From Newton's formula

$$\eta = \frac{F}{A(\Delta v_x / \Delta z)}$$

.: Dimensions of

dimensions of force dimensions of area × dimensions of velocity - gradient

$$= \frac{[MLT^{-2}]}{[L^2]T^{-1}} = [ML^{-1}T^{-1}]$$

As given in question, retardation (negative acceleration) a

 \Rightarrow a = kx

where k is a proportionality constant

$$\Rightarrow \frac{dv}{dt} = kx$$

$$\Rightarrow \frac{dv}{dx} \cdot \frac{dx}{dt} = kx$$

$$\Rightarrow v \frac{dv}{dx} = kx \qquad \left(\because v = \frac{dx}{dt}\right)$$

$$\left(\because v = \frac{dx}{dt}\right)$$

$$\Rightarrow$$
 v dv = kx dx

Integrating, we get

$$\int_{V_1}^{V_f} v dv \int_{V_2}^{x} kx dx$$

where $\boldsymbol{v}_{_{i}}$ and $\boldsymbol{v}_{_{f}}$ respectively are initial and final velocities of particle.

$$v = k \left(\frac{x^2}{2}\right)$$

$$\Rightarrow \frac{v_f^2}{2} - \frac{v_f^2}{2} = k^2$$

$$\Rightarrow \frac{1}{2} m v_f^2 - m v_i^2 = \frac{1}{2} m k x^2$$

$$K.E._{\text{final}} - K.E._{\text{initial}} = \frac{1}{2} \text{mkx}^2$$

ence, loss in kinetic energy $\propto x^2$

3. Second law of motion gives

$$s = ut + \frac{1}{2}gt^2$$

or
$$h = 0 + \frac{1}{2}gt^2$$

$$(\because \mathbf{u} = 0)$$

$$T = \sqrt{\left(\frac{2h}{g}\right)}$$

At
$$t = \frac{T}{3} \sec$$
,

$$x = 0 + \frac{1}{2}g\left(\frac{T}{3}\right)^2$$

$$\Rightarrow$$

$$s = \frac{1}{2}g.\frac{T^2}{9}$$

$$\Rightarrow$$

$$s = \frac{g}{18} \times \frac{2h}{g}$$

$$s = \frac{h}{9}m$$

Hence, the position of ball from the ground

$$=h-\frac{h}{9}=\frac{8h}{9}m$$

$$(\vec{A} \times \vec{B}) = (\vec{B} \times \vec{A})$$

$$(\vec{A} \times \vec{B})$$
 $(\vec{B} \times \vec{A}) = \vec{0}$

$$\Rightarrow$$

$$(\vec{A} \times \vec{B}) + (\vec{A} \times \vec{B}) = \vec{0}$$

$$\left[: (\vec{B} \times \vec{A}) = - (\vec{A} \times \vec{B}) \right]$$

$$\Rightarrow$$

$$\Rightarrow$$

$$2AB \sin \theta = 0$$

$$\Rightarrow$$

$$\widehat{\sin}\theta = 0$$

$$\left[: |\vec{\mathbf{A}}| = \mathbf{A} \neq 0, |\vec{\mathbf{B}}| = \mathbf{B} \neq 0 \right]$$

$$\theta = 0 \text{ or } \pi$$

5. We know in advance that range of projectile is same for complementary angles i.e. for θ and $(90^{\circ} - \theta)$.

$$R = \frac{u^2 \sin 2\theta}{g}$$

Therefore,
$$T_1 T_2 = \frac{2u \sin \theta}{g} \times \frac{2u \cos \theta}{g}$$

$$=\frac{2u^2\left(2\sin\theta\,\cos\theta\right)}{g^2}$$

$$T_1T_2 \propto R$$

- For a particle moving in a circle with constant angular speed, velocity vector is always tangent to the circle and the acceleration vector always points towards the centre of the circle or is always along radius of the circle. Since, tangential vector is perpendigalar to radial vector, therefore, velocity vector will be perpendicular to the acceleration vector. But in no case acceleration vector is tangent to the circle.

On solving;

$$a = \left(\frac{m_1 - m_2}{m_1 + m_2}\right) g$$
 (iii)

Here,

$$m_1 = 5 \text{ kg}, m_2 = 4.8 \text{ kg}, g = 9.8 \text{ m/s}^2$$

$$a = \left(\frac{5 - 4.8}{5 + 4.8}\right) \times 9.8$$

The effective force constant in their series combination is

$$T = 2\pi \sqrt{\frac{m(k_1 + k_2)}{k_1 k_2}}$$

$$T^2 = \frac{4\pi^2 m (k_1 + k_2)}{k_1 k_2}$$

From equations (i) and (ii), we obtain

$$t_1^2 + t_2^2 = 4\pi^2 \left(\frac{m}{k_1} + \frac{m}{k_2} \right)$$

$$\Rightarrow$$

$$t_1^2 + t_2^2 = 4\pi^2 \text{ m} \left(\frac{1}{k_1} + \frac{1}{k_2} \right)$$

[from equation (iii)]

- In simple harmonic motion when a particle is displaced to a position from its mean position, then its kinetic energy gets converted into potential energy and vice-versa. Hence, total energy of a particle remains constant or the total energy in simple harmonic motion does not depend on displacement
- 28. As given

$$y = 10^{-6}$$

$$=10^{-6} \sin 100t + 20x + \frac{\pi}{4}$$

..... (iii)

Comparing it with

$$y = a \sin(\omega t + kx + \phi)$$

.....(ii)

we find $\omega = 100 \text{ rad/sec}$, k = 20 per metre

$$\frac{\omega}{v} = \frac{100}{20} = 5 \text{ m/s}$$

Initial angular velocity of particle = ω_0 and at any instant t, angular velocity = ω

Therefore, for a displacement x, the resultant acceleration

$$f = (\omega_0^2 - \omega^2)x$$

External force
$$F = m(\omega_0^2 - \omega^2)x$$

Since
$$F \propto \cos \omega t$$
 (given)

From eq. (ii)
$$m(\omega_0^2 - \omega^2) x \propto \cos \omega t$$

$$x = A \sin(\omega t + \phi)$$

..... (iv)

at
$$t = 0$$
; $x = A$

$$A = A \sin(0 + \phi)$$

$$\Rightarrow$$

$$\phi = \frac{\pi}{2}$$

$$\therefore x = A \sin \left(\omega t + \frac{\pi}{2} \right) = A \cot \omega t$$

Hence, from equations (iii) and (v), we finally get

$$m(\omega_0^2 - \omega^2) A \cos \omega t \propto \cos \omega t$$

$$\Rightarrow$$

$$A \propto \frac{1}{m(\omega_0^2 - \omega^2)}$$

31. Mayer's formula is

$$C_p - C_v = R$$

and

$$\gamma = \frac{C_P}{C_V}$$

Therefore, using above two relations, we find

$$C_V = \frac{R}{\gamma - 1}$$

For a mole of monoatomic gas; γ

$$C_{V} = \frac{8}{3} \frac{3}{2} F$$

For a mole of diatomic gas 75

$$= \frac{R}{(75)-1} = \frac{5}{2} R$$

When these two moles are mixed, then heat required to raise the temperature to 1°C is

$$C_V = \frac{3}{2}R + \frac{5}{2}R = 4R$$

Hence, for one mole, heat required is

$$=\frac{4R}{2}=2R$$

$$C_V = 2R$$

$$\frac{R}{\gamma - 1} = 2R \implies \gamma = \frac{3}{2}$$

38. A plano-convex lens behaves as a concave mirror if its one surface (curved) is silvered. The rays refracted from plane surface are reflected from curved surface and again refract from plane surface. Therefore, in this lens two refractions and one reflection occur. Let the focal length of silvered lens

 $(:: R = 2f_m)$

is f. $\frac{1}{F} = \frac{1}{f} + \frac{1}{f} + \frac{1}{f_{m}}$ $= \frac{2}{f} + \frac{1}{f_{m}}$

where, $f = focal length of lens before silvering <math>f_m = focal length of spherical mirror$

$$\frac{1}{F} = \frac{2}{f} + \frac{2}{R}$$

Now,
$$\frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$
 (ii)

Here, $R_1 = \infty$, $R_2 = 30 \text{ cm}$

$$\therefore \frac{1}{f} = (1.5 - 1) \left(\frac{1}{100} \right)$$

$$\Rightarrow \frac{1}{f} = -\frac{0.5}{30} = \frac{1}{60}$$

Hence, from equation (

$$=\frac{6}{60}$$

$$F = 10 \text{ cm}$$

Again given that, size of object = size of image

$$O = l$$

$$m = -\frac{v}{u} = \frac{1}{O}$$

$$\frac{\mathbf{v}}{\mathbf{v}} = -1$$

Thus, from lens formula

$$\frac{1}{F} = \frac{1}{v} - \frac{1}{u}$$

$$\frac{1}{10} = \frac{1}{-u} - \frac{1}{u}$$

$$\frac{1}{10} = -\frac{2}{u}$$

$$\therefore$$
 u = -20 cm

Hence, to get a real image, object must be placed at a distance 20 cm on the left side of lens.

$$2\lambda \sin \theta = n\lambda$$

$$2\sin\theta = n$$

The maximum value of $\sin \theta$ is 1, hence, $n = 2\sqrt{1}$

Thus, equation (i) must be satisfied by 5 integer values i.e. - 2, -1, 0, 1, 2. Hence, the maximum number of possible interference maxima is 5.

49. Metre bridge is an arrangement which works on Wheatstone's principle so, the balancing condition is

.....(i)

$$\frac{R}{S} = \frac{l_1}{l_2}$$

where $l_2 = 100 - l_1$

1st case:
$$R = X$$
, $S = Y$, $l_1 = 20$ cm,

$$l_2 = 100 - 20 = 80 \text{ cm}$$

$$\therefore \frac{X}{Y} = \frac{20}{80}$$

IInd case: Let the position of null point is obtained at a distance *l* from same end.

$$\therefore$$
 R = 4x, S = Y, $l_1 = l$, $l_2 = 100$

$$\frac{4X}{Y} = 100 - l$$

Therefore, from equations (i) and (ii)

$$\frac{l}{4(100-l)} = \frac{20}{80}$$

$$\frac{l}{4(100-l)} = \frac{1}{4}$$

$$l = 100 - l$$

54. Let R be the radius of a long thin cylindrical shell.

To calculate the magnetic induction at a distance r (r < R) from the axis of cylinder, a circular the of radius r is shown:

Since no current is enclosed in the circle so, from Ampere's circuital law, magnetic induction is zero at every point of circle. Hence, the magnetic induction at any point inside the infinitely long straight thin walled tube (cylindrical) is zero.

55. The magnetic field at the centre of circular coil is

$$B = \frac{\mu_0 i}{2r}$$

there r = radius of circle = $\frac{1}{2\pi}$ (:: 1 = 2 π r)

.....(i)

..... (i)

$$\therefore B = \frac{\mu_0 i}{2} \times \frac{2\pi}{1}$$

$$\mu_0 i\pi$$

When wire of length i bents into a circular loops of n turns, then

$$1 = n \times 2 \pi r'$$

$$\Rightarrow$$

$$r' = \frac{1}{n \times 2\pi}$$

Thus, new magnetic field

$$B' = \frac{\mu_0 ni}{2r'} = \frac{\mu_0 ni}{2} \times \frac{n \times 2\pi}{1}$$

$$= \frac{\mu_0 i\pi}{1} \times n^2$$

56. The magnetic field at a point on the axis of a circular loop at a distance x from the centre is

$$B = \frac{\mu_0 i R^2}{2(R^2 + x^2)^{3/2}}$$

Given : B = 54 μ T, x = 4 cm, R = 3 cm

Putting the given values in eq (i), we get

$$\therefore 54 = \frac{\mu_0 i \times (3)^2}{2(3^2 + 4^2)^{3/2}}$$

$$\Rightarrow 54 = \frac{9\mu_0 i}{2(25)^{3/2}} = \frac{9\mu_0 i}{2(5)^{3/2}}$$

$$\mu_0 i = \underbrace{54 \times 2 \times 125}_{\mu_0 i}$$

$$\mu_0 i = \underbrace{1500}_{\mu_0 i}$$

Now, putting x = 0 in equation i), magnetic field at the centre of loop is

Solutions of AIEEE 2004 Solved Paper

MATHEMATICS SOLUTIONS

- 1. Let $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$ is a relation on the set $A = \{1, 2, 3, 4\}$, then
 - (a) Since $\in R$ and $(2,3) \in R$, so R is not a function.
 - (b) Since $(1, 3) \in R$ and $(3, 1) \in R$ but $(1, 1) \notin R$. So R is not transitive.
 - (c) Since $(2, 3) \in R$ but $(3, 2) \notin R$, so R is not symmetric.
 - (d) Since (4, 4) ∉ R so R is not reflexive, Hence the option (c) is corrected.
- 2. The given function $f(x) = {}^{7-x}P_{x-3}$ would be defined if
 - (i) $7 x > 0 \implies x < 7$
 - (ii) $x 3 \ge 0 \implies x \ge 3$
 - (iii) $(x 3) \le (7 x)$
 - $\Rightarrow \qquad 2x \le 10 \Rightarrow x \le 5$
 - \Rightarrow x = 3, 4, 5

Hence Range of $f(x) = \{{}^{4}P_{0}, {}^{3}P_{1}, {}^{2}P_{2}\}$

Range of $f(x) = \{1, 3, 2\}$

- 3. Since $\overline{z} + i\overline{w} = 0 \Rightarrow \overline{z} = -i\overline{w}$
 - \Rightarrow z = iw
 - \Rightarrow W = -iz
 - Also $arg(zw) = \pi$
 - \Rightarrow arg $(-iz^2) = \pi$
 - $\Rightarrow \qquad \qquad \arg(-i) + 2 \arg(z)$
 - $\Rightarrow \frac{-\pi}{2} + 2\arg(z) = \pi \qquad (\because \arg(-i) = -\pi/2)$
 - \Rightarrow 2arg(z)
 - \Rightarrow $we v = \frac{3\pi}{4}$
- 4. $z^{1/3} = p + iq$
 - $(\because z = x iy)$
 - $\Rightarrow \qquad (x iy) = (p + iq)^3$
 - $\Rightarrow (x iy) = p^3 + (iq)^3 + 3p^2qi + 3pq^2i^2$
 - $\Rightarrow (x iy) = p^3 iq^3 + 3p^2qi 3pq^2$
 - $\Rightarrow \qquad (x iy) = (p^3 3pq^2) + i (3p^2q q^3)$

On comparing both sides, we get

- $x = (p^3 3pq^2)$ and $-y = 3p^2q q^3$
- $x = p(p^2 3q^2)$ and $y = q(q^2 3p^2)$
- $\frac{x}{p} = (p^2 3q^2)$ and $\frac{y}{q} = (q^2 3p^2)$

Now,
$$\frac{x}{p} + \frac{y}{q} = p - 3q^2 + q^2 - 3p^2$$

$$\Rightarrow \frac{x}{p} + \frac{y}{q} = -2p^2 - 2q^2$$

$$\Rightarrow \frac{x}{p} + \frac{y}{q} = -2(p^2 + q^2)$$

$$\Rightarrow \frac{x/p + y/q}{(p^2 + q^2)} = -2$$

5. Given that

$$|z^2 - 1| = |z|^2 + 2$$

 $|z^2 + (-1)| = |z^2| + |-1|$

It shows that the origin, -1 and z^2 lies on a line and z^2 and -1 lies on one side of the origin, therefore z^2 is a negative number. Hence z will be purely imaginary. So we can say that z lies on y-axis.

- 6. The given matrix $A = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$
 - (a) It is clear that A is not a zero matrix.

(b)
$$(-1)$$
 $1 = -1 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -1 \end{bmatrix} \neq A$

i.e., $(-1)1 \neq A$

(c)
$$|A| = 0 \begin{vmatrix} -1 & 0 \\ 0 & 0 \end{vmatrix} - 0 \begin{vmatrix} 0 & 0 \\ -1 & 0 \end{vmatrix} - 1$$

$$= 0 - 0 - 1 (-1) = 1$$

Since $|A| \neq 0$. So A^{-1} exists.

(d)
$$A^{2} = A \cdot A = \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{bmatrix}$$

$$A^{2} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$A^2 = I$$

7. Since B is inverse of A, i.e. $B = A^{-1}$

$$10A^{-1} = \begin{bmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{bmatrix}$$

The equation of the family of curves is 43.

$$x^2 + y^2 - 2ay = 0$$

$$2x + 2yy' - 2ay' = 0$$

$$2x + 2yy' = 2ay'$$

$$\frac{2x + 2yy'}{y'} = 2a$$

.....(i)

From equation (i) $2a = \frac{x^2 + y^2}{y}$

On putting this value in equation (ii)

$$\frac{2x + 2yy'}{y'} = \frac{x^2 + y^2}{y}$$

$$2xy + 2y^2y' = x^2y' + y^2y'$$

$$(x^2 - y^2)y' = 2xy$$

$$d\left(-\frac{1}{xy}\right) = -\frac{1}{y}dy$$

The given pair of line is x^2 - 2cxy - $7y^2$ = 0

On comparing with $ax^2 + 2hxy + by^2 = 0$,

we get,

$$a = 1, 2h = -2c, b = -7$$

$$m_1 + m_2 = -\frac{2h}{b} = -\frac{2c}{7}$$
 and $m_1 m_2 = \frac{a}{b}$

$$-2c/7 = -4/7$$
, $c = 4/2 = 2$

The pair of lines is $6x^2 - xy + 4cy^2 = 0$

On comparing with $ax^2 + 2hxy + by^2 = 0$, we get

$$a = 6$$
, $2h = -1$, $b = 4c$

$$\therefore$$
 $m_1 + m_2 = -\frac{2h}{b} = \frac{1}{4c}$ and $m_1 m_2 = \frac{a}{b} = \frac{6}{b}$

One line of given pair of lines is

Slope of line = $-3/4 = m_1 (sax)$

$$-3/4 + m_2 = 1/40$$

$$1+3c=\frac{-6\times4}{4}$$

$$1 + 3c = -8$$

$$3c = -9 \Rightarrow c = -3$$

the equation of circle is

Here the circle $x^2 + y^2 = 4$ orthogonally

if
$$2g.0 + 2f.0 = c - 4$$

 \Rightarrow $c = 4$

: Equation of circle is

$$x^2 + y^2 + 2gx + 2fy + 4 = 0$$

: It passes through the point (a, b)

$$a^2 + b^2 + 2ag + 2f + 4 = 0$$

Locus of centre (-g, -f) will be $a^2 + b^2 - 2xa - 2yb + 4 = 0$

50. In a circle AB is as a diameter where the co-ordinate of A is (p, q) and let the co-ordinate of B is (x_1, y_1) .

Equation of circle in diameter form is

$$(x - p)(x - x_1) + (y - q)(y - y_1) = 0$$

$$x^{2} - (p + x_{1})x + px_{1} + y^{2} - (y_{1} + q)y + qy_{1} = 0$$

$$x^{2} - (p + x_{1})x + y^{2} - (y_{1} + q)y + px_{1} + qy_{1} = 0$$

Since this circle touches X-axis

$$\therefore$$
 $y = 0$

$$\Rightarrow$$
 $x^2 - (p + x_1)x + px_1 + qy_1 = 0$

Also the discriminant of above equation will be equal to zero because circle touches X-axis.

$$\therefore (p + x_1)^2 = 4(px_1 + qy_1)$$

$$p^2 + x^2_1 + 2px_1 = 4px_1 + 4qy_1$$

$$x_1^2 - 2px_1 + p^2 = 4qy_1$$

Therefore the locus of point B is,

On solving these we get $x=0$ and $x=4a$
Also $y=0$ and $y=4a$

$$\therefore$$
 The point of intersection of parabolas are A(0, 0) and B(4a, 4a).
Also line $2bx+3cy+4d=0$ passes through A and B.
$$\therefore d=0$$
or $2b\cdot 4a+3c\cdot 4a+4d=0$

$$2ab+3ac+d=0$$

$$a(2b+3c)=0$$

On squaring equation (i) and (ii) and then adding, we get

$$d^2 + (2b + 3c)^2 = 0$$

Since the directrix is x = 4 then ellipse is parallel to X-axis.

$$\Rightarrow \frac{a}{e} = 4 \Rightarrow a = 4e = 4 \times \frac{1}{2}$$

$$\Rightarrow a = 2$$

Also we know that

$$b^{2} = a^{2}(1 - e^{2})$$

 $b^{2} = 4(1 - 1/4) = 4 \times 3$
 $b^{2} = 3$

∴ Equation of ellipse is
$$\frac{x^2}{4} + \frac{y^2}{3} = 1$$

$$\Rightarrow 3x^2 + 4y^2 = 12$$

55. A line makes angle
$$\theta$$
 with x-axis and z-axis and β with y-axis.

$$\therefore 1 = \cos\theta, m = \cos\beta, n = \cos\theta$$

We know that,
$$1^2 + m^2 + m^2 + \cos^2 \theta + \cos^2 \theta + \cos^2 \theta = 0$$

$$2\cos^2\theta = \sin^2\beta \qquad \dots (i)$$

But
$$\sin^2 \beta = 3\sin^2 \theta$$
 (ii)

.. From equation (i) and (ii)

$$3\sin^2\theta = 2\cos^2\theta$$
$$3(1-\cos^2\theta) = 2\cos^2\theta$$
$$3-3\cos^2\theta = 2\cos^2\theta$$
$$3=5\cos^2\theta$$

 $\cos^2 \theta = 3/5$

 $2\cos^2\theta = 1 - \cos^2\beta$

 \therefore Coordinate of F is $(2\lambda - a, \lambda, \lambda)$ Direction Ratio of EF are $(k - 2\lambda + a), (k - \lambda)$

$$\therefore \frac{k-2\lambda+a}{2} = \frac{k-\lambda-a}{1} = \frac{k-\lambda}{2}$$

On solving first and second fraction, $\frac{k-2\lambda+a}{2} = \frac{k-\lambda-a}{1}$

$$k - 2\lambda + a = 2k - 2\lambda - 2a$$

$$k = 3a$$

On solving second and third fraction

$$2k - 2\lambda - 2a = k - \lambda$$

$$k - \lambda = 2a$$

$$=\frac{\sqrt{2}(\sqrt{3}-1)}{4(3-1)}=\frac{1}{8}(\sqrt{6}-\sqrt{2})$$

75. If two particles having same initial velocity u and range R then their direction must be opposite. Let the direction of projection of them are α and 90° - α .

$$\therefore t_1 = \frac{2u\sin\alpha}{g} \text{ and } t_2 = \frac{2u\sin(90^0 - \alpha)}{g}$$

$$t_2 = \frac{2u\cos\alpha}{g}$$

Now,
$$= t_1^2 + t_2^2$$

$$=\;\frac{(2u\;sin\alpha)^2}{g^2}\!+\!\frac{(2u\;\!cos\alpha)^2}{g^2}$$

$$= \frac{4u^{2}}{g^{2}}(\sin^{2}\alpha + \cos^{2}\alpha) = \frac{4u^{2}}{g^{2}}$$
