closing.

**Flash or burrs:** A thin lip or protrusion beyond the body of the part that is generally caused by poor clamping force, improper mold design and/or mold damage.

**Flash Pockets:** Flash pockets provide relief areas outside the pinch-offs to limit the amount of compression for mold closing. The flash pockets are sometimes referred to as gutter or relief areas. Ideally, flash pockets will be deep enough to lessen the compression of the flash material, while providing enough surface contact to cool the flashed material.

**FLASH POINT:** The lowest temperature at which vapors from a volatile liquid will ignite on application of an ignition source under specified conditions. Flash point is a specification for some alkylates. OR The maximum temperature to which a product confined in a closed cup must be heated for the vapours emitted to ignite momentarily in the presence of a flame. OR The temperature at which a coating or solvent will ignite. OR

The temperature when vapor pressure of a substance becomes high enough to allow the air/vapor layer over the substance to be ignited. Ether and acetone have flash points below room temperature, which makes them very dangerous. OR The lowest temperature at which a flammable liquid will produce a combustible vapor that will burn in the presence of a flame, under certain prescribed conditions of test.

**Flash vaporization:** A process in which a liquid feed at a high pressure is suddenly exposed to a lower pressure, causing some vaporization to occur. The vapor product is rich in the more volatile components of the feed and the residual liquid is rich in the less volatile components.

**Flashing:** A brief sub-cure (at lower temperatures than the final cure) to drive off solvents or carriers prior to full cure. This helps prevent bubbling. See Partial cure.

**Flashing:** A fault usually in non-glossy finishes, in which patches of uneven gloss occur/appear especially at the joints or laps.

**Flashing:** This is known as 'flashing'. It's a fault in the paint which causes such patches to appear, especially at joints or laps. You'll need to repaint the surface, first cleaning it thoroughly to remove all dirt, grease and surface contaminants. Then rub down with a suitable abrasive and dust off before painting.

**Flashing off:** Terms used to describe the action of a period during which the major proportion of the volatile solvent evaporates from a paint film.

**Flashpoint:** The temperature at which solvents volatilize sufficiently to produce a flammable mixture.

**Flat:** A surface that scatters or absorbs the light falling on it so as to be substantially free from gloss or sheen (0-15 gloss on a 60-degree gloss meter). OR Another term for 'matt' and refers to paints which dry without a gloss although some low angle sheen may be apparent. OR A paint surface that scatters or absorbs the light falling on it so as to be substantially free from gloss or sheen.

**Flat Bar :** Any commercially available or manufacturable flat bar may be used as cross supports to connect chain. Occasionally, flat bar is inserted through mesh to act as a filler bar, or assembled under the mesh with the mesh welded to the flat bar.

**Flat Wire Belt :** A flat wire belt is a continuous assembly of flat wire pickets connected by a straight round connector inserted through positioned holes.

**flavin adenine dinucleotide (FAD):** a coenzyme that functions in the production of ATP.

**Flavin mononucleotide (FMN):** A coenzyme for oxidation-reduction reactions derived from the vitamin riboflavin. The electron acceptor of FMN, the isoalloxazine ring, is identical with that of FAD, but FMN lacks the adenylnucleotide component of FAD.

**flavin nucleotides:** Nucleotide coenzymes (FMN and FAD) containing riboflavin.

**flavin-linked dehydrogenases:** Dehydrogenases requiring one of the riboflavin coenzymes, FMN or FAD.

**Flavins:** Electron carriers that use riboflavin in electron-transfer reactions; FAD, FADH<sub>2</sub>, FMN, and FMNH<sub>2</sub> are flavins.

**flavone acetic acid:** A synthetic flavonoid with vascular targeting properties. Flavone acetic acid exhibits an antiproliferative effect on endothelial cells as a result of a superoxide-dependent mechanism, which induces changes in permeability of the vasculature of the tumor. This agent may stimulate tumor necrosis and promote shunting of blood flow to viable regions of the tumor, increasing their oxygenation and rendering them more susceptible to the antitumor effects of hyperthermia and ionizing radiation. Check for active clinical trials using this agent.

**flavonoid :** A member of a group of substances found in many plants and plant-based foods. Flavonoids have shown antioxidant effects.

**flavonoid tablet:** A tablet formulation of flavonoids with antioxidant and potential chemopreventive activities. Polyphenolic, soluble plant pigment flavonoids inactivate oxygen radicals, prevent lipid peroxidation, and inhibit DNA oxidation. In vitro, these agents have been shown to increase the rate of apoptosis, and inhibit cell proliferation and angiogenesis. Furthermore, flavonoids can induce conjugating enzymes, such as glutathione transferases and glucuronosyltransferases.

**flavopiridol :** A substance being studied in the treatment of several types of cancer. It stops cells from dividing and may kill cancer cells. It is a type

of cyclin-dependent kinase (CDK) inhibitor. Also called alvocidib and HMR 1275.

**flavoprotein:** An enzyme containing a flavin nucleotide as a tightly bound prosthetic group.

**Flavoproteins:** Proteins tightly associated with FAD or FMN; flavoproteins play important roles in many oxidation-reduction reactions.

**flecainide :** A drug used to treat abnormal heart rhythms. It may also relieve neuropathic pain, the burning, stabbing, or stinging pain that may arise from damage to nerves caused by some types of cancer or cancer treatment.

**Flector Patch:** (Other name for: diclofenac epolamine patch)

**Fleet Phospho-soda:** (Other name for: sodium biphosphate/sodium phosphate oral laxative)

**Fletton:** A common type of brick usually of pink and yellow colour having sharp edges and deep frog.

**Flexeril:** (Other name for: cyclobenzaprine hydrochloride)

**Flexiban:** (Other name for: cyclobenzaprine hydrochloride)

**FLEXIBILITY:** Ability of a coating to expand and contract during temperature changes. OR The property of a material that will permit its being bent or twisted without breaking.

**Flexible Molds:** Molds made of rubber or elastomeric plastics used for casting plastics. They can be stretched to remove cured pieces with undercuts.

**Flexural Modulus:** The ratio, within the elastic limit, of the applied stress on a test specimen in flexure to the corresponding strain in the outermost fibers of the specimen. Or a measure of the strain imposed in the outermost fibers of a bent specimen. Or Ratio of applied stress to strain in outer fibers of a plastic specimen during flexure. or The ratio, within the elastic limit, of the applied stress on a test specimen in flexure to the corresponding strain in the outermost elements of the specimen.

**Flexural Strength:** The strength of a material in bending, expressed as the tensile stress of the outermost fibers of a bent test specimen at the instant of failure. Or the strength of a material in bending, expressed as the tensile stress of the outermost fibers of a bent test specimen at the instant of failure. Or Ability of a material to flex without permanent distortion or breaking.

**Flexural Strength, Yield:** The measure of resistance of the material to fracture during bending.

**Flig:** A bacterial flagellar protein that is part of the MS (membrane and supramembrane) ring; flig, in combination with flagellar proteins motA/motB, forms a proton channel that drives the rotation of the flagellum.

**FLIGHT:** In an extruder, it is the helical metal left after machining the screw channels. The screw flight diameter is the barrel inside diameter minus a specified flight clearance to allow the screw to fit into the barrel. A rule of thumb is 0.001 inch (25 microns) of radial clearance for every inch (25 mm) of barrel diameter.

**Flights (Lifts, Cleats) :** Devices attached across the width of the belt at prescribed intervals to prevent the product from sliding on the inclines and declines. These may be fabricated from woven wire spirals and formed or unformed sheet metal.

**Flint:** A glass color which is transparent and clear.

**Flip Top:** A two-piece closure system where both pieces are typically attached by a living hinge. One half provides the threads for attachment to a bottle, tube or jar and an orifice for dispensing the product while the other half provides the closure mechanism, usually a pintel that snaps audibly into the orifice.

**Flip-up :** Conditions due to high tension. The outside edge of the belt raises up off of the belt supports. The belt may get caught between the drum and inside belt support.

**Flip-up Detection :** Electrical or mechanical/electrical device(s) that detect a Reverse Christmas Tree or edge flip-up condition.

**Float:** A plasterers trowel made of wood or metal and used to apply the second coat of plaster in a three coat system. Hence to apply this coat is called 'to float' see 'plastering'.

**floatation:** the process of removing finely divided particles from a liquid suspension by agitating the liquid with gas bubbles thus increasing the buoyancy of the particles, and concentrating them at the surface of the liquid medium.

**Floating:** A defect apparent in a dried paint coat in which streaks or patches of a different shade or colour can be seen especially along edges or

mouldings. OR Separation of pigment colors on the surface of applied paint.

**Floating matter:** Matter which passes through a 2000 micron sieve and separates by flotation for an hour.

**Floc:** Clumps of bacteria and particulate impurities or coagulants that have come together and formed a cluster. Found in aeration tanks and secondary clarifiers. OR a very fine, fluffy mass formed by the aggregation of fine suspended particles.

**Flocculant :** Flocculation is the second step in separation process, where impurities in the water are collected to larger flocculated particles with the aid of flocculant. The flocculant in the water treatment is usually a charged polymer with very high molecular weight. In the flocculation the coagulated particles are bound together and even larger flocculated particles are formed with the aid of polymers. The large particles are then separated from the water with suitable separation process like clarification, flotation or filtration. See also “Coagulant.”

**Flocculation:** The process of forming floc particles when a chemical coagulant or flocculent such as alum or ferric chloride is added to the wastewater. OR the process of separating suspended solids from wastewater by chemical creation of a coagulated, or flocculent masses. OR The process by which small particles in a dispersion slowly aggregate (or coalesce) to form flocs.

**Flocking:** A method of coating by spraying finely dispersed powders or fibers.

**Flomax:** (Other name for: tamsulosin hydrochloride) OR A drug used to treat urinary problems caused by an enlarged prostate. Flomax relaxes the muscles of the prostate and bladder, which helps the flow of urine. It is a type of alpha blocker. Also called tamsulosin and tamsulosin hydrochloride.

**Flonase:** (Other name for: fluticasone propionate)

**flood currents:** tidal currents preceding high tide.

**flood plain:** the area along the banks of a meandering river that are prone to flooding at various times.

**floodplain:** the area created on both sides of a stream when periodic flooding deposits mud and silt over extensive, low-lying areas.

**Florafur:** (Other name for: tegafur)

**Florinef:** (Other name for: fludrocortisone acetate)

**Flotation:** During drying one or more of the pigments in a paint separates or floats apart from the others and concentrates in streaks or patches producing a variegate effect.

**Flovent:** (Other name for: fluticasone propionate)

**Flow:** The extent to which a paint is able to level out after application. Gloss paints usually have good flow resulting in a smooth finish free from brushmarks. OR The ability of a coating to level out and spread into a smooth film, paints that have a good flow usually level out uniformly and exhibit few brush or roller marks. OR a mass-wasting movement in which the mass moves downslope like a viscous fluid. OR Another word for move. It is often used to describe the movement of lava. OR A qualitative description of the fluidity of a plastic material during the process of molding. Or The movement of a resinous material, thermosetting or thermoplastic, under pressure, to fill all parts of a closed mould. Or The ability of heated plastic or uncured rubber to travel in the mold and runner systems during the molding process or The ability of the molten resin to move or travel during injection. Flow can be influenced by temperature, part design, process conditions and tool design. Or A qualitative description of the fluidity of a plastic material during the process of molding. OR The ability of the molten resin to move or travel during injection. Flow can be influenced by temperature, part design, process conditions and tool design.

**Flow Balancing:** Flow balancing is the process of choosing a mould design strategy, which promotes even filling of mould. First, a gating strategy is selected which will promote ease of filling. Second, a runner layout is developed to feed material to the gates. Finally runner dimensions are identified which will cause all of the flow paths to fill at the same time. Even wall thickness can be manipulated by flow leader or flow deflectors. or Modifying flow paths, particularly runner sections, so that all flow paths within a mold fill in equal time with equal pressure.

**flow chart :** A diagram that shows the order of steps in a complex process. Also called flow sheet.

**flow cytometry :** A method of measuring the number of cells in a sample, the percentage of live cells in a sample, and certain characteristics of cells, such as size, shape, and the presence of tumor markers on the cell surface. The cells are stained with a light-sensitive dye, placed in a fluid, and passed

in a stream before a laser or other type of light. The measurements are based on how the light-sensitive dye reacts to the light.

**Flow equalization system:** A device or tank designed to hold back or store a portion of peak flows for release during low-flow periods.

**flow law:** In glaciology, a constitutive relation for the analysis of three-dimensional deformation states of ice subjected to stress.

**Flow Leader:** A small area in the mold (usually no more than 0.200" to 0.300" wide) which locally thickens the wall to allow material to flow into outer areas more smoothly. A molders "trick" to get a few more inches of flow from the material. Usually not designed in the initial stage of tool construction. Use should be based on experience or qualified molder inputs. Also known as a flow rib.

**Flow Line:** A mark on a molded piece made by the meeting of two flow fronts during molding. Also called weld line. Or Marks visible on the finished items that indicate the direction of the flow of the melt into the mold.

**FLOW LINES OR STREAKS:** Flow lines or streaks in the machine direction are visual defects in the form of continuous lines or streaks, which occur in the same axial location. They may appear and be very persistent after a change in material, screw or die.

**Flow marks:** Visible indications on the finished part that show the flow of plastic within the mold prior to solidification. Or Wavy surface appearance of an object silicone molded caused by improper flow of the liquid silicone rubber or plastic into the mold. A mark made by the freezing-in of a visible flow pattern or A wavy pattern or discoloration caused by a slow injection speed which allows the material to cool too quickly. Or Wavy surface appearance on a molded object caused by improper flow of the material into the mold. See SPLAY MARKS. Or Wavy surface appearances on a molded part caused by improper flow of the melt into the mold.

**Flow path:** A flow path describes the route that is traveled by a melt front as melt fills a section of a mould.

**Flow Pattern :** The contour the melt takes sequentially as it fills the cavity. or The contour the melt takes sequentially as it fills the cavity. The mold should fill with a straight flow front with no changes in direction

throughout filling. Mold-filling analysis software can be used to predict these flow patterns.

**Flow Rate:** The volume of plastic compound passing a fixed point per unit time. OR The ASTM condition of 190°C and a load of 21.6 Kg used for determining the rate of flow of molten HDPE resins through a standard orifice. Also known as High Load Melt Index. OR the volume of material passing a fixed point per unit time. OR Flow rate is a way of describing how much material goes through or past a specific point in a fixed period of time. If nozzle tip is used as reference, flow rate can be described how much melt is flowing out of the machine per second during injection.

**Flow Restrictor:** A small area in the mold which usually thins the wall to stall the flow of resin to select areas of the mold. Used to steer the material in another direction

**flow sheet :** A diagram that shows the order of steps in a complex process. Also called flow chart.

**Flowability:** A measure of the freedom with which a powder flows through tubes and orifices such as those encountered in unit operations.

**Flowed-in gasket:** A gasket formed by a liquid material (vinyl or latex) poured (or flowed) directly into a gasket groove and cured in place, usually by baking; i.e. plastisol.

**flowing artesian well:** a well that taps an aquifer under confining pressure that is sufficient to force the water to rise naturally to the surface through the well.

**flowrate:** usually expressed as liters/minute (gallons/minute) or liters/day. Design flowrate is that used to size the wastewater treatment process. Peak flowrate is 1.5 to 2.5 times design and relates to the hydraulic flow limit and is specified for each plant.

**floxuridine:** A fluorinated pyrimidine monophosphate analogue of 5-fluoro-2'-deoxyuridine-5'-phosphate (FUDR-MP) with antineoplastic activity. As an antimetabolite, floxuridine inhibits thymidylate synthetase, resulting in disruption of DNA synthesis and cytotoxicity. This agent is also metabolized to fluorouracil and other metabolites that can be incorporated into RNA and inhibit the utilization of preformed uracil in RNA synthesis. or A drug used in the treatment of cancer. It is a type of antimetabolite.

**FLT3/CDK4/6 inhibitor FLX925:** An orally available inhibitor of FMS-related tyrosine kinase 3 (FLT3, STK1, or FLK2) and the cyclin-dependent kinases 4 (CDK4) and 6 (CDK6), with potential antineoplastic activity. Upon administration, FLT3/CDK4/6 inhibitor FLX925 specifically binds to and inhibits FLT3, which interferes with the activation of FLT3-mediated signal transduction pathways and reduces cell proliferation in cancer cells that overexpress FLT3. In addition FLX925 inhibits CDK4 and 6 and prevents the phosphorylation of retinoblastoma (Rb) protein in early G1 phase. Inhibition of Rb phosphorylation prevents CDK-mediated G1-S phase transition, which causes G1 phase cell cycle arrest, suppresses DNA synthesis and inhibits cancer cell growth. FLT3, a class III tyrosine kinase receptor, is overexpressed in a variety of cancers. Overexpression of CDK4/6, which is seen in certain types of cancer, causes cell cycle deregulation.

**FLT3/KIT kinase inhibitor AKN-028:** An orally bioavailable protein tyrosine kinase inhibitor for FMS-related tyrosine kinase 3 (FLT3; STK1) and stem cell factor receptor (SCFR; KIT), with potential antineoplastic activity. FLT3/KIT kinase inhibitor AKN-028 binds to and inhibits both the wild-type and mutated forms of FLT3 and SCFR. This may result in an inhibition of tumor cell proliferation in cancer cell types that overexpress these receptor tyrosine kinases.

**flt3L:** A drug that increases the number of immune cells and may stimulate the immune system to kill cancer cells.

**flu matrix peptide p58-66:** A short chain synthetic antigenic peptide (GILGFVFTL) derived from the influenza virus A matrix protein and presented by HLA-A2 major histocompatibility complex (MHC) class I molecules. Flu matrix peptide p58-66 stimulates the lytic functions of cytotoxic T lymphocytes (CTLs), which may result in the eradication of virus-infected or malignant tumor cells.

**Fluarix:** (Other name for: trivalent influenza vaccine)

**Flublok:** (Other name for: trivalent influenza vaccine)

**fluciclatide F 18:** A radiopharmaceutical compound of a small synthetic cyclic peptide containing an RGD-sequence (Arg-Gly-Asp) labeled with the positron-emitting isotope fluorine F 18 that may be used to selectively image tumor cells and tumor vasculature by PET imaging. The RGD motif of fluciclatide F 18 selectively binds to the alphaVbeta3 integrin receptor,

commonly upregulated on the surfaces of tumor cells and endothelial cells of tumor vasculature. This agent may be of use in visualizing and quantifying the development of tumor vascularity in response to antiangiogenic agents.

**fluconazole:** A synthetic triazole with antifungal activity. Fluconazole preferentially inhibits fungal cytochrome P-450 sterol C-14 alpha-demethylation, resulting in the accumulation of fungal 14 alpha-methyl sterols, the loss of normal fungal sterols, and fungistatic activity. Mammalian cell demethylation is much less sensitive to fluconazole inhibition. Check for active clinical trials using this agent. or A drug that treats infections caused by fungi.

**flucytosine:** A pyrimidine compound and a fluorinated cytosine analog exhibiting antifungal activity. After penetration into the fungal cells, flucytosine is deaminated to its active metabolite 5-fluorouracil. 5-fluorouracil replaces uracil during fungal RNA synthesis, thereby inhibiting fungal protein synthesis. In addition, fluorouracil is further metabolized to 5-fluorodeoxyuridylic acid monophosphate, which inhibits thymidylate synthetase, thereby interrupting nucleotide metabolism, DNA synthesis and ultimately protein synthesis. or A drug that treats infections caused by fungi.

**Fludara :** A drug used to treat B-cell chronic lymphocytic leukemia (CLL) that has not responded to treatment with other anticancer drugs or that has gotten worse. It is also being studied in the treatment of other types of cancer. Fludara blocks cells from making DNA and may kill cancer cells. It is a type of purine antagonist and a type of ribonucleotide reductase inhibitor. Also called fludarabine phosphate.

**fludarabine :** The active ingredient in a drug used to treat B-cell chronic lymphocytic leukemia (CLL) that has not responded to treatment with other anticancer drugs or that has gotten worse. Fludarabine blocks cells from making DNA and may kill cancer cells. It is a type of purine antagonist and a type of ribonucleotide reductase inhibitor.

**fludarabine phosphate:** The phosphate salt of a fluorinated nucleotide antimetabolite analog of the antiviral agent vidarabine (ara-A) with antineoplastic activity. Fludarabine phosphate is rapidly dephosphorylated to 2-fluoro-ara-A and then phosphorylated intracellularly by deoxycytidine kinase to the active triphosphate, 2-fluoro-ara-ATP. This metabolite may

inhibit DNA polymerase alpha, ribonucleotide reductase and DNA primase, thereby interrupting DNA synthesis and inhibiting tumor cell growth. Check for active clinical trials using this agent. or A drug used to treat B-cell chronic lymphocytic leukemia (CLL) that has not responded to treatment with other anticancer drugs or that has gotten worse. It is also being studied in the treatment of other types of cancer. Fludarabine phosphate blocks cells from making DNA and may kill cancer cells. It is a type of purine antagonist and a type of ribonucleotide reductase inhibitor. Also called Fludara.

**Fludase:** (Other name for: recombinant cell-surface anchored sialidase DAS181)

**fludeoxyglucose F 18:** A positron-emitting radiopharmaceutical containing radioactive 2-deoxy-2-[18F] fluoro-D-glucose. With similar cell uptake as glucose (high in tumor cells), fludeoxyglucose F 18 is not dephosphorylated and further metabolized. Or The radioactive form of glucose used in positron emission tomography (PET), a diagnostic imaging procedure.

**fludrocortisone :** A synthetic corticosteroid. It is used to replace steroid hormones normally produced by the adrenal gland.

**fludrocortisone acetate:** The acetate salt of a synthetic fluorinated corticosteroid with antiinflammatory and antiallergic activities. As a glucocorticoid-receptor agonist, fludrocortisone binds to cytoplasmic receptors, translocates to the nucleus, and subsequently initiates the transcription of glucocorticoid-responsive genes such as lipocortins to inhibit phospholipase A2 (PLA2). Inhibition of PLA2 activity prevents the release of arachidonic acid, a precursor of eicosanoids such as prostaglandins and leukotrienes; eicosanoids are important mediators in the pro-inflammatory response mechanism. As a mineralocorticoid-receptor agonist, this agent stimulates Na<sup>+</sup> reabsorption and water retention and K<sup>+</sup> and H<sup>+</sup> secretion in the distal tubules and collecting ducts of the kidney.

**Flue gas:** see stack gas

**fluid:** a substance which yields readily to any force which tends to alter its shape; fluids possess no definite shape; the term includes both liquids and gases. OR A liquid or gas

**fluid :** A substance that flows smoothly and takes the shape of its container. Liquids and gases are fluids.

**fluid deprivation test :** A test to measure how much urine is made and how concentrated it becomes when no fluid is given to a patient for a certain amount of time. This test is used to see how well the kidneys work and to help diagnose diabetes insipidus (a condition in which a person is very thirsty and makes large amounts of urine). Also called water deprivation test.

**Fluid mosaic model:** The description of membranes as two-dimensional solutions of oriented lipids and globular proteins. OR A model describing biological membranes as a fluid lipid bilayer with embedded proteins; the bilayer exhibits both structural and functional asymmetry.

**fluid replacement therapy :** Treatment to replace fluids that are lost from the body because of surgery, injury, dehydration, disease, or other conditions.

**Fluidized Bed Coating:** A method of applying a coating of a thermoplastic resin to an article in which the heated article is immersed in a dense-phase fluidized bed of powdered resin and thereafter heated in an oven to provide a smooth, pin-hole-free coating.

**FluLaval:** (Other name for: trivalent influenza vaccine)

**flumatinib mesylate:** The orally bioavailable, mesylate salt form of the tyrosine kinase inhibitor flumatinib, with potential antineoplastic activity. Upon administration, flumatinib inhibits the wild-type forms of Bcr-Abl, platelet-derived growth factor receptor (PDGFR) and mast/stem cell growth factor receptor (SCFR; c-Kit) and forms of these proteins with certain point mutations. This results in the inhibition of both Bcr-Abl-, PDGFR- and c-Kit-mediated signal transduction pathways, and the proliferation of tumor cells in which these kinases are overexpressed. Bcr-Abl fusion protein is an abnormal, constitutively active enzyme expressed in Philadelphia chromosome positive chronic myeloid leukemia (CML), acute lymphoblastic leukemia (ALL) or acute myelogenous leukemia (AML). PDGFR, upregulated in many tumor cell types, is a receptor tyrosine kinase essential to cell migration and the development of the microvasculature. c-kit, a receptor tyrosine kinase mutated and constitutively activated in certain tumors, plays a key role in tumor cell survival, proliferation, and differentiation.

**FluMist:** (Other name for: trivalent live-attenuated influenza vaccine)

**fluocinonide cream:** A synthetic glucocorticoid and derivative of fluocinolone acetonide with anti-inflammatory and antipruritic activities. Fluocinonide binds the glucocorticoid receptor, followed by translocation of the ligand-receptor complex to the nucleus and transcription activation of genes containing glucocorticoid-responsive elements. Lipocortin-1 is one factor induced by fluocinonide that interacts and inhibits cytosolic phospholipase 2 alpha, thereby preventing phospholipase translocation to the perinuclear membrane and subsequent release and conversion of arachidonic acid to inflammatory prostaglandins. In addition, MAPK phosphatase 1 is induced, thereby preventing the triggering of the MAPK cascade resulting in pro-inflammatory effects via Jun N-terminal kinase and c-Jun. Finally, fluocinonide binds to and inhibits nuclear factor kappa-B directly, resulting in inhibition of cyclooxygenase 2 transcription and subsequent prostaglandin synthesis. Check for active clinical trials using this agent.

**fluorescein sodium injection:** An injectable form of the sodium salt of the fluorophore fluorescein. Fluorescein responds to electromagnetic radiation between the wavelengths of 465-490 nm and fluoresces, emitting light at wavelengths of 520-530 nm that can be detected visually.

**Fluorescence:** If a substance absorbs light at one wavelength and re-radiates it at another wavelength almost immediately, it is fluorescent; this is why many materials glow under ultraviolet light. If the substance keeps re-radiating light over a period of seconds, minutes, or hours, it is called phosphorescent. OR The property of giving off light at a particular wavelength (emission wavelength) when illuminated by light of a different wavelength (excitation wavelength) OR The emission of light by an excited molecule in the process of making the transition from the excited state to the ground state. OR A fluorescent substance absorbs short wavelength radiation and re-emits it as radiation with a longer wavelength in a very short time. OR Emission of light by excited molecules as they revert to the ground state. OR the emission of light (or other electromagnetic radiation of longer wavelength) by a substance as a result of absorption of other radiation. The emission continues only as long as the stimulus producing it continues and persists with a half-life of less than about 10<sup>8</sup> second.

**fluorescence imaging agent EMI-137:** A water-soluble compound composed of a 26-amino acid cyclic peptide targeting the human hepatocyte

growth factor receptor (c-MET) conjugated to a cyanine-based fluorescent dye, with potential fluorescent imaging activity. Upon administration of EMI-137, the peptide moiety specifically targets and binds to the human tyrosine kinase receptor c-Met, which is often overexpressed on cancer cells. Upon imaging, the cancer cells can be visualized.

**fluorescence in situ hybridization :** A laboratory technique used to look at genes or chromosomes in cells and tissues. Pieces of DNA that contain a fluorescent dye are made in the laboratory and added to cells or tissues on a glass slide. When these pieces of DNA bind to specific genes or areas of chromosomes on the slide, they light up when viewed under a microscope with a special light. Also called FISH.

**fluorescence in situ hybridization :** A technique used to identify the presence of specific chromosomes or chromosomal regions through hybridization (attachment) of fluorescently-labeled DNA probes to denatured chromosomal DNA. Examination through a microscope under fluorescent lighting detects the presence of the colored hybridized signal (and hence presence of the chromosome material) or absence of the hybridized signal (and hence absence of the chromosome material). Also called FISH.

**fluorescence microscopy :** The use of a special microscope to see objects that give off fluorescent light. For example, cells or tissue can be treated with a substance that contains a fluorescent dye. The dye lights up when viewed under a microscope with a special light.

**Fluorescence photobleaching recovery technique (FRAP):** A technique for measuring membrane fluidity in which a membrane component is labeled with a fluorescent molecule that is subsequently destroyed (or bleached) by an intense burst from a laser; fluidity is determined by the rate at which the bleached region fills with fluorescent molecules from adjoining regions of the membrane.

**fluorescence-guided surgery :** Surgery that uses a fluorescent substance and a special microscope to show tumor margins (edges) so that more of the tumor can be removed. The substance is given by mouth and is taken up by fast-growing cells. These cells light up when seen under a microscope with a special blue light. This may help doctors to remove as much tumor as possible without harming healthy tissue. Fluorescence-guided surgery is being studied in the treatment of certain types of brain tumors.

**fluorescent antibody SGM-101:** A near infrared-emitting fluorochrome-labeled anti-carcinoembryonic antigen (ACE; anti-CEA) monoclonal antibody, with potential diagnostic imaging activity. Upon administration, the fluorescent antibody SGM-101 binds CEA-overexpressing cancer cells. Upon fluorescence imaging, the fluorochrome can be visualized and CEA-overexpressing cancer cell can be imaged and detected. CEA, a tumor-associated antigen (TAA), is overexpressed on the surface of tumor cells. Check for active clinical trials using this agent.

**Fluorescent coating:** Paints which 'glow'™ or show greatly intensified brightness and colour when subjected to certain types of lighting usually ultra violet light. The phenomenon ceases immediately the light source is cut off.

**fluorescent cRGDY PEG-Cy5.5 C dots:** An imaging agent composed of silica-based nanoparticles labeled with a near-infrared (NIR) fluorophore, cyanine 5.5 (Cy5.5) and surrounded by polyethylene glycol (PEG) chains attached to cyclo-[Arg-Gly-Asp-Tyr] (cRGDY) peptides, with potential use as a tumor-selective fluorescent imaging agent. Upon intradermal administration of the fluorescent cRGDY PEG-Cy5.5 C dots, the cRGD moiety selectively binds to alphaVbeta3 integrin expressed on tumor cells. Upon intraoperative fluorescence imaging, alphaVbeta3-expressing tumor cells can be visualized and the degree of both tumor metastasis and sentinel lymph node (SLN) trafficking can be assessed. Integrins are transmembrane glycoproteins upregulated on proliferating tumor vessel endothelial cells and various cancer cells; their overexpression has been associated with neovascularization, differentiation, proliferation of tumor cells, metastasis and an overall poor prognosis.

**fluorescent imaging ligand OTL38:** A fluorescent imaging agent composed of a folate receptor-alpha (FRa)-targeting ligand conjugated to a fluorescent near infrared (NIR) dye, that can be used for imaging of FRa-expressing tumor cells. Upon administration, the FRa-targeting moiety of OTL38 specifically binds to FRa expressed on tumor cells thus selectively delivering the fluorescent dye to FRa-expressing tumor cells. Upon NIR imaging, tumor cells fluoresce, which allows for the visualization and identification of FRa-overexpressing tumor cells. FRa, a high-affinity folate-binding protein and a member of the folate receptor family, is overexpressed in various cancer cell types.

**Fluorescent Pigments:** By absorbing unwanted wavelengths of light and converting them into light of desired wavelengths, these colors seem to have an actual glow of their own.

**fluorescent protease-activated peptide AVB-620:** A protease-cleavable peptide linked to a fluorescent probe, with potential imaging activity. Upon intravenous infusion of the fluorescent protease-activated peptide AVB-620 before surgery, the peptide moiety of AVB-620 can be cleaved by proteases overexpressed by tumor cells. This activates the fluorescent probe and the tumor cells expressing the proteases can be detected using a fluorescence imaging system. This allows for the visualization and removal of the tumor during surgery.

**Fluorescite:** (Other name for: fluorescein sodium injection)

**fluoride :** A form of the element fluorine that helps prevent tooth decay. Fluoride may be naturally present in drinking water or may be added to it. Fluoride may also be put directly on the teeth, as a gel, toothpaste, or a rinse.

**Fluorination:** is an extra process in which a thermoplastic article (container or closure) is exposed to fluorine gas. The fluorine substitutes with some hydrogen atoms in the polymer chain creating a barrier and surface enhancement. Benefits include improved barrier properties and reduced solvent absorption and permeation.

**Fluorine:** Symbol:"F" Atomic Number:"9" Atomic Mass: 19.00amu. Fluorine is member of the halogen group. Fluorine is a very reactive, poisonous gas. It is reactive because it combines with most other elements. You can also find it in rocket fuel, uranium refining, Freon, toothpaste, and etched glass. OR The most reactive non-metallic element. A pale yellow gas which is both corrosive and poisonous, it reacts vigorously with most oxidizable substances at room temperature, and forms fluorides. It is used in the production of metallic and other fluorides, some of which are used to introduce fluorine into organic compounds, i.e., the fluorocarbons.

**fluorine 18 F fludarabine:** A radiopharmaceutical containing the purine analog fludarabine that is labeled with the radioisotope fluorine F18 with potential use as a tumor imaging agent upon positron emission tomography (PET). After intravenous administration, the fludarabine is selectively taken up by tumor cells. The radioisotope moiety is detected using PET, which allows imaging and quantification of both the biodistribution of fludarabine

and the presence of tumor cells. This could identify tumors and select patients that will likely respond to fludarabine treatment.

**fluorine F 18 4-L-fluoroglutamine (2S,4R):** A radioconjugate and glutamine analog consisting of the fluorine F 18 labeled 2S, 4R stereoisomer of 4-fluoroglutamine with potential use as a metabolic tracer for tumor imaging. Upon intravenous administration, fluorine F 18 4-L-fluoroglutamine (2S,4R) is preferentially taken up by cancer cells, possibly driven by c-Myc upregulation. Upon positron emission tomography (PET), cancer cells can be imaged. Tumor cells use the amino acid glutamine for nutritional purposes necessary for energy production and growth; as tumor cells proliferate more rapidly than normal healthy cells, glutamine uptake is higher in certain cancer cells.

**fluorine F 18 5-fluoro-2-deoxycytidine:** A radioconjugate composed of a fluorinated pyrimidine analog, linked to the radioisotope fluorine F 18 with potential imaging activity using positron emission tomography/computed tomography (PET/CT). Upon administration of fluorine F 18 5-fluoro-2-deoxycytidine ([F-18]-FdCyd), the FdCyd moiety is phosphorylated by deoxycytidine kinase to 5-fluoro-2'-deoxycytidylate (FdCMP) and deaminated by deoxycytidylate (dCMP) deaminase, an enzyme overexpressed by tumor cells, to 5-fluoro-2-deoxyuridine monophosphate (FdUMP). Eventually, FdUMP is metabolized to the triphosphate forms 5-fluoro-2'-deoxycytidine-triphosphate (FdCTP) and fluorodeoxyuridine triphosphate (FdUTP). FdCTP and FdUTP inhibit DNA methyltransferase (DNMT) and DNA methylation, and induce DNA strand breaks, respectively. FdCyd is coadministered with tetrahydrouridine (THU), an inhibitor of cytidine/deoxycytidine deaminase, which prevents FdCyd breakdown and increases its efficacy. The fluorine F 18 moiety can be imaged upon PET/CT, thereby allowing for the evaluation of the biodistribution of FdCyd and its uptake by tumor cells.

**fluorine F 18 6-fluorodopamine:** A radioconjugate consisting of 6-fluorodopamine labeled with fluorine F18 (6-[18F]FDA), with potential diagnostic activity. Upon administration, 6-[18F]FDA is taken up by presynaptic sympathetic nerve endings via the norepinephrine transporter (NET) uptake-1. Once inside, 6-[18F]FDA is rapidly converted by dopamine-beta-hydroxylase into 6-[18F]fluoronorepinephrine (6-[18F]FNE) and stored into neuronal storage vesicles. Upon positron

emission tomographic (PET) scanning of the F18, sympathetic innervated regions can be visualized, such as those in pheochromocytoma.

**fluorine F 18 alfatide II:** A radiotracer composed of a pegylated, dimeric arginine-glycine-aspartic acid (RGD) peptide (PRGD2), radiolabeled, via the chelating agent 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA), to a fluorine F 18-aluminum complex (AlF), with potential alphaVbeta3 integrin (vitronectin receptor) imaging activity using positron emission topography (PET). Upon administration, the RGD moiety of fluorine F 18 alfatide II selectively binds to alphaVbeta3 integrin. During PET, alphaVbeta3-expressing tumor cells can be visualized and the degree of tumor angiogenesis can be determined. AlphaVbeta3 integrin, a cell adhesion and signaling receptor, is upregulated in tumor vessel endothelial cells and has been associated with neovascularization, differentiation, proliferation of tumor cells, and metastasis. Pegylation provides improved drug penetration into tumors and decreases drug clearance, thereby increasing efficacy while lowering systemic toxicity.

**fluorine F 18 ara-G:** A radioconjugate composed of the guanosine analog arabinosyl guanine (Ara-G), a high-affinity substrate for both cytoplasmic deoxycytidine kinase (DCK) and mitochondrial deoxyguanosine kinase (dGK), labeled with fluorine F 18, that can potentially be used as a tracer for imaging of activated T-lymphocytes during positron emission tomography (PET). Upon administration, fluorine F 18 ara-G is taken up by and accumulates in activated T-lymphocytes with high levels of DCK and dGK. After phosphorylation by DCK and dGK, the 18F moiety can be visualized by PET imaging. Fluorine F 18 ara-G can potentially be used as an imaging agent to detect anti-tumor immune responses and to predict the therapeutic efficacy of immunotherapies. DCK and dGK, both nucleoside salvage pathway enzymes, are overexpressed in activated T-cells.

**fluorine F 18 choline:** A radioconjugate composed of choline labeled with the positron-emitting isotope fluorine F 18, with potential tumor tracer activity using positron emission tomography (PET). Fluorine F 18 fluorocholine incorporates into tumor cells through an active, carrier-mediated transport mechanism for choline and then is phosphorylated intracellularly by choline kinase, yielding a phosphoryl derivative, that is integrated into the cell membrane as part of phosphatidylcholine. Since the proliferation of cancer cells is much higher than normal cells, tumor cells

exhibit an increased rate of fluorine F 18 fluorocholine uptake and incorporation, facilitating imaging of the tumor using PET. Choline kinase, the enzyme responsible for the phosphorylation of choline, is frequently upregulated in human tumor cells. Choline is essential for the production of phosphatidylcholine, which is an important element of phospholipids in cell membranes. Check for active clinical trials using this agent.

**fluorine F 18 CP18 peptide:** A triazole containing pentapeptide labeled with the positron-emitting isotope fluorine F 18, used as a tracer for positron emitting tomography (PET) imaging. As a caspase-3 specific substrate, fluorine F 18 CP18 peptide is preferentially taken up by and accumulates in tumor cells with high caspase-3 activity. Upon PET imaging, apoptotic cells can be detected and apoptotic activity can be assessed. Caspase-3 is a cysteine protease that plays a key role in the induction of apoptosis.

**fluorine F 18 d-FMAU:** A radioconjugate comprised of the synthetic pyrimidine analogue 1-(2'-deoxy-2'-fluoro-beta-D-arabinofuranosyl)thymine (d-FMAU) labeled with the radioisotope fluorine F 18 (18F-d-FMAU), that can potentially be used as an imaging agent upon positron emission tomography (PET). Upon administration, fluorine F 18 d-FMAU is distributed and taken up by cells based on the rate of the cell's DNA synthesis. Upon PET imaging, cell proliferation in tumors can be assessed as tumor cells have a higher rate of DNA synthesis than normal, healthy cells. This agent is not catabolized and has a long half-life compared to the radioconjugate carbon C 11 thymidine.

**fluorine F 18 dabrafenib:** A radioconjugate containing dabrafenib, a tyrosine kinase inhibitor of the V600 mutated version of the B-raf (BRAF) protein and labeled with the positron-emitting isotope fluorine F 18 with potential prostate tumor imaging upon positron emission tomography (PET). Upon administration, the dabrafenib moiety of fluorine F 18 dabrafenib specifically targets and binds to the BRAF V600-mutated form, expressed on tumor cells, thereby allowing the visualization of tumor cells expressing BRAF V600 upon PET. BRAF is constitutively activated in a variety of cancers due to BRAF gene mutations. Check for active clinical trials using this agent.

**fluorine F 18 DCFBC:** A radioconjugate containing a low molecular weight tracer, DCFBC, specific for prostate-specific membrane antigen

(PSMA) and labeled with the positron-emitting isotope fluorine F 18 with potential prostate tumor imaging upon positron emission tomography (PET). Upon administration, the DCFBC moiety of fluorine F 18 DCFBC specifically targets and binds to the tumor associated antigen PSMA, thereby allowing the visualization of tumor cells expressing PSMA upon PET. PSMA is a transmembrane glycoprotein highly expressed on malignant prostate epithelial cells and vascular endothelial cells of various solid tumors. Check for active clinical trials using this agent.

**fluorine F 18 DCFPyL:** A urea-based radiotracer composed of the prostate specific membrane antigen (PSMA)-targeting agent DCFPyL and labeled with the positron-emitting isotope, fluorine F 18, that can potentially be used for positron emitting tomography (PET) imaging. Upon administration of fluorine F 18 DCFPyL, the DCFPyL moiety binds to PSMA expressed on tumor cells. The fluorine F 18 moiety facilitates PET imaging of PSMA-expressing tumor cells. PSMA, a cell-surface antigen, is abundantly present on the surface of prostate cancer cells and on the neovasculature of most solid tumors.

**fluorine F 18 EF5:** A radioconjugate consisting of EF5, a fluorinated derivative of etanidazole, conjugated to fluorine F 18, a positron emitting isotope. EF5 binds to hypoxic tissue; conjugation to Fluorine F 18 allows imaging of hypoxic regions within tumors. Or A substance being studied in positron emission tomography (PET) imaging to detect tumor hypoxia (a low level of oxygen in the tumor). This may help predict how the tumor will respond to treatment. It is a type of radiopharmaceutical. Also called 18F-EF5.

**fluorine F 18 FDHT:** A radioconjugate containing a derivative of the androgen testosterone, 16-beta-fluoro-5-alpha-dihydrotestosterone (FDHT), labeled with the radioisotope fluorine F18 (18F-FDHT), with potential use as an imaging agent for positron emission tomography (PET). Upon administration, 18F-FDHT binds to the androgen receptor (AR). Upon PET imaging, AR-expressing prostate tumor cells can be imaged and assessed. Check for active clinical trials using this agent.

**fluorine F 18 FEQA:** The anilinoquinazoline derivative FEQA radiolabeled with the positron-emitting radioisotope fluorine F 18 with epidermal growth factor receptor (EGFR) binding and radioisotopic activities. Fluorine F 18 FEQA irreversibly binds to (EGFR), allowing

imaging of EGFR-positive tumor cells with positron emission tomography (PET). or A radioactive substance being studied in positron emission tomography (PET) imaging to detect cancer and to monitor the response of some types of cancer to treatment. Fluorine F 18 FEQA attaches to the epidermal growth factor receptor (EGFR) found on the surface of some tumor cells. It is a type of radiopharmaceutical.

**fluorine F 18 fluciclovine:** A radiotracer containing a synthetic amino acid analogue of L-leucine radiolabeled with fluorine F 18 with potential diagnostic imaging use. Similar to most amino acids, fluorine F 18 fluciclovine ([18]FACBC) appears to enter cells through the energy-independent L-type amino acid transporter (LAT) system. As an amino acid analogue, this agent is preferentially accumulated by tumor cells due to their increased metabolic needs; however, unlike naturally occurring amino acids, this non-natural amino acid-analogue radiotracer is not metabolized. Accordingly, [18]FACBC accumulates in tumor cells and can potentially be used to image tumors using positron emission tomography (PET). Check for active clinical trials using this agent.

**fluorine F 18 fluoro furanyl norprogesterone:** The progesterone derivative fluoro furanyl norprogesterone (FFNP), radiolabeled with fluorine F 18, with positron-emitting radioligand activity. Upon injection, fluorine F 18 fluoro furanyl norprogesterone (F18-FFNP) binds to progesterone receptors (PgR) in progesterone-responsive tissues. In PgR-positive breast cancer, positron emission tomography (PET) may then be used to quantitate hormone receptor status. Check for active clinical trials using this agent.

**fluorine F 18 fluoro-PEG6-IPQA:** A radioconjugate containing the tracer PEG6-IPQA labeled with fluorine F 18 for potential tumor imaging using positron emission tomography (PET). Upon administration, the IPQA moiety of fluorine F 18 fluoro-PEG6-IPQA selectively targets and irreversibly binds to the constitutively active mutant L858R of epidermal growth factor receptor (EGFR) kinase, thereby allowing the visualization of tumor cells expressing the active mutant L858R EGFR using PET. This can be used to select EGFR kinase inhibitors that bind in a similar manner as this tracer and may allow individualized therapy for patients that respond well to these types of EGFR kinase inhibitors. The presence of the L858R EGFR mutation in non-small cell lung cancer (NSCLC) cells is correlated

with a better response to EGFR kinase inhibitors compared to wild-type (WT) or L858R/T790M EGFR dual-mutant. Check for active clinical trials using this agent.

**fluorine F 18 fluorobenzyl triphenyl phosphonium:** A radioconjugate and cationic lipophilic agent consisting of fluorobenzyl triphenyl phosphonium (FBnTP), labeled with the radioisotope fluorine F 18, with potential use as a tracer for both mitochondrial membrane potential (MMP) and apoptosis, and as a tumor imaging agent using positron emission tomography (PET). Upon administration, fluorine F 18 FBnTP is taken up by cells and its uptake and accumulation within mitochondria is directly correlated with MMP. Apoptosis causes a loss of membrane potential across the inner mitochondrial membrane which decreases FBnTP mitochondrial uptake. As apoptosis is suppressed in tumor cells, the FBnTP uptake is increased as compared to normal cells. This allows, upon PET, for the imaging of cancer cells. As apoptosis-inducing chemotherapeutic agents cause a collapse of MMP, this agent can also be used to assess the response of tumor cells to those chemotherapeutic agents. Check for active clinical trials using this agent.

**fluorine F 18 fluorodopa:** The amino acid analog fluorodopa (FDOPA) labeled with fluorine F 18, a positron-emitting isotope, with potential tumor tracer property. Fluorine F 18 fluorodopa is able to cross the blood-brain barrier and is taken up by brain tumor cells. As uptake is higher in tumor cells, tumors may then be imaged using positron emission tomography (PET). Assessing tumor uptake of FDOPA may be beneficial for diagnosis, localization and in determining further treatment.

**fluorine F 18 fluoroethylcholine:** Ethylcholine labeled with fluorine F 18, a positron-emitting isotope. Fluorine F 18 fluoroethylcholine incorporates into tumor cells through an active, carrier-mediated transport mechanism for choline and then is phosphorylated intracellularly by choline kinase, yielding a phosphoryl derivative, and finally is integrated into cellular phospholipids, probably primarily into a phosphatidyl derivative; concentration of this agent in tumor cells as various fluorine F 18 fluoroethylcholine derivatives enables tumor imaging using positron emission tomography (PET). Choline kinase, the enzyme responsible for the phosphorylation of choline, is frequently up-regulated in human tumor cell lines. or A radioactive substance being studied in PET imaging to

detect certain types of cancer. Fluorine F 18 fluoromethylcholine gets taken up by cells in the body and more of it is taken up by tumor cells than by normal cells. A PET scanner is used to detect which cells in the body have taken up fluorine F 18 fluoromethylcholine. It is a type of radioimaging agent. Also called 18F-choline, 18F-fluoromethylcholine, and 18F-FMCH.

**fluorine F 18 fluoropaclitaxel:** A radiotracer containing paclitaxel labeled with the radioisotope fluorine F 18 with potential use as an imaging agent. After cellular uptake, the paclitaxel moiety of fluorine F18 fluoropaclitaxel binds to tubulin. Upon uptake, the radioisotope moiety may be detected using positron emission tomography (PET), thereby allowing imaging and quantification of the biodistribution of paclitaxel. This could identify multidrug resistant (MDR) status of tumor cells and select patients that will likely respond to paclitaxel treatment. Check for active clinical trials using this agent.

**fluorine F 18 fluorothymidine:** A radioconjugate consisting of a thymidine analogue radiolabeled with fluorine F 18, a positron emitting isotope. Phosphorylated by S-phase-specific thymidine kinase 1, fluorine F 18 fluorothymidine is trapped intracellularly by entering the salvage pathway of DNA synthesis without incorporation into DNA. 18F-FLT serves a marker of tumor cell proliferation for imaging with positron emission tomography (PET); as a marker of proliferation rather than metabolism, it is more specific to tumor tissue than 2-deoxy-2-[18F] fluoro-D-glucose (18F-FDG). This agent is metabolically stable, accumulates in the normal bone marrow and the liver, and does not cross the blood-brain barrier. Check for active clinical trials using this agent.

**fluorine F 18 fluorthanatrace:** A radiotracer consisting of an analogue of the poly(ADP-ribose) polymerase 1 (PARP1) inhibitor rucaparib radiolabeled with the positron emitting isotope fluorine F 18, which can potentially be used for the imaging of PARP1 expression using positron emission tomography (PET). Upon administration, fluorine F 18 fluorthanatrace targets and binds to PARP1. Upon PET, PARP1-expressing tumor cells can be visualized. PARP1, which is overexpressed in many cancer cell types, catalyzes post-translational ADP-ribosylation of nuclear proteins and plays a key role in the repair of DNA strand breaks.

**fluorine F 18 FMDHT:** A radioconjugate containing a derivative of the androgen testosterone (FMDHT) and labeled with the radioisotope fluorine

F 18, with potential use as an imaging agent for positron emission tomography (PET). Upon administration, fluorine F 18 FMDHT binds to the androgen receptor (AR). Upon PET imaging, AR-expressing prostate tumor cells can be imaged and assessed.

**fluorine F 18 FP-R01-MG-F2:** A radiotracer composed of the integrin alphaVbeta6 (aVb6) ligand and cystine knot peptide R01 variant R01-MG-F2 radiolabeled with [18F]-fluoropropionate (F 18 FP), with potential integrin aVb6 imaging activity using positron emission tomography (PET). Upon administration, the R01-MG-F2 moiety of fluorine F 18 FP-R01-MG-F2 selectively binds to integrin aVb6-positive cancer cells. During PET, aVb6-expressing tumor cells can be visualized. Integrin aVb6, a cell adhesion and signaling receptor, is upregulated in certain cancer cell types and has been associated with increased proliferation of tumor cells. The cystine knot peptide shows high stability and allows for rapid and high uptake into aVb6-expressing tumor cells.

**fluorine F 18 galacto-RGD peptide:** A radiotracer composed of a cyclic Arg-Gly-Asp (RGD) peptide that is conjugated with galactose and radiolabeled with fluorine 18, for potential noninvasive positron emission tomography (PET) imaging of alphaVbeta3 integrin expression. Upon administration, the RGD moiety of the fluorine 18 galacto-RGD peptide selectively binds to alphaVbeta3 integrin. During PET imaging, alphaVbeta3-expressing tumor cells can be visualized and the degree of tumor angiogenesis can be determined. Use of a hydrophilic glycopeptide-based agent may increase retention in the blood and reduce clearance by the liver. This leads to both increased uptake of fluorine 18 galacto-RGD peptide by tumor cells and enhanced PET imaging efficiency, when compared to other agents that are constructed using lipophilic conjugates. AlphaVbeta3 integrin, a cell adhesion and signaling receptor, is upregulated in tumor vessel endothelial cells and has been associated with proliferation of tumor cells, tumor angiogenesis and metastasis.

**Fluorine F 18 ISO-1:** A radioconjugate consisting of the benzamide ligand ISO-1 labeled with the radioisotope fluorine F18 with positron-emitting radioisotope activity. Upon administration, fluorine [F18]ISO-1 binds to sigma-2 receptors, located on tumor cells, allowing visualization of sigma-2 receptor-expressing tumor cells with positron emission tomography (PET). Sigma-2 receptors, expressed in a variety of normal healthy tissues such as

liver, kidneys, endocrine glands, and in the central nervous system, may be overexpressed in tumor cells.

**fluorine F 18 L-glutamate derivative BAY94-9392:** A radioconjugate composed of the radionuclide fluorine F 18 conjugated to the L-glutamate derivative, (S)-4-(3-fluoropropyl)-L-glutamic acid (FSPG), targeting the cystine/glutamate transporter protein (xCT or SLC7A11), which is a subunit of the transport system xc(-), with potential imaging activity upon positron emission tomography (PET). Upon intravenous administration, the FSPG moiety of BAY94-9392 specifically binds to xCT and BAY94-9392 is subsequently taken up by the cell via xc(-). Upon uptake, xc(-) activity can be assessed and tumor cells can be detected and imaged by PET. System xc(-), a sodium-independent, heterodimeric transporter, mediates the cellular uptake of cystine in exchange for intracellular glutamate at the plasma membrane; although, it will take up glutamate as well. Xc(-) shows increased activity in certain tumor cells compared to normal, healthy cells due to increased metabolic activity in tumor cells; it plays a key role in tumor cell proliferation, progression and chemoresistance as well as in the management of oxidative stress.

**fluorine F 18 RGD-based integrin peptide-polymer AH111585:** A small synthetic peptide containing an RGD-sequence (Arg-Gly-Asp) attached to the positron-emitting isotope fluorine F 18 that may be used to selectively image tumor cells and tumor vasculature by PET imaging. The RGD motif of fluorine F 18 RGD-based integrin peptide-polymer AH111585 selectively binds to the  $\alpha$ V $\beta$ 3 integrin receptor, commonly upregulated on the surfaces of tumor cells and tumor vasculature endothelial cells. This agent may be of use in visualizing and quantifying a decrease in tumor vascularity in response to antiangiogenic agents.

**fluorine F 18 RGD-K5:** A radiotracer composed of a cyclic triazole-containing the Arg-Gly-Asp (RGD) peptide (RGD-K5) radiolabeled with fluorine F 18, with potential  $\alpha$ V $\beta$ 3 integrin imaging activity upon positron emission tomography (PET). Upon administration, the RGD moiety of fluorine F 18 RGD-K5 selectively binds to  $\alpha$ V $\beta$ 3 integrin. During PET,  $\alpha$ V $\beta$ 3-expressing tumor cells can be visualized and the degree of tumor angiogenesis can be determined.  $\alpha$ V $\beta$ 3 integrin, a cell adhesion and signaling receptor, is upregulated in tumor vessel endothelial cells and has been associated with neovascularization, differentiation,

proliferation of tumor cells, and metastasis. Check for active clinical trials using this agent.

**fluorine F 18 SKI-249380:** A radioconjugate composed of a derivative of the multi-targeted kinase inhibitor dasatinib conjugated to the radioisotope fluorine F 18, with potential imaging activity during positron emission tomography (PET). Upon administration of fluorine F 18 SKI-249380, the SKI-249380 moiety targets and binds to Bcr/Abl, SRC-family protein-tyrosine kinases, c-Kit and platelet-derived growth factor receptor (PDGFR). Upon binding, the fluorine F 18 moiety allows PET imaging of tumor cells and can be used as a tracer for the biodistribution of dasatinib. Check for active clinical trials using this agent.

**fluorine F 18 sodium fluoride:** A radiopharmaceutical consisting of the sodium salt of fluorine F 18 fluoride with radioisotopic and bone mineralizing activities. Fluoride binds to calcium ions in hydroxyapatite crystals in bone. The uptake and incorporation of positron-emitting fluorine F 18 fluoride into bone can be imaged using positron emission tomography (PET) or single-photon emission computed tomography (SPECT), allowing visualization of malignant bone lesions in which regional blood flow and bone turnover are increased.

**fluorine F 18 sodium fluoride PET :** A procedure used to find out if cancer has spread to the bone. A small amount of a radioactive substance called fluorine F 18 sodium fluoride is injected into a vein. A PET scan is then used to make detailed pictures of the bones. Bones with cancer in them take up more fluorine F18 sodium fluoride than normal bones do. Also called F 18 sodium fluoride positron emission tomography and F-18 NaF PET.

**fluorine F 18-AV-133:** A radioconjugate composed of the vesicular monoamine transporter 2 (VMAT2) targeting agent AV-133, a dihydrotetrabenazine analog, labeled with the positron-emitting isotope fluorine F 18, that can potentially be used as a tracer using positron emitting tomography (PET) imaging. Upon administration, the AV-133 moiety of fluorine F 18-AV-133 binds to VMATs expressed on monoamine neurons and pancreatic beta-cells within the islets of Langerhans. Upon PET imaging, VMAT2-expressing cells can be detected and the level of functional monoamine neurons can be assessed, which can be used in the diagnosis of neurodegenerative diseases. In addition, this radiotracer can be

used to assess the function of pancreatic beta-cells. VMAT2, a transporter that loads monoamine neurotransmitters into secretory vesicles, is expressed on biogenic amine-containing neurons in the central nervous system (CNS) and pancreatic beta cells.

**fluorine F 18-labeled S-(3-Fluoropropyl)homocysteine hydrochloride:**

The hydrochloride salt form of a radioconjugate composed of a synthetic derivative of the amino acid methionine radiolabeled with fluoride F 18, with potential use as a tumor imaging agent during positron emission tomography (PET). Upon administration, fluorine F 18-labeled S-(3-fluoropropyl) homocysteine is preferentially taken up by tumor cells through an amino acid transporter, which is overexpressed by cancer cells. Because tumor cells have a higher rate of proliferation than normal cells, these cancer cells have increased rates of protein synthesis and thus an increased demand for amino acids. This allows for visualization of tumors cells upon PET.

**Fluorocarbon:** Viton [® DuPont Dow Elastomers], Fluorel [TM, 3M Co.] Polymer designed to meet the most rigid requirements in oils, solvents, synthetic lubricants and corrosive chemicals, at elevated temperatures

**Fluorocarbon Plastics:** Plastics based on polymers made with monomers composed of fluorine and carbon only.

**Fluorofur:** (Other name for: tegafur)

**Fluoroplex:** (Other name for: topical fluorouracil) or A drug used to treat cancers of the breast, colon, rectum, stomach, and pancreas. Under the brand names Carac, Tolak, Efudex, and Fluoroplex, it is used as a cream to treat actinic keratosis (a skin condition that may become cancer). It is also used under the brand name Efudex as a cream to treat basal cell skin cancer that is superficial (not invasive) and cannot be removed by surgery. Fluoroplex is being studied in the treatment of other conditions and types of cancer. It stops cells from making DNA and may kill cancer cells. Fluoroplex is a type of antimetabolite. Also called 5-fluorouracil, 5-FU, Carac, Efudex, fluorouracil, and Tolak.

**Fluoropolymers:** Family of engineering plastics containing fluorine, characterized by high thermal stability, almost universal chemical resistance and low friction.

**fluoropyrimidine :** One of a group of substances used to treat cancer. A fluoropyrimidine is a type of antimetabolite. Examples are capecitabine,

floxuridine, and fluorouracil (5-FU).

**fluoroquinolone** : A type of drug used to prevent and treat infections.

**fluoroscope** : An x-ray machine that makes it possible to see internal organs in motion.

**fluorothymidine F 18** : A radioactive substance being studied in the diagnosis of cancer. Fluorothymidine F 18 is injected into the blood and builds up in cells that are dividing, including cancer cells. The radiation that it gives off as it decays (breaks down) helps make clear pictures of tumors during positron emission tomography (PET) scans. It is a type of radiopharmaceutical. Also called 18F-FLT and 3'-deoxy-3'-(18F) fluorothymidine.

**Fluorouracil**: An analog of thymine that inhibits the methylation of thymine to form thymidylate; fluorouracil is used in chemotherapy.

**fluorouracil** : A drug used to treat cancers of the breast, colon, rectum, stomach, and pancreas. Under the brand names Carac, Tolak, Efudex, and Fluoroplex, it is used as a cream to treat actinic keratosis (a skin condition that may become cancer). It is also used under the brand name Efudex as a cream to treat basal cell skin cancer that is superficial (not invasive) and cannot be removed by surgery. Fluorouracil is being studied in the treatment of other conditions and types of cancer. It stops cells from making DNA and may kill cancer cells. Fluorouracil is a type of antimetabolite. Also called 5-fluorouracil, 5-FU, Carac, Efudex, Fluoroplex, and Tolak.

**fluorouracil implant**: An implant containing a sustained release particle of fluorouracil, an antimetabolite fluoropyrimidine analog of the nucleoside pyrimidine, with antineoplastic activity. Upon implantation and subsequent release, fluorouracil is converted into the active metabolite 5-fluoroxymethyluridine monophosphate that competes with the pyrimidine uracil during RNA synthesis while another active metabolite, 5-fluoro-2'-deoxyuridine-5'-O-monophosphate, inhibits thymidylate synthase and thus DNA synthesis.

**fluorouracil injection**: An antimetabolite fluoropyrimidine analog of the nucleoside pyrimidine with antineoplastic activity. Fluorouracil and its metabolites possess a number of different mechanisms of action. In vivo, fluorouracil is converted to the active metabolite 5-fluoroxymethyluridine monophosphate (F-UMP); replacing uracil, F-UMP incorporates into RNA and inhibits RNA processing, thereby inhibiting cell growth. Another active

metabolite, 5-5-fluoro-2'-deoxyuridine-5'-O-monophosphate (F-dUMP), inhibits thymidylate synthase, resulting in the depletion of thymidine triphosphate (TTP), one of the four nucleotide triphosphates used in the in vivo synthesis of DNA. Other fluorouracil metabolites incorporate into both RNA and DNA; incorporation into RNA results in major effects on both RNA processing and functions.

**fluorouracil-e therapeutic implant:** An injectable collagen matrix gel containing the antimetabolite fluorouracil and the sympathicomimetic agent epinephrine with potential antineoplastic activity. After intratumoral injection, fluorouracil is converted into the active metabolite 5-fluoroxymethyluridine monophosphate that competes with uracil during RNA synthesis while another active metabolite, 5-5-fluoro-2'-deoxyuridine-5'-O-monophosphate, inhibits thymidylate synthase and, so, DNA synthesis. Epinephrine, a potent vasoconstrictor, is added to the gel to enhance penetration of fluorouracil into tumor tissue and reduce dispersion to surrounding tissues, thus enhancing the local concentration of fluorouracil. Compared to systemic administration, the intratumoral injection of fluorouracil combined with epinephrine may increase fluorouracil's chemotherapeutic efficacy while minimizing systemic toxicity.

**fluoxetine :** A drug used to treat depression. It is a type of antidepressant.

**fluoxymesterone:** A halogenated derivative of 17-alpha-methyltestosterone. Similar to testosterone, fluoxymesterone binds to and activates specific nuclear receptors, resulting in an increase in protein anabolism, a decrease in amino acid catabolism, and retention of nitrogen, potassium, and phosphorus. This agent also may competitively inhibit prolactin receptors and estrogen receptors, thereby inhibiting the growth of hormone-dependent tumor lines. Fluoxymesterone is approximately five times more potent than methyltestosterone.

**fluphenazine :** A drug that is used to treat mental and emotional disorders and is being studied in the treatment of multiple myeloma. Fluphenazine may stop tumor growth by keeping myeloma cells from dividing and causing them to die. It is a type of antipsychotic. Also called fluphenazine hydrochloride.

**fluphenazine hydrochloride:** The hydrochloride salt of fluphenazine, a phenothiazine with antipsychotic activity and potential antineoplastic activity. Fluphenazine blocks postsynaptic dopamine D2 receptors in the

limbic system, cortical system and basal ganglia, resulting a reduction of schizophrenia-associated hallucinations and delusions. In addition, as a serotonin antagonist, this agent may inhibit lymphocyte and myeloma cell proliferation by blocking 5-hydroxytryptamine type 1B (5-HT type 1B) receptors for serotonin.

**fluphenazine hydrochloride :** A drug that is used to treat mental and emotional disorders and is being studied in the treatment of multiple myeloma. Fluphenazine hydrochloride may stop tumor growth by keeping myeloma cells from dividing and causing them to die. It is a type of antipsychotic. Also called fluphenazine.

**flurbiprofen:** A derivative of propionic acid, and a phenylalkanoic acid derivative of non-steroidal antiinflammatory drugs (NSAIDs) with analgesic, antiinflammatory and antipyretic effects. Flurbiprofen non-selectively binds to and inhibits cyclooxygenase (COX). This results in a reduction of arachidonic acid conversion into prostaglandins that are involved in the regulation of pain, inflammation and fever. This NSAID also inhibits carbonic anhydrase, thereby reducing the production of hydrogen and bicarbonate ions. Upon ocular administration, flurbiprofen may reduce bicarbonate ion concentrations leading to a decrease in the production of aqueous humor, thereby lowering intraocular pressure.

**Flurizan:** (Other name for: tarenflurbil)

**Flush-panel:** Panel level with the surrounding beading or framing. Hence flush-panelled door where a single smooth unbroken surface is obtained.

**Flushield:** (Other name for: trivalent influenza vaccine)

**flutamide:** A toluidine derivative and nonsteroidal antiandrogen that is structurally related to bicalutamide and nilutamide. Flutamide and its more potent active metabolite 2-hydroxyflutamide competitively block dihydrotestosterone binding at androgen receptors, forming inactive complexes which cannot translocate into the cell nucleus. Formation of inactive receptors inhibits androgen-dependent DNA and protein synthesis, resulting in tumor cell growth arrest or transient tumor regression. or A drug used with another drug to treat certain types of prostate cancer.

Flutamide binds to proteins called androgen receptors, which are found in some prostate cancer cells, and keeps androgens (male hormones) from binding to the receptors. This blocks the ability of androgens to cause prostate cancer cells to grow. Flutamide is a type of antiandrogen.

**flutemetamol F-18:** A radiopharmaceutical containing flutemetamol, a thioflavin derivative of Pittsburgh compound B (PiB) labeled with the radioisotope fluorine F18 that can be used to detect beta-amyloid deposition upon positron emission tomography (PET). After intravenous administration of flutemetamol F 18, the flutemetamol moiety selectively accumulates in and binds to cerebral fibrillar amyloid-beta in the brain. The fluorine F18 radioisotope moiety is detected using PET, which allows imaging and quantification of amyloid-beta density. Amyloid plaque deposition is linked to cognitive decline, including Alzheimer's disease, and may be linked to chemotherapy-induced cognitive impairment (CICI).

**fluticasone propionate:** The propionate salt form of fluticasone, a synthetic trifluorinated glucocorticoid receptor agonist with antiallergic, antiinflammatory and antipruritic effects. Binding and activation of the glucocorticoid receptor results in the activation of lipocortin that in turn inhibits cytosolic phospholipase A2, which triggers cascade of reactions involved in synthesis of inflammatory mediators, such as prostaglandins and leukotrienes. Secondly, mitogen-activated protein kinase (MAPK) phosphatase 1 is induced, thereby leads to dephosphorylation and inactivation of Jun N-terminal kinase directly inhibiting c-Jun mediated transcription. Finally, transcriptional activity of nuclear factor (NF)-kappa-B is blocked, thereby inhibits the transcription of cyclooxygenase 2, which is essential for prostaglandin production.

**fluvastatin sodium:** The sodium salt of a synthetic lipid-lowering agent with potential antineoplastic activity. Fluvastatin competitively inhibits hepatic 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the conversion of HMG-CoA to mevalonate, a key step in cholesterol synthesis. This agent lowers plasma cholesterol and lipoprotein levels, and modulates immune responses through the suppression of MHC II (major histocompatibility complex II) on interferon gamma-stimulated, antigen-presenting cells such as human vascular endothelial cells. Through the inhibition of mevalonate synthesis, statins, like fluvastatin, have been shown to inhibit the production of dolichol, geranylpyrophosphate (GPP) and farnesylpyrophosphate (FPP) and the isoprenylation of the intracellular G-proteins Ras and Rho, which may result in antiangiogenic, apoptotic, and antimetastatic effects in susceptible tumor cell populations.

**Fluvirin:** (Other name for: trivalent influenza vaccine)

**fluvoxamine :** A drug used to treat obsessive-compulsive disorder. It is a type of antidepressant agent and selective serotonin reuptake inhibitor (SSRI). Also called Luvox.

**fluvoxamine maleate:** The maleate salt form of fluvoxamine, a 2-aminoethyl oxime ether of aralkylketones, with antidepressant, antiobsessive-compulsive, and antibulimic activities. Fluvoxamine blocks serotonin reuptake by inhibiting the serotonin reuptake pump of the presynaptic neuronal membrane leading to an increase of serotonin levels within the synaptic cleft. This results in facilitated serotonergic transmission and decreased serotonin turnover leading to antidepressant and antiobsessive-compulsive effects.

**Flux:** A term applied to the amount of some type of particle (neutrons, alpha particles, etc.) or energy (photons, heat, etc.) crossing a unit area per unit time. The unit of flux is the number of particles, energy, etc., per square centimeter per second. OR a material used to promote joining of metals in soldering.

**Fluzone:** (Other name for: trivalent influenza vaccine)

**fluzoparib:** An orally available inhibitor of poly (ADP-ribose) polymerase (PARP) types 1 and 2, with potential antineoplastic activity. Upon oral administration, fluzoparib inhibits PARP 1 and 2 activity, which inhibits PARP-mediated repair of damaged DNA via the base excision repair (BER) pathway, enhances the accumulation of DNA strand breaks, promotes genomic instability, and leads to an induction of apoptosis. The PARP family of proteins catalyze post-translational ADP-ribosylation of nuclear proteins, which then transduce signals to recruit other proteins to repair damaged DNA. PARP inhibition may enhance the cytotoxicity of DNA-damaging agents and may reverse tumor cell chemoresistance and radioresistance.

**FMISO:** A radioactive substance being studied as an imaging agent in head and neck cancers and other types of cancer. It binds to large molecules in tumor cells that have a low level of oxygen. Radiation given off by FMISO is detected by a PET scan. The amount of FMISO in the tumor may help decide the best treatment and help predict whether the cancer will come back after treatment. FMISO is a type of radioimaging agent. Also called 18F-fluoromisonidazole and 18F-MISO.

**FMN (flavin mononucleotide):** Riboflavin phosphate, a coenzyme of certain oxidation-reduction enzymes.

**FMS inhibitor JNJ-40346527:** A small molecule and orally available inhibitor of colony-stimulating factor-1 receptor (CSF1R; FMS) with potential antineoplastic activity. FMS tyrosine kinase inhibitor JNJ-40346527 blocks the receptor-ligand interaction between FMS and its ligand CSF1, thereby preventing autophosphorylation of FMS. As a result, unphosphorylated FMS cannot activate FMS-mediated signaling pathways, thus potentially inhibiting cell proliferation in FMS-overexpressed tumor cells. FMS, a tyrosine kinase receptor, is overexpressed in certain tumor cell types and plays an essential role in macrophage differentiation, recruitment, and activation as well as the regulation of cell proliferation.

**Fms/Trk tyrosine kinase inhibitor PLX7486:** The tosylate salt form of PLX7486, a selective inhibitor of the receptor tyrosine kinases colony-stimulating factor-1 receptor (CSF1R; fms) and neurotrophic tyrosine kinase receptor types 1, 2 and 3 (TrkA, TrkB, and TrkC, respectively) with potential antineoplastic activity. Upon administration, PLX7486 binds to and inhibits the activity of these tyrosine kinases. This inhibits Fms and Trk-mediated signaling transduction pathways that are upregulated in certain cancer cell types. This may eventually halt tumor cell proliferation in Fms and TrkA, TrkB, and/or TrkC-overexpressing tumor cells. Fms and TrkA, TrkB, and TrkC are receptor tyrosine kinases that are upregulated or mutated in a variety of tumors and promote tumor cell proliferation and survival.

**FNA biopsy :** The removal of tissue or fluid with a thin needle for examination under a microscope. Also called fine-needle aspiration biopsy.

**FNU:** see formazin nephelometric unit.

**FOAM:** A foam is a stable, or otherwise, dispersion of a gas in a liquid. OR A colloid in which bubbles of gas are suspended in a solid or liquid. Aerogel (solid smoke) and Styrafoam are examples of solid foams; whipped cream is an example of a liquid foam. OR Process for producing plastic profiles with a cellular construction. Either a chemical or gaseous blowing agent is introduced into the polymer plastic melt while the plastic melt is being prepared in the extruder barrel. As the plastic melt exits the die, it expands a predetermined amount forming a cellular wall.

**FOAM BOOSTER:** A substance which enhances the quality and/or longevity of a foam.

**Foaming:** You're using the wrong type of roller. For instance, if you use a sponge roller to apply water-based paints, air is injected into the wet paint film and the air bubbles burst, forming craters on the surface which dry unevenly. As a rule of thumb, use short pile rollers for flat surfaces, medium pile rollers for medium textures and long pile rollers for textured surfaces. After rolling, some paints, particularly solvent-based gloss, may need to be 'layed-off' with a brush to eliminate foaming. To repair a foamy surface, thoroughly clean it down to remove all dirt, grease and surface contaminants. Rub down the surfaces with wet and dry abrasion and water or a suitable solvent. Finally, rinse down and allow to dry thoroughly before repainting. If this is impractical, line the walls before repainting. OR Foaming is the process of producing a cellular plastic by using foaming agents. A foaming agent is a material mixed with or dissolved in a plastic to make it foam. It includes expanding agents that produce gas on heating – such as easily volatile solvents – or chemical blowing agents that produce gas by thermal decomposition. Weight reduction is the percent volume of a foamed part which contains gas instead of resin. To get 10% weight reduction, the mold is filled 90%, then allowed to “foam” and fill that last 10%. Since only 90% of the volume is resin, the part weighs 10% less than a solid part of the same dimensions would. High weight reductions result in reduced material properties when compared to low weight reductions.

**Foaming Agent :** Any substance which alone or in combination with other substances is capable of producing a cellular structure in a plastic mass. OR Chemicals added to plastics and rubbers that generate inert gases on heating, causing the resin to assume a cellular structure.

**FOBT:** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Guaiac FOBT and immunochemical FOBT are two types of FOBTs. Guaiac FOBT uses a chemical substance called guaiac to check for blood in the stool. Immunochemical FOBT uses an antibody to check for blood in the stool. Also called fecal occult blood test.

**focal :** In terms of cancer, limited to a specific area.

**focus:** exact site of the origin of an earthquake, below the epicenter. OR the point of origin of an earthquake.

**FOG:** Fats, Oils and Greases. A measure of the non-petroleum based fats in waste treatment. OR Liquid particles less than 40 microns in diameter that are formed by condensation of vapor in air.

**FOIL DECORATING:** Molding paper, textile, or plastic foils printed with compatible inks directly into a plastic part so that the foil is visible below the surface of the part as integral decoration.

**folate :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Folate helps to make red blood cells. It is found in whole-grain breads and cereals, liver, green vegetables, orange juice, lentils, beans, and yeast. Folate is water-soluble (can dissolve in water) and must be taken in every day. Not enough folate can cause anemia (a condition in which the number of red blood cells is below normal), diseases of the heart and blood vessels, and defects in the brain and spinal cord in a fetus. Folate is being studied with vitamin B12 in the prevention and treatment of cancer. Also called folic acid.

**folate antagonist :** A type of drug that stops cells from using folic acid to make DNA and may kill cancer cells. Certain folate antagonists are used to treat some types of cancer and inflammatory conditions, such as rheumatoid arthritis. Also called antifolate and folic acid antagonist.

**folate binding protein E39 peptide vaccine:** A cancer vaccine comprised of human leukocyte antigen (HLA) A2 restricted folate binding protein (FBP) epitope E39 (amino acids 191 to 199), with potential immunostimulatory and antineoplastic activity. Upon intradermal injection, FBP E39 peptide vaccine may induce a specific cytotoxic T-lymphocyte (CTL) response against FBP-expressing tumor cell types. FBP is a membrane-bound, tumor-associated antigen highly overexpressed in various tumor cell types, such as in breast, ovarian and endometrial cancers; E 39 is a strong immunogenic peptide.

**folate binding protein J65 peptide vaccine:** A cancer vaccine comprised of human leukocyte antigen (HLA)-A2-restricted folate binding protein (FBP) epitope J65 (9 amino acids; EIWTFSTKV), with potential immunostimulatory and antineoplastic activities. Upon intradermal injection, FBP J65 peptide vaccine may induce a specific cytotoxic T-lymphocyte (CTL) response against J65 FBP-expressing tumor cell types.

FBP is a membrane-bound, tumor-associated antigen overexpressed in various tumor types, including breast, ovarian and endometrial cancers. J65 is a strongly immunogenic peptide.

**folate receptor alpha-loaded dendritic cell vaccine:** A cell-based vaccine composed of autologous-monocyte-derived dendritic cells (DCs) loaded with five immunogenic peptide epitopes, derived from the tumor-associated antigen human folate receptor alpha (FR alpha or FOLR1), including FR30, FR56, FR76, FR113, and FR238, with potential immunomodulatory and antineoplastic activity. Ex vivo treatment of the DCs with a p38 inhibitor decreases p38-mediated signaling and enhances ERK activation. This may allow, upon intradermal administration of the multi-epitope FR alpha-loaded DC vaccine into the patient, for decreased activation and expansion of CD4<sup>+</sup> regulatory T-cells (Tregs), increased differentiation and expansion of interleukin-17 secreting T helper cells (Th17) and activation of CD8<sup>+</sup> CTLs, which induces a strong anti-tumor T-cell immune response against FR alpha-overexpressing tumor cells. FR alpha is a high-affinity folate-binding protein and a member of the folate receptor family; this receptor is overexpressed in the majority of ovarian cancers and in about approximately 50% of breast cancers.

**folate receptor-targeted epothilone BMS753493:** A folate receptor-targeting antimetabolic agent with potential antineoplastic activity. Folate receptor-targeted epothilone BMS753493 contains an epothilone moiety linked to a single folate molecule. Mediated through the folate moiety, this agent delivers the antimetabolic epothilone component into cells expressing folic acid receptors, frequently upregulated in many types of tumor cells. After ligand-receptor internalization, the epothilone moiety induces microtubule polymerization and stabilizes microtubules against depolymerization, resulting in the inhibition of mitosis and cellular proliferation. Check for active clinical trials using this agent.

**folate receptor-targeted technetium Tc 99m EC20:** A folate receptor-targeting radiopharmaceutical consisting of a folate-containing tetrapeptide chelator to which technetium Tc 99m is linked. The folate component of folate receptor-targeted technetium Tc 99m EC20 binds to folic acid receptors, which are frequently upregulated in many types of tumor cells and activated macrophages. Gamma scintigraphy may then be used to image folate receptor-positive tumors.

**folate receptor-targeted tubulysin conjugate EC1456:** An injectable targeted small molecule drug conjugate (SMDC) consisting of folate (vitamin B9) covalently linked to the potent mitotic poison and cytotoxic agent, tubulysin B hydrazide (Tub-B-H) with potential antineoplastic activity. Upon administration, the folate moiety of folate receptor-targeted tubulysin conjugate EC1456 preferentially binds to tumor cells expressing folate receptors (FR). After binding to FR, the agent is internalized by tumor cells and the Tub-B-H moiety inhibits the polymerization of tubulin into microtubules. This may lead to both cell cycle arrest and tumor cell apoptosis. FR, the membrane-bound, high-affinity receptor for folate, is overexpressed on a wide range of primary and metastatic human cancers.

**folate receptor-targeted vinca alkaloid EC0489:** A folate receptor-targeting cytotoxic drug conjugate consisting of a folate vitamin analogue linked to a vinca alkaloid microtubule destabilizing agent with potential antineoplastic activity. Mediated through its folate moiety, folate receptor-targeted Vinca alkaloid EC0489 delivers the cytotoxic vinca alkaloid moiety directly to cells expressing folic acid receptors, frequently upregulated in many types of tumor cells. After ligand-receptor internalization, the vinca alkaloid moiety binds to tubulin and disrupts microtubule assembly-disassembly dynamics, resulting in cell cycle arrest and apoptosis. The relative tumor cell specificity of this agent reduces the toxicity profile of its Vinca alkaloid moiety.

**folate receptor-targeted vinca alkaloid/mitomycin C EC0225:** A folate receptor-targeting cytotoxic agent with potential antineoplastic activity. Folate receptor-targeted vinca alkaloid/mitomycin C EC0225 contains two potent cytotoxic agents, a vinca alkaloid and mitomycin C, linked to a single folate molecule. Mediated through the folate moiety, this agent delivers the cytotoxic agents directly into cells expressing folic acid receptors, frequently upregulated in many types of tumor cells. After ligand-receptor internalization, the vinca alkaloid moiety binds to tubulin and disrupts microtubule assembly-disassembly dynamics, resulting in cell cycle arrest and apoptosis. Mitomycin C alkylates DNA, producing DNA cross-links and inhibiting DNA replication. The relative tumor cell specificity of EC0225 reduces the toxicity profiles of its cytotoxic agent moieties.

**folate-FITC:** A conjugate consisting of fluorescein isothiocyanate (FITC) conjugated with folate with potential antineoplastic activity. Folate-FITC binds to folate receptors, which are overexpressed on the surfaces of many cancer cells including kidney and ovarian cancer cells. Once bound to the cancer cell through the folate moiety of the conjugate, circulating anti-fluorescein antibodies may recognize and bind to the FITC moiety, resulting in antibody-dependent cellular cytotoxicity.

**fold:** a bend in a layered rock.

**fold and thrust belt:** a mountain-building event in which rocks are folded during tectonic stress and detached as thin layers along thrust zones, which vertically stack the layers; typically occurs on the continental side of a magmatic arc.

**folded mountain:** a mountain created by intense compressional forces that fold, fault, and metamorphose the rocks, a process that resulted in many of the world's biggest mountain belts.

**folded mountains:** mountain range formed by the collision of continental plates, causing the rock layers to be crumpled.

**Folex:** (Other name for: methotrexate)

**Folex PFS:** (Other name for: methotrexate)

**FOLFIRI :** An abbreviation for a chemotherapy combination used to treat advanced colorectal cancer that has spread. It is also being studied in the treatment of other types of cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and irinotecan hydrochloride. Also called FOLFIRI regimen.

**FOLFIRI regimen:** A chemotherapy regimen consisting of leucovorin calcium (calcium folinate), 5-fluorouracil, and irinotecan used in the treatment of advanced-stage and metastatic colorectal cancer.

**FOLFIRI regimen :** An abbreviation for a chemotherapy combination used to treat advanced colorectal cancer that has spread. It is also being studied in the treatment of other types of cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and irinotecan hydrochloride. Also called FOLFIRI.

**FOLFIRI-Avastin regimen :** A chemotherapy combination used as an initial treatment of colorectal cancer that has spread. It includes the drugs leucovorin (folinic acid), fluorouracil, irinotecan hydrochloride, and

bevacizumab. Also called FOLFIRI-bevacizumab and FOLFIRI-bevacizumab regimen.

**FOLFIRI-bevacizumab :** A chemotherapy combination used as an initial treatment of colorectal cancer that has spread. It includes the drugs leucovorin (folinic acid), fluorouracil, irinotecan hydrochloride, and bevacizumab. Also called FOLFIRI-Avastin regimen and FOLFIRI-bevacizumab regimen.

**FOLFIRI-bevacizumab regimen:** A first-line chemotherapy regimen consisting of folinic acid (leucovorin), fluorouracil, irinotecan and bevacizumab used for the treatment of advanced-stage colorectal cancer. Or A chemotherapy combination used as an initial treatment of colorectal cancer that has spread. It includes the drugs leucovorin (folinic acid), fluorouracil, irinotecan hydrochloride, and bevacizumab. Also called FOLFIRI-Avastin regimen and FOLFIRI-bevacizumab.

**FOLFIRI-cetuximab :** A chemotherapy combination used to treat a certain type of colorectal cancer that has spread to other parts of the body. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, irinotecan hydrochloride, and cetuximab. Also called FOLFIRI-cetuximab regimen.

**FOLFIRI-cetuximab regimen:** A chemoimmunotherapy regimen consisting of leucovorin (folinic acid), 5-fluorouracil, and irinotecan plus cetuximab used for the treatment of metastatic colorectal cancer that is positive for the expression of the epidermal growth factor receptor (EGFR) and the wild-type form of KRAS. or A chemotherapy combination used as an initial treatment of colorectal cancer that has spread. It includes the drugs leucovorin (folinic acid), fluorouracil, irinotecan hydrochloride, and bevacizumab. Also called FOLFIRI-Avastin regimen and FOLFIRI-bevacizumab.

**FOLFIRINOX :** An abbreviation for a chemotherapy combination used to treat pancreatic cancer that has spread to other parts of the body. It includes the drugs leucovorin calcium, fluorouracil, irinotecan hydrochloride, and oxaliplatin. Also called FOLFIRINOX regimen.

**FOLFIRINOX regimen:** A regimen consisting of leucovorin calcium, fluorouracil, irinotecan hydrochloride, and oxaliplatin used for the treatment of pancreatic cancer.

**FOLFIRINOX regimen :** An abbreviation for a chemotherapy combination used to treat pancreatic cancer that has spread to other parts of

the body. It includes the drugs leucovorin calcium, fluorouracil, irinotecan hydrochloride, and oxaliplatin. Also called FOLFIRINOX.

**FOLFOX :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens, including FOLFOX-4, FOLFOX-6, modified FOLFOX-6 (mFOLFOX-6), and FOLFOX-7. They differ in the doses and ways in which the three drugs are given. Also called FOLFOX regimen.

**FOLFOX regimen:** One of several chemotherapy regimens that include leucovorin calcium (calcium folinate), 5-fluorouracil and oxaliplatin and which may be used in the treatment of advanced-stage and metastatic colorectal cancer. FOLFOX regimens differ in agent dosing and administration schedule and include FOLFOX 4, FOLFOX 6, modified FOLFOX 6 (mFOLFOX 6) and FOLFOX 7. or An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens, including FOLFOX-4, FOLFOX-6, modified FOLFOX-6 (mFOLFOX-6), and FOLFOX-7. They differ in the doses and ways in which the three drugs are given. Also called FOLFOX.

**FOLFOX-4 :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-4 regimen.

**FOLFOX-4 regimen :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-4.

**FOLFOX-6 :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-6 regimen.

**FOLFOX-6 regimen :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-6.

**FOLFOX-7 :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-7 regimen.

**FOLFOX-7 regimen :** An abbreviation for a combination chemotherapy regimen that is used to treat colorectal cancer. It includes the drugs leucovorin calcium (folinic acid), fluorouracil, and oxaliplatin. There are several different FOLFOX regimens that differ in the doses and ways in which the three drugs are given. Also called FOLFOX-7.

**foliated texture:** layered mineral crystals in a metamorphic rock.

**foliation:** the alignment of parallel layers or bands of mineral grains in a rock subjected to prolonged differential stress and/or shearing.

**folic acid:** A collective term for pteroylglutamic acids and their oligoglutamic acid conjugates. As a natural water-soluble substance, folic acid is involved in carbon transfer reactions of amino acid metabolism, in addition to and purine and pyrimidine synthesis, and is essential for hematopoiesis and red blood cell production.

**folic acid :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Folic acid helps to make red blood cells. It is found in whole-grain breads and cereals, liver, green vegetables, orange juice, lentils, beans, and yeast. Folic acid is water-soluble (can dissolve in water) and must be taken in every day. Not enough folic acid can cause anemia (a condition in which the number of red blood cells is below normal), diseases of the heart and blood vessels, and defects in the brain and spinal cord in a fetus. Folic acid is being studied with vitamin B12 in the prevention and treatment of cancer. Also called folate.

**folic acid antagonist :** A type of drug that stops cells from using folic acid to make DNA and may kill cancer cells. Certain folic acid antagonists are used to treat some types of cancer and inflammatory conditions, such as rheumatoid arthritis. Also called antifolate and folate antagonist.

**folinic acid :** The active ingredient in a drug used to lessen the toxic effects of substances that block the action of folic acid, especially the anticancer drug methotrexate. Folinic acid is used to treat some types of anemia and is also used with fluorouracil to treat colorectal cancer. It is also being studied in the treatment of other types of cancer and other conditions. Folinic acid is a form of folic acid. It is a type of chemoprotective agent and a type of chemosensitizing agent. Also called leucovorin.

**folitixorin:** A folate-based biomodulator with potential antineoplastic activity. Folitixorin stabilizes the covalent binding of the fluorouracil metabolite 5-fluoro-2'-deoxyuridine-5'-O-monophosphate (FdUMP) to its target enzyme, thymidylate synthase, which results in inhibition of thymidylate synthase, depletion of thymidine triphosphate (TTP), a necessary constituent of DNA, and tumor cell death. Unlike leucovorin, folitixorin, as the active form of folate, does not require metabolic activation and may increase the chemotherapeutic effects of fluorouracil with lower toxicity.

**follicle :** A sac or pouch-like cavity formed by a group of cells. In the ovaries, one follicle contains one egg. In the skin, one follicle contains one hair.

**follicle-stimulating hormone :** A hormone made in the pituitary gland. In females, it acts on the ovaries to make the follicles and eggs grow. In males, it acts on the testes to make sperm. Also called follitropin and FSH.

**follicular large cell lymphoma :** A rare type of non-Hodgkin lymphoma (cancer that begins in the cells of the immune system) that is marked by enlarged lymph nodes and large cancer cells that may look cleaved (u-shaped) under the microscope. Follicular large cell lymphoma is treated as aggressive (fast-growing) lymphoma, but it sometimes recurs years later and acts like indolent (slow-growing) lymphoma.

**follicular lymphoma :** A type of B-cell non-Hodgkin lymphoma (cancer of the immune system) that is usually indolent (slow-growing). The tumor cells grow as groups to form nodules. There are several subtypes of follicular lymphoma.

**follicular mixed cell lymphoma :** An indolent (slow-growing) type of B-cell non-Hodgkin lymphoma (cancer of the lymphatic system) in which there are both small and large cancer cells.

**follicular thyroid cancer :** Cancer that forms in follicular cells in the thyroid. It grows slowly and is highly treatable.

**folliculitis :** Inflammation of a follicle (a sac or pouch-like cavity), usually a hair follicle.

**follitropin :** A hormone made in the pituitary gland. In females, it acts on the ovaries to make the follicles and eggs grow. In males, it acts on the testes to make sperm. Also called follicle-stimulating hormone and FSH.

**Follow up Pressure:** It is pressure on melt after the switch over point in the moulding process.

**follow-up :** Monitoring a person's health over time after treatment. This includes keeping track of the health of people who participate in a clinical study or clinical trial for a period of time, both during the study and after the study ends.

**follow-up care :** Care given to a patient over time after finishing treatment for a disease. Follow-up care involves regular medical checkups, which may include a physical exam, blood tests, and imaging tests. Follow-up care checks for health problems that may occur months or years after treatment ends, including the development of other types of cancer. Follow-up care is given after positive screening test results, such as a positive Pap test result. In cancer patients, one purpose of follow-up care is checking to see if the cancer has come back or has spread to other parts of the body.

**follow-up care plan :** A detailed plan for a patient's follow-up care after treatment for a disease ends. In cancer, the plan is based on the type of cancer and the treatment the patient received. A follow-up care plan may include schedules for physical exams and medical tests to see if the cancer has come back or spread to other parts of the body. Follow-up care also checks for health problems that may occur months or years after treatment ends, including other types of cancer. A follow-up care plan may also include information to help meet the emotional, social, legal, and financial needs of the patient. It may include referrals to specialists and recommendations for a healthy lifestyle, such as changes in diet and exercise and quitting smoking. Also called survivorship care plan.

**follow-up study :** A study in which individuals or populations, selected on the basis of whether they have been exposed to risk, received a specified preventive or therapeutic procedure, or possess a certain characteristic, are

followed to assess the outcome of exposure, the procedure, or effect of the characteristic, e.g., occurrence of disease (from Last, 1988).

**Follutein:** (Other name for: recombinant human chorionic gonadotropin)

**FOLOTYN:** (Other name for: pralatrexate) or A drug used in the treatment of peripheral T-cell lymphoma (a fast-growing form of non-Hodgkin lymphoma). It is also being studied in the treatment of other types of cancer. FOLOTYN may block the growth of cancer cells and cause them to die. It is a type of dihydrofolate reductase (DHFR) inhibitor. Also called pralatrexate.

**Fonatot:** (Other name for: diethylstilbestrol)

**fondaparinux :** A drug used to prevent blood clots from forming inside blood vessels in the leg. It is being studied in the prevention of blood clots in some cancer patients, including women having surgery for cancer of the reproductive tract. It is a type of anticoagulant. Also called Arixtra and fondaparinux sodium.

**fondaparinux sodium:** The sodium salt form of fondaparinux, a synthetic glucopyranoside with antithrombotic activity. Fondaparinux sodium selectively binds to antithrombin III, thereby potentiating the innate neutralization of activated factor X (Factor Xa) by antithrombin.

Neutralization of Factor Xa inhibits its activity and interrupts the blood coagulation cascade, thereby preventing thrombin formation and thrombus development. Check for active clinical trials using this agent.

**fondaparinux sodium :** A drug used to prevent blood clots from forming inside blood vessels in the leg. It is being studied in the prevention of blood clots in some cancer patients, including women having surgery for cancer of the reproductive tract. It is a type of anticoagulant. Also called Arixtra and fondaparinux.

**food additive:** Any non-nutritive substances added intentionally to food, generally in small quantities, to improve its appearance, flavour, texture or storage properties, with the exception of substances which are added to food exclusively for their nutritive properties, but including animal feed adjuncts which may result in residues in human food and components of packaging materials which may find their way into human food, and other contaminants (Vettorazzi, 1980).

**Food and Drug Administration :** An agency in the U.S. federal government whose mission is to protect public health by making sure that food, cosmetics, and nutritional supplements are safe to use and truthfully labeled. The Food and Drug Administration also makes sure that drugs, medical devices, and equipment are safe and effective, and that blood for transfusions and transplant tissue are safe. Also called FDA.

**Food and Utility Bags:** Small clear bags designed to hold a variety of small objects (e.g., bread, poultry, vegetables, etc.)

**Food chain:** Very simple pathway of nutrient flow. Ex. Carnivore > herbivore > plant . OR The sequence of transfer of matter and energy in the form of food from organism to organism in ascending or descending trophic levels (WHO, 1979). OR the transfer of food energy from producers to consumers. OR A sequence of organisms, each of which uses the next lower member of the sequence as a food source.

**Food grade:** Resins or mold release spray that are approved for use in the manufacture of parts that will contact food in their application.

**food pyramid:** a way of expressing the availability of food in an ecosystem at a successive number of trophic levels.

**food web:** A network of food chains (WHO, 1979). OR many interwoven food chains.

**Footings:** The lowest part of a wall or column standing immediately upon the foundations.

**Footprinting:** A technique used to determine the site of a protein that binds to DNA. DNA is digested in the presence or absence of the protein, and the sequence protected from digestion by the protein is identified. This sequence is the “footprint” of the protein. OR A technique for identifying the nucleic acid sequence bound by a DNA- or RNA-binding protein.

**footwall:** the block that underlies an inclined dip-slip fault.

**Forane:** (Other name for: isoflurane)

**force:** An entity that when applied to a mass causes it to accelerate. Sir Isaac Newton's Second Law of Motion states: the magnitude of a force=mass\*acceleration.

**Force Plate:** The plate that carries the plunger of force plug of a mold and guide pins and bushings. Since it is usually drilled for steam or water lines, it is also called the Steam Plate.

**Force Plug:** The portion of a mold that enters the cavity block and exerts pressure on the molding compound, designated as Top Force or Bottom Force by position in the assembly; also called Plunger or Piston.

**Force-on-Force (FOF):** Inspections designed to evaluate and improve the effectiveness of a licensee's security force and ability to defend a nuclear power plant and other nuclear facilities against a design-basis threat. An essential part of the security program instituted by the NRC, a full force-on-force inspection spans 2 weeks and includes tabletop drills and multiple simulated combat exercises between a mock commando-type adversary force and the plant's security force. For further detail, see Backgrounder on Force-on-Force Exercises at Nuclear Power Plants and Protecting Our Nation.

**Forced Dry:** Baking the paint between room temperature and 150° F to speed the drying process.

**forearc basin:** the relatively undisturbed expanse of ocean floor between an accretionary wedge and an island arc.

**forebrain:** a portion of the brain that consists of the cerebrum, thalamus, hypothalamus, and limbic system.

**foreign :** In medicine, foreign describes something that comes from outside the body. A foreign substance in the body's tissues, such as a bacterium or virus, may be recognized by the immune system as not belonging to the body. This causes an immune response. Other foreign substances in the body, such as artificial joints, are designed to not cause an immune response.

**Foreign Assignee Program:** An on-the-job training program, sponsored by the NRC for assignees from other countries, usually under bilateral information exchange arrangements with their respective regulatory organizations.

**foreland basin:** a shallow continental basin behind a magmatic arc, a result of subsidence.

**forensic:** Relating to the application of scientific knowledge to legal problems.

**Forensic science:** The application of scientific knowledge to questions of civil and criminal law

**foreset bed:** a sandy bed that composes the main body of a delta.

**foreshock:** one of the small earthquakes that may precede the main earthquake.

**foreskin :** The loose skin that covers the head of the penis.

**foretinib:** An orally bioavailable small molecule with potential antineoplastic activity. MET/VEGFR2 inhibitor GSK1363089 binds to and selectively inhibits hepatocyte growth factor (HGF) receptor c-MET and vascular endothelial growth factor receptor 2 (VEGFR2), which may result in the inhibition of tumor angiogenesis, tumor cell proliferation and metastasis. The proto-oncogene c-MET has been found to be over-expressed in a variety of cancers. VEGFR2 is found on endothelial and hematopoietic cells and mediates the development of the vasculature and hematopoietic cells through VEGF signaling. or A substance being studied in the treatment of cancer. Foretinib blocks enzymes involved in the growth and spread of tumor cells. It may also prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called MET/VEGFR-2 inhibitor GSK1363089 and XL880.

**Forfivo XL:** (Other name for: bupropion hydrochloride)

**Form FDA 1572-Statement of Investigator :** A form that must be filed by an investigator running a clinical trial to study a new drug or agent. The investigator agrees to follow the U.S. Food and Drug Administration (FDA) Code of Federal Regulations for the clinical trial. The investigator verifies that he or she has the experience and background needed to conduct the trial and that it will be done in a way that is ethical and scientifically sound. Also called 1572 form.

**formal charge:** a charge on an atom created by the loss or gain of electrons.

**Formaldehyde:** Formaldehyde is pungent-smelling gas that dissolves readily in water to form a 37% formaldehyde solution known as formalin. Formaldehyde is produced industrially by the oxidation of methanol over a metal catalyst. Formalin is used as a disinfectant and as a preservative medium for biological specimens. The main industrial application of formaldehyde, however, is in the production of urea-formaldehyde (UF), phenol-formaldehyde (PF) and melamine-formaldehyde (MF) resins for the manufacture of wood adhesives (e.g. for plywood and chipboard) and other applications. OR A colorless gas (usually employed as a solution in water)

which possesses a suffocating, pungent odor. It is derived from the oxidation of methanol or low-boiling petroleum gases such as methane, ethane, propane, and butane. It is widely used in the production of phenol formaldehyde (phenolic), urea formaldehyde (urea), and melamine formaldehyde (melamine) resins. OR A chemical used in manufacturing and chemical industries, and as a preservative by anatomists, embalmers, and pathologists. Being exposed to formaldehyde may increase the risk of developing leukemia and brain cancer.

**formation:** A reaction that forms one mole of a compound from its elements in their most stable forms. For example, the formation reaction for water is  $\text{H}_2(\text{g}) + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}(\text{l})$ .

**formazin:** a polymer suspension used as the standard for turbidity.

**formazin nephelometric unit (FNU):** an industry standard unit measurement used in the European Union, equivalent to NTU.

**formazin turbidity unit (FTU):** a measure of water turbidity equivalent, but not equal, to Jackson Turbidity Units (JTU).

**formestane:** A synthetic steroidal substance with antineoplastic activity. Formestane binds irreversibly to and inhibits the enzyme aromatase, thereby blocking the conversion of cholesterol to pregnenolone and the peripheral aromatization of androgenic precursors into estrogens.

**Forming:** A general term encompassing processes in which the shape of plastic pieces such as sheets, rods or tubes is changed to a desired configuration. OR The process whereby the current shape of a plastic is transformed to another desired configuration.

**Forming Temperature:** the temperature to which a plastic must be heated in order for it to be able to be formed.

**formoterol fumarate oral:** The orally bioavailable fumarate salt of formoterol, a long-acting, selective beta<sub>2</sub>-adrenergic receptor agonist with bronchodilating and potential anti-cachexia and anabolic activities. In addition to formoterol's bronchodilating activity, formoterol exhibits anti-cachexia activity through the inhibition of the ATP-ubiquitin-dependent proteolytic system, which may result in a decrease in protein degradation and muscle cell apoptosis. In addition, formoterol may also increase insulin-like growth factor (IGF) signaling, resulting in an increase in protein synthesis. This agent may also inhibit the calcium-dependent calpain

system, resulting in the inhibition of muscle wasting. Check for active clinical trials using this agent.

**formoterol fumarate/roxithromycin:** A combination preparation of the fumarate salt of a beta<sub>2</sub>-adrenergic receptor agonist and a macrolide antibiotic, with muscle-sparing and anti-cachexia effects. Formoterol appears to antagonize cachexia by reducing proteolysis mediated through the ubiquitin-protease pathway. Roxithromycin strongly inhibits inflammatory cytokine production and secretion from T cells and macrophages in vitro and in vivo. The combination exhibits a greater muscle sparing effect than either drug given individually at comparable doses. Check for active clinical trials using this agent.

**formula:** an expression of chemical composition, using symbols and figures. OR A shorthand way of showing the composition of a substance with the use of symbols and numerical subscripts. OR This notation tells you the number of atoms in one molecule of a compound. A formula is written with element symbols and numbers in subscript (like the "2" in CO<sub>2</sub>). The formula for salt is NaCl. The formula for water is H<sub>2</sub>O. OR tells what chemicals a compound is made up of

**Formula Mass:** The formula mass is the total atomic mass of a compound. You can determine the formula mass by adding the individual masses of each atom in the compound. The formula mass of NaCl is 58.44.

**Formula quantity:** Special nuclear material, in any combination, in a quantity of 5000 grams or more computed by the formula, grams = (grams contained U-235) + 2.5 (grams U-233 + grams plutonium). This class of material is sometimes referred to as a Category I quantity of material (see 10 CFR 70.4).

**formula unit:** One formula weight of a compound.

**formula weight:** The formula weight is the sum of the atomic weights of the atoms in an empirical formula. Formula weights are usually written in atomic mass units (u).

**FORMULATION:** A blend of a number of base chemicals and additives designed to accomplish a specific purpose. OR Studies leading to the choice of specific processes and additives to be used in the final preparation of a drug dosage form. Also, the composition of that preparation. OR 1) a combination of ingredients before processing or made into a finished product. Also used as a synonym for a material, compound. 2) a selection of

components of a product formula or mixture to provide optimum specific properties for the end-use desired.

**forodesine** : A substance being studied in the treatment of some types of leukemia and lymphoma. It is a type of purine nucleoside phosphorylase (PNP) inhibitor. Also called BCX-1777 and forodesine hydrochloride.

**forodesine hydrochloride** : A substance being studied in the treatment of some types of leukemia and lymphoma. It is a type of purine nucleoside phosphorylase (PNP) inhibitor. Also called BCX-1777 and forodesine. Or The hydrochloride salt of the synthetic high-affinity transition-state analogue forodesine. Forodesine binds preferentially to and inhibits purine nucleotide phosphorylase (PNP), resulting in the accumulation of deoxyguanosine triphosphate and the subsequent inhibition of the enzyme ribonucleoside diphosphate reductase and DNA synthesis. This agent selectively causes apoptosis in stimulated or malignant T-lymphocytes. A transition state analogue is a substrate designed to mimic the properties or the geometry of the transition state of reaction.

**Fortamet:** (Other name for: metformin hydrochloride)

**Fortaz:** (Other name for: ceftazidime sodium)

**fortified food** : A food that has extra nutrients added to it or has nutrients added that are not normally there. Examples are milk with vitamin D added and salt with iodine added.

**Fosamax:** (Other name for: alendronate sodium) or A drug used to treat certain bone conditions, such as osteoporosis and Paget disease of the bone. It is also being studied in the treatment of hypercalcemia (high levels of calcium in the blood) and bone pain caused by cancer. Fosamax slows the breakdown of bone and prevents the loss of calcium. It is a type of bisphosphonate. Also called alendronate sodium.

**fosaprepitant dimeglumine** : A drug used together with other drugs to prevent and control nausea and vomiting caused by cancer treatment. It is given in a vein. It is a type of antiemetic and a type of substance P/neurokinin 1 receptor antagonist. Also called Emend for Injection.

**fosbretabulin disodium:** The disodium salt of a water-soluble phosphate derivative of a natural stilbenoid phenol derived from the African bush willow (*Combretum caffrum*) with potential vascular disrupting and antineoplastic activities. Upon administration, the prodrug fosbretabulin is

dephosphorylated to its active metabolite, the microtubule-depolymerizing agent combretastatin A4, which binds to tubulin dimers and prevents microtubule polymerization, resulting in mitotic arrest and apoptosis in endothelial cells. In addition, this agent disrupts the engagement of the endothelial cell-specific junctional molecule vascular endothelial-cadherin (VE-cadherin) and so the activity of the VE-cadherin/ $\beta$ -catenin/Akt signaling pathway, which may result in the inhibition of endothelial cell migration and capillary tube formation. As a result of fosbretabulin's dual mechanism of action, the tumor vasculature collapses, resulting in reduced tumor blood flow and ischemic necrosis of tumor tissue.

**fosbretabulin tromethamine:** The tromethamine salt form of prodrug fosbretabulin, a water-soluble phosphate derivative of a stilbenoid phenol derived from the African bush willow (*Combretum caffrum*) with antineoplastic activities. Upon administration, fosbretabulin is dephosphorylated to its active metabolite, combretastatin A4, which targets and binds to tubulin dimers and prevents microtubule polymerization, thereby resulting in mitotic arrest and apoptosis in endothelial cells. As apoptotic endothelial cells detach from their substrata, tumor blood vessels collapse; the acute disruption of tumor blood flow may result in tumor necrosis.

**foscarnet sodium :** A drug used to treat infections with herpesviruses in people whose immune systems are weakened by AIDS. It blocks the viruses from making copies of themselves. It is a type of antiviral agent. Also called Foscavir and phosphonoformate trisodium.

**Foscavir :** A drug used to treat infections with herpesviruses in people whose immune systems are weakened by AIDS. It blocks the viruses from making copies of themselves. It is a type of antiviral agent. Also called foscarnet sodium and phosphonoformate trisodium.

**fosfomycin tromethamine:** The tromethamine salt form of fosfomycin, a synthetic broad-spectrum antibiotic. Fosfomycin tromethamine binds to and inactivates the enzyme enolpyruvyl transferase. This leads to an irreversible blockage of the condensation of uridine diphosphate-N-acetylglucosamine with p-enolpyruvate, which is one of the first steps of bacterial cell wall synthesis, thereby eventually causing cell lysis. In addition, fosfomycin tromethamine reduces the adherence of bacteria to uroepithelial cells.

Check for active clinical trials using this agent.

**fosquidone:** A water-soluble pentacyclic pyrrolloquinone analogue of mitoguadone with potential antineoplastic activity. Currently, the mechanism of action of fosquidone is unknown. In vitro studies indicate that this agent does not bind to DNA or inhibit topoisomerases.

**Fossil** : The remains of an animal or plant that have been turned into rock and preserved. They are only found in sedimentary rocks (since the changes that produce metamorphic and igneous rocks would destroy any fossils) OR the trace of a plant or animal in a sedimentary rock. OR evidence that life was present, preserved in a rock.

**fossil assemblage:** a group of different kinds of fossils that coexisted; more useful than single types of fossils in determining the age of a formation.

**Fossil Fuel:** A fossil fuel is a fuel such as coal, oil or natural gas that was formed through the decomposition of ancient plant and animal life. Fossil fuels are generally burnt to release the energy stored in the chemical bonds of the hydrocarbons. A side-effect of this combustion is the release of gases such as carbon dioxide, which has been linked to global warming through the Greenhouse Effect. Fossil fuel reserves are also finite and some of them (particularly oil reserves) are likely to run out within our lifetime. OR coal, oil, or gas derived from organic-rich rocks. OR Any hydrocarbon deposit that can be burned for heat or power, such as petroleum, coal, and natural gas.

**Fossil record** : A method of dating rocks by looking at the types of fossils that are present and matching them to samples from elsewhere. It can also help in identifying the movement of continental plates.

**fostamatinib disodium:** An orally available disodium salt of the Syk kinase inhibitor fostamatinib with potential anti-inflammatory and immunomodulating activities. Fostamatinib inhibits Syk kinase-mediated IgG Fc gamma receptor signaling, resulting in inhibition of the activation of mast cells, macrophages, and B-cells and related inflammatory responses and tissue damage. Syk kinase, widely expressed in hematopoietic cells, is a nonreceptor tyrosine kinase that is involved in coupling activated immunoreceptors to signal downstream events that mediate diverse cellular responses, including proliferation, differentiation, and phagocytosis. or A substance being studied in the treatment of cancer and certain other diseases, such as rheumatoid arthritis. It may block tumor cell signaling and

growth. It is a type of tyrosine kinase inhibitor. Also called R788 sodium and Syk kinase inhibitor R-935788.

**fostriecin:** An anti-tumor antibiotic isolated from the bacterium *Streptomyces pulveraceus*. Fostriecin inhibits topoisomerase II catalytic activity, resulting in protein-associated strand breaks and impaired DNA and RNA synthesis in various malignant cell types. This agent also inhibits serine/threonine protein phosphatase type 2A in some tumor cell types, thereby interfering with cellular proliferation and differentiation. Check for active clinical trials using this agent.

**fotemustine:** A chloroethylating nitrosourea with antineoplastic activity. Fotemustine alkylates guanine by forming chloroethyl adducts at the 6 position of guanine, resulting in N1-guanine and N3-cytosine cross linkages, inhibition of DNA synthesis, cell cycle arrest, and finally apoptosis. This agent is lipophilic and crosses the blood-brain barrier. or A substance being studied in the treatment of advanced melanoma, glioblastoma (a type of brain tumor) that has come back, and certain types of lymphoma. Fotemustine damages the cell's DNA and may kill cancer cells. It is a type of alkylating agent and a type of nitrosourea.

**founder mutation :** A gene mutation observed with high frequency in a group that is or was geographically or culturally isolated, in which one or more of the ancestors was a carrier of the mutant gene. This phenomenon is often called a founder effect.

**Fountain Effect:** The fountain effect describes how the melt front behaves during the filling of the mould. The leading melt front swells into the shape of a bubble; it behaves in much the same way as water flowing from a fountain.

**four-center interaction:** a reaction in which bonds are simultaneously formed and broken between four atoms. For example, the reaction  $A - A + B - B$  could form two  $A - B$  molecules by simultaneously forming the new bonds while breaking the old bonds.

**Fourier transform (FT):** The mathematical treatment of data in which an ensemble of sinusoidal signals are deconvoluted into individually contributing frequencies, amplitudes, and phases.

**FOURIER TRANSFORM INFRARED SPECTROSCOPY (FTIR):** In this technique infrared radiation is passed through a sample and the amount absorbed is measured as a function of wavelength. FTIR allows a wide

range of wavelengths to be scanned quickly. By comparison to known spectra the polymer can be identified and its structure can be deduced. This technique is used extensively for polymer identification purposes.

**fowlpox virus vaccine vector:** A recombinant fowlpox virus-based vaccine vector designed to express various tumor-associated peptide antigens. Strong CD8 cytotoxic T cell responses may be induced after prolonged immunization with fowlpox virus vaccines and have been associated with tumor regression. Fowlpox virus is an attractive vector because its genome is easy to manipulate and it does not multiply in human tissues.

**fowlpox-NY-ESO-1 vaccine:** A cancer vaccine consisting of a recombinant fowlpox virus vector encoding an immunogenic peptide derived from the cancer-testis antigen NY-ESO-1, an antigen found in normal testis and various tumors, including bladder, breast, hepatocellular, melanoma, and prostate cancers. Vaccination with NY-ESO-1 peptide vaccine may stimulate the host immune system to mount a humoral and cytotoxic T lymphocyte (CTL) response against tumor cells expressing NY-ESO-1 antigen, resulting in tumor cell lysis.

**FPDA:** Fluid Power Distributors Association. Freelin-Wade is a member.

**FPG Oleochemicals:** A 50:50 joint venture project between P&G Chemicals and FELDA, or the Federal Land Development Authority of Malaysia. This operation is based in Kuantan, Malaysia, and manufactures fatty alcohols, methyl esters and glycerin.

**FR901228:** A drug used to treat cutaneous T-cell lymphoma in patients who have been treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. FR901228 blocks certain enzymes, which may help kill cancer cells. It is a type of depsipeptide and a type of histone deacetylase inhibitor. Also called Istodax and romidepsin.

**fraction:** The fraction is the mixture of hydrocarbons collected between a certain range of temperatures in the fractional distillation of crude oil. OR A set of hydrocarbons with similar boiling points that is produced by the fractional distillation of crude oil.

**Fractional Distillation:** A type of distillation that separates two substances with boiling points that are very close to each other. You increase the temperature in very small amounts. OR A technique for separation of liquid mixtures by distillation that uses a tower attached to a flask

containing the mixture to perform multiple distillations. Vapor moving up the column condenses on packing material inside the column, trickles down the column, and again vaporises. The more volatile component can then be drawn off at the top of the component, while the less volatile component remains at the bottom.

**Fractional Melt:** Resin which has a melt index less than 1.0.

**FRACTIONAL MELT INDEX:** A melt flow index of less than 1.0.

**Fractionating column :** Used in the fractional distillation of crude oil. It is hotter at the bottom. Crude oil is heated to form a vapour which is then passed in at the bottom of the fractionating tower.

**Fractionation:** Separation of a mixture of hydrocarbons into fractions with different boiling point ranges by heating crude oil in a column that is cooler at the top than at the bottom - 'fractions' are removed from the column at different heights where the temperature is different. OR A way of dividing a total dose of radiation or chemotherapy into separate doses that are larger or smaller than usual.

**fracture:** a crack in a rock along which no motion has taken place. OR the uneven breaking or cracking of a mineral. OR The separation of a body, usually characterized as either brittle or ductile.

**fragment:** c One of two 50-kd polypeptide chains produced when immunoglobulin G (igg) is cleaved by the protease papain; the Fc fragment of an intact igg molecule cannot participate in antigen binding but can mediate other important biological activities, such as complement fixation.

**Fragmin:** (Other name for: dalteparin) or A drug used to prevent blood clots from forming or to treat blood clots that have formed in patients with cancer or other conditions. Fragmin is a type of anticoagulant. Also called dalteparin and dalteparin sodium.

**fragrance :** A pleasant, sweet odor.

**Frame:** Any moulding or structure surrounding a panel or opening hence door frame window frame. Also used to describe the basic structure of a building especially of timber or steel construction.

**frame shift:** A mutation caused by insertion or deletion of one or more paired nucleotides, changing the reading frame of codons during protein synthesis; the polypeptide product has a garbled amino acid sequence beginning at the mutated codon.

**frameshift mutation** : An insertion or deletion involving a number of base pairs that is not a multiple of three, which consequently disrupts the triplet reading frame of a DNA sequence. Such mutations usually lead to the creation of a premature termination (stop) codon, and result in a truncated (shorter-than-normal) protein product. OR Insertions or deletions of genetic material that lead to a shift in the translation of the reading frame. The mutation usually leads to nonfunctional proteins.

**Francium:** Symbol:"Fr" Atomic Number:"87" Atomic Mass: (223)amu. One of the alkali metal family. Francium is the heaviest of the alkali metals and is extremely rare in nature. It can be created in a lab and acts like cesium.

**frankincense tree** : A tree that belongs to the incense tree family. The tree's amber-colored resin is used in incense. The resin has anti-inflammatory effects and has been used to treat arthritis, asthma, and ulcerative colitis. It is also being studied in the treatment of brain tumors. Also called *Boswellia serrata*.

**Fraunhofer diffraction:** A laser-light scattering in which particles create radially symmetrical diffraction patterns consisting of a bright center and coaxial light and dark rings. The angle of diffraction is size dependent; smaller particles diffract at larger angles compared to larger particles. Also known as static-light scattering (SLS) or low-angle forward light scattering.

**free electron:** Electron which is not attached to a nucleus.

**free energy:** the thermodynamic quantity measuring the tendency of a reaction to proceed; also called Gibbs free energy. OR That part of the energy of a system that is available to do useful work. OR A form of energy capable of doing work under conditions of constant temperature and pressure. Also, a measure of the usable energy generated in a chemical reaction; denoted by the symbol  $G$  in thermodynamics. The change in free energy ( $\Delta G$ ) of a system undergoing transformation at constant pressure is equal to the change in enthalpy ( $\Delta H$ ) minus the product of the absolute temperature ( $T$ ) and the change in entropy ( $\Delta S$ ). OR Energy that is actually available to do useful work. A decrease in free energy accompanies any spontaneous process. Free energy does not change for systems that are at equilibrium. OR The component of the total energy of a system that can do work at constant temperature and pressure.

**Free energy of activation:** The energy required to form the transition state from the substrate of a reaction.

**free flap :** A type of surgery used to rebuild the shape of the breast after a mastectomy. A tissue flap, including blood vessels, skin, fat, and sometimes muscle, is removed from one area of the body, such as the back or abdomen. It is then reattached to the chest to form a new breast mound. The blood vessels from the tissue are reconnected to blood vessels under the arm or in the chest. A free flap is a type of breast reconstruction.

**free PSA :** The amount of the protein prostate-specific antigen (PSA) in the blood that is not attached to other proteins. It is compared with the amount of PSA in the blood that is attached to other proteins. The amount of free PSA is higher in men with benign prostatic hyperplasia (BPH). The amount of PSA attached to other proteins is higher in men with prostate cancer.

**Free Radical:** A member of the socialist party not caught by McCarthy's inquisition. Also a molecule which has an odd number of electrons. The "unpaired" electron feels lonely and wants to find a friend. If it finds something that might be willing to give it an electron it reacts very quickly with it. Molecules such as other radicals and alkenes turn out to be good things for radicals to attack. The reaction of radicals with the double bonds in alkenes is how some of us earn our living. OR an atom or group that has a single unshared electron. OR A free radical is a molecule with an odd number of electrons. Free radicals do not have a completed octet and often undergo vigorous redox reactions. Free radicals produced within cells can react with membranes, enzymes, and genetic material, damaging or even killing the cell. Free radicals have been implicated in a number of degenerative conditions, from natural aging to Alzheimer's disease.

**free radical :** A type of unstable molecule that is made during normal cell metabolism (chemical changes that take place in a cell). Free radicals can build up in cells and cause damage to other molecules, such as DNA, lipids, and proteins. This damage may increase the risk of cancer and other diseases.

**free radical scavenger :** A substance, such as an antioxidant, that helps protect cells from the damage caused by free radicals. Free radicals are unstable molecules that are made during normal cell metabolism (chemical changes that take place in a cell). They can build up in cells and cause

damage to other molecules. This damage may increase the risk of cancer and other diseases.

**Free State:** Atoms that have a valence number of zero. Look to the noble gases for a valence number of zero.

**free-energy change ( $\Delta G$ ):** The amount of free energy released (negative  $\Delta G$ ) or absorbed (positive  $\Delta G$ ) in a reaction at constant temperature and pressure.

**free-radical chain reaction:** a reaction that proceeds by a free-radical intermediate in a chain mechanism, which is a series of self-propagating, interconnected steps. (Compare with "free-radical reaction.") OR a reaction that proceeds by a free-radical intermediate in a chain mechanism—a series of self-propagating, interconnected steps.

**free-radical polymerization:** a polymerization initiated by a free radical.

**Free-radical reaction:** A chemical reaction that conceptually involves three sequential types of reactions: 1) initiation steps in which free radicals (e.g., R or Cl) are formed, 2) propagation steps in which the free radicals react with molecules to form products and other free radicals, and 3) termination steps in which free radicals combine to form molecules. OR a reaction in which a covalent bond is formed by the union of two radicals. (Compare with "free-radical chain reaction.") OR a reaction in which a covalent bond is formed by the union of two radicals.

**Freedom of Information Act (FOIA):** A Federal law that requires Federal agencies to provide, upon written request, access to records or information. Some material is exempt from FOIA, and FOIA does not apply to records that are maintained by State and local governments, or Federal contractors, grantees or private organizations or businesses. For detail, see Freedom of Information Act and Privacy Act Requests.

**Freeze off :** the temperature of the material is reduced to the point that it blocks an area it would fill if it were hotter.

**freeze-dried :** A method used to dry substances, such as food, to make them last longer. The substance is frozen and then dried in a vacuum.

**freeze-dried black raspberry bioadhesive gel:** A bioadhesive gel containing 10% freeze-dried black raspberries (FBR) with potential chemopreventive and antioxidant activities. The four main constituent black raspberry anthocyanins that contribute significantly to the chemopreventive

effects are cyanidin 3-glucoside (C3GLU), cyanidin 3-rutinoside (C3RUT), cyanidin 3-sambubioside (C3SAM) and cyanidin 3-(2(G)-xylosyl) rutinoside (C3XRUT). Upon mucosal application, the anthocyanins from the gel penetrate the oral mucosa and are able to modulate expression of certain proapoptotic and terminal differentiation genes, and reduce the expression of epithelial cyclooxygenase-2 (COX-2) protein. In addition, this gel may also reduce vascular densities in the superficial connective tissues.

**Freeze-thaw:** When water turns to ice, it expands. If some water is trapped in a crack in a piece of rock, the freezing can cause more damage to the rock. If this process is repeated many times, the rock can be broken down. This is an example of physical weathering.

**freezing:** The change of phase from a liquid into a solid.

**Freezing Point:** A temperature point when a liquid becomes a solid. The word congeal is also used to describe the process of a liquid becoming a solid. OR The temperature where a liquid or solution changes from a liquid to a solid. Clearly, one person's Freezing Point will be another's Melting Point. In a solution the freezing point will be reduced by a number that depends on the number of particles in solution OR the temperature at which a liquid changes to a solid. OR The temperature at which the vapor pressure of a liquid is equal to the vapor pressure of the corresponding solid form. The liquid and solid forms can coexist at equilibrium at the freezing point. The standard melting point is the melting point at standard pressure. OR The freezing point is the temperature at which a liquid becomes solid. It is the same value as the melting point.

**freezing point depression:** the decrease in freezing point of a solution, proportional to the concentration of solute particles. OR It can be used to identify a substance and it also shows that a liquid is not pure. It explains why salt is spread on the icy roads. Salt solution has a lower freezing point than pure water.

**freezing point depressionfp:** The freezing point of a solution is always lower than the freezing point of the pure solvent. The freezing point depression is roughly proportional to the molality of solute particles in the solution. Freezing point depression is an example of a colligative property of a solution.

**French maritime pine bark extract:** A nutritional supplement containing an extract obtained from the French maritime pine bark *Pinus pinaster*, with potential immunomodulating and antioxidant activities. The French maritime pine bark extract contains high amounts of the phytochemicals proanthocyanidins. Proanthocyanidins are able to scavenge free radicals, and therefore may inhibit cellular damage. This extract may also ameliorate the symptoms of lymphedema and improve blood flow. It might also stimulate the immune system and have antioxidant effects.

**frequency:** Number of events in a given unit of time. When describing a moving wave, means the number of peaks which would pass a stationary point in a given amount of time. OR The number of complete waves passing a point in space in a given amount of time. OR The number of cycles of a wave that move past a fixed observation point per second. The SI unit of frequency is the Hertz (Hz).

**fresolimumab:** A pan-specific, recombinant, fully human monoclonal antibody directed against human transforming growth factor (TGF) -beta 1, 2 and 3 with potential antineoplastic activity. Fresolimumab binds to and inhibits the activity of all isoforms of TGF-beta, which may result in the inhibition of tumor cell growth, angiogenesis, and migration. TGF-beta, a cytokine often over-expressed in various malignancies, may play an important role in promoting the growth, progression, and migration of tumor cells. or A substance being studied in the treatment of breast cancer that has spread to other parts of the body. It is also being studied in the treatment of other cancers and conditions. Fresolimumab binds to a protein called transforming growth factor-beta (TGF-beta), which is found on some cancer cells. Fresolimumab may help keep cancer cells from growing and prevent the growth of new blood vessels that tumors need to grow. It is a type of monoclonal antibody and a type of antiangiogenesis agent. Also called anti-TGF-beta monoclonal antibody GC1008 and GC1008.

**Friction:** Resistance to motion due to contact of surfaces.

**Friction (dynamic):** Resistance to continued motion between two surfaces; also known as sliding friction.

**Friction (static):** Resistance to initial motion between two surfaces.

**Friction Coefficient:** A number expressing the amount of frictional effect.

**Friction, Break Out:** Friction developed during initial or starting motion.

**Frictional coefficient:** A characteristic of a molecule that is proportional to the shape of the molecule. This coefficient multiplied by the velocity at which a molecule moves through a medium constitutes viscous drag, a measure of resistance to movement of the molecule.

**FRictional HEATING:** Heat generated by the friction of the chains of molecules slipping past each other or over a surface. OR Whenever a highly viscous polymer melt is forced to flow through a channel, considerable heat is generated by internal friction. The rotating screw supplies actually more than 70% of the heat required to melt a polymer in an extruder through this frictional heating mechanism. During flow through dies, the frictional heating can cause a significant local temperature increase (hot spots) and thermal degradation, with an eventual discoloration of the product, black specks, pinking, etc.

**Frieze:** In classical architecture the area between the cornice and architrave. Commonly the plain or decorated upper part of a wall immediately below the ceiling or cornice and above the border or picture rail.

**fringing reef:** a flat expanse of reef that is attached directly to shore.

**Frog:** The depression in one or both sides of a brick in order to form a key for the mortar.

**front:** the boundary between two air masses.

**frontal sinus :** A type of paranasal sinus (a hollow space in the bones around the nose). There are two, large frontal sinuses in the frontal bone, which forms the lower part of the forehead and reaches over the eye sockets and eyebrows. The frontal sinuses are lined with cells that make mucus to keep the nose from drying out.

**frost heaving:** the process by which rock and soil are lifted vertically by the formation of ice and repeated freezing and thawing.

**frost point:** dew point temperature, below 0°C.

**frost wedging:** the widening and deepening of cracks by ice, breaking off pieces and slabs of rock.

**FROSTLINE:** In the extrusion of blown film, a ring-shaped zone of frosty appearance located at the point where the resin solidifies, caused by a reduction in film temperature below the melting point of the resin.

**frozen:** Indicates that some orbitals were not included in the treatment. Usually used as "frozen-core," to indicate that the core orbitals were left uncorrelated in a correlated calculation. Sometimes (esp. in some DFT programs) it means that core orbitals were fixed as taken from calculations on isolated atoms.

**Frozen Layer / skin:** The frozen layer is a skin of solid melt that forms next to the mould surface during the filling phase of the moulding cycle.

**FRP:** Fibre reinforced plastic. A composite (see separate entry) consisting of fibre reinforcement and a polymer matrix.

**fructooligosaccharide supplement:** A supplement containing oligosaccharide fructans, with gastrointestinal (GI) protective and immunopotentiating activities. Upon oral administration of the supplement, the oligosaccharides stimulate the growth of certain GI bacteria and activate the immune system. This improves the intestinal microflora, strengthens the immune system and increases the protective function of the GI barrier. Check for active clinical trials using this agent.

**fructooligosaccharide/Lactobacillus paracasei/Lactobacillus rhamnosus/Lactobacillus acidophilus/Bifidobacterium lactis:** A synbiotic nutritional supplement containing fructooligosaccharides (FOS), which are linear chains of fructose units that are linked by beta (2-1) bonds, and probiotic cultures of *Lactobacillus paracasei* (*L. paracasei*), *L. rhamnosus*, *L. acidophilus* and *Bifidobacterium lactis* (*B. lactis*), with gastrointestinal (GI) protective and immunomodulating activities. Upon oral administration, the bacteria in this probiotic supplement help maintain adequate colonization of the GI tract and modulate the composition of the normal microflora. Upon colonization of the GI tract, the probiotic bacteria form a protective barrier that helps maintain the integrity of the epithelial barrier. This will interfere with the attachment of pathogenic bacteria and other harmful substances, prevent inflammation and improve GI function. Additionally, the reconstituted microflora may metabolize FOS, which may promote calcium mobilization into the bloodstream by maintaining a neutral pH in the lower gut.

**fruit acid :** One of a group of substances that are found in several types of fruit and in milk. They are used in skin care products to reduce wrinkles and soften the skin. Examples of fruit acids are glycolic acid, lactic acid, and citric acid. Also called AHA and alpha hydroxyl acid.

**fruit and vegetable extracts:** Extracts from fruits and vegetables that contain fiber, vitamins, minerals, and other natural substances with antioxidant, lipid-lowering, and antiproliferative properties. Used in chemoprevention therapy, these extracts may prevent the development or recurrence of cancer.

**fruquintinib:** An orally available, small molecule inhibitor of vascular endothelial growth factor receptors (VEGFRs), with potential anti-angiogenic and antineoplastic activities. Upon oral administration, fruquintinib inhibits VEGF-induced phosphorylation of VEGFRs 1, 2, and 3 which may result in the inhibition of migration, proliferation and survival of endothelial cells, microvessel formation, the inhibition of tumor cell proliferation, and tumor cell death. Expression of VEGFRs may be upregulated in a variety of tumor cell types.

**FSH:** A hormone made in the pituitary gland. In females, it acts on the ovaries to make the follicles and eggs grow. In males, it acts on the testes to make sperm. Also called follicle-stimulating hormone and follitropin.

**Ftorafur :** A substance being studied in the treatment of some types of cancer. It is a combination of tegafur and uracil. The tegafur is taken up by the cancer cells and breaks down into 5-FU, a substance that kills tumor cells. The uracil causes higher amounts of 5-FU to stay inside the cells and kill them. Ftorafur is a type of antimetabolite. Also called tegafur-uracil and UFT.

**FTU:** see formazin turbidity unit.

**FU-LV:** An abbreviation for a chemotherapy combination used to treat colorectal cancer. It is also used with radiation therapy to treat esophageal cancer and stomach cancer. It includes the drugs fluorouracil and leucovorin calcium. Also called 5-FU/LV and FU-LV regimen.

**FU-LV regimen:** A regimen consisting of fluorouracil and leucovorin, used in both the adjuvant and metastatic disease setting, for the treatment of colorectal cancer. This regimen is also combined with radiation for the treatment of gastric and esophageal cancer. Or An abbreviation for a chemotherapy combination used to treat colorectal cancer. It is also used with radiation therapy to treat esophageal cancer and stomach cancer. It includes the drugs fluorouracil and leucovorin calcium. Also called 5-FU/LV and FU-LV.

**FUDF:** (Other name for: floxuridine)

**fuel:** A material that can be burned to provide a source of energy. OR A substance that can be burned to release energy. When considering energy resources, fuels are often divided into renewable and non-renewable fuels. Renewable fuels are those which can be replaced fairly quickly (such as alcohol which is formed from fermenting sugar from fast growing sugar cane).

**Fuel assembly (fuel bundle, fuel element):** A structured group of fuel rods (long, slender, metal tubes containing pellets of fissionable material, which provide fuel for nuclear reactors). Depending on the design, each reactor vessel may have dozens of fuel assemblies (also known as fuel bundles), each of which may contain 200 or more fuel rods.

**fuel cell:** A fuel cell is a cell in which the chemical energy stored in a fuel is converted directly into electrical energy. OR A device that converts the chemical energy obtained from a redox reaction directly into electrical energy.

**Fuel Oil:** Fuel Oil is the term used to define the heavy distillate stream produced from refinery operations. It is used to fuel power stations and in ships and industry. Different fuel oil grades are classified according to their viscosity and sulphur content.

**Fuel reprocessing (recycling):** The processing of reactor fuel to separate the unused fissionable material from waste material. Reprocessing extracts isotopes from spent nuclear fuel so they can be used again as reactor fuel. Commercial reprocessing is not practiced in the U.S., although it has been practiced in the past. However, the U.S. Department of Defense oversees reprocessing programs at DOE facilities such as in Hanford, WA, and Savannah River, SC. These wastes as well as those wastes at a formerly operating commercial reprocessing facility at West Valley, NY, are not regulated by the NRC. For related information, see High-Level Waste and Waste Incidental to Reprocessing.

**Fuel rod:** A long, slender, zirconium metal tube containing pellets of fissionable material, which provide fuel for nuclear reactors. Fuel rods are assembled into bundles called fuel assemblies, which are loaded individually into the reactor core.

**Fuel temperature coefficient of reactivity:** The change in reactivity per degree of change in the temperature of nuclear fuel. The physical property of fuel pellet material (uranium-238) that causes the uranium to absorb

more neutrons away from the fission process as fuel pellet temperature increases. This acts to stabilize power reactor operations. This coefficient is also known as the Doppler coefficient.

**Fugitive:** Colouring matter which readily suffers partial or total loss of its original colour on exposure to light or weather.

**Fugitive colour:** Description of a paint or pigment which fades on exposure to light or weather.

**Fujita scale:** scale for measuring the intensity of a tornado from F0 to F5.

**fulguration :** A procedure that uses heat from an electric current to destroy abnormal tissue, such as a tumor or other lesion. It may also be used to control bleeding during surgery or after an injury. The electric current passes through an electrode that is placed on or near the tissue. The tip of the electrode is heated by the electric current to burn or destroy the tissue. Fulguration is a type of electrosurgery. Also called electrocautery, electrocoagulation, and electrofulguration.

**full blood count :** A measure of the number of red blood cells, white blood cells, and platelets in the blood. The amount of hemoglobin (substance in the blood that carries oxygen) and the hematocrit (the amount of whole blood that is made up of red blood cells) are also measured. A full blood count is used to help diagnose and monitor many conditions. Also called blood cell count, CBC, and complete blood count.

**Full coat:** As heavy or thick a coat of paint as can be applied in a single application consistent with satisfactory appearance drying etc.

**Full Port Valve:** a valve in which the resistance to flow, in the fully open position, is comparable to the equivalent length of pipe.

**Full-time equivalent (FTE):** A human resources measurement equal to one staff person working full-time for one year.

**fulranumab:** A monoclonal antibody directed against nerve growth factor (NGF) with potential analgesic activity. Upon administration, fulranumab binds to NGF, preventing its binding to and activation of the NGF receptors TrkA and p75NTR. Inhibition of the NGF pathway may prevent the perception of pain and may induce analgesia. NGF, a neurotrophic factor that plays a key role in neuropathic and inflammatory-induced pain, promotes hyperalgesia and allodynia.

**fulvestrant:** A synthetic estrogen receptor antagonist. Unlike tamoxifen (which has partial agonist effects) and the aromatase inhibitors (which reduce the estrogen available to tumor cells), fulvestrant binds competitively to estrogen receptors in breast cancer cells, resulting in estrogen receptor deformation and decreased estrogen binding. In vitro studies indicate that fulvestrant reversibly inhibits the growth of tamoxifen-resistant, estrogen-sensitive, human breast cancer cell lines. or A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. Fulvestrant blocks estrogen activity in the body and is a type of antiestrogen. Also called Faslodex and ICI 182780.

**fumagillin-derived polymer conjugate XMT-1107:** A polymeric prodrug consisting of the fumagillol-derived small molecule XMT-1191 tethered to the hydrophilic, biodegradable 70 kDa polymer poly[1-hydroxymethylethylene hydroxymethylformal] (PHF) with potential antiangiogenic and antineoplastic activities. Upon administration, fumagillin-derived polymer conjugate XMT-1107 releases XMT-1191, which may inhibit angiogenesis through the irreversible inhibition of the methionine aminopeptidase 2 (METAP2); although the exact mechanism of action has yet to be fully elucidated, this agent appears to induce cell cycle arrest in endothelial cells, inhibiting their proliferation and migration. Compared to an unconjugated fumagillin analog, XMT-1107 exhibits improved solubility and an extended half life due to its PHF backbone. METAP2, a member of the methionyl aminopeptidase family, binds two cobalt or manganese ions and protects the alpha subunit of eukaryotic initiation factor 2 (EIF2) from inhibitory phosphorylation by removing the amino-terminal methionine residue from nascent protein; this aminopeptidase may be overexpressed in a variety of tumor cell types.

**fumerole:** a vent in or near a volcano from which steam and other gases escape from molten rock below.

**fumigant:** A gaseous substance used to disinfect an object or to destroy pests.

**Functional chemical :** A functional chemical is added to achieve certain functional properties for the paper or tissue (e.g., hydrophobicity , softness, bulk, strength).

**Functional Group:** In organic chemistry, refers to specific group of atoms within a molecule that are responsible for the characteristic chemical reactions of the molecule. OR An atom or group of atoms that has similar chemical behavior, no matter what the rest of the molecule looks like. For example, the hydroxy (OH) group in all alcohols has similar reactivity, as does the thio (SH) group in all thiols. OR a set of bonded atoms that displays a specific molecular structure and chemical reactivity when bonded to a carbon atom in the place of a hydrogen atom. OR A substructure that imparts characteristic chemical behaviors to a molecule, for example, a carboxylic acid group. OR The specific atom or group of atoms that confers a particular chemical property on a biomolecule.

**functional magnetic resonance imaging :** A noninvasive tool used to observe functioning in the brain or other organs by detecting changes in chemical composition, blood flow, or both.

**Functional magnetic resonance imaging (fmri):** A brain-imaging technique that takes advantage of (1) the fact that magnetic properties of oxyhemoglobin and deoxyhemoglobin are different and can thus be distinguished and (2) the fact that, when a specific part of the brain is active, blood vessels relax and allow more blood flow. Thus, a more active part of the brain will be richer in oxyhemoglobin.

**functioning tumor :** A tumor that is found in endocrine tissue and makes hormones (chemicals that travel in the bloodstream and control the actions of other cells or organs).

**fundoscopy :** An exam that uses a magnifying lens and a light to check the fundus of the eye (back of the inside of the eye, including the retina and optic nerve). The pupils may be dilated (enlarged) with medicated eye drops so the doctor can see through the pupil to the back of the eye. Fundoscopy may be used to check for eye problems, such as glaucoma, macular degeneration, eye cancer, optic nerve problems, or eye injury. Also called funduscopy and ophthalmoscopy.

**fundus :** The larger part of a hollow organ that is farthest away from the organ's opening. The bladder, gallbladder, stomach, uterus, eye, and cavity of the middle ear all have a fundus.

**funduscopy :** An exam that uses a magnifying lens and a light to check the fundus of the eye (back of the inside of the eye, including the retina and optic nerve). The pupils may be dilated (enlarged) with medicated eye drops

so the doctor can see through the pupil to the back of the eye. Funduscopy may be used to check for eye problems, such as glaucoma, macular degeneration, eye cancer, optic nerve problems, or eye injury. Also called fundoscopy and ophthalmoscopy.

**fungating lesion :** A type of skin lesion that is marked by ulcerations (breaks on the skin or surface of an organ) and necrosis (death of living tissue) and that usually has a bad smell. This kind of lesion may occur in many types of cancer, including breast cancer, melanoma, and squamous cell carcinoma, and especially in advanced disease.

**Fungi:** Neither plants nor animals, fungi are eukaryotes (organisms whose cells have nuclei) which are incapable of making their own food by photosynthesis and survive by breaking down chemical compounds made by plants and bacteria to waste products, just like we do. OR a kingdom that includes the yeasts, molds, mildews, and mushrooms. OR Molds, mildews, yeasts, mushrooms, and puffballs, a group of organisms that lack chlorophyll and therefore are not photosynthetic. They are usually nonmobile, filamentous, and multicellular.

**fungicide:** A chemical used to kill fungi. See pesticide. OR Substances which are capable of destroying moulds and fungi. Solutions of fungicide are used in the painting trade for sterilising mould infected surfaces prior to the application of paint. Also incorporated in various types of paint to give protection against further attack.

**fungicide :** Any substance used to kill fungi (plant-like organisms that do not make chlorophyll), such as yeast and molds.

**fungicides:** A chemical that kills fungi or prevents them from growing.

**Fungizone:** (Other name for: amphotericin B deoxycholate)

**fungus :** A plant-like organism that does not make chlorophyll. Mushrooms, yeasts, and molds are examples. The plural is fungi.

**Furan Resins:** Dark colored, thermosetting resins available primarily as liquids ranging from low-viscosity polymers to thick, heavy syrups.

**Furanose:** A sugar that contains a five-membered ring as a result of intramolecular hemiacetal formation. OR A five-membered heterocyclic ring formed when a monosaccharide cyclizes to form a hemiacetal or a hemiketal; the five-membered oxygen-containing ring is similar to that of furan. OR A simple sugar containing the five-membered furan ring.

**furosemide:** An anthranilic derivative and loop diuretic with antihypertensive effect. Furosemide blocks the Na-K-Cl cotransporter (NKCC) in the luminal membrane of the thick ascending limb of the loop of Henle in the kidney, by binding to the Cl-binding site located in the cotransporter's transmembrane domain, thereby inhibiting reabsorption of sodium, chloride, potassium ions and water. This agent reduces plasma and extracellular fluid volume resulting in decreased blood pressure and cardiac output.

**fursultiamine:** A nutritional supplement and vitamin B1 derivative, with potential antineoplastic activity. Upon oral administration, fursultiamine inhibits the expressions of octamer-binding transcription factor 4 (OCT-4), SRY (sex determining region Y)-box 2 (SOX-2), and Nanog homeobox (NANOG) in cancer stem cells (CSCs). This may inhibit the proliferation of CSCs thereby preventing tumor cell growth. In addition, fursultiamine inhibits the expression of ATP-binding cassette (ABC) transporters subfamily B member 1 (ABCB1) and subfamily G member 2 (ABCG2) in cancer CSCs, which may abrogate resistance to chemo- and radiotherapy in CSCs. CSCs promote tumor initiation, progression and metastasis; they play a key role in cancer recurrence and resistance to chemotherapy and radiation.

**fuse:** a protective device containing a short piece of wire that melts and breaks when current through it exceeds a rated value, thus de-energizing the circuit. OR to join two plastic parts by softening the material by heat or solvents.

**Fused deposition modeling (FDM):** With FDM, a wire coil of material is extruded from a print head into successive cross-sectional layers that harden into three-dimensional shapes. OR Thermoplastic modeling material is fed into the temperature-controlled FDM extrusion head and heated to a liquid state. The head extrudes and deposits the material in ultra-thin layers onto a fixture-less base

**fusidic acid/betamethasone valerate topical cream:** A topical cream formulation of the bacteriostatic antibiotic fusidic acid and the synthetic, long-acting glucocorticoid betametasone valerate with potential anti-bacterial and immunomodulating activities. Fusidic acid/betamethasone valerate topical cream inhibits Gram-positive bacterial protein synthesis and replication and inhibits the inflammatory response by preventing

phospholipid release, inhibiting eosinophil activity, and decreasing pro-inflammatory cytokine production.

**Fusilev:** (Other name for: levoleucovorin calcium)

**fusion:** The joining of two small nuclei to form a larger nucleus. OR The melting and flowing of heated polymer particles to form a continuous film. OR melting.

**fusion gene :** A gene made by joining parts of two different genes. Fusion genes may occur naturally in the body by transfer of DNA between chromosomes. For example, the BCR-ABL gene found in some types of leukemia is a fusion gene. Fusion genes can also be made in the laboratory by combining genes or parts of genes from the same or different organisms.

**fusion protein:** (1) A family of proteins that facilitate membrane fusion. (2) The protein product of a gene created by the fusion of two distinct genes. OR A protein made from a fusion gene, which is created by joining parts of two different genes. Fusion genes may occur naturally in the body by transfer of DNA between chromosomes. For example, the BCR-ABL gene found in some types of leukemia is a fusion gene that makes the BCR-ABL fusion protein. Fusion genes and proteins can also be made in the laboratory by combining genes or parts of genes from the same or different organisms.

**Fusion reaction:** A reaction in which at least one heavier, more stable nucleus is produced from two lighter, less stable nuclei. Reactions of this type are responsible for enormous release of energy, such as the energy given off by stars.

**futile cycle:** A set of enzyme-catalyzed cyclic reactions that results in release of thermal energy by the hydrolysis of ATP.

**future perfect:** a verb tense that indicates action in a future time in relation to another time farther in the future; it is formed with will have and the past participle of the verb.

**future tense:** a verb tense that indicates the action has yet to take place

**Fuzz:** An accumulation of broken filaments.

**Fycompa:** (Other name for: perampanel)

**G:** (olf) An  $\alpha$  subunit, uniquely expressed in olfactory cilia, of a G protein associated with odorant receptors.

**G protein:** A guanyl nucleotide-binding protein that is a component of intracellular signaling pathways. In the inactive state, the G protein (sometimes called a heterotrimeric G protein) is a trimeric protein consisting of  $\alpha\beta\gamma$  subunits, with the GDP bound to the  $\alpha$  subunit. In the active state, the  $\alpha$  protein exchanges GDP for GTP and dissociates from the  $\beta\gamma$  subunits. The GTP-bound  $\alpha$  subunit propagates the signal. Signal propagation is terminated when the  $\alpha$  subunit hydrolyzes GTP to GDP and reassociates with the  $\beta\gamma$  subunits.

**G-actins:** Actin monomers that come together to form filaments called F-actin.

**G-CSF:** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. It is also used to treat chronic neutropenia and to prepare the blood for the collection of certain types of blood cells. G-CSF is also used to help prevent damage to the bone marrow in patients who were exposed to very high doses of certain types of radiation. G-CSF helps the body make more white blood cells. It is a type of colony-stimulating factor. Also called filgrastim, granulocyte colony-stimulating factor, Neupogen, and Zarxio.

**G-quadruplex stabilizer BMVC:** A carbazole derivative (3,6-bis[2-(1-methylpyridinium)vinyl]carbazole diiodide) that selectively targets to the G-quadruplex DNA structure, used as a fluorescent probe for cancer cytological diagnosis and with potential antitumor activity. G-quadruplex stabilizer BMVC, preferentially uptaken by cancer cells, binds to and stabilizes the telomeric G-quadruplex structure at the end of DNA; when visualized with fluorescent imaging device, BMVC emits bright fluorescent light and can be used to differentiate tumor cells from normal cells. The BMVC/G-quadruplex complexes also interfere with the activity of telomerase, which is highly active in tumor cells and plays a key role in tumorigenesis while expressed at very low levels in most somatic cells.

**G' and G'' :** See STORAGE MODULUS and LOSS MODULUS

**G1:** Gaussian-1. A composite method for computing thermochemistry, involving extrapolations and a few parameters (9). Effectively superseded by G2 and G2(MP2).

**G1 phase:** That period of the cell cycle in which preparations are being made for chromosome duplication, which takes place in the S phase.

**G1 phase :** 1 a phase within interphase of the cell division cycle that prepares cells for DNA replication.

**G2:** Gaussian-2. A composite method for computing thermochemistry, involving extrapolations and a few parameters (10). Very popular but quite expensive; practical for up to seven "heavy" atoms (i.e., non-hydrogen) on a Cray supercomputer.

**G2 checkpoint inhibitor CBP501:** A peptide with G2 checkpoint-abrogating activity. G2 checkpoint inhibitor CBP501 inhibits multiple serine/threonine kinases, including MAPKAP-K2, C-Tak1, and CHK1, that phosphorylate serine 216 of the dual-specific phosphatase Cdc25C (cell division checkpoint 25 C); disruption of Cdc25C activity results in the inhibition of Cdc25C dephosphorylation of the mitotic cyclin-dependent kinase complex Cdc2/cyclin B, preventing entry into the mitotic phase of the cell cycle.

**G2 phase:** That period of the cell cycle between S phase and mitosis (M phase).

**G2(MP2):** Gaussian-2, second-order variant. A composite method for computing thermochemistry, involving extrapolations and a few parameters (11). Less-expensive alternative to G2, of comparable accuracy.

**G207:** A neuroattenuated, replication-competent, recombinant herpes simplex virus-1 (HSV-1) with potential oncolytic activity. Upon intracerebral administration, oncolytic HSV-1 G207 preferentially replicates within glioma cells, which may elicit tumor-specific systemic immune and cytotoxic T lymphocyte (CTL) responses in addition to direct cytopathic effects. Derived from wild-type HSV-1 strain F, this agent has been neuroattenuated by deletions in both copies of the gamma34.5 gene, the major determinant of HSV neurovirulence. In addition, the HSV-1 gene UL39, encoding the viral ribonucleotide reductase large subunit infected cell protein 6 (ICP6), has been inactivated through the insertion of the *Escherichia coli lacZ* gene. By inactivating UL39, viral ribonucleotide reductase activity is disrupted, resulting in the inhibition of nucleotide metabolism and viral DNA synthesis in nondividing cells but not in dividing cells.

**G250 peptide vaccine:** A cancer vaccine containing of a synthetic form of the renal cell carcinoma (RCC)-associated antigen G250 with potential antineoplastic activity. Vaccination with G250 peptide vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells positive for the G250 antigen, resulting in decreased tumor growth. Found in the majority of renal cell carcinomas, G250 is a cell surface tumor-associated antigen (TAA) that contains an HLA-A2.1-restricted epitope that is recognized by CTLs.

**G6PD deficiency :** An inherited disorder in which a person doesn't have enough of an enzyme called G6PD that helps red blood cells work the way they should. In G6PD deficiency, the red blood cells break down when the body is exposed to infection, severe stress, or certain drugs, chemicals, or foods. This may lead to a condition called hemolytic anemia. This disorder is most common in African-American men and in men of Middle Eastern or Mediterranean descent. Also called glucose-6-phosphate dehydrogenase deficiency.

**Ga-68-labeled F(ab')<sub>2</sub>- trastuzumab:** A radioimmunoconjugate consisting of a trastuzumab fragment labeled with the positron-emitting radioisotope gallium Ga 68 with radioisotopic and antibody activities. Upon administration, Ga-68-labeled F(ab')<sub>2</sub>-trastuzumab may bind to HER2-positive tumor cells, allowing radioimmunolocalization with positron emission tomography (PET). Trastuzumab is a recombinant humanized monoclonal antibody that selectively binds to the extracellular domain of human epidermal growth factor receptor 2 (HER2), overexpressed by many adenocarcinomas, particularly breast adenocarcinomas. Check for active clinical trials using this agent.

**gabapentin:** A synthetic analogue of the neurotransmitter gamma-aminobutyric acid with anticonvulsant activity. Although its exact mechanism of action is unknown, gabapentin appears to inhibit excitatory neuron activity. This agent also exhibits analgesic properties. or A substance that is being studied as a treatment for relieving hot flashes in women with breast cancer. It belongs to the family of drugs called anticonvulsants. or A substance that is being studied as a treatment for relieving hot flashes in women with breast cancer. It belongs to the family of drugs called anticonvulsants.

**Gable:** The triangular upper part of an external wall formed by the sloping ends of the roof.

**GAD:** A condition marked by excessive worry and feelings of fear, dread, and uneasiness that last six months or longer. Other symptoms of GAD include being restless, being tired or irritable, muscle tension, not being able to concentrate or sleep well, shortness of breath, fast heartbeat, sweating, and dizziness. Also called generalized anxiety disorder.

**Gadavist:** (Other name for: gadobutrol)

**gadobenate dimeglumine:** A gadolinium-based paramagnetic contrast agent. When placed in a magnetic field, gadobenate dimeglumine produces a large magnetic moment and so a large local magnetic field, which can enhance the relaxation rate of nearby protons; as a result, the signal intensity of tissue images observed with magnetic resonance imaging (MRI) may be enhanced. Because this agent is preferentially taken up by normal functioning hepatocytes, normal hepatic tissue is enhanced with MRI while tumor tissue is unenhanced. In addition, because gadobenate dimeglumine is excreted in the bile, it may be used to visualize the biliary system using MRI. or A drug used in MRI to help make clear pictures of blood vessels in the brain, spine, and nearby tissues. It is also being studied as a way to find abnormal areas in the liver and other organs and to help diagnose cancer. Gadobenate dimeglumine is a type of contrast agent. Also called MultiHance.

**gadobutrol:** A gadolinium-based, hydrophilic, macrocyclic, electrically neutral contrast agent used in contrast-enhanced MRI (CE-MRI). Gadobutrol is a non-ionic, paramagnetic complex consisting of gadolinium ( $Gd^{3+}$ ) chelated with the macrocyclic compound dihydroxy-hydroxymethylpropyl-tetraazacyclododecane-triacetic acid (butrol). Following intravenous administration, gadobutrol may increase MRI sensitivity for the detection of tumors and inflammatory and demyelinating diseases of the central nervous system (CNS) which are associated with areas with blood-brain barrier defects due to altered perfusion or an enlarged extracellular space. This agent is eliminated in an unchanged form via the kidneys; extra-renal elimination is negligible.

**gadodiamide:** A paramagnetic gadolinium-based contrast agent (GBCA), with imaging activity upon magnetic resonance imaging (MRI). When placed in a magnetic field, gadodiamide generates a large local magnetic

field, which can enhance the relaxation rate of nearby protons. This change in proton relaxation dynamics, increases the MRI signal intensity of tissues in which gadodiamide has accumulated; therefore, visualization of those tissues is enhanced.

**gadofosveset trisodium:** The trisodium salt form of gadofosveset, an injectable, intravascular, amphiphilic gadolinium-based contrast agent (GBCA) used with magnetic resonance angiography (MRA) imaging. Gadofosveset is a stable gadolinium diethylenetriaminepentaacetic acid (Gd-DTPA) chelate derivative with a diphenylcyclohexylphosphate group. Upon injection, gadofosveset binds reversibly to endogenous serum albumin which increases its intravascular retention time compared to non-protein binding contrast agents. The serum albumin binding also increases T1-relaxivity of gadofosveset. This produces an increase in signal intensity of blood, thereby enhancing the visualization of blood vessels upon MRA and may aid in the diagnosis of certain blood vessels and heart disorders.

**Gadolinium:** Symbol:"Gd" Atomic Number:"64" Atomic Mass: 157.25amu. Gadolinium is one of the elements in the lanthanide series of inner transition elements. It may be classified as a rare earth element. This silvery metal is used in many alloys. One of its best uses is in nuclear reactors because it can stop neutrons and contain radioactivity of dangerous reactions.

**gadolinium :** A metal element that is used in magnetic resonance imaging (MRI) and other imaging methods. It is a contrast agent, which helps show abnormal tissue in the body during imaging with a special machine.

**gadolinium texaphyrin :** A substance being studied in the treatment and diagnosis of some types of cancer. It builds up in some cancer cells, which may make them easier to kill with radiation therapy and chemotherapy. Gadolinium texaphyrin is also used in magnetic resonance imaging (MRI) to help find cancer cells in the body. It is a type of radiosensitizing agent, a type of chemosensitizing agent, and a type of contrast agent. Also called motexafin gadolinium.

**gadolinium-based contrast agent P03277:** A gadolinium-based paramagnetic contrast agent, with potential imaging enhancing activity upon magnetic resonance imaging (MRI). Upon administration of P03277 and placement in a magnetic field, this agent produces a large magnetic moment and creates a large local magnetic field, which can enhance the

relaxation rate of nearby protons. This change in proton relaxation dynamics, increases the MRI signal intensity of tissues in which this agent has accumulated; therefore, contrast and visualization of those tissues is enhanced compared to unenhanced MRI. Check for active clinical trials using this agent.

**gadolinium-chelate:** A coordination complex consisting of a gadolinium ion bound to a hexadentate organic chelating agent such as diethylenetriaminepentaacetic acid. Chelates of gadolinium are frequently utilized as magnetic resonance imaging (MRI) contrast agents and can be used to track nanoparticle-mediated drug delivery.

**gadopentetate dimeglumine:** A gadolinium complex of diethylenetriamine pentaacetic acid with ionic paramagnetic properties. Gadopentetate dimeglumine may provide contrast enhancement during magnetic resonance imaging (MRI) of intracranial lesions with abnormal vascularity or of abnormalities in the blood-brain barrier (BBB). or A substance used in magnetic resonance imaging (MRI) to help make clear pictures of the brain, spine, heart, soft tissue of joints, and inside bones. Gadopentetate dimeglumine is being studied in the diagnosis of cancer. It is a type of contrast agent. Also called Gd-DTPA and Magnevist.

**gadoterate meglumine:** A gadolinium chelate paramagnetic contrast agent. When placed in a magnetic field, gadoterate meglumine produces a large magnetic moment and so a large local magnetic field, which can enhance the relaxation rate of nearby protons; as a result, the signal intensity of tissue images observed with magnetic resonance imaging (MRI) may be enhanced. Because this agent is preferentially taken up by normal functioning hepatocytes, normal hepatic tissue is enhanced with MRI while tumor tissue is unenhanced. In addition, because gadobenate dimeglumine is excreted in the bile, it may be used to visualize the biliary system using MRI.

**Gadovist:** (Other name for: gadobutrol)

**gadoxetate disodium:** A paramagnetic contrast agent consisting of the disodium salt of the gadolinium ion chelated with the lipophilic moiety ethoxybenzyl (EOB) bound to diethylenetriamine pentaacetic acid (DTPA). When placed in a magnetic field, gadolinium produces a large magnetic moment and so a large local magnetic field, which can enhance the relaxation rate of nearby protons; as a result, the signal intensity of tissue

images observed with magnetic resonance imaging (MRI) may be enhanced. Because this agent is preferentially taken up by normal functioning hepatocytes, normal hepatic tissue is enhanced with MRI while tumor tissue is unenhanced. In addition, because this agent is excreted in the bile, it may be used to visualize the biliary system using MRI.

**Gag:267-274 peptide vaccine:** A peptide vaccine containing the amino acids 267 through 274 of the human immunodeficiency virus type 1 (HIV-1) gag core protein (gag:267-274), with potential immunostimulating activity. Upon vaccination, the immune system may exert a potent cytotoxic T-lymphocyte (CTL) response against the xenoantigen gag:267-274 and produces pro-inflammatory cytokines. The concomitant administration of a cancer peptide vaccine may benefit from an already activated immune system and may augment an immune response against the administered tumor associated antigen(s). Gag:267-274 peptide is highly immunogenic and may potentially be used as a cancer immunoadjuvant. Check for active clinical trials using this agent.

**Gail model :** A computer program that uses personal and family medical history information to estimate a woman's chance of developing breast cancer. Also called Gail risk model.

**Gail risk model :** A computer program that uses personal and family medical history information to estimate a woman's chance of developing breast cancer. Also called Gail model.

**gaining stream:** a stream into which groundwater flows from the saturated zone.

**galactomannan derivative:** A carbohydrate polymer composed of mannose and galactose, with chemotherapeutic enhancing activity. Galactomannan derivative binds to galectins on cell surfaces and may promote the transport of certain chemotherapeutics, such as 5-fluorouracil (5-FU), into tumor cells. This may increase the antineoplastic effect of 5-FU when administered concomitantly. Galectins are carbohydrate-binding proteins, upregulated on the surface of certain types of tumor cells, and may mediate cell association, survival and metastasis.

**galactose:** A hexose which is almost identical to glucose except that orientation of -H and -OH on carbon 4 are exchanged, making it an epimer at C-4 of glucose (in Fisher projection).

**Galactosemia:** A disease characterized by vomiting, diarrhea, liver dysfunction, and occasionally mental retardation, caused by galactose accumulation due to a deficiency of galactose 1-phosphate uridyl transferase.

**galantamine hydrobromide:** The hydrobromide salt form of galantamine, a tertiary alkaloid obtained synthetically or naturally from the bulbs and flowers of *Narcissus* and several other genera of the Amaryllidaceae family with anticholinesterase and neurocognitive-enhancing activities.

Galantamine competitively and reversibly inhibits acetylcholinesterase, thereby increasing the concentration and enhancing the action of acetylcholine (ACh). In addition, galantamine is a ligand for nicotinic acetylcholine receptors, which may increase the presynaptic release of ACh and activate postsynaptic receptors. This agent may improve neurocognitive function in mild and moderate Alzheimer's disease and may reduce abstinence-induced cognitive symptoms that promote smoking relapse. Check for active clinical trials using this agent.

**galectin inhibitor GR-MD-02:** A carbohydrate-based galectin inhibitor, with potential antineoplastic activity. Galectin inhibitor GR-MD-02 binds to the carbohydrate-binding domain of galectins, especially galectin-3, and may result in an induction of apoptosis mediated through activation of both mitochondria and caspases. This may reduce tumor growth in galectin-overexpressing tumor cells. Galectins, often overexpressed on tumor cells, play a key role in cancer cell proliferation, apoptosis, tumor angiogenesis and evasion of immune responses. Check for active clinical trials using this agent.

**galectin-1 inhibitor OTX008:** A calixarene-based compound and galectin-1 (Gal-1) inhibitor with potential anti-angiogenic and antineoplastic activities. Upon subcutaneous administration, galectin-1 inhibitor OTX008 binds Gal-1 which leads to Gal-1 oxidation and proteosomal degradation through a not yet fully elucidated mechanism, and eventually downregulates Gal-1. This decreases tumor cell growth and inhibits angiogenesis. Gal-1, a multifunctional carbohydrate-binding protein, is often overexpressed on tumor cells and plays a key role in cancer cell proliferation, apoptosis, tumor angiogenesis and evasion of immune responses.

**galeterone:** An orally bioavailable small-molecule androgen receptor modulator and CYP17 lyase inhibitor with potential antiandrogen activity. Galeterone exhibits three distinct mechanisms of action: 1) as an androgen receptor antagonist, 2) as a CYP17 lyase inhibitor and 3) by decreasing overall androgen receptor levels in prostate cancer tumors, all of which may result in a decrease in androgen-dependent growth signaling. Localized to the endoplasmic reticulum (ER), the cytochrome P450 enzyme CYP17 (P450C17 or CYP17A1) exhibits both 17alpha-hydroxylase and 17,20-lyase activities, and plays a key role in the steroidogenic pathway that produces progestins, mineralocorticoids, glucocorticoids, androgens, and estrogens.

**Galileo:** scientist whose observations supported the Copernican model.

**galiximab:** A humanized IgG1 monoclonal antibody directed against CD80, the natural ligand for the T-cell antigen CD28 which mediates T-cell and B-cell adhesion. Galiximab binds to CD80 expressed on the cell surfaces of follicular lymphomas, resulting in antibody-dependent cell-mediated cytotoxicity (ADCC). CD80 is expressed on activated B-cells and gamma-interferon-stimulated monocytes and is often expressed at low levels on the surfaces of follicular lymphoma cells and other lymphoid malignancies. Check for active clinical trials using this agent. or A substance being studied in the treatment of follicular non-Hodgkin lymphoma. It binds to the protein CD80, which is found on certain normal white blood cells and on white blood cells that are cancer. It is a type of monoclonal antibody.

**gallbladder :** The pear-shaped organ found below the liver. Bile is concentrated and stored in the gallbladder.

**gallbladder cancer :** Cancer that forms in tissues of the gallbladder. The gallbladder is a pear-shaped organ below the liver that collects and stores bile (a fluid made by the liver to digest fat). Gallbladder cancer begins in the innermost layer of tissue and spreads through the outer layers as it grows.

**Gallium:** Symbol:"Ga" Atomic Number:"31" Atomic Mass: 69.72amu. It is classified as a basic metal. Gallium is a very brittle, silvery metal. You will find it in electronics, alloys, and thermometers.

**gallium citrate Ga 67:** The citrate salt of the radioisotope gallium Ga 67. Although the mechanism is unknown, gallium Ga 67 concentrates in

lysosomes and is bound to a soluble intracellular protein in certain viable primary and metastatic tumors and focal sites of inflammation, allowing scintigraphic localization. Ga-67 scintigraphy (GS) cannot differentiate between tumor and acute inflammation.

**gallium Ga 68 citrate:** A radiopharmaceutical citrate salt form of the positron-emitting radioisotope gallium Ga 68, with potential imaging activity upon positron emission tomography (PET). Upon administration of Gallium Ga 68 citrate, the gallium Ga 3<sup>+</sup> ion dissociates from the weak citrate chelator. As Ga<sup>3+</sup> is very similar to iron (Fe<sup>3+</sup>) in chemical properties, this ion acts as an iron analogue. Ga<sup>3+</sup> binds to the iron-binding protein transferrin, distributes in blood, and enters and accumulates in the extracellular fluid space of inflamed or tumor-bearing tissue. In turn, the Ga<sup>3+</sup>-transferrin complex binds to transferrin receptors and is taken up by tumor cells. Tumor cells can then be imaged upon PET. Compared to healthy cells, tumor cells have increased iron metabolism and transferrin receptor expression. Increased Ga<sup>3+</sup> uptake is seen in inflamed and infected tissues as well. Check for active clinical trials using this agent.

**gallium Ga 68 OPS202:** A radioconjugate consisting of the somatostatin antagonistic peptide OPS202 that is labeled with the positron-emitting radionuclide gallium Ga 68, which may be used as a somatostatin receptor (SSTR) imaging agent in conjunction with positron emission tomography (PET) to image neuroendocrine tumors (NETs). Gallium Ga 68 OPS202 binds to SSTR subtype 2 present on the cell membranes of many types of NETs. This allows for visualization of SSTR-positive cells upon imaging. SSTR subtypes have been shown to be present in large numbers on NETs and their metastases, while most other normal tissues express low levels of SSTR subtypes. Check for active clinical trials using this agent.

**gallium Ga 68-DOTA-exendin-4:** A radiopharmaceutical composed of the glucagon-like peptide 1 receptor (GLP-1R) agonist exendin-4 linked by the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the positron-emitting radionuclide gallium Ga 68, with potential use in diagnostic imaging upon positron emission tomography (PET). Upon administration of gallium Ga 68-DOTA-exendin-4, the exendin-4 moiety binds to GLP-1R and is subsequently internalized. The radionuclide moiety can be detected using PET and GLP-1R-expressing

tumors can be localized. GLP-1R, located on beta cells, is overexpressed on insulinomas, which are insulin-secreting neuroendocrine tumors.

**gallium Ga 68-DOTANOC:** A gallium Ga 68-radiolabeled analogue of somatostatin that may be used in conjunction with positron emission tomography (PET) to image neuroendocrine tumors and metastases. Gallium Ga 68-DOTANOC is a conjugate of the somatostatin analogue 1-Nal3-octreotide (NOC) and gallium Ga 68-labeled 1,4,7,10-tetraazacyclododecane-N,N',N'',N'''-tetraacetic acid (DOTA). The somatostatin analogue NOC has a high affinity for somatostatin receptor subtypes 2, 3, and 5; these receptor subtypes have been shown to be present in large numbers on neuroendocrine tumors and their metastases, while most other normal tissues express low levels of these somatostatin receptor subtypes. Check for active clinical trials using this agent.

**gallium Ga 68-DOTATATE:** A radioconjugate consisting of the somatostatin analogue tyrosine-3-octreotate (Tyr3-octreotate or TATE) labeled with the positron emission tomography (PET) tracer gallium Ga 68 via the macrocyclic chelating agent dodecanetetraacetic acid (DOTA), which may be used as a somatostatin receptor (SSTR) imaging agent in conjunction with PET to image neuroendocrine tumors (NETs). Gallium Ga 68-DOTATATE binds to SSTRs, with a much higher affinity for type 2 SSTR, present on the cell membranes of many types of NETs. This allows for visualization of SSTR-positive cells upon imaging. SSTR subtypes have been shown to be present in large numbers on NETs and their metastases, while most other normal tissues express low levels of SSTR subtypes.

**gallium Ga 68-edotreotide:** A radioconjugate consisting of the octreotide derivative edotreotide labeled with gallium 68 (Ga-68) with potential application in somatostatin receptor (SSTR) imaging in conjunction with positron emission tomography (PET). Similar to octreotide, gallium Ga 68-edotreotide binds to SSTRs, especially type 2 receptors, present on the cell membranes of many types of neuroendocrine tumor cells and their metastases, thereby allowing for imaging of SSTR-expressing cells upon PET. Gallium Ga 68-edotreotide is produced by substituting tyrosine for phenylalanine at the 3 position of the somatostatin analogue octreotide (Tyr3-octreotide or TOC) and chelating the substituted octreotide to Ga-68 via the macrocyclic chelating agent dodecanetetraacetic acid (DOTA). Check for active clinical trials using this agent.

**gallium Ga 68-labeled affibody molecule ABY-025:** A radioconjugate composed of an optimized affibody conjugated, via its C-terminal cysteine, to maleimide-DOTA, and linked to the radioisotope gallium Ga 68, with potential use as a tracer for human epidermal growth factor receptor type 2 (HER2; ErbB2)-expressing tumors using positron emission tomography (PET). Upon intravenous administration of the gallium Ga 68-labeled affibody ABY-025, the affibody targets HER2-expressing tumor cells. This facilitates both detection of HER2-expressing tumor cells and assessment of responses to HER2-targeting chemotherapeutic agents during PET imaging. The affibody is an optimized antibody mimetic based on a 6.5-kDa 3-helical bundle Z domain derived from the staphylococcal protein A (Z her2:342); the nonbinding surface of the Z domain is reengineered (Z her2:2891) to increase binding affinity for HER2 and to improve tumor imaging. HER2 is overexpressed in many cancer cell types.

**gallium Ga 68-labeled BNOTA-PRGD2:** A radiopharmaceutical agent comprised of a pegylated arginine-glycine-aspartic acid dimer (PRGD2) labeled with gallium Ga 68, with potential alphaVbeta3 integrin imaging activity upon positron emission topography (PET) or single photon emission computed tomography (SPECT). This radiopharmaceutical is prepared by conjugating PRGD2 with chelator S-2-(4-isothiocyanatobenzyl)-1,4,7-triazacyclononane-1,4,7-triacetic acid (BNOTA) which is capable of forming a six-coordinate complex with Ga 68. After intravenous administration, gallium Ga 68-labeled BNOTA-PRGD2 binds to alphaVbeta3 integrin on the cell membrane via the cyclic tri-amino acids RGD motif. Upon PET imaging, alphaVbeta3 integrin-expressing tumor cells can be visualized and expression levels can be quantified. Compared to other radiolabeled RGD-containing peptides, this agent shows increased affinity to alphaVbeta3 integrin, enhanced tumor uptake as well as improved pharmacokinetics. alphaVbeta3 integrin is overexpressed on certain tumor cells and tumor endothelial cells while minimally or not expressed on healthy, normal cells and plays a key role in angiogenesis, tumor proliferation and survival. Check for active clinical trials using this agent.

**gallium Ga 68-labeled DOTA Di-HSG peptide IMP-288:** A radiolabeled divalent histamine-succinyl-glycine (HSG) hapten-peptide linked with the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the radionuclide gallium (Ga) 68 with potential use in

diagnostic imaging. After pretargeting with a bispecific monoclonal antibody (BiMoAB) directed against both a tumor-associated antigen (TAA) and the HSG hapten-peptide, the HSG portion of administered gallium Ga 68-labeled di-HSG-DOTA peptide IMP-288 binds the anti-HSG portion of the BiMoAB; Ga-68 radioisotopic activity localized to tumor cells bearing the TAA can then be visualized upon positron emission tomography (PET).

**gallium Ga 68-labeled GRPR antagonist BAY86-7548:** A radioconjugate containing a synthetic bombesin receptor antagonist targeting the gastrin-releasing peptide receptor (GRPR), that is linked by the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the radionuclide gallium (Ga) 68, with potential use in diagnostic imaging using positron emission tomography/computed tomography (PET/CT). Upon administration of gallium Ga 68 GRPR antagonist BAY86-7548, the peptide moiety targets and binds to GRPR. Upon PET/CT, GRPR-expressing tumor cells can then be visualized. GRPR, also called bombesin receptor 2 (BB2), is a G protein-coupled seven-transmembrane receptor belonging to the bombesin receptor family. It is overexpressed in certain types of cancers.

**gallium Ga 68-labeled MLN6907:** A radioconjugate containing a monoclonal antibody directed against guanylyl cyclase C (GCC) labeled with the radioisotope gallium Ga 68, with positron emission tomography (PET) imaging activity. The monoclonal antibody moiety of MLN6907 selectively binds to GCC, a transmembrane receptor normally found on intestinal cells and dopaminergic neurons in the brain, that is also overexpressed on the surface of a variety of cancer cells. Upon internalization of the agent and PET, tumors expressing GCC can be visualized.

**gallium Ga 68-labeled NODAGA-MJ9:** A radiopharmaceutical agent comprised of a peptide targeting the gastrin releasing peptide receptor (GRPR) chelated with 1,4,7-triazacyclononane,1-glutaric acid-4,7 acetic acid (NODAGA) and radiolabeled with gallium Ga 68, with potential tumor imaging activity upon positron emission tomography (PET). After administration of gallium Ga 68-labeled-NODAGA-MJ9, the MJ9 moiety binds to GRPR located on tumor cells. Upon PET imaging, GRPR-expressing tumor cells can be visualized and expression levels can be

quantified. GRPR is overexpressed on certain tumor cells and plays a key role in tumor proliferation and survival.

**gallium Ga 68-labeled PSMA ligand Glu-urea-Lys(Ahx):** A radioconjugate composed of a human prostate specific membrane antigen (PSMA)-targeting ligand, Glu-urea-Lys(Ahx) (Glu-NH-CO-NH-Lys(Ahx)), conjugated, via the acyclic radiometal chelator N,N'-bis [2-hydroxy-5-(carboxyethyl)benzyl] ethylenediamine-N,N'-diacetic acid (HBED-CC), to the radioisotope gallium Ga 68, with potential use as a tracer for PSMA-expressing tumors during positron emission tomography (PET). Upon intravenous administration of the gallium Ga 68-labeled PSMA ligand, the Glu-urea-Lys(Ahx) moiety targets and binds to PSMA-expressing tumor cells. Upon internalization, PSMA-expressing tumor cells can be detected during PET imaging. PSMA, a tumor-associated antigen and type II transmembrane protein, is expressed on the membrane of prostatic epithelial cells and overexpressed on prostate tumor cells.

**gallium Ga 68-NEB:** A radiotracer composed of a truncated form of the azo dye Evans blue (EB) conjugated, via a 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA) linker (NEB), to the radioisotope gallium Ga 68, with potential blood pool imaging activity for use in positron emission tomography (PET). Upon administration of gallium Ga 68-NEB, the NEB moiety, which has high affinity for serum albumin, targets and forms a complex with albumin. Upon PET, the lymph nodes (LN) and lymphatic vessels as well as other desired tissues can be visualized.

**gallium Ga 68-NOTA-Aca-BBN(7-14):** A radioconjugate containing the bombesin (BBN) fragment BBN(7-14) comprised of the amino acid sequence of Gln-Trp-Ala-Val-Gly-His-Leu-Met-NH<sub>2</sub>, which targets the gastrin-releasing peptide receptor (GRPR), bound to aminocaproic acid (Aca), and linked by the macrocyclic chelating agent, 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA), to the radionuclide gallium (Ga) 68, with potential use in diagnostic imaging using positron emission tomography/computed tomography (PET/CT). Upon administration of gallium Ga 68-NOTA-Aca-BBN(7-14), the peptide moiety targets and binds to GRPR. Upon PET/CT, GRPR-expressing tumor cells can then be visualized. GRPR, also called bombesin receptor 2 (BB2), is a seven-transmembrane G protein-coupled receptor belonging to the bombesin receptor family. It is overexpressed in certain types of cancers.

**gallium Ga 68-NOTA-AE105:** A radiotracer composed of AE105, an urokinase-type plasminogen activator receptor (uPAR) peptide antagonist, conjugated with the bifunctional, macrocyclic chelating agent 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA) and labeled with the radionuclide gallium Ga 68, with potential imaging activity using positron emission tomography (PET). Upon administration, the AE105 moiety of gallium Ga 68-NOTA-AE105 targets and binds, with high affinity, to uPAR expressed on tumor cells. Upon PET imaging, uPAR-expressing tumor cells can be visualized and the degree of tumor aggressiveness can be assessed. uPAR expression is correlated with increased tumor invasiveness and aggressiveness, as well as a poor prognosis.

**gallium Ga 68-NOTA-BBN-RGD:** A radioconjugate containing the bombesin (BBN) fragment BBN(7-14) comprised of the amino acid sequence Gln-Trp-Ala-Val-Gly-His-Leu-Met-NH<sub>2</sub>, which targets the gastrin-releasing peptide receptor (GRPR), and linked, via a glutamate linker, to the cyclic arginine-glycine-aspartic acid (RGD) sequence-based peptide cyclo[Arg-Gly-Asp-D-Tyr-Lys] (c(RGDyK)), which targets integrin alphaVbeta3 (αVβ3), and labeled with the radionuclide gallium (Ga) 68 through the macrocyclic chelating agent, 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA), with potential use in diagnostic imaging using positron emission tomography/computed tomography (PET/CT). Upon administration of gallium Ga 68-NOTA-BBN(7-14)-RGD, the BBN peptide moiety of the RGD-BBN heterodimer specifically targets and binds to GRPR while the RGD moiety specifically binds to the αVβ3. Upon PET/CT, GRPR- and/or αVβ3-expressing tumor cells can be visualized and expression levels can be quantified. GRPR, also called bombesin receptor 2 (BB2), is a seven-transmembrane G protein-coupled receptor belonging to the bombesin receptor family. αVβ3, an integrin receptor, plays a key role in angiogenesis, tumor proliferation and survival. Both are overexpressed in certain types of cancers.

**gallium Ga 68-NOTA-NFB:** A radioconjugate composed of a derivative of the CXCR4 peptide antagonist T140, in which the N-terminal 4-fluorobenzoyl group (NFB) is substituted with the chelating agent 1,4,7-triazacyclononane-N,N',N''-triacetic acid (NOTA) and radiolabeled with gallium Ga 68, with potential CXCR4 imaging activity during positron emission tomography (PET). Upon administration, gallium Ga 68-NOTA-NFB selectively binds to CXCR4 and CXCR4-expressing tumor cells can

then be visualized upon PET imaging. CXCR4, a chemokine receptor belonging to the G protein-coupled receptor (GPCR) gene family, plays an important role in chemotaxis and angiogenesis, and is upregulated in several tumor cell types. CXCR4 expression is correlated with tumor aggressiveness and high metastatic potential. Unmodified T140 binds non-specifically to red blood cells (RBCs); replacing the fluoro-benzoyl group with NOTA (NOTA-NFB) prevents the RBC binding almost entirely, while only minimally reducing the binding to CXCR4-positive tumor cells. Check for active clinical trials using this agent.

**gallium Ga 68-RGD:** A radiopharmaceutical agent comprised of a cyclic arginine-glycine-aspartic acid (Arg-Gly-Asp/RGD) peptide labeled with gallium Ga 68, with potential alphaVbeta3 integrin (avb3) imaging activity during positron emission topography (PET). After intravenous administration, gallium Ga 68-RGD selectively binds to avb3 on the cell membrane via the cyclic RGD motif. Upon PET imaging, avb3-expressing tumor cells can be visualized and their expression levels can be quantified. avb3, a member of the integrin receptor family, is overexpressed on certain tumor cells and tumor endothelial cells while minimally or not expressed on healthy, normal cells; it plays a key role in angiogenesis, tumor proliferation and survival.

**gallium nitrate:** A hydrated nitrate salt of the group IIIa element gallium with potential use in the treatment of malignancy-associated hypercalcemia. Gallium nitrate localizes preferentially to areas of bone resorption and remodeling and inhibits osteoclast-mediated resorption by enhancing hydroxyapatite crystallization and reduction of bone mineral solubility. This agent also increases calcium and phosphorous deposition into bone and may increase collagen synthesis. or A drug that lowers blood calcium. Used as treatment for hypercalcemia (too much calcium in the blood) and for cancer that has spread to the bone (bone metastases). A drug that lowers blood calcium. Used as treatment for hypercalcemia (too much calcium in the blood) and for cancer that has spread to the bone (bone metastases).

**gallium scan :** A procedure to detect areas of the body where cells are dividing rapidly. It is used to locate cancer cells or areas of inflammation. A very small amount of radioactive gallium is injected into a vein and travels through the bloodstream. The gallium is taken up by rapidly dividing cells in the bones, tissues, and organs and is detected by a scanner.

**gallstone** : Solid material that forms in the gallbladder or common bile duct. Gallstones are made of cholesterol or other substances found in the gallbladder. They may occur as one large stone or as many small ones, and vary from the size of a golf ball to a grain of sand. Also called cholelith.

**GalNAc-Anti-C5 siRNA ALN-CC5**: A proprietary formulation composed of small-interfering RNAs (siRNAs) directed against terminal complement component 5 (C5) of the complement pathway conjugated to a N-acetylgalactosamine (GalNAc) ligand, which has potential use in the treatment of complement-mediated diseases, such as paroxysmal nocturnal hemoglobinuria (PNH). Upon subcutaneous administration of ALN-CC5, the GalNAc ligand moiety specifically binds to and is taken up by the asialoglycoprotein receptor (ASGPR) expressed on hepatocytes. Inside the cell, the siRNAs bind to C5 mRNAs, which results in the inhibition of both the translation and expression of the C5 protein. This lowers plasma C5 levels, prevents C5 cleavage into pro-inflammatory components and blocks complement-mediated hemolysis. C5, a complement pathway protein, is expressed at high levels by the liver.

**galunisertib**: An orally available, small molecule antagonist of the tyrosine kinase transforming growth factor-beta (TGF- $\beta$ ) receptor type 1 (TGFBR1), with potential antineoplastic activity. Upon administration, galunisertib specifically targets and binds to the kinase domain of TGFBR1, thereby preventing the activation of TGF- $\beta$ -mediated signaling pathways. This may inhibit the proliferation of TGF- $\beta$ -overexpressing tumor cells. Dysregulation of the TGF- $\beta$  signaling pathway is seen in a number of cancers and is associated with increased cancer cell proliferation, migration, invasion and tumor progression. Check for active clinical trials using this agent.

**galvanic skin response** : A change in the heat and electricity passed through the skin by nerves and sweat. Galvanic skin response increases in certain emotional states and during hot flashes that happen with menopause. Also called electrodermal response and skin conduction.

**Galvanised iron**: Steel or iron that has been zinc-coated generally by immersion in a bath of molten zinc.

**galvanize**: The process of covering iron with a coat of zinc to make it less reactive to air and water. OR Galvanizing is a way of protecting iron from

rusting by coating it with zinc metal. OR A thin coating of zinc that covers iron or steel to prevent rust.

**galvanometer:** A device that is very sensitive and able to detect even small flows of electrons through a wire.

**gamboge resin extract TSB-9-W1:** An orally bioavailable extract from the yellow to brown gum-resin of the gamboge tree (genus *Garcinia*) belonging to the Clusiaceae (or Guttiferae) family, with potential anti-inflammatory and antineoplastic activities. Gamboge resin extract TSB-9-W1 contains various active ingredients, including gambogic acid, formoxanthone A, betulin, betulinic acid, morellic acid, isomorellic acid, isogambogic acid, isomorellinol and desoxymorellin. Upon oral administration, the various active components of the gamboge resin extract TSB-9-W1 may bind to and inhibit the activity of a variety of cancer-related proteins, may induce apoptosis, and may exert cytotoxic activity on tumor cells, thereby inhibiting tumor cell proliferation. TSB-9 is derived from TSB-14, which is the acetone-extract of gamboge resin, and pulverized into powder form; TSB-9 is 90% extract and 10% brown sugar. TSB-9-W1 is a milled form of TSB-9 with a particle size of 5 micrometers.

**GAMESS:** General Atomic and Molecular Electronic Structure System. A free ab initio software package that emphasizes multi-reference calculations (12). There is also a British program with the same name, distinguished as GAMESS-UK (vs. GAMESS-US).

**gametes:** sex cells of parent organisms; usually haploid cells. OR The ova and the sperm, haploid cells that unite during fertilization to generate a diploid zygote. OR Reproductive cells with a haploid gene content; sperm or egg cells.

**Gamimune N:** (Other name for: therapeutic immune globulin)

**gamma irradiation :** A type of radiation therapy that uses gamma radiation. Gamma radiation is a type of high-energy radiation that is different from x-rays.

**Gamma Knife therapy :** A treatment using gamma rays, a type of high-energy radiation that can be tightly focused on small tumors or other lesions in the head or neck, so very little normal tissue receives radiation. The gamma rays are aimed at the tumor from many different angles at once, and deliver a large dose of radiation exactly to the tumor in one treatment session. This procedure is a type of stereotactic radiosurgery. Gamma Knife

therapy is not a knife and is not surgery. Gamma Knife is a registered trademark of Elekta Instruments, Inc.

**Gamma radiation:** High-energy, short-wavelength, electromagnetic radiation emitted from the nucleus of an atom. Gamma radiation frequently accompanies emissions of alpha particles and beta particles, and always accompanies fission. Gamma rays are similar to x-rays, but are very penetrating and are best stopped or shielded by dense materials, such as lead or depleted uranium. OR Electromagnetic disturbance (photons) emanating from an atomic nucleus. This type of radiation travels in wave form, similar to X-Rays or light, but has a shorter wave length (approx. 1 Ado or 107 mm)

**gamma ray :** A type of high-energy radiation that is different from an x-ray. OR are electromagnetic radiations beyond the X-rays in frequency. They are usually produced in nuclear reactions. OR A very high energy form of electromagnetic radiation, typically with wavelengths of less than 3 pm. Gamma rays are produced by certain nuclear decay processes, and are used to sterilize food.

**gamma secretase inhibitor PF-03084014:** A selective gamma secretase (GS) inhibitor with potential antitumor activity. Gamma secretase inhibitor PF-03084014 binds to GS, blocking proteolytic activation of Notch receptors; Notch signaling pathway inhibition may follow, which may result in the induction of apoptosis in tumor cells that overexpress Notch. The integral membrane protein GS is a multi-subunit protease complex that cleaves single-pass transmembrane proteins, such as Notch receptors, at residues within their transmembrane domains. Overexpression of the Notch signaling pathway has been correlated with increased tumor cell growth and survival.

**gamma-delta tocotrienol:** An orally available nutritional supplement containing the gamma and delta forms of the vitamin E family member tocotrienol, with hypocholesterolemic, antithrombotic, antioxidant, and potential antineoplastic activity. Upon oral administration, gamma-delta tocotrienol accumulates in cancer cells and may exert their anti-cancer activity in part through 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase downregulation and/or degradation, cell cycle arrest, and induction of caspase-mediated apoptosis. In addition, this agent may inhibit angiogenesis partially through the blockage of vascular endothelial growth

factor receptor (VEGFR) and the inhibition of tumor cell-induced vessel formation. Altogether, this may result in the inhibition of tumor cell growth. Further, this agent prevents free radical formation and inhibits lipid peroxidation. Tocotrienols contain 3 double bonds, absent in tocopherols, on its farnesyl isoprenoid side chain that likely contribute to its anti-cancer activities.

**gamma-secretase/Notch signalling pathway inhibitor RO4929097:** An orally bioavailable, small-molecule gamma secretase (GS) inhibitor with potential antitumor activity. Gamma secretase inhibitor RO4929097 binds to GS and blocks activation of Notch receptors, which may inhibit tumor cell proliferation. The integral membrane protein GS is a multi-subunit protease complex that cleaves single-pass transmembrane proteins, such as Notch receptors, at residues within their transmembrane domains. Overexpression of the Notch signaling pathway has been correlated with increased tumor cell growth.

**gamma-tocopherol:** The orally bioavailable gamma form of the naturally-occurring fat-soluble vitamin E, found in certain nuts and seeds, with potential antioxidant activity. Although the exact mechanism of action of this tocopherol has yet to be fully identified, gamma-tocopherol appears to have the ability to scavenge free radicals, thereby protecting against oxidative damage.

**Gammagard S/D:** (Other name for: therapeutic immune globulin)

**Gammar-P:** (Other name for: therapeutic immune globulin)

**ganciclovir:** A synthetic guanine derivative with antiviral activity. As the active metabolite of ganciclovir, ganciclovir-5-triphosphate (ganciclovir-TP) appears to inhibit viral DNA synthesis by competitive inhibition of viral DNA polymerases and incorporation into viral DNA, resulting in eventual termination of viral DNA elongation. or An antiviral agent used to prevent or treat cytomegalovirus infections that may occur when the body's immune system is suppressed. In gene therapy, ganciclovir is used with an altered herpes simplex virus-1 gene to kill advanced melanoma cells and brain tumor cells.

**gantotinib:** An orally bioavailable imidazopyridazine and inhibitor of Janus kinase 2 mutant V617F (JAK2V617F), with potential antineoplastic activity. Upon oral administration, gantotinib selectively and competitively inhibits the activation of JAK2V617F, which may result in the inhibition of

the JAK-STAT signaling pathway and the induction of apoptosis in JAK2V617F-expressing tumor cells. JAK2V617F has a substitution of phenylalanine for valine at amino acid position 617 and plays a key role in tumor cell proliferation and survival. Check for active clinical trials using this agent.

**ganetespib:** A synthetic small-molecule inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Ganetespib binds to and inhibits Hsp90, resulting in the proteasomal degradation of oncogenic client proteins, the inhibition of cell proliferation and the elevation of heat shock protein 72 (Hsp72); it may inhibit the activity of multiple kinases, such as c-Kit, EGFR, and Bcr-Abl, which as client proteins depend on functional Hsp90 for maintenance. Hsp90, a 90 kDa molecular chaperone upregulated in a variety of tumor cells, plays a key role in the conformational maturation, stability and function of "client" proteins within the cell, many of which are involved in signal transduction, cell cycle regulation and apoptosis, including kinases, transcription factors and hormone receptors. Hsp72 exhibits anti-apoptotic functions; its up-regulation may be used as a surrogate marker for Hsp90 inhibition.

**Ganglioside:** A ceramide, common in membranes of the nervous system, in which an oligosaccharide is linked to the ceramide by a glucose residue. OR Sphingolipids, containing complex oligosaccharides as head groups; especially common in nervous tissue. OR A complex molecule that contains both lipids (fats) and carbohydrates (sugars) and is found in the plasma (outer) membrane of many kinds of cells. Several different types of gangliosides have been identified.

**Ganite:** (Other name for: gallium nitrate)

**ganitumab:** A recombinant, fully human monoclonal antibody directed against the insulin-like growth factor 1 receptor (IGF-1R) with potential antineoplastic activity. Ganitumab binds to membrane-bound IGF-1R, preventing binding of the ligand IGF-1 and the subsequent triggering of the PI3K/Akt signaling pathway; inhibition of this survival signaling pathway may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. IGF-1R is a tyrosine kinase and a member of the insulin receptor family. IGF-1R activation stimulates cell proliferation, enables oncogenic transformation, and suppresses apoptosis; IGF-1R signaling has been highly implicated in tumorigenesis and metastasis.

**Gap:** The space inside a reactor fuel rod that exists between the fuel pellet and the fuel rod cladding.

**Gap junctions:** Passageways between the interiors of two contiguous cells. Also known as cell-to-cell channels.

**Gardasil:** (Other name for: quadrivalent human papillomavirus (types 6, 11, 16, 18) recombinant vaccine)

**Gardasil :** A vaccine used to prevent anal, cervical, vulvar, and vaginal cancer caused by human papillomavirus (HPV) types 16 and 18 and genital warts caused by HPV types 6 and 11. Gardasil is approved for use in males and females aged 9 to 26 years. It is a type of quadrivalent vaccine (a vaccine that works against four different viruses or other microorganisms). Also called recombinant human papillomavirus quadrivalent vaccine.

**Gardasil 9:** (Other name for: recombinant human papillomavirus nonavalent vaccine) or A vaccine used to prevent anal, cervical, vulvar, and vaginal cancer caused by human papillomavirus (HPV) types 16, 18, 31, 33, 45, 52 and 58 and genital warts caused by HPV types 6 and 11. Gardasil 9 is approved for use in males aged 9 to 15 years and females aged 9 to 26 years. It is a type of nonavalent vaccine (a vaccine that works against nine different viruses or other microorganisms). Also called recombinant human papillomavirus nonavalent vaccine.

**garden heliotrope :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden valerian, Indian valerian, Mexican valerian, Pacific valerian, valerian, *Valeriana officinalis*, and *Valerianae radix*.

**garden valerian :** A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, Indian valerian, Mexican valerian, Pacific valerian, valerian, *Valeriana officinalis*, and *Valerianae radix*.

**GARDNER:** A unit of color density. Measured by comparison of the material to be analyzed against standards of known intensity. (see RFF 705.10.52 - COLOR).

**garlic:** A bulbous herb isolated from the plant *Allium sativum* with potential antineoplastic activity. Garlic contains a number of different

organosulfur compounds, some of which have displayed antineoplastic activity. Or A European plant that has a bulb used to flavor food. It has also been used in some cultures to treat certain medical conditions including high cholesterol, high blood pressure, infections, and cancer. The scientific name is *Allium sativum*.

**GarliPure Maximum Allicin:** (Other name for: garlic)

**gas:** a fluid having neither independent shape nor volume, but tending to expand indefinitely. The word is often used to denote anesthetics, combustibles (gasoline), poisonous materials, etc., whether liquid or solids at ordinary temperatures. OR The least dense state of matter. OR Gases are groups of atoms that are spread over a large space. One of their physical characteristics is that they fill containers evenly and completely. The atmosphere is made up of gases. OR a state of matter in which molecules are widely separated, fluid, expandable, and compressible. OR Matter in a form that has low density, is easily compressible and expandable, and expands spontaneously when placed in a larger container. Molecules in a gas move freely and are relatively far apart. "Vapor" often refers to a gas made of a substance that is usually encountered as a liquid or solid; for example, gaseous H<sub>2</sub>O is called "water vapor". OR One of the three states of matter. In a gas, the particles are a long way apart and are able to move freely. The particles bounce off each other and off the walls of the container. A gas cannot hold its own shape and will fill any container in which it is put.

**Gas centrifuge:** A uranium enrichment process used to prepare uranium for use in fabricating fuel for nuclear reactors by separating its isotopes (as gases) based on their slight difference in mass. This process uses a large number of interconnected centrifuge machines (rapidly spinning cylinders). No commercial gas centrifuge plants are operating in the United States; however, both Louisiana Energy Services (LES) and United States Enrichment Corporation (USEC) have received licenses to construct and operate such facilities, and both facilities are under construction. For additional information, see Gas Centrifuge Enrichment Facility Licensing and the Fact Sheet on Uranium Enrichment.

**gas chromatography:** An analytical chemistry technique in which a sample is vaporized and passed through a column whose walls are covered with a sticky organic solvent; different chemicals in the sample have

different affinities for the solvent and separate as they pass through the column. OR A chromatographic technique in which the sample is volatilized and passed through a column to separate the components of a sample. The column is packed either with a polymeric stationary phase coated on a solid support or simply a thin layer of polymer on the inner surface of a capillary. OR A way of separating chemical substances from a mixed sample by passing the sample, carried by a moving stream of gas, through a tube packed with a finely divided solid that may be coated with a liquid film. Gas chromatography devices are used to analyze air pollutants, blood alcohol content, essential oils, and food products. OR A common technique used in analytical chemistry that involves vapourisation, separation, and analysis of volatile compounds.

**gas constant:**  $R$  equals 0.082 liter-atmospheres per mole-degree.

**Gas Oil:** Gas Oil is the term given to middle distillate streams, generally used as a fuel in heating and air conditioning systems. In refining terms, gas oil comes between fuel oil and the lighter products such as naphtha and gasoline. Its broader definition covers the oil products diesel and jet fuel. Gas Oil can be used as a feedstock in Petrochemical steam cracking, producing ethylene alongside a wide range of co-products.

**Gas Permeability:** the ability of a gas or other volatile substance to penetrate a material. Materials that will allow significant passage of gases are said to be permeable, while materials that resist or stop the passage of gases are said to offer gas barrier properties.

**Gas-cooled reactor:** A nuclear reactor in which the coolant is a gas.

**Gaseous diffusion:** A uranium enrichment process used to prepare uranium for use in fabricating fuel for nuclear reactors by separating its isotopes (as gases) based on their slight difference in velocity. (Lighter isotopes diffuse faster through a porous membrane or vessel than do heavier isotopes.) This process involves filtering uranium hexafluoride (UF<sub>6</sub>) gas to separate uranium-234 and uranium-235 from uranium-238, in order to increase the percentage of uranium-235 from 1 to 3 percent. The only gaseous diffusion plant in operation in the United States is in Paducah, KY. A similar plant near Piketon, OH, was closed in March 2001. Both plants are leased by the United States Enrichment Corporation (USEC) from the DOE and regulated by the NRC since March 4, 1997. For

additional information, see Gaseous Diffusion and the Fact Sheet on Gaseous Diffusion.

**Gaseous diffusion plant:** A facility where uranium hexafluoride gas is filtered. Uranium-235 is separated from uranium-238, increasing the percentage of uranium-235 from 1 to about 3 percent. The process requires enormous amounts of electric power. For additional detail, see Gaseous diffusion.

**Gases:** A substance possessing perfect molecular mobility and the property of indefinite expansion, as opposed to a solid or liquid; any such fluid or mixture of fluids other than air. Normally, these formless substances completely fill the space, and take the shape of, their container.

**Gasification:** The conversion of soluble and suspended materials into gas during anaerobic decomposition. In clarifiers the resulting gas bubbles can become attached to the settled sludge and cause large clumps of sludge to rise and float on the water surface. In anaerobic sludge digesters, this gas is collected for fuel or disposed of using a waste gas burner.

**Gasket:** Piece used to make a joint fluid-tight. OR A static (stationary) sealing device used to retain fluids under pressure or to seal out foreign matter OR a device installed within the gap of a joint for the purpose of retaining fluid.

**gasohol:** A mixture of 90% gasoline and 10% ethyl alcohol that is used as an automotive fuel.

**gasoline:** A volatile, flammable, liquid mixture of hydrocarbons, obtained from petroleum, and used as fuel for internal-combustion engines. OR Gasoline is a relatively light distillate stream produced as one of the principle products from a crude oil refinery. Gasoline specifications vary from region to region with variation in both performance and environmental characteristics. These specifications include octane level, vapour pressure, as well as a wide variety of component limitations such as sulphur, lead, benzene and olefin limitations.

**gastrectomy :** An operation to remove all or part of the stomach.

**gastric :** Having to do with the stomach.

**gastric acid :** Acid that is released into the stomach from glands in the stomach wall. It helps digest food. Gastric acid is made of hydrochloric acid.

**gastric acid secretion test :** A test used to measure the amount of gastric acid made by the stomach. The patient receives an injection of the hormone gastrin or insulin. A tube is put through the nose or throat into the stomach and samples are taken from the stomach and sent to a laboratory for testing. Also called stomach acid stimulation test and stomach acid test.

**gastric atrophy :** A condition marked by thinning of the inner lining of the stomach wall and the loss of gland cells in the lining that release substances that help with digestion. It may be caused by infection with the bacterium *H. pylori* or by certain autoimmune conditions. Gastric atrophy may increase the risk of stomach cancer.

**gastric cancer :** Cancer that forms in tissues lining the stomach. Also called stomach cancer.

**gastric feeding tube :** A tube that is inserted through the nose, down the throat and esophagus, and into the stomach. It can be used to give drugs, liquids, and liquid food, or used to remove substances from the stomach. Giving food through a gastric feeding tube is a type of enteral nutrition. Also called nasogastric tube and NG tube.

**gastric mucosal hypertrophy :** A condition marked by inflammation and ulcers (breaks on the skin or on the surface of an organ) of the mucosa (inner lining) of the stomach and by overgrowth of the cells that make up the mucosa. Symptoms include vomiting, diarrhea, and weight loss. Patients with gastric mucosal hypertrophy may be at a higher risk of stomach cancer. Also called giant hypertrophic gastritis and Ménétrier disease.

**gastric reflux :** The backward flow of stomach acid contents into the esophagus (the tube that connects the mouth to the stomach). Also called esophageal reflux and gastroesophageal reflux.

**gastric scirrhous carcinoma :** A rare type of stomach cancer that begins in the lining of the stomach and spreads to the muscles of the stomach wall. This causes the wall of the stomach to become thick, hard, and rubbery, which leads to trouble digesting food. Also called linitis plastica.

**Gastrimmune:** (Other name for: gastrin immunotoxin)

**gastrin:** a hormone produced by digestive glands to influence digestive processes.

**gastrin :** A hormone released from special cells in the lining of the stomach after eating. Gastrin causes the stomach to release an acid that

helps digest food.

**gastrin immunotoxin:** An immunotoxin containing an epitope of human gastrin conjugated to diphtheria toxin, with antineoplastic activity. The gastrin epitope in this vaccine is chemically identical or similar to the endogenous gastrin-17 (G-17), a 17-amino acid peptide hormone that stimulates secretion of gastric acid by the stomach. Diphtheria toxin inhibits protein synthesis via modifying translation elongation factor 2 (EF-2). Vaccination with this immunotoxin may elicit production of antibodies against gastrinoma cells overexpressing gastrin, in addition to the toxic effects on protein synthesis exerted by the diphtheria toxin moiety.

**gastrinoma :** A tumor that causes overproduction of gastric acid. It usually begins in the duodenum (first part of the small intestine that connects to the stomach) or the islet cells of the pancreas. Rarely, it may also begin in other organs, including the stomach, liver, jejunum (the middle part of the small intestine), biliary tract (organs and ducts that make and store bile), mesentery, or heart. It is a type of neuroendocrine tumor, and it may metastasize (spread) to the liver and the lymph nodes.

**gastritis :** Inflammation of the lining of the stomach.

**gastroenteritis :** Inflammation of the lining of the stomach and the intestines. Symptoms may include nausea, vomiting, diarrhea, and abdominal cramps (dull or sharp pains). Gastroenteritis may be caused by infection with bacteria, parasites, or viruses. It may also be caused by food poisoning, allergic reactions, or reactions to certain medicines or foods.

**gastroenterologist :** A doctor who has special training in diagnosing and treating disorders of the digestive system.

**gastroesophageal junction :** The place where the esophagus is connected to the stomach.

**gastroesophageal reflux :** The backward flow of stomach acid contents into the esophagus (the tube that connects the mouth to the stomach). Also called esophageal reflux and gastric reflux.

**gastrointestinal :** Refers to the stomach and intestines. Also called GI.

**gastrointestinal carcinoid tumor :** An indolent (slow-growing) cancer that forms in cells that make hormones in the lining of the gastrointestinal tract (the stomach and intestines). It usually occurs in the small intestine, rectum, or appendix (a small fingerlike pouch of the large intestine). Having

gastrointestinal carcinoid tumor increases the risk of forming other cancers of the digestive system.

**gastrointestinal stromal tumor :** A type of tumor that usually begins in cells in the wall of the gastrointestinal tract. It can be benign or malignant. Also called GIST.

**gastrointestinal tract :** The stomach and intestines. The gastrointestinal tract is part of the digestive system, which also includes the salivary glands, mouth, esophagus, liver, pancreas, gallbladder, and rectum.

**GastroMARK:** (Other name for: ferumoxsil oral suspension)

**gastroscope :** A thin, tube-like instrument used to examine the inside of the stomach. A gastroscope has a light and a lens for viewing and may have a tool to remove tissue.

**gastroscopy :** Examination of the inside of the stomach using a gastroscope passed through the mouth and esophagus. A gastroscope is a thin, tube-like instrument with a light and a lens for viewing. It may also have a tool to remove tissue to be checked under a microscope for signs of disease. Also called upper endoscopy.

**gastrostomy tube :** A tube inserted through the wall of the abdomen directly into the stomach. It allows air and fluid to leave the stomach and can be used to give drugs and liquids, including liquid food, to the patient. Giving food through a gastrostomy tube is a type of enteral nutrition. Also called PEG tube and percutaneous endoscopic tube.

**gataparsen sodium:** A second-generation antisense oligonucleotide directed against survivin mRNA with potential antitumor activity. Gataparsen sodium hybridizes to survivin mRNA, thereby blocking translation of survivin protein, a member of the inhibitor of apoptosis (IAP) family. Silencing the expression of survivin may result in the restoration of the apoptotic process in tumor cells, facilitating chemotherapeutic treatment. Survivin, expressed during embryonal development, is upregulated in a variety of human cancers while absent in most normal adult cells; its expression in tumors is associated with a more aggressive phenotype, shorter survival times, and a decreased response to chemotherapy. Check for active clinical trials using this agent.

**Gate:** In injection and transfer molding, the orifice through which the melt enters the cavity. Sometimes the gate has the same cross-section as the

runner leading to it; often, it is severely restricted. OR An orifice through which the melt enters the mold cavity. OR An opening found at the entrance of a cavity image (end of the runner system) that allows material to enter that cavity image. OR In injection and transfer molding, the orifice through which the melt enters the cavity. OR The generic term for the portion of the mold where resin enters the mold cavity. OR A silicone injection molding or plastic orifice through which the silicone rubber or plastic enters the cavity OR The channel into which melted plastic flows into a mold.

**Gate Blush:** A blemish or disturbance in the gate area of an injection molded article.

**Gate Edge:** A gate that is cut along one edge of the silicone rubber or plastic mold cavity

**Gate Fan:** Large cross sectional area for feeding plastic into the silicone rubber or plastic cavity. Flow channel tapered from the silicone rubber or plastic runner to the gate

**Gate Flash:** A gate that encompasses entire periphery of the silicone rubber or plastic part. Usually of low sectional thickness in relation to silicone rubber or plastic part

**Gate Mark:** A raised spot or small depression on the surface of a silicone rubber or plastic injection molded part where the gates interface the cavity

**Gate Sprue:** The type of gate in which the liquid silicone rubber or plastic is injected directly from the molding press into the cavity

**Gate Trim:** Remnant of plastic left over from cutting the component from the runner or sprue, usually to be cut flush with the edge of the component.

**Gate Trim :** Remnant of plastic left over from cutting the component from the runner or sprue, usually to be cut flush with the edge of the component.

**Gate Underside:** The orifice found between the “A” and “B” plate which carries the resin into the cavity in an overlap of the part in such a manner so as to obtain a clean break on the part. Usually found in thermoset molding

**Gating Strategy:** It is the approach you use to choose the number, dimension and location of gates in a mould.

**Gauge:** Term used to describe thickness of a plastic sheet, measured in mil's or microns. Mil (One thousandths of an inch) Term used in the measurement of LDPE and LLDPE can liners. One mil is .001". Can liners range between 0.35 to 4.0 mil. Micron Term used in the measurement of

HMW-HD can liners. 25.4 microns equals .001". 1,000 microns (M) = 1mm. HMW-HDPE can liners are 6 to 24 microns. OR Thickness of recycled plastic or plastic film measured in decimal inches or mils. OR Thickness measurement of plastic film, often expressed in mils. One mil equals one thousandth of an inch (0.001" or 0.001in.).

**Gauge Bands:** Raised regions in the machine direction around the circumference of a roll, produced by winding areas of thicker film in the same place on a roll.

**Gauging devices:** Devices used to measure, monitor, and control the thickness of sheet metal, textiles, paper napkins, newspaper, plastics, photographic film, and other products as they are manufactured. Gauges mounted in fixed locations are designed for measuring or controlling material density, flow, level, thickness, or weight. The gauges contain sealed sources that radiate through the substance being measured to a readout or controlling device. Portable gauging devices, such as moisture density gauges, are used at field locations. These gauges contain a gamma-emitting sealed source, usually cesium-137, or a sealed neutron source, usually americium-241 or beryllium. For additional detail, see Gauging Devices.

**Gaussian:** A popular package in the ab initio software industry is by Gaussian Inc (13). The name refers to the common use of gaussian functions as basis functions in quantum chemistry.

**gavage:** Dose given by intragastric intubation (WHO, 1979). OR A way of giving medicines and liquids, including liquid foods, through a small tube placed through the nose or mouth into the stomach or small intestine. Sometimes the tube is placed into the stomach or small intestine through an incision (cut) made on the outside of the abdomen. Gavage may be added to what a person is able to eat and drink, or it may be the only source of nutrition. It is a type of enteral nutrition. Also called tube-feeding.

**gavilimomab:** A murine IgM monoclonal antibody (MoAb) developed for the potential treatment of graft versus host disease (GvHD). Gavilimomab recognizes human CD147 antigen, weakly expressed on human leukocytes and up-regulated on activated lymphocytes. This MoAb is capable of neutralizing inflammatory reactions via a complement-dependent cytotoxic mechanism. However, gavilimomab does not offer an improvement over

antithymocyte globulin in the treatment of acute steroid resistant GVHD. Check for active clinical trials using this agent.

**gavinostat:** An orally bioavailable hydroxamate inhibitor of histone deacetylase (HDAC) with potential anti-inflammatory, anti-angiogenic, and antineoplastic activities. Gavinostat inhibits class I and class II HDACs, resulting in an accumulation of highly acetylated histones, followed by the induction of chromatin remodeling and an altered pattern of gene expression. At low, nonapoptotic concentrations, this agent inhibits the production of pro-inflammatory cytokines such as tumor necrosis factor- (TNF-), interleukin-1 (IL-1), IL-6 and interferon-gamma. HDAC inhibitor ITF2357 has also been shown to activate the intrinsic apoptotic pathway, inducing apoptosis in hepatoma cells and leukemic cells. This agent may also exhibit anti-angiogenic activity, inhibiting the production of angiogenic factors such as IL-6 and vascular endothelial cell growth factor (VEGF) by bone marrow stromal cells. Check for active clinical trials using this agent.

**gaw:** Group additivity method as implemented in the NIST Chemistry Webbook. See <http://webbook.nist.gov/chemistry/grp-add/> for a group additivity method that predicts enthalpies of formation and entropies. Group additivity methods assume that a molecule can be broken down into separate parts (groups), each of which contributes additively to the total enthalpy or entropy. For example acetone is composed of two methyl groups (each adds -42.7 kJ/mol) and a carbonyl group (which adds -131 kJ/mol) for an estimated enthalpy of formation of -216.4 kJ/mol.

**Gaylord:** A large corrugated container usually sized to match the length and width dimensions of a pallet. Gaylord is actually a trade name that has become synonymous with this specific type of container. OR a term used to designate a very large carton (i.e., 45" x 33" x 51") that will fit one per pallet. There are various sizes depending on the pallet and the customer requirements.

**Gazyva :** A drug used with bendamustine to treat follicular lymphoma that has come back or has not gotten better after treatment with rituximab. It is also used with chlorambucil to treat chronic lymphocytic leukemia (CLL) that has not already been treated. It is also being studied in the treatment of other types of cancer. Gazyva binds to a protein called CD20, which is found on B cells (a type of white blood cell) and some types of leukemia

and lymphoma cells. This may help the immune system kill cancer cells. Gazyva is a type of monoclonal antibody. Also called obinutuzumab.

**GBM:** A fast-growing type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord and has cells that look very different from normal cells. GBM usually occurs in adults and affects the brain more often than the spinal cord. Also called glioblastoma, glioblastoma multiforme, and grade IV astrocytoma.

**GC box:** A component of many eukaryotic promoters, especially those from constitutively expressed genes. The consensus sequence for the GC box is 5'-GGGCGG-3'.

**GC1008:** A substance being studied in the treatment of breast cancer that has spread to other parts of the body. It is also being studied in the treatment of other cancers and conditions. GC1008 binds to a protein called transforming growth factor-beta (TGF-beta), which is found on some cancer cells. GC1008 may help keep cancer cells from growing and prevent the growth of new blood vessels that tumors need to grow. It is a type of monoclonal antibody and a type of antiangiogenesis agent. Also called anti-TGF-beta monoclonal antibody GC1008 and fresolimumab.

**GC1008:** A substance being studied in the treatment of breast cancer that has spread to other parts of the body. It is also being studied in the treatment of other cancers and conditions. GC1008 binds to a protein called transforming growth factor-beta (TGF-beta), which is found on some cancer cells. GC1008 may help keep cancer cells from growing and prevent the growth of new blood vessels that tumors need to grow. It is a type of monoclonal antibody and a type of antiangiogenesis agent. Also called anti-TGF-beta monoclonal antibody GC1008 and fresolimumab.

**GCP:** An international set of guidelines that helps make sure that the results of a clinical trial are reliable and that the patients are protected. GCP covers the way a clinical trial is designed, conducted, performed, monitored, audited, recorded, analyzed, and reported. Also called Good Clinical Practice.

**GCT:** A rare tumor that usually forms in bone, but may also form in cartilage, muscle, fat, blood vessels, or other supportive tissue in the body. Most GCTs occur at the ends of the long bones of the arms and legs, near a joint (such as the knee, wrist, hip, or shoulder). Most are benign (not

cancer) but some are malignant (cancer). GCTs usually occur in young and middle-aged adults. Also called giant cell tumor.

**Gd-DTPA:** A substance used in magnetic resonance imaging (MRI) to help make clear pictures of the brain, spine, heart, soft tissue of joints, and inside bones. Gd-DTPA is being studied in the diagnosis of cancer. It is a type of contrast agent. Also called gadopentetate dimeglumine and Magnevist.

**GD2 lactone/GD3 lactone-KLH conjugate bivalent vaccine:** A cancer vaccine, containing epitopes of the gangliosides GD2 and GD3 conjugated with the immunostimulant keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Vaccination with GD2 lactone/GD3 lactone-KLH conjugate bivalent vaccine may elicit antibodies against tumor cells expressing either epitope, resulting in complement-mediated cytotoxicity (CMC) and antibody-dependent cell-mediated cytotoxicity (ADCC). Located primarily in the nervous system, gangliosides, such as GD2 and GD3, are cell membrane components involved in cellular recognition and cell-cell communication.

**GD2-CAR-expressing autologous T-lymphocytes:** Genetically modified, autologous T-lymphocytes transduced with a retroviral vector encoding a 14g2a.zeta chimeric antigen receptor (CAR) directed against the disialoganglioside GD2, with potential immunomodulating and antineoplastic activities. Upon intravenous administration, the activated T-lymphocytes target the GD2 antigen on tumor cells and selectively kill those cells. The tumor-associated antigen GD2 is overexpressed on the surface of almost all tumors of neuroectodermal origin. Check for active clinical trials using this agent.

**GDC-0449:** A drug used to treat advanced basal cell carcinoma that has spread to other parts of the body or has come back after surgery. It is also used in patients who cannot be treated with surgery or radiation therapy. It is also being studied in the treatment of other types of cancer. GDC-0449 blocks a type of protein involved in tissue growth and repair and may block the growth of cancer cells. It is a type of Hedgehog signaling pathway antagonist. Also called Erivedge and vismodegib.

**gedatolisib:** An agent targeting the phosphatidylinositol 3 kinase (PI3K) and mammalian target of rapamycin (mTOR) in the PI3K/mTOR signaling pathway, with potential antineoplastic activity. Upon intravenous

administration, gedatolisib inhibits both PI3K and mTOR kinases, which may result in apoptosis and growth inhibition of cancer cells overexpressing PI3K/mTOR. Activation of the PI3K/mTOR pathway promotes cell growth, survival, and resistance to chemotherapy and radiotherapy; mTOR, a serine/threonine kinase downstream of PI3K, may also be activated independent of PI3K.

**gefitinib:** An anilinoquinazoline with antineoplastic activity. Gefitinib inhibits the catalytic activity of numerous tyrosine kinases including the epidermal growth factor receptor (EGFR), which may result in inhibition of tyrosine kinase-dependent tumor growth. Specifically, this agent competes with the binding of ATP to the tyrosine kinase domain of EGFR, thereby inhibiting receptor autophosphorylation and resulting in inhibition of signal transduction. Gefitinib may also induce cell cycle arrest and inhibit angiogenesis. Check for active clinical trials using this agent.

**gefitinib :** A drug that is used to treat certain types of non-small cell lung cancer and is being studied in the treatment of other types of cancer. It is a type of epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor. Also called Iressa and ZD1839.

**Geiger counter:** Instrument that measures radiation output.

**Geiger-Mueller counter:** A radiation detection and measuring instrument. It consists of a gas-filled tube containing electrodes, between which there is an electrical voltage, but no current, flowing. When ionizing radiation passes through the tube, a short, intense pulse of current passes from the negative electrode to the positive electrode and is measured or counted. The number of pulses per second measures the intensity of the radiation field. It was named for Hans Geiger and W. Mueller, who invented it in the 1920s. It is sometimes called simply a Geiger counter or a G-M counter and is the most commonly used portable radiation instrument. For related information, see Detecting Radiation.

**gel:** A colloid in which the dispersed phase has combined with the continuous phase to produce a semisolid material as a jelly; a colloid formed by coagulation of a sol. OR A gell is a sol in which the solid particles fuse or entangle to produce a rigid or semirigid mixture. For example, gelatin dissolved in water produces a sol of protein molecules. When the gelatin is cooked, the protein chains entangle and crosslink, forming a gel which is a mesh of solid protein with trapped pockets of

liquid inside. Fruit jellies are also gels OR Small globular mass which has not blended completely into the surrounding material, resulting in a fault in the film or sheet. OR Mass of unmelted polymer or degraded material causing a defect in plastic film. OR The state of a resin which has set to a jelly-like consistency, solid but not yet hard.

**gel electrode :** A device that uses a gel to carry an electric current from the skin to a measuring instrument. A sticky patch may hold the gel electrode on the skin so that the electrical activity of the heart or brain can be measured.

**Gel filtration chromatography:** A technique that makes use of certain polymers that can form porous beads with varying pore sizes. In columns made from such beads, it is possible to separate molecules, which cannot penetrate beads of a given pore size, from small molecules that can. Also called gel-exclusion or molecular sieve chromatography.

**gel filtration:** A chromatographic procedure for the separation of a mixture of molecules on the basis of size; based on the capacity of porous polymers to exclude solutes above a certain size.

**GEL PERMEATION CHROMATOGRAPHY (GPC):** In this measurement technique separation of polymer fractions is effected by flowing a pulse of a polymer solution through a packed bed of porous particles. By measuring the polymer concentration in the effluent stream, and comparing to calibration standards, the molecular weight distribution can be determined.

**Gel time:** The time taken for a resin to set to a non-fluid gel, also called setting time.

**Gel-coat:** A thin layer of unreinforced resin on the outer surface of a reinforced resin moulding (usually applied direct to the mould as the first layer), which hides the fibre pattern of the reinforcement, protects the resin/reinforcement bond, give a smooth external finish, and can also provide special properties. it is usually pigmented.

**Gel-filtration chromatography:** A separation technique based on size differences. A sample is applied to a column consisting of porous beads. Large molecules move through the column faster than small molecules because they cannot enter the beads and, thus, have a shorter path to travel.

**Gelation (compounding):** A stage in compounding material, at which it first becomes a coherent mass.

**Gelclair :** A gel used to lessen pain from mouth sores caused by chemotherapy or radiation therapy, oral surgery, braces, or disease. Gelclair is being studied in the treatment of pain caused by mouth sores in children receiving cancer treatment. It forms a thin layer over the surface of the mouth and throat to prevent irritation while eating, drinking, and talking. Also called polyvinylpyrrolidone-sodium hyaluronate gel.

**geldanamycin analog :** An antineoplastic antibiotic drug that belongs to the family of drugs called ansamycins.

**Gelfoam:** (Other name for: absorbable gelatin sponge)

**Gelling:** A condition in which a paint changes usually on storage into a jelly-like state and cannot be restored to a usable condition.

**GELS:** In polymer science, a gel is defined as a 3-dimensional network of sufficient cross-link density that prevents flow. However, in extrusion practice the term "GEL" encompasses various visual defects in the final product, which sometimes appear as elongated ellipses and even includes various contaminants that are called "fisheyes" (see FISHEYE).

**GEM 231:** A drug that may inhibit the growth of malignant tumors.

**GEM640:** A substance being studied in the treatment of cancer. GEM640 may kill cancer cells by blocking the production of a protein called XIAP that helps cells live longer. It also makes cancer cells more sensitive to anticancer drugs. It is a type of antisense oligonucleotide, and a type of chemosensitizing agent. Also called AEG35156.

**gemcitabine :** The active ingredient in a drug that is used to treat pancreatic cancer that is advanced or has spread. It is also used with other drugs to treat breast cancer that has spread, advanced ovarian cancer, and non-small cell lung cancer that is advanced or has spread. It is also being studied in the treatment of other types of cancer. Gemcitabine blocks the cell from making DNA and may kill cancer cells. It is a type of antimetabolite

**gemcitabine 5'-elaidic acid ester:** A lipophilic, unsaturated fatty acid ester derivative of gemcitabine (dFdC), an antimetabolite deoxynucleoside analogue, with potential antineoplastic activity. Upon hydrolysis intracellularly by esterases, the prodrug gemcitabine is converted into the

active metabolites difluorodeoxycytidine di- and tri-phosphate (dFdCDP and dFdCTP) by deoxycytidine kinase. dFdCDP inhibits ribonucleotide reductase, thereby decreasing the deoxynucleotide pool available for DNA synthesis; dFdCTP is incorporated into DNA, resulting in DNA strand termination and apoptosis. Due to its lipophilicity, gemcitabine 5'-elaidic acid ester exhibits an increased cellular uptake and accumulation, resulting in an increased conversion to active metabolites, compared to gemcitabine. In addition, this formulation of gemcitabine may be less susceptible to deamination and deactivation by deoxycytidine deaminase.

**gemcitabine hydrochloride:** The hydrochloride salt of an analogue of the antimetabolite nucleoside deoxycytidine with antineoplastic activity.

Gemcitabine is converted intracellularly to the active metabolites difluorodeoxycytidine di- and triphosphate (dFdCDP, dFdCTP). dFdCDP inhibits ribonucleotide reductase, thereby decreasing the deoxynucleotide pool available for DNA synthesis; dFdCTP is incorporated into DNA, resulting in DNA strand termination and apoptosis. or A drug used to treat pancreatic cancer that is advanced or has spread. It is also used with other drugs to treat breast cancer that has spread, advanced ovarian cancer, and non-small cell lung cancer that is advanced or has spread. It is also being studied in the treatment of other types of cancer. Gemcitabine hydrochloride blocks the cell from making DNA and may kill cancer cells. Also called Gemzar.

**gemcitabine hydrochloride emulsion:** An orally available nanoparticle-based formulation containing the hydrochloride salt form of gemcitabine, a broad-spectrum antimetabolite and deoxycytidine analogue, with antineoplastic activity. The formulation consists of an oil-in-water emulsion in which gemcitabine is solubilized in the excipient matrix containing a mixture of oil and (co)surfactants. Upon oral administration, gemcitabine is converted into the active metabolites difluorodeoxycytidine diphosphate (dFdCDP) and difluorodeoxycytidine triphosphate (dFdCTP) by deoxycytidine kinase. dFdCTP competes with deoxycytidine triphosphate (dCTP) and is incorporated into DNA, resulting in premature termination of DNA replication and the induction of apoptosis. Further, dFdCDP inhibits ribonucleotide reductase and reduces the deoxynucleotide pool available for DNA synthesis. Compared to gemcitabine alone, the emulsion allows for increased oral bioavailability and decreases its susceptibility to deamination and deactivation by cytidine deaminase.

**gemcitabine prodrug LY2334737:** An orally available valproic acid ester of gemcitabine, a broad-spectrum antimetabolite with antineoplastic activity. Upon administration, gemcitabine prodrug LY2334737 is hydrolyzed by carboxylesterase 2 (CES2) and releases gemcitabine systemically over a period of time consistent with formation rate-limited kinetics. In turn, gemcitabine is converted into the active metabolites difluorodeoxycytidine diphosphate and triphosphate (dFdCDP and dFdCTP) by deoxycytidine kinase. dFdCDP inhibits ribonucleotide reductase, thereby decreasing the deoxynucleotide pool available for DNA replication; dFdCTP is incorporated into DNA, resulting in premature termination of DNA replication and eventually the induction of apoptosis. Compared to gemcitabine, this prodrug is able to avoid hydrolysis in enterocytes and the portal circulation thus avoiding first pass metabolism and increasing systemic gemcitabine availability. In addition, the slow release of gemcitabine may enhance efficacy while lowering toxicity. CES2, a serine ester hydrolase, is expressed in certain tumors which may allow for increased conversion of gemcitabine at the tumor site, thus increasing cytotoxicity. Check for active clinical trials using this agent.

**gemcitabine-cisplatin :** A chemotherapy combination used to treat malignant mesothelioma, advanced non-small cell lung cancer, advanced bladder cancer, advanced cervical cancer, pancreatic cancer, and epithelial ovarian cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs gemcitabine hydrochloride and cisplatin. Also called gemcitabine-cisplatin regimen.

**gemcitabine-cisplatin regimen:** A chemotherapy regimen consisting of gemcitabine hydrochloride and cisplatin used in the treatment of advanced-stage non-small cell lung, advanced-stage bladder, advanced-stage cervical, pancreatic, and epithelial ovarian cancers; this regimen is also used in the treatment of malignant mesothelioma. or A chemotherapy combination used to treat malignant mesothelioma, advanced non-small cell lung cancer, advanced bladder cancer, advanced cervical cancer, pancreatic cancer, and epithelial ovarian cancer. It is also being studied in the treatment of other types of cancer. It includes the drugs gemcitabine hydrochloride and cisplatin. Also called gemcitabine-cisplatin.

**gemcitabine-erlotinib regimen:** A first-line chemotherapy regimen consisting of gemcitabine and erlotinib used for the treatment of locally

advanced and metastatic pancreatic cancer. Or A chemotherapy combination used for the treatment of locally advanced and metastatic pancreatic cancer. It includes the drugs gemcitabine hydrochloride and erlotinib hydrochloride. Also called gemcitabine-Tarceva regimen.

**gemcitabine-erlotinib regimen :** A chemotherapy combination used for the treatment of locally advanced and metastatic pancreatic cancer. It includes the drugs gemcitabine hydrochloride and erlotinib hydrochloride. Also called gemcitabine-Tarceva regimen.

**gemcitabine-oxaliplatin :** A chemotherapy combination used to treat pancreatic cancer and some other types of cancer. It includes the drugs gemcitabine hydrochloride and oxaliplatin. Also called gemcitabine-oxaliplatin regimen and GEMOX.

**gemcitabine-oxaliplatin regimen:** A regimen consisting of gemcitabine and oxaliplatin used for the treatment of biliary adenocarcinoma, pancreatic cancer, hepatocellular cancer, and testicular cancer. This regimen is currently being studied in a variety of other cancers. Or A chemotherapy combination used to treat pancreatic cancer and some other types of cancer. It includes the drugs gemcitabine hydrochloride and oxaliplatin. Also called gemcitabine-oxaliplatin and GEMOX.

**gemcitabine-phosphoramidate NUC-1031:** A pyrimidine analogue and a proprietary prodrug based on an aryloxy phosphoramidate derivative of gemcitabine with potential antineoplastic activity. Upon intravenous administration and cellular uptake, NUC-1031 is converted into the active metabolites difluorodeoxycytidine di- and triphosphate (dFdCDP, dFdCTP). dFdCDP inhibits ribonucleotide reductase, thereby decreasing the deoxynucleotide pool available for DNA replication; dFdCTP is incorporated into DNA, resulting in premature termination of DNA replication and eventually induction of apoptosis. With the phosphoramidate moiety on the gemcitabine monophosphate group, NUC-1031 has improved properties over its parent molecule: 1) is more lipophilic and accumulates in cancer cells by passive diffusion and does not require a nucleoside transporter, 2) as the agent is delivered in the monophosphate form, the first phosphorylation step by deoxycytidine kinase is not required, 3) this agent is not susceptible to deactivation by cytidine deaminase cleavage of the monophosphorylated form. Altogether, this may help overcome resistance to gemcitabine.

**gemcitabine-Tarceva regimen :** A chemotherapy combination used for the treatment of locally advanced and metastatic pancreatic cancer. It includes the drugs gemcitabine hydrochloride and erlotinib hydrochloride. Also called gemcitabine-erlotinib regimen.

**gemfibrozil:** A fibric acid derivative with hypolipidemic effects. Gemfibrozil interacts with peroxisome proliferator-activated receptors (PPAR $\alpha$ ) resulting in PPAR $\alpha$ -mediated stimulation of fatty acid oxidation and an increase in lipoprotein lipase (LPL) synthesis. This enhances triglyceride-rich lipoprotein clearance and reduces the expression of apolipoprotein C-III (apoC-III). The reduction in hepatic production of apoC-III results in subsequent reduction of serum levels of very-low-density-lipoprotein cholesterol (VLDL-C). In addition, gemfibrozil-mediated PPAR $\alpha$  stimulation of apoA-I and apoA-II expression results in an increase in high-density lipoprotein cholesterol (HDL-C). Check for active clinical trials using this agent.

**gemigliptin:** An orally bioavailable inhibitor of the serine protease dipeptidyl peptidase 4 (DPP-4), with hypoglycemic and potential renoprotective activities. Upon administration, gemigliptin binds to DPP-4 and inhibits the breakdown of the incretin hormones, glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP). This prolongs incretin activity, increases postprandial insulin secretion from pancreatic beta cells, decreases glucagon secretion, delays gastric emptying and lowers blood glucose levels. In addition, gemigliptin exerts a renoprotective effect, probably through enhanced GLP-1 signaling, may prevent apoptosis and acute kidney injury induced by nephrotoxic agents, and may protect against diabetic nephropathy.

**geminal:** a term that describes the location of two identical atoms or groups as being bonded to the same carbon atom; a geminal dihalide, for example. (Compare with "vicinal.")

**GEMOX:** A chemotherapy combination used to treat pancreatic cancer and some other types of cancer. It includes the drugs gemcitabine hydrochloride and oxaliplatin. Also called gemcitabine-oxaliplatin and gemcitabine-oxaliplatin regimen.

**gemtuzumab ozogamicin:** A recombinant, humanized anti-CD33 monoclonal antibody attached to the cytotoxic antitumor antibiotic calicheamicin. In this conjugate, the antibody binds to and is internalized by

tumor cells expressing CD33 antigen (a sialic acid-dependent glycoprotein commonly found on the surface of leukemic blasts), thereby delivering the attached calicheamicin to CD33-expressing tumor cells. Calicheamicin binds to the minor groove of DNA, causing double strand DNA breaks and resulting in inhibition of DNA synthesis. or A drug that was used to treat acute myeloid leukemia (AML) that recurred (came back). It was used in older patients who were not able to take other anticancer drugs.

Gemtuzumab ozogamicin was taken off the market but continues to be studied in clinical trials for the treatment of certain types of leukemia. It contains a monoclonal antibody that binds to a protein called CD33, which is found on some leukemia cells. It also contains a toxic substance, which may help kill cancer cells. Gemtuzumab ozogamicin is a type of antibody-drug conjugate. Also called Mylotarg.

**gemtuzumab ozogamicin :** A drug that was used to treat acute myeloid leukemia (AML) that recurred (came back). It was used in older patients who were not able to take other anticancer drugs. Gemtuzumab ozogamicin was taken off the market but continues to be studied in clinical trials for the treatment of certain types of leukemia. It contains a monoclonal antibody that binds to a protein called CD33, which is found on some leukemia cells. It also contains a toxic substance, which may help kill cancer cells. Gemtuzumab ozogamicin is a type of antibody-drug conjugate. Also called Mylotarg.

**Gemzar :** A drug used to treat pancreatic cancer that is advanced or has spread. It is also used with other drugs to treat breast cancer that has spread, advanced ovarian cancer, and non-small cell lung cancer that is advanced or has spread. It is also being studied in the treatment of other types of cancer. Gemzar blocks the cell from making DNA and may kill cancer cells. Also called gemcitabine hydrochloride.

**Genasense :** A substance being studied in the treatment of cancer. It may kill cancer cells by blocking the production of a protein that makes cancer cells live longer and by making them more sensitive to anticancer drugs. It is a type of antisense oligodeoxyribonucleotide. Also called augmerosen, bcl-2 antisense oligodeoxynucleotide G3139, and oblimersen sodium.

**Gencept:** (Other name for: ethinyl estradiol/norethindrone)

**gene:** The fundamental physical and functional unit of heredity. A gene is an ordered sequence of nucleotides located in a particular position on a

particular chromosome that encodes a specific functional product (i.e., a protein or RNA molecule). OR This is the part of the DNA molecule in chromosomes which carries the information defining the sequence of amino-acids in a specific polypeptide chain. OR the functional segment of chromosomes. OR A segment of the genome that codes for a functional product. OR A chromosomal segment that codes for a single functional polypeptide chain or RNA molecule.

**gene :** The basic unit of heredity that occupies a specific location on a chromosome. Each consists of nucleotides arranged in a linear manner. Most genes code for a specific protein or segment of protein leading to a particular characteristic or function. Or The functional and physical unit of heredity passed from parent to offspring. Genes are pieces of DNA, and most genes contain the information for making a specific protein.

**Gene amplification:** The duplication of a particular gene within a chromosome two or more times.

**gene amplification :** An increase in the number of copies of a gene. There may also be an increase in the RNA and protein made from that gene. Gene amplification is common in cancer cells, and some amplified genes may cause cancer cells to grow or become resistant to anticancer drugs. Genes may also be amplified in the laboratory for research purposes.

**gene deletion :** The loss of all or a part of a gene. There may also be a change in the RNA and protein made from that gene. Certain gene deletions are found in cancer and in other genetic diseases and abnormalities.

**Gene duplication:** Duplication of a gene in the process of replication. One of the duplication products may accumulate mutations and eventually evolve into a gene with a different but related function.

**gene expression:** Transcription and, in the case of proteins, translation to yield the product of a gene; a gene is expressed when its biological product is present and active.

**gene expression :** The process by which a gene gets turned on in a cell to make RNA and proteins. Gene expression may be measured by looking at the RNA, or the protein made from the RNA, or what the protein does in a cell.

**gene expression profile :** A laboratory test that identifies all of the genes in a cell or tissue that are making messenger RNA. Messenger RNA

molecules carry the genetic information needed to make proteins. A gene expression profile may be used to find and diagnose a disease or condition or to see how well the body responds to treatment.

**gene flow:** a mechanism of evolution that results when individuals migrate from one group to another and contribute their genes to the gene pool of the new population.

**gene linkage:** the concept of transfer of a linkage group.

**gene linkage map:** a map that pinpoints the location of genes based on their connection to certain marker gene sequences.

**gene pool:** the collection of genes within a population; as changes in the gene pool occur, a population evolves.

**Gene splicing:** The cutting and rejoining of DNA sequences. OR The enzymatic attachment of one gene, or part of a gene, to another.

**gene therapy :** A type of experimental treatment in which foreign genetic material (DNA or RNA) is inserted into a person's cells to prevent or fight disease. Gene therapy is being studied in the treatment of certain types of cancer.

**gene transfer :** The insertion of genetic material into a cell.

**gene-modified :** Cells that have been altered to contain different genetic material than they originally contained.

**General acid catalysis:** Acid catalysis in which the source of the proton is a donor group rather than a free  $H^+$ .

**General acid-base catalysis:** Catalysis in which a molecule other than water plays the role of a proton donor or acceptor. OR Catalysis involving proton transfer(s) to or from a molecule other than water.

**general anesthesia :** A temporary loss of feeling and a complete loss of awareness that feels like a very deep sleep. It is caused by special drugs or other substances called anesthetics. General anesthesia keeps patients from feeling pain during surgery or other procedures.

**general circulation models:** Hydrodynamic models of the atmosphere on a grid or spectral resolution that determine the surface pressure and the vertical distributions of velocity, temperature, density, and water vapor as functions of time from the mass conservation and hydrostatic laws, the first law of thermodynamics, Newton's second law of motion, the equation of state, and the conservation law for water vapor. Abbreviated as GCM.

Atmospheric general circulation models are abbreviated AGCM, while oceanic general circulation models are abbreviated OGCM.

**General recombination:** Recombination that occurs between homologous chromosomes at homologous sites.

**general surgery :** The branch of surgery that covers the main areas of surgical treatment. General surgeons treat diseases of the abdomen, breast, head and neck, blood vessels, and digestive tract. They also manage care of patients who have been injured or who have deformities or other conditions that need surgery.

**generalized anxiety disorder :** A condition marked by excessive worry and feelings of fear, dread, and uneasiness that last six months or longer. Other symptoms of generalized anxiety disorder include being restless, being tired or irritable, muscle tension, not being able to concentrate or sleep well, shortness of breath, fast heartbeat, sweating, and dizziness. Also called GAD.

**Generation (gross):** The total amount of electric energy produced by a generating station as measured at the generator terminals.

**Generation (net):** The gross amount of electric energy produced by a generating station, minus the amount used to operate the station. Net generation is usually measured in watthours (Wh).

**Generation time:** The time it takes for a cell to double its mass under specified conditions. OR The time required for a given population to double in size. This time can be as short as 20 minutes or as long as a week.

**Generator capacity:** The maximum amount of electric energy that a generator can produce (from the mechanical energy of the turbine), adjusted for ambient conditions. Generator capacity is commonly expressed in megawatts (MW).

**Generator nameplate capacity:** The maximum amount of electric energy that a generator can produce under specific conditions, as rated by the manufacturer. Generator nameplate capacity is usually expressed in kilovolt-amperes (kVA) and kilowatts (kW), as indicated on a nameplate that is physically attached to the generator.

**generic :** Official nonbrand names by which medicines are known. Generic names usually refer to the chemical name of the drug.

**genetic :** Having to do with genes. Most genes are sequences of DNA that contain information for making specific proteins or molecules of RNA that perform important functions in a cell. The information in genes is passed from parents to children.

**genetic analysis :** The study of a sample of DNA to look for mutations (changes) that may increase risk of disease or affect the way a person responds to treatment.

**genetic anticipation :** A phenomenon in which the signs and symptoms of some genetic conditions tend to become more severe and/or appear at an earlier age as the disorder is passed from one generation to the next. Huntington disease is an example of a genetic disorder in which the biological mechanism for this phenomenon has been well documented. In other cases, it may be due to factors such as increased surveillance or other nongenetic causes.

**Genetic code:** The relation between nucleic acid sequence information and protein sequence information. OR The set of triplet code words in DNA (or mRNA) coding for the amino acids of proteins.

**genetic counseling :** A communication process between a specially trained health professional and a person concerned about the genetic risk of disease. The person's family and personal medical history may be discussed, and counseling may lead to genetic testing.

**genetic counseling :** A communication process that seeks to assist affected or at-risk individuals and families in understanding the natural history, disease risks, and mode of transmission of a genetic disorder; to facilitate informed consent for genetic testing when appropriate; to discuss options for risk management and family planning; and to provide for or refer individuals for psychosocial support as needed.

**genetic drift:** a mechanism of evolution that occurs when a small group of individuals leaves a population and establishes a new one in a geographically isolated region.

**Genetic engineering:** The manipulation of an organism's genes-introducing, eliminating, or changing them-using modern molecular biology techniques OR Scientists isolate a strand of DNA responsible for specific desired talents, but other undesirable traits, such as being slow-growing, finicky, delicate or belonging to a pathogenic organism, make the source strain unsuitable for large-scale commercial growth to produce desired raw

enzymes or end product. This isolated strand of desired DNA is often coupled with a gene for resistance to a specific antibiotic that is not native to a selected, safe, fast-growing, robust production strain so that exposing the genetically engineered cell to high levels of the antibiotic will kill off ALL clone offspring cells that did not incorporate the desired plasmid.

**genetic heterogeneity :** The production of the same or similar phenotypes (observed biochemical, physiological, and morphological characteristics of a person determined by his/her genotype) by different genetic mechanisms. There are two types: (1) allelic heterogeneity – when different alleles at a locus can produce variable expression of a condition; and (2) locus heterogeneity – the term used to describe disease in which mutations at different loci can produce the same disease phenotype.

**genetic infantile agranulocytosis :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called congenital neutropenia, infantile genetic agranulocytosis, Kostmann disease, Kostmann neutropenia, and Kostmann syndrome.

**genetic information:** The hereditary information contained in a sequence of nucleotide bases in chromosomal DNA or RNA.

**Genetic map:** The arrangement of genes or other identifiable sequences on a chromosome. OR A diagram showing the relative sequence and position of specific genes along a chromosome.

**genetic marker :** An identifiable segment of DNA (e.g., Single Nucleotide Polymorphism [SNP], Restriction Fragment Length Polymorphism [RFLP], Variable Number of Tandem Repeats [VNTR], microsatellite) with enough variation between individuals that its inheritance and co-inheritance with alleles of a given gene can be traced; used in linkage analysis. or A specific sequence of DNA at a known location on a chromosome. There are many genetic markers on each chromosome. Genetic markers and genes that are close to each other on a chromosome are usually inherited (passed from parent to child) together. This may help researchers find a gene near a marker that may cause a certain disease or trait within a family. Examples of genetic markers are single polymorphism nucleotides (SNPs) and microsatellites.

**genetic marker of susceptibility :** A specific change in a person's DNA that makes the person more likely to develop certain diseases such as cancer.

**genetic predisposition :** Increased likelihood or chance of developing a particular disease due to the presence of one or more gene mutations and/or a family history that indicates an increased risk of the disease. Also called genetic susceptibility. Or An inherited increase in the risk of developing a disease. Also called genetic susceptibility.

**genetic profile :** Information about specific genes, including variations and gene expression, in an individual or in a certain type of tissue. A genetic profile may be used to help diagnose a disease or learn how the disease may progress or respond to treatment with drugs or radiation.

**genetic screening :** Genetic testing designed to identify individuals in a given population who are at higher risk of having or developing a particular disorder, or carrying a gene for a particular disorder.

**genetic susceptibility :** Increased likelihood or chance of developing a particular disease due to the presence of one or more gene mutations and/or a family history that indicates an increased risk of the disease. Also called genetic predisposition. Or An inherited increase in the risk of developing a disease. Also called genetic predisposition.

**genetic testing :** The process of analyzing cells or tissues to look for genetic changes that may be a sign of a disease or condition, such as cancer. These changes may be a sign that a person has an increased risk of developing a specific disease or condition.

**genetic variant :** An alteration in the most common DNA nucleotide sequence. The term variant can be used to describe an alteration that may be benign, pathogenic, or of unknown significance. The term variant is increasingly being used in place of the term mutation.

**genetically engineered HSV-1 expressing IL-12:** A genetically engineered, replication selective, infected cell protein (ICP) 34.5 gene-deleted, oncolytic human simplex virus type 1 (HSV-1) expressing the human immunostimulating cytokine interleukin-12 (IL-12), with potential antineoplastic activity. Upon intratumoral administration of HSV-1 expressing IL-12, the IL-12-expressing HSV-1 preferentially infects and replicates in tumor cells of neuronal origin causing viral-mediated tumor cell lysis. The released virus particles, in turn, infect and replicate in

neighboring tumor cells. In addition, the IL-12-expressing HSV-1 promotes the secretion of IL-12 by the tumor cells. IL-12 promotes the activation of natural killer cells, which induces both the secretion of interferon-gamma and a cytotoxic T-lymphocyte (CTL) response against the tumor cells. This results in both immune-mediated tumor cell death and further inhibition of tumor cell proliferation. Deletion of the gene encoding for ICP34.5 imparts tumor selectivity by preventing replication in healthy cells.

**genetically-modified MAGE-A3-expressing MG1 Maraba virus vaccine:** A vaccine consisting of the attenuated, genetically-modified, oncolytic form of the Maraba virus, MG1, which has been engineered to express a gene encoding the cancer testis antigen melanoma antigen family A3 (MAGE-A3), with potential antineoplastic activity. Upon administration of genetically-modified MAGE-A3-expressing MG1 Maraba virus vaccine, the attenuated Maraba virus selectively and rapidly replicates in cancer cells; however, it is unable to replicate in normal, healthy cells. This induces a selective Maraba virus-mediated cytotoxicity in those cancer cells, and leads to cancer cell lysis. In addition, the expression of MAGE-A3 further stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing MAGE-A3. The tumor-associated antigen MAGE-A3 is overexpressed by a variety of cancer cell types. The attenuated virus is a double mutant strain with single amino acid substitutions occurring in both G protein (Q242R) and M protein (L123W).

**geneticist :** A scientist who has special training in the study of genes and heredity (the passing of genetic information from parents to their children). A medical geneticist is a doctor who specializes in diagnosing and treating genetic disorders or conditions. Medical geneticists also counsel individuals and families at risk for certain genetic disorders or cancers.

**genetics :** The study of genes and heredity. Heredity is the passing of genetic information and traits (such as eye color and an increased chance of getting a certain disease) from parents to offspring.

**Genexol-PM:** (Other name for: paclitaxel-loaded polymeric micelle)

**Gengraf:** (Other name for: cyclosporine)

**genistein:** A soy-derived isoflavone and phytoestrogen with antineoplastic activity. Genistein binds to and inhibits protein-tyrosine kinase, thereby disrupting signal transduction and inducing cell differentiation. This agent

also inhibits topoisomerase-II, leading to DNA fragmentation and apoptosis, and induces G2/M cell cycle arrest. Genistein exhibits antioxidant, antiangiogenic, and immunosuppressive activities.

**genistein** : An isoflavone found in soy products. Soy isoflavones are being studied to see if they help prevent cancer.

**genital** : Refers to the genitalia (external and internal sex organs and glands).

**genital wart** : A raised growth on the surface of the genitals caused by human papillomavirus (HPV) infection. The HPV in genital warts is very contagious and can be spread by skin-to-skin contact, usually during oral, anal, or genital sex with an infected partner. Also called condyloma.

**genitourinary system** : The parts of the body that play a role in reproduction, getting rid of waste products in the form of urine, or both.

**genodermatosis** : An inherited syndrome that includes a dermatological (skin) phenotype.

**genome**: the set of all genes that specify an organism's traits. OR The total genetic content of a cell or a virus. OR All the genetic information encoded in a cell or virus. OR An organism's complete set of genetic information. OR The complete set of DNA (genetic material) in an organism. In people, almost every cell in the body contains a complete copy of the genome. The genome contains all of the information needed for a person to develop and grow. Studying the genome may help researchers understand how different types of cancer form and respond to treatment. This may lead to new ways to diagnose, treat, and prevent cancer.

**genome-wide association study** : A genome-wide association study (GWAS) is a way for scientists to identify inherited genetic variants associated with risk of disease or a particular trait. This method surveys the entire genome for genetic polymorphisms, typically single nucleotide polymorphisms (SNPs) (pronounced "snips"), that occur more frequently in cases (people with the disease or trait being assessed) than in controls (people without the disease or trait). Also called GWAS. or A study that compares DNA markers across the genome (the complete genetic material in a person) in people with a disease or trait to people without the disease or trait. These studies may uncover clues to help prevent, diagnose, and treat disease. Also called GWAS.

**genomic characterization :** A laboratory method that is used to learn about all the genes in a person or in a specific cell type, and the way those genes interact with each other and with the environment. Genomic characterization may be used to find out why some people get certain diseases while others do not, or why people react in different ways to the same drug. It may also be used to help develop new ways to diagnose, treat, and prevent diseases, such as cancer. Also called genomic profiling.

**genomic imprinting :** An epigenetic process resulting in the inactivation of an allele depending on which parent it was inherited from. Genomic imprinting can have clinical relevance because it may affect the expression of a gene mutation (i.e., the phenotype) in the offspring of an affected parent depending on which parent is passing on the mutation.

**Genomic library:** A collection of DNA fragments, inserted into vector molecules, that represents the entire genome of an organism.

**genomic profiling :** A laboratory method that is used to learn about all the genes in a person or in a specific cell type, and the way those genes interact with each other and with the environment. Genomic profiling may be used to find out why some people get certain diseases while others do not, or why people react in different ways to the same drug. It may also be used to help develop new ways to diagnose, treat, and prevent diseases, such as cancer. Also called genomic characterization.

**genomic sequencing :** A laboratory method that is used to determine the entire genetic makeup of a specific organism or cell type. This method can be used to find changes in areas of the genome that may be important in the development of specific diseases, such as cancer.

**genomics :** The study of the complete set of DNA (including all of its genes) in a person or other organism. Almost every cell in a person's body contains a complete copy of the genome. The genome contains all the information needed for a person to develop and grow. Studying the genome may help researchers understand how genes interact with each other and with the environment and how certain diseases, such as cancer, diabetes, and heart disease, form. This may lead to new ways to diagnose, treat, and prevent disease.

**Genotropin:** (Other name for: somatotropin)

**genotype:** the gene composition of a living organism. OR The genetic characteristics of an organism (distinguished from its observable

characteristics, or phenotype). OR The genetic constitution of an organism, as distinct from its physical characteristics, or phenotype. OR At its broadest level, genotype includes the entire genetic constitution of an individual. It is often applied more narrowly to the set of alleles present at one or more specific loci.

**genus:** a grouping of similar species (plural, genera).

**geocentric:** a model in which Earth is at the center of the universe.

**geochemistry:** The study of materials and chemical reactions in rocks, minerals, magma, seawater, and soil.

**geographic distribution:** the distribution of species in geographical areas.

**geologic cross section:** a vertical slice across a map area; depicts the spatial relationships of rock units and structures beneath the surface.

**Geological repository:** An excavated, underground facility that is designed, constructed, and operated for safe and secure permanent disposal of high-level radioactive waste. A geological repository uses an engineered barrier system and a portion of the site's natural geology, hydrology, and geochemical systems to isolate the radioactivity of the waste. The Nuclear Waste Policy Act of 1982, as amended, specifies that this waste will be disposed of in a deep geologic repository, and that Yucca Mountain, NV, will be the single candidate site for such a repository. On June 3, 2008, DOE submitted a license application to the NRC seeking authorization to construct the Yucca Mountain repository. For further detail, see High-Level Waste Disposal.

**Geometric Dimensioning & Tolerancing:** A means of specifying engineering design and drawing requirements with respect to actual function and relationship of part features, it is a technique which properly applied ensures the most economical and effective production of these features

**geometric isomer:** Geometric isomers are molecules that have the same molecular formula and bond connections, but distinctly different shapes.

**geometric isomers:** Isomers related by rotation about a double bond; also called cis and trans isomers.

**geomorphology:** The study of present-day landforms, including their classification, description, nature, origin, development, and relationships to

underlying structures. Also the history of geologic changes as recorded by these surface features. The term is sometimes restricted to features produced only by erosion and deposition.

**geophysics:** a field concerning the application of the laws of physics to the study of the earth.

**geosphere:** The solid mass (lithosphere) of the Earth as distinct from the atmosphere and hydrosphere or all three of these layers combined.

**geostatic pressure:** pressure that is equally applied to all sides of a deeply buried mass of rock.

**geostrophic flow:** A type of movement where the Coriolis force balances exactly the horizontal pressure force.

**geothermal energy:** the energy produced when exceptionally hot water underground is tapped by wells and used to generate electricity.

**geothermal gradient:** the rate at which temperature increases with depth.

**geotropism:** the turning of a plant away from or toward the earth.

**geranium :** A type of plant that is native to southern Africa and has white, pink, purple, or red flowers and 3- to 5-lobed leaves. An essential oil that smells like roses is taken from the leaves and used in perfume, in mosquito repellants, and in aromatherapy to treat skin problems and to reduce stress. The scientific name is *Pelargonium graveolens*. Also called pelargonium.

**germ :** A bacterium, virus, or other microorganism that can cause infection and disease.

**germ cell :** A reproductive cell of the body. Germ cells are egg cells in females and sperm cells in males.

**germ cell tumor :** A type of tumor that begins in the cells that give rise to sperm or eggs. Germ cell tumors can occur almost anywhere in the body and can be either benign or malignant.

**germ-line cell:** A type of animal cell that is formed early in embryogenesis and may multiply by mitosis or may produce, by meiosis, cells that develop into gametes (egg or sperm cells).

**German chamomile :** A plant whose daisy-like flowers are used in tea to calm and relax, improve sleep, and help stomach problems. German chamomile has been studied in the prevention of mucositis (mouth sores) caused by chemotherapy and radiation therapy. It has also been used in

some cultures to treat skin conditions, mild infections, and other disorders. The scientific name is *Matricaria recutita*.

**German Commission E :** The German Federal Institute for Drugs and Medical Devices Commission E. A committee made up of scientists, toxicologists, doctors, and pharmacists formed by the German government in 1978 to find out if herbs sold in Germany are safe and effective. The Commission has published information on the uses, side effects, and drug interactions of more than 300 herbs.

**Germanium:** Symbol:"Ge" Atomic Number:"32" Atomic Mass: 72.59amu. Germanium is classified as a semi-metallic element. Germanium is a grayish crystalline metal that is very brittle. You will find it in glass lenses, fluorescent lights, electronics, and many alloys.

**germfree :** Free of bacteria, viruses, and other microorganisms that can cause infection and disease.

**germicide :** Any substance or process that kills germs (bacteria, viruses, and other microorganisms that can cause infection and disease). Also called microbicide.

**germline :** The cells from which eggs or sperm (i.e., gametes) are derived.

**germline DNA :** Germline DNA refers to tissue derived from reproductive cells (egg or sperm) that become incorporated into the DNA of every cell in the body of the offspring. A germline mutation may be passed from parent to offspring. Also called constitutional DNA. Or The DNA in germ cells (egg and sperm cells that join to form an embryo). Germline DNA is the source of DNA for all other cells in the body. Also called constitutional DNA.

**germline mutation :** A gene change in a body's reproductive cell (egg or sperm) that becomes incorporated into the DNA of every cell in the body of the offspring. Germline mutations are passed on from parents to offspring. Also called hereditary mutation.

**germline variant :** A gene change in a reproductive cell (egg or sperm) that becomes incorporated into the DNA of every cell in the body of the offspring. A variant contained within the germline can be passed from parent to offspring, and is, therefore, hereditary.

**Gerota's capsule :** A fibrous envelope of tissue that surrounds the kidney. Also called Gerota's fascia and renal fascia.

**Gerota's fascia :** A fibrous envelope of tissue that surrounds the kidney. Also called Gerota's capsule and renal fascia.

**Gerson therapy :** A diet plan that has been claimed to be a treatment for cancer, migraine, tuberculosis, and other diseases. It is a vegetarian diet that includes eating organic fruits and vegetables and 13 glasses of fresh juice each day. It also includes supplements with iodine, vitamin B-12, potassium, thyroid hormone, liver extract, and pancreatic enzymes. No clinical trial to test Gerson therapy has been reported.

**gerund:** a noun created from the -ing form of a verb; gerunds act as subjects and objects in sentences.

**gerund phrase:** phrases that begin with the -ing form of a verb and have objects and modifiers; a gerund phrase always acts as a noun in a sentence, not as an adjective.

**Gesso:** A composition for executing designs in relief on woodwork and plaster “ made of whiting and glue or plaster of Paris and size.

**gestational trophoblastic disease :** A rare condition in which abnormal cells grow inside the uterus from tissue that forms after conception (the joining of sperm and egg). This tissue is made of trophoblastic cells, which normally surround the fertilized egg in the uterus and help connect the fertilized egg to the wall of the uterus. These cells also form part of the placenta (the organ that passes nutrients from the mother to the fetus). Most gestational trophoblastic diseases are benign (not cancer) and do not spread, but some types are malignant (cancer) and spread to nearby tissues or other parts of the body. The two main types of gestational trophoblastic diseases are hydatidiform mole and choriocarcinoma. Also called gestational trophoblastic tumor, GTD, and GTT.

**gestational trophoblastic tumor :** A rare condition in which abnormal cells grow inside the uterus from tissue that forms after conception (the joining of sperm and egg). This tissue is made of trophoblastic cells, which normally surround the fertilized egg in the uterus and help connect the fertilized egg to the wall of the uterus. These cells also form part of the placenta (the organ that passes nutrients from the mother to the fetus). Most gestational trophoblastic tumors are benign (not cancer) and do not spread, but some types are malignant (cancer) and spread to nearby tissues or other parts of the body. The two main types of gestational trophoblastic tumors

are hydatidiform mole and choriocarcinoma. Also called gestational trophoblastic disease, GTD, and GTT.

**Gesterol 100:** (Other name for: therapeutic progesterone)

**geyser:** an explosive hot spring that periodically erupts scalding water and steam; water temperatures in a geyser are generally near boiling. OR groundwater deep in the Earth that turns to steam and is forced to the surface when enough pressure is generated.

**geyserite:** a build-up of ledgelike layers, generally of calcite or silica, around a geyser.

**GF:** Glass-filled. This refers to a resin with glass fibers mixed into it. Glass-filled resins are much stronger and more rigid than the corresponding unfilled resin, but are also more brittle.

**gFOBT:** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards coated with a chemical substance called guaiac and sent to a doctor or laboratory for testing. A testing solution is put on the cards and the guaiac causes the stool sample to change color. If there is blood in the stool, the color changes very quickly. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called guaiac fecal occult blood test, guaiac smear test, and stool guaiac test.

**GG745:** A drug used to treat symptoms of an enlarged prostate gland. It is being studied in the treatment of male hair loss and prostate cancer. GG745 blocks enzymes the body needs to make male sex hormones. It is a type of 5-alpha reductase inhibitor. Also called Avodart and dutasteride.

**ghost function:** A basis function that is not accompanied by an atomic nucleus, usually for counterpoise corrections for BSSE.

**ghrelin peptide analogue:** A ghrelin peptide analogue with potential anti-cachexia activity. Upon subcutaneous administration, ghrelin peptide analogue binds to and stimulates the G protein-coupled growth hormone secretagogue receptor (GHSR) in the central nervous system (CNS), thereby mimicking the appetite-stimulating and growth hormone-releasing effects of endogenous ghrelin. Stimulation of GHSR may also reduce the production of the pro-inflammatory cytokines TNF-alpha and interleukin-6, which may play direct roles in cancer-related loss of appetite. Ghrelin,

naturally secreted by gastric endocrine cells, is a 28 amino acid peptide and an endogenous ligand for GHSR.

**GI:** Refers to the stomach and intestines. Also called gastrointestinal.

**GI-4000 vaccine:** A vaccine containing a heat-killed recombinant *Saccharomyces cerevisiae* yeast transfected with mutated forms of Ras, an oncogene frequently found in solid tumors, with potential immunostimulant and antitumor activity. Upon administration, GI-4000 vaccine elicits an immune response by stimulating a specific cytotoxic T-cell response against the mutated forms of Ras. This may lead to a destruction of cancer cells expressing a Ras mutation.

**GI14721:** An antitumor drug that belongs to the family of drugs called topoisomerase inhibitors. It is a camptothecin analog.

**giant cell fibroblastoma :** A rare type of soft tissue tumor marked by painless nodules in the dermis (the inner layer of the two main layers of tissue that make up the skin) and subcutaneous (beneath the skin) tissue. These tumors may come back after surgery, but they do not spread to other parts of the body. They occur mostly in boys and are related to dermatofibrosarcoma protuberans.

**giant cell tumor :** A rare tumor that usually forms in bone, but may also form in cartilage, muscle, fat, blood vessels, or other supportive tissue in the body. Most giant cell tumors occur at the ends of the long bones of the arms and legs, near a joint (such as the knee, wrist, hip, or shoulder). Most are benign (not cancer) but some are malignant (cancer). Giant cell tumors usually occur in young and middle-aged adults. Also called GCT.

**giant hypertrophic gastritis :** A condition marked by inflammation and ulcers (breaks on the skin or on the surface of an organ) of the mucosa (inner lining) of the stomach and by overgrowth of the cells that make up the mucosa. Symptoms include vomiting, diarrhea, and weight loss. Patients with giant hypertrophic gastritis may be at a higher risk of stomach cancer. Also called gastric mucosal hypertrophy and Ménétrier disease.

**giant lymph node hyperplasia :** A rare disorder in which benign (not cancer) growths form in lymph node tissue. There are two main ways that giant lymph node hyperplasia occurs: localized (unicentric) and multicentric. Unicentric giant lymph node hyperplasia affects only one group of lymph nodes in one part of the body, usually in the chest or abdomen. It may not cause symptoms. Multicentric giant lymph node

hyperplasia affects many groups of lymph nodes and lymphoid tissue all through the body. It can weaken the immune system and cause problems such as infection, fever, weight loss, fatigue, night sweats, nerve damage, and anemia. People with giant lymph node hyperplasia have an increased risk of lymphoma. Also called angiofollicular lymph node hyperplasia and Castleman disease.

**GIAO:** Gauge-independent atomic orbitals. A method specially designed for calculation of NMR shifts. Currently used with methods such as HF,MP2, or DFT. Research codes can handle CCSD.

**Gibb's free energy:** The energy of a system that is available to do work at constant temperature and pressure. OR A thermodynamic property devised by Josiah Willard Gibbs in 1876 to predict whether a process will occur spontaneously at constant pressure and temperature. Gibbs free energy  $G$  is defined as  $G = H - TS$  where  $H$ ,  $T$  and  $S$  are the enthalpy, temperature, and entropy. Changes in  $G$  correspond to changes in free energy for processes occurring at constant temperature and pressure; the Gibbs free energy change corresponds to the maximum nonexpansion work that can be obtained under these conditions. The sign of  $\Delta G$  is negative for all spontaneous processes and zero for processes at equilibrium.

**Gibbs free energy of formationf:** The change in Gibbs free energy that accompanies the formation of one mole of a compound from its elements in their most stable form.

**gigantism :** A condition in which the whole body or any of its parts grow much larger than normal.

**Gigaseal:** A high-resistance seal formed between a pipette and a small patch of plasma membrane, required for use in the patch-clamp technique.

**Gigawatt (GW):** A unit of power equivalent to one billion watts.

**Gigawatthour (GWh):** One billion watthours.

**gills:** structures that allow fish to exchange gases with their environment.

**Gilotrif:** (Other name for: afatinib dimaleate) OR A drug used to treat non-small cell lung cancer that has spread to other parts of the body. It is used in patients with certain mutations (changes) in a cell protein called epidermal growth factor receptor (EGFR). It is also being studied in the treatment of other types of cancer. Gilotrif blocks certain EGFRs, which may help keep

cancer cells from growing. It may also prevent the growth of new blood vessels that tumors need to grow. Gilotrif is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called afatinib dimaleate.

**gilteritinib:** An orally bioavailable inhibitor of the receptor tyrosine kinases (RTKs) FMS-related tyrosine kinase 3 (FLT3, STK1, or FLK2), AXL (UFO or JTK11) and anaplastic lymphoma kinase (ALK or CD246), with potential antineoplastic activity. Gilteritinib binds to and inhibits both the wild-type and mutated forms of FLT3, AXL and ALK. This may result in an inhibition of FLT3, AXL, and ALK-mediated signal transduction pathways and reduction of tumor cell proliferation in cancer cell types that overexpress these RTKs. FLT3, AXL and ALK, overexpressed or mutated in a variety of cancer cell types, play a key role in tumor cell growth and survival.

**gimatecan:** An orally bioavailable, semi-synthetic lipophilic analogue of camptothecin, a quinoline alkaloid extracted from the Asian tree *Camptotheca acuminata*, with potential antineoplastic and antiangiogenic activities. Gimatecan binds to and inhibits the activity of topoisomerase I, stabilizing the cleavable complex of topoisomerase I-DNA, which inhibits the religation of single-stranded DNA breaks generated by topoisomerase I; lethal double-stranded DNA breaks occur when the topoisomerase I-DNA complex is encountered by the DNA replication machinery, DNA replication is disrupted, and the tumor cell undergoes apoptosis. Although the mechanism of its antiangiogenic activity has yet to be fully elucidated, this agent may inhibit endothelial cell migration, tumor neovascularization, and the expression of proangiogenic basic fibroblast growth factor (bFGF).

**gimatecan :** A substance that is being studied in the treatment of cancer. It belongs to the family of drugs called topoisomerase inhibitors. Also called ST1481.

**gimeracil:** A pyridine derivative with antitumor activity. Gimeracil enhances the antitumor activity of fluoropyrimidines by competitively and reversibly inhibiting the enzyme dihydropyrimidine dehydrogenase causing decreased degradation of the fluoropyrimidines.

**ginger :** An herb with a root that has been used in cooking, and by some cultures to treat nausea, vomiting, and certain other medical conditions. It is

being studied in the treatment of nausea and vomiting caused by cancer chemotherapy. The scientific name is *Zingiber officinale*.

**ginger extract:** An extract of the rhizome of the perennial plant *Zingiber officinale* with potential antineoplastic activity. Ginger extract contains a number of different phenolic compounds, some of which have displayed antineoplastic, anti-inflammatory, and antioxidant activities. This agent also exhibits antiemetic properties.

**gingiva :** The tissue of the upper and lower jaws that surrounds the base of the teeth. Also called gums.

**gingival:** relating to the gums

**ginkgo :** A tree native to China. Substances taken from the leaves and seeds have been used in some cultures to treat certain medical problems. Ginkgo has been studied in the prevention and treatment of Alzheimer disease, dementia, certain blood vessel diseases, and memory loss. It may cause bleeding or high blood pressure when used with certain drugs. Also called ginkgo biloba and maidenhair tree.

**ginkgo biloba :** A tree native to China. Substances taken from the leaves and seeds have been used in some cultures to treat certain medical problems. Ginkgo biloba has been studied in the prevention and treatment of Alzheimer disease, dementia, certain blood vessel diseases, and memory loss. It may cause bleeding or high blood pressure when used with certain drugs. Also called ginkgo and maidenhair tree.

**ginseng :** An herb with a root that has been used in some cultures to treat certain medical problems. It may have anticancer effects.

**ginseng compound:** A compound containing the traditional Chinese medicine (TCM) ginseng, a herb belonging to the Araliaceae family, with potential antioxidant, chemopreventive, anti-inflammatory and antineoplastic activities. Upon administration of the ginseng compound, the active ingredients, mainly ginsenosides, inhibit various signal transduction pathways that play key roles in carcinogenesis and inflammation. This leads to the induction of apoptosis in and inhibits proliferation of tumor cells. In addition, ginsenosides enhance the activity of various antioxidant enzymes, induce nitric oxide (NO) formation, inhibit the formation of reactive oxygen species (ROS) and protect against free radical-induced DNA damage. Ginseng also modulates various components of the immune system, including the activation of dendritic cells (DCs).

**girentuximab:** A chimeric monoclonal antibody directed against G250, a cell surface antigen found in the majority of renal cell carcinomas. Following binding, girentuximab may be internalized by G250 antigen-expressing renal carcinoma cells; mAb G250 may be useful as a carrier for radioisotopes and other antineoplastic therapeutic agents. Check for active clinical trials using this agent.

**GIST :** A type of tumor that usually begins in cells in the wall of the gastrointestinal tract. It can be benign or malignant. Also called gastrointestinal stromal tumor.

**GITR agonist MEDI1873:** An agonist of human glucocorticoid-induced tumor necrosis factor receptor (tumor necrosis factor superfamily, member 18; TNFRSF18; GITR), with potential immunomodulating and antineoplastic activities. Upon administration, GITR agonist MEDI1873 binds to GITR found on multiple types of T-cells, thereby inducing both the activation and proliferation of tumor antigen-specific T effector cells. This abrogates the suppression of T effector cells which is induced by inappropriately activated T regulatory cells (Tregs), and activates the immune system to help eradicate tumor cells. GITR, a member of the TNF receptor superfamily, is expressed on the surface of multiple types of immune cells, including regulatory T cells, effector T cells, B cells, dendritic cells (DCs) and natural killer (NK) cells.

**GITRL RNA-transfected autologous dendritic cell vaccine:** An autologous dendritic cell (DC) cancer vaccine with potential immunostimulatory activity. GITRL RNA-transfected autologous DC vaccine is prepared by transfecting DCs with RNAs encoding tumor necrosis factor (ligand) superfamily, member 18 (TNFSF18 or GITRL); expression of GITRL results in modulating T lymphocyte survival in peripheral tissues. Co-vaccination of this vaccine with melanoma antigen specific vaccine may eliminate the adverse effects associated with systemic administration of immune modulators, while also enhancing vaccine-induced immune responses.

**Giulio Natta:** Nobel prize winning chemist (1903-1979) who did a vast quantity of work on the catalysts allowing high density poly(ethene) and poly(propene) to be produced. Most of his work was done in Milan, Italy, for the Montecatini corporation, making him one of the most successful industrial chemists of the 20th century. He was married to Rosita Beati

Natta. Like Karl Ziegler, he was a keen mountain climber. A quote: "What had been exclusively in the power of Nature, namely to join the monomeric units in a giant molecule with a predetermined steric order and not at random, is now possible also for man." (quoted in "The Chain Straighteners," by F. McMillan)

**glacial maximum:** The position or time of the greatest advance of a glacier (e.g., the greatest equatorward advance of Pleistocene glaciation).

**glacial rebound:** The isostatic adjustment of previously glaciated areas after glacial retreat (e.g., the uplift of Scandinavia after the most recent glaciation).

**glaciation:** the movement of an ice mass over a land surface.

**glacier:** a large mass of ice that forms on land during cooler climatic periods. OR A mass of land ice that is formed by the cumulative recrystallization of firn. A glacier flows slowly (at present or in the past) from an accumulation area to an ablation area. Some well-known glaciers are: the Zermatt, Stechelberg, Grindelwald, Trient, Les Diablerets, and Rhone in Switzerland; the Nigards, Gaupne, Fanarak, Lom, and Bover in Norway; the Wright, Taylor, and Wilson Piedmont glaciers in Antarctica; the Bossons Glacier in France; the Emmons and Nisqually glaciers on Mt. Ranier, Washington; Grinnell glacier in Glacier National Park, Montana; the Dinwoody glacier in the Wind River Mountains and the Teton glacier in Teton National Park, both in Wyoming; and many glaciers in the Canadian Rockies.

**glacier flow (ice flow):** The slow downward or outward movement of ice in a glacier caused by gravity.

**Gland:** The space in a mechanical system into which a seal is installed. the gland consists of the seal groove and any additional space required to achieve the proper compression of the seal. Care should be taken to distinguish between the terms gland and groove, which are separate but related concepts

**gland :** An organ that makes one or more substances, such as hormones, digestive juices, sweat, tears, saliva, or milk. Endocrine glands release the substances directly into the bloodstream. Exocrine glands release the substances into a duct or opening to the inside or outside of the body.

**gland of Lieberkuhn :** Tube-like gland found in the lining of the colon and rectum. Glands of Lieberkuhn renew the lining of the intestine and make mucus. Also called colon crypt.

**glandular cell of the cervix :** A type of cell that makes mucus and is found in tissue that lines the inner part of the cervix. Abnormal glandular cells may be found in Pap tests and may be a sign of cancer or other serious condition.

**glans penis :** The rounded, gland-like head of the penis.

**Glass:** A solid that does not have an ordered arrangement of molecules and is hard or brittle; an amorphous solid below its glass-transition temperature. OR It is made from sodium carbonate, limestone and sand. Other materials can be added to give the glass special properties. OR It is made from sodium carbonate, limestone and sand. Other materials can be added to give the glass special properties.

**Glass Cloth:** fabric used as insulating material base formed by weaving yarns comprising glass filaments and possessing high strength, heat resistance and dielectric properties.

**Glass Fiber:** Glass in fibrous form that has cooled to a rigid condition without crystallizing. OR A family of reinforcing materials for reinforced plastics based on single filaments of glass.

**Glass Thread:** A type of threading in which the thread sides gradually taper down to the neck finish. Cross section of threads are semi-circular.

**Glass Transition:** The reversible change in an amorphous polymer or in amorphous regions of a partially crystalline polymer from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one. NOTE – The glass transition generally occurs over a relatively narrow temperature region and is similar to the solidification of a liquid to a glassy state: it is not a phase transition. Not only do hardness and brittleness undergo rapid changes in this temperature region but other properties, such as thermal expansion and specific heat also change rapidly. This phenomenon has been called second order transition, rubber transition and rubbery transition. The word transformation has also been used instead of transition. Where more than one amorphous transition occurs in a polymer, the one associated with segmental motions of the polymer backbone chain or accompanied by the largest change in properties is usually considered to be the glass transition.

OR Change in an amorphous polymer from viscous to hard and relatively brittle.

**Glass transition temperature:** The temperature above which a glassy amorphous solid becomes rubbery,  $T_g$ . OR The temperature at which an amorphous polymer ceases to be brittle and glassy in character and becomes less rigid and more rubbery. OR The temperature where the molecules of a polymeric solid can begin to move relative to one another, giving a substance that behaves like a rubber, rather than a brittle glass.

Alternatively, you can think of it as the temperature where the molecules of a polymeric solid can no longer move relative to one another, giving a substance that behaves like glass, rather than a rubber that can be stretched without breaking. It all depends on which way you are going... OR The temperature at which a reversible change occurs in an amorphous polymer when it is heated to a certain temperature and undergoes a rather sudden transition from a hard, glassy, or brittle condition to a flexible or elastomeric condition.

**Glassy state:** A state of an amorphous material having rather low mobility, as in window glass.

**glaucoma :** A condition in which there is a build-up of fluid in the eye, which presses on the retina and the optic nerve. The retina is the layer of nerve tissue inside the eye that senses light and sends images along the optic nerve to the brain. Glaucoma can damage the optic nerve and cause loss of vision or blindness.

**Glaze:** In painting this refers to a transparent or lightly pigmented coating used to modify the previously applied coating to produce a rich effect in depth. OR A term used to describe several types of finishing materials. (1) Glazing putty is of a creamy consistency and is applied to fill imperfections in the surface. (2) A glazing stain is a pigmented stain applied over a stained, filled or painted surface to soften or blend the original color without obscuring it. (3) A glaze coat is a clear finish applied over previously coated surfaces to create a gloss finish. OR When used as a painting term denotes the application of a thin translucent coloured coating to produce an effect or depth of colour not obtainable by the use of a fully pigmented paint. OR Brightness or shine of a plastic resulting from a smooth surface within recycled plastic and plastic material. Similar to a

polished effect. OR Measure of how much light is reflected by a film. OR Brightness or luster of a plastic resulting from a smooth surface.

**Glazing bar:** The shaped and rebated narrow member of metal or wood into which glass is bedded or fixed.

**Gleason score :** A system of grading prostate cancer tissue based on how it looks under a microscope. Gleason scores range from 2 to 10 and indicate how likely it is that a tumor will spread. A low Gleason score means the cancer tissue is similar to normal prostate tissue and the tumor is less likely to spread; a high Gleason score means the cancer tissue is very different from normal and the tumor is more likely to spread.

**Gleevec :** A drug used to treat different types of leukemia and other cancers of the blood, gastrointestinal stromal tumors, skin tumors called dermatofibrosarcoma protuberans, and a rare condition called systemic mastocytosis. It is also being studied in the treatment of other types of cancer. Gleevec blocks the protein made by the bcr/abl oncogene. It is a type of tyrosine kinase inhibitor. Also called imatinib mesylate and STI571.

**glembatumumab vedotin:** An antibody-drug conjugate, consisting of the fully human monoclonal antibody CR011 directed against glycoprotein NMB (GPNMB) and conjugated via a cathepsin B-sensitive valine-citrulline (vc) linkage to the cytotoxic agent monomethyl auristatin E (MMAE), with potential antineoplastic activity. Upon administration, the monoclonal antibody CR011 moiety binds to glycoprotein nmb (GPNMB), expressed on the surfaces of a variety of cancer cell types; upon endocytosis, the synthetic dolastin analogue MMAE is released via enzymatic cleavage into the tumor cell cytosol, where it binds to tubulin and inhibits tubulin polymerization, which may result in G2/M phase arrest and apoptosis. The vc linkage system is highly stable in serum, rendering the cytotoxicity of glembatumumab vedotin specific for GPNMB-positive cells. GPNMB is a transmembrane protein overexpressed on the surfaces of various cancer cell types, including melanoma, breast, and prostate cancer cells.

**Gleostine:** (Other name for: lomustine)

**Gleostine :** A drug used to treat brain tumors that have already been treated with surgery or radiation therapy. It is also used to treat Hodgkin lymphoma that has not gotten better with other types of treatment or has come back. It is being studied in the treatment of other types of cancer. Gleostine damages

the cell's DNA and may kill cancer cells. It is a type of alkylating agent. Also called CCNU and lomustine.

**Gliadel:** (Other name for: polifeprosan 20 with carmustine implant)

**Gliadel Wafer :** A biodegradable wafer that is used to deliver the anticancer drug carmustine directly into a brain tumor site after the tumor has been removed by surgery. Also called carmustine implant and polifeprosan 20 carmustine implant.

**glial cell :** Any of the cells that hold nerve cells in place and help them work the way they should. The types of glial cells include oligodendrocytes, astrocytes, microglia, and ependymal cells. Also called neuroglia. OR the cells of the nervous system that support, protect, and nourish the neurons.

**glial tumor :** A general term for tumors of the central nervous system, including astrocytomas, ependymal tumors, glioblastoma multiforme, and primitive neuroectodermal tumors.

**gliclazide:** A short-acting, relatively high-potency, second-generation sulfonylurea compound with hypoglycemic activity. Gliclazide also increases peripheral insulin sensitivity. This agent is metabolized by CYP2C9.

**Glide plane:** A symmetry element involving reflection through a plane followed by a translation.

**glimepiride:** A long-acting, third-generation sulfonylurea with hypoglycemic activity. Compared to other generations of sulfonylurea compounds, glimepiride is very potent and has a longer duration of action. This agent is metabolized by CYP2C9 and shows peroxisome proliferator-activated receptor gamma (PPARgamma) agonistic activity.

**glioblastoma :** A fast-growing type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord and has cells that look very different from normal cells. Glioblastoma usually occurs in adults and affects the brain more often than the spinal cord. Also called GBM, glioblastoma multiforme, and grade IV astrocytoma.

**glioblastoma cancer vaccine ERC1671:** A cancer vaccine composed of a combination of autologous glioblastoma (GBM) tumor cells, allogeneic GBM tumor cells, generated from three different GBM donor cancer patients, and the lysates of all of these cells, with potential antineoplastic activity. Upon intradermal administration of GBM cancer vaccine

ERC1671, the mixture of the autologous and allogeneic cells and lysates stimulates the immune system to mount a cytotoxic T-lymphocyte (CTL) response against GBM-associated antigens, which leads to the destruction of glioblastoma cells.

**glioblastoma multiforme :** A fast-growing type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord and has cells that look very different from normal cells. Glioblastoma multiforme usually occurs in adults and affects the brain more often than the spinal cord. Also called GBM, glioblastoma, and grade IV astrocytoma.

**glioblastoma multiforme multi-peptide vaccine IMA950:** A cancer vaccine comprising 11 peptides associated with glioblastoma multiforme (GBM), with potential immunomodulating and antineoplastic activities. Vaccination with glioblastoma multiforme multi-antigen vaccine IMA950 stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response as well as a T-helper (Th) immune response against tumor cells expressing these peptides, potentially resulting in decreased tumor growth of GBM. Peptides in IMA950 comprise the following: brevican (BCAN); chondroitin sulfate proteoglycan 4 (CSPG4); fatty acid binding protein 7, brain (FABP7); insulin-like growth factor 2 mRNA binding protein 3 (IGF2BP3); neuroligin 4, X-linked (NLGN4X); neuronal cell adhesion molecule (NRCAM); protein tyrosine phosphatase, receptor-type, Z polypeptide 1 ( PTPRZ1); tenascin C (TNC); Met proto-oncogene (MET); baculoviral IAP repeat-containing 5 (BIRC5); and hepatitis B virus core antigen. Check for active clinical trials using this agent.

**glioma :** A cancer of the brain that begins in glial cells (cells that surround and support nerve cells).

**glioma-associated antigen peptide-pulsed autologous dendritic cell vaccine:** A cancer vaccine comprised of autologous dendritic cells pulsed with synthetic glioma-associated antigen (GAA) peptides with potential antineoplastic activity. Upon administration, this vaccine may stimulate anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against GAA peptide-expressing glioma cells, resulting in tumor cell lysis.

**glioma-associated peptide-loaded dendritic cell vaccine SL-701:** A cell-based cancer vaccine comprised of dendritic cells (DCs) pulsed with various synthetic glioma-associated antigen (GAA) peptides, with potential antineoplastic activity. Upon subcutaneous administration, the glioma-

associated peptide-loaded DC vaccine SL-701 exposes the immune system to various GAA peptides. This may stimulate both anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against the GAA-expressing glioma cells, which may result in tumor cell lysis.

**gliosarcoma** : A type of glioma (cancer of the brain that comes from glial, or supportive, cells).

**glipizide**: A short-acting, second-generation sulfonylurea with hypoglycemic activity. Glipizide is rapidly absorbed, has a very quick onset of action and a short half-life. This agent is extensively metabolized in the liver and the metabolites as well as the unchanged form are excreted in the urine.

**gliquidone**: A potent, second-generation sulfonylurea with antihyperglycemic activity. Like other second-generation compounds, gliquidone exerts greater binding affinity to SUR1 and increased potency compared to first-generation compounds. In addition, this agent exerts peroxisome proliferator-activated receptor (PPAR) gamma agonistic activity. Check for active clinical trials using this agent.

**glisoxepide**: A second-generation sulfonylurea with antihyperglycemic activity. Like other second-generation compounds, glisoxepide exerts greater binding affinity than the first-generation compounds. Glisoxepide shows peroxisome proliferator-activated receptor (PPAR) gamma agonistic activity, has a short half-life and is excreted in both the bile and urine.

**Global dimming** : There is some evidence that the production of particulates during the combustion of fossil fuels is causing the sun's rays to be reflected away from the Earth.

**Global Energy Minimum**: Important in molecular modelling, the global energy minimum refers to a molecule's most stable conformation.

**Global warming** : Many people are worried that the average temperature of the Earth is increasing. Some scientists believe that this is nothing to worry about because the Earth's average temperature has always been changing both up and down. Other scientists are very worried because they believe that the temperature is rising too fast and will not go down again after a time.

**Globin fold**: A folding structure of a polypeptide chain, exemplified by myoglobin and hemoglobin subunits, that creates an environment for a

heme group to reversibly bind oxygen.

**Globo H-DT vaccine OBI-833:** A carbohydrate-based vaccine comprised of the Globo H hexasaccharide 1 (Globo H) antigen conjugated to DT-CRM197, a non-toxic, mutated form of diphtheria toxin (DT), with potential immunostimulating and antineoplastic activities. Upon administration of Globo H-DT vaccine OBI-833, the carbohydrate antigen Globo H may stimulate a cytotoxic T-lymphocyte (CTL) response against Globo H-expressing tumor cells, thereby decreasing tumor cell proliferation. The hexasaccharide Globo H is a tumor-associated antigen (TAA) commonly found on a variety of tumor cells. DT-CRM197 is used to increase the immunogenicity of the Globo H carbohydrate antigen.

**Globo H-KLH immunostimulant OPT-822:** A carbohydrate-based immunostimulant comprised of the Globo H hexasaccharide 1 (Globo H) epitope linked to the immunostimulant carrier protein keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Upon administration of Globo H-KLH immunostimulant OPT-822, the carbohydrate antigen Globo H may stimulate a cytotoxic T-lymphocyte (CTL) response against Globo H-expressing tumor cells, thereby decreasing tumor cell proliferation. Globo H is a tumor associated antigen (TAA) commonly found on a variety of tumor cells including breast cancer cells. KLH improves antigenic immune recognition and T-cell responses. Check for active clinical trials using this agent.

**Globo-H-GM2-Lewis-y-MUC1-32(aa)-sTn(c)-TF(c)-Tn(c)-KLH conjugate vaccine:** A heptavalent vaccine consisting of the tumor-associated carbohydrate antigens globohexaosylceramide (globo-H), GM2, Lewis-y, MUC1-32(aa), sTn(c), TF(c), and Tn(c) conjugated with keyhole limpet hemocyanin (KLH), an immunomodulator. This vaccine may induce the production of IgG and IgM antibodies and an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumors expressing these antigens.

**Globular protein:** A folded protein that adopts an approximately globular shape. May also be called soluble proteins. OR Soluble proteins with a globular (somewhat rounded) shape.

**globulin component macrophage-activating factor:** A recombinant form of GC (group-specific component) protein-derived macrophage-activating factor (GC-MAF) with potential immunostimulating and antineoplastic activities. Upon administration, globulin component macrophage-activating

factor is able to stimulate macrophages to kill cancer cells, inhibit angiogenesis and stimulate the immune system. This decreases tumor cell proliferation. GC, also known as vitamin D binding protein (VDBP), is converted to GC-MAF by enzymes located in the membrane of B- and T-lymphocytes. However, deglycosylated GC protein cannot be converted to GC-MAF. Endogenous GC-MAF is often not activated in patients with cancer due to an increased activity of nagalase (also called alpha-N-acetylgalactosaminidase), an enzyme secreted by cancer cells that mediates the deglycosylation of GC; thus preventing macrophage activation and immunosuppression.

**glomerulus:** a ball of capillaries that comprises Bowman's capsule in the human kidney.

**Gloss:** The luster or shininess of paints and coatings. Different types of gloss are frequently arbitrarily differentiated, such as sheen, distinctness-of-image gloss, etc. Trade practice recognizes the following gloss levels, in increasing order of gloss: flat (or matte)-- practically free from sheen, even when viewed from oblique angles (usually less than 15 on 60-degree meter); eggshell-- usually 20-35 on 60-degree meter; semi-gloss--usually 35-70 on 60-degree meter; full-gloss--smooth and almost mirror-like surface when viewed from all angles, usually above 70 on 60-degree meter. OR The extent to which a painted surface reflects light. The degree of gloss may be described as ranging from: matt or flat (having no visible gloss); eggshell; semi-gloss; full gloss (usually meaning the highest obtainable gloss). OR The luster or shininess of paints and coatings are generally classified as flat, semi-gloss, or gloss; the latter has the higher reflecting ability.

**Gloss Meter:** A device for measuring the light reflectance of coatings. Different brands with the same description (such as semi-gloss or flat) may have quite different ratings on the gloss meter. OR A standard scale for measuring the shininess or light reflectance of paint. Different brands with the same description such as semi-gloss or flat may have quite different ratings on the gloss meter.

**Glossary:** A set of definitions of words, such as this one. Not all glossaries are self-referential.

**glossectomy :** Surgical removal of all or part of the tongue.

**glottis:** a slitlike structure at the opening to the mammalian trachea. OR The middle part of the larynx; the area where the vocal cords are located.

**glucagon:** a hormone produced in the pancreas that stimulates the breakdown of glycogen to glucose in the liver.

**Glucagon:** A polypeptide hormone that is secreted by the  $\alpha$  cells of the pancreas when the bloodglucose level is low and leads to glycogen breakdown in the liver and the release of glucose to the blood.

**glucagon :** A hormone produced by the pancreas that increases the level of glucose (sugar) in the blood.

**glucagonoma :** A rare pancreatic tumor that produces a hormone called glucagon. Glucagonomas can produce symptoms similar to diabetes.

**glucarpidase:** A zinc-dependent enzyme isolated from a strain of the bacterium *Pseudomonas*. Because glucarpidase rapidly hydrolyzes methotrexate into inactive metabolites, it may be useful as a rescue agent for methotrexate-induced nephrotoxicity. In antibody-directed enzyme prodrug therapy (ADEPT), this agent is conjugated with an antibody that binds to a specific tumor cell type, allowing for glucarpidase-catalyzed activation of a co-administered prodrug at the site of the tumor. or A drug used to treat toxic levels of methotrexate (an anticancer drug) in the blood of patients with kidney problems. It is a bacterial enzyme that breaks down proteins and other substances, such as methotrexate. Glucarpidase may also help certain drugs kill cancer cells. It is a type of chemoprotective agent and a type of prodrug activator. Also called carboxypeptidase-G2 and Voraxaze.

**Glucidex:** (Other name for: maltodextrin)

**glucocorticoid :** A compound that belongs to the family of compounds called corticosteroids (steroids). Glucocorticoids affect metabolism and have anti-inflammatory and immunosuppressive effects. They may be naturally produced (hormones) or synthetic (drugs).

**glucocorticoid receptor antagonist CORT125134:** An orally available antagonist of the glucocorticoid receptor (GR), with potential antineoplastic activity. Upon administration, CORT125134 competitively binds to and blocks GRs. This inhibits the activity of GRs, and prevents both the translocation of the ligand-GR complexes to the nucleus and gene expression of GR-associated genes. This decreases the negative effects that result from excess levels of endogenous glucocorticoids, like those seen

when tumors overproduce glucocorticoids. In addition, by binding to GRs and preventing their activity, inhibition with CORT125134 also inhibits the proliferation of GR-overexpressing cancer cells. GRs are overexpressed in certain tumor cell types and promote tumor cell proliferation. Check for active clinical trials using this agent.

**Glucocorticoids:** A class of steroid hormones, synthesized by the adrenal cortex and exemplified by cortisol, that promote gluconeogenesis, the formation of glycogen, and the degradation of fats and proteins.

**Glucodry:** (Other name for: maltodextrin)

**glucogenic amino acids:** Amino acids with carbon chains that can be metabolically converted into glucose or glycogen via gluconeogenesis.

**Gluconeogenesis:** The production of sugars from nonsugar precursors such as lactate or amino acids. Applies more specifically to the production of free glucose by vertebrate livers. OR The synthesis of glucose from noncarbohydrate precursors, including lactate, glycerol, and amino acids. OR The biosynthesis of a carbohydrate from simpler, noncarbohydrate precursors such as oxaloacetate or pyruvate.

**gluconeogenesis :** The process of making glucose (sugar) from its own breakdown products or from the breakdown products of lipids (fats) or proteins. Gluconeogenesis occurs mainly in cells of the liver or kidney.

**Glucophage:** (Other name for: metformin hydrochloride)

**Glucophage :** A drug used to treat diabetes mellitus (a condition in which the body cannot control the level of sugar in the blood ). It is also being studied in the treatment of cancer. It decreases the amount of glucose (a type of sugar) released into the bloodstream from the liver and increases the body's use of the glucose. Glucophage is a type of antidiabetic agent. Also called metformin hydrochloride.

**Glucophage XR:** (Other name for: metformin hydrochloride)

**glucosamine sulfate/chondroitin sulfate tablet:** An oral tablet formulation of a dietary supplement containing the sulfate salts of the amino sugar glucosamine and the glucosaminoglycan chondroitin with potential analgesic, anti-inflammatory, and anti-arthritic activities. Both glucosamine and chondroitin are naturally occurring substances that play a key role in cartilage formation and repair. Glucosamine is an essential substrate for glycosaminoglycans and hyaluronic acid, needed for formation

of the joint proteoglycan structural matrix, and may prevent chondrocytic catabolic activity and inhibit production of inflammatory mediators.

Chondroitin is the major glycosaminoglycan in cartilage, responsible for the elasticity of cartilage; it may reduce the IL-1beta-induced nuclear factor-kappaB (NF-kB) translocation in chondrocytes, inhibiting NF-kB-mediated inflammatory processes.

**glucose:** A 6-carbon sugar that plays a major role in cell metabolism. OR A common sugar, one of many with the chemical formula  $C_6O_6H_{12}$  but different three-dimensional structures. It is not the simplest of all sugars (that honour belongs to glyceraldehyde,  $C_3O_3H_6$ ), but glucose is the fundamental building block of many biopolymers, including starch and cellulose, and is the starting material for the serious biochemical reactions used to obtain energy in most "higher" organisms. OR a carbohydrate with the chemical formula  $C_6H_{12}O_6$  that serves as the primary carbon source of living things.

**glucose :** A type of sugar; the chief source of energy for living organisms.

**Glucose 6-phosphatase:** A membrane protein of the luminal side of the endoplasmic reticulum that catalyzes the formation of free glucose from glucose 6-phosphate. In the liver, the enzyme plays a key role in maintaining blood-glucose levels. OR A key intermediate in metabolism that can be processed to free glucose, stored as glycogen, oxidized to produce NADPH and ribose, or metabolized to generate cellular energy either aerobically or anaerobically.

**Glucose 6-phosphate dehydrogenase:** An enzyme that initiates the oxidative phase of the pentose phosphate pathway by oxidizing glucose 6-phosphate to 6-phosphoglucono- $\alpha$ -lactone to generate one molecule of NADPH.

**Glucose homeostasis:** Maintenance of a constant level of glucose in the blood.

**Glucose transporter:** An integral membrane protein consisting of a single polypeptide chain that has 12 transmembrane segments and facilitates the movement of glucose across the plasma membrane into the cell.

**glucose-6-phosphate dehydrogenase deficiency :** An inherited disorder in which a person doesn't have enough of an enzyme called G6PD that helps red blood cells work the way they should. In glucose-6-phosphate dehydrogenase deficiency, the red blood cells break down when the body is

exposed to infection, severe stress, or certain drugs, chemicals, or foods. This may lead to a condition called hemolytic anemia. This disorder is most common in African-American men and in men of Middle Eastern or Mediterranean descent. Also called G6PD deficiency.

**glucosuria:** excess urinary glucose output

**Glucotrol:** (Other name for: glipizide)

**glucuronic acid:** A carboxylic acid with structural similarity to glucose with detoxifying activity. The xenobiotic metabolism of various substances such as drugs, pollutants, bilirubin, androgens, estrogens, mineralocorticoids, glucocorticoids, fatty acid derivatives, retinoids, and bile acids involves glucuronidation, a process in which water-soluble, excretable glucuronides of these substances are formed via glycosidic linkages to glucuronic acid. UDP-glucuronic acid, formed in the liver through the linkage of glucuronic acid to uridine diphosphate (UDP) via a glycosidic bond, is an intermediate in the process of glucuronidation. or A form of a type of sugar called glucose that helps remove harmful substances from the body. Glucuronic acid and the harmful substance combine in the liver and then are passed in the urine. Glucuronic acid is also found in other substances in the body, such as cartilage and synovial fluid (fluid found in the joints).

**glufosfamide :** An anticancer drug that belongs to the family of drugs called alkylating agents.

**Glumetza:** (Other name for: metformin hydrochloride)

**glutamate:** Ionic salts of glutamic acid used as flavor enhancers in many foods. Glutamate is usually manufactured by acid hydrolysis of vegetable proteins. Besides being a basic building block of proteins, glutamate functions as a neurotransmitter that helps neurons grow new connections; as such, glutamate plays an important role in learning and memory. At high concentrations, glutamate can function as an excitotoxin.

**Glutamate dehydrogenase:** An enzyme that catalyzes the oxidative deamination of glutamate, yielding ammonium ion and  $\alpha$ -ketoglutarate.

**glutamate receptors:** Glutamate receptors are protein molecules that help gate the flow of ions across a nerve cell's membrane. They play a role in the formation of new connections between nerve cells (and so, in learning and memory). The receptors are normally activated by aspartate and glutamate.

In amnesic shellfish poisoning, domoic acid acts as an excitotoxin that very strongly activates some of these receptors, preventing their proper functioning.

**glutamic acid:** A naturally occurring amino acid that has a carboxylic acid group on its side chain. In proteins, glutamic acid residues can occur with the side-chain carboxylic acid group converted to an amide; the residue is then called glutamine.

**glutamic acid :** One of twenty amino acids (molecules that join together to form proteins). Glutamic acid may help nerve cells send and receive information from other cells. It is being studied for its ability to decrease or prevent nerve damage caused by anticancer drugs. Also called L-glutamic acid.

**glutaminase inhibitor CB-839:** An orally bioavailable inhibitor of glutaminase, with potential antineoplastic activity. Upon oral administration, CB-839 selectively and irreversibly inhibits glutaminase, a mitochondrial enzyme that is essential for the conversion of the amino acid glutamine into glutamate. By blocking glutamine utilization, proliferation in rapidly growing cells is impaired. Glutamine-dependent tumors rely on the conversion of exogenous glutamine into glutamate and glutamate metabolites to both provide energy and generate building blocks for the production of macromolecules, which are needed for cellular growth and survival.

**glutamine:** A nonessential amino acid. Glutamine can donate the ammonia on its side chain to the formation of urea (for eventual excretion by the kidneys) and to purines (necessary for the synthesis of nucleic acids). Glutamic acid-to-glutamine conversion, in which an ammonia group is added to glutamic acid (catalyzed by glutamine synthase), is of central importance in the regulation of toxic levels of ammonia in the body. This agent is a substrate for the production of both excitatory and inhibitory neurotransmitters (glutamate and GABA) and is also an important source of energy for the nervous system. Glutamine may become a conditionally essential amino acid during certain catabolic states. or An amino acid used in nutrition therapy. It is also being studied for the treatment of diarrhea caused by radiation therapy to the pelvis.

**glutamine:** The amide of the amino acid glutamic acid. Glutamic acid often occurs as glutamine when built into proteins.

**Glutamine phosphoryl amidotransferase:** An enzyme that catalyzes the committed step in purine synthesis, which is the displacement of pyrophosphate in 5-phosphoribosyl-1-pyrophosphate by ammonia to yield 5-phosphoribosyl-1-amine with the amine in the  $\beta$  configuration.

**Glutapak-10:** (Other name for: glutamine)

**GlutaSolve:** (Other name for: glutamine)

**Glutasolve Resource:** (Other name for: glutamine)

**glutathione:** A tripeptide comprised of three amino acids (cysteine, glutamic acid, and glycine) present in most mammalian tissue. Glutathione acts as an antioxidant, a free radical scavenger and a detoxifying agent. Glutathione is also important as a cofactor for the enzyme glutathione peroxidase, in the uptake of amino acids, and in the synthesis of leukotrienes. As a substrate for glutathione S-transferase, this agent reacts with a number of harmful chemical species, such as halides, epoxides and free radicals, to form harmless inactive products. In erythrocytes, these reactions prevent oxidative damage through the reduction of methemoglobin and peroxides. Glutathione is also involved in the formation and maintenance of disulfide bonds in proteins and in the transport of amino acids across cell membranes.

**glutathione :** A substance found in plant and animal tissues that has many functions in a cell. These include activating certain enzymes and destroying toxic compounds and chemicals that contain oxygen.

**Glutathione ( $\gamma$ -glutamylcysteinylglycine or GSH):** A tripeptide playing a role in combating oxidative stress by maintaining the reduced state of the cell. Glutathione cycles between the reduced (GSH) and oxidized (GSSG) state.

**glutathione disulfide NOV-002:** A stabilized formulation of disodium glutathione disulfide (GSSG; oxidized glutathione) and cisplatin (1000:1) with potential chemoprotective and immunomodulating activities. Mimicking endogenous GSSG, glutathione disulfide NOV-002 acts as a competitive substrate for gamma-glutamyl-transpeptidase (GGT), which may result in the S-glutathionylation of proteins, predominantly actin, a redox stress on endoplasmic reticulum (ER), and ER stress-induced apoptosis; S-glutathionylation may be stimulated by reactive oxygen species (ROS) liberated by a glutathione disulfide NOV-002-induced increase in GGT activity. Glutathione disulfide NOV-002 may also induce

phosphorylation of proteins such as ERK and p38, two kinases that play critical regulatory roles in cell proliferation and apoptosis. The cisplatin component of this agent does not provide an effective therapeutic concentration of cisplatin in vivo.

**glutathione pegylated liposomal doxorubicin hydrochloride**

**formulation 2B3-101:** A glutathione (GSH) pegylated, liposome-encapsulated preparation of the hydrochloride salt form of the anthracycline antineoplastic antibiotic doxorubicin, with potential antineoplastic activity. Upon administration, the glutathione pegylated liposomal formulation 2B3-101 specifically delivers doxorubicin into the brain. Doxorubicin intercalates between DNA base pairs and interferes with topoisomerase II activity, which inhibits both DNA replication and RNA synthesis, resulting in cancer cell death and tumor regression. Doxorubicin also generates reactive oxygen species, which causes cell membrane lipid peroxidation leading to cytotoxicity. The pegylated liposomal delivery of doxorubicin improves drug penetration into tumors and prolongs circulation time, thereby increasing doxorubicin's efficacy and decreasing its toxicity. Conjugation of GSH to the PEG molecules directs the liposomes to the GSH transporters on the blood brain barrier (BBB) and improves the delivery of doxorubicin into the brain.

**glutathione S-transferase :** A family of enzymes involved in metabolism and in making toxic compounds less harmful to the body.

**gluten-free compact nutritional supplement drink:** A gluten-free, calorie-dense, milkshake-like nutritional supplement drink containing all essential vitamins, minerals, and trace elements, as well as protein, fat and carbohydrates. Upon oral intake, gluten-free compact nutritional supplement drink may aid in the prevention of malnutrition and weight loss. The drink is provided in a reduced volume (125 ml) but with the same complete nutrition as the standard drink (200 ml); the reduced volume may increase patient compliance.

**gluten-free DHA/EPA/GLA/antioxidant-rich nutritional liquid:** A gluten- and lactose-free, energy-rich, calorie-dense, non-complete liquid nutritional supplement enriched with eicosapentaenoic acid (EPA), docosahexaenoic acid (DHA), gamma-linolenic acid (GLA) and antioxidants, with potential anti-cachexic and anti-inflammatory activities. The nutritional liquid also contains protein, in the form of sodium and

calcium caseinates, carbohydrates, as maltodextrin and sucrose, fat, as canola, borage, and marine oils, L-carnitine, taurine, and several other vitamins and minerals. Upon oral intake of the gluten-free DHA/EPA/GLA/antioxidant-rich nutritional liquid, the essential omega-3 polyunsaturated fatty acids EPA and DHA, derived from refined marine oil, and GLA, derived from borage oil, are incorporated into cell membranes and affect the production of pro-inflammatory mediators, which elicits an anti-inflammatory effect and may also prevent infections. The antioxidants, including ascorbic acid, beta-carotene, and tocopherols, neutralize free radicals, thereby protecting tissues and organs from oxidative damage. Medium chain triglycerides (MCT) and large chain triglycerides (LCT) in this supplement enhance fat absorption and increase calorie intake. Additionally, this nutritional supplement may prevent malnutrition and weight loss.

**gluten-free/fiber enriched compact nutritional supplement drink:** A gluten-free, calorie-dense, fiber-enriched milkshake-like nutritional supplement drink containing all essential vitamins, minerals, and trace elements, as well as protein, fat and carbohydrates. Upon oral intake, gluten-free, fiber-enriched compact nutritional supplement drink may aid in the prevention of malnutrition and weight loss. The drink is provided in a reduced volume (125 ml) but with the same complete nutrition as the standard drink (200 ml); the reduced volume may increase patient compliance. The fiber, acting as a prebiotic, promotes beneficial bacterial growth in the gastrointestinal (GI) tract, increases digestive health and may reduce the incidence of constipation and/or diarrhea.

**glyburide:** A sulfonamide urea derivative with antihyperglycemic activity that can potentially be used to decrease cerebral edema. Upon administration, glyburide binds to and blocks the sulfonylurea receptor type 1 (SUR1) subunit of the ATP-sensitive inwardly-rectifying potassium (K(ATP)) channels on the membranes of pancreatic beta cells. This prevents the inward current flow of positively charged potassium (K<sup>+</sup>) ions into the cell, and induces a calcium ion (Ca<sup>2+</sup>) influx through voltage-sensitive calcium channels, which triggers exocytosis of insulin-containing granules. In addition, glyburide also inhibits the SUR1-regulated nonselective cation (NC) Ca-ATP channel, melastatin 4 (transient receptor potential cation channel subfamily M member 4; (TRPM4)), thereby preventing capillary failure and brain swelling. SUR1-TRPM4 channels are formed by co-

assembly of SUR1 with TRPM4 in neurons, astrocytes, and capillary endothelium during cerebral ischemia. Upon ischemia-induced ATP depletion, channels open which results in sodium influx, cytotoxic edema formation, capillary fragmentation and necrotic cell death. SUR1-TRPM4 is not expressed in normal, uninjured tissues. Check for active clinical trials using this agent.

**Glycan:** A polysaccharide; a polymer of sugars; see oligosaccharide OR Another term for polysaccharide; a polymer of monosaccharide units joined by glycosidic bonds.

**glycan :** A large carbohydrate molecule. It contains many small sugar molecules that are joined chemically. Also called polysaccharide.

**glycan analysis :** A study of the types of carbohydrate (sugar) molecules attached to proteins in cells. Proteins with carbohydrate molecules are called glycoproteins. Glycan analysis is being studied to find out if glycoproteins on cancer cells may be used as biomarkers for cancer.

**glycemia :** Glucose (a type of sugar) found in the blood. Also called blood sugar.

**glycemic index :** A measure of the increase in the level of blood glucose (a type of sugar) caused by eating a specific carbohydrate (food that contains sugar) compared with eating a standard amount of glucose. Foods with a high glycemic index release glucose quickly and cause a rapid rise in blood glucose. Foods with a low glycemic index release glucose slowly into the blood. A relationship between the glycemic index and recurrent colorectal cancer is being studied.

**glyceride:** Glycerides are fats and oils that are esters of glycerol with one or more fatty acids. Monoglycerides, diglycerides, and triglycerides contain one, two, and three fatty acids linked to the glycerol, respectively.

**glycerin enema:** An enema solution containing 5% glycerin, a trihydroxy alcohol with osmotic laxative activity. Upon rectal administration, glycerin enema creates an osmotic gradient thereby attracting water into the rectum. This increases volume, increases peristalsis, stimulates evacuation, and relieves constipation.

**Glycerine:** Glycerine (chemical name 1,2,3-propanetriol), also known as glycerol or glycerine, is a non-toxic, colorless, odorless, sweet-tasting,

viscous (at room temperature) liquid that is hydrophilic (water loving), hygroscopic and emollient.

**Glycerol:** Glycerol is a biological compound that has three carbons with three alcohol functional groups. It is the backbone molecule of many fats when combined with fatty acids. OR Propan-1,2,3-triol, named from the greek word for 'sweet' thanks to its taste. It is the basis for many animal and vegetable fats.

**Glycerol 3-phosphate shuttle:** A pathway that transfers electrons from cytoplasmic NADH into the mitochondria; dihydroxyacetone phosphate (DHAP) is reduced by NADH to glycerol 3-phosphate, which enters the mitochondria and is oxidized to yield FADH<sub>2</sub> and DHAP, which leaves the mitochondria.

**glycerol<sup>22</sup>:** Glycerol is a small molecule with three alcohol groups. It is a basic building block of fats and oils.

**glycerophospholipid:** An amphipathic lipid with a glycerol backbone; fatty acids are ester-linked to C-1 and C-2 of glycerol, and a polar alcohol is attached through a phosphodiester linkage to C-3.

**Glycerol ether phospholipid:** A phospholipid that contains an ether unit rather than an acyl unit at C-1 and is synthesized starting with dihydroxyacetone phosphate rather than glycerol phosphate.

**glycinamide ribonucleotide formyltransferase inhibitor :** A drug that blocks DNA synthesis and may prevent tumor growth. It is being studied as a treatment for cancer.

**glycine:** A non-essential, non-polar, non-optical, glucogenic amino acid. Glycine, an inhibitory neurotransmitter in the CNS, triggers chloride ion influx via ionotropic receptors, thereby creating an inhibitory post-synaptic potential. In contrast, this agent also acts as a co-agonist, along with glutamate, facilitating an excitatory potential at the glutaminergic N-methyl-D-aspartic acid (NMDA) receptors. Glycine is an important component and precursor for many macromolecules in the cells.

**Glycine max :** A product from a plant of Asian origin that produces beans used in many food products. Glycine max contains isoflavones (estrogen-like substances) that are being studied for the prevention of cancer, hot flashes that occur with menopause, and osteoporosis (loss of bone density).

Glycine max in the diet may lower cholesterol levels and reduce the risk of heart disease. Also called soy, soya, and soybean.

**glycine<sup>22</sup>:** A naturally occurring aliphatic amino acid, found in large quantities in gelatin.

**Glycoforms:** Forms of a specific protein that differ only in patterns of glycosylation.

**glycogen:** A polysaccharide the body uses for energy storage; it is made up of chains of glucose molecules. When the body has depleted the free glucose in the blood, the liver breaks down glycogen into more glucose. OR a polysaccharide composed of thousands of glucose units that serves as the storage form of glucose in the human liver. OR A polymer of glucose residues in 1,4 linkage, with 1,6 linkages at branchpoints. OR A readily mobilized storage form of glucose in which the glucose monomers are linked by  $\alpha$ -1,4-glycosidic bonds and with branches ( $\alpha$ -1,6-glycosidic bonds) at about every tenth residue.

**Glycogen degradation:** The cleavage of glycogen by phosphorolysis, catalyzed by glycogen phosphorylase, to yield glucose 1-phosphate, which can be converted into glucose 6-phosphate.

**Glycogen phosphorylase:** An enzyme that catalyzes the phosphorolysis of glycogen to yield glucose 1-phosphate; an allosteric enzyme whose activity is further regulated by reversible covalent modification.

**glycogen storage disease :** A type of inherited disorder in which there are problems with how a form of glucose (sugar) called glycogen is stored and used in the body. Certain enzymes that help make or break down glycogen are missing or do not work the way they should. This causes abnormal amounts or types of glycogen in the tissues, especially in the liver and in muscle tissue. There are many types of glycogen storage disease, which can cause problems in different parts of the body, including the liver, muscles, kidneys, and heart. Also called GSD.

**Glycogen storage diseases:** Any of a number of heritable diseases characterized by an inability to store or utilize glycogen appropriately.

**Glycogen synthase:** An allosteric enzyme that can be reversibly covalently regulated and is responsible for the synthesis of glycogen; it transfers glucose from UDP-glucose to the hydroxyl group at a C-4 terminus of glycogen.

**Glycogen synthesis:** The synthesis of glycogen from UDP-glucose, which is catalyzed by the enzyme glycogen synthase.

**Glycogenic:** Describing amino acids whose metabolism may lead to gluconeogenesis.

**Glycogenin:** A protein that bears an oligosaccharide of  $\alpha$ -1,4 glucose units and is the primer for glycogen synthase. Glycogenin uses UDP-glucose to catalyze its own autoglycosylation.

**glycol:** a class of alcohols that contain two — OH groups;  $C_nH_{2n}(OH)_2$ .

**glycolic acid :** A substance found in some fruits, sugar beets, and sugar cane. It is used in skin care products to reduce wrinkles and soften the skin. It is a type of alpha hydroxyl acid.

**Glycolipid:** A lipid covalently linked to a sugar OR A lipid containing a carbohydrate group.

**glycolipid:** A lipid covalently linked to a sugar or polysaccharide. These biomolecules are important parts of animal cell membranes.

**Glycolipids:** Sugar-containing lipids that are derived from sphingosine; the sugar moiety is attached at the alcohol on sphingosine.

**glycolysis:** A complex biochemical process in which one molecule of glucose is anaerobically converted into two molecules of pyruvate and energy in the form of ATP. OR the subdivision of cellular respiration in which glucose molecules are broken down to form pyruvic acid molecules. OR The catabolic conversion of glucose to pyruvate with the production of ATP. OR A sequence of reactions that convert glucose into pyruvate with the concomitant generation of energy. OR The catabolic pathway by which a molecule of glucose is broken down into two molecules of pyruvate.

**glycolysis :** A process in which glucose (sugar) is partially broken down by cells in enzyme reactions that do not need oxygen. Glycolysis is one method that cells use to produce energy. When glycolysis is linked with other enzyme reactions that use oxygen, more complete breakdown of glucose is possible and more energy is produced.

**glycooptimized trastuzumab-GEX:** A glycoengineered form of a monoclonal antibody directed against the human epidermal growth factor receptor-2 (HER2), with potential antineoplastic activity. Glycooptimized trastuzumab-GEX specifically binds to the extracellular domain of HER2, thereby inducing an antibody-dependent cell-mediated cytotoxicity

(ADCC) against HER2-expressing tumor cells. This eventually results in apoptosis and growth inhibition of tumor cells. HER2, a member of the receptor tyrosine kinase EGFR superfamily, is overexpressed on the cell surfaces of various solid tumors. This agent has a specific glycosylation profile that may enhance its ADCC response against HER2-expressing tumor cells.

**glycopeptide :** A short chain of amino acids (the building blocks of proteins) that has sugar molecules attached to it. Some glycopeptides have been studied for their ability to stimulate the immune system.

**glycopeptide antibiotic:** One of a class of antibiotics originally isolated from plant and soil bacteria with structures containing either a glycosylated cyclic or polycyclic nonribosomal peptide. These antibiotics inhibit the cell wall structure of susceptible organisms (principally Gram-positive cocci) by inhibiting peptidoglycan synthesis. First-generation glycopeptide antibiotics include vancomycin, teicoplanin, and ramoplanin; second-generation semi-synthetic glycopeptide antibiotics include oritavancin, dalbavancin, and telavancin. Check for active clinical trials using this agent.

**Glycoprotein:** A protein covalently linked to a sugar OR A protein containing a carbohydrate group. OR A protein linked to an oligosaccharide or a polysaccharide. Glycosaminoglycans: Long, unbranched polysaccharide chains composed of repeating disaccharide subunits in which one of the two sugars is either N-acetylglucosamine or N-acetylgalactosamine.

**glycoprotein :** A protein that has sugar molecules attached to it.

**glycoprotein 100 :** gp100. A tumor-specific antigen used in the development of cancer vaccines. Also called gp100.

**Glycoproteins:** Proteins that have a specific carbohydrate moiety attached.

**glycopyrrolate:** A synthetic quaternary ammonium that is an anticholinergic agent with antispasmodic activity. Glycopyrrolate competitively binds to peripheral muscarinic receptors in the autonomic effector cells of, and inhibits cholinergic transmission in smooth muscle, cardiac muscle, the sinoatrial (SA) node, the atrioventricular (AV) node, exocrine glands and in the autonomic ganglia. Blockage of cholinergic transmission, in smooth muscle cells located in the gastrointestinal tract and the bladder, causes smooth muscle relaxation and prevents the occurrence

of painful spasms. In addition, glycopyrrolate inhibits the release of gastric, pharyngeal, tracheal, and bronchial secretions.

**Glycosaminoglycan:** A heteropolysaccharide made of repeating disaccharide units and containing the amino sugar glucosamine or galactosamine. OR A heteropolysaccharide of two alternating units: one is either N-acetylglucosamine or N-acetylgalactosamine; the other is a uronic acid (usually glucuronic acid). Formerly called mucopolysaccharide.

**glycosaminoglycan :** A type of long, unbranched polysaccharide molecule. Glycosaminoglycans are major structural components of cartilage and are also found in the cornea of the eye.

**Glycoscience:** A branch of chemistry dedicated to the study of the many types of carbohydrate molecules

**Glycosidase:** A class of enzymes that cleave glycosidic bonds; lysozyme is a glycosidase.

**Glycosidic bond:** The bond between a sugar and an alcohol Also the bond that links two sugars in disaccharides, oligosaccharides, and polysaccharides. OR A covalent bond between an aldehyde or ketone function of a monosaccharide and an oxygen, nitrogen, or sulfur atom of another molecule. The most common glycosidic linkages are O-links between the anomeric carbon atom of a sugar and a hydroxyl group of another saccharide. OR Bonds between a sugar and another molecule (typically an alcohol, purine, pyrimidine, or sugar) through an intervening oxygen or nitrogen atom; the bonds are classified as O-glycosidic or N-glycosidic, respectively.

**glycosylated recombinant human G-CSF AVI-014:** A glycosylated form of a recombinant agent that is chemically identical to or similar to endogenous human granulocyte colony-stimulating factor (G-CSF) and is produced using transgenic biotechnology. Transgenic hens carrying recombinant human G-CSF cDNA express the naturally glycosylated recombinant human protein in egg albumen from which glycosylated recombinant human G-CSF AVI-014 is isolated. Produced endogenously by monocytes, fibroblasts, and endothelial cells, G-CSF binds to and activates specific cell surface receptors, stimulating neutrophil progenitor proliferation and differentiation and selected neutrophil functions.

**glycosylated recombinant human interleukin-7:** A glycosylated recombinant protein which is chemically identical to or similar to

endogenous human interleukin-7 (IL-7) with hematopoietic and immunopotentiating activities. Naturally produced by bone marrow, thymic stromal, and spleen cells, the cytokine interleukin-7 is a hematopoietic growth factor for progenitor B cells and T cells, stimulating proliferation and differentiation of mature T-cells and natural killer (NK) cells. As with glycosylated endogenous proteins, glycosylation of recombinant proteins may fundamentally affect their biological activity, function, clearance from circulation, and antigenicity; glycosylation of recombinant proteins that are chemically identical to similar to endogenous proteins may render protein structures and biological activities that are more similar to those of glycosylated endogenous proteins. Check for active clinical trials using this agent.

**Glycosyltransferase:** Any one of a number of specific enzymes that catalyze the formation of glycosidic bonds.

**glymidine:** A sulfapyrimidine derivative, also known as glycodiazine, with antihyperglycemic activity. Like sulfonylureas, glymidine is able to lower blood glucose levels by increasing the release of insulin from pancreatic beta cells and increasing the sensitivity of peripheral tissues to insulin.

**Glyoxylate cycle:** A pathway that uses some of the enzymes of the TCA cycle and some enzymes whereby acetate can be converted into succinate and carbohydrates. OR A metabolic pathway that converts two-carbon units into succinate for energy production and biosyntheses; found primarily in bacteria and plants, the cycle bypasses two decarboxylation steps in the citric acid cycle and allows the net formation of glucose and other molecules through oxaloacetate from acetate or acetyl coa. OR A variant of the citric acid cycle, for the net conversion of acetate into succinate and, eventually, new some OR A modification of the Krebs cycle, which occurs in some bacteria. Acetyl coenzyme A is generated directly from oxidation of fatty acids or other lipid compounds.

**Glyoxysome:** An organelle containing some enzymes of the glyoxylate cycle. OR A specialized peroxisome containing the enzymes of the glyoxylate cycle; found in cells of germinating seeds. OR Plant organelles in which enzymes of the glyoxylate pathway are present.

**Glyset:** (Other name for: miglitol)

**GlyT2/5HT2a antagonist VVZ-149:** An antagonist of both glycine transporter type 2 (GlyT2) and serotonin receptor 2A (5HT2A), with

potential anti-nociceptive activity. Upon administration, GlyT2/5HT2A antagonist VVZ-149 binds to and blocks both GlyT2 and 5HT2A. Blockage of GlyT2 prevents the re-uptake of the inhibitory neurotransmitter glycine in the synaptic cleft, thereby potentiating glycine-mediated inhibitory signaling, and inhibiting the firing of neurons, which suppresses the transmission of pain signals to the brain and induces analgesia. Blockage of 5HT2A prevents both the binding of its ligand serotonin and 5HT/5HT2A-mediated signaling. This also suppresses pain signaling and induces analgesia. GlyT2 and 5HT2A play key roles in the induction and transmission of pain signals. GlyT2, a glycine plasma membrane transporter, modulates glycine-mediated inhibition of synaptic transmission in the spinal cord and mediates pain signal transmission to the brain; inhibition of GlyT2 potentiates glycinergic mediated pain signaling. Serotonin and its 5HT2A receptor are involved in both serotonin receptor-mediated signaling and the perception of pain.

**GM-CSF:** A substance that helps make more white blood cells, especially granulocytes, macrophages, and cells that become platelets. It is a cytokine that is a type of hematopoietic (blood-forming) agent. Also called granulocyte-macrophage colony-stimulating factor and sargramostim.

**GM-CSF-encoding oncolytic adenovirus CGTG-102:** A recombinant, oncolytic serotype 5/3 capsid-modified adenovirus encoding the immunostimulatory cytokine granulocyte-macrophage colony-stimulating factor (GM-CSF) with potential antineoplastic activity. Upon administration, the oncolytic adenovirus selectively infects and replicates in tumor cells, which may result in tumor cell lysis. Synergistically, GM-CSF (sargramostim) expressed by the oncolytic adenovirus enhances antigen presentation, promotes natural killer (NK) cell-mediated killing and causes a cytotoxic T cell (CTL) response against tumor cells harboring the oncolytic adenovirus, resulting in an immune-mediated tumor cell death. CGTG-102 is designed to replicate only in cells with defects in the p16/Rb/E2F pathway, attributed to a mutation common in many solid tumors. Replacement of the Ad5 capsid protein knob with a knob domain from serotype 3 causes higher transduction in cancer cells as compared to normal cells.

**GM-CSF-secreting breast tumor vaccine :** A vaccine that is being studied as a way to help the body's immune system kill breast cancer cells.

To make the vaccine, the GM-CSF gene is put into breast cancer cells in the laboratory. The cells are then treated with radiation to stop them from growing and injected into the same or a different patient. The GM-CSF protein made by the changed breast cancer cells may help the immune system kill breast cancer cells in the body.

**GM-K562 cell vaccine:** A cell-based vaccine comprised of K562 cells transfected with the granulocyte macrophage-colony stimulating factor (GM-CSF) gene with potential immunopotentiating properties. Vaccination with GM-K562 cells may stimulate the host immune system to produce an antitumoral T-lymphocyte response, thereby inhibiting tumor growth. K562 cells are derived from the human erythroleukemia cell line K562. GM-CSF (also known as sargramostim) expressed by vaccine cells binds to specific cell surface receptors, modulating the proliferation and differentiation of a variety of hematopoietic progenitor cells with some specificity towards stimulation of leukocyte production. GM-CSF also promotes antigen presentation, up-regulates antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated lymphokine-activated killer cell function; it may also augment host antitumoral immunity.

**GM.CD40L cell vaccine:** A cell-based vaccine composed of irradiated tumor cells transduced with granulocyte-macrophage colony-stimulating factor (GM-CSF) and CD40-ligand (CD40L) genes. Upon administration, this vaccine may stimulate an anti-tumoral dendritic cell-mediated host immune response.

**GM2-KLH vaccine:** A cancer vaccine consisting of GM2 ganglioside, a melanoma-specific antigen, conjugated with the immunostimulant keyhole limpet hemocyanin. Vaccination with GM2-KLH vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against GM2 ganglioside-expressing melanoma cells, resulting in tumor growth inhibition. or A substance used to stimulate the production of antibodies that fight certain cancer cells

**GM2/GD2/GD3 lactone-KLH conjugate trivalent vaccine:** A trivalent cancer vaccine containing the ganglioside lactones GM2, GD2 and GD3 conjugated with the immunostimulant keyhole limpet hemocyanin (KLH), with potential antineoplastic activity. Vaccination with GM2 lactone/GD2 lactone/GD3 lactone-KLH conjugate trivalent vaccine may elicit antibodies

against tumor cells expressing any of these epitopes, resulting in an antibody-dependent cell-mediated cytotoxicity (ADCC) against tumor cells expressing these gangliosides. GM2, GD2 and GD3 are tumor associated antigens (TAAs) that are overexpressed in a variety of tumor cell membranes.

**GnRH:** A hormone made by a part of the brain called the hypothalamus. GnRH causes the pituitary gland in the brain to make and secrete the hormones luteinizing hormone (LH) and follicle-stimulating hormone (FSH). In men, these hormones cause the testicles to make testosterone. In women, they cause the ovaries to make estrogen and progesterone. Also called gonadotropin-releasing hormone, LH-RH, LHRH, and luteinizing hormone-releasing hormone.

**GnRH agonist :** A substance that keeps the testicles and ovaries from making sex hormones by blocking other hormones that are needed to make them. In men, GnRH agonists cause the testicles to stop making testosterone. In women, they cause the ovaries to stop making estrogen and progesterone. Some GnRH agonists are used to treat prostate cancer. Also called gonadotropin-releasing hormone agonist, LH-RH agonist, and luteinizing hormone-releasing hormone agonist.

**GnRH antagonist :** A substance that blocks the pituitary gland from making hormones called follicle-stimulating hormone (FSH) and luteinizing hormone (LH). In men, this causes the testicles to stop making testosterone. In women, this causes the ovaries to stop making estrogen and progesterone. Some GnRH antagonists are used to treat advanced prostate cancer. They are also used to treat certain gynecologic conditions and are being studied in the treatment of hormone-sensitive breast cancer. Also called gonadotropin-releasing hormone antagonist, LH-RH antagonist, and luteinizing hormone-releasing hormone antagonist.

**GnRH antagonist TAK-385:** An orally available, non-peptide gonadotropin-releasing hormone (GnRH or luteinizing hormone-releasing hormone (LHRH)) antagonist, with potential antineoplastic activity. GnRH antagonist TAK-385 competitively binds to and blocks the GnRH receptor in the anterior pituitary gland, which both prevents GnRH binding to the GnRH receptor and inhibits the secretion and release of both luteinizing hormone (LH) and follicle stimulating hormone (FSH). In males, the inhibition of LH secretion prevents the release of testosterone from Leydig

cells in the testes. Since testosterone is required to sustain prostate growth, reducing testosterone levels may inhibit hormone-dependent prostate cancer cell proliferation.

**goiter** : An enlarged thyroid. It may be caused by too little iodine in the diet or by other conditions. Most goiters are not cancer.

**Gold:** Symbol:"Au" Atomic Number:"79" Atomic Mass: 196.97amu. Gold is one of the transition elements. Gold is one of the Earth's precious metals. You will find the yellow colored metal used in jewelry, electronics, coins, satellites, and even medicines. Gold is very non-reactive and will not oxidize in air.

**gold fiducial marker seeds** : Tiny, gold seeds, about the size of a grain of rice, that are put in and/or around a tumor to show exactly where it is in the body. Doctors are then able to target the tumor directly and give higher doses of radiation with less harm to nearby healthy tissue. Also called gold fiducial markers, gold seeds, and gold-seed fiducial markers.

**gold fiducial markers** : Tiny, gold seeds, about the size of a grain of rice, that are put in and/or around a tumor to show exactly where it is in the body. Doctors are then able to target the tumor directly and give higher doses of radiation with less harm to nearby healthy tissue. Also called gold fiducial marker seeds, gold seeds, and gold-seed fiducial markers.

**gold seeds** : Tiny, gold seeds, about the size of a grain of rice, that are put in and/or around a tumor to show exactly where it is in the body. Doctors are then able to target the tumor directly and give higher doses of radiation with less harm to nearby healthy tissue. Also called gold fiducial marker seeds, gold fiducial markers, and gold-seed fiducial markers.

**Gold size:** A general description for an adhesive used for affixing gold leaf. It can be either a gelatine or glue-size or an oil-varnish. The latter product is now usually meant and is also used as a drier in oil paints or a hardener/drier for stopping and filling compounds. It should more correctly be termed 'Japan gold size'.

**gold sodium thiomalate:** The sodium salt of gold thiomalic acid, an organogold compound with antirheumatic and potential antineoplastic activities. Gold sodium thiomalate (GST) appears to inhibit the activity of atypical protein kinase C iota (PKCiota) by forming a cysteinyl-aurothiomalate adduct with the cysteine residue Cys-69 within the PB1 binding domain of PKCiota. This prevents the binding of Par6 (Partitioning

defective protein 6) to PKC $\zeta$ , thereby inhibiting PKC $\zeta$ -mediated oncogenic signaling, which may result in the inhibition of tumor cell proliferation, the promotion of tumor cell differentiation, and the induction of tumor cell apoptosis. Atypical PKC $\zeta$ , a serine/threonine kinase overexpressed in numerous cancer cell types, plays an important role in cancer proliferation, invasion, and survival; Par6 is a scaffold protein that facilitates atypical PKC-mediated phosphorylation of cytoplasmic proteins involved in epithelial and neuronal cell polarization.

**gold therapy :** A procedure that uses gold salts (a salt form of the metal element gold) to treat diseases, such as rheumatoid arthritis. The gold salts stop cells from releasing chemicals that can harm tissues. Also called aurotherapy and chrysotherapy.

**Gold-leaf:** Pure gold beaten out to produce an extremely thin leaf (approx. 1/2000 000 of an inch) and applied to surfaces to be gilded.

**gold-seed fiducial markers :** Tiny, gold seeds, about the size of a grain of rice, that are put in and/or around a tumor to show exactly where it is in the body. Doctors are then able to target the tumor directly and give higher doses of radiation with less harm to nearby healthy tissue. Also called gold fiducial marker seeds, gold fiducial markers, and gold seeds.

**goldenrod:** A group of North American weedy herbs belonging to the genus *Solidago* (family Asteraceae) with potential chemopreventive activities. Goldenrod may also possess anti-inflammatory, antiseptic properties, diuretic and antifungal properties, and may relieve chemotherapy-induced side-effects.

**Goldman equation:** An equation expressing the quantitative relationship between the concentrations of charged species on either side of a membrane and the resting transmembrane potential.

**Golgi apparatus:** an organelle within eukaryotic cells comprised of a series of flattened sacs; the site of protein and lipid processing and packaging; also called Golgi bodies. OR A complex series of double-membrane structures that interact with the endoplasmic reticulum and that serve as a transfer point for proteins destined for other organelles, the plasma membrane, or extracellular transport.

**Golgi apparatus :** A stack of small flat sacs formed by membranes inside the cell's cytoplasm (gel-like fluid). The Golgi apparatus prepares proteins and lipid (fat) molecules for use in other places inside and outside the cell.

The Golgi apparatus is a cell organelle. Also called Golgi body and Golgi complex.

**Golgi body :** A stack of small flat sacs formed by membranes inside the cell's cytoplasm (gel-like fluid). The Golgi body prepares proteins and lipid (fat) molecules for use in other places inside and outside the cell. The Golgi body is a cell organelle. Also called Golgi apparatus and Golgi complex.

**Golgi complex:** In the cytoplasm, a stack of membranous sacks that constitute the major sorting center for proteins that reside in cell membranes and the lumen of organelles. OR A complex membranous organelle of eukaryotic cells; functions in the posttranslational modification of proteins and their secretion from the cell or incorporation into the plasma membrane or organellar membranes.

**Golgi complex :** A stack of small flat sacs formed by membranes inside the cell's cytoplasm (gel-like fluid). The Golgi complex prepares proteins and lipid (fat) molecules for use in other places inside and outside the cell. The Golgi complex is a cell organelle. Also called Golgi apparatus and Golgi body.

**golnerminogene pradenovec:** A recombinant agent consisting of a genetically-modified adenovirus 5 vector encoding the protein cytokine tumor necrosis factor (TNF) alpha. TNF exhibits potent anti-tumor cytolytic properties; the adenovirus 5 vector efficiently infects tumor cells, delivering tumor-specific TNF.

**golotimod:** An orally bioavailable synthetic peptide containing the amino acids D-glutamine and L-tryptophan connected by a gamma-glutamyl linkage with potential immunostimulating, antimicrobial and antineoplastic activities. Although the exact mechanism of action is unknown, golotimod appears to inhibit the expression of STAT-3, reversing immunosuppression and stimulating an anti-tumor immune response. This agent may stimulate the production of T-lymphocytes (in particular the helper T [Th1] cells), activate macrophages, and increase levels of interleukin 2 and interferon gamma. STAT-3, a transcription factor upregulated in many cancer cell types, is involved in tumor cell growth and survival and immunosuppression.

**golvatinib:** An orally bioavailable dual kinase inhibitor of c-Met (hepatocyte growth factor receptor) and VEGFR-2 (vascular endothelial growth factor receptor-2) tyrosine kinases with potential antineoplastic

activity. Golvatinib binds to and inhibits the activities of both c-Met and VEGFR-2, which may inhibit tumor cell growth and survival of tumor cells that overexpress these receptor tyrosine kinases. c-Met and VEGFR-2 are upregulated in a variety of various tumor cell types and play important roles in tumor cell growth, migration and angiogenesis.

**gonad** : The part of the reproductive system that produces and releases eggs (ovary) or sperm (testicle/testis).

**gonadal dysgenesis** : Abnormal development of a gonad (ovary or testicle). Men with gonadal dysgenesis have a greater risk of developing testicular cancer. Gonadal dysgenesis is usually part of a genetic syndrome.

**gonadal shielding** : A procedure used to help keep a person fertile by preventing damage to reproductive organs during radiation therapy. A protective shield is placed on the outside of the body to cover the area of the gonads (the testicles or ovaries) and other parts of the reproductive system during radiation therapy. For males, this would also include the prostate and penis. For females, it would also include the fallopian tubes, uterus, cervix, and vagina. Gonadal shielding is a type of fertility preservation.

**gonadotrophin releasing hormone analogue**: A synthetic analog of the endogenous hormone gonadotropin-releasing hormone (GnRH), with potential antineoplastic activity. Upon administration, GnRH analog mimics endogenous GnRH and strongly binds to and activates pituitary GnRH receptors, which stimulates the synthesis and secretion of the gonadotropic hormones, follicle stimulating hormone (FSH) and luteinizing hormone (LH). Continuous, prolonged activation by the GnRH analog results in pituitary GnRH receptor desensitization and receptor downregulation. This causes inhibition of pituitary gonadotropin secretion of LH and FSH. In males, the inhibition of LH secretion prevents the production and release of testosterone from Leydig cells in the testes and causes a significant decline in testosterone production that is near the levels seen after castration. This may inhibit androgen receptor-positive tumor progression. In females, this results in a decrease in estradiol production. GnRH, also called luteinizing hormone-releasing hormone (LH-RH), is normally synthesized in and secreted by the hypothalamus. Synthetic analogs of GnRH have a stronger receptor binding affinity than the endogenous form.

**gonadotropin-releasing hormone agonist** : A substance that keeps the testicles and ovaries from making sex hormones by blocking other

hormones that are needed to make them. In men, gonadotropin-releasing hormone agonists cause the testicles to stop making testosterone. In women, they cause the ovaries to stop making estrogen and progesterone. Some gonadotropin-releasing hormone agonists are used to treat prostate cancer. Also called GnRH agonist, LH-RH agonist, and luteinizing hormone-releasing hormone agonist.

**gonadotropin-releasing hormone antagonist :** A substance that blocks the pituitary gland from making hormones called follicle-stimulating hormone (FSH) and luteinizing hormone (LH). In men, this causes the testicles to stop making testosterone. In women, this causes the ovaries to stop making estrogen and progesterone. Some gonadotropin-releasing hormone antagonists are used to treat advanced prostate cancer. They are also used to treat certain gynecologic conditions and are being studied in the treatment of hormone-sensitive breast cancer. Also called GnRH antagonist, LH-RH antagonist, and luteinizing hormone-releasing hormone antagonist.

**Gondwanaland:** a paleocontinent that consisted of what is now Africa, India, South America, Australia, and Antarctica.

**Goniometer head:** A device used to mount crystals and control their orientation at precise angles.

**gonioscopy :** A procedure in which a gonioscope (special lens) is used to look at the front part of the eye between the cornea (the clear layer) and the iris (the colored part of the eye). Gonioscopy checks for blockages in the area where fluid drains out of the eye.

**Gonzalez regimen :** An alternative therapy that is being studied as a treatment for pancreatic cancer. It includes a special diet, nutritional supplements, pancreatic enzymes, and coffee enemas.

**good agricultural practice in the use of pesticides:** Good agricultural practice in the use of pesticide is the officially recommended or authorized usage of pesticides under practical conditions at any stage of production, storage, transport, distribution, and processing of food and other agricultural commodities, bearing in mind the variations in requirements within and between regions and taking into account the minimum quantities necessary to achieve adequate control, the pesticide being applied in such a manner as to leave residues that are the smallest amounts practicable and that are toxicologically acceptable (WHO, 1976).

**Good Clinical Practice :** An international set of guidelines that helps make sure that the results of a clinical trial are reliable and that the patients are protected. Good Clinical Practice covers the way a clinical trial is designed, conducted, performed, monitored, audited, recorded, analyzed, and reported. Also called GCP.

**Goodbelly Probiotic:** (Other name for: Lactobacillus plantarum 299v/Lactobacillus acidophilus/Bifidobacterium lactis probiotic supplement)

**Gorlin syndrome :** A genetic condition that causes unusual facial features and disorders of the skin, bones, nervous system, eyes, and endocrine glands. People with this syndrome have a higher risk of basal cell carcinoma. Also called basal cell nevus syndrome and nevoid basal cell carcinoma syndrome.

**goserelin acetate:** The acetate salt of a synthetic decapeptide analog of luteinizing hormone-releasing hormone (LHRH). Continuous, prolonged administration of goserelin in males results in inhibition of pituitary gonadotropin secretion, leading to a significant decline in testosterone production; in females, prolonged administration results in a decrease in estradiol production. (NCI04) or A drug used to treat prostate cancer and to relieve the symptoms of advanced breast cancer. It is also used to treat problems with the endometrium (lining of the uterus). Goserelin acetate keeps the body from making the hormones luteinizing hormone-releasing hormone (LHRH) and luteinizing hormone (LH). This causes the testicles to stop making testosterone (a male hormone) in men, and the ovaries to stop making estradiol (a form of the hormone estrogen) in women. Goserelin acetate may stop the growth of cancer cells that need testosterone or estrogen to grow. It is a type of LHRH agonist. Also called ZDX and Zoladex.

**gossan:** a rusty, iron-bearing cap; a remnant of a weathered metallic ore deposit at the surface.

**gossypol:** An orally-active polyphenolic aldehyde with potential antineoplastic activity. Derived primarily from unrefined cottonseed oil, gossypol induces cell cycle arrest at the G0/G1 phase, thereby inhibiting DNA replication and inducing apoptosis. This agent also inhibits cell-signaling enzymes, resulting in inhibition of cell growth, and may act as a male contraceptive.

**gossypol** : A substance being studied in the treatment of several types of cancer. It comes from the seed of the cotton plant (Gossypium). It blocks the growth of cells and may kill cancer cells. Gossypol may also act as a male contraceptive (a type of birth control). Also called cottonseed meal toxin.

**gossypol acetic acid** : A substance being studied in the treatment of several types of cancer. It is a form of a chemical taken from the seed of the cotton plant (Gossypium). It blocks the growth of cells and may kill cancer cells. Gossypol acetic acid may also act as a male contraceptive (form of birth control).

**Gouache**: A method of painting with opaque colours that have been ground in water and mixed with a preparation of gum; also any picture painted by this method.

**Gout**: A disease characterized by inflammation of the joints and kidneys due to the precipitation of abnormally high levels of sodium urate, a breakdown product of purines. OR A condition marked by increased levels of uric acid in the blood, joints, and tissue. The buildup of uric acid in the joints and tissues causes arthritis and inflammation.

**gp100**: A tumor-specific antigen used in the development of cancer vaccines. Also called glycoprotein 100.

**gp100 antigen**: A melanoma-associated antigen. When administered in a vaccine formulation, gp100 antigen may stimulate a cytotoxic T cell HLA-A2.1-restricted immune response against tumors that express this antigen, which may result in a reduction in tumor size. Check for active clinical trials using this agent.

**gp100-fowlpox vaccine**: A cancer vaccine comprised of a recombinant fowlpox virus vector encoding the melanoma antigen glycoprotein 100 (gp 100) with potential antineoplastic activity. The expression of gp100 may generate a cellular immune response to melanoma cells; this effect is enhanced by the co-administration of interleukin 2 (IL-2). Check for active clinical trials using this agent.

**gp100:154-162 peptide vaccine**: A peptide consisting of amino acid residues 154 through 162 of the melanoma-melanocyte antigen gp100. Vaccination with gp100:154-162 peptide may enhance tumor-specific T-cell immunity. gp100 antigen is a self-antigen expressed by melanocytes,

pigmented retinal cells, and most melanoma lesions and is recognized via class I and II HLA-restricted mechanisms.

**gp100:209-217(210M) peptide vaccine:** A synthetic peptide cancer vaccine consisting of amino acid residues 209 through 217 of the glycoprotein 100 (gp100) melanoma antigen, with a methionine substitution at position 210 designed to improve immunogenicity. Vaccination with gp100:209-217(210M) peptide may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing gp100.

**gp100:209-217(210M) peptide vaccine:** A synthetic peptide cancer vaccine consisting of amino acid residues 209 through 217 of the glycoprotein 100 (gp100) melanoma antigen, with a methionine substitution at position 210 designed to improve immunogenicity. Vaccination with gp100:209-217(210M) peptide may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing gp100.

**gp100:280-288(288V) peptide vaccine:** A peptide vaccine consisting of the amino acids 280 through 288 of the melanoma antigen glycoprotein 100 (gp100) with potential antineoplastic activity. gp100:280-288(288V) peptide has a valine substitution at amino acid position 288 to improve immunogenicity. Vaccination with gp100:280-288(288V) peptide may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells positive for the gp100 antigen, resulting in decreased tumor growth.

**GP2 peptide/GM-CSF vaccine:** A vaccine containing a HER2/Neu-derived epitope (amino acids 654-662) (GP2), and combined with granulocyte-macrophage colony-stimulating factor (GM-CSF), with potential antineoplastic and immunoadjuvant activity. Upon vaccination, GP2 may activate the immune system to mount a cytotoxic T-lymphocyte (CTL) immune response against HER2/Neu expressing cancer cells. GM-CSF may potentiate a tumor-specific cytotoxic T-lymphocyte (CTL) response against cancer cells expressing the HER2/Neu antigen. HER2/neu, a tumor associated antigen (TAA), is overexpressed in a variety of tumor cell types and is highly immunogenic.

**gp209-2M:** A peptide (short piece of protein) made from the tumor-specific antigen gp100, and used to make vaccines being studied in the

treatment of melanoma.

**gp96 heat shock protein-peptide complex vaccine :** A vaccine made from a patient's tumor cells that may help the body's immune system kill cancer cells. This vaccine is used to treat kidney cancer, a type of brain cancer called glioma, and metastatic melanoma (a type of skin cancer that has spread). It is also being studied in the treatment of other types of cancer. Also called gp96 HSP-peptide complex, Oncophage, and vitespen.

**gp96 HSP-peptide complex :** A vaccine made from a patient's tumor cells that may help the body's immune system kill cancer cells. This vaccine is used to treat kidney cancer, a type of brain cancer called glioma, and metastatic melanoma (a type of skin cancer that has spread). It is also being studied in the treatment of other types of cancer. Also called gp96 heat shock protein-peptide complex vaccine, Oncophage, and vitespen.

**gp96-secreting allogeneic bladder cancer cell vaccine HS-410:** An allogeneic urothelial bladder cancer cell vaccine expressing a recombinant secretory form of the immunoadjuvant heat shock protein gp96 fused with an immunoglobulin Fc domain (gp96-Ig) protein, with potential antineoplastic activity. Upon administration of the gp96-Ig-secreting allogeneic bladder cancer cell vaccine HS-410, the live, irradiated tumor cells continuously secrete gp96-Ig along with its chaperoned tumor associated antigens (TAAs). This enhances antigen cross presentation to cytotoxic T-lymphocytes (CTLs) and, upon expansion, leads to the induction of a potent CTL response against the TAAs on the endogenous bladder cancer cells. This vaccine also induces a memory T cell response that could fight recurring cancer cells. gp96-Ig is constructed by replacing the KDEL endoplasmic reticulum (ER) retention sequence of gp96 with the Fc portion of the IgG1 protein. This allows for gp96, normally an ER-resident chaperone peptide, to be released from cells.

**GPI-0100:** A semi-synthetic triterpene glycoside, derived from the naturally occurring saponins. GPI-0100 functions as an adjuvant when given as part of a vaccine preparation to improve the immunogenicity of antigens such as proteins, carbohydrates. GPI-0100 containing vaccines have been used with both viral and tumor antigens to elicit a Type 1 helper T cell response for those diseases in which a cytotoxic T lymphocyte (CTL) response is desired. Check for active clinical trials using this agent.

**GPX-100:** An analogue of the anthracycline antineoplastic antibiotic doxorubicin. GPX-100 intercalates DNA and interacts with topoisomerase II, thereby inhibiting DNA replication and repair and RNA and protein synthesis. GPX-100 was designed to be a non-cardiotoxic anthracycline antibiotic.

**GPX-100:** An anticancer drug that belongs to the family of drugs called antitumor antibiotics. It is an anthracycline.

**Graafian follicle:** a cluster of cells within the ovary that is derived from egg cells and secretes female hormones called estrogens.

**grab sample:** a single sample of wastewater taken at neither set time nor flow.

**graben:** a feature formed when a block that is bounded by normal faults slips downward, usually because of a tensional force, creating a valleylike depression.

**Grade:** the designation given to a specific formulation of a given plastic compound. While similar formulations from different suppliers are often interchangeable, some suppliers have unique (and often proprietary) formulations.

**grade :** In cancer, a description of a tumor based on how abnormal the cancer cells and tissue look under a microscope and how quickly the cancer cells are likely to grow and spread. Low-grade cancer cells look more like normal cells and tend to grow and spread more slowly than high-grade cancer cells. Grading systems are different for each type of cancer. They are used to help plan treatment and determine prognosis. Also called histologic grade and tumor grade.

**grade 1 follicular lymphoma :** An indolent (slow-growing) type of non-Hodgkin lymphoma marked by enlarged lymph nodes and small cells that have cleaved (u-shaped) nuclei.

**grade 2 follicular lymphoma :** An indolent (slow-growing) type of non-Hodgkin lymphoma marked by enlarged lymph nodes and a mix of large cells and small cells that have cleaved (u-shaped) nuclei.

**grade 3 follicular lymphoma :** A type of non-Hodgkin lymphoma marked by large cells and enlarged lymph nodes. Grade 3 follicular lymphoma is less common, and more aggressive than grades 1 or 2 follicular lymphoma.

**grade IV astrocytoma :** A fast-growing type of central nervous system tumor that forms from glial (supportive) tissue of the brain and spinal cord and has cells that look very different from normal cells. Grade IV astrocytoma usually occurs in adults and affects the brain more often than the spinal cord. Also called GBM, glioblastoma, and glioblastoma multiforme.

**graded bed:** a bed in which the base consists of coarser material and subsequent beds grade upward through sand and silt to the finest clay sizes at the top.

**graded effect:** An effect that can usually be measured on a graded scale of intensity or severity and its magnitude related directly to the dose (WHO, 1978a).

**graded stream:** a stream that has smoothed out its longitudinal profile to resemble a smooth, concave-upward curve.

**grading :** A system for classifying cancer cells in terms of how abnormal they appear when examined under a microscope. The objective of a grading system is to provide information about the probable growth rate of the tumor and its tendency to spread. The systems used to grade tumors vary with each type of cancer. Grading plays a role in treatment decisions.

**Graffiti:** Graffiti is a very difficult problem to deal with and may require a specialist removal company in the most severe cases. Normal decorative paints are not suitable for painting over graffiti as many felt marker inks and aerosol spray paints tend to bleed through conventional coatings. Take great care when attempting to remove graffiti from unpainted surfaces, especially when the substrate is porous. To avoid permanent damage to the affected area it may be best to seek professional advice.

**graft :** Healthy skin, bone, or other tissue taken from one part of the body and used to replace diseased or injured tissue removed from another part of the body.

**Graft Copolymers:** A chain of one type of polymer to which side chains of a different type are attached or grafted (i.e., polymerizing butadiene and styrene monomer at the same time).

**graft-versus-host disease :** A disease caused when cells from a donated stem cell graft attack the normal tissue of the transplant patient. Symptoms

include jaundice, skin rash or blisters, a dry mouth, or dry eyes. Also called GVHD.

**graft-versus-tumor** : An immune response to a person's tumor cells by immune cells present in a donor's transplanted tissue, such as bone marrow or peripheral blood.

**Graham's law**: The rate of diffusion of a gas is inversely proportional to the square root of its molar mass.

**Grain** : This is a tiny piece of rock. They are usually rounded because they have been greatly weathered.

**Graining**: A method of imitating the grain of wood by the application of semi-transparent coat or coats over a painted groundwork. It should not be confused with 'staining' which is the direct application of a coloured stain or coating direct to bare timber.

**Gralise**: (Other name for: gabapentin)

**gram**: A metric unit of mass, equal to 1/1000 of a kilogram. Kilograms are the base SI units for mass, not grams. OR A gram is metric unit of measure for mass. It is the weight of one milliliter of water at a temperature of 39.2 degrees Fahrenheit. OR The basic unit of mass in the metric system.

**gram** : A unit of weight in the metric system. One gram is equal to one thousandth of a kilogram and is approximately 30-times less than an ounce.

**gram formula**: weight an amount of a substance equal in grams to the sum of the atomic weights.

**Gram molecular weight**: For a given compound, the weight in grams that is numerically equal to its molecular weight. OR The weight in grams of a compound that is numerically equal to its molecular weight; the weight of 1 mole.

**Gram negative**: Bacteria cells which lose the crystal violet during the decolorizing step and are then colored by the counterstain. Pseudomonas and Thiobacillus are examples of gram negative strains.

**Gram positive**: Bacterial cells which retain the crystal violet stain during a staining procedure. Most strains of bacilli are gram positive.

**Gram-mole**: This is a specific measure of mass. The mass of a substance when there is one mole of the substance. For sodium chloride, the formula mass is 58.44. One gram-mole of sodium chloride is 58.44 grams.

**grana:** Stacks of thylakoids, flattened membranous sacs or discs, in chloroplasts.

**granisetron hydrochloride:** The hydrochloride salt of an indazole derivative with antiemetic properties. As a selective serotonin receptor antagonist, granisetron competitively blocks the action of serotonin at 5-hydroxytryptamine<sub>3</sub> (5-HT<sub>3</sub>) receptors, resulting in the suppression of chemotherapy- and radiotherapy-induced nausea and vomiting.

**granisetron hydrochloride :** A drug used to prevent nausea and vomiting caused by chemotherapy and radiation therapy. It is also used to prevent nausea and vomiting after surgery. Granisetron hydrochloride blocks the action of the chemical serotonin, which binds to certain nerves and may trigger nausea and vomiting. Blocking serotonin may help lessen nausea and vomiting. It is a type of serotonin receptor antagonist and a type of antiemetic. Also called Kytril.

**granisetron hydrochloride nasal spray:** An intranasal formulation containing the hydrochloride salt form of the indazole derivative granisetron, a selective serotonin (5-hydroxytryptamine; 5-HT) receptor antagonist, with antinauseant and antiemetic activities. Upon administration to the nostril, granisetron selectively binds to and inhibits 5-HT subtype 3 receptors (5-HT<sub>3</sub>R) located peripherally on vagus nerve terminals and centrally in the chemoreceptor trigger zone (CTZ) of the area postrema, which may result in suppression of chemotherapy-induced nausea and vomiting (CINV).

**granisetron transdermal system:** A transdermal system containing the selective serotonin (5-HT) receptor antagonist granisetron with antinauseant and antiemetic activities. Upon application of the transdermal system (patch) to the skin and the subsequent sustained release of granisetron into the bloodstream, granisetron selectively binds to and inhibits 5-HT subtype 3 (5-HT<sub>3</sub>) receptors located peripherally on vagus nerve terminals and centrally in the chemoreceptor trigger zone (CTZ) of the area postrema, which may result in suppression of chemotherapy-induced nausea and vomiting. Check for active clinical trials using this agent.

**Granite :** This is an igneous rock that has large crystals. It has formed slowly as the molten rock (magma) cooled inside other rock. Compare it with basalt.

**Granocyte:** (Other name for: lenograstim)

**granular leukocyte :** A type of immune cell that has granules (small particles) with enzymes that are released during infections, allergic reactions, and asthma. Neutrophils, eosinophils, and basophils are granular leukocytes. A granular leukocyte is a type of white blood cell. Also called granulocyte, PMN, and polymorphonuclear leukocyte.

**Granular Structure:** Non-uniform appearance of finished plastic material due to retention of, or incomplete fusion of, particles of composition, either within the mass or on the surface.

**Granulator:** A machine designed to grind up rejected pre-molded plastic (products or runners)The material generated by this process is called regrind.

**granule:** one of the individual cells that make up the photosphere of the sun.

**granulocyte :** A type of immune cell that has granules (small particles) with enzymes that are released during infections, allergic reactions, and asthma. Neutrophils, eosinophils, and basophils are granulocytes. A granulocyte is a type of white blood cell. Also called granular leukocyte, PMN, and polymorphonuclear leukocyte.

**granulocyte colony-stimulating factor :** A drug used to treat neutropenia (a condition in which there is a lower-than-normal number of white blood cells) caused by some types of chemotherapy. It is used to help prevent infection in patients with certain types of cancer. It is also used to treat chronic neutropenia and to prepare the blood for the collection of certain types of blood cells. Granulocyte colony-stimulating factor is also used to help prevent damage to the bone marrow in patients who were exposed to very high doses of certain types of radiation. Granulocyte colony-stimulating factor helps the body make more white blood cells. It is a type of colony-stimulating factor. Also called filgrastim, G-CSF, Neupogen, and Zarxio.

**granulocyte-macrophage colony-stimulating factor :** A substance that helps make more white blood cells, especially granulocytes, macrophages, and cells that become platelets. It is a cytokine that is a type of hematopoietic (blood-forming) agent. Also called GM-CSF and sargramostim.

**granulocytic sarcoma :** A malignant, green-colored tumor of myeloid cells (a type of immature white blood cell). This tumor is usually associated

with myelogenous leukemia. Also called chloroma.

**granulocytopenia** : A condition in which there is a lower-than-normal number of granulocytes (a type of white blood cell).

**granulosa cell tumor** : A type of slow-growing, malignant tumor that usually affects the ovary.

**Granum**: Proteolytic enzymes secreted by activated T cells into target cells to initiate apoptosis.

**graphical model**: a graph showing relationships.

**graphite**: The most stable allotrope, or form of carbon, having a hexagonal type linking of atoms with relatively strong bonds to 3 neighboring carbon atoms, and a much weaker bond to a fourth carbon atom. OR A form of carbon, similar to that used in pencils, used as a moderator in some nuclear reactors. OR An amorphous form of carbon, made of carbon atoms bound hexagonally in sheets (like chickenwire).

**Gravitation**: A process used to separate compounds that have different densities. When river water is thoroughly mixed, sand will settle on the bottom of a glass before the silt. Sand settles first because it has a greater density.

**gravity meter**: a device that measures the force of gravity between a mass inside the instrument and the earth.

**Gray (Gy)**: One of the two units used to measure the amount of radiation absorbed by an object or person, known as the "absorbed dose," which reflects the amount of energy that radioactive sources (with any type of ionizing radiation) deposit in materials (e.g., water, tissue, air) through which they pass. One gray (Gy) is the international system of units (SI) equivalent of 100 rads, which is equal to an absorbed dose of 1 Joule/kilogram. An absorbed dose of 0.01 Gy means that 1 gram of material absorbed 100 ergs of energy (a small but measurable amount) as a result of exposure to radiation. For additional information, see Doses in Our Daily Lives and Measuring Radiation.

**gray elm** : The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called Indian elm, red elm, slippery elm, sweet elm, *Ulmus fulva*, and *Ulmus rubra*.

**Green chemistry:** A chemical philosophy, also called sustainable chemistry, that encourages the design of products and processes that reduce or eliminate the use and generation of hazardous substances

**Green fluorescent protein:** A protein isolated from the jelly fish *Aequorea victoria* that fluoresces. Because the protein can be attached to other proteins by genetic engineering techniques, it provides a means of localizing proteins in cells.

**Green Manufacturing:** A method of product development and manufacturing that is seen to be minimally-invasive for the environment and the associated ecosystem.

**green tea:** Tea derived from the dried leaves of the plant *Camellia sinensis* with potential antioxidant, chemopreventive, and lipid-lowering activities. Green tea contains polyphenols that may be responsible for its chemopreventive effect. The polyphenol fraction contains mainly epigallocatechin-3-gallate (EGCG) and other catechins, such as epicatechin (EC), gallic acid (GCG), epigallocatechin (EGC), and epicatechin gallate (ECG). Green tea polyphenols act as antioxidants and free radical scavengers and may affect enzymes involved in cellular replication and tumor angiogenesis by modulating angiogenic factors, such as vascular endothelial growth factor (VEGF).

**green tea extract:** A defined, decaffeinated green tea polyphenol mixture isolated from *Camellia sinensis*, a plant native to Asia, with antiviral and antioxidant activities and potential chemopreventive activity. Green tea extract contains antioxidant compounds, including flavonoids, vitamins and polyphenols such as epigallocatechin-3-gallate (EGCG), which may have antineoplastic properties. Consumption of green tea extract may confer chemopreventive protection against various cancers including those of the prostate, stomach, and esophagus.

**green tea extract :** A mixture that is prepared from the leaves of the *Camellia sinensis* plant. It contains substances called flavonoids and polyphenols, which are antioxidants. Antioxidants help protect cells from damage caused by certain chemicals that may increase the risk of cancer and other diseases. Green tea extract may be taken to treat certain conditions. It is also being studied in the prevention of cancer and other diseases.

**green tea extract-based antioxidant supplement:** A dietary supplement containing a green tea extract including the catechin epigallocatechin gallate and other vitamins and antioxidants, with potential antineoplastic and chemopreventive activities. The polyphenols in green tea act as antioxidants and scavenge free radicals which may inhibit cellular oxidation and prevent free radical damage to cells. In addition, polyphenols may affect enzymes involved in cellular reproduction and tumor angiogenesis by modulating angiogenic factors. Other ingredients in green tea extract-based antioxidant supplement include dry cinnamon extract, germanium, zinc sulfate, manganese sulfate, arginine, cysteine, malic acid, ascorbic acid (vitamin c), glycyrrhizinic acid, glycine, glucosamine, pyridoxal (vitamin B6), calcium pantothenate (vitamin B5), folic acid, cyanocobalamin (vitamin B12).

**green tea lozenge:** A lozenge formulation of green tea, derived from the dried leaves of *Camellia sinensis*, with potential antioxidant and chemopreventive activities. Green tea lozenge contains polyphenols that may be responsible for its chemopreventive effect. The polyphenol fraction contains mainly epigallocatechin-3-gallate (EGCG) and other catechins, such as epicatechin (EC), gallic acid (GCG), epigallocatechin (EGC), and epicatechin gallate (ECG). Green tea polyphenols act as antioxidants and free radical scavengers, protecting cells from the damaging effects of reactive oxygen species (ROS). Check for active clinical trials using this agent.

**Greene Menopause Index :** A tool used by researchers to study the symptoms of menopause. It is a standard list of 21 questions which women use to rate how much they are bothered by menopause symptoms such as hot flashes, night sweats, rapid heartbeat, and difficulty sleeping.

**greenhouse effect:** incoming (shortwave) energy is reradiated as heat energy (longwave) and trapped by the greenhouse gases in the atmosphere; causes global warming. OR A popular term used to describe the roles of water vapor, carbon dioxide, and other trace gases in keeping the Earth's surface warmer than it would be otherwise. These " radiatively active " gases are relatively transparent to incoming shortwave radiation, but are relatively opaque to outgoing longwave radiation. The latter radiation, which would otherwise escape to space, is trapped by these gases within the lower levels of the atmosphere. The subsequent reradiation of some of the

energy back to the surface maintains surface temperatures higher than they would be if the gases were absent. There is concern that increasing concentrations of greenhouse gases, including carbon dioxide, methane, and manmade chlorofluorocarbons, may enhance the greenhouse effect and cause global warming.

**Greenhouse effect and greenhouse gas** : The Sun's energy is trapped by the Earth's atmosphere. It is said to be a contributor to global warming. Many gases can cause global warming but carbon dioxide and methane are the most talked about. If people use a lot of energy that has been provided by burning fuels, they are responsible for releasing large amounts of carbon dioxide into the atmosphere. In recent years, the term "carbon footprint" has been used to try to help people understand that we all have a share in this problem.

**greenhouse gas:** A greenhouse gas is a gas, such as carbon dioxide, in the Earth's atmosphere that absorbs infrared radiation and contributes to global warming. OR a gas produced from burn fossil fuels, which hold and trap heat energy; carbon dioxide is an example. OR A gas that raises the temperature of the earth's atmosphere by absorbing part of the long-wave radiation reflected back from the earth's surface. Carbon dioxide is an example

**greenhouse gases:** Those gases, such as water vapor, carbon dioxide, tropospheric ozone, nitrous oxide, and methane, that are transparent to solar radiation but opaque to longwave radiation. Their action is similar to that of glass in a greenhouse. Also see greenhouse effect and trace gas.

**Greenland Ice Sheet:** See ice sheet.

**grenz:** A soil horizon, which is frequently marked by a bed of clay, that results from a temporary halt in the accumulation of vegetal material.

**Grid:** See Electric Power Grid.

**grief** : The normal response to a major loss, such as the death of a loved one. Grief may also be felt by a person with a serious, long-term illness or with a terminal illness. It may include feelings of great sadness, anger, guilt, and despair. Physical problems, such as not being able to sleep and changes in appetite, may also be part of grief.

**grief counseling** : The process by which a trained counselor or a support group helps a person work through normal feelings of sorrow after a loss,

such as the death of a loved one.

**grief therapy :** Treatment that helps a person work through a greater than normal reaction to a loss, such as the death of a loved one. This reaction may include behavioral and physical problems, extreme mourning, and being unable to separate emotionally from the person who died. Grief therapy may be individual or group therapy.

**Grignard reagent:** an organometallic reagent in which magnesium metal inserts between an alkyl group and a halogen; for example,  $\text{CH}_3\text{MgBr}$ .

**Grinning:** When a paint does not completely obliterate the under-surface the latter is said to be 'grinning through'. OR When an under-surface shows through a painted surface, it is said to be 'grinning through'. This can happen when a paint fails to completely cover the under-surface, or when an incorrect undercoat has been used for a gloss system. To correct the grinning, thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants, rub down with a suitable abrasive, dust off and repaint.

**Grit:** The heavy material present in wastewater, such as sand coffee grounds, eggshells, gravel and cinders.

**Grit Blasted:** A surface treatment of a mold in which steel grit or sand materials are blown to the walls of the cavity to produce a roughened surface. Air escape from mold is improved and special appearance of molded article is often obtained by this method.

**groin:** one of a series of walls built perpendicular to the coast to widen beaches that are losing sand to longshore drift.

**groin :** The area where the thigh meets the abdomen.

**GROOVED (BARREL) EXTRUDERS:** The forward conveying action of a single-screw extruder can be increased by intentionally roughening the barrel surface (grooves) in the solids-conveying zone. Grooved extruders can produce rapid pressure rise, which can sometimes be high enough to damage the screw or barrel. Grooved extruders produce higher throughputs, but they might be susceptible to output instabilities and surging problems.

**gross error:** Gross errors are undetected mistakes that cause a measurement to be very much farther from the mean measurement than other measurements.

**gross primary production:** The total amount or weight of organic matter created by photosynthesis over a defined time period (total product of photosynthesis). Abbreviated GPP.

**Ground:** A general term for a surface suitable for painting; also used for an undercoat particularly an undercoat for graining or glazing.

**ground cover:** Plants grown to keep soil from eroding.

**ground fog:** fog formed by radiational cooling.

**ground moraine:** a thin, widespread layer of till deposited across the surface as an ice sheet melts.

**ground state:** the electronic configuration of lowest energy for an atom. OR the most stable electron configuration for an atom; this configuration has the least energy associated with it. OR The lowest electronic energy state of an atom or a molecule. OR The lowest energy state for an atom or molecule. When an atom is in its ground state, its electrons fill the lowest energy orbitals completely before they begin to occupy higher energy orbitals, and they fill subshells in accordance with Hund's rule (usually!) OR The normal, stable form of an atom or molecule; as distinct from the excited state.

**ground tissue:** the tissue of the vascular plant that is responsible for storing the carbohydrates produced by the plant.

**ground wire:** a conductor leading from electrical equipment to a low resistance connection with the earth.

**grounding line:** The boundary between the area where an ice shelf or a glacier is floating on water and where it is in contact with the shore or underlying earth (grounded).

**groundwater:** water derived from rain and melting snow that percolates downward from the surface and collects in the open pore spaces between soil particles or in cracks and fissures in bedrock.

**groundwater:** The supply of fresh water found beneath the surface of the Earth (usually in aquifers) that often supplies wells and springs.

**group:** a family of elements with similar chemical properties, represented by a vertical column in the periodic table. OR A vertical column in the periodic table. OR On the periodic table, the columns are called groups. Elements are arranged in groups by the number of electrons that are in the outside shell. The elements of each group have the same number of

electrons in their outer shells. OR Groups are the vertical columns in the Periodic Table, consisting of elements with similar properties (chemical 'families'). OR a column of elements in the periodic table. OR 1. A substructure that imparts characteristic chemical behaviors to a molecule, for example, a carboxylic acid group. (also: functional group). 2. A vertical column on the periodic table, for example, the halogens. Elements that belong to the same group usually show chemical similarities, although the element at the top of the group is usually atypical.

**group transfer potential:** A measure of the ability of a compound to donate an activated group (such as a phosphate or acyl group); generally expressed as the standard free energy of hydrolysis.

**Group-transfer reaction:** A reaction in which a chemical group is transferred from one molecule to another.

**grouping symbols:** Usually parentheses, but grouping is also indicated by brackets and braces.

**Grout:** Thin fluid mortar or cement mixture for filling joints or interstices or for bonding loose rubble.

**growth and development milestones :** Goals for the expected sizes of infants and children and activities they should be able to do at specific ages, such as sit, stand, play, speak, think, and interact with others.

**Growth factor:** A substance that must be present in the growth medium to permit eucaryotic cell proliferation. OR A substance made by the body that functions to regulate cell division and cell survival. Some growth factors are also produced in the laboratory and used in biological therapy.

**Growth fork:** The region on a DNA duplex molecule where synthesis is taking place. It resembles a fork in shape, since it consists of a region of duplex DNA connected to a region of unwound single strands.

**growth hormone :** A protein made by the pituitary gland that helps control body growth and the use of glucose and fat in the body. Also called somatotropin.

**growth water-use efficiency:** A measure at the individual plant level of how well plants use available water in growth. The units of dry matter synthesized are divided by the units of water lost.

**GRP:** Glass reinforced plastic.

**GS-pan Notch inhibitor BMS-986115:** An orally bioavailable, gamma secretase (GS) and pan-Notch inhibitor, with potential antineoplastic activity. Upon administration, GS/pan-Notch inhibitor BMS 986115 binds to GS and blocks the proteolytic cleavage and release of the Notch intracellular domain (NICD), which would normally follow ligand binding to the extracellular domain of the Notch receptor. This prevents both the subsequent translocation of NICD to the nucleus to form a transcription factor complex and the expression of Notch-regulated genes. This results in the induction of apoptosis and the inhibition of growth of tumor cells that overexpress Notch. Overexpression of the Notch signaling pathway plays an important role in tumor cell proliferation and survival. The integral membrane protein GS is a multi-subunit protease complex that cleaves single-pass transmembrane proteins, such as Notch receptors, at residues within their transmembrane domains and leads to their activation.

**GS/pan-Notch inhibitor BMS-906024:** An orally bioavailable, small-molecule gamma secretase (GS) and pan-Notch inhibitor, with potential antineoplastic activity. Upon administration, GS/pan-Notch inhibitor BMS-906024 binds to GS and blocks activation of Notch receptors, which may inhibit the proliferation of tumor cells with an overly-active Notch pathway. The integral membrane protein GS is a multi-subunit protease complex that cleaves single-pass transmembrane proteins, such as Notch receptors, at residues within their transmembrane domains that lead to their activation. Overexpression of the Notch signaling pathway has been correlated with increased tumor cell growth. Check for active clinical trials using this agent.

**GSD:** A type of inherited disorder in which there are problems with how a form of glucose (sugar) called glycogen is stored and used in the body. Certain enzymes that help make or break down glycogen are missing or do not work the way they should. This causes abnormal amounts or types of glycogen in the tissues, especially in the liver and in muscle tissue. There are many types of GSD, which can cause problems in different parts of the body, including the liver, muscles, kidneys, and heart. Also called glycogen storage disease.

**GSK1070916A:** A substance being studied in the treatment of some types of cancer. It blocks certain enzymes (Aurora kinases) involved in cell division and may kill cancer cells. It is a type of serine/threonine protein kinase inhibitor. Also called Aurora B/C kinase inhibitor GSK1070916A.

**GTD:** A rare condition in which abnormal cells grow inside the uterus from tissue that forms after conception (the joining of sperm and egg). This tissue is made of trophoblastic cells, which normally surround the fertilized egg in the uterus and help connect the fertilized egg to the wall of the uterus. These cells also form part of the placenta (the organ that passes nutrients from the mother to the fetus). Most GTDs are benign (not cancer) and do not spread, but some types are malignant (cancer) and spread to nearby tissues or other parts of the body. The two main types of GTDs are hydatidiform mole and choriocarcinoma. Also called gestational trophoblastic disease, gestational trophoblastic tumor, and GTT.

**GTI-2040:** A 20-mer antisense oligonucleotide complementary to a coding region in the mRNA of the R2 small subunit component of human ribonucleotide reductase. GTI-2040 decreases mRNA and protein levels of R2 in vitro and may inhibit tumor cell proliferation in human tumors in vivo. or A substance being studied in the treatment of cancer. It blocks the production of a protein called ribonucleotide reductase, which helps cells make DNA. This may kill cancer cells that need ribonucleotide reductase to grow. It may also make cells more sensitive to anticancer drugs. It is a type of antisense oligonucleotide, and a type of ribonucleotide reductase inhibitor.

**GTN transdermal patch:** (Other name for: nitroglycerin transdermal patch)

**GTO:** Gaussian-type orbital. Basis function consisting of a Gaussian function, i.e.,  $\exp(-r^2)$ , multiplied by an angular function. If the angular function is "cartesian", there are six d-functions, ten f-functions, etc. (6d, 10f). If the angular function is spherical, there will be the usual number of functions (5d, 7f).

**GTT:** A rare condition in which abnormal cells grow inside the uterus from tissue that forms after conception (the joining of sperm and egg). This tissue is made of trophoblastic cells, which normally surround the fertilized egg in the uterus and help connect the fertilized egg to the wall of the uterus. These cells also form part of the placenta (the organ that passes nutrients from the mother to the fetus). Most GTTs are benign (not cancer) and do not spread, but some types are malignant (cancer) and spread to nearby tissues or other parts of the body. The two main types of GTTs are

hydatidiform mole and choriocarcinoma. Also called gestational trophoblastic disease, gestational trophoblastic tumor, and GTD.

**guadecitabine:** A dinucleotide antimetabolite of a decitabine linked via phosphodiester bond to a guanosine, with potential antineoplastic activity. Following metabolic activation by phosphorylation and incorporation into DNA, guadecitabine inhibits DNA methyltransferase, thereby causing genome-wide and non-specific hypomethylation and inducing cell cycle arrest at S-phase. This agent is resistant to cytidine deaminase, hence may result in gradual release of decitabine both extra- and intracellularly, leading to more prolonged exposures to decitabine.

**guaiac :** A substance from a type of tree called Guaiacum that grows in the Caribbean. Guaiac is used in the fecal occult blood test (a test for blood in human stool samples).

**guaiac fecal occult blood test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards coated with a chemical substance called guaiac and sent to a doctor or laboratory for testing. A testing solution is put on the cards and the guaiac causes the stool sample to change color. If there is blood in the stool, the color changes very quickly. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called gFOBT, guaiac smear test, and stool guaiac test.

**guaiac smear test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards coated with a chemical substance called guaiac and sent to a doctor or laboratory for testing. A testing solution is put on the cards and the guaiac causes the stool sample to change color. If there is blood in the stool, the color changes very quickly. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called gFOBT, guaiac fecal occult blood test, and stool guaiac test.

**guanabenz acetate:** The orally bioavailable, acetate salt form of guanabenz, a centrally-acting alpha-2 adrenergic receptor agonist, with anti-hypertensive and potential antineoplastic, cytoprotective and bone resorption inhibitory activities. Upon oral administration, guanabenz suppresses endoplasmic reticulum (ER) stress by inhibiting the stress-induced dephosphorylation of eukaryotic translation initiation factor 2 alpha (eIF2a), thereby enhancing the phosphorylation level of eIF2a. This causes

eIF2a-mediated downregulation of the Rac1 pathway, upregulates the expression of activating transcription factor 4 (ATF4), which plays a key role in osteoblastogenesis, and downregulates the expression of nuclear factor of activated T-cells, cytoplasmic 1 (NFATc1), which is a transcription factor that plays a key role in osteoclastogenesis. This enhances osteoblastogenesis and suppresses osteoclastogenesis. Altogether, this promotes new bone formation and prevents bone degradation. In addition, guanabenz blocks the proliferation, survival, motility and invasiveness of tumor cells through the eIF2a-mediated downregulation of Rac1 signaling. Rac1, a Ras-related small GTPase belonging to the Rho family, plays a key role in tumor cell proliferation, survival and motility.

**guanazole:** A cytostatic triazole derivative antimetabolite. Guanazole scavenges tyrosine free radicals, thereby inhibiting mammalian ribonucleotide reductase activity and DNA synthesis.

**Guanine:** A purine base found in DNA or RNA. OR A chemical compound that is used to make one of the building blocks of DNA and RNA. It is a type of purine.

**Guanosine:** A purine nucleoside found in DNA and RNA.

**Guanylate cyclase:** An enzyme that catalyzes the synthesis of cgmp, a second messenger, from GTP.

**guarana supplement:** An herbal supplement containing an extract from guarana (*Paullinia cupana*), a climbing plant of the Sapindaceae family which is native to the Amazon basin, with stimulant, antioxidant and potential chemoprotective activities. Guarana supplement contains various phytochemicals, including caffeine, theobromine, theophylline, tannins, saponins, catechins, epicatechins, proanthocyanidols and other compounds in minor concentrations. Caffeine is a central nervous system stimulant and may reduce chemotherapy-related fatigue. Tannins and other polyphenols may have chemopreventive activity. Intake of the guarana supplement may prevent cancer-related anorexia. In addition, animal studies have demonstrated that the ingestion of guarana resulted in decreased proliferation and increased apoptosis of tumor cells.

**Guard Edge Plate :** Plates assembled between links and mesh to prevent product from falling off belt. Guard edge plates are tack welded to links as needed to secure position.

**guggulsterone:** also called guggul (or guggal) or guggul lipid; is an extract from the Commiphora mukul tree of India

**GUIDE PINS:** Devices that maintain proper alignment of core and cavity as mold closes. Also called "Leader Pins." OR Devices that maintain proper alignment of force plug and cavity as mold closes.

**guided imagery :** A technique in which a person focuses on positive images in his or her mind. It can help people reach a relaxed, focused state and help reduce stress and give a sense of well-being. Also called imagery.

**guideline level:** A guideline level is the maximum concentration of a pesticide residue that might occur after the officially recommended or authorized use of a pesticide for which no acceptable daily intake or temporary acceptable daily intake is established and that need not to be exceeded if good practices are followed. It is expressed in milligrams for the residue per kilogram of food (WHO, 1976).

**guides to air quality:** Sets of concentrations and exposure times that are associated with specific effects of varying degrees of air pollution on man, animals, vegetation, and on the environment in general (WHO, 1979).

**guides to environmental quality:** Sets of levels and exposure times that are associated with the specific effects of varying levels of environmental factors on man, animals, vegetation, and the environment in general (WHO, 1979).

**guinea pig maximization test:** This is a skin test for screening possible contact allergens. It is considered to be a useful model for predicting moderate and strong sensitizers in humans.

**Gulf Stream meander:** A transient winding bend in the Gulf Stream. These bends intensify as the Gulf Stream merges into the North Atlantic and can break up into detached eddies at about 40 degrees S.

**Gum:** An amorphous substance or mixture which, at ordinary temperatures, is either a very viscous liquid or a solid which softens gradually on heating, and which either swells in water or is soluble in it. Natural gums, obtained from the cell walls of plants, are carbohydrates or carbohydrate derivatives of intermediate molecular weight.

**gums :** The tissue of the upper and lower jaws that surrounds the base of the teeth. Also called gingiva.

**gusperimus:** A derivative of the antitumor antibiotic spergualin with immunosuppressant activity. Gusperimus inhibits the interleukin-2-stimulated maturation of T cells to the S and G2/M phases and the polarization of the T cells into IFN-gamma-secreting Th1 effector T cells, resulting in the inhibition of growth of activated naive CD4 T cells; this agent may suppress growth of certain T-cell leukemia cell lines.

**Gusset:** A tuck placed in each side of a tube of blown tubing as produced to provide a convenient square or rectangular package, similar to that of the familiar brown paper bag or sack, in subsequent packaging. OR a tuck placed in each side of a tube of blown tubing as produced to provide a convenient square or rectangular package, similar to that of the familiar brown paper bag or sack, in subsequent packaging. OR Gussets are indented folds on the sides or bottom of a poly bag that allow the bag to expand up to the limits of the fold in order to comfortably accommodate variable volume or shaped contents. Gusseted bags are designated in three dimension measurements; Side Seal =  $W \times \text{Gusset} \times \text{Length}$ ; Bottom Gusset =  $W \times L + BG$ . OR The inward fold in the sides of bags which reduce the width of the bag and allow the bags to assume a rectangular form when opened.

**Gustation:** The sense of taste.

**Gustducin:** An  $\alpha$  subunit of a G protein that is primarily expressed in taste buds and is associated with 7TM bitter and sweet receptors.

**gut flora :** Bacteria and other organisms that live inside the intestines. They help digest food. Vitamins such as biotin and vitamin K are made by gut flora. Also called gut microflora, intestinal flora, intestinal microflora, and microflora.

**gut microflora :** Bacteria and other organisms that live inside the intestines. They help digest food. Vitamins such as biotin and vitamin K are made by gut microflora. Also called gut flora, intestinal flora, intestinal microflora, and microflora.

**gutka :** A type of smokeless tobacco that is made in India and is widely used throughout Asia. It is a mixture of tobacco, crushed areca nut (also called betel nut), spices, and other ingredients. It is used like chewing tobacco and is placed in the mouth, usually between the gum and cheek. Gutka contains nicotine and many harmful, cancer-causing chemicals.

Using it can lead to nicotine addiction and can cause cancers of the lip, mouth, tongue, throat, and esophagus. Also called betel quid with tobacco.

**Gutta-percha:** While natural rubber from the rubber tree *Hevea brasiliensis* is cis-poly(isoprene), the Malaysian sapodilla tree *Palaquium oblongifolia* produces a latex that is trans-poly(isoprene). This material is called gutta-percha and is more brittle and hard than natural rubber.

**guyot:** a submerged, flat-topped seamount that was once above sea level and was eroded flat by continual wave action. OR flat-topped seamount, eroded by ocean waves while exposed.

**GVAX lung cancer vaccine:** An autologous lung cancer vaccine consisting of patient-specific lung cancer cells genetically modified to secrete granulocyte-macrophage colony stimulating factor (GM-CSF), an immunostimulatory cytokine. GM-CSF modulates the proliferation and differentiation of a variety of hematopoietic progenitor cells with some specificity towards stimulation of leukocyte production and may reverse treatment-induced neutropenias. This agent also promotes antigen presentation, up-regulates antibody-dependent cellular cytotoxicity (ADCC), and increases interleukin-2-mediated lymphokine-activated killer cell function and may augment host antitumoral immunity. For safety, cells are irradiated prior to vaccination.

**GVAX pancreatic cancer vaccine:** A whole cell vaccine expressing human granulocyte macrophage-colony stimulating factor (GM-CSF) with potential antineoplastic activity. Tumor cells from prostate cancer patients are harvested and then genetically modified to secrete GM-CSF, an immune stimulatory growth factor that plays a key role in stimulating the body's immune responses against tumor cells. Because the vaccine is derived from allogeneic cells, it has demonstrated a favorable side effect profile than other approaches of delivering long-lasting GM-CSF.

**GVB:** Generalized valence bond. A limited type of MCSCF, in which excitations are taken within an electron pair but not between orbitals in different pairs. Dissociation-consistent. If restricted to doubles, is called "perfect pairing" (GVB-PP). If includes both singles and doubles, is called "restricted configuration interaction" (GVB-RCI).

**GVHD:** A disease caused when cells from a donated stem cell graft attack the normal tissue of the transplant patient. Symptoms include jaundice, skin

rash or blisters, a dry mouth, or dry eyes. Also called graft-versus-host disease.

**GW572016:** A drug used with another anticancer drug to treat breast cancer that is HER2 positive and has advanced or metastasized (spread to other parts of the body) after treatment with other drugs. GW572016 is also being studied in the treatment of other types of cancer. It is a type of ErbB-2 and EGFR dual tyrosine kinase inhibitor. Also called lapatinib, lapatinib ditosylate, and Tykerb.

**GW786034:** A drug used to treat advanced renal cell carcinoma, which is the most common type of kidney cancer. It is also used to treat advanced soft tissue sarcoma that has been treated with other anticancer drugs. It is being studied in the treatment of other types of cancer. GW786034 may prevent the growth of new blood vessels that tumors need to grow. It is a type of protein tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called pazopanib hydrochloride and Votrient.

**GWAS :** A GWAS (genome-wide association study) is a way for scientists to identify inherited genetic variants associated with risk of disease or a particular trait. This method surveys the entire genome for genetic polymorphisms, typically single nucleotide polymorphisms (SNPs) (pronounced “snips”), that occur more frequently in cases (people with the disease or trait being assessed) than in controls (people without the disease or trait). Also called genome-wide association study. or A study that compares DNA markers across the genome (the complete genetic material in a person) in people with a disease or trait to people without the disease or trait. These studies may uncover clues to help prevent, diagnose, and treat disease. Also called genome-wide association study.

**gymnosperms:** vascular plants having naked seeds, such as the conifers.

**Gyne-Lotrimin:** (Other name for: clotrimazole)

**gynecologic :** Having to do with the female reproductive tract (including the cervix, endometrium, fallopian tubes, ovaries, uterus, and vagina).

**gynecologic cancer :** Cancer of the female reproductive tract, including the cervix, endometrium, fallopian tubes, ovaries, uterus, and vagina.

**gynecologic oncologist :** A doctor who has special training in diagnosing and treating cancers of the female reproductive organs.

**gynecologist** : A doctor who has special training in diagnosing and treating diseases of the female reproductive organs.

**gynecomastia** : The abnormal growth of breast gland tissue in males. Gynecomastia in infants and boys may be caused by an imbalance in certain hormones. It may also be caused by conditions that affect hormones, such as tumors; malnutrition; kidney, liver, or thyroid disease; or treatment with certain drugs. It can occur at any age.

**Gypsum**: A hydrous crystalline calcium sulphate used as an extender pigment in some paints and in special cement paints and is the basis of some wall plasters.

**gyres**: Major circular flow patterns in the oceans. The wind- driven eastward- and westward-flowing equatorial currents are blocked by the continents and rotate slowly in a clockwise direction in the North Atlantic and Pacific Oceans and in a counter- clockwise direction in the South Atlantic, South Pacific, and Indian Oceans.

**H-ras gene** : A gene that may cause cancer when it is mutated (changed). The H-ras gene makes the HRAS protein, which is involved in cell signaling pathways, cell growth, and apoptosis (cell death). Agents that block the actions of the mutated H-ras gene or its protein in cancer cells may stop the growth of cancer. Also called Hras gene.

**H. pylori** : A type of bacterium that causes inflammation and ulcers in the stomach or small intestine. People with H. pylori infections may be more likely to develop cancer in the stomach, including MALT (mucosa-associated lymphoid tissue) lymphoma. Also called Helicobacter pylori.

**H1299 tumor cell lysate vaccine**: A cell lysate derived from a lung cancer cell line, H1299, with potential immunostimulatory and antineoplastic activities. Upon intramuscular administration, the H1299 tumor cell lysate exposes the immune system to an undefined amount of tumor associated antigens (TAA), particularly cancer testis antigens (CTAs), which may result in the induction of both anti-tumoral cytotoxic T-lymphocytes (CTL) and antibody-dependent responses against TAA-expressing cells, leading to tumor cell lysis. CTAs, such as MAGE, are selectively expressed in a variety of cancers but are not expressed in normal, healthy cells outside the testis.

**hA20**: A substance being studied in the treatment of several types of lymphoma. It binds to the protein CD20, which is found on B cells (a type

of immune system cell) and some types of lymphoma cells. This causes the immune system to kill the cancer cells. hA20 is a type of monoclonal antibody. Also called HCD20, IMMU-106, and veltuzumab.

**HAART :** Treatment that uses a combination of three or more drugs to treat HIV infection. HAART stops the virus from making copies of itself in the body. This may lessen the damage to the immune system caused by HIV and may slow down the development of AIDS. It may also help prevent transmission of HIV to others, including from mother to child during birth. Also called cART, combination antiretroviral therapy, and highly active antiretroviral therapy.

**Habit:** See Crystal habit.

**haceous deposits:** sandy, gritty, nodular masses of urate crystals typical in patients with gout

**Hadley cell:** A direct thermally-driven and zonally symmetric large-scale atmospheric circulation first proposed by George Hadley in 1735 as an explanation for the trade winds. It carries momentum, sensible heat, and potential heat from the tropics to the mid-latitudes (30 degrees). The poleward transport aloft is complemented by subsidence in the subtropical high pressure ridge and a surface return flow. The variability of this cell and the Walker cell is hypothesized to be a major factor in short-term climatic change.

**Haelan 951:** (Other name for: fermented soybean protein beverage)

**haematite:** Haematite is a mineral composed of iron (III) oxide. It is the major ore of iron.

**Haemophilus influenzae b vaccine:** A vaccine against serotype b of the Gram-negative bacterium *H. influenzae* (Hib). Hib vaccines contain polysaccharide-protein conjugate antigens that produce greater host immune responses than first-generation purified polysaccharide vaccine. These vaccines may differ with regard to use of protein carriers, polysaccharides, diluents, and preservatives.

**Hafnium:** Symbol:"Hf" Atomic Number:"72" Atomic Mass: 178.49amu. Hafnium is one of the transition elements. Hafnium is often found with zirconium. This silvery metal has been put to use in nuclear reactor control rods and in many alloys.

**hafnium oxide-containing nanoparticles NBTXR3:** A suspension of nanoparticles containing inert inorganic hafnium oxide (HfO<sub>2</sub>) crystals with potential antineoplastic activity. Upon injection of NBTXR3 into the tumor, the hafnium oxide-containing nanoparticles accumulate in the tumor cells. Subsequent application of radiation beams to the tumor tissue causes HfO<sub>2</sub> particles to emit huge amounts of electrons. This results in the formation of free radicals within the tumor cells, which in turn causes targeted destruction of the cancer cells. Compared to standard radiotherapy, because of the inert nature of NBTXR3, this agent emits electrons only during its exposure to radiation which improves radiotherapy efficiency.

**hail:** layers of ice formed in a large thunderstorm cloud that fall to Earth.

**Hair cells:** Specialized neurons inside the cochlea of the inner ear; hair cells use a connected bundle of stereocilia to detect motion and initiate the hearing signal-transduction pathway.

**Hair cracks:** This usually refers to very fine cracks which occur in plaster or cement rendered walls and which are often not seen until the surface is being painted. These cracks are too fine to 'fill' and the only remedy is to apply lining paper. On external walls the use of an aggregate type coating will often give satisfactory results.

**hair follicle :** A shaft or opening on the surface of the skin through which hair grows.

**Hairpin loop:** A single-stranded complementary region of DNA or RNA that folds back on itself and base-pairs into a double helix. OR A loop of nucleic acid formed by duplex formation within a single strand.

**hairy cell leukemia :** A rare type of leukemia in which abnormal B-lymphocytes (a type of white blood cell) are present in the bone marrow, spleen, and peripheral blood. When viewed under a microscope, these cells appear to be covered with tiny hair-like projections.

**Halaven :** A drug used to treat metastatic breast cancer in patients who have already been treated with other chemotherapy. It is also being studied in the treatment of other types of cancer. Halaven may block cancer cell growth by stopping cell division. It belongs to the family of drugs called antitubulin agents. Also called E7389 and eribulin mesylate.

**Haldol :** A drug used to treat certain mental and neurological disorders. It is also being studied in the treatment of nausea and vomiting caused by

some cancer treatments. It is a type of antiemetic and a type of antipsychotic. Also called haloperidol.

**half life:** The amount of time it takes for half an initial amount to disintegrate. OR The half life of a reaction is the time required for the amount of reactant to drop to one half its initial value.

**half-cell:** An oxidation or reduction reaction that occurs at an electrode. Two half-cells must be combined to form an electrochemical cell.

**half-equation:** A half-equation describes the reaction at an electrode during electrolysis (or during any reduction/oxidation reaction) that includes the electrons involved, e.g.  $\text{Na}^+ + \text{e}^-$

**half-life:** The time required for concentration of one substance to reach half of its initial value. The time it takes for one half of a substance to be metabolized and/or excreted from the body. OR In terms of pharmacology, drug half-life refers to the time taken for a drug's plasma concentration to fall by half. In terms of nuclear chemistry, half-life refers to the time taken for a radioisotope to fall to half its original value. OR the amount of time it takes a radioactive element to decay into half of its original mass. OR the time it takes for half of a known quantity of radioactive material to convert to daughter products. OR The time in which one half of the atoms of a particular radioactive substance disintegrate into another nuclear form. Measured half-lives vary from millionths of a second to billions of years. Also called physical or radiological half-life. OR The time required for the disappearance of one half of a substance. OR The time required for the disappearance or decay of one-half of a given component in a system.

**Half-life (radiological):** The time required for half the atoms of a particular radioisotope to decay into another isotope. A specific half-life is a characteristic property of each radioisotope. Measured half-lives range from millionths of a second to billions of years, depending on the stability of the nucleus. Radiological half-life is related to, but different from, the biological half-life and the effective half-life.

**Half-life, biological:** The time required for the body to eliminate one half of the material taken in by natural biological means.

**Half-life, effective:** The time required for the activity of a particular radioisotope deposited in a living organism, such as a human or an animal, to be reduced by 50 percent as a result of the combined action

of radioactive decay and biological elimination. Effective half-life is related to, but different from, the radiological half-life and the biological half-life.

**half-reaction:** A reaction that shows the electrons involved in an oxidation or reduction step of a reaction. OR an oxidation or reduction reaction with free electrons as a product or reactant.

**half-sibling :** A person's brother or sister who has one parent in common.

**Half-thickness:** Any given absorber that will reduce the intensity of an original beam of ionizing radiation to one-half of its initial value.

**halide:** The ions of charge -1 of the elements in the next to last column of the periodic table: chloride, fluoride, bromide, iodide (and astatide, but there are only eleven known atoms of astatine, so no one ever counts it).

OR A compound or ion containing fluorine, chlorine, bromine, iodine, or astatine. OR A negatively charged ion of the group VIIA elements.

**Halide Mineral:** This is a mineral that is made of compounds with one or more halogen atoms. Salt (Halite) is considered a halide because it has sodium and chloride in the formula.

**halides:** Halides are ionic salts of the Group 7 elements, e.g. sodium fluoride, potassium iodine.

**hallucination :** A sight, sound, smell, taste, or touch that a person believes to be real but is not real. Hallucinations can be caused by nervous system disease, certain drugs, or mental disorders.

**halo:** the zone of metamorphism surrounding an intrusion in contact metamorphism.

**haloalkane:** an alkane that contains one or more halogen atoms; also called an alkyl halide.

**halocline:** In the oceans, a well-defined vertical gradient of salinity.

**Halodrin:** (Other name for: fluoxymesterone)

**halofuginone hydrobromide:** The hydrobromide salt of halofuginone, a semisynthetic quinazolinone alkaloid anticoccidial derived from the plant *Dichroa febrifuga*, with antifibrotic and potential antineoplastic activities. Halofuginone specifically inhibits collagen type I gene expression and matrix metalloproteinase 2 (MMP-2) gene expression, which may result in the suppression of angiogenesis, tumor stromal cell development, and tumor cell growth. These effects appear to be due to halofuginone-mediated

inhibition of the collagen type I and MMP-2 promoters. Collagen type I and MMP-2 play important roles in fibro-proliferative diseases.

**halofuginone hydrobromide** : A substance that is being studied for its ability to slow the growth of connective tissue and to prevent the growth of new blood vessels that tumors need to grow. It is a type of quinazolinone alkaloid and a type of antiangiogenesis agent.

**halogen**: An element of group VIIA (a. k. a. Group 18). The name means "salt former"; halogens react with metals to form binary ionic compounds. Fluorine (F), chlorine (Cl), bromine (Br), iodine (I), and astatine (At) are known at this time. OR an electronegative, nonmetallic element in Group VII of the periodic table, including fluorine, chlorine, bromine, and iodine. Halogens are often represented in structural formulas by an "X." OR One of the elements in the next-to-last column of the periodic table - fluorine, chlorine, bromine, iodine, and astatine. OR Halogen is the name of the seventh group of elements. They all have seven electrons in their outer shell. They are also very reactive. OR The group VIIa elements in the periodic table.

**halogenation**: a reaction in which halogen atoms are bonded to an alkene at the double bond.

**halogens**: The halogens are the elements of Group 7 in the Periodic Table fluorine, chlorine, bromine, iodine, and astatine. OR the column of elements from fluorine to astatine.

**halonium ion**: a halogen atom that bears a positive charge. This ion is highly unstable.

**haloperidol**: A phenylbutylpiperadine derivative with antipsychotic, neuroleptic, and antiemetic activities. Haloperidol competitively blocks postsynaptic dopamine (D2) receptors in the mesolimbic system of the brain, thereby eliminating dopamine neurotransmission and leading to antidelusionary and antihallucinagenic effects. Antagonistic activity mediated through D2 dopamine receptors in the chemoreceptive trigger zone (CTZ) accounts for its antiemetic activity. or A drug used to treat certain mental and neurological disorders. It is also being studied in the treatment of nausea and vomiting caused by some cancer treatments. It is a type of antiemetic and a type of antipsychotic. Also called Haldol.

**Halophilic or Halotolerant**: Bacteria which thrive in a highly salt environment, up to 25% NaCl.

**Halotestin:** (Other name for: fluoxymesterone)

**Halsted radical mastectomy :** Surgery for breast cancer in which the breast, chest muscles, and all of the lymph nodes under the arm are removed. For many years, this was the breast cancer operation used most often, but it is used rarely now. Doctors consider radical mastectomy only when the tumor has spread to the chest muscles. Also called radical mastectomy.

**hamartin:** protein encoded by the tuberous sclerosis 1 (TSC1) gene

**hamartoma :** A benign (not cancer) growth made up of an abnormal mixture of cells and tissues normally found in the area of the body where the growth occurs.

**Hammett equation:** A linear free-energy relationship for substituent effects in reactions or ionizations (pKa) given as: where  $k_H$  is the rate constant or equilibrium constant for the parent compound,  $k_X$  is the constant for the compound bearing a substituent X,  $r$  is a constant for a given reaction under a given set of conditions, and  $s_X$  is a constant characteristic of the group X.

**Hand Load:** For low production mold with undercut, steel fixture which create the undercut are manually removed from the mold during the part ejection process.

**hand-foot syndrome :** A condition marked by pain, swelling, numbness, tingling, or redness of the hands or feet. It sometimes occurs as a side effect of certain anticancer drugs. Also called palmar-plantar erythrodysesthesia.

**hanging valley:** a valley that forms a cliff face with the main valley it enters because its lower part has been eroded away by glacial action.

**hanging wall:** the block that overlies the inclined fault plane in a dip-slip fault.

**Hansch Analysis:** In QSAR, Hansch analysis expresses biological activity using electronic, hydrophobic, and steric parameters.

**haploid:** cells containing one copy of each chromosome. OR Having a single set of genetic information; describing a cell with one chromosome of each type.

**Haploid cell:** A cell containing only one chromosome of each type.

**haploinsufficiency :** The situation that occurs when one copy of a gene is inactivated or deleted and the remaining functional copy of the gene is not

adequate to produce the needed gene product to preserve normal function.

**haplotype** : A set of closely linked genetic markers present on one chromosome which tend to be inherited together.

**happy major** : A plant whose seeds and root have been used in some cultures to treat certain medical problems. It may have antioxidant effects. The scientific name is *Arctium lappa*. Also called burdock and lappa.

**Hapten**: A small foreign molecule that can elicit specific antibody formation when attached to a macromolecule. The dinitrophenyl group is effective at eliciting an antigenic response and has been widely used as a haptenic determinant.

**Hard Drug**: In medicinal chemistry, hard drugs refer to compounds that are generally nonmetabolisable.

**Hard dry**: This term is normally used to denote that the paint has dried without 'tack' or 'softness'. In the case of primer or undercoat a hard dry surface is one which can be rubbed down without undue clogging of the abrasive paper and which can be safely overcoated.

**Hard gloss paint**: General term for an oil-varnish bound paint originally used to distinguish such paints from those based solely on a drying oil.

**hard palate** : The front, bony part of the roof of the mouth.

**Hard stopper**: A drying or setting material which is sufficiently stiff to stop up open joints and holes in timber without sagging and which will not shrink when set. Usually applied with a putty knife or small trowel. Bare surface should be primed before applying a hard stopper.

**Hard stopping**: A material in stiff paste form usually applied by knife to fill deep indentations cracks or joints in a painted surface. It dries hard through and should not be confused with ordinary putty.

**Hardboard**: Hard-pressed fibre building board.

**Hardener**: A substance or mixture of substance added to a material to increase or control the curing reaction by taking part in it.

**hardness**: a characteristic of water, imparted by salts of calcium, magnesium, and iron, such as bicarbonates, carbonates, sulfates, chlorides, and nitrates that cause curdling of soap, deposition of scale in boilers, damage in some industrial process, and sometimes objectionable taste. It may be determined by a standard laboratory procedure or computed from the amounts of calcium and magnesium as well as iron, aluminum,

manganese, barium, strontium, and zinc; expressed as equivalent parts per million of calcium carbonate. OR Hardness is a measure of how easily you can scratch a substance. Diamonds have a greater hardness than copper sulfate crystals. Copper sulfate is softer than a diamond. OR The ability of a paint film to resist denting, scratching or marring. OR a quality of minerals determined by the Mohs hardness scale. OR property of matter that determines how easily the substance can be scratched. OR The hardness of a material can be measured by its resistance to scratching or to indentation. Mostly used hardness tests involve the determination of the material resistance to indentation under standardized conditions. A hard indenter of standard shape is pressed into the surface of the material under a specified load. The resulting area of indentation or the depth of indentation is measured and assigned a numerical value. Various methods can be used. For plastics, the most widely used methods are Ball hardness, Rockwell and Shore methods. OR A measurement of the resistance to penetration of a silicone rubber sample by an indenter on a Durometer tester. High values indicate harder materials while low values indicate softer materials. OR The resistance of a material to compression and indentation. Among the most important methods of testing this property are Brinell hardness, Rockwell hardness and Shore hardness. OR The hardness of a material can be measured by its resistance to scratching or to indentation. Mostly used hardness tests involve the determination of the material resistance to indentation under standardized conditions. A hard indenter of standard shape is pressed into the surface of the material under a specified load. The resulting area of indentation or the depth of indentation is measured and assigned a numerical value. Various methods can be used. For plastics, the most widely used methods are Ball hardness, Rockwell and Shore methods.

**Hardness Points:** Steel rods used by geologists to test the hardness of minerals and rocks.

**hardpan:** a layer of soil, usually the B horizon, that is so hard (usually cemented by calcite or quartz) that even a backhoe cannot break through it.

**Hardwood:** Wood from a tree of the botanical group of trees that are broadleaved and usually deciduous. The term has no reference to the actual hardness of the wood.

**harmless parentheses:** Parentheses that are not necessary but that do not do any harm in the expression.

**Hartman–Hann Condition:** A spin-lock experiment that increases the efficiency of cross polarization; it uses two rf fields, one at the Larmor frequency of the protons and one at the Larmor frequency of the carbons.

**hartree:** One atomic unit of energy, equal to 2625.5 kJ/mol, 627.5 kcal/mol, 27.211 eV, and 219474.6 cm<sup>-1</sup>.

**Hartree-Fock:** Simplest and least expensive ab initio wavefunction. Involves only a single Slater determinant (a single electron configuration). Orbitals that contain electrons are "occupied," those that are vacant are called "virtual."

**hartreeh:** The atomic unit of energy, equal to  $4.359\,743\,81 \times 10^{-18} \text{ J} \pm 0.000\,000\,34 \times 10^{-18} \text{ J}$  [1998 CODATA values].

**Hashimoto disease :** An autoimmune condition of the thyroid gland (a gland located beneath the larynx). It is caused by the formation of antibodies that attack the thyroid gland and it usually causes hypothyroidism (too little thyroid hormone). Symptoms include fatigue, weight gain, constipation, dry skin, depression, and the inability to exercise. It is more common in females and can run in families. Also called autoimmune thyroiditis and Hashimoto thyroiditis.

**Hashimoto thyroiditis :** An autoimmune condition of the thyroid gland (a gland located beneath the larynx). It is caused by the formation of antibodies that attack the thyroid gland and it usually causes hypothyroidism (too little thyroid hormone). Symptoms include fatigue, weight gain, constipation, dry skin, depression, and the inability to exercise. It is more common in females and can run in families. Also called autoimmune thyroiditis and Hashimoto disease.

**Hassium:** Symbol:"Hs" Atomic Number:"108" Atomic Mass: (265)amu. Hassium is one of the postactinide elements. Scientists have created these in labs and may have found only a few atoms of the element. You will not find these in use anywhere.

**Haul-off:** Also called a "caterpillar," it is an apparatus used for the continual removal of extrudate from the die.

**Havrix:** (Other name for: hepatitis A vaccine)

**Haworth perspective formulas:** A method for representing cyclic chemical structures so as to define the configuration of each substituent group; the method commonly used for representing sugars.

**Haworth projection:** A depiction of a cyclic carbohydrate in which the plane of each ring is perpendicular to the plane of the page and in which ring carbon atoms are not explicitly shown.

**hawthorn fruit :** The fruit of the hawthorn tree or bush. It has been used in some cultures to treat certain medical problems, including heart problems and gastrointestinal problems.

**hazard:** A source of danger a qualitative term expressing the potential that an environmental agent can harm health (WHO, 1988).

**hazard identification:** The identification of the substance of concern, its adverse effects, target populations, and conditions of exposure (WHO, 1988).

**hazard ratio :** A measure of how often a particular event happens in one group compared to how often it happens in another group, over time. In cancer research, hazard ratios are often used in clinical trials to measure survival at any point in time in a group of patients who have been given a specific treatment compared to a control group given another treatment or a placebo. A hazard ratio of one means that there is no difference in survival between the two groups. A hazard ratio of greater than one or less than one means that survival was better in one of the groups.

**Haze:** The cloudy or turbid appearance of an otherwise transparent material caused by light scattered from within the specimen or from its surfaces.

**HBOC syndrome :** An inherited disorder in which the risk of breast cancer (especially before the age of 50) and ovarian cancer is higher than normal. Most cases of HBOC syndrome are caused by certain mutations (changes) in the BRCA1 or the BRCA2 gene. People with HBOC syndrome may also have an increased risk of other types of cancer, including pancreatic cancer, prostate cancer, and melanoma. Also called hereditary breast and ovarian cancer syndrome.

**HBV:** A virus that causes hepatitis (inflammation of the liver). It is carried and passed to others through the blood and other body fluids. Different ways the virus is spread include sharing needles with an infected person and being stuck accidentally by a needle contaminated with the virus. Infants born to infected mothers may also become infected with the virus. Although many patients who are infected with HBV may not have symptoms, long-

term infection may lead to cirrhosis (scarring of the liver) and liver cancer. Also called hepatitis B virus.

**HCA:** A chemical that is formed when meat, poultry, or fish is cooked at high temperatures, such as frying, broiling, and barbecuing. HCAs are carcinogens (substances that may cause cancer). Also called heterocyclic amine.

**HCD20:** A substance being studied in the treatment of several types of lymphoma. It binds to the protein CD20, which is found on B cells (a type of immune system cell) and some types of lymphoma cells. This causes the immune system to kill the cancer cells. HCD20 is a type of monoclonal antibody. Also called hA20, IMMU-106, and veltuzumab.

**HCP:** Healthcare proxy. A type of advance directive that gives a person (such as a relative, lawyer, or friend) the authority to make healthcare decisions for another person. It becomes active when that person loses the ability to make decisions for himself or herself. Also called healthcare proxy.

**hCRF:** A substance being studied in the treatment of brain cancer. It is made naturally by the hypothalamus (a part of the brain) and can also be made in the laboratory. hCRF may help reduce symptoms caused by edema (swelling) of the brain. It is a type of neurohormone. Also called human corticotropin-releasing factor.

**HCT:** The amount of whole blood that is made up of red blood cells. It depends on the number and size of red blood cells. A HCT test is usually part of a complete blood count (CBC). It may be used to check for conditions such as anemia, dehydration, malnutrition, and leukemia. Also called hematocrit.

**HCV:** A virus that causes hepatitis (inflammation of the liver). It is carried and passed to others through the blood and other body fluids. Different ways the virus is spread include sharing needles with an infected person and being stuck accidentally by a needle contaminated with the virus. Infants born to infected mothers may also become infected with the virus. Although patients who are infected with HCV may not have symptoms, long-term infection may lead to cirrhosis (scarring of the liver) and liver cancer. These patients may also have an increased risk for certain types of non-Hodgkin lymphoma. Also called hepatitis C virus.

**HCV DNA vaccine INO-8000:** A multi-antigen DNA vaccine consisting of plasmids encoding the hepatitis C virus (HCV) nonstructural proteins 3 (NS3), 4A (NS4A), 4B (NS4B) and 5A (NS5A), with potential immunomodulating and cancer preventive activities. Administered via intramuscular injection followed by electroporation, cells transfected with the HCV DNA vaccine INO-8000 express the encoded HCV proteins, which may elicit a cytotoxic T-lymphocyte (CTL) response against HCV-infected liver cells expressing the NS3, NS4A, NS4B or NS5A proteins. This results in the eradication of HCV-infected cells. HCV, a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family, is associated with the development of hepatocellular carcinoma (HCC).

**HDAC:** An enzyme that removes a small molecule called an acetyl group from histones (proteins found in chromosomes). This changes the way the histones bind to DNA and may affect its activity. HDAC inhibitors are being studied in the treatment of cancer. Also called histone deacetylase.

**HDAC inhibitor :** A substance that causes a chemical change that stops tumor cells from dividing. HDAC inhibitors are being studied in the treatment of cancer. Also called histone deacetylase inhibitor.

**HDAC inhibitor 4SC-202:** An orally bioavailable benzamide and inhibitor of human class I histone deacetylases (HDACs) isoenzymes 1, 2 and 3, with potential antineoplastic activity. HDAC inhibitor 4SC-202 selectively binds to and inhibits class I HDACs leading to an accumulation of highly acetylated histones. This may result in an induction of chromatin remodeling, the selective transcription of tumor suppressor genes, and the tumor suppressor protein-mediated inhibition of tumor cell division and eventually the induction of tumor cell apoptosis. This may inhibit tumor cell proliferation in susceptible tumor cells. HDACs, upregulated in many tumor types, are a class of enzymes that deacetylate chromatin histone proteins. Check for active clinical trials using this agent.

**HDAC inhibitor ACY-241:** An orally available histone deacetylase (HDAC) inhibitor, with potential antineoplastic activity. Upon oral administration, ACY-241 inhibits the activity of HDACs; this results in an accumulation of highly acetylated chromatin histones, the induction of chromatin remodeling and an altered pattern of gene expression. This leads to the inhibition of tumor oncogene transcription, and the selective transcription of tumor suppressor genes, which inhibit tumor cell division

and induce tumor cell apoptosis. HDAC, an enzyme upregulated in many tumor types, deacetylates chromatin histone proteins.

**HDAC inhibitor AR-42:** An orally available phenylbutyrate-derived histone deacetylase (HDAC) inhibitor, with potential antineoplastic activity. Upon oral administration, AR-42 inhibits the catalytic activity of HDAC, which results in an accumulation of highly acetylated chromatin histones, the induction of chromatin remodeling and an altered pattern of gene expression. This leads to the inhibition of tumor oncogene transcription, and the selective transcription of tumor suppressor genes, which inhibits tumor cell division and induces tumor cell apoptosis. HDAC, an enzyme upregulated in many tumor types, deacetylates chromatin histone proteins.

**HDAC inhibitor CG200745:** A histone deacetylase (HDAC) inhibitor with potential antineoplastic activity. CG200745 inhibits the catalytic activity of HDAC, resulting in an accumulation of highly acetylated chromatin histones, followed by the induction of chromatin remodeling and an altered pattern of gene expression. In particular, this agent enhances the histone acetylation of the tumor suppressor gene p53. This results in an accumulation of p53, p53-dependent transactivation and apoptosis in tumor cells. HDAC, an enzyme upregulated in many tumor types, deacetylates chromatin histone proteins.

**HDAC inhibitor CHR-2845:** A hydroxamic acid-derived histone deacetylase (HDAC) inhibitor with potential antineoplastic activity. CHR-2845 inhibits HDAC leading to an accumulation of highly acetylated histones, which may result in chromatin remodeling, inhibition of tumor oncogene transcription, inhibition of tumor cell division, and the induction of tumor cell apoptosis. HDAC, an enzyme upregulated in many tumor types, deacetylates chromatin histone proteins; this agent may specifically target HDACs in cells of the monocyte-macrophage lineage.

**HDAC inhibitor CHR-3996:** An orally bioavailable, second-generation hydroxamic acid-based inhibitor of histone deacetylase (HDAC) with potential antineoplastic activity. HDAC inhibitor CHR-3996 inhibits HDAC, resulting in an accumulation of highly acetylated histones, the induction of chromatin remodeling, and the selective transcription of tumor suppressor genes; these events may result in the inhibition of tumor cell division and the induction of tumor cell apoptosis. This agent may upregulate HSP70 and downregulate anti-apoptotic Bcl-2 proteins more

substantially than some first-generation HDAC inhibitors. HDACs, upregulated in many tumor cell types, are a family of metalloenzymes responsible for the deacetylation of chromatin histone proteins.

**HDAC inhibitor CXD101:** A novel histone deacetylase (HDAC) inhibitor with potential antineoplastic activity. Although the exact therapeutic mechanism of action for CXD101 is not known, oral administration of this agent should inhibit the catalytic activity of HDAC, which results in an accumulation of highly acetylated histones, followed by the induction of chromatin remodeling and an altered pattern of gene expression. HDAC, a family of enzymes upregulated in many tumor types, deacetylates chromatin-associated histone proteins.

**HDAC inhibitor MPT0E028:** An orally bioavailable N-hydroxyacrylamide-derived inhibitor of both human pan-histone deacetylase (HDAC) enzymes and the serine/threonine protein kinase Akt (protein kinase B), with potential antineoplastic activity. Upon administration, HDAC inhibitor MPT0E028 selectively binds to and inhibits HDACs, which inhibits deacetylation of histone proteins and leads to the accumulation of highly acetylated histones. This may result in both an induction of chromatin remodeling, and the selective transcription of tumor suppressor genes. This prevents cell division and induces both cell cycle arrest and apoptosis, which may inhibit the proliferation of susceptible tumor cells. In addition, MPT0E028 inhibits the phosphorylation and activation of Akt, which prevents the activation of downstream signaling pathways, independent of its HDAC inhibitory activity. HDACs, upregulated in many tumor cell types, are a family of enzymes that deacetylate histone proteins. Akt, overexpressed in many tumor cell types, plays a key role in tumor cell proliferation and survival.

**HDAC inhibitor OBP-801:** An inhibitor of histone deacetylase (HDAC) enzymes, with potential antineoplastic activity. Upon administration, OBP-801 inhibits the activity of HDACs; this results in an accumulation of highly acetylated chromatin histones, the induction of chromatin remodeling and an altered pattern of gene expression. This leads to selective transcription of tumor suppressor genes, tumor suppressor protein-mediated inhibition of tumor cell division and induction of tumor cell apoptosis. This may inhibit proliferation of susceptible tumor cells. HDAC,

which is upregulated in many tumor cell types, deacetylates chromatin histone proteins.

**HDAC inhibitor SHP-141:** A topical formulation containing the histone deacetylase (HDAC) inhibitor with potential antineoplastic activity. Upon cutaneous administration, SHP-141 selectively binds to and inhibits HDAC, resulting in an accumulation of highly acetylated histones in the skin (dermis and epidermis), the induction of chromatin remodeling, and the selective transcription of tumor suppressor genes. These events may result in the inhibition of tumor cell division and the induction of tumor cell apoptosis. HDACs, upregulated in many tumor cell types, are a family of metalloenzymes responsible for the deacetylation of chromatin histone proteins. Topical administration of SHP-141 allows for high concentrations of this agent locally while minimizing systemic toxicity.

**HDAC inhibitor SNDX-275 :** A substance being studied in the treatment of several types of cancer. It blocks enzymes needed for cell division and may kill cancer cells. It is a type of histone deacetylase (HDAC) inhibitor. Also called entinostat and SNDX-275.

**HDAC/EGFR/Her2 inhibitor CUDC-101:** A multi-targeted, small-molecule inhibitor of histone deacetylase (HDAC), epidermal growth factor receptor tyrosine kinase (EGFR/ErbB1), and human epidermal growth factor receptor 2 tyrosine kinase (HER2/neu or ErbB2) with potential antineoplastic activity. HDAC/EGFR/HER2 inhibitor CUDC-101 inhibits the activity of these three enzymes but the exact mechanism of action is presently unknown. This agent may help overcome resistance to inhibition of EGFR and Her2 through a simultaneous, synergistic inhibition of EGFR, Her2, and HDAC.

**HDL (high-density lipoprotein):** A lipoprotein that collects cholesterol released into the blood from dying cells or from membranes undergoing turnover.

**HDM2 antagonist JNJ-26854165:** An orally bioavailable, small-molecule HDM2 antagonist with potential antineoplastic activity. HDM2 antagonist JNJ-26854165 inhibits the binding of the HDM2–p53 complex to the proteasome, blocking the degradation of p53; p53 signaling and p53-mediated induction of tumor cell apoptosis may thus be restored. In addition to p53, degradation of other HDM2 client proteins may be inhibited. HDM2 (human homolog of double minute 2), a zinc finger

protein, is a negative regulator of the p53 pathway; often overexpressed in cancer cells, this oncoprotein has been implicated in cancer cell proliferation and survival.

**HDM2 inhibitor HDM201:** An orally bioavailable human double minute 2 homolog (HDM2) inhibitor with potential antineoplastic activity. HDM2 inhibitor HDM201 inhibits the binding of the HDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this HDM2-p53 interaction, the proteasome-mediated enzymatic degradation of p53 is inhibited, which may result in the restoration of both p53 signaling and p53-mediated induction of tumor cell apoptosis. HDM2, a zinc finger protein and negative regulator of the p53 pathway, is often overexpressed in cancer cells and has been implicated in cancer cell proliferation and survival.

**HDM2 inhibitor MK-8242:** An orally bioavailable inhibitor of human homolog of double minute 2 (HDM2), with potential antineoplastic activity. Upon oral administration, HDM2 inhibitor MK-8242 inhibits the binding of the HDM2 protein to the transcriptional activation domain of the tumor suppressor protein p53. By preventing this HDM2-p53 interaction, the degradation of p53 is inhibited, which may result in the restoration of p53 signaling. This induces p53-mediated tumor cell apoptosis. HDM2 is a member of the RING finger-type family of E3 ubiquitin protein ligases and targets p53 for degradation; it is often overexpressed in cancer cells and has been implicated in cancer cell proliferation and survival. Check for active clinical trials using this agent.

**HDPE:** This is the acronym for High density, (0.95-0.965) polyethylene. It has much higher stiffness, higher temperature resistance and much better water vapor barrier properties than LDPE, but it is considerably hazier.

**HDR:** An amount of radiation that is greater than that given in typical radiation therapy. HDR is precisely directed at the tumor to avoid damaging healthy tissue, and may kill more cancer cells in fewer treatments. Also called high-dose radiation.

**HDT:** Heat-deflection test

**HE4:** A protein found on cells that line the lungs and reproductive organs, such as the ovaries. HE4 may be found in higher than normal amounts in patients with some types of cancer, including ovarian epithelial cancer. Measuring the amount of HE4 in the blood may help plan cancer treatment

or find out if cancer is getting worse or has come back. It is a type of tumor marker. Also called human epididymis protein 4.

**Head:** a unit of measure representing the relative energy of a flowing fluid. Commonly recorded in “feet” of fluid, it provides a convenient means of combining the pressure, velocity, and elevation energy portions of a flowing fluid.

**head and neck cancer :** Cancer that arises in the head or neck region (in the nasal cavity, sinuses, lips, mouth, salivary glands, throat, or larynx [voice box]).

**Head Loss:** energy loss in a fluid as it passes through a flow passage. The loss is due to friction between fluid particles and can be expressed as a linear change in the height of a column of fluid.

**Head Space:** the space between the level of the contents in the neck of a bottle and the closure. It is intended to furnish space for expansion of product due to heat or other action after packing. Head space may also refer to the amount of space in a corrugated shipper carton filled with plastic bottles or jars.

**Head, reactor vessel:** The removable top section of a reactor pressure vessel. It is bolted in place during power operation and removed during refueling to permit access of fuel handling equipment to the core.

**Header:** A stone or brick laid across the thickness of the wall. On the face of the brickwork only the end of the header is visible. Opposite to 'stretcher'.

**headland:** a rocky arm of a coastline that juts into the sea.

**headward erosion:** erosion that results when a valley is extended upward above its original source by gullying, mass wasting, and sheet erosion.

**headwaters:** the origination of a stream; usually in higher elevations of mountainous terrain.

**Headworks:** The facilities where wastewater enters a wastewater treatment plant. The headworks may consist of bar screens, comminutors, a wet well and pumps.

**healing touch :** A form of complementary and alternative medicine based on the belief that vital energy flows through the human body. This energy is said to be balanced or made stronger by practitioners who pass their hands over, or gently touch, a patient's body. Healing touch is being studied in

patients receiving cancer therapy, to find out if it can improve quality of life, boost the immune system, or reduce side effects. Healing touch is a type of energy therapy. Also called therapeutic touch.

**health:** A state of complete physical, mental and social well-being, and not merely the absence of disease or infirmity (WHO, 1978b).

**Health Insurance Portability and Accountability Act :** A 1996 U.S. law that allows workers and their families to keep their health insurance when they change or lose their jobs. The law also includes standards for setting up secure electronic health records and to protect the privacy of a person's health information and to keep it from being misused. Also called HIPAA and Kassebaum Kennedy Act.

**Health physics:** The science concerned with recognizing and evaluating the effects of ionizing radiation on the health and safety of people and the environment, monitoring radiation exposure, and controlling the associated health risks and environmental hazards to permit the safe use of technologies that produce ionizing radiation. For further information, see Frequently Asked Questions About Health Physics Based on 10 CFR Part 20.

**healthcare provider :** A licensed person or organization that provides healthcare services.

**healthcare proxy :** A type of advance directive that gives a person (such as a relative, lawyer, or friend) the authority to make healthcare decisions for another person. It becomes active when that person loses the ability to make decisions for himself or herself. Also called HCP.

**healthy control :** In a clinical study, a person who does not have the disorder or disease being studied. Results from healthy controls are compared to results from the group being studied.

**healthy worker effect:** A phenomenon observed initially in studies of occupational diseasesworkers usually exhibit lower overall death rates than the general population, due to the fact that the severely ill and disabled are ordinarily excluded from employment. Death rates in the general population may be inappropriate for comparison if this effect is not taken into account (Last, 1983).

**Heap leach:** A method of extracting uranium from ore using a leaching solution. Small ore pieces are placed in a heap on an impervious material

(plastic, clay, asphalt) with perforated pipes under the heap. Acidic solution is then sprayed over the ore, dissolving the uranium. The solution in the pipes is collected and transferred to an ion-exchange system for concentration of the uranium.

**heart cancer :** A rare cancer that develops in tissues of the heart. Also called cardiac sarcoma.

**heart disease :** A type of disease that affects the heart or blood vessels. The risk of certain heart diseases may be increased by smoking, high blood pressure, high cholesterol, unhealthy diet, lack of exercise, and obesity. The most common heart disease is coronary artery disease (narrow or blocked coronary arteries), which can lead to chest pain, heart attacks, or stroke. Other heart diseases include congestive heart failure, heart rhythm problems, congenital heart disease (heart disease at birth), and endocarditis (inflamed inner layer of the heart). Also called cardiovascular disease.

**heart rate :** In medicine, the number of times the heart beats within a certain time period, usually a minute. The heart rate can be felt at the wrist, side of the neck, back of the knees, top of the foot, groin, and other places in the body where an artery is close to the skin. The resting heart rate is normally between 60 and 100 beats a minute in a healthy adult who is at rest. Measuring the heart rate gives important information about a person's health. Also called pulse.

**Heartwood:** Inner zone of wood that in a growing tree has ceased to contain living cells. It is usually more durable than the outer zone of sapwood.

**heat:** The transfer of (thermal) energy between two objects that are at different temperatures. OR Energy transferred between a system and its surroundings as a consequence of a temperature difference. heat always flows from a higher temperature to a lower one. OR a form of energy that spontaneously flows from a warm body to a cold body. OR a form of energy marked by differences in temperatures OR Heat is a transfer of energy that occurs when objects with different temperatures are placed into contact. Heat is a process, not a property of a material.

**Heat Aging:** The unique process of aging a thermoplastic or thermoset product and examining the percentage of retained physical and chemical properties after exposure to heat for a prolonged period of time.

**Heat Capacity:** A measure of how much heat is needed to raise the temperature of one gram of anything one degree Celsius. OR the amount of energy needed to raise the temperature of a substance by one degree Celsius. OR The heat required to raise the temperature of an object by 1°C is called the heat capacity of the object. Heat capacity is an extensive property with units of J K<sup>-1</sup>.

**Heat capacity rule:** This rule states that at a given temperature, if the higher melting polymorph has a heat capacity greater than another modification, the system is enantiotropic. Otherwise, the system is monotropic.

**Heat Chamber:** In injection molding, that part of the machine in which the cold feed is reduced to a hot melt. Also Heating Cylinder.

**Heat conduction calorimetry:** A technique in which the response of the instrument is directly proportional to the rate of the heat produced in the sample cell. The advantage of this technique is that small values of heat ( $\mu\text{W}$ ) can be detected.

**Heat conductor (thermal conductor):** A substance that can allow heat to pass through it easily. Metals are good heat conductors. The bottom of a frying pan is made of metal so that the heat from the cooker can reach the food very easily.

**Heat Deflection Temperature (HDT):** The temperature at which a standard test bar (ASTM D648) deflects 0.010 in. under a stated load of either 66 or 264 psi. OR indicates how loaded material deforms at higher temperature. Test bars are placed in a heating bath, resting horizontally on two supports. A constant load is applied in the center of the specimen and the bath temperature is raised at a constant rate. The temperature of the bath at which the flexural deflection of the loading point has reached a predefined level is the heat deflection temperature of the material.

**Heat Distortion Point:** The temperature in degrees Celsius at which a standard test bar (ASTM D648) deflects .010 in. under a stated load of either 66 or 264 psi, when the temperature is raised at a specific rate of increase.

**Heat exchanger:** A process unit through which two fluid streams at different temperatures flow on opposite sides of a metal barrier. Heat is transferred from the stream at the higher temperature through the barrier to

the other stream. OR Any device that transfers heat from one fluid (liquid or gas) to another fluid or to the environment.

**heat flow:** of the earth in general, the amount of heat from the earth's interior that is lost at the surface.

**heat flux (thermal flux):** The amount of heat that is transferred across a surface of unit area in a unit of time.

**heat island effect:** A dome of elevated temperatures over an urban area caused by the heat absorbed by structures and pavement.

**Heat Loss:** power dissipated as heat.

**heat of combustion:** the energy released when an alkane is completely oxidized.

**Heat of combustion:** The amount of heat released in burning completely an amount of substance is its heat of combustion. The amount needed for one mole is naturally called the molar heat of combustion. A general formula for the combustion of any organic compound is:

**Heat of Fusion:** The amount of energy required to transform a substance from a liquid state to a solid state. The amount of energy is measured in calories and is a measure of how many calories must be removed from the system since solids hold less energy overall than liquids. OR The heat required to mobilize the molecules of a solid polymer to produce a fluid melt i.e. the heat required to destroy the solid crystal structure without increasing the temperature. For amorphous polymers like polystyrene (PS) the heat of fusion is zero. For LDPE it is about 130,000 J/kg, which is roughly equivalent to the heat required to raise the temperature of 1kg of LDPE by about 50°C.

**Heat of fusion rule:** See Enthalpy of fusion rule

**heat of hydrogenation:** the energy released when two hydrogen atoms bond to the carbon atoms of a former double bond.

**Heat of transition rule:** See Enthalpy of transition rule

**Heat of vaporisation:** The amount of heat energy required to transform an amount of a substance from the liquid phase to the gas phase is its heat of vaporisation. The amount needed for one mole is naturally called the molar heat of vaporisation...

**Heat Seal:** The process of bonding two or more thermoplastic films using heat and pressure.

**Heat Sealing:** A method of joining plastic films by simultaneous application of heat and pressure to areas in contact. Heat may be supplied conductively or dielectrically. OR The process of joining two or more thermoplastic films or sheets by heating areas in contact with each other to the temperature at which fusion occurs, usually aided by pressure.

**Heat sink:** Anything that absorbs heat. It is usually part of the environment, such as the air, a river, or a lake.

**Heat Stabilizers:** These additives increase the ability of the material to withstand the negative effects of heat exposure. They are used to increase the overall service temperature of the material. Hesitation effect: occurs in parts of varied thicknesses. The flow moves preferentially into a thicker area causing an adjacent thin area to freeze off while the thicker area fills. Gates should be positioned as far as possible from where the flow divides into thick and thin flow paths. OR These additives increase the ability of the material to withstand the negative effects of heat exposure. They are used to increase the overall service temperature of the material.

**Heat-Distortion Point:** The temperature at which a standard test bar (ASTM D648) deflects 0.010 in. under a stated load of either 66 or 264 psi. OR The temperature at which a standard test bar deflects 0.010 in. under a stated load of either 66 or 264 psi.

**heat-shock protein :** One of a group of proteins that help protect cells from stresses such as heat, cold, and low amounts of oxygen or glucose (sugar). Heat-shock proteins help other proteins function in normal cells and may be present at high levels in cancer cells. Blocking the activity of a heat-shock protein called HSP90 is being studied in the treatment of cancer. Other heat-shock proteins including HSP70 and gp96 are being studied in vaccines to treat cancer. Also called HSP and stress protein.

**Heat-shock proteins:** A ubiquitous group of proteins that are synthesized in response to stress, such as a heat shock, and that bind unfolded polypeptides and assist in their refolding.

**heat-treated varicella-zoster virus vaccine V212:** A heat-treated varicella-zoster virus (VZV) vaccine with potential immunomodulating activity. Upon vaccination with heat-treated varicella-zoster virus vaccine V212, this vaccine may activate the immune system to generate specific anti-VZV antibodies and an active immunity against VZV infection.

**Heater bands:** Bracelet-shaped electrical heaters that are placed around the outside circumference of the heating barrel. OR Electrical heating units shaped to fit extruder barrels, injection molding cylinders, and the like, for heating the plastic material to the desired temperature.

**Heating cylinder:** That section of the injection molding machine in which the plastic resin is heated to the proper molding temperature prior to injection into the mold.

**Heating zone:** An area of the heating barrel that is controlled by a temperature controller attached to a set of heater bands. There are four major zones: rear, center, front, and nozzle. OR Parts of the barrel, head and die arranged for independent temperature control.

**Heatup:** The rise in temperature of the reactor fuel rods resulting from an increase in the rate of fission in the core.

**Heavy (H) chain:** A 50-kd polypeptide that is one of two types of paired chains found in the immunoglobulin G molecule; each heavy chain consists of a variable region and three constant regions, and each chain is linked by a disulfide bond to a light chain.

**heavy atom:** An atom beyond helium, i.e.,  $Z > 2$ .

**Heavy Crude:** Heavy Crude is a term used to define crude oils with a high fraction of high boiling point waxy components such that processing cannot be performed in "normal" refinery operations. Heavy Crude is defined as those crudes having a specific gravity below 28 API and include some Venezuelan oils and oil from Canadian Tar Sand deposits.

**heavy crude oil:** a dense, viscous petroleum that flows so slowly it is usually left behind in an oil field.

**Heavy gram bottles:** bottles blown from a parison or preform to a size that is relatively small for the parison's/preform's capacity. The result is a bottle with greater wall thickness, because more plastic has been distributed over a smaller bottle shape.

**Heavy isoes:** Heavy isoes. Forms of atoms that contain greater numbers of neutrons than the most common form (e.g.,  $^{15}\text{N}$ ,  $^{13}\text{C}$ ).

**Heavy isotopes:** Forms of atoms that contain greater numbers of neutrons than the most common form (e.g.,  $^{15}\text{N}$ ,  $^{13}\text{C}$ ).

**Heavy meromyosin (HMM):** Along with light meromyosin, one of the tryptic digestion products of myosin; it retains atpase activity and the ability

to bind actin but does not form filaments.

**heavy metals:** a general term given to the ions of metallic elements such as copper, zinc, chromium, and aluminum. They are removed from wastewater by forming an insoluble precipitate (usually a metallic hydroxide).

**Heavy water (D<sub>2</sub>O):** Water containing significantly more than the natural proportions (one in 6,500) of heavy hydrogen (deuterium, D) atoms to ordinary hydrogen atoms. Heavy water is used as a moderator in some reactors because it slows down neutrons effectively and also has a low probability of absorption of neutrons.

**Heavy water moderated reactor:** A reactor that uses heavy water as its moderator. Heavy water is an excellent moderator and thus permits the use of unenriched uranium as a fuel.

**heavy water<sub>2</sub>:** Water that contains 2H, rather than 1H. Heavy water is about 11% denser than ordinary water.

**Heavy-atom method:** A method used to determine the crystal structure of compounds that contain atoms with atomic numbers greater than 17.

**Hecoria:** (Other name for: tacrolimus)

**Hectorol:** (Other name for: doxercalciferol)

**Hedgehog inhibitor PF-04449913:** An orally bioavailable small-molecule inhibitor of the Hedgehog (Hh) signaling pathway with potential antineoplastic activity. Hedgehog inhibitor PF-04449913 appears to inhibit Hh pathway signaling. The Hh signaling pathway plays an important role in cellular growth, differentiation and repair. Constitutive activation of Hh pathway signaling has been observed in various types of malignancies.

**Hedyotis diffusa :** An herb used in traditional Chinese medicine to treat certain medical problems. It has been used to boost the immune system and may have anticancer effects.

**Heel:** Refers to the portion of an automatic custom injection mold that keeps the slide in the forward position when the molding machine is closed on the mold. OR the part of a bottle between the bottom bearing surface and the side wall.

**height:** altitude. From the highest point, a perpendicular drawn to the base.

**height (of a triangle):** A line segment that is perpendicular to the base of a triangle, with one endpoint being the opposite vertex.

**Height Indicator:** This is used to accurately measure small distances and angles as well as amplify them to make them more obvious.

**Heisenberg uncertainty principle:** This principle states that it is not possible to know a particle's location and momentum precisely at any time.

**helical computed tomography :** A procedure that uses a computer linked to an x-ray machine to make a series of detailed pictures of areas inside the body. The x-ray machine scans the body in a spiral path. This allows more images to be made in a shorter time than with older CT methods. A dye may be injected into a vein or swallowed to help the organs or tissues show up more clearly on the x-ray. Helical computed tomography also creates more detailed pictures and may be better at finding small abnormal areas inside the body. It may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Also called spiral CT scan.

**helical tomotherapy :** A type of therapy in which radiation is aimed at a tumor from many different directions. The patient lays on a table and is moved through a donut-shaped machine. The radiation source in the machine rotates around the patient in a spiral pattern. Before radiation, a 3-dimensional (3-D) image of the tumor is taken. This helps doctors find the highest dose of radiation that can be used to kill tumor cells while causing less damage to nearby tissue. Helical tomotherapy is a type of intensity-modulated radiation therapy (IMRT). Also called tomotherapy.

**helicase:** An enzyme that catalyzes the separation of strands in a DNA molecule before replication.

**Helicases:** Enzymes that catalyze the ATP-driven unwinding of nucleic acids; DNA helicases are important in DNA replication.

**Helicobacter pylori :** A type of bacterium that causes inflammation and ulcers in the stomach or small intestine. People with Helicobacter pylori infections may be more likely to develop cancer in the stomach, including MALT (mucosa-associated lymphoid tissue) lymphoma. Also called H. pylori.

**heliocentric:** sun-centered model of the solar system.

**helium:** Element 2, atomic weight 4.0026. A colorless, odorless, inert gas, first discovered in the emission spectrum of the sun in 1868.

**Helium:** Symbol:"He" Atomic Number:"2" Atomic Mass: 4.00amu.

Helium is a very non-reactive element. It is the first in the group of noble or

inert gases. You can find it in balloons, scuba tanks, lasers, nuclear reactors, and blimps.

**Helium pycnometry:** An analytical method for determining the density of a powdered solid. An accurately weighed sample (~5 g) is placed in a sample cell and evacuated to remove ambient gases. The cell is then pressurized with helium, followed by adiabatic expansion into a chamber of known volume. The resulting pressure is recorded after thermal equilibrium. The density of the solid is calculated as follows: where WS is the weight of the sample, VS is the volume of the sample, V1 is the volume of the sample cell, V2 is the volume of the expansion chamber, P1 is the original pressure of the sample cell, and P2 is the pressure of the system after the expansion step.

**Helix:** A spiral structure with a repeating pattern.

**Helix-turn-helix:** A recurring motif found in many DNA-binding proteins, in which two  $\alpha$ -helical segments are linked by a short hairpin turn; the two segments are 34 Å apart, which allows them to fit into adjoining major grooves in DNA.

**helix,  $\alpha$ :** See  $\alpha$  helix.

**Helmholtz free energy:** A thermodynamic property that can be used to predict whether a process will occur spontaneously at constant volume and temperature. Helmholtz free energy A is defined as  $A = U - TS$  where U, T and S are the internal energy, temperature, and entropy. Changes in A correspond to changes in free energy for processes occurring at constant temperature and volume. The sign of  $\Delta A$  is negative for spontaneous processes and zero for processes at equilibrium.

**helper T cell :** A type of immune cell that stimulates killer T cells, macrophages, and B cells to make immune responses. A helper T cell is a type of white blood cell and a type of lymphocyte. Also called CD4-positive T lymphocyte. OR T cells that stimulate the proliferation of specific B lymphocytes and cytotoxic T cells.

**hemagglutinin-neuraminidase :** A protein found in the outer coat of paramyxoviruses. This protein helps virus particles bind to cells, making infection easier.

**Hemangeol :** A drug used to treat infantile hemangioma (a benign blood vessel tumor). It is used in infants 5 weeks to 5 months of age. It is also

being studied in the treatment of other conditions and some types of cancer. Hemangeol may help shrink certain types of vascular tumors. Hemangeol contains the active ingredient propranolol hydrochloride. It is a type of beta blocker.

**hemangiopericytoma** : A type of cancer involving blood vessels and soft tissue.

**hemangiosarcoma** : A type of cancer that begins in the cells that line blood vessels.

**hemarthroses**: bleeding in the joints

**Hematide**: (Other name for: synthetic peptide-based erythropoiesis stimulating agent)

**hematocrit** : The amount of whole blood that is made up of red blood cells. It depends on the number and size of red blood cells. A hematocrit test is usually part of a complete blood count (CBC). It may be used to check for conditions such as anemia, dehydration, malnutrition, and leukemia. Also called HCT.

**hematogenous** : Originating in the blood or spread through the bloodstream.

**hematologic cancer** : Cancer that begins in blood-forming tissue, such as the bone marrow, or in the cells of the immune system. Examples of hematologic cancer are leukemia, lymphoma, and multiple myeloma. Also called blood cancer.

**hematologist** : A doctor who has special training in diagnosing and treating blood disorders.

**hematoma** : A pool of clotted or partially clotted blood in an organ, tissue, or body space, usually caused by a broken blood vessel.

**hematopathology laboratory** : A laboratory that specializes in doing tests that help to diagnose and treat diseases of the blood, bone marrow, and lymph system.

**hematopoiesis** : The formation of new blood cells.

**hematopoietic growth factor** : A group of proteins that causes blood cells to grow and mature.

**hematopoietic stem cell** : An immature cell that can develop into all types of blood cells, including white blood cells, red blood cells, and platelets.

Hematopoietic stem cells are found in the peripheral blood and the bone marrow. Also called blood stem cell.

**hematopoietic tissue :** Tissue in which new blood cells are formed.

**hematoporphyrin derivative:** A complex mixture of monomeric and aggregated porphyrins with photosensitizing activity. Upon systemic administration, hematoporphyrin derivatives accumulate in tumor cells and, once activated by red laser light (630 nm), in the presence of oxygen, produce singlet oxygen and other reactive oxygen radicals, resulting in local radical-mediated tumor cell death. or A drug used in photodynamic therapy that is absorbed by tumor cells. When exposed to light, it becomes active and kills the cancer cells.

**hematuria :** Blood in the urine.

**Heme:** An iron-porphyrin complex found in hemoglobin and cytochromes  
**Hemiacetal**The product formed by the condensation of an aldehyde with an alcohol; it contains one oxygen linked to a central carbon in a hydroxyl fashion and one oxygen linked to the same central carbon by an ether linkage. or The prosthetic group of myoglobin and hemoglobin as well as other proteins; consists of an organic constituent, protoporphyrin, and an iron atom. Or The iron-porphyrin prosthetic group of heme proteins.

**heme :** The part of certain molecules that contains iron. The heme part of hemoglobin is the substance inside red blood cells that binds to oxygen in the lungs and carries it to the tissues.

**heme protein:** A protein containing a heme as a prosthetic group.

**hemiasterlin analogue E7974:** An analogue of the sponge-derived anti-microtubule tripeptide hemiasterlin with antimitotic and potential antineoplastic activities. Hemiasterlin analogue E7974 binds to the Vinca domain on tubulin, resulting in inhibition of tubulin polymerization and microtubule assembly; depolymerization of existing microtubules; inhibition of mitosis; and inhibition of cellular proliferation. This agent may have more affinity for the beta-3 tubulin isotype.

**hemihypertrophy :** A condition in which one side of the body or a part of one side is larger than the other. Children with hemihypertrophy have an increased risk of developing certain types of cancer, including Wilms tumor (a childhood kidney cancer) and liver cancer.

**hemiketal:** a functional group of the structure or A compound formed by the reaction of a ketone group and a hydroxyl group; for example, the C-2 keto group of the open-chain form of fructose reacts with the C-5 hydroxyl group to form an intermolecular hemiketal.

**hemilaryngectomy :** An operation to remove one side of the larynx (voicebox).

**hemizygous :** Describes an individual who has only one member of a chromosome pair or chromosome segment rather than the usual two. Hemizyosity is often used to describe X-linked genes in males who have only one X chromosome. This term is sometimes used in somatic cell genetics where cancer cell lines are often hemizygous for certain alleles or chromosomal regions.

**hemochromatosis:** a disorder in iron metabolism that is characterized by excess iron absorption, saturation of iron-binding proteins and deposition of hemosiderin (amorphous iron deposits) in the tissues

**hemochromatosis :** A condition in which the body takes up and stores more iron than it needs. The extra iron is stored in the liver, heart, and pancreas, which may cause liver disease, heart problems, organ failure, and cancer. It may also cause bronze skin, diabetes, pain in the joints and abdomen, tiredness, and impotence. Hemochromatosis may be inherited, or it may be caused by blood transfusions. Also called iron overload.

**hemodialysis:** a method for removing waste products such as potassium and urea, as well as free water from the blood when the kidneys are in renal failure

**hemoglobin:** a red pigment that binds oxygen and carbon dioxide molecules and carries them through the bloodstream. OR An allosteric protein that is the primary oxygen-carrying protein in vertebrates; it also plays a role in the transport of CO<sub>2</sub> and H<sup>+</sup>. Or A heme protein in erythrocytes; functions in oxygen transport. OR A protein inside red blood cells that carries oxygen from the lungs to tissues and organs in the body and carries carbon dioxide back to the lungs. Testing for the amount of hemoglobin in the blood is usually part of a complete blood cell (CBC) test. It is used to check for conditions such as anemia, dehydration, and malnutrition.

**Hemoglobinopathy:** A genetic disorder resulting from any number of mutations that produce insufficient amounts of normal hemoglobin or

normal amounts of defective hemoglobin chains.

**hemolysis :** The breakdown of red blood cells. Some diseases, medicines, and toxins may cause red blood cells to break down more quickly than usual.

**hemophagocytic lymphohistiocytosis :** A rare disorder in which histiocytes and lymphocytes (types of white blood cells) build up in organs including the skin, spleen, and liver, and destroy other blood cells. Hemophagocytic lymphohistiocytosis may be inherited or caused by certain conditions or diseases, including infections, immunodeficiency (inability of the body to fight infections), and cancer. Also called HLH.

**Hemophilia:** A general term for a number of disorders of blood clotting, in which one or another protein in the blood-clotting pathway is defective or missing.

**hemophilia :** Group of hereditary disorders in which affected individuals fail to make enough of certain proteins needed to form blood clots.

**hemoptysis :** Coughing or spitting up blood from the respiratory tract.

**hemorrhage :** In medicine, loss of blood from damaged blood vessels. A hemorrhage may be internal or external, and usually involves a lot of bleeding in a short time.

**hemorrhagic cystitis :** A condition in which the lining of the bladder becomes inflamed and starts to bleed. The blood can be seen in the urine. Symptoms include pain and a burning feeling while urinating, feeling a need to urinate often, and being unable to control the flow of urine. Hemorrhagic cystitis may be caused by anticancer drugs, radiation therapy, infection, or being exposed to chemicals, such as dyes or insecticides.

**hemorrhoid :** An enlarged or swollen blood vessel, usually located near the anus or the rectum.

**henatinib maleate:** The maleate salt form of henatinib, an orally bioavailable, multitargeted tyrosine kinase inhibitor with potential antitumor and antiangiogenic activities. Henatinib inhibits vascular endothelial growth factor receptor type 2 (VEGFR2), a tyrosine kinase receptor upregulated in many tumor cells that plays a key role in angiogenesis. This may result in an inhibition of angiogenesis and eventually tumor cell proliferation. Henatinib, structurally similar to sunitinib, also inhibits, though to a lesser

extent, mast/stem cell growth factor receptor (c-Kit) and, platelet-derived growth factor receptor (PDGFR) alpha and beta.

**Henderson-Hasselbalch equation:** An equation that relates the pKa, to the pH and the ratio of the proton acceptor (A-) and the proton donor (HA) species of a conjugate acid base pair. OR An equation relating the pH, the pKa, and the ratio of the concentrations of the protonacceptor (A-) and proton-donor (HA) species in a solution.

**Henry's Law:** Henry's law predicts that the solubility (C) of a gas or volatile substance in a liquid is proportional to the partial pressure (P) of the substance over the liquid: OR Gases are able to be dissolved in solvent just like solids and liquids. Henry's law says that gases that don't react with the solute are able to dissolve an amount relative to the partial pressure of the gas over the solution. So, if you have oxygen above water, some oxygen will dissolve in the water. As you increase the pressure, more gas will be able to dissolve in the water. OR The amount of gas dissolved in a solution is directly proportional to the pressure of the gas above the solution.

**heparan sulfate glycosaminoglycan mimetic M402:** A low molecular weight heparin derivative and heparan sulfate proteoglycan (HSPG) mimetic with no or minimal anticoagulant activity and potential antineoplastic activities. Upon administration, M402 mimics HSPGs by binding to and inhibiting various heparin-binding growth factors, chemokines, and cytokines such as VEGF, HGF, FGF2, SDF-1a, heparanase and P-selectin all of which are essential for tumor angiogenesis and metastasis to occur. This inhibits heparin binding growth factor-mediated signaling and disrupts tumor-stromal interactions eventually leading to an inhibition of angiogenesis and tumor cell progression. In addition, M402 may enhance the cytotoxic effect of other chemotherapeutic agents.

**heparan sulfate glycosaminoglycan mimetic nanopolymer mouthwash:** A nanopolymer-based mouthwash formulation containing a mimetic of the glycosaminoglycan (GAG) heparan sulfate, with potential anti-mucositic and protective activities. Upon rinsing with the mouthwash, GAGs bind to heparan sulfate binding sites on macromolecules within the extracellular matrix (EMC), which prevents the destruction of the ECM and protects both growth factors and cytokines from being degraded. By replacing the GAGs damaged by chemotherapy and/or radiation, this mouthwash may

protect healthy tissue against the cytotoxic effects of chemotherapy and radiation and may prevent against radiotherapy- and chemotherapy-induced mucositis.

**heparin:** A sulfur-rich glycosaminoglycan with anticoagulant property. Heparin binds to antithrombin III to form a heparin-antithrombin III complex. The complex binds to and irreversibly inactivates thrombin and other activated clotting factors, such as factors IX, X, XI, and XII, thereby preventing the polymerization of fibrinogen to fibrin and the subsequent formation of clots. or A substance that slows the formation of blood clots. Heparin is made by the liver, lungs, and other tissues in the body and can also made in the laboratory. Heparin may be injected into muscle or blood to prevent or break up blood clots. It is a type of anticoagulant.

**hepatectomy :** Surgery to remove all or part of the liver.

**hepatic :** Refers to the liver.

**hepatic arterial infusion :** A procedure to deliver chemotherapy directly to the liver. Catheters are put into an artery in the groin that leads directly to the liver, and drugs are given through the catheters.

**hepatic arterial occlusion :** A block in blood flow to the liver. It can happen while giving chemotherapy through a catheter in the hepatic artery. Sometimes doctors use drugs or other agents to cause hepatic arterial occlusion on purpose. This block of blood flow to the liver helps kill cancer cells growing in the liver.

**hepatic artery :** The major blood vessel that carries blood to the liver.

**hepatic portal vein :** A blood vessel that carries blood to the liver from the intestines, spleen, pancreas, and gallbladder. Also called portal vein.

**hepatic veno-occlusive disease :** A condition in which some of the veins in the liver are blocked. This causes a decrease in blood flow inside the liver and may lead to liver damage. Signs and symptoms include weight gain, yellowing of the skin and whites of the eyes, dark-colored urine, and increased liver size. It may occur at some point in time after radiation therapy to the liver and bile ducts or after high-dose anticancer drugs were given before a stem cell transplant. Also called sinusoidal obstruction syndrome.

**hepatitis :** Disease of the liver causing inflammation. Symptoms include an enlarged liver, fever, nausea, vomiting, abdominal pain, and dark urine.

**hepatitis A vaccine:** An inactivated virus vaccine that provides active immunization against hepatitis A virus (HAV). Immunization with hepatitis A vaccine induces the formation of anti-HAV antibodies which provide protection against hepatitis A infection. Or A vaccine used to prevent infection with the hepatitis A virus, which causes a serious liver disease. The vaccine is made of a weakened form of the virus that cannot cause disease but causes the body's immune system to make antibodies that destroy the hepatitis A virus.

**hepatitis A virus :** A virus that causes a serious liver disease. It is usually spread by contact with an infected person's stool by eating food he or she has handled after not washing hands, but it can be spread in other ways. Symptoms of infection include jaundice, dark urine, and fever and other flu-like symptoms.

**hepatitis B vaccine (recombinant):** A non-infectious mixture containing recombinant hepatitis B surface antigen (HBsAg) in a liquid vehicle. Immunization with the hepatitis B vaccine induces the formation of specific anti-hepatitis B antibodies and an active immunity against hepatitis B infection. Check for active clinical trials using this agent.

**hepatitis B virus :** A virus that causes hepatitis (inflammation of the liver). It is carried and passed to others through the blood and other body fluids. Different ways the virus is spread include sharing needles with an infected person and being stuck accidentally by a needle contaminated with the virus. Infants born to infected mothers may also become infected with the virus. Although many patients who are infected with hepatitis B virus may not have symptoms, long-term infection may lead to cirrhosis (scarring of the liver) and liver cancer. Also called HBV.

**hepatitis C immune globulin intravenous:** A human plasma-derived, polyclonal, intravenous immunoglobulin G (IgG) formulation containing high levels of antibodies against hepatitis C virus (HCV), a small, enveloped, single-stranded RNA virus belonging to the Flaviviridae family, with potential immunomodulating and antiviral activities. The hepatitis C IgG is isolated from donors expressing high amounts of HCV antibodies. Upon intravenous administration, the anti-HCV antibodies bind to the virus and provide passive immunization against HCV. This may prevent both infection by HCV in immunocompromised patients and hepatitis C-related

liver disease. The polyclonal anti-HCV antibodies are able to target various viral epitopes.

**hepatitis C virus :** A virus that causes hepatitis (inflammation of the liver). It is carried and passed to others through the blood and other body fluids. Different ways the virus is spread include sharing needles with an infected person and being stuck accidentally by a needle contaminated with the virus. Infants born to infected mothers may also become infected with the virus. Although patients who are infected with hepatitis C virus may not have symptoms, long-term infection may lead to cirrhosis (scarring of the liver) and liver cancer. These patients may also have an increased risk for certain types of non-Hodgkin lymphoma. Also called HCV.

**hepatitis D virus :** A type of hepatitis virus that may be present in the body at the same time as the hepatitis B virus. It makes the hepatitis (inflammation of the liver) caused by hepatitis B much worse. The hepatitis D virus and the hepatitis B virus are spread to others through blood or sexual contact. Infants born to infected mothers may also become infected with the virus. Also called hepatitis delta virus.

**hepatitis delta virus :** A type of hepatitis virus that may be present in the body at the same time as the hepatitis B virus. It makes the hepatitis (inflammation of the liver) caused by hepatitis B much worse. The hepatitis delta virus and the hepatitis B virus are spread to others through blood or sexual contact. Infants born to infected mothers may also become infected with the virus. Also called hepatitis D virus.

**hepatitis E virus :** A virus that causes hepatitis (inflammation of the liver). It is usually spread through food that has been handled by an infected person, or through drinking water that is contaminated with human waste.

**hepatitis G virus :** A virus that may be found in patients with hepatitis (inflammation of the liver). It is spread to others through blood or sexual contact. Infants born to infected mothers may also become infected with the virus.

**hepatobiliary :** Having to do with the liver, bile ducts, and/or gallbladder.

**hepatoblastoma :** A type of liver tumor that occurs in infants and children.

**hepatocellular carcinoma :** A type of adenocarcinoma and the most common type of liver tumor.

**hepatocyte:** The major cell type of liver tissue. OR A liver cell.

**hepatoma** : A liver tumor.

**hepatomegaly** : Enlarged liver.

**hepatotoxic**: The adjective applied to anything which is harmful to the liver.

**Hepsera**: (Other name for: adefovir dipivoxil)

**hepsulfam**: A bisulfamic ester which is similar in structure to busulfan and belongs to the family of drugs known as alkylsulfonate alkylating agents. Hepsulfam forms covalent linkages with nucleophilic centers in DNA, resulting in depurination, base miscoding, strand scission, DNA-DNA and DNA-protein cross-linking, and cytotoxicity. Check for active clinical trials using this agent.

**heptagon**: a plane closed figure with seven sides and seven angles.

**Heptoses**: Monosaccharides that have seven carbon atoms.

**HER-2-neu, CEA peptides, GM-CSF, Montanide ISA-51 vaccine**: A vaccine comprised of HER-2-neu and carcinoembryonic antigen synthetic (CEA) peptides, combined with the adjuvants granulocyte-macrophage colony stimulating factor (GM-CSF), and Montanide ISA-51 with potential antineoplastic activity. HER-2-neu, CEA peptides, GM-CSF, Montanide ISA-51 vaccine may stimulate a cytotoxic T-cell response against HER-2-neu- and CEA-expressing tumor cells. The GM-CSF adjuvant stimulates the proliferation of monocytes and monocyte differentiation into macrophages and dendritic cells, immunohematopoietic elements with important antitumoral functions. Montanide ISA-51, also known as incomplete Freund's adjuvant or IFA, is a stabilized water-in-oil emulsion adjuvant containing mineral oil with mannide oleate added as a surfactant that non-specifically stimulates cell-mediated immune responses to antigens.

**HER-2-positive B-cell peptide antigen IMU-131**: A cancer vaccine consisting of a fusion peptide, composed of three peptides derived from the extracellular domain (ECD) of the HER2 peptide antigen found on B-cells (P4, P6 and P7; P467), conjugated to the carrier protein DT-CRM197, a non-toxic, mutated form of diphtheria toxin (DT), and combined with the immunoadjuvant montanide ISA 51, with potential immunostimulatory and antineoplastic activities. Upon administration, IMU-131 vaccine induces the production of polyclonal antibodies against the HER2 protein. In turn, the

antibodies bind to three separate binding sites on HER2 expressed on tumor cells and inhibit HER2 dimerization and activity, resulting in the inhibition of HER2-mediated signal transduction pathways. This induces apoptosis in and reduces cellular proliferation of HER2-overexpressing tumor cells. In addition, IMU-131 induces a cytotoxic T-lymphocyte (CTL) response against the HER2-expressing tumor cells. The tumor-associated antigen (TAA) HER2, also called Neu or ErbB2, is a tyrosine kinase receptor for epidermal growth factor (EGF) and is often overexpressed by a variety of tumor cell types. Montanide ISA 51, also known as incomplete Freund's adjuvant or IFA, is a stabilized water-in-oil (w/o) emulsion adjuvant containing mineral oil with mannide oleate added as a surfactant that non-specifically stimulates cell-mediated immune responses to antigens. DT-CRM197 is used to increase the immunogenicity of the HER2/neu peptide antigen. In P467, the three B-cell epitopes were combined in a specific order into a single 49 amino acid peptide antigen. Check for active clinical trials using this agent.

**HER-2/neu intracellular domain protein:** The cytoplasmic domain or intracellular domain (ICD) of the HER2/neu protein that exhibits tyrosine kinase activity. Based on sensitization theory, co-administration of trastuzumab (anti-HER-2/neu monoclonal antibody) and HER-2/neu intracellular domain protein may result in the potentiation of a HER2/neu-specific cytotoxic T lymphocyte (CTL) response against tumor cells overexpressing the HER2/neu protein. HER-2/neu protein, a glycoprotein cell surface receptor that is composed of an extracellular domain (ECD), a transmembrane domain, and an ICD, is overexpressed by many adenocarcinomas including breast adenocarcinoma.

**HER-2/neu peptide vaccine:** A cancer vaccine comprised of peptides derived from the extracellular domain of the tumor-associated antigen Her-2/neu with potential antineoplastic activity. HER-2/neu peptide vaccine may induce antibodies with anti-tumor activity and may also elicit a specific CD8 T-cell response against specific tumor cell types. Check for active clinical trials using this agent.

**HER1 :** The protein found on the surface of some cells and to which epidermal growth factor binds, causing the cells to divide. It is found at abnormally high levels on the surface of many types of cancer cells, so

these cells may divide excessively in the presence of epidermal growth factor. Also called EGFR, epidermal growth factor receptor, and ErbB1.

**HER2 ECD+TM virus-like replicon particles vaccine AVX901:** A cancer vaccine based on virus-like replicon particles (VRP) packaged with an alphaviral vector encoding the extracellular domain (ECD) and transmembrane (TM) regions of the human epidermal growth factor receptor 2 (EGFR2, NEU or HER2), with potential antineoplastic activity. After immunization with HER2 ECD+TM virus-like replicon particles vaccine AVX901, the VRPs infect cells and express HER2 ECD+TM protein that may activate the immune system to elicit a cytotoxic T-lymphocyte (CTL) response against HER2-expressing tumor cells. The alphaviral replicon of this vaccine is an attenuated strain of the Venezuelan equine encephalitis virus (VEEV) in which 3 of the 7 viral genes were substituted with a truncated HER2 gene to create a self-amplifying replicon RNA. HER2, a tyrosine kinase involved in several cell growth signaling pathways, is dysregulated or overexpressed in a wide variety of cancer cell types. Check for active clinical trials using this agent.

**HER2 negative :** Describes cancer cells that do not have a large amount of a protein called HER2 on their surface. In normal cells, HER2 helps to control cell growth. Cancer cells that are HER2 negative may grow more slowly and are less likely to recur (come back) or spread to other parts of the body than cancer cells that have a large amount of HER2 on their surface. Checking for the amount of HER2 on some types of cancer cells may help plan treatment. These cancers include breast, bladder, ovarian, pancreatic, and stomach cancers. Also called human epidermal growth factor receptor 2 negative.

**HER2 positive :** Describes cancer cells that have too much of a protein called HER2 on their surface. In normal cells, HER2 helps to control cell growth. When it is made in larger than normal amounts by cancer cells, the cells may grow more quickly and be more likely to spread to other parts of the body. Checking to see if a cancer is HER2 positive may help plan treatment, which may include drugs that kill HER2 positive cancer cells. Cancers that may be HER2 positive include breast, bladder, pancreatic, ovarian, and stomach cancers. Also called c-erbB-2 positive and human epidermal growth factor receptor 2 positive.

**HER2 test:** A laboratory test that measures the amount of HER2 protein on cancer cells or how many copies of the HER2 gene are in the DNA. The HER2 protein is involved in normal cell growth. It may be made in larger than normal amounts by some types of cancer, including breast, ovarian, bladder, pancreatic, and stomach cancer. This may cause cancer cells to grow more quickly and spread to other parts of the body. A HER2 test may be done to help plan treatment. It is a type of tumor marker test. Also called HER2/neu test and human epidermal growth factor receptor 2 test.

**HER2-pulsed type-1 polarized autologous dendritic cell vaccine:** A dendritic cell (DC)-based cancer vaccine composed of autologous, type-1 polarized dendritic cells (DCs) pulsed with human leukocyte antigen (HLA)-A2-restricted HER-2-derived peptides, with potential immunomodulatory and antineoplastic activities. Autologous DCs were treated with GM-CSF, interleukin-4, interferon-gamma and bacterial lipopolysaccharide (LPS), a toll-like receptor type 4 agonist, to produce highly polarized DCs (alphaDC1) that are capable of producing high levels of interleukin-12p70 (IL-12p70). Upon administration, HER2-pulsed autologous DC vaccine may stimulate a potent cytotoxic T-lymphocyte (CTL) response against HER-2-positive tumor cells, which may result in tumor cell death and decreased tumor growth. HER-2, a tyrosine kinase receptor for epidermal growth factor (EGF) (also known as neu and ErbB2), is overexpressed by a variety of cancers.

**HER2-targeted liposomal doxorubicin hydrochloride MM-302:** An antibody-targeted lipidic nano-carrier containing the antineoplastic anthracycline antibiotic doxorubicin encapsulated within liposomes, and conjugated to a monoclonal antibody against the human epidermal growth factor receptor 2 (HER2), with potential antitumor activity. Upon administration of HER2-targeted liposomal doxorubicin hydrochloride MM-302, the immunoliposome allows for specific delivery of doxorubicin to tumors overexpressing the HER2 receptor. Once inside the HER2-expressing tumor cells, doxorubicin intercalates into DNA and interferes with topoisomerase II activity, thereby inhibiting DNA replication and RNA synthesis. Compared to doxorubicin alone or liposomal doxorubicin, targeted liposomal delivery of doxorubicin improves efficacy while lowering the toxicity profile. HER2, a tyrosine kinase receptor, is overexpressed in many cancer cell types. Check for active clinical trials using this agent.

**HER2-targeting antibody Fc fragment FS102:** A proprietary, antibody fragment composed of a constant (Fc) region that is engineered to bind to the tumor-associated antigen human epidermal growth factor receptor-2 (HER2), with potential antineoplastic activity. HER2-targeted antibody Fc fragment FS102 specifically binds to its HER2 epitope, and causes downregulation of HER2-mediated signaling. This leads to tumor cell apoptosis. HER2, a member of the receptor tyrosine kinase (RTK) epidermal growth factor receptor (EGFR) superfamily, is overexpressed on the cell surface of various solid tumors.

**HER2/neu :** A protein involved in normal cell growth. It is found on some types of cancer cells, including breast and ovarian. Cancer cells removed from the body may be tested for the presence of HER2/neu to help decide the best type of treatment. HER2/neu is a type of receptor tyrosine kinase. Also called c-erbB-2, human EGF receptor 2, and human epidermal growth factor receptor 2.

**HER2/neu test:** A laboratory test that measures the amount of HER2/neu protein on cancer cells or how many copies of the HER2 gene are in the DNA. The HER2/neu protein is involved in normal cell growth. It may be made in larger than normal amounts by some types of cancer, including breast, ovarian, bladder, pancreatic, and stomach cancer. This may cause cancer cells to grow more quickly and spread to other parts of the body. A HER2/neu test may be done to help plan treatment. It is a type of tumor marker test. Also called HER2 test and human epidermal growth factor receptor 2 test.

**HER2Bi-armed activated T cells:** Activated T cells (ATC) that have been coated with bispecific antibodies (BiAb), with potential antineoplastic and immunomodulating activities. In vitro, T cells are activated through exposure to the anti-CD3 murine monoclonal antibody OKT3 and interleukin 2 for 14 days and then armed with anti-CD3 × anti-Her2 bispecific antibody (Her2Bi). Upon administration, HER2Bi-armed activated T cells attach to CD3-expressing T cells and HER2/neu-expressing tumor cells, selectively cross-linking T cells and tumor cells; this may result in the recruitment and activation of cytotoxic T lymphocytes (CTLs), CTL perforin-mediated tumor cell cytolysis, and the secretion of antitumor cytokines and chemokines.

**herba scutellaria barbata:** A Chinese herb isolated from the plant *Scutellaria barbata* D. Don (Lamiaceae) with potential antineoplastic activity. Containing the antioxidant flavone scutellarin, herba *Scutellaria barbata* has been shown to induce apoptosis of ovarian and breast tumor cells in vitro.

**herba *Scutellaria barbatae* :** An herb used in traditional Chinese medicine to treat certain medical problems. It may have anticancer effects.

**herbal :** Having to do with plants.

**herbal cigarette :** A type of cigarette that contains a mixture of flowers, herbs, and other natural ingredients. Herbal cigarettes do not contain tobacco or nicotine. When they are smoked, they make many of the same harmful chemicals found in tobacco smoke, including tar and carbon monoxide.

**herbal medicine :** A type of medicine that uses roots, stems, leaves, flowers, or seeds of plants to improve health, prevent disease, and treat illness.

**herbal polysaccharide saliva substitute:** A plant-based, proprietary formulation of saliva substitute with potential anti-xerostomia activity. Extracted from the plant called yerba santa (holy herb), herbal polysaccharide saliva substitute contains plant mucins, which is nearly identical to that of human mucous membranes. Upon direct application using the polysaccharide-containing spray, a protective film of moisture is deposited over the mucous membranes of the mouth and throat. The xylitol in this preparation protects against the formation of harmful oral flora and thus helps to prevent cavities. Moreover, this agent has shown a demineralization effect on dentin.

**herbal supplement :** A product made from a plant that is thought to be useful in treating disease or staying healthy. Herbal supplements are taken by mouth.

**herbicide:** The descriptor applied to a chemical used to kill plants. See pesticide.

**herbicide :** A chemical that kills plants.

**herbivore:** An animal that feeds on plants.

**herbivores:** animals that eat plants.

**Herceptin** : A drug used to treat breast cancer that is HER2-positive (expresses the human epidermal growth factor receptor 2). It is also used with other drugs to treat HER2-positive stomach cancer that has not already been treated and has spread to other parts of the body. It is being studied in the treatment of other types of cancer. Herceptin binds to HER2 on the surface of HER2-positive cancer cells, and may kill them. It is a type of monoclonal antibody. Also called trastuzumab.

**hereditary** : In medicine, describes the passing of genetic information from parent to child through the genes in sperm and egg cells. Also called inherited.

**hereditary breast and ovarian cancer syndrome** : An inherited disorder in which the risk of breast cancer (especially before the age of 50) and ovarian cancer is higher than normal. Most cases of hereditary breast and ovarian cancer syndrome are caused by certain mutations (changes) in the BRCA1 or the BRCA2 gene. People with hereditary breast and ovarian cancer syndrome may also have an increased risk of other types of cancer, including pancreatic cancer, prostate cancer, and melanoma. Also called HBOC syndrome.

**hereditary cancer syndrome** : A type of inherited disorder in which there is a higher-than-normal risk of certain types of cancer. Hereditary cancer syndromes are caused by mutations (changes) in certain genes passed from parents to children. In a hereditary cancer syndrome, certain patterns of cancer may be seen within families. These patterns include having several close family members (such as a mother, daughter, and sister) with the same type of cancer, developing cancer at an early age, or having two or more types of cancer develop in the same person. Examples of hereditary cancer syndromes are hereditary breast and ovarian cancer syndrome, Li-Fraumeni syndrome, Cowden syndrome, and Lynch syndrome. Also called inherited cancer syndrome.

**hereditary leiomyomatosis and renal cell cancer syndrome** : A rare inherited disorder that increases the risk of developing benign (not cancer) tumors of the skin and the uterus (leiomyomas) and malignant (cancer) tumors of the uterus (leiomyosarcoma) and the kidney. Also called HLRCC.

**hereditary mutation** : A gene change in a body's reproductive cell (egg or sperm) that becomes incorporated into the DNA of every cell in the body of

the offspring. Hereditary mutations are passed on from parents to offspring. Also called germline mutation.

**hereditary nonpolyposis colon cancer :** An inherited disorder in which affected individuals have a higher-than-normal chance of developing colorectal cancer and certain other types of cancer, often before the age of 50. Also called HNPCC and Lynch syndrome.

**Hereditary nonpolyposis colorectal cancer (HPCC):** A common form of hereditary colon cancer due to defective correction of DNA mismatches. Also called Lynch syndrome.

**hereditary paraganglioma-pheochromocytoma syndrome :** A rare, genetic disorder marked by tumors called paragangliomas, which are found in paraganglia. Paraganglia are groups of nerve-like cells found near the adrenal glands and near blood vessels or nerves in the head, neck, chest, abdomen, and pelvis. Paragangliomas that form in the adrenal glands are called pheochromocytomas. Paragangliomas are usually benign (not cancer), but sometimes become malignant (cancerous). People with hereditary paraganglioma-pheochromocytoma syndrome usually have more than one paraganglioma, and may have an increased risk of certain types of cancer, such as kidney cancer and thyroid cancer.

**heritability :** The proportion of variation in a population trait that can be attributed to inherited genetic factors. Heritability estimates range from 0 to 1 and are often expressed as a percentage. A number close to 1 may be indicative of a highly heritable trait within a population. It should not be used to estimate risk on an individual basis. or In medicine, describes a characteristic or trait that can be passed from a parent to a child through the genes. Several types of cancer have heritable forms, in which the risk of developing a particular type of cancer is inherited from a parent. Some signs of heritable cancer are a family history of the cancer, mutations (changes) in certain genes passed from a parent to a child, or a mutation that occurs at the time of conception (fertilization of an egg by a sperm). Heritable forms of cancer often develop at an early age.

**heritage :** Something handed down from the past, such as a tradition, birthright, or inherited traits.

**Hermetic seal:** a seal that will exclude air and will be gas tight at normal temperatures and atmospheric pressures.

**hernia** : The bulging of an internal organ through a weak area or tear in the muscle or other tissue that holds it in place. Most hernias occur in the abdomen.

**heroin** : A substance made from morphine. Heroin is very addictive, and it is illegal to use or sell it in the United States. It may be used outside the United States to treat severe pain. Heroin binds to opioid receptors in the central nervous system. It is a type of analgesic agent and a type of opiate. Also called diacetylmorphine hydrochloride and diamorphine hydrochloride.

**herpes simplex virus** : A type of virus that causes herpes infections and has DNA as its genetic material. There are two types of herpes simplex viruses. Infections with type 1 viruses cause cold sores on the lips or nostrils. Infections with type 2 viruses cause sores on the genitals (external and internal sex organs and glands). Also called HHV, HSV, and human herpesvirus.

**herpes zoster vaccine GSK1437173A**: A recombinant, subunit herpes zoster (HZ) vaccine containing varicella-zoster virus (VZV) glycoprotein E (gE), that can potentially be used to prevent HZ infection, also called shingles. Upon administration, HZ vaccine GSK1437173A stimulates the host immune system to induce both specific CD4-positive T-cells and antibodies against VZV gE, thereby protecting against infection with HZ. VZV gE, the most common antigen in VZV viral particles, plays a key role in VZV infection. Compared to live-attenuated vaccines, the subunit vaccine prevents the risk of vaccine-induced HZ in immunocompromised patients.

**herpesvirus** : A member of the herpes family of viruses.

**Herplex**: (Other name for: idoxuridine)

**Herringbone** : Arrangement of support rails in which rails are arranged in a "V-shape" pattern. Tip of "v" points in direction of belt travel. This arrangement provides even distribution of wear across belt width, and aids to keep the belt centered in its path.

**herringbone cross-bedding**: a distinctive pattern of alternating cross-bedding directions that is reflective of a rhythmic, high-energy environment, such as a tidal zone.

**Hers disease:** A disease resulting from a lack of liver glycogen phosphorylase; glycogen is present in increased amounts with mild clinical effects.

**hertz:** a measure of a wave's frequency. A hertz equals the number of waves that passes a specific point per second.

**hertz (Hz):** in electrical/electronic applications with alternating current, a unit of frequency where 1 Hz equals one cycle per second.

**Hertz-1:** The SI unit of frequency, equal to one cycle of the wave per second (s<sup>-1</sup>).

**Hesitation effect :** occurs in parts of varied thicknesses. The flow moves preferentially into a thicker area causing an adjacent thin area to freeze off while the thicker area fills. Gates should be positioned as far as possible from where the flow divides into thick and thin flow paths.

**Hess's law:** The heat released or absorbed by a process is the same no matter how many steps the process takes. For example, given a reaction A → B, Hess's law says that H for the reaction is the same whether the reaction is written as A → C → B or as A → B. This is the same as writing that  $H(A \rightarrow B) = H(A \rightarrow C) + H(C \rightarrow B)$ .

**hetastarch:** A synthetic, nonionic hydroxyethyl derivative of starch used as a plasma expander when prepared in an isotonic solution. Upon intravenous administration, hydroxyethyl starch colloid increases blood volume and thus improves circulation. This agent is almost exclusively excreted by the kidneys and is potentially nephrotoxic. Check for active clinical trials using this agent.

**hetero atom:** in organic chemistry, an atom other than carbon.

**Heteroatom:** In terms of organic compounds, heteroatoms are any atoms that are not carbon or hydrogen.

**Heterochromatin:** Highly condensed regions of chromosomes that are not usually transcriptionally active.

**heterocycle:** A compound containing at least one ring that consists of both carbon and non-carbon atoms .

**Heterocycle:** Cyclic organic compounds that contain at least two different elements in the ring system.

**heterocyclic:** An organic group or molecule containing rings with at least one noncarbon atom on the ring.

**heterocyclic amine :** A chemical that is formed when meat, poultry, or fish is cooked at high temperatures, such as frying, broiling, and barbecuing. Heterocyclic amines are carcinogens (substances that may cause cancer). Also called HCA.

**heterocyclic compound:** a class of cyclic compounds in which one of the ring atoms is not carbon; epoxyethane, for example.

**heterodimeric interleukin-15:** A fusion protein complex composed of heterodimeric IL-15 (hetIL-15), which consists of a synthetic form of the endogenous cytokine interleukin-15 chain (IL-15) complexed to the soluble IL-15 binding protein IL-15 receptor alpha chain (IL-15Ra) (IL15:sIL-15Ra), with potential immunomodulatory, anti-infective and antineoplastic activities. Upon administration, hetIL-15 binds to the IL-2/IL-15 receptor beta-common gamma chain (IL-2Rbeta-gamma) receptor on natural killer (NK) and T-lymphocytes, which activates and increases the levels of NK cells and CD8+ and CD4+ T cells. The T cells enhance the secretion of the cytokine interferon-gamma (IFN-g), which further potentiates the immune response against tumor cells. Altogether, this enhances tumor cell killing and decreases tumor cell proliferation. By coupling IL-15 to IL15Ra, this agent has an improved pharmacokinetic profile, shows an increased ability to bind IL-2Rbeta-gamma, and shows increased immunostimulatory activity as compared to IL-15 alone.

**Heteroduplex:** An annealed duplex structure between two DNA strands that do not show perfect complementarity. Can arise by mutation, recombination, or the annealing of complementary single-stranded DNAs.

**heteroduplex analysis :** A method of detecting sequence differences between normal DNA and the DNA to be tested. It is commonly used as a screening method to detect potential mutations in a gene.

**heteroduplex DNA:** Duplex DNA containing complementary strands derived

**heterogeneity logarithm of the odds score :** A statistical estimate of whether two genetic loci are physically near enough to each other (or “linked”) on a particular chromosome that they are likely to be inherited together. A heterogeneity logarithm of the odds score is calculated in the presence of locus heterogeneity (when the same phenotype can be caused by mutations in genes at different chromosomal loci). Also called HLOD score.

**heterogeneous:** Describes a material or substance or chemical reaction which is not the same throughout in its properties, composition, or state of matter.

**HETEROGENEOUS:** materials are not uniform throughout. OR A sample of matter consisting of more than one pure substance and more than one phase. Blood, protoplasm, milk, chocolate, smoke, and chicken soup are examples of heterogeneous mixtures.

**heterogeneous :** Made up of elements or ingredients that are not alike.

**heterogenic :** Derived from a different source or species. Also called heterogenous.

**heterogenic bond formation:** a type of bond formed by the overlap of orbitals on adjacent atoms. One orbital of the pair donates both of the electrons to the bond.

**heterogenous :** Derived from a different source or species. Also called heterogenic.

**heterogenous mixture:** A common misspelling of heterogeneous.

**heterolytic cleavage:** the fracture of a bond in such a manner that one of the atoms receives both electrons. In reactions, this asymmetrical bond rupture generates carbocation and carbanion mechanism.

**Heteropolymer:** A polymer containing more than one type of monomeric unit.

**Heterotroph:** A microorganism which uses organic matter for energy and growth. OR An organism that requires preformed organic compounds for growth. OR An organism that requires complex nutrient molecules, such as glucose, as a source of energy and carbon.

**heterotrophic:** species that acquire food from organic matter.

**Heterotrophs:** Organisms that obtain energy from chemical fuels only and that are ultimately dependent on autotrophs for fuel.

**heterotrophs:** Organisms that break down and use organic matter.

**Heterotropic effects:** The effects of nonsubstrate molecules on allosteric enzymes. OR An allosteric enzyme requiring a modulator other than its substrate.

**heterozygous:** two different alleles that are present for a particular characteristic. OR Describing an organism (a heterozygote) that carries two

different alleles for a given gene.

**heterozygous genotype :** Occurs when the two alleles at a particular gene locus are different. A heterozygous genotype may include one normal allele and one mutation, or two different mutations. The latter is called a compound heterozygote.

**Hexa-:** A prefix meaning six

**Hexa-Betalin:** (Other name for: pyridoxine hydrochloride)

**hexagon:** a plane closed figure with six sides and six angles.

**Hexagonal Crystal:** This crystal shape has six sides and no specific length. It looks like an elongated hexagon. OR A crystal class containing one six-fold rotation axis. This class contains 27 space groups and has three restrictions: 1) the lengths of the a and b axes are equal, 2) the a and b angles are equal to  $90^\circ$ , and 3) the c angle is equal to  $120^\circ$ .

**Hexalen:** (Other name for: altretamine)

**hexamethylene bisacetamide:** A hybrid polar-planar compound with potential antineoplastic activity that induces terminal differentiation, inhibits cell growth, and causes apoptosis in several tumor cell lines. Its precise mechanism of action is unknown.

**Hexamethylene diamine or 1,6-diaminohexane (HMDA):**

Hexamethylene diamine or 1,6-diaminohexane (HDMA) is produced by catalytic hydrogenation of adiponitrile. The majority of HMDA is reacted with adipic acid to produce nylon 6,6 in a two-step process.

**hexamethylmelamine:** (Other name for: altretamine)

**hexaminolevulinate:** The hexyl ester of 5-aminolevulinic acid (ALA) with photodynamic properties. As a precursor of photoactive porphyrins, hexaminolevulinate induces the endogenous production of the photosensitizer protoporphyrin IX (PPIX) which accumulates selectively in tumor tissue. When exposed to specific wavelengths of light, PPIX is activated and, depending on the wavelength and/or intensity of light, either fluoresces, thereby allowing tumor imaging, or induces tumor cell apoptosis.

**hexaminolevulinate hydrochloride:** The hydrochloride salt form of hexaminolevulinate, a hexyl ester of the heme precursor 5-aminolevulinic acid (ALA) with potential photosensitizing activity. Hexaminolevulinate serves as a precursor of photoactive porphyrins (PAPs), particularly

protoporphyrin IX (PpIX), which selectively accumulate in rapidly proliferating cells, such as those seen in tumor tissue. When exposed to blue light, PpIX is activated and emit red light thereby allowing tumor imaging.

**Hexene:** Used as a monomer in the formation of polymers, usually LLDPE resin.

**Hexokinase:** A kinase that phosphorylates six-carbon sugars, usually glucose, at the expense of ATP.

**hexose:** A simple sugar with a backbone containing six carbon atoms.

**high-energy compound:** A compound that on hydrolysis undergoes a large decrease in free energy under standard conditions. OR Monosaccharides that have six carbons.

**Hexose:** A sugar with a six-carbon backbone.

**Hextend:** (Other name for: hetastarch)

**hexyl 5-aminolevulinate :** A substance that is used to find and kill tumor cells. It enters tumor cells and becomes activated when exposed to a special type of light. A chemical reaction causes the cells to produce fluorescent light and die.

**HF:** Hartree-Fock. In the Gaussian programs, HF denotes RHF for closed-shell molecules and UHF for open-shell.

**HFS:** Hartree-Fock Slater. An older DFT method involving only local, Slater-style exchange. Often synonymous with the X alpha method.

**HGS-ETR1:** A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL R1 on the surface of some tumor cells. This may kill the tumor cells. HGS-ETR1 is a type of monoclonal antibody. Also called anti-TRAIL R1-mAb and mapatumumab.

**HGS-ETR2:** A substance being studied in the treatment of some types of cancer. It binds to a protein called TRAIL-R2 on the surface of some tumor cells, which may kill the tumor cells. HGS-ETR2 is a type of monoclonal antibody. Also called anti-TRAIL R2 mAb HGS-ETR2 and lexatumumab.

**HHV:** A type of virus that causes herpes infections and has DNA as its genetic material. There are two types of HHVs. Infections with type 1 viruses cause cold sores on the lips or nostrils. Infections with type 2 viruses cause sores on the genitals (external and internal sex organs and glands). Also called herpes simplex virus, HSV, and human herpesvirus.

**HHV8:** A type of virus that causes Kaposi sarcoma (a rare cancer in which lesions grow in the skin, lymph nodes, lining of the mouth, nose, and throat, and other tissues of the body). HHV8 also causes certain types of lymphoma (cancer that begins in cells of the immune system). Also called human herpesvirus 8, Kaposi sarcoma-associated herpesvirus, and KSHV.

**HibTITER:** (Other name for: Haemophilus influenzae b vaccine)

**Hiding power:** The ability of paint to hide or obscure a surface colour of stain over which it has been uniformly applied. Hiding power is provided by the paint's pigment OR The ability of a paint to hide the previous surface or color.

**HIF-1alpha inhibitor PX-478:** An orally active small molecule with potential antineoplastic activity. Although its mechanism of action has yet to be fully elucidated, HIF1-alpha inhibitor PX-478 appears to inhibit hypoxia-inducible factor 1-alpha (HIF1A) expression, which may result in decreased expression of HIF1A downstream target genes important to tumor growth and survival, a reduction in tumor cell proliferation, and the induction of tumor cell apoptosis. The inhibitory effect of this agent is independent of the tumor suppressor genes VHL and p53 and may be related to derangements in glucose uptake and metabolism due to inhibition of glucose transporter-1 (Glut-1).

**HIF-2alpha inhibitor PT2385:** An orally active, small molecule inhibitor of hypoxia inducible factor (HIF)-2alpha, with potential antineoplastic activity. Upon oral administration, HIF-2alpha inhibitor PT2385 allosterically binds to HIF-2alpha, thereby preventing HIF-2alpha heterodimerization and its subsequent binding to DNA. This results in decreased transcription and expression of HIF-2alpha downstream target genes, many of which regulate tumor cell growth and survival. Blocking HIF-2alpha reduces the proliferation of HIF-2alpha-expressing tumor cells. HIF-2alpha, a heterodimeric transcription factor overexpressed in many cancers, promotes tumorigenesis.

**HIFU:** A procedure in which high-energy sound waves are aimed directly at an area of abnormal cells or tissue in the body. The waves create heat that kills the cells. HIFU is being studied in the treatment of prostate cancer and some other types of cancer and other diseases. Also called high-intensity focused ultrasound therapy.

**high blood pressure :** A blood pressure of 140/90 or higher. High blood pressure usually has no symptoms. It can harm the arteries and cause an increase in the risk of stroke, heart attack, kidney failure, and blindness. Also called hypertension.

**high blood sugar :** Higher than normal amount of glucose (a type of sugar) in the blood. High blood sugar can be a sign of diabetes or other conditions. Also called hyperglycemia.

**High Conservation Value Forest (HCVF):** A term that is designed to describe forest and ecosystem areas that are “set aside” and restricted from commercial development or deforestation, based on its biodiversity or socioeconomic factors.

**HIGH DENSITY POLYETHYLENE:** This term is generally considered to include polyethylenes ranging in density from about 0.940 to 0.960 and over. Whereas the molecules in low density polyethylene are branched in random fashion, those in the higher density polyethylenes have fewer side branches, resulting in more rigid material with greater strength, hardness, chemical resistance, and higher softening temperature.

**High Density Polyethylene (HDPE):** High density polyethylene (HDPE) is the name given to the densest member of the polyethylene family. HDPE is more rigid and opaque than the other polyethylenes and is used in many packaging and container applications which benefit from its strength and high temperature resistance. HDPE goods are commonly marked with a 2 following the recycling codes developed by the American Society of the Plastics Industry. HDPE was initially produced by low pressure reaction of ethylene monomers with specialized Ziegler-Natta catalysts in slurry reactors. More recently production has also been obtained by low pressure gas phase HDPE/LLDPE swing plants. OR Polyethylene resin with a density over .940 gm/cc.

**high grade :** A term used to describe cells and tissue that look abnormal under a microscope. High-grade cancer cells tend to grow and spread more quickly than low-grade cancer cells. Cancer grade may be used to help plan treatment and determine prognosis. High-grade cancers usually have a worse prognosis than low-grade cancers and may need treatment right away or treatment that is more aggressive (intensive).

**HIGH LOAD MELT FLOW INDEX (HLMFI):** This is a melt flow index test that uses a higher than the usual (2.16 kg) weight. For PE, the

HLMFI weight is usually 10 kg, but sometimes 21.6 kg.

**High melting point:** Substances with high melting points have strong attractions between their particles. Metals (in general) have high melting points and so do ionic compounds and macromolecules.

**high performance liquid chromatography:** An efficient form of column chromatography that pumps a liquid solution of the sample at very high pressure through a column packed with a stationary phase made of very tiny particles. The high pressure pumps required make HPLC an expensive technique.

**High Performance Liquid Chromatography (HPLC):** A form of liquid chromatography used in analytical chemistry used to separate, identify, and quantify the components of a mixture.

**High radiation area:** Any area with dose rates greater than 100 millirems (1 millisievert) in one hour 30 centimeters from the source or from any surface through which the ionizing radiation penetrates. Areas at licensee facilities must be posted as "high radiation areas" and access into these areas is maintained under strict control.

**high spin complex:** A metal-ligand complex with the same number of unpaired electrons as the uncomplexed metal ion. When a weak ligand complexes the metal ion, the crystal field splitting is small and the electrons can still occupy all of the d orbitals without pairing.

**High Tension :** Tension meeting or exceeding the capabilities of the belt. High tension can result from system layout, high coefficient of friction between belt and product (dirty system), or product loading.

**High Throughput Screening:** An automated method of performing large amounts of in vitro experiments.

**High-alloy steel :** Some steels contain up to 25% of other elements. Stainless steel is an example of a high alloy steel (it contains large amounts of nickel and chromium).

**High-density lipoprotein (HDL):** A lipoprotein that picks up cholesterol from dying cells and from membranes undergoing turnover, esterifies it, and then transfers the cholesterol esters to the liver and other steroid-synthesizing tissues.

**High-Density Polyethylene (HDPE):** a rigid, tough and strong resin of natural milky color. Hdpe has very good stress crack resistance as well as

high impact and melt strength. With hdpe it is easy to add color. OR A conventional (not biodegradable) plastic, as used commonly in single-use plastic carry bags (HDPE). OR This term is generally considered to include polyethylene plastics ranging in density from about 0.940 to 0.960 and over in recycled plastic and plastic materials. Its main usages are crates and boxes, bottles (for food products, detergents, cosmetics), food containers, toys, petrol tanks, industrial wrapping and film, pipes and houseware.

**high-dose chemotherapy** : An intensive drug treatment to kill cancer cells, but that also destroys the bone marrow and can cause other severe side effects. High-dose chemotherapy is usually followed by bone marrow or stem cell transplantation to rebuild the bone marrow.

**high-dose radiation** : An amount of radiation that is greater than that given in typical radiation therapy. High-dose radiation is precisely directed at the tumor to avoid damaging healthy tissue, and may kill more cancer cells in fewer treatments. Also called HDR.

**high-dose-rate remote brachytherapy** : A type of internal radiation treatment in which the radioactive source is removed between treatments. Also called high-dose-rate remote radiation therapy and remote brachytherapy.

**high-dose-rate remote radiation therapy** : A type of internal radiation treatment in which the radioactive source is removed between treatments. Also called high-dose-rate remote brachytherapy and remote brachytherapy.

**High-energy compound**: A compound that undergoes hydrolysis with a high negative standard free energy change.

**high-energy photon therapy** : A type of radiation therapy that uses high-energy photons (units of light energy). High-energy photons penetrate deeply into tissues to reach tumors while giving less radiation to superficial tissues such as the skin.

**High-enriched uranium**: Uranium enriched to at least 20 percent uranium-235 (a higher concentration than exists in natural uranium ore). For detail, see Uranium Enrichment.

**high-grade lymphoma** : A type of lymphoma that grows and spreads quickly and has severe symptoms. Also called aggressive lymphoma and intermediate-grade lymphoma.

**high-grade squamous intraepithelial lesion :** A growth on the surface of the cervix with moderately or severely abnormal cells. High-grade squamous intraepithelial lesions are usually caused by certain types of human papillomavirus (HPV) and are found when a Pap test is done. If not treated, these abnormal cells may become cancer and spread to nearby normal tissue. A high-grade squamous intraepithelial lesion is sometimes called moderate or severe dysplasia. Also called HSIL.

**high-intensity focused ultrasound therapy :** A procedure in which high-energy sound waves are aimed directly at an area of abnormal cells or tissue in the body. The waves create heat that kills the cells. High-intensity focused ultrasound therapy is being studied in the treatment of prostate cancer and some other types of cancer and other diseases. Also called HIFU.

**High-performance liquid chromatography (HPLC):** A chromatographic technique that involves passing a solution at high pressures through a packed column of fine particles. The components of a sample are separated on the column and noted by a detector (e.g., UV-Vis, refractive index, potentiometric, etc.) An octadecylsilyl (C-18) column is the most commonly used column and a UV detector is the most commonly used detector.

**high-performance liquid chromatography (HPLC):** Chromatographic procedures, often conducted at relatively high pressures, using automated equipment that permits refined and highly reproducible profiles.

**High-Pressure Laminates (molding pressure high):** Laminates molded and cured at pressures not lower than 1,000 psi. (Pressures of 1,000 to 2,500 psi are not uncommon.)

**high-risk cancer :** Cancer that is likely to recur (come back), or spread.

**high-risk HPV :** A type of human papilloma virus (HPV) that can cause cervical cancer and other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Most high-risk HPV infections go away on their own without treatment, and do not cause cancer. Also called high-risk human papillomavirus.

**high-risk human papillomavirus :** A type of human papilloma virus (HPV) that can cause cervical cancer and other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Most high-risk

human papillomavirus infections go away on their own without treatment, and do not cause cancer. Also called high-risk HPV.

**high-selenium baker's yeast:** A baker's yeast (*Saccharomyces cerevisiae*) containing high levels of the trace element selenium (Se) with potential chemopreventive, immunomodulating and antioxidant activities. Selenium is introduced into yeast during fermentation and incorporated into selenocompounds, such as selenomethionine and glutamyl SE methylselenocysteine. Selenium functions as a cofactor for antioxidant enzymes such as glutathione peroxidases and thioredoxin reductase.

**high-selenium Brassica juncea:** A formulation of the mustard plant *Brassica juncea* grown in a medium that has been enriched with the trace element selenium with potential chemopreventive and chemopotentiating activities. *Brassica juncea* hyperaccumulates trace elements in soil. Selenium amino acid species found in selenized *Brassica juncea* include methylselenomethionine (MeSeMet) and methylselenocysteine (MeSeCys); both may be incorporated into selenoproteins in vivo. Selenium functions as a cofactor for antioxidant enzymes such as glutathione peroxidases and thioredoxin reductase, which protect cells from the free radical damage. In addition, in vitro MeSeCys has been shown to potentiate the antitumor effects of the irinotecan metabolite SN-38, by inducing phosphorylation of checkpoint kinase 2 (chk2) at threonine 68, which results in poly(ADP-ribose) polymerase cleavage, caspase 3 activation, and DNA fragmentation.

or v

**high-titer RSV immune globulin RI-001:** A plasma-derived, polyclonal, intravenous immunoglobulin formulation (IVIG) containing standardized high levels of antibodies against respiratory syncytial virus (RSV), a single-stranded, enveloped paramyxovirus, with potential immunomodulating activity. The high-titer RSV immune globulin RI-001 is derived from healthy donors with high amounts of RSV antibodies. Upon intravenous administration, the antibodies against RSV may provide passive immunization against RSV. This may prevent lower respiratory tract infections by RSV in immunocompromised patients. The polyclonal antibodies in RI-001 are able to target various viral epitopes.

**Higher Oxo-alcohols:** Higher oxo-alcohols are collectively the heavier, smaller volume oxo-alcohols which are produced in addition to the principal oxo-alcohols 2-ethylhexanol and butanols. Oxo-alcohols are so

named because of the “oxo process” process by which they are produced, which involves hydroformulation of an olefin with syngas. Higher oxo-alcohols have a wide variety of end-uses ranging from pesticides to perfumery. Higher oxo-alcohol production is relatively specialised and small volume chemistry and tends to be restricted to large industrial economies.

**Highly (or High-) enriched uranium:** Uranium enriched to at least 20 percent uranium-235 (a higher concentration than exists in natural uranium ore). For detail, see Uranium Enrichment.

**highly active antiretroviral therapy :** Treatment that uses a combination of three or more drugs to treat HIV infection. Highly active antiretroviral therapy stops the virus from making copies of itself in the body. This may lessen the damage to the immune system caused by HIV and may slow down the development of AIDS. It may also help prevent transmission of HIV to others, including from mother to child during birth. Also called cART, combination antiretroviral therapy, and HAART.

**highly purified Staphylococcal protein A PRTX-100:** A proprietary formulation containing a highly purified form of Staphylococcal protein A (SpA; protein A), with potential immunomodulating activity. Upon administration of PRTX-100, this protein is able to specifically bind to both the subset of B lymphocytes that express the heavy chain variable region 3 (VH3)-encoded immunoglobulin (Ig) (VH3-B-cells) and macrophages. This prevents B-cell activation, induces apoptosis, prevents VH3-derived antibody formation, antibody-mediated immune responses, and destruction by macrophages. This may modulate specific immune signaling pathways and restore normal immune system functions caused by certain immune-mediated inflammatory diseases. In patients with the autoimmune-mediated disease immune thrombocytopenia (ITP), PRTX-100 prevents destruction of platelets, increases platelet production and platelet blood levels, and decreases the risk of bleeding. SpA, a 42 kDa bacterial membrane protein produced by *Staphylococcus aureus* bacteria, consists of five nearly identical Ig binding domains; each SpA domain binds with high affinity to the Igs containing regions encoded by the VH3 gene family. B-lymphocytes that express VH3-encoded Igs are specifically involved in various autoimmune diseases. Check for active clinical trials using this agent.

**hilar :** Refers to the area where nerves and blood vessels attach to an organ.

**Hill reaction:** The evolution of oxygen and the photoreduction of an artificial electron acceptor by a chloroplast preparation in the absence of carbon dioxide.

**Hiltonol:** (Other name for: poly ICLC)

**hindbrain:** the portion of the brain that consists of the medulla, pons, and cerebellum.

**hinge line:** the center axis of a fold.

**HIP:** High-impact polystyrene

**HIPAA :** A 1996 U.S. law that allows workers and their families to keep their health insurance when they change or lose their jobs. The law also includes standards for setting up secure electronic health records and to protect the privacy of a person's health information and to keep it from being misused. Also called Health Insurance Portability and Accountability Act and Kassebaum Kennedy Act.

**HIPS:** High Impact Polystyrene is a low density, rigid, clear plastic extrusion material mostly used for indoor applications (see Polystyrene).

**Hirschsprung disease :** A condition in which certain nerve cells are missing from the muscle layers of part of the large intestine. This causes severe constipation or blockage of the large intestine. Constipation is when stool becomes hard, dry, and difficult to pass and bowel movements occur less often than normal. Other symptoms include swollen abdomen, vomiting, bloody diarrhea, gas, lack of energy, and trouble gaining weight. Hirschsprung disease is present from birth, but the symptoms may not appear until later in a child's life. This condition has been linked to an increased risk of thyroid cancer and neuroblastoma. Also called aganglionic megacolon.

**histamine :** A substance that has many effects in the body. It is released from some types of white blood cells during allergic reactions. It causes small blood vessels to dilate (widen) and become leaky, which can cause tissues to swell. It also causes smooth muscles to contract, gastric acid to be made, and the heart rate to increase. Histamine is used in tests for allergies, asthma, and gastric acid secretion. It is a type of neurotransmitter.

**histamine dihydrochloride :** A substance being studied in the treatment of some types of cancer and other conditions. When used together with interleukin-2, histamine dihydrochloride may help some immune cells find and kill tumor cells. It is a type of biological response modifier. Also called Maxamine.

**histiocytoid hemangioma :** A rare benign (not cancer) tumor of small blood vessels surrounded by lymphocytes and eosinophils (types of white blood cells). Histiocytoid hemangioma usually forms on or in the skin, especially the skin of the head, but can occur in other areas of the body, such as in bone. On the skin, it may appear as firm pink to red bumps that may be itchy or painful. If the tumor is in bone, it may cause swelling and pain. Histiocytoid hemangioma is sometimes caused by injury and often comes back after treatment. Histiocytoid hemangioma is most common in young and middle-aged adults. It is a type of vascular tumor. Also called angiolymphoid hyperplasia with eosinophilia and epithelioid hemangioma.

**histologic examination :** The examination of tissue specimens under a microscope.

**histologic grade :** A description of a tumor based on how abnormal the cancer cells and tissue look under a microscope and how quickly the cancer cells are likely to grow and spread. Low-grade cancer cells look more like normal cells and tend to grow and spread more slowly than high-grade cancer cells. Grading systems are different for each type of cancer. They are used to help plan treatment and determine prognosis. Also called grade and tumor grade.

**histology :** The study of tissues and cells under a microscope.

**histone :** A type of protein found in chromosomes. Histones bind to DNA, help give chromosomes their shape, and help control the activity of genes.

**Histone acetyltransferase (HAT):** An enzyme that catalyzes the attachment of acetyl groups from acetyl coa to specific lysine residues in the amino-terminal domains of histones. These enzymes play crucial roles in the modification of chromatin structure that enhances transcription.

**Histone deacetylase:** An enzyme that contributes to transcriptional repression by deacetylation of acetylated lysine residues in histones.

**histone deacetylase :** An enzyme that removes a small molecule called an acetyl group from histones (proteins found in chromosomes). This changes

the way the histones bind to DNA and may affect its activity. Histone deacetylase inhibitors are being studied in the treatment of cancer. Also called HDAC.

**histone deacetylase inhibitor :** A substance that causes a chemical change that stops tumor cells from dividing. Histone deacetylase inhibitors are being studied in the treatment of cancer. Also called HDAC inhibitor.

**histone-lysine N-methyltransferase EZH2 inhibitor GSK2816126:** A small molecule selective and S-adenosyl methionine (SAM) competitive inhibitor of histone-lysine N-methyltransferase EZH2, with potential antineoplastic activity. Upon administration, histone-lysine N-methyltransferase EZH2 inhibitor GSK2816126 inhibits the activity of EZH2 and specifically prevents the methylation of histone H3 lysine 27 (H3K27). This decrease in histone methylation alters gene expression patterns associated with cancer pathways and results in decreased tumor cell proliferation in cancer cells that overexpress this enzyme. EZH2, which belongs to the class of histone methyltransferases (HMTs), is overexpressed or mutated in a variety of cancers and plays a key role in tumor cell proliferation.

**histones:** nuclear proteins that coil DNA molecules.

**Histones:** The family of basic proteins that is normally associated with DNA in most cells of eukaryotic organisms. OR A highly conserved group of small basic proteins found in eukaryotes in association with DNA to form nucleosomes. OR The family of five basic proteins that associate tightly with DNA in the chromosomes of all eukaryotic cells.

**histopathology :** The study of diseased cells and tissues using a microscope.

**historic cohort study :** A research study in which the medical records of groups of individuals who are alike in many ways but differ by a certain characteristic (for example, female nurses who smoke and those who do not smoke) are compared for a particular outcome (such as lung cancer). Also called retrospective cohort study.

**historical control subject :** An individual treated in the past and used in a comparison group when researchers analyze the results of a clinical study that had no control group. The use of a control, or comparison, group helps researchers determine the effects of a new treatment more accurately.

**histosol:** Wet organic soils, such as peats and mucks.

**histrelin acetate:** The acetate salt form of histrelin, a long-acting, synthetic nonapeptide analog of gonadotropin-releasing hormone (GnRH) with potential anti-tumor activity. Upon administration, histrelin binds to and activates GnRH receptors; prolonged administration results in pituitary GnRH receptor desensitization and inhibition of follicle stimulating hormone (FSH) and luteinizing hormone (LH) secretion, leading to a significant decline in testosterone production in males and may inhibit androgen receptor-positive tumor progression; in females, prolonged administration results in decreased estradiol production.

**HIV:** The cause of acquired immunodeficiency syndrome (AIDS). Also called human immunodeficiency virus.

**HIV antibody :** A substance produced by certain white blood cells in reaction to contact with the human immunodeficiency virus (HIV).

**HIV antibody test :** A test to check for human immunodeficiency virus (HIV) infection. HIV is the virus that causes acquired immunodeficiency syndrome (AIDS). An HIV antibody test checks for HIV antibodies in a sample of blood, urine, or saliva. It can take from 2 weeks to 6 months after a person is infected with HIV before the antibodies are found with this test. It is the most common type of HIV test.

**HIV DNA test:** A test to check for human immunodeficiency virus (HIV) infection. HIV is the virus that causes acquired immunodeficiency syndrome (AIDS). An HIV DNA test checks for DNA (genetic material) from the virus in a sample of blood. This test can find HIV in the blood about 9-11 days after the person is infected with the virus. An HIV DNA test may be used to test someone who has just become infected with HIV and it may also be used to test for infection in infants born to mothers infected with HIV.

**HIV negative :** Refers to a person who is not infected with the human immunodeficiency virus (HIV). HIV is the virus that causes acquired immunodeficiency syndrome (AIDS).

**HIV positive :** Refers to a person who is infected with the human immunodeficiency virus (HIV). HIV is the virus that causes acquired immunodeficiency syndrome (AIDS).

**HIV RNA test:** A test to check for human immunodeficiency virus (HIV) infection. HIV is the virus that causes acquired immunodeficiency syndrome (AIDS). An HIV RNA test checks for RNA (genetic material) from the virus in a sample of blood. This test can find HIV in the blood about 9-11 days after the person is infected with the virus. An HIV RNA test is used to test someone who may have just become infected with HIV.

**HIV test :** A test to check for human immunodeficiency virus (HIV) infection. HIV is the virus that causes acquired immunodeficiency syndrome (AIDS). The most common type of HIV test is called the HIV antibody test, which checks for antibodies against HIV in a sample of blood, urine, or fluid from the mouth. It can take from 2 weeks to 6 months after a person is infected with HIV before the antibodies are found with an HIV antibody test. Another type of HIV test checks for RNA or DNA from HIV in a sample of blood. This test can find HIV in a person's blood about 9-11 days after the person is infected with the virus.

**HIV window period :** The time period that starts when a person becomes infected with the human immunodeficiency virus (HIV) and ends when the body makes enough antibodies against the virus or HIV DNA or RNA to be found with an HIV test. For the test that looks for antibodies against HIV, the HIV window period can last from 2 weeks to 6 months. For the HIV DNA or RNA test, the HIV window period is about 9-11 days. During the HIV window period, an infected person may have negative HIV test results but still be able to infect other people.

**hives :** Itchy, raised red areas on the skin. Hives are caused by a reaction to certain foods, drugs, infections, or emotional stress. Also called urticaria.

**Hivid:** (Other name for: zalcitabine)

**HLA:** A type of molecule found on the surface of most cells in the body. HLAs play an important part in the body's immune response to foreign substances. They make up a person's tissue type, which varies from person to person. HLA tests are done before a donor stem cell or organ transplant, to find out if tissues match between the donor and the person receiving the transplant. Also called human leukocyte antigen and human lymphocyte antigen.

**HLA matching :** A process in which blood or tissue samples are tested for human leukocyte antigens (HLAs). HLAs are molecules found on the surface of most cells in the body. They make up a person's tissue type,

which varies from person to person. They play an important part in the body's immune response to foreign substances. HLA matching is done before a donor stem cell or organ transplant to find out if tissues match between the donor and the person receiving the transplant. Also called human leukocyte antigen matching.

**HLA-A\*0201-restricted TERT(572Y)/TERT(572) peptides vaccine Vx-001:** A peptide-based cancer vaccine consisting of two human leukocyte antigen (HLA)-A\*0201 restricted 9-mer epitopes derived from the human telomerase reverse transcriptase (hTERT), TERT 572Y (YLFFYRKS<sup>V</sup>; TYR-Vx001) and TERT 572 (RLFFYRKS<sup>V</sup>; ARG-Vx001), with potential immunostimulating and antineoplastic activities. Subcutaneous injection of TERT(572Y) peptide followed by subcutaneous administration of the TERT(572) peptide may elicit a specific and possibly optimal cytotoxic T cell (CTL) response against hTERT-expressing tumor cells. hTERT, the catalytic subunit of human telomerase, is a human leukocyte antigen-A\*0201-restricted cryptic epitope of telomerase. TERT is expressed in the majority of human cancer cells, is not expressed or is expressed at very low levels in normal cells and plays a key role in tumorigenesis. TERT572Y is the optimized variant of the native cryptic peptide TERT572 in which tyrosine has been substituted for an arginine at position 1; TERT572Y shows increased HLA-A\*0201 binding affinity compared to TERT572.

**HLA-A\*0201-restricted TRP2-gp100-EphA2-HER2 multipeptide vaccine:** A cancer vaccine containing four HLA-A\*0201-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Vaccine peptide epitopes are derived from the tumor associated antigens (TAAs) tyrosinase-related protein 2 (TRP2), glycoprotein 100 (gp100), Ephrin receptor A2 (EphA2) and human epidermal growth factor receptor 2 (HER2). Upon administration, HLA-A\*0201-restricted TRP2-gp100-EphA2-HER2 multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against TRP2-gp100-EphA2-HER2-expressing tumor cells, resulting in tumor cell lysis and decreased tumor cell proliferation. HLA-A\*0201 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*0201 may improve antigenic peptide immunogenicity.

**HLA-A\*0201-restricted URLC10-VEGFR1-VEGFR2 multipeptide vaccine:** A cancer vaccine containing three HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory, antiangiogenic, and antitumor activities. Vaccine peptide epitopes are derived from the tumor associated antigen (TAA) URLC (up-regulated in lung cancer 10) and vascular endothelial growth factor receptors (VEGFR) 1 and 2. Upon administration, HLA-A\*0201-restricted URLC10-VEGFR1-VEGFR2 multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-expressing tumor cells and the tumor microvasculature expressing VEGFR 1 and 2 peptides; this may result in tumor cell lysis, the inhibition of tumor angiogenesis, and decreased tumor growth. HLA-A\*0201 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*0201 may improve antigenic peptide immunogenicity.

**HLA-A\*0201-restricted VEGFR1 peptide vaccine:** A cancer vaccine containing an HLA-A\*0201-restricted vascular endothelial growth factor receptor 1 (VEGFR1) peptide (sequence: TLFWLLLTL) with potential immunostimulatory and antitumor activities. Upon administration, HLA-A\*0201-restricted VEGFR1-derived peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing VEGFR1, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*0201 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*0201 may improve antigenic peptide immunogenicity.

**HLA-A\*0201-restricted VEGFR1-VEGFR2 multipeptide vaccine:** A cancer vaccine containing two HLA-A\*0201-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from: vascular endothelial growth factor receptors (VEGFR) 1 and 2. Upon administration, HLA-A\*0201-restricted VEGFR1-VEGFR2 multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing VEGFR 1 and 2 peptides, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*0201 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most

efficiently to HLA-A\*0201 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted CDCA1-A24-56 peptide vaccine:** A cancer vaccine containing the HLA-A\*2402-restricted peptide epitope derived from cell division associated gene 1 (CDCA1), with potential immunostimulatory and antitumor activities. Upon administration, HLA-A\*2402-restricted CDCA1-A24-56 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against CDCA1-expressing tumor cells, resulting in tumor cell lysis and decreased tumor cell proliferation. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted CDCA1-KIF20A multipeptide vaccine:** A cancer vaccine containing two HLA-A\*2402-restricted peptide epitopes derived from cancer-testis antigens with potential immunostimulatory and antitumor activities. The peptide epitopes are derived from cell division associated 1 (CDCA1) and kinesin-like family member 20A (KIF20A). Upon administration, HLA-A\*2402-restricted CDCA1-KIF20A multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against CDCA1- and KIF20A-expressing tumor cells, resulting in tumor cell lysis and decreased tumor cell proliferation. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A\*2402-restricted KOC1-TTK-CO16-DEPDC1-MPHOSPH1 multipeptide vaccine:** A cancer vaccine containing five HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from IGF II mRNA binding protein 3 (KOC1); TTK protein kinase (TTK); URLC10 (up-regulated lung cancer 10); DEP domain containing 1 (DEPDC1); and M phase phosphoprotein 1 (MPHOSPH1). Upon administration, HLA-A\*2404-restricted KOC1-TTK-CO16-DEPDC1-MPHOSPH1 multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing KOC1, TTK, CO16, DEPDC1 and MPHOSPH1

peptides, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted multipeptide vaccine S-488410:** A cancer vaccine composed of HLA-A\*2402-restricted epitopic peptides derived from three cancer/testis (CT) antigens, with potential antineoplastic activity. Upon subcutaneous administration, HLA-A\*2402-restricted multipeptide vaccine S-488410 may elicit a cytotoxic T-lymphocyte (CTL) response against tumor cells expressing these CT antigens. CT antigens, normally expressed only in germ cells of the testis, are overexpressed in a wide variety of human cancers.

**HLA-A\*2402-restricted URLC10 peptides vaccine:** A cancer vaccine containing HLA-A\*2402-restricted epitope peptides URLC10 (up-regulated lung cancer 10) with potential immunostimulatory and antineoplastic activities. Upon administration, HLA-A\*2402-restricted URLC10 peptides vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-expressing tumor cells. URLC10, a tumor associated antigen, is often overexpressed in lung, esophageal and gastric cancers. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted URLC10-CDCA1-KIF20A multipeptide vaccine:** A cancer vaccine containing three HLA-A\*2402-restricted peptide epitopes derived from cancer-testis antigens with potential immunostimulatory and antitumor activities. The peptide epitopes are derived from up-regulated lung cancer 10 (URLC10); cell division cycle associated 1 (CDCA1); and kinesin-like family member 20A (KIF20A). Upon administration, HLA-A\*2402-restricted URLC10-CDCA1-KIF20A multipeptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-, CDCA1-, and KIF20A-expressing tumor cells, resulting in tumor cell lysis and decreased tumor cell proliferation. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most

efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted URLC10-CDCA1-VEGFR1-VEGFR2**

**multi-peptide vaccine:** A cancer vaccine containing four HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. The peptide epitopes are derived from URLC10 (up-regulated lung cancer 10); CDCA1 (cell division associated 1); and vascular endothelial growth factor receptors (VEGFRs) 1 and 2. Upon administration, HLA-A\*2402-restricted URLC10-CDCA1-VEGFR1-VEGFR2 multi-peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-, CDCA1-, VEGFR1- and VEGFR2-expressing tumor cells, resulting in tumor cell lysis and decreased tumor cell proliferation. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted URLC10-KOC1-VEGFR1-VEGFR2**

**multi-peptide vaccine:** A cancer vaccine containing four HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from URLC10 (up-regulated lung cancer 10 or CO16); KOC1 (IGF II mRNA Binding Protein 3); and vascular endothelial growth factor receptors (VEGFRs) 1 and 2. Upon administration, this multi-peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against URLC10-, KOC1-, VEGFR1- and VEGFR2-expressing tumor cells, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A\*2402-restricted URLC10-TTK-KOC1 multi-peptide vaccine:**

A cancer vaccine containing three HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from URLC10 (up-regulated lung cancer 10); TTK (TTK protein kinase); and KOC1 (IGF II mRNA Binding Protein 3). Upon administration, URLC10-TTK-KOC1 multi-peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells

expressing URLC10, TTK and KOC1 peptides, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted URLC10-TTK-VEGFR1-VEGFR2**

**multi-peptide vaccine:** A cancer vaccine containing four HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from: URLC10 (up-regulated lung cancer 10), TTK (TTK protein kinase), and VEGFRs (vascular endothelial growth factor receptors) 1 and 2. Upon administration, URLC10-TTK-KOC1-VEGFR1-VEGFR2 multi-peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing URLC10, TTK, VEGFR 1 and 2 peptides, resulting in cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A\*2402-restricted VEGFR1 peptide vaccine:** A cancer vaccine containing the HLA-A\*2402-restricted vascular endothelial growth factor receptor 1 (VEGFR1) peptide epitope with potential immunostimulatory and antitumor activities. Upon administration, HLA-A\*2402-restricted VEGFR1 peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing VEGFR 1 peptide, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8+ T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2402-restricted VEGFR1/2 multi-peptide vaccine:** A cancer vaccine containing two HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from vascular endothelial growth factor receptors (VEGFRs) 1 and 2. Upon administration, this peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against VEGFR1- and VEGFR2-expressing tumor cells, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents

antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity.

**HLA-A\*2404-restricted RNF43-TOMM34-VEGFR1-VEGFR2**

**multi-peptide vaccine:** A cancer vaccine containing four HLA-A\*2402-restricted peptide epitopes with potential immunostimulatory and antitumor activities. Peptide epitopes in this vaccine are derived from ring finger protein 43 (RNF43); translocase of outer mitochondrial membrane 34 (TOMM34); and vascular endothelial growth factor receptors (VEGFR) 1 and 2. Upon administration, HLA-A\*2404-restricted RNF43-TOMM34-VEGFR1-VEGFR2 multi-peptide vaccine may stimulate a cytotoxic T lymphocyte (CTL) response against tumor cells expressing RNF43, TOMM34, and VEGFR 1 and 2 peptides, resulting in tumor cell lysis and decreased tumor growth. HLA-A\*2402 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A\*2402 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A1-binding MAGE-1/MAGE-3 multi-peptide-pulsed autologous dendritic cell vaccine:**

A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with human leukocyte antigen (HLA)-A1-binding melanoma-associated antigen peptides MAGE-1 and MAGE-3 with potential immunomodulating and antineoplastic activity. Upon vaccination, HLA-A1-binding MAGE-1/MAGE-3 multi-peptide-pulsed autologous dendritic cell vaccine may stimulate the host immune system to mount an anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against MAGE1- and MAGE-3-expressing cancer cells, resulting in tumor cell lysis. HLA-A1 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A1 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A1, A2, B35-restricted survivin peptides/Montanide ISA-51**

**vaccine:** A peptide vaccine comprised of synthetic HLA-A1, -A2 and -B35 restricted survivin epitopes combined with the adjuvant Montanide ISA-51 with potential antineoplastic activity. Upon administration, HLA-A1, A2, B35-restricted survivin peptides/Montanide ISA-51 vaccine may stimulate a cytotoxic T cell response against tumor cells that overexpress survivin,

resulting in tumor cell lysis. Montanide ISA-51, also known as incomplete Freund's adjuvant or IFA, is a stabilized water-in-oil emulsion adjuvant containing mineral oil with mannide oleate added as a surfactant that non-specifically stimulates cell-mediated immune responses to antigens.

**HLA-A2-binding TYR/MART-1/gp100 multi-peptide-pulsed autologous dendritic cell vaccine:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with human leukocyte antigen (HLA)-A2-restricted melanoma-associated antigen peptides tyrosinase (TYR), MART-1 (melanoma antigen recognized by T-cells) and melanoma antigen glycoprotein 100 (gp100), with potential immunomodulating and antineoplastic activity. Upon vaccination, HLA-A2-binding TYR/MART-1/gp100 multi-peptide-pulsed autologous dendritic cell vaccine may stimulate the host immune system to mount an anti-tumoral cytotoxic T lymphocyte (CTL) and antibody responses against Tyr-, MART-1 and gp100-expressing cancer cells, resulting in tumor cell lysis. HLA-A2 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to epitopes that bind most efficiently to HLA-A2 may improve antigenic peptide immunogenicity. Check for active clinical trials using this agent.

**HLA-A2-restricted melanoma-specific peptides vaccine GRN-1201:** A cancer peptide vaccine composed of four human leukocyte antigen (HLA)-A2 (HLA-A\*02)-restricted peptides derived from four specific and separate tumor-associated antigens (TAAs) expressed by melanoma cells, with potential antineoplastic activity. Upon administration of the HLA-A2-restricted melanoma-specific peptides vaccine, the melanoma specific antigens in the vaccine activate the immune system to exert a cytotoxic T-lymphocyte (CTL) response against the HLA-A2-positive melanoma cells.

**HLA-A2-restricted synthetic glioma antigen peptides vaccine:** A synthetic peptide cancer vaccine consisting of HLA-A2-restricted peptides derived from glioma-associated antigens (GAA) with potential immunostimulating and antineoplastic activities. Upon administration, HLA-A2-restricted synthetic glioma antigen peptides vaccine may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells expressing the corresponding GAAs, resulting in glioma tumor cell lysis. HLA-A2 is an MHC class I molecule that presents antigenic peptides to CD8<sup>+</sup> T cells; epitope design restricted to

epitopes that bind most efficiently to HLA-A2 may improve antigenic peptide immunogenicity.

**HLA-A2, A3-restricted FGF-5 peptides/Montanide ISA-51 vaccine:** A peptide vaccine comprised of synthetic HLA-A2- and HLA-A3-binding peptides, derived from amino acid sequences of fibroblast growth factor-5 (FGF-5), combined with the adjuvant Montanide ISA-51 with potential antineoplastic activity. HLA-A2, A3-restricted FGF-5 peptides contain motifs recognized by the MHC class I molecules HLA-A2 and HLA-A3 and may stimulate a cytotoxic T-cell response against tumor cells that overexpress FGF-5. Montanide ISA-51 (also known as incomplete Freund's adjuvant or IFA), a stabilized water-in-oil emulsion adjuvant containing mineral oil with mannide oleate added as a surfactant, non-specifically stimulates cell-mediated immune responses to antigens.

**HLA-DP0401/0402-restricted, MAGE-A3-reactive T cell receptor-transduced autologous T cells:** Human autologous T-lymphocytes transduced with a retroviral vector encoding a T-cell receptor (TCR) specific for the human leukocyte antigen (HLA)-DP0401/0402-restricted, melanoma antigen A3 (MAGE-A3), with potential antineoplastic activity. CD4-positive cells are isolated from a patient, transduced with an anti-MAGE-A3-DP0401/0402 restricted TCR, expanded ex vivo, and reintroduced into the HLA-DP0401/0402 positive patient. Then, the HLA-DP0401/0402-restricted, MAGE-A3-reactive TCR-transduced autologous T cells bind to tumor cells expressing the MAGE-A3 antigen, which may result in both an inhibition of growth and increased cell death for MAGE-A3-expressing cancer cells. The tumor-associated antigen MAGE-A3 is overexpressed by a variety of cancer cell types. Check for active clinical trials using this agent.

**HLH:** A rare disorder in which histiocytes and lymphocytes (types of white blood cells) build up in organs including the skin, spleen, and liver, and destroy other blood cells. HLH may be inherited or caused by certain conditions or diseases, including infections, immunodeficiency (inability of the body to fight infections), and cancer. Also called hemophagocytic lymphohistiocytosis.

**hLL1:** A substance being studied in the treatment of multiple myeloma and several other types of cancer. It binds to CD74, a protein on the surface of myeloma cells and certain other types of cells. It may help kill cancer cells.

hLL1 is a type of monoclonal antibody. Also called IMMU-110 and milatuzumab.

**HLOD score :** A statistical estimate of whether two genetic loci are physically near enough to each other (or “linked”) on a particular chromosome that they are likely to be inherited together. An HLOD score is calculated in the presence of locus heterogeneity (when the same phenotype can be caused by mutations in genes at different chromosomal loci). Also called heterogeneity logarithm of the odds score.

**HLRCC:** A rare inherited disorder that increases the risk of developing benign (not cancer) tumors of the skin and the uterus (leiomyomas) and malignant (cancer) tumors of the uterus (leiomyosarcoma) and the kidney. Also called hereditary leiomyomatosis and renal cell cancer syndrome.

**HME:** High-vinyl modified epoxy

**HMG-CoA reductase inhibitor :** A substance that blocks an enzyme needed by the body to make cholesterol and lowers the amount of cholesterol in the blood. HMG-CoA reductase inhibitor drugs are called statins. Also called hydroxymethylglutaryl-coenzyme A reductase inhibitor.

**HMGA1:** A protein that binds to the DNA and certain proteins in chromosomes. It is involved in many functions in the cell, and helps protect cells from dying. HMGA1 is found at high levels in several types of cancer cells.

**HMR 1275:** A substance being studied in the treatment of several types of cancer. It stops cells from dividing and may kill cancer cells. It is a type of cyclin-dependent kinase (CDK) inhibitor. Also called alvocidib and flavopiridol.

**HMW:** High molecular weight

**HMW-HIGH DENSITY POLYETHYLENE:** High molecular weight high density polyethylene is usually defined as a polyethylene with a density of 0.940 or greater and a flow rate of 1 to 20 (190°C/21.6 Kg). The average molecular weight ranges from 200,000 to 500,000.

**HNPC:** An inherited disorder in which affected individuals have a higher-than-normal chance of developing colorectal cancer and certain other types of cancer, often before the age of 50. Also called hereditary nonpolyposis colon cancer and Lynch syndrome.

**HO/02/02:** A topical formulation that can be used to relieve radiation dermatitis.

**Hob:** A master model in hardened steel used to sink the shape of a mold into a steel block. OR A master model in hardened steel. Also the wearing in of an A&B plate of a silicone injection mold

**Hodgkin disease :** A cancer of the immune system that is marked by the presence of a type of cell called the Reed-Sternberg cell. The two major types of Hodgkin disease are classical Hodgkin lymphoma and nodular lymphocyte-predominant Hodgkin lymphoma. Symptoms include the painless enlargement of lymph nodes, spleen, or other immune tissue. Other symptoms include fever, weight loss, fatigue, or night sweats. Also called Hodgkin lymphoma.

**Hodgkin lymphoma :** A cancer of the immune system that is marked by the presence of a type of cell called the Reed-Sternberg cell. The two major types of Hodgkin lymphoma are classical Hodgkin lymphoma and nodular lymphocyte-predominant Hodgkin lymphoma. Symptoms include the painless enlargement of lymph nodes, spleen, or other immune tissue. Other symptoms include fever, weight loss, fatigue, or night sweats. Also called Hodgkin disease.

**Hodgkin's antigens-GM-CSF-expressing cell vaccine:** An allogeneic vaccine consisting of Hodgkin lymphoma cells transfected with the granulocyte macrophage-colony-stimulating factor (GM-CSF) gene with potential antineoplastic activity. Upon vaccination, Hodgkin antigens-GM-CSF-expressing cell vaccine may stimulate a cytotoxic T-lymphocyte (CTL) immune response against Hodgkin lymphoma-associated antigens, which may result in the lysis of tumor cells expressing these antigens. In addition, transfected Hodgkin lymphoma cells secrete GM-CSF, which may potentiate the CTL response against Hodgkin lymphoma-associated antigens.

**Hold Downs :** Members that limit the amount the belt edges can rise in a Christmas Tree or flip-up condition.

**Hold on Pressure Follow up pressure:** It is pressure on melt after the switch over point in the moulding process.

**Hold Pressure:** The applied hydraulic injection pressure maintained after the completion of mold filling. Also referred to as secondary pressure.

**Holdridge life zone:** A climate category defined by three weighted climatic indexes, namely, mean annual heat, precipitation, and atmospheric moisture.

**Holidays:** A term used to define a small area missed during the application of a paint coating e.g. where during application of a gloss paint a small area of undercoat is left unpainted.

**Holliday intermediate:** An intermediate in genetic recombination in which two double-stranded DNA molecules are joined by virtue of a reciprocal crossover involving one strand of each molecule.

**Holliday junction:** A crosslike structure, formed by four polynucleotide chains, that is a key intermediate in the recombination process.

**Holmium:** Symbol:"Ho" Atomic Number:"67" Atomic Mass: 164.93amu. Holmium is one of the elements in the lanthanide series of inner transition elements. It may also be classified as a rare earth element. You can find this magnetic metal in many minerals. It has even been used in some lasers.

**holmium Ho 166 DOTMP :** A drug containing a radioactive isotope that is used in the diagnosis and treatment of cancer.

**Holocene:** The most recent epoch of the Quaternary period , covering approximately the last 10,000 years.

**Holoenzyme:** An intact enzyme containing all of its subunits and any necessary cofactors with full enzymatic activity. OR An enzyme that consists of the protein component forming the main body of the enzyme (the apoenzyme) and any necessary, usually small, cofactors. OR A catalytically active enzyme including all necessary subunits, prosthetic groups, and cofactors.

**holy thistle :** A plant whose leaves, stems, and flowers have been used in some cultures to treat certain medical problems. Holy thistle may have anti-inflammatory and anticancer effects. The scientific name is Cnicus benedictus. Also called blessed thistle, cardin, spotted thistle, and St. Benedict's thistle.

**homologous proteins:** Proteins having sequences and functions similar in different species; for example, the hemoglobins. made up ride unit.

**homeobox:** A conserved DNA sequence of 180 base pairs encoding a protein domain found in many proteins that play a regulatory role in development.

**homeodomain:** The protein domain encoded by the homeobox.

**homeopathic medicine :** An alternative approach to medicine based on the belief that natural substances, prepared in a special way and used most often in very small amounts, restore health. According to these beliefs, in order for a remedy to be effective, it must cause in a healthy person the same symptoms being treated in the patient. Also called homeopathy.

**homeopathy:** A system of disease treatment involving application of minute doses of a remedy that, in a healthy person, would produce symptoms of the disease. OR An alternative approach to medicine based on the belief that natural substances, prepared in a special way and used most often in very small amounts, restore health. According to these beliefs, in order for a remedy to be effective, it must cause in a healthy person the same symptoms being treated in the patient. Also called homeopathic medicine.

**homeostasis:** the process in which the internal environment exists at a steady-state equilibrium despite changes in the external environment. OR The maintenance of a dynamic steady state by regulatory mechanisms that compensate for changes in external circumstances. OR A state of balance among all the body systems needed for the body to survive and function correctly. In homeostasis, body levels of acid, blood pressure, blood sugar, electrolytes, energy, hormones, oxygen, proteins, and temperature are constantly adjusted to respond to changes inside and outside the body, to keep them at a normal level.

**homeostatic :** Having to do with homeostasis, which is a state of balance among all the body systems, needed for the body to function correctly.

**homeothermic:** animals that can maintain a constant body temperature.

**homeotic genes:** Genes that regulate the development of the pattern of segments in the *Drosophila* body plan; similar genes are found in most vertebrates.

**HOMO:** Highest occupied molecular orbital. The energy of this orbital approximates the ionization energy of the molecule (Koopmans' theorem).

**Homo Neanderthalensis:** A species of human, now extinct, that was common in Europe and the Mideast about 100 000 years ago. The name comes from Neandertal, meaning 'Neander valley', in northwestern Germany, which was in turn named after the 17th century latin teacher and

school principal Joachim Neander, where the first remains of Neandertal man were discovered. Here is more info.

**HOMO-1:** The second-highest occupied molecular orbital.

**homogeneous:** Having uniform properties or composition. OR Describes a material or substance or chemical reaction which is the same throughout in its properties, composition, or state of matter. OR materials are the same throughout. All solutions are homogeneous.

**homogeneous mixture:** A sample of matter consisting of more than one pure substance with properties that do not vary within the sample.

**homogeneous units:** When both numbers are measured with the same units.

**homogenic bond formation:** a type of bond formation in which each atom donates one electron to the bond.

**homogenous:** A common misspelling of homogeneous.

**homoharringtonine :** A drug used to treat certain types of chronic myelogenous leukemia (CML) that have not gotten better after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Homoharringtonine blocks certain proteins involved in cancer cell growth and may kill cancer cells. It is a type of plant alkaloid. Also called omacetaxine mepesuccinate and Synribo.

**homolog:** A compound belonging to a series of compounds that differ by a repeating group. For example, propanol ( $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ ), n-butanol ( $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$ ), and n-pentanol ( $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$ ) are homologs; they belong to a homologous series  $\text{CH}_3(\text{CH}_2)_n\text{OH}$ .

**Homologous chromosomes:** Chromosomes that carry the same pattern of genes, but not necessarily the same alleles.

**homologous genetic recombination:** Recombination between two DNA molecules of similar sequence, occurring in all cells; occurs during meiosis and mitosis in eukaryotes.

**Homologous recombination:** Recombination between homologous segments of two DNA molecules. Also called general recombination.

**homologous series:** A homologous series is a family of organic molecules all containing the same groupings of atoms (for example, the alcohols, which all contain the  $-\text{OH}$  group). OR a set of compounds with common

compositions; for example, the alkanes, the alkenes, and the alkynes. OR a set of compounds with common compositions; for example, the alkanes.

**Homologs:** Molecules that have evolved from a common ancestor. Also referred to as homologous molecules.

**homologue:** one of a series of compounds in which each member differs from the next by a constant unit.

**homolytic cleavage:** the fracture of a bond in such a manner that both of the atoms receive one of the bond's electrons. This symmetrical bond rupture forms free radicals; in reactions, it generates free-radical mechanisms.

**Homopolymer:** Homopolymers are polymers which are made up of one single repeated basic unit or (mono)mer. OR Plastic that results from the polymerization of a single monomer. OR A polymer, consisting of (neglecting the ends, branch junctions, and other minor irregularities) a single type of repeating unit. OR a polymer that consists of only one monomer unit; their properties can be regulated via molar mass distribution and the degree of isotacticity (stereoregular structure). OR Homopolymers are polymers which are made up of one single repeated basic unit or (mono)mer. OR The result of the polymerization of a single monomer. In the plastic industry a homopolymer is a sequence of identical bases. OR A polymer composed of only one type of monomeric building block.

**Homotropic effects:** The effects of substrate molecules on allosteric enzymes.

**homotropic enzyme:** An allosteric enzyme that uses its substrate as a modulator.

**Homozygous:** Describing an organism (a homozygote) that carries two identical alleles for a given gene. OR An ab initio program package; genealogically related to GAMESS. OR two identical alleles that are present for a particular characteristic.

**homozygous genotype :** Occurs when both alleles at a particular gene locus are the same. A person may be homozygous for the normal allele or for a mutation.

**honey:** A sweet and viscous fluid produced by honey bees from flower nectar and other plant fluids.

**honey-containing mouthwash:** A mouthwash containing honey with potential antimucositis activity. Upon rinsing with this mouthwash, honey modulates the production of pro-inflammatory cytokines which may kill bacteria thus potentially preventing inflammation of the mucosal membranes and may decrease chemotherapy- and/or radiation-induced oral mucositis. In addition, honey may have a protective and healing effect on the oral mucosa. Check for active clinical trials using this agent.

**Honeycomb:** Manufactured product consisting of sheet metal or a resin impregnated sheet material (paper, fibrous, glass, etc.) which has been formed into hexagonal-shaped cells. Used as core material for sandwich constructions.

**Honing:** A machining process that sharpens, enlarges, and smooths material through the use of a fine-grit stone

**hookah :** A device used to smoke a special type of tobacco that comes in different flavors. In a hookah, charcoal is used to heat the tobacco. The smoke from the heated tobacco is cooled by passing it through a water-filled bowl. It is then inhaled through a flexible tube with a mouthpiece. Hookah tobacco smoke contains nicotine and many cancer-causing chemicals that are harmful to both smokers and nonsmokers. Hookah smoking can lead to nicotine addiction and can cause many of the same health problems as cigarette smoking. Hookah smoking is not safer than cigarette smoking. Also called water pipe.

**Hoop Stress:** The force per unit area in the wall of the pipe in the circumferential orientation due to internal hydrostatic pressure. OR the circumferential stress imposed on a cylindrical wall by internal pressure loading.

**HOPPER:** The container that holds the resin before it enters the extruder feed zone. OR In polymer processing, the container holding a supply of molding material to be fed to the screw or ram. The hopper may be intermittently filled or continuously fed. OR A funnel-shaped container mounted over the feed throat of a molding machine. It holds fresh material to be gravity fed into the feed zone of the heating barrel. Hoppers are normally designed to hold enough material to run the injection molding process for an average of two hours. OR Conical feed reservoir into which molding powder is loaded and from which it falls into a molding machine or extruder, sometimes through a metering device.

**HOPPER BLENDER:** Mixes material such as virgin resin, regrind, blowing agents, fillers, and colorants in desired proportions. Materials to be blended are metered in ratio to a mixing chamber and then discharged into the hopper of the processing machine.

**Hopper Dryer:** A combination feeding and drying device for extrusion and injection molding of thermoplastics. Hot air flows upward through the hopper containing the feed pellets. OR Auxiliary equipment that removes moisture from resin pellets. OR Auxiliary equipment for the plastic extrusion process that removes moisture from the resin pellets. OR Auxiliary equipment for automatically loading resin pellets into machine hopper.

**HOPPER LOADER:** A device for automatically feeding resins to hoppers of extruders, injection molding machines, and the like. OR A curved pipe through which molding powders are pneumatically conveyed from shipping drums to machine hoppers. OR Auxiliary equipment for automatically loading plastic pellets into the hopper.

**Horizontal gene transfer:** The passing of pieces of DNA (plasmids) between species that provide a selective advantage in particular environments.

**Horizontal Gene Transfer:** The process by which bacteria and Archaea transfer genes to other bacteria or Archaea, especially obvious when a sudden environmental change forces resident bacteria or Archaea to seek a faster method of evolution than will occur slowly due to mutations of native DNA. Methods used include: 1. conjugation - One cell binds to another cell, often unrelated, opening a connection through which it can pass a strand of DNA, copied from its primary DNA, into a separate contained packet of DNA, called a plasmid, to the recipient cell, without risking spilling cell contents from either donor or recipient cell into the environment.

Conjugation is often a two-way transfer that enhances survival of both participants. If bacteria develop antibiotic resistance due to improper application of antibiotics (incorrect selection of treatment antibiotic, insufficient dosage to kill ALL bacteria exposed to the antibiotic), escaping bacteria may choose to pass antibiotic resistance along in plasmids to other bacteria they encounter in their environment (whether they normally live in hospitals, sewage systems, lakes, ponds, rivers or turf that is grazed by livestock). 2. DNA scavenging - One cell samples DNA strands strewn about

during cell wall breakdown following death of bacterial cells that were intolerant of primary environmental conditions (temperature, pH, salinity, available food sources, antibiotics produced by native bacteria to keep them dominant, etc.), sometimes delivering beneficial enzyme pathways to the resident species. When horizontal gene transfer happens naturally in the environment, huge leaps in adaptation can occur, creating new species very distinct from parental strains. I

**hormonal therapy :** Treatment that adds, blocks, or removes hormones. For certain conditions (such as diabetes or menopause), hormones are given to adjust low hormone levels. To slow or stop the growth of certain cancers (such as prostate and breast cancer), synthetic hormones or other drugs may be given to block the body's natural hormones. Sometimes surgery is needed to remove the gland that makes a certain hormone. Also called endocrine therapy, hormone therapy, and hormone treatment.

**Hormone:** A chemical substance made in one cell and secreted so as to influence the metabolic activity of a select group of cells located at other sites in the organism.

**hormone:** A molecule produced by endocrine glands that controls specific biological processes like growth and metabolism. OR A chemical substance synthesized in small amounts by an endocrine tissue and carried in the blood to another tissue, where it acts as a messenger to regulate the function of the target tissue or organ.

**hormone :** One of many substances made by glands in the body. Hormones circulate in the bloodstream and control the actions of certain cells or organs. Some hormones can also be made in the laboratory.

**Hormone receptor:** A protein that is located on the cell membrane or inside the responsive cell and that interacts specifically with the hormone. OR A protein in, or on the surface of, target cells that binds a specific hormone and initiates the cellular response.

**hormone receptor :** A cell protein that binds a specific hormone. The hormone receptor may be on the surface of the cell or inside the cell. Many changes take place in a cell after a hormone binds to its receptor.

**hormone receptor test :** A test to measure the amount of certain proteins, called hormone receptors, in cancer tissue. Hormones can attach to these proteins. A high level of hormone receptors may mean that hormones help the cancer grow.

**hormone replacement therapy :** Treatment with hormones to replace natural hormones when the body does not make enough. For example, hormone replacement therapy may be given when the thyroid gland does not make enough thyroid hormone or when the pituitary gland does not make enough growth hormone. Or, it may be given to women after menopause to replace the hormones estrogen and progesterone that are no longer made by the body. Also called HRT.

**Hormone response elements (hres):** Specific DNA sequences that bind members of the nuclear receptor family of transcription factors; hres for steroid receptors are palindromic 6-bp sequences separated by a 3-bp spacer.

**hormone responsive :** In oncology, describes cancer that responds to hormone treatment.

**hormone therapy :** Treatment that adds, blocks, or removes hormones. For certain conditions (such as diabetes or menopause), hormones are given to adjust low hormone levels. To slow or stop the growth of certain cancers (such as prostate and breast cancer), synthetic hormones or other drugs may be given to block the body's natural hormones. Sometimes surgery is needed to remove the gland that makes a certain hormone. Also called endocrine therapy, hormonal therapy, and hormone treatment.

**hormone treatment :** Treatment that adds, blocks, or removes hormones. For certain conditions (such as diabetes or menopause), hormones are given to adjust low hormone levels. To slow or stop the growth of certain cancers (such as prostate and breast cancer), synthetic hormones or other drugs may be given to block the body's natural hormones. Sometimes surgery is needed to remove the gland that makes a certain hormone. Also called endocrine therapy, hormonal therapy, and hormone therapy.

**Hormone-binding domain:** A conserved 240-residue domain in members of the nuclear receptor superfamily of transcription factors that binds a hormone or hormonelike molecule, thus activating the factor.

**hormone-refractory :** In medicine, describes a disease or condition that does not respond to treatment with hormones. Also called hormone-resistant.

**hormone-resistant :** In medicine, describes a disease or condition that does not respond to treatment with hormones. Also called hormone-refractory.

**hormones:** biochemical substances produced within plant or animal cells, or glands, that exert a particular effect.

**horn:** a sharply defined peak that has formed from erosional processes along the rim of a cirque.

**Horner syndrome :** A condition in which one side of the face is flushed, does not produce sweat, and has a constricted pupil and drooping eyelid. It can be caused by an injury to, or paralysis of, nerves in the neck, or by a tumor.

**Horse Latitudes:** area of little surface winds and high pressure along 30° N latitude.

**horst:** a feature that results when a block that is bounded by normal faults experiences a compressive force that forces the block upward, forming mountainous terrain.

**Hose:** Hose A tube that has been reinforced with an innerbraid. Freelin-Wade offers a variety of flexible hose products.

**hospice :** A program that gives special care to people who are near the end of life and have stopped treatment to cure or control their disease. Hospice offers physical, emotional, social, and spiritual support for patients and their families. The main goal of hospice care is to control pain and other symptoms of illness so patients can be as comfortable and alert as possible. It is usually given at home, but may also be given in a hospice center, hospital, or nursing home.

**hospitalist :** A medical doctor who manages and coordinates the daily medical care of patients while they are in the hospital. A hospitalist may also supervise and teach medical students, interns, and residents. A patient's personal doctor will work with a hospitalist to care for his or her patient while the patient is in the hospital.

**Host cell:** A cell used for growth and reproduction of a virus. OR A cell that is infected by a virus or another type of microorganism.

**host dendritic cell vaccine-001 MSSM/BIIR:** A dendritic cell (DC) vaccine containing ex vivo expanded autologous DCs obtained from a patient with leukemia with potential immunostimulating activity. Upon reintroduction into the host, the host dendritic cell vaccine-001 MSSM/BIIR may stimulate the immune system to mount a leukemia-specific cytotoxic T lymphocyte (CTL) response.

**Hot:** A colloquial term meaning highly radioactive.

**hot (circuit):** connected, alive, energized.

**hot flash :** A sudden, temporary onset of body warmth, flushing, and sweating (often associated with menopause).

**Hot Gas Welding:** a technique for joining thermoplastic materials (usually sheet) whereby the materials are softened by a jet of hot air from a welding torch, and joining together at the softened points. Generally thin rod if the same material is used to fill and consolidate the gap. OR Hot-plate welding consists of two stages: Two parts to be joined together are placed close to or in contact with heating modules that are first pre-heated to the temperature needed for assembly. Secondly, once the parts soften sufficiently they are removed from the heating module and quickly brought into contact for the controlled assembly phase.

**Hot hardness:** Ability of a coating to retain hardness and wear resistance at elevated temperatures. Usually a characteristic of coatings based on thermosetting resin binders.

**hot nodule :** When radioactive material is used to examine the thyroid with a scanner, nodules that collect more radioactive material than the surrounding thyroid tissue are considered "hot." Hot nodules are rarely malignant. Hot nodules are sometimes called hyperfunctioning nodules.

**Hot Runner Manifold:** Runner less plastic injection molding of a thermoplastic, the melt stays molten until it reaches gate at cavity.

**hot spot:** weak or thin area in a plate that allows magma to rise up and reach the surface. OR The region in a radiation/contamination area where the level of radiation/contamination is significantly greater than in neighboring regions in the area.

**hot spring:** a spring with water 6 to 9 degrees centigrade (11 to 16 degrees Fahrenheit) warmer than the mean annual air temperature for the locality where it occurs. OR groundwater heated by magma rising to the surface through an opening in the ground.

**hot springs deposit:** a disseminated metal deposit formed in response to hot spring activity at the surface of the earth.

**Hot Stamp:** process for marking plastic by applying a leaf to the surface through the use of hot metal dies.

**Hot Stamping:** Dry printing method in which a heated die and foil are used to apply graphics to a surface. OR Engraving operation for marking plastics in which roll leaf is stamped with heated metal dies onto the face of an article by means of felt rolls, ink is applied to type or by means of heat and pressure, type is impressed into the material, leaving the marking compound in the indentation

**Hot surface:** In the painting sense this denotes a highly absorbent surface which tends to take up the liquid content of paint very rapidly.

**HOT TACK:** Hot tack is a measure of the strength of a heat seal before the seal has cooled completely.

**Hot tip gate:** A specialized gate that injects the resin into a face on the A-side of the mold. This type of gate doesn't require a runner or sprue.

**Hot-Runner Mold:** A mold in which the runners are insulated from the chilled cavities and are kept hot. Hot-runner molds make parts that have no scrap. OR A mold in which the runners are insulated from the chilled cavities and are kept hot. Parting line is at gate of cavity, runners are in separate plate(s), so they are not, as is the case usually, ejected with the piece. OR Hot runner molds consist of 2 plates that are heated with a manifold system. The manifold sends the melted plastic to nozzles which fill the part cavities.

**Hot-stamping:** Engraving operation for marketing plastics in which roll leaf is stamped with heated metal dies onto the face of the plastics. Ink compounds can also be used. By means of felt rolls, ink is applied to type and by means of heat and pressure, type is impressed into the material, leaving the marking compound in the indentation. OR Engraving operation for marking plastics in which roll leaf is stamped with heated metal dies onto the face of the plastics.

**HOT/HEATED MANIFOLD MOLD:** A thermoplastic injection mold in which the portion of the mold which contains the runner system has its own heating elements which keep the molding material in a plastic state ready for injection into the cavities, from which the manifold is insulated.

**HOT/HEATED MANIFOLD MOLD:** A thermoplastic injection mold wherein the portion of the mold that contains the runner system has its own heating elements that keep the molding material in a plastic state ready for injection into the cavities from which the manifold is insulated.

**hotspot :** In genetics, an area of DNA that is likely to mutate (change).

**House Sewer:** The pipeline connecting the house and drain and the septic tank.

**HPPH:** A lipophilic, second-generation, chlorin-based photosensitizer. Upon intravenous administration, HPPH selectively accumulates in the cytoplasm of cancer or pre-cancerous cells. When laser light is applied, a photodynamic reaction between HPPH and oxygen occurs, resulting in the production of cytotoxic free radicals and singlet oxygen and free radical-mediated cell death. Compared to the first-generation photosensitizer porfimer sodium, HPPH shows improved pharmacokinetic properties and causes only mild skin photosensitivity which declines rapidly within a few days after administration. Check for active clinical trials using this agent. or 2-(1-hexyloxyethyl)-2-devinyl pyropheophorbide-a. A drug that is used in photodynamic therapy that is absorbed by tumor cells; when exposed to light, it becomes active and kills the cancer cells.

**HPV:** A type of virus that can cause abnormal tissue growth (for example, warts) and other changes to cells. Infection for a long time with certain types of HPV can cause cervical cancer. HPV may also play a role in some other types of cancer, such as anal, vaginal, vulvar, penile, oropharyngeal, and squamous cell skin cancers. Also called human papillomavirus.

**HPV 16 E6 peptides vaccine/candida albicans extract:** A human papillomavirus (HPV) type 16 vaccine containing four E6 peptides in combination with the extract of *Candida albicans*, with potential immunomodulating activity. Upon administration of HPV-16 E6 peptides vaccine/*Candida albicans* extract, the four HPV-16 E6 peptides and the *candida albicans* may activate the immune system to mount a cytotoxic T lymphocyte (CTL) response against cells expressing the E6 oncoprotein, resulting in tumor cell lysis. The HPV 16 transforming protein E6 is expressed in precancerous and malignant cervical lesions. *Candida albicans* allergenic extract may be used as a recall antigen to stimulate the immune system against HPV.

**HPV 16 E7 antigen-expressing Lactobacillus casei vaccine BLS-ILB-E710c:** An orally available *Lactobacillus casei* (*L. casei*)-based vaccine expressing the human papillomavirus (HPV) type 16 isoform E7 protein linked to the poly-gamma-glutamate synthetase complex gene PgsA, with potential immunostimulating activity. Upon oral administration, the

expressed HPV 16 E7 may stimulate the immune system to mount a mucosal cytotoxic T-lymphocyte (CTL) response against HPV 16 E7-expressing tumor cells. The poly-glutamic acid synthetase PgsA from *Bacillus subtilis* acts as an anchoring motif that facilitates the expression of the HPV antigen protein on the surface of the bacteria. HPV 16 E7, a cell surface glycoprotein and tumor associated antigen, is overexpressed in various viral-related cancers.

**HPV 16 E7:86-93 peptide vaccine:** A synthetic peptide vaccine consisting of amino acids 86 through 93 (TLGIVCPI) of the viral oncoprotein human papillomavirus (HPV) 16 E7. Vaccination with HPV-16 E7:86-93 peptide, which binds to HLA-A\* 0201 molecule, may stimulate the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells positive for HPV-16 E7. Check for active clinical trials using this agent.

**HPV DNA plasmids therapeutic vaccine VGX-3100:** A DNA vaccine consisting of plasmids encoding the E6 and E7 genes of human papilloma virus (HPV) subtypes 16 and 18, respectively, with potential immunostimulating and antineoplastic activities. Administered via intramuscular electroporation, HPV DNA plasmids therapeutic vaccine VGX-3100 expresses E6 and E7 proteins, which may elicit a cytotoxic T-lymphocyte (CTL) response against cervical cancer cells expressing E6 and E7 proteins, resulting in tumor cell lysis. HPV type 16 and HPV type 18 are the most common HPV types involved in cervical carcinogenesis.

**HPV DNA test :** A laboratory test in which cells are scraped from the cervix to look for DNA of human papillomaviruses (HPV). HPV can cause abnormal tissue growth (for example, warts) and other changes to cells. Infection for a long time with certain types of HPV can cause cervical cancer. HPV can also play a role in other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Also called human papillomavirus DNA test.

**HPV E1/E2 interaction inhibitor gel AP611074:** A topical gel composed of a human papillomavirus (HPV) E1/E2 protein:protein interaction (PPI) inhibitor with potential antiviral activity. Upon topical application of AP611074, this agent prevents binding of the HPV viral proteins E1 to E2, thereby preventing viral DNA replication and growth of HPV. This inhibits viral proliferation and may prevent the formation of anogenital warts

caused by HPV. The HPV proteins E1 and E2 are essential for HPV viral replication.

**HPV E6/E7 DNA vaccine GX-188E:** A therapeutic DNA vaccine encoding the E6/E7 fusion protein of human papillomavirus (HPV) subtypes 16 and 18, plus the immune-enhancer, Fms-like tyrosine kinase-3 ligand (FLT3L), with potential immunostimulating and antineoplastic activities. DNA vaccine GX-188E is administered using a proprietary delivery system that electroporates the vaccine into cervical cells.

Expression of the E6/E7 fusion product may elicit a cytotoxic T-lymphocyte (CTL) response against cervical cancer cells expressing E6 and E7 oncoproteins, resulting in tumor cell lysis. FLT3L is a ligand for the FLT3 tyrosine kinase receptor, which upon activation stimulates the proliferation of hematopoietic progenitor cells. HPV types 16 and 18 are the most common HPV types involved in cervical carcinogenesis. Check for active clinical trials using this agent.

**HPV L1 VLP vaccine V504:** A vaccine formulation consisting of several types of human papillomavirus (HPV)-derived noninfectious virus-like particles (VLPs) with potential immunoprophylactic activity. Upon administration, HPV L1 VLP vaccine V504 may generate humoral immunity against various HPV L1 major capsid proteins, thereby preventing cervical infection upon exposure to the associated HPV types. VLPs are composed of self-assembling L1 major capsid proteins or functional L1 major capsid protein derivatives.

**HPV RNA test :** A laboratory test in which cells are scraped from the cervix to look for RNA of the most common types of human papillomavirus (HPV). Certain types of HPV may cause abnormal tissue growth, such as warts, and other changes to cells. Infection for a long time with other types of HPV may cause cervical cancer. An HPV RNA test may be done with a Pap test to check for HPV infection and cervical cancer. HPV infection may also cause other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Also called human papillomavirus RNA test.

**HPV test:** A laboratory test in which cells are tested for DNA or RNA from certain types of human papillomavirus (HPV) that are known to cause cervical cancer. These high-risk types of HPV can also cause other types of cancer, including cancers of the anus, vagina, vulva, penis, and oropharynx. An HPV test may be done at the same time as a Pap test for cervical cancer

screening in women aged 30 to 65 years. An HPV test may also be done after certain abnormal Pap test results. Also called human papillomavirus test.

**HPV vaccine :** A vaccine used to prevent genital warts, anal cancer, cervical cancer, vulvar cancer, and vaginal cancer caused by certain types of human papillomavirus (HPV). It is also used to prevent lesions that are caused by those viruses and that can lead to anal, cervical, vulvar, or vaginal cancer. Also called human papillomavirus vaccine.

**HPV-6-targeting immunotherapeutic vaccine INO-3106:** A DNA vaccine consisting of plasmids encoding the E6 and E7 genes of human papilloma virus subtype 6 (HPV-6), with potential immunostimulating and antineoplastic activities. Administered via intramuscular electroporation, HPV-6-targeting immunotherapeutic vaccine INO-3106 expresses the HPV-6 E6 and E7 proteins, which may elicit a cytotoxic T-lymphocyte (CTL) response against tumor cells that are expressing those proteins, resulting in tumor cell lysis. HPV-6 infections are associated with aerodigestive malignancies.

**HPV/Pap cotest:** A procedure in which a human papillomavirus (HPV) test and a Pap test are done at the same time to check for cervical cancer. The HPV test looks for DNA or RNA from certain high-risk types of HPV in samples of cells taken from the cervix. The Pap test checks for cervical cancer cells and cell changes that may lead to cervical cancer. The same cell sample may be used for both the HPV test and the Pap test. Women aged 30 to 65 years may have an HPV/Pap cotest every 5 years. Cotesting is more likely to find abnormal cells or cervical cancer than a Pap test alone is. Also called Pap/HPV cotest.

**HPV16 L2/E6/E7 fusion protein vaccine TA-CIN:** A recombinant human papillomavirus (HPV), genetically engineered fusion protein vaccine in which the three HPV16 viral proteins L2, E6 and E7 are fused together in a single tandem fusion protein (TA-CIN; HPV16 L2\E6\E7), with potential immunoprotective and antineoplastic properties. Upon administration, HPV16 L2/E6/E7 fusion protein vaccine TA-CIN may stimulate the immune system to generate HPV16 E6\E7-specific CD4+ and CD8+ T-cell responses as well as the induction of L2-specific antibodies. In addition, this vaccine may prevent infection and the development of other HPV16-

associated diseases. L2, a minor viral capsid protein, is able to induce a strong antibody response against certain HPV types.

**Hras gene :** A gene that may cause cancer when it is mutated (changed). The Hras gene makes the HRAS protein, which is involved in cell signaling pathways, cell growth, and apoptosis (cell death). Agents that block the actions of the mutated Hras gene or its protein in cancer cells may stop the growth of cancer. Also called H-ras gene.

**HRT:** Hours of Retention Time. OR Treatment with hormones to replace natural hormones when the body does not make enough. For example, HRT may be given when the thyroid gland does not make enough thyroid hormone or when the pituitary gland does not make enough growth hormone. Or, it may be given to women after menopause to replace the hormones estrogen and progesterone that are no longer made by the body. Also called hormone replacement therapy.

**HSIL:** A growth on the surface of the cervix with moderately or severely abnormal cells. HSILs are usually caused by certain types of human papillomavirus (HPV) and are found when a Pap test is done. If not treated, these abnormal cells may become cancer and spread to nearby normal tissue. A HSIL is sometimes called moderate or severe dysplasia. Also called high-grade squamous intraepithelial lesion.

**HSP:** One of a group of proteins that help protect cells from stresses such as heat, cold, and low amounts of oxygen or glucose (sugar). HSPs help other proteins function in normal cells and may be present at high levels in cancer cells. Blocking the activity of a HSP called HSP90 is being studied in the treatment of cancer. Other HSPs including HSP70 and gp96 are being studied in vaccines to treat cancer. Also called heat-shock protein and stress protein.

**Hsp70-peptide TKD/IL-2-activated autologous natural killer cells:** A preparation of autologous natural killer (NK) cells that are stimulated ex vivo by a 14-mer heat shock protein 70 (Hsp70) TKD peptide and interleukin-2 (IL-2), with potential tumor-selective cytolytic activity. Upon re-infusion into the patient, the treated NK cells recognize and bind to Hsp70-expressing tumor cells, which induces NK-mediated tumor cell lysis. Hsp70, a membrane-bound, stress-inducible protein, is overexpressed on almost all tumor cells; however, it is absent or minimally present on

normal, healthy cells. TKD is the C-terminal substrate-binding domain of Hsp70 and is the structure recognized by the activated NK cells.

**Hsp90 antagonist KW-2478:** An agent that targets the human heat-shock protein 90 (Hsp90) with potential antineoplastic activity. Although the mechanism of action remains to be fully elucidated, Hsp90 antagonist KW-2478 appears to inhibit Hsp90, resulting in impaired signal transduction, inhibition of cell proliferation, and the induction of apoptosis in tumor cells. HSP90 is a molecular chaperone that plays a key role in the conformational maturation of oncogenic signaling proteins, such as HER2/ERBB2, AKT, RAF1, BCR-ABL, and mutated p53, as well as many other molecules that are important in cell cycle regulation or immune responses.

**Hsp90 inhibitor AB-010:** An orally bioavailable nanoparticle albumin-bound inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor AB-010 selectively binds to Hsp90, inhibiting its chaperone function and promoting the degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival. This agent may inhibit the growth of a wide variety of cancer cell types; the incorporation of albumin into its formulation may facilitate its endothelial transcytosis through the gp60-regulated albumin transport pathway. Hsp90, a chaperone protein upregulated in a variety of tumor cells, regulates the folding and degradation of many oncogenic signaling proteins. Check for active clinical trials using this agent.

**Hsp90 inhibitor AT13387:** A synthetic, orally bioavailable, small-molecule inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor AT13387 selectively binds to Hsp90, thereby inhibiting its chaperone function and promoting the degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival. Hsp90, a chaperone protein upregulated in a variety of tumor cells, regulates the folding, stability and degradation of many oncogenic signaling proteins.

**Hsp90 inhibitor AUY922:** A derivative of 4,5-diarylisoaxazole and a third-generation heat shock protein 90 (Hsp90) inhibitor with potential antineoplastic activity. Hsp90 inhibitor AUY922 has been shown to bind with high affinity to and inhibit Hsp90, resulting in the proteasomal degradation of oncogenic client proteins; the inhibition of cell proliferation; and the elevation of heat shock protein 72 (Hsp72) in a wide range of

human tumor cell lines. Hsp90, a 90 kDa molecular chaperone, plays a key role in the conformational maturation, stability and function of other substrate or "client" proteins within the cell, many of which are involved in signal transduction, cell cycle regulation and apoptosis, including kinases, transcription factors and hormone receptors. Hsp72 exhibits anti-apoptotic functions; its up-regulation may be used as a surrogate marker for Hsp90 inhibition. Check for active clinical trials using this agent.

**Hsp90 inhibitor BIIB028:** A small-molecule inhibitor of heat shock protein (Hsp) 90 with potential antineoplastic activity. Hsp90 inhibitor BIIB028 blocks the binding of oncogenic client proteins to Hsp90, which may result in the proteasomal degradation of these proteins and so the inhibition of tumor cell proliferation. Hsp90 is a molecular chaperone that plays a key role in the conformational maturation of oncogenic signaling proteins, such as Her2/ErbB2, Akt, Raf1, Bcr-Abl, and mutated p53, in addition to other molecules involved in cell cycle regulation and immune responses.

**Hsp90 inhibitor CNF2024:** An orally active, purine-scaffold, small-molecule inhibitor of heat shock protein 90 (HSP90) with potential antineoplastic activity. HSP90 inhibitor CNF2024 specifically blocks active HSP90, inhibiting its chaperone function and promoting the degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival; this may result in the inhibition of cellular proliferation in susceptible tumor cell populations. HSP90, a chaperone protein upregulated in a variety of tumor cell types, regulates the folding and degradation of many oncogenic signaling proteins.

**Hsp90 inhibitor debio 0932:** An orally active and small molecule inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor Debio 0932 specifically blocks Hsp90, thereby inhibiting its chaperone function and promoting the degradation of its client proteins, many of which are oncogenic signaling proteins involved in tumor cell proliferation and survival. This may lead to an inhibition of tumor cell proliferation. Hsp90, a chaperone protein upregulated in a variety of tumor cells, regulates the folding, stabilization and degradation of many oncogenic signaling proteins.

**Hsp90 inhibitor DS-2248:** An orally active and small molecule inhibitor of heat shock protein 90 (Hsp90), with potential antineoplastic activity.

Upon oral administration, Hsp90 inhibitor DS-2248 specifically blocks Hsp90, which inhibits its chaperone function and promotes the proteasomal degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival. This may lead to an inhibition of tumor cell proliferation. Hsp90, a chaperone complex protein upregulated in a variety of tumor cell types, regulates the folding and degradation of many oncogenic signaling proteins.

**HSP90 inhibitor HSP990:** An orally bioavailable inhibitor of human heat-shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor Hsp990 binds to and inhibits the activity of Hsp90, which may result in the proteasomal degradation of oncogenic client proteins, including HER2/ERBB2, and the inhibition of tumor cell proliferation. Hsp90, upregulated in a variety of tumor cells, is a molecular chaperone that plays a key role in the conformational maturation, stability and function of oncogenic signaling proteins, such as HER2/ERBB2, AKT, RAF1, BCR-ABL, and mutated p53, as well as many other molecules that are important in cell cycle regulation and/or immune responses.

**Hsp90 inhibitor MPC-3100:** An orally bioavailable, synthetic, second-generation small-molecule inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor MPC-3100 selectively binds to Hsp90, thereby inhibiting its chaperone function and promoting the degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival; this agent may inhibit the growth and survival of a wide variety of cancer cell types. Hsp90, a chaperone protein upregulated in a variety of tumor cells, regulates the folding, stability, and degradation of many oncogenic signaling proteins.

**HSP90 inhibitor PU-H71:** A purine-based heat shock protein 90 (Hsp90) inhibitor with potential antineoplastic activity. Hsp90 inhibitor PU-H71 specifically inhibits active Hsp90, thereby inhibiting its chaperone function and promoting the proteasomal degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival. This may result in the inhibition of cellular proliferation in susceptible tumor cell populations. Hsp90, a molecular chaperone protein, is upregulated in a variety of tumor cell types.

**Hsp90 inhibitor SNX-5422 mesylate:** The orally bioavailable mesylate salt of a synthetic prodrug targeting the human heat-shock protein 90

(Hsp90) with potential antineoplastic activity. Although the mechanism of action remains to be fully elucidated, Hsp90 inhibitor SNX-5422 is rapidly converted to SNX-2112, which accumulates more readily in tumors relative to normal tissues. SNX-2112 inhibits Hsp90, which may result in the proteasomal degradation of oncogenic client proteins, including HER2/ERBB2, and the inhibition of tumor cell proliferation. Hsp90 is a molecular chaperone that plays a key role in the conformational maturation of oncogenic signaling proteins, such as HER2/ERBB2, AKT, RAF1, BCR-ABL, and mutated p53, as well as many other molecules that are important in cell cycle regulation or immune responses.

**Hsp90 inhibitor XL888:** An orally bioavailable, ATP-competitive, small-molecule inhibitor of heat shock protein 90 (Hsp90) with potential antineoplastic activity. Hsp90 inhibitor XL888 specifically binds to Hsp90, inhibiting its chaperone function and promoting the proteasomal degradation of oncogenic signaling proteins involved in tumor cell proliferation and survival; inhibition of tumor cell proliferation may result. Hsp90, a chaperone complex protein upregulated in a variety of tumor cell types, regulates the folding and degradation of many oncogenic signaling proteins, including Her-2 and Met.

**HspE7:** A recombinant chimeric protein composed of the heat shock protein 65 (Hsp65) from *Mycobacterium bovis*, and the human papilloma viral (HPV) protein E7. Hsp65, similar to other members of its family of proteins, elicits a strong immune response and may be used to design vaccines against a number of different cancers. E7 protein is involved in carcinogenesis of anal and cervical tumors, and represents a tumor antigen that may be specifically targeted by lymphocytes.

**HSV:** A type of virus that causes herpes infections and has DNA as its genetic material. There are two types of HSVs. Infections with type 1 viruses cause cold sores on the lips or nostrils. Infections with type 2 viruses cause sores on the genitals (external and internal sex organs and glands). Also called herpes simplex virus, HHV, and human herpesvirus.

**HSV-1 HF10:** A non-engineered, naturally oncolytic, replication-competent spontaneous herpes simplex virus (HSV) type I mutant variant. Upon intratumoral injection, HSV1 HF10 transfects, replicates in, and lyses rapidly dividing cells such as tumor cells. In addition, this agent may increase host immune responses that may kill non-infected tumor cells.

**HSV-TK-transduced donor lymphocytes:** A preparation of donor lymphocytes transduced with the "suicide" gene herpes simplex virus thymidine kinase (HSV-TK) with potential immunomodulating activity. Administration of HSV-TK-transduced lymphocytes after T cell-depleted allogeneic stem cell transplantation allows an early controllable immune reconstitution, which takes advantage of the antitumor effect of donor lymphocytes and helps to mitigate the risk of post-transplant opportunistic infection. To control graft-versus-host disease (GvHD) due to donor lymphocyte infusion, HSV-TK-transduced donor lymphocytes are selectively eliminated by administration of the antiviral agent ganciclovir. Ganciclovir, a prodrug, is readily phosphorylated by the suicide gene HSV-TK within HSV-TK-transduced lymphocytes to its monophosphate form and, subsequently, converted into its active triphosphate form, which specifically kills HSV-TK-transduced donor lymphocytes.

**hTERT I540/R572Y/D988Y multi-peptide vaccine:** A peptide vaccine consisting of multiple epitopes derived from the human telomerase reverse transcriptase (hTERT), the catalytic subunit of human telomerase, with potential immunostimulating and antineoplastic activities. hTERT I540/R572Y/D988Y multi-peptide vaccine contains strongly antigenic peptide epitopes I540 (9-mer), R572Y (9-mer) and D988Y (10-mer). Vaccination with this agent may elicit a cytotoxic T cell (CTL) response against telomerase-expressing tumor cells. Directly linked to tumorigenesis, telomerase is expressed in the majority of human cancer cells but is infrequently expressed in normal cells.

**hTERT mRNA /survivin peptide-double-loaded autologous dendritic cell vaccine:** A cancer vaccine containing autologous dendritic cells (DCs) that are pulsed with mRNA encoding human telomerase reverse transcriptase (hTERT) and survivin peptide, with potential immunostimulatory and antineoplastic activities. Upon administration, hTERT mRNA/survivin peptide-double-loaded autologous dendritic cell vaccine may elicit an immune response against cancer cells expressing hTERT and survivin by activating cytotoxic T-cells (CTLs), natural killer cells (NKs), and B-lymphocytes. The tumor associated antigens (TAAs) hTERT, the catalytic subunit of human telomerase, and survivin, a member of the inhibitor of apoptosis (IAP) family of proteins, may be upregulated in certain tumor cell types and play key roles in tumor cell growth and survival. Check for active clinical trials using this agent.

**hTERT multipeptide/Montanide ISA-51 VG/imiquimod GX 301:** A therapeutic cancer vaccine consisting of four epitopes derived from the human telomerase reverse transcriptase (hTERT), the catalytic subunit of human telomerase, including hTERT (540-548) acetate, hTERT (611-626) acetate, hTERT (672-686) acetate and hTERT (766-780) acetate, emulsified individually in the adjuvant montanide ISA-51 VG and administered with the immune response modifier (IRM) imiquimod, with potential immunostimulating and antineoplastic activities. Each hTERT peptide emulsion is administered individually by intradermal injection. Subsequently, imiquimod is applied topically to the injection site(s). Vaccination with GX 301 may elicit a cytotoxic T-cell (CTL) response against telomerase-expressing tumor cells. Telomerase is expressed in the majority of human cancer cells, infrequently expressed in normal cells, and is directly linked to tumorigenesis. Imiquimod stimulates cytokine production through the activation of toll-like receptor 7 (TLR-7), and also exhibits antiproliferative effects. Montanide ISA-51, also known as incomplete Freund's adjuvant (IFA), is a stabilized water-in-oil emulsion containing mineral oil with mannide oleate, which contains vegetable-grade (VG) oleic acid derived from olive oil. ISA-51 non-specifically stimulates cell-mediated immune responses to antigens.

**hTERT vaccine V934/V935:** A cancer vaccine directed against human telomerase reverse transcriptase (hTERT), the catalytic subunit of human telomerase, with potential immunostimulating and antineoplastic activities. Upon administration, hTERT vaccine V934/V935 may elicit a cytotoxic T cell (CTL) response against telomerase-expressing tumor cells, which may result in tumor cell death. Telomerase is involved in the restoration and maintenance of telomere length and so the functional lifespan of cells. Abnormally reactivated in tumorigenesis, telomerase is expressed in the majority of human cancer cells but is not expressed or is expressed at very low levels in normal cells.

**hTERT-encoding DNA vaccine INVAC-1:** A DNA vaccine consisting of a plasmid encoding a modified, inactive form of the human telomerase reverse transcriptase (hTERT), the catalytic subunit of human telomerase which synthesizes telomeric DNA at the chromosome ends, fused to ubiquitin, with potential immunostimulating and antineoplastic activities. Upon intradermal vaccination of the hTERT encoding DNA vaccine INVAC-1 in combination with electroporation, hTERT protein is expressed

and activates the immune system to mount a cytotoxic T-cell (CTL) response against telomerase-expressing tumor cells, which may result in tumor cell death. Telomerase prolongs the functional lifespan of cells via the restoration and maintenance of telomere length. Abnormally activated in tumorigenesis, telomerase is expressed in the majority of human cancer cells, but its expression is low or non-existent in normal cells. hTERT conjugation to ubiquitin, a 76 amino-acid peptide involved in the regulation of normal protein intracellular turnover in the cytoplasm, enhances proteasome-dependent degradation of the hTERT protein, increases hTERT presentation by major histocompatibility complex (MHC) class I molecules and results in an increased immune response against hTERT.

**hTERT/survivin/CMV multipeptide vaccine:** A vaccine containing multiple peptides derived from the human telomerase reverse transcriptase (hTERT), survivin and cytomegalovirus (CMV), with potential immunostimulating and antineoplastic activities. Upon administration, hTERT/survivin/CMV multipeptide vaccine may elicit a cytotoxic T cell (CTL) response against tumor cells expressing hTERT, survivin and CMV. hTERT, the catalytic subunit of telomerase, and the inhibitor of apoptosis (IAP) family member survivin, both often upregulated in tumor cells, play key roles in tumor cell growth and survival. Further, CMV expression is correlated with certain types of cancer.

**hTERT/survivin/melanoma tumor cell-derived mRNA-transfected dendritic cell vaccine:** A cancer vaccine containing dendritic cells (DCs) that are transfected with messenger RNA (mRNA) encoding human telomerase reverse transcriptase (hTERT) and survivin in addition to patient-specific melanoma-derived mRNA with potential immunostimulatory and antineoplastic activities. Upon administration, hTERT/survivin/melanoma tumor cell-derived mRNA-transfected dendritic cell vaccine may elicit a highly specific cytotoxic T-cell (CTL) response against melanoma cells expressing hTERT, survivin, and patient-specific melanoma-associated antigens. hTERT, the catalytic subunit of human telomerase, and survivin, a member of the inhibitor of apoptosis (IAP) family of proteins, may be upregulated in certain tumor cell types, playing key roles in tumor cell growth and survival.

**HTLV-1:** A type of virus that infects T cells (a type of white blood cell) and can cause leukemia and lymphoma. HTLV-1 is spread by sharing

syringes or needles, through blood transfusions or sexual contact, and from mother to child during birth or breast-feeding. Also called human T-cell leukemia virus type 1 and human T-cell lymphotropic virus type 1.

**<http://www.nih.gov>**: A drug used to treat prostate cancer that has spread to other parts of the body. It is used in patients who have had surgery to remove the testicles (orchiectomy). Nilutamide binds to proteins called androgen receptors, which are found in some prostate cancer cells, and keeps androgens (male hormones) from binding to the receptors. This blocks the ability of androgens to cause prostate cancer cells to grow. Nilutamide is a type of antiandrogen. Also called Nilandron.

**hu14.18-IL2 fusion protein**: A recombinant protein consisting of the hu14.18 monoclonal antibody fused to the cytokine interleukin-2 (IL2) with potential antineoplastic activity. The monoclonal antibody portion of the hu14.18-IL2 fusion protein binds to tumor cells expressing the GD2 antigen (melanoma, neuroblastoma and certain other tumors); the Fc component of the fusion protein antibody moiety and natural killer (NK) cells mediate antibody-dependent cell-mediated cytotoxicity (ADCC) and complement-dependent cellular cytotoxicity (CDCC) towards GD2-expressing tumor cells. The localized IL2 moiety of the fusion protein stimulates NK and T-cell antitumor cellular immune responses.

**hu14.18-interleukin-2 fusion protein** : An anticancer drug in which hu14.18, a monoclonal antibody, is combined with interleukin-2. The monoclonal antibody binds to the cancer cells and delivers IL-2, which stimulates the immune system to destroy the cancer cells.

**Hu3S193**: A monoclonal antibody that is being studied in the treatment of some types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Hu3S193 binds to the protein Lewis(y), which is found on colon, breast, lung, ovary, and prostate cancer cells.

**huachansu**: A traditional Chinese medicine (TCM) containing a water soluble Bufo toad skin extract that includes the cardiac glycosides bufalin, cinobufagin and resibufogenin with potential antineoplastic and antiangiogenic activities. Although the exact mechanism of action of this TCM has yet to be fully elucidated, huachansu, which may be administered in an injectable form, may induce cell cycle arrest and apoptosis by

suppressing the expression of anti-apoptotic proteins, such as Bcl-2, while inducing the expression of pro-apoptotic proteins, such as BAX.

**HuAFP31:** A monoclonal antibody being studied in the treatment of several types of cancer. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. HuAFP31 attaches to tumor cells that make alpha fetoprotein (AFP). This makes it easier for T cells to find and kill the tumor cells.

**Huaier extract granule:** An orally bioavailable traditional Chinese medicine (TCM) composed of a granule containing an aqueous extract of *Trametes robiniophila murr* (Huaier), a mushroom found on hardwood tree trunks, with potential antineoplastic and anti-angiogenic activities. Although the exact mechanism of action through which Huaier exerts its effects is largely unknown, upon administration, this agent induces cell cycle arrest and apoptosis, and inhibits proliferation and migration of susceptible cancer cells through the modulation of various signal transduction pathways involved in carcinogenesis and angiogenesis.

**Huang Lian :** A Chinese herb that has been used as a treatment for a variety of medical problems. It is being studied as an anticancer drug.

**huBC1-huIL12 fusion protein AS1409:** An immunoconjugate consisting of the anti-tumor cytokine interleukin-12 (IL-12) fused to the tumor-targeting antibody BC1 with potential immunostimulatory and antineoplastic activities. The antibody moiety of huBC1-huIL12 fusion protein AS1409 binds to the human fibronectin splice variant ED-B, delivering IL-12 directly to the tumor vasculature; tumor vasculature-targeted IL-12 initiates localized immune cascade responses and exhibits cytotoxic and anti-angiogenic activity while minimizing the systemic side effects of IL-12. The human fibronectin splice variant ED-B is over-expressed in the extracellular matrix and blood vessels of tumor tissues.

**huC242-DM4:** A substance being studied in the treatment of some types of cancer. It is made by linking the monoclonal antibody huC242 to a toxic substance called maytansinoid DM4. The monoclonal antibody binds to the surfaces of cancer cells and the maytansinoid DM4 enters the cells and blocks their growth. It is a type of immunotoxin. Also called maytansinoid DM4-conjugated humanized monoclonal antibody huC242.

**Hückel's rule:** a rule stating that a compound with  $4n + 2 \pi$  electrons will have a closed shell electron configuration and will be aromatic.

**Hue:** the attribute of a color by which we distinguish red from green, blue from yellow, etc. It is what we think of as the colors in a color wheel. Black, white and the grays between them are called neutral colors. They have no hue. Colors that have a hue are called chromatic colors. In color space hues are arranged circularly around the vertical axis. OR The attribute of a colour that determines whether it is red yellow green blue purple etc.

**HuHMFG1:** A monoclonal antibody that binds to the protein MUC1, which is found on breast, ovarian, pancreatic, gastric, and colon cancer cells. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. HuHMFG1 is being studied in the treatment of some types of cancer.

**HuLuc63:** A drug used with lenalidomide and dexamethasone to treat multiple myeloma. It is used in patients whose cancer was treated with one to three anticancer therapies. HuLuc63 binds to a protein called CS1, which is found on myeloma cells and some types of immune cells. HuLuc63 may block CS1 and help the immune system kill cancer cells. It is a type of monoclonal antibody. Also called elotuzumab and Empliciti.

**Humalog:** (Other name for: insulin lispro)

**human combinatorial antibody library-based antibody VAY736:** A fully human combinatorial antibody library (HuCAL)-derived monoclonal antibody targeting the B-cell-activating factor receptor (BAFF-R), with potential anti-inflammatory and antineoplastic activities. Upon administration of HuCAL-based antibody VAY736, the antibody targets and binds to BAFF-R, which inhibits both BAFF/BAFF-R interaction and BAFF-R-mediated signaling. This may decrease cell growth in tumor cells expressing BAFF-R. BAFF-R, also known as tumor necrosis factor receptor superfamily member 13C, is overexpressed in certain tumor cell types and autoimmune diseases. In cancer cells, BAFF-R plays a key role in B-cell proliferation and survival. VAY736 was developed using HuCAL technology.

**human corticotropin-releasing factor :** A substance being studied in the treatment of brain cancer. It is made naturally by the hypothalamus (a part of the brain) and can also be made in the laboratory. Human corticotropin-releasing factor may help reduce symptoms caused by edema (swelling) of the brain. It is a type of neurohormone. Also called hCRF.

**human corticotropin-releasing factor :** A substance being studied in the treatment of brain cancer. It is made naturally by the hypothalamus (a part of the brain) and can also be made in the laboratory. Human corticotropin-releasing factor may help reduce symptoms caused by edema (swelling) of the brain. It is a type of neurohormone. Also called hCRF.

**human ecology:** The interrelations between man and his physical, biological, socio-economic, and cultural environment, including the interrelations between himself and other individuals or groups of other species, and the interrelationship between himself and his entire environment. Because of the broad approach, human ecology studies are almost always multidisciplinary (WHO, 1988).

**human epidermal growth factor receptor 2 :** A protein involved in normal cell growth. It is found on some types of cancer cells, including breast and ovarian. Cancer cells removed from the body may be tested for the presence of human epidermal growth factor receptor 2 to help decide the best type of treatment. Human epidermal growth factor receptor 2 is a type of receptor tyrosine kinase. Also called c-erbB-2, HER2/neu, and human EGF receptor 2.

**human epidermal growth factor receptor 2 negative :** Describes cancer cells that do not have a large amount of a protein called HER2 on their surface. In normal cells, HER2 helps to control cell growth. Cancer cells that are human epidermal growth factor receptor 2 negative may grow more slowly and are less likely to recur (come back) or spread to other parts of the body than cancer cells that have a large amount of HER2 on their surface. Checking for the amount of HER2 on some types of cancer cells may help plan treatment. These cancers include breast, bladder, ovarian, pancreatic, and stomach cancers. Also called HER2 negative.

**human epidermal growth factor receptor 2 positive :** Describes cancer cells that have too much of a protein called HER2 on their surface. In normal cells, HER2 helps to control cell growth. When it is made in larger than normal amounts by cancer cells, the cells may grow more quickly and be more likely to spread to other parts of the body. Checking to see if a cancer is human epidermal growth factor receptor 2 positive may help plan treatment, which may include drugs that kill human epidermal growth factor receptor 2 positive cancer cells. Cancers that may be human epidermal growth factor receptor 2 positive include breast, bladder,

pancreatic, ovarian, and stomach cancers. Also called c-erbB-2 positive and HER2 positive.

**human epidermal growth factor receptor 2 test :** A laboratory test that measures the amount of HER2 protein on cancer cells or how many copies of the HER2 gene are in the DNA. The HER2 protein is involved in normal cell growth. It may be made in larger than normal amounts by some types of cancer, including breast, ovarian, bladder, pancreatic, and stomach cancer. This may cause cancer cells to grow more quickly and spread to other parts of the body. A human epidermal growth factor receptor 2 test may be done to help plan treatment. It is a type of tumor marker test. Also called HER2 test and HER2/neu test.

**human epididymis protein 4 :** A protein found on cells that line the lungs and reproductive organs, such as the ovaries. Human epididymis protein 4 may be found in higher than normal amounts in patients with some types of cancer, including ovarian epithelial cancer. Measuring the amount of human epididymis protein 4 in the blood may help plan cancer treatment or find out if cancer is getting worse or has come back. It is a type of tumor marker. Also called HE4.

**human gp100 plasmid DNA vaccine:** A vaccine consisting of a plasmid DNA encoding the human melanoma-associated antigen gp100. Upon administration, expressed gp100 antigen may stimulate a cytotoxic T cell HLA-A2.1-restricted immune response against tumor cells that express this antigen, resulting in tumor cell lysis.

**human herpesvirus :** A type of virus that causes herpes infections and has DNA as its genetic material. There are two types of human herpesviruses. Infections with type 1 viruses cause cold sores on the lips or nostrils. Infections with type 2 viruses cause sores on the genitals (external and internal sex organs and glands). Also called herpes simplex virus, HHV, and HSV.

**human herpesvirus 8 :** A type of virus that causes Kaposi sarcoma (a rare cancer in which lesions grow in the skin, lymph nodes, lining of the mouth, nose, and throat, and other tissues of the body). Human herpesvirus 8 also causes certain types of lymphoma (cancer that begins in cells of the immune system). Also called HHV8, Kaposi sarcoma-associated herpesvirus, and KSHV.

**human immunodeficiency virus :** The cause of acquired immunodeficiency syndrome (AIDS). Also called HIV.

**Human immunodeficiency virus (HIV):** The cause of acquired immune deficiency syndrome (AIDS). HIV destroys helper T cells by increasing the permeability of the T cell membrane. Loss of the helper T cells severely cripples the immune system, rendering the victim susceptible to many types of infection.

**human lactoferrin peptide hLF1-11:** A synthetic peptide corresponding to the first 11 N-terminal amino acids of human lactoferrin (hLF1-11) with potential antimicrobial activity. Although the exact mechanism through which this peptide exerts its effect has yet to be fully elucidated, hLF1-11 binds ferric iron, limiting the availability of free iron for microbial functions. hLF1-11 may be effective against a variety of bacteria and fungi, including multidrug-resistant (MDR) strains of *Acinetobacter baumannii* and *Staphylococcus aureus*, and fluconazole-resistant *Candida albicans* strains. Human lactoferrin, a 692 amino acid glycoprotein belonging to the transferrin family of metal-binding proteins, can be found in human milk and other secretory fluids, and the secondary granules of polymorphonuclear (PMN) cells. Human lactoferrin plays a role in the innate defense of mucosal surfaces.

**human leukocyte antigen :** A type of molecule found on the surface of most cells in the body. Human leukocyte antigens play an important part in the body's immune response to foreign substances. They make up a person's tissue type, which varies from person to person. Human leukocyte antigen tests are done before a donor stem cell or organ transplant, to find out if tissues match between the donor and the person receiving the transplant. Also called HLA and human lymphocyte antigen.

**Human leukocyte antigen (HLA):** The name given to a member of the major-histocompatibility complex proteins in human beings.

**human leukocyte antigen matching :** A process in which blood or tissue samples are tested for human leukocyte antigens (HLAs). HLAs are molecules found on the surface of most cells in the body. They make up a person's tissue type, which varies from person to person. They play an important part in the body's immune response to foreign substances. Human leukocyte antigen matching is done before a donor stem cell or organ

transplant to find out if tissues match between the donor and the person receiving the transplant. Also called HLA matching.

**human MHC non-restricted cytotoxic T-cell line TALL-104:** An allogeneic human cytotoxic T-lymphocyte cell line with potential antineoplastic activity. Human MHC non-restricted cytotoxic T-cell line TALL-104 is an IL-2-dependent human leukemic T cell line, expressing CD8 and CD3 but not CD16. Upon administration, human MHC non-restricted cytotoxic T-cell line TALL-104 interacts with tumor cells and activates apoptotic and necrotic pathways, resulting in tumor cell lysis. Endowed with MHC-non-restricted killer activity, these cells are cytotoxic against a broad range of tumor cells, sparing normal cells. In addition, TALL-104 may induce secretion of various cytokines, such as interferon-gamma, potentially enhancing its cytotoxic activity.

**human monoclonal antibody 216:** A naturally-occurring human IgM monoclonal antibody with potential antineoplastic activity. Human monoclonal antibody 216, derived from the gene VH4-34, binds to the glycosylated epitope CDIM on the surface of both malignant and normal B cells. Upon binding to B cells, this antibody may crosslink two or more CDIM molecules, resulting in the formation of cell membrane pores, the disruption of cell membrane integrity, and B cell lysis; this mechanism of antibody-mediated cell death is direct and does not involve mechanisms of complement-mediated cytotoxicity or antibody-dependent cell-mediated cytotoxicity (ADCC). CDIM is the glyco-moiety of a 75 kD MW B-cell cell surface glycoprotein.

**human monoclonal antibody B11-hCG beta fusion protein CDX-1307:** A human monoclonal antibody (B11) directed against the mannose receptor and linked to the beta-subunit of human chorionic gonadotropin (hCG beta) with potential immunostimulating and antineoplastic activities. The monoclonal antibody moiety of human monoclonal antibody B11-hCG beta fusion protein CDX-1307 binds to mannose receptors on antigen presenting cells (APCs), including human dendritic cells (DCs) and macrophages. Upon internalization and processing, APCs present the processed hCG beta antigen on their cell surfaces, which may initiate an antibody-dependent cell-mediated cytotoxicity (ADCC) response against hCG beta-expressing tumor cells. The tumor-associated antigen (TAA) hCG beta is selectively overexpressed by a number of tumors including breast, colorectal,

pancreatic, bladder and ovarian tumors; its expression may correlate with the stage of disease.

**human myeloid progenitor cells CLT-008:** Early- to late-stage myeloid progenitor cells derived from adult human stem cells with potential hematopoietic activity. Upon infusion, human myeloid progenitor cells CLT-008 proliferate into mature myeloid cells, including granulocytes, macrophages, platelets, and erythrocytes. These myeloid progenitor cells die within forty-five days after a burst of hematopoiesis. This agent cannot create lymphoid cells, including T cells associated with graft-versus-host disease (GVHD).

**human papillomavirus :** A type of virus that can cause abnormal tissue growth (for example, warts) and other changes to cells. Infection for a long time with certain types of human papillomavirus can cause cervical cancer. Human papillomavirus may also play a role in some other types of cancer, such as anal, vaginal, vulvar, penile, oropharyngeal, and squamous cell skin cancers. Also called HPV.

**human papillomavirus 16 E7 peptide:** A synthetic peptide sequence of human papillomavirus (HPV) E7 nuclear protein which is used to produce vaccines against HPV infection and HPV-related neoplasms. HPV E7 oncogenic protein binds the retinoblastoma tumor suppressor protein, pRB, as well as a number of other cellular proteins, and serves as a transcriptional activator. This protein is important in the induction and maintenance of cellular transformation and is co-expressed in the majority of HPV-containing carcinomas.

**human papillomavirus 16/18 L1 virus-like particle/AS04 vaccine:** A recombinant, bivalent, human papillomavirus (HPV) vaccine, containing virus-like particles for HPV types 16 and 18 linked to the adjuvant AS04, with potential immunoprotective and antineoplastic properties. Upon administration, HPV 16/18 L1 virus-like particle/AS04 vaccine may generate humoral and cellular immunity against HPV types-16 and -18 antigens, thereby preventing cervical infection upon exposure to HPV types 16 and 18. In addition, this agent may stimulate an antitumoral cellular immune response against cervical cancer associated with HPV infection.

**human papillomavirus DNA test :** A laboratory test in which cells are scraped from the cervix to look for DNA of human papillomaviruses (HPV). HPV can cause abnormal tissue growth (for example, warts) and

other changes to cells. Infection for a long time with certain types of HPV can cause cervical cancer. HPV can also play a role in other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Also called HPV DNA test.

**human papillomavirus RNA test :** A laboratory test in which cells are scraped from the cervix to look for RNA of the most common types of human papillomavirus (HPV). Certain types of HPV may cause abnormal tissue growth, such as warts, and other changes to cells. Infection for a long time with other types of HPV may cause cervical cancer. A human papillomavirus RNA test may be done with a Pap test to check for HPV infection and cervical cancer. HPV infection may also cause other types of cancer, such as cancers of the anus, vagina, vulva, penis, and oropharynx. Also called HPV RNA test.

**human papillomavirus test :** A laboratory test in which cells are tested for DNA or RNA from certain types of human papillomavirus (HPV) that are known to cause cervical cancer. These high-risk types of HPV can also cause other types of cancer, including cancers of the anus, vagina, vulva, penis, and oropharynx. A human papillomavirus test may be done at the same time as a Pap test for cervical cancer screening in women aged 30 to 65 years. A human papillomavirus test may also be done after certain abnormal Pap test results. Also called HPV test.

**human papillomavirus vaccine :** A vaccine used to prevent genital warts, anal cancer, cervical cancer, vulvar cancer, and vaginal cancer caused by certain types of human papillomavirus (HPV). It is also used to prevent lesions that are caused by those viruses and that can lead to anal, cervical, vulvar, or vaginal cancer. Also called HPV vaccine.

**human papillomavirus vaccine V503:** A vaccine consisting of noninfectious, recombinant virus-like particles (VLP) containing the major viral capsid protein L1 of nine strains of human papillomavirus (HPV), with potential immunoprotective activity. Vaccination with HPV V503 may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against cells positive for any of these nine strains of HPV, thereby preventing cervical infection upon exposure to certain HPV subtypes.

**human participant protection regulations :** Laws set by the U.S. Department of Health and Human Services (DHHS) to protect a person

from risks in research studies that any federal agency or department has a part in. Also called 45 CFR 46, 45 Code of Federal Regulations Part 46, and Protection of Human Subjects.

**human prostate-specific membrane antigen plasmid DNA vaccine:** A vaccine consisting of a plasmid DNA encoding the human prostate-specific membrane antigen (PSMA). Upon administration, expressed PSMA may stimulate a cytotoxic T cell response against tumor cells that express this antigen, resulting in tumor cell lysis.

**human T-cell leukemia virus type 1 :** A type of virus that infects T cells (a type of white blood cell) and can cause leukemia and lymphoma. Human T-cell leukemia virus type 1 is spread by sharing syringes or needles, through blood transfusions or sexual contact, and from mother to child during birth or breast-feeding. Also called HTLV-1 and human T-cell lymphotropic virus type 1.

**human T-cell lymphotropic virus type 1 :** A type of virus that infects T cells (a type of white blood cell) and can cause leukemia and lymphoma. Human T-cell lymphotropic virus type 1 is spread by sharing syringes or needles, through blood transfusions or sexual contact, and from mother to child during birth or breast-feeding. Also called HTLV-1 and human T-cell leukemia virus type 1.

**human trefoil factor 1-secreting Lactococcus lactis AG013:** An oral rinse solution containing a strain of the bacteria *Lactococcus lactis* (*L. lactis*) genetically modified to express human Trefoil Factor 1 (hTFF1) with potential cytoprotective activity. With oral rinsing, human trefoil factor 1-secreting *Lactococcus lactis* AG013 may secrete and deliver hTFF1 to oral mucosal tissue, protecting or promoting the healing of damaged oral mucosa. hTFF1, a peptide belonging to the Trefoil factors family (TFF), is normally secreted by mucous epithelia and is involved in protecting mucosal tissue and maintaining mucosal surface integrity.

**human varicella zoster immune globulin:** A human plasma-derived immunoglobulin G (IgG) formulation containing high levels of antibodies against varicella zoster virus (VZV), a double-stranded DNA virus that causes chickenpox and herpes zoster (shingles), with potential immunomodulating and antiviral activities. VZV IgG (VZIG) is isolated from donors expressing high amounts of VZV antibodies. Upon intramuscular (IM) administration, the anti-VZV antibodies provide passive

immunization against VZV. This may prevent infection by VZV in immunocompromised patients.

**humanized monoclonal antibody** : A type of antibody made in the laboratory by combining a human antibody with a small part of a mouse or rat monoclonal antibody. The mouse or rat part of the antibody binds to the target antigen, and the human part makes it less likely to be destroyed by the body's immune system.

**humanized monoclonal antibody 3F8**: A humanized monoclonal antibody directed against the human tumor-associated antigen GD2, with potential antineoplastic activity. Upon vaccination, the humanized monoclonal antibody 3F8 stimulates antibody-dependent cell-mediated cytotoxicity (ADCC) against GD2-expressing tumor cells. GD2, a disialoganglioside with expression in normal tissues restricted primarily to the cerebellum and peripheral nerves, is commonly expressed at high levels on tumors of neuroectodermal origins such as melanomas and neuroblastomas. Compared to the murine monoclonal antibody 3F8 (m3F8), the humanized form does not cause a human anti-mouse antibody (HAMA) response and shows enhanced ADCC activity.

**humanized monoclonal antibody MEDI-522** : A substance being studied in the treatment of some types of cancer and other conditions. Humanized monoclonal antibody MEDI-522 binds to a protein on the surface of blood vessels and may prevent the growth of new blood vessels that tumors need to grow. It may also prevent the spread of cancer. It is a type of antiangiogenesis agent, a type of metastasis inhibitor, and a type of monoclonal antibody. Also called Abegrin, etaracizumab, and MEDI-522.

**Humatin**: (Other name for: paromomycin sulfate)

**HuMax-CD20**: A drug used to treat chronic lymphocytic leukemia (CLL) that has not gotten better with other anticancer drugs. It is also used with chlorambucil in patients who have not already been treated and cannot receive certain anticancer drugs. It is also being studied in the treatment of other types of cancer. HuMax-CD20 binds to a protein called CD20, which is found on B cells (a type of white blood cell) and some types of leukemia and lymphoma cells. This may help the immune system kill cancer cells. HuMax-CD20 is a type of monoclonal antibody. Also called Arzerra and ofatumumab.

**humectant:** A substance that absorbs or retains moisture, added to a product to keep it from drying out.

**humidifier :** A machine that puts moisture in the air.

**humor therapy :** A type of therapy that uses humor to help relieve pain and stress and improve a person's sense of well-being. It may be used to help people cope with a serious disease, such as cancer. Humor therapy may include laughter exercises, clowns, and comedy movies, books, games, and puzzles. It is a type of complementary therapy. Also called laughter therapy.

**Humoral immune response:** A system for the recognition of foreign substances that employs soluble antibodies to bind to and inactivate such substances.

**Humulin N:** (Other name for: insulin, NPH)

**Humulin R Insulin:** (Other name for: insulin, regular)

**Humus:** The dark organic material in soils, produced by the decomposition of soils. The matter that remains after the bulk of detritus has been consumed (leaves, roots). Humus mixes with top layers of soil (rock particles), supplies some of the nutrients needed by plants -increases acidity of soil; inorganic nutrients more soluble under acidic conditions, become more available, EX. wheat grows OR This is a component of soil. Humus is the mixture of rotting vegetation and animal remains. A compost bin will provide a source of humus for a gardener. OR Decomposed organic material.

**Hund's rule:** A rule of thumb stating that subshells fill so that the number of unpaired spins is maximized, or "spread them out and line them up."

**Hungry:** Almost a synonym for 'hot' and indicates a porous surface that quickly absorbs paint applied to it. It is also sometimes used to describe the appearance of a paint film that has been affected by the excessive porosity of the surface beneath - hence is applied to any thin coating with poor 'build'. Alternatively the term 'starved' may be used. OR A thin coating applied over a porous surface can often have poor 'build', known as a 'hungry' coating. The solution is to thoroughly clean down the surfaces to remove all dirt, grease and surface contaminants, then rub down with a suitable abrasive and dust off. Prime the whole surface with a suitable primer before repainting.

**hurricane:** low-pressure system with sustained winds of 74 mph or greater.

**Hurthle cell neoplasm :** An uncommon type of thyroid tumor that can be benign or malignant.

**Hyalo GYN:** (Other name for: hyaluronic acid-based hydrating vaginal gel)

**hyaluronic acid:** A glucosaminoglycan consisting of D-glucuronic acid and N-acetyl-D-glucosamine disaccharide units that is a component of connective tissue, skin, vitreous humour, umbilical cord, synovial fluid and the capsule of certain microorganisms contributing to adhesion, elasticity, and viscosity of extracellular substances. Check for active clinical trials using this agent.

**hyaluronic acid-based hydrating vaginal gel:** A clear, colorless water-based vaginal gel containing the partial benzyl ester of hyaluronic acid (HA) with potential hydrating activity. Upon vaginal application, HA adheres to the vaginal mucosa where it retains water, provides moisture to the vagina and protects the vaginal mucosa. This gel may provide relief in vaginal dryness and may prevent sexual discomfort, itching and irritation. This HA derivative is less susceptible to enzymatic breakdown and provides longer lasting activity compared to HA. HA is naturally present in the vaginal epithelium.

**hyaluronic acid-containing topical cream:** A topical cream formulation containing hyaluronic acid (HA) with wound repair-promoting, skin moisturizing, and potential radioprotective activities. Upon application of the topical cream, HA adheres to injured tissues, provides hydration to the skin, and protects against dehydration and chemical or mechanical irritation. Hyaluronate, a non-sulfated glucosaminoglycan, is a major component of the extracellular matrix in connective, epithelial, and neural tissues and contributes significantly to cell proliferation and migration.

**Hybrid:** A resin or reinforcement made from two or more different polymers or reinforcement materials.

**Hybrid (or chimeric) plasmid:** A plasmid that contains DNA from two different organisms.

**hybrid atomic orbital:** a probability area created by a linear combination of atomic orbitals.

**hybrid orbital:** an orbital formed by the linear combination of atomic orbitals in the ground state.

**hybrid orbital number rule:** the hybrid orbital number is equal to the sum of a molecule's  $\sigma$  bonds plus the number of unshared electron pairs. A hybrid orbital number of 2 indicates sp hybridization; 3 indicates sp<sup>2</sup> hybridization; 4 indicates sp<sup>3</sup> hybridization.

**Hybrid resin:** A combination of two or more common resins.

**hybridization:** The combination of a set of atomic orbitals to produce a new set of "hybrid" orbitals. Hybridized orbitals are theoretical constructions that make molecular structures easier to explain. For example, combining the valence s and p orbitals of carbon produces a set of four "sp<sup>3</sup>" hybrid orbitals that can be used to explain the tetrahedral bonding in CH<sub>4</sub>. OR A technique used to determine the relatedness of nucleic acids by assaying the ability of single strands of one sample to form a duplex by complementary base pairing to single strands of another sample. OR the changing, or mixing, of orbitals to form new atomic or molecular orbitals that are lower in energy. OR A mixing process, often applied to description of atomic orbitals, producing orbitals that have characteristics intermediate between the various types of orbitals involved.

**Hybridoma cell:** A cell, resulting from the fusion of an antibody-producing cell and a tumor cell, that produces a single antibody and has an unlimited capacity for proliferation.

**Hycamtin:** (Other name for: topotecan hydrochloride)

**Hycamtin :** A drug used to treat certain types of ovarian cancer, lung cancer, and cervical cancer. Hycamtin is a type of topoisomerase inhibitor. Also called topotecan and topotecan hydrochloride.

**Hycamtin Capsules:** (Other name for: oral topotecan hydrochloride)

**hycanthone:** A thioxanthene derivative of lucanthone with anti-schistosomal activity and potential antineoplastic activity. Hycanthone interferes with parasite nerve function, resulting in parasite paralysis and death. This agent also intercalates into DNA and inhibits RNA synthesis in vitro.

**hydatidiform mole :** A slow-growing tumor that develops from trophoblastic cells (cells that help an embryo attach to the uterus and help form the placenta) after fertilization of an egg by a sperm. A hydatidiform

mole contains many cysts (sacs of fluid). It is usually benign (not cancer) but it may spread to nearby tissues (invasive mole). It may also become a malignant tumor called choriocarcinoma. Hydatidiform mole is the most common type of gestational trophoblastic tumor. Also called molar pregnancy.

**Hydeltra:** (Other name for: prednisolone)

**Hydeltrasol:** (Other name for: prednisolone)

**Hydratase:** An enzyme that adds the elements of water to a carbon-carbon double bond.

**hydrate:** A crystalline solid with molecules of water trapped in the solid state structure, which can often be removed partly or completely by relatively gentle heating. OR A hydrate is an addition compound that contains water in weak chemical combination with another compound. For example, crystals of  $\text{CuSO}_4 \cdot 5 \text{H}_2\text{O}$  (copper sulfate pentahydrate) are made of regularly repeating units, each containing 5 molecules of water weakly bound to a copper(II) ion and a sulfate ion.

**hydrated sodium calcium aluminosilicate:** A naturally occurring, highly mineralized phyllosilicate clay used as a nutritional supplement with mycotoxin binding and protective activities. Upon ingestion prior to each meal, hydrated sodium calcium aluminosilicate is not absorbed by the gastrointestinal tract but rather binds certain food contaminants, including aflatoxin (AF) and fumonisin B1 (FB1), thereby reducing the bioavailability of these substances. Dietary exposure of AF and FB1 has been associated with an increased risk of certain cancers. Check for active clinical trials using this agent.

**hydration:** Having solvent molecules of water surrounding and becoming attached to ions or molecules of the solute. OR Hydration is the addition of  $\text{H}_2\text{O}$  to a molecule in a chemical reaction. OR the addition of the elements of water to a molecule. OR Combination with water. OR The process of combining with water. In medicine, the process of giving fluids needed by the body.

**Hydraulic:** A system in which energy is transferred from one place to another by means of compression and flow of a fluid (e.g., water, oil).

**hydraulic action:** the ability of flowing water to dislodge, pick up, and transport rock particles or sediment.

**Hydraulic clamp:** A term used to describe the use of a large hydraulic cylinder to open and close the clamp unit of a molding machine.

**Hydraulic loading:** Hydraulic loading refers to the flows (MGD or  $m^3/day$ ) to a treatment plant or treatment process.

**hydrazine sulfate:** The synthetic sulfate salt of hydrazine, a derivative of ammonia. Hydrazine inhibits the enzyme phosphoenol pyruvate carboxykinase, thereby blocking gluconeogenesis. This agent has been reported to decrease the excessive energy needs and cachexia of cancer patients. Classified as a likely human carcinogen, hydrazine sulfate is also a weak inhibitor of mono-amine oxidase (MAO).

**hydrazine sulfate :** A substance that has been studied as a treatment for cancer and as a treatment for cachexia (body wasting) associated with advanced cancer.

**hydrazine<sup>22</sup>:** A colorless, fuming, corrosive liquid that is a powerful reducing agent.  $NH_2NH_2$  is used in jet and rocket fuels, and as an intermediate in the manufacture of agricultural, textile, photographic, and industrial chemicals.

**Hydrea:** (Other name for: hydroxyurea) OR A drug used to treat chronic myelogenous leukemia (CML) that has not gotten better with other treatment. It is also used with radiation therapy and other anticancer drugs to treat certain types of head and neck cancer. It is also being studied in the treatment of other conditions and types of cancer. Hydrea stops cells from making DNA and may kill cancer cells. It may also make cancer cells easier to kill with radiation therapy. Hydrea contains the active ingredient hydroxyurea. It is a type of antimetabolite.

**hydride ion-:** A  $-1$  ion formed from hydrogen. Hydride ions and hydride ionic compounds react instantly and sometimes violently with water.

**hydride shift:** the movement of a hydride ion, a hydrogen atom with a negative charge, to form a more inductively stabilized carbocation.

**hydroboration:** the addition of boron hydride to a multiple bond.

**hydroboration-oxidation:** the addition of borane ( $BH_3$ ) or an alkyl borane to an alkene and its subsequent oxidation to produce the anti-Markovnikov indirect addition of water.

**hydrocarbon:** A hydrocarbon is a compound containing only hydrogen and carbon. OR An organic compound containing only the elements

hydrogen and carbon. OR a chemical compound containing only hydrogen and carbon; the largest source of hydrocarbons comes from petroleum crude oil. OR Any chemical compound containing only hydrogen and carbon. We have been unable to determine where the word comes from. OR an organic compound containing only carbon and hydrogen. OR Hydrocarbons are organic compounds that contain only hydrogen and carbon. The simplest hydrocarbons are the alkanes. OR An organic molecule consisting of hydrogen and carbon atoms only. An example is petroleum, which contributes to air pollution when released into the atmosphere OR a molecule that contains exclusively carbon and hydrogen atoms. The central bond may be a single, double, or triple covalent bond, and it forms the backbone of the molecule. OR an organic compound that consists exclusively of the elements carbon and hydrogen. Generally, the term hydrocarbon is used for the chemicals that are derived from natural gas, oil, and coal. OR This is the chemical term for an organic compound containing only carbon and hydrogen. OR A hydrocarbon is a chemical that contains ONLY hydrogen atoms and carbon atoms. The main source of hydrocarbons is crude oil. This is mostly alkanes (hydrocarbons with only single bonds). The hydrocarbons in crude oil are separated by fractional distillation into groups that have similar boiling points.

**hydrocarbon :** A substance made of only hydrogen and carbon. Examples of hydrocarbons are coal, petroleum, natural gas and tar. They are used as energy sources. Being exposed to hydrocarbons may increase the risk of certain types of cancer.

**Hydrocarbon Plastics:** Plastics based on resins made by the polymerization of monomers composed of carbon and hydrogen only.

**hydrocephalus :** The abnormal buildup of cerebrospinal fluid in the ventricles of the brain.

**Hydrochloric acid (HCl) :** A gaseous, strong acid, used typically as water solution. A key component in manufacturing inorganic coagulants.

**hydrocodone bitartrate :** A drug used to treat moderate to severe pain and cough. Hydrocodone bitartrate is made from codeine and binds to opioid receptors in the central nervous system. It is a type of analgesic agent, a type of antitussive, and a type of opiate.

**hydrocodone/acetaminophen:** A combination preparation of the analgesic acetaminophen and the semisynthetic opioid agonist hydrocodone with

analgesic and antitussive activities. Acetaminophen exerts its analgesic activity by inhibiting prostaglandin synthesis while hydrocodone exerts its analgesic activity by binding to the mu-receptors in the central nervous system (CNS), thereby mimicking the effects of endogenous opioids.

**hydrocortisone :** A drug used to relieve the symptoms of certain hormone shortages and to suppress an immune response.

**hydrocortisone sodium succinate:** The sodium salt of hydrocortisone succinate with glucocorticoid property. Hydrocortisone sodium succinate is chemically similar to the endogenous hormone that stimulates anti-inflammatory and immunosuppressive activities, in addition to exhibiting minor mineralocorticoid effects. This agent binds to intracellular glucocorticoid receptors and is translocated into the nucleus, where it initiates the transcription of glucocorticoid-responsive genes, such as various cytokines and lipocortins. Lipocortins inhibit phospholipase A<sub>2</sub>, thereby blocking the release of arachidonic acid from membrane phospholipids and preventing the synthesis of prostaglandins and leukotrienes, both potent mediators of inflammation.

**Hydrocortone:** (Other name for: therapeutic hydrocortisone)

**Hydrodealkylation (HDA):** Hydrodealkylation of toluene to benzene is the most common dealkylation route. The use of toluene dealkylation is sensitive to the producer's alternative value for toluene (i.e. gasoline or chemicals), the hydrogen value (on-purpose or by-product), as well as the benzene market price. As a result the motivation to dealkylate is very different for each producer with some producers dedicated to dealkylate at all times (usually lacking a sufficient gasoline pool or chemical market for toluene) while others are "opportunistic" dealkylators, running their plants at times when the economics fully justify and encourage the process and spot benzene sales are available.

**Hydrogen:** Symbol:"H" Atomic Number:"1" Atomic Mass: 1.01amu. Hydrogen is the first element in the periodic table. It is very light and the smallest atom. There is more hydrogen in the universe than any other element. On Earth, it is usually found with oxygen in water. OR This gas is produced when a metal reacts with an acid. Hydrogen gas has a very low density. It burns with a squeaky pop. This is the test for hydrogen OR Element 1, atomic weight 1.00797. The most abundant element in the universe. Hydrogen occurs as H<sub>2</sub> at ambient temperature and pressure, a

colorless, odorless, and extremely flammable gas. Discovered in 1766 by Cavendish.

**Hydrogen Bond:** A chemical bond that has hydrogen covalently bonded to an electronegative atom. It happens when oxygen bonds to hydrogen. OR is a special situation that exists between the hydrogen atom in one molecule (like water) and the oxygen atom in another molecule (like another water molecule). This bond is ten times weaker than the covalent bond, and ten times stronger than the van der Waals force. The hydrogen bond caused water to have its unusual properties of high boiling point, high melting point, high surface tension, and its formation of the six-sided ring structure in ice. The latter causes water to expand upon freezing, become less dense, and float in water. OR Attractive interactions involving two groups: one containing an electron-deficient hydrogen covalently bonded to an electronegative atom and one containing an electron-rich heteroatom. OR The strongest attraction between two dipoles is when one or both of them involves a bond between hydrogen and a strongly electronegative atom, like oxygen, fluorine, or nitrogen. Because hydrogen only has one electron, if it forms a bond with an element that is very keen to grab an electron, it becomes much more positive than an element that has plenty of other electrons left to hang around the positively charged nucleus. Dipole-dipole interactions between these sort of molecules (like water {H<sub>2</sub>O}, ammonia {NH<sub>3</sub>}, hydrofluoric acid {HF}) are so much stronger than ordinary dipole-dipole bonds that we give them the special name of 'hydrogen bonds'. OR a weak, secondary bond between a partially positive hydrogen atom and a partially negative N, O, or F atom. An inter-molecular force of attraction. OR A weak, noncovalent, attractive force between one electronegative atom and a hydrogen atom that is covalently linked to a second electronegative atom. OR A bond formed when two relatively electronegative atoms, such as oxygen or nitrogen, unequally share a hydrogen atom that is covalently bonded to one of the electronegative atoms. OR An especially strong dipole-dipole force between molecules X-H...Y, where X and Y are small electronegative atoms (usually F, N, or O) and ... denotes the hydrogen bond. Hydrogen bonds are responsible for the unique properties of water and they loosely pin biological polymers like proteins and DNA into their characteristic shapes. OR A weak electrostatic attraction between one electronegative atom (such as oxygen or nitrogen) and a hydrogen atom covalently linked to a second electronegative atom.

**Hydrogen Bond Acceptor (HBA):** The functional group that contains the electron-rich heteroatom and is the recipient of the hydrogen bond.

**Hydrogen Bond Donor (HBD):** The functional group that contains the electron-deficient hydrogen covalently bonded to an electronegative atom.

**hydrogen bonding:** Strong type of intermolecular dipole-dipole attraction. Occurs between hydrogen and F, O or N.

**HYDROGEN BONDING:** The electrostatic attraction between a hydrogen atom bearing a slight positive charge and an electronegative atom, such as oxygen, in the same (intramolecular), or a different (intermolecular) molecule.

**hydrogen ion concentration:** the normality of a solution with respect to hydrogen ions,  $H^+$ ; it is related to acidity measurements in most cases by the equation  $pH = -\log [H^+]$  where  $H^+$  is the hydrogen ion concentration in gram equivalents per liter of solution.

**hydrogen peroxide :** A chemical used in bleaches, dyes, cleansers, antiseptics, and disinfectants. In a concentrated form, it is toxic and irritating to tissues.

**Hydrogen peroxide” (H<sub>2</sub>O<sub>2</sub>) :** Hydrogen peroxide has strong oxidizing properties, and is a powerful bleaching agent. It is also used as a disinfectant, an antiseptic agent and an oxidizer.

**Hydrogen sulfide:** 'Rotten egg gas', H<sub>2</sub>S. It is responsible for the distinctive odour of Rotorua, in New Zealand.

**Hydrogen sulfide gas:** Hydrogen sulfide is a gas with a rotten egg odor. This gas is produced under anaerobic conditions. Hydrogen sulfide is particularly dangerous because it dulls your sense of smell so that you don't notice it after you have been around it for a while and because the odor is not noticeable in high concentrations. The gas is very poisonous to your respiratory system, explosive, flammable, and colorless.

**hydrogenation:** the infusing of unsaturated or impure hydrocarbons with hydrogen gas at controlled temperatures and pressures for the purpose of obtaining saturated hydrocarbons and/or removing various impurities such as sulfur and nitrogen. OR Hydrogenation is a chemical reduction reaction which results in the addition of hydrogen to an unsaturated compound (e.g. alkenes). Metal catalysts are typically used for these reactions, including cobalt-molybdenum or nickel-molybdenum OR the addition of hydrogen to

a multiple bond. OR the addition of hydrogen to an unsaturated compound.  
OR Chemical process whereby hydrogen is introduced into a compound.

**hydrogenous sediments:** sediments on the ocean floor that have chemically precipitated from seawater.

**hydrohalogenation:** a reaction in which a hydrogen atom and a halogen atom are added to a double bond to form a saturated compound.

**hydrolases:** Enzymes (proteases, lipases, phosphatases, nucleases, for example) that catalyze hydrolysis reactions.

**hydrologic budget:** A quantitative accounting of all water volumes and their changes with time for a basin or area.

**hydrologic cycle:** the continuous exchange of water between the atmosphere, oceans, continents, plants, and animals. OR The process of evaporation, vertical and horizontal transport of vapor, condensation, precipitation, and the flow of water from continents to oceans. It is a major factor in determining climate through its influence on surface vegetation, the clouds, snow and ice, and soil moisture. The hydrologic cycle is responsible for 25 to 30 percent of the mid-latitudes' heat transport from the equatorial to polar regions.

**hydrology:** The science dealing with the properties, distribution, and circulation of water.

**Hydrolysis:** Cleavage of a bond, such as an anhydride or peptide bond, by the addition of the elements of water, yielding two or more products. OR A catch-all term for any reaction in which the water molecule is split. OR The cleavage of a molecule by the addition of water. OR Hydrophilic Preferring to be in contact with water. OR Hydrolysis is a reaction where water attacks a part of a molecule, usually breaking it up. An example of hydrolysis is the breaking of the ester linkages to form a soap out of an oil. In this reaction, the ester linkage is broken, releasing an alcohol and an acid. OR Hydrolysis is the breakdown of a compound by water. OR Cleavage of a covalent bond brought about by water; the H- and -OH of water typically become attached to the respective cleavage fragments. For example: OR The reactions of cations with water to produce a weak base or of anions to produce a weak acid. OR The process in which carbohydrates and starches are simplified into organic soluble organics, usually by facultative anaerobes.

**hydrolysis :** A chemical reaction that uses water to break down a compound.

**Hydrolysis Reaction:** A reaction that occurs when water is added to a compound. In the case of a disaccharide, the molecule is broken up into monosaccharides with the addition of water. OR Reactions in which bonds are cleaved by the addition of water.

**hydrolyze:** to cleave a bond via the elements of water. OR To add hydrogen or hydroxyl to a substance.

**hydrometer:** An instrument for measuring the specific gravity of liquids. A hydrometer is a weight with a vertical scale attached. When placed into a liquid, the hydrometer bobs upright, and sinks to a certain level. The specific gravity or solution composition can be read from the liquid level on the vertical scale. Hydrometers are often calibrated in degrees Baumé.

**hydromorphone hydrochloride:** The hydrochloride salt of the semi-synthetic opioid hydromorphone with analgesic activity. Hydromorphone, the hydrogenated ketone of morphine, selectively binds the mu-opioid receptor, a G protein-coupled receptor. Binding stimulates the exchange of guanosine triphosphate (GTP) for guanosine diphosphate (GDP) on the G-protein complex, resulting in inhibition of plasma membrane-associated adenylate cyclase (AC) and a reduction in intracellular cyclic 3',5'-adenosine monophosphate (cAMP) levels. Due to a reduction in cAMP levels, voltage-gated potassium channels are activated, resulting in neuronal hyperpolarization and a reduction in neuronal excitability. In addition, this agent inhibits the opening of voltage-gated calcium channels, resulting in inhibition of calcium entry into neuronal cells and a reduction in the release of nociceptive neurotransmitters such as substance P and glutamate.

**hydromorphone hydrochloride :** A drug used to treat moderate to severe pain. It may also be used to treat certain types of cough. Hydromorphone hydrochloride is made from morphine and binds to opioid receptors in the central nervous system. It is a type of opioid and a type of analgesic agent. Also called Dilaudid, Exalgo, and Hydrostat IR.

**hydronephrosis :** Abnormal enlargement of a kidney, which may be caused by blockage of the ureter (such as by a kidney stone) or chronic kidney disease that prevents urine from draining into the bladder.

**hydronium ion:** The hydrated hydrogen ion (H<sub>2</sub>O<sup>+</sup>).

**hydronium ion $3+$ :** The  $H_3O^+$  ion, formed by capture of a hydrogen ion by a water molecule. A strong covalent bond is formed between the hydrogen ion and water oxygen; all hydrogen ions in aqueous solution are bound inside hydronium ions.

**hydropathy index:** A scale that expresses the relative hydrophobic and hydrophilic tendencies of a chemical group.

**Hydropathy plot:** A means of determining transmembrane sequences in proteins by measuring the change in free energy required to move a segment comprising 20 amino acids of a protein from a hydrophobic environment to water. The free-energy change is plotted against the position of the amino acid sequence in the protein.

**HYDROPHILE:** A material having an affinity for, attracting, adsorbing or absorbing water. The opposite of hydrophobe.

**HYDROPHILE-LIPOPHILE BALANCE:** A measure of the relative simultaneous attraction of a surfactant to both phases of an emulsion.

**Hydrophilic:** Something that is attracted to water. The term is also used to describe portions of molecules that dissolve well in polar water molecules. "Hydro" means water. "Philic" means to "like or love." OR Refers to molecules or groups that are polar and are capable of forming strong hydrogen bonds with water. OR From the greek words for water (something like hydro) and love (something like philos). A hydrophilic compound is one that "loves" water and easily dissolves in it. Having lots of potential for hydrogen bonding or having a charge will make a compound hydrophilic. Most inorganic salts and some organic molecules including ethanol and diethyl ether are hydrophilic. Opposite of hydrophobic. OR A polar molecule or group that can form strong hydrogen bonds with water. OR Polar or charged; describing molecules or groups that associate with (dissolve easily in) water.

**Hydrophilic Interactions:** Interactions between molecules where nonpolar portions of the molecule are attracted to any interaction with polar water molecules. The molecule will align itself so that the hydrophobic portions have the best chance of coming into contact with the other polar molecules.

**HYDROPHOBE:** A material lacking affinity for, repelling, failing to adsorb or absorb water. The opposite of hydrophile.

**hydrophobic:** A nonpolar molecule or group that has little affinity for water. Hydrophobic groups on molecules in solution tend to turn in on themselves or clump together with other hydrophobic groups because they are unable to disrupt the network of strong hydrogen bonds in the water around them. OR Nonpolar; describing molecules or groups that are insoluble in water.

**Hydrophobic:** From the greek words for water (something like hydro) and fear (something like phobos). A compound is hydrophobic if it is "hates" water and will not dissolve in it. Having little hydrogen bonding capacity and no charge makes a molecule hydrophobic. Most organic molecules, such as hexane, triolein, and styrene are hydrophobic. Opposite of hydrophilic. Nothing to do with rabies (hydrophobia).

**Hydrophobic:** Preferring not to be in contact with water, as is the case with the hydrocarbon portion of a fatty acid or phospholipid chain.

**Hydrophobic:** Refers to non-polar molecules that have little affinity for water.

**Hydrophobic:** Something that is afraid or repulsed by water. The term is also used to describe portions of molecules that do not dissolve well in polar water molecules. "Hydro" means water. "Phobic" means to be afraid of or dislike.

**Hydrophobic effect:** The noncovalent association of nonpolar groups with each other in aqueous solution.

**Hydrophobic Interactions:** Interactions between molecules in which nonpolar portions of the molecule tend to avoid interaction with polar water molecules. The molecule will align itself so that the hydrophobic portions have the least chance of coming into contact with the other polar molecules. OR Refers to the tendency of nonpolar molecules in water to interact with one another; the interactions are driven by an increase in the entropy of water when the water molecules in contact with the nonpolar molecules are released into bulk water.

**hydrophobic interactions:** The association of nonpolar groups, or compounds, with each other in aqueous systems, driven by the tendency of the surrounding water molecules to seek their most stable (disordered) state.

**hydrops fetalis:** a condition in the fetus characterized by an accumulation of fluid, or edema, in at least two fetal compartments, including the

subcutaneous tissue, pleura, pericardium, or in the abdomen

**hydrosphere:** the water layer of the Earth. OR The aqueous envelope of the Earth, including the oceans, freshwater lakes, rivers, saline lakes and inland seas, soil moisture and vadose water, groundwaters, and atmospheric vapor.

**Hydrostat:** (Other name for: hydromorphone hydrochloride)

**Hydrostat IR :** A drug used to treat moderate to severe pain. It may also be used to treat certain types of cough. Hydrostat IR is made from morphine and binds to opioid receptors in the central nervous system. It is a type of opioid and a type of analgesic agent. Also called Dilaudid, Exalgo, and hydromorphone hydrochloride.

**hydrostatic equation:** In the vector equation of motion, the form assumed by the vertical component when all Coriolis, earth-curvature, frictional, and vertical-acceleration terms are considered negligible compared with those involving the vertical pressure force and the force of gravity. The error in applying the hydrostatic equation to the atmosphere for cyclonic-scale motions is less than 0.01%. In extreme situations, the strong vertical accelerations in thunderstorms and mountain waves can be 1% of gravity.

**hydrostatic skeleton:** a water-based skeleton present in many animals (such as the earthworm) that lack structures, such as bone, for muscles to pull against.

**hydrothermal deposit:** of metallic ore, the result of the formation of rich deposits from hydrothermal solutions that circulate through fractured country rock.

**hydrothermal rocks:** those rocks whose minerals crystallized from hot water or whose minerals have been altered by hot water passing through them.

**hydrothermal vein:** minerals that are deposited from hydrothermal processes and fill a crack in the country rock.

**HYDROTROPE:** A substance, such as sodium xylene sulfonate, which increases the aqueous solubility of surfactants and other substances. Hydrotropes are sometimes used to reduce a systems viscosity. (see RFF 705.10.08 - HYDROTROPES).

**hydroureter :** Abnormal enlargement of the ureter caused by any blockage that prevents urine from draining into the bladder.

**hydroxide:** refers to the OH<sup>-</sup> ion.

**Hydroxide Mineral:** A mineral that is made up of compounds with a hydroxide group bonded to a metal. Bauxite is a good example of a hydroxide mineral.

**hydroxide-:** 1. The OH<sup>-</sup> ion. 2. Compounds containing the OH<sup>-</sup> ion. See also: hydroxide compounds.

**Hydroxy group:** An hydroxy group is an -OH group hanging off an organic molecule.

**Hydroxyapatite:** A calcium phosphate gel used, in the case of nucleic acids, to selectively absorb duplex DNA-RNA from a mixture of single-stranded and duplex nucleic acids.

**hydroxychloroquine:** A 4-aminoquinoline with immunosuppressive, antiautophagy, and antimalarial activities. Although the precise mechanism of action is unknown, hydroxychloroquine may suppress immune function by interfering with the processing and presentation of antigens and the production of cytokines. As a lysosomotropic agent, hydroxychloroquine raises intralysosomal pH, impairing autophagic protein degradation; hydroxychloroquine-mediated accumulation of ineffective autophagosomes may result in cell death in tumor cells reliant on autophagy for survival. In addition, this agent is highly active against the erythrocytic forms of *P. vivax* and *malariae* and most strains of *P. falciparum* but not the gametocytes of *P. falciparum*.

**hydroxychloroquine :** A substance that decreases immune responses in the body. It is used to treat some autoimmune diseases, and is being studied as a treatment for graft-versus-host disease. Hydroxychloroquine belongs to the family of drugs called antiprotozoals.

**hydroxydaunorubicin :** A drug used to treat many types of cancer, including leukemia, lymphoma, neuroblastoma, sarcoma, Wilms tumor, and cancers of the lung, breast, stomach, ovary, thyroid, and bladder. It is also being studied in the treatment of other types of cancer.

Hydroxydaunorubicin comes from the bacterium *Streptomyces peucetius*. It damages DNA and may kill cancer cells. It is a type of anthracycline antitumor antibiotic. The brand names Adriamycin PFS, Adriamycin RDF, and Rubex have been taken off the market and are no longer available. Also called doxorubicin and doxorubicin hydrochloride.

**hydroxyl:** 1. An -OH group within a molecule. 2. A free radical formed by abstraction of a hydrogen atom from water.

**Hydroxyl Group:** This is a side group which is one hydrogen atom bonded to one oxygen atom. The result is a negatively charged ion (OH<sup>-</sup>).

**HYDROXYL NUMBER:** A measure of the hydroxyl content of ethoxylates. Measured titrimetrically. Usually used for molecular weight determinations.

**hydroxyl radical:** an oxygen and hydrogen atom occurring as a group (OH<sup>-</sup>).

**hydroxymethylglutaryl-coenzyme A reductase inhibitor :** A substance that blocks an enzyme needed by the body to make cholesterol and lowers the amount of cholesterol in the blood. Hydroxymethylglutaryl-coenzyme A reductase inhibitor drugs are called statins. Also called HMG-CoA reductase inhibitor.

**hydroxytyrosol:** A phenolic phytochemical naturally occurring in extra virgin olive oil, with potential antioxidant, anti-inflammatory and cancer preventive activities. Although the mechanisms of action through which hydroxytyrosol exerts its effects have yet to be fully determined, this agent affects the expression of various components of the inflammatory response, possibly through the modulation of the nuclear factor-kappa B (NF- $\kappa$ B) pathway. The effects include the modulation of pro-inflammatory cytokines, such as the inhibition of interleukin-1alpha (IL-1 $\alpha$ ), IL-1beta, IL-6, IL-12, and tumor necrosis factor-alpha (TNF- $\alpha$ ); increased secretion of the anti-inflammatory cytokine IL-10; inhibition of the production of certain chemokines, such as C-X-C motif chemokine ligand 10 (CXCL10/IP-10), C-C motif chemokine ligand 2 (CCL2/MCP-1), and macrophage inflammatory protein-1beta (CCL4/MIP-1b); and inhibition of the expression of the enzymes inducible nitric oxide synthase (iNOS/NOS2) and prostaglandin E2 synthase (PGES), which prevent the production of nitric oxide (NO) and prostaglandin E (PGE2), respectively. In addition, hydroxytyrosol is able to regulate the expression of other genes involved in the regulation of tumor cell proliferation, such as extracellular signal-regulated and cyclin-dependent kinases. Also, hydroxytyrosol scavenges free radicals and prevents oxidative DNA damage. This induces apoptosis and inhibits proliferation in susceptible cancer cells. Check for active clinical trials using this agent.

**hydroxyurea:** A monohydroxyl-substituted urea (hydroxycarbamate) antimetabolite. Hydroxyurea selectively inhibits ribonucleoside diphosphate reductase, an enzyme required to convert ribonucleoside diphosphates into deoxyribonucleoside diphosphates, thereby preventing cells from leaving the G1/S phase of the cell cycle. This agent also exhibits radiosensitizing activity by maintaining cells in the radiation-sensitive G1 phase and interfering with DNA repair.

**hydroxyurea :** A drug used to treat chronic myelogenous leukemia (CML) that has not gotten better with other treatment. It is also used with radiation therapy and other anticancer drugs to treat certain types of head and neck cancer. It is used under the brand name Hydrea to treat these cancers. It is also used under the brand name Droxia to treat certain patients with sickle cell anemia. Hydroxyurea is also being studied in the treatment of other conditions and types of cancer. It stops cells from making DNA and may kill cancer cells. It may also make cancer cells easier to kill with radiation therapy. Hydroxyurea is a type of antimetabolite.

**hygiene :** The science of health, and the practice of cleanliness that promotes good health and well-being.

**hygiene :** The science of health, and the practice of cleanliness that promotes good health and well-being.

**hygrometer:** an instrument used to measure humidity; can be made from hair.

**Hygroscopic:** Absorbing or attracting moisture from the air. OR Able to absorb moisture from air. For example, sodium hydroxide pellets are so hygroscopic that they dissolve in the water they absorb from the air. OR Tending to absorb moisture. OR A term applied to those plastics (such as ABS and nylon) that absorb moisture from the atmosphere.

**Hygroscopic solid:** A solid that can adsorb atmospheric moisture. There is both a kinetic and a thermodynamic component to this process. The kinetic component determines the rate of water uptake, while the thermodynamic component determines the energy of this process.

**hygroscopically:** By absorbing moisture from air. OR The hygroscopic nature of a solid. OR The ability of a substance to absorb moisture from air. For example, sodium hydroxide pellets are so hygroscopic that they dissolve in the water they absorb from the air.

**Hymorphan:** (Other name for: hydromorphone hydrochloride)

**hyper-CVAD :** An abbreviation for a chemotherapy combination used to treat some types of acute lymphoblastic leukemia (ALL) and non-Hodgkin lymphoma (NHL). Hyper-CVAD includes the drugs cyclophosphamide, vincristine sulfate, doxorubicin hydrochloride (Adriamycin), and dexamethasone. It also includes the drugs methotrexate and cytarabine. It is given as hyperfractionated therapy, in which the total dose of the drugs is divided into small doses and given more than once a day. Also called hyper-CVAD regimen.

**Hyper-CVAD regimen:** A regimen consisting of cyclophosphamide, vincristine, doxorubicin and dexamethasone, administered on a hyperfractionated schedule, used to treat adult L3 acute lymphoblastic leukemia (ALL3 or Burkitt's-type) and adult small non-cleaved cell (Burkitt's) lymphoma.

**hyper-CVAD regimen :** An abbreviation for a chemotherapy combination used to treat some types of acute lymphoblastic leukemia (ALL) and non-Hodgkin lymphoma (NHL). Hyper-CVAD regimen includes the drugs cyclophosphamide, vincristine sulfate, doxorubicin hydrochloride (Adriamycin), and dexamethasone. It also includes the drugs methotrexate and cytarabine. It is given as hyperfractionated therapy, in which the total dose of the drugs is divided into small doses and given more than once a day. Also called hyper-CVAD.

**hyperactivity :** A higher than normal level of activity. Hyperactivity can be used to describe the increased action of a body function, such as hormone production, or behavior. A person who is hyperactive may seem to be always moving or fidgeting, impulsive, unable to concentrate, and talking too much.

**Hyperacute Melanoma:** (Other name for: B16alphaGal melanoma vaccine)

**HyperAcute-Lung Cancer Vaccine:** (Other name for: alpha-1,3-galactosyltransferase-expressing allogeneic lung tumor cell vaccine)

**Hyperacute-Pancreatic Cancer Vaccine:** (Other name for: algenpantucel-L)

**HyperAcute™ Renal:** (Other name for: alpha-1,3-galactosyltransferase-expressing allogeneic renal cell carcinoma vaccine)

**hyperalimentation :** A form of nutrition that is delivered into a vein. Hyperalimentation does not use the digestive system. It may be given to people who are unable to absorb nutrients through the intestinal tract because of vomiting that won't stop, severe diarrhea, or intestinal disease. It may also be given to those undergoing high-dose chemotherapy or radiation and bone marrow transplantation. It is possible to give all of the protein, calories, vitamins and minerals a person needs using hyperalimentation. Also called parenteral nutrition, total parenteral nutrition, and TPN.

**Hyperammonemia:** A condition characterized by high levels of ammonia in the blood due to deficiencies in the urea cycle, which can result in brain damage and death.

**hyperbaric oxygen:** Oxygen that is administered at a higher pressure compared to standard (i.e. sea-level) atmospheric pressure. Administration of oxygen under hyperbaric conditions enhances the delivery of oxygen to hypoxic tumor cells, thereby increasing their sensitivity to radiation and chemotherapy. In addition, hyperbaric oxygen may improve the healing of radiation-induced injuries by improving oxygen delivery to damaged tissue.

**hyperbaric oxygen :** Oxygen that is given at a pressure that is higher than the pressure of the atmosphere at sea level. In medicine, breathing hyperbaric oxygen increases the amount of oxygen in the body. It is used in treating certain kinds of wounds, injuries, and infections. It is also used to treat carbon monoxide poisoning and other conditions in which the tissues are not getting enough oxygen. It is being studied in the treatment of some types of cancer. Hyperbaric oxygen may increase the amount of oxygen in cancer cells, which may make them easier to kill with radiation therapy and chemotherapy. It is a type of radiosensitizing agent and a type of chemosensitizing agent.

**hyperbilirubinemia :** Higher-than-normal amount of bilirubin in the blood. Bilirubin is a substance formed when red blood cells break down.

**hypercalcemia :** Higher than normal levels of calcium in the blood. Some types of cancer increase the risk of hypercalcemia.

**hyperchromic effect:** The large increase in light absorption at 260 nm occurring as a double-helical DNA is melted (unwound).

**Hyperchromism:** An increase in the absorbance of light by the unstacking of base pairs when a DNA duplex is melted into single strands.

**hyperfractionated radiation therapy :** Radiation treatment in which the total dose of radiation is divided into small doses and treatments are given more than once a day. Hyperfractionated radiation therapy is given over the same period of time (days or weeks) as standard radiation therapy. Also called superfractionated radiation therapy.

**hyperfractionation :** A treatment schedule in which the total dose of radiation or chemotherapy is divided into small doses and treatments are given more than once a day.

**hyperglycemia :** Higher than normal amount of glucose (a type of sugar) in the blood. Hyperglycemia can be a sign of diabetes or other conditions. Also called high blood sugar.

**hypergolic mixture:** An oxidizing agent and a fuel that react or ignite instantly and spontaneously on contact. Methylhydrazine and dinitrogen tetroxide is a hypergolic mixture used as a propellant in the space shuttle's orbital maneuvering engines.

**Hypericum perforatum :** An herbal product sold as an over-the-counter treatment for depression. It is being studied for its ability to lessen certain side effects of cancer treatment. Also called St. John's wort.

**hyperimmune bovine colostrum:** A dietary supplement consisting of bovine colostrum, containing high titers of immunoglobulins (Igs), with immunostimulating and anti-infective activities. Hyperimmune bovine colostrum is harvested during the first days after calving from cows that have been inoculated repeatedly with specific pathogens during pregnancy. In addition to high titers of anti-pathogen specific antibodies, hyperimmune colostrum is also rich in other immune factors, proline-rich polypeptides (PRP), lactoferrin, glycoproteins, lactalbumins, cytokines, growth factors, vitamins, and minerals. This dietary supplement may exhibit anti-infective activity in immunocompromised patients.

**hyperkeratosis :** A condition marked by thickening of the outer layer of the skin, which is made of keratin (a tough, protective protein). It can result from normal use (corns, calluses), chronic inflammation (eczema), or genetic disorders (X-linked ichthyosis, ichthyosis vulgaris).

**hyperlordosis:** exaggerated lumbar curvature of the spine

**hypermetric saccades:** fast movement of the eyes

**hypernephroma :** The most common type of kidney cancer. It begins in the lining of the renal tubules in the kidney. The renal tubules filter the blood and produce urine. Also called renal cell adenocarcinoma, renal cell cancer, and renal cell carcinoma.

**hyperparathyroidism :** A condition in which the parathyroid gland (one of four pea-sized organs found on the thyroid) makes too much parathyroid hormone. This causes a loss of calcium from the bones and an increased level of calcium in the blood. Symptoms include bone pain and kidney problems.

**hyperphagia:** excessive hunger and abnormally large intake of solid foods OR An increase in the number of cells in an organ or tissue. These cells appear normal under a microscope. They are not cancer, but may become cancer.

**hyperpolarized helium 3:** A contrast agent composed of hyperpolarized helium He 3 gas (HP3He), with potential usage in diagnostic nuclear magnetic resonance (NMR)-based imaging (MRI). Upon inhalation, the hyperpolarized helium He 3 gas is distributed throughout the lungs. MRI, immediately following HP3He administration, allows for the visualization of lung structures based on the distribution pattern of the gas. This may aid in the diagnosis of certain lung abnormalities. Hyperpolarization of He 3 enhances NMR signals and thus improves imaging and assessment of lung function.

**hyperpolarized xenon 129:** A contrast agent composed of hyperpolarized xenon Xe 129 gas (HP129Xe), with potential usage in diagnostic nuclear magnetic resonance (NMR)-based imaging (MRI). Upon inhalation, the hyperpolarized xenon 129 gas is distributed throughout the lungs. MRI, immediately following HP129Xe administration, allows for the visualization of lung structures based on the distribution pattern of the gas. This may aid in the diagnosis of certain lung abnormalities. Hyperpolarization of Xe 129 enhances NMR signals and thus improves imaging and assessment of lung function.

**hyperreflexia:** defined as overactive or over responsive reflexes

**Hypersensitive sites:** Regions of the chromosome that are especially sensitive to digestion by exogenous DNases; such regions are usually located at the 5' end of actively transcribed genes.

**hypersensitivity** : An exaggerated response by the immune system to a drug or other substance.

**hypertelorism**: an abnormally increased distance between two organs or bodily parts, usually referring to an increased distance between the eyes

**hypertension** : A blood pressure of 140/90 or higher. Hypertension usually has no symptoms. It can harm the arteries and cause an increase in the risk of stroke, heart attack, kidney failure, and blindness. Also called high blood pressure.

**hyperthermia** : Abnormally high body temperature. This may be caused as part of treatment, by an infection, or by exposure to heat.

**hyperthermia therapy** : A type of treatment in which body tissue is exposed to high temperatures to damage and kill cancer cells or to make cancer cells more sensitive to the effects of radiation and certain anticancer drugs.

**hyperthermic perfusion** : A procedure in which a warmed solution containing anticancer drugs is used to bathe, or is passed through the blood vessels of, the tissue or organ containing the tumor.

**hyperthyroidism** : Too much thyroid hormone. Symptoms include weight loss, chest pain, cramps, diarrhea, and nervousness. Also called overactive thyroid.

**hypertonic**: Describes a solution which has higher osmotic pressure than some other solution (usually, higher osmotic pressure than cell or body fluids). Freshwater fish die if placed in seawater because the seawater is hypertonic, and causes water to leave the cells in fish's body.

**hypertonic saline**: Any solution of sodium chloride (NaCl) in water with a concentration of NaCl higher than that found in physiological saline (0.9% w/v). When administered in vivo, hypertonic saline (HTS) exhibits several physiological effects beneficial to cerebral injury including: 1) osmotic and vasoregulatory - by promoting the flow of excess water from cerebral tissue to the blood via osmosis and decreasing edema in the vascular endothelium of injured tissues, thus lowering vascular resistance and allowing more blood flow; 2) hemodynamic - by effectively expanding plasma volume; 3) immunomodulatory - by preventing leukocytes from becoming activated and adhering to injured neurons and; 4) neurochemical - by counteracting detrimental excitatory amino acids through the normalization of neuronal

cell membranes and by restoration of normal electrolyte and neurotransmitter levels in brain cells, and normal cell volumes.

**hypertrichosis:** excessive growth of hair in locations where it is not normally found

**Hyperuricemia:** Excessively high levels of blood urate; hyperuricemia can induce gout. OR A buildup of uric acid (a byproduct of metabolism) in the blood. Hyperuricemia is a side effect of some anticancer drugs.

**Hypervariable loop:** In immunoglobulin light and heavy chains, polypeptide segments that have great sequence variability and are responsible for antigenic specificity.

**Hypervariable segment:** In immunoglobulin light and heavy chains, polypeptide segments that have great sequence variability and are responsible for antigenic specificity.

**hypervascular :** Having a large number of blood vessels.

**hypnosis :** A trance-like state in which a person becomes more aware and focused on particular thoughts, feelings, images, sensations, or behaviors. While under hypnosis, a person may feel calm, relaxed, and more open to suggestion. Hypnosis is usually done with the help of a specially trained therapist. It may be used to help relieve stress, anxiety, and pain, and to help a person quit smoking or lose weight. Hypnosis is a type of complementary and alternative medicine (CAM).

**Hypochromism:** A decrease in the absorbance coefficient as DNA renatures from the single-stranded to the double-stranded form. OR a defect of the reproductive system that results in lack of function of the gonads (ovaries or testes).

**hypofractionated radiation therapy :** Radiation treatment in which the total dose of radiation is divided into large doses and treatments are given once a day or less often. Hypofractionated radiation therapy is given over a shorter period of time (fewer days or weeks) than standard radiation therapy.

**hypofractionation :** A treatment schedule in which the total dose of radiation is divided into large doses and treatments are given once a day or less often.

**hypogammaglobulinemia :** A condition in which the level of immunoglobulins (antibodies) in the blood is low and the risk of infection is

high.

**hypoglycemia** : Abnormally low blood sugar.

**hypomagnesemia** : Lower-than-normal amount of magnesium in the blood.

**hyponatremia** : Lower-than-normal amount of sodium in the blood.

**hypopharyngeal cancer** : Cancer that forms in tissues of the hypopharynx (the bottom part of the throat). The most common type is squamous cell carcinoma (cancer that begins in flat cells lining the hypopharynx).

**hypopharynx** : The bottom part of the throat. Cancer of the hypopharynx is also known as hypopharyngeal cancer.

**hypophosphatemia** : Lower-than-normal amount of phosphorus in the blood.

**hypoplasia**: underdevelopment or incomplete development of a tissue or organ

**hypospadias** : A birth defect in which the opening of the urethra (the tube through which urine leaves the body) is not in its normal place. In males with hypospadias, the urethra opens on the underside of the penis or between the anus and the scrotum. In females with hypospadias, it opens into the vagina. Hypospadias is much more common in males than in females, and can be corrected by surgery. Children with hypospadias have an increased risk of developing Wilms tumor (a type of kidney cancer).

**hypotension** : Abnormally low blood pressure.

**hypotenuse**: in a right triangle, the side opposite the  $90^\circ$  angle.

**hypothalamus**: the portion of the forebrain that serves as the control center for hunger, thirst, body temperature, and blood pressure. OR The area of the brain that controls body temperature, hunger, and thirst.

**hypothesis**: A hypothesis is a conjecture designed to guide experimentation. Hypotheses are extremely useful in problem solving, and are essential in developing new theories. OR the proposal of a solution to the question within the scientific method. OR A scientific "hunch," a tentative explanation of or prediction derived from experimentation. OR A tentative proposal made to explain certain observations or facts that requires further investigation to be verified.

**hypothyroidism :** Too little thyroid hormone. Symptoms include weight gain, constipation, dry skin, and sensitivity to the cold. Also called underactive thyroid.

**hypotonia:** a disorder that causes low muscle tone (the amount of tension or resistance to movement in a muscle), often involving reduced muscle strength

**hypotonic:** Describes a solution which has lower osmotic pressure than some other solution (usually, lower osmotic pressure than cell or body fluids). Washing your contact lenses with distilled water rather than saline is painful because distilled water is hypotonic; it causes water to move into cells, and they swell and burst.

**Hypoxanthine:** A purine base that reacts with 5-phosphoribosyl-1-pyrophosphate (PRPP) to form inosinate; the reaction is part of the salvage pathway for purine nucleotides.

**hypoxemia :** A condition in which there is not enough oxygen in the blood.

**hypoxia :** A condition in which there is a decrease in the oxygen supply to a tissue. In cancer treatment, the level of hypoxia in a tumor may help predict the response of the tumor to the treatment.

**hypoxia-activated prodrug TH-302:** A hypoxia-activated prodrug consisting of a 2-nitroimidazole phosphoramidate conjugate with potential antineoplastic activity. The 2-nitroimidazole moiety of hypoxia-activated prodrug TH-302 acts as a hypoxic trigger, releasing the DNA-alkylating dibromo isophosphoramidate mustard moiety within hypoxic regions of tumors. Normoxic tissues may be spared due to the hypoxia-specific activity of this agent, potentially reducing systemic toxicity.

**hypoxia-activated prodrug TH-4000:** A proprietary, hypoxia-activated prodrug with potential antineoplastic activity. Upon administration, the hypoxia-activated prodrug TH-4000 is activated in the hypoxic cells within tumors into an irreversible pan-HER inhibitor via a mechanism of action not yet fully elucidated. As a result, this agent inhibits cellular proliferation and differentiation of tumor cells overexpressing HER kinases, which belong to the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases. Healthy, normal tissues may be spared due to the hypoxia-specific activity of this agent, potentially reducing systemic toxicity. Check for active clinical trials using this agent.

**hypoxic** : Having too little oxygen.

**Hypoxin:** (Other name for: hypoxia-activated prodrug TH-4000)

**hyparrhythmia:** abnormal EKG patterns observed in infants suffering spasms

**hypothermal period:** The period about 4000 to 8000 years ago when the Earth was apparently several degrees warmer than it is now. More rainfall occurred in most of the subtropical desert regions and less in the central midwest United States and Scandinavia. It is also called the altithermal period and can serve as a past climate analog for predicting the regional pattern of climate change should the mean Earth surface temperature increase from an increase in atmospheric carbon dioxide concentration.

**hysterectomy** : Surgery to remove the uterus and, sometimes, the cervix. When the uterus and the cervix are removed, it is called a total hysterectomy. When only the uterus is removed, it is called a partial hysterectomy.

**Hysteresis (sensor memory):** the occurrence of a different value in the potential difference after the concentration of the test solution has been changed and then restored to its original value. This systematic error is generally in the direction of the concentration of the previous solution. Thus, if the electrodes are washed with water between each sample measurement, successive readings of the same solution can be expected to become progressively lower for cations and higher for anions.

**Hytone:** (Other name for: therapeutic hydrocortisone)

**Hytrin** : A drug used to treat urinary problems caused by an enlarged prostate. It is also used to treat high blood pressure and is being studied in the treatment of other conditions. Hytrin relaxes muscle tissue in blood vessels and in the prostate. It is a type of alpha blocker. Also called terazosin and terazosin hydrochloride.

**I 131 monoclonal antibody CC49:** A radioimmunoconjugate of the humanized monoclonal antibody CC49 labeled with iodine I 131. Iodine I 131 monoclonal antibody CC49 delivers beta and gamma radiation-emitting I 131 radionuclide specifically to tumor cells that express tumor-associated glycoprotein (TAG)-72, allowing localization of TAG-72-expressing tumor cells with radioimaging devices in diagnostic applications or resulting in specific TAG-72-expressing tumor cell radiocytotoxicity in therapeutic

applications. Monoclonal antibody CC49 binds to TAG-72, a pancarcinoma antigen, with high affinity.

**I-cell disease:** A lysosomal storage disease in which certain hydrolases are missing from the lysosomes owing to a defect in the synthesis of the lysosomal targeting signal, mannose 6-phosphate.

**IAP inhibitor AT-406:** An orally bioavailable inhibitor of IAP (Inhibitor of Apoptosis Protein) family of proteins with potential apoptotic inducing and antineoplastic activity. IAP inhibitor AT-406 selectively inhibits the biological activity of IAP proteins, including X chromosome-linked IAP (XIAP), the cellular IAPs 1 (c-IAP1) and 2 (c-IAP2) and melanoma inhibitor of apoptosis protein (ML-IAP). This may restore and promote the induction of apoptosis through apoptotic signaling pathways. AT-406 may work synergistically with cytotoxic drugs to overcome tumor cell resistance to apoptosis. IAPs are overexpressed by many cancer cell types, suppressing apoptosis by binding and inhibiting active caspases-3, -7 and -9 via their BIR (baculoviral IAP repeat) domains.

**IAP inhibitor HGS1029:** The hydrochloride salt of a small-molecule inhibitor of IAP (Inhibitor of Apoptosis Protein) family proteins with potential antineoplastic activity. IAP inhibitor HGS1029 selectively inhibits the biological activity of IAP proteins, which may restore apoptotic signaling pathways; this agent may work synergistically with cytotoxic drugs to overcome tumor cell resistance to apoptosis. IAPs are overexpressed by many cancer cell types, suppressing apoptosis by binding and inhibiting active caspases-3, -7 and -9 via their BIR (baculoviral IAP repeat) domains.

**iAPA-based dendritic cells/cytotoxic T lymphocytes:** A cell-based product composed of dendritic cells (DCs) pulsed with tumor-associated antigens (TAAs) and devoid of the inhibitory effect of antigen presentation attenuators (iAPA) combined with cytotoxic T-lymphocytes (CTLs) (iAPA-DC/CTL), with potential immunostimulating and antineoplastic activities. DCs are transduced with a viral vector containing small interfering RNAs (siRNAs) against APAs, which prevents the expression of APA genes and inhibits attenuation of antigen presentation. Upon administration of iAPA-DC/CTL, the DCs are able to efficiently present antigens to the immune system, stimulate the immune system against tumor-associated antigens (TAAs) and hyperactivate TAA-specific CTLs and T-helper cells. Also, the

iAPA-based DCs inhibit the activity of the T-regulatory cells (Tregs), thereby abrogating their negative effect on CTL activation and preventing their immunosuppressive activity against TAAs. Altogether, this inhibits tumor cell proliferation. Additionally, the administered CTLs induce direct cancer cell lysis. APAs negatively regulate antigen presentation, activate Tregs and their immunosuppressive activity, affect inflammatory cytokine production by DCs, and negatively regulate the immunostimulatory activity of DCs; they have an overall inhibitory effect on the stimulation of the immune system.

**IAPD:** International Association of Plastics Distributors.

**ibandronate :** A drug that is used to prevent and treat osteoporosis, and is being studied in the treatment of cancer that has spread to the bones. It belongs to the family of drugs called bisphosphonates.

**ibandronate sodium:** The sodium salt of ibadronic acid, a synthetic nitrogen-containing bisphosphonate. Ibandronic acid inhibits farnesyl pyrophosphate synthase, resulting in a reduction in geranylgeranyl GTPase signaling proteins and apoptosis of osteoclasts. This agent increases bone mineral density, decreases bone remodeling, inhibits osteoclast-mediated bone resorption, and reduces metastases-related and corticosteroid-related bone pain.

**Ibrance :** A drug used to treat hormone-receptor positive (HR+), HER2 negative (HER2-) breast cancer that is advanced or has spread to other parts of the body. It is used with fulvestrant in women whose disease has gotten worse after treatment with hormone therapy. It is used with letrozole in postmenopausal women who have not been treated with hormone therapy. It is also being studied in the treatment of other types of cancer. Ibrance blocks certain proteins, which may help keep cancer cells from growing. It is a type of cyclin-dependent kinase inhibitor. Also called palbociclib.

**ibritumomab tiuxetan:** An immunoconjugate of the monoclonal antibody ibritumomab conjugated with the linker-chelator tiuxetan, a high affinity, conformationally restricted chelation site for radioisotopes. When bound to indium In 111 or yttrium Y 90, ibritumomab tiuxetan, targeting the CD20 antigen on B cell surfaces, specifically delivers a potentially cytotoxic dose of radiation to B lymphocytes. Ibritumomab is a murine IgG1 kappa monoclonal antibody directed against the CD20 antigen, which is found on the surface of normal and malignant B lymphocytes. or A monoclonal

antibody that is used to treat certain types of B-cell non-Hodgkin lymphoma and is being studied in the treatment and detection of other types of B-cell tumors. Monoclonal antibodies are made in the laboratory and can locate and bind to substances in the body, including cancer cells. Ibritumomab binds to the protein called CD20, which is found on B cells. It is linked to the compound tiuxetan. This allows certain radioisotopes to be attached before it is given to a patient. It is a type of monoclonal antibody-chelator conjugate. Also called Zevalin.

**ibrutinib:** An orally bioavailable, small-molecule inhibitor of Bruton's tyrosine kinase (BTK) with potential antineoplastic activity. Upon oral administration, ibrutinib binds to and irreversibly inhibits BTK activity, thereby preventing both B-cell activation and B-cell-mediated signaling. This leads to an inhibition of the growth of malignant B cells that overexpress BTK. BTK, a member of the src-related BTK/Tec family of cytoplasmic tyrosine kinases, is required for B cell receptor signaling, plays a key role in B-cell maturation, and is overexpressed in a number of B-cell malignancies. The expression of BTK in tumor cells is also associated with increased proliferation and survival. Check for active clinical trials using this agent.

**IBS:** A disorder of the intestines commonly marked by abdominal pain, bloating, and changes in a person's bowel habits. This may include diarrhea or constipation, or both, with one occurring after the other. Also called irritable bowel syndrome, irritable colon, mucus colitis, and spastic colon.

**ibuprofen:** A propionic acid derivate and nonsteroidal anti-inflammatory drug (NSAID) with anti-inflammatory, analgesic, and antipyretic effects. Ibuprofen inhibits the activity of cyclo-oxygenase I and II, resulting in a decreased formation of precursors of prostaglandins and thromboxanes. This leads to decreased prostaglandin synthesis, by prostaglandin synthase, the main physiologic effect of ibuprofen. Ibuprofen also causes a decrease in the formation of thromboxane A<sub>2</sub> synthesis, by thromboxane synthase, thereby inhibiting platelet aggregation.

**ibuprofen :** A drug used to treat fever, swelling, pain, and redness by preventing the body from making a substance that causes inflammation. It is a type of nonsteroidal anti-inflammatory drug (NSAID). Also called Advil and Motrin.

**ibuprofen intravenous:** A formulation for intravenous injection containing ibuprofen, a propionic acid derivative and nonsteroidal anti-inflammatory drug (NSAID), with anti-inflammatory, analgesic, and antipyretic activities. Upon intravenous injection, ibuprofen inhibits the activity of the enzymes cyclooxygenase I (COX-1) and II (COX-2), resulting in a decreased formation of precursors of prostaglandins and thromboxanes. Inhibition of COX-2 specifically blocks the conversion of arachidonic acid (AA) to prostaglandins, which mediate inflammation, fever and pain.

**IC-GREEN:** (Other name for: indocyanine green solution)

**iC9-GD2-CD28-OX40-expressing T lymphocytes:** Modified T-lymphocytes expressing a 3rd generation chimeric antigen receptor (CAR) specific for the disialoganglioside GD2, which contains the CD3zeta chain, the signaling domains of the co-stimulatory molecules CD28 and CD134 (OX-40) and the suicide gene inducible caspase 9 (iCasp9), with potential immunomodulating and antineoplastic activities. Upon administration, iC9-GD2-CD28-OX40-expressing T lymphocytes target the GD2 antigen on tumor cells, thereby providing selective toxicity towards GD2-expressing tumor cells. iCasp9 consists of a human FK506 drug-binding domain with an F36V mutation (FKBP12-F36V) linked to human caspase 9. If the administered T cells lead to unacceptable side effects, the chemical homodimerizer AP1903 can be administered, which binds to the drug binding FKBP12-F36V domain and activates caspase 9, resulting in the apoptosis of the administered T-cells. The tumor-associated antigen GD2 is overexpressed on the surface of almost all tumors of neuroectodermal origin. OX40 and CD28, both T-cell surface-associated co-stimulatory molecules, are required for full T-cell activation.

**ICD:** A small device used to correct a heartbeat that is abnormal (too fast, too slow, or irregular). The device is placed by surgery in the chest or abdomen. Wires are passed through a vein to connect the device to the heart. When it detects abnormal heartbeats, it sends an electrical shock to the heart to restore the heartbeat to normal. Also called implantable cardioverter-defibrillator.

**ICE :** An abbreviation for a chemotherapy combination that is used to treat non-Hodgkin and Hodgkin lymphomas that have come back and do not respond to other treatments. It includes the drugs ifosfamide, carboplatin, and etoposide phosphate. Also called ICE regimen.

**ice age:** A glacial epoch or time of extensive glacial activity. Also, as Ice Age, which refers to the latest glacial epoch, the Pleistocene Epoch.

**ice and snow albedo:** The reflectivity of ice and snow-covered surfaces. The albedo of freshly fallen snow may be as much as 90%, while older snow may have values of 75% or less. The larger the areal extent of snow and ice cover, the higher the albedo value. The surface albedo will also increase as a function of the depth of snow cover up to 13 cm and be unaffected by increased snow cover after reaching that depth.

**ice and snow-albedo-temperature feedback:** Interactions that can be described as a theoretical concept of a feedback mechanism in which the interacting elements are the areal extent of polar ice and snow cover, the albedo of the polar region (dependent on areal extent of ice and snow), absorption of solar radiation (dependent on the albedo), temperature (dependent on the absorption of solar radiation) and the area of ice and snow cover (dependent on temperature). Less snowfall would mean more absorption of solar radiation, therefore a surface warming would occur. Climate modeling studies indicate an amplification effect (i.e., positive feedback) of the ice and snow-albedo feedback on increased surface air temperatures caused by increases in the atmospheric concentration of carbon dioxide.

**ice cap:** a glacial ice mass that is centered on a highland area and migrates outward in all directions.

**ice cover:** During the present time, the extent, especially the thickness, of glacier ice on a land surface. Also the same as ice concentration, which is the ratio of an area of sea ice to the total area of sea surface within some large geographic area.

**ice fall:** a blocky, piled-up ice surface that results when rapid ice movements rupture glacial crevasses.

**ice flow:** See glacier flow.

**ice front:** The floating vertical cliff that forms the seaward face or edge of a glacier or an ice shelf that enters water. It can vary from 2 to 50 m in height.

**ICE regimen:** A chemotherapy regimen consisting of ifosfamide, carboplatin and etoposide used in the treatment of relapsed and refractory non-Hodgkin and Hodgkin lymphomas. Or An abbreviation for a

chemotherapy combination that is used to treat non-Hodgkin and Hodgkin lymphomas that have come back and do not respond to other treatments. It includes the drugs ifosfamide, carboplatin, and etoposide phosphate. Also called ICE.

**ice sheet:** a glacier that covers a broad expanse of land and is not restricted to a channel.

**ice sheet (continental glacier):** A glacier of considerable thickness and more than 50,000 sq km in area. It forms a continuous cover of ice and snow over a land surface. An ice sheet is not confined by the underlying topography but spreads outward in all directions. During the Pleistocene Epoch, ice sheets covered large parts of North America and northern Europe but they are now confined to polar regions (e.g., Greenland and Antarctica).

**ice shelf:** A sheet of very thick ice with a level or gently undulating surface. It is attached to the land on one side, but most of it is floating. On the seaward side, it is bounded by a steep cliff (ice front) 2 to 50 m or more above sea level. Ice shelves have formed along polar coasts (e.g., Antarctica and Greenland); they are very wide with some extending several hundreds of kilometers toward the sea from the coastline. They increase in size from annual snow accumulation and seaward extension of land glaciers. They decrease in size from warming, melting, and calving.

**iceberg:** a floating mass of ice that results from calving from a glacial face into the water of a lake or ocean.

**ICI 182780:** A drug used to treat certain types of breast cancer in postmenopausal women. It is also being studied in the treatment of other types of cancer. ICI 182780 blocks estrogen activity in the body and is a type of antiestrogen. Also called Faslodex and fulvestrant.

**ICI D1694:** An anticancer drug that stops tumor cells from growing by blocking the ability of cells to make DNA. It belongs to the family of drugs called thymidylate synthase inhibitors. Also called raltitrexed.

**Iclusig :** A drug used to treat chronic myelogenous leukemia (CML) and Philadelphia chromosome-positive acute lymphoblastic leukemia. It is used in patients who are not able to take or have not gotten better after treatment with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Iclusig blocks BCR-ABL and other proteins, which may help keep cancer cells from growing and may kill them. It may also prevent

the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of angiogenesis inhibitor. Also called ponatinib hydrochloride.

**icodextrin solution:** An isosmotic solution containing icodextrin, a starch-derived, water-soluble glucose polymer, used in peritoneal dialysis and for the prevention of adhesion after surgery. Due to its isoosmotic nature and inability to cross the peritoneal membrane, the icodextrin solution, upon administration into the peritoneal cavity, is able to exert osmotic pressure. This allows for the removal of excess fluids and waste products in dialysis patients. In addition, icodextrin can provide a barrier between tissue surfaces when administered during surgery. This physically separates tissues, prevents adhesion after surgery and promotes wound healing.

**Icosahedral symmetry:** The symmetry displayed by a regular polyhedron that is composed of 20 equilateral triangular faces with 12 corners.

**icotinib hydrochloride:** An orally available quinazoline-based inhibitor of epidermal growth factor receptor (EGFR), with potential antineoplastic activity. Icotinib selectively inhibits the wild-type and several mutated forms of EGFR tyrosine kinase. This may lead to an inhibition of EGFR-mediated signal transduction and may inhibit cancer cell proliferation. EGFR, a receptor tyrosine kinase, is upregulated in a variety of cancer cell types. Check for active clinical trials using this agent.

**icrucumab:** A fully human IgG1 monoclonal antibody directed against human vascular endothelial growth factor receptor 1 (VEGFR-1/FLT-1) with potential antiangiogenesis and antineoplastic activities. Icrucumab specifically binds to and inhibits the activity of VEGFR-1, which may prevent the activation of downstream signaling pathways and so inhibit tumor angiogenesis; the subsequent reduction in tumor nutrient supply may inhibit tumor cell proliferation. Tumor cell overexpression of VEGFR-1 may be associated with tumor angiogenesis and tumor cell proliferation and invasion; VEGFR-1 may modulate VEGFR-2 signaling.

**icteric:** yellowish

**ID (Inner Diameter):** The innermost (smallest diameter) surface of a circular object, such as a bore or a round seal

**Idamycin :** A drug used with other drugs to treat acute myelogenous leukemia (AML). It is also being studied in the treatment of other types of cancer. Idamycin blocks a certain enzyme needed for cell division and DNA

repair, and it may kill cancer cells. It is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called 4-demethoxydaunorubicin and idarubicin hydrochloride.

**idarubicin hydrochloride:** The hydrochloride salt of the anthracycline antineoplastic antibiotic idarubicin. Idarubicin intercalates into DNA and inhibits topoisomerase II, thereby inhibiting DNA replication and ultimately, interfering with RNA and protein synthesis. Due to its high lipophilicity, idarubicin penetrates cell membranes more efficiently than other anthracycline antibiotic compounds. or A drug used with other drugs to treat acute myelogenous leukemia (AML). It is also being studied in the treatment of other types of cancer. Idarubicin hydrochloride blocks a certain enzyme needed for cell division and DNA repair, and it may kill cancer cells. It is a type of anthracycline antibiotic and a type of topoisomerase inhibitor. Also called 4-demethoxydaunorubicin and Idamycin.

**idarubicin-eluting beads:** A sustained-release drug delivery embolization system containing small polymeric beads impregnated with the anthracycline antibiotic idarubicin with potential antineoplastic activity. The beads consist of polyvinyl alcohol (PVA) microspheres modified with sulfonic acid groups and loaded with idarubicin. During transarterial chemoembolization (TACE) in the hepatic artery, idarubicin-eluting beads embolize to the tumor vasculature, occlude tumor blood vessels and induce ischemic necrosis of tumor tissue due to mechanical blockage of the tumor vasculature. Simultaneously, idarubicin-eluting beads release cytotoxic idarubicin locally and in a sustained manner. This may result in idarubicin-mediated inhibition of tumor cell proliferation.

**idasanutlin:** An orally available, small molecule, antagonist of MDM2 (mouse double minute 2; Mdm2 p53 binding protein homolog), with potential antineoplastic activity. Idasanutlin binds to MDM2 blocking the interaction between the MDM2 protein and the transcriptional activation domain of the tumor suppressor protein p53. By preventing the MDM2-p53 interaction, p53 is not enzymatically degraded and the transcriptional activity of p53 is restored. This may lead to p53-mediated induction of tumor cell apoptosis. MDM2, a zinc finger nuclear phosphoprotein and negative regulator of the p53 pathway, is often overexpressed in cancer cells and has been implicated in cancer cell proliferation and survival.

**Ideal Gas:** An ideal gas is a perfect gas. There is no ideal gas in the world. An ideal gas would follow the combined gas law exactly in any environment. OR A gas whose pressure  $P$ , volume  $V$ , and temperature  $T$  are related by  $PV = nRT$ , where  $n$  is the number of moles of gas and  $R$  is the ideal gas law constant. Ideal gases have molecules with negligible size, and the average molar kinetic energy of an ideal gas depends only on its temperature. Most gases behave ideally at sufficiently low pressures.

**ideal gas equation:** the equation relating the volume of a gas to its pressure, temperature and moles of gas.

**ideal gas law:**  $PV=nRT$  Describes the relationship between pressure ( $P$ ), temperature ( $T$ ), volume ( $V$ ), and moles of gas ( $n$ ). This equation expresses behavior approached by real gases at low pressure and high temperature.

**ideal gas law constant:** A constant  $R$  equal to  $PV/(nT)$  for ideal gases, where the pressure, volume, moles, and temperature of the gas are  $P$ ,  $V$ ,  $n$ , and  $T$ , respectively. The value and units of  $R$  depend on the units of  $P$ ,  $V$ , and  $T$ . Commonly used values and units of  $R$  include:  $82.055 \text{ cm}^3 \text{ atm K}^{-1} \text{ mol}^{-1}$ ;  $0.082055 \text{ L atm mol}^{-1} \text{ K}^{-1}$ ;  $8.31434 \text{ J mol}^{-1} \text{ K}^{-1}$ ;  $1.9872 \text{ cal K}^{-1} \text{ mol}^{-1}$ ;  $8314.34 \text{ L Pa mol}^{-1} \text{ K}^{-1}$ ;  $8.31434 \text{ Pa m}^3 \text{ mol}^{-1} \text{ K}^{-1}$ .

**ideal solution:** All molecules in an "ideal solution" interact in exactly the same way; the solvent-solvent, solvent-solute, and solute-solute intermolecular forces are all equivalent. Ideal solutions obey Raoult's law exactly. Real solutions behave ideally only when they are very dilute.

**IDEC-Y2B8:** A drug used with the drug rituximab to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of B-cell tumors. IDEC-Y2B8 contains a monoclonal antibody that binds to a protein called CD20, which is found on B cells. It also contains a radioactive substance called yttrium Y 90, which may help kill cancer cells. IDEC-Y2B8 is a type of radioimmunoconjugate. Also called Y 90 ibritumomab tiuxetan, Y 90 Zevalin, and yttrium Y 90 ibritumomab tiuxetan.

**idelalisib:** An orally bioavailable, small molecule inhibitor of the delta isoform of the 110 kDa catalytic subunit of class I phosphoinositide-3 kinase (PI3K) with potential immunomodulating and antineoplastic activities. Idelalisib inhibits the production of the second messenger phosphatidylinositol-3,4,5-trisphosphate (PIP3), preventing the activation of the PI3K signaling pathway and inhibiting tumor cell proliferation,

motility, and survival. Unlike other isoforms of PI3K, PI3K-delta is expressed primarily in hematopoietic lineages. The targeted inhibition of PI3K-delta is designed to preserve PI3K signaling in normal, non-neoplastic cells. or A drug used with rituximab to treat chronic lymphocytic leukemia (CLL) that has come back. It is also used to treat follicular B-cell non-Hodgkin lymphoma (NHL) and small lymphocytic lymphoma (SLL) that have come back after treatment with other anticancer therapy. It is also being studied in the treatment of other types of cancer. Idelalisib blocks certain proteins, which may help keep cancer cells from growing and may kill them. It is a type of kinase inhibitor. Also called Zydelig.

**identify the variable(s):** The process of choosing a letter to represent the unknown value and describing that variable.

**identity:** A math property which states:  $A+0=A$  and  $A*1=A$ .

**identity property of multiplication:** Any number times one has the same value.

**IDH mutant inhibitor AG-881:** An orally available inhibitor of mutated forms of both isocitrate dehydrogenase type 1 (IDH1, IDH1 [NADP+ soluble) in the cytoplasm and type 2 (IDH2, isocitrate dehydrogenase [NADP+], mitochondrial) in the mitochondria, with potential antineoplastic activity. Upon administration, pan-IDH mutant inhibitor AG-881 specifically inhibits mutant forms of IDH1 and IDH2, thereby inhibiting the formation of the oncometabolite 2-hydroxyglutarate (2HG) from alpha-ketoglutarate (a-KG). This prevents 2HG-mediated signaling and leads to both an induction of cellular differentiation and an inhibition of cellular proliferation in tumor cells expressing IDH mutations. In addition, AG-881 is able to penetrate the blood-brain barrier (BBB). IDH1 and 2, metabolic enzymes that catalyze the conversion of isocitrate into a-KG, play key roles in energy production and are mutated in a variety of cancer cell types. In addition, mutant forms of IDH1 and 2 catalyze the formation of 2HG and drive cancer growth by blocking cellular differentiation and inducing cellular proliferation.

**IDH1 inhibitor AG-120:** An orally available inhibitor of isocitrate dehydrogenase type 1 (IDH1), with potential antineoplastic activity. Upon administration, AG-120 specifically inhibits a mutated form of IDH1 in the cytoplasm, which inhibits the formation of the oncometabolite, 2-hydroxyglutarate (2HG). This may lead to both an induction of cellular

differentiation and an inhibition of cellular proliferation in IDH1-expressing tumor cells. IDH1, an enzyme in the citric acid cycle, is mutated in a variety of cancers; it initiates and drives cancer growth by both blocking cell differentiation and catalyzing the formation of 2HG.

**IDH1(R132) inhibitor IDH305:** An inhibitor of the citric acid cycle enzyme isocitrate dehydrogenase [NADP] cytoplasmic (isocitrate dehydrogenase 1; IDH1) with mutations at residue R132 (IDH1(R132)), with potential antineoplastic activity. Upon administration, IDH305 specifically inhibits IDH1(R132) mutant forms in the cytoplasm, which inhibits the formation of the oncometabolite 2-hydroxyglutarate (2HG). This may lead to both an induction of cellular differentiation and an inhibition of cellular proliferation in IDH1(R132)-expressing tumor cells. IDH1(R132) mutations are highly expressed in certain malignancies, including gliomas. They initiate and drive cancer growth by both blocking cell differentiation and catalyzing the formation of 2HG.

**IDH1R132H mutation-targeting IDH1 peptide vaccine:** A peptide vaccine consisting of a 20-mer peptide derived from isocitrate dehydrogenase type 1 (IDH1) containing the point mutation R132H (IDH1R132H), with potential antineoplastic activity. Upon subcutaneous vaccination with the IDH1R132H mutation-targeting IDH1 peptide vaccine, the vaccine stimulates the host immune system to mount a cytotoxic T-lymphocyte (CTL) response against tumor cells that express the IDH1R132H protein. R132H is a point mutation, which contains an amino acid substitution where arginine is replaced by histidine at position 132 of IDH1, and is highly expressed in gliomas as well as other tumor types; this mutation is associated with increased production of the oncometabolite R-2-hydroxyglutarate (2HG).

**IDH1R132H-specific peptide vaccine PEPIDH1M:** A peptide vaccine consisting of a peptide derived from isocitrate dehydrogenase 1 (IDH1) containing the point mutation R132H (IDH1R132H), with potential antineoplastic activity. Intradermal vaccination with the IDH1R132H-specific peptide vaccine PEPIDH1M may stimulate the host immune system to mount a cytotoxic T lymphocyte (CTL) response against tumor cells that express the IDH1R132H protein. The IDH1 point mutation of amino acid residue 132 is highly expressed in gliomas and is associated

with increased production of the oncometabolite R-2-hydroxyglutarate (2HG).

**IDH2 inhibitor AG-221:** An orally available inhibitor of isocitrate dehydrogenase type 2 (IDH2), with potential antineoplastic activity. Upon administration, AG-221 specifically inhibits IDH2 in the mitochondria, which inhibits the formation of 2-hydroxyglutarate (2HG). This may lead to both an induction of cellular differentiation and an inhibition of cellular proliferation in IDH2-expressing tumor cells. IDH2, an enzyme in the citric acid cycle, is mutated in a variety of cancers; It initiates and drives cancer growth by blocking differentiation and the production of the oncometabolite 2HG.

**idiom:** an accepted phrase or expression that doesn't follow the usual patterns of language, or has a meaning other than the literal.

**idiopathic :** Describes a disease of unknown cause.

**idiopathic myelofibrosis :** A progressive, chronic disease in which the bone marrow is replaced by fibrous tissue and blood is made in organs such as the liver and the spleen, instead of in the bone marrow. This disease is marked by an enlarged spleen and progressive anemia. Also called agnogenic myeloid metaplasia, chronic idiopathic myelofibrosis, myelosclerosis with myeloid metaplasia, and primary myelofibrosis.

**idiopathic pneumonia syndrome :** A set of pneumonia-like symptoms (such as fever, chills, coughing, and breathing problems) that occur with no sign of infection in the lung. Idiopathic pneumonia syndrome is a serious condition that can occur after a stem cell transplant.

**idiopathic pulmonary fibrosis :** A disease in which the alveoli (tiny air sacs at the end of the bronchioles in the lungs) are overgrown with fibrous tissue. The cause of the disease is unknown and it gets worse over time. Symptoms include difficult, painful breathing and shortness of breath.

**idiopathic thrombocytopenic purpura :** A condition in which platelets (blood cells that cause blood clots to form) are destroyed by the immune system. The low platelet count causes easy bruising and bleeding, which may be seen as purple areas in the skin, mucous membranes, and outer linings of organs. Also called immune thrombocytopenic purpura and ITP.

**idiosyncrasy:** The increased individual sensitivity of an organism to the effect of certain substances (UNEP/IRPTC, 1982).

**idiotype-pulsed autologous dendritic cell vaccine APC8020:** A cell-based cancer vaccine composed of autologous dendritic cells (DCs) pulsed with tumor-derived clonal immunoglobulin (Ig) with potential immunostimulatory and antineoplastic activities. Upon administration, idiotype-pulsed autologous dendritic cell vaccine APC8020, containing idiotype (Id) protein structures that can be recognized by antibodies and by CD41 T lymphocytes and CD81 T lymphocytes, may stimulate antitumoral cytotoxic T lymphocyte (CTL) and antibody responses against Id-expressing tumor cells. The Id represents the unique antigenic determinants in the variable regions of the clonal Ig.

**Idls (intermediate-density lipoproteins):** Lipoprotein particles that remain after much of the triacylglycerides from VLDL are hydrolyzed and absorbed by other tissues; can be absorbed by the liver or converted into LDL.

**IDO inhibitor NLG919:** An orally available inhibitor of indoleamine 2,3-dioxygenase 1 (IDO1), with potential immunomodulating and antineoplastic activities. Upon administration, NLG919 targets and binds to IDO1, a cytosolic enzyme responsible for the oxidation of the essential amino acid tryptophan into kynurenine. By inhibiting IDO1 and decreasing kynurenine in tumor cells, this agent increases tryptophan levels, restores the proliferation and activation of various immune cells, including dendritic cells (DCs), natural killer (NK) cells, T-lymphocytes, and causes a reduction in tumor-associated regulatory T-cells (Tregs). Activation of the immune system, which is suppressed in many cancers, may induce a cytotoxic T-lymphocyte (CTL) response against the IDO1-expressing tumor cells. IDO1 is overexpressed by a variety of tumor cell types and plays an important role in immunosuppression. Tryptophan depletion is associated with immunosuppression caused by T-cell suppression.

**idoxifene :** A drug that blocks the effects of estrogen.

**idoxuridine:** An iodinated analogue of deoxyuridine, with antiviral activity against herpes simplex virus (HSV) and potential radiosensitizing activities. Upon ocular administration, idoxuridine (IUdR) is converted to its mono-, di-, and triphosphate forms, is incorporated into DNA and disrupts viral replication. Upon oral administration of the idoxuridine prodrug ropidoxuridine and hepatic conversion by aldehyde oxidase into

idoxuridine, this agent incorporates into DNA and sensitizes cells to ionizing radiation by increasing DNA strand breaks.

**idoxuridine** : A drug that reduces the risk of cancer cell growth by interfering with the cells' DNA.

**idronoxil**: A synthetic flavonoid derivative. Idronoxil activates the mitochondrial caspase system, inhibits X-linked inhibitor of apoptosis (XIAP), and disrupts FLICE inhibitory protein (FLIP) expression, resulting in tumor cell apoptosis. This agent also inhibits DNA topoisomerase II by stabilizing the cleavable complex, thereby preventing DNA replication and resulting in tumor cell death.

**IEEE**: Institute for Electrical and Electronic Engineers.

**IEP**: An education plan for children with certain disabilities or health conditions, such as cancer. By law, these children must receive special education services and other support they need in school. An IEP describes which special services the child needs and how those needs will be met. This may include special class placement, extra help with class assignments and tests, tutoring, and other services such as counseling, speech therapy, and physical therapy. IEPs are covered in the U.S. law, Individuals with Disabilities Education Act. Also called individualized education plan.

**IFA**: A mixture of oil and water that is combined with a specific antigen to boost the immune response to that antigen. It is being studied in immunotherapy and as a way to increase the immune response to cancer vaccines. It is a type of immune modulator. Also called incomplete Freund's adjuvant and Montanide ISA-51.

**Ifex**: (Other name for: ifosfamide)

**Ifex** : A drug that is used with other drugs to treat germ cell testicular cancer that did not respond to previous treatment with other drugs. It is also being studied in the treatment of other types of cancer. Ifex attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent and a type of antimetabolite. Also called ifosfamide.

**IFN alpha-2B** : A drug used to treat AIDS-related Kaposi sarcoma in certain patients, hairy cell leukemia, and melanoma that has been removed by surgery. It is also used with other anticancer drugs to treat a certain type of non-Hodgkin lymphoma. IFN alpha-2B is also used to treat some infections caused by viruses, such as the hepatitis C virus. It is being

studied in the treatment of other types of cancer and other conditions. IFN alpha-2B is a form of interferon alfa (a substance normally made by cells in the immune system) and is made in the laboratory. It is a type of cytokine and a type of biological response modifier. Also called interferon alfa-2b, Intron A, and recombinant interferon alfa-2b.

**iFOBT:** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called fecal immunochemical test, FIT, immunoassay fecal occult blood test, immunochemical fecal occult blood test, and immunologic fecal occult blood test.

**ifosfamide:** A synthetic analogue of the nitrogen mustard cyclophosphamide with antineoplastic activity. Ifosfamide alkylates and forms DNA crosslinks, thereby preventing DNA strand separation and DNA replication. This agent is a prodrug that must be activated through hydroxylation by hepatic microsomal enzymes. or A drug that is used with other drugs to treat germ cell testicular cancer that did not respond to previous treatment with other drugs. It is also being studied in the treatment of other types of cancer. Ifosfamide attaches to DNA in cells and may kill cancer cells. It is a type of alkylating agent and a type of antimetabolite. Also called Ifex.

**Ifosfamidum:** (Other name for: ifosfamide)

**Ig :** A protein that is made by B cells and plasma cells (types of white blood cells) and helps the body fight infection. Some Igs may be found in higher than normal amounts in patients with certain conditions or certain types of cancer, including multiple myeloma and Waldenstrom macroglobulinemia. Measuring the amount of specific Igs in the blood and urine may help diagnose cancer or find out how well treatment is working or if cancer has come back. Some Igs may be used as tumor markers. Also called immunoglobulin.

**IGES:** Initial Graphics Exchange Specification. It is a common file format for exchanging CAD data. Protomold can use IGES solid or surface files to create molded parts.

**IGF:** A protein made by the body that stimulates the growth of many types of cells. IGF is similar to insulin (a hormone made in the pancreas). There are two forms of IGF called IGF-1 and IGF-2. Higher than normal levels of IGF-1 may increase the risk of several types of cancer. IGF is a type of growth factor and a type of cytokine. Also called insulin-like growth factor and somatomedin.

**IGF ligand neutralizing antibody BI 836845:** A humanized IgG1 insulin-like growth factor (IGF) monoclonal antibody targeting the IGF ligands 1 (IGF-1) and 2 (IGF-2), with potential antineoplastic activity. Upon administration, IGF ligand neutralizing antibody BI 836845 binds to both IGF-1 and IGF-2 and inhibits the binding of these ligands to their receptor, IGF-1R. This blocks the insulin growth factor (IGF) signaling pathway, which is upregulated in a number of cancer cell types and plays a key role in cancer cell proliferation and chemoresistance. In addition, BI 836845 prevents the binding of IGF-2 to insulin receptor variant A (IR-A), preventing its activation. Check for active clinical trials using this agent.

**IGF-1R antagonist BMS-754807:** An oral small molecule inhibitor of insulin-like growth factor 1 receptor (IGF-1R) and insulin receptor (InsR) tyrosine kinases with potential antineoplastic activity. Dual IGF-1R/InsR inhibitor BMS-754807 binds reversibly to and inhibits the activities of IGF-1R and InsR, which may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. IGF-1R and InsR tyrosine kinases, overexpressed in a variety of human cancers, play significant roles in mitogenesis, angiogenesis, and tumor cell survival.

**IGF-1R antisense oligodeoxynucleotide-treated autologous glioma cells:** Autologous glioma cells treated ex vivo with an 18-mer antisense oligodeoxynucleotide of insulin-like growth factor receptor 1 (IGF-1R/AS ODN), with potential antineoplastic activity. IGF-1R/AS ODN pre-treated glioma cells encapsulated in small Lucite diffusion chambers are implanted into a subcutaneous pocket in the patient's abdominal rectus sheath. Within the diffusion chambers, IGF-1R/AS ODN binds to IGF-1R mRNA, and shuts down the translation of IGF-1R in the glioma cells. Downregulation of IGF-1R induces apoptosis and causes the release of exosomes, which contain tumor-associated antigens (TAAs). The diffusion of exosomes and IGF-1R/AS ODN from the Lucite chambers may activate the patient's immune system and mount a cytotoxic T-lymphocyte (CTL) response

against cells expressing these TAAs. IGF-1R, a receptor tyrosine kinase, is overexpressed in a variety of tumor cell types and is essential for tumor cell growth, transformation and survival.

**IGF-1R inhibitor OSI-906 :** A substance being studied in the treatment of cancer. It blocks a protein called IGF-1R, which is found at high levels in some types of tumors. IGF-1R is needed for cell growth and blocking it may cause tumor cells to die. IGF-1R inhibitor OSI-906 is a type of IGF-1R inhibitor. Also called OSI-906.

**IGF-1R inhibitor PL225B:** An orally bioavailable inhibitor of the insulin-like growth factor 1 receptor (IGF-1R) with potential antineoplastic activity. IGF-1R inhibitor PL225B selectively binds to and inhibits the activities of IGF-1R, which may result in both the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis in IGF-1R-overexpressing tumor cells. IGF-1R, a receptor tyrosine kinase overexpressed in a variety of human cancers, plays a significant role in the stimulation of cellular proliferation, oncogenic transformation, and suppression of apoptosis.

**IGF-1R/IR inhibitor KW-2450:** An orally bioavailable inhibitor of insulin-like growth factor 1 receptor (IGF-1R) and insulin receptor (IR) tyrosine kinases with potential antineoplastic activity. IGF-1R/IR inhibitor KW-2450 selectively binds to and inhibits the activities of IGF-1R and IR, which may result in the inhibition of tumor cell proliferation and the induction of tumor cell apoptosis. IGF-1R and IR tyrosine kinases, overexpressed in a variety of human cancers, play significant roles in the stimulation of cellular proliferation, oncogenic transformation, and suppression of apoptosis.

**IGF-methotrexate conjugate:** A conjugate containing the antimetabolite and antifolate agent methotrexate conjugated to insulin-like growth factor (IGF), with potential antineoplastic activity. After intravenous administration, the IGF moiety of the IGF-methotrexate conjugate binds to and is internalized by IGF receptors (IGFR) on the surface of tumor cells. Following cell entry, the methotrexate then binds to and inhibits the enzyme dihydrofolate reductase, which catalyzes the conversion of dihydrofolate to tetrahydrofolate. This results in both the inhibition of DNA and RNA synthesis and the induction of death in rapidly dividing cells. Binding to IGFR can localize the cytotoxic effect of methotrexate in tumor cells. This may increase its efficacy while decreasing its toxicity to normal, healthy

cells. IGFR is overexpressed on many types of cancer cells and has been implicated in metastasis and resistance to apoptosis.

**IGFR:** A protein found on the surface of some types of cells that binds to insulin-like growth factor (IGF). This causes the cells to grow and divide. IGFR is found at high levels on the surface of several types of cancer cells, which causes these cells to grow rapidly in the presence of IGF. Also called insulin-like growth factor receptor.

**IgG-RFT5-dgA:** A monoclonal antibody linked to a toxic substance. It is being studied in the treatment of melanoma that has spread to distant parts of the body. IgG-RFT5-dgA is made in the laboratory. It can find and kill certain white blood cells that prevent the immune system from killing cancer cells. Also called RFT5-dgA immunotoxin.

**igneous:** rock formed when molten rock cools.

**Igneous Rock:** A rock type that has been created from super-heated magma. The three main types of rock are igneous, sedimentary, and metamorphic. OR Igneous rock is rock formed when molten rock cools down and solidifies. OR rock that at one time was molten and part of magmas or lavas and that then cooled.

**IGRT:** A procedure that uses a computer to create a picture of a tumor to help guide the radiation beam during radiation therapy. The pictures are made using CT, ultrasound, X-ray, or other imaging techniques. IGRT makes radiation therapy more accurate and causes less damage to healthy tissue. Also called image-guided radiation therapy.

**IH636 grape seed extract :** A substance being studied for its ability to prevent damage to normal tissue caused by radiation therapy. It is a type of antioxidant.

**IH636 grape seed proanthocyanidin extract:** An oligomeric proanthocyanidin extracted from grape seeds. IH636 grape seed proanthocyanidin extract exhibits dose-dependent free-radical scavenging and antioxidant properties.

**IL:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. ILs regulate immune responses. ILs made in the laboratory are used as biological response modifiers to boost the immune system in cancer therapy. An interleukin is a type of cytokine. Also called interleukin.

**IL-1:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-1 is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. There are two forms of IL-1, alpha and beta, which act the same. IL-1 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-1 is a type of cytokine. Also called interleukin-1.

**IL-1-alfa :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-1-alfa, one form of IL-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of IL-1, IL-1-beta, acts the same as IL-1-alfa. IL-1-alfa made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-1-alfa is a type of cytokine. Also called IL-1-alpha, interleukin-1-alfa, and interleukin-1-alpha.

**IL-1-alpha :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-1-alpha, one form of IL-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of IL-1, IL-1-beta, acts the same as IL-1-alpha. IL-1-alpha made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-1-alpha is a type of cytokine. Also called IL-1-alfa, interleukin-1-alfa, and interleukin-1-alpha.

**IL-1-beta :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-1-beta, one form of IL-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of IL-1, IL-1-alpha, acts the same as IL-1-beta. IL-1-beta

made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-1-beta is a type of cytokine. Also called IL-1B and interleukin-1-beta.

**IL-10:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-10 is made by activated macrophages and by some T lymphocytes. It reduces inflammation by blocking production of cytokines by immune cells. IL-10 also increases antibody production by plasma cells and helps them live longer. IL-10 made in the laboratory is used as a biological response modifier to boost the immune system. It is a type of cytokine. Also called interleukin-10.

**IL-10 immunomodulator MK-1966:** An agent that downregulates the activity of the anti-inflammatory cytokine human interleukin-10 (IL-10), with potential immunomodulating and antineoplastic activities. Upon administration, IL-10 immunomodulator MK-1966 blocks the activity of IL-10 and may abrogate the IL-10-induced immunosuppressive tumor microenvironment. This activates cell-mediated immunity against cancer cells, increases cytokine production, including interferon-gamma (IFN-g), decreases T regulatory cell (Treg) activity, and induces a tumor-specific cytotoxic CD8<sup>+</sup> T-cell-mediated immune response, which enhances tumor cell death.

**IL-11:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-11 is made by support cells in the bone marrow. It causes the growth of several types of blood cells. Oprelvekin (IL-11 made in the laboratory) is used as a biological response modifier to increase the number of platelets, especially in patients receiving chemotherapy for cancer. IL-11 is a type of cytokine. Also called interleukin-11.

**IL-12:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-12 is made mainly by B lymphocytes and macrophages. It causes other immune cells to make cytokines and increases the growth of T lymphocytes. It may also block the growth of new blood vessels. IL-12 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-12 is a type of cytokine. Also called interleukin-12.

**IL-12-expressing mesenchymal stem cell vaccine GX-051:** Human mesenchymal stem cells (MSCs) transduced with a retroviral vector

encoding a modified form of the cytokine interleukin-12 (IL-12), with potential immunomodulating and antineoplastic activities. Upon intratumoral administration, IL-12-expressing MSC vaccine GX-051 secretes IL-12. IL-12 activates the immune system by both promoting the secretion of interferon-gamma, which activates natural killer cells (NKs), and inducing cytotoxic T-cell responses, which may result in both decreased cell proliferation and increased cell death in tumor cells.

**IL-13:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-13 is made by a type of T lymphocyte. It reduces inflammation by blocking production of cytokines by macrophages. It also increases the number and activity of B lymphocytes. IL-13 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. It is a type of cytokine. Also called interleukin-13.

**IL-1B:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-1B, one form of IL-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of IL-1, IL-1-alpha, acts the same as IL-1B. IL-1B made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-1B is a type of cytokine. Also called IL-1-beta and interleukin-1-beta.

**IL-2:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-2 is made by a type of T lymphocyte. It increases the growth and activity of other T lymphocytes and B lymphocytes, and affects the development of the immune system. Aldesleukin (IL-2 made in the laboratory) is being used as a biological response modifier to boost the immune system in cancer therapy. IL-2 is a type of cytokine. Also called interleukin-2.

**IL-2 plasmid DNA/lipid complex:** An immunotherapeutic agent consisting of a plasmid DNA encoding human Interleukin-2 (IL-2) complexed with a cationic lipid, 1,2-dimyristyloxypropyl-3-dimethyl-hydroxyethyl ammonium bromide/dioleoyl-phosphatidyl-ethanolamine (DMRIE/DOPE), in a 5:1 ratio. Due to the lipophilic nature of this cation

liposome complex, this gene transfer system may improve the efficiency of introducing the IL-2 gene into the cells, thereby increasing the production of IL-2 and inducing an immune response.

**IL-2 recombinant fusion protein ALT-801:** A recombinant protein consisting of the cytokine interleukin-2 (IL-2) fused to a humanized soluble T-cell receptor (TCR) directed against a tumor suppressor p53-derived antigen with potential immunopotentiating and antineoplastic activities. The TCR moiety of IL-2 recombinant fusion protein ALT-801 binds to tumor cells displaying p53 epitope/MHC complexes; subsequently, the tumor cell-localized IL-2 moiety may stimulate natural killer (NK) cell and T cell cytotoxic immune responses against p53-expressing tumor cells.

**IL-2/Lptn gene-modified allogeneic neuroblastoma tumor cell vaccine:** A cancer vaccine consisting of allogeneic neuroblastoma tumor cells have been genetically modified to secrete the human cytokine interleukin-2 (IL-2) and the human chemokine lymphotactin (Lptn) with potential immunostimulating and antineoplastic activities. Upon administration, IL-2 and Lptn are secreted by the IL-2/Lptn gene-modified allogeneic neuroblastoma tumor cell vaccine, potentially enhancing the cytotoxic T lymphocyte (CTL) response elicited by vaccine neuroblastoma tumor-associated antigens (TAAs) against host neuroblastoma tumor cells. Produced by activated progenitor T cells, Lptn belongs to the C chemokine subfamily and is a potent chemotactic factor for lymphocytes; IL-2 stimulates natural killer (NK) cells and may enhance a vaccine-elicited CTL immune response against tumor cells.

**IL-3:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-3 is made mainly by a type of T lymphocyte. It increases the number of blood cells made by the bone marrow. IL-3 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-3 is a type of cytokine. Also called interleukin-3.

**IL-4:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-4 is made by a type of T lymphocyte. It causes B lymphocytes to increase and to make antibodies and also increases the production of T lymphocytes. IL-4 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-4 is a type of cytokine. Also called interleukin-4.

**IL-5:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-5 is made mainly by some T lymphocytes. It causes B lymphocytes to make more antibodies and increases the number of eosinophils. IL-5 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. It is a type of cytokine. Also called interleukin-5.

**IL-6:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-6 is made mainly by some T lymphocytes. It causes B lymphocytes to make more antibodies and also causes fever by affecting areas of the brain that control body temperature. IL-6 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-6 is a type of cytokine. Also called interleukin-6.

**IL-7:** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. IL-7 is made by cells that cover and support organs, glands, and other structures in the body. It causes the growth of T lymphocytes and B lymphocytes. IL-7 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. IL-7 is a type of cytokine. Also called interleukin-7 and lymphopoietin-1.

**IL13Ralpha2-specific hinge-optimized 41BB-co-stimulatory CAR truncated CD19-expressing autologous T-lymphocytes:** A preparation of ex vivo expanded, genetically modified autologous central memory-enriched T-cells (T<sub>cm</sub>) transduced with a replication-incompetent, self-inactivating (SIN) lentiviral vector expressing a hinge-optimized, chimeric antigen receptor (CAR) specific for interleukin-13 receptor alpha 2 (IL13Ra2), and containing the cluster of differentiation 137 (CD137; 4-1BB) co-stimulatory signaling domain fused to the signaling domain of the T cell antigen receptor complex zeta chain (CD3-zeta), and a truncated form of human cluster of differentiation 19 (CD19t), with potential immunostimulating and antineoplastic activities. Upon intratumoral or intracavitary administration, IL13Ra2-specific, hinge-optimized, 41BB-co-stimulatory CAR/truncated CD19 expressing T-lymphocytes are directed to, and induce selective toxicity and cytolysis in IL13Ra2-expressing tumor cells. IL13Ra2, overexpressed by a variety of tumor cell types, is associated with increased tumor cell proliferation, migration and invasiveness. The

costimulatory signaling domain enhances both proliferation of T cells and antitumor activity. Hinge optimization prevents the recognition and clearance of the CAR by endogenous Fc receptors (FcRs). CD19t is used as a surface marker to both quantify and track the gene-modified T cells in vivo.

**IL4-Pseudomonas exotoxin fusion protein PRX321:** A fusion protein consisting of the cytokine interleukin-4 (IL-4) linked to a truncated form of Pseudomonas exotoxin with potential antineoplastic activity. Upon specific, high-affinity binding to IL-4 receptors (IL-4Rs) located on the tumor cell surface., IL4-Pseudomonas exotoxin fusion protein PRX321 is internalized; the exotoxin moiety then binds to translation elongation factor 2 (EF-2), which may result in ADP ribosylation, deactivation of EF-2, inhibition of protein synthesis, and tumor cell apoptosis. The Pseudomonas exotoxin moiety of this agent has been engineered to reduce non-specific binding to cells expressing its receptor, the multiligand cell surface receptor alpha 2-macroglobulin receptor/low-density lipoprotein receptor-related protein (alpha 2MR/LRP). IL-4R is a type I transmembrane protein that binds IL-4 and IL-13 and may be overexpressed by cancers such as renal cell carcinoma (RCC) and glioma.

**ilaprazole:** A substituted benzimidazole prodrug with selective and irreversible proton pump inhibitor activity. A weak base, ilaprazole accumulates in the acidic environment of the secretory canaliculus of the gastric parietal cell where it is converted to an active sulfenamide form that binds to cysteine sulfhydryl groups on the luminal aspect of the proton pump hydrogen-potassium adenosine triphosphatase (H<sup>+</sup>/K<sup>+</sup> ATPase), thereby inhibiting the pump's activity and the parietal cell secretion of H<sup>+</sup> ions into the gastric lumen, the final step in gastric acid production.

**ileostomy :** An opening into the ileum, part of the small intestine, from the outside of the body. An ileostomy provides a new path for waste material to leave the body after part of the intestine has been removed.

**ileum :** the final 12 feet of the small intestine. OR The last part of the small intestine. It connects to the cecum (first part of the large intestine). The ileum helps to further digest food coming from the stomach and other parts of the small intestine. It absorbs nutrients (vitamins, minerals, carbohydrates, fats, proteins) and water from food so they can be used by the body.

**ileus** : Blockage of the intestines

**Ilopan**: (Other name for: dexpanthenol cream)

**iloprost**: A prostacyclin analogue with potential chemopreventive activity. Iloprost binds to the prostacyclin receptor in various target cells, thereby causing vasodilation, inhibition of platelet aggregation, and decreased tumor cell adhesion to endothelium among other effects. Prostacyclin is a naturally occurring eicosanoid with anti-inflammatory, antineoplastic, and anti-metastatic properties. or A substance that is being studied in the prevention of lung cancer. It belongs to the family of drugs called prostaglandin analogs.

**ilorasertib**: An orally bioavailable, adenosine triphosphate mimetic, and inhibitor of Aurora kinases, vascular endothelial growth factor receptors (VEGFRs) and platelet-derived growth factor receptor (PDGFRs), with potential antineoplastic activity. Upon administration, ilorasertib selectively binds to and inhibits Aurora kinases A, B and C, which may disrupt both the assembly of the mitotic spindle apparatus and chromosome segregation, and inhibit both cellular division and proliferation in Aurora kinase-overexpressing tumor cells. In addition, ilorasertib selectively binds to and inhibits VEGFRs and PDGFRs, which may result in the inhibition of both angiogenesis and tumor cell proliferation in VEGFR/PDGFR-overexpressing tumor cells. This agent also inhibits the Src family of cytoplasmic tyrosine kinases. Aurora kinases A, B and C, are serine/threonine kinases that play essential roles in mitotic checkpoint control and are overexpressed by a wide variety of tumor cell types. Both VEGFRs and PDGFRs are receptor tyrosine kinase families whose members may be upregulated in various tumor cell types.

**Ilotycin**: (Other name for: erythromycin)

**ILX-295501**: A substance that is being studied as an anticancer drug. It belongs to the family of drugs called diarylsulfonylureas.

**ILX23-7553**: A substance that is being studied as an anticancer drug.

**IM**: Within or into muscle. Also called intramuscular.

**IM-862**: An anticancer drug that belongs to the family of drugs called angiogenesis inhibitors.

**Image analysis**: An automated microscopic technique for analyzing particle properties, especially shape and size distributions.

**image-guided radiation therapy :** A procedure that uses a computer to create a picture of a tumor to help guide the radiation beam during radiation therapy. The pictures are made using CT, ultrasound, X-ray, or other imaging techniques. Image-guided radiation therapy makes radiation therapy more accurate and causes less damage to healthy tissue. Also called IGRT.

**Imagent:** (Other name for: perflubron)

**imagery :** A technique in which a person focuses on positive images in his or her mind. It can help people reach a relaxed, focused state and help reduce stress and give a sense of well-being. Also called guided imagery.

**imaging :** In medicine, a process that makes pictures of areas inside the body. Imaging uses methods such as x-rays (high-energy radiation), ultrasound (high-energy sound waves), and radio waves.

**imaging procedure :** A type of test that makes detailed pictures of areas inside the body. Imaging procedures use different forms of energy, such as x-rays (high-energy radiation), ultrasound (high-energy sound waves), radio waves, and radioactive substances. They may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Examples of imaging procedures are computed tomography (CT), ultrasonography, magnetic resonance imaging (MRI), and nuclear medicine tests. Also called imaging test.

**imaging test :** A type of test that makes detailed pictures of areas inside the body. Imaging tests use different forms of energy, such as x-rays (high-energy radiation), ultrasound (high-energy sound waves), radio waves, and radioactive substances. They may be used to help diagnose disease, plan treatment, or find out how well treatment is working. Examples of imaging tests are computed tomography (CT), ultrasonography, magnetic resonance imaging (MRI), and nuclear medicine tests. Also called imaging procedure.

**imalumab:** A human, recombinant monoclonal antibody (MoAb) against macrophage migration inhibitory factor (MIF), with potential immunomodulating, anti-inflammatory and antineoplastic activities. Upon intravenous administration, imalumab binds to MIF, blocking its activity and preventing the MIF-mediated secretion of certain cytokines, including interleukin-1 beta and tumor necrosis factor-alpha. This may lead to an inhibition of cancer cell proliferation in MIF-overexpressing tumor cells.

MIF, a pro-inflammatory cytokine overexpressed in some cancers, plays a key role in inflammation, immune responses and cancer cell proliferation.

**imatinib mesylate:** The mesylate salt of imatinib, a tyrosine kinase inhibitor with antineoplastic activity. Imatinib binds to an intracellular pocket located within tyrosine kinases (TK), thereby inhibiting ATP binding and preventing phosphorylation and the subsequent activation of growth receptors and their downstream signal transduction pathways. This agent inhibits TK encoded by the bcr-abl oncogene as well as receptor TKs encoded by the c-kit and platelet-derived growth factor receptor (PDGFR) oncogenes. Inhibition of the bcr-abl TK results in decreased proliferation and enhanced apoptosis in malignant cells of Philadelphia-positive (Ph+) hematological malignancies such as CML and ALL; effects on c-kit TK activity inhibit mast-cell and cellular proliferation in those diseases overexpressing c-kit, such as mastocytosis and gastrointestinal stromal tumor (GIST).

**imatinib mesylate :** A drug used to treat different types of leukemia and other cancers of the blood, gastrointestinal stromal tumors, skin tumors called dermatofibrosarcoma protuberans, and a rare condition called systemic mastocytosis. It is also being studied in the treatment of other types of cancer. Imatinib mesylate blocks the protein made by the bcr/abl oncogene. It is a type of tyrosine kinase inhibitor. Also called Gleevec and STI571.

**Imbruvica :** A drug used to treat Waldenstrom macroglobulinemia (a type of non-Hodgkin lymphoma). It is also used to treat mantle cell lymphoma and chronic lymphocytic leukemia (CLL) in patients who have already received other treatment. It is also being studied in the treatment of other types of cancer. Imbruvica blocks a protein called Bruton's tyrosine kinase (BTK), which may help keep cancer cells from growing. It is a type of tyrosine kinase inhibitor. Also called ibrutinib.

**IMC-1121B:** A drug used with other drugs to treat colorectal cancer and non-small cell lung cancer that have spread to other parts of the body. It is used alone or with another drug to treat cancer of the stomach or gastroesophageal junction (area where the esophagus connects to the stomach) that is advanced or has spread to other parts of the body. It is also being studied in the treatment of other types of cancer. IMC-1121B binds to receptors for a protein called vascular endothelial growth factor (VEGF),

which may be found on some types of cancer cells. This may prevent the growth of new blood vessels that tumors need to grow. IMC-1121B is a type of antiangiogenesis agent and a type of monoclonal antibody. Also called anti-VEGFR-2 fully human monoclonal antibody IMC-1121B, Cyramza, and ramucirumab.

**IMC-3G3:** A substance being studied in the treatment of glioblastoma (a type of brain tumor) that has come back. It binds to receptors for a protein called platelet-derived growth factor (PDGF). This keeps PDGF from binding to the cells. This may stop the growth of cancer cells and blood vessels that have the receptors for PDGF. It is a type of monoclonal antibody. Also called anti-PDGFR alpha monoclonal antibody IMC-3G3 and anti-platelet-derived growth factor receptor alpha monoclonal antibody IMC-3G3.

**IMC-A12:** A substance being studied in the treatment of some types of cancer. It is a monoclonal antibody that is made in the laboratory and can bind to substances in the body. IMC-A12 blocks the action of a protein needed for cell growth and may kill cancer cells. It is a type of insulin-like growth factor-1 receptor (IGF-1R) inhibitor. Also called cixutumumab.

**imetelstat sodium:** The sodium salt of imetelstat, a synthetic lipid-conjugated, 13-mer oligonucleotide N3' P5'-thio-phosphoramidate with potential antineoplastic activity. Complementary to the template region of telomerase RNA (hTR), imetelstat acts as a competitive enzyme inhibitor that binds and blocks the active site of the enzyme (a "telomerase template antagonist"), a mechanism of action which differs from that for the antisense oligonucleotide-mediated inhibition of telomerase activity through telomerase mRNA binding. Inhibition of telomerase activity in tumor cells by imetelstat results in telomere shortening, which leads to cell cycle arrest or apoptosis.

**imexon:** A 2-cyanoaziridine derivative with antitumor activity in multiple myeloma. Although its mechanism of action is not clearly known, imexon may induce apoptosis via a pathway involving cleaved caspase-3, caspase-9, and/or caspase-8. Other cytotoxic mechanisms of action of this agent may involve thiol depletion, generation of reactive oxygen species (ROS), and decreases in the mitochondrial membrane potential. or A substance that is being studied in the treatment of some types of cancer, including pancreatic, lung, breast, prostate, melanoma, and multiple myeloma. It

belongs to the family of drugs called cyanoaziridine derivatives. Also called Amplimexon.

**imidazole mustard:** A synthetic derivative of imidazole with potent antineoplastic properties. Imidazole mustard alkylates DNA, preferentially at guanine residues, resulting in DNA interstrand crosslinks and inhibition of DNA replication and RNA and protein synthesis. Check for active clinical trials using this agent.

**imidazolyl ethanamide pentandioic acid:** An orally bioavailable small molecule, with potential hematopoiesis inducing and antiviral activities. Upon oral administration, myelo001 stimulates the differentiation of bone marrow cells of the leukocytic, lymphocytic, and erythrocytic lineages, and prevents apoptosis of hematopoietic cells. This prevents chemotherapy-induced neutropenia (CIN), inhibits the risk of infections, increases tolerance and allows for the continuation of the neutropenia-inducing chemotherapeutic agent. In addition, myelo 001 has antiviral properties.

**Imine:** A molecule containing a nitrogen atom attached to a carbon atom by a double bond. The nitrogen is also covalently linked to a hydrogen. **Immunofluorescence:** A cytological technique in which a specific fluorescent antibody is used to label an antigen. Frequently used to determine the location of an antigen in a tissue or a cell.

**imipenem:** A broad-spectrum, semi-synthetic beta-lactam carbapenem derived from thienamycin, produced by *Streptomyces cattleya*. Imipenem binds to and inactivates penicillin-binding proteins (PBPs) located on the inner membrane of the bacterial cell wall. PBPs are enzymes that are involved in the last stages of assembling the bacterial cell wall and in reshaping the cell wall during growth and division. This inactivation results in the weakening of the bacterial cell wall and eventually causes cell lysis. Imipenem has the greatest affinity for PBP 1A, 1B, and 2, and its lethal effect is related to binding to PBP 2 and 1B. This antibiotic is active against a wide range of gram-positive and gram-negative organisms and is stable in the presence of beta-lactamases. or An antibiotic drug used to treat severe or very resistant infection. It belongs to the family of drugs called carbapenems.

**imiquimod:** A synthetic agent with immune response modifying activity. As an immune response modifier (IRM), imiquimod stimulates cytokine production, especially interferon production, and exhibits antitumor

activity, particularly against cutaneous cancers. Imiquimod's proapoptotic activity appears to be related to Bcl-2 overexpression in susceptible tumor cells.

**imiquimod :** A drug used to treat early basal cell skin cancer and certain other skin conditions. It is being studied in the treatment of other types of cancer. Imiquimod is a type of biological response modifier. Also called Aldara.

**imisopasem manganese:** A manganese-based non-peptidyl mimetic of the human mitochondrial manganese superoxide dismutase (MnSOD), with potential antioxidant and chemo/radioprotective activities. Upon administration, imisopasem manganese mimics the activity of MnSOD and scavenges reactive oxygen species (ROS), such as superoxide anion, which prevents oxygen free radical damage to macromolecules such as DNA. This reduces ROS-mediated lipid peroxidation, prevents apoptosis and protects against oxygen free radical-induced toxicity in normal tissues.

**Imitrex:** (Other name for: sumatriptan succinate)

**Imlygic :** A drug used to treat melanoma that has recurred (come back) after surgery. It is used in patients whose cancer is in the skin and lymph nodes and cannot be removed by surgery. It is also being studied in the treatment of other types of cancer. Imlygic is made with a form of the herpesvirus that has been changed in the laboratory to infect and break down cancer cells without harming normal cells. It may also help the immune system kill cancer cells. Imlygic is injected directly into tumors in the skin and lymph nodes. It is a type of oncolytic virus therapy. Also called T-VEC and talimogene laherparepvec.

**immature teratoma :** A rare type of germ cell tumor (type of tumor that begins in the cells that give rise to sperm or eggs). Immature teratomas often contain several different types of tissue such as hair, muscle, and bone.

**immediate-release afuresertib:** An immediate-release (IR) tablet formulation containing afuresertib, an inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity. Upon oral administration of the IR formulation, afuresertib binds to and inhibits the activity of Akt, which may result in the inhibition of PI3K/Akt signaling pathway, decreased tumor cell proliferation and the induction of tumor cell apoptosis in Akt-expressing tumor cells. Activation of the

PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**immediate-release onapristone:** An immediate-release (IR) formulation of onapristone, an orally bioavailable progesterone receptor (PR) antagonist, with antineoplastic activity. Onapristone binds to the PR and inhibits both PR activation and the associated expression of PR-responsive genes. This may inhibit PR-mediated proliferative effects in cancer cells overexpressing PR. PR is expressed in certain cancer cell types and plays a key role in proliferation and survival. Check for active clinical trials using this agent.

**immiscible:** Two liquids are considered "immiscible" or unmixable if shaking equal volumes of the liquids together results in a meniscus visible between two layers of liquid. If the liquids are completely immiscible, the volumes of the liquid layers are the same as the volumes of liquids originally added to the mixture. OR Liquids are said to be immiscible when they do not mix, for example oil and water. OR Descriptive of two or more fluids which are not mutually soluble. OR Incapable of intermittently mixing, i.e., oil and water are immiscible.

**immiscible:** Two liquids that do not dissolve in each other.

**Immobilization of the reagent :** procedure used in the design of the receptor part, required to obtain stable signal of a chemical sensor. The appropriate reagent immobilization consists the main problem of the design of receptor part of fiber optic chemical sensor. The reagent can be immobilized either directly on the surface or in the bulk of the optomembrane. Physical (entrapment, formation of lipophilic ionpairs) and chemical (covalent binding of the chromoionophore) methods of the reagent immobilization in the chemooptical interface are used. Also there is possible to immobilize the reagent phase directly on the fiber. In all cases, the efficiency of the reagent immobilization governs the durability of the designed sensor.

**ImmTher:** (Other name for: disaccharide tripeptide glycerol dipalmitoyl)

**IMMU-106:** A substance being studied in the treatment of several types of lymphoma. It binds to the protein CD20, which is found on B cells (a type of immune system cell) and some types of lymphoma cells. This causes the

immune system to kill the cancer cells. IMMU-106 is a type of monoclonal antibody. Also called hA20, HCD20, and veltuzumab.

**IMMU-110:** A substance being studied in the treatment of multiple myeloma and several other types of cancer. It binds to CD74, a protein on the surface of myeloma cells and certain other types of cells. It may help kill cancer cells. IMMU-110 is a type of monoclonal antibody. Also called hLL1 and milatuzumab.

**Immucell WGP:** (Other name for: beta-glucan)

**Immun-Aid:** (Other name for: arginine/omega-3 fatty acids/nucleotides oral supplement)

**immune adjuvant :** A drug that stimulates the immune system to respond to disease.

**immune checkpoint inhibitor :** A type of drug that blocks certain proteins made by some types of immune system cells, such as T cells, and some cancer cells. These proteins help keep immune responses in check and can keep T cells from killing cancer cells. When these proteins are blocked, the “brakes” on the immune system are released and T cells are able to kill cancer cells better. Examples of checkpoint proteins found on T cells or cancer cells include PD-1/PD-L1 and CTLA-4/B7-1/B7-2. Some immune checkpoint inhibitors are used to treat cancer.

**immune complex hemolytic anemia :** A condition in which the body’s immune system stops red blood cells from forming or causes them to clump together. Immune complex hemolytic anemia can occur in patients who have chronic lymphocytic leukemia (CLL). Also called autoimmune hemolytic anemia and immunohemolytic anemia.

**immune function :** Production and action of cells that fight disease or infection.

**immune response:** the stimulation of B and T lymphocytes. OR The capacity of a vertebrate to generate antibodies to an antigen, a macromolecule foreign to the organism. OR The immune response is a general reaction of the body to substances that are foreign or treated as foreign. It may take various forms antibody production, cell-mediated immunity, immunological tolerance, or allergy. OR The activity of the immune system against foreign substances (antigens).

**immune system** : A complex network of cells, tissues, organs, and the substances they make that helps the body fight infections and other diseases. The immune system includes white blood cells and organs and tissues of the lymph system, such as the thymus, spleen, tonsils, lymph nodes, lymph vessels, and bone marrow.

**immune system disorder** : A condition that affects the immune system. The immune system is made up of cells, tissues, and organs that help the body fight infections and other diseases. There are many different types of immune system disorders, including immunodeficiency disease, autoimmune disorders, and allergic disorders. Immunodeficiency disease occurs when a part of the immune system is missing or not working properly. Autoimmune disorders occur when the immune system recognizes its own tissues as foreign and attacks them. Allergic disorders occur when the immune system overreacts to substances that are usually not harmful, such as pollen, molds, and certain foods. Cancers of the immune system (such as leukemia and lymphoma) are also immune system disorders.

**immune system tolerance** : The failure of the immune system to respond to an antigen that previously caused an immune response.

**immune thrombocytopenic purpura** : A condition in which platelets (blood cells that cause blood clots to form) are destroyed by the immune system. The low platelet count causes easy bruising and bleeding, which may be seen as purple areas in the skin, mucous membranes, and outer linings of organs. Also called idiopathic thrombocytopenic purpura and ITP.

**immunity** : The condition of being protected against an infectious disease. Immunity can be caused by a vaccine, previous infection with the same agent, or by transfer of immune substances from another person or animal.

**immunization** : A technique used to cause an immune response that results in resistance to a specific disease, especially an infectious disease.

**immunoadjuvant QS-DG**: A synthetic saponin, chemically identical to the natural saponin QS-21, with immunoadjuvant activity. When co-administered with vaccine antigens, immunoadjuvant QS-DG may increase total antitumoral vaccine-specific antibody responses and cytotoxic T-lymphocyte (CTL) responses.

**immunoassay** : A test that uses the binding of antibodies to antigens to identify and measure certain substances. Immunoassays may be used to diagnose disease. Also, test results can provide information about a disease

that may help in planning treatment (for example, when estrogen receptors are measured in breast cancer).

**immunoassay fecal occult blood test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called fecal immunochemical test, FIT, iFOBT, immunochemical fecal occult blood test, and immunologic fecal occult blood test.

**Immunocal:** (Other name for: whey protein isolate)

**immunochemical fecal occult blood test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called fecal immunochemical test, FIT, iFOBT, immunoassay fecal occult blood test, and immunologic fecal occult blood test.

**immunocompetence :** The ability to produce a normal immune response.

**immunocompetent :** Having the ability to produce a normal immune response.

**immunocompromised :** Having a weakened immune system caused by certain diseases or treatments.

**immunoconjugate :** An agent made up of an immune substance, such as a monoclonal antibody, that is chemically linked to a cell-killing substance such as a toxin, a radioactive molecule, or a drug. The antibody part of the immunoconjugate targets cancer cells and the linked substance may kill the cells or make them visible in the body. Some immunoconjugates are used to treat cancer or to help find cancer cells in the body.

**immunoconjugate RO5479599:** An immunoconjugate containing a glycoengineered, humanized monoclonal antibody directed against the human epidermal growth factor receptor HER3 (ErbB3), with potential antineoplastic activity. Upon administration, RO5479599 binds to the extracellular domain of HER3 and inhibits HER3 dimerization; thereby,

preventing EGFR-dependent signaling. In addition, RO5479599 stimulates the immune system to exert antibody-dependent cellular cytotoxicity (ADCC). This may decrease proliferation of HER3-overexpressing tumor cells. HER3, a member of the epidermal growth factor receptor (EGFR) family of receptor tyrosine kinases, is frequently overexpressed in tumors; it has no active kinase domain but is activated through heterodimerization with other members of the EGFR receptor family, such as HER2. Check for active clinical trials using this agent.

**immunoconjugate therapy :** A type of treatment that uses an immune substance, such as a monoclonal antibody, that is chemically linked to a cell-killing substance such as a toxin, radioisotope, or drug. The immune substance targets certain types of cells and the linked substance kills the targeted cells without harming other cells. Immunoconjugates are used in the treatment of cancer. Examples include antibody-drug conjugates, immunotoxins, and some targeted therapy drugs.

**immunocytochemistry :** A lab test that uses antibodies to test for certain antigens (markers) in a sample of cells. The antibodies are usually linked to an enzyme or a fluorescent dye. When the antibodies bind to the antigen in the cell sample, the enzyme or dye is activated, and the antigen can then be seen under a microscope. Immunocytochemistry is used to help diagnose diseases, such as cancer. It may also be used to help tell the difference between different types of cancer.

**immunocytokine NHS-IL12:** A fusion protein consisting of the heavy-chains of the human antibody NHS76, raised against DNA released by necrotic tumor cells, and fused to two molecules of a genetically modified human interleukin-12 (IL-12) with potential immunostimulating and antineoplastic activities. Upon administration, the antibody moiety of immunocytokine NHS-IL12 binds to DNA released from necrotic tumor cells located primarily at the core of necrotic solid tumors, thereby delivering the IL-12 moiety. In turn, the IL-12 moiety of this agent stimulates the host immune system to mount an immune response against tumor cells, thereby inhibiting tumor growth. IL-12 is a proinflammatory cytokine with numerous immunoregulatory functions and may augment host immune responses to tumor cells. By targeting tumor cells, NHS-IL-12 may reduce the toxicity associated with systemic administration of recombinant human IL-12.

**immunocytokine NHS-IL2-LT:** A fusion protein consisting of a mouse-human chimeric antibody directed against DNA released by necrotic tumor cells fused to two molecules of a genetically modified human interleukin-2 (IL-2) with potential antineoplastic activity. Upon administration, the antibody moiety of immunocytokine NHS-IL2-LT binds to DNA released by necrotic tumor cells located primarily at the core of necrotic solid tumors, delivering the IL-2 moiety. In turn, the IL-2 moiety of this agent activates the immune system to mount a cytotoxic T lymphocyte response against nearby tumor cells.

**immunodeficiency :** The decreased ability of the body to fight infections and other diseases.

**immunodeficiency syndrome :** The inability of the body to produce an immune response.

**Immunoglobulin:** A protein made in a B plasma cell and usually secreted; it interacts specifically with a foreign agent. Synonymous with antibody. It is composed of two heavy and two light chains linked by disulfide bonds. Immunoglobulins can be divided into five classes (IgG, IgM, IgA, IgD, and IgE) based on their heavy-chain component. OR An antibody protein generated against, and capable of binding specifically to, an antigen.

**immunoglobulin :** A protein that is made by B cells and plasma cells (types of white blood cells) and helps the body fight infection. Some immunoglobulins may be found in higher than normal amounts in patients with certain conditions or certain types of cancer, including multiple myeloma and Waldenstrom macroglobulinemia. Measuring the amount of specific immunoglobulins in the blood and urine may help diagnose cancer or find out how well treatment is working or if cancer has come back. Some immunoglobulins may be used as tumor markers. Also called Ig.

**Immunoglobulin A (iga):** The major class of antibodies in external secretions, such as saliva, tears, bronchial mucus and intestinal mucus.

**Immunoglobulin D (igd):** An antibody of unknown function.

**Immunoglobulin E (ige):** An antibody that confers protection against parasites; ige also initiates allergic reactions.

**Immunoglobulin fold:** A common structural motif for immunoglobulins, in which two broad sheets of antiparallel  $\beta$  strands enclose hydrophobic side

chains, and complementarity-determining regions of variable domains pair to form an antigen-binding site.

**Immunoglobulin G (igg):** The major antibody in serum; igg possesses two antigen-binding sites.

**Immunoglobulin M (igm):** The first class of antibodies to appear in the serum after exposure to an antigen; igm possesses ten antigen-binding sites.

**immuno-hemolytic anemia :** A condition in which the body's immune system stops red blood cells from forming or causes them to clump together. Immuno-hemolytic anemia can occur in patients who have chronic lymphocytic leukemia (CLL). Also called autoimmune hemolytic anemia and immune complex hemolytic anemia.

**immunohistochemistry :** A lab test that uses antibodies to test for certain antigens (markers) in a sample of tissue. The antibodies are usually linked to an enzyme or a fluorescent dye. When the antibodies bind to the antigen in the tissue sample, the enzyme or dye is activated, and the antigen can then be seen under a microscope. Immunohistochemistry is used to help diagnose diseases, such as cancer. It may also be used to help tell the difference between different types of cancer.

**immunologic fecal occult blood test :** A test that checks for occult (hidden) blood in the stool. Small samples of stool are placed on special cards and sent to a doctor or laboratory for testing. An antibody that binds to a blood protein called hemoglobin is used to detect any blood. Blood in the stool may be a sign of colorectal cancer or other problems, such as polyps, ulcers, or hemorrhoids. Also called fecal immunochemical test, FIT, iFOBT, immunoassay fecal occult blood test, and immunochemical fecal occult blood test.

**immunological adjuvant :** A substance used to help boost the immune response to a vaccine so that less vaccine is needed.

**immunological adjuvant OPT-821:** A purified, natural saponin isolated from the soapbark tree *Quillaja saponaria* Molina with potential immunoadjuvant activity. When co-administered with vaccine peptides, OPT-821 may increase the antibody and cytotoxic T-cell responses against the targeted antigen(s).

**immunology :** The study of the body's immune system.

**immunomodulating agent** : A substance that stimulates or suppresses the immune system and may help the body fight cancer, infection, or other diseases. Specific immunomodulating agents, such as monoclonal antibodies, cytokines, and vaccines, affect specific parts of the immune system. Nonspecific immunomodulating agents, such as BCG and levamisole, affect the immune system in a general way.

**immunomodulation** : Change in the body's immune system, caused by agents that activate or suppress its function.

**immunomodulator OHR/AVR118**: A peptide-nucleic acid immunomodulator with proinflammatory, broad-spectrum antiviral, and potential antineoplastic activities. Immunomodulator OHR/AVR118 stimulates the peripheral blood mononuclear cell (PBMC) production of the proinflammatory cytokines IFN- $\gamma$ , IL-1 $\beta$ , IL-6 and TNF- $\alpha$ . This agent may reduce HIV-1 p24 antigen; viral reverse transcriptase activity; syncytial cell formation; and viral mRNA in infected PBMCs and human CD4+ lymphocyte H9 cells, and may decrease viral loads and increase CD4+ and CD8+ T-cell counts in HIV patients. In vitro, immunomodulator OHR/AVR118 has been shown to induce the maturation of HL60 leukemic cells and to inhibit the invasive and metastatic properties of a highly malignant breast cancer cell line.

**immunomodulatory agent CC-11006**: A proprietary, orally available, small molecule and thalidomide analog, with potential immunomodulating and antineoplastic activity. CC-11006 appears to have a similar mechanism to thalidomide and may modulate the expression of proinflammatory and regulatory cytokines. Check for active clinical trials using this agent.

**immunophenotyping** : A process that uses antibodies to identify cells based on the types of antigens or markers on the surface of the cells. This process is used to diagnose specific types of leukemia and lymphoma by comparing the cancer cells to normal cells of the immune system. Immunophenotyping may also be used to separate cells into different groups based on the markers they have on the surface.

**immunophilin**: intracellular proteins that binds to immunosuppressive drugs such as FK506 and rapamycin

**Immunoreceptor tyrosine-based activation motif (ITAM)**: The intracellular region of Ig- $\alpha$  and Ig- $\beta$  membrane proteins of immature B cells; upon antigen binding to the membrane-bound antibodies of the B cell,

the ITAM regions of Ig- $\alpha$  and Ig- $\beta$  are phosphorylated, which initiates pathways leading to cell growth and B-cell differentiation.

**immunoscintigraphy** : An imaging procedure in which antibodies labeled with radioactive substances are given to the person. A picture is taken of sites in the body where the antibody localizes.

**immunosignature** : Information about the antibodies in a person's blood at a given point in time. Over time, the antibodies can change and immunosignatures might be used to help track a person's health and diagnose infections, cancer, or other medical conditions earlier.

**immunostimulant** : A substance that increases the ability of the immune system to fight infection and disease.

**immunosuppression** : Suppression of the body's immune system and its ability to fight infections and other diseases. Immunosuppression may be deliberately induced with drugs, as in preparation for bone marrow or other organ transplantation, to prevent rejection of the donor tissue. It may also result from certain diseases such as AIDS or lymphoma or from anticancer drugs.

**immunosuppressive** : Describes the ability to decrease the body's immune system responses.

**immunosuppressive agent** : An agent that decreases the body's immune responses. It reduces the body's ability to fight infections and other diseases, such as cancer. Immunosuppressive agents may be used to keep a person from rejecting a bone marrow or organ transplant. They are also used in the treatment of conditions marked by overactive immune responses, such as autoimmune diseases and allergies.

**immunosuppressive therapy** : Treatment that lowers the activity of the body's immune system. This reduces its ability to fight infections and other diseases, such as cancer. Immunosuppressive therapy may be used to keep a person from rejecting a bone marrow or organ transplant. It may also be used to treat conditions in which the immune system is overactive, such as autoimmune diseases and allergies. Some types of immunosuppressive therapy may increase a person's risk of cancer by lowering the body's ability to kill cancer cells.

**immunotherapeutic combination product CMB305**: An immunotherapeutic combination product composed of LV305, an

engineered lentiviral vector that both targets dendritic cells (DCs) and contains nucleic acids encoding the human tumor-associated cancer-testis antigen NY-ESO-1 (CTAG1), and G305, a cancer vaccine comprised of an NY-ESO-1 recombinant protein and glucopyranosyl lipid adjuvant (GLA)-stable emulsion (GLA-SE), with potential synergistic immunostimulatory and antineoplastic activities. Upon intradermal administration of LV305, the DC-targeting lentiviral vector targets and binds to dermal DCs via the DC-specific intercellular adhesion molecule-3-grabbing non-integrin (DC-SIGN) receptor. Upon internalization of the vector, the NY-ESO-1 protein is expressed, which stimulates DC maturation, and activates the immune system to mount a cytotoxic T-lymphocyte (CTL) response against NY-ESO-1-expressing cells; this may result in tumor cell lysis. Upon the sequential intramuscular injection of G305, the adjuvant portion of G305 binds to toll-like receptor 4 (TLR-4) expressed on various immune cells, including DCs, monocytes, macrophages and B-cells. The activated DCs present the NY-ESO-1 antigen to CD4-positive Th1 T-lymphocytes. The induction of antigen-specific CD4-positive T-lymphocytes further induces a CTL response against NY-ESO-1-expressing tumor cells. In addition, G305 induces an NY-ESO-1-specific antibody response. NY-ESO-1, expressed in normal testes and on the surfaces of various tumor cells, plays a key role in tumor cell proliferation and survival.

**immunotherapeutic GSK1572932A:** An immunotherapeutic containing a proprietary adjuvant system combined with a melanoma-associated antigen peptide MAGE-A3 epitope with potential immunomodulating and antineoplastic activities. Intramuscular administration with GSK1572932A may stimulate the immune system to exert both humoral and cellular immune responses against MAGE-A3-expressing tumor cells. MAGE-A3, a tumor associated antigen (TAA), is overexpressed in a variety of tumor cell types, including non-small cell lung cancer (NSCLC), melanoma, head and neck cancer, and bladder cancer. Check for active clinical trials using this agent.

**immunotherapy :** A type of biological therapy that uses substances to stimulate or suppress the immune system to help the body fight cancer, infection, and other diseases. Some types of immunotherapy only target certain cells of the immune system. Others affect the immune system in a general way. Types of immunotherapy include cytokines, vaccines, bacillus Calmette-Guerin (BCG), and some monoclonal antibodies.

**immunotherapy regimen MKC-1106-MT:** An immunotherapy regimen containing three components: a plasmid encoding portions of the two melanoma-associated antigens Melan A (also called MART-1) and tyrosinase and two synthetic analogs of Melan-A and tyrosinase antigen epitopes with potential immunostimulating and antitumor activities. First, the plasmid is injected directly into lymph nodes in order to sensitize or prime antigen-presenting cells (APCs) and central memory T cells in lymph nodes to plasmid-expressed Melan A and tyrosinase. After several priming injections with plasmids, the Melan A and tyrosinase synthetic epitope analogs are injected directly into lymph nodes; upon binding to major histocompatibility complex (MHC) molecules on APC cell surfaces, these synthetic epitope analogs may stimulate a "primed" cytotoxic T lymphocyte (CTL) response against melanoma tumor cells, resulting in tumor cell lysis. Melan-A and tyrosinase are overexpressed by melanoma tumor cells.

**immunotoxin :** An antibody linked to a toxic substance. Some immunotoxins can bind to cancer cells and kill them.

**immunotoxin CMD-193:** A humanized immunotoxin directed against the Lewis Y antigen conjugated with calicheamicin, a hydrophobic enediyne antibiotic, with potential antineoplastic activity. CMD193 binds to the Lewis Y antigen, a tetrasaccharide expressed on the cell surfaces of many tumor cell types. Upon binding, CMD-193 is internalized, thereby delivering the attached calicheamicin to Lewis Y antigen-expressing tumor cells. Calicheamicin binds non-covalently to the minor groove of DNA and prompts conformational changes and DNA oxidation, thereby inhibiting DNA synthesis and inducing apoptosis.

**immunotoxin D2C7-(scdsFv)-PE38KDEL:** A recombinant immunotoxin fusion protein consisting of single-chain variable-region antibody fragments (scFvs), which contain disulfide stabilized heavy- (Vh) and light- (Vl) chain variable regions of the monoclonal antibody D2C7 (D2C7-scdsFv), targeting both the wild-type form (EGFRwt) and the in-frame deletion mutant form (EGFRvIII) of epidermal growth factor receptor (EGFR), and fused, via a 15-amino acid peptide linker to domains II and III of the Pseudomonas exotoxin A (PE38KDEL) (D2C7-(scdsFv)-PE38KDEL), with potential antineoplastic activity. Upon intratumoral administration by convection-enhanced delivery, the scFv moiety of immunotoxin anti-EGFR scFv monoclonal antibody fragment immunotoxin D2C7-(scdsFv)-

PE38KDEL targets and binds to a specific amino acid epitope present in the extracellular domain of both the EGFRwt and EGFRvIII proteins. This binding facilitates the internalization of the immunotoxin by tumor cells. Inside the cells, the exotoxin portion of the fusion protein binds to translation elongation factor 2 (EF-2), and deactivates EF-2 through ADP ribosylation. This results in the inhibition of protein synthesis, the induction of apoptosis and a reduction in cell proliferation of EGFRwt/EGFRvIII-expressing tumor cells. Compared to intact IgG antibodies and single-chain antibodies, scFvs are smaller with increased tumor-penetrating capacity which may enhance therapeutic efficacy. The EGFR gene, a transmembrane receptor tyrosine kinase, and its mutant form, EGFRvIII, which contains a deletion of exons 2–7 of the EGFR gene, are frequently amplified and overexpressed in a variety of cancers. KDEL increases the toxin's intracellular retention, thereby enhancing its cytotoxicity. Check for active clinical trials using this agent.

**Immunox:** (Other name for: thymopentin)

**Imodium :** A drug used to treat diarrhea. Imodium slows the movement of the muscles in the small intestine to allow more water to be taken out of the feces (waste matter) and more nutrients to be absorbed. Also called loperamide hydrochloride.

**Imodium A-D:** (Other name for: loperamide hydrochloride)

**IMP321:** A T-cell immunostimulatory factor derived from the soluble form of lymphocyte-activation gene 3 (LAG-3) protein with potential antineoplastic activity. Upon administration, alone or in combination with tumor antigens, IMP321 binds, with high affinity, to MHC class II molecules expressed by dendritic cells (DC), which may result in DC maturation, DC migration to lymph nodes, enhanced DC cross-presentation of antigens to T cells, and antitumor cytotoxic T cell responses.

**Impact:** (Other name for: arginine/omega-3 fatty acids/nucleotides oral supplement)

**Impact Bar (specimen):** A test specimen of specified dimensions which is utilized to determine the relative resistance of a plastic to fracture by shock.

**Impact Modifiers:** Additive used to enhance the material's ability to withstand the force of impact.

**Impact Resistance:** relative susceptibility of material to fracture by stress at high speeds. OR Relative susceptibility of plastics or silicone rubber to fracture by shock as indicated by the energy expended by a standard pendulum type impact machine in breaking a standard specimen in one blow

**IMPACT STRENGTH:** (1) The ability of a material to withstand shock loading. (2) The work done in fracturing, under shock loading, a specified test specimen in a specified manner. (3) Molded plastics are usually given a value on an izod scale. An Izod impact test is designed to determine the resistance of a plastics material to a shock loading, it involves the notching of a specimen, which is then placed in the jaws of the machine and struck with a weighted pendulum.

**impairment :** A loss of part or all of a physical or mental ability, such as the ability to see, walk, or learn.

**impedance:** total opposition to flow of current, measured in ohms; combined effort of resistance, inductance, and capacitance.

**IMPEP:** Acronym for the Integrated Materials Performance Evaluation Program. The U.S. Nuclear Regulatory Commission (NRC) implemented this program in 1996 to ensure that public health and safety are adequately protected from the potential hazards associated with the use of radioactive materials, and that Agreement State programs are compatible with the NRC's program.

**imperative:** refers to the mood of the verb used in requests and commands.

**impermeable:** rock that water cannot sink into or through.

**Impermeable:** describes a material that prevents the passage of a substance into or through it.

**Impervious:** An impervious paint system is one which will prevent the passage of moisture or moisture vapour.

**implant :** A substance or object that is put in the body as a prosthesis, or for treatment or diagnosis.

**implant displacement views :** A procedure used to do a mammogram (x-ray of the breasts) in women with breast implants. The implant is pushed back against the chest wall and the breast tissue is pulled forward and

around it so the tissue can be seen in the mammogram. Also called Eklund displacement views and Eklund views.

**implant radiation therapy :** A type of radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into or near a tumor. Also called brachytherapy, internal radiation therapy, and radiation brachytherapy.

**implantable cardioverter-defibrillator :** A small device used to correct a heartbeat that is abnormal (too fast, too slow, or irregular). The device is placed by surgery in the chest or abdomen. Wires are passed through a vein to connect the device to the heart. When it detects abnormal heartbeats, it sends an electrical shock to the heart to restore the heartbeat to normal. Also called ICD.

**implantable pump :** A small device installed under the skin to administer a steady dose of drugs.

**implied multiplication:** Multiplication is implied when a number is placed next to a variable, or when a number is placed next to an expression surrounded by parentheses.

**impotence :** In medicine, refers to the inability to have an erection of the penis adequate for sexual intercourse. Also called erectile dysfunction.

**impotent :** In medicine, describes the inability to have an erection of the penis adequate for sexual intercourse.

**Impregnate:** 1) to fill the voids and interstices of material with a compound (this does not imply complete fill or complete coating of the surfaces by a hole-free film). 2) the process of thoroughly soaking a material of an open or porous nature with a resin.

**Impregnation:** The process of thoroughly soaking a material such as wood, paper or fabric, with a synthetic resin so that the resin gets within the body of the material. The process is usually carried out in an impregnator. OR Saturation of reinforcement with a liquid resin.

**Imprime PGG:** (Other name for: PGG beta-glucan)

**imprinting:** process whereby expression of a given gene is determined by the parental origin; involves differential DNA methylation

**Impulse Sealing:** a heat sealing technique in which a pulse of intense thermal energy is applied to the sealing area for a very short time, followed immediately by cooling. It is usually accomplished using a RF heated metal

bar which is cored for water cooling or is of such a mass that it will cool rapidly at ambient temperatures.

**IMRT:** A type of 3-dimensional radiation therapy that uses computer-generated images to show the size and shape of the tumor. Thin beams of radiation of different intensities are aimed at the tumor from many angles. This type of radiation therapy reduces the damage to healthy tissue near the tumor. Also called intensity-modulated radiation therapy.

**IMT-1012 immunotherapeutic vaccine:** A multi-peptide cancer vaccine with potential immunostimulating and antineoplastic activities. IMT-1012 immunotherapeutic vaccine contains twelve different synthetic peptides or tumor associated antigens (TAAs), including cyclin I (CCNI), cyclin-dependent kinase CDC2, EDDRI and TACE/ADAM17, each of which is involved in a different pathway associated with tumor growth, survival, and metastasis. Each antigen in the vaccine elicits a specific cytotoxic T-lymphocyte (CTL) immune response against tumor cells expressing that antigen. This multi-antigen/multi-pathway targeting strategy provides broad immunotherapeutic coverage with respect to tumor complexity and heterogeneity and may result in enhanced vaccine efficacy.

**Imuran:** (Other name for: azathioprine sodium)

**In 111 ibritumomab tiuxetan :** A radiolabeled monoclonal antibody that is used to detect certain types of B-cell non-Hodgkin lymphoma and is being studied in the detection of other types of B-cell tumors. It is made up of the monoclonal antibody ibritumomab plus the radioisotope indium 111. It binds to the protein called CD20, which is found on B cells. A machine is used to detect which cells in the body have bound the antibody. In 111 ibritumomab tiuxetan is a type of radiopharmaceutical. Also called In 111 Zevalin and indium In 111 ibritumomab tiuxetan.

**In 111 Zevalin :** A radiolabeled monoclonal antibody that is used to detect certain types of B-cell non-Hodgkin lymphoma and is being studied in the detection of other types of B-cell tumors. It is made up of the monoclonal antibody ibritumomab plus the radioisotope indium 111. It binds to the protein called CD20, which is found on B cells. A machine is used to detect which cells in the body have bound the antibody. In 111 Zevalin is a type of radiopharmaceutical. Also called In 111 ibritumomab tiuxetan and indium In 111 ibritumomab tiuxetan.

**In silico:** Refers to experiments and/or studies performed with a computer. OR Literally "within silicon" refers to modeling research conducted with computers only

**in situ:** from Latin, meaning "in place."

**in situ :** In its original place. For example, in carcinoma in situ, abnormal cells are found only in the place where they first formed. They have not spread.

**In situ hybridization:** A technique in which cells are immobilized and their DNA is denatured and then hybridized to radioactive RNA probes; these hybrids are then detected by autoradiography.

**In situ leach:** A process using a solution called lixiviant to extract uranium from underground ore bodies in place (in other words, in situ). Lixiviant, which typically contains an oxidant such as oxygen and/or hydrogen peroxide mixed with sodium carbonate or carbon dioxide, is injected through wells into the ore body in a confined aquifer to dissolve the uranium. This solution is then pumped via other wells to the surface for processing. For additional detail, see In Situ Recovery Facilities.

**In situ recovery (ISR):** One of the two primary recovery methods that are currently used to extract uranium from ore bodies where they are normally found underground (in other words, in situ), without physical excavation. Also known as "solution mining" or in situ leaching. For additional detail, see In Situ Recovery Facilities.

**in vitro:** A term applied to any study carried out in isolation from the living organism in an experimental system ('in a test tube'). OR Refers to experiments and/or studies performed with isolated macromolecules, cells, or tissue samples. OR From the Latin for "in glass," isolated from the living organism and artificially maintained, as in a test tube. OR "In glass"; that is, in the test tube.

**in vitro :** In the laboratory (outside the body). The opposite of in vivo (in the body).

**in vitro fertilization :** A procedure in which eggs are removed from a woman's ovary and combined with sperm outside the body to form embryos. The embryos are grown in the laboratory for several days and then either placed in a woman's uterus or cryopreserved (frozen) for future use.

**in vivo:** The term used in contrast with 'in vitro' describing any study carried out within the living organism. OR Refers to experiments and/or studies performed with live animals or humans. OR From the Latin for "in one that is living," occurring within the living. OR "In life"; that is, in the living cell or organism. OR In the body. The opposite of in vitro (outside the body or in the laboratory).

**In-Run :** The length of belt from the load point to point tangent to the cage of a spiral system or turn of a fixed turn conveyor. Also known as infeed.

**in-transit metastasis :** A type of metastasis in which skin cancer spreads through a lymph vessel and begins to grow more than 2 centimeters away from the primary tumor but before it reaches the nearest lymph node.

**inactivated poliovirus vaccine:** A vaccine consisting of inactivated poliovirus (IPV) types 1,2 and 3, with active immunizing activity against poliomyelitis. Upon intramuscular vaccination, inactivated poliovirus vaccine (IPV) activates the immune system to develop antibodies against polioviruses.

**inalimarev:** A cancer vaccine comprised of a recombinant vaccinia viral vector encoding the carcinoembryonic antigen (CEA), MUC-1 (mucin-1), a transmembrane glycoprotein secreted by glandular tissues, and TRICOM, comprised of the three co-stimulatory molecule transgenes B7-1, ICAM-1 and LFA-3. Upon administration, inalimarev may enhance CEA and MUC-1 presentation to antigen presenting cells (APC) and may activate a cytotoxic T lymphocyte (CTL) response against CEA- and MUC-1-expressing tumor cells.

**inalimarev :** A cancer vaccine made with a form of vaccinia virus that does not cause disease in humans. It is being studied in the treatment of some types of cancer. The virus is changed in the laboratory to make human proteins, including the tumor markers called CEA and MUC-1, that may help immune cells in the body kill tumor cells. Also called PANVAC-V and recombinant vaccinia-CEA-MUC-1-TRICOM vaccine.

**Inapsine:** (Other name for: droperidol)

**Incel:** (Other name for: biricodar dicitrate)

**incidence:** The number of instances of illness commencing, or of persons falling ill, during a given period in a specific population. Incidence is usually expressed as a rate, the denominator being the average number of

persons in the specified population during a defined period or the estimated number of persons at the mid-point of that period. The basic distinction between incidence and prevalence is that whereas incidence refers only to new cases, prevalence refers to all cases, irrespective of whether they are new or old. When the terms incidence and prevalence are used, it should be stated clearly whether the data represent the numbers of instances of the disease recorded or the numbers of persons ill (WHO, 1966).

**incidence :** The number of new cases of a disease diagnosed each year.

**incidence rate:** The rate at which new events occur in a population. The numerator is the number of new events that occur in a defined period; the denominator is the population at risk of experiencing the event during this period, sometimes expressed as person-time. The incidence rate most often used in public health practice is calculated by the formula

**Incident response (IR):** Activities that address the short-term, direct effects of a natural or human-caused event and require an emergency response to protect life or property. For detail, see Emergency Preparedness and Response and the NRC Incident Response Plan (NUREG-0728) .

**incineration:** the combustion of organic matter in wastewater sludge solids after water evaporation from the solids. OR Burning of wastes under controlled high temperatures and oxygen levels that results in their complete combustion; not the same as burning leaves in the back yard or wood in the fireplace.

**incised meander:** a steep-walled canyon that results from the down-cutting of a meandering stream.

**incision :** A cut made in the body to perform surgery.

**incisional biopsy :** A surgical procedure in which a portion of a lump or suspicious area is removed for diagnosis. The tissue is then examined under a microscope to check for signs of disease.

**Incivek:** (Other name for: telaprevir)

**inclinometer:** a device on a compass used to measure dip angle.

**inclusion:** a rock fragment enclosed within an intrusive rock unit.

**incomplete combustion:** Incomplete combustion is the burning of a substance in a limited supply of air or oxygen. OR A combustion reaction or process that does not convert all of the fuel's carbon and hydrogen into

carbon dioxide and water, respectively. For example, incomplete combustion of carbon produces carbon monoxide.

**incomplete dominance:** an allele combination in which two characteristics blend and both alleles can express themselves; one example is red, white, and pink snapdragons.

**incomplete Freund's adjuvant:** A water-in-oil emulsion that stimulates the T-cell immune response to antigens and may be used in various types of cancer vaccines. A mixture of oil and water that is combined with a specific antigen to boost the immune response to that antigen. It is being studied in immunotherapy and as a way to increase the immune response to cancer vaccines. It is a type of immune modulator. Also called IFA and Montanide ISA-51.

**incomplete octet:** 1. An atom with less than eight electrons in its valence shell. 2. An atom with less than eight total bonding and nonbonding electrons in a Lewis structure, for example, B in  $BH_3$  has an incomplete octet.

**inconclusive :** A negative test result in an individual where a clearly deleterious mutation has not been found in any family members. The genetic risk status of such an individual must be interpreted in the context of his or her personal and family history. Also called indeterminate and uninformative.

**incontinence :** Inability to control the flow of urine from the bladder (urinary incontinence) or the escape of stool from the rectum (fecal incontinence).

**incretin:** any substance/hormone that induces insulin release from the pancreas in response to food intake

**incubated :** Grown in the laboratory under controlled conditions. For example, white blood cells can be grown in special conditions so that they attack specific cancer cells when returned to the body.

**incyclinide:** A chemically-modified tetracycline with potential antineoplastic activity. Incyclinide inhibits matrix metalloproteinases (MMPs), thereby inducing extracellular matrix degradation, and inhibiting angiogenesis, tumor growth and invasion, and metastasis. This agent also causes mitochondrial depolarization in tumor cells and induces both cellular apoptosis and tissue necrosis.

**IND:** A substance that has been tested in the laboratory and has been approved by the U.S. Food and Drug Administration (FDA) for testing in people. Clinical trials test how well INDs work and whether they are safe to use. An IND may be approved by the FDA for use in one disease or condition but still be considered investigational in other diseases or conditions. Also called experimental drug, investigational agent, investigational drug, and investigational new drug.

**indefinite pronouns:** (all, any, he, she, it, and so on) stand in for nouns but do not specify the persons or things to which they refer.

**Indented label panel:** when the diameter of the label panel area on a bottle is smaller than the diameter of the bottle immediately above and below the label panel area.

**independent clause:** a clause that contains a subject and a predicate, expresses a complete thought, and can stand alone as a sentence.

**Independent molecule:** A term used to describe the unique, non-symmetry-related molecules in a unit cell.

**Independent spent fuel storage installation (ISFSI):** A complex designed and constructed for the interim storage of spent nuclear fuel; solid, reactor-related, greater than Class C waste; and other associated radioactive materials. A spent fuel storage facility may be considered independent, even if it is located on the site of another NRC-licensed facility. For further information, see Storage of Spent Nuclear Fuel and Locations of Independent Spent Fuel Storage Installations.

**independent variable:** An independent variable that can be set to a known value in an experiment. Several independent variables may be controlled in an experiment. For example, in an experiment where the vapor pressure of a liquid is measured at several different temperatures, temperature is the independent variable and vapor pressure is the dependent variable.

**Inderal :** A drug used to treat high blood pressure, including before surgery for pheochromocytoma, and to treat chest pain (angina), abnormal heartbeat (arrhythmia), and several other conditions. It is also being studied in the treatment of other conditions and types of cancer. Inderal blocks certain receptors on nerve cells and causes blood vessels to relax and dilate (widen). This allows blood to flow more easily and lowers blood pressure and heart rate. Inderal contains the active ingredient propranolol hydrochloride. It is a type of beta blocker.

**indeterminate** : A negative test result in an individual where a clearly deleterious mutation has not been found in any family members. The genetic risk status of such an individual must be interpreted in the context of his or her personal and family history. Also called inconclusive and uninformative.

**index case** : A clinically affected individual through whom attention is first drawn to a genetic disorder in a family.

**index fossil**: a fossil of an organism that occurred for a short amount of time and over a widespread area; used to connect rock layers over long distances. OR a fossil of those species that lived only during a restricted period and that identifies the narrow time range during which the host rock could have formed.

**Indian cress** : Parts of the flowering plant have been used in some cultures to treat certain medical problems. It may have anticancer effects. The scientific name is *Nasturtium officinale*. Also called watercress.

**Indian elm** : The inner bark of this plant has been used in some cultures to treat certain medical problems. It may have antioxidant effects. Also called gray elm, red elm, slippery elm, sweet elm, *Ulmus fulva*, and *Ulmus rubra*.

**Indian rhubarb** : The root of this plant has been used in some cultures to treat certain medical problems. It may have anti-inflammatory and anticancer effects. The scientific name is *Rheum palmatum* or *Rheum officinale*. Also called Chinese rhubarb, da-huang, rhubarb, and Turkish rhubarb.

**Indian saffron** : An East Indian plant that is a member of the ginger family and is used as a spice and food color. The underground stems are used in some cultures to treat certain stomach problems. The substance in Indian saffron that gives it a yellow color (curcumin) is being studied in the treatment of cancer, Alzheimer disease, cystic fibrosis, and psoriasis. The scientific name is *Curcuma longa*. Also called jiang huang and turmeric.

**Indian valerian** : A plant whose roots are used as a sedative and to treat certain medical conditions. It is being studied as a way to improve sleep in cancer patients undergoing treatment. Also called garden heliotrope, garden valerian, Mexican valerian, Pacific valerian, valerian, *Valeriana officinalis*, and *Valeriana radix*.

**indibulin:** A synthetic small molecule with antimitotic and potential antineoplastic activities. Indibulin binds to a site on tubulin that is different from taxane- or Vinca alkaloid-binding sites, destabilizing tubulin polymerization and inducing tumor cell cycle arrest and apoptosis. This agent has been shown to be active against multidrug-resistant (MDR) and taxane-resistant tumor cell lines.

**indication :** In medicine, a sign, symptom, or medical condition that leads to the recommendation of a treatment, test, or procedure.

**indicative:** refers to a mood of the verb that is used in most statements and questions.

**indicator:** a compound that changes color at a particular pH, or over a particular narrow range of pH, used to show titration end points. OR A substance used to indicate the end point of a titration by a change in color. OR A substance that undergoes a sharp, easily observable change when conditions in its solutions change. See, for example, acid-base indicator and redox indicator. OR A substance which takes on a different colour dependin on the pH of a solution.

**indicator diagram:** A plot of pressure vs. volume. Lines or curves on the indicator diagram represent processes. The areas under curves on the indicator diagram are equal to the work released by the process.

**Indicatrix:** A structural representation, portrayed as an ellipsoid, of the magnitudes and directions of the O and E rays within a crystal.

**indicine-N-oxide:** A natural pyrrolizidine alkaloid with antineoplastic properties. Indicine-N-oxide alkylates and crosslinks DNA.

**indinavir :** A drug that interferes with the ability of a virus to make copies of itself.

**indinavir sulfate:** A synthetic antiviral agent. Indinavir selectively binds to the active site of human immunodeficiency virus (HIV) protease and inhibits its activity, preventing the protease-mediated cleavage of gag-pol viral polyproteins; as a result immature, noninfectious virions are produced.

**indirect bilirubin:** when bilirubin is not conjugated to glucuronate the measurement of this form of bilirubin requires the addition of alcohol to promote the azotization reaction used for determining bilirubin concentration

**Indirect method:** This is used to compare study populations for which the specific rates are either statistically unstable or unknown. The specific rates in the standard population are averaged, using as weights the distribution of the study population. The ratio of the crude rate for the study population to the weighted average so obtained is the standardized mortality (or morbidity) ratio, or SMR. The indirectly standardized rate itself is the product of the SMR and the crude rate for the standard population (Last, 1988).

**indirect object:** tells to or for whom an action is done, although the words to and for are not used; it is used with a transitive verb and precedes the direct object.

**indirect ophthalmoscopy :** An exam of the inside of the back of the eye using a beam of light and a hand-held lens. Indirect ophthalmoscopy gives a wider view inside the eye than an exam using an ophthalmoscope does.

**indirect question:** a question that is being reported rather than asked and ends with a period rather than a question mark.

**Indium:** Symbol:"In" Atomic Number:"49" Atomic Mass: 114.82amu. It is classified as a basic metal. This metal is a lot like zinc. It is a soft, silvery metal used in electronics and mirrors. One interesting note is that there are more isotopes of indium than any other element.

**Indium 111 ProstaScint:** (Other name for: indium In 111 capromab pendetide)

**indium In 111 anti-CD45 monoclonal antibody BC8:** A radioimmunoconjugate containing the murine IgG1 anti-CD45 monoclonal antibody (MoAb) BC8 labeled with the gamma-emitting isotope indium 111 (In 111), with potential radioimaging application. Upon administration, indium In 111 anti-CD45 monoclonal antibody BC8 binds to CD45 antigen, a receptor protein tyrosine phosphatase expressed on the surface of most of the normal and malignant hematopoietic cells. After binding and internalization by CD45-expressing tumor cells, radioactive In 111 allows for the detection of BC8 distribution and tumor localization using gamma scintigraphy.

**indium In 111 anti-CEA monoclonal antibody M5A :** A substance being studied in the imaging of some types of cancer. M5A is a monoclonal antibody that binds to a protein called CEA on the surface of some tumor cells. It is linked to a radioisotope called indium In 111. The combined

substance is injected into the blood, and a machine is used to find cells in the body that bind to it. Indium In 111 anti-CEA monoclonal antibody M5A is a type of radioimmunoconjugate.

**indium In 111 anti-EGFR monoclonal antibody ABT-806:** A radioimmunoconjugate composed of a humanized monoclonal antibody IgG1 directed against the epidermal growth factor receptor (EGFR) and labeled with the radioisotope indium In 111, with potential radioimaging activity. Indium In 111 anti-EGFR monoclonal antibody ABT-806 binds to a specific epitope of either wild-type or EGFR variant III mutant on tumor cells, thereby allowing imaging of EGFR-expressing tumor cells using gamma scintigraphy. ABT-806 is the humanized version derived from the predecessor chimeric monoclonal antibody 806. EGFR, a receptor tyrosine kinase overexpressed on the cell surfaces of many tumor cell types, plays a key role in tumor cell proliferation. Check for active clinical trials using this agent.

**indium In 111 bevacizumab:** A radioimmunoconjugate comprised of the recombinant humanized monoclonal antibody bevacizumab conjugated with the gamma-emitting radioisotope indium In 111. Indium I 111 bevacizumab binds to vascular endothelial growth factor (VEGF), allowing the detection of VEGF distribution using gamma scintigraphy. Check for active clinical trials using this agent.

**indium In 111 capromab pendetide:** A radioimmunoconjugate consisting of the murine IgG1 kappa monoclonal antibody capromab (7E11-C5.3), conjugated to the linker-chelator glycyl-tyrosyl-(N,-diethylenetriaminepentaacetic acid)-lysine hydrochloride (GYK-DTPA-HCl) and labeled with radioisotope indium In 111, with ligand-binding and gamma-emitting activities. Upon intravenous administration, indium In 111-capromab pendetide binds to a cytoplasmic epitope of human prostate specific membrane antigen (PSMA) expressed on prostate tumor cell surfaces via its capromab moiety and, upon internalization, allows radioimmunolocalization with gamma scintigraphy. PSMA is a cell surface glycoprotein abundantly expressed by prostate epithelium and is typically overexpressed by prostate cancer cells.

**indium In 111 chimeric monoclonal antibody 806:** A recombinant chimeric, mouse-human monoclonal antibody IgG1, directed against the epidermal growth factor receptor (EGFR) and labeled with the radioisotope

indium-111, with potential radioimaging activity. Indium 111 chimeric monoclonal antibody 806 binds to a specific epitope on EGFR-expressing tumor cells, allowing imaging of EGFR-expressing tumor cells using gamma scintigraphy. EGFR is a receptor tyrosine kinase that is involved in the regulation of cell growth and is found to be overexpressed on the cell surfaces of many tumor cell types.

**indium In 111 CHX-A DTPA trastuzumab:** An indium I 111-labeled trastuzumab with potential use as an imaging agent. Indium In 111 CHX-A DTPA trastuzumab is chemically conjugated via a bifunctional metal chelator molecule, 2-(p-isothiocyanatobenzyl)-cyclohexyl-diethylenetriaminepentaacetic acid (CHX-A DTPA), a backbone-substituted derivative of DTPA. This agent may allow radioimmunolocalization of HER2-positive cells. Trastuzumab, a recombinant humanized monoclonal antibody that selectively binds with high affinity to the extracellular domain of human epidermal growth factor receptor 2 (HER2), may elicit an antibody-dependent cellular cytotoxicity (ADCC) against tumor cells that overexpress HER2.

**indium In 111 CHX-A DTPA trastuzumab :** A substance being studied in the imaging of breast cancer and some other types of cancer. It is made by attaching a radioactive substance called indium 111 to the monoclonal antibody trastuzumab (Herceptin). Trastuzumab binds to the human growth factor receptor 2 (HER2/neu) on some breast cancer cells and on several other types of cancer cells. Indium In 111 CHX-A DTPA trastuzumab is a type of radioimmunoconjugate.

**indium In 111 ibritumomab tiuxetan:** A targeted radioimmunoconjugate composed of a murine monoclonal anti-CD20 antibody (ibritumomab) linked by a chelator (tiuxetan) to the imaging radioisotope indium-111. This radioimmunoconjugate binds to CD20-positive cells, permitting radioimmuno-localization of CD20-positive cell biodistribution. or A radiolabeled monoclonal antibody that is used to detect certain types of B-cell non-Hodgkin lymphoma and is being studied in the detection of other types of B-cell tumors. It is made up of the monoclonal antibody ibritumomab plus the radioisotope indium 111. It binds to the protein called CD20, which is found on B cells. A machine is used to detect which cells in the body have bound the antibody. Indium In 111 ibritumomab tiuxetan is a

type of radiopharmaceutical. Also called In 111 ibritumomab tiuxetan and In 111 Zevalin.

**indium In 111 monoclonal antibody BrE-3:** A humanized monoclonal antibody conjugated to the imaging radioisotope (indium-111). This radioimmunoconjugate binds to the breast epithelial mucin antigen, which is found primarily on breast cancer cells, permitting radioimmuno-localization of mucin-positive tumor cells and an estimate of radiation dosimetry prior to administration of cytotoxic radiotherapy.

**indium In 111 monoclonal antibody huPAM4:** The humanized monoclonal antibody huPAM4, directed against the pancreatic cancer antigen MUC-1 and radiolabeled with the gamma-emitting radioisotope indium I 111, with radioisotopic and antibody activities. Upon administration, indium In 111 monoclonal antibody huPAM4 may bind to MUC-1-positive tumor cells, allowing radioimmunolocalization with gamma scintigraphy. Overexpressed by many tumor cell types, MUC-1 antigen, a mammary-type apomucin, is a high-molecular-weight transmembrane glycoprotein.

**indium In 111 pentetate:** A sterile, non-pyrogenic, isotonic solution of radioactive indium In 111 diethylenetriamine pentaacetate (DTPA). When administered intrathecally, indium In 111 pentetate percolates up the spinal canal with the cerebrospinal fluid (CSF) to the basal cisterns of the posterior and middle cranial fossas. This agent is used in radionuclide cisternography to image the flow of CSF, for the identification of abnormalities in CSF circulation, for location of sites of CSF leakage, and for evaluation of CSF shunt patency. Normally, this agent does not penetrate into the brain ventricles.

**indium In 111 pentetreotide:** An indium 111 radioconjugate of pentetreotide, the diethylenetriaminopentaacetic (DTPA) conjugate of the human hormone somatostatin peptide analogue (octreotide), used for radioimaging neuroendocrine tumor cells. The pentetreotide moiety of indium In 111 pentetreotide binds to somatostatin receptors (SSTRs), especially type 2 receptors, present on the cell membranes of many types of neuroendocrine tumor cells. Upon binding and internalization, this radioconjugate allows for specific imaging of neuroendocrine tumors that overexpress somatostatin using scintigraphic imaging techniques. In addition, high dose indium In 111 pentetreotide may specifically deliver a

cytotoxic dose of gamma radiation to SSTR-positive cells thereby killing SSTR-expressing tumor cells. or An anticancer drug belonging to a family of drugs called radiopharmaceuticals.

**indium In 111 pertuzumab:** A radioimmunoconjugate composed of a humanized recombinant monoclonal antibody directed against the extracellular dimerization domain of the tyrosine kinase receptor human epidermal growth factor-2 (HER-2) and linked to the gamma-emitting radioisotope indium In 111, with potential use in radioimaging. Upon administration, indium In 111 pertuzumab binds to HER-2. After binding and internalization into HER-2-expressing tumor cells, radioactive In 111 facilitates the detection of HER-2-expressing tumor cells using single photon emission computed tomography (SPECT). This may predict or evaluate the tumor's response to certain HER-2-targeting chemotherapeutics.

**indium In 111-CMD-193:** A radiolabeled antibody-targeted antineoplastic antibiotic consisting of the enediyne antibiotic calicheamicin conjugated with anti-Lewis Y antibody and labeled with indium In 111. In 111 CMD-193 binds to Lewis Y antigen-expressing tumor cells via its antibody moiety and is internalized; subsequently, the calicheamicin moiety binds to the minor groove of tumor cell DNA, causing double-strand DNA breaks, the inhibition of DNA synthesis, and apoptosis. The indium In 111 radiolabel allows the detection of CMD-193 distribution and tumor localization using gamma scintigraphy.

**indium In 111-DOTA-biotin:** A radioimmunoconjugate of biotin conjugated with the bifunctional, macrocyclic chelating agent tetraazacyclododecanetetra-acetic acid (DOTA) and labeled with indium 111 (In-111). Biotin is a water-soluble B-complex vitamin, present in minute amounts in every living cell, while its level in cancerous tissue is higher than that of normal tissue. In 111-DOTA-Biotin could be used in 3-step pre-targeting radioimmunotherapy that employs tumor targeting antibody conjugated with streptavidin, the natural ligand of biotin. Check for active clinical trials using this agent.

**indium In 111-DOTA-exendin-4:** A radiopharmaceutical composed of the glucagon-like peptide 1 receptor (GLP-1R) agonist exendin-4 linked by the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the positron-emitting radionuclide indium In 111, with

potential use in diagnostic imaging upon positron emission tomography (PET). Upon administration of indium In 111-DOTA-exendin-4, the exendin-4 moiety binds to GLP-1R and is subsequently internalized. The radionuclide moiety can be detected using PET and GLP-1R-expressing tumors can be localized. GLP-1R, located on beta cells, is overexpressed on insulinomas, which are insulin-secreting neuroendocrine tumors.

**indium In 111-DOTA-girentuximab:** A radioimmunoconjugate comprised of the chimeric monoclonal antibody girentuximab conjugated with the gamma-emitting radioisotope indium In 111. Indium In 111-DOTA-girentuximab binds to G250, allowing the localization of G250-expressing tumor cells using gamma scintigraphy. Found in the majority of renal cell carcinomas (RCCs), G250 or carbonic anhydrase isozyme IX (CA IX) is a cell surface tumor-associated antigen (TAA).

**indium In 111-labeled autologous peripheral blood mononuclear cells:** A preparation of autologous peripheral blood mononuclear cells (PBMCs) radiolabeled with indium In 111 with radioisotopic activity. Autologous PBMCs are isolated, expanded ex vivo, radiolabeled with indium In 111, and then infused back into the patient. Gamma scintigraphy may then be used to image gamma ray-emitting indium In 111 PBMCs localized in lymphoma tissue.

**indium In 111-labeled autologous polymorphonuclear leukocytes:** A preparation of autologous peripheral polymorphonuclear (PMNLs) radiolabeled with indium In 111 with radioisotopic activity. Autologous PMNLs are isolated, expanded ex vivo, radiolabeled with indium In 111, and then infused back into the patient. Gamma scintigraphy may then be used to image gamma ray-emitting indium In 111 PMNLs localized in lymphoma tissue.

**indium In-111-DOTA-di-HSG peptide IMP-288:** A radiolabeled divalent histamine-succinyl-glycine (HSG) hapten-peptide linked with the macrocyclic chelator 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetraacetic acid (DOTA) to the radionuclide indium (In) 111. After pretargeting with a bispecific monoclonal antibody (BiMoAB) directed against both a tumor associated antigen (TAA) and the HSG hapten-peptide, the HSG portion of administered indium-In-labeled di-HSG-DOTA peptide IMP-288 binds the anti-HSG portion of the BiMoAB; In-111 radioisotopic activity localized to

tumor cells bearing the TAA can then be visualized scintigraphically. Check for active clinical trials using this agent.

**Individual plant examination (IPE):** As requested by the NRC in Generic Letter 88-20, "Individual Plant Examination for Severe Accident Vulnerabilities" (November 23, 1988), a risk analysis that considers the unique aspects of a particular nuclear power plant, identifying the specific vulnerabilities to severe accident of that plant.

**Individual plant examination for external events (IPEEE):** While the "individual plant examination" takes into account events that could challenge the design from things that could go awry internally (in the sense that equipment might fail because components do not work as expected), the "individual plant examination for external events" considers challenges such as earthquakes, internal fires, and high winds.

**individualized education plan :** An education plan for children with certain disabilities or health conditions, such as cancer. By law, these children must receive special education services and other support they need in school. An individualized education plan describes which special services the child needs and how those needs will be met. This may include special class placement, extra help with class assignments and tests, tutoring, and other services such as counseling, speech therapy, and physical therapy. Individualized education plans are covered in the U.S. law, Individuals with Disabilities Education Act. Also called IEP.

**Individually Quick Frozen:** Freezes bagged meat or vegetables rapidly by exposing it to blast of air at approximately -40° F.

**Indocin:** (Other name for: indomethacin)

**indocyanine green solution:** A sterile solution of a nontoxic tricarboyanine dye with a peak spectral absorption at 790 nm, used for determining cardiac output, hepatic function, and liver blood flow, as well as for ophthalmic angiography. Designed to be administered intravenously, indocyanine green solution (ICG) contains less than 5% sodium iodide. Upon intravenous injection, ICG rapidly binds to its principle carrier, plasma protein, and is thereby confined to the vascular space. This agent, with a half-life of 150 to 180 seconds, is removed exclusively by the liver from circulation to bile juice. Furthermore, due to poor uptake, ICG is not suitable for angiography or functional output analysis of kidney, lung, cerebro-spinal, or peripheral tissues.

**indocyanine green/albumin solution:** A solution containing a non-toxic, fluorescent tricarbo-cyanine dye with a peak spectral absorption at 790 nm bound to the plasma protein albumin, that may be used in sentinel node mapping using a near infrared (NIR) imaging system. Upon injection of the indocyanine green (ICG)/albumin solution around the tumor, the ICG/albumin complex, travels through the vascular system. Using a NIR imaging system, the ICG, which emits light in the NIR range, permits the visualization of sentinel nodes and may help in cancer staging. Check for active clinical trials using this agent.

**indole :** A type of chemical found in plants and in certain vegetables, such as broccoli, cabbage, and cauliflower. Indoles may promote good health and are being studied in the prevention of certain types of cancer, including breast cancer, prostate cancer, and colon cancer. An indole is a type of phytochemical.

**indole-3-carbinol:** A naturally occurring, orally available cleavage product of the glucosinolate glucobrassicin, a natural compound present in a wide variety of plant food substances including members of the family Cruciferae with antioxidant and potential chemopreventive properties. Indole-3-carbinol scavenges free radicals and induces various hepatic cytochrome P450 monooxygenases. Specifically, this agent induces the hepatic monooxygenase cytochrome P4501A1 (CYP1A1), resulting in increased 2-hydroxylation of estrogens and increased production of the chemoprotective estrogen 2-hydroxyestrone. or A substance that is being studied as a cancer prevention drug. It is found in cruciferous vegetables.

**indole-3-carbinol/calcium/Schizandra/vitamin D3/milk thistle/stinging nettle/lignan-based nutritional capsule:** An orally available capsule-based nutritional supplement containing indole-3-carbinol, calcium-D-glucarate, Schizandra, vitamin D3, milk thistle, stinging nettle and hydroxymatairesinol (HMR) lignans, with potential estrogen modulating, antiproliferative and antioxidant activity. Indole-3-carbinol, found in vegetables of the Cruciferae family, may inhibit mammary cell growth and exerts antiestrogenic activity; Milk thistle (*Silybum marianum*) and Schizandra chinensis may enhance some of the phase II detoxification enzymes; calcium-D-glucarate and vitamin D3 may inhibit mammary cell growth; stinging nettle may exert its effect through its aromatase inhibiting activity; HMR lignans may have a beneficial effect on estrogen balance and

levels. Therefore, ingredients in indole-3-carbinol/calcium/Schizandra/vitamin D3/milk thistle/stinging nettle/lignan-based nutritional capsule may alter estrogen balance and may protect against mammary carcinogenesis.

**indoleamine 2,3-dioxygenase peptide vaccine:** A peptide vaccine against the immunomodulatory enzyme indoleamine 2,3-dioxygenase (IDO), with potential immunomodulating and antineoplastic activities. Vaccination with indoleamine 2,3-dioxygenase peptide vaccine may activate the immune system to induce an immune response against IDO-expressing cells. This may increase and restore the proliferation and activation of various immune cells, including dendritic cells (DCs), natural killer (NK) cells, and T-lymphocytes, and may eradicate IDO-expressing tumor cells. IDO, a cytosolic enzyme responsible for tryptophan catabolism and conversion of tryptophan into kynurenine, is overexpressed by a variety of tumor cell types and antigen presenting cells (APCs) and plays an important role in immunosuppression; tryptophan depletion inhibits T-lymphocyte proliferation and activation, and suppresses the immune system. Check for active clinical trials using this agent.

**indolent :** A type of cancer that grows slowly.

**indolent lymphoma :** A type of lymphoma that tends to grow and spread slowly, and has few symptoms. Also called low-grade lymphoma.

**indomethacin:** A synthetic nonsteroidal indole derivative with anti-inflammatory activity and chemopreventive properties. As a nonsteroidal anti-inflammatory drug (NSAID), indomethacin inhibits the enzyme cyclooxygenase, thereby preventing cyclooxygenase-mediated DNA adduct formation by heterocyclic aromatic amines. This agent also may inhibit the expression of multidrug-resistant protein type 1, resulting in increased efficacies of some antineoplastic agents in treating multi-drug resistant tumors. In addition, indomethacin activates phosphatases that inhibit the migration and proliferation of cancer cells and downregulates survivin, which may result in tumor cell apoptosis. or A drug that reduces pain, fever, swelling, and redness. It is also being used to reduce tumor-induced suppression of the immune system and to increase the effectiveness of anticancer drugs. It is a type of nonsteroidal anti-inflammatory drug (NSAID).

**indoximod:** A methylated tryptophan with immune checkpoint inhibitory activity. Indoximod inhibits the enzyme indoleamine 2,3-dioxygenase (IDO), which degrades the essential amino acid tryptophan, and may increase or maintain tryptophan levels important to T cell function. Tryptophan depletion is associated with immunosuppression involving T cell arrest and anergy. Check for active clinical trials using this agent.

**Induced Dipole Interactions:** A charge or a dipole can induce a dipole in another molecule. Induced dipole interactions refer to interactions between a charge or a dipole and an induced dipole.

**Induced fit:** A change in the shape of an enzyme that results from the binding of substrate. OR The modification of the shape of an active site in an enzyme after the substrate is bound. OR A change in the conformation of an enzyme in response to substrate binding that renders the enzyme catalytically active; also used to denote changes in the conformation of any macromolecule in response to ligand binding such that the binding site of the macromolecule better conforms to the shape of the ligand.

**Induced radioactivity:** Radioactivity that is created when stable substances are bombarded by ionizing radiation. For example, the stable isotope cobalt-59 becomes the radioactive isotope cobalt-60 under neutron bombardment.

**Inducer:** A small molecule that binds to a repressor and alters its interaction with an operator. OR A signal molecule that, when bound to a regulatory protein, produces an increase in the expression of a given gene. OR Molecules that cause an increase in a protein activity when added to cells.

**inducible CD4+CD25+ regulatory T cells:** Inducible regulatory T-lymphocytes that express CD4, CD25 (the alpha chain of the interleukin 2 receptor) and forkhead box P3 (FOXP3), with potential immunomodulating activity. Inducible CD4+CD25+ T regulatory cells (iTregs) are a subset of CD4+ T lymphocytes that are induced from CD25- precursors in peripheral lymphoid organs with interleukin-2 and transforming growth factor-beta. These regulatory T cells are essential in maintaining immunologic homeostasis. They may also prevent autoimmunity by suppressing self-reactive T cells, and may induce tolerance to allogeneic organ transplants such as in hematopoietic stem cell transplants.

**Inducible proteins:** Those which are synthesized in different amounts depending on cellular signals.

**induction:** An increase in the expression of a gene in response to a change in the activity of a regulatory protein.

**induction therapy :** The first treatment given for a disease. It is often part of a standard set of treatments, such as surgery followed by chemotherapy and radiation. When used by itself, induction therapy is the one accepted as the best treatment. If it doesn't cure the disease or it causes severe side effects, other treatment may be added or used instead. Also called first-line therapy, primary therapy, and primary treatment.

**Induction Welding:** A type of welding in which coalescence is achieved by heat derived from the work's resistance to an induced electric current, either with or without applied pressure.

**inductive effect:** the electron donating or electron withdrawing effect that is transmitted through  $\sigma$  bonds. It can also be defined as the ability of an alkyl group to "push" electrons away from itself. The inductive effect gives stability to carbocations and makes tertiary carbocations the most stable. OR An inductive effect is the polarization of a chemical bond caused by the polarization of an adjacent bond. (Field effects are polarization caused by nonadjacent bonds).

**Industrial chemists:** What is the difference between an industrial chemist and a chemical engineer? While a chemical engineer is concerned with moving lots of chemicals around and ensuring reactors do what they're supposed to, industrial chemists are more like real chemists and busy themselves with the reactions that are going on, trying to optimise how much of an industrial product is made and how quickly it is made.

**inecalcitol:** An analog of calcitriol and a vitamin D3 receptor (VDR) agonist, with potential antineoplastic activity. Upon administration, inecalcitol targets and binds to VDR. This activates VDR and VDR-mediated signal transduction pathways. This modulates the VDR-mediated expression of certain genes, including the expression of anti-cancer genes, enhances cellular differentiation, induces tumor cell apoptosis and inhibits tumor cell growth. VDR plays a central role in calcium homeostasis and in the growth of certain cancer cells.

**Inert:** deficient in active properties; not affecting other substances when in contact with them such as inert gases not participating in any fashion in

chemical reactions. Infrared the band of light in the electromagnetic spectrum that lies between the visible light range and the radar range. OR The word inert is used to describe the elements in group eight. They all have enough electrons to fill their outer shell. It is the column where Helium is at the top. Inert gases are very non-reactive. OR 'Inert' means unreactive.

**inert gas:** Any of the elements of Group 18, which includes helium, neon, argon, krypton, xenon, radon, and element 118. These elements are referred to as "inert" or "noble" because they do not easily form compounds with other elements.

**inert gases:** the column of elements from helium to radon; also called noble gases.

**inert pair:** Valence electrons in an s orbital penetrate to the nucleus better than electrons in p orbitals, and as a result they're more tightly bound to the nucleus and less able to participate in bond formation. A pair of such electrons is called an "inert pair". The inert pair effect explains why common ions of Pb are  $Pb^{4+}$  and  $Pb^{2+}$ , and not just  $Pb^{4+}$  as we might expect from the octet rule.

**Inert pigments:** Materials which are resistant to attack by chemicals normally encountered in the environment in which they will be used e.g. atmospheric pollution.

**inertia:** The tendency of a body to stay at rest or to continue to move at the same velocity, unless acted on by an outside force. A tractor trailer has more inertia than a bicycle. A bowling ball has more inertia than a tennis ball.

**Infanrix:** (Other name for: diphtheria toxoid/tetanus toxoid/acellular pertussis vaccine adsorbed)

**infantile genetic agranulocytosis :** An inherited disorder in which there is a lower-than-normal number of neutrophils (a type of white blood cell that is important in fighting infections). Infants with the disorder get infections caused by bacteria, and are at an increased risk of acute myelogenous leukemia (AML) or myelodysplasia (a bone marrow disorder). Also called congenital neutropenia, genetic infantile agranulocytosis, Kostmann disease, Kostmann neutropenia, and Kostmann syndrome.

**infantile hemangioma :** A benign (not cancer) blood vessel tumor that forms on the skin, in the tissue below the skin, or in an organ. Infantile

hemangiomas may be raised or flat and usually appear as bright red-blue lesions on the skin. They may sometimes be called a “strawberry mark”. They can occur anywhere on or in the body, but usually form on the skin of the head and neck. Infantile hemangiomas are not usually seen at birth but appear when the infant is 3 to 6 weeks old. They usually get bigger, then stop growing and slowly go away on their own. Infantile hemangiomas are the most common type of vascular tumor in children.

**infantile rickets :** A condition in children in which bones become soft and deformed because they don’t have enough calcium and phosphorus. It is caused by not having enough vitamin D in the diet or by not getting enough sunlight. In adults, this condition is called osteomalacia. Also called juvenile rickets, rachitis, and rickets.

**Infasurf Intratracheal Suspension:** (Other name for: calfactant)

**infection :** The invasion and growth of germs in the body. The germs may be bacteria, viruses, yeast, fungi, or other microorganisms. Infections can begin anywhere in the body and may spread all through it. An infection can cause fever and other health problems, depending on where it occurs in the body. When the body’s immune system is strong, it can often fight the germs and cure an infection. Some cancer treatments can weaken the immune system, which may lead to infection.

**inference:** an educated guess based on collected data.

**Infergen:** (Other name for: interferon alfacon-1)

**inferior vena cava :** A large vein that empties into the heart. It carries blood from the legs and feet and from organs in the abdomen and pelvis.

**infertile :** Unable to produce children.

**infertility :** The inability to produce children.

**infiltrating breast cancer :** Cancer that has spread from where it began in the breast to surrounding normal tissue. The most common type of infiltrating breast cancer is infiltrating ductal carcinoma, which begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple). Another type is infiltrating lobular carcinoma, which begins in the lobules (milk glands) of the breast. Infiltrating breast cancer can spread through the blood and lymph systems to other parts of the body. Also called invasive breast cancer.

**infiltrating cancer :** Cancer that has spread beyond the layer of tissue in which it developed and is growing into surrounding, healthy tissues. Also called invasive cancer.

**infiltrating ductal carcinoma :** The most common type of infiltrating breast cancer. It begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple) and spreads outside the ducts to surrounding normal tissue. Infiltrating ductal carcinoma can also spread through the blood and lymph systems to other parts of the body. Also called invasive ductal carcinoma.

**infiltrating lobular carcinoma :** A type of invasive breast cancer that begins in the lobules (milk glands) of the breast and spreads to surrounding normal tissue. It can also spread through the blood and lymph systems to other parts of the body. Also called invasive lobular carcinoma.

**infiltration:** water sinking into the ground.

**infiltration (soil):** Movement of water from the ground surface into the soil.

**infinitive:** the base form of a verb with to, and that usually functions as a noun, although it can be an adjective or adverb.

**infinitive phrase:** a phrase containing an infinitive and its objects and modifiers; infinitive phrases usually function as nouns, although they can be used as adjectives and adverbs.

**Inflammation:** The body's reaction to noxious stimuli or foreign particles, resulting in swelling, redness, and pain

**inflammation :** Redness, swelling, pain, and/or a feeling of heat in an area of the body. This is a protective reaction to injury, disease, or irritation of the tissues.

**inflammatory :** Having to do with inflammation (redness, swelling, pain, and a feeling of heat that helps protect tissues affected by injury or disease).

**inflammatory bowel disease :** A general term that refers to the inflammation of the colon and rectum. Inflammatory bowel disease includes ulcerative colitis and Crohn disease.

**inflammatory breast cancer :** A type of breast cancer in which the breast looks red and swollen and feels warm. The skin of the breast may also show the pitted appearance called peau d'orange (like the skin of an orange). The

redness and warmth occur because the cancer cells block the lymph vessels in the skin.

**infiximab:** A recombinant chimeric, mouse-human monoclonal antibody directed against tumor necrosis factor alpha (TNF-alpha), a protein involved in inflammation, cell survival, and apoptosis. Infiximab may be pro- apoptotic or anti-apoptotic, depending on cell type. or A monoclonal antibody that blocks the action of a cytokine called tumor necrosis factor alfa. It is being studied in the treatment and prevention of weight loss and loss of appetite in patients with advanced cancer. It belongs to the family of drugs called monoclonal antibodies.

**influent:** sewage, water or other liquid, either raw or partly treated, flowing into a reservoir basin, or treatment plant or any part thereof.

**influenza A virus :** One of three types of virus that cause the illness called influenza (flu). The influenza A virus can infect people, birds, pigs, horses, and other animals. It is the main cause of most influenza epidemics.

**informational macromolecules:** Biomolecules containing information in the form of specific sequences of different monomers; for example, many proteins, lipids, polysaccharides, and nucleic acids.

**informative :** In genetic testing, a test result that reveals definitively the presence or absence of the germline genetic alteration associated with the hereditary disorder being assessed. In linkage analysis, the ability to distinguish between maternally inherited and paternally inherited DNA markers (polymorphisms) within or near a given gene of interest.

**informed consent :** A process of information exchange between a clinician and an individual or their legal proxy designed to facilitate autonomous, informed decision making. The informed consent process for genetic testing should include an explanation of the medical and psychosocial risks, benefits, limitations, and potential implications of genetic analysis, a discussion of privacy, confidentiality, the documentation and handling of genetic test results, as well as options for managing the hereditary disease risk. Also called consent process. or A process in which patients are given important information, including possible risks and benefits, about a medical procedure or treatment, a clinical trial, or genetic testing. This is to help them decide if they want to be treated, tested, or take part in the trial. Patients are also given any new information that might affect their decision to continue. Also called consent process.

**Infra-red:** Part of the electromagnetic spectrum between the visible light range and the radar range. Radiant heat is in this range, and infra-red heaters are used in sheet thermoforming.

**infrared coagulation :** A technique in which abnormal tissue is exposed to a burst of infrared light (a type of radiation). This causes blood in veins in the tissue to coagulate (harden) and the abnormal tissue to shrink. It is being studied in the prevention of anal cancer in some patients with HIV.

**infrared radiation:** Electromagnetic radiation lying in the wavelength interval from 0.7 micrometers to 1000 micrometers. Its lower limit is bounded by visible radiation, and its upper limit by microwave radiation. Most of the energy emitted by the Earth and its atmosphere is at infrared wavelength. Infrared radiation is generated almost entirely by large-scale intra- molecular processes. The tri-atomic gases, such as water vapor, carbon dioxide, and ozone, absorb infrared radiation and play important roles in the propagation of infra- red radiation in the atmosphere.

Abbreviated IR; also called "longwave radiation". OR Electromagnetic radiation with wavelength longer than visible light but shorter than that of microwaves. Infrared radiation is produced by hot objects; absorption of infrared radiation causes chemical bonds to vibrate.

**Infrared Spectroscopy:** Spectroscopic technique that deals with the infrared region of the electromagnetic spectrum. Used during the characterisation of molecules. OR A method of analysis that involves the absorption of infrared energy by the sample. The molecules that absorb the infrared energy are in an excited, vibrational state and the wavelengths of the various vibrations reveal structural details of the given molecules. OR a type of spectroscopy that provides structural information about a molecule, based on the molecule's interaction with energy from infrared light. OR A technique for determining the structure (and sometimes concentration) of molecules by observing how infrared radiation is absorbed by a sample.

**infrared thermography :** In medicine, a procedure in which an infrared camera (one that senses heat) is used to measure temperature differences on the surface of the body. The camera makes pictures that show areas of possible abnormal cell growth because abnormal tissue gives off more heat than normal tissue does.

**infratentorium :** The lower back part of the brain that contains the cerebellum and brain stem. Examples of tumors that form in the

infratentorium are medulloblastomas and brain stem gliomas.

**Infumorph:** (Other name for: morphine sulfate)

**infusion :** A method of putting fluids, including drugs, into the bloodstream. Also called intravenous infusion.

**ingenol derivative LEO 43204 gel:** A topical, aqueous gel formulation containing a derivative of ingenol, a selective small-molecule activator of protein kinase C (PKC) that is isolated from the sap of Euphorbia species, with the potential to treat preneoplastic skin lesions. Upon topical application of the ingenol derivative LEO 43204 gel, the agent presumably activates various PKC isoforms, which may induce apoptosis in abnormal cells found in severely sun-damaged skin with multiple actinic keratoses. This may decrease the number of actinic keratoses and prevent the development of skin neoplasms. The PKC family consists of signaling isoenzymes that regulate many cell processes, including proliferation, differentiation, and apoptosis.

**ingenol mebutate:** A selective small-molecule activator of protein kinase C (PKC) isolated from the plant Euphorbia peplus with potential antineoplastic activity. Ingenol mebutate (I3A) activates various protein kinase C (PKC) isoforms, thereby inducing apoptosis in some tumor cells, including myeloid leukemia cells, melanoma cells, and basal cell carcinoma cells. The PKC family consists of signaling isoenzymes that regulate many cell processes including proliferation, differentiation, and apoptosis.

**ingenol mebutate gel:** A topical, aqueous gel formulation containing the mebutate salt form of ingenol, a selective small-molecule activator of protein kinase C (PKC) that is isolated from the sap of Euphorbia species, with potential antineoplastic activity. Upon topical application of the ingenol mebutate gel, ingenol activates various PKC isoforms, which induces apoptosis in certain tumor cells, including myeloid leukemia cells, melanoma cells, and basal cell carcinoma cells. The PKC family consists of signaling isoenzymes that regulate many cell processes, including proliferation, differentiation, and apoptosis.

**ingestion :** Taking into the body by mouth.

**inguinal orchiectomy :** An operation in which the testicle is removed through an incision in the groin.

**inhalation** : In medicine, refers to the act of taking a substance into the body by breathing.

**inhaler** : A device for giving medicines in the form of a spray that is inhaled (breathed in) through the nose or mouth. Inhalers are used to treat certain medical problems, such as bronchitis, angina, emphysema, and asthma. They are also used to help relieve symptoms that occur when a person is trying to quit smoking.

**inherited** : In medicine, describes the passing of genetic information from parent to child through the genes in sperm and egg cells. Also called hereditary.

**inherited bone marrow failure syndrome** : A rare disorder in which a person's bone marrow is unable to make enough blood cells and there is a family history of the same disorder. There are several different types of inherited bone marrow failure syndrome, and patients with one of them are at high risk of forming acute leukemia or certain solid tumors. Also called IBMFS.

**inherited cancer syndrome** : A type of inherited disorder in which there is a higher-than-normal risk of certain types of cancer. Inherited cancer syndromes are caused by mutations (changes) in certain genes passed from parents to children. In an inherited cancer syndrome, certain patterns of cancer may be seen within families. These patterns include having several close family members (such as a mother, daughter, and sister) with the same type of cancer, developing cancer at an early age, or having two or more types of cancer develop in the same person. Examples of inherited cancer syndromes are hereditary breast and ovarian cancer syndrome, Li-Fraumeni syndrome, Cowden syndrome, and Lynch syndrome. Also called hereditary cancer syndrome.

**inherited cancer syndrome** : Describes the clinical manifestations associated with a mutation conferring cancer susceptibility.

**inherited erythroblastopenia** : A very rare disorder in which the bone marrow doesn't make enough red blood cells. It is usually seen in the first year of life. Patients may have deformed thumbs and other physical problems. They also have an increased risk of leukemia and sarcoma, especially osteosarcoma (bone cancer). Patients with inherited erythroblastopenia may have a mutation (change) in one of the genes that make proteins found in the cell's ribosomes. Also called Blackfan–

Diamond anemia, congenital hypoplastic anemia, congenital pure red cell aplasia, DBA, Diamond-Blackfan anemia, and erythrocytopenia.

**Inhibitor:** An additive which retards or prevents chemical reactions (such as cure). OR a substance that slows down chemical reactions. Inhibitors are sometimes used in certain types of monomers and resins to prolong storage life. OR A substance that retards the rate of a chemical reaction. OR An inhibitor is a compound that slows down the process of a reaction. You may also hear the term negative catalyst. OR An inhibitor is a substance that slows down a chemical reaction (a type of 'negative catalyst').

**Inhibitor 1:** A protein that, when phosphorylated, inhibits the activity of protein phosphatase 1 and thereby sustains glycogen breakdown and inhibits glycogen synthesis.

**iniparib:** A small molecule iodobenzamide with potential cytotoxic and antineoplastic activities. Although the mechanism of action is unknown, iniparib appears to be cytotoxic in cells with DNA alterations or DNA damage, like that found in tumor cells with mutations in the ataxia telangiectasia mutated (ATM) gene. ATM encodes a serine/threonine protein kinase and mutations of the gene are associated with ataxia telangiectasia and contribute to certain cancers such as T-cell acute lymphoblastic leukemia, B-cell chronic lymphocytic leukemia and B-cell non-Hodgkin lymphomas. or A substance being studied in the treatment of some types of cancer. Iniparib may kill cancer cells. Also called BSI-201.

**Initiation:** The first of the three stages common to all biological polymerization reactions; this stage establishes conditions for the beginning of the polymerization process.

**initiation codon:** AUG (sometimes GUG in prokaryotes); codes for the first amino acid in a polypeptide sequence: N-formylmethionine in prokaryotes, and methionine in eukaryotes.

**Initiation complex:** A complex of an RNA polymerase, promoter elements, and specific transcription factors that permits the initiation of RNA synthesis. OR A complex of a ribosome with an mRNA and the initiating Met-tRNA<sup>Met</sup> or fMet-tRNA<sup>fMet</sup>, ready for the elongation steps.

**Initiation factor:** One of a set of proteins that assist in the association of the ribosome, mRNA, and initiator tRNA to initiate the process of protein synthesis. OR Those protein factors that are specifically required during the initiation phase of protein synthesis.

**initiation step:** the first step in the mechanism of a reaction.

**Initiator:** A compound required to start a chain reaction, such as free-radical polymerisation. Unlike a catalyst, it is consumed in the reaction, but only a small quantity is normally required since one molecule of initiator can initiate the reaction of many other molecules. OR a material capable of being easily fragmented into free radicals, which in turn initiate a free-radical reaction.

**injectable Astragalus membranaceus polysaccharide:** An injectable form of a polysaccharide isolated from the radix of Astragalus membranaceus (PG2), used in traditional Chinese medicine, with potential hematopoiesis inducing and immunomodulating activities. Upon injection, APS may be able to relieve certain chemotherapy-induced side effects, including myelosuppression, fatigue, mucositis, pain, nausea and vomiting, as well as loss of appetite and body weight. Also, APS may exert immunostimulatory activities by stimulating B-lymphocytes, activating T-lymphocytes, inducing cytokine production, and activating macrophages and natural killer cells through as of yet unidentified mechanism(s). APS may improve compliance of radiotherapy and/or chemotherapy.

**injectable liposomal vinorelbine:** An injectable, sphingomyelin/cholesterol liposome-encapsulated formulation of the semisynthetic vinca alkaloid vinorelbine with antineoplastic activity. Vinorelbine binds to tubulin and prevents formation of the mitotic spindle, resulting in cell cycle arrest in metaphase. Like other vinca alkaloids, vinorelbine may also interfere with the metabolism of nucleic acids, lipids, amino acids, cAMP, and glutathione, as well as other biological processes including calmodulin-dependent Ca<sup>2+</sup>-transport, ATPase activity, or cellular respiration. Liposomal delivery of vinorelbine may improve drug penetration into tumors and decreases drug clearance, increasing the duration of therapeutic effects while lowering the toxicity profile.

**Injectafer:** (Other name for: ferric carboxymaltose solution)

**Injection:** The act of forcing molten resin into the mold to form the part.

**injection :** Use of a syringe and needle to push fluids or drugs into the body; often called a "shot."

**Injection (also known as Fill Time):** Time required to fill the cavity or mold.

**Injection blowmolding:** A two-stage, plastic bottling process. First, a preform (or parison) is injection molded forming the bottle finish. Then, the preform is transferred to a blow mold where the bottle takes its ultimate shape. OR Blow molding process by which the plastic parison to be blown is formed by injection molding.

**Injection capacity:** A rating of the maximum amount of plastic material, in ounces, a machine is capable of injecting in a single stroke of the injection screw or plunger. It is based on the specific gravity of polystyrene as a standard.

**Injection Compression Molding:** A method of molding where the plastic is injected into a partially open cavity with injection pressure typically 50-75% lower than standard injection molding depending on wall thickness and mold open distance. The 2nd stage clamp action closes the telescoping core and subsequently compresses and distributes the melt into the far extremities of the cavity, including ribs and bosses. OR The method of forming objects from granular or powdered plastics, most often of the thermoplastic type, in which the material is fed from a hopper to a heated chamber in which it is softened, after which a ram or screw forces the material into a mold. Pressure is maintained until the mass has hardened sufficiently for removal from the mold. OR method of forming a plastic to the desired shape by forcing heat softening plastic into a relatively cool cavity where it rapidly solidifies.

**Injection Molding Pressure:** The pressure applied to the cross-sectional area of the molding cylinder.

**Injection molds:** a mold into which a plasticated material is introduced from an exterior heating cylinder.

**Injection Moulding:** The method of forming objects from granular or powdered thermoplastic materials using moulds. The mould gives the plastic product its shape by means of a confining cavity or matrix. This is a different process to plastic extrusion manufacture using different grades of plastic compounds.

**Injection Or Fill Time:** Time required to fill the cavity or mold.

**Injection pressure:** That pressure that performs the initial filling of the mold. It is supplied by the injection screw or plunger as it pushes material out of the heating barrel and into the mold. OR The pressure on the face of the silicone injecting ram when injecting material into the mold

**Injection Pressure :** The applied hydraulic pressure used to push the resin into the mold cavity.

**Injection Pressure Profile:** Before the switch over point the set pressure remains constant but set injection speed is varied with stroke position. After switch over point injection speed should remain at lower value and pressure is changed with time till the mould is just filled with out over packing. This set pressure for filling stage and follow up / hold on pressure change with respect to time is called Injection pressure profile.

**Injection Ram:** The ram which applies pressure to the plunger in the process of injection molding or transfer molding.

**Injection Rate:** It is the flow rate of melt (cc/sec) coming out of nozzle. Melt comes out in the form of jet. Then it spreads inside the mould in shape of the space between the core and cavity.

**Injection Speed:** The elapsed time required to fill the mold cavity.

**Injection Tearout:** A molding defect identified by a hole in the silicone liquid rubber part at varying widths and depths located at the point where the silicone rubber is injected into the cavity area

**Injection unit:** The section of the molding machine that contains the injection components, including the hopper, heating cylinder, screw (or plunger), nozzle, and heater bands.

**Inline forming:** Process where a plastic sheet moves from a roll onto inline thermo formers and through the heating section. The heated thermoforming material advances into the forming section where pressure and/or vacuum force the plastic onto a mold. It then proceeds to another station where formed parts are finish-trimmed.

**Inlyta:** (Other name for: axitinib)

**Inlyta :** A drug used to treat advanced renal cell carcinoma (the most common type of kidney cancer). It is used in patients who have not gotten better with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Inlyta blocks the action of proteins called growth factor receptors and may prevent the growth of new blood vessels that tumors need to grow. It is a type of tyrosine kinase inhibitor and a type of antiangiogenesis agent. Also called axitinib.

**innate defense regulator SGX942:** A synthetic, 5-amino acid peptide and innate defense regulator (IDR), with immunomodulating, anti-

inflammatory, anti-infective and anti-mucositis activities. Upon intravenous administration, SGX942 binds to the ZZ domain of sequestosome-1, also called p62, and activates regulatory signaling transduction pathways involved in the modulation of the innate immune system, such as those mediated by mitogen-activated protein kinase (MAPK) p38 and CCAAT-enhancer-binding protein. This agent promotes monocyte and macrophage recruitment to, and accelerates healing in damaged and infected tissue; it suppresses inflammation through the regulation of the expression of multiple cytokines. This agent may prevent or decrease chemo- or radiotherapy-induced mucositis as well as other types of infection. p62, an intracellular adaptor protein that functions downstream of certain signaling receptors, plays a key role in the activation of the innate immune system.

**innate immunostimulator rBBX-01:** A recombinant 19 kDa protein derived from the Apicomplexa protozoan *Eimeria* with potential immunostimulating and antitumor activities. Upon administration, innate immunostimulator rBBX-01 activates dendritic cells (DCs), stimulates the Toll-like receptor 11 (TLR-11)-mediated release of interleukin-12 (Il-12) from DCs, and induces a T-helper 1 (Th1) type immune response, which may induce an immune response against tumor cells. Infection with *Eimeria*, a coccidian commonly infecting the intestine, may be negatively correlated with tumorigenesis.

**inner cell mass:** a group of cells that continues to develop at one end of the blastocyst.

**inner core:** the solid center of the Earth, composed of iron and nickel. OR the spherical, solid, innermost part of the earth.

**Inner Transition Elements:** Elements in the periodic table that have three shells that are not filled with electrons. The shells are usually the outer three shells. Uranium and holmium are examples of inner transition elements. The actinide and lanthanide series are all inner transition elements.

**Innerbraid:** A woven thread that is inside a tube providing reinforcement. The thread may be any one of many materials though nylon is most common.

**Innohep :** A drug that is used with another drug, warfarin, to treat blood clots that form deep in the veins and to prevent new blood clots from forming. It is a type of anticoagulant. Also called tinzaparin and tinzaparin sodium.

**Innopran XL:** (Other name for: propranolol hydrochloride)

**INO-1001:** A isoindolinone derivative and potent inhibitor of the nuclear enzyme poly (ADP-ribose) polymerase (PARP) with chemosensitization and radiosensitization properties. INO-1001 inhibits PARP, which may result in inhibition of tumor cell DNA repair mechanisms and, so, tumor cell resistance to chemotherapy and radiation therapy. PARP enzymes are activated by DNA breaks and have been implicated in the repair of DNA single-strand breaks (SSB).

**inoperable :** Describes a condition that cannot be treated by surgery.

**Inorganic chemistry:** The branch of chemistry that studies substances not derived from a living organism and/or not composed of carbon and hydrogen (a hydrocarbon) OR the study of chemical elements and compounds except for carbon. OR The study of inorganic compounds, specifically their structure, reactions, catalysis, and mechanism of action.

**Inorganic coagulant :** Aluminum or iron salt based water treatment chemicals.

**inorganic compound:** A compound that does not contain carbon chemically bound to hydrogen. Carbonates, bicarbonates, carbides, and carbon oxides are considered inorganic compounds, even though they contain carbon.

**inorganic pyrophosphatase:** An enzyme that hydrolyzes a molecule of inorganic pyrophosphate to yield two molecules of (ortho) phosphate; also known as pyrophosphatase.

**Inosinate:** A purine nucleotide formed by the reaction of hypoxanthine with 5-phosphoribosyl-1- pyrophosphate (PRPP); a precursor to both AMP and GMP.

**inosine 5'- monophosphate dehydrogenase inhibitor FF-10501-01:** An orally bioavailable inhibitor of inosine 5'- monophosphate dehydrogenase (IMPDH), with potential antineoplastic activity. Upon administration, IMPDH inhibitor FF-10501-01 competitively inhibits the enzyme IMPDH, thereby preventing the conversion of inosine monophosphate to xanthosine monophosphate. This inhibits the synthesis of guanine nucleotides, deprives cancer cells of guanosine triphosphate (GTP), disrupts DNA and RNA synthesis, and decreases tumor cell proliferation. Tumor cells are highly susceptible to IMPDH inhibition because they are rapidly dividing cells that

are dependent on rapid DNA synthesis, which requires a high concentration of nucleotides. IMPDH, an enzyme that catalyzes the rate-limiting step in the synthesis of guanosine triphosphate (GTP), is overexpressed in numerous tumor cell types.

**inosine dialdehyde:** A toxic purine analogue. Inosine dialdehyde inhibits ribonucleotide reductase, resulting in decreased synthesis of DNA, RNA, and proteins, and G2/M-phase cell cycle arrest. This agent also forms stable covalent crosslinks in proteins, thereby inhibiting the activity of enzymes involved in nucleic acid synthesis.

**inositol:** A natural sugar found in cell membrane phospholipids, plasma lipoproteins, and (as the phosphate form) in the nucleus with potential chemopreventive properties. As one of a number of intracellular phosphate compounds, inositol is involved in cell signaling and may stimulate tumor cell differentiation.

**inositol :** A nutrient in the vitamin B complex that the body needs in small amounts to function and stay healthy. Inositol helps cells make membranes and respond to messages from their environment. It has the same chemical formula as glucose (the chief source of energy for living organisms) but has a different arrangement of atoms. It is found in beans, peas, brown rice, wheat bran and nuts. It is water-soluble (can dissolve in water) and must be taken in every day. Inositol is being studied in the prevention of cancer. Also called myoinositol.

**Inositol 1,4,5-trisphosphate:** A second messenger of the phosphoinositide cascade that causes an increase in intracellular calcium levels.

**inositol hexaphosphate :** A substance found in many foods that come from plants, including corn, wheat, rice, and soybeans, and in large amounts in cereals and legumes. It is being studied in the prevention of cancer. Also called IP6 and phytic acid.

**inotuzumab ozogamicin:** A CD22-targeted cytotoxic immunoconjugate composed of a humanized IgG4 anti-CD22 antibody covalently linked to N-acetyl-gamma-calicheamicin dimethyl hydrazide (CalichDMH) with potential antineoplastic activity. Inotuzumab ozogamicin is rapidly internalized upon binding of the antibody moiety to B cell-specific CD22 receptors, delivering the conjugated CalichDMH intracellularly; the CalichDMH moiety binds to the minor groove of DNA in a sequence-specific manner, resulting in double-strand DNA breaks and apoptosis.

CalichDMH is a derivative of gamma calicheamicin, a cytotoxic antibiotic produced by the bacterium *Micromonospora echinospora*.

**INS316:** A substance being studied in the diagnosis of lung diseases, including lung cancer. It helps bring up a sample of mucus from deep in the lungs and improves the quality of the sample for testing. It is a type of nucleoside triphosphate.

**inscribed angle:** in a circle, an angle formed by two chords. Its vertex is on the circle. The measure of an inscribed angle equals one-half the measure of its arc.

**insecticide:** A chemical used to kill insects. See pesticides.

**Insegia:** (Other name for: gastrin immunotoxin)

**inselberg:** an isolated bedrock remnant of a former mountain front; may project through the pediment cover.

**Insert:** A removable part of the mold imparting increased resistance to wear, heat transferability, or changeable part shape to that area of the mold.

**Insert:** An integral part of a plastics molding consisting of metal or other material which may be molded into position or may be pressed into the molding after the molding is completed. Also a removable or interchangeable component of the mold.

**Insert Molding:** Insert molding is the process of molding plastic around preformed metal inserts. This process is compatible with both thermoplastic and thermoset materials. OR A means of producing a part with two or more materials, the metal, plastic or liquid silicone rubber part is inserted into the mold and plastic or silicone rubber is injected onto to the part attaching by means of mechanical or chemical bond OR Insert Molding combines metal and plastics, or multiple combinations of materials and components into a single unit. The process makes use of engineering plastics for improved wear resistance, tensile strength and weight reduction as well as using metallic materials for strength and conductivity.

**Insert Part:** An article of metal or other material which is incorporated into a plastic molded part either by pressing the insert into the finished molded part or by placing the insert in the cavity so that it becomes an integral part of the molding.

**Insert Pull-Out Strength:** Force required to pull an insert straight out of a material at least 0.020" thick. Insert performance criterion maintained for

the most part in molded parts.

**Insert, Mold:** A removable part of the mold imparting increased resistance to wear or heat transferability to that area of the mold.

**Insertion:** A type of mutation in which one or more base pairs are erroneously inserted into DNA.

**insertion:** placing between two atoms.

**insertion :** A type of genetic change that involves the addition of a segment of DNA. It may be as small as a single base but can vary significantly in size.

**insertion mutation:** A mutation caused by insertion of one or more extra bases, or a mutagen, between two successive bases in DNA.

**Insertion sequence:** A simple DNA transposon, composed of a kilobase sequence that specifies a transposase and is bounded on either end by inverted terminal repeats; an insertion sequence can insert itself into any site on a bacterial chromosome. OR Specific base sequences at either end of a transposable segment of DNA.

**Insertional inactivation:** Gene inactivation that occurs when an unrelated DNA fragment is inserted at a restriction site; inactivation of a gene for antibiotic resistance in a plasmid can be used to detect those plasmids in which a DNA fragment has been successfully inserted.

**Inside Radius :** The distance from the rotational axis (center) of the drum to the driving surface of the drum.

**Inside Turn Radius :** Turn radius measured to the inside edge of the belt

**insolation:** a combination of the words incoming solar radiation. OR The solar radiation incident on a unit horizontal surface at the top of the atmosphere. It is sometimes referred to as solar irradiance. The latitudinal variation of insolation supplies the energy for the general circulation of the atmosphere. Insolation depends on the angle of incidence of the solar beam and on the solar constant.

**Insoluble:** An insoluble substance is one that is not able to dissolve in another substance. Some solutes are not able to dissolve in some solvents. Carbonates are often insoluble compounds. They just sink to the bottom of solutions. OR Refers to a substance that does not dissolve in a solvent to any significant degree. Compounds with solubilities of less than 1 g per liter

of water are often referred to as 'insoluble', even though they do dissolve to a small extent.

**insomnia :** Difficulty in going to sleep or getting enough sleep.

**Inspection Reports:** Reports are issued periodically to document inspection findings. These may cover a specific time period for the baseline inspection or a particular event or problem examined in a reactive inspection. All inspection reports are public documents and, when issued, are posted to the NRC's internet web site.

**Inspra:** (Other name for: eplerenone)

**instability:** A wavefunction is expressed as a long list of parameters (basis-set expansion) that are adjusted to minimize the total energy. Sometimes the global minimum is not obtained; the local minimum that is obtained may be unstable with respect to various perturbations or liberalization of constraints. Such a wavefunction is said to be unstable. One of the more common instabilities is an RHF to UHF instability, which indicates that the UHF solution (different alpha and beta orbitals) is of lower energy than the RHF solution (identical alpha and beta orbitals) for a closed-shell system. This may be encountered, for example, when a bond is stretched.

**instantaneous transpiration efficiency:** A measure at the physiologic level of how well plants use available water in photosynthesis. The assimilation rate is divided by the transpiration rate; the moles of CO<sub>2</sub> taken up are divided by the moles of water lost through transpiration in a unit of time.

**instillation :** In medicine, a method used to put a liquid into the body slowly or drop by drop.

**Institutional Review Board :** A group of scientists, doctors, clergy, and patient advocates that reviews and approves the detailed plan for every clinical trial. Institutional Review Boards are meant to protect the people who take part in a clinical trial. They check to see that the trial is well designed, legal, ethical, does not involve unneeded risks, and includes a safety plan for patients. There is an Institutional Review Board at every health care facility that does clinical research. Also called IRB.

**Instron:** An instrument utilized to determine the tensile and compressive properties of material.

**instrument:** tool used to extend your senses and gather data.

**Insulated Runner:** A mold in which the runners are insulated from the chilled cavities and are kept hot.

**Insulated Runner (also known as Hot-Runner Mold or Runnerless Molding) :** A mold in which the runners are insulated from the chilled cavities and are kept hot. Hot-runner molds make parts that have no scrap.

**Insulation:** Material having a high resistance to the flow of electric current, to prevent leakage of current from a conductor.

**Insulation:** material having a high resistance to the flow of electric current, to prevent leakage of current from a conductor.

**Insulation board:** Commonly refers to soft fibre board but can also be used for similar boards of any composition.

**Insulation Resistance:** the ratio of the applied voltage to the total current between two electrodes in contact with a specific conductor under prescribed conditions of test.

**Insulin:** A polypeptide hormone secreted by the  $\beta$  cells of the pancreas, that stimulates fuel storage and protein synthesis.

**insulin :** A hormone made by the islet cells of the pancreas. Insulin controls the amount of sugar in the blood by moving it into the cells, where it can be used by the body for energy.

**insulin glargine :** A drug used to control the amount of sugar in the blood of patients with diabetes. It is a form of the hormone insulin that is made in the laboratory. Insulin glargine controls blood sugar longer than insulin does. It is a type of therapeutic insulin. Also called insulin glargine recombinant and Lantus.

**insulin glargine recombinant :** A drug used to control the amount of sugar in the blood of patients with diabetes. It is a form of the hormone insulin that is made in the laboratory. Insulin glargine recombinant controls blood sugar longer than insulin does. It is a type of therapeutic insulin. Also called insulin glargine and Lantus.

**insulin lispro:** A recombinant therapeutic agent which is chemically identical to or similar to endogenous human insulin. In lispro insulin, the amino acid proline at B-28 and the amino acid lysine at B-29 are reversed, resulting in the rapid dissolution of this insulin to a monomer that is absorbed rapidly after subcutaneous administration. Lispro insulin is equipotent to human insulin on a molar basis but its effects are faster and of

shorter duration. Endogenous insulin, a pancreatic hormone composed of two polypeptide chains, is important in the normal metabolism of carbohydrates, proteins and fats, promoting glucose utilization and protein synthesis; it has anabolic effects on many types of tissues. Check for active clinical trials using this agent.

**insulin-like growth factor :** A protein made by the body that stimulates the growth of many types of cells. Insulin-like growth factor is similar to insulin (a hormone made in the pancreas). There are two forms of insulin-like growth factor called IGF-1 and IGF-2. Higher than normal levels of IGF-1 may increase the risk of several types of cancer. Insulin-like growth factor is a type of growth factor and a type of cytokine. Also called IGF and somatomedin.

**insulin-like growth factor receptor :** A protein found on the surface of some types of cells that binds to insulin-like growth factor (IGF). This causes the cells to grow and divide. Insulin-like growth factor receptor is found at high levels on the surface of several types of cancer cells, which causes these cells to grow rapidly in the presence of IGF. Also called IGFR.

**insulin, NPH:** An intermediate-acting insulin used in the treatment of diabetes mellitus. Administered once or twice daily, NPH (neutral protamine hagedorn) insulin lowers blood glucose within 1 to 2 hours after administration and exerts a peak effect at 6 to 10 hours. Endogenous insulin, a pancreatic hormone composed of two polypeptide chains, is important in the normal metabolism of carbohydrates, proteins and fats, promoting glucose utilization and protein synthesis; it has anabolic effects on many types of tissues.

**insulin, regular:** A recombinant form of the naturally occurring human pancreatic hormone insulin. Upon administration, regular insulin mimics the action of endogenous human insulin and binds to insulin receptors located on muscle and fat cells. This both facilitates the cellular uptake of glucose and lowers blood glucose levels. In addition, insulin inhibits the liver's conversion of stored glycogen into glucose, which also decreases blood glucose levels. Insulin also inhibits lipolysis in adipose tissue, inhibits proteolysis, and enhances protein synthesis.

**insulinoma :** An abnormal mass that grows in the beta cells of the pancreas that make insulin. Insulinomas are usually benign (not cancer). They secrete insulin and are the most common cause of low blood sugar caused by

having too much insulin in the body. Also called beta cell neoplasm, beta cell tumor of the pancreas, and pancreatic insulin-producing tumor.

**intake:** The amount of a substance or material that is taken into the body, regardless of whether or not it is absorbed. The daily intake may be expressed as the amount taken in by a particular exposure route, e.g., ingestion or inhalation. The daily intake from food is the total amount of a given substance taken in during one day through the consumption of food. The daily intake by inhalation is calculated by multiplying the concentration of the substance (or agent) in air by the total amount of air inhaled during one day (24 hours). The total daily intake is the sum of the daily intake by an individual from food, drinking-water, and inhaled air (WHO, 1979).

**integer:** A counting number or a negative whole number.

**integral enthalpy of solution:** ( $H_{\text{soln}}$ ) integral heat of solution; integrated heat of solution; integrated enthalpy of solution. Compare with enthalpy of solution. The heat absorbed or released when a solute is dissolved in a definite amount of solvent. The heat of solution depends on the nature of the solute and on its concentration in the final solution. The integral heat of solution when one mole of solute is added to an infinite amount of solvent is sometimes written as  $H_{\text{soln}}$ .

**Integral Guard Edge :** Inside leg link raised to prevent product from falling off belt. Integral guard edge links offer improved cleanup and sanitation over guard edge plates.

**Integral membrane proteins:** Proteins found in membranes that interact extensively with the hydrocarbon chains of the membrane lipids and usually span the membrane. OR Proteins firmly bound to a membrane by hydrophobic interactions; as distinct from peripheral proteins.

**Integrated plant evaluation:** An evaluation that considers the plant as a whole rather than system by system.

**integrated rate law:** Rate laws like  $d[A]/dt = -k[A]$  give instantaneous concentration changes. To find the change in concentration over time, the instantaneous changes must be added (integrated) over the desired time interval. The rate law  $d[A]/dt = -k[A]$  can be integrated from time zero to time  $t$  to obtain the integrated rate law  $\ln([A]/[A]_0) = -kt$ , where  $[A]_0$  is the initial concentration of A.

**integrative medicine :** A type of medical care that combines conventional (standard) medical treatment with complementary and alternative (CAM) therapies that have been shown to be safe and to work. CAM therapies treat the mind, body, and spirit.

**integrin receptor antagonist GLPG0187:** A small molecule integrin receptor antagonist (IRA) with potential antineoplastic activity. Upon administration, GLPG0187 binds to and blocks the activity of 5 RGD-integrin receptor subtypes, including  $\alpha v \beta 1$ ,  $\alpha v \beta 3$ ,  $\alpha v \beta 5$ ,  $\alpha v \beta 6$  and  $\alpha 5 \beta 1$ . This may result in the inhibition of endothelial cell-cell interactions and endothelial cell-matrix interactions, and the prevention of angiogenesis and metastasis in tumor cells expressing these integrin receptors. Integrin receptors are transmembrane glycoproteins expressed on the surface of tumor vessel endothelial cells and some types of cancer cells, and play a crucial role in endothelial cell adhesion and migration. Check for active clinical trials using this agent.

**intensification therapy :** Treatment that is given after cancer has disappeared following the initial therapy. Intensification therapy is used to kill any cancer cells that may be left in the body. It may include radiation therapy, a stem cell transplant, or treatment with drugs that kill cancer cells. Also called consolidation therapy and postremission therapy.

**intensifiers:** words intended to add force to what you say.

**intensity-modulated radiation therapy :** A type of 3-dimensional radiation therapy that uses computer-generated images to show the size and shape of the tumor. Thin beams of radiation of different intensities are aimed at the tumor from many angles. This type of radiation therapy reduces the damage to healthy tissue near the tumor. Also called IMRT.

**intensive property:** A property that does not change when the amount of sample changes. Examples are density, pressure, temperature, color.

**Intercalating agent:** A chemical, usually containing aromatic rings, that can sandwich in-between adjacent base pairs in a DNA duplex. The intercalation leads to an adjustment in the DNA secondary structure, as adjacent base pairs are usually close-packed.

**Intercalating agents:** Flat, aromatic compounds that can insert between adjacent base pairs in a DNA double helix; these agents, such as ethidium bromide, can cause insertions and deletions.

**intercalating mutagen:** A mutagen that inserts itself between two successive bases in a nucleic acid, causing a frame-shift mutation.

**intercalation:** Insertion between two stacked aromatic or planar rings; for example, the insertion of a planar molecule between two successive bases in a nucleic acid.

**intercalation:** The binding of a molecule between adjacent base pairs in DNA.

**intercellular communication :** The transfer of information from one cell to another. Cells signal each other by direct contact with each other or by the release of a substance from one cell that is taken up by another cell. Intercellular communication is important for cells to grow and work normally. Cells that lose the ability to respond to signals from other cells may become cancer cells. Also called cell-cell signaling and cell-to-cell signaling.

**Intercoat:** (Other name for: absorbable adhesion barrier gel)

**Intercoat adhesion:** A coating's ability to adhere to previously applied films, including primers.

**Interesting example of a steric effect:** Results for a reaction in which a phenyl ring was added to toluene or t-butylbenzene are given below. There are no relevant chemical differences between the methyl and t-butyl groups; the difference in product distribution is entirely due to the greater size of the t-butyl group.

**Interface:** an electronic device, which allows connecting the output from a sensor directly to a desktop or laptop computer without the need for an expensive ion meter. Interfaces are provided with sophisticated software, which facilitates complex data processing, display and storage. Multiple interfaces can connect several electrode systems to one PC at the same time and permit continuous monitoring of batch processes or simultaneous multicomponent analysis.

**Interface:** The contact area between reinforcement and resin matrix.

**Interfacial angle:** The angle between faces in a crystal. This angle is dictated by the Miller indices of the faces and the crystallographic unit cell.

**INTERFACIAL INSTABILITY IN COEXTRUSION:** Highly irregular or sometimes regular waviness, which appears in coextruded structures at

the polymer/polymer interface. Two types of interfacial instability are common zigzag and wave.

**interference:** The amplitudes of waves moving into the same region of space add to produce a single resultant wave. The resultant wave can have higher or lower amplitude than the component waves. See constructive interference and destructive interference.

**Interference:** the effect of any species, other than the ion being measured, which presence in the sample solution affects the measured potential difference of the cell. The most common cause of interference is due to the fact that most ionselective membranes are not 100% selective for the detected ion. Many permit the passage of other ions to some extent. These extra ions generally increase the measured electrode potential and cause spuriously high concentration results. Other interferences may be due to chemical reactions with the membrane material which may cause positive or negative anomalies, and reactions in the sample which may cause precipitation, complexing, oxidation or reduction of the ion being measured, and thus spuriously low results.

**Interfering ion:** any ion in solution, other than that being measured, that reacts with the ISE membrane to change the measured potential (see Interference).

**interfering thought :** An unpleasant memory or idea that occurs often in a person's everyday thoughts and keeps him or her from thinking about other things. Interfering thoughts can make sleep difficult and make a person unable to carry out daily activities. Also called intrusive thought.

**Interferon:** One of a family of proteins that are liberated by special host cells in the mammal in response to viral infection. The interferons attach to an infected cell, where they stimulate antiviral protein synthesis.

**interferon :** A biological response modifier (a substance that can improve the body's natural response to infections and other diseases). Interferons interfere with the division of cancer cells and can slow tumor growth. There are several types of interferons, including interferon-alpha, -beta, and -gamma. The body normally produces these substances. They are also made in the laboratory to treat cancer and other diseases.

**interferon alfa-2b :** A drug used to treat AIDS-related Kaposi sarcoma in certain patients, hairy cell leukemia, and melanoma that has been removed by surgery. It is also used with other anticancer drugs to treat a certain type

of non-Hodgkin lymphoma. Interferon alfa-2b is also used to treat some infections caused by viruses, such as the hepatitis C virus. It is being studied in the treatment of other types of cancer and other conditions. Interferon alfa-2b is a form of interferon alfa (a substance normally made by cells in the immune system) and is made in the laboratory. It is a type of cytokine and a type of biological response modifier. Also called IFN alpha-2B, Intron A, and recombinant interferon alfa-2b.

**interferon alfacon-1:** An analogue of consensus interferon which contains an additional methionyl amino acid residue. Consensus interferon (also known as interferon alfacon-1, rCon-IFN, and CIFN) is a genetically engineered synthetic interferon created from the most common amino acid sequences from the naturally occurring alpha interferons. Alpha interferons bind to specific cell-surface receptors, resulting in the transcription and translation of genes whose protein products have antiviral, antiproliferative, anticancer, and immune-modulating effects. An analogue of consensus interferon which contains an additional methionyl amino acid residue. Consensus interferon (also known as interferon alfacon-1, rCon-IFN, and CIFN) is a genetically engineered synthetic interferon created from the most common amino acid sequences from the naturally occurring alpha interferons. Alpha interferons bind to specific cell-surface receptors, resulting in the transcription and translation of genes whose protein products have antiviral, antiproliferative, anticancer, and immune-modulating effects.

**interferon beta-secreting mesenchymal stem cells:** Human autologous mesenchymal stem cells (MSCs) harvested from the bone marrow of healthy individuals and transduced with a retroviral vector encoding the human cytokine interferon beta (IFN $\beta$ ), with potential immunomodulating and antineoplastic activities. Upon administration of IFN $\beta$ -secreting MSCs, the cells are attracted and specifically migrate to tumor sites and become part of the tumor microenvironment. Since the MSCs express IFN $\beta$ , these cells selectively deliver high levels of IFN $\beta$  to the tumor site. In turn, IFN $\beta$  binds to IFN-specific cell surface receptors and modulates the transcription and translation of certain genes whose protein products are involved in tumor cell proliferation. This decreases tumor cell growth.

**interferon-gamma-expressing adenovirus vaccine ASN-002:** A replication-defective adenoviral serotype 5 vector encoding a recombinant

form of the human cytokine interferon-gamma (IFN-g), with potential antineoplastic and immunoregulatory activities. Upon intratumoral administration, the sustained expression of IFN-g by IFN-g-expressing adenovirus vaccine ASN-002 promotes a T-helper type 1 (Th1) immune response and inhibits the Th2-mediated cytokine production observed in many cutaneous lymphomas. IFN-g also mediates interleukin-12 (IL-12) production by antigen-presenting cells (APCs); activates macrophages, cytotoxic T-cells, and natural killer (NK) cells; upregulates major histocompatibility complex (MHC) molecules; and stimulates antibody-dependent cellular cytotoxicity (ADCC). Altogether, these IFN-g-mediated effects may result in both an inhibition of tumor cell proliferation and tumor cell death. Compared to IFN-g injections, the prolonged local production of IFN-g at the tumor site allows for higher efficacy and a reduction of systemic toxicity.

**interferons:** A class of glycoproteins with antiviral activities.

**interior angles:** angles formed inside the shape or within two parallel lines.

**interior drainage pattern:** a drainage pattern in which streams empty into landlocked basins.

**interjection:** words that express a burst of emotion but are not grammatically related to other elements in a sentence.

**interleukin :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukins regulate immune responses. Interleukins made in the laboratory are used as biological response modifiers to boost the immune system in cancer therapy. An interleukin is a type of cytokine. Also called IL.

**interleukin-1 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-1 is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. There are two forms of interleukin-1, alpha and beta, which act the same. Interleukin-1 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-1 is a type of cytokine. Also called IL-1.

**interleukin-1-alfa** : One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-1-alfa, one form of interleukin-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of interleukin-1, interleukin-1-beta, acts the same as interleukin-1-alfa. Interleukin-1-alfa made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-1-alfa is a type of cytokine. Also called IL-1-alfa, IL-1-alpha, and interleukin-1-alpha.

**interleukin-1-alpha** : One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-1-alpha, one form of interleukin-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of interleukin-1, interleukin-1-beta, acts the same as interleukin-1-alpha. Interleukin-1-alpha made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-1-alpha is a type of cytokine. Also called IL-1-alfa, IL-1-alpha, and interleukin-1-alfa.

**interleukin-1-beta** : One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-1-beta, one form of interleukin-1, is made mainly by one type of white blood cell, the macrophage, and helps another type of white blood cell, the lymphocyte, fight infections. It also helps leukocytes pass through blood vessel walls to sites of infection and causes fever by affecting areas of the brain that control body temperature. The other form of interleukin-1, interleukin-1-alpha, acts the same as interleukin-1-beta. Interleukin-1-beta made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-1-beta is a type of cytokine. Also called IL-1-beta and IL-1B.

**interleukin-10** : One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-10 is made by activated macrophages and by some T lymphocytes. It reduces

inflammation by blocking production of cytokines by immune cells. Interleukin-10 also increases antibody production by plasma cells and helps them live longer. Interleukin-10 made in the laboratory is used as a biological response modifier to boost the immune system. It is a type of cytokine. Also called IL-10.

**interleukin-11 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-11 is made by support cells in the bone marrow. It causes the growth of several types of blood cells. Oprelvekin (interleukin-11 made in the laboratory) is used as a biological response modifier to increase the number of platelets, especially in patients receiving chemotherapy for cancer. Interleukin-11 is a type of cytokine. Also called IL-11.

**interleukin-12 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-12 is made mainly by B lymphocytes and macrophages. It causes other immune cells to make cytokines and increases the growth of T lymphocytes. It may also block the growth of new blood vessels. Interleukin-12 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-12 is a type of cytokine. Also called IL-12.

**interleukin-12 gene:** The DNA sequence that encodes the protein cytokine interleukin-12 (IL-12). When introduced as the complementary DNA (cDNA) form into tumor cells by, for example, a genetically engineered adenovirus vector, the transfected IL-12 cDNA expresses IL-12 which activates antitumoral natural killer (NK) cells and CD8<sup>+</sup> T-cells and stimulates the secretion of interferon-gamma (IFN-gamma), potentially inhibiting tumor cell metastasis. This gene therapy may also result in IL-12-mediated inhibition of vascular endothelial growth factor (VEGF) and enhancement of matrix metalloproteinases (MMPs). Check for active clinical trials using this agent.

**interleukin-13 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-13 is made by a type of T lymphocyte. It reduces inflammation by blocking production of cytokines by macrophages. It also increases the number and activity of B lymphocytes. Interleukin-13 made in the laboratory is used as a biological

response modifier to boost the immune system in cancer therapy. It is a type of cytokine. Also called IL-13.

**interleukin-13 PE38QQR immunotoxin :** A substance being studied in the treatment of cancer. It is made by combining interleukin-13 with a toxin from Pseudomonas bacteria. It is a type of recombinant chimeric protein.

**interleukin-2 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-2 is made by a type of T lymphocyte. It increases the growth and activity of other T lymphocytes and B lymphocytes, and affects the development of the immune system. Aldesleukin (interleukin-2 made in the laboratory) is being used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-2 is a type of cytokine. Also called IL-2.

**interleukin-2 gene:** The DNA sequence that encodes the protein cytokine interleukin-2 (IL-2). When introduced as the complementary DNA (cDNA) form into tumor cells by, for example, a genetically engineered adenovirus vector, the transfected IL-2 cDNA expresses IL-2 which may activate antitumoral natural killer cells and elicit an antitumoral cytotoxic T-cell response, resulting in an inhibition of tumor progression.

**interleukin-3 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-3 is made mainly by a type of T lymphocyte. It increases the number of blood cells made by the bone marrow. Interleukin-3 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-3 is a type of cytokine. Also called IL-3.

**interleukin-4 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-4 is made by a type of T lymphocyte. It causes B lymphocytes to increase and to make antibodies and also increases the production of T lymphocytes. Interleukin-4 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-4 is a type of cytokine. Also called IL-4.

**interleukin-4 PE38KDEL cytotoxin :** A substance being studied in the treatment of cancer. It is made by combining interleukin-4 with a bacterial toxin. Interleukin-4 PE38KDEL cytotoxin is a type of recombinant chimeric protein. Also called interleukin-4 PE38KDEL immunotoxin and NBI-3001.

**interleukin-4 PE38KDEL immunotoxin :** A substance being studied in the treatment of cancer. It is made by combining interleukin-4 with a bacterial toxin. Interleukin-4 PE38KDEL immunotoxin is a type of recombinant chimeric protein. Also called interleukin-4 PE38KDEL cytotoxin and NBI-3001.

**interleukin-5 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-5 is made mainly by some T lymphocytes. It causes B lymphocytes to make more antibodies and increases the number of eosinophils. Interleukin-5 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. It is a type of cytokine. Also called IL-5.

**interleukin-6 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-6 is made mainly by some T lymphocytes. It causes B lymphocytes to make more antibodies and also causes fever by affecting areas of the brain that control body temperature. Interleukin-6 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-6 is a type of cytokine. Also called IL-6.

**interleukin-7 :** One of a group of related proteins made by leukocytes (white blood cells) and other cells in the body. Interleukin-7 is made by cells that cover and support organs, glands, and other structures in the body. It causes the growth of T lymphocytes and B lymphocytes. Interleukin-7 made in the laboratory is used as a biological response modifier to boost the immune system in cancer therapy. Interleukin-7 is a type of cytokine. Also called IL-7 and lymphopoietin-1.

**Interlocking Looped Edge :** A retaining edge formed extending ends of straight wire connectors or reinforcing wires into interlocking loop design at prescribed angle to belt.

**Interlocking Plate :** A retaining edge consisting of a series of formed plates which "interlock" with each other to form a guard edge.

**intermediary metabolism:** In cells, the enzyme-catalyzed reactions that extract chemical energy from nutrient molecules and utilize it to synthesize and assemble cell components.

**Intermediate:** Any chemical compound that is primarily of interest as one of the steps between the starting material and the final product. It is usually best to design chemical processes so that intermediates do not need to be

transported from place or stored in large quantities. Methyl isocyanate, an intermediate in the manufacture of certain pesticides, is a good example. For the horrific consequences of inappropriate and entirely unnecessary storage of this highly toxic intermediate, have a look at: OR a species that forms in one step of a multistep mechanism; intermediates are unstable and cannot be isolated. OR A highly reactive substance that forms and then reacts further during the conversion of reactants to products in a chemical reaction. Intermediates never appear as products in the chemical equation for a net chemical reaction.

**Intermediate filaments:** Filaments ranging from approximately 7 to 10 nm in diameter that can be components of the cell cytoskeleton in epithelial cells; keratins are intermediate filaments.

**intermediate grade :** A term used to describe how abnormal cancer cells look under a microscope. Intermediate-grade cancer cells look more abnormal than low-grade cancer cells but not as abnormal as high-grade cancer cells. They also tend to grow and spread more quickly than low-grade cancer cells but not as quickly as high-grade cancer cells. Cancer cell grade, along with cancer type and stage, may be used to help plan treatment and determine prognosis.

**intermediate rock:** a general term for rock between mafic and felsic classifications.

**intermediate-affinity interleukin-2 receptor agonist ALKS 4230:** A selective effector cell activator protein and agonist of the intermediate-affinity interleukin-2 (IL-2) receptor with potential immunostimulating and antineoplastic activity. Upon administration, intermediate-affinity interleukin-2 receptor agonist ALKS 4230 binds to and signals through the intermediate-affinity IL-2 receptor complex; this may selectively stimulate and activate natural killer (NK) cells and memory CD8 T cells, leading to tumor cell elimination, while circumventing the activation of immunosuppressive cells that may prevent the anti-tumor response. IL-2 is a cytokine signaling molecule that plays a critical role in the immune response.

**intermediate-grade lymphoma :** A type of lymphoma that grows and spreads quickly and has severe symptoms. Also called aggressive lymphoma and high-grade lymphoma.

**intermolecular:** Between molecules. Intermolecular forces are those forces between molecules. OR Contacts between adjacent molecules in a crystal. These contacts define the crystal packing. OR An attraction or repulsion between molecules. Intermolecular forces are much weaker than chemical bonds. Hydrogen bonds, dipole-dipole interactions, and London forces are examples of intermolecular forces.

**intermolecular forces:** Forces between molecules. OR Intermolecular forces (or bonds) are the forces between molecules.

**Intermolecular interactions:** Interactions that occur between molecules.

**internal coordinates:** Bond lengths, bond angles, and dihedral (torsional) angles; sometimes called "natural coordinates."

**internal energy:** Internal energy ( $U$ ) is defined so that changes in internal energy ( $U$ ) are equal to the heat absorbed or released by a process running at constant volume. While changes in internal energy can be measured using calorimetry, absolute values of internal energy usually cannot be determined. Changes in internal energy are equal to the heat transferred plus the work done for any process.

**Internal energy ( $U$ ):** The total energy possessed by the individual molecules in a system (as opposed to the kinetic and potential energies of the system as a whole).  $U$  is a strong function of temperature, phase, and molecular structure, and a weak function of pressure (it is independent of pressure for ideal gasses). Its absolute value cannot be determined, so it is always expressed relative to a reference state at which it is defined to be zero.

**internal exam :** A physical exam of the vagina, cervix, uterus, fallopian tubes, ovaries, and rectum. First, the area outside the vagina is checked for signs of disease. A speculum is then inserted into the vagina to widen it so the vagina and cervix can be checked for signs of disease. Cell samples may be taken for a Pap test, or to test for sexually transmitted diseases or other infections. The doctor or nurse then inserts one or two lubricated, gloved fingers of one hand into the vagina and presses on the lower abdomen with the other hand to feel for lumps and check the size, shape, and position of the uterus and ovaries. The rectum may also be checked for lumps or abnormal areas. Also called pelvic exam.

**Internal filling solution (of an ISE):** an aqueous electrolyte solution, which may be gelled, containing a fixed concentration of the ion to which

the inner reference electrode is reversible; usually the chloride ion in the case of silver/silver chloride electrodes. This forms the electrolytic conductor, which transfers the charge from the detected ion in the ionselective membrane to the electrical conductor (silver wire) which conducts the charge to the measuring system. Not present in allsolidstate electrodes.

**internal medicine :** A branch of medicine that specializes in preventing, diagnosing, and treating diseases in adults, without using surgery. An internal medicine doctor is often a person's main health care provider and may coordinate treatment given by other specialists.

**Internal Pigtails :** Secure the rod position within the overlay spirals. They are recommended for applications with a soft or wet product. Internal pigtailed may be added to any Omni-Tough overlay at the time of fabrication. Minimum belt width for this feature is 12 inches (305 mm) nominal.

**internal radiation therapy :** A type of radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into or near a tumor. Also called brachytherapy, implant radiation therapy, and radiation brachytherapy.

**Internal reference electrode (of an ISE):** part of the electrode, which is electrically, connected to the screened cable which connects to the measuring instrument. Usually a chloridised silver wire immersed in the silver chloride/potassium chloride filling solution or gel. In the case of allsolidstate electrodes, the material of the reference electrode is deposited directly on to the internal surface of the ionselective membrane and the internal filling solution is not necessary.

**Internally Lubricated Rubber:** A silicone rubber formulation containing lubricating materials incompatible with the silicone rubber structure causing it to leach out as a lubricant

**International Atomic Energy Agency (IAEA):** The center of worldwide cooperation in the nuclear field, through which member countries and multiple international partners work together to promote the safe, secure, and peaceful use of nuclear technologies. The United Nations established the IAEA in 1957 as "Atoms for Peace."

**International Date Line:** the longitude line measuring 180° where the day changes.

**International Nuclear Regulators Association (INRA):** An association established in January 1997 to give international nuclear regulators a forum to discuss nuclear safety. Countries represented include Canada, France, Japan, Spain, South Korea, Sweden, the United Kingdom, and the United States.

**International Unit :** A unit used to measure the activity of many vitamins, hormones, enzymes, and drugs. An International Unit is the amount of a substance that has a certain biological effect. For each substance there is an international agreement on the biological effect that is expected for 1 International Unit. Also called IU.

**interneuron:** a type of neuron that connects sensory and motor neurons and carries stimuli in the brain and spinal cord.

**internist :** A doctor who has special training in internal medicine. An internist works with adult patients to prevent, diagnose, and treat diseases without using surgery.

**interphase:** the cell division cycle phase in which the cell spends most of its time; includes G1, S phase (DNA replication), and G2.

**interpretation of data:** The evaluation of all the facts available from a given investigation or study with a view to their significance for health (IRPTC, 1982).

**interrogative pronoun:** (who, whom, whose, which, what) introduce questions.

**Interrupted decoupling:** A brief delay (20–50  $\mu\text{s}$ ) in the  $1\text{H}$ – $13\text{C}$  contact time during which the magnetization of the carbons directly attached to protons rapidly dephase, with the exception of methyl carbons. The result is an enhancement of nonprotonated carbons, methyl groups, and sometimes highly-mobile methylenes. Also known as NQS (non-quaternary suppression).

**intersecting lines:** lines that meet at a point.

**interstitial cell-stimulating hormone :** A hormone made in the pituitary gland. In females, it acts on the ovaries to make follicles release their eggs and to make hormones that get the uterus ready for a fertilized egg to be implanted. In males, it acts on the testes to cause cells to grow and make testosterone. Also called LH, luteinizing hormone, and lutropin.

**interstitial fluid :** Fluid found in the spaces around cells. It comes from substances that leak out of blood capillaries (the smallest type of blood vessel). It helps bring oxygen and nutrients to cells and to remove waste products from them. As new interstitial fluid is made, it replaces older fluid, which drains towards lymph vessels. When it enters the lymph vessels, it is called lymph. Also called tissue fluid.

**interstitial radiation therapy :** A type of internal radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into a tumor or body tissue.

**Intertropical Convergence Zone:** area along the Equator where trade winds from the Northern and Southern hemispheres meet, forming thunderstorms.

**intervention :** In medicine, a treatment or action taken to prevent or treat disease, or improve health in other ways.

**intervention group :** The group in a clinical research study that receives the drug, vaccine, or other intervention being tested. Interventions may also include medical procedures (such as radiation therapy and surgery), medical devices, behavior changes (such as diet and exercise), education programs, and counseling. Also called experimental group and investigational group.

**intervention study:** An epidemiologic investigation designed to test a hypothesized cause-effect relationship by modifying a supposed causal factor in a population (Last, 1988).

**Interwoven Weave :** A fabric consisting of two conventional weaves in which one is woven into the other and sometimes reinforced by straight rods through the hinging points of the spirals.

**intestinal :** Having to do with the intestines.

**intestinal flora :** Bacteria and other organisms that live inside the intestines. They help digest food. Vitamins such as biotin and vitamin K are made by intestinal flora. Also called gut flora, gut microflora, intestinal microflora, and microflora.

**intestinal microflora :** Bacteria and other organisms that live inside the intestines. They help digest food. Vitamins such as biotin and vitamin K are made by intestinal microflora. Also called gut flora, gut microflora, intestinal flora, and microflora.

**intestinal obstruction :** A partial or complete block of the small or large intestine that keeps food, liquid, gas, and stool from moving through the intestines in a normal way. Intestinal obstructions may be caused by a twist in the intestines, hernias, inflammation, scar tissue from surgery, and certain types of cancer, such as cancers of the stomach, colon, and ovary. They may also be caused by conditions that affect the muscles of the intestine, such as paralysis. Signs and symptoms may include pain and swelling in the abdomen, constipation, diarrhea, vomiting, and problems passing gas. Most intestinal obstructions occur in the small intestine. Also called bowel obstruction.

**intestinal reabsorption:** Absorption further down the intestinal tract of material that has been absorbed before and subsequently excreted into the intestinal tract, usually through the bile (WHO, 1979).

**intestinal villi :** Tiny hair-like projections that line the inside of the small intestine. They contain blood vessels and help absorb nutrients.

**intestine :** The long, tube-shaped organ in the abdomen that completes the process of digestion. The intestine has two parts, the small intestine and the large intestine. Also called bowel.

**intetumumab:** A pan alpha-v human monoclonal antibody that recognizes alpha-v beta-1, alpha-v beta-3, alpha-v beta-5, and alpha-v beta-6 integrins with antiangiogenic and antitumor activities. Intetumumab competitively binds to and blocks both alpha-v beta-3 and alpha-v beta-5 integrins, resulting in inhibition of integrin-mediated tumor angiogenesis and tumor growth. Integrins facilitate the adhesion of stimulated endothelial cells to the extracellular matrix (ECM); trigger the secretion of ECM-rearranging proteases; and propagate signaling events that promote the survival and differentiation of cells in newly formed vasculature.

**intoplicine :** A substance that has been studied in the treatment of some types of cancer. Intoplicine blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of topoisomerase inhibitor.

**intoxicating pepper :** An herb native to islands in the South Pacific. Substances taken from the root have been used in some cultures to relieve stress, anxiety, tension, sleeplessness, and problems of menopause. Intoxicating pepper may increase the effect of alcohol and of certain drugs used to treat anxiety and depression. The U.S. Food and Drug

Administration advises users that intoxicating pepper may cause severe liver damage. The scientific name is *Piper methysticum*. Also called kava kava, rauschpfeffer, tonga, and yangona.

**intra-arterial** : Within an artery (blood vessel that carries blood from the heart to tissues and organs in the body).

**intra-arterial brachytherapy** : A type of radiation therapy used to treat liver cancer that is advanced or has come back. Tiny beads that hold the radioisotope yttrium Y 90 are injected into the hepatic artery (the main blood vessel that carries blood to the liver). The beads collect in the tumor and the yttrium Y 90 gives off radiation. This destroys the blood vessels that the tumor needs to grow and kills the cancer cells. Intra-arterial brachytherapy is a type of selective internal radiation therapy (SIRT). Also called radioembolization.

**intracarotid infusion** : The introduction of fluids and drugs directly into the carotid artery, the main artery in the neck that carries blood from the heart to the brain.

**intracavitary** : Within a cavity or space, such as the abdomen, pelvis, or chest.

**intracavitary radiation therapy** : A type of internal radiation therapy in which radioactive material sealed in needles, seeds, wires, or catheters is placed directly into a body cavity such as the chest cavity or the vagina.

**intracellular** : Inside a cell.

**intracolonic** : Within the colon.

**intracranial tumor** : A tumor that occurs in the brain.

**intracutaneous** : Within the skin. Also called intradermal.

**intradermal** : Within the skin. Also called intracutaneous.

**IntraDose**: (Other name for: cisplatin-e therapeutic implant)

**intraductal breast papilloma** : A benign (not cancer), wart-like growth in a milk duct of the breast. It is usually found close to the nipple and may cause a discharge from the nipple. It may also cause pain and a lump in the breast that can be felt. It usually affects women aged 35-55 years. Having a single papilloma does not increase the risk of breast cancer. When there are multiple intraductal breast papillomas, they are usually found farther from the nipple. There may not be a nipple discharge and the papillomas may not

be felt. Having multiple intraductal breast papillomas may increase the risk of breast cancer. Also called intraductal papilloma.

**intraductal carcinoma :** A noninvasive condition in which abnormal cells are found in the lining of a breast duct. The abnormal cells have not spread outside the duct to other tissues in the breast. In some cases, intraductal carcinoma may become invasive cancer and spread to other tissues. At this time, there is no way to know which lesions could become invasive. Also called DCIS and ductal carcinoma in situ.

**intraductal papilloma :** A benign (not cancer), wart-like growth in a milk duct of the breast. It is usually found close to the nipple and may cause a discharge from the nipple. It may also cause pain and a lump in the breast that can be felt. It usually affects women aged 35-55 years. Having a single papilloma does not increase the risk of breast cancer. When there are multiple intraductal papillomas, they are usually found farther from the nipple. There may not be a nipple discharge and the papillomas may not be felt. Having multiple intraductal papillomas may increase the risk of breast cancer. Also called intraductal breast papilloma.

**intraepithelial :** Within the layer of cells that form the surface or lining of an organ.

**intrahepatic :** Within the liver.

**intrahepatic bile duct :** A bile duct that passes through and drains bile from the liver.

**intrahepatic bile duct cancer :** A rare cancer that forms in the bile ducts inside the liver. A bile duct is a tube that carries bile (fluid made by the liver) between the liver and gallbladder and the small intestine. Only a small number of bile duct cancers are intrahepatic.

**intrahepatic infusion :** The delivery of anticancer drugs directly to the blood vessels of the liver.

**intralesional :** Within an area of cancer, for example, within a tumor in the skin.

**Intralipid:** (Other name for: fat emulsion)

**intraluminal intubation and dilation :** A procedure in which a plastic or metal tube is inserted through the mouth into the esophagus (the tube that carries food to the stomach) to keep it open. This procedure may be used during radiation therapy for esophageal cancer.

**intramolecular:** Refers to a characteristic within one molecule or ion, referring only to the atoms in the molecule or ion.

**Intramolecular contacts:** Non-covalent contacts between atoms in the same molecule within a crystal.

**intramolecular forces:** Forces within molecules. Forces caused by the attraction and repulsion of charged particles.

**Intramolecular interactions:** Interactions that occur within a molecule.

**intramuscular :** Within or into muscle. Also called IM.

**intramuscular injection :** Injection into muscle.

**intranasal ketamine:** An intranasal formulation of the synthetic cyclohexanone ketamine with analgesic and anesthetic activities. Although its mechanism of action is not well understood, ketamine appears to non-competitively block N-methyl-D-aspartate (NMDA) receptors and agonistically bind to and activate opioid mu and sigma receptors, thereby reducing pain perception, inducing sedation, and producing dissociative anesthesia.

**intransitive verb:** verbs that do not take an object.

**intraocular :** Within the eyeball.

**intraocular melanoma :** A rare cancer of melanocytes (cells that produce the pigment melanin) found in the eye. Also called ocular melanoma.

**intraoperative radiation therapy :** Radiation treatment aimed directly at a tumor during surgery. Also called IORT.

**intraoperative ultrasound :** A procedure that uses ultrasound (high-energy sound waves that are bounced off internal tissues and organs) during surgery. Sonograms (pictures made by ultrasound) of the inside of the body are viewed on a computer to help a surgeon find tumors or other problems during the operation. Also called IOUS.

**intrapelvic :** Within the pelvis, the lower part of the abdomen between the hip bones.

**intrapertoneal :** Within the peritoneal cavity (the area that contains the abdominal organs). Also called IP.

**intrapertoneal chemotherapy :** Treatment in which anticancer drugs are put directly into the abdominal cavity through a thin tube.

**intraperitoneal infusion** : A method of delivering fluids and drugs directly into the abdominal cavity through a thin tube. Also called peritoneal infusion.

**intraperitoneal radiation therapy** : Treatment in which a radioactive liquid is put directly into the abdomen through a thin tube.

**intrapleural** : Within the pleural cavity.

**intraspinal** : Within the spine (backbone).

**intrathecal** : Describes the fluid-filled space between the thin layers of tissue that cover the brain and spinal cord. Drugs can be injected into the fluid or a sample of the fluid can be removed for testing.

**intrathecal chemotherapy** : Treatment in which anticancer drugs are injected into the fluid-filled space between the thin layers of tissue that cover the brain and spinal cord.

**intratumoral** : Within a tumor.

**intrauterine** : Inside the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops).

**intrauterine device** : A small, plastic T-shaped device that is placed inside the uterus (the small, hollow, pear-shaped organ in a woman's pelvis in which a fetus develops) to prevent pregnancy. Intrauterine devices prevent sperm from fertilizing an egg, and prevent fertilized eggs from implanting in the uterus. The use of intrauterine devices is also being studied in the prevention and treatment of endometrial cancer and other conditions. Also called IUD.

**intravaginal** : Having to do with the inside of the vagina (the birth canal).

**intravasation** : The movement of a cell or a foreign substance through the wall of a blood or lymph vessel into the vessel itself. In cancer, this is how cancer cells pass through a vessel wall and enter the blood or lymph systems. It is one way that cancer spreads in the body.

**intravenous**: Into or inside the vein

**intravenous** : Into or within a vein. Intravenous usually refers to a way of giving a drug or other substance through a needle or tube inserted into a vein. Also called IV.

**intravenous chemotherapy** : Treatment in which anticancer drugs are given through a needle or tube inserted into a vein. The anticancer drugs

travel through the blood to kill cancer cells in the body.

**intravenous infusion :** A method of putting fluids, including drugs, into the bloodstream. Also called infusion.

**intravenous injection :** Injection into a vein.

**intravenous pyelogram :** An x-ray image of the kidneys, ureters, and bladder. It is made after a substance that shows up on x-rays is injected into a blood vessel. The substance outlines the kidneys, ureters, and bladder as it flows through the system and collects in the urine. An intravenous pyelogram is usually made to look for a block in the flow of urine.

**intravenous pyelography :** A procedure in which x-ray images of the kidneys, ureters, and bladder are taken at regular times after a substance that shows up on x-rays is injected into a blood vessel. The substance outlines the kidneys, ureters, and bladder as it flows through the system and collects in the urine. Intravenous pyelography is usually done to look for a block in the flow of urine. Also called IVP.

**intraventricular infusion :** The delivery of a drug into a fluid-filled cavity within the heart or brain.

**intravesical :** Within the bladder.

**intravitreal chemotherapy :** Treatment in which anticancer drugs are injected directly into the vitreous humor (gel-like fluid inside the eye). Intravitreal chemotherapy is used to treat retinoblastoma that has spread to the vitreous humor and has come back or has not gotten better after other treatment.

**Intrinsic clotting pathway:** The-blood clotting cascade of enzyme activities that is initiated by the activation of factor XII through contact of activating proteins (kininogen and kallikrein) with abnormal cell surfaces produced by injury; at least six proteins are activated in the pathway to thrombin formation and the continuing sequence that leads to a blood clot.

**Intrinsic dissolution:** A method of measuring dissolution that eliminates the effect of surface area.

**Intrinsic dissolution rate (IDR):** The rate of dissolution measured in an intrinsic dissolution apparatus. The intrinsic dissolution rate is independent of surface area.

**Intrinsic factor:** A glycoprotein secreted into the gut to bind vitamin B12 and assist in its absorption into the intestinal epithelium.

**Intrinsic Viscosity:** The intrinsic viscosity of a polymer is the limiting value of infinite dilution of the ratio at the specific viscosity of the polymer solution to its concentration in moles per liter.

**INTRINSIC VISCOSITY (IV):** The limiting value of viscosity (at infinite dilution) of a polymer in a solution, which is used in the determination of an average molecular weight. The viscosity average molecular weight lies between the weight average and number average molecular weight (see also MOLECULAR WEIGHT).

**introduction:** beginnings of essays that establish the purpose and tone; introductions should attract the reader's attention and guide the reader naturally into the rest of the paper.

**Intron:** A segment of the nascent transcript that is removed by splicing. Also refers to the corresponding region in the DNA. Synonymous with intervening sequence.

**intron :** The sequence of DNA in between exons that is initially copied into RNA but is cut out of the final RNA transcript and therefore does not change the amino acid code. Some intronic sequences are known to affect gene expression.

**intron (intervening sequence):** A sequence of nucleotides in a gene that is transcribed but excised before the gene is translated.

**Intron A :** A drug used to treat AIDS-related Kaposi sarcoma in certain patients, hairy cell leukemia, and melanoma that has been removed by surgery. It is also used with other anticancer drugs to treat a certain type of non-Hodgkin lymphoma. Intron A is also used to treat some infections caused by viruses, such as the hepatitis C virus. It is being studied in the treatment of other types of cancer and other conditions. Intron A is a form of interferon alfa (a substance normally made by cells in the immune system) and is made in the laboratory. It is a type of cytokine and a type of biological response modifier. Also called IFN alpha-2B, interferon alfa-2b, and recombinant interferon alfa-2b.

**Introns:** Regions of the primary transcript that are removed in the mature mRNA. Also called intervening sequences.

**intrusion:** magma that crosses through other rock layers, cooling and hardening before reaching the surface.

**intrusive:** rock that forms below the Earth's surface (plutonic).

**intrusive igneous rock:** igneous rock that formed from magmas that moved upward into cracks and voids deep in the crust and that never reached the surface.

**intrusive thought :** An unpleasant memory or idea that occurs often in a person's everyday thoughts and keeps him or her from thinking about other things. Interfering thoughts can make sleep difficult and make a person unable to carry out daily activities. Also called interfering thought.

**Intumescence:** A mechanism whereby fire-retardant paints protect the substrates to which they are applied. An intumescent paint puffs up when exposed to high temperatures, forming an insulating, protective layer over the substrate. OR To swell enlarge or expand when exposed to heat. Many fire retardant materials have this property.

**inulin:** A naturally occurring, indigestible and non-absorbable oligosaccharide produced by certain plants with prebiotic and potential anticancer activity. Inulin stimulates the growth of beneficial bacteria in the colon, including Bifidobacteria and Lactobacilli, thereby modulating the composition of microflora. This creates an environment that protects against pathogens, toxins and carcinogens, which can cause inflammation and cancer. In addition, fermentation of inulin leads to an increase in short-chain fatty acids and lactic acid production, thereby reducing colonic pH, which may further control pathogenic bacteria growth and may contribute to inulin's cancer protective properties. Check for active clinical trials using this agent.

**Invanz:** (Other name for: ertapenem sodium)

**invasive breast cancer :** Cancer that has spread from where it began in the breast to surrounding normal tissue. The most common type of invasive breast cancer is invasive ductal carcinoma, which begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple). Another type is invasive lobular carcinoma, which begins in the lobules (milk glands) of the breast. Invasive breast cancer can spread through the blood and lymph systems to other parts of the body. Also called infiltrating breast cancer.

**invasive cancer :** Cancer that has spread beyond the layer of tissue in which it developed and is growing into surrounding, healthy tissues. Also called infiltrating cancer.

**invasive cervical cancer :** Cancer that has spread from the surface of the cervix to tissue deeper in the cervix or to other parts of the body.

**invasive ductal carcinoma :** The most common type of invasive breast cancer. It begins in the lining of the milk ducts (thin tubes that carry milk from the lobules of the breast to the nipple) and spreads outside the ducts to surrounding normal tissue. Invasive ductal carcinoma can also spread through the blood and lymph systems to other parts of the body. Also called infiltrating ductal carcinoma.

**invasive hydatidiform mole :** A type of cancer that grows into the muscular wall of the uterus. It is formed after conception (fertilization of an egg by a sperm). It may spread to other parts of the body, such as the vagina, vulva, and lung. Also called chorioadenoma destruens.

**invasive lobular carcinoma :** A type of invasive breast cancer that begins in the lobules (milk glands) of the breast and spreads to surrounding normal tissue. It can also spread through the blood and lymph systems to other parts of the body. Also called infiltrating lobular carcinoma.

**invasive procedure :** A medical procedure that invades (enters) the body, usually by cutting or puncturing the skin or by inserting instruments into the body.

**inverse:** A math property which states:  $A+(-A)=0$  and  $A*(1/A)=1$

**inverse relationship or proportion:** When one quantity decreases as a result of the other increasing or vice versa. For example, density is inversely related to volume for constant mass.

**inversion:** an atmospheric condition where warm air is on top of cold air. OR An anomaly in the normal positive lapse rate; usually refers to a thermal inversion, in which temperature increases rather than decreases with height. OR A nucleotide sequence whose normal order is reversed in a gene or in a chromosome. OR A chromosomal defect in which a segment of the chromosome breaks off and reattaches in the reverse direction.

**invertebrates:** the most primitive of the chordates; lack a backbone.

**inverted papilloma :** A type of tumor in which surface epithelial cells grow downward into the underlying supportive tissue. It may occur in the nose and/or sinuses or in the urinary tract (bladder, renal pelvis, ureter, urethra). When it occurs in the nose or sinuses, it may cause symptoms

similar to those caused by sinusitis, such as nasal congestion. When it occurs in the urinary tract, it may cause blood in the urine.

**Inverted region:** Refers to the optimal rate of electron transfer as a function of free energy of the driving force; the rate of electron transfer increases toward the inverted region as the free energy of the driving force increases but then decreases with further increases in driving force.

**Inverted repeat:** A chromosome segment that is identical to another segment on the same chromosome except that it is oriented in the opposite direction.

**Inverted terminal repeats:** Sequences of 20 or so base pairs at opposite ends of a bacterial insertion sequence.

**investigational :** In clinical trials, refers to a drug (including a new drug, dose, combination, or route of administration) or procedure that has undergone basic laboratory testing and received approval from the U.S. Food and Drug Administration (FDA) to be tested in human subjects. A drug or procedure may be approved by the FDA for use in one disease or condition, but be considered investigational in other diseases or conditions. Also called experimental.

**investigational agent :** A substance that has been tested in the laboratory and has been approved by the U.S. Food and Drug Administration (FDA) for testing in people. Clinical trials test how well investigational agents work and whether they are safe to use. An investigational agent may be approved by the FDA for use in one disease or condition but still be considered investigational in other diseases or conditions. Also called experimental drug, IND, investigational drug, and investigational new drug.

**investigational drug :** A substance that has been tested in the laboratory and has been approved by the U.S. Food and Drug Administration (FDA) for testing in people. Clinical trials test how well investigational drugs work and whether they are safe to use. An investigational drug may be approved by the FDA for use in one disease or condition but still be considered investigational in other diseases or conditions. Also called experimental drug, IND, investigational agent, and investigational new drug.

**investigational group :** The group in a clinical research study that receives the drug, vaccine, or other intervention being tested. Interventions may also include medical procedures (such as radiation therapy and surgery), medical

devices, behavior changes (such as diet and exercise), education programs, and counseling. Also called experimental group and intervention group.

**investigational new drug** : A substance that has been tested in the laboratory and has been approved by the U.S. Food and Drug Administration (FDA) for testing in people. Clinical trials test how well investigational new drugs work and whether they are safe to use. An investigational new drug may be approved by the FDA for use in one disease or condition but still be considered investigational in other diseases or conditions. Also called experimental drug, IND, investigational agent, and investigational drug.

**investigator** : A researcher in a clinical trial or clinical study.

**investment problems**: Word problems that involve investing money at a simple interest rate.

**inviable** : Not able to survive.

**Invirase**: (Other name for: saquinavir mesylate)

**involuntary** : An action that is not made by choice. In the body, involuntary actions (such as blushing) occur automatically, and cannot be controlled by choice.

**involuntary nervous system** : The part of the nervous system that controls muscles of internal organs (such as the heart, blood vessels, lungs, stomach, and intestines) and glands (such as salivary glands and sweat glands). One part of the involuntary nervous system helps the body rest, relax, and digest food and another part helps a person fight or take flight in an emergency. Also called ANS and autonomic nervous system.

**INxin**: (Other name for: IL4-Pseudomonas exotoxin fusion protein PRX321)

**iobenguane I 123** : A drug containing a form of radioactive iodine called I 123 that is used to detect certain types of tumors, including pheochromocytomas and neuroblastomas. Radiation from the I 123 may help show where cancer cells are in the body. Iobenguane I 123 is a type of radioimaging agent and a type of radioconjugate. Also called 123I-MIBG, AdreView, and iodine I 123 metaiodobenzylguanidine.

**iobenguane I 131**: An I 131 radioiodinated synthetic analogue of the neurotransmitter norepinephrine. Iobenguane localizes to adrenergic tissue and, in radioiodinated forms, may be used to image or eradicate tumor cells

that take up and metabolize norepinephrine. Check for active clinical trials using this agent. or A drug containing a form of radioactive iodine called I 131 that is used to find or treat certain types of tumors, including pheochromocytomas and neuroblastomas. It is also used to relieve pain caused by cancer that has spread to the bones. Radiation from the I 131 may help kill cancer cells or show where they are in the body. Iobenguane I 131 is a type of radioimaging agent and a type of radioconjugate. Also called 131I-MIBG and iodine I 131 metaiodobenzylguanidine.

**iobenguane scan :** A procedure used to find neuroendocrine tumors, such as neuroblastomas and pheochromocytomas. A small amount of a substance called radioactive iobenguane is injected into a vein and travels through the bloodstream. Neuroendocrine tumor cells take up the radioactive iobenguane and are detected by a scanner. Also called metaiodobenzylguanidine scan and MIBG scan.

**iobitridol:** A water-soluble, tri-iodinated, non-ionic monomeric benzoate derivative and contrast medium used in diagnostic radiography. Upon administration, iobitridol is distributed through the vascular system and interstitial space. Like other organic iodine compounds, this agent blocks x-rays and appears opaque on x-ray film thus, enhancing the visibility of body parts containing this agent. Iobitridol is rapidly removed by the kidneys in an unchanged form, and in cases of renal failure, heterotropic excretion occurs via the biliary route. Check for active clinical trials using this agent.

**iodinated contrast dye:** A contrast agent containing an iodine-based dye used in many diagnostic imaging examinations, including computed tomography, angiography, and myelography. Check for active clinical trials using this agent.

**Iodine:** Symbol:"I" Atomic Number:"53" Atomic Mass: 126.90amu. Iodine is member of the halogen family. Iodine is a bluish black solid but can quickly become a bluish gas. It is less reactive than other halogens. The element is used as an ingredient in medicine, as a dye, and as an essential element in your diet. Without iodine, you could get a goiter (swelling of your thyroid).

**iodine :** An element that is necessary for the body to make thyroid hormone. It is found in shellfish and iodized salt.

**iodine 131-6-beta-iodomethyl-19-norcholesterol:** A radioiodine-labeled cholesterol analogue with radioisotopic activity. Iodine 131-1-6-beta-

iodomethyl-19-norcholesterol accumulates in tissues where steroid hormones are produced, including the adrenal cortex and, to a lesser extent, the ovaries and the testes. After binding to low-density lipoprotein (LDL) receptors in the adrenal cortex, this agent is internalized, permitting scintigraphic localization of areas of adrenocortical glucocorticoid, mineralocorticoid and androgen secretion, and the scintigraphic assessment of adrenocortical function.

**iodine I 123:** A radioactive isotope of iodine, a nonmetallic element of the halogen group with an atomic mass of 123 and a half-life of 13.2 hours with radioisotopic activity. Selectively accumulating in the thyroid tissue, iodine I 123 emits gamma rays that can be detected with gamma scintigraphy, allowing localization of thyroid tissue. This agent may be used as a tracer in whole body scintigraphy (WBS) to localize thyroid carcinoma metastases.

**iodine I 123 ADAM:** A radiopharmaceutical containing the serotonin transporter (SERT) ligand ADAM [2-((2-((dimethylamino)methyl)phenyl)thio)-5-iodophenylamine] labeled with the radioisotope iodine I 123, with SERT-binding and radioisotope activities. Upon administration, iodine I 123 ADAM selectively binds to SERT-expressing cells; subsequently, SERT-expressing tissues may be visualized using single photon emission computed tomography (SPECT). SERT is a monamine transporter protein found in the membranes of neurons and platelets; in neurons it transports the neurotransmitter serotonin from synaptic spaces into presynaptic neurons, terminating serotonin's function.

**iodine I 123 anti-CEA recombinant diabody T84.66:** A radioimmunoconjugate comprised of a recombinant scFv dimer diabody of a monoclonal antibody against human carcinoembryonic antigen (CEA) labeled with iodine I 123 (I-123) with potential radioimmunolocalization applications. The antibody moiety of iodine I 123 anti-CEA recombinant diabody T84.66 binds to cells expressing CEA, selectively delivering I-123 upon cellular internalization and allowing the scintigraphic imaging of CEA-expressing tumor cells. CEA, a tumor associated antigen, is overexpressed in many cancer types, including gastrointestinal, breast, non-small cell lung, and thyroid cancers. Compared to whole monoclonal antibodies, diabody fragments offer the advantages of rapid tumor targeting, rapid blood clearance, more uniform tumor distribution, and a lower potential for eliciting an immune response.

**iodine I 123 iodobenzamide:** A radiopharmaceutical containing the dopamine D2/D3 receptor agonist iodobenzamide (IBZM) labeled with the radionuclide iodine I 123 with dopamine receptor-binding and radioisotopic activities. Upon administration, iodine I 123 iodobenzamide binds to dopamine D2/D3 receptors; subsequently, tissues expressing these receptors can be visualized using single photon emission computed tomography (SPECT). Dopamine receptors are a class of metabotropic G protein-coupled receptors found in the central nervous system (CNS) and neuroendocrine tumors such as pheochromocytoma and paraganglioma.

**iodine I 123 iodometomidate:** An iodine I-123 conjugate of metomidate (MTO) with potential application in adrenal imaging. Metomidate is a potent and selective inhibitor of the cytochrome P-450 enzymes, especially CYP11B1 (11 beta-hydroxylase) and CYP11B2 (aldosterone synthase). Because both CYP11B1 and CYP11B2 are expressed exclusively in the adrenal cortex, I-123 iodometomidate can be used as a radiotracer for adrenal scintigraphy.

**iodine I 123 metaiodobenzylguanidine :** A drug containing a form of radioactive iodine called I 123 that is used to detect certain types of tumors, including pheochromocytomas and neuroblastomas. Radiation from the I 123 may help show where cancer cells are in the body. Iodine I 123 metaiodobenzylguanidine is a type of radioimaging agent and a type of radioconjugate. Also called 123I-MIBG, AdreView, and iobenguane I 123.

**iodine I 124:** A radioactive isotope of iodine, a nonmetallic element of the halogen group, with an atomic mass of 124 and a half-life of 4.18 days with radioisotopic activity. Selectively accumulating in thyroid tissue, iodine I 124 emits positrons that can be detected by positron emission tomography (PET), allowing localization of thyroid tissue. This radiosotope also emits gamma rays.

**iodine I 124 CPD-1028:** A radioconjugate composed of the insulin-like growth factor 1 receptor (IGF-1R) binding agent CPD-1028 and conjugated to the radionuclide iodine I 124, with potential tumor imaging properties upon positron emission tomography/computed tomography (PET/CT). Upon administration, iodine I 124 CPD-1028 targets and binds to IGF-1R-expressing tumor cells. Upon PET/CT imaging, the iodine I 124 moiety can be visualized and the quantity of IGF-1R-expressing tumor cells can be assessed. IGF-1R, a receptor tyrosine kinase overexpressed in a variety of

human cancers, plays a significant role in the stimulation of cellular proliferation, oncogenic transformation, and the suppression of apoptosis.

**iodine I 124 FIAU:** A radioconjugate containing the nucleoside analog 2'-fluoro-2'-deoxy-1beta-D-arabinofuranosyl-5-iodouracil (FIAU) labeled with the radioisotope iodine I 124 with positron-emitting activity.

Chemotherapeutic agents such as bortezomib may induce viral thymidine kinase expression in EBV- and Kaposi's sarcoma herpesvirus (KSHV)-associated tumors. Subsequent to chemotherapy induction of viral TK in these tumors, administered iodine I 124 FIAU is phosphorylated by expressed viral TK, becoming selectively trapped within TK-expressing tumor cells; these cells can then be visualized with positron emission tomography (PET). Viral TK is either not expressed or is expressed at very low levels in EBV- and Kaposi's sarcoma herpesvirus (KSHV)-associated tumors and may be activated by certain chemotherapeutic agents.

**iodine I 124 iobenguane:** A radioconjugate composed of the positron-emitting radioisotope iodine I 124 labeled to iobenguane, the synthetic aralkylguanidine analogue of the neurotransmitter norepinephrine (NE), with potential diagnostic imaging applications upon positron emitting tomography (PET) or computed tomography (CT). Upon administration, iodine I 124 iobenguane is taken up and accumulates in the granules of adrenal medullary chromaffin cells and in the pre-synaptic granules of adrenergic neurons in a manner almost identical with that of NE. In turn, tumor cells can be imaged upon PET or CT.

**iodine I 124 iodo-azomycin galactopyranoside:** A diagnostic radiopharmaceutical comprised of iodo-azomycin galactopyranoside (IAZGP) labeled with the positron-emitting radioisotope iodine I 124 and used as an imaging agent. Iodine I 124 iodo-azomycin galactopyranoside (I-124 IAZGP) is reduced under hypoxic conditions, covalently binding to macromolecules in hypoxic cells. After incorporation into hypoxic tumor cell DNA, I-124 IAZGP can be localized and quantified using positron emission tomography (PET), allowing a quantitative assessment of hypoxic tumor burden. IAZGP appears to have a higher water solubility and faster clearance from normal tissue than traditional imidazole tracers.

**iodine I 124 iododeoxyuridine:** A radiopharmaceutical comprised of the thymidine analog, 5-iodo-2-deoxyuridine (idoxuridine), labeled with the positron emitter iodine I 124. After incorporation into tumor cell DNA,

positron emission tomography (PET) is used to image iodine I 124 localized to tumor cells for determining and monitoring tumor burden. Check for active clinical trials using this agent.

**iodine I 124 monoclonal antibody 3F8:** A radioimmunoconjugate consisting of 3F8, a murine anti-GD2 ganglioside monoclonal antibody labeled with iodine I 124 (I-124), with radioimaging activity using positron emission tomography (PET). Upon intravenous administration of iodine I 124 monoclonal antibody 3F8, the 3F8 moiety binds to GD2 expressed on tumor cells. This binding enables both PET imaging via iodine I 124 and the visualization of GD2-expressing tumor cells. GD2 is a ganglioside overexpressed in a variety of cancer cells, including neuroblastoma cells.

**iodine I 124 monoclonal antibody 8H9:** A radioimmunoconjugate consisting of the iodine I 124-radiolabeled murine IgG1 monoclonal antibody (MoAb) 8H9 directed against the cell surface glycoprotein CD276 (4Ig-B7-H3) with potential for radioimaging using positron emission tomography (PET). Through convection enhanced delivery, iodine I 124 monoclonal antibody 8H9 binds to the 4Ig domain of CD276, in turn CD276 expressing tumor cells may be visualized upon PET imaging of the iodine I 124 moiety. CD276, a tumor associated antigen and member of the B7 family of co-stimulatory proteins, suppresses natural killer (NK) cell and cytotoxic T-lymphocyte activation; it is expressed on the cell membranes of a wide variety of tumors of neuroectodermal, mesenchymal and epithelial origin and its expression is associated with increased aggressiveness, poor prognosis and resistance. Check for active clinical trials using this agent.

**iodine I 124 monoclonal antibody A33:** A radioimmunoconjugate of a humanized monoclonal antibody (MoAb) A33 labelled with iodine 124 (I-124). MoAb A33 recognizes A33 antigen, a 43 KDa transmembrane glycoprotein of the immunoglobulin superfamily, highly and homogeneously expressed in 95% of colorectal cancer metastases, with only restricted expression in normal colonic mucosa. I-124 MoAb A33 delivers beta particle emitting I-124 nuclide directly to metastatic colorectal tissues, thereby this agent could be used in kinetics studies or radioimmunotherapy.

**iodine I 124 NM404:** A phospholipid ether analog labeled with iodine I 124, with a potential imaging property upon positron emission tomography (PET). Upon administration, iodine I 124 NM404 selectively accumulates

in and is retained within tumor cells for a prolonged period of time due to the decreased activity of a phospholipase D (PLD), most likely isoform 1 of PLD, in tumor cells compared to normal cells. As tumor cells are unable to metabolize and eliminate MN404, tumor cells can be visualized upon PET imaging. In addition, iodine I 124 NM404 may provide a more accurate image of the tumor than imaging with the current standard. PLD is an enzyme found in the cell membrane of normal cells that degrades phospholipids. Check for active clinical trials using this agent.

**iodine I 124 phospholipid ether analogue CLR1404:** A small molecule radiopharmaceutical composed of the radioisotope iodine I 124 covalently attached to a proprietary alkylphospholipid ether (PLE) analogue, with potential imaging activity upon positron emission tomography (PET). Iodine I 124 phospholipid ether analogue CLR1404 is selectively taken up by tumor cells via membrane lipid rafts and accumulates in tumor cells. The accumulation of this agent is due to a decreased ability of tumor cells to metabolize PLEs because certain tumor cells have lower levels of the enzyme phospholipase-D, in comparison to normal cells. This facilitates imaging of cancer cells by PET. Lipid rafts, specialized microdomains of plasma membrane, are overexpressed in cancer cells compared to normal cells. In addition, the radioiodine moiety of this agent is resistant to deiodination.

**iodine I 124 PU-AD:** A radioconjugate composed of PU-AD, a synthetic purine-scaffold inhibitor of the molecular chaperone heat shock protein 90 (Hsp90), conjugated to the radioisotope iodine I 124, with potential imaging activity upon positron emission tomography (PET). Upon administration of iodine I 124 PU-AD, the PU-AD moiety selectively binds to cancer cells expressing stress-induced Hsp90 (stress Hsp90). Upon PET, Hsp90-overexpressing cancer cells can be visualized and patients who may benefit from PU-AD therapy can be identified. This radioconjugate may also be used to determine the pharmacokinetics of the therapeutic agent PU-AD. PU-AD is able to cross the blood-brain-barrier (BBB) and specifically targets stress Hsp90, as seen in certain conditions, such as cancer and neurodegenerative diseases, while normal housekeeping Hsp90 complexes are not targeted by PU-AD at dose levels administered for imaging. Additionally, housekeeping Hsp90 complexes are only targeted at doses that are much larger than that are needed to exert an anticancer effect. Check for active clinical trials using this agent.

**iodine I 124-labeled anti-phosphatidylserine monoclonal antibody**

**PGN650:** A radioimmunoconjugate composed of the F(ab')<sub>2</sub> fragment of human monoclonal antibody PGN650 against phosphatidylserine (PS) labeled with the radioisotope iodine I 124, with potential imaging activity upon positron-emission tomography (PET). Upon administration, the MoAb moiety of PGN650 binds to exposed PS on tumor cells, thereby allowing for the visualization of tumors upon PET. This may facilitate the assessment of the effectiveness of antitumor agents. The phospholipid PS is normally located on the inner leaflet of the plasma membrane of healthy cells but is flipped to the outer leaflet in the endothelial lining of the tumor vasculature and other tumor cells in response to chemo- or radio- treatments in addition to oxidative stress.

**iodine I 124-labeled anti-PSCA A11 minibody:** A radioconjugate composed of an affinity-matured antibody fragment, the A11 minibody, directed against human prostate stem cell antigen (PSCA), and conjugated with the radioisotope iodine I 124, that can potentially be used as an imaging agent for positron emission tomography (PET)/computed tomography (CT). The minibody moiety of iodine I 124-labeled anti-PSCA A11 minibody selectively targets and binds to PSCA. The PSCA-expressing tumor cells can then be visualized using PET/CT. PSCA, a cell surface antigen expressed in normal human prostate and bladder, is overexpressed in a variety of cancers, including bladder, pancreatic, and prostate cancer. The A11 minibody is formed by the fusion of a single chain Fv fragment with the immunoglobulin G1 CH3 domain. Check for active clinical trials using this agent.

**iodine I 124-labeled HSP90 inhibitor PUH71:** A radioconjugate containing the purine scaffold heat shock protein 90 (Hsp90) inhibitor PUH71 labeled with the radioisotope iodine I 124, with positron emitting activity. Hsp90 inhibitor PUH71 is thought to bind to cytosolic Hsp90 and the endoplasmic reticulum paralogue gp96 (HSP90B1), thereby inhibiting its molecular chaperone function and promoting the degradation of the oncogenic signaling proteins. This induces caspase-dependent apoptosis. The iodine I 124 moiety can be visualized using positron emission tomography (PET) imaging, thereby allowing an assessment of the accumulation of PUH71 in vivo, particularly in tumors. Hsp90, a chaperone protein upregulated in a variety of tumor cells, regulates the folding, stability and degradation of many oncogenic signaling proteins.

**iodine I 125:** A radioactive isotope of iodine, a nonmetallic element of the halogen group. With a half-life of 60 days, iodine 125 occurs naturally and can be produced artificially. This agent has both therapeutic and diagnostic uses, particularly in thyroid disease.

**iodine I 125 anti-EGFR-425 monoclonal antibody:** A radioimmunoconjugate consisting of a murine IgG2a monoclonal antibody directed against the human epidermal growth factor receptor (EGFR) labeled with iodine I 125 with potential antineoplastic activity. Iodine I 125 anti-EGFR-425 monoclonal antibody binds specifically to the epidermal growth factor receptor (EGFR). Upon binding to EGFR-expressing tumor cells, this agent is internalized, selectively delivering a potentially cytotoxic dose of gamma radiation. EGFR is a receptor tyrosine kinase that may be overexpressed on the cell surfaces of various solid tumors. Check for active clinical trials using this agent.

**iodine I 131:** A radioactive isotope of iodine with an atomic mass of 131, a half life of eight days, and potential antineoplastic activity. Selectively accumulating in the thyroid gland, iodine I 131 emits beta and gamma particles, thereby killing thyroid cells and decreasing thyroid hormone production.

**iodine I 131 anti-fibronectin antibody fragment L19-SIP:** An iodine 131 radioimmunoconjugate of a small immunoprotein (SIP), derived from the variable region fragment of human monoclonal antibody L19, that is directed against the extra-domain B (ED-B) of fibronectin, with potential radioimmunotherapeutic activity. The SIP moiety of iodine I 131 anti-fibronectin antibody fragment L19-SIP binds to the ED-B domain of fibronectin on tumor cells in the tumor neovasculature. Upon internalization, the I 131 radionuclide may selectively detect or deliver cytotoxic radiation to fibronectin-expressing tumor cells. ED-B of fibronectin, a naturally occurring marker of tissue remodeling and angiogenesis, is expressed in the majority of aggressive solid human tumors, whereas it is not detectable in normal vessels and tissues.

**iodine I 131 chimeric monoclonal antibody G-250:** A radioimmunoconjugate comprised of the chimeric monoclonal antibody G-250 conjugated with iodine I 131 with potential antineoplastic activity. The antibody moiety of iodine I 131 chimeric monoclonal antibody G-250 binds

to G-250, a renal-cell carcinoma-associated antigen, delivering cytotoxic iodine I 131 specifically to renal cell carcinoma cells that express G-250.

**iodine I 131 ethiodized oil:** A cytotoxic radioconjugate consisting of ethiodized oil, an iodinated ethyl ester derived from poppy seed oil, labeled with iodine 131 (I-131). Iodine I 131 ethiodized oil accumulates in hepatocellular carcinoma and hepatoblastoma tumor cells, resulting in targeted cytotoxicity to tumor cells while sparing surrounding normal cells and tissues. Check for active clinical trials using this agent. or A radioactive substance being studied in the treatment of liver cancer. It is a form of poppy seed oil that contains iodine, some of which is the radioactive substance iodine I 131. It builds up in the blood and lymph vessels in the liver and may kill cancer cells. It is a type of radiopharmaceutical. Also called iodine I 131 Lipiodol.

**iodine I 131 Lipiodol :** A radioactive substance being studied in the treatment of liver cancer. It is a form of poppy seed oil that contains iodine, some of which is the radioactive substance iodine I 131. It builds up in the blood and lymph vessels in the liver and may kill cancer cells. It is a type of radiopharmaceutical. Also called iodine I 131 ethiodized oil.

**iodine I 131 metaiodobenzylguanidine :** A drug containing a form of radioactive iodine called I 131 that is used to find or treat certain types of tumors, including pheochromocytomas and neuroblastomas. It is also used to relieve pain caused by cancer that has spread to the bones. Radiation from the I 131 may help kill cancer cells or show where they are in the body. Iodine I 131 metaiodobenzylguanidine is a type of radioimaging agent and a type of radioconjugate. Also called 131I-MIBG and iobenguane I 131.

**iodine I 131 monoclonal antibody 3F8:** A radioimmunoconjugate consisting of 3F8, a murine anti-GD2 ganglioside monoclonal antibody labeled with iodine 131 (I-131), with radioimaging and radioimmunotherapeutic properties. Using monoclonal antibody 3F8 as a carrier for I-131 results in the targeted imaging and/or destruction of cells expressing GD2. GD2 is a ganglioside which is overexpressed in malignant melanoma, neuroblastoma, and small cell carcinoma of the lung.

**iodine I 131 monoclonal antibody 81C6:** A radioimmunoconjugate consisting of 81C6, a murine IgG2 anti-tenascin monoclonal antibody labeled with iodine 131 (I-131), with radioimaging and

radioimmunotherapeutic activities. Using monoclonal antibody 81C6 as a carrier for I-131 results in the targeted imaging and/or destruction of cells expressing tenascin. Tenascin is an extracellular matrix protein which is overexpressed in gliomas and other cancers. Check for active clinical trials using this agent.

**iodine I 131 monoclonal antibody 8H9:** A radioimmunoconjugate consisting of the iodine 131-radiolabeled murine IgG1 monoclonal antibody 8H9 directed against the surface immunomodulatory glycoprotein 4Ig-B7-H3 with potential radioimaging and radioimmunotherapeutic uses. Iodine I 131 monoclonal antibody 8H9 binds to 4Ig-B7-H3 (human B7-H3 with 4 Ig-like domains) and may be used to radioimage and/or destroy tumor cells that express tenascin. 4Ig-B7-H3 inhibits T-cell activation and the production of effector cytokines such as interferon-gamma and interleukin-4; it is expressed on the cell membranes of a wide variety of tumors of neuroectodermal, mesenchymal and epithelial origin and is highly expressed on monocyte-derived dendritic cells (mdDCs). In vitro, it has been shown that monoclonal antibody-mediated masking of 4Ig-B7-H3 on neuroblastoma cells resulted in the enhancement of natural killer (NK)-mediated lysis of target cells.

**iodine I 131 monoclonal antibody BC8:** A radioimmunoconjugate consisting of BC8, a murine IgG1 anti-CD45 monoclonal antibody labeled with iodine 131 (I-131), with radioimmunotherapeutic properties. Using monoclonal antibody BC8 as a carrier for I-131 results in the targeted destruction of cells expressing CD45. CD45 is tyrosine phosphatase expressed on virtually all leukocytes, including myeloid and lymphoid precursors in bone marrow and mature lymphocytes in lymph nodes; it is also expressed on most myeloid and lymphoid leukemic cells, but not on mature erythrocytes or platelets. or A substance being studied in the treatment of some types of leukemia and lymphoma. BC8 is a monoclonal antibody that binds to a protein called CD45, which is found on most white blood cells and some types of leukemia and lymphoma cells. It is linked to a radioactive substance called iodine I 131, which may help kill cancer cells. Iodine I 131 monoclonal antibody BC8 is a type of radioimmunoconjugate.

**iodine I 131 monoclonal antibody CC49-deltaCH2:** A radioimmunoconjugate consisting of the humanized CH2 domain-deleted

monoclonal antibody CC49 and iodine I 131 with antineoplastic activity. Monoclonal antibody CC49-deltaCH2 targets the tumor-associated glycoprotein 72 (TAG-72) that is expressed by a wide range of human neoplasms including colorectal, gastric, pancreatic, ovarian, endometrial, breast, non-small cell lung, and prostate cancers. Iodine I 131 monoclonal antibody CC49-deltaCH2 binds to tumor cells expressing TAG-72, selectively delivering a cytotoxic dose of beta and gamma radiation.

**iodine I 131 monoclonal antibody F16SIP:** A fully human monoclonal antibody (MoAb) against human A1 domain of tenascin-C, in small immunoprotein (SIP) format conjugated with iodine 131 with potential antineoplastic activity. Iodine I 131 MoAb F16SIP binds to tenascin-C on the vascular tissues and delivers cytotoxic radiation to the tumors, thereby minimizing systemic radiotoxicity. Tenascin-C is a glycoprotein of the extracellular matrix, and the large isoform of this matrix protein is expressed and restricted around vascular structures in the tumor stroma of a variety of different tumors.

**iodine I 131 monoclonal antibody TNT-1/B:** An iodine 131 labeled radioimmunoconjugate of monoclonal antibody (MOAB) TNT-1/B with radioimaging and antineoplastic properties. MOAB TNT-1/B was developed for radioimmunotherapy of solid tumors, designated as Tumor Necrosis Treatment (TNT). TNT exploits the presence of degenerating and necrotic cells within tumors by utilizing MOABs directed against universal, intracellular nucleosomal determinants consisting of histone H1 and DNA. This MOAB was conjugated with biotin (B) molecules, which increase pharmacokinetic performance of the monoclonal antibody. MOAB TNT-1/B delivers I 131 to tumor cells and results in the targeted imaging and/or destruction of cells with exposed necrotic antigens.

**iodine I 131 NM404:** A phospholipid ether analog labeled with iodine I 131, with potential radiotherapeutic and radioimaging potential upon positron emission tomography (PET). Upon administration, iodine I 131 NM404 selectively accumulates in and is retained within tumor cells for a prolonged period of time due to the decreased activity of a phospholipase D (PLD), most likely isoform 1 of PLD, in tumor cells compared to normal cells. As tumor cells are unable to metabolize and eliminate MN404, tumor cells can be visualized upon PET imaging. In addition, iodine I 131 NM404 selectively delivers a cytotoxic dose of iodine I 131 to the tumor cells. PLD

is an enzyme found in the cell membrane of normal cells that degrades phospholipids.

**iodine I 131 phospholipid ether analogue CLR1404:** A small-molecule radiopharmaceutical consisting of the beta-emitting radioisotope iodine I 131 attached to a phospholipid ether (PLE) analogue, comprised of a linear 18 carbon backbone, with potential antineoplastic activity. Iodine I 131 phospholipid ether analogue CLR1404 selectively accumulates in tumor cells, thereby delivering a cytotoxic dose of radiation to cancer cells. Compared to normal cells, tumor cells are unable to metabolize and eliminate PLEs possibly due to deficiency of the enzyme phospholipase-D. In addition, the radioiodine moiety of this agent is resistant to de-iodination.

**iodine I 131 rituximab:** A radioimmunoconjugate comprised of rituximab, a recombinant chimeric monoclonal antibody directed against the CD20 antigen, and labeled with iodine I 131 with potential antineoplastic activity. The antibody moiety of iodine I 131 rituximab binds to the CD20 antigen thereby delivering cytotoxic iodine I 131 specifically to cancer cells expressing CD20. The CD20 antigen, a hydrophobic transmembrane protein, is expressed on normal pre-B and mature B lymphocytes.

**iodine I 131 SGMIB-anti-HER2 VHH1:** A monoclonal antibody (MoAb) directed against the human epidermal growth factor receptor 2 (HER2; ERBB2) labeled with iodine I 131 using the residualizing radio-iodinating reagent N-succinimidyl 4-guanidinomethyl 3-iodobenzoate (SGMIB), with potential radiotherapeutic and radioimaging activities upon positron emission tomography (PET). Upon administration of iodine I 131 SGMIB-anti-HER2 VHH1, the HER2 MoAb moiety selectively targets and binds to HER2-expressing tumor cells. Upon PET imaging, tumor cells can be visualized. In addition, the iodine I 131 moiety of VHH1 selectively delivers a cytotoxic dose of iodine I 131 to the tumor cells. HER2, a tyrosine kinase receptor, is overexpressed by many cancer cell types. SGMIB improves tumor retention of radioactivity and decreases exocytosis.

**iodine I 131 tenatumomab:** A radioimmunoconjugate of tenatumomab, a murine monoclonal antibody targeting the tumor-associated antigen (TAA) tenascin-C (TNC), labeled with iodine I 131, with potential antineoplastic activity. The antibody moiety of iodine I 131 tenatumomab binds to TNC, thereby delivering a cytotoxic dose of iodine I 131 specifically to tumors expressing TNC. TNC, an extracellular matrix protein, is upregulated in a

variety of tumor cell types; it plays a key role in invasion, tumor cell proliferation and immune evasion. or A monoclonal antibody directed against the CD20 protein expressed on the surface of B-lymphocytes and radiolabeled with the radioisotope iodine I 131 with potential antineoplastic activity. Iodine I 131 tositumomab binds to and selectively delivers cytotoxic radiation to CD20-expressing B-lymphocytes, thereby minimizing systemic radiotoxicity. or A drug used with another drug to treat certain types of B-cell non-Hodgkin lymphoma. It is also being studied in the treatment of other types of cancer. Iodine I 131 tositumomab is a form of the monoclonal antibody tositumomab that is linked to the radioactive substance iodine I 131. It is a type of radioimmunoconjugate.

**iodine I 131-labeled anti-CEA/anti-HSG bispecific monoclonal antibody TF2:** A tri-Fab bispecific monoclonal antibody (BiMoAb) divalent for the carcinoembryonic antigen (CEA) and monovalent for histamine-succinyl-glycine (HSG) peptide-hapten radiolabeled with iodine I 131 (I131) with antigen-binding and radioisotopic activities. Iodine I 131-labeled anti-CEA/anti-HSG bispecific monoclonal antibody TF2 binds to the tumor-associated antigen (TAA) CEA on CEA-expressing tumor cells; these cells may then be radioimaged scintigraphically.

**iodine I-124 girentuximab:** A radioimmunoconjugate comprised of the chimeric monoclonal antibody G250 conjugated with the positron emitter iodine I 124. The antibody moiety of iodine I 124 girentuximab may bind to renal cell carcinoma (RCC) cells that express the RCC-associated antigen G250, allowing detection of tumor-localized iodine I 124 with positron emission tomography (PET). G250 is a cell surface tumor-associated antigen (TAA) that is found in the majority of renal cell carcinomas.

**Iodine spiking factor:** The magnitude of a rapid, short-term increase in the appearance rate of radioiodine in the reactor coolant system. This increase is generally caused by a reactor transient that results in a rapid drop in reactor coolant system pressure relative to the fuel rod internal pressure.

**iodine-123 metaiodobenzylguanidine:** The neurotransmitter analogue 3-nitrobenzylguanidine conjugated to iodine I 123 and used as a gamma-emitting imaging agent. The adrenergic tissue uptake and storage of I-123 metaiodobenzylguanidine (I-123 MIBG) mimics that of norepinephrine (NE). The distribution of this agent enables the scintigraphic imaging of neural crest tumors, such as neuroblastoma and pheochromocytoma.

**iodixanol:** A dimeric iso-osmolar, non-ionic, hydrophilic iodinated radiocontrast agent used in diagnostic imaging. Upon intravascular administration and during computed tomography (CT) imaging, iodixanol blocks x-rays and appears opaque on x-ray images. This allows body structures that absorb iodine to be visualized. The degree of opacity produced by iodixanol is directly proportional to the total amount of the iodinated contrast agent in the path of the x-rays. The visualization of body structures is dependent upon the distribution and elimination of iodixanol. Compared to other iodinated contrast agents, iodixanol appears to exhibit less nephrotoxicity.

**iodized oil :** A form of poppy seed oil that contains iodine. Iodized oil is given by injection and builds up in the blood and lymph vessels in tumors. It is used for imaging (taking pictures) of the salivary glands and the lymph system. It is also being studied in the imaging of other organs such as the liver, lung, stomach, and thyroid. It is a type of diagnostic imaging agent. Also called ethiodized oil, Ethiodol, and Lipiodol.

**iododoxorubicin :** A substance that is being studied as a treatment for cancer and for primary systemic amyloidosis (a disease in which proteins are deposited in specific organs). It is a type of anthracycline antitumor antibiotic.

**Iodotope:** (Other name for: iodine I 131)

**ioflubenzamide I-131:** An iodine 131-radiolabeled small-molecule benzamide compound with potential antineoplastic activity. The benzamide moiety of ioflubenzamide I-131 binds to melanin, selectively delivering a cytotoxic dose of gamma and beta radiation to melanin-expressing tumor cells. Melanin pigments, polymer derivatives of the amino acid tyrosine, are over-expressed in approximately 40% of melanomas.

**iofolastat I123:** An iodine 123-radiolabeled small molecule that exhibits high affinity for prostate-specific membrane antigen (PSMA) with potential use in molecular imaging. Iofolastat I123, a radiolabeled glutamate-urea-lysine analogue, selectively binds PSMA, which allows imaging of PSMA-expressing prostate cancer cells with gamma scintigraph. PSMA is a transmembrane glycoprotein highly expressed by malignant prostate epithelial cells and vascular endothelial cells of various solid tumors.

**iohexol:** An X-ray contrast medium containing iohexol in various concentrations, from 140 to 350 milligrams of iodine per milliliter.

**ion:** an isolated electron or positron; an atom or molecule which by loss or gain of one or more electrons has acquired a net electric charge. OR Removing or adding electrons to an atom creates an ion (a charged object very similar to an atom). OR An electrically charged particle formed by the gain or loss of electrons. OR is a charged atom or group of atoms. Ionization is caused by a gain or loss of electrons. A loss leaves a positive charge, a gain leaves a negative charge. OR An ion is a charged particle made when an atom (or group of atoms) loses or gains one or more electrons, e.g.  $\text{Na}^+$  and  $\text{Cl}^-$ . OR a charged atom; an atom that has either lost or gained electrons. OR An electrically charged atom OR an atom or group of atoms that have a net electrical charge OR An atom or group of atoms that has gained or lost one or more electrons. OR (1) An atom that has too many or too few electrons, causing it to have an electrical charge, and therefore, be chemically active. (2) An electron that is not associated (in orbit) with a nucleus. OR An atom or molecule that has acquired a charge by either gaining or losing electrons. An atom or molecule with missing electrons has a net positive charge and is called a cation; one with extra electrons has a net negative charge and is called an anion.

**ion :** An atom or a molecule that has a positive or negative electrical charge. Examples are sodium, potassium, calcium, chloride, and phosphate. These ions help move nutrients into cells, help move waste out of cells, and help nerves, muscles, the heart, and the brain work the way they should.

**ion channel:** An integral membrane protein that provides for the regulated transport of a specific ion, or ions, across a membrane. OR Passive transport systems for ions capable of very high transport rates; ion channels often display a high degree of specificity for the transported ion.

**ion exchange:** a chemical reaction in which mobile hydrated ions of a solid are exchanged, equivalent for equivalent, for ions of like charge in solution. The process can be used to remove ionic pollutants from wastewater. OR Ion exchange is a method of separating ions from a solution by reversibly binding them onto a resin that has charged sites on its surface. Ion exchangers are used to remove metal ions from drinking water.

**Ion meter:** a sophisticated pH/milivolt meter containing a microprocessor, which allows for the processing of ISE signals to permit electrode calibration and direct reading of sample concentrations.

**ion product of water (K<sub>w</sub>):** The product of the concentrations of H<sup>+</sup> and OH<sup>-</sup> in pure water:  $KW = [H^+][OH^-] = 1 \times 10^{-14}$  at 25 °C.

**ion-dipole forces:** Intermolecular force that exists between charged particles and partially charged molecules.

**Ion-dipole Interactions:** Intermolecular interactions between a charged species and a dipole.

**Ion-exchange:** A common method for concentrating uranium from a solution. The uranium solution is passed through a resin bed where the uranium-carbonate complex ions are transferred to the resin by exchange with a negative ion like chloride. After build-up of the uranium complex on the resin, the uranium is eluted with a salt solution and the uranium is precipitated in another process.

**Ion-exchange chromatography:** A protein purification technique that relies on the charge of proteins. Proteins are applied to an inert matrix to which is attached a charged moiety (e.g., a carboxylate group). Proteins will bind to the matrix with an affinity proportional to their content of the counterion (i.e., positive charges in regard to the carboxylate matrix).

**Ion-exchange resin:** A polymeric resinous substance, usually in bead form, that contains fixed groups with positive or negative charge. An anion exchange resin has positively-charged groups and is therefore useful in exchanging the anionic groups in a test sample; a cation exchange resin is itself negatively charged, and has the opposite application. The resin is usually used in a column chromatographic procedure. OR A polymeric resin that contains fixed charged groups; used in chromatographic columns to separate ionic compounds.

**ion-exchanger:** A resin capable of removing unwanted ions and replacing them with more desirable ones. For example, Ca<sup>2+</sup> or Mg<sup>2+</sup>, which interfere with the action of soap or detergent can be replaced by Na<sup>+</sup>, which does not.

**Ionic additives (lipophilic salt) :** additional component of an ionselective polymeric membrane required to obtain theoretical sensor performances. The Nernstian response of the potentiometric sensor is measured if the presence of lipophilic counter ions maintains the constant concentration of the free target ions in the membrane, due to the ion buffering mechanism of the ionophore. This buffering mechanism establishes a constant ratio between the concentration of the ionionophore complex and the free

ionophore in the membrane. The presence of ionic sites in the membrane is also necessary to improve the selectivity of the potentiometric sensors. In cationselective electrodes with neutral receptors, tetraphenylborate salts are added to the membrane composition (tetraalkylammonium salts for anionselective membranes containing neutral ionophore). Recently, it has been shown that the presence of ionic sites is also required in the case of ionselective membranes with charged ionophores.

**Ionic Agglomerate:** An ionic agglomerate is a group of atoms which are held together by electrovalent bonds.

**Ionic Bond:** A chemical bond between two atoms where one or more electrons are passed from one atom to another. When they give up electrons, each of the atoms should have a filled shell. A good example of an ionic bond is the sodium chloride bond. You may also hear the term electrovalent bond. OR A bond in which the predominant forces are ionic in nature. OR atoms linked together by the attraction of unlike charges. OR a bond formed by the transfer of electrons between atoms, resulting in the formation of ions of opposite charge. The electrostatic attraction between these ions is the ionic bond. OR A force that holds together two electrically charged atoms (called ions) OR An attraction between ions of opposite charge. Potassium bromide consists of potassium ions ( $K^+$ ) ionically bound to bromide ions ( $Br^-$ ). Unlike covalent bonds, ionic bond formation involves transfer of electrons, and ionic bonding is not directional.

**ionic compound:** A ionic compound is a compound made up of oppositely charged ions bonded to each other in a giant lattice. OR A compound made of distinguishable cations and anions, held together by electrostatic forces.

**Ionic crystal:** A crystal composed of ions in which each ion of a given charge is equidistant from a small number of ions of opposite charge (e.g., sodium chloride).

**ionic dissociation:** When ionic substances dissolve, their ions are surrounded by solvent molecules and separated from each other. This phenomena is also called ionization.

**ionic equation:** An ionic equation is one which shows the atoms and ions that actually change in a reaction, e.g.  $Zn(s) + Cu^{2+}(aq) \rightarrow Zn^{2+}(aq) + Cu(s)$ . OR An ionic equation is a balanced chemical equation in which strong electrolytes are written as dissociated ions. For example,  $Ag^+$

(aq) + NO<sub>3</sub><sup>-</sup>(aq) + Na<sup>+</sup>(aq) + Cl<sup>-</sup>(aq) = AgCl(s) + Na<sup>+</sup>(aq) + NO<sub>3</sub><sup>-</sup>(aq) is an ionic equation; AgNO<sub>3</sub>(aq) + NaCl(aq) = AgCl(s) + NaNO<sub>3</sub>(aq) is not.

**Ionic Interactions:** Often refers to attractive interactions between oppositely charged ions.

**ionic radius:** The radii of anions and cations in crystalline ionic compounds, as determined by consistently partitioning the center-to-center distance of ions in those compounds.

**ionic silver-impregnated sodium carboxymethyl cellulose antimicrobial dressing:** A textile fiber dressing composed of ionic silver-impregnated sodium carboxymethylcellulose with potential wound-healing and antimicrobial activities. Ionic silver-impregnated sodium carboxymethylcellulose antimicrobial dressing inhibits microbial growth and promotes wound healing while protecting the wound site from external factors that may cause pain, promote infection, or slow the natural wound healing process. Ionic silver has a high affinity for negatively charged side groups on microbial cell proteins. Upon binding, ionic silver alters the molecular structure of proteins with a role in normal microbial cell functions thereby interfering with cell wall synthesis, transcription, translation, electron transport across membranes and protein folding, resulting in microbial cell death.

**Ionic strength:** this is a measure of the effective concentration of ions in solution. It is calculated according to the following formula: Ionic strength =  $\frac{1}{2} \sum C_x Z_x^2$  (where: C<sub>x</sub> = the concentration of ion x; Z<sub>x</sub> = the charge of ion x). The ionic strength determines the activity coefficient of each ion in the solution. Conductivity measurements give an estimate of ionic strength.

**Ionic strength adjustment buffer (ISAB):** a solution of high ionic strength used to dilute samples and standard solutions. The ISAB minimizes differences in ion strength from solution to solution, making the activity coefficient of the ion approximately the same in all solutions. Multipurpose ISAB's may contain pH adjustors, decomplexing agents or species that remove interferences. Examples of such solutions are Total Ionic Strength Adjustment Buffer (TISAB) for fluoride measurements and Sulphide AntiOxidant Buffer (SAOB) for sulphide measurement.

**ionization:** adding or subtracting electrons from an atom; alternatively, the dissociation of a solute into ions. OR The process of adding one or more electrons to, or removing one or more electrons from, atoms or molecules,

thereby creating ions. High temperatures, electrical discharges, or nuclear radiations can cause ionization.

**ionization:** a process by which a neutral atom or molecule loses or gains electrons, thereby acquiring a net charge and becoming an ion; occurs as the result of the dissociation of the atoms of a molecule in solution or of a gas in an electric field.

**Ionization chamber:** An instrument that detects and measures ionizing radiation by measuring the electrical current that flows when radiation ionizes gas in a chamber, making the gas a conductor of electricity.

**IONIZATION ENERGIES SUNSEQUENT:** remove more electrons. The factors that determine the ionization energies are: distance from the nucleus (inverse square law) whether the orbital is filled or half-filled whether there is a noble gas structure the shielding effect of electrons in lower orbitals the ratio of protons to remaining electrons (guards to prisoners ratio)

**ionization energy:** the energy needed to remove an electron from an atom. OR (IE,IP) ionization potential. Compare with adiabatic ionization energy, vertical ionization energy, electronegativity, and electron affinity. The energy needed to remove an electron from a gaseous atom or ion.

**ionization energy:** Energy required to remove an electron from a specific atom.

**IONIZATION ENERGY:** is the minimum energy needed to remove an electron from an atom.

**IONIZATION ENERGY FIRST:** takes off the first (outermost) electron.

**ionizes:** When a substance breaks into its ionic components.

**Ionizing radiation:** A form of radiation, which includes alpha particles, beta particles, gamma rays, x-rays, neutrons, high-speed electrons, high-speed protons, and other particles capable of producing ions.

Compared to non-ionizing radiation, such as radio- or microwaves, or visible, infrared, or ultraviolet light, ionizing radiation is considerably more energetic. When ionizing radiation passes through material such as air, water, or living tissue, it deposits enough energy to produce ions by breaking molecular bonds and displace (or remove) electrons from atoms or molecules. This electron displacement may lead to changes in living cells.

Given this ability, ionizing radiation has a number of beneficial uses, including treating cancer or sterilizing medical equipment. However, ionizing radiation is potentially harmful if not used correctly, and high doses may result in severe skin or tissue damage. It is for this reason that the NRC strictly regulates commercial and institutional uses of the various types of ionizing radiation. Radiation, as used in 10 CFR Part 20, does not include non-ionizing radiation (see also 10 CFR 20.1003). OR A type of radiation, such as x rays, that causes loss of electrons from some organic molecules, thus making them more reactive. OR A type of high-energy radiation that has enough energy to remove an electron (negative particle) from an atom or molecule, causing it to become ionized. Ionizing radiation can cause chemical changes in cells and damage DNA. This may increase the risk of developing certain health conditions, such as cancer. Ionizing radiation can come from natural sources, such as radon and cosmic rays (rays that enter the earth's atmosphere from outer space). It may also come from medical imaging equipment, such as x-ray, CT scan, or PET scan machines. Nuclear power plant accidents and atomic weapons also release high levels of ionizing radiation. Being exposed to very high doses of ionizing radiation can cause immediate damage to a person's body, including severe skin or tissue damage, acute radiation sickness, and death.

**Ionomer:** Copolymers of ethylene and acrylic acids that have been neutralized to some degree to form metal salts.

**Ionomer Resins:** A polymer which has ethylene as its major component, but containing both covalent and ionic bonds. The polymer exhibits very strong interaction ionic forces. The anions hang from the hydrocarbon chain and the reactions are metallic – sodium, potassium, magnesium. These resins have many of the same features as polyethylene plus high transparency, tenacity, resilience, and increased resistance to oils, greases and solvents. Fabrication is carried out as with polyethylene.

**ionomycin :** An antibiotic drug used to treat infection.

**Ionophore:** a lipophilic charged or neutral organic molecule, which has an affinity for a particular ionic species in solution (i.e. forms selectively reversible complexes with a particular ionic species). For ionselective electrodes, there are introduced into a polymeric membrane, which forms a barrier between the test solution and the electrode. The detected ion is passed from one ionophore molecule to the next by diffusion under a

concentration gradient and hence is selectively transferred across the membrane and causes a build up of electrical charge on the inside of the membrane. OR A compound that binds one or more metal ions and is capable of diffusing across a membrane, carrying the bound ion.

**IONS NEGATIVE:** are those which have gained electrons and therefore have more negative charges than positive charges (protons).

**Ionselective electrode (ISE):** an electrode which responds selectively to the ions of a particular species in solution.

**Ionselective membrane :** the principal component (receptor part) of the membrane chemical sensor, which generally determines its performances i.e. selectivity, sensitivity and stability. Ionselective membrane is based on membrane matrix containing appropriate active components (i.e. the ionophore, ionic sites).

**iopromide:** A contrast medium.

**IORT:** Radiation treatment aimed directly at a tumor during surgery. Also called intraoperative radiation therapy.

**IOUS:** A procedure that uses ultrasound (high-energy sound waves that are bounced off internal tissues and organs) during surgery. Sonograms (pictures made by ultrasound) of the inside of the body are viewed on a computer to help a surgeon find tumors or other problems during the operation. Also called intraoperative ultrasound.

**IP:** Internet Protocol. OR Within the peritoneal cavity (the area that contains the abdominal organs). Also called intraperitoneal.

**IP6:** A substance found in many foods that come from plants, including corn, wheat, rice, and soybeans, and in large amounts in cereals and legumes. It is being studied in the prevention of cancer. Also called inositol hexaphosphate and phytic acid.

**ipafricept:** A proprietary fusion protein comprised of the cysteine-rich domain of frizzled family receptor 8 (Fzd8) fused to the human immunoglobulin Fc domain with potential antineoplastic activity. Upon intravenous administration, ipafricept competes with the membrane-bound Fzd8 receptor for its ligand, Wnt proteins, thereby antagonizing Wnt signaling. This may result in the inhibition of Wnt-driven tumor growth. Fzd8, a member of the Frizzled family of G protein-coupled receptors, is

one of the components in the Wnt/beta-catenin signaling pathway that plays key roles in embryogenesis and cancer growth.

**ipamorelin:** A pentapeptide (Aib-His-D-2-Nal-D-Phe-Lys-NH<sub>2</sub>) and a ghrelin mimetic with growth hormone (GH) releasing activity. Ipamorelin mimics ghrelin and binds to the ghrelin receptor (or GH secretagogue receptor, GHSR) in the brain, thereby selectively stimulating the release of GH from the pituitary gland. This results in increased plasma GH levels, which would affect many biological processes. Besides its presence in the brain, GHSR can also be found in the gastrointestinal tract, heart, lung, liver, kidney, pancreas, adipose tissue and immune cells. Unlike other GH releasing peptides, ipamorelin only stimulates GH release in a manner very similar to that of growth hormone releasing hormone.

**ipatasertib:** An orally bioavailable inhibitor of the serine/threonine protein kinase Akt (protein kinase B) with potential antineoplastic activity. Ipatasertib binds to and inhibits the activity of Akt in a non-ATP-competitive manner, which may result in the inhibition of the PI3K/Akt signaling pathway and tumor cell proliferation and the induction of tumor cell apoptosis. Activation of the PI3K/Akt signaling pathway is frequently associated with tumorigenesis and dysregulated PI3K/Akt signaling may contribute to tumor resistance to a variety of antineoplastic agents.

**ipilimumab:** A recombinant human immunoglobulin (Ig) G1 monoclonal antibody directed against the human T-cell receptor cytotoxic T-lymphocyte-associated antigen 4 (CTLA4), with immune checkpoint inhibitory and antineoplastic activities. Ipilimumab binds to CTLA4 expressed on T-cells and inhibits the CTLA4-mediated downregulation of T-cell activation. This leads to a cytotoxic T-lymphocyte (CTL)-mediated immune response against cancer cells. CTLA4, an inhibitory receptor and member of the immunoglobulin superfamily, plays a key role in the downregulation of the immune system.

**ipilimumab :** A drug used to treat melanoma that cannot be removed by surgery or has spread to other parts of the body. It is also used as adjuvant therapy to treat melanoma in the skin and lymph nodes in patients who have already had surgery. Ipilimumab is also being studied in the treatment of other types of cancer. Ipilimumab binds to a substance called CTLA-4, which is found on T cells (a type of white blood cell). Ipilimumab may block CTLA-4 and help the immune system kill cancer cells. It is a type of

monoclonal antibody and a type of immune checkpoint inhibitor. Also called MDX-010 and Yervoy.

**IPOL:** (Other name for: inactivated poliovirus vaccine)

**ipomeanol:** A natural toxic furan isolated from a fungus-infected sweet potato (*Ipomoea batatas*) with potential antineoplastic activity. Ipomeanol is activated by mixed function oxidases in vivo to its epoxide form, an alkylating agent that covalently binds cell macromolecules. This agent causes cell death by a p53-independent mechanism. Check for active clinical trials using this agent.

**iproplatin:** A synthetic second-generation platinum-containing compound related to cisplatin. Iproplatin binds to and forms DNA crosslinks and platinum-DNA adducts, resulting in DNA replication failure and cell death. Although less prone to glutathione inactivation compared to cisplatin, resistance to this agent has been observed in vitro due to repair of platination damage by tumor cells.

**ipsilateral :** On the same side of the body as another structure or a given point.

**iq'mik :** A type of smokeless tobacco that is made by mixing cured tobacco leaves with ashes from a certain type of fungus. It is used mainly in Alaska and is chewed. It contains nicotine and many harmful, cancer-causing chemicals. Using iq'mik can lead to nicotine addiction and can cause cancer of the mouth and other health problems.

**iratumumab:** A monoclonal antibody with potential antineoplastic activity. Iratumumab is a fully humanized antibody that targets CD30, a member of the tumor necrosis factor receptor superfamily found on activated lymphocytes. CD30 is over-expressed in various lymphoproliferative disorders, Hodgkin's disease and other lymphomas, and other cancers.

**IRB:** A group of scientists, doctors, clergy, and patient advocates that reviews and approves the detailed plan for every clinical trial. IRBs are meant to protect the people who take part in a clinical trial. They check to see that the trial is well designed, legal, ethical, does not involve unneeded risks, and includes a safety plan for patients. There is an IRB at every health care facility that does clinical research. Also called Institutional Review Board.

**IRC:** Intrinsic reaction coordinate. An optimized reaction path that is followed downhill, starting from a transition state, to approximate the course (mechanism) of an elementary reaction step.

**IRE (iron-response amount)-binding protein:** An iron-sensitive protein that regulates the translational capability of ferritin mRNA and the stability of transferrin receptor mRNA by binding to a stem-loop structure called an iron-response element in the mRNA molecule.

**Iressa:** (Other name for: gefitinib)

**Iressa :** A drug that is used to treat certain types of non-small cell lung cancer and is being studied in the treatment of other types of cancer. It is a type of epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor. Also called gefitinib and ZD1839.

**Iridium:** Symbol:"Ir" Atomic Number:"77" Atomic Mass: 192.22amu. Iridium is one of the transition elements. Iridium is another member of the platinum family of metals. You might find it in alloys and in materials that need to withstand very high temperatures.

**iridium Ir 192:** A radioactive isotope of iridium. Iridium-192 emits gamma rays and has a half-life of 74 days. A high dose rate of this radioisotope can be used in brachytherapy to treat tumors by selectively delivering a cytotoxic dose of radiation to the tumor site.

**irinotecan :** The active ingredient in a drug used alone or with other drugs to treat colon cancer or rectal cancer that has spread to other parts of the body or has come back after treatment with fluorouracil. It is also being studied in the treatment of other types of cancer. Irinotecan blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of topoisomerase inhibitor and a type of camptothecin analog.

**irinotecan hydrochloride:** The hydrochloride salt of a semisynthetic derivative of camptothecin, a cytotoxic, quinoline-based alkaloid extracted from the Asian tree *Camptotheca acuminata*. Irinotecan, a prodrug, is converted to a biologically active metabolite 7-ethyl-10-hydroxy-camptothecin (SN-38) by a carboxylesterase-converting enzyme. One thousand-fold more potent than its parent compound irinotecan, SN-38 inhibits topoisomerase I activity by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks that inhibit DNA replication and trigger apoptotic cell death. Because ongoing DNA

synthesis is necessary for irinotecan to exert its cytotoxic effects, it is classified as an S-phase-specific agent.

**irinotecan hydrochloride :** A drug used alone or with other drugs to treat colon cancer or rectal cancer that has spread to other parts of the body or has come back after treatment with fluorouracil. It is also being studied in the treatment of other types of cancer. Irinotecan hydrochloride blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called Camptosar and CPT 11.

**irinotecan hydrochloride liposome:** A liposomal formulation of the hydrochloride salt of the semisynthetic camptothecin analogue irinotecan with potential antineoplastic activity. During the S phase of the cell cycle, irinotecan selectively stabilizes topoisomerase I-DNA covalent complexes, inhibiting religation of topoisomerase I-mediated single-strand DNA breaks and producing lethal double-strand DNA breaks when complexes are encountered by the DNA replication machinery. Liposome encapsulation of this agent promotes efficient drug delivery into the cytosol from the endosome compartment of the cell.

**irinotecan hydrochloride liposome :** A form of the anticancer drug irinotecan hydrochloride that is contained in very tiny, fat-like particles. Irinotecan hydrochloride liposome is used together with fluorouracil and leucovorin to treat a certain type of pancreatic cancer that has spread to other parts of the body and has gotten worse after treatment with gemcitabine anticancer therapy. It is also being studied in the treatment of other types of cancer. Irinotecan hydrochloride blocks certain enzymes needed for cell division and DNA repair, and it may kill cancer cells. Irinotecan hydrochloride liposome may have fewer side effects and work better than irinotecan hydrochloride. It is a type of topoisomerase inhibitor and a type of camptothecin analog. Also called liposome-encapsulated irinotecan hydrochloride PEP02, Onivyde, and PEP02.

**irinotecan-eluting beads:** Microporous hydrospheres of polyvinylalcohol (PVA) impregnated with irinotecan with potential antineoplastic activity. In transarterial chemoembolization (TACE), irinotecan-eluting beads are administered into blood vessels that feed the tumor, occluding tumor blood vessels and inducing ischemic tumor necrosis while simultaneously delivering high-dose chemotherapy locally. Irinotecan, a semisynthetic

derivative of camptothecin, inhibits topoisomerase I activity by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks that inhibit DNA replication and trigger apoptotic cell death.

**irinotecan/P-glycoprotein inhibitor HM30181AK combination tablet:**

An orally bioavailable combination tablet containing the semisynthetic camptothecin derivative irinotecan and the multidrug resistance (MDR) efflux pump P-glycoprotein (P-gp) inhibitor HM30181AK, with potential antineoplastic activity. HM30181A binds to P-gp and prevents the P-gp-mediated efflux of irinotecan from tumor cells, which may result in greater intracellular concentrations of irinotecan and enhanced cytotoxicity.

Retained intracellularly, the prodrug irinotecan is converted, by a carboxylesterase-converting enzyme, to the biologically active metabolite 7-ethyl-10-hydroxy-camptothecin (SN-38). SN-38 inhibits topoisomerase I activity by stabilizing the cleavable complex between topoisomerase I and DNA, resulting in DNA breaks that inhibit DNA replication and trigger apoptotic cell death. P-gp, encoded by the MDR-1 gene, is a member of the ATP-binding cassette (ABC) superfamily of transmembrane transporters and is overexpressed by some MDR tumors, preventing the intracellular accumulation of various cytotoxic agents.

**iris :** The colored tissue at the front of the eye that contains the pupil in the center. The iris helps control the size of the pupil to let more or less light into the eye.

**irofulven:** A semisynthetic sesquiterpene derivative of illudin S, a natural toxin isolated from the fungus *Omphalotus illudens*. Irofulven alkylates DNA and protein macromolecules, forms adducts, and arrests cells in the S-phase of the cell cycle. This agent requires NADPH-dependent metabolism by alkenal/one oxidoreductase for activity. Irofulven is more active in vitro against tumor cells of epithelial origin and is more resistant to deactivation by p53 loss and MDR1 than other alkylating agents.

**irofulven :** A substance being studied in the treatment of some types of cancer. Irofulven attaches to the cell's DNA and may block cancer cell growth. It is a type of alkylating agent. Also called 6-hydroxymethylacylfulvene.

**iron:** An element with atomic symbol Fe, atomic number 26, and atomic weight 55.85. Check for active clinical trials using this agent.

**Iron:** Symbol:"Fe" Atomic Number:"26" Atomic Mass: 55.85amu. Iron is one of the transition metals. You can find it in steel, meteorites, and the core of the Earth. Iron is everywhere in the universe.

**iron :** An important mineral the body needs to make hemoglobin, a substance in the blood that carries oxygen from the lungs to tissues throughout the body. Iron is also an important part of many other proteins and enzymes needed by the body for normal growth and development. It is found in red meat, fish, poultry, lentils, beans, and foods with iron added, such as cereal.

**iron dextran complex:** A colloidal solution containing ferric oxyhydroxide complexed with polymerized dextran, used as a form of parenteral iron-replacement therapy. Upon administration and absorption, the iron dextran complex is removed from plasma by the reticuloendothelial system which cleaves it into the components iron and dextran; ferric iron subsequently binds to transferrin or is stored as hemosiderin or ferritin. Transferrin-bound iron is transported in the plasma to the liver, spleen and bone marrow, where it is incorporated into hemoglobin (Hgb) and to muscle where it is incorporated into myoglobin (Mb). Use of this agent circumvents the gastrointestinal adverse effects commonly encountered with the use of orally administered iron salt preparations. Because of cross-reactivity with antibodies targeted against polysaccharides similar to dextran, anaphylactic reactions may occur with this type of iron formulation.

**iron isomaltoside 1000:** An intravenous colloidal solution containing trivalent iron ( $Fe^{3+}$ ) chelated to isomaltosides, used as iron replacement. The iron in iron isomaltoside 1000 is strongly bound to the carbohydrate particles; each particle contains a trivalent iron core and a carbohydrate shell of isomaltosides which protects and stabilizes the iron core. This results in low levels of free iron and decreases inorganic, unbound iron-related toxicities thereby allowing for administration of higher doses of iron as compared to other iron-containing formulations. Upon parenteral administration and degradation of the carbohydrate shell, the iron in iron isomaltoside 1000 is released and replenishes iron stores. Check for active clinical trials using this agent.

**iron overload :** A condition in which the body takes up and stores more iron than it needs. The extra iron is stored in the liver, heart, and pancreas,

which may cause liver disease, heart problems, organ failure, and cancer. It may also cause bronze skin, diabetes, pain in the joints and abdomen, tiredness, and impotence. Iron overload may be inherited, or it may be caused by blood transfusions. Also called hemochromatosis.

**iron sucrose injection:** A sterile aqueous complex of polynuclear iron (III)-hydroxide in sucrose for intravenous use. Following intravenous administration, iron sucrose is dissociated by the reticuloendothelial system into iron and sucrose; the sucrose component is eliminated mainly by urinary excretion. Iron sucrose can be administered with or without erythropoietin to raise hemoglobin levels and may be used in cases of oral iron therapy intolerance or ineffectiveness. Hypersensitivity reactions are less common with iron sucrose compared to other parenteral iron products, such as iron dextran.

**Iron-response element (IRE):** A stem-loop structure found in the mRNAs for ferritin and transferrin receptor that interacts with the IRE-binding protein and regulates the translation of the mRNAs.

**iron-sulfur center:** A prosthetic group of certain redox proteins involved in electron transfers;  $\text{Fe}^{2+}$  or  $\text{Fe}^{3+}$  is bound to inorganic sulfur and to Cys groups in the protein.

**Iron-sulfur proteins:** Proteins that contain clusters of iron and sulfur that play a role in electron transfer reactions; iron cycles between the  $\text{Fe}^{2+}$  and  $\text{Fe}^{3+}$  state. Also called nonheme iron proteins.

**irradiance:** The total radiant flux received on a unit area of a given real or imaginary surface. Also called the radiant flux density.

**irradiated :** Treated with radiation.

**Irradiation:** Exposure to ionizing radiation. Irradiation may be intentional, such as in cancer treatments or in sterilizing medical instruments.

Irradiation may also be accidental, such as being exposed to an unshielded source. Irradiation does not usually result in radioactive contamination, but damage can occur, depending on the dose received.

**irradiation :** The use of high-energy radiation from x-rays, gamma rays, neutrons, protons, and other sources to kill cancer cells and shrink tumors. Radiation may come from a machine outside the body (external-beam radiation therapy), or it may come from radioactive material placed in the body near cancer cells (internal radiation therapy or brachytherapy).

Systemic irradiation uses a radioactive substance, such as a radiolabeled monoclonal antibody, that travels in the blood to tissues throughout the body. Also called radiation therapy and radiotherapy.

**irregular verb:** verbs that form the past tense and past participle in a variety of ways, but not by adding -d or -ed as regular verbs do.

**irreversible enzyme inhibitor :** A substance that permanently blocks the action of an enzyme. In cancer treatment, irreversible enzyme inhibitors may block certain enzymes that cancer cells need to grow and may kill cancer cells. They are being studied in the treatment of some types of cancer.

**Irreversible inhibitor:** An inhibitor that binds very tightly to its target enzyme, either covalently or noncovalently; such an inhibitor dissociates very slowly from the enzyme.

**irreversible toxicity :** Side effects that are caused by toxic substances or something harmful to the body and do not go away.

**irrigation :** In medicine, washing out an organ (such as the stomach or colon), a body cavity, or a wound by flushing it with a fluid. Also called lavage.

**irritable bowel syndrome :** A disorder of the intestines commonly marked by abdominal pain, bloating, and changes in a person's bowel habits. This may include diarrhea or constipation, or both, with one occurring after the other. Also called IBS, irritable colon, mucus colitis, and spastic colon.

**irritable colon :** A disorder of the intestines commonly marked by abdominal pain, bloating, and changes in a person's bowel habits. This may include diarrhea or constipation, or both, with one occurring after the other. Also called IBS, irritable bowel syndrome, mucus colitis, and spastic colon.

**irritant:** Applied to any substance causing inflammation following immediate, prolonged or repeated contact with skin or mucous membranes.

**IRX-2:** A cell-free mixture comprised of a variety of naturally-derived cytokines obtained from normal, unrelated donor lymphocytes with potential immunostimulatory activity. The cytokines in IRX-2, including interleukin (IL)-1, -2, -6, -8, -10, -12, tumor necrosis factor alpha (TNF-a), interferon-gamma (IFN-g) and colony stimulating factors (CSFs), play vital roles in regulating cellular immunity and may synergistically stimulate a cellular immune response against tumor cells.

**Isaac syndrome :** A rare nerve disorder that causes constant muscle activity that cannot be controlled, even during sleep. It often affects the muscles in the arms and legs, but may affect the whole body. Symptoms include muscle twitching, weakness, stiffness, and cramping; increased skin temperature, sweating, and heart rate; and problems with chewing, swallowing, speech, and breathing. The disorder often gets worse over time. Isaac syndrome usually occurs in people aged 15 to 60 years. It may occur with certain types of cancer and is sometimes inherited. Also called neuromyotonia.

**isavuconazole:** A water-soluble triazole prodrug with broad-spectrum antifungal activity. Administered intravenously or orally with high oral bioavailability, isavuconazole is hydrolyzed to the active moiety BAL4815 by plasma esterases. BAL4815 inhibits fungal cytochrome P450 lanosterol 14-alpha-demethylase (CYP51), which catalyzes the conversion of lanosterol to ergosterol, an important component of the fungal cell membrane. CYP51 inhibition by this agent leads to a decrease in ergosterol pool, thus disturbing synthesis of the fungal cell membrane; increasing fungal cell membrane permeability; promoting the loss of essential intracellular elements; and resulting in fungal cell lysis and death.

**Iscar:** (Other name for: mistletoe extract)

**ischemia :** Lack of blood supply to a part of the body. Ischemia may cause tissue damage due to the lack of oxygen and nutrients.

**ischemic necrosis :** A condition in which there is a loss of blood flow to bone tissue, which causes the bone to die. It is most common in the hips, knees, shoulders, and ankles. It may be caused by long-term use of steroid medicines, alcohol abuse, joint injuries, and certain diseases, such as cancer and arthritis. It may also occur at some point in time after cancer treatment that included methotrexate, bisphosphonates, or corticosteroids. Also called aseptic necrosis, avascular necrosis, and osteonecrosis.

**Iscomatrix:** (Other name for: saponin-cholesterol-phospholipid adjuvant)

**iseganan hydrochloride :** A substance being studied in the treatment of oral mucositis (painful mouth sores) caused by cancer therapy and other conditions. Iseganan hydrochloride kills certain bacteria, fungi, and viruses by making holes in their outer membranes and causing them to burst. It is a type of synthetic antimicrobial peptide and a type of synthetic protegrin analog.

**Isentress:** (Other name for: raltegravir potassium)

**ISFET (ionsensitive FET) :** an electrochemical microsensor based on FET (field effect transistor) transducer. Ionsensitive FET is generally selective to H<sup>+</sup> ions. This selectivity arises from acid/base properties of the inorganic oxide (gate material) contacting the electrolyte. Examples of the inorganic oxides used are SiO<sub>2</sub>, Si<sub>3</sub>N<sub>4</sub>, Al<sub>2</sub>O<sub>3</sub> and Ta<sub>2</sub>O<sub>5</sub>.

**ISIS 2503:** A synthetic oligodeoxynucleotide. Functioning as an anti-sense agent, it hybridizes to the translation initiation region of the human mRNA for the oncogene H-Ras. ISIS 2503 selectively inhibits the expression of H-Ras, and may inhibit the growth of some Ras-dependent tumor cells. or A substance that is being studied in the treatment of cancer.

**ISIS 3521:** A synthetic phosphorothioate oligodeoxynucleotide. As an antisense molecule, ISIS 3521 hybridizes to the 3-untranslated region of the human protein kinase C (PKC-alpha) mRNA, thereby inhibiting PKC-alpha expression and growth of PKC-alpha-dependent tumor cells. or A substance that is being studied in the treatment of cancer.

**ISIS 5132:** A synthetic, 20-base antisense oligodeoxynucleotide that hybridizes to c-raf kinase messenger RNA. ISIS 5132 has been shown to specifically suppress Raf-1 expression both in vitro and in vivo. Raf-1 serine/threonine kinase functions as a critical effector of Ras-mediated signal transduction; constitutive activation of this pathway directly contributes to malignant transformation. or A substance that is being studied in the treatment of cancer.

**ISIS-STAT3rx:** (Other name for: STAT3 antisense oligonucleotide ISIS 481464)

**island arc:** a curved chain of islands that develops between an oceanic trench and a continental landmass.

**islet cell :** A pancreatic cell that produces hormones (e.g., insulin and glucagon) that are secreted into the bloodstream. These hormones help control the level of glucose (sugar) in the blood. Also called endocrine pancreas cell and islet of Langerhans cell.

**islet cell carcinoma :** A rare cancer that forms in islet cells (hormone-making cells) of the pancreas. Islet cells make several different hormones that affect body functions, including controlling the amount of glucose (sugar) in the blood and helping digest food in the stomach. Functional islet

cell carcinomas make extra amounts of these hormones, which can cause symptoms. Nonfunctional islet cell carcinomas do not make extra amounts of hormones, but they may cause symptoms as they grow and spread. Also called pancreatic endocrine cancer.

**islet cell tumor :** A tumor that forms in islet cells (hormone-making cells) of the pancreas. Islet cell tumors may be benign (not cancer) or malignant (cancer). Islet cells make several different hormones that affect body functions, including controlling the amount of glucose (sugar) in the blood and helping digest food in the stomach. Functional islet cell tumors make extra amounts of these hormones, which can cause symptoms.

Nonfunctional islet cell tumors do not make extra amounts of hormones, but they may cause symptoms as they grow and spread. Also called pancreatic endocrine tumor and pancreatic neuroendocrine tumor.

**islet of Langerhans cell :** A pancreatic cell that produces hormones (e.g., insulin and glucagon) that are secreted into the bloodstream. These hormones help control the level of glucose (sugar) in the blood. Also called endocrine pancreas cell and islet cell.

**islets of Langerhans:** clusters of cells that make up the endocrine portion of the pancreas.

**ISO:** The International Organization for Standardization, a worldwide federation of national standards bodies from some 140 countries.

Equivalent to ASTM.

**ISO 9000:** Family of standards concerned with "quality management". This means what the organization does to enhance customer satisfaction by meeting customer and applicable regulatory requirements.

**ISO Certification:** The International Organization for Standardization (ISO) is an international standard-setting body composed of representatives from various national standards organizations. This organization promotes worldwide proprietary, industrial and commercial standards for business.

**Iso-Butanol:** Iso-butanol is an oxo-alcohol with various uses as a direct process solvent, although is mainly used in the production of various acetates, glycol ethers and amines. It is used as a precursor for isobutyl acetate (a solvent) as a partial replacement for n-butanol in some applications. Iso-Butanol is a propylene derivative, and is produced by catalytically hydrogenated n-butyraldehyde from propylene oxonation (the

hydroformulation of propylene with syngas in an oxo-process). Iso-Butanol is produced in all regions.

**iso-fludelone:** A third-generation epothilone B analogue with potential anti-mitotic and antineoplastic activities. Iso-fludelone binds to tubulin and induces microtubule polymerization and stabilizes microtubules against depolymerization, which may result in the inhibition of cell division, the induction of G2/M arrest, and apoptosis. Compared to other generations of epothilones, iso-fludelone exhibits increased stability, water solubility, potency, duration of action, tumor penetration as well as reduced toxicity. In addition, this agent is not a substrate of the P-glycoprotein (P-gp), a multidrug resistance pump often overexpressed in cancer cells.

**isobar:** line connecting areas of equal pressure on a map. OR 1. A contour line that corresponds to values measured at identical pressures. For example, curves on a plot of gas volumes measured at different temperatures in an open container are isobars. 2. Nuclides that have the same isotopic mass but different atomic number. OR a line of equal pressure. Any point along an isobar sees the same cavity pressure as any other point along the same isobar.

**isobaric:** Having constant pressure.

**isochore:** A contour line that corresponds to values measured at identical volumes. For example, a curve on a plot of gas pressure measured at different temperatures in a rigid container is an isochore.

**isochoric:** Having constant volume.

**Isochrone :** a line of equal time. Any point along an isochrone is filled at the same time as any other point along the same isochrone.

**Isocitrate dehydrogenase:** An enzyme that catalyzes the oxidative decarboxylation of isocitrate to form  $\alpha$ -ketoglutarate; plays a role in controlling the rate of the citric acid cycle.

**Isocitrate lyase:** An enzyme of the glyoxylate cycle, isocitrate lyase cleaves isocitrate into succinate and glyoxylate.

**isoclinal fold:** a fold that has undergone stress great enough to compress its limbs tightly together.

**isodesmic:** Refers to a chemical reaction that conserves types of chemical bond. Due to better cancellation of systematic errors, energy changes computed using such reactions are expected to be more accurate than those

computed using reactions that do not conserve bond types. Example:  $\text{CH}_3\text{CH}_2\text{F} + \text{CH}_4 = \text{CH}_3\text{CH}_3 + \text{CH}_3\text{F}$  for computing the C-F bond strength in fluoroethane.

**Isoelectric focusing:** A technique for separating proteins. A mixture of proteins undergoes electrophoresis in a pH gradient; each protein will migrate in the electrical field until it reaches its isoelectric point. OR An electrophoretic method for separating macromolecules on the basis of their isoelectric pH.

**isoelectric pH (isoelectric point):** The pH at which a solute has no net electric charge and thus does not move in an electric field.

**Isoelectric point (p<sub>i</sub>):** The pH of a protein at which its net charge is equal to zero.

**Isoelectric point or pH:** The pH at which a protein has no net charge.

**isoelectronic:** refers to several dissimilar atoms or ions with identical electronic configurations. OR having the same number of electrons. For example, a sodium atom that is lacking one electron is isoelectronic with neon, an inert gas. OR Refers to a group of atoms or ions having the same number of electrons. For example, F<sup>-</sup>, Ne, and Na<sup>+</sup> are isoelectronic.

**isoenzymes:** See isozymes.

**isoflavone :** An estrogen-like substance made by some plants, including the soy plant. Soy isoflavones are being studied in the prevention of cancer, hot flashes that occur with menopause, and osteoporosis (loss of bone density).

**Isoflo:** (Other name for: isoflurane)

**isoflurane:** A fluorinated ether with general anesthetic and muscle relaxant activities. Although the exact mechanism of action has not been established, inhaled isoflurane, appears to act on the lipid matrix of the neuronal cell membrane, which results in disruption of neuronal transmission. This agent enhances the release of the inhibitory neurotransmitter gamma-aminobutyric acid (GABA), thereby increasing the activity of the inhibitory neurotransmitter on synaptic transmission. Isoflurane may inhibit glutamatergic excitatory transmission by increasing glutamate re-uptake and it may potentiate glycine receptor activity, which decreases motor function. In addition, isoflurane may alter certain pro- and anti-inflammatory cytokines, including interleukin-6 and -10 (IL-6, IL-10),

possibly through the activation of the nuclear factor kappa B (NF- $\kappa$ B) pathway, which may affect immune responses during surgery.

**isogyric:** Refers to a chemical reaction that conserves net spin. Due to better cancellation of systematic errors, energy changes computed using such reactions are expected to be more accurate than those computed using reactions that do not conserve spin. Example:  $\text{CH}_3\text{CH}_2\text{F} + \text{H} = \text{CH}_3\text{CH}_2 + \text{HF}$  for computing the C-F bond strength in fluoroethane.

**isointense :** Having the same intensity as another object. Used to describe the results of imaging tests, such as x-rays, MRIs, or CT scans.

**isolated double bond:** a double bond that is more than one single bond away from another double bond in a diene.

**isolated hepatic perfusion :** A procedure in which a catheter is placed into the artery that provides blood to the liver. A second catheter is placed into the vein that takes blood away from the liver. This temporarily separates the liver's blood supply from blood circulating throughout the rest of the body and allows high doses of anticancer drugs to be directed to the liver only.

**isolated limb infusion :** A procedure used to deliver anticancer drugs directly to an arm or leg but not to the rest of the body. The flow of blood to and from the limb is temporarily stopped with a tourniquet (a tight band around the limb). Catheters (small, flexible tubes) attached to a pump are put into an artery and a vein in the limb so that blood can be circulated through the pump into the limb. Anticancer drugs are injected into the catheters. Wrapping the limb in a heated blanket or warming the drugs or blood may help the drugs work better.

**isolated limb perfusion :** A procedure that may be used to deliver anticancer drugs directly to an arm or leg. The flow of blood to and from the limb is temporarily stopped with a tourniquet (a tight band around the limb), and anticancer drugs are put directly into the blood of the limb. This allows the person to receive a high dose of drugs in the area where the cancer occurred. Also called limb perfusion. or A surgical procedure during which the circulation of blood to the lungs is separated from the circulation of blood through the rest of the body, and a drug is delivered directly into the lung circulation. This allows a higher concentration of chemotherapy to reach tumors in the lungs.

**isolation :** State of being separated from others. Isolation is sometimes used to prevent disease from spreading.

**isoleucine**: A naturally occurring amino acid with a nonpolar side chain.

**isoline**: line that connects equal values.

**isomer**: cis a stereoisomer in which substituents are located on the same side of a double bond. (Compare with "trans isomer.") OR chemical compound that has the same number, and kinds of atoms as another compound, but a different structural arrangement of the atoms. OR An isomer is a molecule or compound that has the same number of atoms as another but a different structure. Two molecules with the same chemical structure but have different structures are structural isomers. When atoms are arranged, bonds can be created in different directions. Glucose and fructose are good examples of structural isomers. OR Generally, any two chemicals with the same chemical formula but a different structure. For example, hexane (C<sub>6</sub>H<sub>14</sub>) could be n-hexane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,2-dimethylbutane: OR compounds that have the same molecular formula but different structural formulas. OR Molecules with identical molecular formulas but different structural formulas. OR one of two or more compounds, radicals or ions that contain the same number of atoms of the same elements by differ in structural arrangement and properties.

**isomer** : One of two or more compounds that have the same chemical formula but different arrangements of the atoms within the molecules and that may have different physical/chemical properties.

**Isomerase**: An enzyme that catalyzes an intramolecular rearrangement. OR An enzyme that catalyzes the interconversion of isomeric forms of a compound. OR Enzymes that catalyze the transformation of compounds into their positional isomers.

**Isomerization**: Rearrangement of atomic groups within the same molecule without any loss or gain of atoms. OR A chemical change that involves a rearrangement of atoms and bonds within a molecule, without changing the molecular formula.

**Isomerization reaction**: A reaction in which particular atoms within a molecule are rearranged.

**isomers**: Compounds with the same molecular formulas but different arrangements of atoms. OR Isomers are molecules that have the same chemical formula but different arrangements of atoms. For example OR several molecules with the same composition but different structures. OR

compounds that have the same molecular formula but different structural formulas. OR Any two molecules with the same molecular formula but a different arrangement of molecular groups.

**Isomorphous replacement method:** A method of determining crystal structure used for proteins. This method involves replacing heavy atoms in a crystal with different heavy atoms.

**isoniazid:** A synthetic derivative of nicotinic acid with anti-mycobacterial properties. Although its mechanism of action is still unclear, isoniazid appears to block the synthesis of mycolic acids, major components of the mycobacterial cell wall. This agent is only active against actively growing mycobacteria because, as a pro-drug, it requires activation in susceptible mycobacterial species. Isoniazid also interferes with mycobacterial metabolism of vitamin B6. Resistance occurs due to decreased bacterial wall penetration.

**Isopentenyl pyrophosphate:** Activated isoprene; the basic building block of cholesterol.

**Isopotential point:** the activity of a sample at which the electrode potential does not vary with temperature. For some types of electrode this point is within the range of the calibration curve, but for most it lies below this range. The temperature effect on electrode potential increases with increasing divergence of the sample activity from the isopotential point.

**Isoprene:** Monomer sometimes used in chain polymerisation. Natural rubber is poly(isoprene), although it generated in nature from the somewhat more complicated building block mevalonic acid phosphate. Here is a picture: OR The hydrocarbon 2-methyl-1,3-butadiene, a recurring structural unit of the terpenoid biomolecules.

**Isoprene-acrylonitrile Rubber:** A low-plasticity copolymer with around 34 per cent ACN.

**Isopropanol (IPA):** Iso-propanol (IPA) is a solvent with various applications including printing inks, coatings, de-icer and the manufacture of isopropyl amines, an intermediate to fertilizers. High purity IPA is used in medical and IT solvent applications. It is produced directly by sulphuric acid oxidation of propylene or indirectly by the hydrogenation of acetone. Isopropanol production is widespread globally.

**Isopropylthiogalactoside (IPTG):** An inducer of the lac operon; IPTG binds to the lac repressor and reduces the repressor's affinity for the operator DNA, which permits transcription to take place.

**isopynic:** A line on a chart that connects all points of equal or constant density.

**isoquercetin:** An orally bioavailable, glucoside derivative of the flavonoid quercetin and protein disulfide isomerase (PDI) inhibitor, with antioxidant and potential antithrombotic activity. As an antioxidant, isoquercetin scavenges free radicals and inhibits oxidative damage to cells. As a PDI inhibitor, this agent blocks PDI-mediated platelet activation, and fibrin generation, which prevents thrombus formation after vascular injury. In addition, isoquercetin is an alpha-glucosidase inhibitor. PDI, an oxidoreductase secreted by activated endothelial cells and platelets, plays a key role in the initiation of the coagulation cascade. Cancer, in addition to other thrombotic disorders, increases the risk of thrombus formation.

**isosceles right triangle:** a triangle having two equal sides, two equal angles, and one  $90^\circ$  angle. Its sides are always in the ratio 1, 1,  $\sqrt{2}$ .

**isosceles triangle:** a triangle having two equal sides (and thus two equal angles across from those sides). OR A triangle with two sides of equal length.

**isostasy:** the equilibrium, or balance, between adjacent blocks of crust overlying the mantle.

**isostatic adjustment (isostatic compensation):** The process whereby lateral transport at the Earth's surface from erosion or deposition is compensated for by movements in a subcrustal layer to maintain equilibrium among units of varying masses and densities.

**isosteric:** Having identical valence electron configurations.

**isosulfan blue:** A synthetic visual lymphatic imaging agent. Injected into the periphery of the tumor site, isosulfan blue localizes to the lymphatic system and aids in the surgical identification of tumor sentinel nodes which stain blue. or A dye made in the laboratory that helps identify the sentinel lymph node (the first lymph node that cancer spreads to from a primary tumor). Isosulfan blue is injected at the edge of a tumor and travels through the lymph fluid to lymph nodes near the tumor. The sentinel lymph node is

identified by removing lymph nodes that are stained with the blue dye and looking for cancer cells under a microscope.

**isosurface:** three-dimensional diagram showing surfaces connecting equal values.

**Isotactic:** having a stereochemical regularity of structure in the repeating units of a polymer.

**isotherm:** line connecting areas of equal temperature on a map.

**isotherm:** A contour line that corresponds to values measured at identical temperatures. For example, curves on a plot of gas pressure measured at different volumes in a constant temperature bath are isotherms. OR a line of equal temperature. Any point along an isotherm is at the same temperature as any other point along the same isotherm.

**isotherm:** A line on a chart that connects all points of equal or constant temperature.

**isothermal:** Having constant temperature. OR Occurring at constant temperature.

**Isothermal mode:** A thermogravimetric analysis technique in which the temperature of the sample is held constant.

**isotone:** One of a group of atoms or ions with nuclei that contain the same number of neutrons but different numbers of protons.

**isotonic:** Refers to solutions that have equal osmotic pressure.

**Isotope:** Isotopes are atoms of the same element that have different atomic masses. The change in mass occurs because the atoms have different numbers of neutrons. Their charges are all the same but their masses are different. Atomic masses are not even numbers because they represent the average mass of the atoms. The atomic mass includes the mass of isotopes and normal atoms. OR Isotopes are atoms of the same element with different numbers of neutrons. They have the same atomic number but different mass numbers. OR a variety of an element characterized by a specific number of neutrons in the nucleus. OR an atom of an element that contains a different number of neutrons in its nuclei than does another atom of that element. OR atoms with the same number of protons, but different numbers of neutrons. OR One of two or more atoms that have the same atomic number (i.e., the same number of protons in their nuclei) but have different mass numbers. OR Two or more forms (or atomic configurations)

of a given element that have identical atomic numbers (the same number of protons in their nuclei) and the same or very similar chemical properties but different atomic masses (different numbers of neutrons in their nuclei) and distinct physical properties. Thus, carbon-12, carbon-13, and carbon-14 are isotopes of the element carbon, and the numbers denote the approximate atomic masses. Among their distinct physical properties, some isotopes (known as radioisotopes) are radioactive because their nuclei emit radiation as they strive toward a more stable nuclear configuration. For example, carbon-12 and carbon-13 are stable, but carbon-14 is unstable and radioactive. OR Atoms or ions of an element with different numbers of neutrons in their atomic nucleus. Isotopes have the same atomic number but different mass number. Isotopes have very similar chemical properties but sometimes differ greatly in nuclear stability.

**isotope :** A form of a chemical element in which the atoms have the same number of protons (part of the nucleus of an atom) but with a different number of neutrons (part of the nucleus of an atom). For example, carbon 12, carbon 13, and carbon 14 are isotopes of carbon. They all have six protons in the nucleus, but each has different number of neutrons. Isotopes may be used in certain medical tests and procedures.

**Isotope separation:** The process of separating isotopes from one another, or changing their relative abundances, as by gaseous diffusion or electromagnetic separation. Isotope separation is a step in the isotopic enrichment process.

**isotopes:** Atoms of the same element with differing numbers of neutrons. OR are the same elements with different mass numbers. This is caused by having a different number of neutrons in the nucleus. OR two elements that have the same atomic number but different atomic masses. OR Stable or radioactive forms of an element that differ in atomic weight but are otherwise chemically identical to the naturally abundant form of the element; used as tracers. OR Elements with the same number of protons but have different numbers of neutrons, and thus different masses.

**isotopic abundance:** The fraction of atoms of a given isotope in a sample of an element.

**Isotopic enrichment:** A process by which the relative abundance of the isotopes of a given element are altered, thus producing a form of the

element that has been enriched in one particular isotope and depleted in its other isotopic forms.

**isotopic mass:** The mass of a single atom of a given isotope, usually given in daltons.

**isotretinoin:** A naturally-occurring retinoic acid with potential antineoplastic activity. Isotretinoin binds to and activates nuclear retinoic acid receptors (RARs); activated RARs serve as transcription factors that promote cell differentiation and apoptosis. This agent also exhibits immunomodulatory and anti-inflammatory responses and inhibits ornithine decarboxylase, thereby decreasing polyamine synthesis and keratinization. or A drug that is used in the treatment of acne and psoriasis and is being studied in cancer prevention. It is a type of retinoid. Also called 13-cis retinoic acid.

**Isotropic:** Having identical properties in all directions.

**Isotropic shrinkage:** Shrinkage that occurs equally in all directions See anisotropic shrinkage.

**ISOTROPY:** The situation where properties are independent of the direction in which they are measured.

**Isovorin:** (Other name for: L-leucovorin)

**isozymes:** Multiple forms of an enzyme that catalyze the same reaction but differ from each other in their amino acid sequence, substrate affinity,  $V_{max}$ , and/or regulatory properties; also called isoenzymes. OR Multiple forms of an enzyme that differ from one another in one or more of the properties. OR Enzymes in an organism that catalyze the same reaction but differ in structure; these differences may range from one to several amino acid residues. Also called isoenzymes.

**ispinesib:** A synthetic small molecule, derived from quinazolinone, with antineoplastic properties. Ispinesib selectively inhibits the mitotic motor protein, kinesin spindle protein (KSP), resulting in inhibition of mitotic spindle assembly, induction of cell cycle arrest during the mitotic phase, and cell death in tumor cells that are actively dividing. Because KSP is not involved in nonmitotic processes, such as neuronal transport, ispinesib may be less likely to cause the peripheral neuropathy often associated with the tubulin-targeting agents. or A substance being studied in the treatment of

cancer. Ispinesib blocks a protein that tumor cells need to divide. It is a type of mitotic inhibitor. Also called SB-715992.

**ISS 1018 CpG oligodeoxynucleotide:** A short, synthetic, unmethylated CpG motif-based oligodeoxynucleotide (CpG ODN) with immunostimulatory activity. As an immunostimulatory sequence (ISS) that signals through Toll-like receptor 9 (TLR9), ISS 1018 CpG ODN induces the production of immunoglobulin by B cells and interferon (IFN) -alpha, IFN-beta, interleukin (IL) -12, and tumor necrosis factor (TNF) -alpha by plasmacytoid dendritic cells (pDC). In turn, pDC, through cell-cell contact and secretion of and IFN-alpha and -beta induce natural killer (NK) cell proliferation, NK cell production of IFN-gamma, and NK cell-mediated cytotoxicity; secreted IFNs also stimulate bystander T cell activation and differentiation of naive CD4+ T cells into T-helper 1 cells on specific antigen challenge. In addition, ISS 1018 CpG ODN promotes antigen presentation and co-stimulatory molecule expression. Unmethylated CpG motifs are regions of genomic DNA containing the cytosine-guanine dinucleotide in which cytosine remains unmethylated, especially in prokaryotic DNA.

**isthmus :** A narrow part inside the body that connects two larger structures.

**Istodax :** A drug used to treat cutaneous T-cell lymphoma in patients who have been treated with other anticancer drugs. It is also being studied in the treatment of other types of cancer. Istodax blocks certain enzymes, which may help kill cancer cells. It is a type of depsipeptide and a type of histone deacetylase inhibitor. Also called FR901228 and romidepsin.

**ITP:** A condition in which platelets (blood cells that cause blood clots to form) are destroyed by the immune system. The low platelet count causes easy bruising and bleeding, which may be seen as purple areas in the skin, mucous membranes, and outer linings of organs. Also called idiopathic thrombocytopenic purpura and immune thrombocytopenic purpura.

**itraconazole:** A synthetic triazole agent with antimycotic properties. Formulated for both topical and systemic use, itraconazole preferentially inhibits fungal cytochrome P450 enzymes, resulting in a decrease in fungal ergosterol synthesis. Because of its low toxicity profile, this agent can be used for long-term maintenance treatment of chronic fungal infections. Check for active clinical trials using this agent.

**itraconazole :** A drug used to prevent or treat fungal infections. It belongs to the family of drugs called antifungal agents.

**itraconazole dispersion in polymer matrix:** A proprietary oral formulation composed of the poorly soluble, synthetic triazole agent, itraconazole, dispersed in a polymer matrix, with antifungal and potential anti-angiogenic activities. Upon oral administration, itraconazole inhibits the enzyme cytochrome P450 lanosterol 14 alpha-demethylase, resulting in a decrease in fungal ergosterol synthesis. Although the exact mechanism through which itraconazole inhibits angiogenesis has yet to be fully elucidated, this agent appears to inhibit the Hedgehog (Hh) signaling pathway, cholesterol synthesis and mammalian target of rapamycin (mTOR) signaling in endothelial cells. This agent may also prevent the activation of and signaling by various angiogenic growth factors. By decreasing the tumor vasculature and nutrient supply, itraconazole ultimately inhibits tumor cell growth. The solid dispersion of itraconazole in the polymer matrix enhances dissolution of itraconazole in the gastrointestinal tract and increases its bioavailability; this allows for the administration of a much lower dose compared to itraconazole alone.
