Assertion & Reason For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
- (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
- (c) If assertion is true but reason is false.
- (d) If the assertion and reason both are false.
- (e) If assertion is false but reason is true.
- 1. Assertion : Volume of a gas is inversely proportional to

the number of moles of a gas.

Reason : The ratio by volume of gaseous reactants and

products is in agreement with their mole

ratio.

[AIIMS 1995]

- **2.** Assertion : Molecular weight of oxygen is 16.
 - Reason : Atomic weight of oxygen is 16.

[AIIMS 1996]

- **3.** Assertion : Atoms can neither be created nor destroyed.
 - Reason : Under similar condition of temperature and pressure, equal volume of gases does not

contain equal number of atoms.

[AIIMS 1994,2002]

4. Assertion : One mole of SO_2 contains double the number of

molecules present in one mole of O_2 .

Reason : Molecular weight of SO_2 is double to that of

 O_2 .

- **5.** Assertion : 1.231 has three significant figures.
 - Reason : All numbers right to the decimal point are

significant.

6. Assertion : 22.4 L of N_2 at NTP and 5.6 L O_2 at NTP

contain equal number of molecules.

Reason

Under similar conditions of temperature and pressure all gases contain equal number of

molecules.

7. Assertion : One atomic mass unit (amu) is mass of an

atom equal to exactly one-twelfth the mass of

a carbon-12 atom.

Reason : Carbon-12 isotope was selected as standard.

8. Assertion

Molecular mass of A is $\frac{M}{4}$ if the molecular

mass of B is M.

Reason : Vapour density of A four times that of B.

9. Assertion: Pure water obtained from different sources

such as, river, well, spring, sea etc. always contains hydrogen and oxygen combined in

the ratio 1:8 by mass.

Reason : A chemical compound always contains elements combined together in same

proportion by mass, it was discovered by

French chemist, Joseph Proust (1799).

10. Assertion: As mole is the basic chemical unit, the

concentration of the dissolved solute is usually specified in terms of number of moles

of solute.

Reason : The total number of molecules of reactants

involved in a balanced chemical equation is

known as molecularity of the reaction.

11. Assertion: A certain element X, forms three binary

compounds with chlorine containing 59.68%,68.95% and 74.75% chlorine respectively. These data illustrate the law of

multiple proportions.

Reason : According to law of multiple proportions, the

relative amounts of an element combining with some fixed amount of a second element in a series of compounds are the ratios of

small whole numbers.

12. Assertion : Equivalent weight of Cu in CuO is 63.6

and in Cu_2O 31.8.

Reason : Equivalent weight of an element

 $= \frac{\text{Atomic weight of the element}}{\text{Valency of the element}}$

13. Assertion : Mass spectrometer is used for the

determination of isotopes.

Reason : Isotopes are the atoms of same element

differing in mass numbers.

14. Assertion : Gases combine in simple ratio of their

volume but, not always.

Reason : Gases deviate from ideal behaviour.

15. Assertion : Isomorphous substances form crystals of

same shape and can grow in saturated

solution of each other.

Reason : They have similar constitution and chemical

formulae.

16. Assertion : Atomicity of oxygen is 2.

Reason : 1 mole of an element contains 6.023×10^{23}

atoms.

17. Assertion : 1 amu equals to $1.66 \times 10^{-24} \ g$.

Reason : 1.66×10^{-24} g equals to $\frac{1}{12}th$ of mass of a

 C^{12} atom.
